THOUGHTS ON THERMAL INSULATION

No. 7

How can insulation help productivity

THERE IS A significant connection between thermal insulation and productivity. Productivity is one of the keys to our industrial future. Many factors, of course, have a bearing on this problem, but in a large measure increased productivity depends on the substitution of mechanical and electrical energy for human exertion. One of the interesting facts referred to by the Teams who visited the U.S.A. was that the average American worker has something like 2½ times more power at his disposal compared with his British counterpart. If, then, we are planning for a rise in productivity we must also expect a rise in the demand for industrial power.

Coal production, however, is not keeping pace; although output per man shift in the mines is up, total production is down. What can we do about it? One of the most effective ways to reduce coal consumption is by the greater use of thermal insulation and this can produce astonishing savings.

In this specialised field, Newalls have a wide experience both as manufacturers and contractors. If you would like to know how much fuel you could save by improved thermal insulation—and it is a figure you should have—call in Newalls for a preliminary investigation, which will cost you nothing. A line from your Plant Engineer will suffice.

Issued in the interests of a better understanding of thermal insulation in industry

Glenfield Control

IN WATER SUPPLY

There can be no expansion without "pure-water," and there can be no "pure-water" without applying efficient methods of control in places of storage, in pipelines, in treatment plants and throughout distribution networks. In all these fields Glenfield Control Equipment has been in ever-increasing demand for over one hundred years.

DAVID BROWN AND THE SUGAR INDUSTRY

Some of the largest Sugar mills and refineries in Britain and the Commonwealth rely on the engineering skill of the David Brown companies. In the arduous conditions of this industry, many David Brown products— notably gears and gear units— play a key role. The guarantee of maximum efficiency is the fact that the resources and combined skill of the whole Group contribute to the making of each product bearing the name David Brown.

Avoiding a Railway Crash

IN just over a week's time the country may fall into the grip of a national railway strike. Such a stoppage would be an inconvenience to everybody, and a personal and financial tragedy to some (including some railwaymen). It is therefore natural that the general mood should be one of unreasoning apprehension: the train is bearing down on the damsel who is tied to the railway line, and there will no doubt be loud applause for Sir Walter Monckton or the members of the Court of Inquiry or anybody else who carries out a last-minute rescue operation. But, before reason becomes lost in melodrama once again, the public would be wise to think out very carefully on what terms it would be worth while to avoid this strike.

Nobody need stand fast on the argument that no increase should be offered to any railwayman; there will be general agreement that some of the workers—especially the skilled men and certain of the lower grades who have little or no opportunity to add to their basic wage—are still underpaid. But there should be still more general agreement, among all who are ready to look beyond immediate inconveniences, that the worst outcome of all would be unconditional surrender to the union's demand, for a flat percentage increase to every grade financed by a Government subsidy. A flat percentage increase would make nonsense of the exercise in restoring differentials between grades, on which the Transport Commission and the union leaders themselves have been working for twelve months. A Government subsidy might conceivably be justifiable if the troubles of the railways were due wholly to what are known as the railways' "public obligations"; in the present circumstances, however, Government money would be a direct encouragement to unenterprising management and to some thoroughly bad labour practices. There should be no subsidising them.

If a subsidy is ruled out, are there any other ways in which wage increases could be financed? There are three possible ways, and taken together they could finance very substantial increases indeed. The first way would be to cut down the large number of what can only be called "spiv" jobs on the railways. A glaring example—not the worst, but perhaps the most familiar to the traveller—is provided by the profusion of porters waiting to carry passengers' luggage on London railway stations. Quite often, less than half of these men will be genuine passenger porters: they get a basic wage of £6 10s. a week and, when their tips are added, some of them may sometimes take home more money than skilled engine-drivers. Many of the rest, on some stations at any rate, will be goods porters who should not be there at all; either they are enjoying an extended lunch hour or—a practice that has proved very difficult to stop—a goods gang somewhere is short of a man and will share his tips when he gets back. Similar systems of feather-bedding, not so much to increase earnings as to spin out work, exist in certain districts among linemen, cleaners, and many of the other lower grades.

All these practices react directly upon the wages that can be paid to other railwaymen. The first step towards a sane wage structure should clearly be to cut out the dead wood that results from them. There is an appalling amount ready for the axe. The number of employees on the railways has already come down from some 670,000 at one period in 1948 to under 600,000 now, but there is good reason to believe that the railways could carry on with equal efficiency—though less feather-bedding—with 100,000 fewer workers still. This cut of between 15 and 20 per cent in staff would make possible an increase of between 15 and 20 per cent in wage rates; the balance of the claim for which the NUR is now prepared to strike ranges from 4 per cent for some grades to about 7 per cent for others. Necessarily, the redundant workers could not be laid off overnight; necessarily, the money thus saved should not be spread among all workers in the equal proportions that the NUR—for the sake of peace and quiet in its ranks—has proposed. But unless the union accepts a hard and fast agreement about pruning down the labour force, even though this would involve some redeployment of workers in the face of retirements and occasional instances of forced redundancy, then the country will be wise to stand up and meet this strike.

★

This is the corner that the union should take if it really believes in furthering the best interests of the majority of its members, instead of feathering the beds of a few. If it would do this the way would be open for the second step towards restoring prosperity to the railways, which should be yet another review of the system's "public obligations." It is at this point that one of the railwaymen's favourite political arguments—that their troubles are partly due to the denationalisation of road transport—comes into the picture.

Under any transport system, nationalised or private, the prerequisite of efficiency is that each passenger and package should be carried across the country by the medium that can bear him or it at the smallest real cost. Under nationalisation, the idea was that some "co-ordinator" or "integrator" would see to this—in the last resort, by offering no choice beyond the service that he considered most economic. The idea never worked; while some of the commission's back room experts made mystical assessments of relative real costs, its front room operators were more concerned with not disturbing the convenience of existing interests, of which the unions were one, than with re-directing any traffic on economic principles. The argument that renationalisation of road transport would help the railway unions' present policy—although it may well be true—is therefore not the original argument for "co-ordination" at all; it is that argument stood upon its head.

But if "co-ordination" will not in practice lead to greater efficiency in transport, something else must be

put in its place, or else the industry never will be able to pay a decent wage to all its employees. The only possible "something else" is competition. But if this is what the present government believes in, then it needs to clear certain encumbrances out of the way. Though the railways are no longer a monopoly, they still act—indeed, in many ways they are still required by law to act—as if they were. The changes in their attitudes and actions that would be required if they were really to start competing can best be explained by considering what would happen if these "public obligations," legally binding or otherwise, did not exist at all. For example, under really competitive conditions, long distance train services would be reduced until each train could be sure of running reasonably full, as airline services (to some extent) and long distance buses are reduced at the moment; if this happened, however, then—at times of sudden rush—a passenger buying a ticket to Sheffield might be told that the railways could not accommodate him until next Thursday week. Again, costs per passenger mile or ton mile on certain branch lines are sometimes twenty or thirty times those on the main and most frequented lines; under a really economic system of charges rates would reflect these differentials, and more branch lines would be closed down. This would not mean that all charges should go up; in some cases—because the demand for railway travel can be elastic—it would certainly be economic to bring them down.

★

All these examples have been quoted in terms of passenger traffic; there are similar obligations in the even more important field of goods traffic, but here another factor comes into play. The railways have hitherto always reacted to the inconvenient invention of the motor lorry as a defensive ex-monopolist seeking the protection of the state, not as an aggressive competitor. In this they have been abetted by the law, which has only last year begun to give them the freedom they will need if they are to compete with vigour. It remains to be seen whether, with their desire never to disturb anybody if they can avoid it, they will make full use of their new powers. As with the problem of redundancy, reforms of this type cannot be carried through overnight; and nobody (not even an economist) wants them to be carried through to the ultimate and painful extreme of recanting on public obligations altogether. But, in the desperate search for more revenue with which to pay their employees, it is in these directions—towards higher charges for season tickets and for difficult hauls on branch lines, towards basing goods charges on the clear economies of carrying a full wagon load, and towards the reduction or closure of uneconomic services—that the railways will have to move. The higher charges would be very unpopular politically, and the reduction of services would require flexibility from

the unions. Once again, however, this will be a necessary flexibility, if the railways are to pay decent wages and their own way.

The final way of raising the revenue of—and thus wage levels on—the railways will need to be by modernisation of their equipment. Once again, the unions have a part to play here. It is, in part, the conservatism of labour—especially the unions' desire that the railways' money should be used to pay tolerable rates to far too many unskilled men, instead of high rates that would attract sufficient skilled engineers—that has stood in the way of modernisation so far; in much larger part, however, it has been the conservatism of management. The Government will certainly have to lend a hand in financing the modernisation programme that is now being discussed; it is much better that it should invest in success for all concerned in the future, rather than subsidise soft jobs for a minority of railwaymen now.

The Government is clearly aware that these are the lines along which policy for the railways should move. It would like any offer to the railwaymen to be tied very closely to the union's acceptance of new obligations. Mr Boyd-Carpenter referred to the three basic prerequisites—redemption of labour, freedom of charges, and modernisation of equipment—in his interview with the NUR in the middle of last month. But the time for talk is passing, and the time for action has

come. If the threat of a strike is averted by another supine and unconditional retreat before the union's demands, then the Transport Commission (which has a lot of constructive thinking to do, and has so far not done it particularly well) will have lost all opportunity for effective leadership. If the strike is forced, and if the railwaymen win it—with perhaps little more than the conventional and vague promises to be more concerned about productivity in the future—then at least the memory will linger that this year's bout of threats struck bone. If the strike is forced, and if it becomes clear that the railwaymen are not going to win it, then the Transport Commission and the Government could speed its end by proposals that would give the railwaymen their eventual rise on conditions; the interest of the public is that the union leaders should lose either the will or the power to hold the country to ransom, not that they should lose face.

Best of all, of course, would be if an offer on these lines could be formulated within the next week, and if the union leaders could accept it without a strike. Even if they sense high hopes for an eventual victory—and it is by no means certain that their sense is keen—they should ponder carefully what that victory would bring; it would be no happy position to be forced to ask, each year and from governments of differing political persuasions, for a higher standard of living for their members than those members allow themselves to earn.

Vote of Small Confidence

ON Christmas Eve, a chasm of doubt suddenly yawned in Paris—an all too familiar chasm, dividing Frenchmen from each other and France from its friends. The fact that, as this New Year opens, the gaping rift has been sealed over ought not to lead to any comfortable illusions. M. Mendès-France has secured a modest majority in the French Assembly for the ratification of the Paris agreements on western defence, and a much larger number of deputies have reaffirmed their faith in the partnership of the free nations. Across this bridge, the advance towards Western European Union can continue. There is still a hard road ahead; but at least the ponderous progress initiated at the London and Paris conferences in the autumn has not been brought to a jarring and fatal halt. Throughout the free world, the prevailing reaction will be one of relief—but not of exultation. It should be clear enough to all eyes that the chasm, although bridged, has not been filled in. Beneath the formal agreements, the doubts remain: not only French doubts about the role of Germany in western defence, and allied doubts about the role of France, but, gravest of all, Frenchmen's doubts of their own country.

To call the decisions M. Mendès-France obtained on Wednesday and Thursday "votes of confidence" is

an abuse of nomenclature, for his victory depended, in the event, on the votes of many deputies who dislike both him and his policies, and who will probably seek the first opportunity of overthrowing his government now that the debate on Western Union is over. But there is also a deeper meaning here. Many speakers in the Assembly's debate, the Prime Minister foremost among them, begged their hearers to consider whether France could hope to retain any weight in the western partnership if it rejected agreements which most of its allies regarded as the last possible compromise. And M. Mendès-France, for one, pushed this logic further, pointing out that France must not only keep its friends' respect but recover its own self-respect too. What prospect is there of such a recovery? If the Christmas debates are examined, as they should be, for the light they shed on Frenchmen's confidence in France, little ground for optimism emerges.

At times, it seemed that the Assembly's debate was being conducted on two quite separate planes. There was little to connect the unsavoury intrigues and calculated evasions with the notes of genuine anguish and resolution struck by some of the speakers. It is hardly possible to accept at its face value the idea that last Friday's negative vote was the true mirror of French

opinion, undisturbed by the prime minister's forcefulness or by warning words from allied capitals. Many deputies, completely taken aback by the Friday vote, later frankly revealed that they had counted on ratification going through without their support, and had abstained, or voted against the government instead of abstaining, from motives ranging from personal hostility towards M. Mendès-France to pure reluctance to share responsibility for a painful decision.

★

Those members of the Assembly who stooped to such cynical calculations provided the justification for the brusque terms used by the British Foreign Office in commenting on last week's vote. This comment was violently denounced by Moscow as amounting to "crude pressure"—an odd phrase to fall from lips that had been bellowing threats and barefaced falsehoods at France for weeks. However, the British statement was also deplored, if obliquely, by M. Mendès-France. Such criticism cannot be ignored; the Foreign Office did not couch its comments in the language of a Christmas card, although equally it used no words comparable to Mr Molotov's menaces. Yet was it anything more than a statement of facts to recall that Britain's commitment of troops to the Continent for fifty years depends on the formation of the new Western Union, and to point out that, since a sovereign German state will eventually acquire armed forces anyway, what matters vitally is the terms on which they are acquired? Many deputies revealed in the Assembly debate that they fully appreciated these truths. It was to others that the British words were clearly directed—to the irresponsible and, last week, mistaken calculators of minimum majorities.

It is a first duty of any parliamentary representative in any country to shoulder his share of responsibility for measures which are unwelcome but to which he knows there is no practicable alternative. Where this duty can be shirked with impunity, can any government hope even to impose essential taxes, let alone to carry out vital reforms? French deputies are not unique in their dislike of responsibility; before their eyes last week was the example of the Labour Party's abstention on the very same Paris agreements. But there is overwhelming evidence that the French party and parliamentary system encourages a shirking of this duty up to the very borders of anarchy. To find a parallel to the absurdities perpetrated in the Palais Bourbon on the eve of Christmas, one must almost turn back to the old, chaotic Polish diet. Did any of the deputies who disgusted a watching world by their antics—described by an eye-witness in an article on page 34—pause for a moment to reflect on the fate of Poland?

Yet, paradoxically, on the other and higher plane of the debate, sincere emotion and crystal-clear reasoning emerged, and painful decisions were taken by such men as M. Schuman. Their mental agony, and that of such veterans as M. Herriot, was entirely understand-

able. No thinking person anywhere in the free world ever expected a single Frenchman to give enthusiastic backing to a plan that involves arming Germans. What France's friends did expect was that a people with a cherished reputation for logical thought would grasp the fact that there was no alternative. At the very end of the debate, M. Guy Mollet, the secretary-general of the Socialist party, which, although still outside M. Mendès-France's coalition, has proved his best source of support in the past fortnight, urged deputies to realise that Britain and America have urged France to this distasteful course simply because of the undeniable and overriding threat of Soviet military and political pressure. More, indeed, might have been said. In particular, how would any of the deputies who opposed the Paris agreements explain the support given to them, and earlier to the EDC, by France's other allies—Dutch, Belgian, Norwegian and Italian, to name no more? Holland, Belgium and Norway felt the horrors of Nazi occupation as keenly as France. Italy has to grapple with even greater social and economic problems than France. Why, then, has France been alone in carrying its hesitations to the brink of disaster for the whole western partnership?

★

The essential answer is clear. Too many Frenchmen lack confidence in their own country. Many things have contributed to this—the disaster of 1940, the futilities of parliamentary life in Paris, the biting suspicions between political and religious factions, the long draining of blood and treasure into the Indo-Chinese war, the economic *immobilisme* springing from governmental instability. Until this psychological state is altered, there can be small comfort for France or for its friends in a technical victory that allows the strengthening of the West to continue on the technical plane. In London, Washington and every other allied capital, it will be recognised that even a France so restored to health as to be uncomfortably assertive would be a better partner than a limp, distracted and feverish country. And the past fortnight's events reveal how far France still has to go to attain a new and vigorous health.

Will it, even now, be able to make progress towards that goal? Admittedly, it has survived one agonising fit. The extraordinary efforts of one Frenchman have saved his country from a relapse that would have set it far back in the direction of complete paralysis. But can even M. Mendès-France escape the traps that his enemies will lay for him in the months to come, and if he falls, is there any other leader who can maintain the psychological impetus that he has set off? France's allies are now deeply in his debt; but they will have even greater cause for gratitude if he succeeds, in the year that is now opening, in giving his fellow countrymen enough faith in themselves and in France to enable Europe to work out its new pattern harmoniously.

Diggers and Developers

BY A SPECIAL CORRESPONDENT

IN the palms of the Botanic Gardens, the cicadas are unbearably shrill. In the Sydney shopwindows, Christmas tradition has again been stubbornly observed, and the time has come to remove the fir trees and the artificial snow. The ladies as they shop are sleeveless and many of the men coatless, encouraged by sub-tropical sunshine towards free spending and good living. Australia is living high on the sheep's back, enjoying a standard of living perhaps unmatched anywhere outside the United States. In the big coastal cities, where some three-quarters of Australia's nine million live, there is all the appearance of an economy steamed up for prosperity. There is no apparent dismay that the Commonwealth has this year been spending abroad beyond its income, and using up its London funds at the rate of £150 million a year. Short of manpower, short of capital, and short of water, Australia insists on enjoying itself, in a climate that makes enjoyment temptingly possible.

Some have said that the temptation is too great. It was an Australian himself who used the stinging phrase "the milk bar economy" to describe an Australia keener on eating than on building. Today, the sting has a much blunter point. Consumption may still remain the keynote, but new construction is visibly impressive. Australia could have done more, for there has been no tightening of Australian belts; but girth has been added to the Australian economy in real industrial growth, beyond the mere corpulence of sheltered secondary industries. There is a new pioneering feeling in the air. The "digger" has for long been a folk-symbol, tenaciously sentimentalised by the town-dwelling Australian; now the town-dwellers are as alert as any to the future development of a country that has been dangerously dependent in the past upon a few primary products.

Few of the normal economic recipes can be applied directly to Australia's case. Inflation is the ever-present risk in any modern democracy; but inflation has been built into the Australian economy for a couple of generations through the basic wage enactments. The task of controlling an economy so devoted to consumption and so responsive to wool for its prosperity can never be easy. Wool sets the pace of Australian spending abroad; a booming wool cheque in one season is followed by a booming import bill in the next as predictably as night follows day. This season's wool cheque will be down, perhaps from about £A400 million to £A360 million, and the country will be bound to look more closely at its balance of payments. But no wool grower feels that prosperity has departed. Wool is still the most efficient industry that Australia has, and it has kept pace with the times. The jackaroo

now gets around the sheep station on a motor bicycle; more productive pastures have been developed and water supplies have been improved. The old extensive running of sheep is giving way to more intensive and scientifically controlled methods. It may be asking a lot of Nature to be as kind to the industry as it has been in recent years; but wool has fought off the threat of the synthetic fibres, and it now sees what full employment all over the world can do to demand.

★

The Commonwealth Government has recently raised a loan at 4½ per cent which was not enthusiastically received. Australians, indeed, show a marked reluctance to contemplate the true rates of interest that in theory should apply to an economy so short of capital; this fact, coupled with the inadequacies of the capital market, must be held responsible for the failure to attract a sufficient volume of savings from high Australian incomes, except perhaps from the surpluses of the wool growers who "have everything" and cannot spend much more. The next stage in Australia's progress clearly rests on the gathering of more capital, from both domestic and overseas sources. Some of the States and the public utilities are casting an eye towards the London market, and they have many projects that should be able to attract support at the right price. Recently, the main sources of foreign capital have been the World Bank and the heavy private investment made by the leading oil groups in new refineries. Obviously, an influx of overseas capital will do nothing to increase the physical resources that are now being strained to the very limit in Australia, but it will relieve pressure on the balance of payments.

Is this strain a permanent condition? There are some grounds for believing that, given Australia's circumstances and labour traditions, a perpetual head of inflation is the only condition under which capital formation can take place at all. If the frictions of the capital market and the hangover of capital controls inhibit the free forces of interest rates, then the result must be a tussle of competing projects scrambling for what physical resources there are—and a good deal of the investment will be at the expense of an inflation of prices. One result, plainly visible during recent months, has been a degree of pressure on bank finance that runs well beyond the limits that the Commonwealth Bank holds to be appropriate. Another sign is the offer by a well-established hire purchase finance company to pay 7 per cent for two-year deposits; the counterpart to this is the fact that Australia now has thirty sizeable producers of washing machines.

The disposition of Australia's capital resources through three main channels—the banks, hire-purchase finance, and the operations of the Loan Council (which in 1954-55 will be disposing of £A200 million to finance States' works and housing)—sets a limit to the part that the capital market ought to play in Australia's new development. It would be a less feverish market if Australians were less attached to the notion of making a fortune in oil prospecting or uranium. But a gamble is in the Australian tradition, and it is useless to moralise about it. It is more to the point that a respectable volume of personal savings is beginning to be generated in the Commonwealth, and that people's eyes are directed much more than they were towards new economic horizons, and much less towards the familiar ground at their feet. If one could dare to hope for a change in Australian labour attitudes, a radical advance would be possible. But the most precious possession in Australia is still a pair of hands, allied to a demanding and restrictive union organisation. Given the fact that the basic wage for forty hours of unskilled work is £A12 6s. (with extra margins for skill and double pay for overtime) the more responsible union leaders might well reflect that the size of the cake will in future be more important than the thickness of the slice that labour now gets.

★

There are, perhaps, three main factors in Australia's present situation that give promise of new advance. One is the rapid growth of population, assisted since the war by an ambitious and highly successful immigration programme. The migrants, or "New Australians," have already proved their value in market gardening, catering, personal service and the clothing trades. At first they were an expensive strain on the economy; now, increasingly, they are making a positive contribution to it, not only in the menial chores but also in some of the graces of life. They do not settle in the scarcely-populated "outback," but in that they are no different from most of the "old Australians." And it is doubtful whether any great increase in labour will be required in those regions until the limits of husbandry, cattle raising, and irrigation have been pushed back much further than they are today.

The second factor is the evident benefit that is now beginning to appear from postwar investment programmes. There may, indeed, be too many washing machines and refrigerators, but there is certainly a lot more power to drive them, and many more houses (expensive though they are) in which to install them. And accompanying the emergence of an American-type consuming economy are the beginnings of an American-type industrial structure. Hundreds of thousands of tons of steel sheet and tinplate will, in the next few years, be running off the new mills at Port Kembla. Roughly eight million tons of oil products will be pouring out of the new refineries. Western Australia has put

itself on the industrial map with the new British Petroleum refinery at Kwinana and a steel rolling mill and cement works alongside. General Motors-Holdens are at the throes of another expansion scheme, having made the pardonable mistake of leaving themselves too little space in the first place for later building.

★

Not all of this development is over-expensive, even in Australian terms. And comparatively little of it is "secondary industry" in the pejorative meaning usually applied to that word. In two or three years, the Australian economy will certainly be able fully to support the refinery programme. With coal costing perhaps 30s. a ton and ore containing more than 60 per cent of iron, the Australian steel industry is still the cheapest in the world, though its costs are rising. And if the building up of engineering and metal using skills could be loftily criticised as an economic indulgence before 1939, when the rest of the world was enjoying Australia's produce at dirt-cheap prices, the war settled the argument for good. Australians look at the four hulks in Darwin harbour and the Japanese midget submarine that penetrated the Sydney defences, and have no doubt about the part that manufacturing industry has to play in their economy and defence.

The third factor—it may in the end be the most important of all—is Australia's preoccupation with scientific research. Probably no single organisation in the world has such widely-ranging activities in these fields as the Commonwealth Scientific and Industrial Research Organisation. Its work on trace elements long ago passed into the scientific alphabet, and this is only one example of the way it is extending scientific frontiers in agriculture and industry. Work on atomic energy goes forward, with hopes of a low-power reactor at Sydney and the world's biggest cyclotron at Canberra. Both in technology and in industrial investment, Australia is determined, and may well be able, to do most things for itself.

A tiny part of Australia's crust has been scratched, and has brought forth riches. Disappointed again about crude oil, the country is convinced that oil exists, and major groups are actively searching for it. The discovery of oil, even more than the recent finds of uranium and other metals, might be the springboard from which Australia could leap ahead after the slower but still impressive results that have materialised from "Operation Bootstraps." The important thing for the British to realise is that Australia no longer regards itself as a primary producer bound to the British market, or a consumer bound to British products irrespective of price. And the important thing for Australians to realise is that the promise of their economy by the end of this century ought to be well worth some small inroads on the comfort and plenty they now enjoy.

Stunted Schooldays

THE report of the Ministry of Education's Central Advisory Council,* published this week, contains some quite unexpected social and political dynamite. The subject that the council had been asked to illuminate had seemed uncontroversial: that of premature leaving from grammar schools. Why was it that of those who entered the grammar schools in 1946, 24 per cent left at the age of fifteen, and only 17 per cent availed themselves of their opportunity, so hardly won, to stay at school until they were eighteen? The proportion who stay on until that age has admittedly been rising steadily since the war (in the prewar years it had fallen to as low as 10.6 per cent); but far too many grammar school places, which might have been occupied by others who would have made full use of them, are still being wasted by early leavers. In consequence far too much talent withers on the stalk.

The council's terms of reference were to report on: what factors influence the age at which boys and girls leave secondary schools which provide courses beyond the minimum school leaving age; to what extent it is desirable to increase the proportion of those who remain at school roughly to the age of 18; and what steps should be taken to secure such an increase.

The research was conducted on a 10 per cent sample of maintained and direct grant grammar schools in England. The heads of 120 grammar schools were asked questions about all pupils who had entered their schools in 1946—the last year that would have enabled those children to complete a seven-year course by the time the inquiries began.

The most interesting facts that emerge from the inquiry are first, that out of 27,000 who were thought suitable for advanced courses no less than 10,000 boys and girls left without taking them; and secondly, that it is the middle classes who make the best use of equal educational opportunity. Children from professional and managerial families account for 15 per cent of the population, but for 25 per cent of the grammar school population and 43.7 per cent of the sixth form population. It is not merely that, by and large, their performance is better in the selection tests at eleven and that they stay at school longer; it is also that they do better at the grammar school. Many middle-class children in this sample who were near the borderline in the selection tests had far more satisfactory academic careers than children from poorer homes who at eleven had been placed at the top of the list. In the words of the report:

we have found that from the children of parents in professional or managerial occupations at one extreme to the children of unskilled workers at the other there is a steady and marked decline in performance at the grammar

*Early Leaving. HMSO. 3s. 6d.

school, in the length of school life, and in academic promise at the time of leaving.

There will be two sorts of reaction to these findings. Middle-class parents whose children have failed to get grammar school places will say how wrong it is that they, who would have made good use of a grammar school place, are unable to secure one even by paying. On the other hand those who still carry the torch for "the underprivileged" can find in this report ample confirmation of their belief that there is still no real equality of educational opportunity in Britain. The poorer child, struggling to do his homework, is handicapped by an overcrowded home, a blaring radio (not to mention television). He may be held back by the attitude of parents who had little schooling themselves and cannot see the point of it (least of all, for girls); and by neighbours who think he is old enough to be contributing, as they do, to the family exchequer—although the council found that financial difficulties were not the most common reason for leaving.

★

This is the nature of the problem. What can be done about it? The council flatly rejects the idea that a proportion of places at all grammar schools should be open, as they were before the war, to those who pay fees, on the ground that it would be unacceptable to public opinion and would benefit only the wealthier of the aggrieved parents. It also rejects the notion that the handicaps already suffered by the poorer child should be increased by discriminating against him in the entrance examination. It points out that not until a whole generation of parents have had a secondary school education can a full appreciation of its value be expected. In the meantime it suggests a few carrots that might be dangled in front of the would-be leaver—for example, employers and professional bodies might alter their conditions of entry in employment to make it worth while to have stayed at school until eighteen. It would also like to see steps taken to lessen the handicaps of the poorer child—for example, by keeping open public libraries and schools so that he may work there in the evenings. So far, so good. But the council's financial proposals are more controversial, and the Minister of Education is openly dubious about them.

In the first place, the council believes that there should be a substantial increase in the maintenance allowance which local authorities can pay to those who could not otherwise keep their children at school without hardship. An all-round increase is not required, but there are areas where the allowances (which vary widely) ought to be increased. Allowances, of course, can never compensate parents for lack of juvenile earn-

ings—but, as the council suggests, they should surely offer a larger carrot for pupils of seventeen and eighteen than for pupils of fifteen and sixteen.

Secondly, the council believes that family allowances should be paid for children still at school up to any age—instead of to the age of sixteen (fifteen if they are not at school) as now. This is a quite separate problem. To make a change here would require legislation, which is one disadvantage. Another is that family allowances do not apply to the first child; and a third is that any such concession would have to be made indiscriminately, without regard to the “need and merit” of which Sir David Eccles writes.

The council shows signs of realising that to mitigate the hardships of the child who leaves early—who is probably a poorer child—is not enough. What about the hardships of the (probably middle class) child who just missed a grammar school place, and could after all have filled it more profitably than the child who will leave after a year or two? For his benefit the council has two suggestions—not counting the obvious one that transfers from other secondary schools should be made easier. The first is that the proportion of grammar school places should be increased—or at any rate should not be allowed to fall as the “bulge” in the school population moves into the secondary schools. The second is that the secondary modern schools should provide more advance courses for those who can benefit from them.

Notes of the Week

Afro-Asian Rendezvous

THE meeting of five Asian prime ministers just outside Jakarta this week has done much to deflect the attention of the Indonesian people from the depressing confusion of their own political and economic situation. Whether it can have done more, whether indeed it was ever seriously expected to do much more by the man who called it, Dr Ali Sastroamidjojo, is still a moot question. The Indonesian prime minister has played host to Mr Nehru, to Mr Mohammed Ali from Pakistan, to Burma's U Nu, and to Sir John Kotelawala of Ceylon. Their aim in getting together was to renew the personal contact first made as members of the Colombo powers in Ceylon last May, and ostensibly to discuss the specific project of holding a much wider conference of Asian and African states, now arranged

The Minister plainly inclines to the set British Petro controversial proposal. He is doubtful about the W and a of an all-round increase in the proportion of grammar school places—although, as he says, there are certainly areas where there are too few. The report may have added to his doubts, showing as it does that 40 per cent of those who attend grammar schools leave without obtaining even three passes in the General Certificate at ordinary level and that more than half are unsuited to sixth form work as at present organised.

The net effect of the report is to bring back into the educational controversy some awkward facts that the educationists and the politicians have for a decade or more been conspiring to ignore. The most awkward—but also the most undeniable—of these facts is that heredity and environment do, after all, matter a great deal. It would be convenient to pretend that there are no class distinctions in ability or promise; “equality of educational opportunity” could then be assured by simple and rigid rules. But the facts, unfortunately, are otherwise, and they create the dilemma: which is more in the public interest, to see that no potentially useful brain is handicapped, or to see that every third-class brain gets a chance? Different people will give different answers to this question until the end of time, and in a universal suffrage democracy politicians will have to do their best to straddle between the two views. Meanwhile, this report at least suggests some practical ways in which the problem might be mitigated.

for April. It would be wrong to be purely critical of the idea, but the report of Mr Nehru's rather defensive “I have not come on a stunt,” when he landed in Jakarta, confirms the impression of hesitation verging on definite unwillingness which had characterised the attitude of almost all but Dr Sastroamidjojo himself.

If the proposal for an Afro-Asian conference were to be confined to those states which are known to aim at some form of genuine neutralism, it could be argued that their closer alignment might have a definite contribution to make to world peace. This is not, of course, the point of view of most of those in the West who have had previous experience of dealing with the Communist powers. They believe that any so-called “area of peace,” whether parading under the title of a third force or a neutral bloc, would be more likely to endanger peace than to safeguard it, since its leaders would act as if they had their heads in the sand. But in London at any rate the attitude is fully appreciated

who dread involvement because, according to their scale of values, they genuinely think that the war is not the world's most important problem.

What has not been so clear is how the membership of the proposed Afro-Asian conference could best be determined, and how such a meeting can in practice avoid merely descending into the sterility of that anti-colonialism which appears to be in the minds of its Indonesian sponsors. As it now transpires, the Chinese have been invited, and they must be licking their chops at the prospect of such a wonderful opportunity for making trouble; their presence will certainly put paid to any claim about evolving a neutral bloc. Notably, and for the first time since the war, the Japanese have also been asked as a counterweight—though over Indonesia's dead body. And, as the price of Arab participation, Israel has been left out. The fact is that Asia is no more united or unbiased than Europe; and it will be instructive, for the participants as well as outsiders, to see how the April conference clears its many obvious hurdles. Little concrete may be accomplished, but if the meeting can help Asian statesmen to face facts it will have done good.

Italy Ratifies

AT the end of last week the Italian Chamber of Deputies voted by 335 to 215 in favour of ratification of the London and Paris agreements. In contrast to the exhibition of bitterness and irresponsibility in Paris, there was almost no intrusion of purely personal spite into the debate in Rome. Nearly all those who opposed the motion did so for well-known reasons of party belief and allegiance; in fact the explanation of the big majority, the largest since Signor Scelba's government came to power last March, was that the right-wing nationalist parties supported the motion. The Communists joined with the left-wing Socialists in fighting the agreements by the tactic of proposing postponement rather than outright rejection of German rearmament. Only a splinter group of 29 Christian Democrats fell for this manoeuvre and favoured a three-month delay in which further talks with Russia might be held.

Italy, at one time a stronghold of federalism, is today a disillusioned supporter of the new Brussels Pact approach to the ideal of European union. Before the French debate there had consequently been some hope that the Italian Christian Democrats might be able to influence the French Catholics, the MRP, in favour of ratification. Some reference was also made to the dying but not quite extinct ideal of a common French-Italian policy “within the framework of a united Europe and the Atlantic Pact,” expressed four years ago at Santa Margherita. But it was characteristic of the present era in France that M. Pleven, who, as prime minister, had made the pact with De Gasperi, himself opposed the new Western European Union.

No one can pretend that Italy's experiences in the war were happy ones. Admittedly, the country was never occupied by the Germans on the same terms as France; indeed, to begin with the Germans and Italians were Axis allies. But Italy was subsequently laid waste quite as much as France, and many Italians fought each other with

equal bitterness. And today it is not France but Italy that has the largest Communist party outside the Soviet orbit. The fact is that, as General Smuts once predicted nearly ten years ago, the Italians have completed their psychological as well as their economic recovery more quickly and more fully than the French. This is a factor in the new Europe as creditable to them as it is important to their neighbours.

Nearly Liberal Highlands

THE by-election at Inverness was the first for a long time to bring any cheer to the Liberals, and it is only natural that they should savour the experience to the full. Unhappily, however, this looks much more like a rosy glow in the evening than a new Liberal dawn. True, their candidate got within 1,331 votes of winning the seat and, compared with the last time they fought it, they increased their proportion of the poll from 22.71 per cent to 36.04 and pushed Labour to the bottom of the list. But it could be argued that if the Liberals could not win this contest they will never win anything, for conditions could scarcely have been more helpful. They had a striking candidate and a strong, popular local issue in Scottish nationalism. Their opponents were beset by apathy, which was no doubt intensified by the wild topography of the area and the shocking weather on polling day. It is difficult to think of many other seats in Scotland or Wales, or any at all in England, where similarly favourable circumstances might arise.

There are, however, two lessons that the party can draw from Inverness, which might help it to delay for a time the depressing slide of recent years. The first, and the other parties should take note of it, is that moderate nationalism is an increasingly powerful force north of the Tweed and west of the Wye. The second is the importance to the Liberals, perhaps more than to the other parties, of having a strong, even colourful, candidate and giving him the best of backing. The party has for some time been trying to reorganise its election planning, concentrating on seats in which it has a chance of winning or at least of polling a reasonable figure. But there must always be some doubt whether there is enough voluntary discipline at local level to avoid dissipating resources that must be getting increasingly scarce.

The Liberals' real tragedy is that most of their best policy ideas are filched by one of the bigger parties, leaving a residue of distinctive Liberal policy which—apart from nationalism—has little electoral appeal. The number of Liberal MPs has therefore progressively shrunk and the impact of the party leaders steadily declined. Mr Clement Davies struck a defiantly independent note in his message to Inverness; but how much more publicity there would have been if it had been Mr Attlee who accused Sir Winston Churchill of Fascism. The Liberals must accept the fact that Inverness was but one by-election among many that take place in the lifetime of a Parliament. The other two parties are already writing it off as not a very important one. Of more significance to them will be the election due later this month in South Norfolk, where the Tories will be fighting to hold a marginal agricultural

seat. The significance of this election is not that the previous Conservative MP is now in prison (although that must help the Labour candidate); the real point is that this will be the best test yet—under exceptionally favourable circumstances—of Labour's claim to have gained ground in traditionally Tory farming areas. This may be crucial, for it has not gained ground anywhere else.

Clash with Shop Stewards

A SPECTACULAR fight between employers and shop stewards is being waged at London Airport and at Coventry. British European Airways have refused to reinstate Mr Peters, the shop steward who worked up an agitation because he was not allowed to act as a full-time convenor while on the company's payroll; but it has reinstated the rest of the 315 maintenance engineers whom it dismissed just before Christmas for following in his wake. At the Standard Motor works at Coventry nine workers who refused to handle a job that had been transferred from one factory to another were "suspended indefinitely" on Christmas Eve, and the shop steward concerned in this dispute was dismissed. Later, when a protest meeting was held in working time in defiance of the management's orders, the shop stewards who addressed and convened it were also dismissed—making four in all. As a result all 11,000 workers employed have come out on strike.

There will be widespread sympathy among other employers with BEA and Standard for the stand they are taking against tiresome agitators, meetings held in working time and breaches of industrial agreements. But it is a sacred trade union principle to stand by the shop steward—the man who makes a fuss on behalf of the rest. The two concerns involved are both in a strong position and presumably know what they are doing. Standard pays better wages than its employees are likely to get elsewhere in Coventry. As for BEA, this time of year, when its passenger services do not pay, is the best time to risk having those services stopped by a strike. Moreover, it acts in the consciousness that its arrangements for joint consultation are exceptionally good; that the union authorities agreed with its original action against the tiresome Mr Peters; and that the readiness with which the dismissed engineers re-applied for their jobs and signed the undertaking to respect their agreements does not suggest very strong support among the men, in the long run, for the dismissed man. It would be a mistake, however, for the war against shop stewards to be taken up by other concerns less infested with agitators—and less strongly entrenched—than the present champions appear to be.

Complications in Buganda

IT is not a good omen for the outcome of Buganda's constitutional crisis that the native Parliament, the Lukiko, has burked voting on the Hancock proposals and is setting up a committee to re-examine them. If the committee

suggests any important changes the ~~with British Petrol~~ reopened, and the British government's ~~constitutional~~ and a —for integrating Buganda as a constitutional ~~and a~~ into the Uganda protectorate (with much increased African representation in its government) and for permitting Mutesa II to return after a short trial period—will fall to the ground. The many months of delicate negotiation, of patient clarifying of African ideas, would then be almost wasted and deadlock re-established. It looks uncomfortably as if the pessimists who doubted whether the members of the Lukiko were capable of the intellectual effort of comprehending and appraising the proposals agreed at the Namirembe conference may be proved right. The proposals were complicated in English. In the vernacular translation they may be even harder to understand—and they apparently overlooked some procedural problems of African custom. But the prospect is not improved by the explanation that Buganda's legislators cannot grasp a complicated constitutional scheme, since no simple scheme (other than the restoration of the Kabaka to an unreformed Buganda native state) would meet the long-standing political and administrative problems in this territory.

The chairman of the original constitutional committee that worked with Sir Keith Hancock, Mr Mugwanya, has told a local newspaper that it is clear to him that some of the Lukiko members have not the slightest idea what they are after. In the debate, amid talk of reform and democracy, some members opposed removal of the Kabaka's absolute powers, which is vital to the whole scheme. Mr Mugwanya complained that it was their own considerable powers in an unreformed state which they were really concerned to preserve; and he sought to win African support for the scheme by pointing to the fact that it has been criticised in Kenya for going too far too fast. It is to be hoped that the committee—which is apparently under the influence of Dr Kalibala, whose inclusion in the original constitutional committee was at first opposed by the Governor and administration on fears that he might prove prejudiced—will heed Mr Mugwanya's argument, and that it will do what the Lukiko jibs at—approve a scheme which would take Uganda a long way towards self-government and Buganda with it.

Dr Adenauer's Future

AN incident in the recent Bundestag debate on foreign affairs created a sensation in German political circles, and is still reverberating round Bonn. Dr Adenauer, heckled by Social-Democrats, became confused, and left the podium, obviously exhausted. None of the Chancellor's assistants jumped into the breach, because, it is assumed, they were so accustomed to leaving their leader to handle the opposition in his usual masterful fashion. With some exaggeration, the Germans attributed Dr Adenauer's momentary discomfiture solely to his age, though the circumstances would have shaken a younger political debater. Suddenly, the press discovered that their Chancellor was nearly 79 years of age, and that he was a Grand Old Man, without a substitute.

It is fortunate that Dr Adenauer realises this too. He has been ordered by his doctor to slacken his activities and may try to do so. If the Paris agreements are once safely

hand over the office of foreign minister to Brentano, leader of the parliamentary Christian-Democratic Party, who may take some of the more routine burden off his shoulders. It is thought that Dr Adenauer wants to concentrate on setting up the new German army in a firm political framework that will prevent it from endangering the democratic state. And he will himself handle the difficult matter of establishing direct diplomatic relations with the Soviet Union, and of seeing that German nationalists do not play into Mr Molotov's hands.

The internal party situation will also call for Dr Adenauer's direction. He has had a setback in Bavaria and Hesse, where he has been frustrated in his desire to see the same coalition as governs in Bonn. In Bavaria, the Christian-Social Union, in spite of being the strongest party, has been ousted from the government altogether. The whole future of the Christian-Democratic party, and of the party system itself, is now at stake. The decision has to be taken whether to alter the federal electoral law and establish a two-party system—a move which may be made to punish small parties which have joined the Social-Democrats in Land governments.

Dr Adenauer seems indispensable for all these tasks. But even his closest supporters do not succeed in removing the impression that the Chancellor is an isolated figure. For that they do not echo him quite faithfully enough. Dr Adenauer himself is usually blamed for not having trained an adequate heir-apparent. It would be reassuring if the only reason for the gap in the succession were a dominating personality's objection to having equals around him, for there would be room for hope that, out of the blue, a new leader might emerge once the Chancellor had retired from the stage. But, unfortunately, Hitler has ensured that there is a real dearth of politicians, a generation younger than Dr Adenauer, who could be expected to combine ability and his international "western" principles. Dr Adenauer, a German Gladstone, is not only a clever politician and a man of strong will. He is the conscience of Germany. This is, perhaps, what the Bundestag felt in that painful moment when the Chancellor lost his presence of mind and the members held their breath. If so, the incident may, by softening the critics, actually help him to carry through his work.

Mr Dedijer in Trouble

THE trouble that has overtaken Mr Dedijer, the biographer of Marshal Tito and the only man to stand up for the heretical Mr Djilas a year ago, is a vivid reminder of Yugoslavia's equivocal position. It is inconceivable that any disgruntled Communist leader behind the iron curtain would dare to unburden himself to a foreign journalist, or that if he did, the censors would allow his discontents to reach the outside world. On the other hand, Mr Dedijer's words have been kept from the Yugoslav people, and the efforts made to force him to toe the party line, which have now culminated in a demand for his expulsion from the party and his prosecution for hostility to the state, all smack strongly of the traditional Communist methods of dealing with dissidents.

There is no evidence that either Mr Dedijer or Mr Djilas is disloyal to Marshal Tito's government or has done anything to justify Mr Kardelj's harsh and vindictive condemnation of them. Mr Dedijer's principal crime seems to be that he is not a sufficiently steely-hearted Communist to stifle his feelings of loyalty towards his old friend; and when the pressures on him to cold-shoulder Mr Djilas became intolerable, he was reduced to letting off steam—in a restrained way—to the correspondent of *The Times*. Mr Djilas, for his part, seems to have been moved by the news of his friend's difficulties to get off his chest, in an interview with the *New York Times* correspondent, some of the thoughts he has been brooding over in silence since his enforced retirement last January. He expressed disillusion, but not subversion. He felt that the Yugoslav Communist party was controlled by "undemocratic" forces and was still "in essence close to Stalinism"; that this was not the time for a drastic change but that since the Communist party would not allow free discussion, it would be a good idea to allow an opposition party—democratic, socialist and loyal—to be formed.

To the more rigid and orthodox Yugoslav Communists, such thoughts, of course, are dangerous; and now that the pressure from Russia has eased off, these men may feel less compulsion to emphasise their differences from the Soviet pattern, even if they have no wish to return to the Soviet fold. There is, moreover, some justice in their complaint that Mr Dedijer has damaged their country's international standing; such an open advertisement of political intolerance in Belgrade can hardly enhance Yugoslavia's credit in the West. But neither Dedijer nor Djilas would have turned to the pages of foreign newspapers if their own had been open to them. The whole affair, in fact, is symptomatic of the difficulties and frustrations that are bound to arise when men are encouraged to expect more political freedom and then disappointed in their hopes. It will not shake Marshal Tito's government, but it may cause him to reflect that he ought to resolve some of Yugoslavia's internal contradictions before he sets out on any more foreign travels.

Farm Prices on Manoeuvre

THE National Farmers' Union has given a broad hint that if (as is likely) the recent seven shillings wage award to farm workers is confirmed, it will press the Government to hold a special price review. Confirmation of the award cannot take place before January 17th, and soon after that the annual review of farm prices is due to start. This means that the annual review and any special review might have to take place concurrently—a curious procedure, but one from which the union can secure a tactical advantage. Price floors for next year's harvest were fixed this year, and the farmers' only hope of getting them raised to meet their higher wage bill is to invoke their right to a special review whenever there is a "sudden and substantial" increase in costs.

By this method the farmers can also take advantage of the inconvenient promise made by Mr Tom Williams, when he was Labour's Minister of Agriculture, that any

major increase in costs occurring between annual reviews will be fully and promptly made good by higher prices. The present Government has never repudiated this pledge, although on at least one occasion it has managed to wriggle out of implementing it. This year, however, the abominable weather and poor harvest preclude any real chance of dodging the issue. Either the Government will have to deny farmers the increased recoupment which they think of as their due, or it will have to abandon its intention (reiterated by Mr Heathcoat-Amory at Derby shortly before Christmas) of reducing the taxpayers' bill for subsidies. Mr Williams's promise seems to be coming home to roost on his opponents' shoulders at what he must regard as the best possible time.

Means Test for Scholars

SHORTLY before the Parliamentary recess the Minister of Education was asked whether he would consider abolishing the means test for winners of state university scholarships. He answered that this would be contrary to the provisions of the 1944 Act, but expressed willingness to reconsider the scales according to which the test is operated. Although in this—as in other fields—means tests should certainly be retained, this reconsideration is overdue. The present scales, under which grants taper to nothing at £2,200 a year gross parental income (with an additional gross £100 per additional child in the family), would have been generous at the prices and the taxation levels of 1938; but a gross income of £2,000-odd at that time represented a standard of living, and a power of budgetary manoeuvre, requiring something nearer £8,000 gross today.

Two main changes seem to be needed. First, the present scales might be just about adequate for only children. The professional family with only one son at the university carries, it may well be argued, no heavier a proportionate burden than do similarly placed working-class parents, to whom it is no small matter to forgo those contributions to the family budget normally expected from a twenty-year-old son or daughter. Scholars, however, are no less apt than other people to have brothers and sisters of their own kind; and to set against the expense of putting a second, third or fourth brilliant but unsubsidised youngster through the university—at £350 or so a year apiece, not counting vacation keep and personal requirements—a mere £100 less income tax and surtax is an unqualified absurdity. The allowance for additional children should clearly be increased.

Secondly, the system bears with grossly unequal weight on the old rich and the new. The owner of inherited capital can, at a pinch, run it down over the educational period. The "new man" who has himself climbed the educational ladder on his own merits and attained professional status without the benefit of inherited wealth has no such alternative. Sometimes this may rob the second generation of the especially gifted of their chance of a university education altogether; more widespread is the differential check which, in the name of the most elementary prudence, it imposes on the family raising capacity of every new recruit to the professional classes. It would be

difficult to find, in all the structure of British Petro—a device more pointedly dysgenic. The obvious and here would be to distinguish in the means test between earned income and unearned (which implies the existence of a cushion of capital). Together with Dame Florence Horsbrugh's suggestion that net rather than gross income should be used as a basis for the test, this would represent an excellent—and politically uninvincible—beginning of reform.

Dr Nkrumah in Difficulties

THE United Nations decision to send a mission to the Gold Coast, to make investigations on the spot before deciding whether the mandated territory of Togoland can be integrated in the Gold Coast under undiluted African management, has come at an awkward moment for Dr Nkrumah; it will inevitably postpone the prospect of complete independence for "Ghana," which, in an important but perhaps maladroit speech last October, he promised was very near. Complete sovereignty can hardly be transferred while Britain is the mandatory power. And if by the time the mission arrives the Asanteman Council and the National Liberation Movement are still vociferously demanding independence within a federal state for Ashanti and the Northern Territories, it is unlikely to be impressed by the claims for complete control of Togoland from Accra.

It would not be true to say that the Gold Coast is falling to pieces even before the remaining elements of British power—always a unifying force—are withdrawn; but it is true that the revolt against his Convention People's Party is a very real challenge to Dr Nkrumah's supremacy and claims for the competence of his government. On the morrow of the election which swept the CPP to power last June there was no sign of it; now a confederation of malcontents, both chiefs and former CPP supporters, are refusing to discuss their demands with the prime minister and requesting direct access to the ultimate sovereign power—Britain, through the Governor. The Governor has rightly left the problem to the elected leader of the people, but Dr Nkrumah has taken rather a long time to perceive his responsibilities. At length he has issued an invitation to the people he first dubbed "an irresponsible minority" to discuss their complaints.

Some of Dr Nkrumah's critics are motivated by tribalism, but they have gained strength from the failure of a considerable number of CPP candidates in Ashanti last June to make clear their policy about the price to be paid to cocoa farmers; the farmers feel deeply aggrieved at the government's decision to leave that payment at half the world market price and to put the proceeds into general revenue. These CPP members are now in trouble; the conclusion to be drawn is that the party must be more sensitive to the country. Such are the realities of power which Dr Nkrumah and his colleagues must show themselves fully able to master, since they are inseparable from the creation of a viable independent state. If dissension grew it would give a handle to those who are anxious to find excuses to oppose the Gold Coast's admission to the Commonwealth club as a full member. As it is, the Togoland question and the challenge to Dr Nkrumah's authority

*May we give you
a piece of our mind?*

Our technicians are always glad to give you the benefit of their experience. Why not get together before planning that electrical job? The chances are you will save yourself time and trouble.

The BICC Technical Advisory Service has been helping solve customers' problems for many years. Advice is given on the selection, application and installation of electric cables and wires for every purpose—and on the wide range of associated equipment manufactured by BICC.

This service of course is entirely without obligation.

BRITISH INSULATED CALLENDER'S CABLES LIMITED
21 BLOOMSBURY STREET, LONDON, W.C.1

It shall not burn

At last, nuclear knowledge brings to every office, factory, warehouse or other industrial building, a sure and certain means of fire prevention which is now available to all.

The main illustration shows the Central Telephone Exchange in Zurich. Over 3,500 detectors are installed in the 128 telephone exchanges of the Postal, Telegraph and Telephone System of Switzerland.

WHAT DOES IT DO?

Minerva instantly detects the first trace of smoke from any smouldering material.

HOW DOES IT WORK?

The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. No current is consumed while the detector is on guard. The entry of smoke triggers the detector.

HOW IS IT INSTALLED?

Each detector is no larger than an electric light bulb and can be fitted as simply.

Only one is required in a room or for every 1,000 sq. ft. of floor area.

WHAT DOES IT COST?

Only the cost of the simple wiring—the detectors and signal equipment are hired to the user by the makers at a low annual fee which includes servicing and free replacements.

FIRE DETECTION SYSTEM

APPROVED AND ADOPTED BY THE
ADMIRALTY AND AIR MINISTRY

Manufactured by The Minerva Detector Company Ltd., Richmond, Surrey, England

the country may already justify any decision not at the Gold Coast's coming application for membership before the meeting of Commonwealth prime ministers later this month.

Sudanisation and Scapegoats

As from today, January 1st, the 800 or so British officials who remain in the service of the Sudan government are confronted with a choice that adds yet one more trial to their unenviable lives. Up till now, all expatriates holding appointments which might be designated as "politically dangerous" by the Sudanisation Committee have been liable to dismissal at two months' notice. Almost all the British servants holding administrative posts have been liquidated under this head. From today, under the Compensation Bill that lays down the terms for their withdrawal, the survivors may give six months' notice of retirement, and so become masters of their own immediate fate. What are they to do?

Of the remaining 800, nearly all are technicians, very few of whom are as yet replaceable by Sudanese. Were they making their choice in reasonable conditions, many would choose to stay in spite of the generous money compensation that is available to them if they resign, partly because they are interested in their work, and partly because no man likes to quit a technical job that is bound to lapse if he goes. But reasonable conditions are not available. They know the Sudanisation Committee has been meeting to decide their fate, but it has chosen to tell them nothing of its deliberations; likely tales about its decisions have, however, reached them at secondhand—often via the bazaar—and 80 to 90 per cent of them are said to be scheduled for dismissal "at an early date." The temptation to go at a moment of their own choosing is therefore very great; for any who have a substantial period of working life ahead of them there are plenty of jobs available in other countries in view of their quality and experience, and the Sudanese government, having created a climate of insecurity around

them, will have only itself to thank if, when they depart, the Sudan is left short of essential services.

Yet this is not the light in which Sudanese nationalists will see the practical difficulties into which they are about to plunge their country. These they will lay at the door of the British technicians who "walked out"; they will dub it the "final proof" that the British were only prepared to work in the Sudan in the role of masters. Some of the technicians concerned foresee this accusation; some, working in rural areas, are being implored to hang on by local notables who know their worth. Their New Year decision is a difficult one to take—just how difficult is recognised only in Europe, and not at all in the Nile Valley.

Co-existing in Indo-China

SCPTICAL voices are already being raised among French businessmen in Saigon about the practical value of the experiment in "co-existence" which has been given a formal basis in the new Franco-Viet Minh agreement. This agreement, it is said, provides insufficient safeguards to tempt French enterprises either to stay on or to return. A closer study suggests that some, at any rate, of these fears are groundless. Within the limits of the agreement, its provisions are not unduly weighted on the Viet Minh side. It is complained in Saigon, for instance, that the provision that French enterprises shall be maintained "within the framework of Viet Minh legislation" provides the Communists with a free hand to treat French businesses as they see fit. On the other hand, the agreement specifically lays down that "no discriminatory measures, whether legislative, administrative, fiscal or jurisdictional will be taken against them." The long-term prospects for French industrial and commercial enterprises may not have noticeably improved as a result of the agreement, but the Viet Minh are unlikely in the earlier stages to discourage the goose from laying its golden eggs. Meanwhile, as this week's announcement of Chinese aid demonstrates, Ho Chi Minh is not neglecting such opportunities as exist on his side of the bamboo curtain. The Chinese help, however, will be mainly concentrated on communications; though valuable to a country ravaged by war, it will not solve the Viet Minh's foreign exchange difficulties.

The dilemma of French policy in Indo-China is that it looks in two directions at the same time: toward co-existence with the Viet Minh and toward support for American policy in the Nationalist South. Neither, however, is necessarily incompatible with the Geneva agreements. M. Sainteny's business accord with Mr Phan Anh of the Viet Minh represents one facet, M. Mendès-France's budget allocations for Indo-China the other. These latter, together with the French request for participation in the Colombo Plan, confirm that France is committed to maintaining not merely its cultural links with the Associated States, but also its share of economic aid. The budget allocations for the current year are relatively small: 3.9 billion francs (about £4 million) for Cambodia, one billion francs for Laos and 2 billion for Vietnam, together with 100 million for "international aid and unforeseen requirements." The true scale of French economic aid is revealed in the item headed "autorisation des programmes," which calls for a French contribution of

We regret

to announce that we can no longer accept orders for the 1955 edition of THE ECONOMIST DIARY. The size of the edition was substantially greater than for 1954, but it was, nevertheless, insufficient to meet the heavy demand from home and overseas.

We suggest

that you may be able to obtain a copy from one of the leading bookshops and stationers. If you wish to ensure that you are not too late next year you can instruct us to notify you when the 1956 edition is ready. All you need do is to write your name and address on the back of a postcard and send it addressed to: 1956 DIARY, THE ECONOMIST, 22 RYDER ST., LONDON, S.W.1.

20 billion francs for the year 1955-56. Of this, 11.2 billion will go to Cambodia, 2.8 billion to Laos and 5.5 billion to southern Vietnam, with a margin of 500 million for "unforeseen requirements." As most of these funds are earmarked for projects already receiving Colombo Plan assistance, it will be seen that France is already, in fact if not in form, a member of the Plan.

X in a Spot

IT is three years ago today since the X certificate was added to the armoury of the British Board of Film Censors, and the *News Chronicle* has performed a public service by drawing attention to the remarkably silly situation that has arisen in connection with it. An X film is one that may not be seen by any child under the age of sixteen, even if accompanied by his or her parents. As any cinema showing an X film suffers a serious cut in family audiences, the Rank group, which controls the Gaumont and Odeon circuits, will not make or screen any films that are marked by this certificate. In consequence, other producers who make X films for the British market have to fall back, in part, on the custom of rather specialised types of cinema—some of which will not accept films that they consider to be insufficiently pornographic.

Meanwhile, and most unfortunately, the Board of Censors seems to have interpreted its responsibilities very strictly. Among the films which it has blocked by indicating that it would qualify only for an X certificate are Michael Croft's "Spare the Rod," on the grounds that "an inefficiently run school and the moral deterioration of its teachers through their inability to control children

are not subjects to be debated in the presence of school age"; it has also indicated that only a certificate could be allowed to a screened version of George Orwell's "1984."

Three points arise. First, this policy—which stems, of course, from the best intentions of the film industry itself—seems to be drawing perilously near to the stage where, except under such exceptional circumstances as now surround the supposedly horrific "1984," no film with a serious social purpose can be made in Britain at all; the proposal to film "Spare the Rod" has already been abandoned. Secondly, the device of the A certificate already exists so that parents may decide to which films they will allow their children to go; when an X certificate is given to a film it indicates that, in the censors' opinion, any parent who wanted to take even an intelligent boy of fifteen to see it would be wildly irresponsible. A list of some of the best films that have been given X certificates—nearly all of which were produced originally for foreign markets, including some of the finest French films and such serious American films as "Detective Story"—suggests that definitions of irresponsibility can differ. Thirdly, it is no use the Board saying, as it has said, that "none of these films could have been passed if this category had not existed." What this peculiarly annoying phraseology means is that under the system now existing and as the British Board of Film Censors now interprets it, these films "would" not have been passed if there had been no such device as the X certificate. It is for the public to consider carefully whether the system, or the Board's interpretation of it, should be changed.

Costing a Cholecystectomy

A TOTAL budget for the hospitals of some £300 million a year, like most other items of national expenditure, is too big to have any impact on the average person's mind. It may be salutary, therefore, for him to study the latest hospital costing returns for England and Wales (HMSO, 17s. 6d.) and find out what it costs the taxpayers every time he goes into hospital as an in-patient.

He should not, however, jump to conclusions from the simple comparison between the different types of hospitals shown in the accompanying diagram. Thus, although it appears to be expensive to treat people in isolation hospitals, that is because their staffed beds are—and by the nature of infectious disease are bound to be—grossly under-occupied most of the time. Similarly, the comparisons show that it is cheap to be mad. But it has to be remembered that the staff of most mental hospitals is very small in relation to their large numbers of patients, and that these large numbers account for the small cost per patient of other standing charges—and, presumably, for the very low cost (17s. per head per week) of feeding the patients and staff.

Hospital authorities, according to the Ministry of Health, ought to be able, by comparing the costs of their own hospitals with those of similar hospitals, to see where economies can be made. Why, for instance, should the laundry costs or the food bill of one hospital be so much bigger than those of another with roughly the same number

of patients? But what have the hospitals for making economies when they cannot retain the fruits of them and use them for badly needed improvements or expansion? Similarly, what incentive has the Ministry of Health to encourage the hospitals to use their beds more fully, and so reduce both costs per patient and waiting lists, when it means that the

total bill to be presented to the Treasury for the hospital service will be even higher? These costing returns are full of interesting information. But they have little bearing on the main problem of hospital finance.

Love in Too Cold a Climate

THE odd impression seems widespread that the congress of writers just held in Moscow has concentrated its ardour on thoughts of love. This idea apparently arose from a report of some remarks by Mr Konstantin Simonov, who is usually a sound two-minute-hate man, but who happened, this year, to make a passing comment on his colleagues' failure to match the Tsarist authors in ability to describe romantic passion. The congress, however, had little time for such amorous wantonings. Its atmosphere was far too chilly. Under the eyes of Malenkov, Khrushchev, Molotov and other watchful demigods from the Kremlin, the members of the Writers' Union underwent the reading of a "greetings message" from the Party Central Committee, which accused them of "deviations," of writing "worthless works," of "defaming Soviet people," and of failing to write enough about the Red Army. In a three-hour secretarial report, Mr Alexei Surkov piled up further charges, including bourgeois nationalism, "Leftist methods of criticism," and, above all, "cosmopolitanism." Mr Ilya Ehrenburg must have squirmed mentally as his recent novel, "The Thaw," was solemnly condemned. Its hopeful title was clearly premature.

However, if dangerous thoughts such as Mr Ehrenburg evidently retains from his days in the West are to go back into the deep freeze, the culprits may at least live to write

another day. Mr Ehrenburg himself, having duly "reviewed his erroneous stand," got a seat on the platform at this congress. And the less "monolithic" Soviet authors may hope to keep their names before the public during the literary winter by meeting the undoubted demand for escapist romances. Soviet newspapers have recently been publishing collective pleas from collective farms for something in the manner of Pushkin or of "Romeo and Juliet"; and this implies a measure of official endorsement. Love stories will probably prove easier to deliver than the great increase in consumer goods which Mr Malenkov is pledged to provide by next year.

Perón's Christmas

PRESIDENT PERÓN has marked the festive season by intensifying his campaign against the Church and the role of Catholicism in Argentine life. He is attacking along two main lines: religious education and marriage. His government has passed laws which legitimise children born out of wedlock, and legalise divorce. At the same time, he is preparing to abolish compulsory religious instruction in Catholic schools. These moves have provoked a violent reaction among Argentine bishops, and have caused outbreaks of rioting among the faithful. But despite the efforts for conciliation made by the Papal Nuncio, and despite mounting discontent in what is a predominantly Catholic country, General Perón has gone ahead arresting recalcitrant priests, breaking up Catholic student organisations and denouncing the interference of the Church in political life. In Cordoba alone, police have arrested nearly sixty persons who have expressed opposition.

It is not altogether clear what the motives of the Argentine

Great Pantomime

THE ROSE AND THE RING, etc. A Fireside Pantomime for Great and Small Children.
By Mr M. A. Titmarsh.

Smith, Elder, and Co.

MR THACKERAY should confine himself to making fun. When he writes serious novels he grows sad and wearisome—falls into dismal mistakes of sentiment—confounds reason, instinct, propriety, fashion, nature, truth, virtue—and writes books that are at once, in spite of an admirable style, tiresome and offensive. The "Rose and the Ring; or, the History of Prince Giglia and Prince Bulbo," may be a political satire, but we have not found out its bearings. It is, however, a most delightful mixture of fairy incidents with common things, of royal ceremonies and the humblest everyday cares of fashionable and vulgar life, of prose and rhyme, that will make all the boys and girls of the kingdom who can only get a reading of it laugh all the Christmas holidays, and all through all the holidays they will have for the next year. Great boys and girls will laugh at it, too, and laugh almost as much at the cuts as at the letter-press. It will be introduced no doubt at all the theatres where there is time, and be on the stage as it is off—the great pantomime of 1854.

The Economist

December 30, 1854

regime are. There has been speculation that it is seeking a scapegoat and a diversion of attention at a time when *Peronista* policies have brought on a serious economic crisis. But it is paradoxical that a regime which, since the death of Eva Perón, has lost a good deal of its former popularity, should deliberately alienate a major part of its population. It is more likely that the president, who may feel that his days are already numbered, is seeking to consummate the social revolution with which he has identified his dictatorship. The Catholic Church has been the main centre of potential opposition to *Peronismo*, and the president's hand may even have been forced by recent Catholic gains in the universities and the trade unions.

More Legal Aid

RECOMMENDATIONS for the provision of legal aid and advice to litigants in county courts which is contained in the fourth report on the legal aid scheme published this week, were partly anticipated by the Government's decision a few weeks ago to extend the operation of the Act to legal aid in county courts. This decision was the inevitable corollary of another decision—which is to be incorporated in a Bill that will shortly be laid before Parliament—to extend the jurisdiction of the county courts so as to relieve the congestion of litigation in the High Court. At present legal aid committees are putting every

possible case to the High Court in order to get British Petrol the advantage of aid (which has so far been used a lot in High Court actions), and some cases are being put forward that should never come before the courts at all. The decision to extend county court jurisdiction—it now applies to cases in which the sum involved does not exceed £200 (a limit which may be raised to £500, though it has not been fixed)—may also mean that many cases now taken to the High Court will be settled at the lower scale of costs prevailing in the county courts. This will do something to mitigate the hardship often caused to litigants who do not qualify for legal aid, but who have to pay High Court costs when forced to conduct a case against someone who does so qualify—and must pay heavily even when they win their case.

Unfortunately they may have many more such cases to face. It is undeniable that the provision of legal aid, desirable as it may be, has greatly increased the amount of litigation; and it seems certain that some further increase will follow the extension of legal aid to county court cases, many of which could not by any argument be sent up to the High Court. Moreover, the demand for extension of the scheme is based particularly on the need of poor persons to bring actions in connection with the Housing Repairs and Rents Act. Congestion in the county courts is therefore likely to grow even more rapidly than the strain on the overworked High Court is relieved. The increase in the county courts' business may also focus more interest on their procedure, as contrasted with that of the High Court. It is more simple, but not necessarily less effective or just.

Books & Publications

Colour Complex

AN ESSAY ON RACIAL TENSION.
By Philip Mason.
Royal Institute of International Affairs.
158 pages. 8s. 6d.

TO no present-day controversy is Dr Johnson's exordium "clear your mind of cant" more applicable than that of the colour-bar—to give Mr Mason's subject its common, emotional, political label. His essay is an admirable *vade-mecum* for just such a personal exercise in clear thinking. It was, perhaps, inevitable that the main, indeed the only, practical suggestion which emerges from this lucid and compelling analysis is for more research into the facts of racial differences—or similarities—and for wider and more systematic dissemination of the facts which are already to hand. He points, in his final chapter, to the significant easing of racial tension in the United States. This easing of tension has followed such widespread publicity for the findings of

sociologists on the race situation in that country that to display crude racial prejudice there is now the mark of an uneducated person.

For race prejudice is just as much a fact as is the emphatic negative which physiological, neurological and psychological investigation has so far returned to the hypothesis that any human group, distinguished solely by skin pigment, is mentally inferior to any other. Scientists may write as they will—Mr Mason admirably and readably summarises their findings—but the Kenya settler or Platteland Afrikaner, looking round at the disparity between European and Bantu material achievement, can also quote Johnson against such solipsistic laboratory studies, observing with a sweep of the arm which takes in the Rand or the Owen Falls Dam, "Sir, I refute it thus!" In so doing, Europeans in Africa make a moral judgment about the superiority of their culture

which Mr Mason does not fail to dissect; the fact remains that such a judgment based on common observation is made, and shapes almost unalterably the European emotional attitude to the African as well as the attitude of the African whose whole development is rigidly prescribed thereby. Mr Mason's analysis of these hardening attitudes, at first complementary, but later becoming opposed and irreconcilable, constitutes a notable addition to the whole argument about colour and colonial policy.

As Mr Mason shows, the period of dependence and mutual confidence is succeeded on the part of the dominated race, after a varying period, by a neurotic rebelliousness; and it is this, almost as much as the downright suppression practised by Afrikaners, which is producing tension and indeed violence on such a scale as to become a factor of growing weight in the fine balance between the material and moral strengths of the two great opposing blocs of powers. It is this that makes the finding of a solution of such political interest: on race relations, Communism has (like Islam) the moral initiative, however undeservedly; it is increasingly clear that the West must spare no effort to retrieve it. It is this that makes South Africa, apparently remote from the world struggle, a key country as much for American as for British statesmanship.

The political problem in Africa is at least in part one of the timetable. Euro-

peans—certainly British intentions—are good; even the record, in terms of human realities, is infinitely better than is widely supposed as the result of mischievous propaganda; but political needs go far ahead of the power of human beings to adjust. The Labour party can demand that a time limit shall be put on the granting of independence to African peoples; but it cannot ensure that they shall become capable of running modern states by that time. Yet upon their ability to run the paraphernalia of modern government and technology, the Europeans on the spot, who have to live with them, insist on judging them. In the interests of material welfare and technical efficiency, the dominant race has created the "stabilising techniques" which Mr Mason describes, and which maintain it as the unchallenged cadre of technocrats in Africa. Such technocrats are not impressed by the argument that in the time-scale of human evolution the start that they have inherited from the European forebears is merely fractional. Prisoners of their own system of thought, moreover, they cannot accept socially the gifted individuals of the darker race who represent now that theoretical equality of races which is to be achieved some time in the long run.

Mr Mason offers in this essay neither a quick solution nor an outright forecast of catastrophe. He has concentrated on Africa (with illuminating analogies drawn from his personal experiences of the British Raj in India) because it is in Africa—rather than Cardiff, Carolina or Kingston, Jamaica—that racial disparities are at once greatest and liable to be most explosive. The White-Black, European-Negro, antithesis is by no means the only point of racial friction in the world; the danger is that European and Afrikaner handling of it may make of it a trigger-mechanism for detonating latent colour antagonisms throughout the world to the ultimate ruin of Western culture.

Theoretical League

THE LEGAL COMMUNITY OF MANKIND.

By Walter Schiffer.
Columbia University Press (London: Geoffrey Cumberlege). 377 pages. 45s.

IN the whole erection of the League of Nations there was an "as if" element—an assumption that it was hopeful to set up an international organisation as if there existed a real community of nations in which men would behave reasonably. This community might then come into being. As many critics of the League have pointed out, the conditions necessary for its success, if they had existed, would have made it unnecessary. But no previous critic has explored with so much scholarly care and acuteness the historical reasons for this "as if" element.

Dr Schiffer shows how the whole legacy of human thought about international law and organisation was conducive to such assumptions. The

medieval notion of natural law implied that "the highest standards were considered to be not merely moral but legal rules," and such rules applied despite the absence of a worldwide organisation. Grotius and the other fathers of international law perpetuated the idea of the world as a legal community which was yet not a state: and even the positivist view of international law clung to the concept of a legal order binding upon actual states. To such ideas the nineteenth-century champions of *laissez-faire* liberalism added the doctrine of a natural harmony of interests among nations, with the corresponding concept that some spheres of activity (particularly the social and economic) are separable from politics. From the combination of all these ideas with the liberal-democratic faith in the purifying moral force of public opinion emerged the theories on which the League rested.

Only these assumptions made it seem practicable to set up an organisation of sovereign states, voluntary in character and designed to prevent war. The general realisation of common interests and the democratic operation of overriding reasonableness would supply the unity of purpose needed to make it work. Meanwhile technical progress in non-political co-operation would weave the fabric of the new world community. Dr Schiffer avoids the question whether it was for these reasons, or for others, that the League failed. But he rightly indicates the extent to which the United Nations rests on only slight modifications of the same ideas.

His argument is always lucid and temperate, and he writes as a friendly critic of the League of Nations. In so far as the present world organisation assumes still greater autonomy of social and economic co-operation from politics, it puts even more faith in the capacity of functional agencies to create that community of interests which the political structure presupposes. A corresponding study of assumptions underlying the United Nations organisations would be of immense value; and it could fruitfully build upon this admirable analysis.

A Modern Moses

JINNAH: *Creator of Pakistan.*
By Hector Bolitho.
Murray. 254 pages. 18s.

BY the test of sheer achievement, Mahomed Ali Jinnah must be reckoned as one of the most dynamic and successful political leaders thrown up by the present century. It has fallen to Mr Bolitho to write the first full-scale biography of this remarkable man, and he has done it very successfully. And yet, for all the fascination of the subject and of the stirring chapter of history which Jinnah helped to make, it must have been a difficult biography to write, for there seems to have been little of the ordinary raw material of biography, the detritus of a great man's life, available for sorting and selection by the historian.

Apart from the brief story of his unhappy marriage, Jinnah could be said to be as nearly without any private life as it is possible for a man to be. There seem to have been very few letters to quote from and nothing at all in the way of self-revealing diaries or other personal documents; nor had Jinnah any intimate friends to whom he would have bared his heart. Aloof, austere, seemingly devoid of human interests, shunning emotional contacts, he was not the man to provide his biographer with any "human touches."

But if this is not, and could not be, an intimate biography, the very facts of the story, as they unfold, create an absorbing picture of a modern Moses who led the Muslims of India, against all odds, into their promised land; who, though already a dying man when the crisis of partition was reached, saw his dream come true. The story has, moreover, some paradoxical features. It was a curious phenomenon that the creator of the largest Islamic state in the world was himself not a good Muslim, so far as religious observance went, took a strictly secular view of the state, was completely modernised and westernised in thought and habit, and was anything but a demagogue. He could sway huge crowds, but did not even bother to speak to them in their own language, and was far too fastidious to be a popularity-seeker; "public relations" had no place in his scheme of things, and at his press conferences reporters were not even regaled with tea and cigarettes. If he was fanatical in anything, it was only in his uncompromising honesty, both moral and intellectual. It was, of course, this quality which won Pakistan for the Muslim League. A lesser man would have compromised not once but a dozen times along the way, but Jinnah was not to be bamboozled: neither the sentimentalism of Gandhi, nor the subtlety of Nehru, nor the charm of Mountbatten could prevail against his icy defences; there were no chinks in the armour of his mind, which reacted against any kind of humbug as instantaneously as an automatic machine rejecting false coins.

The Congress leaders had, of course, made the mistake of underestimating him for years, just as they refused until the eleventh hour to take the idea of Pakistan seriously. All through the critical period of the thirties they had, in Jinnah, if only they had realised it, a unique instrument for holding India together. Not only was he free from bigotry and racial prejudice, but his friendships (such as they were) lay at least as much among the Hindus and the Parsees as among the Muslims, and he was actively disposed to be a champion of Hindu-Muslim unity. This aspect of his earlier life is well brought out in Mr Bolitho's book, which also clearly outlines the stages by which he was gradually forced, by the shortsighted attitude of the Congress leaders, to draw back from this position and nail the colours of Pakistan to his masthead, where they stayed for the rest of his life. It was logic, not sentiment, that drove him to this position.

The War in Korea

FROM THE DANUBE TO THE YALU.

By General Mark Clark.

Harper. 356 pages. 21s.

WHAT HAPPENED IN KOREA?

By Guy Wint. Background Books.

Batchworth Press. 152 pages. 5s.

GENERAL MARK CLARK never got to the Yalu. He assumed command of the United Nations forces in Korea in May, 1952, when the armistice negotiations had been in intermittent progress at Kaesong and Panmunjom for nearly a year, and the military situation was already a mere facet of a complex political tangle. It was a thoroughly frustrating position for any commander-in-chief, and particularly so for a man who had earlier had two years of frustration while serving as American High Commissioner for Austria. As early as 1946 General Clark had discovered in Vienna that firmness got results from the Russians. Thereafter, Marshall and others urged him to "pull his punches" in public statements about the Russians, and he did so; but his views never changed. Nor, he tells us, did he ever change the opinion, formed after a talk with General MacArthur in 1951, that the United Nations should not have granted Peng Teh-huai's forces a sanctuary behind the Yalu river whence their aircraft could operate and where their supply bases were safe from air attack. General Clark loyally observed this and other restrictions while he held his Korea command; but the pain he felt at seeing his men dying day after day in a war which he was not free to fight to a finish was very real.

Mark Clark was the first American general in history to sign a compromise armistice; this, too, he did very much against his will. His conquest of his personal feelings was a remarkable feat. From the moment of his arrival in the Far East he had had to wrestle with problems far outside normal military experience. There was the outbreak in the Kojé prison camps. There were the newly sovereign Japanese, who, among other things, tapped his telephone in Tokyo. In Seoul he was whipping-boy for a Syngman Rhee with whose desire to fight the war to a finish he privately sympathised, but whose blackmailing methods he bitterly resented. He knew that, at Panmunjom, Nam Il was not negotiating at all but merely making propaganda, but he could do nothing to stop it. He still seems uncertain why the Communists eventually agreed to an armistice when they did. As he points out, Stalin's death in March, 1953, provoked a swift change of front; but the Communists reverted to stonewalling several times between that date and the signing of the armistice in July.

Mr Wint is inclined to see a clearer connection between the death of the stubborn old despot and the end of the fighting; but he too is reluctant to define the chain of causation very closely. It is, indeed, the special merit of his book that it brings together in a concise form all the main aspects of the Korean war

without over-simplifying any of them. Mr Wint's narrative begins with Korea under the Japanese, and continues until the breakdown of the Korea negotiations at Geneva last June. It is to be highly commended to all who failed to follow the tangled skein from start to finish, those whose memory has become blurred on specific points, and, particularly, to younger readers who now want a reasonably short and straightforward account of a chapter in recent history to which they may not have paid much attention at the time. Mr Wint writes with understanding of the nature of Chinese Communist revolutionary zeal, but with no illusions about the grisly methods used by the Communists in, for example, their cruel shadow-play on "germ warfare." His conclusions are extremely suggestive. He does not try to pretend that the doctrine of collective security was put into effect in Korea in its purest form and with complete success; but he argues that the United Nations

had accomplished one very great thing. They had taken the shock of Communist aggression at a time when Communist policy was to aggress. If there had been no resistance in Korea, other aggression would have followed elsewhere. . . . Sooner or later the western nations would have been forced to stand and fight, as they were forced to do by Hitler. They might have resisted in circumstances very much worse than in Korea. . . .

The Korean war was "a small one which was fought in order to prevent a big war happening." Mr Wint points out the danger of generalising from one example. But it is equally dangerous to ignore such an example. That is why such a book deserves a very wide reading.

Preacher and Poet

JOHN DONNE.

By K. W. Gransden.

Longmans. 205 pages. 10s. 6d.

WHEN John Morley was editing his famous English Men of Letters series, the taste of the day was such that Donne did not qualify for inclusion. More surprisingly, in spite of all the critical attention that has been focused on him over the last thirty years and more, nobody has hitherto produced a brief and balanced account of his life and achievements. Mr Gransden's book is accordingly welcome. It is not pretentious, but it covers the whole ground. The less-read poems come in for the attention they deserve, and so do the prose works, and not the sermons and devotions only but the satirical and controversial pieces as well.

For his biographical material Mr Gransden naturally leans heavily on Izaak Walton, who had the inestimable advantage of being a friend of Donne's. In his distribution of emphasis he comes closer to Walton than some of the admirers of the youthful love-poetry have done. Walton has been criticised for too hagiographical an approach, but in fact he did not base his high estimate of Donne entirely on the piety of the

latter years. Donne's literary Petrarchism is perfectly apparent to him. . . . and a memory of Dr Donne . . . must not, and a not die, so long as men speak English," he wrote; and his *Elegy*, written within a week of Donne's death, begins:

Our Donne is dead! and we may sighing say
We had that man where Language chose to stay
And shew her utmost power . . .

Where Walton differed from modern readers was in admiring the works of Donne's maturity more than the poems of his dissolute youth. Fortunately we are not troubled by the discrepancy between the reputations of the young man about town and the learned Dean of St. Paul's; but if we are freer than Walton was to appreciate the love poems, we should also recognise that what Donne wrote as a servant of God is as authentically interlarded with his peculiar genius as what he wrote for his "profane mistresses." Mr Gransden acknowledges this and (perhaps a little against his natural inclinations) gives due weight to Donne the theologian, the preacher and the religious poet.

Some of his expositions of difficult passages in the poems are in an Empsonian idiom that is not very happily managed, and there are a few actual blunders: the third satire is not in blank verse; and George Herbert's mother was either Mrs Herbert or Lady Danvers, but not Lady Herbert. But these are very minor defects in a genuinely useful book.

Man and Science

SCIENCE AND THE COMMON UNDERSTANDING.

By J. Robert Oppenheimer.

Oxford University Press. 127 pages. 10s. 6d.

THE reception given to Professor Oppenheimer's Reith Lectures when they were broadcast in 1953 was generally one of bewilderment and disappointment; apparently something different was expected from the man who had engineered the mightiest scientific experiment in history. Since then a storm has broken over his head in his own country, and the appearance of the lectures in print is opportune for a re-reading with fresh sympathy and curiosity.

The lectures undertake "to attempt to elucidate what there is new in atomic physics that is relevant, helpful, and inspiring for men to know." Dr Oppenheimer is one of the few dozen men in the world with the technical ability to perceive the utmost to which the boundary of physical discovery has been pushed; he has unusual qualities of thoughtful introspection and sincere self-expression. If physical science has turned new corners and brought fresh vistas into view, therefore, here is where we might expect to have them displayed to us by a showman of exceptional talents. Once again, then, re-reading

ECONOMIST, JANUARY 1, 1955

the excitement at finding that expressed are, on the whole, familiar ones; the basic viewpoint is still essentially the same as that of fifteen or twenty years ago. The fault lies in the time, not in the man. Physics at the moment is turning too many corners for new vistas to unfold; Dr Oppenheimer and his colleagues have as yet found no stars bright enough to guide the mind of man through this murky maze. And so, unwilling under his self-imposed terms of reference to speculate, he presents again the trustworthy picture whose general lines were drawn in the "heroic age" of the twenties: "For those who participated, it was a time of creation; there was terror as well as exaltation in their new insight." This is not simply unconstructive nostalgia; it ranks as intellectual honesty of a high order to have eschewed the exciting and baffling novelties of which he knows as much as any man.

The main themes, then, of his dissertation are the two principles which formed the intellectual core of the quantum mechanics of the twenties—the principle of correspondence between the old, large-scale mechanics and the new, atomic-scale processes; and the principle of complementarity—the "uncertainty principle," which sets a limit to the minuteness of the scientific delineation of nature, by making the roundabouts all the vaguer, the more precise we try to make the swings. Dr Oppenheimer's argument is sometimes obscure and intuitive, almost mystical; but he can speak plainly, too, and here and there his expression has a poetically moving quality rare in books on these themes. Even if he tells an oft-told tale, we can be grateful to him for the freshness of the telling, and the faith and sincerity he shows us.

History and Myth

CONQUEST BY MAN: *The saga of early exploration and discovery.*

By Paul Herrmann. Translated from the German by Michael Bullock.

Hamish Hamilton. 478 pages. 30s.

THIS omnibus survey of ancient history and myth, which ranges from the travels of Carthaginians, Greeks, Arabs and Vikings to the identity of the White Gods of the Incas and of Prester John, is aimed "not at the professional scholar or scientist, but rather at the harassed and overworked man in the street." It has therefore, we are told, been made "rather more entertaining" than is usual with books of this kind. Certainly Mr Michael Bullock's translation hurries us along in a spate of journalese.

To offer the layman a readable account of exploration and discovery from prehistoric times to the fifteenth century is a praiseworthy object, but in seeking to popularise his theme the author has surely underestimated the intellectual level of his audience. Subtitled "How much does a concubine cost?" "The vicious women on the

island of Cos" and "Do gorillas throw stones?" indicate the style. But the question of style goes deeper than this, for the desire to enliven the text has proved incompatible with the avowed intention of avoiding any "sacrifice of factual accuracy." The more colourful interpretation apparently ousts prosaic reality. Thus the ruins of Zimbabwe are identified with the biblical Ophir although excavations a generation ago proved them indisputably medieval. Again, hoary myths are given a new lease of life: the disappearance of King Madoc from Wales c.1170 AD is linked circumstantially with the eighteenth century Mandaean Indian settlements of the North American plains. There are also inconsistencies. On page 130 we read that when Columbus set sail he knew nothing of America. "That," says the author, "is definite." But on page 227 he comments that "in all probability" Columbus had heard seafarers' tales of its discovery by the Vikings.

In keeping with the aim of popularisation, the eye is continually distracted from the text by a profusion of drawings, photographs and maps, whose number must fill every serious writer on these subjects with envy. Many of the maps are little more than outlines with rivers and place-names inserted and some, No. XXI for example, require a key. In many cases their value would have been greatly enhanced by some indication of relief and vegetation—high mountains, bogs, forests and deserts were serious obstacles for early man to contend with in his journeyings. Indeed this book leaves one with the regret that, unlike Herodotus, Herr Herrmann has not recognised geography as "the very kernel of world history" and has said so little of the natural environment in which our forebears worked.

Despite its faults this work will probably achieve its objective—a popular success. The greater the pity, therefore, that the hard core of fact has been sugared with so much fancy.

Danubian Satellites

RUSSIA'S DANUBIAN EMPIRE.

By Gordon Shepherd.

Heinemann. 273 pages. 21s.

"DIGGING up the Communist present is worse than excavating the Babylonian past, for whereas our remote ancestors made no intentional attempts to deceive us, the present masters of Eastern Europe often seem to do little else." In spite, however, of this entirely justified *cri de cœur*, Mr Shepherd, who has worked in Vienna for eight years, first on the Allied Commission and then as a journalist, has done a good job. If his spade has not turned up any important new finds, he has arranged, expounded and interpreted what information there is about the Communist regimes in Czechoslovakia, Hungary, Bulgaria and Rumania with intelligence, and honesty.

He would perhaps have done even better if he had jettisoned some of his

facts and figures and devoted more space than he has done to discussing the long-term problems facing the Communists in Eastern Europe. How, for instance, are they to choose between their practical need to persuade the peasants to grow more food for the industrial workers, and their doctrinal need to press on with collectivisation? Again, Mr. Shepherd is quite rightly suspicious of the "new course" economic policies introduced in 1953 with the object of improving living standards; nevertheless, the problems created by the lop-sided development of heavy industry are very real.

Mr Shepherd has some sensible and realistic things to say about the prospects of peacefully liberating the Soviet satellites; and his wholehearted condemnation of the Communists' political aims and methods does not delude him into thinking that the clock can or should ever be completely put back in Eastern Europe, particularly in the countryside. It is a pity that he has restricted his survey to the Danubian satellites; for whatever the past—and the future—geographical and political importance of the Danube basin, the present reality is a closely integrated bloc, that includes Poland and Eastern Germany, and stretches to the Baltic. It is also a pity that the book, which contains some photographs of Communist celebrities and victims, does not contain one map.

Letters to the Editor

Contrary Kenya

SIR—The article in your issue of December 11th shows a woeful misunderstanding of the local situation.

When the present Council came into being the European Elected Members appointed Mr Blundell as "leader," and it was made clear to him and accepted by him that the term "leader" did not connote "Führer" or "Duce," but merely entrusted him with the formal functions of leading in the Chamber and day-to-day contacts with the Governor and did not empower him to instigate policy or indulge in any constitutional negotiations without the full knowledge and consent of all the members of the European Elected Members' Organisation.

It was the discovery that recently there had been a clandestine breach of this understanding which disrupted us as a coherent team. We had had the most solemn assurance that there would be no constitutional changes during the Emergency or without a round table conference and adequate time for the electorate to consider any concrete proposals. As a result of what can only be described as backstairs intrigue, these assurances were ignored and I and other of my colleagues were summoned to Government House, presented with a long and complicated document, and brusquely informed by the then Secretary of State, Mr Oliver Lyttelton (now Lord Chandos), that we had four hours in which to agree to support or otherwise!

It appears to have been forgotten that Kenya is a British colony and its rule was entrusted to Britons by treaty, agreements and acquiescence with and by the Arabs and the native tribes (*vide* Lord Halsbury's Laws of England). Nearly all of us are in favour of a multi-racial government in so far as it means the incorporation of Arabs and Africans in the machinery of governance. This is a moral obligation even though at present largely symbolic and educational because of their as yet limited experience and grasp of the more subtle and complicated problems of today's national affairs. There is also general agreement that the Indians should have adequate representation in Legislative Council.

The basic objection to the Lyttelton set-up is the inclusion of Indians in the executive citadel of Government with its future implications. The Imperial Government refuses to transfer the rule of the High Commission Territories in South Africa without the consent of the African inhabitants to a European Government and we resent the blatant inconsistency of imposing part Indian rule over us and our Africans without

their consent. If the straight issue "Are you willing to be ruled by Indians?" could be put to the Arabs and the Africans there is no question but that the answer would be a universal and emphatic "No."

Who then, Sir, are the Bourbons?—Yours faithfully,
Nairobi E. S. GROGAN,
Member of Legislative Council

★

SIR—In your Note of the Week of December 25th you refer to "the recent court cases in which the conduct of both the Kenya police and the Kenya Police Reserve has appeared in a most unsavoury light." This statement in the context of your Note does the Kenya Police Reserve a great injustice.

It is not clear to which cases or to which "recent convictions" you refer. The Searle case is reported to be the subject of an appeal. But apart from the issue whether it is fair to base innuendoes about the whole force on individual cases, I wonder whether you have included cases and convictions with regard to individuals who were serving on secondment to other formations. Resentment at recent convictions is not confined to the Kenya Police Reserve. It is common to most of the European community. In fact it is widespread amongst all loyalists. The resentment is due to the fact that great responsibility has been placed on young and inexperienced officers who have been expected by their superiors to produce results. It is alleged that, after being assured of the support of their superiors, these officers have been let down.

Whatever may be the merits of each particular case, the point is that the cases and the incidents out of which they arose are due to a situation in which a state of emergency descended upon Kenya when the government was unable either to restore order or to supply officers of suitable age and experience to undertake tasks requiring the necessary qualities of judgment and responsibility.—Yours faithfully,
London, S.W.7 A. P. LE MESURIER

Enticing the Scientist

SIR—In your note on December 25th you mention that the number of research workers at universities may be excessive with the result that the shortage of scientists is aggravated. I know of no satisfactory measure by which the amount of research done can be judged excessive. On the other hand it can be stated that the number of qualified workers engaged in producing the present volume of

results is certainly excessive.

Scientists at universities often find a much of their time over trivial tasks such as—taking physical chemists as examples—glass-blowing, wiring simple circuits, constructing metalwork, setting up standard pieces of apparatus and making routine observations. It is good that a Ph.D. student should experience these chores but it is waste of the time of a post-doctoral fellow or lecturer. Laboratory technicians without degrees can do such work. A chemistry department, say, would often produce more results if two post-doctoral fellows, costing perhaps £1,500 per annum, were replaced by two senior technicians and a lad, at the same cost. Two Ph.D.s would then be released for teaching other work. Unfortunately this exchange cannot be made because of the methods by which research is presently financed.

The valuable time of senior university staff would similarly be saved if all large departments had administrative assistants.—Yours faithfully,

A. F. TROTMAN-DICKENSON
University of Edinburgh

Cross Currents at Geneva

SIR—In your issue of November 20, 1954, on page 651, you write: "The extreme demands of such countries as Indonesia not only for freedom in tariffs and quantitative controls but also in export subsidies would, if granted, make nonsense of Gatt."

The Indonesian delegation objects against the wrong intimation by your special correspondent which ascribes to it a demand for freedom in tariffs. The Indonesian delegation was among the delegations that were prepared to accept the proposal to bind the existing tariff schedules for a limited period. Furthermore, it was in favour of reducing the margins of preference in preferential tariff schedules, the existence of which still means a deviation from the principle of Article I of Gatt.—Yours faithfully,

A. P. MAKATITA
Indonesian Delegation to Gatt.

Wards of the Public

SIR—I find your article of November 6th a little disheartening in its complete omission of any reference to the Child Care Committees which operate throughout the LCC area. "Individuals" you say, "and categories of persons are the focus of assistance, but there is often nobody to deal with the family as a unit."

It is true that by its very nature the work of the Child Care Committees receives little or no publicity, but I think it should be generally known that these committees, through their voluntary home visitors, do, in fact, apply themselves predominantly to the family as a unit. Wherever there is a child who can be considered underprivileged, there is a case for the Care Committee home visitor who will not consider the child in isolation but against the whole family background.—Yours faithfully,

GILBERT FROST
London, S.W.18

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

President in a Divided House

Washington, D.C.

NEXT Thursday's State of the Union Message, which the President will open relations with the new Democratic Congress, is not expected to contain many surprises. To those sections of the Eisenhower "middle-of-the-road" programme which the last Republican Congress shied away from will be added something about building roads, about building an army for "the long pull" on the basis of universal military training, and about another aspect of the now fashionable doctrine that the cold war will be the business of generations, the expansion of economic aid to Asia. But, since Christmas Day, the free world has had the most solemn of promises from President Eisenhower that immediate priority is to be given to the proposals for increasing international trade put forward by the Randall Commission a year ago.

There is no reason to doubt the Administration's sincerity and determination in this matter. A sense of guilt has hung heavily over the White House ever since Europe sturdily declined to excuse the comparatively reputable political calculations that led to the Randall report being held over for a year. Strenuous efforts are being made—and being co-ordinated by a small unit in the White House headed by Mr Randall—both to plan to the last detail an impressive presentation to Congress of the Administration's case and to reassure the free world that, when the President pulls the strings of power, something now moves at the other end. As evidence of the first there is, according to reliable information, the President's personal drilling of the awkward squad in his Cabinet, including Mr Sinclair Weeks, the Secretary of Commerce; this exercise provides a guarantee that there will be an impeccable turnout on Capitol Hill to testify before congressional committees "and back up the boss." As evidence of the second line of activity there is the recent administrative redefinition of the "Buy American" Act. This is expected greatly to ease the task of foreign firms wishing to bid for contracts with American government departments and, since the decision was announced, official ears have been straining to catch the applause from abroad.

The Administration is fortunate that it is able to start off the new period of divided government with a measure that should command strong Democratic support. Freer trade is, historically, a Democratic cause and one in which the Southerners, for powerful economic reasons, take the lead. This is an issue, indeed almost the only issue, toward which even Senator Byrd of Virginia, who will be the next chairman of the Senate Finance Committee, has a liberal

approach. He was in fact a signatory of the Randall report, as was Mr Jere Cooper, the chairman of the Ways and Means Committee of the House of Representatives, where the new legislation will have to start its course.

Even on this question, however, the Democrats are not absolutely united; a number of Senators from mining and industrial states will probably vote against the Bill for regional economic reasons. In the House of Representatives, where members are more immediately exposed to local pressures, there may be a larger defection, though many of these Democrats will probably feel able to vote with the party leadership for a broad measure that does not mention their sensitive commodity by name but passes on to the President discretionary power in negotiating tariff reductions. The main objective, therefore, must be to keep detailed amendments mentioning such commodities as lead, zinc and fuel oil from appearing on the floor of the House. Control over this lies in the Rules Committee, over which that arch-conservative, Representative Howard Smith of Virginia, will, by the force of seniority, preside in the next session. The course of the battle for lower tariffs, as for much else in the session, may thus turn on the ability of the new Speaker, Mr Rayburn, to enforce his promise that, seniority or no seniority, Democrats will only be assigned to vacant places on the Rules Committee if they pledge themselves to support the party's leadership.

★

There is much greater doubt about how the Republicans will treat the President's programme on trade. But at least many of their leaders are keenly aware of the danger that the Democrats may appear as the only genuine supporters of Mr Eisenhower's proposals, and the cracks that opened so widely in the party's fabric a few weeks ago have been papered over. Both the election results and the general revulsion against Senator McCarthy's attack on the President have made the Republicans more conscious than ever of their dependence on Mr Eisenhower. For this reason, if for no other, the President will be careful to avoid making any clear commitment on whether or not he will run for a second term in 1956. He will, of course, be under the heaviest possible pressure to do so but, as long as he has not announced a decision, he can put the heaviest pressure on his party to conform to his policies.

For the Democrats and for Mr Adlai Stevenson personally Mr Eisenhower's intentions are a question of peculiar poignancy. Unless things change radically in the coming

eighteen months Mr Stevenson will be the next Democratic candidate and his chances of ever being President will probably depend on the personal decision of Mr Eisenhower. If Mr Eisenhower runs, he will, again unless things change in the meantime, defeat Mr Stevenson once more; it is doubtful if any other Republican can. But a defeated candidate is seldom given a third chance. The Democrats will be hard put to it to decide whether the President is more likely to be edged into retirement or needled into seeking vindication if he is driven out of his present position of "privileged sanctuary." The indications are that the congressional leaders, Senator Lyndon Johnson and Representative Rayburn, differ on this point from the new party chairman, Mr Butler; they are inclined to think that, for the time being at least, the Administration's shortcomings should continue to be blamed on Mr Eisenhower's "bad advisers."

This will not, of course, prevent congressional committees under Democratic chairmen from opening up hostile investigations of the Administration's more controversial decisions. The famous Dixon-Yates electricity contract and other instances of a supposed propensity to "give away" the nation's natural resources, the heavy cuts in the Army's manpower, which will be attributed to the triumph of budgetary economies over military prudence, and the security regulations for civil servants are all on the short list of coming congressional enquiries. The Democrats may also attempt to undo the relief given to recipients of dividends in the Republican tax Bill and to reverse the switch from a rigid to a flexible system of farm price supports. But it is doubtful if either of these cases will be pressed to the limit this year; the juiciest concessions in terms of tax cuts and farm subsidies will no doubt be reserved for the pre-election session of 1956.

New Look or Old?

IN Washington it is suspected that the coming cuts in the number of men in the armed forces, announced just before Christmas, are the result of the old, unbalanced, look of the Budget rather than of the new, atomic, look of defence policy. The reductions, ordered by the President himself, represent not merely a return to the plans of a year ago, modified when the military situation in Asia deteriorated last spring, but a speeding-up which will cut the number of men in the armed forces from the present 3,218,000 to 2,815,000 by the middle of 1956. Nearly all of the cuts will fall on the Army; the number of men in the Air Force will go up by about 15,000.

This apparent reversion to a policy of relying on air rather than ground forces, which, it was thought, had been discredited by developments in connection with Indo-China, is arousing concern among the experts. Doubts whether the full implications had been discussed at the highest levels were encouraged when the Secretary of Defence, Mr Wilson, announcing the new plans, said that the threat of global war had decreased, only to be followed by the Secretary of State, on his return from Paris, declaring that the danger of war was undiminished. Mr Wilson, with his usual tactless candour, stressed the economies that would result from the saving in manpower and, rightly or wrongly, the critics have

seized upon this as the key to a development. British Petroleum, maintain, jeopardises the security of the United States and a

It is a key which the President must certainly be tempted to use. For he, who promised to balance the Budget and to reduce taxation, is once again about to present an unbalanced Budget to Congress and to ask for a postponement of scheduled tax reductions. The estimated deficit for the 1956 fiscal year, beginning next July, is expected to be

"But I Thought He Was Coming For Sure This Time."

Herblock in the Washington Post

about \$3 billion; this was the original estimate for the current year, and the figure has now risen to \$4.7 billion. The deficit for 1956 will go up by another \$3 billion if corporate income taxes are allowed to fall from 52 to 47 per cent and if excise taxes on a number of articles, including cars, petrol, cigarettes and beer, are allowed to drop, as they are now supposed to do, on April 1st.

More Heat than Power

THE Securities and Exchange Commission is giving the Democrats in the new Congress an opportunity to revise, and possibly break, the controversial Dixon-Yates contract. By postponing final arguments on the proposed financing of the project to January 18th, the SEC has ensured that political heat will continue to be generated over the question of electric power for the Atomic Energy Commission's plant at Paducah, Kentucky. Rear-Admiral Strauss, chairman of the AEC, has made it clear, however,

They might the Democrats all the way on what has been one of the most vexed issues in American politics. Mr Dixon, president of Middle South Utilities, Inc., and Mr Yates, chairman of the Southern Company, are now household words in the United States. They are the main personages in one of those melodramas that Americans traditionally enjoy: a fight between big business and government on the one hand, and the rugged individualists led by a fighting lawyer and a Senator with a coon-skin cap on the other. Last June, the Administration directed the Atomic Energy Commission to negotiate an electricity contract with the Mississippi Valley Generating Company, formed by Messrs Dixon and Yates. They were to build a steam generating plant, costing \$107 million, at West Memphis, Arkansas, with a capacity of 600,000 kilowatts, to supply the Tennessee Valley Authority with power to replace that being delivered by the TVA to the AEC. The Administration declared that it had authorised the agreement because it would save the taxpayer the expense of adding a new plant to the TVA system.

This touched off fierce opposition from the Democrats in Congress and from the people of Tennessee, led by Senator Kefauver. To them the whole scheme is a sinister attempt by the Administration to undermine the principle of government-owned electricity enterprises, and to return into the hands of big business one of the proudest achievements of the New Deal. The battle cry of "Nixon, Dixon and Yates" did much to account for the victory of the Democrats in the November elections in Kentucky and Oregon, another state where hydro-electric power projects are of major importance. Rear-Admiral Strauss has argued that power must be drawn from the TVA to keep the atomic plants going and that it can most cheaply be replaced by private utilities. His statement that the government would simply take what it needed, if necessary at the expense of TVA's customers, has sent the men of Tennessee scurrying for their famous squirrel-guns.

Private Life for Synthetic Rubber

New York.

THE poker game, which began six months ago between the Rubber Producing Facilities Disposal Commission and the rubber, petroleum and chemical companies that want to buy the government's synthetic rubber plants, ended last Monday with contracts signed for 24 of the 27 plants, leaving only the most uneconomic on the commission's hands. The prices agreed will not be revealed officially until the commission makes its formal report to Congress on January 27th, but unofficially the proceeds of the sales are put at \$300 million, compared with an original cost of \$450 million and a present book value of about \$170 million. Congress will have 60 days to approve or reject the contracts and to consider the Attorney-General's report on whether or not the commission has succeeded in creating a competitive synthetic rubber industry. The undertakings that the commission had to sell included facilities for the production of the two chief raw materials, styrene and butadiene, and the rubber or copolymer plants in which these materials are combined to make general purpose (GR-S) synthetic rubber.

Most of these plants will be bought, if Congress approves, by the petroleum and rubber companies that operated them for the government, and were consequently in the best position to bid for them, although there are also a few new faces amongst the successful bidders. Most of the butadiene plants, which are dependent for their feedstock on adjacent oil refineries, have gone, as was expected, to the petroleum companies which operate the refineries. To assure outlets for their butadiene, some of these companies have carried the integrated process one step further forward into rubber production. Except in the case of one plant, the big rubber companies have secured only the copolymer facilities they were formerly operating, and have not taken on the business of making their own raw materials. The Attorney-General's anti-trust criteria have apparently been met by the new competition that will be provided for the four big rubber manufacturers by the entry of oil companies and of two groups of smaller firms into synthetic rubber production.

The confidence of the oil and rubber companies in the future of the American synthetic rubber industry is shown by their willingness not only to meet the commission's asking prices, but also to accept the burdensome "national security requirement" to keep the plants in good operating condition for ten years after taking them over. Whether this is to be the final structure of the industry is now up to Congress, and there seems a fair chance that the commission has secured prices high enough to convince the Democrats that this is not "another Republican giveaway programme."

Prosperity on Wheels

THE cost of living index, based on the prices of things the average consumer buys, rose in November for the first time for several months, and the rise was explained almost entirely by the appearance of new car models on the market. The prices listed were not much above those of the 1954 cars, but dealers had been selling the old models at heavy discounts in order to get rid of them. The 1955 cars are, however, villains only in housewives' shopping baskets; elsewhere they are heroes who are sending 1954 out with a bang instead of the whimper with which it began. For it is thanks to the new models that the year has turned

CONSUMER PRICES in the UNITED STATES

INDEX NUMBERS 1947-49=100

out to be more satisfactory, statistically, than any other except 1953.

The Department of Commerce traces almost all the upturn in the economic indicators, such as industrial production, manufacturing employment and payrolls, in November and December back to the "sharp pick-up" in automobile output. In the last full week before Christmas more cars came off the assembly lines than ever before in a December week, nearly twice as many as in the comparable period of 1953. The industry expects to end the year with a total output of about 5½ million cars, only about half a million less than last year. There is talk of all records being broken during the first quarter of 1955, and this has much to do with the optimism with which the New Year is being greeted by businessmen all over the country.

These plans are based on a sound foundation of booming retail demand; the 1955 models are selling, no one quite knows why, better than new models usually do. The best sellers are, as always, Chevrolets and Fords, which are racing bonnet and bonnet for the advertising crown that rewards the winner of the annual sales contest. It is 19 years since Ford last won, but this year the company is convinced that it has the race in the bag, although the result will not be officially announced for several weeks.

Little White School-House?

FROM A CORRESPONDENT IN MISSISSIPPI

ON December 21st the people of Mississippi voted for an amendment to the state constitution which permits the abolition of the present school system. This amendment, which passed by 89,434 votes to 38,431, expresses the will to resist with all means short of secession the decision of the Supreme Court forbidding racial segregation in publicly financed schools. Georgia, South Carolina and Louisiana have passed similar measures, and on January 11th the Mississippi Legislature will meet to write this threat into the state constitution. In those counties where Negroes predominate heavily in the population, the atmosphere was tense, and it is possible that fear prevented coloured voters from expressing their views. But the outcome was expected and exemplified the formula which Southern legislators have devised to defeat the Supreme Court while remaining strictly within the law.

If and when the federal government finally takes steps to enforce the end of segregation, Mississippi proposes to dissolve its public schools. It would then proceed to vote funds directly to children who would go to "private" segregated schools. Such "separate but equal" facilities would be in accordance with that interpretation of the Constitution which the Supreme Court ruling of last May superseded after more than fifty years.

It would be a mistake to suppose that Mississippi is unconcerned with the need for satisfactory education for both races. Although the state ranks 48th in the nation in *per capita* income, it is 27th in the proportion of total personal incomes spent on public schooling. There is every indication, moreover, that Mississippi will take seriously its pledge to make educational facilities for whites and Negroes

equal in the hope that this will induce Negro British Petro- in segregation.

Before the Supreme Court took its decision on May 17th—"Black Monday" as it is known to many Mississippians—the State Legislature had already equalised salaries for white and coloured teachers. Assurances have been given that the Legislature, when it meets, will raise an additional \$18 million a year in state taxes and vote a \$60 million bond issue to finance a new system of parallel education. The present steps are, in fact, part of a long development by which Mississippi has sought to improve its school system and lessen the gap between facilities for whites and Negroes. In 1940, Mississippi spent on the education of a Negro child only 17 per cent of the amount given to the schooling of a white child. By 1952, the proportion had risen to 30 per cent, and in that year the capital outlays for each Negro pupil totalled \$32.23 as compared with \$25.48 for a white schoolchild. Nevertheless, the gap remains enormous: current expenditures per white pupil in 1952 amounted to \$117.43 whereas only \$35.27 were spent on each coloured student. Owing to its relative poverty, Mississippi has been able up to now to afford only a small part of the investment in education that has characterised the southern states since 1940.

★

The whole business is thus a calculated gamble that integration of the schools can be postponed for years. But not all Mississippians accept the theory behind the new amendments. The Friends of Segregated Public Schools believe that, through the use of the state's police powers and an artificial replanning of school districts, desegregation can be avoided without dissolving the school system. They also point out that in many areas the money which the state allocates for Negro education is likely to be diverted to the white schools. The National Association for the Advancement of Coloured People, on the other hand, continues its crusade for a complete end to segregation and can argue that both time and the courts are inevitably on its side.

There are, furthermore, threats of extremist violence if desegregation were to be enforced. In 53 of Mississippi's 82 counties, "citizens' councils" of "white males" have been set up with a view to exercising all "legal" pressures, including boycott, to prevent the Negroes from claiming what Washington has granted them. The coloured leaders in the state held a mass meeting in September to rally their forces. They urged Negroes to use all their political rights, to demand immediate admission to white colleges and to let their white neighbours know that economic pressures would ruin both groups in the community. At the same time, however, they voted to remain patient until the Supreme Court indicated how its decision was to be enforced.

The segregation fight can be understood only against the background of economic and social revolution that is taking place in predominantly agricultural Mississippi. The state is making enormous efforts to pull itself up by its bootstraps by balancing agriculture with industry, and farming is rapidly turning to science and mechanisation. Other factors of supreme importance have been the general movement of both races from rural areas to the cities and a net gain in the 1940s in the white population of the state of 7.4 per cent while the Negro population was decreasing by 8.2 per cent. Younger white citizens of

are not so concerned as are their parents about the loss to southern traditions. This is shown by the unanimous vote of 70 college students and 52 out of 55 high school pupils against the amendment at a youth congress which met in Jackson on December 4th.

Governor White has declared that Mississippi does not propose to defy the Supreme Court, but that there exists "universal resolution not to abide by such an unreasonable decision if lawful means could be found to avoid it." All except the die-hards agree that the Court will quickly strike down any pseudo-private school system and rule that the whole Mississippi project is unconstitutional. But the future also holds a definite danger of extra-legal action and even the possibility that the whites will be goaded and stampeded into such a frenzied state of mind that they will accept abolition of the schools altogether rather than integrate them. In the last analysis, however, calm observers believe that the elimination of segregation is today as inevitable as was the overthrow of slavery a hundred years ago.

Sugaring the Farmer's Pill

LAST month Mr Benson, the Secretary of Agriculture, removed the last of the restrictions which laid down what farmers might, and might not, grow next year on land on which they are forbidden to plant wheat and cotton. He was rewarded with the condemnation of the American Farm Bureau Federation, meeting in New York, which normally backs him up loyally. The members of this organisation are mostly large commercial farmers, and they fear that Mr Benson's change of heart will merely mean that the chronic over-production, which the controls on the basic crops are designed to prevent, will reappear in other commodities. The justification for these fears was admitted by Mr Benson himself, when he announced severe reductions in next season's price supports for the non-basic grain crops—oats, rye, barley and sorghums—in order that more of them might be fed to livestock instead of into the government's storage bins. For this autumn surpluses of these crops, and therefore the cost of price supporting operations, have been mounting sharply because large quantities of feed grains have been grown on land already diverted from wheat and cotton.

Mr Benson's argument, however, is that if farmers will do without high and rigid price supports, they can be given greater freedom in other ways. The successive relaxations of the unprecedented restrictions imposed on next season's plantings earlier this year have evidently been intended to sugar the pill of the lower price supports which the last Congress authorised for next year. Perhaps also Mr Benson hopes to reduce the pressure on the next Congress for a return to the old unsatisfactory system, something which the Democrats have rather unwisely pledged themselves to bring about.

The first skirmish may break out if southern Senators try to get an increase in next year's cotton acreage. Cotton farmers have just accepted the lowest allotment in history, 15 per cent below this year's plantings. These were already substantially less than last year, but output per acre was so heavy that no inroads were made on the government-held

surplus. Altogether, the Commodity Credit Corporation owns or has made loans on more than 7 million bales of cotton, over half a year's supply, and its total investment in price supporting operations for all commodities is now about \$7 billion, an increase of \$2½ billion during the year. So far the efforts to dispose of these surpluses abroad have not been very effective and Mr Benson may surely be excused for giving serious consideration once again to the possibility of selling farm products to countries behind the iron curtain.

Atomic Packages

New York.

THE Atomic Energy Commission has awarded to the American Locomotive Company a contract to design and build the prototype of a small "packaged" nuclear power plant that can be transported by air. It will be financed jointly by the Army and the AEC, and will cost slightly over \$2 million for a power output of 2,000 kilowatts. The reactor will be of conventional design, using highly enriched uranium as a fuel, and moderated and cooled by ordinary water under pressure. This type, although it is expected to be less economic than other more advanced types under development, was selected because it can be built with existing technology. The American Locomotive Company's "packaged" reactor is expected to take only three years to build.

This experimental plant is designed primarily to provide power for military bases in isolated areas, the radar communications centres above the Arctic circle for example. It is essential, therefore, that all the components be sufficiently small and light to be transported by air, and that the plant be capable of operating for several years—the Army is reported to have asked for five—without refuelling. The main advantage in the use of atomic plants on these remote bases is the elimination of the high cost of shipping bulky conventional fuels. The supplying of Arctic bases by sea is limited to the short ice-free period each year, and oil for some bases costs as much as \$42 a barrel, because of the high cost of flying it in.

But, although for military purposes atomic packaged power plants may justify their cost, they are still uneconomic for commercial uses. The need is for simpler and safer reactors that are more dependable and easier to operate. Even so, American manufacturers are already looking for a lucrative future export market for packaged reactors. But given the present state of nuclear technology, the regions where such an atomic reactor—or any other atomic power plant—could compete with diesel-fuelled power plants appear to be few in number. Only, it is estimated, in places where diesel fuel costs more than 25 cents a gallon and where the demand for electricity ensures a high load factor, could a nuclear power plant be competitive; even then its capital costs should not exceed \$500 a kilowatt. The results of the Army's programme and of the American Locomotive Company's initiative will, nevertheless, be awaited with keen interest, as providing the first empirical evidence for these and other cost comparisons and therefore guidance towards the future commercial possibilities of atomic energy.

Oft touched by human hand

IN DAYS GONE BY, when disease could sweep unchecked through the land, foodstuffs were passed from hand to hand, exposed both to the elements and to passing dogs and flies. Now those 'good old days' are gone. Thanks to modern packaging and the use of brand names, our food is protected to a degree unknown to our ancestors.

Vital indeed is the part that packaging has

to play in the nation's economy. That is why the demand for "Thames Board" and "Fiberite" Cases is increasing. That is why Thames Board Mills are thinking ahead, planning new ways of increasing production. Already they produce over half the cardboard made in Britain. The new £9,000,000 extensions at Warrington, part of which is already in operation, confirm Thames Board Mills' leadership in this vital industry.

THAMES BOARD MILLS LIMITED

THE LARGEST MANUFACTURERS of BOARD & PACKING CASES in BRITAIN

Purfleet, Essex and Warrington, Lancs

"THAMES BOARD" for cartons, boxes, bookbinding, etc. • "FIBERITE" Packing Cases in solid and corrugated fibreboard.

The World Overseas

Cairo's Pavement Politics

FROM OUR CAIRO CORRESPONDENT

DINNER table conversations in Cairo have gained in variety what they have lost in passion since the Anglo-Egyptian Agreement was signed. Formerly one discussed the relations between the two countries with the maximum of repetition and a wealth of detail which left little time for the great wide world of interests which lay beyond. One might say that the Agreement was washed to its haven on a sea of coffee. Now a window is opened on the Mediterranean; one thinks more widely; there is even time to talk of a book.

It is equally evident that Lieut.-Col. Gamal Abdel Nasser and his colleagues of the Revolutionary Council have had time to think of other things. They have thought and acted with the energy of young men freed of a heavy burden: capturing Moslem Brothers, creating courts to try them, inflicting rough justice with revolutionary speed and, eschewing that caution which was expected of them, sweeping President Neguib into the limbo of Madame Nahas's confiscated villa.

One might judge the state of government in the various Arab states by the reactions of their countries to the destruction of the Brotherhood organisation in Cairo. In Lebanon the *rédacteurs en chef* wrote *articles de fond*; in Syria, where the government is weak, Parliament debated the event, and demonstrators in the streets shouted "Down with Nasser"; in Jordan the newspapers kept quiet and some murmurings gave way to a dejected demonstration; some Iraqis sent a few telegrams. In Cairo no one was foolhardy enough to raise a voice in criticism.

There may be some Brotherhood terrorists in Egypt hatching in hiding a fanatical plot against the Egyptian leaders, but the security authorities believe they have smashed the organisation of the Brotherhood. Colonel Nasser does not believe that it is possible to kill the Brotherhood idea, the concept of aggressive Islam which appeals to the young, the ambitious and the simple; but he does think he has destroyed the Brethren as a political force in the country. Already the trials have lost their interest.

The Council of Revolution has reached the point to which it has marched with reluctant inevitability ever since it came to power. The country has been swept clean of all organised opposition, and of the dispute with Britain which was the red meat of nationalism. Criticism of the regime is still widespread, but as time passes it is more and more dissipated in private opinions lacking the corporate strength of parties or movements. One hears less and less of the Wafd, almost nothing at all of the Saadists, Liberals and other minority parties. One finds even a sneaking respect for the power to

stay in power and for the courage which went to smashing the Brotherhood.

No one would pretend that this is enough, least of all Nasser, who seems to see the mind of Egypt as a sump emptying of the dregs of overworked political thought in readiness for refilling. The negativeness of opposition to Britain needs replacement with positive thinking on Egypt's world position, and the *élan* of the Brotherhood must be swept into new activities. The reorientation of domestic and foreign policy must be geared to the development of popular thinking along new lines.

The effort is being made. The Finance Minister gives regular information on the economic position which, by comparison with some Ministry statements, is surprising in its accuracy. Wing Commander Abdel Latif el-Boghdady, the Minister of Municipal and Rural Affairs, is making propaganda out of street works by announcing target dates and tearing towards them with feverish impatience. Stubbed toes and balked motorists are constant witnesses to his claim that what is promised is done. In the dirt roads of the delta the same method applies. He digs not one but many trenches all at once so that no one can fail to notice he is laying the water pipes that have been promised by every government for a decade.

These small examples are in themselves unimportant to the future of Egypt and are not intended to stand for the achievements of the regime. Nor do they compensate for its manifest shortcomings, such as Labour Laws which have been modified but not corrected. They merely describe the attempts of the regime to touch the mind of a people unused to active government and by nature ill-disposed to authority. The press and radio are used as all dictatorships use them, to damn enemies and laud friends, often to the utter boredom of the Egyptians but sometimes, as in the case of the broadcasts of the main Moslem Brotherhood trials, with effect on the home front, if with detriment elsewhere.

The importance of the roads-and-pavements approach possibly lies more in the minds of those in authority who pursue it. The desire to demonstrate to the Egyptian people that Egypt is "a place where things get done" is neither ambitious nor novel, but here it is at least unusual. It could indicate to a mistrustful people that "the government," which they have for centuries regarded as their enemy, can in fact be benevolent and a friend. The success of the policy will depend on the stamina of those who direct it, but for the moment there is evidence of the intention to give the people something for their money. The roads of Cairo are being paved with the regime's good intentions.

The Marathon in Paris

FROM OUR SPECIAL CORRESPONDENT

TO anybody who for the last ten days and nights watched the succession of speakers—critical or resigned—climbing the rostrum in the *Palais Bourbon*, who witnessed surprises, *volte-faces* and bargains in the lobbies, it was clear that it was with iron in its heart—*la mort dans l'âme*, said one deputy—that the Assembly finally accepted German rearmament; the debate showed that French mistrust of its eastern neighbour is undiminished. A negative vote on this issue would probably represent more faithfully the mood of the deputies, but, with the exception of the Communists, most were torn between their fear of Germany and their fear of wrecking the Atlantic alliance. This dilemma gave to the marathon debate a sense of drama, despite its moments of bathos and the procedural squabbles bordering on the farcical.

Nothing foreshadowed such tension and excitement. When the debate opened last week, on Monday evening, it began on a note of anti-climax after the bitter exchanges over Indo-China. Orators coming from all sides of the semi-circular hall, except its extreme left, were clearly pulling their punches. The crusaders had no cross. The "Europeans" (Christian Democrats, Conservatives or Radicals still hankering after the supranational clauses of EDC) feared that too violent an attack would destroy the Atlantic edifice. The Gaullist and Socialist opponents of German rearmament were too faithful to M. Mendès-France to question his intentions and had to tone down their outbursts. One had the impression of a repeat performance in which the roles had been reversed and the actors found it difficult to read their lines.

A Tactical Blunder

When M. Mendès-France said that the London-Paris agreements arouse no enthusiasm in France he was indulging in understatement. With the exception of the prime minister, few deputies came forward to defend, let alone to extol them. Most speakers were critical. In the early stages of the debate it was the Socialist, M. Jules Moch, drawing a picture of the horrors of the atomic age, and the Gaullist, M. Jacques Soustelle, pleading for further negotiations with Russia before rearming Germany, who were greeted with the most widespread applause. But nobody doubted that the Paris agreements would be ratified although very reluctantly. Ministers, deputies, and experts on lobby arithmetic differed only on the likely margin.

M. Mendès-France himself was bursting with confidence and energy. Sitting on the central front bench, morning, afternoon and until the early hours of the next morning, he would take notes, jump up to correct an impression or rectify a statement and whenever needed make a speech of his own. His line was obvious; he warned "Europeans" that a second French veto would prove fatal to the western alliance; to partisans of prior talks with Russia he argued that France must be respected in the Atlantic partnership if it was to play its part as a peace-maker. But for once M. Mendès-France seemed carried away by the magic of his own rhetoric. He thought that everything was in the bag, and probably in order to end the debate before Christmas

THE ECONOMIST, JANUARY 1, 1955

he decided to get the agreements ratified with British Petro confidence; (if a question of confidence is put, the vote must have at least twenty-four hours for "reflection").

This was a big tactical blunder. Without a question of confidence the deputies had a perfect opportunity to express their opposition to German rearmament unperturbed by the consequences. The government would stay in power and the breach in the alliance could be mended by a second vote. The Assembly seized this unique chance and early on Friday morning a second French veto on German rearmament was recorded. Article 1 of the new agreements (covering the modifications of the Brussels Treaty and Germany's entry into the new Western Union) was rejected by 280 votes to 259.

Bewilderment could be read on the exhausted faces of victors and vanquished alike. Something had gone wrong with the traditional *dosage* of votes. Most of the 180 non-Communist deputies who had voted against had apparently expected that their individual action would not tilt the balance too far. M. Mendès-France, shaken but still determined, set out to repair the damage. The Saar agreement was rapidly ratified, but once bitten the French premier was not going to run a second risk, and articles 2 and 3 (Germany's entry into Nato, and the additional protocols) were made into issues of confidence. At breakfast time on Christmas Eve, exhausted and bewildered deputies were leaving the Palais Bourbon. They had little time for sleep and festivities: two days to feel the pulse of the electorate, to ponder over "miracles" and miscalculations, and over the awkwardness of being too clever.

Bookmaker's Paradise

On Boxing Day they were back in the crowded semi-circle. Communist delegations and police contingents swarmed outside the barriers. The atmosphere was tense. Party groups argued and bargained. How many ballots could be switched? At the tribune speakers asked anxiously: will a veto mean French isolation? Yes, answered M. Mendès-France in an eloquent speech, which for the first time gave the impression of a desperate search for votes. For the Gaullists' benefit he emphasised that most "supranational" features have been eliminated from the new agreements; for the Christian Democrats and others who mourned the lost EDC he underlined the remnants of "supranationality" and the chances of "building Europe" yet. Once again it was a late night session.

By now interest had once again shifted to the lobbies, already transformed into a bookmaker's paradise. The government was at the mercy of its Christian Democrat and conservative opponents. At midnight it was known that a sufficient number had changed their mind or rather their vote. By 289 votes to 251 Germany's admission into Nato was approved. But could the deputies, by the strangest of paradoxes, admit Germany into Nato and then refuse its rearmament within the Western European Union? This, however, would be reckoning without French procedure. In a new *coup de théâtre*, the Foreign Affairs Commission refused by a single vote a second reading of article 1. In the ensuing pandemonium the government announced its intention of having a vote of confidence on all the articles on Wednesday. Before the initiated had time to discover whether this included the

THE ECONOMIST, JANUARY 1, 1955

crucial article 1, M. Mendès-France proposed, amid Communist uproar and general laughter, that it was resurrected as a separate bill.

The stage was thus set for the final act, and it seems that after years of shifting and delay France has finally resigned itself to German rearmament. Now that the debate is over can all this reluctance be explained by the antics and irresponsibility of the deputies? Is it a case of wisdom after years of folly? A deeper explanation must be sought in the mistrust of Germany, in the bitter memories not so much of the two previous wars as of scarcely ten years ago when soldiers in field grey used to parade on the Place de la Concorde just across the bridge from the Chamber. One need spend only a short time in France to realise how many people still have their eyes fixed on the "blue line of the Vosges" and hanker after an eastern counterbalance to the German threat. Last Friday's irresponsible vote cannot be ignored. The deputies will continue to erect obstacles to German rearmament and press for conversations with the East.

Above all, this marathon was a one-man show. Without the skill and prestige of M. Mendès-France the result might well have been different. But the new leader is not certain of staying long at the helm. During the debate he antagonised many of his friends without winning over any of his opponents. Should complications arise in the upper chamber or over the application of the agreements, the indefatigable M. Mendès-France may no longer be there to come to the rescue. Is it really the end of a chapter?

Hatoyama in Power

IT is seldom that eight years elapse between a politician's appointment as prime minister of his country's government and his actual entry into office. This, however, is what has happened to Mr Hatoyama, who heads Japan's new cabinet after the fall of his enemy, the "Adenauer of Japan," Mr Yoshida. Mr Hatoyama came to the fore in the days after Japan's surrender in 1945, when all Japanese political leaders who had held high public office during the Pacific war were excluded from public life.

Before the war Mr Hatoyama had been a political figure of the second rank; he had, however, qualified for advancement under the new régime of General MacArthur by having withdrawn from active politics after Pearl Harbour and thus dissociated himself from the policies of the war-makers. He was now permitted to form a new political party, which took the name of Liberal, and as a result of a general election he found himself at the head of a parliamentary majority with a clear title to form a government—the old system of nominating a non-party statesman as premier having been abolished. But just as he was about to take office, Supreme Allied headquarters suddenly discovered that Mr Hatoyama had once written articles praising Hitler and Mussolini and showing enthusiasm for fascism; he was at once purged and excluded from public life. This was hard for him to bear, but he appears to have consoled himself with the belief that Mr Yoshida, the ex-diplomat who took over from him the leadership of the Liberal party, was willing to restore it to him if ever he should be de-purged.

When, however, that time came, with the ending of the occupation, Mr Yoshida denied that he had ever given any such undertaking. There was certainly nothing in writing, and a gentleman's agreement is liable to break down if the gentlemen cannot agree on what has been agreed. The result was that Hatoyama and Yoshida became bitter enemies, and the former did his best to capture the party leadership from his rival, but was unsuccessful because Mr Yoshida was by this time well dug in and was considered to be the man who stood highest in the favour of the United States—a qualification regarded as essential in view of Japan's dependence on American economic aid.

The mood of Japan was, nevertheless, gradually changing, and the American favour which had been a political asset to Mr Yoshida was more and more transformed into a liability. As Japanese nationalist sentiment revived there was an increasing unwillingness to accept a permanent inferiority of national status as a result of the defeat of 1945. That the restoration of sovereignty to Japan by the San Francisco peace treaty had still left it a negligible factor in the eyes of the world was forcibly brought home to the Japanese people during the attempts to reach a political settlement in Korea after the end of the Korean war; almost every nation could apparently claim some voice in settling Korean affairs, but Japan's interests were ignored.

Stopgap Government

There was growing resentment in Japan at a policy which acquiesced in the maintenance of American bases on Japanese soil and conformed to the requirements of American political strategy in Asia, but could not obtain for Japan any position of international prestige or influence. This current of feeling by degrees destroyed the foundations of Mr Yoshida's political power, which had already been weakened by corruption scandals involving his party; he was denounced as an American stooge and his journey to Europe and America as a national humiliation. Had he returned with some spectacular diplomatic or economic gain for Japan, he might have triumphed over his enemies. As it was, he had very little to show for his trip, and he was attacked on all sides as soon as he returned.

He was overthrown by a combination of factions which have struck bargains for a stopgap government pending a new general election. Mr Hatoyama, with a group of his followers had broken away from the Liberal party and joined up with the Progressive party founded by Mr Shigemitsu after his release from prison as a war criminal. Like Yoshida, Shigemitsu had entered politics from diplomacy, but without the latter's unblotted copybook as far as the western powers were concerned; this was formerly to his disadvantage, but in the present temper of the Japanese people to have been convicted as a war criminal is an even greater political asset than to have been merely purged as undesirable.

Mr Shigemitsu has probably a better grasp of world affairs than anyone else in Japanese politics today, not excluding the late prime minister himself, and though his ambition no doubt extends ultimately to the premiership, his main purpose has been to become again foreign minister so that he can reshape Japan's foreign policy. Thus, even though he could bring more parliamentary votes than Mr Hatoyama to a coalition, he was ready to yield the premiership to the latter, and on this basis the two groups amal-

gated to form a new Democratic party. But with 120 seats in the Diet they still could not challenge the Liberals except by a bargain with the Socialists. As Mr Shigemitsu is a strong advocate of Japanese rearmament, which is bitterly opposed by the Socialists, Socialist support was not easily obtained, but it was finally won with a promise of a general election before the end of March.

In spite of the fact that Mr Hatoyama has at last attained his heart's desire by becoming prime minister, he has done so not as leader of the Liberals, but as nominal leader of a *bloc* in which Mr Shigemitsu is really the key figure. Mr Hatoyama is in any case in poor health—he had a stroke some time ago—and it is doubtful whether he can stand the pace for long. Moreover, he cannot stay in power for longer than three months on the basis of the present agreement with the Socialists; after the elections, especially if the Socialists make substantial gains—as they expect to do—he will have to decide whether to make a fresh agreement with them involving large political concessions or to seek a reconciliation with the Yoshida Liberals.

The Democrats, like the Liberals, are in fact a party of the Right, and it is almost inconceivable that they can work in a real coalition with the Socialists against the Liberals. But, if the Democrats and the Liberals are to come together, the bitterness of the Yoshida-Hatoyama personal feud makes it likely that the Liberals will be more ready to come to terms with Shigemitsu than with Hatoyama. Much depends, however, on whether Mr Shigemitsu at the Foreign Ministry can make the world take note that the period of Japan's international eclipse is over.

Communist Chances in Germany

THE speeches and resolutions against the Paris agreements which have come from the German Socialist leader, Herr Ollenhauer, and the west German trade unions are being praised by Herr Ulbricht and his colleagues. They add, however, that words are not enough. The Social Democrats must take extra-parliamentary action and the unions must call a general strike to overthrow the Bonn regime. To support this call for deeds, a barrage of appeals and threats is being organised by innumerable Communist-led organisations and factory groups in the Soviet Zone.

A similar effort was made by the Communists to prevent ratification of the European Defence Community, and it is no more likely to succeed in bringing about a *Putsch* against Dr Adenauer now than it did in 1952. Neither the Social-Democratic Party nor the Trade Union Federation intend to leave the democratic path for the jungle of political strikes. The Socialist leaders will fight to prevent the Paris treaties from being ratified, but they will not obstruct implementation. And the trade union chiefs will, it is hoped, join in keeping the new army free from old-school militarists and neo-Nazis. They know their followers, who want stability above all. The German people fear anything that would mean a change in their present steady climb to prosperity. This is one of the main reasons why they object to rearmament, but equally the reason why they would not stage a

revolution to prevent it. According to one *British Petro-* about 50 per cent of the young men are indifferent and a question of an army, about 25 per cent are positively in favour of having a new *Wehrmacht*, while the same proportion is actively opposed.

Though a *Putsch* need not be feared, there will probably be serious trouble from the active opponents of rearmament, aided by the agitators from Herr Ulbricht's Germany. The Communists are working under cover from inside the socialist and trade union ranks; and, following current Moscow orders, they collaborate with neo-Nazis in rousing nationalist resentment against America, France and Britain. The ground is unwittingly fertilised for them by the popular illustrated press, which keeps anti-western feeling alive among its vast circle of readers.

The greatest cause for concern is not the attitude of the German public, but of their political leaders. Among all the parties, there are nowadays politicians who think that neutrality and not-quite free elections might be tolerated for the sake of reunification. The dangerous idea is spreading that an all-German parliament could safely "digest" the fifty to one hundred Communist members who might be elected from the Soviet Zone if the Communist party apparatus there were left initially intact. If this tendency continues, Dr Adenauer and the other western statesmen will have a hard task in seeing that these do not become German democracy's famous last words.

Switzerland's Success Story

FEW countries in the world can point to a better record of economic progress with stability since the war than can Switzerland. In the first half of 1954, according to the recent review of the OEEC,* economic conditions there continued to develop favourably. But, in spite of the successful record, the Federal government still looks askance at possible adverse economic trends in the future; two new laws which only recently passed the Federal parliament, are designed to give the government additional powers to maintain economic stability.

Nearly every sector of the economy has participated in the recent advance. Only the watchmaking industry has experienced a setback. Here sales to export markets were down by 8 per cent in the first half of 1954 compared with the same period last year. This is largely the result of a decline in American imports, which account for a third of total Swiss watch exports. This fall came before the 50 per cent tariff increase sanctioned by President Eisenhower last July; consequently the outlook in this industry is anything but rosy. Elsewhere in the industrial sector, however, good headway is being made; the index of industrial production is up by 4 points compared with 1953. In agriculture, where output was stationary in the previous year, production has again started to rise.

Switzerland's foreign trade accounts during 1954 wear a more familiar look than last year, when, exceptionally, it had a large surplus on visible trade. But, in spite of the trade deficit, receipts from tourists and overseas investments

* Economic Conditions in Switzerland: OEEC, December, 1954.

to offset this and produce a current balance payments surplus.

But Switzerland's prosperity is often embarrassing. This is particularly true in the case of its capital markets, which, because of the persistent payments surplus and the high level of internal saving is in an extremely liquid state. Interest rates have been driven down to below 2½ per cent on long-term public loans, though recently the pressure has slightly eased. Switzerland has been able to find new investment opportunities in South Africa, Sweden, Italy and France, as well as subscribing 50 million francs to a further International Bank loan issue. Nevertheless, last summer the head of the Federal finance department found it necessary to make an urgent appeal to everyone concerned to do their utmost to prevent a further fall in the rate of interest.

The future outlook is clouded only by the watch tariff decision, which is bitterly resented in Switzerland. But even this is not likely to affect the OEEC's description of the country's economic position as "highly satisfactory."

Israel and German Reparations

FROM A CORRESPONDENT IN TEL AVIV

DELIVERIES of goods under the reparations agreement which Western Germany signed with Israel in September, 1952, caused Germany's share of Israel's imports to rise from only 2 per cent in the first eight months of 1953 to 16.8 per cent in the corresponding months of 1954 and are paying for two-thirds of its fuel needs; but there seem to be some misgivings inside Israel over the extent to which this windfall is being allowed to disappear into consumer goods. Admittedly, the deliveries have caused the wheel of life to spin more normally and much more regularly since they began last winter, and this release from eternal crisis offers some psychological advantage from eternal crisis offers some psychological advantage. Thanks to steadier arrivals of both oil and raw materials, plants have been enabled to work without interruption, and consumers have been spared the familiar fraying of nerves caused by gaps in supply. But, without counting oil, the proportion of reparations goods that has been appearing into current consumption has been as high as 40 per cent; including oil, the figure is 55 per cent. It is now proposed to decrease it and to increase the proportion of goods productive of employment. There are, as usual, some powerful voices raised in favour of cushioning the country against the sharp drop in living standards that must ensue if and when help from America falls off.

Expenditure of reparations from Germany on development projects and other capital equipment was, theoretically, always the intention. It was the basis of planning when the Israeli purchasing mission was set up in Bonn in May, 1953, and when the *Shilumin* company—the name is the Hebrew word for reparations—was formed in Tel Aviv in order to canalise the orders for reparation goods. But in practice the line has proved difficult to stick to; if living standards were to be tolerable, part of the goods had to be diverted to current consumption; for more than a year, controversy has raged as to what the proportion ought to be.

There has been controversy, too, about allocating the pro-

portion spent on capital goods; planners have differed and even quarrelled on the issue. Shortly before the treaty was signed in 1952, the government charged a foreign expert, Dr Trone, with the job of drawing up a long-range development plan to be financed out of reparations. His scheme, based on receipt of the whole \$800 million that is due to be paid over the next ten to twelve years, concentrated all on the development of irrigation, communications and electric power supply—that is, on creating the conditions for agricultural and industrial expansion. But the Trone plan was shelved, and at the same time the amount to be spent on long-range plans was scaled down by almost half. In its place the team that manages *Shilumin* drew up another scheme, placing greater emphasis on the establishment of industrial plant; but this scheme, too, has never had official blessing and comes in for constant revision in the light of experience. The decision as to what is to be ordered from Germany rests with a committee of ministers from the economic departments; they seem to have stuck to pre-arranged plans chiefly in the field of communications in general, and the railways in particular.

Up to a point, there is a limit to what is ordered, set by the terms of the agreement with Germany. DM53 million per year are earmarked for metals and metal products, 90 million for steel, machinery, cars, ships, electrical equipment, optical and precision instruments, and 70 million for products of the chemical industry, building materials and raw materials for agriculture. DM30 million are reserved for administrative purposes, insurance and freight; for the purchase of oil, Germany puts blocked sterling at Israel's disposal; other three-cornered arrangements have enabled the Israelis to buy wheat from Turkey, rubber from Malaya and hides from Latin America.

Concentration of orders in the hands of a committee of ministers has given fresh impetus to the old controversy as to whether or no the government (this time in the guise of *Shilumin*) is discriminating against private enterprise. General Zionist ministers have argued that this is so, only to be countered by Mapai colleagues who have produced some impressive figures to support their case. Inevitably, the big development schemes will be executed either by the state or else by semi-public corporations—that is, will be greatly influenced by the *Histadruth* or Federation of Labour; private enterprise cannot afford the outlay and risks entailed in projects of such size. It follows that *Shilumin* is bound to increase the influence of the government and Labour sectors, since only these can venture on the projects in which it is bound chiefly to engage. It should be noted that the \$25 million of reparations goods allocated for equipment of private industry were only slowly taken up.

Psychologically, all has gone smoothly. The aversion to using goods from Germany, expressed when the news first broke, has had to be swallowed. So far, also, there has been no heartburning or disturbance over arrival of goods in German vessels, for advantage has not yet been taken by the Germans of the clauses in the reparations agreement that reserve them the right to carry the goods to Israel, and to send experts to instal machinery when required. Israeli shipping has so far managed all the freight, but the volume of goods scheduled for delivery is rising. German bottoms will eventually be needed to carry the heavy machinery that is on order and probably, also, German experts will be needed to set it up. Necessity, along with Bonn's newly acquired sovereign status, is about to force Israel into a revised relationship with Western Germany.

The growth of an Idea

For many years Barclays Bank has been building up a structure unique in world banking, a structure based upon two distinct principles. The private banks which combined to form Barclays have provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the day-to-day control of affairs; while, ranged around the English bank, there has been developed a group of associated companies which provide in Scotland, in France, in the Mediterranean, in Africa, in Canada, and in the West Indies, a banking service comparable to that of the parent company. The Englishman doing business overseas may well find invaluable this direct representation in many countries; it is of course supplemented by a network of correspondent banks throughout the world.

The system of decentralisation through Local Head Offices is not confined to this country. Branch managers can deal with practically any banking question you put to them; but if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Leicester or Lagos, rather than to a remote Head Office in London.

THE ECONOMY AT FULL STRETCH

Last year THE ECONOMIST replaced its Commercial History and Review of the preceding year, which has been published since 1863, by a new feature consisting of a retrospect of the main economic events of the old year and an assessment of the economic outlook for the year ahead. This change was made because the proliferation of such documents as the Government's Economic Survey has made a mere record of events superfluous. The following four articles constitute the second forward-looking survey in the new series.

Guesses at the Balance Sheet

THE old year, which opened under the shadow of a question mark, has gone out with Britain's prosperity still increasing, and the economy at full stretch. There can be no doubt about the reasons for that increase in prosperity. The first—and most important—economic feature of 1954 was that America did not slump. The alarming decline in American industrial production from 110 per cent of the 1952 average in June, 1953, to 102 at the end of that year quivered on down to an index figure of 99 in March. Since then it has risen to 104 for November. In this survey a year ago it was possible to say that the whole of the recession up to that time had been due to a lower rate of stock building, but necessary to record "the apprehension—it cannot yet be called a forecast"—that there might soon be a confidence reaction on fixed investment and consumption as well. Within three months that apprehension was very nearly dead; by its first issue in April an article in *The Economist* could be called "Recession Recedes?"

The check to the recession once stocks had come down to a minimum convenient working level was not due to any deliberately Keynesian policies on the part of President Eisenhower's administration; indeed, it is legitimate to criticise the administration for being content with an economy in which production in 1954 remained consistently below the level of 1953, while Soviet production still raced ahead. But the fact remains that under the business men's government confidence held up. This was good for General Motors, and for the rest of the free world as well.

The second really heartening feature of 1954 was the increase in British industrial production. It was opined in this review a year ago that "it seems most unlikely that industrial production can be stimulated into another increase of 4½ or 5 per cent in 1954; there is no longer any slack of short-time working to be taken up." That

opinion proved quite wrong. In the first ten months of the year industrial production was some 6 per cent higher than in the same period of 1953; only about 2 per cent of this was due to more intensive employment, so that output per man hour—no doubt aided by a smoother flow of raw materials—seems to have risen more hearteningly than in any year since the war. By October the increase in production compared with a year before had narrowed to 3 per cent: while the terms of trade, which were some ½ per cent better in 1954 as a whole than in 1953 as a whole, have now turned traitor to the extent of some 2 per cent compared with the beginning of the year. Nevertheless, the improvements in production and the terms of trade in 1954 as a whole—together with an increase in dividend receipts from abroad—may prove to have given the British people some £600 million more of real resources than they had enjoyed in any year before.

How does this £600 million-odd of new real resources appear to have been used? Rather more than £300 million was probably absorbed by an increase in consumption. This was not the effect of any tax concessions, for the budget in April wisely gave nothing

away. But, thanks partly to the seven shilling standard for wage increases set up after the threat of a Christmas railway strike, money wages and salaries seem likely to have risen by as much as £600 million in the year; as this is equal to the total rise in real resources, and as dividends and profits also rose, prices inevitably increased; the rise was of the order of 4 per cent. The consumer was also helped by a relaxation of hire-purchase restrictions, while the final wind-up of rationing in July left rented housing and the dollar import trade as the only major fields in which consumers' demand is still distorted by controls.

It is more difficult to apportion expenditure on the other £250 to £300 million of new resources that seem to have

NEW SUPPLY AND DEMAND, 1954

(Estimate of Possible Changes in Britain's Balance Sheet between 1953 and 1954, in £ million at 1954 prices)

Increase in production ..	550	Increase in consumption.	300
Improvement in terms of trade	Negligible	Improvement in export balance	100
Increase in dividend receipts, from abroad ...	50	Increase in defence expenditure and house building	100
Increase in resources available	600	Increase in other fixed investment	100-150
		Change in rate of stock building	Small
		Increased use of resources	600

Note.—These are very rough estimates of possible orders of magnitude, and are based on the very incomplete statistical material so far available. They are set down here merely as an indication of likely recent trends.

become available. Britain's external surplus in the first half of 1954 was some £150 million better than the bare balance achieved in the first half of 1953; but, as the surplus achieved in the second half of the year was almost certainly smaller than the £107 million achieved in the second half of 1953, it is probable that only some £100 million of the new resources were devoted to strengthening the export balance in 1954 as a whole. Defence and housebuilding expenditure probably also absorbed an additional £100 million between them.

That would leave only a bare £100 million for the increase in fixed investment (other than in houses and defence) and in stockbuilding. Fixed investment, which was stimulated by the new investment allowance that was the major feature of the budget, almost certainly rose by more than £100 million; so that, on these assumptions, expenditure on stockbuilding may have been less than in 1953. This is not impossible; if the rate of stockbuilding was, say, £50 million lower than in 1953, that would merely mean that the total level of stocks ran up by some £150 million compared with the increase of £200 million that has been tentatively—though officially—estimated for 1953. Stock estimates are so frequently altered by the official statistics in hindsight, however, that nobody should set

much store by unofficial guesses before any of the relevant figures have come out. The most important point about the level of stocks this winter was that it proved sufficient for the country to keep going at almost full stretch through a four-week-long dock strike, which in every previous post-war year would have brought it to its knees. In many ways this was the most significant sign of economic strength in the whole period since postwar recovery became complete.

This apparent adequacy of stocks and the continuance of some balance of payments surplus provide cushions for the British economy at the beginning of the new year, and the Chancellor may be glad of them as the time for his next budget draws near. Unless he rests his policy heavily on these cushions, or unless he deliberately tries to create some slack in the economy by an increase in Bank rate in the meantime, it is extraordinarily difficult to see how he will be able to find any room for tax reliefs next April.

The key to his budget must lie in the increase in real resources that he expects the British people to earn or to gain in 1955. With employment already over-full, it would seem optimistic to expect industrial production to increase

by another 5 or 6 per cent this year; admittedly, the same caution was expressed here last year, and proved wrong. With American production and demand for raw materials on the upgrade, the terms of trade seem likely to deteriorate; admittedly, the opposite fear about American production was expressed last year, and that proved wrong, too. But, unless Mr Butler has decided that the best way to judge economic prospects is to expect the precise opposite of the present trend, the next budget must presumably be based on the assumption of a smaller increase in real resources than in 1954; even allowing for some further increase in dividend receipts from abroad—and even assuming that the threatened railway strike does not hold up production for long—the accretion of £400 million of new resources in 1955 seems a high hope.

From this smaller accretion, defence expenditure and housebuilding should not make any new demands; indeed, defence expenditure may actually fall. Stockbuilding must remain a statistical mystery, but fixed investment—on the evidence of recently announced projects—is clearly likely to rise; if the rise is less than £200 million—and there is no reason why it should be—then the incentives offered in the last budget will not have done their job. The increases already foreshadowed in certain sectors of government civil expenditure—such as roads and schools—seem likely to outweigh any new administrative economies that can be found. That would leave less than £200 million of resources for additional consumption; and the projected rise in personal incomes, both from the higher earnings that follow higher production and from that part of the increase in basic wage rates that is not reflected in higher consumer prices, would seem at least sufficient to take up such an amount. Britain is sailing into what everybody expects to be an election year with a stauncher ship and a still following wind, but with a canvas already very heavily spread.

Will Exports Keep Up?

THE favourable out-turn suggested for the year ahead depends in part upon the ability of the export trades to keep up their remarkably satisfactory showing. But a touch of inflation might force up their costs and competition from abroad is keen. Most British exports are fully competitive now—will they stay so, and will demand for them be sustained?

The answer to the last part of the question seems favourable. Sharp swings in world trade follow bouts of inflation or deflation, and neither is looming large this year. The anticipated upswing in the American economy should ripple, if gently, across the rest of the world—at once sustaining the buoyancy of industrial production in Europe, and, by stimulating American demand for raw materials, raising the purchasing power of the primary producing countries.

Increased American demand for commodities would be felt by markets that in most cases are already firm. Hence commodity prices should rise further. Higher prices of imports into the manufacturing countries, however, are unlikely to be fully reflected in their export prices, not only because of the normal time-lag, but also because competi-

tion will tend to restrain a rise. But though the terms of trade of Britain and other manufacturing countries may well deteriorate somewhat, this should not press significantly on their balance of payments. Deterioration should be partly offset by an increased demand for manufactures from the primary producers, because their terms of trade would correspondingly improve.

If that is the picture of world trade in 1955, how will Britain and the overseas sterling area fit into it? Will they do a little better, or a little worse, than in 1954? It has been a year of expansion, but not for the sterling area as a whole. In the first half of 1954 the value of world trade rose about 5 per cent above the level of the first half of 1953. World exports of manufactures rose by about 3 per cent in value and in volume by rather more, and exports of British manufactures kept pace. Exports from primary producing countries did not expand to the same extent as total world trade, and exports from the overseas

sterling area were somewhat lower than in the first half of 1953. Earnings from the colonies and most of the independent sterling countries increased, but not enough to offset the fall in the earnings of Australia, Pakistan and India.

The colonies and most independent sterling countries should fare at least as well this year as in 1954. World demand for their exports should remain buoyant; earnings from rubber, tin, copper and other metals have improved, prices of cocoa and coffee are still high, and tea prices have soared. As this area takes over two-thirds of Britain's total exports, what is good for it will be good for Britain, too.

That prospect is marred only by the fleecy cloud hovering over Australia, Britain's largest single market. That market wears a slightly less prosperous air today. Even before the sharp drop in wool prices, Australia's appetite for imports was again outrunning its ability to pay for them, and imports have once more been restricted. Speedy action has probably prevented any repetition of the severe cuts made in 1952. Wool, which pays half Australia's import bill, is now prosperous rather than booming, but past buying has given the country comfortable stocks of most imported goods, and a repetition of the buying boom is unlikely. It might be possible to trim British export prices to maintain our position in the market.

In other markets there should still be scope for expansion, particularly in Europe. Exports to the OEEC countries, which now account for over one-quarter of total British exports, rose by £2½ million a month in the first nine months of 1954 from a monthly average of £62½ million in 1953. Exports to Holland, Denmark and West Germany—a more promising market than some British manufacturers suppose—were substantially higher than before. Nor were these gains a flash in the pan. Exports to these countries and the OEEC group as a whole have risen steadily in recent years. Further steps towards liberalisation will open the door wider.

A recovery in exports to North America, Britain's next largest market after Western Europe, should be possible in 1955, and further efforts to win over to British goods some of the dollar account Latin American countries, particularly Venezuela, would be worth while. Farther south progress may have to be slow, but it need not be impossible. Though exports to Brazil in 1954 dwindled further, exports to Argentina recovered almost to the level of 1952; and exports to Uruguay were twice as high as in 1953. In some Middle East countries the opportunities are bright, as the British Trade Fair in Baghdad confirmed.

But if world trade remains high in 1955, the main exporting countries will also be jostling each other for orders. The gradual relaxation of restrictions against dollar imports is extending the field of American competition; Germany has not yet finished its "come-back" in the world markets, and Japanese competition will continue to be felt acutely by some British industries, particularly textiles. Exports of manufactures by the United States rose sharply by 8 per cent in the first half of 1954, compared with the 1953 average, a remarkably sharp turn of the tide, for American exports were falling in the second half of 1953. German exports in the first half of 1954 were

11 per cent above the 1953 average, and in the third quarter the rate of increase was still greater. Germany's exports still do not equal Britain's, but the gap is narrowing steadily, and it cannot be assumed that German rearmament will be to Britain's advantage. Four years ago Germany's

exports were one-third of Britain's; now they are two-thirds. Perhaps the surprising thing is that this appears to have been so little at the expense of British exports.

Britain should not find it unduly difficult to maintain its share of world exports. Some shift in direction may be necessary; competition may be more severe and the head of steam in the home market may make it harder to meet. But with the barometer of world trade set fair, those problems should not be formidable. Sceptics may already be tempted to conclude that the rise in British exports has spent its force. The rate of increase has certainly slowed down; did anyone expect it not to?

Between the first and fourth quarters of 1953 the volume of British exports rose by 13 per cent to 105.7 (1950=100). In the first quarter of 1954 the volume dropped back to 103.3, rose slightly to 103.7 in the second quarter, and returned to 103.3 in the third. A seasonal fall in the third quarter was to be expected, and so is a seasonal recovery in the fourth. If that recovery is not shown in the fourth quarter, that may well be the result of the dock strike rather than a sign that Britain is beginning to lose ground. And while this article has discussed Britain's visible exports, it is well to remember that a high level of world trade will also benefit Britain's invisible earnings from shipping, banking services and the like.

How Much More from Industry?

TWO years ago Mr Butler pressed his accelerator. Last year British motorists pressed theirs—in 350,000 new British cars. The economy responded. The power behind 1954's industrial boom, it is fair to say, came primarily from the home consumer with extra money to spend over and above the weekly budget—and something durable, readily available and lavishly advertised to spend it on. That splurge on consumer durables, which has of late gained new support from freer hire purchase, set the pattern of demand on British industry in 1954.

Hard consumer goods, indeed, have been the backbone of this boom. The most significant single contribution to an 8 per cent increase in manufacturing output came from the vehicle industries, and there overwhelmingly from the motor industry; within motors, from cars; and among extra cars, mostly to the home market. Later in the year, the other durables and "conventional necessities" felt the same surge of demand—furniture, television and radio, domestic equipment. Neither more humdrum household expenditure, nor on the other hand industrial equipment, expanded as much. Clothing, textiles and the food and drink industries rose in output, but less than the average of the production index. Deliveries of plant and machinery probably did too.

How much did the main factors of production contribute to the boom, and can they be counted on to support a similar rate of increase in output? Because the labour force is easily measurable, it is fashionable to separate out the rise in manpower—or, this year, womanpower—from the production increase and to attribute the residue to "increased productivity." The exercise is, of course, artificial; but improvements in the flow of materials, or in the extent and employment of industrial capacity, are certainly less easy to gauge.

Britain's working population in 1954 grew more than the experts had predicted. It rose by 175,000-200,000, of whom 120,000 were extra women, against a predicted "natural" increase of "about 55,000, mainly men"; a growing proportion of women seem to have been taking paid jobs. At the same time, the numbers unemployed and in the defence services fell by a further 75,000. Civil industry, therefore, had another quarter of a million hands to employ, all of them in manufacturing. The manufacturing industries' labour force, therefore, rose by about 3 per cent while their output rose by some 8 per cent. But by the middle of the year industry was already crying out for labour, particularly skilled men. It is hardly to be expected that the number of unemployed can drop much further; whether women will continue to upset the estimates is impossible to say. But it would perhaps be imprudent to expect that civil employ-

ment would rise in 1955 by more than 100,000. The defence services may continue to shrink. Within that total a continued shift to manufacturing is certainly possible; but if this continues at the expense of the basic industries, it might stultify itself by hampering general expansion.

Industry's advance in 1954 has required—for the economy as a whole—about 3 per cent more coal from Britain and abroad and 4-5 per cent more steel. The coal industry has been unable to fill its stint here and maintain exports without buying more from abroad. The steel industry by a 5 per cent increase in crude steel output has been broadly able to meet the increase in demand. But particular products became short early in 1954, and towards the end, with consumers attempting to build up depleted stocks, shortages have become rather more general and steel imports have once again gone up.

As an output of 19½ million ingot tons is in prospect in 1955, the British steel industry expects to meet the demands put upon it even if imports slacken from their present rate. Such an output might offer home deliveries of 4-5 per cent over 1954's—which is conventionally considered sufficient to support a rise of 5-6 per cent in industrial production. It might become harder to import some of the products that need supplementing if American demand continues to recover; but the quantities required are marginal.

If demand for coal continues to rise as fast as it has done in 1954, coal imports may become rather more than marginal—but should not be difficult to secure. Output per manshift in the industry has increased considerably in 1954, partly through the use of better equipment; but the industry is still losing miners to easier jobs elsewhere, and in 1954 has dashed its confidence of any steady increase. It is certainly not easy to hope that production of coal will rise as much as consumption this year. But there is no lack of coal to import; it would take more than a renewed boom in the United States to make the American coal industry busy. In Britain, this means coal less cheap; and a continued swing to fuel oil.

There are few significant signs of shortage among other

materials. In 1955, however, industry cannot expect the quite significant fillip to production in general that came during the last 18 months as supplies of materials to the factories became steady and uninterrupted; freer markets were the index rather than the cause of this change. That flow has remained fairly steady—except, in certain industries recently, for steel. In the same way, some advantage was gained in 1954 from the fact that plant and machinery throughout industry in general became more fully utilised; the recovery of 1952-53, though steeper, had been less even. Some of the plant commissioned during the previous two years was fully employed for the first time in 1954; and though the steady accretion of maturing industrial investment will continue in 1955 and perhaps increase, last year's total improvement may not be easy to match.

Any More for the Investor?

IF finance is the handmaid of industry—and she never ought to be the mistress—she can reasonably claim to have been a good servant all through 1954. Large sums of private savings were canalised into industry through the new issue market and through other channels, such as the building societies. Prices grew keener as the market grew stronger; the year's work included about £55 million worth of nationalised steel stocks whose sale from the government to private hands was the same in effect as the floating of a government loan. Excluding government issues the total of new capital passing through the issue market into industry during the year will turn out to have been about £325 million compared with £190 million in 1953. At the same time sterling was a steady measure of value and the first approach to loosening its shackles was made when the bullion market was restarted, and exchange control was simplified. Foreigners found London a good centre in

which to hold money and the industrialist was not jockeyed by sharply rising commodity prices into investing in bigger raw material stocks than his business needed.

Finance has also been well paid for her services. It has been far easier to make £100 on the Stock Exchange than to lose it. The investor in equities who did neither better nor worse than the *Financial Times* industrial index has added about 38½ per cent to his capital; in fixed interest securities he has gained a mere 6 per cent. After one of the biggest booms in memory these figures look modest enough. It is being argued that since equities are less than twice their prewar level and most other merchandise has risen much more steeply, equities are still cheap and the boom should go on. Perhaps it may, but not for that reason. No comparison between the rise in securities and the rise in merchandise can be worth much when the whole basis of taxation has changed, when a gross dividend is a

far smaller net sum in the pocket of the shareholder, and when the whole business of cutting the national cake is under new management.

But it is relevant that the investor who was clever could beat the indices. If he had spotted early that the abolition of controls over consumption, rising wages and a successful housing drive were all pulling in the same direction—towards a much greater demand for consumer goods—if he had also noticed that the controls on hire purchase were bursting at the seams and would have to be scrapped, he would not have found it impossible to double his money. A nice selection of hire purchase shares, multiple traders or for that matter tea shares would have served.

The recipe for a bull market is not difficult to write, though the ingredients are not always available. Take a rising trend of industrial earnings; a rise of the 1954 type when dividends are going up faster than gross profits is ideal. Add a generous measure of savings seeking investment and a good leavening of confidence. Just a trace of inflation—enough to flavour but not to dominate—will complete the mixture. It worked perfectly in 1954. Industry was recovering strongly and dividends long due for adjustment were being fixed by boards of directors—not by national policy. The great growth of the pension funds flooded the market with new life office money demanding investment. Indeed, insurance company money not only kept the supply of sound investment stocks low but provided a great deal of finance that by-passed the market finding employment in real estate, in industry by private placing, and the non-insured pension

funds probably helped to finance hire purchase. Confidence grew and the boom that at first few people trusted became the boom that must go on.

Must it continue? Several of the essential ingredients remain. Published industrial profits will continue rising for some time though there may be a tendency for the rate of growth to slacken before 1955 is over. The insurance funds will continue to provide a mass of new money seeking investment. The Prudential's £1 million a week will not vanish. But now that convertibility is not an early prospect there will not necessarily also be an inflow of foreign money into London on the scale experienced last spring. The calls on the market for money for investment will also remain heavy. Industry's fixed investment plans remain big, and the very fact that on the other side of the Atlantic industry's prosperity is growing seems to promise a firm level of commodity prices and a need to keep stocks at least at the present level. Lastly, the flavouring of inflation has recently become more noticeable. There may be a move to subdue it. But a minor move should suffice.

In slightly reduced quantities most of the ingredients of another bull market seem to be present, yet it is certain that these ingredients will not bake a cake of last year's texture.

It is confidence—the human element—that will make most of the difference. Normally the market is a sensitive indicator discounting changes in trade and profits well ahead; when investors see the trend of profits and of trade flatten they begin to demand a higher yield on their money. When an election threatens they have an added excuse either for caution or else for abandoning caution in favour of overt speculation even though the timing of the election is still anybody's guess. And confidence which hardly faltered throughout 1954 now has some distance to fall, even though there is still delightfully little speculation in the market. If political labour spoke with one voice, and that an aggressive one, it might already be right to speak of the Stock Exchange boom as a thing of the past. But with an opposition that is neither cohesive nor coherent the political risk does not loom larger as the election draws nearer. Confidence can hardly approach an election without occasional checks, but a sideways drift in markets, perhaps with a trend that is still rising, seems quite possible. It would be folly to try to look beyond the election. It would equally be folly to suppose that in 1955 the investor is going to have opportunities as many or as fruitful as in 1954. Opportunities should nevertheless still be there.

Sulphuric acid

No. 3 IN A SERIES ON RESEARCH & DEVELOPMENT

The uncertainty and dollar cost of sulphur supplies have given prominence to pyrites, anhydrite and spent oxide as raw materials for sulphuric acid. Simon-Carves are developing highly efficient pyrites-roasting techniques in conjunction with Swedish and German specialists; plants using these techniques are already in use in Britain and under construction in Australia and South Africa. They are building two huge anhydrite plants in Britain with chemical engineering know-how provided by ICI and licensed to Simon-Carves throughout the world. They are also building the first two plants in Britain to use the Kachkaroff tower process of making sulphuric acid from spent oxide, which is produced in large amounts at gasworks but has not so far been found usable alone in orthodox "contact" plants.

FOR NEW IDEAS*

ON LOW-COST ACCOUNTING

The Man from Remington Rand has a ready answer for all accounting problems. If business figurework is taking up too much time and money in your organisation, it's time you asked him to call. He'll gladly make a free analysis of your needs; prescribe the equipment to meet them; give you and your staff new ideas altogether on speed and accuracy in the accounts department.

***THIS IS REMTIMATIC** It is the modern method of manual book-keeping—based on proved mechanized-accounting principles. It cuts the manual labour of book-keeping—often by two-thirds. It is as near fool-proof as an accounts system can be. It can provide daily balances and speed your routine on payroll, ledgers, analysis, and statements. And it costs about the same as a standard typewriter. Does Remtimatic sound your kind of accounting system? Then let us show you that it is.

Send for the Man from

Remington Rand

COUPON: I would like to know more about Remtimatic. Please * arrange for your representative to call by appointment ☐ * send me free informative literature ☐ (tick course of action required)

Quebracho

Glance down the list of Britain's imports from Latin America and you will find quebracho extract. The quebracho itself is a tall hardwood tree which grows in the northern forests of Argentina, taking a full century to reach maturity. Its extract, a valuable tanning agent, is shipped to world markets from Buenos Aires, where the Bank of London and South America has long been established. You will find quebracho mentioned from time to time in the

Argentine section of the Bank's *Fortnightly Review*. This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control received from our 51 branches in South and Central America.

We shall be glad to send you a specimen copy, on application to:—

THE BUSINESS WORLD

Steel This Year

THIS time last year the British steel industry was wondering if it would be able to sell all the steel it could produce in 1954; today it thinks it could sell a good deal more than it hopes to produce in 1955. That is a normal and hardly an uncomfortable swing of circumstances for a heavy industry, which can add to its capacity only in steps, while its demand—sometimes—goes up in a smoother curve. But it is natural that the transformation should set people wondering whether steel might not become the “brake on the boom” of 1955, and whether the industry's plans to increase capacity have been sufficiently expansionist. The second question is a proper one, constantly recurring in a healthy economy; no answer to it can ever be more than provisional. But the first can be answered fairly confidently today, and should be. In 1955, at least, even on the more optimistic of guesses about production in general, the British economy is likely to get all the steel it needs.

The industry will not, of course, itself produce all of all the kinds of steel that its customers want; the difference will have to be made up from imports. But confidence about steel supplies does not need to be based upon any considerable increase in imports; the industry, indeed, expects that these need be no higher than last year's, or the equivalent of about half a million ingot tons of crude steel. In the first few months of the year the rate of imports may be higher; later, as further British capacity comes in, imports could decline. Most of these imports may have to be flat steel products. The foreign steel will be expensive by British standards; but, in these quantities, it should not be hard to buy on the world market, particularly since the American steel industry is still running at least 20 million tons below capacity. More detailed forecasting of imports, by the industry or the Iron and Steel Board,

is perhaps unnecessary. Last year, for the first time since the war, a significant proportion of imports, particularly of sheet steel, was bought and paid for by British customers direct; this marked a partial change from the previous policy of bulk purchases of steel by the industry's central buying organisation, which were then resold at lower British prices and the loss made good by levies on British steel in general. Import duty has been lifted on such products, and licences to import are being granted freely. This sensible practice should be extended.

How much steel will British consumers require to support the boom? Any answer depends not only upon guesses about production in general this year (some of which are discussed in the special section, “The Economy at Full Stretch,” beginning on page 39), but also on opinions about the amount of steel that any given increase in production might require. Here, post-war statistics are informative, but they offer no very consistent indications; moreover, their interpretation depends partly on the somewhat shaky estimates that are made of stocks in the hands of the steel industry's customers. Since 1946, there has been an increase of some 45-50 per cent in industrial production, as measured by the official index; this has included a rise of well over 60 per cent in the output of the engineering and vehicles industries. Over the same period, home deliveries of steel increased by about 40 per cent; but when these are adjusted to take account of the shifting levels of merchants' and consumers' stocks, it appears that actual consumption of steel in Britain may have risen by some 45 per cent over these nine years.

A rule of thumb sometimes used in the industry assumes that every ten per cent rise in the output of the main steel-consuming industries—engineering, vehicles, and “metal goods not elsewhere specified”—

Australia

from a business point of view

This booklet will assist anyone contemplating establishing a business in Australia whether it is a small retail business or a large manufacturing company.

Written with the authority of Australia's oldest and largest joint-stock bank, it offers those who wish to start a new enterprise in that young but growing country a short account of the framework of business organization throughout the Commonwealth of Australia. It also affords some knowledge of the problems and conditions which would be met.

If you are interested in establishing a business in Australia, obtain a free copy of this book from:

BANK OF NEW SOUTH WALES

MAIN LONDON OFFICE—29 Threadneedle St., E.C.2—D. J. M. Frazer, Manager

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

requires a rise of about 8 per cent in the actual consumption of steel. This ratio applies fairly well over any period of about five years or more since the war; it can hardly be expected to fit changes from one year to another too precisely. Last year's rise of 5.6 per cent in total industrial production certainly included a much higher rise in the output of these metal goods industries; this amounted to roughly 10 per cent during the first half of the year, and may not have been much less over the year as a whole. Home deliveries of finished steel rose by about 400,000 tons, or less than 4 per cent; but during 1953 consumers had been building up their stocks, while last year, despite considerable buying for stock during the closing months, their stocks may not have shown much net change over the whole year. Actual consumption of steel, therefore, may have risen by as much as 650,000—700,000 tons, or about 5½ per cent. Applying the rule of thumb, this should have supported a rise of about 7 per cent in output of metal goods—which may not accord too badly with what really happened.

* Estimated.

In 1955 the industry may be able to produce as much as 19½ million tons—nearly a million tons more crude steel than it did last year. All of this can go to increase home deliveries. Such an increase in output would be no more than was achieved last year, compared with 1953, with one striking difference—that last year imports were reduced by 600,000 ingot tons, while this year the whole benefit of the increase can accrue to the British consumer. Home deliveries of steel, therefore, might rise by more than 5 per cent—equivalent to 900,000 ingot tons, or about 650,000 tons of finished steel products. Unless consumers are over-anxious to increase their stocks, they can use the whole of the extra supplies—which seem likely to support comfortably any rise in output that the economy as a whole can manage.

So much for total supplies of steel; but the pressure is on particular products. The new capacity that will be coming in this year will increase output of flat steel

products, the items that are today in greatest demand, with the hire-purchase boom in sales of domestic equipment reinforcing the great expansion in demand from the motor industry. But the increases—from an uninterrupted year's output at Margam, and more steel capacity at Ebbw Vale and Shotton—are perhaps unlikely to catch up with the growth of demand for flat steel, unless the boom in hard goods should falter. Tinplate capacity at Ebbw Vale will be somewhat increased by the commissioning of a new five-stand mill during the year, but the canner's growing demand—for such pre-requisites of a high standard of living as tinned pet foods—may necessitate imports, as well as continued operation of the hand mills, for many months yet. How much demand will grow for flat steel—and how far this could be met by stepping up output at the existing strip mills—is the largest problem that confronts the steel planners as they come to review their intentions for 1957-58 and to look further into the sixties. The forecasts of demand, certainly, may brighten the prospects of eventually selling the Steel Company of Wales to the public; but the implications of a fourth strip mill are enough to sober the steel industry.

With the motor companies ready to import their own sheet steel, and the main tinplate companies prepared to import plate and sell it to their own customers at British prices, taking the loss themselves, the immediate difficulties of flat steel supplies should not be too hard to handle in 1955, though the imports will be costly. Demand today also exceeds supplies of various other products; partly, the industry thinks, because consumers are trying to rebuild up their stocks. Indeed, the one element in demand for steel today that might bring about an apparent "general shortage"—and a real maldistribution—would be a rush by consumers to do just this. There is certainly today a tendency to build up steel stocks again, after running them down earlier this year; as ever when talk of shortage begins, any customer has a natural tendency to increase his own orders. Merchants' and consumers' stocks, generally, amount to about three months' home deliveries by the industry. Any general attempt to increase them—say by little more than 10 per cent on the average—can obviously raise the current rate of ordering by as much as a third, and create a paper shortage of steel. There are some signs that this is happening today.

Here, too, freer importing should help. More and more, the responsibility for balancing his steel supplies and stocks—and paying a realistic price for doing so—should be left to the consumer. Traditions of price stability prevent the British steel industry from allowing the price mechanism to operate fully in adjusting short-term fluctuations of demand and supply, as some Continental producers would do; and there is much to be said for those traditions. But the consumer who is determined to over-insure against shortage—and who may bring about the semblance of shortage by doing so—should be made to pay the world price, at least for his extra margin of safety.

Business Notes

A Little Market Festivity

IN the share markets an upward movement starting just before Christmas and extending into the new year is a frequent occurrence. By that time tax sales and balance sheet adjustments for the year end have been made, and in the industrial market operators are buying for settlement in the new year. Such a change of tone, muted but audible, did indeed occur around the Christmas holiday that has just passed. In the gilt-edged market the slight upward turn came on the Thursday before Christmas and in a quiet market, there was a modest further advance immediately after the holiday but the rise was not held. In the industrial market (where the dealings are for the account and therefore for payment in 1955) the turn round was more noticeable. With Wall Street reaching a new peak and commodity prices rising, commodity shares helped the advance along so that the industrial index has also reached a new peak.

After such a glorious year as 1954 in the markets, there is every reason for the investor to pause, reflect and perhaps to digest. He may well decide to do no more than add a little caution to his predominant feeling of cheerfulness. But at this moment there are two other special considerations that he has to weigh. One is the threat of a railway strike. The threat of a major strike always holds markets back; often, but not always, it is a worse deterrent to investors than the strike itself, for investors always try to look beyond the present. If the present threat looks serious, the market was not disposed to take the possibility too tragically.

FINANCIAL TIMES STOCK INDICES, 1954

	Jan. 1	Oct. 29	Nov. 30	Dec. 29
Fixed interest.....	111.84	117.52	117.59	115.83
Industrial ordinary.....	131.10	180.70	177.70	182.80
Gold producers.....	89.62	95.79	93.63	95.98
Gold developers.....	95.98	132.22	128.47	134.93

The other main thought for reassessment is the extent to which the great market gains of 1954 have been curtailed in the December market set-back. Investors have not lost money over the year as a whole; in industrials they have held all their gains and markets finish the year near the peak. But those who have a substantial investment in the gilt-edged market and in other fixed interest securities have surrendered a slice of what they had hoped to gain. A rough guide to the size of that set-back on a varied investment portfolio can be obtained by applying to the accounts of the 44 insurance offices analysed in *The Economist* last July the *Financial Times* share indices. They had total assets with a book value of £3,524 million invested as to

40.8 per cent in government securities, 18.8 per cent in other fixed interest stocks, 11.9 per cent in ordinary shares and the balance outside the market. They employ expert advisers and should be expected to beat the indices, which are mere averages, but assuming they did neither better nor worse they might at the end of November have counted an appreciation of £255 million (10 per cent of the quoted section of their total assets) on the first 11 months of the year. During December they would have lost £25 million of it and their final appreciation over the year would be 9 per cent. No disaster has occurred. Indeed the market and the balance sheets may be healthier for the shake out, but investment policy may become a shade more cautious.

Record Cash for Christmas

THIS Christmas, as in the rest of 1954, more money than ever has been in use; a glance at the Bank of England's weekly returns shows the size of the movement. In 1953, for the first time since 1949, the pre-Christmas increase in the Bank of England active note circulation was actually smaller than that for the year before. But this Christmas the withdrawals of notes during the five weeks before the holiday leapt to £110.5 million—larger by over £15 million than the outflow in the comparable weeks of 1953 and 1952, just twice the outflow in 1945 and nearly four times as large as that of 1938. This year's expansion is equally striking on a proportionate basis; it reached 6.7 per cent of the active note circulation in the middle of November, compared with 6.1 per cent in 1953, 6.5 per cent in 1952 and 6 per cent in 1938. It may be noted, however, that whilst the pre-Christmas expansion was larger than in previous postwar years, it began later. The note circulation began to rise after its steady early-autumn decline only at the end of October (a week later than in recent years) and in the early weeks of November the increase was relatively small. This could possibly presage a return to the seasonal pattern of pre-war years, in which the lowest autumn point occurred around the middle or third week of November.

The accelerated rise in the circulation in 1954 was not confined to the Christmas season; it was particularly marked also in May, June and July taken together. From the low point of end January last to the Christmas peak the circulation rose by £224 million, to £1,759 million, or by £33 million more than the increase in the corresponding period of 1953. This quickening is certainly attributable in part to the movement of retail prices. In 1953 the retail price index rose by only two points on balance, whereas

from January to November, 1954, it rose by five points. Even so, there can be no doubt that the larger increase in the use of cash last year reflects also, and perhaps for the most part, a higher level of real personal consumption.

ACTIVE NOTE CIRCULATION
(£ million)

Year	Christmas Peak	Christmas expansion*	
		£ million	Per cent
1938	504.7	28.6	6.0
1945	1,379.9	55.3	4.2
1946	1,428.2	64.3	4.7
1947	1,368.4	27.9	2.1
1948	1,296.4	63.3	5.2
1949	1,321.9	62.0	4.9
1950	1,357.7	78.1	6.1
1951	1,437.9	81.2	6.0
1952	1,550.4	94.9	6.5
1953	1,640.3	94.8	6.1
1954	1,758.7	110.5	6.7

* Measured from lowest point in second half of November.

In coming weeks, as usual, the banks will be returning notes on a large scale to the Bank of England; the first reflux, amounting to £7.0 million, was indeed recorded in the week to Wednesday last. The increase of £100 million in the fiduciary issue to cover Christmas demands is also likely to be reversed in the new year. During 1954 no less than eleven changes were made in the fiduciary issue—compared with eight in 1953 and seven in 1952.

Rubber's New Peak

RUBBER has this week been reaching new peaks; at 2s. 5d. per lb for spot, it is at its highest since mid 1952. Rubber shares, long neglected, have been more slowly creaking back into activity. As to the present rise in the commodity, views are divided. It is undeniable that there is at present no surplus. Even so small an event as a ship fire in Singapore on Christmas Eve, destroying less than 2,000 tons, can be an appreciable

	Lowest of 1954	Price Dec. 22, 1954	Price Dec. 29, 1954
United Suisa Betong (£1).....	25/2	46/3	48/9
Golden Hope (£1).....	17/9	25/-	27/6
Linggi (2/-).....	2/3½	3/-	3/3
Seaford (£1).....	30/1½	42/6	43/9
Labu Cheviot (2/-).....	2/7½	3/5½	3/7½
Prang Besar (2/-).....	5/-	7/3	7/3
Sogomana (2/-).....	7/3	8/-	8/3

market factor. The doubt is how long the strong market can last. Production was lost in Malaya in December owing to the floods. The year 1954 ends with rubber in strong demand; German rearmament has still to come but without it Western Germany is a good buyer; Poland is in the market. In Britain the recent dock strike and the threatened

railway strike is giving the manufacturers reason to consider whether their supplies of raw material provide sufficient cover. In the Far East there are the usual rumours about big deals between Indonesia and China.

It seems unlikely that the present strength of the commodity can be quickly broken; the doubt is whether the strong market will last a month or two or half the year. For the next two months consumers in America will certainly need to buy substantially. What may happen after that becomes increasingly doubtful. American manufacturers have bought increased supplies of synthetic rubber for March; that may be a natural precaution to cover any possible gap in supplies if and when the factories pass over to private ownership. They may be intending to cover themselves with increased purchases of natural rubber too. But it is also possible that American consumers are already restive about the price relations between natural and synthetic rubber. Straight GRS synthetic costs 23 cents, the oil-extended type around 19 cents per lb; a comparable grade of natural rubber (No. 3 sheet and a little lower) comes in the price range 31 to 32 cents per lb. That is the kind of situation in which cries of "price gouging" begin to be heard. Certainly if natural rubber moves still higher the long-term prospect will become disconcerting. No factories have yet actually been sold to private owners; the Administration still has a free hand.

Fortunately the danger seems still to be distant; and the rubber companies can operate at a profit at a price lower than the present. That thought has guided demand for rubber shares into the type of company that has a high proportion of new high yielding stock planted in the years 1946 to 1950. Those are the companies from which sharply rising yields per acre and therefore falling costs per lb can be expected. Investment is still small but the market is short of stock and price movements are disproportionate.

American Coal for Sterling

A NEW formula for American aid has been used in the agreement announced this week under which Britain will be able to pay for some of its imports of American coal with sterling. The sterling payment will not be simply a book-keeping "counterpart" appropriation credited to one of the defence votes in the UK budget; Britain will have to supply goods in exchange, which the United States government will give away to other countries. What goods it will buy and where it will send them are as yet unspecified, but it may be assumed that they will be largely capital goods to be sent to countries in South East Asia. The arrangement can thus be linked with the Colombo Plan and the "Aid for Asia" programme, of which a great deal more is likely to be heard from the United States in the near future.

The \$2½ million provided under this agreement by the United States Government will buy some 250,000 tons of coal, which represents about two months' deliveries under the National Coal Board's current programme of purchases from America. Since the dollars are provided under the Mutual Security Act, at least half of this coal must be

carried in American ships; but the United States government will authorise further dollars to pay the American ship owners and Britain will have to pay in sterling only the going rate of transatlantic freight charges. At about £3 4s. a ton, this coal is in line with the price that the National Coal Board has been paying for American coal this winter; up to the end of last year the Board had probably brought in about half a million tons. American coal is still cheaper than most other foreign coal that Britain can buy, though the rise in freights is pushing up the landed price here. The American mines are an extremely depressed industry, with a powerful lobby pressing the American government for assistance. This week's arrangement has no doubt been influenced by that pressure. Britain should be thankful for the dollars; but in fact it seems probable that the coal would have been bought anyway, for dollars or sterling.

Coal Stocks for 1955

WITH the last fortnight's figures still to come, it appears that Britain last year used at home and exported something over five million tons more coal than it produced. About half of this extra coal came from imports; the other half, over the year, from stocks. Coal consumption inside Britain, in 1954, seems likely to have taken about 213-214 million tons—as much as the mines produced; exports, at about 13½ million tons, and bunkers, about 2½ million tons, took much more than the equivalent of open-cast output, which fell to some 10½ million tons.

How did 1954 compare with 1953 in coal? Output from the deep mines increased by about 2½ million tons, only half of what Sir Hubert Houldsworth and the union leaders had hoped; opencast fell off by about a million tons, partly no doubt through bad summer weather; in the upshot, total production will probably have risen by only about 1½ million tons, or about 0.7 per cent. Consumption had to support an industrial boom in a cold climate (over the year, about 1.5 degrees Fahrenheit colder, which may well have accounted for an extra two million tons); it rose by more than five million tons. The amount of coal sent overseas was cut by about half a million tons; imports were quadrupled.

Total coal stocks at the end of the year seem likely to have been just under 18 million tons, with 16½ million tons of this in the hands of consumers and merchants. With about 2 million tons more imported coal due to arrive this winter, that is a safe, if not an ample, level. The public utilities and industry in general have probably three to five weeks' supplies in hand, though the power station engineers have recently had to revise upwards their estimates of coal consumption this winter. The first effect of a railway strike, therefore, might fall upon mining itself. About 700,000 tons of coal a day are shifted from the pits by rail; unless this coal goes, and the 60,000 empty wagons to take the coal raised next day are delivered to the colliery sidings, the rate of output in many mines would soon have to be cut, since there are limits to the amount that can be stocked in pit yards. Whether, thereafter, it would be lack of fuel or lack of transport to bring people, raw materials and components and to take away finished goods that might eventu-

ally bring other industries to a halt is a gloomy and profitless speculation. A prolonged railway strike would fairly soon slow down all industry, and fuel consumption with it; but a short one might well hit the coal industry more than most others, and leave behind it some danger of fuel shortage this winter.

Colvilles for Sale

ALMOST certainly the first big share marketing operation of the new year will be the offer to the public of the ordinary capital of Colvilles, the Scottish steel company. Subject to a last-minute decision early next week as to the likelihood and probable effect of a railway strike, the offer will be underwritten next week and take place in the middle of this month. It will consist, as have all recent offers by the Iron and Steel Holding and Realisation Agency, of the company's ordinary shares only (about £10 million will be involved), and the prior charges will be retained for later release.

In that expectation and flanked by the new confidence that the agency's recent successes has inspired, iron and steel shares have this week been moving upwards. Colvilles offer will indeed be almost the last of the type of marketing operation in which the agency has specialised, supported by the full consortium of issuing houses and group of leading brokers. The Whitehead Iron and Steel Company will also involve another and smaller public offer, but after that public offers of steel equities will for a time at least come to an end, and the agency will devote itself to the probably easier task of selling the prior charges.

Lancashire Cotton's Orders

A JUMP in gross trading profits by over £1 million, to £4.3 million, seems large enough to persuade any company chairman to describe the result as "very satisfactory." Sir Frank Platt, the chairman of the Lancashire Cotton Corporation, does indeed use that phrase to describe the year to October 31st. But his first comment on trade was about the "difficulties" that the company experienced in some sectors of its business. There was a time when Sir Frank would have counted the existence of a free cotton market in Liverpool among those difficulties, for he was among the supporters of the Raw Cotton Commission. That time is long past, and Sir Frank is evidently happy about the corporation's present cotton buying plans. A small subsidiary has been formed to handle the company's transactions in "futures" on the Liverpool Exchange. By implication the corporation continues to use the New York market, too, for the balance sheet shows a holding of £303,000 (against £404,000) in dollars.

One of Sir Frank's principal concerns is with what he describes as the "dumping" of cheap Indian cloth in this country. Sir Frank would clearly welcome a tariff wall erected against these imports. They are indeed formidable. In the first eleven months of 1954 imports of Indian cotton

yarn and cloth amounted to £6.2 million, compared with £758,000 in the same months of 1953. These goods enter the United Kingdom free while India imposes duties of 60 per cent or more on cotton imports from the United Kingdom. It is an issue that divides the trade; Sir Frank naturally speaks as a spinner. Some other spinners and manufacturers share his view. The combines at the finishing end of the trade often welcome imports as cheap raw material and not, as Sir Frank sees them, as cut-throat competition. But all would agree that it would be fine if India could be induced to cut her tariffs. The Corporation, like the rest of the cotton textile industry, is now much more dependent on the home market, and the British home market is among India's best export markets. That dependence on trade at home makes Sir Frank loth to prophesy about 1955. But he does report that "order books are shorter, with buying on a hand to mouth basis."

Bright New Sparkle

THE price of diamonds rarely moves; the Diamond Trading Company which controls the selling of over 90 per cent of the world's diamonds has held its price nearly steady since the war, never caring whether inflation caused the prices of cut stones and second-hand diamonds to rocket or not. But a small rise of an average of 2½ per cent in gem stones was announced just before Christmas. It happens that that is only the second true price increase since the war, and that both have occurred within twelve months—even within a twelve-month period in which it seemed to leaders of the trade that the demand for diamonds had reached its peak. The other increase of about the same amount took place in January, 1954. Apart from those two genuine increases, the only other price adjustments were those made to equate the devaluation of sterling; in terms of dollars, rough gem diamonds still sell at about 5 per cent above the prewar price.

	Dec. 15	Dec. 22	Dec. 23	Yield per cent
Anglo-American Investment Trust (£1)	£9	£9 ½	£10 ½	5 17 1
"Casts" (5/-)	23/9	24/3	26/6	14 3 0
De Beers Delft. (Bearer) (5/-)	£5	£6 ½	£6 ½	7 4 2

News of the latest price increase was one cause—but only one—of the rise in diamond shares that began before Christmas and has since continued. The table illustrates the strength of the rise. It would be wrong to think of it purely as a market reaction to a small rise confined to gem stones. The diamond market as a whole, including both gems and industrial stones, has grown much firmer in the last month. It has done so at a time when big stocks are exhausted and producers have nothing but their current production to sell, and in spite of Sir Ernest Oppenheimer's forecast that sales of industrial stones would show a decline this year. Full sales figures for the year are not

yet available but the nine months' sales suggest that his forecast was in itself correct. The trade is now, however, fully expecting that the increase in the sales of gems will more than outweigh the decline in industrial sales. A good

DIAMOND SALES
(£ million)

	1953, First 9 Months	1953, Full Year	1954, First 9 Months
Gems	32.5	43.2	34.7
Industrial stones	13.0	17.8	11.3
TOTAL	45.5	61.0	46.0

increase for total diamond sales for the year as a whole seems assured. The market is also bitten with the idea that since industrial diamonds are now experiencing an improved demand, their price, too, may be increased in the coming months.

H Line for Purchase Tax

CUSTOMS and Excise have made a seasonable little gift to retailers. From today, they are partially abolishing "uplift," that irritating notional wholesale margin that manufacturers who sell direct to the shops had to add to their price in order to arrive at the value of the goods for purchase tax. The concessions were announced in the Budget, but their introduction has been postponed until now to give time for details to be worked out. Those cases where "uplift" has still to be charged present difficulties. When an order is so much bigger than the average that the manufacturer is prepared to quote a special price for it, "uplift" of about 10 per cent will still have to be added, with the laudable object of preventing goods ordered in these quantities from bearing less tax than those bought in more modest numbers. But when is an order so big that it confers a "purchasing advantage"?

Not, apparently, when it is an order from a big retailer, for many big shops stock a great variety of goods, the individual orders for which are not necessarily bigger than average. If, then, the bigness of an order cannot be related to the bigness of the shop that places it, the only recourse is to deal with each order on its merits. This is what Customs and Excise intend to do. And to prevent evasion (for example, a retailer might break down a bulk order into a number of small orders to be spread over a pre-arranged period of time) the Customs and Excise will take account of the general volume of business between the manufacturer and the retailer.

This has been done by dividing manufacturers into two categories—those who deal primarily with "ordinary" retailers and those who do business largely with bulk customers such, for example, as the chain stores. In the former case, a manufacturer charges "uplift" only when he takes an order that is so much bigger than average that he sells at a specially low price. The second class of manufacturers would always charge "uplift" except to small

British steel makes the world's news

"Avanti", "Figaro", "Der Kurier", the "Herald Tribune" — every day the world's news is put into print. And in almost every civilised country British printing presses are there to do it. British printing machinery even goes to America, the home of giant-size newspapers. This machinery is steel. Wherever you go the prefix 'British' means steel of the highest quality. New and better steels are constantly being developed, and wherever there is steel there is British steel.

OLD MARÍA sits making her lace. As stitch follows stitch she gives thanks for the electricity that lights her work. "Electricity", says María, "is *una bendición para el hombre* — for the benefit of Man."

Up at Los Peares, in the Province of Galicia, work is proceeding on a new hydro-electric power station. It is generating electricity for the growing industries in the North of Spain.

The electrical plant is being supplied by The British Thomson-Houston Co. Ltd., one of the nine famous A.E.I. companies. The equipment includes three huge generators, transformers, switchgear and control gear, much of which is already running.

A.E.I. are Associated Electrical Industries whose Companies make everything electrical from a turbine to a torch bulb.

AEI

for progress through electricity

Associated Electrical Industries are a family of companies:

The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
Birlec Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Premier Electric Heaters Ltd.
Sunvic Controls Ltd.

customers who get a less favourable price. The difficulty here is to know when the order is small enough to escape "uplift" altogether. Manufacturers in this category can hardly be expected to have sufficient experience of "ordinary" retailers to know when they were permitted to make this concession and when they were not.

Because traders are grateful for any concession, they will probably do their best to make this arrangement work, but it is becoming increasingly plain that the machinery of purchase tax is an Emmett-like relic of the wartime economy that shows no capacity for adaptation to more normal trading conditions. The "uplift" concessions are only one example of the administrative safety valves that have been fitted all over the apparatus of purchase tax at points where explosion or breakdown seemed imminent. Three committees have studied various aspects of the tax during the past three years. What now needs discussion is its whole future and the possibility of raising the same revenue by more flexible means.

Phoenix in the Builders' Yard

THE London Builders' Conference, that remarkable organisation whose activities were roundly condemned by the Monopolies Commission, appears to have made its peace with the Ministry of Works. This is not quite the outcome for which critics of the Conference had hoped. Nothing short of the disbanding of the London Conference and similar regional conferences would have satisfied them and, contrary to many expectations, the London Conference is not winding up. The Minister of Works told the House of Commons shortly before Christmas that the Conference had agreed to drop the practices that were criticised by the Monopolies Commission—which concerned mainly the co-operative adjustment of building tenders by Conference members before they were sent in to the building owner. In future, said Mr Birch, builders' names would be placed on the Government list of approved contractors only after they had given an undertaking that they would not follow the tendering practices to which objection had been taken. This gentlemen's agreement was to replace the old declaration that successful government tenderers were formerly asked—and sometimes refused—to sign when they were awarded a government contract.

It has not escaped the notice of the builders, of the Conference and of the Ministry that this new undertaking applies only to work done for the Government. What builders do when they are tendering for other work does not appear to be affected by any undertakings given to the Ministry. The conferences came into being solely to operate the tendering procedures that have been criticised, and this explains the anxiety in many quarters to see the machinery dismantled and the conferences disbanded. The Conference members include many of the country's most respected contractors, and while they do not like the conclusions of the Monopolies Commission about the Conferences' activities they are nevertheless prepared to accept them—having originally asked for the investigation. But when faced with the prospect of disbanding the Conference, they have found that it has come to perform for them many of the functions of a trade association. The

needs of the big builders cannot always be met by their official organisation, the National Federation of Building Trades' Employers, with its 17,000 members of varying size. Whether or not the Conference may on occasions perform some of its old functions when occasion permits, there seems every likelihood that it will continue in being to fulfil some of the less controversial activities that have arisen from them. Sir David Eccles, who fired the first shots against the Conference and who moved to the Ministry of Education shortly after the report of the Monopolies Commission was completed must be wondering whether this change will be another case of *plus c'est la même chose*.

Powell Duffryn Pays Out

SHAREHOLDERS of Powell Duffryn may have had a long wait for the decision of their board to pay out the company's surplus cash, but they have every reason for satisfaction with the payment now announced. Altogether this former giant of the South Wales coalfield is to distribute £11.8 million in cash, a distribution that will still leave it holding £1,650,000 in cash and short-term investments with the final instalment of its colliery compensation (including the valuable power station) still to come:

Ordinary stockholders will receive more than 20s. per £1 unit in cash—a distribution of 19s. by way of return of capital not subject to tax, and a special dividend of 2s. 6d. subject to tax, making altogether 20s. 4½d. net to the shareholder liable to the standard rate of tax.

Preference shareholders are to receive 10s. in cash by way of return of half their capital plus a cash premium of 1s. per share—a premium which is just because shares were issued for 21s., though it is no legal necessity to repay it.

Finally reserves are to be capitalised in a 9 for 1 scrip issue, so that the ordinary shareholder ends with one 10s. share for each £1 of ordinary stock he now holds. The 4½ per cent preference stockholders will also be retaining a 10s. share in respect of each £1 share now held, and their class rights are strengthened by better voting powers and by making the existing stock plus the £900,000 unissued preference capital a closed class.

For Powell Duffryn, the scheme is no swan song. Substantially less than the compensation for the nationalised assets (tentatively estimated by the chairman recently at £15½ million) is being paid out in cash. Moreover the £11.8 million that Powell Duffryn pays out is all money that is at present earning little or no return. The present earnings that cover the 8 per cent ordinary dividend with a modest margin should on the new 10s. shares justify a bigger—possibly a doubled—rate of dividend. And shorn both of its collieries and its surplus cash the company remains a great industrial group. It will still comprise the whole Stephenson Clarke group engaged in coal distribution by land and sea; the Cory Brothers section represents the group's investment in oil storage and in distribution, in shipping and merchanting; the technical consulting group headed by Powell Duffryn Technical Services is now reorganising coal mines under the United Nations contract in South Korea, and in India. There remain also the Cambrian Wagon Company, building railway wagons in South Wales, and Powell Duffryn Carbon Products supplying special chemical carbons.

Business in the Air

LAST year, air transport passed a beacon when for the first time more people flew over the oceans than sailed across them. Estimates suggest that airliner revenue has risen about 10 per cent, giving the major airlines a turnover of nearly \$2,000 million. On this, they had a profit margin—before payment of interest—of just over one per cent. These narrow margins have become an established feature of airline accountancy. Success still tends to be measured more in terms of traffic won than of profit earned and most operators can make their bid for traffic in the comfortable knowledge that a subsidy in some form or other stretches beneath them like a safety net. Profitable operations are therefore almost inevitably followed by pressure from the more ambitious operators for lower fares to attract more traffic and the tight-rope becomes more slender as the acrobats' agility increases.

WORLD AIR TRAFFIC IN 1954

Passenger Miles 000,000	Freight ton-miles 000,000	Mail ton-miles 000,000
32,000	716	217
+ 12	% change on 1953 + 3	+ 16
+ 172	% change on 1947 + 283	+ 143

Source: ICAO

The increase in traffic during 1954 was therefore partly offset by the lower fares at which it was carried. The figures in the table are taken from estimates circulated by the International Civil Aviation Organisation, and these cover a wider field than those given above for the major airlines by their own trade organisation. The big carriers did not increase their percentage of passenger or of mail traffic by quite as much as is suggested by the ICAO figures, which indicates an expansion in traffic carried by the smaller operators. The big carriers did, however, record for the second year in succession a four per cent rise in freight. The 12 airlines that fly on the North Atlantic carried between them a record total of 12,000 tons of freight. The next few years are likely to see a determined drive to build up air freighting, and in the process the British independent airlines may develop as world carriers. Airwork opens an all-freight service across the North Atlantic this spring and Aquila Airways is at present defending its application for a licence to operate a freight service by flying boat to Australia against opposition from the established carriers, who have, generally speaking, been throwing all their energies into developing passenger traffic in the belief that freight could be tackled later at their leisure.

Trade Agreement with Germany

BILATERAL negotiations can do little to expand British trade with Federal Germany, and the latest trade agreement, though it has increased the range of liberalised

goods on both sides, may not make a great difference to a trade that runs freely without special negotiations, save only on the narrow front still covered by quotas. Both countries have little left on quotas, but both guard that little jealously. On paper, Federal Germany has already liberalised 92 per cent of its imports, and the United Kingdom only 80 per cent, although the difference partly reflects OEEC's arbitrary methods of calculating the extent of liberalisation. Germany still clings to quotas on agricultural imports and Britain still clings to quotas on a number of German specialities. As British exports include little agricultural produce, it may be argued that the Germans are harder hit by British quotas than *vice versa*.

Anglo-German trade has been growing satisfactorily partly because the Germans have seized their opportunities of buying sterling area raw materials in London markets. Instead of a United Kingdom deficit, payments now roughly balance, at a much higher level than in 1953. United Kingdom exports, including re-exports, to Federal Germany in the first eleven months of 1954 were nearly £80 million, an increase of over £8 million over the same period of 1953, while imports from Germany (including west Berlin) rose by over £6 million to more than £70 million.

The German exporters are dissatisfied that imports from the United Kingdom have grown more than sales to the British; and further efforts will be made to induce the British to reduce the range of goods on quota. But, there should still be more chances for the British to expand their sales in Germany than the other way round. The German standard of living is constantly rising, taxes have been cut, and there is no reason why more of the money that is being spent should not go to British manufacturers.

Hire Purchase Insurance

SHOPKEEPERS can now insure against loss arising from default under hire purchase contracts. Finishing touches are being put by a leading insurance company to a policy that will cover three-quarters of any bad debts that result from default by customers who buy on hire purchase. The remaining twenty-five per cent will be at the risk of the trader or of the finance house that stands behind him, for it is a cardinal principle of credit insurance that the trader must be left with some incentive to avoid bad debts. The full sum at risk is never covered. This is a much more extensive cover than has previously been available under policies that covered failure to pay instalments on cars and motor cycles but only when default was due to unemployment, sickness or accident. Premium rates will vary with the underwriter's assessment of the trader's past success in avoiding defaults and with the type of goods that are offered for sale on HP terms; the proportion of the cost price at which an article can be sold second hand varies considerably within the range of HP trading, and some types of merchandise are more difficult to keep track of than others. A figure of 30s. per cent is thought to be the pivotal rate. The cost of finance will, it is claimed, normally be appreciably less when the debt is insured than the charge made by finance houses for loans without recourse to the shopkeeper if default

is not insured. It should be added that the opposite view is held by some hire purchase traders. They argue that their loss ratio is in the region of $\frac{1}{2}$ per cent and that a premium of $1\frac{1}{2}$ per cent is too high.

Hire purchase credit insurance involves risks beyond what has traditionally been considered to be insurable. It is necessary for the insurers to feel their way. They will naturally insist that the trader will include all his HP sales in his insurance and not merely those where he feels a doubt about the credit-worthiness of his customer. Policies will be renewable annually. Underwriters will therefore be able at reasonably frequent intervals to raise rates of premium to traders whose default ratio is too high, or even to decline to renew the insurance at all. But these safeguards cannot insulate insurers from a fall in prices to the level where the amount outstanding under an HP contract would considerably exceed the price at which the purchaser could buy an identical article second hand. There is also the risk of widespread short-time working or unemployment. For these reasons the immediate boost that the hire purchase boom will receive from the new facilities may be small.

New World Bank Loans

DETAILS are now available of the \$10 million loan by the International Bank for Reconstruction and Development to the Industrial Credit and Investment Corporation of India. The loan will be for 15 years at $4\frac{1}{2}$ per cent, including the statutory commission of 1 per cent that the bank charges. Amortisation will begin in 1960. It is also confirmed from Washington that the Bank took an active part in the preliminary negotiations that led to the establishment of India's Investment Corporation. In February, 1954 a mission organised by the World Bank went to India to explore the matter with Government officials. It was during that visit that the main outlines of the Corporation were agreed and a Steering Committee of five Indian business men was set up to make detailed plans. The World Bank meanwhile explored the possibility of obtaining private British and American participation in the Corporation's equity.

The World Bank has also announced this week a new loan for \$5 million to Colombia, to be repaid over seven years at $4\frac{1}{2}$ per cent, beginning in 1957. A notable feature is the participation of private interests without the Bank's guarantee. The Bank of the Manhattan Company is providing \$2 million and the First National Bank of Boston \$1 million.

Help for Yugoslavia

JUGOSLAVIA's accommodating attitude on the Trieste settlement is providing solid advantages for that country. One of them is a most lenient readjustment of the terms on which the Yugoslav debt of £17 million to Britain is to be repaid. That debt arises from credits granted to Yugoslavia in the years 1949-51. It was due for

repayment between 1954 and 1958 by annuities varying between £3 and £4 million. Before the first repayment Yugoslavia pleaded special balance of payments difficulties, occasioned by "adverse climatic factors" and by the incidence of heavy debt repayments in the next few years. Now a new agreement has been reached, and the text to be published shortly as a White Paper will show that Yugoslavia's burden has been greatly lightened. The period covered by the annuities is to be extended until 1962 and the rate of interest is to be reduced.

That is not all. According to official Yugoslav reports the United Kingdom, reversing an earlier decision, has now agreed to join in a programme for aid to Yugoslavia in which the other participants will be the United States and France. For the year ending June, 1955, the sterling grant in aid to the Yugoslav government is expected to be £2 million, while the United States government will provide \$40 million and about 850,000 tons of wheat. Taking the new assistance and the revised debt agreement together it is seen that not only is Yugoslavia's debt burden being eased, but that that country is being furnished with resources out of which to provide the first repayment.

Freights in 1954

ALTHOUGH tramp chartering activity had been slightly reduced before the Christmas holidays, business is still being done at very firm rates in the dry-cargo market, both for voyage and time charters. The Chamber of Shipping index of tramp freight rates which hardly changed at all early in 1954, from 71.9 in January (1952=100) to 80.1 in August, rose by about 10 points every month up to November when the index was 110.4. The time charter index showed rather more fluctuation, but also rose from

58.3 in January to 101.8 in November. It seems likely that the December index will again show a rise, so that the average for the year 1954 is likely to work out somewhere in the region of 85, compared with 77.5 for the whole of 1953.

All the main trades have shared in the recent rise, but the principal influence behind the movement has been renewed activity in chartering for grain and American coal,

assisted more recently by increased demand for scrap from the United States. A special feature of the present situation is the unusual number of forward fixtures, some vessels having been fixed for carrying American coal to Western Europe as far ahead as next October. Several vessels have also been fixed already for next season's grain from the St. Lawrence at rates up to 63s. 9d., compared with the 42s. 6d. that was paid for the first fixtures of the season now ended. Vessels now coming off time charter are having no difficulty in renewing employment at higher rates, and the market is displaying a firmness that it has not experienced for some time. There is certainly no "panic" chartering going on, but it seems that the underlying strength of the freight market is likely to continue for the next few months.

The tanker freight market also ended the year with a majestic flourish. Colder weather, coming rather earlier than usual, stimulated the seasonal United States coast-wise traffic and made a very sharp impact upon the market both in New York and in Europe. London spot rates are now at their highest level for two years, after sinking last summer to their lowest point since 1949. There has been appreciably more business in the time charter market, too. In the last six months over 1½ million tons dw. of tanker tonnage have come back into commission; but there is still about 2 million tons dw. laid up.

At Your Doorstep, Madam

INDUSTRIAL LIFE ASSURANCE, involving the collection of premiums at the door, has changed its name to Home Service Life Assurance. The latest report of the Industrial Assurance Commissioner* also shows that it is changing in character. The average new sum assured is growing; it was £46 7s. in 1953, compared with £43 16s. in 1952. Moreover, new business is now predominantly endowment assurance; not long ago the funeral benefit policy, under which the assured got nothing until he was dead, was the most popular contract. The whole business is also rising in status. For the first time since the 1936 report a summary is given of the actuarial valuations of the companies and societies doing industrial life business. The volume of endowment industrial business in force at the latest valuation was over six times as great for the societies concerned as in 1936, and for the companies over five times as great. Only five small collecting societies showed deficiencies—totalling £40,000—whereas in 1936 ten societies had deficiencies of £210,000. All the companies had surpluses and with one small exception each of them was

* Report of the Industrial Assurance Commissioner for the year 1953. HMSO. 3s. 6d.

Uranium in the Union

THE grade of uranium ore in South Africa is so low that it can be mined economically only in association with gold. There are now 26 scheduled uranium producers, all of them gold mines, in the Union and one copper company, Rhokana, further north in Rhodesia. The three newest comers to the list are Freddie's Consolidated, Merriespruit and Vaal Reefs. Freddie's and Merriespruit will pump their slimes by pipelines to uranium extraction plants at neighbouring mines. But Vaal Reefs is to erect its own extraction plant, capable of treating 60,000 tons a month. Rumour points to four other mines—Lorraine, Hartebeestfontein, Buffelsfontein and St. Helena—to the list.

Seven of the 26 scheduled mines are already producing uranium. They are, in historical order of coming into production, West Rand, Daggafontein, Blyvooruitzicht, West Reefs, Stilfontein, Randfontein and East Champ d'Or. Five more—Vogelstruisbult, Luipaards Vlei, Harmony, Virginia and Freddie's—should be in production in the early months of 1955.

Profits reported by the mines already in production have been mounting steadily. An odd feature about these earnings is that their yearly totals for 1953 added up to more than the aggregate of the profits the mines reported quarterly. The fact suggests that not only does the price paid for uranium oxide, which is calculated to cover production costs and capital costs (spread over 10 years) leaving a reasonable margin of profit, vary from mine to mine but also that the price is adjusted to changes in the flow of production. In the first nine months of 1954, the gross revenue earned in South Africa from the sale of uranium and thorium oxides—the latter is not a big money spinner—was £9.1 million, compared with £2.3 million in the same period of 1953. That figure is sufficiently encouraging to

suggest that the estimate of a gross revenue of £40 million in 1958 may err on the conservative side.

FLEXIBLE FLAMES

Some industries need a flame 20 feet long, others a mere pencil point of heat. Gas provides both and every gradation in between—a complete heat service for industry, clean, constant and infinitely controllable. The adaptability of gas is a virtue which can reward the user with lower production costs. However you put it to use, you pay only one bill for your gas. You do not have to

budget for storage costs or space nor, unless your needs are exceptional, for special handling equipment and the concomitant labour. If yours is one of the 4,000 industrial processes already served by gas, you may find ideas for increasing efficiency in the latest advances in gas technology; if it is not, it could become the 4,001st. Either way the Gas Industry welcomes your inquiries.

Firm Facts

Questions about your own firm's gas usage can be answered by your Area Gas Board. The free advice and help given by the Boards' Industrial Gas Engineers are backed by full resources of the Gas Industry through the Gas Council's Industrial Gas Development Committee. The first step is to have this coupon filled in and sent to your Area Gas Board or to the Gas Council, 1, Grosvenor Place, London, S.W.1.

For industrial development

everything points to

LIVERPOOL

LAND The three great Liverpool trading estates at Speke, Fazakerley and Kirkby offer manufacturers ideal conditions for industrial development.

LABOUR A great advantage of siting plants on a Liverpool industrial estate is the large labour force available, particularly of young men keen to train and skilled technicians. New housing schemes for workers, with full community amenities, are related to the requirements of developing industry.

SERVICES The estates are well equipped with public services and are adjacent to main roads. Easy access to docks, airport and railways.

FINANCE Mortgage facilities are available for the purchase of factory sites and the building of new factories.

LIVERPOOL INFORMATION
Write for illustrated brochure to the City Engineer and Surveyor, Liverpool Corporation, Dale Street, Liverpool, 2.

017-22

Drambuie originated in the Isle of Skye where it was made in accordance with the recipe presented to a Mackinnon by Prince Charlie in 1745. The secret remains in the same family to this day.

Drambuie

THE DRAMBUIE LIQUEUR CO. LTD., EDINBURGH

allocating a surplus to policy holders: in 1936 only ten out of sixteen companies were doing so.

The high rate of lapsing because premiums have been discontinued before either a surrender value or a free policy has been earned and the high expense ratio are the main criticisms of this type of assurance. Some improvement is reported under both headings. For companies the lapse ratio was 18.3 per cent, the same figure as in 1952 and comparing with 18.7 per cent in 1951. For societies the ratio was 22.1 per cent compared with 23.4 per cent in 1952 and 20.7 per cent in 1951. Highest marks go to the Pearl among the companies with a lapse ratio of only 11.2 per cent and the Liverpool Victoria among the societies with 15.0 per cent. Expenses were also declining. For companies the figure was 30.5 per cent of premium income compared with 30.8 per cent in 1952 and 30.7 per cent in 1951. For societies it was 35.2 per cent in 1953 compared with 38.9

per cent in 1952 and 36.2 per cent in 1951. Best marks on expense ratios go among the companies to the Co-operative, with 28.1 per cent, and among the societies to the Liverpool Victoria, with 33.2 per cent. The Commissioner notes that most of the big societies with sums assured of more than a quarter of a million pounds showed lower expense ratios than in 1936, whereas most of the small societies transacting less than 10 per cent of the total business have higher expense ratios than 20 years ago.

In spite of this modern look in home service assurance, it is not growing rapidly like ordinary life insurance. New industrial sums assured in 1953 were £278.8 million, compared with the 1952 figure of £267.6 million, but well below the peak of £286.8 million in 1947. The number of policies also fell to 6.0 million in 1953 compared with 6.1 million in 1952 and 8.5 million in 1947.

Company Notes

TATE AND LYLE. The directors of Tate and Lyle have provided in the full accounts almost every detail that a shareholder could wish for. The news of bigger profits, an increase in the ordinary dividend from 16 to 18 pence and a 25 per cent free scrip issue has now been supplemented by a gross trading account, showing the breakdown of sales, and a description of the sugar refining processes. All that the accounts lack is an explanatory statement from

	Year ended Sept. 26, 1953	53 weeks ended Oct. 2, 1954
Income and expenditure:—		
Export sales	30,398,690	38,846,776
Home sales and other income	70,528,559	79,641,749
Total income	100,927,249	118,488,525
Raw materials (incl. duty)	83,740,382	96,793,895
Fuel and power	1,264,760	1,562,149
Packing materials	4,261,143	4,455,472
Other refining costs	975,387	1,051,510
Overhead costs	1,609,193	3,850,904
Advertising	50,839	61,983
Wages, etc.	4,884,691	5,638,581
Total costs	96,786,395	113,414,494
Income, before tax and depreciation	4,140,854	5,074,031
Depreciation and renewals	1,045,366	1,065,138
Taxation	1,967,742	2,013,823
Reserves	470,848	1,261,172
Net dividends	656,898	733,898

the chairman. They need the support of such a statement for they are full of intriguing and significant changes.

The first that will catch the eye of any shareholder is the sudden increase in the net book value of fixed assets from £9.8 million to over £17 million. That represents a revaluation of fixed assets to present-day values; their estimated gross replacement cost is put at £33.4 million. The revaluation has been balanced by the appearance of £6½ million standing to the credit of capital reserves.

Later in the balance sheet there is an alteration which may be less permanent but is of great temporary interest. Stocks have fallen in the first year free from sugar rationing from £10.2 million to

£5.9 million, while debtors have risen from £3.7 million to £6.1 million. In the autumn of 1953 large stocks were built up just before rationing came to an end in anticipation of a sudden increase in demand. Stocks were thus abnormally high and some reduction was inevitable. The reduction may also owe something to fluctuations in raw sugar deliveries. And as it is associated with a rise in debtors it may also mean that in a year of unrationed supplies the refiners have been keeping the traders' shelves full rather than their own. Turning to the liabilities side of the balance sheet, the shareholder will notice that the company has largely, though not entirely, replaced its bank and short-term loans by commercial bills. Clearly, it has found it cheaper to finance its raw sugar commitments through the discount market.

The end of rationing has brought some important changes in Tate and Lyle's trading account as well as in its balance sheet. Derationing was followed by an expansion in sales at home and by a steep rise in overhead costs. With the end of rationing the company had to take over the distribution of sugar from the Ministry of Food. Thus distribution, selling and transport costs (which are grouped under the heading of overhead expenses) have soared. The changes that

	On Sept. 26, 1953	On Oct. 2, 1954
Balance sheet analysis:—		
Fixed assets, less depreciation	9,858,831	17,028,498
Trade investments, etc.	812,626	1,303,360
Net current assets	6,618,040	6,832,425

Debtors	3,734,753	6,120,846
Cash and T.R.C.s.	29,270	2,683,220
Short-term debts and bills payable	2,324,000	2,790,000
Capital reserve	6,518,118	6,518,118
Revenue reserves	3,569,509	4,830,681
Ordinary capital	7,000,000	7,000,000

have taken place in the 53 weeks to October 2nd cannot fail to intrigue shareholders, but it is perhaps still too early to decide that the figures now established in the accounts represent

"normal" quantities in a period of unrestricted sugar consumption.

ASSOCIATED COMMERCIAL VEHICLES. With the accounts of Associated Commercial Vehicles the directors have published a four years' comparison of accounting ratios. Some of them are shown in the accompanying table. Their value to those unfamiliar with the mysteries of a slide rule is great, even though the message that the figures bring is unwelcome. Until September 30, 1953, earnings were expanding. In the latest year there has been a sad falling off. Ordinary earnings as related to net assets have fallen from 10.0 to 5.4 per cent and maintained ordinary dividend of

	Years to Sept. 30, 1953	1954
Earnings and assets:—		
Net assets*	7,313,244	7,461,089
Profit, before tax†	1,621,116	923,326
Net ordinary earnings	730,055	406,099
Net ordinary dividends	258,328	258,328
Accounting ratios:—		
Untaxed profit to net assets	22.2	12.4
Ordinary earnings to net assets	10.0	5.4
Ordinary dividends to net assets	3.5	3.5
Ordinary dividends to ordinary capital	22.5	22.5

* Net assets, excluding goodwill, attributable to ordinary capital. † Profit before tax but after deducting minority interests and gross preference dividends.

22½ per cent is now covered by these earnings 1.6 times instead of 2.8 times. The key to these disappointing results is the decline in the group's gross trading surplus from £1,984,319 to £1,273,357.

The directors rightly give a candid explanation: the "large fall in turnover"—and hence in profits—was due first to "the large drop in sales of vehicles at home" and secondly to "the introduction of new models to meet the demand by operators for vehicles with a more economical fuel consumption." That may seem to be an admission that for a time ACV backed the wrong horse. But the company has now marketed "new medium-weight passenger and goods vehicles." These have met with great success and "the total value of unexecuted orders on hand is at a very

much higher level than that attained at the comparable date last year." Export orders are also well maintained. Shareholders will therefore expect better trading results. And their hopes will be strengthened by the knowledge that the company has now redeemed its £1½ million of unsecured loan stock. That redemption has made a hole in the group's liquid balances, but it will mean a welcome reduction in interest charges.

★

RALEIGH INDUSTRIES. It must be with joy that the chairman of Raleigh Industries, Sir Harold Bowden, tells shareholders that his forecasts of a year ago have been wrong. He then said that the cycle industry was approaching the point where the supply of cycles and accessories was catching up with demand. In fact in the year to July 31st the group had still to ration supplies to customers both at home and abroad even though the group's output again beat all previous records—as did sales and profits. Group trading profits before all charges advanced from £2.2 million to £2.8 million; similarly net profits went up from £712,622 to £1,021,589 and the directors were able to raise the ordinary dividend from 10 to 12½ per cent.

With full order books the group has decided to build two new factories at Nottingham. These will cost between £3 and £4 million, but, as in the past, the group will meet the cost from its own resources. Raleigh's cash balances are not enormous, so that the decision to invest more in bricks and mortar could have some influence on future dividend payments. But shareholders will note that deliveries, sales and profits are likely to go up again in the current year and that the group will no longer have to pay EPL, which in five months took

£95,000, or only £10,000 less than in the full year 1952-53.

★

ARTHUR GUINNESS. The full accounts of Guinness add surprisingly little to the preliminary statement, discussed in these columns on December 11th. They show that the group's trading surplus has risen from just under £5.7 million to over £6.5 million. But the latest profits include £517,000, compared with a mere £162,000, from interests unconnected with brewing. In the accounts the directors still do not explain what these interests are. That explanation will presumably have to wait upon Lord Iveagh's speech at the annual general meeting. (But can it be soft drinks?) If these non-brewing profits are excluded from the reckoning the group's profits from the sale of beer have risen from under £5.6 million to about £6 million. That increase is sharp enough to suggest that Guinness, long-established in the bottled beer trade, has not lost any of its hold on a market, which is growing steadily more competitive. The fact that the group does not—as other bottled beer breweries do—control a chain of public houses in this country may be one factor contributing to its continuing success. That success in the year to September 30th was marked by the increase in the ordinary dividend from 18 to 23 per cent.

The increase in equity payments must owe something to the improvement in liquidity. That improvement in turn owes a good deal to the reduction in the book value of stocks from £6.6 million to £5.5 million. Hence the brewery has been able to add its fixed assets—the net book value of which has risen from £16 million to £17 million—and to pay out a bigger dividend without any sign of strain.

BEFORE Christmas industrial equities were firm and after the holiday they remained in good fettle. Indeed, by the close on Wednesday the *Financial Times* ordinary share index had risen to a new peak of 182.8. On the same day on Wall Street the Dow Jones industrial index jumped to a new record height of 401.97; "rails" and "utilities" advanced to new 1954 peaks. Prices in the gilt-edged market were rather uncertain. They rallied a little just after the holiday but subsequently became irregular and declined on Thursday. In the Dominion and Colonial issues, prices were dull at first but then improved on some demand for the higher couponed stocks. German and Japanese bonds were generally firmer in the foreign market. Among overseas rails "Canpacs" improved.

The continued improvement in industrial equities was led by the store shares. Most of these were marked up after the holiday. Marks and Spencer, Woolworth and "Gussies" led the way. On Wednesday, however, some profits were taken and prices eased. Tobacco shares, notably Carreras "B," were stronger on reports of bigger cigarette sales in 1954. A quiet demand for motor and aircraft shares was concentrated largely on Ford and Rolls-Royce. In the electrical group, Siemens at one point moved out of line with AEL. Buying came from Birmingham on unconfirmed suggestions of a counter bid. Steel shares were rather better again in advance of the next steel offer.

Oil shares were firm, with British Petroleum leading yet another advance. Buying of rubber shares was stimulated by the better price for the commodity. Tea shares were firm and Bowland went up 20s. to 77s. 6d. on the news that the estate was to be sold. The feature of the mining market was the strength of copper shares, which were in demand from the Continent. Diamond shares continued to go up following the news of higher diamond prices. Little business was reported in Kaffirs and prices tended to sag on Wednesday.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figure up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year - annual figures relate to October survey. (6) Revised series based on Liverpool spot market prices, as from July 1, 1954.

Financial Statistics

EXCHEQUER RETURNS

For the week ended December 18th there was an "above-line" deficit (after allowing for Sinking Funds) of £21,696,000 compared with one of £37,001,000 in the previous week and a deficit of £57,303,000 in the corresponding period of last year—when ordinary expenditure was inflated after the sanctioning of the supplementary estimate for the Ministry of Food. Net expenditure "below-line" last week reached £24,435,000, bringing the total cumulative deficit to £571,303,000 (£778,735,000 in 1953-54).

THE MONEY MARKET

THE authorities continue to leave Lombard Street "on its own," and the market's fears of dearer money and its need to protect itself against a credit squeeze at the year-end have in consequence forced rates higher still. On Wednesday of last week one or two houses were forced to take aid at Bank rate; but no acute shortage of credit was experienced in the week covered by the Bank return. On Christmas Eve, indeed, there was a superfluity of funds, and the authorities resorted to considerable "reverse" sales of bills.

At the week's Treasury bill tender, however, the rate was raised for the fourth successive time. The market again lowered its bid by 3d. to £99 10s. 9d. per cent, with the result that the average rate of discount rose by 1s. 1d. to £1 16s. 11.56d. per cent. Total applications fell by £3.8 million to £382.4 million, and the market again secured a higher allotment (at 62 per cent against 59 per cent). After the tender commercial bill rates hardened in sympathy, with the three months bank bill quoted ¼ per cent higher at 1½ per cent. Loans into January were arranged before the holiday at 1½ per cent and on Wednesday last at 2 per cent.

Business in the gold market was quiet before the holiday, but on Wednesday the authorities made considerable sales (possibly on South African account). The Bank return shows a reflux of notes of £7.0 million.

COMPANY MEETINGS

O.K. BAZAARS (1929)

(Incorporated in the Union of South Africa)

LARGER NET PROFIT

DIRECTORS' REPORT ON PAST YEAR'S OPERATIONS

The twenty-fifth annual general meeting of OK Bazaars (1929), Limited, was held on December 31st at Johannesburg.

The following is the directors' report, which has been issued to shareholders with the accounts for the year ended June 30, 1954:

To the Shareholders,

Your directors submit herewith in respect of the year ended June 30, 1954:

- (1) The directors' annual report;
- (2) The balance sheet and profit and loss account of the company;
- (3) The consolidated balance sheet and profit and loss account of the company and its subsidiary companies.

DIRECTORS' REPORT
CAPITAL

The authorised and issued share capital of the company has not been altered since last year.

PROFIT

The net profit for the year under review after providing for all expenses and taxation was £782,261 as compared with £730,551 for the previous year. The net profit available for allocation and appropriation in the accounts of the parent company has been

dealt with as set out in the accompanying table.

DIVIDEND

Your directors recommend that on this the twenty-fifth anniversary of the formation of the public company the present and past trading results justify the payment to the holders of ordinary shares of a cash bonus of 10 per cent in addition to the usual final dividend of 30 per cent. These payments together with the interim dividend of 20 per cent paid in July last, make a total for the year of 60 per cent (including the bonus).

RESERVES

Capital reserve in the parent company's accounts has been increased to £3,500,000 by transferring £2,151,475 from general reserve and £1,141,782 from unappropriated profits. The amount of £82,258 shown in previous balance sheets as a "reserve for furniture, fittings, plant and equipment" has been transferred to the "provision account" to which reference is made in the next paragraph. Corresponding adjustments of these accounts are reflected in the group accounts. The balance sheet under review now reflects two reserves, a capital reserve and a revenue reserve, the latter being unappropriated profits at June 30, 1954.

PROVISION FOR REPLACEMENT AND RENEWAL OF FIXTURES AND FOR MODERNISATION AND MAINTENANCE OF SHOP PREMISES AND EQUIPMENT

It is proposed that in future as far as possible a uniform annual charge be made for replacements and renewals of certain equipment. With this object in view, your directors have established a "provision account," which at June 30, 1954, stood at £132,258 and includes the £82,258 mentioned above.

CONSOLIDATED ACCOUNTS

Shareholders are referred to the consolidated accounts of the company and its subsidiaries, which present a picture of the activities of the group as a whole. The group net profit, after deducting all expenses, taxation and the interests of outside shareholders, is £853,090, which compares with £834,749 for 1953. Capital and reserves total £7,961,301 at June 30, 1954; the 1953 figure was £7,666,697. Trading stocks at £4,392,377 were £162,212 less than the previous year.

OTHER INTERESTS

Raphael Bros., Limited.—This wholly owned subsidiary company earned a profit of £17,156 for the year.

Sowden and Stoddart, Limited.—The trading results of the Sowden and Stoddart shops for the year were disappointing and showed a group profit of £2,464.

CTC Bazaars (South Africa), Limited.—Your company continues to hold 54 per cent of the issued ordinary share capital of CTC Bazaars (South Africa) Limited, which company is again paying a dividend of 10 per cent, the same as last year.

Federated Shippers Limited.—During the year under review your company received a dividend of £18,000 from Federated Shippers Limited, being 15 per cent on an investment of £120,000.

Dok Products Limited.—It was a term of the franchise granted by the Pepsi-Cola Company of New York to Dok Products Limited that the controlling interest in that company should be held and retained by a private company controlled by Messrs Michael Miller, Sam Cohen and Sheldon S. Wilson. Dok Holdings (Pty.) Limited was formed for this purpose and your company was the holder of 300,000 shares of 5s. each in that company which it purchased at par. The remaining 312,000 shares in the company were held by the three persons mentioned above, and at previous annual general meetings shareholders were advised of the position. Subsequently, with the consent of the Pepsi-Cola Company, Messrs M. Miller, S. Cohen and S. S. Wilson transferred their shares in Dok Holdings (Pty.) Limited to Columbine Investment (Private) Limited, of which company they are the sole shareholders.

The only asset of Dok Holdings (Pty.) Limited consists of 612,000 ordinary shares in Dok Products Limited. The profit history

of the latter company for the four years to June 30, 1954, is as follows:

	1951	1952	1953*	1954*
Profit after tax.....	46,274	66,761	33,117	5,405
Dividends on 7 per cent preference shares.....	Nil	Nil	1,342	6,720
Balance available for holders of ordinary shares..	46,274	66,761	31,775	12,125
Dividends paid on ordinary shares:				
Amount.....	37,500	38,576	23,379	7,844
Per cent.....	12½	12½	7½	2½
Balance carried forward to unappropriated profits	8,774	28,185	8,396	19,969

* Consolidated with subsidiary company. Italics denote deficit.

Subsequent to the end of the financial year an offer was received from Columbine Investments (Private) Limited to purchase the company's shares in Dok Holdings (Pty.), Limited, on the basis of 6s. 3d. per share, which approximates to the value of the ordinary shares of Dok Products, Limited, as disclosed by the 1954 audited balance sheet. Your directors accepted the offer as they are of the opinion that the company's investment in Dok Holdings (Pty.), Limited, should be used to better advantage for the company's trading requirements. The interested directors abstained from voting on the relative board resolution.

DEVELOPMENT

Worcester (Cape).—The erection of a store at Worcester has been delayed due to the purchase of adjoining ground and a change in the building layout. New working plans are nearing completion and tenders will be called for early in the New Year. It is anticipated that the building will be ready for trading towards the end of 1955 or early in 1956.

Durban.—The rebuilding of your company's Durban store is now under way and is being constructed in sections to minimise dislocation of trading. The erection of a new, modern store on the three-quarter-acre site in Durban is a major undertaking involving a capital expenditure of approximately half a million pounds.

Springs (Transvaal).—Plans are well advanced for the erection of a new store on modern lines in Springs on a central site owned by the company to replace the one in which the company now trades. This building should be completed about December, 1955.

Pretoria.—Important additions and improvements are now being carried out to the Pretoria store in order to give the company an enlarged trading area.

Kimberley (Cape).—The company has completed plans for the erection of a modern store in Kimberley and building operations will commence in 1955. At present the company is trading in leased premises which are inadequate.

Kenilworth (Johannesburg).—A new store is in the course of construction at Kenilworth, Southern Suburbs, Johannesburg, and the company should be trading there before the end of the current financial year.

Carletonville (Western Transvaal).—A site has been purchased by the company at Carletonville, a new and fast-developing town which serves the rich Far West Rand Goldfields area. Building plans are in progress and the premises should be complete and ready for trading during the next financial year.

Modernisation of Premises.—It is the policy of your directors to modernise and keep up to date the company's stores including those held under long-term leases and during the year considerable progress was made and the relevant expenditure is shown in the balance sheet. In particular, alterations and improvements are being effected to the Johannesburg, Eloff Street store, where work was still in progress at June 30, 1954.

Port Elizabeth Property.—Your company

has recently purchased Aegis Buildings, which adjoins the present store in Port Elizabeth.

In 1950 it purchased Advertiser Buildings which is at the back of and adjoins Aegis Buildings and it is the board's intention, as soon as possible, to demolish the existing buildings and build shop premises to link up with the existing store.

ORANGE FREE STATE

Kroonstad.—The company opened a branch at Kroonstad on September 22, 1954, and trading to date has been satisfactory.

Fresta Holdings Limited.—Your company held a 25 per cent interest in Fresta Holdings Limited which was formed for the purpose of trading in the new Orange Free State Goldfields area with both the European and African population. During 1954 your company purchased the remaining 75 per cent interest and, therefore, holds all the share capital of Fresta Holdings Limited. Your board has decided to restrict the company's activities in that area to the usual OK Bazaars type of business for which it is equipped and not to operate the five stores which hitherto catered exclusively for Africans, as this is a specialised type of trading. Three of these stores have been leased on satisfactory terms, one has been closed down as the premises were demolished in terms of the original conditions of its establishment, and trading has continued in the remaining one on a temporary basis.

The main store at Welkom, which is an OK Bazaars store and is the major capital investment of Fresta, is now firmly established and has shown a marked improvement during the year under review. Steps are presently being taken to erect on sites adjacent to this store a substantial block of retail shops which will be let to outside tenants, thus ensuring that the OK Branch remains situated in the hub of the Welkom Civic Centre. At the same time, the upper floors of the new building will provide additional trading space for the branch.

Virginia.—Your company has purchased a site in Virginia, another town in the Orange Free State Goldfields area, and plans are being prepared for the erection without delay of an OK Branch.

The company is now trading in Bloemfontein, Welkom and Kroonstad, the three largest towns in the Orange Free State and its programme includes the development and extension of its operations in this wealthy gold and uranium mining area.

GENERAL

Since the close of the financial year, your company sold Stands Nos. 539 and 540, Johannesburg, being the northern half of Glencairn Buildings.

This year, as in previous years, bonuses were paid to the staff.

The directors take this opportunity of thanking the senior executives and other members of the staff for their continued enthusiastic co-operation and loyal and efficient services.

On Behalf of the Board,
M. MILLER, Chairman,
S. COHEN, Deputy Chairman,
Directors.

THE LIVERPOOL WAREHOUSING COMPANY

59TH ANNUAL MEETING

CHAIRMAN'S STATEMENT

The fifty-ninth annual general meeting of the Liverpool Warehousing Company Limited, was held in Liverpool on December 22nd. Mr W. Milligan, the chairman, had circulated to stockholders the following statement:

It is a pleasure to furnish you with your directors' report, balance sheet and profit and loss account for the year ended September 30, 1954.

You will note that the net profit for the year, after taxation and all charges, including depreciation, amounts to £231,769. From this sum we have transferred £48,044 to capital profits reserve, leaving available a sum of £183,725. After bringing into account the balance of profit and loss account brought forward from the previous year and interim dividends already paid, there remains a sum of £269,770, which has been appropriated as follows: £50,000 to rebuilding reserve, £25,000 to general reserve and £76,416 for the payment of final dividends, leaving £118,354 to be carried forward.

The total of the company's capital and reserves at September 30, 1954, amounts to £2,835,633, which compares with £2,720,945 at the end of the previous year. The total of our investments shows no material change as compared with last year, although there is a marked increase in the market value at September 30, 1954, indicative of the general rise in Stock Exchange prices.

Last year virtually marked the end of our rebuilding programme under the War Damage Act, and this year the building work executed has been paid for entirely out of our own resources. It is incumbent upon us to provide depreciation upon such expenditure, and this accounts for the increase in the item of depreciation of fixed assets in the profit and loss account. At the same time we have thought it appropriate that the amount of £52,847 previously shown as a deduction from the fixed assets, should be added to this item, which has been grouped under provisions in the balance sheet.

The year commencing October 1st has unfortunately had a bad start owing to the dock strike. This prompts me to mention that the basic business of the company is vulnerable to happenings outside our control, and for this reason your directors are anxious to promote subsidiary activities. We are of the opinion that the development of our road haulage business offers one of the best prospects. At the present time the company owns a modern fleet of 57 vehicles engaged in short- and long-distance haulage, and it is our intention to acquire additional vehicles in the near future.

Road haulage, as you will recognise, is closely allied to warehousing, and we are hopeful that the enlargement of our operations in this sphere will open up new possibilities for the utilisation of warehousing facilities.

Motor vehicles engaged in the conveyance of exports to the docks from time to time encounter serious delays. We believe that your company can be of material assistance in solving this problem by providing temporary warehouse accommodation for exports.

During the past year we have disposed of some further warehouses to neighbours of ours who require additional space for an expansion of their factory. These are being replaced by premises of the latest type in

which we are able to make extensive use of mechanical appliances for the more rapid handling of goods.

"THE SANDON" SUBSIDIARY

The results achieved by our subsidiary, The Sandon Motor and Engineering Company, Limited, show an improvement. The new garage and service station opposite the Cotton Exchange, which was mentioned last

year, is being well supported. Having regard to the inevitable expansion in the use of private and commercial motor vehicles, we have every confidence that this business will continue to develop and that it will, as time goes on, play an increasingly important part in the combined affairs of the company. We have placed to the reserves an amount approximately equivalent to the net profit after provision for taxation.

One final word: I see the Duke of Edin-

burgh recently referred to what in the Navy they called "a happy ship." I am sure that term may also be applied to the many departments of The Liverpool Warehousing Company Limited and The Sandon Motor and Engineering Company Limited, and I am sure, also, that you would not like to close the year without a very hearty vote of thanks to all employees who have contributed such good and willing work to our success.

The report and accounts were adopted.

BANK OF CEYLON

POSITION OF FINANCIAL STRENGTH

MR H. V. PERERA ON INTRODUCTION OF NEW SERVICES

The annual general meeting of the Bank of Ceylon was held on December 18th at Colombo.

The following is an extract from the statement by the chairman, Mr H. V. Perera, on the report and accounts for the year ended September 30, 1954:

As you are probably aware, Sir Ernest de Silva, who had been the chairman of the bank from its inception in 1939, resigned from the board in October this year owing to ill-health. During the long period he was chairman, the board had the benefit of his very wise guidance, which was based on his wide knowledge of men and affairs, and his remarkable ability to see an issue clearly and get to the heart of a problem quickly. I am sure you will wish to be associated with the directors in their expression of regret at his resignation, and in the hope that he will be speedily restored to health.

Consequent on the resignation of Sir Ernest de Silva the other directors did me the honour of electing me chairman. Mr H. W. Peiris, who has been on the board since the inception of the bank, was elected deputy chairman in my place. The vacancy on the board created by the resignation of Sir Ernest de Silva has been filled by the nomination of Mr Fasil A. Caffoor by the Hon the Minister of Finance. Mr Caffoor has been for many years a friend and supporter of the bank, and I have no doubt that, with his wide experience and well established reputation in business affairs, he will give his colleagues on the board every assistance in the conduct of its business. Sir Arthur Ranasinha, who was the Government director on your board for about four years till recently, has been called to the high office of Governor of the Central Bank of Ceylon. While regretting his departure from our midst, we would congratulate him on his appointment and wish him all success in his new sphere of activity. Sir Arthur Ranasinha's place on the board as Government director has been taken by Mr L. J. de S. Seneviratne by virtue of his appointment as Secretary to the Treasury, and I have no doubt that Mr Seneviratne will be of great assistance to the board.

GOVERNOR-GENERAL

July 17th will be a memorable date in Ceylon's history as it marks the first appointment of a Ceylonese as Governor-General and as such the representative of Her Majesty the Queen of Ceylon. The selection of His Excellency Sir Oliver Goonetilleke is most fitting, as no one has served his country better in the many and varied appointments he has held. His Excellency, as you know, was on the board as Government director for some time when he was holding the office of Financial Secretary under the Donoughmore Constitution. We recall with a sense of pride his association with the board during that period.

I am sure you will join us in congratulating Mr M. D. H. Jayawardene on his appointment to the high office of Minister of Finance. From the knowledge we have of what he has done in the sphere of finance during the short period he has been in office, we are confident that he will prove a worthy successor to Sir Oliver Goonetilleke, who functioned as Minister of Finance for about a year. We feel proud that Mr Jayawardene was associated with the bank as one of its staff officers, though for a very short period. Mr Jayawardene has modestly claimed that his departure from the bank was of benefit to it. We do not share this view, as we are certain that on his leaving the bank it lost an officer who would have proved an excellent executive. However, the bank's loss is the country's gain.

BANK OF CEYLON

In the last report mention was made of the fact that the bank controlled over a third of the total deposits of all commercial banks, and I am now happy to inform you that this position is still being maintained.

Cash on hand and balances with banks rose by Rs. 14 million to Rs. 66 million, and this figure bears a very satisfactory relation to total deposits, the ratio being about 19 per cent.

It will be seen that the bank's holdings of Ceylon Government securities have dropped by Rs. 13½ million. This drop, however, is more than offset by increases in Treasury bill holdings and cash reserves aggregating Rs. 19 million.

Investments are still stated at book or par value, whichever is lower, for reasons explained to you in the last report.

It may also be mentioned that redemptions or sales, which account for the drop of Rs. 13½ million on government securities, have been at par or at prices yielding on the whole a net appreciation to the bank.

Advances comprising loans, overdrafts, bills discounted and purchased, totalled Rs. 93 million—an increase of Rs. 8½ million over the corresponding figure for the previous year. Here, too, as in the case of deposits, the bank continues to control over a third of the total advances made by all commercial banks, the actual ratio being slightly higher than that for the preceding year.

You will also be happy to learn that this high level of activity in the bank's credit operations has been maintained without any deterioration in the quality of its credits.

Balance sheet total rose by Rs. 46½ million to Rs. 428½ million. Of this increase, deposits account for Rs. 15 million, and credits and other contra accounts for Rs. 28½ million. The increase in the contra item is largely due to a "recording account" of the balances of

transactions between the governments of Ceylon and China. Of the accounts which carry the bank's liability, I am happy to state that credits show a welcome addition of Rs. 5 million, and this indicates a return of improved trade which it is hoped will expand.

Gross profit has been maintained at just over last year's level and the net profit shows a small increase over last year. Your directors have pleasure in recommending payment of a final dividend of 9 per cent, making 15 per cent for the year.

It will be seen from the directors' report that a further transfer has been made from inner reserves to permanent reserve account of a sum of Rs. 1,150,000 and, with the allocation to permanent reserve of Rs. 350,000 which is recommended from this year's profits, the addition will be Rs. 1,500,000. This brings the total permanent reserve to Rs. 6 million, which exceeds the issued and paid-up capital of the bank and is only Rs. 1,500,000 less than the authorised capital. This tangible evidence of the strength of the bank will, we hope, give satisfaction to our shareholders, and they are assured that substantial inner reserves are held over and above those earmarked to meet contingencies.

SERVICES INTRODUCED DURING THE YEAR

Banks in Ceylon have been criticised in the past for not making available to the small man the current account or cheque-using facility.

The problem of providing current account facilities to all and sundry with adequate safeguards against fraud and cheating called for a practical solution. We now have a satisfactory solution in the provision of accounts called security checking accounts which are operated through cheques made available to all constituents without in any way prejudicially affecting the confidence reposed in a cheque.

To own a security checking account, the minimum initial deposit required is only Rs. 100. Cheques are available from the bank against each deposit, and each cheque can only be issued for a sum not exceeding a specified amount which the bank inserts in the cheque. Hence, a person accepting such a cheque is certain that it will not "bounce"—the funds are there in the bank.

The State could step in here and help us in our efforts to popularise the cheque-using habit by waiving the stamp duty of six cents per cheque leaf on at least the security cheques which have been specially designed to serve the small man. What the State would forgo by way of revenue on stamp duty will, in my opinion, be compensated for by an increased investment in Government securities arising from the resulting development of the banking habit and the expansion of deposits.

Medium-term loans repayable over a

maximum period of eight years are now granted for the purpose of financing development projects and house construction. Our experience so far with these specialised loans has been satisfactory, though the usual difficulties in the passing of title to immovable property exist.

MOBILE BANKING SERVICE

I must also refer to our mobile banking service. This did not come into operation during the financial year under review, but all the preliminary work was done during that period and a mobile banking unit has already been introduced to serve Wellawatte and Hultsdorp. It is hoped to extend this service to other parts of the city and also to the provinces, with the aid of more units, and such extension will, of course, depend on the results shown by the first unit already introduced.

When we meet next year I hope that we shall be in a position to announce that the multipurpose "bank on wheels" just introduced has been followed by several more.

Further progress was made during the year under review in the development of our branch system. A branch of the bank was opened in Chilaw, and all construction work in connection with our branch at Amparai was completed and the official opening of the Amparai branch took place shortly after the end of the financial year. We expect to open branches at Matara and Anuradhapura early in the new year, and in keeping with the policy of your directors more and more branches will be opened throughout the country as and when circumstances permit us to do so.

The report and accounts were adopted.

TOWN INVESTMENTS LIMITED

BOARD'S EXPANSION POLICY

The thirty-second annual general meeting of Town Investments Limited will be held on January 20th in London.

The following is an extract from the statement by the chairman, The Viscount Buckmaster:

The consolidated accounts show a further rise in the revenue of the group from £332,055 to £346,801. In spite of rising costs, we have achieved certain economies in the management of the business, and the net profit, subject to taxation, available for dividend is increased from £150,141 to £161,114. The board have every confidence in the future of the company. They believe that the increase in revenue will continue and they recommend an increase in the dividend for the year from 9½ per cent to 12½ per cent.

Your board recommend that the sum of £175,000 be transferred from unappropriated profits to capital general reserve, with a view to an issue of shares out of the capital general reserve in due course.

Only a small proportion of the properties owned by the group is within the Rent Restrictions Acts. Progress has been made on an amicable basis in negotiating agreements as to the increased cost of services, and serving the requisite notices of repairs increases under the Housing Repairs and Rents Act, 1954.

In regard to the future, your board are continuing to pursue an active policy. We have entered into substantial financial commitments for the erection of office and business premises in London and elsewhere, and the board are determined to lose no opportunity of expanding where it is prudent to do so.

THE NATIONAL BANK OF SCOTLAND

CONTINUING PROGRESS

LORD ROWALLAN'S SURVEY

The hundred and twenty-ninth annual general meeting of the Proprietors of The National Bank of Scotland Limited was held in the bank's head office on December 23rd.

In the absence of the Right Honourable Lord Rowallan, KBE, MC, TD, DL, governor of the bank, who was unable to be present by reason of indisposition, the chair was taken by the deputy governor, Lord Balfour of Burleigh, DCL, DL, who delivered an address on Lord Rowallan's behalf, from which the following are extracts:

The balance sheet and report give ample testimony to the continuing progress of the bank. Perhaps the feature that stands out with greatest prominence is the increase in the deposits from £96 million to £112,500,000, an increase of no less than £16,500,000, and although not all of this increase may be permanent, for some of it represents moneys of a temporary character, nevertheless a very considerable, indeed the greater, part is a real addition to the bank's connections.

On the other side of the balance sheet you will find that these increased funds have been fairly evenly divided between liquid resources, in the form of cash balances, and investments, each of which shows an increase of about £9 million. We continue to preserve our high ratio of immediately liquid assets which provide a backing of about thirty-six per cent for our liabilities to the public in the form of deposits and note circulation. Advances and bills discounted together closely approximate £30 million, which is only £500,000 less than in 1953, a reduction which is of no significance and is no more than a day-to-day fluctuation.

RECORD PROFITS

The profits, after meeting all expenses and making all suitable provisions, were £36,000 higher at £342,000, the largest amount yet recorded, and after setting aside £100,000 to revenue reserve, £40,000 for writing down the value of bank buildings and other property, and allocating £75,000 to the trustees for the officers' pension scheme, the directors have thought it right and proper to recommend that the sum set aside for dividend should this year be increased, the net amount so required, after deduction of tax, being £121,000 as against £107,800 for 1953.

DIVIDEND HISTORY

If I were to go back a little in the history of the bank to bring this increased dividend distribution into its proper perspective, it would be pertinent to recall that for some years up to 1909 dividends of 20 per cent were paid on the then capital stock of £1 million without any deduction of tax, or to put it in another way, the stockholders at that time received £200,000 when the balance sheet totals were less than £20 million. In 1909 income tax was deducted from the dividend for the first time, and then at the rate of only 1s. 2d. per £.

In 1913 and again in 1914 the rate of dividend was restricted to 18 per cent, but in 1915, when the impact of the First World War began to be felt, the dividend was cut to 16 per cent and has continued at that rate

ever since, although the paid-up capital was increased by £100,000 in 1919. From 1920 until 1953 the gross amount distributed to the consolidated capital stockholders was £176,000, but with income tax during part of these years as high as 10s. in the £, these stockholders had at times to be content with no more than £88,000 net.

A STRIKING CONTRAST

The contrast between the amounts that passed into the hands of the stockholders in these later years and what they obtained in the early part of the century is striking indeed. Like the Israelites of old, it could be said that they have wandered for nearly forty years in the wilderness and they are only now approaching within sight of the Promised Land. Moreover, in 1909 the paid-up capital was £1 million and the reserve fund £900,000, whereas today the issued capital stands at £1,650,000 and the reserve fund at £3,150,000, together £4,800,000.

It should be easily enough understood that this additional £2,900,000 of proprietors' funds, which—apart from £400,000 derived from the issue of the "A" stock—have been built up over these intervening years, to say nothing of the sums that have been allocated to inner reserves for contingencies, have been earning and producing revenue in which stockholders up to now received no participation.

FURTHER ADJUSTMENT OF CAPITAL

With a balance sheet containing record figures of £135 million, the time is fully ripe for a further adjustment in the bank's capital. The first step was, as you know, taken in July, 1954, following upon the intimation made in the 1953 annual report, when £150,000 was transferred from reserve fund towards reducing the uncalled liability on the consolidated capital stock, increasing the amount paid up thereon from £1,100,000 to £1,250,000.

Because of the improvement in the general financial situation, and for the purpose of bringing the bank's capital more into line with the actual resources employed, the directors have felt fully justified in arranging to take the second step. They have therefore transferred from inner reserves the sum of £700,000 which, together with the appropriation of £100,000 from out of the year's profits, has raised the reserve fund to £3,150,000.

DISCHARGE OF UNCALLED LIABILITY

On January 17, 1955, £750,000 will be withdrawn from the reserve fund and be applied to discharge the balance of the uncalled liability on the consolidated capital stock, making the amount paid up £2 million. Thereafter there will remain only the reserve liability of £3 million, which cannot be called except in the event of liquidation. It can be accepted that this transfer from the inner reserves to the published reserve still leaves the inner reserves standing at a level which, in the opinion of the directors, is ample to take care of all likely contingencies.

When these transactions are completed, the

capital paid up, partly consolidated capital stock and partly "A" stock, will amount to £2,400,000 and the reserve fund will stand at the like sum of £2,400,000.

TAXATION

Much has been said from this chair in the past on the need for reduced taxation, but regretfully I have to say that politicians of all shades seem to be much more taken up with schemes adding to expenditure which, however well-intentioned, may be somewhat different from what the country can properly afford. From certain quarters we hear the outcry against profits, but properly understood profits are the measure of the efficiency of industry. It is paradoxical but true that the Welfare State can exist only in a community where profits are large.

The report and accounts were adopted.

NETHERLANDS BANK OF SOUTH AFRICA LIMITED

INCREASED ACTIVITY

UNION'S FAVOURABLE ECONOMIC PROSPECTS

The fourth ordinary general meeting of shareholders of Netherlands Bank of South Africa Limited was held on December 21, 1954, in Pretoria, Mr J. P. Kakebeke (the chairman) presiding.

The following is an extract from his circulated statement:

The results for the financial year 1953/54 may be considered as satisfactory and the progress made by the bank as reflected by the figures submitted to you are in conformity with the generally favourable position of conditions in the Union.

POSITION OF THE BANK

The total balance sheet figures as at September 30, 1954, show an increase to £29,321,435 of which current, deposit and other accounts contributed an amount of about £2 million. The increased activity of the bank is also noticeable in the higher advances to our customers. Bills discounted remained approximately at the same level, mainly due to continued import control.

The purchase of new premises in Cape Town and further building operations in Johannesburg, Pretoria and some smaller centres resulted in increased figures for bank premises of approximately £500,000.

The ultimate profit figure is slightly higher than last year. Income from interest, commission and exchange showed an improvement which, however, was set off to a large extent by higher expenditure. A balance of pre-incorporation excess taxation reserve has been included in our profit and loss account which amount has also been included in the transfer to reserve.

As customary all additions to furniture, office equipment and stationery which were not inconsiderable this year, were written off. Adequate provision has been made for taxation, possible bad and doubtful debts, depreciation of bank premises and for the ordinary strengthening of the separately established staff pension fund which is actuarially on a sound basis.

Our London office again showed a favourable development. The gradual progress made in Southern Rhodesia gives reason for satisfaction.

Business with the Continent through our affiliates in Amsterdam and other centres continued to increase.

During the financial year new branches

were opened in Kimberley, Welkom and Umtali (Southern Rhodesia), while two daily agencies were established in Johannesburg at Siemert Row and Hillbrow. In the North-Western Transvaal we opened agencies (to our Potgietersrus branch) at Tolwe/Welgedacht, Swartwater and Marken. After the close of our financial year, agencies were opened in Malvern (to our Nugget Street branch in Johannesburg) and at the Dominion Reef Mine (to our Hartbeesfontein branch).

From the directors' report you will note that a dividend of 7½ per cent (1s. 6d. per share) can again be recommended. Moreover your directors propose to allocate from this year's profit:

(a) A special depreciation of £50,000 (unchanged) on bank buildings.

(b) A special allocation of £15,000 (last year £25,000) to the staff pension fund.

(c) An addition of £50,000 (unchanged) to reserve, which will then reach a figure of £600,000.

Summarising I may state that economic prospects for the Union and Southern Rhodesia may on the whole be considered favourable and the bank is fully prepared to take part in any further development.

The report and accounts were adopted.

BARCLAYS BANK D.C.O.

ANNUAL GENERAL MEETING

The twenty-ninth ordinary general meeting of Barclays Bank DCO was held on December 29th at 28 Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the chairman) presided.

The secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors' report to the stockholders.

With the concurrence of the stockholders present, the report and accounts and statement by the chairman, which had been previously circulated, were taken as read.

The chairman reported with regret the death of Mr O. Gordon, who had been chairman of the Rhodesian Committee (which was later reconstituted as the Rhodesian Local Board) until his retirement in September, 1951, prior to which he had been chief agent in Rhodesia. On his retirement, Mr Gordon had rendered distinguished service to the bank for forty-nine years.

RETIREMENT OF MR E. O. HOLDEN

The chairman also referred to the impending retirement on December 31st of Mr E. O. Holden who had been a member of the London Committee since July, 1945. He spoke of the many important positions Mr Holden had held in the bank since he joined the bank from Barclays Bank Limited in 1926, his last appointment being that of a general manager of the bank—an appointment he held from 1940-1945, when he retired on pension and became a member of the London committee. Mr Holden had been a director of Barclays Overseas Development Corporation since its inception in 1946, and the chairman said that he was glad to say that although Mr Holden was retiring from the London Committee, the Development Corporation would have the benefit of his experience and advice as a director for some time longer. The chairman said that when Mr Holden retired he would have completed over fifty years' service with the bank and his colleagues on the London Committee would greatly miss his wise counsel.

The chairman then mentioned that he had said in his statement that the time was now

approaching when the bank would feel justified in offering the members an opportunity to participate in the progress of Barclays Overseas Development Corporation Limited, and he was now proposing that, as a first step, the corporation should announce an issue of £1 million 4 per cent unsecured loan stock 1974/79 which had been successfully placed with institutions in the City.

NEW DIRECTORS

The chairman referred to the appointment of the two new directors—Mr P. V. Emrys-Evans and Mr G. F. Lewis—both of whom were well known and whose election would later in the meeting come forward for confirmation, and on behalf of the stockholders welcomed them at the meeting.

The chairman said that Mr P. V. Emrys-Evans was the son of Mr John Emrys-Evans, CMG, who was vice-chairman of the National Bank of South Africa from 1902 to the date of the amalgamation in 1926, when he became a member of the South African Board of this bank and was vice-chairman of that board until his death in 1931. The chairman said that it gave him particular pleasure to be able to welcome his son to the board.

OVERSEAS VISITS

He also referred to Mr G. F. Lewis, well known as a former general manager of Barclays Bank Limited, who in the short time he had been a director, had paid several visits overseas—to Rhodesia, Israel, Canada and New York.

The chairman also mentioned that Mr Barnes, the deputy chairman, had just returned from a visit to Egypt and Cyprus. The chairman said that considerable importance was attached to these visits of directors and senior staff to overseas territories as they were a means of bringing up to date knowledge of the rapidly changing conditions and trend of events in those places, and this was most helpful in shaping the policy of the bank.

FINAL DIVIDEND

The chairman then moved the adoption of the report of the directors and the statement of accounts and the payment of a final dividend of 4 per cent on £9,276,875 ordinary stock (£1,500,000, the new capital, not ranking for dividend in respect of the year ended September 30, 1954), less income tax at the standard rate of 9s. in the £.

The motion was seconded by Mr A. C. Barnes, deputy chairman, and carried.

The retiring directors, Sir Eric Gustav Machtig, GCMG, KCB, OBE; The Hon Geoffrey Cokayne Gibbs, CMG; Mr Cuthbert Fitzherbert; Mr Paul Vychan Emrys-Evans; and Mr George Frederick Lewis, were re-elected.

On the motion of Mr R. G. Thornton, seconded by Sir Frank Newson-Smith Bart, the auditors, Messrs Deloitte, Plender, Griffiths and Company, Price Waterhouse and Company, Peat, Marwick, Mitchell and Company and Cooper Brothers and Company, were reappointed.

VOTES OF THANKS

A vote of thanks to the staff, proposed by Mr A. T. Dudley, MC, a director, and seconded by Brigadier E. C. Pepper, CBE, DSO, DL, was carried unanimously and responded to by Mr B. F. Macdona, a general manager.

A vote of thanks to the chairman for presiding at the meeting was proposed by the Rt Hon Lord Rennell of Rodd, KBE, CB, and was unanimously accorded.

CENTRAL AND DISTRICT PROPERTIES LIMITED

The twentieth annual general meeting of Central and District Properties Limited was held on December 17th in London.

Mr Russell L. Tillett, FCA (the chairman), presided as said:

The increase in fixed assets, with the accompanying increase in net current liabilities, is due partly to the incorporation for the first time of the assets of the subsidiary company acquired in 1953 and their cost of acquisition, and partly to the substantial addition to "investments." This latter purchase of shares in a property company will prove an advantageous investment for the company.

The increase in the excess of current liabilities over current assets has been mitigated by the issue of £50,000 worth of ordinary shares at par to the members by way of rights.

Rental values have been well maintained, and the opportunity has been taken, where possible, to renew leases at increased rents.

There have, as you know, been certain changes in legislation affecting property owners, namely, the passing of the Housing Repairs and Rents Act, 1954, and the Landlord and Tenant Act, 1954. As regards the former, we feel that material increases in revenue can be expected. The necessary steps are well in hand to secure these benefits.

Property at Angel Hill Parade, Sutton, is about to be rebuilt as a block of shops with flats over, and the income to be derived therefrom will be a welcome addition.

Next year the company will have the benefit of a full year's income from the trade investments, with the possibility of a reduction in taxation by reason of our increased expenditure on repairs. The report was adopted.

J. BROCKHOUSE & CO.

PROBLEM OF STEEL SUPPLIES

The fifty-seventh annual general meeting of J. Brockhouse & Co., Limited, was held on December 22nd at West Bromwich.

Mr J. L. Brockhouse, MA (chairman and managing director), presided, and in the course of his speech said: The accounts reflect in part the result of the reorganisation of certain of the subsidiary companies, to which I referred last year and indeed, the result would have been very much better had we not been subjected to very keen competition in the earlier part of the year in many of our trades.

At the present moment in all our production factories, our order book is more than comfortably full but it must be remembered that this business is taken on a highly competitive basis.

Our greatest concern at the present time is the supply of steel in all its forms. Steel mills today are quoting nine to twelve months against specification. The worst feature, however, is that there is no guarantee of tonnage, even at this protracted delivery. The repercussions on the export market are very harmful and export customers are not interested whatever the price may be if protracted and uncertain deliveries have to be quoted. This question of guaranteeing steel supplies to consumers is one which must be studied by the Iron and Steel Federation. The arbitrary methods at present adopted are a great disservice to the whole of the steel consumer industries.

The report was adopted and a total dividend of 6 per cent on the ordinary stock was approved.

JOSHUA HOYLE & SONS

SUBSTANTIAL IMPROVEMENT

The annual general meeting of Joshua Hoyle & Sons Limited was held on December 29th at Bacup. The following are extracts from the speech of the chairman, Mr H. A. Enright:

I am pleased to report a substantial improvement in the group trading profit from £704,407 in 1953 to £794,378, achieved in a year of progressively keener competition.

Increasing quantities of goods are being diverted into home trade channels due to a falling off in export demand, with the result that although we are able to report a larger turnover, profit margins have narrowed.

The menace of imported foreign and Empire grey cloth does not show any signs of decreasing. It is having a most disturbing effect on the trade and is an undermining influence upon the buyers' confidence. Cotton remains at a firm and high price and, coupled with increased wages and costs, does not point to a cheapening of prices.

We are constantly considering the heavy expenditure necessary to maintain existing plant and to acquire modern and improved machinery and methods; therefore, a re-equipment reserve has been established to which £500,000 has been transferred. It is intended to make the necessary provisions for this programme from the company's earnings.

It is impossible to forecast future trends but our flexibility and efficiency will help us to take advantage of changing conditions at home and abroad.

We have now had a full year's trading since we de-centralised our organisation and we have found our new grouping a great advantage. The report was adopted.

KENDALL AND GENT LIMITED (Machine Tool Makers)

SATISFACTORY FUTURE OUTLOOK

The one hundred and eighth annual general meeting of Messrs Kendall and Gent Limited was held on December 21, 1954, at the registered offices of the company, Victoria Works, Hyde Road, Gorton, Manchester.

Mr F. C. Mosley (the chairman), who presided, said:

Ladies and gentlemen: This is our one hundred and eighth annual general meeting and I am happy to welcome you to it.

The accounts and the report of the directors have been circulated and, with your permission, I will take them as read. (Agreed.)

The last year was no exception to any preceding it in so far as there were the usual number of difficulties to be overcome, but I feel sure you will all agree that the results for the year are extremely satisfactory, and were only achieved by the very splendid efforts put forward by everyone.

As you are aware, we have enjoyed for some years a "sellers' market in overseas countries, but this no longer exists today, and, as is well known, we are meeting greater competition in those markets, but we are members of a selling organisation which is most ably represented in all overseas markets and we hope that as the world gradually settles down we shall increase our overseas business again.

During the year large machines have been completed and erected in Canada and Australia.

We have always striven to provide a works in which our people would be happy to work and we have tried at all times to provide them with all the amenities we possibly can.

ADDITIONS TO FACTORY

A further bay has been added which will have the effect of giving us more very valuable additional floor space.

All necessary repairs have been carried out; new machinery has been installed during the year; the plant is right up to date, and we have an excellent lot of skilled workmen, so that if we have to face in the future a more difficult period of trade, we feel we shall be able to hold our own.

The directors are once again pleased to record a good output from the works, and at the same time consider the balance of orders "on hand" to be satisfactory. Since the close of the year we have received some very nice orders.

The net profit for the year (including investment income and after charging management and all other expenses and directors' fees) amounts to £156,658. This sum is more than last year by £51,408. As you all know, we have been very conservative in dealing with our profits for a long number of years, and have built up very good reserves.

Turning to the balance sheet:

The net profit is £139,836, after depreciation, which is a great improvement. We are again making full provision for taxation by reserving the sum of £78,200 which is £20,200 more than last year. This year your directors have decided to recommend placing £30,000 to general reserve fund; £10,000 to dividend equalisation reserve fund.

With regard to the subsidiary company, we are glad to report another successful year.

CAPITAL RESERVES

Now we come to the capital reserves—these remain the same as last year at £70,000. The revenue reserves which stood last year at £60,000 to which we have added £30,000 making £90,000; the dividend equalisation reserve of £10,000—to which we have added a further £10,000 this year; making that fund £20,000—or a grand total of reserves of £180,000. We have also increased the "carry forward" from £47,777 to £48,788—a difference of £1,011. As you are all aware, the capital of the company was increased last year by a bonus of £30,000, so we are very glad that we have been able to pay an increased dividend on the increased capital.

From the balance sheet you will see that the current assets, £446,428, exceed current liabilities, £142,003, by £304,425. Cash in hand at bank, £81,283 more. Stocks of materials, etc., are down by £25,376. Debtors and payments in advance, £17,225 less.

As usual, the other assets—loose tools, patterns and drawings, patents and trade marks, furniture and fittings—have been entirely written off, and stand in the balance sheet at nil.

The report and accounts were adopted and the final dividend of 10 per cent and bonus of 10 per cent less income tax, making with the interim dividend of 5 per cent, a total of 15 per cent and bonus of 10 per cent for the year, less income tax, was approved. Messrs Edwin Collier and Company, our auditors, were re-elected, and the proceedings terminated.

ALLIED RETAIL TRADES (LONDON), LTD

LARGER TURNOVER

The seventh annual general meeting of this company was held on December 30th in London, Mr W. H. Martin (chairman and joint managing director) presiding.

The following is an extract from his circulated statement for the year to October 3, 1954. The trading profits from all our branches amounted to £128,591 (£124,490), and the net profit to £77,628 (£76,639). The net ordinary dividend is 15 per cent.

Newspaper and Tobacco Group.—The trade of this group has been satisfactory and branch profits have gone up from £118,547 to £125,620. Once again our increased turnover has not reaped the increased net profit to the extent we hoped, owing chiefly to increased wages, but under the conditions prevailing this year the increase is not entirely unsatisfactory.

The Bakery Group.—The bakery trade still remains in the doldrums and our problems are much the same as they were, although we have one or two schemes in mind which, should they come to fruition, might prove a satisfactory solution to our problems.

Turnover.—Our turnover for the year was £2,047,184, compared with £1,852,005 last year, thus showing an increase of £195,179, or 10.5 per cent.

The outlook of the Tobacco and Newspaper group is not unpromising, while the outlook for the bakery trade is no worse than last year. The prospect for the coming year can be viewed with some confidence.

The report and accounts were adopted.

HECHT, LEVIS & KAHN, LTD. (Merchants in Raw Rubber Developments) Commodities

DIVERSIFICATION OF ACTIVITIES

SIR WALTER FLETCHER'S SPEECH

The twenty-ninth annual general meeting of Hecht, Levis & Kahn, Ltd., was held on December 22nd in London, Sir Walter Fletcher, CBE, MP (the chairman), presiding.

In the course of his speech, the chairman said: The conditions to which I referred last year were greatly accentuated in the year now under review. This is reflected in the group trading profit of £155,437 as compared with the previous year's figure of £328,985. The practice continued in certain countries of dealing in rubber more as a counter with which to speculate in foreign exchange, particularly in those countries where the retention of a proportion of dollars is permitted, than in normal straightforward dealing. As a result, the Malayan and, above all, the London markets were left to a considerable extent to stagnate, with rubber quoted at prices which, when one considers the cost of purchase and shipping from Malaya, showed little relationship to the prices at which big buyers in America and Europe could obtain rubber from the sources which I have mentioned.

The net profit figure of £103,442 compared favourably with that of the previous year, £120,154, and the proportion of the net profit applicable to the parent company, i.e. £42,187, is considerably better than that shown for the previous year, i.e. £26,953.

Diversification of our business has continued, but we are having to pay towards our way in the technical intricacies of each and every article in which we are now dealing.

THE OUTLOOK

Since the end of the financial year under review, there has been a distinct brightening of the future. We are mounting a very difficult slope and are much encouraged by a revival in the rubber market, aided by the ability which all concerned have shown to seize the opportunity when it presented itself, and by the willingness of everyone concerned not to think backwards into the past but of new forms of work in the future.

The menace of synthetic rubber may, or may not, be less great than it appears and we may indeed have to participate even in that activity in some form or other. The world is likely to develop more on road than on rail and, in the long run, it may well be that the general demand, which would certainly rise if something like a peaceful solution of the political problems which beset us were found, would present a bright future for raw rubber as well as synthetic, but we cannot count on this and we must resolutely pursue new policies with new and young minds to help us.

The modest dividend of 15 per cent we are recommending on the ordinary stock was not entirely earned during the year but we are able to pay this ordinary dividend, plus of course the usual preference dividend, and to provide for the annual redemption of preference stock and thereby only diminish the carry forward by £2,724. This still leaves the company with total reserves of over £730,000, this after full taxation reserves have been made.

I hope that when we next meet, and I have the pleasure of facing you again, it will be possible to present better accounts and, can I say, with less care and worry besetting us.

The report was adopted.

Where we stand

To found and operate an industrial or commercial undertaking in modern society presupposes the possession of certain purposes and principles.

To put it another way: there are certain assumptions and beliefs—economic, social and moral—which underlie all industrial and commercial enterprise.

In our opinion it is of value to examine these beliefs from time to time and to state them publicly, so that everyone may know where we stand. Here we set them out—the beliefs and principles on which this Company bases its conduct of affairs with the outside world and within its own organization. There is nothing extraordinary in them. If we did not, however, believe in certain principles and act on them, obviously we should not be in business at all.

Esso Petroleum Company, Limited

WE BELIEVE that competitive private enterprise is the best and most flexible means of providing the community with the goods and services it needs. It is the most efficient system yet found of creating wealth, eliminating waste and raising standards of living. By making the most economical use of the community's resources in capital, skill and labour, it secures the maximum well-being for the community. To the consumer it guarantees goods and services of the highest quality at the lowest practical cost. For the employee it provides the best wages and conditions of work that are economically realisable. It secures the highest return on invested capital. Failure to satisfy any of the above conditions results in the private undertaking concerned being forced out of business to make way for others who can. That is the law of competition.

WE BELIEVE that competitive private enterprise is also the most effective and least wasteful way of mobilising capital resources for productive purposes. By offering fair reward for risk taken it ensures the availability of new capital for development. While profits are the reward of success, losses are the penalty for failure. Under private enterprise such losses are borne by the private investor and not by the public purse; that is the best guarantee in the long run that a business will be run efficiently and economically and will be continuously adjusted to the real and expressed needs of the community. And that in its turn is the best guarantee of stable and improving conditions of employment. Therefore...

WE BELIEVE in private enterprise in the oil industry, in which the condition of survival for individual companies is to supply ever improving goods and services to the community at the right price. That is the principal characteristic of the system—the constant need for improvement and economy. No one has yet discovered a better system for achieving both these ends.

WE BELIEVE that the oil industry is performing a vitally important service to the public, essential to present-day civilization and essential to maintaining and raising world-wide standards of living. Therefore we are convinced that the provision of the petroleum products which make this possible is a task which is without qualification worth while.

WE BELIEVE that this Company has the knowledge, the experience, the competence and the resources to carry out this task worthily. This has been demonstrated to date by its success in serving the public in open competition with other companies engaged in the same trade. We have no reason to suppose that the future will prove otherwise.

WE BELIEVE that in thus engaging in business—which we have done for the last 66 years—a company takes upon itself certain obligations:—

OBLIGATIONS. To those who have associated themselves with the Company's business as suppliers of capital or labour; to the community at large; and finally to the Company itself. Specifically, these obligations can be summarised as follows:

TO THE SHAREHOLDERS. Since it is the Shareholders who provide the money without which the Company cannot either come into being, remain in business or develop, it is right that the Company should so conduct its affairs as to provide a fair return for the Shareholders' investment and the risk they have taken. Plainly it is also in the Company's direct interest to do so, otherwise capital will not remain available nor will fresh capital be forthcoming for development.

TO THE EMPLOYEES. Since the Employees give their skill, experience, energy and time to the Company, it is right that the Company should secure for them also the material reward appropriate to their efforts and abilities. This reward should at all times be adequate to ensure a decent progressive standard of living, and should be increased as and when individual ability, loyal service and acceptance of greater responsibility make this in equity desirable. A fair system of material rewards will also include facilities for social security, such as pensions and other benefits, supplementary to those already provided by the State. The Company also recognises its obligation to provide safe and sanitary working conditions and to see that hours of work and opportunities for rest, holidays and recreation are at least as favourable as those observed by other leading companies in comparable operations. Its aim is, by objective selection, to place employees in the work most suited to their abilities and to provide the means for them to improve their performance by training and so advance in their profession.

For the efficient and harmonious conduct of its business, the Company believes in the necessity and value of joint consultation at all levels.

Finally, the Company recognises an employee's religious and political freedom; that is, his freedom to associate or not with any religious body, political party or any lawful society or organization.

TO THE COMMUNITY. Since a company is an integral part of the social and economic life of the community—be it locally or nationally—it is under an obligation to conduct its business in such a way as to further the social and economic progress of that community, or at very least not to impede it.

It has a duty beyond its immediate business of supplying goods and services at the right quality and price; it has a duty of citizenship, of co-operating with the proper authorities at every level of government. In framing its policies, it must consider the aspects of the public interest. In its everyday actions it must practise consideration for its neighbours. It must be an active asset to the community within which it operates, not a passive occupier of space.

TO THE COMPANY. If one is convinced, as we in this Company are convinced, that a competitive, privately-owned oil industry best serves the public's needs; that, inside that industry, this Company is well fitted and well able to supply the consumer with the products he requires at an economic price; and that, at the same time, the Company fulfils its obligations to its shareholders, to its employees and to the community at large, then one final obligation logically follows.

It is the obligation to maintain, perpetuate and develop the Company itself so that it can continue to perform its task in a like manner to the greater benefit of all who work, or come into contact, with it.

That responsibility falls not only on management, but on every one of the 12,000 men and women who earn their living in this country with Esso.

WIN YOUR SHARE OF THE BIG NORTH AMERICAN MARKET

In Canada and the United States the construction of homes, office buildings, factories and public works continues at a high level. This activity can mean business for you, because it stimulates the buying of the widest range of commodities.

Use the effective showroom of the Canadian International Trade Fair to display and sell your goods in the North American market—and thus earn dollars required for your country's purchases abroad.

SHOW YOUR PRODUCTS AT THE

8th Annual CANADIAN International TRADE FAIR

TORONTO, MAY 30 TO JUNE 10, 1955

OPERATED BY THE GOVERNMENT OF CANADA TO PROMOTE YOUR BUSINESS

Here you can meet key businessmen from many countries who come prepared to buy the products displayed—such as household appliances and furnishings, machine tools, construction equipment, electrical apparatus and office equipment—and to compare values for future requirements.

It would take you a long time to find as many potential new customers as you meet in just two weeks at the Trade Fair.

*
Apply now for the space you want, to Canada House, London, S.W.1, or direct to Canadian International Trade Fair, Exhibition Park, Toronto, Canada.

KILLING TWO BIRDS WITH ONE THERM

YOU BURN COAL RAW, and what happens? You make smoke, which makes smog, and you destroy the raw materials of a hundred different products from paint to motor-spirit, from nylons to fertilizers. Smoke is not only a menace to health—it is the funeral pyre of wealth. Mr. Therm carbonises coal, and what happens?

He produces gas and coke, the two great smokeless fuels—highly efficient and clean burning. And he provides for British Industry (and for export) all the chemicals and substances that would otherwise be lost for ever to our National economy. Thus with one stone Mr. Therm kills two hateful birds—waste of wealth and menace to health.

Mr. Therm's way is much the more sensible.

WALLSPAN—Engineering's Modern Miracle gives you outer walls in days!

*If you want your new building finished faster — EARNING SOONER —
discuss Wallspan with your architect*

What is Wallspan? A means of providing walls in an incredibly short space of time. Since the weight of a modern building is carried on the framework, the walls are left with two main jobs to do. They must keep cold and wet out, and heat in. At the same time, they must give the building an appearance that both the architect and the owner are proud of. Wallspan does all this extremely well and with the added advantage of getting walls up very quickly.

Wallspan—like all great engineering advances—is comparatively simple. To the structural frame of the building is bolted a grid formed from vertical and horizontal components. These are made of strong aluminium alloy that never rusts or corrodes. Into the spaces of this grid are fixed sheets of glass or opening window frames. There you have your light and air. In the other spaces of the grid are put sheets of solid panelling materials—and there's your solid wall. There are dozens of different kinds of these panelling materials in various textures, colours and thicknesses. With them, an infinite variety of Wallspan walls can be designed, each exactly suiting the uses of the building in any climate of the world. That is all there is to it. One contractor erects the whole wall and it is fixed for all time. It needs negligible maintenance and it can go up in a matter of days.

WALLSPAN CURTAIN WALLING

WILLIAMS & WILLIAMS

RELIANCE WORKS · CHESTER

Wallspan starts here
This is the stage at which Williams & Williams fixing teams move in to put up the Wallspan wall.

The grid goes up
The vertical and horizontal components are put in place. Each bar takes about 4 minutes to fix.

Glass, windows, panels, next
Into the grid are put sheets of glass, opening window frames and panels of solid insulating material, each fixed in five minutes—weatherproof for all time.

All the light and air you want
Opening window frames provide ventilation wherever it is required. Plain glass sheets are fixed straight in, giving all the natural light you want, exactly where you want it. Solid panels complete the wall.

You'll be using your building sooner — much sooner — if it has Wallspan walls

Craven

his

first

love

THE MAN who has been tempted to smoke something else for a while comes back to Craven like the prodigal returning to peace after suffering. And how bewitchingly his "first love" welcomes him. Slowly, yet irresistibly, the cool, slow burning Craven captivates once again and holds him in its deeply satisfying spell. How right Sir James Barrie was when he said Craven "is a tobacco to live for".

Try CRAVEN

As the first pipeful casts its spell you'll agree that here is real smoking luxury... as every Craven man knows.

Craven Mixture 4/7 oz. Craven Empire de luxe Mixture 4/3 oz.

Nappies aired yet, Mrs. Hollis?

When washed in water soft as rain, clothes are really clean and free from hard-water lime deposits. In laundries, Albright & Wilson's 'CALGON' (Sodium Metaphosphate) has long been used to soften hard water. 'CALGON' is not a soap, nor a detergent, but simply a water softening powder. It is now being distributed through retail shops for all home uses.

A sample of Calgon will be sent on request.

'ENGLISH ELECTRIC'

Providing superior acceleration with greater fuel economy, and demanding less routine attention, electric and diesel locomotives are taking over from steam in many lands. ENGLISH ELECTRIC has supplied such locomotives to 29 countries — carrying out, in many of them, complete railway electrification schemes. In every case, design and construction take full account of local conditions and particular technical and traffic requirements.

bringing you

These modern locomotives bring cleaner and more comfortable travel, faster goods and passenger services. In Spain, electric locomotives powered by ENGLISH ELECTRIC are hauling heavy trains at higher speeds over the Cantabrian mountains, on lines noted for their gradients, curves and tunnels. Helping to improve the railways of many nations is only one of this busy Company's contributions to better living in the modern world.

better living

Means to What End?

AT the beginning of the week it seemed probable that the country would have to choose between the evil of a railway strike and the still greater evil of a railway subsidy. As *The Economist* goes to press, early on Thursday afternoon, it seems possible that it is going to get both. This moment—the moment between Godesberg and either Munich or battle, when new demands have been presented which may cause even a Transport Commission to turn—would normally be a very difficult one at which to write. But this week it is not difficult at all.

For the really important news of the past week is not the still undecided question of whether there is going to be the temporary—though bitter—inconvenience of a railway strike. The really important news, in the broad context of history, is that the desperately dangerous principle on which peace negotiations will be based, either before or after a strike, has already been decided. It has been laid down by, and apparently universally accepted from, the lamentable report of the Court of Inquiry into this dispute. "The Nation," begins the passage proclaiming it, "has provided by statute that there shall be a nationalised system of railway transport, which must therefore be regarded as a public utility of the first importance. Having willed the end, the Nation must will the means."

There would be no harm in this statement, if the court and the public understood exactly what it means. What the phrase "a public utility of the first importance" should mean, of course, is that the economic distribution and effective use of resources in this industry is of the first importance. What the court takes it to mean is precisely the opposite. Its interpretation is that railway workers—however many of them there are, however inefficiently deployed, however small the net addition of each man to national production—should receive wages that would leave them "in no worse case" than their colleagues in "comparable" industries. The court does not pass judgment on whether railwaymen are getting such a comparable wage at the moment. It leaves that question to be decided by negotiations—but negotiations between a union whose duty it will be to demand as much for its members as it can get, and a nationalised body which will have no incentive (indeed, since it will naturally seek good labour relations, it will have a positive disincentive) to draw the union's kicks upon itself in order to save other people's ha'pence. For the court believes that it is a false and "unfortunate" principle to suggest that the Transport Commission can only pay out money that it itself has earned. Instead, the taxpayer "must will the means."

This principle—and the Government's acceptance of a report enunciating it—may be the opening of a new stage in British industrial and political history. On the court's ruling, a nationalised industry now means an industry which has an inalienable right to draw a subsidy from the public, and no responsibility to return efficient service to it. Let no British Socialist, in particular, be under any delusions

about the implications of this report for his doctrine of efficiency through public ownership, for the long fight he has waged against sectional concentrations of monopoly power. Let no politician of any party fail to recognise what this report portends. It used to be a cardinal feature of the British constitution that there could be no expenditure of public money, no new burden imposed upon the taxpayer, save under the authority of a Minister of the Crown. These things can now apparently be done under the authority of a court of inquiry instead.

These will seem harsh judgments to the three members of the court—a lawyer, a shipowner and a trade union leader (in a recently nationalised industry)—all of whom worked unpaid at great speed to complete the report. It is easy to see now that the Government should never have shifted a decision of such major economic importance, at the kernel of public policy, on to three distinguished but arbitrarily chosen gentlemen under such impossible conditions. It is easy to see now that, once the recommendations were published, first the Government and then the Transport Commission should have said that it could not possibly accept them.

But this is not the time to apportion blame. It is the time to restate the principles on which any tolerable settlement, before or after a strike, will need to be based.

Temptations of Orthodoxy

THE Exchequer return which was published on December 31st shows that Mr Butler will be faced this year with a very curious dilemma—a dilemma which those who formed their views about economic “respectability” during the controversies of the nineteen thirties might not have believed could exist. When he comes to frame his Budget he will have to choose between steering an old, orthodox and very popular course—or a modern, Keynesian, and very much sterner course. He will have to choose between the thoroughly inflationary policy of a balanced budget, and the far stricter Keynesian doctrine—in present circumstances—of surplus finance. This is a dilemma to bleed the heart of any Chancellor, and especially a Conservative Chancellor who is entering what everybody expects to be an election year.

The message of last week's Exchequer return is that Mr Butler is currently gathering in rather more money, and is spending very much less, than he expected when he presented his Budget last April. At that time he estimated that his total budgetary outturn this financial year would be £100 million worse than in 1953-54; instead, in the first nine months of the year, it has been £184 million better. A principal reason for this is that deliveries of, and therefore payments for, military aircraft are shamefully behind schedule; subsi-

The chief of these is that railwaymen should have the opportunity to earn a decent wage, instead of the right to be doled out with one. The end which the nation seeks is an efficient railway system; and that is the only end to which it should will the means. This will require Government help for the railways' capital programme, and it may require that the Transport Commission should be allowed to run a deficit for a strictly limited period, during which it will need to cut down its labour force, reform its charges, and re-organise many of its services. But it certainly does not mean that the Commission—or any other essential industry, nationalised or private, with an uneconomically swollen labour force—should be allowed to run a deficit for ever.

Paradoxically, the enforcement of these principles may have been made more possible by the National Union of Railwaymen's slowness to grasp at the opportunity which was held out to it on Wednesday of this week; paradoxically, it may now be better for the national economy if there is after all a strike. But the prospect of an economic settlement to this dispute has been made very much dimmer by the report from this Court of Inquiry—and by the public's apparent acceptance of it. The nation, as well as the Government, will have no reason for satisfaction, whether it spends this miserable weekend in looking back on a second surrender or forward to the bitter hardship of a stoppage.

diary reasons are that the swelling of private incomes and capital in the past year has increased the yield of both income taxes and death duties, and that the hire purchase boom has added sensibly to revenue from purchase tax. None of these factors, when considered soberly, is a logical excuse for tax reliefs that would swell the volume of private purchasing power to a larger torrent still. But it is very difficult for a Chancellor to consider such factors soberly, when the less complicated and more exciting raw figures are being brandished in his face.

The most exciting of these figures is that, unless something goes badly wrong in the last quarter, by Budget day Mr Butler should be able to show an ordinary or “above-the-line” surplus of perhaps £300 million for 1954-55; when he drew up his Budget nine months ago, he expected to show an above-the-line surplus of only £10 million, which is as near to exact balance as any Chancellor can decently aim. Moreover, on the basis of present tax rates, that surplus might be more or less maintained through 1955-56. It is true that Government civil expenditure will probably go up next year, and that defence expenditure—while below this year's estimate—will not necessarily be much below this year's performance; but against this, with incomes still rising and next year's tax receipts from

this year's profits already certain to be high, revenue might increase quite sharply. If the Chancellor has a surplus of £300 million in hand for 1955-56, and feels that he can give it all away, that would be the equivalent of at least 1s. 3d. off the income tax. It is not surprising that Conservative bankbenchers are licking their chops.

But if the Chancellor does not disappoint them, those who fear inflation will be at his throat. An above-the-line surplus of £300 million sounds very impressive until it is realised how very little it actually means; the items that are entered above the line in the budget accounts are determined much more by historical accident than by any recognised canons of finance. If the different, though equally accidental, American system of budget accounting were used, the Chancellor would not show a surplus at all but a fairly substantial deficit; if the “capital account” system used in some other countries were in vogue, he would show an even larger surplus than now. All these budget accounts, as Keynes never tired of pointing out in the nineteen thirties, are utterly misleading idols; to tighten or loosen the whole national economy in order to ensure that one accidental total falls equal to another accidental total in the period that it takes the earth to move round the sun, is a strange form of heathen magic. But during the nineteen thirties, at a time when Keynesian precepts suggested that large tax reliefs could be made, Conservatives regarded Keynes as unrespectable; it is a little hard on them to be told that they must regard his ghost as the supreme financial arbiter now, at a time when pursuit of his precepts would compel the Chancellor to give nothing away at all.

★

For that, on the strictest interpretation, would seem to be the gloomy conclusion that a genuinely economic approach to the Budget would reach. It is important to explain why. The first step in the latter-day system of public finance is for the Chancellor to estimate by how much real national income might increase in the year ahead, under conditions of the fullest possible employment of resources. If he takes note of the level of industrial production now compared with a year ago, and assumes that any higher flow of dividend receipts from abroad will be just about offset by a deterioration in the terms of trade, it is difficult to see how he could rely in prudence on an increase of much more than £400 million in real income in 1955-56. The second step is to judge by how much demand upon these new resources is likely to rise. Neither defence nor house-building—both of which have absorbed a large segment of any increases in resources in recent years—is likely to rise in 1955-56. But fixed investment of other kinds seems likely to increase by at least £200 million; and consumption, which probably rose (in real terms) by more than £300 million in 1954 even without the benefit of any tax reliefs, might be expected to take at

least £200 million too. On these stern criteria no part of the postulated increase of £400 million in real incomes would be left to give away.

This, however, will surely be too stern a reading for working politicians to bear. It is probable therefore that the pre-election Budget in April will be based on a compromise between the new view and the old. The Chancellor is most unlikely to find £300 million for tax remissions. But he will be very receptive to arguments, or even to excuses, for granting some relief. And in this context, without wholly abandoning the latter-day approach, there are three excuses that he might parade.

First, if a dose of electoral budgeteering proved inflationary, the pressure of too insistent demand would fall primarily upon the balance of payments and upon the level of stocks. The external surplus in 1954 was probably more than £200 million, and experience in the dock strike showed that stocks are surprisingly well-upholstered; it may be argued that this will justify the running of some risks. Secondly, if budgetary policy proved too loose, Bank rate policy could be tightened; indeed, there is an emerging case for an anticipatory increase in Bank rate already. Within limits and in the short run, cheap money and lower taxes are alternatives, and if the country were willing to do without the one it might safely be given the other. Thirdly—and Conservative politicians may attach especial emphasis to this—the centre-piece of the new-fangled analysis is the extent to which real income can be expected to increase; this is always a most hazardous estimate, and it may itself be affected by tax reliefs almost as much as it determines them. The experience of the past few years shows that it is unsafe to deride the importance of marginal incentives to harder work.

These are excuses of very varying worth. The Bank rate argument is by far the best; the balance of payments argument by far the worst. The incentives argument hovers in between; it might justify an extension of earned income relief, but hardly a cut in the purchase tax or in other indirect taxes about which politicians seem to be currently most concerned. In broad perspective, however—and in an economy in which it is surely worth while to run some risk to make a cut in the crushing burden of taxation—economists who are also taxpayers may agree that a little leeway should be allowed to the Chancellor; it will be taken in any event. But they will believe, too, that this should add up to a few inches rather than many ells. Above all, the country should realise what is happening if it gets a really popular budget. The surplus that has so joyfully appeared in the Exchequer accounts will be the excuse much more than the cause; the tenets of modern finance will not be overthrown, they will merely be taking a rest in an election year. This, perhaps, is a new manifestation of the divine right of Governments. King James is once again calling for his old shoes; as his historian wisely pointed out, they are easier on the feet.

Saigon and Hanoi

ON February 23rd the foreign ministers of the eight Seato powers will assemble in Bangkok for their first meeting. It will be an important occasion—Sir Anthony Eden is expected to lead the British delegation—and it is clear that Indo-China will be prominent on the agenda. This is a reminder of something that is not sufficiently realised in this country: that there has been no real settlement in Indo-China. There is, indeed, a special ambiguity about the word "settlement" in current political speech. An international agreement which merely relaxes tension for the time being may serve to postpone a crucial conflict, and the time gained may be used for fruitful negotiation which in the end averts the conflict; but the situation may just as easily deteriorate further, so that its last state is worse than the first.

It is widely assumed that the Geneva conference failed to achieve any settlement in Korea, but succeeded in Indo-China. In reality, however, the conference had almost exactly the opposite effect. There was no cause for alarm at its failure to agree about Korea, for such an agreement, though desirable, was not immediately vital. The fighting in Korea had produced a stalemate on a clearly defined front which served as a *de facto* frontier. The western powers were not under any compulsion to accept the enemy's terms because of military disaster or the imminent prospect of it; hence they resolutely maintained their position that Korea should be unified only on the basis of free elections conducted under the supervision of the United Nations—the same formula as they have maintained with equal constancy for the reunification of Germany.

The refusal of the Communists to agree to this has meant in both cases that partition continues; but it is a stable partition in that both sides are aware that any serious military trespass across the boundary line means war. The feeling of relative confidence which now prevails with regard to Korea is not due to any expectation that the Communists will keep any promises which it is in their power to break without war, but simply to the belief that they will not deem it expedient to launch a fresh military aggression there, and that likewise the South Koreans, despite President Rhee's

threats, will not venture to march north. The Communists' dissatisfaction with this state of affairs is indicated by the suggestions from Peking for another conference on Korea; but unless they have some constructive proposals to make for ensuring free elections, such a conference could only perpetuate the existing deadlock.

The situation in Indo-China is quite different. The military background there at the time of the Geneva conference was one not of stalemate, but of catastrophic defeat. The Communists at Geneva were not willing to grant a truce without a political agreement; they had the French on the run and they knew it. Had they insisted, they could probably have forced a total French

evacuation of Indo-China and the surrender not only of Hanoi, but also of Saigon. That they refrained from exerting all the military pressure in their power was doubtless due partly to the fear that the Americans might after all intervene if matters were pressed too far, and partly to their anxiety to take over Hanoi and the delta installations intact rather than in ruins; but it was due even more to their conviction that the agreement on elections which they obtained would enable them to take over south Vietnam too in two years' time.

For in agreeing to nationwide elections for Vietnam in 1956, the western powers did not insist on United Nations supervision or any of the guarantees thought essential for Germany and Korea. The only supervision was to be provided by a three-nation commission with one Communist member and an Indian chairman and casting vote. France and Britain accepted this—and America too undertook not to contest the Geneva terms—because in the circumstances it was impossible to get anything better. The essential thing was to extricate a beaten army from a disastrous entanglement and to relieve the French people of a war which they no longer had the will to fight.

It is estimated that the population of northern Vietnam, even after the loss of half a million refugees, will still slightly exceed that of the south. The Communist Viet Minh could therefore count on winning nationwide elections if it gained all the votes in the

north while those in the south were divided between various factions, including pro-Communist ones. The Viet Minh should have no difficulty in mobilising the votes of the north, where no political opposition is now tolerated. Unless there is some drastic change in this situation the Viet Minh must inevitably win a nation-wide election, whatever may be the relative strength of parties in the south. That this is so has been clear from the beginning to those who understand the issue involved in the western insistence on guarantees of free elections in Germany and Korea, and who realise that the Geneva agreement does not provide such guarantees for Vietnam.

★

It may well be asked: what then is the sense of pouring money into southern Vietnam, of building up a Vietnamese army, or indeed of any political activity at all in the south, other than that of caretaking for the new masters who are shortly to arrive? When the Viet Minh have won the elections by their automatic majority, they will appropriate whatever new installations and equipment have been provided for southern Vietnam by France and America, and everyone in the south who has been guilty of any anti-Viet Minh activity will face brain-washing, forced labour or execution. The present policies of the Saigon government, of the United States and of France—in so far as France is not simultaneously trying to "co-exist" with the Viet Minh—only make sense if there is a will to refuse participation in any national elections until genuine political freedom is assured throughout the country.

The legal ground for such a refusal would be that the Geneva agreement implied electoral freedom in all Vietnam, and that the 1956 elections cannot be held if this freedom is denied in the north. (Indeed, the visible breakdown of the experiment in democratic government in the south ought to strengthen the arguments against holding elections before political freedom is assured there too.) But the Communists would certainly claim that the Geneva agreement had been violated. They have evidently understood the agreement as a face-saving device to cover a total French surrender and French permission for them to take over the whole of Vietnam within two years. Last week their foreign minister, Pham Van Dong, warned France that it would be held responsible if the Saigon government jibbed at elections, and declared that

Vietnam will be united one way or another, with France or against France; if France tries to stop it she will be defeated. . . . Our only enemies are those who oppose the unity of Vietnam. . . . France must choose between Washington and Hanoi. . . .

As far as France is concerned, their estimate seems fairly accurate. The French are determined not to let themselves in for any more fighting in Indo-China. Many politicians in Paris see the only hope of salvaging

the wreck of French economic interests there in an agreement with the Viet Minh; and even while the war was still going on, the French were careful in their retreat not to destroy installations of economic value. Ever since the military collapse in Tongking the French have in fact been ready to write off the Saigon government, and particularly since it has been led by a strongly anti-French prime minister.

Unfortunately for such calculations, the Saigon government has not so far written itself off, nor has Washington. The Americans argue that no further advance of Communism in South East Asia should be tolerated, and that control of south Vietnam would give the Viet Minh a stranglehold on Cambodia and Laos, whose main communications are with Saigon. (It would also, be it noted, bring a Communist army within 300 miles of Malaya.) Although serious doubts have been expressed by some Americans, such as Mr Joseph Alsop, Washington still seems to believe that a stable government may yet be organised in southern Vietnam, if a feeling of confidence and security can be created there; and that the southern army, although due to be reduced in size, could be improved with American training and equipment, and at least made adequate to police its own territory. American policy since Geneva has clearly been directed towards strengthening the Saigon regime, and the aid given—as from this week, it is being given directly to Saigon, by-passing Paris—is obviously not meant to provide a free gift for the Vietnamese Communists at the expense of the American taxpayer. It cannot be intended, as is conventionally said, to give the non-Communist groups a chance of winning the elections, for there is no likelihood that Ho Chi Minh will permit any genuine opposition in the north, and without that genuinely free elections cannot possibly be held—let alone won.

★

The only intelligible aim of the American policy is to give the southern government the best possible chance of survival on as permanent a basis as that of South Korea. But if the *de facto* partition becomes an enduring one, it is vital not only that the democratic allies should publicly insist that responsibility for the division rests on the Communists who block the road to free and fair elections, but also that they should remember this fact themselves. If they fail in this, the Viet Minh's claim to be the only champions of national unity will prevail both in Vietnam and far outside. This difficult and dangerous situation should be frankly recognised without delay; and the policies of the Seato partners should be co-ordinated quickly, not left to drift until the next crisis. A critical point will be reached in mid-1955, when arrangements for the elections are due to be discussed, if not sooner. Next month's meeting of ministers at Bangkok provides a timely opportunity to take this urgent matter in hand.

Copperbelt in Crisis

THE strike of the African mineworkers on the Northern Rhodesian copperbelt may seem an unexpected outcome to the storm that has been gathering over racial and industrial relations in that area. The mines have been brought to a standstill not on the issue of Africans doing skilled jobs hitherto reserved for Europeans, but on a demand for a wage increase for the Africans, in the jobs they are already doing, of from 100 to 300 per cent, according to grade. Nonetheless, the strike arises directly out of the crisis over the colour bar in employment in the mines, and its explosive possibilities may not be much less than those of a strike of white workers in defence of their privileges.

A showdown between the white mineworkers and the copper companies has been in prospect ever since the Rhodesian Selection Trust gave notice, last November, to terminate the agreement with the European mineworkers enshrining the principle of "equal pay for equal work." This principle has been successfully erected as a barrier to Africans rising above the level of semi-skilled labourers, because European pay is so high that it is called "wages" only to maintain the useful fiction that the privileged white miners are a section of the British working class. In outspoken statements, Mr R. L. Prain has made it clear that the Selection Trust considers that such prevarication must cease, and that a beginning must be made with African advancement before African resentment reaches a point where peaceful labour relations are hopelessly prejudiced. The other group of copper companies, the Rhodesian Anglo-American group, has fallen out with its determined opposite number (so that the Chamber of Mines has temporarily ceased to function as the employers' organisation) and is continuing to negotiate; but if it achieves any success, that will probably be due as much to Mr Prain's determination to force the issue as to any powers of persuasion possessed by Sir Ernest Oppenheimer's negotiators. Moreover, it is difficult to imagine the terms of the settlement being much less than those already proposed—namely, that over five years some 5 per cent of skilled jobs shall be opened to Africans. For these indeed are the bare minimum.

★

With Mr Prain fighting their battles against the white mineworkers and against Anglo-American, with its South African affiliations, the obvious tactic of the African mineworkers might seem to be to sit back and acquire merit by good behaviour. To cut across the white men's private fight over the first principles of justice to Africans is to offer a handle to those who have all along declared that the Africans are not interested in advancement or justice, only in higher unskilled wages. The alacrity with which the European Mine-

workers' Union declared legitimate the Africans' strike objective, and promised not to blackleg in the interests of multiracial working class solidarity, suggests its relief at this promising diversion. But the Africans have not been appeased.

It is certainly true that there is a struggle for power in the African Mineworkers Union which has discredited the policy of "wait and see." A strike, furthermore, will conveniently divert attention from the auditors' comments on the union's last annual accounts, which make very understandable any effort to increase its membership and its income from dues. This is indeed the primary object of the strike; but it is part of a new phenomenon in African trade unionism, and a very ominous one—a sustained and well-organised effort to create a powerful, militant and politically conscious mass union. The African Mineworkers Union, for all its vagaries, is the best run black trade union in the whole continent. The present strike follows carefully engineered strikes by the African building and government industrial workers (the demand for an increase of 10s. 8d. a shift is exactly double the demand made by the building workers). And with it goes a demand that the employers shall pay the increased wages to workers with union cards only.

The African retort to the European mineworkers' obstinacy is, in fact, to organise themselves on a racial basis. African leaders have perfectly appreciated the recent Forster report on the advancement of Africans, and have at last seen through the sham phrase "equal pay for equal work"—which, in the brilliant African metaphor quoted in the report, provides a ladder for African advancement with a top and a bottom rung and all the intermediate rungs missing. Their first move is now to demand a bigger share in the copperbelt's profits for all Africans. It is of less importance to them immediately that a few Africans should get skilled jobs than that all Africans should look to a single powerful union as the champion of all African rights. They have pitched their demands high—but that is only another indication that the strike itself, win or lose, is expected to achieve a vital political purpose. They are demanding that the lowest paid worker, now earning some £4 15s. a month, shall get £18 or £19 while the highest, earning perhaps £20 a month, shall get £35 or so. The whole African wages level is to be lifted much nearer to the European, and though such a demand is no doubt quite unrealistic both in terms of African productivity and the general level of African agricultural income, the fact is—and can be used as propaganda—that the whole increase will cost the industry between £6,000,000 and £7,000,000 a year—against annual profits which Mr Prain told the Royal Society of Arts this week were running at £40 million before taxation.

The unrealism of the Africans' demand, and the probability that they will lose the strike, should not divert attention from the basic inference that they are deliberately turning their face against the white man; that what Mr Prain and others have feared—that European concessions may come too late—is already happening. The European Mineworkers have, in short, played into the hands of men like Mr Nkoloma, the dynamic secretary of the African Mineworkers Union, who had so much to say to the Russians at the last meeting of the International Labour Organisation; they have lost the day, almost certainly, for the moderate arguments of Mr Katilungu for patience and trust in the white man's good will and his formula of "partnership." To whose interest was it to bring into existence a small but growing and influential cadre of African skilled artisans, prosperous, with a stake in the copperbelt and its orderly progress and therefore in moderation? It is very clear how the Belgians have answered this question across the Rhodesian frontier. But the European mineworkers can only see the skilled black artisan as a threat to themselves and their children. They have failed to see the significance of the refusal of the African Mineworkers Union to allow the companies to recognise the African Salaried Staff Association as a legal union, jealously insisting on keeping them under its control. But these privileged Africans—clerks, bossboys and so forth—are in fact the Africans most opposed to the present strike.

★

What is the reason for this ostrich attitude of the European mineworker? He is usually credited with the sense to see that an encroachment of skilled Africans on one per cent of the skilled jobs, at a time when the whole industry is expanding, is no threat to his money and privileges; it is said that he is thinking of his children. The reply that an expanding economy will always provide good jobs, if not always the same jobs, does not satisfy his craving for security. But this is not the whole story. Of the 6,000 European mineworkers relatively few expect their children to make their careers in the copperbelt, for many—perhaps half—of them are migratory workers who hope to make a "pile" out of six or seven years' work in the mines wherewith to buy a farm or a small business in South Africa. While they are in the copperbelt, the spirit they bring to trade union discussions is the spirit of South Africa. But the legacy they leave will have to be borne by settlers of mainly British stock—many of whom are more liberal-minded and farseeing.

The outlook is ugly. It is reported that the white union leaders are now more anxious to settle, and they may gratify the Anglo-American negotiators by coming to tolerable terms, whereupon, doubtless, the Rhodesian Selection Trust will be content to join in, and both firms will take credit for the result. But it begins to look as if none of this will impress the Africans. Even

if rioting, bloodshed and further embitterment of race relations are avoided, the Africans seem set on a course which will lead to an increasingly hard and fast white-versus-black alignment.

This is an unhappy conclusion to reach as the Federation nears the first anniversary of its first general election—an election which swept the Federal Party, on a policy of moderation and partnership, to power. Sir Geoffrey Huggins and Sir Roy Welensky, however, cannot ignore the dangers of the gap between promises and practice. In trouble with a growing Confederate wing in the Federal Party itself, they are trying to keep out of the copperbelt dispute. They cannot do so. For what is happening on the copperbelt is fateful for the whole political future of Central Africa. The major task of statesmanship in the Federation is to induce a decisive change of heart among black and white alike on the copperbelt (whence, to put the government's interest at its lowest, half the Federation's taxes comes). It is not too late, for the African industrial movement is still in a formative stage, and the leadership is still in question, besides being inexperienced. But time is getting short.

War Aims

To fight once for all, and until victory should have crowned our efforts, the great coming battle of the world between progress secured by freedom, and despotism bent upon stagnation and reaction, would be a cause to call forth all our efforts and to hallow all our sacrifices. . . . To fight for the rescue of Europe from the overpowering and paralysing influence of Russia, to emancipate the people of Germany by depriving the Sovereigns of Germany of that mighty bugbear in the East by which their subjects have hitherto been frightened and kept down; so to weaken the Czar that his future policy must be widely different from his past . . . this, too, would be an object sufficient to justify a war. . . . To carry on a contest of which the purpose and result should be such an effective and masterly revision of the map of Europe as should be self-sustaining; to secure our complete and final disentanglement as principals from the complicated "Eastern Question," by some such arrangement as Talleyrand proposed and Napoleon half contemplated; . . . this even, would be a course not discreditable either to our manhood or our statesmanship. . . . But to break a forty-years' peace with the sole purpose and effect of administering a severe and mortifying rebuke to Russia; of warning her to be more careful and more modest for the future, to choose her time with more sagacity and calculate her means with greater accuracy; to enter into a duel for the sake of showing that we are not afraid and not disposed to be bullied or insulted with impunity; to fight for the sake of keeping the Ottoman Empire on its legs for a few years longer; . . . to be satisfied, in fine, with a desperate and bloody conflict in which we shall have reaped barren honour, and our adversary shall have come off with considerable damage;—this, we confess, would seem to us a most "lame and impotent conclusion," and would go far to justify all that has been said of the sinfulness and the impolicy of war.

The Economist

January 6, 1855

Notes of the Week

All the Wrong Lines

IN the report of the Court of Inquiry, said Mr Campbell of the National Union of Railwaymen on Wednesday, "the commission has got its backside tanned more than we have." The aim of the report was clearly to enable him to say this, and to enable Sir Brian Robertson to find some consolation for his grossly unfair public humiliation in the thought that Mr Campbell had been spanked, too. But, up to early on Thursday afternoon, this was all that the report had achieved. The National Union of Railwaymen refused on Wednesday to call off the strike even under the favourable conditions for negotiation that the court recommended—unless it was assured in advance that it would receive from these negotiations virtually everything for which it had asked. A meeting at which it would be decided whether the commission would make this final surrender was in progress as *The Economist* went to press.

It is difficult to find a single good word that can be said for the court's report. The points on which it criticised Mr Campbell were that he acted improperly in rejecting an agreement that he had already ratified, and that he did not make constitutional use of the railways' conciliation machinery; although there is substance in these complaints, it would have been wiser to have rubbed home the Commission's real grievance about unimplemented promises on productivity, instead of castigating the unfortunate Mr Campbell, but not his more irresponsible rank and file, upon an admitted procedural irregularity.

Having said nothing at all about the efficiency of labour on the railways—which is the kernel of the dispute—the court also ran as far away as it could from passing judgment on the wage problem, which is the dispute's outward and visible shell. It did not know whether railwaymen were getting a wage comparable to other workers' at the moment, although it said that it believed that there were some problems to discuss—particularly in the grades of higher responsibility; this last point is indisputable, but the grades of highest responsibility—the engine drivers and footplate-men—were not in fact involved in the strike threat. Finally, the court put forward its extraordinary argument that since the Transport Commission had already offended against its statutory duty of covering its expenditure by receipts, taking one year with another, it should now be able to forget about this duty altogether. One of the principal lessons to be drawn from this report is that the Minister of Labour should now reconsider for what functions he really intends the device of these hastily assembled "courts" to be used. At the moment they are being used as a convenient instrument of possible government abdication from responsibility for economic affairs.

No Rest for Europe

TOO many people now seem to think that the new European system is virtually an accepted fact. It is vital to avoid any such illusions. The Paris agreements on Western Union and western defence have not yet been ratified. The French Assembly's vote last week was an essential link in the chain of the ratification process, but it was not the last link; and what remains to be done is not mere formality. Even a brief relaxation at this stage could yet prove disastrous. Those who are tempted to relax should take warning from the unflagging campaign that the Soviet leaders and their followers in the West are still waging against the Paris agreements, if from nothing else. Moscow does not waste its energy on lost causes. And M. Mendès-France, although contemplating the transfer of his portfolio as foreign minister into other hands, is clearly under no illusions about the difficulties that still lie ahead; instead of taking the rest that most men would need after his recent ordeals, he is visiting Italy and Germany.

It is true that the ratification of the agreements is as good as assured in Belgium and the Netherlands, and that the Italian Senate is unlikely to upset the decision already given in the lower house. But the Saar problem remains an obvious threat to the relationship between France and Germany during the tricky weeks to come, when the Paris agreements must pass through both the *Bundestag* and the French upper house. After the events of Christmas week, not even the most expert French observers are eager to prophesy how the *Conseil de la République* will act. The only point that is generally granted is that if the agreements are returned to the Assembly on some procedural pretext, all M. Mendès-France's personal talents will be needed to steer them out again. The prime minister's prospects of survival in office, which are described by a correspondent on page 116, are therefore a vital factor in the equation. Another, perhaps just as vital, must be the tactics of an American Administration which was acutely distressed by the way the French deputies celebrated Christmas, but which nevertheless shows a clear recognition of the French premier's problems—and of his uniqueness.

The Communists' Big Push

IT would be hard to exaggerate the effort which the Communists are still making to prevent the ratification and implementation of the Paris agreements. Moscow expects that every man this day will do his duty. In Soviet

Germany, calls for action of all kinds have been renewed by President Pieck and others. In spite of the vote in the French Assembly, says *Neues Deutschland*, "all possibilities for stopping final ratification are still open. These possibilities lie above all and in the first instance in the extra-parliamentary field." A "Russian Hour" commentator on the Vienna radio has said, in connection with the Paris decision, that "the peace-loving forces do not make their struggle for peace dependent on the outcome of a particular parliamentary vote. . . . It is not impossible that the French people may force the annulment of the Paris agreements." A general strike is the action for which the Communists hope.

There is little chance that the Communist agitators will bring off a general strike in Germany; and in France their power is not what it was when the trade union federation called a strike in an attempt to wreck the Marshall Plan at its outset. As for British strikes, they are, of course, welcomed in the headquarters of the World Federation of Trade Unions, and Communists are doubtless doing what they can to foster trouble. But for a strike to be really effective in Soviet eyes, it must openly support Russia's foreign policy, and should not be solely for the express purpose of higher wages. If the up train fails to run on Monday morning, it should be because the driver objects to German rearmament. And this is where British strikes must be a disappointment in Moscow.

The "Department of Misinformation" in the Soviet propaganda headquarters is doubtless working overtime. It is safe to assume that in all western countries Communists, and in particular crypto-Communists, are under orders to spread reports that rouse opposition to the treaties. They may well have some success. It is more difficult for even the most conscientious journalist to know whether a "story" that has been given to him is tendentious or twisted than it is for a trade union official to decide whether there are political motives behind agitation for a strike. Indeed, it is not the job of a newspaper correspondent to judge the effect of his message, and often impossible for him to find out whether it is entirely accurate. There will be many pitfalls to avoid in the weeks and months to come.

East German Sabre-rattling

A STATEMENT issued from Prague on the last day of 1954 followed up the threats made at Mr Molotov's conference of satellites a month earlier. It gave notice that in the event of West German rearmament Poland, Czechoslovakia and East Germany will form a defensive military alliance. Staff talks have already taken place, and will be resumed this month. In East Berlin, President Pieck and other speakers have brought in the new year with speeches about the formation of a national army and militia which will be set up if the western treaties are ratified and implemented.

How seriously should the new Communist threats be taken? As usual, there is an element of bluff in them. After the *Bundestag* approved the EDC in 1952, just as alarming statements were issued as now. General conscription seemed imminent in the Soviet zone. Field-

Marshal Paulus—now a mouthpiece for the Communists in appeals to West German officers—was brought back from Russia. But in the event, little was done. The Soviet leaders are probably not at all anxious to build up a large German force. Conceivably, the Russians are fearful lest "their" Germans should go over to the other side. It will not have been forgotten in Moscow that even a Russian general, Vlasov, fought on the German side in the war, with an army of Soviet citizens. As for a coalition with Poles and Czechs, the Russians have always shown great reluctance to allow their satellites to band together, except under the strictest supervision. And the Poles and Czechs themselves will find it hard to accept a German army as an ally.

In the meantime, the Russians are trying to make their German sabre-rattling as loud as possible by pretending that no East German army already exists and that there is no East European military alliance. This deceives nobody. The Soviet German forces have been known for years by the peace-loving name of "barrack-based police," but everyone recognises them as soldiers in their Russian-type uniforms. The force has been built up slowly, with due regard to political reliability, but it already numbers six divisions, two of them armoured. The Polish army consists of 23 divisions, including four armoured ones, and the Czech of 13 divisions, two of which are mechanised. Purely on the basis of numbers, therefore, the satellite coalition might be a powerful force, even without the Soviet divisions behind it.

Swift Answer to Malenkov

THE Foreign Office is to be congratulated on the speed of its reaction last weekend to Mr Malenkov's observations about four-power talks. The Soviet prime minister marked this New Year, like the last one, by answering questions sent to him by an American news agency, a means of catching the world's ear which evidently appeals to Moscow. Asked about his attitude towards a possible further meeting on the Berlin model between Russia, Britain, France and America, Mr Malenkov insisted that by "working to settle the major international problems by themselves" the three western powers were destroying "the possibility of holding a four-power conference." On the Far East, he said that he felt that talks with "interested powers" should be welcomed. It was of some interest that in neither case did he press the claims of the Chinese, although they themselves increasingly demand a voice in European affairs, and although it is obvious that nothing can be settled in the Far East without them.

Within a matter of a few hours the Foreign Office issued a statement in London. It reminded the world that four-power talks could not be considered till the agreement on Western European Union had been ratified. And on the Far East it retorted that, while the Geneva conference was "useful" just because it was "summoned to deal with specific problems," "it is unlikely that a conference to discuss Far Eastern affairs in general would make progress at this stage." One factor which made possible such a

rapid Foreign Office reply was the view that, since this was not a formal Russian communication to the western powers, they did not need to keep in step when answering it. The British could simply say what they thought.

A lie is the more readily nailed the more quickly it is answered. And, while in this instance Mr Malenkov was merely indulging in a characteristically suggestive misrepresentation of the facts, there can be little doubt that his words lost much of their sting when read by most of the world almost simultaneously with a western answer. Obviously haste has more dangers than delay, where policy has to be carefully co-ordinated between several capitals. But, in an age when diplomacy by propaganda has become a normal method of conducting international relations, if the Russians can be countered at once they should be. It is good that the Foreign Office has begun the new year so very much on its toes.

Bait for Farmers

ON the surface, the Labour's policy statement on agricultural marketing seems a queer document to have produced during a by-election in the marginal farming constituency of South Norfolk. It has the virtue of being fairly explicit—which will assist Labour's opponents to make political capital out of selected passages from it. It has the disadvantage—from a propagandists' point of view—that a cover has been drawn over the feather-bedding policy that it inevitably contains.

This cover—at first sight it looks very heartening—is that Labour has made a bow towards the principles of the Lucas report of 1947. It has come out in favour of independent—though Government-appointed—regulatory and trading commissions for cereals, livestock and eggs. Because of its "special and exemplary history" (in other words, its entrenched position), the producer-controlled

Milk Marketing Board will be allowed to continue, fenced in only by a revived advisory commission. This concession will certainly not satisfy the farmers who—abetted by some Conservatives—are keen to bring all agricultural marketing under their own control.

But closer inspection shows that Labour has in fact stood the Lucas report on its head, and produced a result little different from the machinery of its own postwar controls. The Lucas Committee had the reasonable idea that, in a free market, limited subsidies to agriculture would go furthest if administered by independent bodies, which should have sufficient trading and other powers to dispose of home-grown food to the best advantage. But the appointed commissions proposed by Labour would be given complete control over the marketing of all produce, both home and imported. The Livestock Commission, in particular, would be a formidable body. It would be responsible for meat imports, purchase all home-produced meat, operate all slaughterhouses and retain "a measure of control" over all meat to the retail stage; evidently not a single chop would escape its scrutiny. Bulk purchasing of imports would be resumed, and an "appropriate Ministry" (it is not stated which) would supervise the commissions. In practice the activities of these commissions would almost certainly be quickly submerged in a comprehensive, and producer-pressured, Government control.

Consumers in the Cold

LABOUR presumably hopes that its marketing proposals—when and if they are understood in the countryside—will have a nostalgic appeal to those farmers who are finding free market conditions to be tough. Farmers would again be paid guaranteed fixed prices (except for coarse grains) and sheltered from competition through import control. Additionally, the promise to abolish auction

Strikers' Resources

If the railwaymen do go on strike, they will have the following sources of income:

1. The National Union of Railwaymen's strike pay of 36s. a week. The union's total assets are £5½ million, but not all of this can be used for the strike fund.

2. National Assistance. The striker himself cannot draw it (or unemployment benefit either), but his dependants are entitled to national assistance. His wife gets nothing for the man on strike, but would probably draw the statutory rate of 31s. for a female "non-householder." For children under 5 she would get 11s. a week; for those aged 5-11, 13s. 6d. a week; and for those aged 11-16, 16s. a week. In addition she gets an allowance for rent—which may be the actual amount of the rent possibly less a deduction for the space occupied by the striker. From the total sum thus calculated any sources of income, such as the

wife's earnings, family allowances, the husband's strike pay, and any tax rebates are deducted in order to arrive at the sum actually paid in national assistance.

3. Rebate of income tax under Pay-As-You-Earn, which can be collected by the striker from the pay office of the Railway Executive. Average weekly earnings on the railways at the end of March, 1954, ranged from £7 10s. for locomotive cleaners to £11 for drivers, but let us take as an example a man who earns £10 a week. He has been paying tax as if his income would continue at that rate, i.e., as if his income for the year would be £520. In the first 40 weeks of the financial year he has earned £400, but if in the 41st week (which is next week) he is on strike and earns nothing his annual income for tax purposes is calculated at the new rate of £400 x 52. He has therefore paid too much tax and a rebate is due. If in the

42nd week he again earns nothing another rebate is due. As the table shows, this would continue at a substantial rate for the single man (who does not enjoy indirectly the benefits of national assistance), but it would quickly arrive at nil for the man who only just comes into the taxable category. The table assumes that a railway strike could hardly continue for more than six weeks (i.e., past the 46th week of the financial year); if it did the single man in our example would still continue to draw between 16s. and 18s. a week.

This battery case and aerial mast made from BAKELITE Polyester Resins are typical of the many parts developed for modern aircraft using BAKELITE materials. Products made from BAKELITE Polyester Resins are light and easily machined but extremely strong. This battery case is used on the Bristol Britannia and the aerial mast is used on the Vickers Viscount.

Hundreds of other components—both large and small—are made from the various grades of BAKELITE Resins, Laminated and Moulding Materials. The aircraft industry is just one of the many served by the Bakelite organisation.

Battery Box moulded by British Moulded Plastics Limited for Varley Dry Accumulators Limited. Aerial mast manufactured by Chelton Electronics Limited.

PROGRESS IN ELECTRONICS

The wonder of television is already lost to the millions who see and hear in their own homes events which may be occurring hundreds of miles away. It is already an accepted part of our lives, to be judged and debated not on its technical qualities, but on its value as an entertainment and its influence on our culture.

And yet what it is and what it may become depends largely upon the scientific research and manufacturing techniques that have converted light into electrical energy, and electrical energy into light.

Present day television would be impossible without the cathode ray tube. A beam of electrons, modulated by received signals, scans a fluorescent screen within the tube, and paints upon it a reproduction of the original scene or picture.

Mullard long-life cathode ray tubes are specially designed to maintain excellent picture quality over a very long period of service. Modern methods of production and rigid quality control permit large scale manufacture of tubes of consistently high performance, even though they are highly intricate and complex devices.

Mullard's contribution to the development of television is, therefore, a significant one. Great manufacturing resources are supported by extensive research and development facilities, and these are at the service of an industry which leads the world in the progress of electronics.

markets for fatstock should please the big brass of the National Farmers' Union, although not all among the rank and file. But what the package contains for consumers—and since the Co-operatives have had a hand in the statement it should contain something for them—is a mystery. The usual promise that distributive costs will be greatly reduced is only given one concrete illustration—a proposal to build modern abattoirs and utilise their by-products efficiently. Consumers are smugly told that they will not have to find the £9 million a year paid before the war to subsidise British wheat; instead they would be subject to the whims of a commission which could juggle home and imported supplies as it liked and would doubtless in addition present a large bill to the taxpayer.

It is possible, as Labour insists, that the scheme could be worked without a return to rationing. But surely nobody today believes that a state-run monopoly or monopolies for all main foodstuffs will, to quote Labour, "widen consumer choice by the rational use of available supplies"; and before the farmers rise to this well-worn bait they might reflect that it would make their prosperity permanently dependent on political favour.

Coventry and St Custard's

STUDENTS of industrial relations and the psychology of the worker have recently had their attention directed to that phenomenon of the grass-roots, that spontaneous manifestation of solidarity, the sending to Coventry of offenders against the unofficial anti-management code of the shop floor. It is not, of course, entirely new; one can hardly suppose that those heroes of the class struggle who used to drop gunpowder down the chimneys of actual blacklegs preserved a Chesterfieldian politeness towards lesser offenders, nor are manual workers the only people to make life socially unpleasant for non-conformists. The novelty lies in the pertinacity of the boycotters, in the nature of the offences penalised, and in the unmistakable fashionableness of the penalty—now being emulated, in works after works, much as bag-snatching, window-slashing, or the wearing of Edwardian dress with bicycle-chains, is emulated from town to town. One victim has just emerged, with dignity, from twelve months of silent treatment imposed because he followed the instructions of his own union against participating in a strike that had been called by a union to which he did not belong. (Another, in rather similar circumstances, committed suicide.) The latest sufferer has been a foreman who reported, as was his duty, a recalcitrant smoker in a fire-trap; the wrath of his comrades fell not on the man who was endangering their lives and livelihoods but on the traitor who gave him away.

It all seems, allowing for the difference of scale, remarkably familiar. Even so do small boys behave at prep-schools of the more old-fashioned sort. The master is the Enemy, and against that massive and unquestionable truth, that axiom of social existence, no argument about the common good, no demonstration of the practical usefulness of this or that rule or convention, carries an instant's conviction—let alone the slightest power to extenuate the crime of the Sneak. The proper chronicler of this aspect of the workers'

struggle is not in fact a Webb, a Hammond, or a Professor Cole; it is not even an Elton Mayo. It is the author of "Down with Skool" and "How to be Topp," the creator of Nigel Molesworth the Curse of St Custard's. The conclusion may not be encouraging for social democracy; and the leaders of one union—the very able Woodworkers, who last hit the headlines when they turned themselves into cabinet-makers at Scarborough in the autumn—have just recognised that fact, by stamping swiftly on such trouble in their ranks. But one may also ask whether management is quite without responsibility—even now that it has perforce discarded its cane—for a social atmosphere which produces outbreaks on the floor so precisely in the tradition of the nastier sort of eleven-year-old child.

Mr Hammarskjold Arrives

BY the time Mr Hammarskjold returns to his post at the United Nations, few people will have had a better opportunity to feel the pulse of the world. In quick succession he has been in intimate personal conversation with Mr Dulles, Sir Anthony Eden, Mr Nehru, and Mr Chou En-lai, each in their own capitals. And the outcome of his mission—to release the eleven American airmen imprisoned in China for spying—is one that must also closely concern the men in the Kremlin; for, if China's apparently deliberate attempt to provoke American anger and loss of face succeeds, it will almost certainly raise the temperature in the Far East by another degree or so. But can Mr Hammarskjold succeed? As we go to press, his actual arrival in Peking has yielded no clue, except perhaps that, while Mr Chou En-lai was not friendly enough to go to the airfield to meet the Secretary-General, his hospitality has already worn a rather better grace than that meted out in Delhi.

Mr Hammarskjold was wise to arm himself with the views of Sir Anthony Eden and Mr Nehru, both of them men who have had considerable direct dealing with Mr Chou En-lai. But the attitude he met in India was unnecessarily unfair to his mission. Mr Nehru may be excused his cool-

GOLD AND DOLLAR RESERVES
US DOLLARS (THOUSAND MILLION)

ness towards Mr Hammarskjold in so far as he himself had only just stepped off an aeroplane from Jakarta when the UN Secretary-General arrived. The Indian prime minister, however, reflected as well as led Indian public opinion—as he is so skilled at doing—in asserting that the United Nations has no right to be judge and advocate at the same time; in deducing that this UN bias only goes to show that China ought to be admitted as a member; and in assuming that the eleven airmen were indeed guilty of "espionage," in defiance of the plain fact that they were captured in uniform, and of the vital principle, enshrined in Indian law as in British, that no man may be treated as guilty until he has been convicted in a fair trial. No Indian, other than a Communist, would believe that these airmen received such a trial. The fact is that, by falling for China's tireless propaganda, some Indians have done a considerable disservice not only to the cause of the United Nations, but to their own interests in upholding that cause. Fortunately, it looks as if there has already been some reaction in India itself. There is a new feeling that a brake must be applied before events go too far.

Efficiency at Suez

THE Suez Canal Company runs its charge so smoothly that its working is taken for granted until there occurs the rare accident that happened last weekend. A loaded oil tanker fouled a swing bridge and turned it into what amounted to a steel boom, blocking passage. Ships at the rate of over 40 a day piled up at the Canal ends; the company is greatly to be congratulated on the feat of organisation whereby in only two and a half days it cleared the mess and reopened the right of way. But the incident is a reminder of the dependence of through shipping upon slender threads, many of which now lie in Egypt's hands, and all of which will do so as from 1968.

At present the Canal, although Egyptian property, has two masters, one handling its administration and day to day activity under a 99-year concession granted when it was opened, the other concerned only with the right of free passage under a permanent international treaty signed in 1888. The first—the body that showed its paces

to such effect last week—is the Suez Canal Company, Egyptian by nationality but largely French in management; when its concession expires in 1968 its responsibilities will revert to the Egyptian government, which can then choose whether to run the job with Egyptians or to employ a team such as the present one, but working in the role of a twentieth-century servant, as opposed to a nineteenth-century concessionaire. Nationalist pride will furnish no excuse, in the nineteen seventies, for failure to maintain the Canal's day to day workings at the high standard that de Lesseps' company has set.

From Blockage to Blockade

ACCIDENTAL blockage at Suez is a problem soluble by mere good management. Far less easy to resolve is the question of free passage through the Canal—which is supposedly governed by the international Suez Canal Convention of 1888, but is in fact regulated, in time of world war, by the powers that control the seas at either end and, at all other times, by Egypt's goodwill or illwill. The question is in the news again this week because Israel has once more set the Security Council the conundrum of how to deal with Egypt's discriminatory practices.

The immediate cause of complaint is the *Bat Galim*, which the Israelis despatched canalwards in September as a test case, sending it northbound with a non-contraband cargo. After routine preliminaries about quarantine had taken place according to the normal good manners that prevail at Suez, the Egyptian authorities (needing to be actively anti-Israeli for purposes of home politics) trumped up a story about firing on fishermen and impounded both vessel and crew. They have since dropped the unlikely tale of gunfire (who would fire at the farmer when establishing title to a right of way?) but they have only just released the crew and still hold the vessel. They do so in defiance, according to most opinion, of the 1888 Convention, which prescribes "free use" of the Canal at all times and for all comers.

One source of the trouble is the imprecision of the Convention itself. Its Articles I and XI stipulate that the canal shall never be used for the exercise of blockade, but its Article X allows Egypt latitude to take measures in its own defence or "for the maintenance of public order." On this latter basis, the Egyptians are able to present a case in law for continuing to blockade Israel, though whether they would win it in court has never been tested.

But even if the Egyptians were branded as treaty breakers, what would deter them from continuing on their course of hostility to Israel? Onlookers are forced to the conclusion that the major users of the Canal will take no action, other than making justified but ineffectual speeches such as that of Sir Pierson Dixon at Uno this week. To make their protests effective, they would need to be ready to impose a boycott, to build an alternative canal, or to devise such sanctions as to deny Egypt loans and grants. It is depressing, but realistic, to have to record that all practical courses are so fraught with drawbacks that they are unlikely to be adopted on behalf of Israel.

Comprehending the Comprehensives

SOME of the *idées fixes* of both opponents and advocates of comprehensive schools may be shaken by the results of a survey conducted by Dr Robin Pedley, of the Department of Education at University College, Leicester. This was recently published in the journal *Education*, and is now reprinted with critical essays from four distinguished pens.*

* *Comprehensive Schools Today*. By Robin Pedley, H. C. Dent, Harold Shearman, Eric James, W. P. Alexander. Councils and Education Press.

The fear that comprehensive schools must necessarily be of vast size may be somewhat modified by the fact that none of the fourteen schools in Dr Pedley's survey exceeded 1,500 pupils. Only in very large schools, however, is it possible (as at Kidbrooke) to appoint an administrative assistant to the head; at the other schools the head was in fact simply an administrator. Only the large school, moreover, can provide a variety of sixth-form work at all comparable with what is obtainable at a good grammar school, or avoid using senior teachers for uneconomically small classes. But Dr Pedley's evidence does not bear out the contention that in comprehensive schools bright children are held back by the less able, and in this connection it is significant that selection tests and grading are still used to place the children in sets of comparable ability. This demolishes one of the arguments most commonly used against comprehensive schools, and may reassure those who were alarmed at the London County Council's idea that certain subjects should be taught in classes of "mixed ability." On the other hand, it undermines those who base their support of the comprehensive principle on the allegedly dreadful psychological effect of being rejected for the grammar school. Which is likely to be the more deflating to the child's ego—to be placed at the bottom of Kidbrooke's fifteen-form entry or to go to a school where her distance from the top set is not so easily measurable?

Any judgments based on the survey must be tentative, since only Kidbrooke so far has been specially built in accordance with the pure theory of comprehensive schools. Most of the others were established as a practical, and sensible, response to certain conditions—for example, the scattered populations of Anglesey or the Isle of Man. The evidence as it stands supports the extremists of neither side, but confirms the view that this is a field for experiment, not for doctrinaire policy.

Broadening the Mind

SIR DAVID ECCLES had a word to say about comprehensive schools in his first speech as Minister of Education last week. He told an assembly of grammar school teachers that he would never agree to the "assassination" of the grammar schools. Of the 23 local authorities in England and Wales whose plans include one or more comprehensive schools, only those of the London County Council would involve the absorption of a grammar school into a comprehensive school. Was the Minister warning the LCC that it could expect a repetition of its experiences with Miss Horsburgh when it wanted to absorb Eltham Hill School into Kidbrooke? Or was he tilting at imaginary assailants in the Labour Party—whose official policy of organising all secondary education in comprehensive schools would in fact be as impracticable if they were in power as it is while they are in opposition?

The Minister's chief point, however, concerned the production of scientists. It is good news that he has asked the Burnham Committee to inform him how the local authorities are using their power to pay special allowances to attract science teachers, and to suggest what more should be done. But he is just as concerned about the quality of scientists, and he appealed to his audience to take action to broaden

their minds. Scientists (who justifiably point out that their ignorance of the arts is as nothing to the arts man's ignorance of science) may not quite appreciate Sir David's description of them as

the new men and women, who are putting their hands on the wealth and power but whose manners may at first be awkward and whose need is to share the grace and humanity of the past.

But Sir David was certainly right in saying that it is at the schools that any such minds need to be broadened. There is little to be said for—and much to be said against—an alternative solution that is sometimes proposed: that at the universities and higher technical colleges the already overloaded curriculum of the science student should be further burdened by compulsory lectures in the humanities.

Cabinet Making in Nigeria

As was expected, the Northern People's Congress led by the Sardauna of Sokoto handsomely won the federal elections in Northern Nigeria with 79 out of 92 seats; and now the difficult problem of creating an administration must be faced. In the Federal House, the Northerners have 79 seats; Dr Azikiwe's National Council of Nigeria and the Cameroons 58; Mr Awolowo's Action Group 21; there are 18 independents and six results to come from the Cameroons. Under the constitution hammered out at the London conference in 1953, it had been assumed that a regional party would win a majority in the federal constituencies of each region and would then nominate three ministers to the Central Council of Ministers (except for the Cameroons, which nominates one). But with Dr Azikiwe unexpectedly winning a majority both in the west and in the east, his NCNC can apparently claim the right of nominating six ministers. Thus NCNC would have a majority of ministers with a minority of federal seats. Though the constitution does not prevent this outcome, the Northerners are unlikely to accept it; they profoundly distrust Dr Azikiwe, and they particularly detest the politician who is likely to lead the NCNC sextet of federal ministers. But if they refuse to play, the NCNC cannot govern the country on a minority in the House.

The alternative seems to be for the Northerners and the Action Group to form a coalition; or for the Northerners to get a dozen or more independents to accept their whip. In either event they could claim an overall majority and ask permission to form a government (the phrase is not exact, since the Central Council includes European *ex officio* ministers) in accordance with their control of the House. Dr Azikiwe, relegated to opposition after his notable victory at the polls in the west, would certainly protest; for in his view the will of the people is not expressed in the Sardauna's following at all, since it was put into the House by a system of indirect election. The only other possibility seems to be a caretaker government with ministers representing all the parties, each of which would have to make concessions; such a government would merely hold the country together until the review of the constitution, and the decision on Nigerian independence, which are due in 1956. A peaceable outcome will to no small degree depend on the Governor-General, Sir John

Facts take shape...

Do you sometimes yawn over the facts and figures of industry? They can be hard going unless you have discovered THE FINANCIAL TIMES as a refreshing daily tonic. This well-respected newspaper—read by directors, engineers and all business men who want to keep ahead—gives industrial news a new look without sacrificing an iota of truth. There is infinite pleasure to be found in the cool clear reporting of THE FINANCIAL TIMES and in its concise articles and features. As you read, facts take shape and form, and puzzling situations become clear. In the space of a morning train journey you can absorb the essence of the day's news from industry and commerce, and appear at your office stimulated and well-informed. Try reading THE FINANCIAL TIMES every day for a week—at the end of that time we believe you will wonder how you ever managed without it.

MacPherson, who has hitherto taken the line that he plays the cards he is dealt by the Nigerians, but who will have to take the initiative to prevent a recurrence of the crisis of 1953. The election results emphasise the abiding importance of his high office, from which he is due to retire in March. His successor will need to be a man of viceregal quality to maintain Nigeria's frail unity.

Towards a European Fund

BOTH the special OEEC ministerial group on convertibility and the OEEC Council will meet in Paris next week under the chairmanship of Mr Butler. The flurry of speculation on the imminence of convertibility which accompanied the last meeting of the group in London in July quickly gave way to a loud official silence broken only by intermittent assurances that the aim had not been forgotten but that the conditions must be "right" before the plunge could be taken. These "right" conditions fall into three categories: first, the purely political ones (it is generally assumed that no major step will be taken until after the next general election); second, those which, taken together, amount to the Americans adopting what is now called a good creditor policy; third, the bundle of interrelated conditions that the OEEC working parties have been discussing since last summer. When the first condition will be met is anybody's guess. As to the second, from what has been revealed of the context of the special economic message that Mr Eisenhower is to send to Congress on Monday, and the mood of a Democrat-controlled Congress, prospects are bright that at least modest action will be taken this spring on the Randall Commission's recommendations on trade policy.

Next week in Paris some progress should be possible on the third set of conditions. The prospect is that agreement will be reached on the principles of a European Fund to take the place of the European Payments Union once the major European currencies have become convertible. The job of spelling out in detail the provisions of a formal agreement can then safely be left to experts. (At each round in the discussions on the new fund, it has become rather less like a truncated EPU and rather more like a

small, but open-handed, IMF.) There would seem little chance of finally settling the question of the trade rules for a transitional period following convertibility of the major European currencies, and the allied question of what organisation is to police these rules. The OEEC talks cannot easily be disentangled from the Gatt discussions which are resuming their inconclusive course this week. Some countries will still be reluctant to reach decisions in one organisation for fear of prejudicing their bargaining position in the other; others will hope that difficult decisions will become easier if they are again put off. Both views had much merit last July, but the time has now come for compromise and decision.

The "Green Pool" Stirs

THE "Green Pool," or Pfimlin plan, which was launched in 1951 as an agricultural counterpart of the Schuman plan, has evolved into a very different thing devoid of supra-national attributes and aspirations and covering a wide geographic area. If the recommendation of the current manifestation of the "Green Pool," the European Conference on the Organisation of Agricultural Markets, is accepted by the OEEC Council next week, this conference group will now be brought within the OEEC orbit in a semi-autonomous fashion somewhat like the Productivity Agency. Quantitative restrictions on intra-European trade in agricultural products are now the largest stumbling block to full liberalisation. If a new agricultural group within the general framework of the OEEC could succeed in liberalising trade in this sector, M. Pfimlin should have no regrets.

Structurally, the membership and active participation of the Spanish in the "Green Pool" conferences presents a new situation for the Council, but one which can probably be settled for the time being without much trouble by associating the Spanish with the work of the new agricultural committee, but side-stepping the question of their full membership in the OEEC. But, given this one foot in the door, the question of full participation by Spain would seem not far over the horizon, if the Spanish show themselves anxious for closer economic co-operation with the rest of Western Europe.

The Balkans of the West

THE assassination of President Jose Antonio Remón of Panama spotlights the explosive political conditions in the Central American republics. The murder was all the more unexpected as Panama, in contrast to its immediate neighbours, has recently enjoyed a period of political calm and increasing financial stability. Under President Remón's guidance, Panama has successfully re-negotiated its agreements with the United States over the rent for the Canal territory. As yet there is no indication that the assassins had revolutionary aims, and the former vice-president, Sr Jose Ramón Guizado, has taken over without opposition.

One can only hope that Panama will remain a steadying factor in the Caribbean, for there are signs of trouble to the north.

Trouble has for some time been brewing between President Figueres of Costa Rica and President Somoza of Nicaragua. Last August, only American pressure prevented a clash at the border. Much of the hostility is due to General Somoza's belief that his neighbour is supporting exiles who are planning to overthrow his "strong-man" regime. Costa Rica has been living in a state of siege, and Nicaragua's recent acquisition of jet planes from Sweden has naturally heightened the tension. The republic of Honduras is also involved, for it is sheltering, much against its own will, a growing band of Costa Ricans evidently intending a coup against Sr Figueres. On its northern border, moreover, Honduras is playing uneasy host to many supporters of Colonel Arbenz, the pro-Communist president of Guatemala who was overthrown with such fracas only six months ago.

In Guatemala itself a trumped-up election and a new regime based on American support have, so far, maintained tranquillity. The United Fruit Company has had restored to it the lands confiscated by Colonel Arbenz; and the latter's discovery, while touring Europe, that he is of Swiss nationality adds a final touch to the present Central American pattern of violence mixed with absurdity. All this might not matter so much to countries on this side of the Atlantic if it did not mean that a vital strategic region and a sizeable part of the dollar market for sterling goods continues to lag behind the realities of world affairs.

Estates Under the Hammer

LONDON, as well as the countryside, is suffering from the break-up of large private estates that are sold to pay death duties. In the last two years a large part of the Portman estate has been split up among some hundred separate owners, and the same fate overhangs the Westminster, Bedford and the other large urban estates. This process of dissolution is already spoiling the amenities of what were once among the most attractive and graceful residential areas in London. A single ground landlord can maintain standards far more effectively and less contentiously than can the town planning authorities; in the absence of such control, parts of the estate become permeated by a miscellany of styles and uses that ruins the unity of the original lay-out.

Part of the trouble is that a fairly substantial shift of capital from urban to rural properties is now in train; agricultural land is subject to a reduced rate of death duties (at present 55 per cent of the rate levied on most other forms of property), and the Country Landowners' Association last year called for an even more generous privilege—which would make the situation in the urban estates worse. One way out of the dilemma would be to grant this death duties concession to big estates generally; but this hand-out—to the dukes who own parts of London—would hardly be practical politics. The alternative of public or municipal ownership, which has been much aired in Labour circles, would be economically unsatisfactory; public management of property on such a scale—

besides tending to be remote, heartless and pedestrian—could easily be swayed by political breezes to the detriment of sound estate management. The best middle course would seem to be to facilitate the promotion of trustee bodies to take over the management of private estates, with the present owners retaining their financial interest, accepting certain obligations about maintenance of standards and limitation of yield, and with some death duties concession applicable only to estates managed in this way.

Not to be Prescribed

RAYNAUD'S phenomenon has nothing to do with French politics. It is a disability of the hand, popularly known as "dead fingers" or "white fingers"; its symptoms are an extreme pallor and numbness. The phenomenon occurs widely among the population at large as a result of exposure to cold, but it can also be caused by the use of certain vibratory tools. The question to be decided by the Industrial Injuries Advisory Council was whether Raynaud's phenomenon should be a prescribed disease under the Industrial Injuries Act.

Under the Act, a person can claim benefit for an injury or for disablement if it has arisen by accident "out of and in course of employment," or if it is due to the effects of one of the diseases prescribed in the regulations. If the disease causing the disability is not prescribed, a claim to benefit will still be allowed if the disease can be shown to be an accident arising out of employment—thus, a day nursery nurse, who caught poliomyelitis from an infected child, was allowed benefit—but it is not so easily established as in the case of a prescribed disease. In a claim brought under the old Workmen's Compensation Acts, the Court of Appeal had decided that Raynaud's phenomenon was the result of a series of tiny blows—the vibrations—each of which was an accident. But doubt was thrown on this principle by subsequent decisions; and after workmen's compensation had been superseded by the industrial injuries scheme, the commissioners decided, on an appeal before them, that incapacity due to Raynaud's phenomenon was the result of a continuous process, not of a series of accidents. Hence the appointment of a committee to decide whether the phenomenon should be a prescribed disease.

In coming to its decision, by a majority, that the phenomenon should not be prescribed, the committee bore in mind the principle that a disease should be prescribed only if it is a real occupational risk and not a risk common to all persons. (Tuberculosis is a common risk, and is a prescribed disease only for certain workers in close contact with the infection.) The majority report also decided that the technical difficulties of diagnosis and assessment of disability were too great for the phenomenon, which is only intermittent, to be prescribed. In any case, the degree of disability is normally small, rarely causes loss of employment or earnings, and would attract a lump sum gratuity rather than regular benefit. But these considerations will not weigh with the trade unions, which naturally prefer that ninety-nine non-justifiable claims should be allowed than that one meritorious claim should be rejected. The last has probably not been heard of Raynaud's phenomenon.

Letters to the Editor

Hospital Finance

SIR—In your short paragraph on the hospital costing returns, you note that the Ministry of Health thinks that the hospital authorities ought to be able, by comparing the costs of their own hospitals with those of similar units, to see where economies can be made. "But," you ask, "what incentive have the hospitals for making economies when they cannot retain the fruits of them and use them for badly needed improvements or expansion?"

It seems to me that your question is unrealistic. I cannot claim to know exactly how the system has been working at every point, but there is certainly nothing in the methods of financial allocation adopted by the Ministry to justify the assumption on which your question is based. The Ministry each year makes what, for all practical purposes, amounts to a block grant to each of the Regional Boards, and the Boards in their turn can, if they wish, make the same kind of grants to Hospital Management Committees. There need be nothing to prevent Hospital Management Committees from using economies achieved under one head for application to other desirable purposes. (Powers of virement can be freely given.) For several years now on the Regional Board of which I am Chairman we have been impressing on our Hospital Management Committees that, since they cannot expect the total allocation for the hospital service to be substantially increased year by year, their best chance for opening ways to develop new improvements is to find economies in running their existing services, and we have given them full assurance that if they can achieve such economies it will be they who will be allowed to benefit from them. It is, of course, true that unspent balances of the yearly allocations cannot be carried forward to succeeding years; but hospital authorities which have efficient control of their financial situation and have plans worked out in advance need not get into the position of ending the year with substantial unspent balances. It is also true that money saved from the "maintenance" allocation cannot be used for capital expenditure, which is a real and, in my view, unnecessary restriction. But this raises a separated and limited issue. It does not affect my main point, which is that, broadly speaking, the assumption underlying your question is not necessarily true and that one of the chief tasks for hospital authorities is so to handle the money which the Ministry gives them as to make it completely untrue.

Your paragraph asks the further question: "What incentive has the Ministry to encourage hospitals to use their beds more fully when it means that the total bill to be presented to the Treasury for the hospital service will be even higher?" This is another unrealistic question. Whatever the lack of incentive may be, the Ministry is in fact constantly urging us to use our existing beds more fully instead of asking for more beds. In the long run, this must mean total economy.

Your paragraph ends "These costing returns are full of interesting information but they have little bearing on the main problem of hospital finance." There are indeed other problems (notably how to get more capital to improve ill-designed buildings and obsolete equipment) but it is a pity to belittle what the hospital authorities themselves can do by extracting lessons from the costing returns. It is true that the value of these has limitations, the principal one being that they only give one bearing on the situation, and can take no account of the quality or quantity of service rendered. (To give a crude illustration, a hospital which takes an average period of 24 days to deal with a certain type of case may well show a lower cost per bed per week than one which turns over similar cases in 12 days). Other types of record must be used in combination with the costing returns, and a great need to-day is to devise some method of assessing "work units" in relation to money spent. In the meanwhile, however, as providing pointers to areas which *prima facie* call for critical investigation the present returns are of real value.—Yours faithfully,
GEORGE SCHUSTER
London, S.W.1

Road Haulage Policy

SIR—In your issue of December 25th you referred in Business Notes to Mr. Quick Smith's interesting paper. If anyone is contemplating amending legislation to authorise British Road Services to retain more vehicles, there is a point of great importance to be borne in mind. The Transport Act, 1953, is a combined road and rail Act, and it concedes unprecedented freedom to the railways as regards rates in return for real competition from roads. The one would never have been agreed without the other. If BRS were to retain a huge trunk service nucleus, there would be far too much risk that in hard times the British Transport Commission would take advantage of its position of virtual monopoly and arrange road and rail rates non-competitively. If this hap-

pened, traders everywhere would rise up and demand the re-constitution of the old Railway Rates Tribunal or its equivalent.—Yours faithfully,

NORMAN KIPPING
Federation of British Industries

Twenty Republics

SIR—Your article of November 27th raises some of the problems I am facing daily as an exporter to the Americas. The clamour for official support is one example. Illusions are bred by recurring reports about negotiations and goodwill missions. The immediate results are inevitably disappointing—perhaps an extra few licences from Argentina.

We ourselves would not at present encourage large shipments to Bolivia, Brazil and Chile. The other six Republics with import controls (Colombia, Ecuador, Mexico, Nicaragua, Paraguay, Uruguay) do not seriously discriminate against us. We could certainly have no complaints against the ten countries (Costa Rica, Cuba, Dominican Republic, Guatemala, Haiti, Honduras, Panama, Peru, Salvador, Venezuela) with free imports. Incidentally, some of these have on the statute book penal duties for countries which buy too little from them; official intervention might bring the dormant clauses to life against us.

Differential exchange rates are not as common as generally believed. They may breed some fraudulent competition, but are fundamentally no different from the currency switches practised by quite respectable European countries. Neither are frozen assets a widespread disease. There were delays in Colombia, Costa Rica and Chile, but Brazil is at the moment the only bad case.

The Twenty Republics are not likely to change their trading methods. Unless we choose to stay out, we should have long ago adapted ourselves to inescapable realities and at least should have done away with handicaps, from which our competitors do not seem to suffer.

Unsuitable literature is an obstacle easiest to remove. A buyer in this country would be surprised to find in his mail a quotation in German with centimetres, litres, kilogrammes and D-marks. We do, however, expect the importer in Caracas to know English and to be initiated in the mysteries of imperial quarts and hundredweights.

Our price conventions mainly suit the manufacturer who maintains an export department, employs agents overseas, sends out travellers and carries credit risks. If he cannot do all that, most associations' rules will prevent him from enlisting the services of a competent export merchant. This form of restraint of trade clearly benefits continental competition and revision is overdue.

With the largest merchant fleet in Europe, we provide totally inadequate services to the Caribbean and none at all to the Central American Pacific Coast. German, Dutch and French lines have regular direct sailings, whilst we rely on time-wasting transshipments in New York or Cristóbal.

The removal of obstructions—some of our own creation—will not in itself bring a flow of orders, but we should at least be competing on something like equal terms.—Yours faithfully,
L. SHIPMAN
London, W.14

Books & Publications

Personalities of the Civil War

THE KING'S PEACE, 1637-1641.

By C. V. Wedgwood.

Collins. 510 pages. 25s.

THE appearance of a new book by an historian of the seventeenth century as accomplished as Miss Wedgwood is very welcome. Opening in 1637, when Charles I took his first step towards the scaffold by forcing the Prayer Book on the Scots, and ending with the Grand Remonstrance, it is the first of several volumes designed to cover the vital and controversial period of the Civil War and the republican experiment. Since Gardiner wrote his majestic, scholarly and ponderous narrative, historians have concentrated upon interpretation. Their disputes over the role and social fortunes of the gentry, the relation of religious sentiment to class structure and the inevitability of the revolution have made the flames of controversy burn as brightly as did the camp-fires of the opposing armies.

Miss Wedgwood has not added fuel to the flames: she has neatly skirted them. She will not impose upon the past theories which contemporaries "would neither recognise nor accept" and which make history "merely the subject of our own analytical ingenuity or our own illusions." She is avowedly more interested in the behaviour of men as individuals than as members of groups or classes; and she rejects the search for underlying causes in favour of a rigorously chronological narrative. Thus she has returned to the method of Gardiner, though she disclaims his moral certainty. Gardiner, a member of the obscure sect of the Irvingites and claiming descent from Cromwell, sympathised with the Puritans and with the architect of revolution, John Pym. Miss Wedgwood admires Strafford and enjoys displaying the incandescent world of the court.

Miss Wedgwood's predilections give colour and vitality to her narrative, and she can evoke personalities with sensitive perception. Gardiner wrote despairingly of the anonymity of thought and character in Scotland: "Argyle and Montrose stand out with distinct characters. The rest are scarcely more than names." But Miss Wedgwood is not defeated: Huntly, Aboyne, Traquair and others come tumbling buoyantly alive from her pages. Johnston of Warriston was for Gardiner only "the shrewdest of lawyers": Miss Wedgwood uses his journal to reveal that dangerous seventeenth century phenomenon, the man who claimed "great liberty, freedom and familiarity with my God." And this power to

recreate personality enlivens and illuminates her treatment of foreign policy, rightly stressed as a major cause of the king's unpopularity. Adhering strictly to chronology, her narrative is deliberately and effectively managed to give an impression of "vigorous and vivid confusion." January, 1641, sees the Commons making an order for the reglazing of their broken windows; the passage of the Triennial Bill; a demand for the law to take its course against a Jesuit; and also that evening when Sir John Suckling attended the marriage feast of Lord Broghill and so came to describe "one of the prettiest brides in English poetry."

Although this method reveals the "immediate pressures and confusions," its drawback, as Miss Wedgwood herself admits, lies in the kaleidoscopic changes of scene. Not only analysis but also the grouping of related facts have to be sacrificed; and the treatment of Scottish issues suffers particularly. Nor is it true that contemporaries were always unaware of the problems that now interest historians. The role of the gentry was not invented by Professor Tawney. Windebank, Secretary of State, spoke of how "that pig of a Henry VIII" had enriched for his own support the gentry who were now Charles I's greatest enemies. In her preoccupation with the court Miss Wedgwood passes too cursorily over those outside it, such as the Earl of Bedford, whose death in 1641 can be held to be one of the accidents that made the Civil War inevitable. The greatest weakness lies in the treatment of economic affairs. There is not enough stress upon the business depression of 1640 nor upon the rise in the price of consumer goods, itself the result of government policy. In explaining the unpopularity of Strafford Miss Wedgwood does not mention his support for a proposed drastic debasement of the coinage and his suggestion that the good coin be reserved for the soldiers' pay; nor his advice to hang some of the City aldermen. She suggests that an efficient Lord Treasurer, perhaps Strafford, might have saved the monarchy, but, though aware of corruption at court, she does not investigate its cancerous spread, which both alarmed contemporaries and interests modern historians.

Those who agree with Dr Johnson that "there is but a shallow stream of thought in history" may be fortified in their belief by this book. But all its readers should enjoy the lively narrative and be grateful for portraits of the court as delightful as those of van Dyck.

SIR—In your article of November 27th I felt that you did less than justice to Peru in dismissing it as "a disappointing market in the past three years," although it "has struggled gallantly to keep its trade doors wide open." I wonder how many of your readers realise that in the last four years there has been no exchange control and virtually no restrictions on imports.

Of course, the market may be thought disappointing compared with the palmy days of 1950, when import restrictions were abolished for soft currencies, including sterling, and when American competition was thus circumscribed and German competition not yet felt. But if the word "disappointing" should be applied to anything, it should be to the performance of the British exporters. The 1954 figures up to date are even worse than the 1953 figures; exports to Peru were rather less than £5½ million for the first ten months.

In Peru, with its free economy and absence of bilateral deals, the discouraging factors which elsewhere may be pleaded in excuse do not apply. I believe that the main cause for the decline in British exports to this market is that exporters do not realise the particularly favourable conditions obtaining here. As a small example of their apparent indifference, this Chamber some time ago sent out 480 letters to United Kingdom firms suggesting associate membership. Acknowledgment of the letters was received from only 117.—Yours faithfully,

S. J. OTTIKER

British Chamber of Commerce in Peru

Victory and Defeat for Dr Adenauer

SIR—What did Mark Twain say about statistics? In your issue of December 4th you say "The Socialists lost heavily in Hesse in comparison with the last Land election, partly owing to the failure of the government's experiment in nationalisation. In Bavaria, they also lost (on the same comparison . . .)"

True, the Socialists did drop in Hesse from 47 seats out of 80 to 44 out of 96, and in Bavaria from 63 to 61. But in votes they declined in Hesse only from 44.4 per cent to 42.6 per cent. (And although their vote declined relatively, it actually increased by 244,000.) The failure of nationalisation evidently affected the opinions of less than one-fiftieth of the electorate. In Bavaria, the Socialist vote actually increased slightly from 28.0 per cent to 28.1 per cent.—Yours faithfully,

London, S.E.26
EDWIN CHAPMAN

Constitutional Monarchy

FAIRER SHARES.

By John Spedan Lewis.

Staples Press. 253 pages. 8s. 6d.

IN "Partnership for All" Mr John Spedan Lewis, founder of the John Lewis Partnership, expounded the principles, and gave the history, of his own organisation. In this volume he draws on his experience to provide a constitutional theory and a set of practical rules for "partnerships" in general. Out-and-out industrial democrats have never liked the John Lewis Partnership, and indeed it is not an industrial democracy. It is a well-governed constitutional monarchy in which the ultimate authority rests firmly with the monarch—the Chief Executive—subject to a range of safeguards against tyranny, inequity and incompetence which differ from the normal conventions of "good" employment mostly in being written down and embodied in a legal settlement.

The political theory of the "partnership" has some affinity with that of Hobbes—the sovereign's power is justified by a general covenant for mutual benefit which concentrates authority in his hands. He exercises this authority inside the framework of a constitution which both sets limits, wide but definite, to his discretion, and provides for representative bodies to advise and to wield delegated powers. Notably, this constitution limits the inequality of gains within the "state" and forbids the sovereign to compromise the "state's" independence by bestowing civic rights (i.e. voting stock) on outsiders. There is no question, however, of the sovereign's office, or of his delegates' offices, being made elective, nor of his will being over-riden, so long as his decisions are constitutional, by any majority vote. Mr Spedan Lewis does not regard the peculiarities of the John Lewis Partnership's constitution as sacrosanct, nor the concentration of power for which it provides as necessarily essential in all times and places; a mature and stable partnership might well, with freedom broadening down from precedent to precedent, succeed in accomplishing the transition from, as it were, 1688 to 1832 or later. But for the time being this is, he opines, the biggest dose of democracy that a competitive commercial concern can safely take.

This is a suggestive, intelligent, and highly practical approach to the sociology and politics of industry; and the experience of co-operative experiment bears out Mr Spedan Lewis's conclusions to the hilt. His detailed observations on internal power relationships, on the rôle of criticism, on the technique of two-way communications, on the criteria of success, are full of good sense and experienced wisdom. If the John Lewis Partnership, despite more than its share of ill luck, is a buoyant and expanding business enjoying a great fund of customer goodwill, it is easy to see why.

It is a thousand pities, however, that

Mr Spedan Lewis should choose to be his own propagandist. That his implied economic theory is naïve does not matter so much; it only leads him to suppose his new deal more of a panacea than it is. That his style is downright bad whether judged by literary or by journalistic standards, being tortuous, clumsy and deoxygenated, is certainly regrettable; but bad style is unfortunately nothing unusual. The real trouble is harder to define; as a sighting shot, one might call it euphemism. The word "partnership" itself denotes something a little closer to the status hitherto so called than the word "democracy," in "people's democracy," bears to the democracy of the West; but not much closer. However impeccable Mr Spedan Lewis's sincerity, it has a bogus ring in the public ear. His addiction to tentative, conditional and vaguely phrased statements has a rather similar effect; "it may be found," "some partners might feel," "decisions will presumably be influenced"—the reader grows increasingly suspicious that these modest suggestions express in reality the cast-iron dogmatism of the successful and authoritarian Old Man, whose subordinates have long since learned to translate "Might it not be better if . . . ?" into "Get going and don't argue." Unfair? Unjustified? Very possibly. But among the jobs which the Chief Executive certainly ought to delegate is that of public relations officer for the cause of partnership in industry.

Postwar Japan

TYPHOON IN TOKYO.

By Harry Emerson Wildes.

Allen and Unwin. 361 pages. 18s.

THOSE who can survive without exhaustion 150,000-word doses of the racy and staccato slickness cultivated by *Time* will be entertained and informed by this survey of Japan from the surrender to the spring of 1954. Mr Wildes, if he has little of importance to say, has much that is interesting to tell. The events he chronicles cover a wide field: land reform; the Emperor; the mechanisms of domestic politics; food supplies; local government; vice; Communism; town planning; the police; recent anti-Americanism; and, as a recurrent theme and one with which his own Occupation experience left him well equipped to deal, the rivalries and frictions within Headquarters out of which Occupation policy fitfully and haphazardly emerged. Each chapter is packed with statistical information which, if sometimes ambiguous or inaccurate, and sometimes speciously precise to the point of absurdity (9,242 people, we are told, took part in 81 Communist riots in February, 1950), is generally apposite and illuminating and not easily available elsewhere.

But from the wealth of factual trees the shape of a wood never emerges. The author seems, on the whole, to prefer the Occupation's later, more conservative, to its earlier reformist phase. But we are never sure; for in

THE ECONOMIST, JANUARY 8, 1955

all the lively narrative of sparring within GHQ, or between GHQ and Washington or the Japanese Government, there is rarely any hint of the basic principles, motives or policy considerations involved. Despite the wide range of his coverage, the important field of education is entirely omitted; the discussion of party politics avoids any consideration of the democratic left; industrial deconcentration appears not at all and trade union development only peripherally in relation to the civil service and the "red menace." The selection of topics is, in fact, largely by "news value" criteria; and since the book rarely leaves front-page level the reader will look in vain for any assessment of the changes that have taken place in the distribution of political and economic power since the war, or of the way in which the experiences of the last decade have affected the outlook of the Japanese peasant or school-teacher or industrial worker.

Nevertheless, a general conclusion is pulled out of the hat in the last chapter. Despite the ineptitude of the higher officials of the Occupation, the "middle brass" and a cooperative Japanese populace have between them achieved, not General MacArthur's "spiritual revolution," but at least a "Renaissance." That Japan is today a less regimented, less authoritarian and in many ways a more healthy society than it was nine years ago few would dispute; but legitimate doubts may be aroused by the author's resounding conclusion that the Occupation experiment offers strong evidence "that honest people of goodwill, working harmoniously, can build a world of peace and fellowship." No one could do more to foster such doubts than Mr Wildes in his preceding thirty chapters.

Watching the Rehearsal

MY MISSION TO SPAIN.

By Claude Bowers.

Gollancz. 453 pages. 21s.

THE Spanish civil war of 1936-39 belongs to history, and history brings with it its own imperatives. Yet there is a certain melancholy interest attaching to this honest, if pedestrian, account of the actual facts of eighteen years ago and more, which were then so much obscured by the clouds of propaganda and self-delusion. For it is now plain as daylight that those were right who maintained that the Spanish bloody assizes, in their international aspect, were "the rehearsal for World War II" (the author's sub-title).

Mr Bowers was United States Ambassador to Spain from June, 1933, to April, 1939. He waited fourteen years before publishing his story—until his retirement from the United States foreign service and out of deference to Britain, whose Government, in the person of Mr Chamberlain, he scourges. This "Jeffersonian democrat" never had any doubt about the purpose of the onslaught against the democratic institutions of Spain, of which Spanish poli-

ticians of the Right from 1931-36 were the convenient tools; nor does he mince his words about the hollow sham of the Non-Intervention Committee expedient. When he returned to the United States, after the fall of Barcelona, he tells us, President Roosevelt handsomely admitted to him: "We have made a mistake; you have been right all along." Still more revealing is the comment by Mr Cordell Hull in his memoirs:

At the State Department, while recognising that what Bowers had to say about Germany and Italy was true, we had to pursue a broader course, which recognised the grave danger that the civil war in Spain might erupt into a European war.

The tragedy of it all was that through ignorance, malice and a pathological fear of Communism, on which propaganda battered, substantial sections of opinion in Europe and America denied the unassailable facts about Spanish politics, the non-existence of Communism in Spain before the military rebellion, the Italo-German fishing in troubled waters, and so on, and, later, refused to acknowledge the relative insignificance of Russian help to the hapless Republic (Russian war material was sold, not given), which was eventually attested by the League of Nations Military Commission. Here is where Mr Bowers's book might have been a most valuable vehicle of "de-bamboozlement."

Unfortunately, the author, a most unorthodox Ambassador, who really did go and see things for himself up to the civil war (thereafter he was penned by diplomatic expediency in St. Jean-de-Luz), presents his facts in a partisan tone and trivial manner, intermingling pertinent political observations with platitudinous travel-talk. Nor does he draw on his actual despatches, so that the net effect, for European readers at all events, is jejune and sadly unimpressive, indeed at times what the Spaniards call *contrabroadente* (having the opposite effect of that intended).

Laws of Ethiopia

THE ETHIOPIAN EMPIRE, FEDERATION AND LAWS.
By Nathan Marein.
J. Vurheim and Son, Ltd., Rotterdam.
455 pages.

ETHIOPIA, which is rejoicing in a coffee boom and in prosperity, is included in the itinerary of the British trade mission that is to visit north-east Africa early this year. It is therefore opportune that a book has been published which is a guide to its legislation and administrative regulations. It is compiled by Mr Nathan Marein, who, some years ago, published a handbook on the laws and judicial system of Ethiopia. He was an advocate in Palestine, has been in the Ethiopian service since the return of the Emperor in 1941, and is now described as Advocate-General and General Adviser to the Ethiopian Imperial Government. He sets out a full paraphrase

of some of the principal enactments, particularly those concerning the judicial system and the Court procedure, both in Ethiopia and in Eritrea. But in other cases of the fundamental laws, e.g., the constitutions of both countries, he only summarises the table of contents and cites two or three articles. He has aimed at stating what commercial law there is, but not giving the law itself. It is notable that income tax was introduced only in 1944 by a Proclamation of the Emperor. Proclamation is the regular form of legislation.

This new guide to the law contains much fresh material consequent on the enlargement of the Empire. A chapter has been added, for example, concerning maritime laws. This lays down rules such as those about registration and transfer of ships, international conventions, charter-parties, average contribution and territorial waters, etc. The law about administration of justice in Eritrea is a legacy of the British Administration which continued up to the moment of federation. Mr Marein gives an interesting history of the Government during the British occupation; and this last law, for which the Administration was responsible, is designed to preserve the essential principles of the independence of the judiciary. The English rule of precedent is maintained by an article, which is that stating: "a decision of the Supreme Court upon any question of law shall constitute a precedent binding upon all courts in any matter or cause in which the same question may arise."

A valuable appendix to the book contains the report of the United Nations Committee for Eritrea and the text of the Federal Act ratified in September, 1952.

Shorter Notice

POWER TODAY AND TOMORROW
By F. Sherwood Taylor.
Frederick Muller. 192 pages. 15s.

This book is in the tradition of Arthur Mee rather than of Palmer Putnam—but is none the worse for that. Its account of "the application of energy to human needs," that is to say, is concerned with how people apply energy today, rather than with how much of it they apply now and may need to apply in the future. It gives a simple and useful survey of the technical apparatus used in the various fuel industries and in consuming the fuels they supply, seldom entering into questions of cost. Where it does so—for example, in comparisons of various methods of domestic heating—its figures, perhaps inevitably, are too generalised to be useful. But its real value lies in setting out briefly and clearly, for the ordinary consumer of fuel, some of the elaborate and arduous processes that underlie the provision of the heat and power on which industrial civilisation depends.

LEADERS OF BRITISH INDUSTRY

A study of the careers of more than a thousand public company directors

by

G. H. COPEMAN, Ph.D.

How many of the directors of large British companies are accountants, lawyers, engineers, scientists? How often during their careers did they change their jobs? What sort of education did they have? What proportion started work in a small firm; what proportion in a large firm? At what age did they receive their first board appointments? How many are the sons of business men, professional men, etc.?

Answers are given to these and other questions in the first major study of the careers of directors of large British companies. This book should prove of interest and value to those who have already achieved the responsibilities of leadership. But it should be of even greater value to the younger executives who aspire to leadership, and who wish for guidance from a broad picture of their present directors. Academic readers should also find the book a useful starting point for further studies of leadership.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

State of the Union

Washington, D.C.

"GOOD hard honest work that leaves neither time nor breath for any nonsense" might have been in President Eisenhower's mind when he supervised the drafting of the Message on the State of the Union which he delivered to a joint session of Congress on Thursday. As politicians were assembling to organise a Democratic Congress and listen to the programme of a Republican President, there was much talk of forswearing "politics." Senator Lyndon Johnson, the new leader of the Democratic majority in the upper house, dissociated himself from the view, which he attributed to the late Senator Taft, that the duty of the opposition was to oppose. Mr Rayburn, the new Speaker of the House of Representatives, was promising to look upon the President's recommendations with sympathy. But these sentiments sound rather too much like cobblers undertaking not to use their last.

However, with some forty or fifty separate legislative proposals, many of which call for hard work in hammering out details, but few of which provide an excuse for ideological passion, President Eisenhower has done his best to provide boisterous legislators with exercise. This year's presidential programme, presented only in general terms in the message, is cut of the same cloth as last year's. Some old favourites are still there: home rule for the District of Columbia, whose inhabitants paradoxically have no vote; statehood for Hawaii; and a constitutional amendment that would lower the voting age to eighteen. For none of these can the chances be rated as high; Southern Democrats, who possess many of the key positions in the new Congress, have a way of disposing of them as quietly as if they were drowning kittens. The Territory of Hawaii, which is likely to send two Republicans to the Senate, will only get admitted to statehood if the Administration finally decides also to back the admission of Democratic Alaska.

Some of the items on President Eisenhower's list of social legislation should draw broad support. For instance, Senator Holland of Florida, an arch-conservative, is enthusiastic about road building and federal aids to education stand high on the list of Senator McClellan of Arkansas. The reference to the anguish from state and local authorities all over the country who are wrestling with the rise in the school population, it had been thought that President Eisenhower would wait until after the White House conference on education which is to meet next November.

Last year, President Eisenhower found it necessary to

establish the fact that he was against "socialised medicine," but he has asked Congress to have a second look at his plan for curing by kindness the inadequacies of private enterprise in the field of health insurance. This, and various other minor prescriptions from the Administration's medicine chest, seem hardly commensurate with the bald, and by no means exaggerated, statement that there are fundamental inadequacies in the nation's health services. It is difficult to see how the proposed measures "constitute a comprehensive programme holding rich promise for better health for all our people." But perhaps, in the light of the extraordinarily unscrupulous propaganda with which the subject is choked, this is the most that can be aimed at realistically.

Although the liberals in Congress expected slim pickings from the State of the Union Message, some of their favourite causes have not passed unmentioned; the President suggests a rise in the federal minimum wage from seventy-five to ninety cents an hour, some new compensation and safety measures for workers, a not very far-reaching amendment of the Taft-Hartley labour law and the safeguarding of union members on strike. The perennial fight to keep going a modest programme of public housing for families with very low incomes is also to be renewed, and the President will press for the removal of some of the more noxious and internationally embarrassing features of the immigration laws. It is evidently hoped that it will be possible to divert Congressmen from farming areas from renewing the old fight over agricultural subsidies, by putting them to work on new proposals which would bring special help to really small farmers, and to farmers of all kinds who are in trouble on account of floods or drought.

★

Apart from this catalogue of measures rebaked after being left to go stale by Congress last year, the message contained two major legislative proposals about which much is known already—the Randall Commission's proposals on reciprocal trade, and the new manpower scheme for the military forces. It also contained a studied defence of three controversial aspects of the Administration's policy and an appeal to both parties to "avoid paralysis of the will for peace and international security" and to co-operate with the executive branch of the government.

Three matters on which President Eisenhower felt it necessary to explain himself at length were his conciliatory foreign policy, his cut in the size of the Army, and his

attitude towards the proper role of the federal government in developing the country's natural resources. This latter issue is likely to be the major subject of partisan contention in the new Congress. With regard to the first, President Eisenhower took up the phrase used by Senator Knowland when he demanded a complete review of American foreign policy. The President conceded that all present policy could lead to was "merely world stalemate," but he insisted that it is with this stalemate that the American people must learn to live. He pointedly emphasised the merits of working within the United Nations.

Secondly, the President took upon himself the responsibility for that military redeployment at the expense of the Army which is reported to have dismayed General Ridgway and which Democrats on the armed services committees are certain to query with vigour. In anticipation of their scrutiny, an exchange of letters has been released in which Mr Wilson, the Secretary of Defence, is displayed making a delicate inquiry as to whether the august author of the decision would commit himself about it on paper. The President obliges with a letter setting out his reasons more fully than in his speech and throwing his full weight as a five-star general behind his civilian function as commander-in-chief. The President's views will be anxiously debated, but it is hard to see how Congress can gainsay a man of his military experience.

When the Democrats challenge President Eisenhower on natural resources, however, he will be credited with less infallibility. He used his message to set out once again his policy of "partnership" for development between private companies and local, state and federal governments. Despite some electoral setbacks on this issue—notably in the decisive senatorial contest in Oregon—the Administration clearly has no intention of giving way for the sake of a quieter life. Although past Democratic Congresses crippled the development of public power by stopping appropriations, it is in this sphere that speech-day resolutions not to play politics are likely to be most speedily forgotten.

What are the prospects for civilised coexistence between the "two governments" in Washington? There is nothing in the programme outlined by the President that should give Democratic leadership an excuse to refuse the White House a large measure of legislative initiative. It will, of course, revert to the Democrats when they can claim, as over reciprocal trade, to be more pro-Eisenhower than the Republicans. The main test of the quality of this Congress will be how soon it can get down to the laborious task of working out the President's programme, or how much time it will waste over such laboured archaisms as a revised version of Senator Bricker's amendment to abrogate presidential powers in foreign affairs.

Neither Brains nor Trust

MR STASSEN has added to his staff in the Foreign Operations Administration Mr Wolf Ladejinsky, probably the foremost American expert on the vital problem of land reform in Asia. Mr Stassen was able to make this fortunate acquisition because the Department of Agriculture, although Mr Ladejinsky had been serving with distinction as agricultural attaché in Tokyo, had decided that he was a poor security risk and had dismissed him. The resulting uproar, and the quick retreat on the part of the Administration, illustrate once again the vicious stupidity of present security regulations.

Mr Ladejinsky was first chosen for his post in Tokyo by General MacArthur and he was twice cleared by Mr Scott McLeod, the grand inquisitor of the State Department. But Mr Milan Smith, assistant to the Secretary of Agriculture, and Mr John Cassidy, that department's new security officer, thought otherwise. After all, Mr Ladejinsky had only arrived in the United States in 1922 and had relatives in Russia. Moreover, he had been so disloyal

as to visit them in 1939. Finally, in Mr Smith's dossier

"That's the Kind We Want—You Can See Just What He's Not Thinking"

Herblock in the Washington Post

was a letter from a White Russian emigré denouncing Mr Ladejinsky because people born in Russia are always dangerous and Jews born in Russia are positively a menace.

The release of this letter unleashed a storm. Led by Senator Humphrey and Representative Judd of Minnesota, political forces rallied to Mr Ladejinsky's defence. Mr Benson, the Secretary of Agriculture, realised too late that delicate personnel questions must not be left to the zeal of inexperienced young officials. If anything, Mr Ladejinsky emerges as fully vindicated. But the whole affair should never have arisen and for the few cases in which public opinion and organised support have obtained a reversal of administrative injustice, there are many others in which loyal public servants have been dismissed without due process of law. Is it not time that President Eisenhower himself should look more closely at the seven-year-old loyalty programmes under which nearly ten million Americans (who have some connection with "classified" work) are liable to dismissal without notice or appeal?

Bulls Stampeded

THE bulls of Wall Street, racing uphill at a steady clip despite professional warnings, were stampeded on Wednesday by shots from the chief rancher at the Federal Reserve Board. The Board wants to keep the bulls grazing on a plateau and is trying to avoid a continued rush followed by a sudden plunge over the precipice into the

gulch where the bones of 1929 still lie. To check the boom which was beginning to arouse concern, the Federal Reserve Board, on Tuesday night, raised the down payment in cash required for the purchase of shares on margin from 50 to 60 per cent of the purchase price. This alteration in required margins is a favourite weapon with the Board and one which it did not have in 1929: margins were set at 100 per cent during the inflationary period from January, 1946, to January, 1947; they were set at 75 per cent during the Korean war and lowered to 50 per cent in February, 1953. The present adjustment is a slight one precisely because the Board agrees with the Administration's other experts that the recent upward trends have been based on a sound estimate of the country's economic prospects.

Nevertheless, Wall Street reacted badly. Falls of \$3 to \$5 per share were common and at the close the tickers were running thirteen minutes behind the waves of selling. The Dow Jones average of industrial shares fell by almost nine points, and the volume of sales totalled 4,640,000. What happened was that weak speculators, who had been playing a disturbingly large role in the recent rising markets, even in the leading stocks, were shaken out by the rise in margin. This inevitably influenced the whole market. There is now every reason to expect that Wall Street will recover quickly and continue, although a little more slowly, on its optimistic way.

Moving Into Albany

AFTER twelve years of Republican rule, the Governor's mansion at Albany has passed into the hands of its new Democratic tenant, Mr Averell Harriman. Although the Republicans continue to dominate both houses of the New York State Legislature, the two key posts in the state, the governorship and the mayoralty of New York City, are held by Democrats. Governor Dewey, who is retiring into private life for the present, hands over to his successor a state which has made major gains during three terms of Republican rule. Nevertheless, Governor Harriman is facing a number of serious difficulties. Among them are unemployment in the northern districts of the state, economic distress in rural areas, a housing shortage and a difficult budgetary position.

Owing to a rather absurd law, a balanced budget for 1955-56 must be ready for the Legislature by February 1st. But Mr Harriman faces a minimum deficit of more than \$40 million as a result of increases in next year's expenditure bequeathed to him by the outgoing administration, combined with a decrease in tax revenue owing to the recession in 1954. During his campaign, Mr Harriman promised to avoid new taxes, although he qualified his promise by saying that it could only be kept if the economy were expanding. Faced with dour reports from his director of the budget, Governor Harriman is now taking the line that the Republicans have left a heritage of stagnation and that new taxes may be an absolute necessity. Republican leaders in the State Legislature are in a strong tactical position: if they grant Governor

THE PRESIDENT AND THE EIGHTY-FOURTH CONGRESS

Members who are likely to support Mr Eisenhower
Members who are likely to oppose Mr Eisenhower
Members who are uncertain

These charts follow forecasts, made in Washington by *Congressional Quarterly*, of probable voting in the new Congress based on the known views on major issues of members, whether Republicans or Democrats. The charts show that it makes little difference, except in the case of foreign affairs in the House of Representatives, when assessing the President's strength in Congress, whether the calculations are based on official party allegiances or, more realistically, on the liberal or conservative sympathies of members. President Eisenhower will have to fight for his majorities in this Congress as he did in the last.

Harriman an increase in taxes, the new administration will get off to an unpopular start. If they turn down the request, Governor Harriman cannot carry out his Fair Deal programme.

In addition to outmanoeuvring the Republican legislators and Mr Jacob Javits, a Republican who has been elected as Attorney General, Governor Harriman will also have to satisfy the professional Democratic politicians who brought him to power. His main debt is to the boss of New York's Democratic old guard, Tammany Hall. Mr Carmine De Sapio, an astute king-maker who will steer the New York delegation to the Democratic national convention in 1956, has been made secretary of state. His onerous duties will include licensing barber shops and presiding over the Cemetery Board, which should leave him time to prepare for the nomination of a presidential candidate. But there are countless smaller debts to be settled and already the Democrats are fighting over the spoils. For Mr Harriman, the very embodiment of striped-trouser diplomacy and high-level statesmanship, the entry into grass-roots politics may be a difficult one.

Economic Man of the Year

THE American consumer was undoubtedly the economic man of 1954. Unless he lived in a place, such as Detroit, where unemployment was severe, he paid more attention to the extra money that tax reductions put into his pocket than to threatened declines in his earnings, and increased his spending steadily. The main increase, on housing, was admittedly forced upon him by the ending of rent controls, but otherwise prices were stable or falling

during the year. Almost the only things the consumer had doubts about buying were automobiles, and in recent weeks he has made up for his earlier restraint in this respect. Taking advantage of the extra shopping day in the week before this Christmas, consumers broke all records for that period; department store sales were up by 16 per cent over the comparable period of last year. And in the Christmas month retail sales—of 156 million pairs of gift stockings, for example—rose sharply enough to push the total for the year nearly up to 1953's high level.

Retail traders, with their shelves satisfactorily empty as a result of the buying spree, are preparing to spend heavily on new stocks in the belief that the recent rise in personal incomes, to an annual rate of \$287.5 billion in November, ensures that consumers will continue to put their confidence into practice over shop counters. Most of the expectations for a prosperous 1955 are based on this belief, which will not be seriously tested until the Easter shopping season opens. Should the test prove unsatisfactory, congressional interest will be stimulated in the current proposals for encouraging consumers to spend more, by further tax reductions and other means. These would supplement the aggressive selling, competitive advertising, new styles and new products which manufacturers and retail traders will find as essential to good business in 1955 as they were in 1954.

Ten-Year Plan for Roads

New York.

PEOPLE as wedded to the motor car and as conscious of the need for good roads as are Americans are naturally attracted by the prospect of more than doubling the present rate of road-building. One of the most popular of the President's recommendations to the new Congress is therefore likely to be his "grand plan" to increase by some \$50 billion the total amount spent during the next ten years on building roads. Details of the plan will be sent to Congress at the end of the month and will be based on the report on the country's highway needs which General Clay is about to present to the President, and on consultations with the State Governors.

There are some 3.3 million miles of roads and streets in the United States. For about 670,000 miles of these the federal government pays half of the bill and the states and municipalities the remainder. The most important section of the roads built with federal aid is the 40,000-mile interstate highway system—just over 1 per cent of the nation's roads but carrying 30 per cent of the traffic. Total expenditure on all new roads and improvements is now running at about \$4 billion a year. Of this the federal government has been contributing \$575 million a year and is authorised to spend \$875 million a year in future; this will include \$175 million for the interstate highway system. The states and municipalities are entirely responsible for the remaining 80 per cent of the nation's roads, except for the toll roads.

Over the next decade, if no further changes were made in present plans, some \$47 billion would be spent on new and improved roads. If the President's proposals are accepted, the total expenditure for the next ten years would come

close to the \$101.4 billion which, it is estimated, is required if the 40,000-mile interstate highway system is to be made adequate for the volume of traffic expected in 1974 and the rest of the nation's roads adequate for only the present volume of traffic. Of the President's additional \$50 billion, at least half would come from federal sources, provided that the states and municipalities guaranteed to fulfil their own long-term road construction plans. It has been suggested that the federal part of the new plan should consist of an extra \$26 billion to be spent on the interstate highway system, with the federal government assuming full financial responsibility for that system; from now on Washington will in any case be paying 60 per cent of its costs but until the 1954 Highway Act the federal contribution was matched fifty-fifty with that of the state concerned. The balance, of some \$28 billion if the target of \$101 billion is to be met by 1974, would have to be found primarily by the states and municipalities.

★

There is great unanimity of purpose between the various groups planning America's future roads, but much disagreement when it comes to choosing the key to the whole programme—the method of financing. The individual states traditionally maintain that the federal petrol tax of 2 cents a gallon should be abolished, leaving all the revenue and the responsibility for new roads in the hands of the states. It is also contended that, whether the petrol and other motor vehicle taxes are collected by the federal government

or the states, or by both, the expected growth in motoring and petrol consumption over the next decade would provide, without any increase in tax rates, an annual increase in tax revenue sufficient to finance the entire expanded programme on a "pay as you go" basis. The federal government, which insists on retaining its present share of the petrol tax revenue, doubts whether the additional revenue would be sufficient to finance the federal share of the expanded programme, at least in the initial stages. An alternative course, increased borrowing, comes up hard against the limits on bonded debt set by state legislatures.

The Clay committee's answer to this dilemma is expected to be that an independent federal highway authority should be created. This authority would sell bonds, on the security of the federal petrol tax revenues, to the public and use the receipts directly for federal highway construction, or indirectly for making loans to the states or for guaranteeing bond issues made by the states on the security of their portion of the petrol tax revenues. This scheme would have the double advantage of evading the risk of politically unpopular budget deficits and of avoiding any addition to the federal debt.

Opponents of any system of earmarking particular revenues for special purposes deplore the loss of budgetary flexibility that would result, they maintain, from the allocation of the federal petrol tax revenues to support the proposed highway authority's bonds. Other groups, amongst which the oil industry is prominent, declare that road users should not be expected to foot the entire bill for new roads—that everyone in the country benefits and that, moreover,

"Yes Sir! You can now fly TWA to USA at reduced Thrift Season fares . . ."

TRAVEL AGENT

"You enjoy the same superb
TWA service all
the way . . . on the ground . . ."

. . . and in the air, with the
same comfort and
individual attention . . .

. . . but on your next trip to
America and back
when you fly TWA . . .

. . . you'll be making the
worth-while saving
of £28 . . .

. . . nearly £35 if you fly by
the thrifty TWA
Sky Tourist service . . .

. . . TWA can fly you on to
any one of 60 major cities
inside America, too."

Now is the time to plan your trip to the U.S.A. TWA Thrift Season reduced fares are in operation until the end of March. Reductions apply to all TWA transatlantic services.

London to New York (RETURN FARES)	On Season (APR-OCT)	Thrift Season (NOV-MAR)	Saving
First Class	£257. 5.0	£228.12.0	£28.13.0
Sky Tourist	£186. 9.0	£151.16.0	£34.13.0

To dollar earners—TWA is the only airline flying from Europe which also serves 60 major U.S. cities in the principal markets of America. TWA knows America. Their specialised knowledge can be of assistance to you.

petrol and oil taxes are paid in many cases where the products are not used on the roads at all. It has also been contended that the public issues of the new authority would merely pre-empt private funds that would otherwise have been available to finance state and local road building. Nevertheless the principle of earmarking petrol tax revenues for road expenditures may now be adopted by the US Treasury as it has already been by most of the states.

★

The other important disagreement concerns the part to be played in the expanded highway programme by the toll roads. This method of financing road construction—the issuing of bonds by an independent authority on the sole security of the anticipated revenue from tolls—has won spectacular support since the war. When those under construction and authorised are completed, there will be over 3,000 miles of toll roads, costing \$3½ billion, in the United States. Many of the existing toll roads, or turnpikes, such as the famous "Jersey Pike," are in areas of the highest traffic density, and have been profitable beyond all expectation. The Department of Commerce has estimated that another 10,000 miles of toll roads, costing some \$10 billion, would pay for themselves in toll revenues; but this estimate may have to be revised in the light of the President's road plan.

It was at one time suggested that the proposed federal highway authority might help the toll roads to secure lower interest rates by guaranteeing their bonds. But the state highway authorities complain that the toll roads are not efficiently integrated into the state and federal road systems. They also contend that the public receives more road to the dollar from state construction than from the toll roads. The cost to the motorist of a toll of, say, 1 cent a mile is the equivalent of an extra petrol tax of 15 cents a gallon—200 per cent more than the combined federal and average state petrol tax. Because of opposition from the state highway officials the toll road authorities are likely to be left to fend for themselves as best they can—a prospect which, in the light of their past successes and present ambitious plans, will hardly alarm them.

Slipped Discs

THE long-playing gramophone disc and the high-fidelity record player have become important features in American life. In many homes where bookshelves are few, record albums fill cabinets and many people who would in no other respect be thought of as "high-brow" are ardent enthusiasts for pre-Bach chamber music or twelve-tone orchestration. The transmission and amplification of music has become a technical obsession with countless Americans and classical works are being heard in a range and clarity that was undreamt-of before the appearance of the long-playing disc in 1948. Last week's surprise decision by the Radio Corporation of America to cut the price of its records by as much as 40 per cent is expected to stimulate even further the whole "sound industry." Already there are some 25 million American homes with record players, many of them equipped for

three speeds. In the next five years it is expected that this figure will be increased by a further 20 million.

In this great movement towards good music the local record dealers have played a major part. They have acted as discount houses and have, in the past, staged fierce price wars, cutting list prices by 50 per cent or giving large disc bonuses. Mr Sam Goody, New York's most famous dealer, handles \$3 million worth of records a year, usually at discounts of 30 per cent. It is his theory that the purchase of discs and recording equipment is habit-forming and that customers who are encouraged by low prices at the start will soon become addicts. The growth of a "high-fidelity jargon" and of many specialised magazines confirms his view.

Whether the other major record producers, Columbia Records Inc., Capitol Records Inc. and Decca Records Inc., will follow the example of RCA remains to be seen. Their first reaction, and that of the smaller dealers, has been one of stunned displeasure, but it seems more than probable that discs will be slipping all along the line.

SHORTER NOTES

The right of the judiciary to bar the press and the public from the courts "in the interests of good morals" or to prevent the reporting of a trial "steeped in filth" has been denied by New York's Court of Appeals. The high court's decision that the constitutional guarantee of a public trial, even in cases of an obscene or indecent nature, must be observed has provided Mr Jelke, who had been previously convicted of compulsory prostitution, with the opportunity of a new, and a public, trial.

★

The special benefits for men serving in the Korean War will not be available to men joining the services after the end of this month, as the result of a presidential proclamation. Educational and other allowances under the Veterans' Readjustment Assistance Act are among the most important of the benefits affected.

★

The federal government has won another round in its attempts to render the Communist party ineffective by court action. The US Court of Appeals, by a two-to-one decision, has upheld the Subversive Activities Control Board's ruling of last year requiring the party to register as a Soviet-dominated subversive organisation under the McCarran Internal Security Act of 1950. However, the party is expected to appeal to the Supreme Court.

★

Photographers will soon be able to get their coloured films developed and printed anywhere they want. The Department of Justice has charged the Eastman Kodak Company with monopolising colour film processing and the company, while denying any violation of the anti-trust laws, has agreed to sell Kodachrome and Kodacolor film without including processing charges in the price. During the next seven years the company will also give up any colour film processing facilities it may own in excess of 50 per cent of the total capacity in the country.

The World Overseas

France on the Morning After

FROM OUR SPECIAL CORRESPONDENT

WHEN last week, after a hard-won battle, a tired M. Mendès-France was going out of the Chamber through the lobbies, a by-stander remarked: "He has just signed his own death warrant; it is merely a suspended sentence." He was thus expressing, in a crude and exaggerated fashion, the pessimistic estimates of the government's prospects now prevailing in Paris. It is argued that by fighting tooth and nail for ratification of the Paris agreements M. Mendès-France did nothing to improve his own chances of survival. Many of his friends are hurt, his enemies are unreconciled. The former have lost enthusiasm, the latter are waiting to trip the premier on the slippery path that leads through North Africa, Indo-China and domestic economic problems. Now that the memorable ratification debate is over, they have less reason to pull their punches. Judging by the usual standards of parliamentary arithmetic, or merely by the present mood, the days of M. Mendès-France's government are numbered.

This is, however, only half of the story. The dragged-out ratification debate has also provided the government with a breather, with a short respite to consolidate and prepare a counter-offensive. When one talked to the friends and associates of M. Mendès-France earlier in December they sounded like Jeremiahs lamenting in refrain: "If he could only last till January 15th." Now this is guaranteed. The Assembly has dispersed and when it meets will be busy electing its officers. M. Mendès-France has thus about two weeks in front of him. His journey to Rome and next week's visit to Dr Adenauer will leave little time for rest and home affairs, but the key question is how long it will take the Assembly to get rid of its hangover from the European debate.

The fifteenth of the month is considered the decisive date because a government reshuffle should then take place and M. Mendès-France has promised to relinquish the Quai d'Orsay (M. Edgar Faure is expected to succeed him) and devote himself more to economic problems. The man whose original mission was to put new life into his country's stagnating economy has been almost exclusively busy with foreign affairs since he came to power. Now he is supposed to proclaim a broad economic programme. The nature and boldness of this programme will have a vital influence on his future career, whether he actually falls from power because of it or not. Had he fallen beforehand or should he fail to produce a plan both bold and concrete, his opponents would have a fairly easy task in dismissing all the "saviour" talk as bluff.

This does not mean that boldness will pay immediate dividends. The treatment begun under the previous government has produced superficial signs of recovery and the climate is not, therefore, particularly propitious for radical innovations. The government is pleased with the progress achieved up to now in agriculture, but has serious misgivings about prospects for industry. The effects of the slight relaxation of import controls should begin to be felt very soon, particularly in the textile industry. This breeze from abroad was destined to help in the task of reconversion, but the funds necessary to pay for the anaesthetic and the operation are clearly not yet available. The tiniest breeze will be hailed immediately as a storm and those affected will join in the wailing chorus together with the beet lobbies, wine growers and other vested interests. M. Mendès-France in fact inspires more panic in these circles than his actions hitherto would justify.

His enemies are mustering their forces, while M. Mendès-France cannot rely on much support in the Chamber. In reshuffling his cabinet he has little room for manoeuvre. Even the Papal blessing is unlikely to insure him much backing from the Christian Democrats. The Socialists still feel happier outside the government. The Gaullists most friendly to the prime minister were strongly opposed to unconditional ratification of the Paris agreements. Finally, many of his Radical colleagues are only waiting for the moment to join hands with his bitterest opponents.

The alignments on the home front cannot be without effect on the French government's strategy in foreign policy. The conservatives, MRP and other members of the opposition made it quite plain that they tolerate this government on sufferance, from a "European" angle, and will bring it down at the earliest opportunity. If he is to stand a chance of getting a bold economic programme through the Assembly—assuming that this is his intention—M. Mendès-France will have to regain the support of leftist Gaullists and will also need the support of all the Socialists. But these are the very people whom he had to assure throughout the debate that unconditional ratification does not spell the doom of East-West talks, but on the contrary provides the only chance of their success. To regain the confidence of people who were his earliest supporters, such as the Gaullists MM. Palewski and Soustelle, the French premier will have not only to press Washington and London for four-power talks, but to show some tangible results.

This will be the most important, though not the most immediate, task for the Quai d'Orsay. First, on January

17th, the French will press their allies to accept their version of the arms' pool agency. This was the second pledge of M. Mendès-France to the deputies and here he will be backed by most of them; by the former supporters of EDC who see in the agency the nucleus of the European idea and by the opponents of German rearmament who see in it a possible way of controlling a rearmed Germany. When bargaining with Mr Dulles or Sir Anthony Eden, M. Mendès-France has still one trump card up his sleeve. The ratification process is not yet over and he is indispensable to carry it through.

For ten days M. Mendès-France has shown himself a past master at parallel bars. He has swung skilfully between rationalism and the European idea, between "Atlantic faith" and the need to talk with the Russians soon. The exercise was not quite faultless, although he finally emerged from it unscathed. But the test is not yet over. He will now have to continue this strenuous exercise with his eyes fixed on the home scene. At the end of the historic ten-day debate a commentator remarked cynically: "He'd better think of the future and stage his exit." The electoral bill that the government has just tabled proposing to restore the prewar system of one-member constituencies (*le scrutin d'arrondissement*) is a sign that M. Mendès-France, relying on public support rather than on party machinery, does think of to-morrow.

Greenland Comes of Age

FROM OUR SCANDINAVIAN CORRESPONDENT

THIS Christmas 42,000 letters from British children addressed to "Santa Claus, Greenland," reached the Danish National Tourist Association. Replies, over Santa's signature, pointed out that "my home Greenland is—as you know—a part of Denmark." For in June, 1953, Denmark adopted a new constitution whereby, *inter alia*, the former non-self-governing territory of Greenland became (together with the Faroe Islands) an integral part of the Danish kingdom; 850,000 square miles were added to the 18,000 square miles of the mother country, so that today, technically, Denmark occupies an area nine times as great as the United Kingdom. Two Greenlanders (and two Faroese) sit in the Danish *Folketing*. The 13-man Greenland National Council, over which a Danish governor presides, has considerable local powers. Last autumn Denmark's representative at the United Nations announced that, in view of Greenland's new status, no further reports would be submitted to the Committee on information from non-self-governing territories; and in November the General Assembly passed a resolution welcoming Greenland's constitutional advancement.

The 23,000 Greenlanders, mainly of mixed Eskimo and Scandinavian blood, live in scattered communities along the narrow habitable coastal fringe of their vast and desolate country. Most of the 185 settlements—linked only by sea—are in the south-west, where a branch of the Gulf Stream provides a relatively temperate climate and ice-free harbours. Eighty-five per cent of Greenland lies beneath the ice-cap, 2,300 inhabitants, has a dial telephone system, a daily news-

paper, a radio station and a training college. Julianehaab and Egedesminde have 3,500 and 2,700 inhabitants respectively.

Greenland's political coming-of-age crowns a series of events which between them put the country on the map. During the war, both Allies and Germans set up meteorological stations in the "weather-factory of Europe." Air bases, too, were established. In 1951, the United States and Denmark concluded a treaty which gave the Americans the use, rent-free, of bases at Thule, Søndre Strømfjord and Narssarsuaq.

They established a radar network, and built supply depots and runways for jet-fighters and strategic bombers. Last November the Scandinavian Airlines System began regular commercial flights between Europe and the Pacific via Greenland.

Another event early in this century, which passed unnoticed by the outside world, revolutionised Greenland's development. For no discoverable reason the sea off Greenland's west coast began to grow warmer. Hitherto, the entire economy

had rested on hunting seal, which provided meat for food, skins for clothing and tents, blubber for light and heat, and bone for implements and utensils. The seal now retreated northwards, while cod in increasing numbers appeared. Codfishing, the new means of livelihood, demands co-operative effort, and different tools and techniques. The fisherman must sell his catch to buy the necessities of life. Greenlanders were thus obliged gradually to exchange a natural for a money economy. The Royal Greenland Trade Department, exercising a benevolent monopoly, both markets Greenland's products and controls the volume and price of imports.

Inside four decades a Stone Age culture gave place to twentieth-century technological civilisation. Concentration in larger and fewer settlements has been actively encouraged. Fish freezing and drying plants have been set up. The graceful *kayak* and *umiak* have given way to a fleet of 600 motor-boats. The shipyard at Holsteinsborg undertakes 700 repair jobs annually, and builds boats and cutters. In 1948 the world's largest shrimp and prawn beds were discovered off Disko Bay. New canneries at Christianshaab and Narssaq handle 300 tons of raw shrimps annually.

Although fifty per cent of all Greenlanders are fishermen and hunters, other sources of wealth exist. The mines at Ivigtut produce 50,000 tons of cryolite—an essential ingredient of aluminium—each year. But the mines, which are the only commercial source of cryolite and have been for long the mainstay of Greenland's economy, will one

day be worked out. There are deposits of copper, zinc, iron, wolframite, graphite and uranium, although it has not yet proved economic to work them. Twenty-five million kroner have been invested—over-optimistically, some say—in the lead mines at Mesters Vig. Oil has been struck in the west. The continued retreat of the ice-cap may eventually permit large-scale exploitation of Greenland's mineral wealth. The state-owned coal mines at Qutdligssat yield 9,000 tons of low-grade coal annually. Around Julianehaab sheepfarming prospers.

Under the Greenland Department's enlightened stewardship social and cultural progress has matched economic development. Much of the budget goes on hospitals and schools. Teaching is largely bilingual; and Greenland boasts that illiteracy has vanished. The Greenlanders, however, are peculiarly susceptible to European ailments, and tuberculosis still accounts for 39.2 per cent of deaths. Alcoholism, work-shyness and a passion for hunting remain a brake on prosperity. Greenlanders are exempt from direct taxation, but recently they astonished observers when—impatient at the pace of advance—they reversed the cry of the American colonies, demanding “no representation without taxation.” For a people with such civic sense, there is surely a promising future.

Movement on the Mekong

THE peoples of Indo-China may be tempted to relax in the fresh breeze of fiscal freedom now blowing down the broad Mekong river. That old symbol of colonial dependence, the Pau agreement of December 1950, has been torn up, bringing to an end the economic and customs union of the three Associated States with France. The bad old Indo-China piastre, inflated, discredited and the tool of black marketeers, becomes an unhappy heading in the history of the recent past, and in its place three shiny new piastres appear, one each for Vietnam, Laos and Cambodia.

But that is the picture in its brightest colours. The leaders of the three states will need to shield their eyes to avoid the dazzle of ambitions fulfilled after years of longing and four months of tough negotiations in Paris. The reality may then look slightly less appealing. Freedom from the shackles of the franc may turn sour if it means no more than a greater dependence on the dollar. Parity between the three currencies is a sane notion, but will it still be possible in the cloudy future if, say, the Laotian piastre has to lean too heavily on the Vietnamese one in order to maintain itself at an artificially high rate?

There is, however, a constructive ring about the part of the new agreement which deals with freedom of navigation on the Mekong river and with access to the port of Saigon. With a modicum of reason on either side, this may even remove the perennial Cambodian complaint that the Vietnamese take too much of the profit from Cambodian rice shipped through Saigon. It will be gratifying to Vietnamese pride, also, to receive American aid direct through the new National Bank instead of through France. Dollars, after all, are handier than the equivalent in francs.

Training for Soviet Service

ONE of the arguments used in the current drive to prune the Soviet civil service is that highly qualified people are badly needed throughout the economy. There is a particularly large demand for engineers and agronomists. It may seem paradoxical that this cry for experts grows louder now that the Soviet Union is at last mass producing its *intelligentsia* and the army of graduates is growing at an unprecedented pace. But the demand for skill in a highly expanding economy is insatiable. The extraordinary expansion of modern industry could not, and obviously cannot, be maintained without both raising the general level of education and increasing the supply of graduates.

The curve of admissions to establishments of higher education has been rising very steeply in recent years. In Tsarist Russia, on the eve of the war, there were about 112,000 students. After the ravages of revolution and civil war it was at first difficult to expand the higher branches of education, and by 1928—on the eve of the planned era—the number of students had only reached some 170,000. In the following quarter of a century, however, this figure was swollen about tenfold, and it is claimed that some 1,700,000 people now attend Soviet universities and other higher institutes (though those studying by correspondence are also included in the figure). This year 230,000 students graduated and 400,000 newcomers were enrolled.

The total number of graduates, taking into account war-time losses, may be estimated at 2.7 million or about 1.3 per cent of the population. The bulk are the product of the Soviet regime and indeed some 60 per cent finished their studies after the last war. Another very interesting feature is the very high percentage of women—about two-fifths of the total. The distribution of graduates according to their speciality can only be established in broad groupings and rather rough terms. Technicians, engineers, physicists and chemists account for about 6-700,000. Teachers follow close behind, and there are 300,000 doctors in Russia.

Experts for Export

These figures are certainly impressive and they explain why Russia, which once was so dependent on foreign skill, can now in turn export specialists to the satellites and particularly to China. Obviously there is no surplus of technicians and experts are still scarce, but a few thousands more or less have only a marginal importance. Indeed, American analysts are now worried lest Soviet Russia should outstrip the United States in the mass output of highly skilled technicians. But the Russians themselves attack their system of higher education as inadequate.

Criticisms are twofold. The system is attacked both for not producing enough people and for not producing them in the right proportions. The former criticism is, above all, the result of the insatiable demand. At first it was only possible to cover the whole country with 4-year schools (for children from 7 to 11 years); 7-year schools then spread throughout the country, but only two years ago did the system extend to the whole child population. It is claimed, however, that next year 10-year education will be compulsory in all big towns; by 1960 it should become

A. V. ROE CANADA LIMITED

MEMBER OF THE HAWKER SIDDELEY GROUP

announces the formation of

AVRO AIRCRAFT LIMITED

ORENDA ENGINES LIMITED

and the acquisition of

CANADIAN STEEL IMPROVEMENT LIMITED

A. V. Roe Canada Limited, leading Commonwealth member of Britain's Hawker Siddeley Group, this week enters its tenth year of operation and announces a major move in its steady advance as Canada's largest aviation enterprise... on January 2nd, 1955, A. V. Roe Canada Ltd. will become the parent company of a three-company group through the incorporation of its Aircraft Division as AVRO AIRCRAFT LIMITED, its Gas Turbine Division as ORENDA ENGINES LIMITED and through the acquisition of CANADIAN

STEEL IMPROVEMENT LIMITED. Thus, A. V. Roe Canada Ltd., a subsidiary of Hawker Siddeley Group becomes a parallel Group Canadian operation with headquarters at Malton, near Toronto. Each company will be operationally independent of the other... will have the greatest possible scope for industrial growth... will develop its own products and customers, whilst enjoying the benefits of the management and financial strength of the Group as a whole.

AVRO AIRCRAFT LIMITED

On its emergence as a separate corporate entity, Avro Aircraft rededicates itself to the maintenance of its pre-eminence in Canada through its past and current design and production achievements and through the promise of greater things to come. In fulfilling its role, the new company will direct the efforts of some 10,000 skilled designers, engineers, technicians and production workers in maintaining the flow of CF-100 all-weather fighters... in helping the R.C.A.F. “keep ‘em flying” through trained service representatives in the field, and modern repair and overhaul facilities at Malton... and most important, by ensuring through constant and unremitting research, design and development by its engineering staff, that the aeronautical needs of the future are successfully met. With management and policy unchanged, Avro Aircraft will continue to discharge its high responsibility as one of the main industrial arms of the R.C.A.F. and through present and future projects build and reinforce Canada's air defence.

CANADIAN STEEL IMPROVEMENT LIMITED

Established in 1951 to supply jet engine blades—probably the most exacting shape ever forged in Canada—Canadian Steel Improvement Limited occupies a unique place in Canadian industry. Since its formation, C.S.I. has produced millions of jet engine blades and other precision forgings for the aircraft industry and at the same time has expanded into other fields until today it offers a complete forging service of the highest standard for the fabrication of components in steel, high temperature alloys, aluminium, titanium, and other non-ferrous alloys. C.S.I.'s work force of 400 includes expert metallurgists, die designers and skilled craftsmen and, in step with Canadian industrial growth, will have additional facilities available next year. These will include an increased range of forging equipment to undertake the largest forgings in the aircraft industry, thereby bringing C.S.I. closer to its goal of a complete forging and casting service.

ORENDA ENGINES LIMITED

Orenda Engines begins its corporate life with an established record of engineering and production achievement, with management and policies unchanged and with the same goal... leadership in the field of aerial propulsion. From Orenda's design, development and production departments came the first all-Canadian jet engine to power the CF-100 and F-86 Sabres V and VI. Through constant development, the various series of the Orenda, now at 11 and 14, have increased in power and reliability. In addition to the present extensive design, engineering and experimental offices and laboratories at Malton and a full scale test plant at Nobel, Ontario, expanded research facilities are now under construction to deal with the increasingly complex requirements of the future. The 6,000 people in the Orenda family are dedicated to designing, manufacturing, maintaining and servicing modern jet engines and other forms of aero power and to the building of a sound aircraft industry for the defence and development of Canada.

C.S.I.'s current production facilities in Etobicoke will be tripled in 1955 to meet forging and casting demands.

CF-100, Mark 4

Orenda-Series II

Orenda Engines' 30-acre plant, power house and test cells produce Orendas for CF-100's and Sabre V's and VI's.

Avro Aircraft's multi-plant operation at Malton produces Mark 4, CF-100's for the R.C.A.F.

A. V. ROE CANADA LIMITED
MALTON, ONTARIO

“DEDICATED TO CANADA'S JETPOWERED LEADERSHIP IN THE AIR”

Resourcefulness

Originality must always lie in an ability to blossom forth. If you look at the Crompton Parkinson organisation you will find that we have done exactly that thing. From the small bud that was Colonel Crompton's original Company 75 years ago have sprung today twelve outstanding petals—each a department that is

in bloom . . .

representative of the important things in electrical equipment and installation.

Like all blooms, the Crompton bloom will vary in form with the years, but it will continue to win the top prizes in the electricity show. It is an essential part in the world's industrial garden.

It is something that should be button-holed whenever you are considering how to use electrical power to its best advantage.

When it comes to electrical equipment . . .

you've got to hand it to

Crompton Parkinson

universal. The completion of ten years at school qualifies one for higher education, but even now there is not enough room in universities for all those who are knocking at the door; this year more than half could not be admitted.

The wrong proportions of graduates are the result of the changing structure of the economy. In the first phase doctors and teachers were needed above all. Now the shortage of industrial and agricultural specialists is most acute. Although it will not be possible to find room for all those with "matric," the number of establishments of higher education—now 900—will have to be increased; it has been estimated that over 1.5 million should graduate during the next five-year plan or substantially more than during the whole prewar period. In this expansion emphasis will have to be put on schools for engineers and agronomists. One measure designed to kill two birds with one stone has already been devised; boys completing their ten-year course will be directed to technical schools for practical training not quite up to university standard.

This should reinforce the tendency towards specialisation. On the other hand, at the university level it is now intended to broaden and diversify the programme. Narrow specialisation was an economic necessity; but Stalin's successors apparently consider that Russia can and must go beyond it for its highest cadres. Views on the standard of Soviet colleges vary greatly, though it is generally agreed that much progress has been made with technical education. In the Soviet Union, as elsewhere, there are big differences between the great universities—particularly Moscow—and the provincial colleges.

Soviet universities have also suffered from the handicaps of Stalinism. Though the "élite" was always allowed a better glance at the truth than the "masses," it was also hedged in by totems and taboos. Art students in particular had much rubbish thrown into their curricula, but science students, too, were handicapped by Stalinist narrow-mindedness. Thus, it was recently admitted that the study of Einstein's theories had been neglected because of official disapproval of the philosophical implications of his work; the admission, however, was coupled with an attack on this state of affairs.

What will be the effect of this "liberalisation" now that an ever-growing mass of people get the chance of higher education? The position of this qualified intelligentsia presents yet another paradox: it is both the mainstay of the regime and the most likely material for discontent. These managers are the favourite children of the regime and are naturally keen to stick to their privileges. But they dream not only of greater security but of more freedom, too. Its manner of dealing with these contradictory forces will have an important influence on the political shape of the regime.

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

NOTES FROM AUSTRALIA

(The following notes have been written by our special correspondent recently in Australia)

Bankers at Odds

A LIVELY argument has broken out among the bankers in Sydney. Rumblings against the policy of the Commonwealth Bank have been known before, but rarely so forcibly expressed as they were by Sir Colin Sinclair in his recent address to the shareholders of the Bank of New South Wales. Sir Colin showed no disposition to accept unchallenged the policy laid down by the central bank, and the banking trends of the past nine months explain the forthright character of his remarks. In March last year, the total deposits of the eight main trading banks stood at £A1,526 million; by October they had fallen to £A1,459 million. But advances rose during the same period from £736 million to £864 million, with the result that by October the liquid assets of the trading banks had shrunk to 19 per cent of total deposits, compared with more than 26 per cent in March; the liquidity ratio of the private trading banks (excluding, that is, the Commonwealth Trading Bank, which is under the closer control of the central bank) fell below 17 per cent in October.

Thus the banking system has been financing a rising volume of advances during a period in which deposits have been falling (though October showed some increase). The banks criticise the Commonwealth Bank's policy on two grounds. First, they declare, it is asking too much of them to maintain a 25 per cent liquidity ratio; in any event they have disregarded the Commonwealth Bank's advice, tendered last August, to work broadly to that figure. Secondly, the banks point out that the equivalent of 21 per cent of their deposits is locked up in the special accounts kept by the Commonwealth Bank. "It appears," declared Sir Colin Sinclair, "only too evident that the central bank bases its theories on an experience which may not be entirely appropriate to dynamic conditions." But given the manifest expansion of credit that has taken place in Australia during 1954, and the equally manifest expectation that Australia's balance of payments deficit will exert a progressive deflationary force on the banking system, the task of central bank control is bound to be one of considerable delicacy. It has proclaimed its general objective: "to ensure that the banking system has sufficient, but not more than sufficient, funds to meet the needs of a steadily expanding economy." These are hardly the words of ardent deflationists.

Uranium in the North

RUM JUNGLE is one of the world's romantic names. What has been done there in two years is a romance in its own right. In fact, twenty and a half months elapsed from the moment when Territory Enterprises Proprietary Ltd. (an offshoot of Zinc Corporation) were given the signal to start before the first batch of uranium oxide emerged from the concentrator. Rum Jungle is 13 degrees south of the Equator, hot and humid; it is 70 miles from Darwin, which itself is 2,000 miles from any Australian city; and it is the only mine anywhere in the tropics exclusively staffed by white workers. There are about 400 of them, housed and

fed at the nearby township of Batchelor with a good deal less hardship than sometimes has to be endured in Australia's city hotels. The amenities are highly civilised; the kitchens and mess glisten with stainless steel; there are two churches and a school with sixty children; a swimming pool and hospital. The hardships of mining can, it seems, be overrated.

Uranium comes under the heading of imperative necessity, rather than economic argument. It may be that the by-products will in the end prove to be at least as important as the mustard-like powder that begins the march towards atomic fission. On the Rand, uranium is the by-product of gold-mining; in the Northern Territory, the copper, lead, zinc and cobalt found in association with uranium may eventually provide a full economic return for what must inevitably be a high capital investment. A hundred miles to the south-east, along the Alligator River, is a further area of active exploring interest, in part of which North Australian Uranium Corporation is being partnered by Rio Tinto.

These companies, and a dozen others, are at work in a belt stretching south-east from Darwin for two hundred miles—a tiny corner of the Northern Territory and a speck completely lost in Australia's total vastness. The costs are high. At Rum Jungle, ordinary grades of labour can earn £21 by working 48 hours a week, and they pay only £2 15s. for their quarters and food. The Commonwealth Government provides generous tax concessions to the companies. But uranium may be only the trigger to future development. Basing itself on postwar research work, the Department of Territories sees the possibility of doubling the pastoral capacity of the Territory and eventually, perhaps, of putting two million acres under rice. There can be no mistake about the courage of such hopes; the Territory contains no more than 17,000 people, of whom more than half live in Darwin. Men and millions will be needed.

* * *

Newcastle Outstripped

AUSTRALIA produces the cheapest steel in the world, but that fact has not saved Broken Hill Proprietary from a good deal of public criticism because steel is short. The more extreme critics declare that BHP has not kept pace with the natural expansion of demand for steel products; and it may be true that the company has underestimated the growth of the steel using industries. No doubt, too, it is more appreciative than it was of the need to explain its intentions and programmes to the Australian public. In steel, development is bound to proceed by jumps; and a further jump forward is now being undertaken at Port Kembla, about 50 miles south of Sydney, where the company is installing a hot strip mill, with an ultimate capacity approaching a million tons a year.

Except in abnormal conditions, Australia's ability to export steel is virtually ruled out by the cost of freight. Steel plans, therefore, must be based on future projections of domestic demand. The completed section of the new mill is turning out plates sufficient to meet the home demand, and it cannot be very consoling to those who have brought it into production that recently 35,000 tons of plates were stacked and awaiting shipping, which is scarce and costly. The full potentialities of the new mill will not be realised until extensions to the existing steel plant (raising ingot pro-

duction from 1.2 million tons to 1.6 million tons) and a second iron and steel works with a new harbour are completed—when the total capacity at Port Kembla should reach 2½ million ingot tons.

The general policy of the BHP company is to leave finishing processes to other companies. There is already one exception at Port Kembla—a spun iron pipe works—and there are proposals for a tinplate works which might be ready perhaps by 1957. Close to the plant are the galvanised sheet works of John Lysaght (Australia), where a continuous pickling and rolling plant is being installed to take hot strip from the BHP mill in the middle of this year; on the other side of the plant, Commonwealth Rolling Mills are completing a cold rolling mill for deep drawn sheet to be used for car bodies which should reach out for 100,000 tons of output a year. These major plants, now well advanced towards completion, have pushed Port Kembla ahead of Newcastle, the steel town to the north. They also mean that projected steel developments in South Australia have had to be delayed; but no doubt Whyalla's turn will come.

* * *

£65,000 for Contented Cows

AT Camden, about 60 miles west of Sydney, motor coaches unload their passengers to see a slightly surrealist installation called a "Rotolactor." There is only one other similar machine in the world, in the United States; this is an all-Australian creation, which began working in 1952 after £65,000 had been spent on it. Members of the Macarthur-Onslow family, who installed the machine on their Camden Park Estate, do not claim that it is yet working at a profit. But that is a matter of capacity and throughput; the aim is to milk 2,500 cows twice daily at the Rotolactor, and at present the numbers are well below that level.

The name explains the principle, but it cannot convey much sense of the ingenious design of the plant. The cows walk from the paddock up a ramp into the circular building, getting a wash on the way. Inside its glass walls is a circular platform, which makes one rotation in ten minutes. This platform has fifty milking bails, and as the cows make their gentle revolution they are milked and fed automatically, and contentedly walk down a spiral ramp under the platform and out again into the paddock. Stainless steel abounds, and the milk is chilled to 35 degrees in a couple of minutes. Outside, the cows are given a green feed, cut and carried to the feeding racks; this and the concentrates provide the whole of their food, for they are not grazed. The concentrates are made at another estate to the west, and consist principally of dried lucerne yielding 18 per cent protein. If British milk producers are tempted to make the same experiment, they should bear in mind that the beneficent climate makes it possible to operate the Templewood drier throughout the 24 hours of the day for nine months of the year.

All the cows are, of course, de-horned, and all are bred by artificial insemination. The present aim is to increase their numbers and improve their yield per lactation by introducing Friesian blood. A venture of this kind involves large capital resources and much patience. At Camden there seems no lack of either, and a project that must have begun as something of a rich man's hobby may eventually prove a most satisfactory business proposition.

What's in a barn

Or a milk churn. A tractor, or a harvester. In all of them you'll find steel sheet. And that should not be surprising. For more things than you may realise are made of steel sheet or by steel sheet.

Who makes this steel sheet? In Britain one firm is prominent — John Summers. This firm makes steel

sheet by the mile. The works at Shotton have doubled in size since 1939—and go on growing. Production will soon exceed a million ingot tons annually.

John Summers is 100 years old. It is a firm with a fine family tradition; and with a future that is bright and full of opportunity.

THE BUSINESS WORLD

Towards Flexible Money

DURING the past few weeks the process begun in 1951 of restoring the monetary regulators that are vital for the health of a free economy has entered a new and significant phase. The effectiveness of the regulators depends not only upon the degree of skill and judgment shown by the monetary authorities themselves, but also upon the sensitiveness and freedom of the monetary and banking mechanism. By far the most important part of that mechanism is the money market. This is the central point upon which cash deficiencies or surpluses arising anywhere within the banking system are quickly concentrated, and towards which, therefore, the authorities' own operations in supplying or withdrawing marginal amounts of cash are directed. In particular, it is through this mechanism for short-term credits that the major regulator, Bank rate, exerts its effect, since Bank rate is the rate charged by the Bank of England to members of the money market when it lends to them (for not less than seven days) as lender of last resort. If the money market is free and flexible, it will faithfully reflect the sum of all the credit influences playing upon the economy, and will respond quickly and sensitively to any actions upon it by the authorities. A free market mechanism will set corrective

forces in motion automatically, because money rates will rise, and a restraining influence will ripple outwards in ever-widening circles.

At first glance, the experience of the past few weeks implies that the monetary apparatus has indeed been functioning in this sensitive and flexible way. The key "market" rate is the allotment rate for Treasury bills offered at the weekly tenders, and this rate has risen on six of the seven Fridays since mid-November, carrying it from nearly 1 19/32 per cent to about 1 7/8 per cent. This rise has been provoked by the sustained weakness of sterling, by the growing indications that the economy is at full stretch and by the consequent fears that the monetary authorities may apply the brake of a higher Bank rate. The money market, responding in the

classical fashion for the first time since prewar days (if not for the first time since 1931), has already applied the subsidiary brake of a rising discount rate.

The assertion that flexible money has shown marked signs of revival does not, however, rest only on this rise in bill rates. Nor is that rise proof that a sufficient flexibility already exists, but the manner in which it has occurred and the tendencies springing from it show that the move towards flexibility has gathered much strength

* "Market rate" is rate for three months' fine bank bills for the years 1919-21, and thereafter is the weekly average allotment rate for Treasury bills offered at the tenders. "Deposit rate" is London Deposit Rate for the prewar period and Banker's Deposit rate (applicable, as a maximum, to all deposit accounts) for the postwar period.

in recent months. Throughout the three years that have passed since the authorities made their first cautious increase in the long-stabilised Bank rate, the biggest obstacle to the full revival of sensitive monetary regulators has been the rigid techniques and habits of thinking that grew up in the commercial banking system during the years when the Bank rate instrument was set aside and the monetary authorities virtually abdicated from their traditional role as controller of the volume of money. Their policy then of pegging money rates at arbitrarily low levels and of releasing whatever volume of central bank credit was needed to support the pegs, crystallised into rigid shape rate agreements that already existed among the commercial banks and market and stimulated the development of new arrangements of the same kind. Some of these arrangements, notably that governing the rates at which the banks bought Treasury bills from the market, were dropped after the first rise in Bank rate, and some others became more flexible some time ago. But some arbitrary or unnatural relationships between the different categories of rates remain.

★

Especially since the reduction of Bank rate to 3 per cent last May, the banks have been paying increasing attention to the question of what relationships are "appropriate" between the principal money rates—the Treasury bill rate, the rates charged by the banks for short loans to the market and allowed by them on ordinary deposit accounts—and the relationship of each of these rates to Bank rate. These discussions have not been prompted by the desire to promote flexibility as such, but rather by a recognition that the particular pattern of rates established when monetary policy was inert could scarcely be expected to be appropriate, or even sustainable, under conditions of positive policy and a variable Bank rate. The natural approach to this question was to consider how present techniques and patterns differ from when flexible money prevailed.

Three major differences at once become apparent. In the first place, the margin between the Treasury bill rate and Bank rate is very much wider than it used to be. Secondly, the minimum rates at which the clearing banks, by agreement among themselves, will lend to the money market are likewise much further below Bank rate than was traditional; and in most cases the agreed rates, though technically minimum rates, are applied automatically to a high proportion of the money lent, so that only a fraction is subject to variable rates according to conditions in the market. Thirdly, the rate allowed by the banks on customers' deposit balances is closer to Bank rate than in the nineteen-twenties (the last phase of flexible money), and is identical with the lowest of the short loan minima (the rate for short money secured by Treasury bills).

These differences have recently been examined in

detail in a series of articles in *The Banker**; their extent can be readily indicated by some averages abstracted from those articles. Until the recent rise in the Treasury bill rate, its average margin below Bank rate was nearly $1\frac{1}{2}$ per cent, actually a wider margin than obtained when rates were pegged at abnormally low rates, and one three times as wide as the average for each of the periods 1923-31 and 1898-1913. In those former periods of flexible money, the margin was generally much less than $\frac{1}{2}$ per cent, except at times of trade depression or when rates were falling; and on several occasions the average through a six-months' period was no more than $\frac{3}{16}$ per cent. Now, even after the recent rise in the Treasury bill rate, the margin is still fully $1\frac{1}{8}$ per cent. Similarly, the spread between Bank rate and the clearing banks' minimum short loan rate (for loans against Treasury bills) is now $1\frac{3}{4}$ per cent, whereas the traditional spread—dating from the inception of the agreed minimum in 1921—was 1 per cent. On the other hand, whereas in the period 1921-31 the London Deposit Rate was 2 per cent below Bank rate, now the deposit rate (applicable, as a maximum, to all deposit balances) is $1\frac{1}{4}$ per cent below it. For the first time under conditions of a variable Bank rate, the bankers find themselves without any margin between the minimum rate they charge for short loans to the market and the maximum rate they allow on deposit accounts. It is this circumstance, in particular, that has led the bankers to explore the possibility of moving towards a new structure of rates.

★

When considering what changes are desirable, it would certainly be wrong to assume that they should necessarily attempt simply to reproduce the patterns of the past; but there is no doubt that they ought to move in that direction. In principle, each of the major divergences reflects a survival of habits and relationships arbitrarily established to meet quite special needs that are no longer present. The equality of the short-loan minimum and the deposit rate first occurred during the highly abnormal conditions of prewar cheap money; it did not obtain during the war, and is a survival of the *force majeure* of ultra-cheap money. Similarly, the abnormally wide spread between these two rates (and the Treasury bill rate) on the one hand and Bank rate on the other is partly a survival from postwar inflation and partly a reflection of the anxiety of the authorities to avoid any unduly abrupt rise in the cost of Treasury borrowings when they first moved towards flexibility. All but one of the special techniques introduced for this purpose have, however, now been abandoned. The one remaining technical justification for a wider margin between Bank rate and other rates now is that the Bank's lendings "at last resort" are charged at Bank rate, whereas

* "What Pattern for Money Rates?" and "Flexible Money and Full Employment," in the issues of September, October and November, 1954.

formerly they were charged at $\frac{1}{2}$ per cent over Bank rate. But this difference does not justify such wide margins as now obtain.

If the money mechanism is to be flexible, sensitive and efficient, there must be no technical impediment to the rise in market rates towards Bank rate, and normally they should stand much closer to it than they do now. At present, the habit of the clearing banks of fixing their short-loan minimum far below Bank rate, and then of lending the greater part of their short money more or less automatically at this agreed rate, keeps other rates also far below Bank rate. And when, as in these past few weeks, the Treasury bill rate rises noticeably above its equilibrium relationship to the banks' basic short-loan rate, technical anomalies and stresses are immediately set up. Moreover, if rates normally remain far out of touch with Bank rate and are primarily influenced by the agreed minima of the banks, the power of the authorities to make fine adjustments may be impaired. Indeed, during most of these past three years of transition, official market operations to supply credit deficiencies have given no independent lead on rates (except by a change in Bank

rate), and have therefore tended to consolidate a rate pattern that is moulded largely upon the rate agreements of the banks.

It is much to be hoped that the changes in the banks' practice, when they come, will deliberately provide for greater flexibility and will not consist only of adjustments in the relationship of the agreed rates. To produce a market rate-system normally operating closer to Bank rate, it is necessary that a spread should be opened up again between the deposit rate and the short money rate, and it is important that a substantial proportion of the short money should enter a genuinely competitive market. If a more mobile short-loan market imposes stresses upon deposit account balances, the banks should consider whether greater flexibility cannot be permitted for the deposit rate too. So far as can be seen at present, both the drift of opinion and the tendencies in the market are in this general direction. But full flexibility is still far away. Even if all the changes mooted in recent discussions were to mature, there would still remain one difficult issue—the future of the system of "syndicated" tenders for Treasury bills.

The Wheat Argument

ARGUMENT about the International Wheat Agreement will soon shift to wider ground. The present agreement expires on July 31, 1956, and before the end of 1955 all interested governments, members of the agreement and others, will be invited to negotiate its renewal. To set the stage for those negotiations, the International Wheat Council has published a full survey* containing both a re-statement of the faith for the enlightened, and an appeal to the wayward to see the light. That appeal does not rest solely on the dangers of the present massive surplus of wheat; the council has wisely gone back to first principles.

Wheat is an unstable commodity. Its history is full of sharp fluctuations in production, prices and trade. Fluctuations in output have been caused mainly by good or bad weather, and by the farmers' fairly rapid response to high prices coupled with tardy response to low prices. Normally, large crops brought low prices, but low prices did not quickly bring small crops. Nor do low prices stimulate demand to any appreciable extent. The main consuming countries do not eat more bread when wheat is cheap. The Asian countries will consume more if wheat is cheaper than rice—as it is today—and more wheat will be fed to animals, but those outlets are limited. Hence a surplus of wheat is not quickly self-correcting.

* The World Wheat Situation and the International Wheat Agreement. The International Wheat Council, 32, Queen Anne's Gate, London, S.W.1.

Since wheat is a major world crop, and a major item in world trade, the council argues that stability is in the common interest of both the exporting and the importing countries. That is its case—a strong one—for bringing a measure of stability into the world wheat trade. The council cannot resist pressing its argument home by pointing out that the present surplus of wheat is even larger than that of 1929, and recalling the collapse in prices and the depression that followed in the 1930s. But there the council is on weaker ground, for in fairness it has to recognise that the world and the wheat trade have changed so much that the spectre of the 'thirties is not looming today. The wheat market is no longer crowded with farmers hungry for a sale at almost any price. In the four major exporting countries—Canada, the United States, Argentina and Australia—their place has been taken by official agencies that fix their own prices and are able to carry large stocks. The balance of power in the market has swung in the producers' favour, and is maintained by governments that are determined to support their own wheat producers.

Those forms of support are extended internationally by the wheat agreement; in particular by the undertaking of the importing members to buy minimum quantities if called upon to do so when the price is at the IWA minimum, now \$1.55 a bushel for No. 1 Manitoba wheat. Could that undertaking prevent a collapse in price? The council doubts whether it can—under the present agreement. In the first agreement

the guaranteed quantities represented more than half the total world trade in wheat. In the present agreement, mainly because Britain is not a member, the proportion has dropped to less than half, and the IWA minimum is therefore a less effective prop for world wheat prices.

After setting aside the potential guaranteed outlet for wheat under the agreement, the council finds that the remaining supply in all exporting countries this season amounts to about 30 million tons, twice as much as the potential demand outside the agreement. "All-out competition for the non-IWA market," the council states, "would obviously put great pressure on wheat prices outside the agreement, and could hardly fail to force the non-IWA price below, and perhaps far below, the IWA minimum. . . ." That is true, though not everyone will share the council's sympathy for the plight of the monopoly exporter who has to hold up his price. And is all-out competition among exporters likely? It did not develop in 1954, when there was a record surplus.

★

Is there, then, any need for a wheat agreement? If the case for price stability is conceded, the answer must be Yes. One reason is Nature. Largely owing to bad weather, this season's crops were significantly smaller than in 1953-54; as a result, the carry-over into next season will at least be no larger than before. Had Nature not intervened, no one can be certain that the exporting countries would not have panicked. Another reason is that stability cuts both ways. The function of the agreement is not only to provide the exporters with the assurance of sales at the floor price; it is also to provide the importers with the assurance of supplies at the maximum price, now \$2.05 a bushel. That protection may be unnecessary now, but it could again be valuable if there were another bout of poor harvests.

To some importers, the disadvantage of an agreement covering a larger share of world trade may seem to be that it would strengthen the ability of the exporters not

only to hold the price at the minimum, but to hold it well above the minimum. Even in this season, prices of hard wheats have not reached the minimum, and it may be doubted whether they would have fallen as far as they did if Britain had been a member of the agreement. The fear that prices might tend to "stick" in the upper part of the range may increase the pressure from importers for a lower maximum price.

There seems little need for any radical changes in the agreement, but if its principles are not to be mocked in practice, its members must recognise that their responsibilities do not stop at the agreement. International co-operation, as the council states, was assumed to extend to domestic wheat policies too, though it tactfully forbears to press that point. The United States is now trying to bring production down to more reasonable levels, but the attempt has come late in the day. The high American support price, which has encouraged wheat production in America and the rest of the world, bears much of the blame for the present world surplus. Even Canada, which is apt to feel somewhat holier than the United States, might consider whether it is sufficient to exercise only a remote control over acreage through its initial payments to the farmer. And it is high time that the importing countries studied whether it is in their real—as opposed to their political—interests to encourage a high level of wheat production at guaranteed prices as high, and frequently much higher, than the American support price. The events of the past year may have improved the agreement's prospects of survival. The exporters have had a fright, and may be more willing to compromise on price to obtain the renewal of the agreement; the United States, for example, is less likely now to look on a high ceiling price mainly as a means of minimising the subsidy it pays on its exports of wheat. And as the council recalls, the refusal of Britain to join the present agreement was wholly a matter of the ceiling price; Britain expressed its support of the agreement in principle, and there is no evidence that its attitude has since changed.

Business Notes

Markets Unworried

MARKETS ended 1954 in an advance. The *Financial Times* industrial index finished at 184.0, a higher point than it had touched before but not since. It happened that the lowest point of the year was January 1st (how high the index then looked at 131.1) and that the highest point was December 31st (how cheap industrials looked to some after they had shown that they could rise just over 40 per cent in a year). Prices marched on again as 1955 opened, gently at first under the threat of a railway strike, but when the new account began on Wednesday and fresh hopes of a railway settlement sprang up, the movement gathered momentum. The industrial index leaped forward to 186.6 on Wednesday as though investors were counting

another 40 per cent rise in 1955 as already in their grasp. The offer of Colville's equity was postponed a week—not because the Iron and Steel Holding and Realisation Agency distrusted the market, but simply lest a rail strike interfered with mails. The gilt-edged market that had been lagging behind industrials at last joined heartily in Wednesday's advance.

It is worth remembering the reason why the gilt-edged market has indulged but frugally in the general festivity of markets: it had a little to do with trouble on the railways, but much more with the lingering suspicion that there is but more than a trace of inflation in the system and that it will sooner or later need to be washed out. Wall Street dis-

covered this abruptly on Wednesday when margins were raised by the Federal Reserve Board from 50 per cent to 60 per cent Wall Street fell sharply, yet London pursued its blithe course, with neither gilt-edged nor equities affected in any material degree, apart from an hour or two of alarm. The industrial index at the close of Thursday's business showed a further rise at 187.3. It says much for the confidence of the markets that a week of considerable tension that could have been capable of damaging effects on prices has had no effect at all.

Defence Lag Aids the Chancellor

IF modern budgets were tailored simply to the pattern of the Exchequer's own finances, taxpayers now—as an article on page 88 points out—would be entitled to cherish high hopes for next April. There is no doubt that the outturn of the 1954 budget will be much more favourable than the Chancellor envisaged. He estimated that for the full year 1954-55 his "above-line" account would be only just in balance—with a surplus of £10 million compared with the surplus of £94 million actually achieved in 1953-54. Yet in the first nine months of this year the above-line account, instead of deteriorating, has actually improved by no less than £191 million; the deficit outstanding at December 31st last was £355 million, compared with £546 million at end-1953.

By far the greater part of this big gain has been attributable to a shortfall in expenditure; in the full year total ordinary expenditure was expected to rise by £248 million, whereas in the first nine months it has fallen by £17 million. There is no doubt that this unexpected behaviour of expenditure has been due very largely to the lag in defence expenditures—a lag that may reflect to some extent mere delays in payments and also some real economies due to changes in programmes, but is more probably mainly due to the failure of production to keep pace with expectations. The shortfall is the more remarkable, however, in that it is computed after bringing in smaller amounts of "counterpart" defence aid this year than last, this difference being of the order of £40 million.

Buoyant Revenue

PART of this lag in defence expenditure will doubtless be made good in the next few months, but it seems evident that any such catching-up of arrears will not be large enough to transform the general appearance of the

accounts. Tax revenue plainly reflects the buoyancy of the economy, for total ordinary revenue already shows a gain of £173 million on the corresponding period of 1953-54, compared with the budgeted gain for the full year of £165 million. The year's estimate for total revenue should thus be substantially exceeded, for the big increase shown by end-December was achieved despite the fact that at least 60 per cent of the year's yield from income-tax remains to be collected. The budget also envisaged an increase of £109 million in miscellaneous receipts, because of large expected sales of stocks by the Ministry of Food; but so far this item shows a rise of only £37 million. Although both the pace of liquidation and the prices realised have probably been less favourable than expected, it seems probable that the Exchequer will receive further credits from this source before the year-end. Meanwhile, receipts

from stamps and EPL have already surpassed the year's estimate, and the revenue from death duties and customs and excise is flowing strongly.

Expenditure below the line has risen by £8 million, despite the fact that loans to local authorities are again falling short of estimate, and, at £212 million, are £28

million less than in the similar period of 1953-54. The increase in total below-line expenditure arises from a change in the method of financing the capital expenditures of the Post Office. Until the middle of last year these capital requirements were being met by the investment of Savings Bank funds in special annuities, whereas now they are being provided by advances from the Exchequer itself. These advances, therefore, figure as a new item of below-line expenditure; at end-December last the amount outstanding was £27.4 million. The upshot is that the overall deficit now stands at £646 million compared with £829 million at end-1953; for the full year it was expected to rise by almost £100 million to £397 million.

Bank Dividends—Round Two

THE opening of the bank dividend season has, after all, provided both surprises and excitement for bank shareholders. By October last all the principal English banks had followed the lead set by the National Provincial Bank two years ago by conceding modest increases in their long-established rates of dividend. The Westminster and Midland Banks, which twelve months ago still seemed determined to cling to their traditional rates, came into line during the course of the year, and both indicated what their final payments for 1954 were expected to be—both granting an increase of 2 per cent, to rates equivalent to 18 and 20 per cent respectively. After this round of increases, it was generally taken for granted that a new equilibrium point had been reached. But on Tuesday, Barclays Bank started a second round, and was followed on Wednesday by the National Provincial. Martins Bank has maintained its payment at the increased 1953 level, but one of the discount houses, the National, has made a substantial increase (paying 12 per cent, compared with a rate equivalent to 7½ per cent for earlier years). Alexanders Discount has maintained its distribution, but has in effect consolidated the cash bonus paid last year into the new basic dividend.

Barclays' second increase proves to be larger than the first: this was from 14 to 16 per cent, a rate that became equivalent to 10 per cent after the capital reorganisation. Now the distribution is raised to 12 per cent by a "special dividend" of 2 per cent, so that the total increase over the two years is equivalent to rather more than one-third. Moreover, this latest increase applies to the whole capital apart from staff stock (since the former "A" and "B" stocks were merged last year). The directors indicate that they hope to maintain this special payment until they feel able to recommend a further capitalisation of reserves. The National Provincial's increase is a straightforward lifting of the final payment to 9½ per cent, making the year's payment 18 per cent, or 1 per cent more than that for 1953 and 3 per cent more than the stabilised rate maintained until 1952. These unexpected announcements naturally provoked some sharp rises in the bank share market; but investors should bear in mind that in this matter of a second round there is room for considerable divergence of view as between the several banks.

"Yes, he said I needn't take on extra staff after all..."

"YOU KNOW when our orders were going up and up? Our accountant told me we might have to take on more staff. So we decided to call in the Burroughs man. It couldn't do any harm and his advice was free... As it is, I'm more than glad. He went into the details with our accountant, then showed us how we could mechanize our accounting at low cost—and save a lot of overtime. He certainly knew his job..."

The Burroughs man is always at your disposal without cost. He is an experienced adviser on all accounting and

record-keeping systems, and well qualified to work with your accountant and auditor.

He has a complete knowledge of mechanized accounting. But he won't propose changing your accounting methods just to suit certain machines. Rather, after a full analysis of your problem, he will make proposals for a rapid, economical and workable solution.

If he does recommend a new system, he will prepare a detailed plan for it and help you get it working smoothly. He will make sure you continue to get full benefit from any Burroughs machine you install.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve it. Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment.

Call in the Burroughs man as soon as you like—you're committed to nothing and his advice is free. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

FOR EXPERT ADVICE ON BUSINESS SYSTEMS

One Burroughs man solved this problem. The Phonotas Co. Ltd. (weekly telephone cleaning and sterilizing service) have 80,000 separate accounts, and until recently, in London and in provincial offices, figures were copied by hand. As this led to errors and delays, they called in this Burroughs man, Mr. J. G. Winterbottom (left). He showed Phonotas how, with just two typewriter-accounting machines and two abbreviated-description accounting machines, they could halve their accounting time, and obtain up-to-date figures—all without extra staff.

Inquest on Coal

COAL output in 1954 turns out to have been rather lower than was guessed in these columns last week—223½ million tons against 225 million. Final figures are not yet available; but provisional totals published by the Ministry of Fuel and Power and estimates made this week by the National Coal Board indicate that deep-mined output was only about 1½ million tons higher than in 1953, while opencast coal production was down by nearly 1½ million tons. On this showing, total output rose hardly at all last year, and coal stocks will have been drawn upon very heavily in the last fortnight of 1954.

Sir Hubert Houldsworth this week pointed out that productivity—of men and machinery—was a record last year, but that manpower, on the average, was 5,700 lower, cancelling out almost all the gain. It was less an explanation of 1954 than a warning for 1955. At present, the mines have at least 12,000 fewer men than they could use effectively; and the National Coal Board believes that in times of full employment throughout industry it will do well to maintain its labour force, let alone increase this. The emphasis, in 1955, is upon extending the use of power-loaders to get the same output or more without extra men. Sir Hubert was not prepared to guess at the chances of output in 1955, and he emphasised that this would be related to the industry's capacity, not to the growth of inland demand. This pre-supposes a fairly substantial margin of imports, unless exports are cut more heavily than those responsible—in the Ministry of Fuel and Power, not in the Coal Board—have yet indicated.

Savings and Banking

THERE is one bank that pays 2½ per cent on all the money that the customer puts in, charges him nothing for keeping his account and will issue him a batch of crossed warrants to pay the butcher and the baker (provided the amounts are over £1) without a charge for the service or even a twopenny stamp on the warrant. It is the Post Office Savings Bank. Other banks have so far endured the competition without a murmur. How far the public is taking advantage of such unrivalled services is obscure. There is some evidence that the Post Office is being used more freely as a bank for current transactions, but it is less effective as a vehicle for the collection of more permanent savings. The emphasis is on bank and not on savings.

So it happens that in 1954 when national savings took a sharp turn for the better, the Post Office Savings Bank was left lagging behind. The other three channels that make up the so-called "national savings"—savings certificates, defence bonds and the trustee savings banks, all collected substantial additions to net savings; certificates added a net £34 million, defence bonds £36 million, and the trustee banks £24 million. The Post Office showed a net withdrawal of £60 million, albeit an improvement over the 1953 drawal of £109½ million. There are naturally sufficient reasons to explain the trend. Heavy withdrawals from the

Post Office must owe something to the inquest into interest payments over £15, making it a less attractive refuge for the rich man's money, and something to the counter-attractions of other forms of investment. Even the higher limits on holdings of savings certificates and defence bonds to which some savings may have been switched have probably cost the Post Office some of its deposits. Moreover, the flow of encashments has been drying up, in part.

As a whole, that part of the nation's savings that is called "national savings" certainly did much better last year. Receipts less encashments were a *plus* figure for the first time since 1948 and the total remaining invested rose by £91 million to £6,051 million, whereas in the previous three years there had been a decline in that total. Lord Mackintosh of Halifax, chairman of the National Savings Movement, was amply justified in his claim that last year's figures were "good news for the nation."

The Output Margin Narrows

MOST people who make any specific use of the official index of industrial production have to arrive at some guess about the final annual average by about the end of the year; thereafter, as the provisional figures come steadily in, two months in arrears, the indices of total production serve mainly to correct their guesses. The figure for October, 135 (1948=100), published last week with the customary estimate of what the figure for November may be and some revisions for earlier months, probably will not alter most of the guesses much. It confirms that the margin of increase over output in 1953 was still narrowing; in October this was down to about 3 per cent for industry as a whole and less than 4 per cent for manufacturing, and indications for November (136-137) suggest that the increase then may have been even less.

Nine months' figures of 1954 are now available for most of the main industrial groups covered by the index. These show that the big groups that had been most successful in

the first half of the year, vehicles, chemicals, paper and printing, were still contributing most of the boom during the third quarter of the year ; some of the smaller groups, such as non-ferrous metal manufactures, were also sharply up on a year before. Only glass manufacture and the

EXPANSION IN SELECTED INDUSTRIES

Industrial Group	Per cent increase over same period a year before

“leather, leather goods and fur” industries were lower in the third quarter than a year before; but textiles and clothing showed practically no increase. The consumer took most of the product of the 1954 boom, but he was buying hard goods, not soft.

Optimism from the Shipyards

IN terms of final output, the shipyards have a success story to tell of 1954. Mr J. W. Elliott, president of the Shipbuilders' Conference, is already able to report that the industry completed 1½ million gross tons of new merchant ships during the year. This was the largest total since the war (the next best having been in 1951) and an increase of about a fifth over 1953. The industry is probably to be congratulated—though it is not easy to know just how much. Completions are obviously not an adequate measure of shipbuilding activity, because of the long and varying periods that ships take to build; they give no indication of the volume and rate of work in progress in the shipyards as a whole. In the first ten months of last year, according to Admiralty returns, the tonnage laid down in British yards was about 15 per cent lower than the tonnage completed, so that over the year total tonnage under construction declined. The Central Statistical Office, it may be said, constructs a more elaborate index of shipbuilding output by estimating the man-hours worked in the yards and the relative value of them, in compiling its general index of production; but it does not publish this separately. It is not possible, therefore, to guess at the illness that really adequate supplies of steel plate may have given the industry last year.

In terms of orders, too, Mr Elliott sounded encouraged. The industry booked only 600,000 tons of new orders for ships during 1954, and orders for 300,000 tons already on the books were cancelled. But half of the new orders did come in the last three months of the year, and the autumn recovery in freight rates may well be making more ship-owners think once again about replacements. British yards have still 4½ million gross tons of ships on order, which would take more than two years to work off if all yards were equally busy. This is a long way down from 7 million tons, which represented the length of the order book in mid-1952: but Mr Elliott feels that:

The working down of the order book to a level nearer normal will in due course help British yards to meet Continental competition based upon earlier deliveries.

It is true that too much gloom has often been generated by the reduction of this order book from a level representing almost intolerable delays for the customer, and that shorter delivery periods may persuade the yards to reconsider their adamant refusal to quote fixed prices. But some of Britain's lost customers have recently been attracted away by prices that are a good deal lower than Britain's, quite apart from the irritations of Britain's escalator clauses.

Hire Purchase Boom

THERE was never any doubt that 1954 would prove a bonanza year for the hire purchase trades. The figures just issued by HP Information give an indication of how good it really was in the few trades in which comprehensive statistics are prepared. In the past two years the number of new cars sold by hire purchase has risen from 14,048 to 52,794 and of used cars from 90,587 to 253,961. Applying a little guesswork to the number of new car registrations in this country last year, it can be estimated that hire purchase held about 14 per cent of the new car market compared with 9.1 per cent in 1953.

Unfortunately the field of comprehensive figures is narrow but the more sketchy evidence that comes from other sources points the same way. The Radio and Television Retailers Association has now started the publication of a monthly

The forgery that saved lives★

Normally, we should have been horrified to learn that the Rolex trade mark had been forged on inferior wrist-watches, which were then sold for fabulous sums.

In this case, we were flattered! Because, by committing this fraud, a man had helped to save many lives in the dark and perilous days of the war.

In 1942, Mr. Edward Porter (then Private Porter) was captured and incarcerated in a P.O.W. camp. Food was practically nonexistent, clothing scant and medical supplies scarce. Only by selling their few treasured possessions to the guards, could the prisoners obtain money to buy, "through the wire," such food and medicines as friendly natives could provide.

It was soon discovered that the object most prized of all by the guards was a Rolex watch. Porter, whose skill with makeshift tools had become a byword, was asked by his fellow prisoners to "transform" their lesser known watches into Rolex watches. After carefully considering the extenuating circumstances, he agreed.

"I therefore set to work," he writes, "engraving the 'Rolex' trademark on watches of similar design, and inscribing 'Rolex' on the watch dials with indian ink, using a mapping pen."

So ignorant were the prison guards, that this simple ruse succeeded, and the money thus obtained helped save the lives of many of the stricken prisoners.

We are proud to have been of service in such an unusual fashion. But this was made possible only by the world-wide reputation of the Rolex trade mark, built up by many, many years of manufacturing the world's finest waterproof and self-winding wrist-watches.

And now, Rolex will be proud to be of service to you—to keep time for you, precisely, by night and by day, through the many years to come.

★ This is a true story, taken from a letter written by Mr. Edward W. Porter to the Rolex Watch Company. The original letter can be inspected at the offices of the Rolex Watch Company, 18 rue du Marché, Geneva.

"I therefore set to work, engraving the 'Rolex' trade mark..."

The Rolex Red Seal signifies that the watch to which it is attached has been awarded an Official Timing Certificate by a Swiss Government Testing Station, with the proud title of chronometer.

The smooth-running, silent, self-winding "rotor" keeps the Rolex Oyster Perpetual fully wound automatically, provided the watch is worn for at least six hours a day. This constantly even tension on the mainspring makes for still greater accuracy.

THE ANATOMY OF TIME

A fascinating, illustrated book, recording man's deep preoccupation with Time measurement, from the earliest recorded device to the split-second accuracy of the modern watch. For your free copy, write to the Rolex Watch Co. Ltd., on personal or business stationery.

THE ROLEX OYSTER PERPETUAL—truly a monarch among watches. The astonishingly accurate movement, perfectly protected by the Oyster case, is given added precision by the self-winding mechanism. The tension on the mainspring is much more even, overwinding is impossible.

THE ROLEX OYSTER PERPETUAL DATEJUST,
finest of a long line of masterpieces. This
watch is waterproofed by the famous Oyster
case, self-wound by the unique Rolex Perpetual
self-winding "rotor," and it shows the date
clearly and automatically, in a neat window
cut in the dial.

television from roughly half to fully two thirds of the market compared with a year earlier and in radio from under 40 per cent to over half.

The Gold Reserve

BRITISH gold and dollar holdings fell by \$163 million in December, but the fall was more than accounted for by the payment in that month of \$181 million on the US and Canadian 1946 credits. To arrive at the true balance of dollar payments of the sterling area during the month allowance must be made on the credit side for \$8 million received as Defence aid from America, and for the \$3 million inflow from the European Payments Union in settlement of Britain's November surplus. On the debit side, \$8 million went out to Canada for the quarterly instalment on the Canadian interest free loan, and \$2 million went to EPU creditors under the bilateral settlements. The residual figure is a surplus of \$17 million, in dollars gained over the exchange and in gold secured through purchases in the market. That residual surplus for December compares with a deficit of \$30 million in November and a surplus of \$11 million in October. In December, 1953, the true dollar surplus amounted to \$114 million. The modest surplus last month is in part explained by the extension of the seasonal pressure against sterling due to larger and later purchases of dollar cereals than usual, which have run into the period when sterling is normally strong. During December sterling was also still under the influence of disappointment at the evaporation of convertibility hopes: it took the form of running down sterling balances in the course of normal trade rather than of outright withdrawals over the exchanges.

During the whole of 1954 the gold and dollar reserve rose by \$244 million to \$2,762 million. In the same period the United Kingdom repaid dollar debt to a total of \$304 million, consisting of \$112 million to the International Monetary Fund, \$99 million to the EPU, \$24 million on the Canadian interest free loan and \$69 million, the principal on the US and Canadian lines of credit repaid last month. During 1954 the dollar capital account of the United Kingdom improved by \$548 million plus a substantial amount newly invested in the United States and Canada partly in new ventures and partly through security buying.

It will be hard for 1955 to provide a comparable achievement—though the recent strength of the sterling commodities together with the likelihood of some building up of inventories in the United States bear their message of hope.

* After taking account of the payments in December for the service of United States and Canadian lines of credit, the United States lend lease loan and the ERP loan (\$181 mn.), Canadian interest free loan (\$8 million) and bilateral settlements with EPU members (\$2 million).

† After taking account of payments totalling \$99 million in mid-July direct to creditor countries in EPU in initial settlement of part of the U.K.'s overdraft with the Union.

‡ After payment of \$112 to IMF for "repurchase" of sterling.
§ EPU settlements in any month depend on the surplus or deficit with Europe in the previous month.

The portent for 1955 is less encouraging. The UK had a deficit of £7 million with the EPU in December and half of this will fall to be settled in gold in January. There was also a deficit—amounting to £3 million only—in December, 1953.

Dearer Aluminium

THE increase of 1d. a lb. in prices of most aluminium products, following a rise of £7 a ton in the ingot price, is unlikely to discourage demand in established uses. Consumption recovered strongly last year and will no doubt remain buoyant as long as activity in the transport, construction and packaging industries is maintained at the present high rate. Deliveries of virgin ingots to fabricators rose by 42,000 tons to 181,000 tons in the first ten months of 1954, and output of products has shown a corresponding increase; output of aluminium sheet and strip, the largest group of products, rose by 13,000 tons to 100,000 tons in the same period, while output of foil was 2,700 tons higher at 14,000 tons. This expansion has been well within the industry's capacity and delivery dates for most products are now only slightly longer than a year ago. But production is still below the high levels of 1951/52, for some marginal users of that time switched back to tinplate and other steel products when the shortage of steel ended. Tinplate is now short

again and some consumers are showing more interest in aluminium container sheet.

The increase of 1d. a lb in prices of products is equal to £9 6s. 8d. a ton, £2 6s. 8d. a ton more than the increase in the ingot price. It is the custom of the fabricators to revise their prices in stages of ½d. Had they increased the price by ½d. that would have given them only £4 13s. 4d. a ton and involved a loss. It should be possible to pass most, if not all, of the increase on to export prices, for competition in foreign markets is now less keen than a year ago. British exports to most foreign markets rose last year, although the total was lower than in 1953 because shipments to the United States fell steeply from an exceptionally high figure. The rise of £7 to £163 a ton in prices of ingots reflects mainly the increased costs of the huge expansion programme by Aluminum Company of Canada, and partly the appreciation of the Canadian dollar against the pound. Aluminum Company of Canada supplies about four-fifths of Britain's requirements of ingots, and therefore makes the market price in this country. The last increase—of £6 a ton—was made a year ago. When private trading in aluminium was resumed in July, 1953, the company undertook not to charge more than the British government would have charged as a public trader, and the latest increase meets that undertaking. It would be unrealistic to expect that undertaking to continue until the government's options to take up Canadian metal expire in 1970; it will probably be allowed to lapse at the end of this year, when the Government's firm contracts with the Canadian company end. No material change in price policy would follow; for much of the growth of the demand for aluminium depends on the producers maintaining a conservative policy.

Life Insurance Bounds Ahead

AGAIN the life assurance offices broke all records in 1954. That is clear from the figures of 57 offices in the table below. They are a generous sample covering over 90 per cent of the home and overseas business of the British offices

* Approximation. † UK business only.

and the British business of the Commonwealth offices. Their total of £883.8 million for new sums assured points to a final total of around £925 million for the whole industry compared with £815 million in 1953. With only one exception all the offices that have so far announced figures show increases. These point to a rate of expansion of around 16 per cent in 1954 compared with 6 per cent in 1953 and 17 per cent in 1952.

The Millard Tucker Report may lie in the pigeon hole, but new pension business—from the incomplete data so far available—seems to have gone on growing; it has certainly been greater than in 1953 when pensions of about £43 million a year were assured under group schemes. New individual sums assured were also probably greater than in the previous year, and substantial business was again done in "top hat" policies and in those issued under the Married Women's Property Act. New industrial life business (which totalled £279 million in 1953) also seems to have increased, though again more slowly than new ordinary business.

All the indications suggest that policyholders will not do badly. Life offices have enjoyed a substantial capital appreciation in 1954—perhaps 6 per cent on the average, with a higher figure for those with a more than average stake in equities. This naturally has been coupled with a downward pressure on the yield from invested funds, partly relieved for those offices with a large stake in equities by higher dividends. The substantial increases in bonuses on participating policies that have so far been announced suggest that those that are to follow in the coming weeks will reflect the current prosperity of the insurance industry.

More Troubles in Copper

AFTER fluctuating sharply at a high level, copper prices in London touched a new peak of £307 a ton for cash metal this week. The persistent shortage of nearby supplies and the prospect of a continued shortage of metal in the early months of this year have been accentuated by the strike of African labour on the Rhodesian copperbelt, and reports

of a dock strike in Chile. Technical consequences of the new contract for copper have also played a part. Under this contract, which came into force for three months' metal last October, and for cash this week, copper is only good delivery on the market if it is in an official warehouse. Formerly the seller had the option of delivering ex-warehouse, ex-ship, ex-quay, or ex-refiners' works. Therefore the supply of prompt metal in which the market can operate has been reduced, for the holder of metal afloat, or on the Continent, or ex-refiners' works cannot sell until that metal has been put into warehouse, and nowadays he can usually avoid the cost of that operation by selling direct to the consumer.

This is the opposite of what was intended. By removing sellers' option of delivery the new contract was intended to encourage consumers to make greater use of the market and to promote stability of price. But the case for the new contract cannot be judged on the events of one week alone; it is simply unfortunate that it has come into force for cash metal at a time of acute shortage. That risk was foreseen, and had to be taken. And consumers should also remember that the contract does assure them of delivery on the prompt date, instead of up to three weeks after the "prompt" date. The contract cannot be expected to function satisfactorily until there is surplus metal available to the market, and that may not happen for some months. The Rhodesian producers probably fear that high prices will discourage consumption, and that may be the main reason for the discussions on introducing a scheme for stabilising prices. Before any such schemes are tried, however, the producers might well consider selling more metal through the market. It may be argued that this would merely transfer a theoretically equal supply and demand from direct channels to the market, and hence that this would not make any difference to prices. But it is the volume of turnover that matters; a larger turnover would almost certainly diminish fluctuations in price. An opportunity to sell more metal on the market will come in the middle of the year, when the long-term contracts with consumers will be due for renewal.

New Issues in 1954

BRITISH industry went to market for fresh capital on an increased scale last year. The Chancellor's capital allowances stimulated fixed investment and the boom on the Stock Exchange provided fine opportunities for appeals to investors. Outside the sphere of government borrowing last year was one of the busiest periods on record for the new issue market. Borrowings by the government (in *The Economist* table on page 143 they include the net receipts and repayments of National Savings Certificates and Defence Bonds) declined from £767 million to £550 million. That decline was responsible for the fall in all borrowings from £975 million to £904 million, which masks the great activity of industry as a borrower. It should also be remembered that £55 million worth of steel shares were sold by the government to the public and that that is the same in broad effect as a government issue of £55 million.

New issues for cash to the public or to shareholders

by companies, however, went up sharply from £136.6 million to £275.7 million. Over half of this total was raised on equities, but there was also a marked resurgence in debenture and preference issues. With interest rates lower, some companies were finding it cheaper to raise long-term money on fixed interest stocks. New money flowed strongly into the engineering and motor industries; elsewhere in industry the most notable increase came in the miscellaneous group, which includes the two big issues by Imperial Tobacco and Imperial Chemical Industries. More new capital was also directed towards the mining companies. Here, the money financed the last stages of development of the gold and uranium mines in the Orange Free State, and further extensions by the Rhodesian copper producers.

Higher Prices of Paper and Pulp

WOOD pulp, newsprint and other types of paper have risen in price. Most grades of paper other than newsprint have been increased by some 3 to 8 per cent; this is the first general advance in prices for twelve months, and it is claimed that it does not fully cover the rise in costs of production and raw materials during that period. That was a period in which the output of the paper-making industry was running high, and profits have also been high. But with the continued buoyancy of demand for paper an increase in prices was probably inevitable. The industry appears anxious to preserve stability in prices, and the new prices are generally firm minimum quotations for six months instead of the customary three. That promise of stability is founded partly on a similar stability in prices of wood pulp.

Prices of chemical grades of wood pulp from Scandinavia, whence most of Britain's pulp comes, have been raised by up to £2 a ton for shipment in the first quarter, and the big paper-makers have been able to buy at the same prices in the second quarter. That is the first change in chemical pulp prices for six months, and it brings bleached sulphite pulp, which is used in the manufacture of fine grades of

HELP FOR BUSINESSMEN

Available by subscription:

BUSINESS ABROAD—Three-monthly reports on business conditions in 70 countries.

CAPITAL REPLACEMENT COSTS—Quarterly indices for nearly twenty major types of capital equipment issued regularly; others on request.

THANK YOU, MRS. WILSON, FOR NEXT YEAR'S AIRLINERS

Keeping Britain ahead in the air by building new airliners is a big job — and calls for a lot of skilled people. But — when you're thanking them all — *please don't forget Mrs. Wilson.* Mrs. Wilson — and nearly 2 million passengers like her — flew BEA last year. Her ticket helps (for example) to put more Viscounts and more Elizabethans in the air. It also helps BEA to send development engineers to advise on the building of the airliners of the future. It's people like Mrs. Wilson who make Britain's civil air supremacy possible.

... and a prosperous New Year for you, too

It is just before midnight on December 31. In a few moments the most important year of their lives will begin. Their first year of married life. And as the bells ring it in, they'll be wishing for a wonderful and prosperous New Year. If their wish is granted it can mean a prosperous New Year for you, too.

Why?

Because they are representative of millions of young people who are looking ahead. With a new home to furnish they have long discussions on what to buy. Like most of their generation they are exceedingly discerning, but they can be persuaded by skilful advertising. Even if your products are beyond their price range today, you can give them the ambition to buy them in the future.

By approaching the problems of our time realistically and presenting the news in a vital, up-to-the-minute style, the Daily Mirror appeals outstandingly to the vigorous, keen-to-get-on younger generation. With the biggest daily net sale on earth (it exceeds 4,600,000) it offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers today... next month... next year.

paper, to £59 a ton cif east coast ports. Mechanical pulp, the basis of newsprint, has been raised by 25s. to £28 15s. a dry ton cif, the first change for two years, and manufacturers have contracted for supplies at that price for the whole of 1955. The equalised price of home-produced and imported newsprint has been raised by 30s. to £54 10s. a ton. Imports of wood pulp for paper making will be slightly larger in the first half of this year. The value of licences amounts to £41.1 million cif, compared with £38.8 million in the second half of last year, an increase which more than offsets the rise in prices. The import quotas for paper (excluding newsprint) and board have also been raised by £2.5 million to £17.5 million fob.

A Long Bow at Kansanshi

It may seem strange that a rich group like Anglo American Corporation of South Africa, with big projects on its hands, should chase the will o' the wisp of profitability in the old Kansanshi mine. The property never became a producer of copper, for the reserves so far proven are small and difficult to mine and treat; the owners, the Rhodesia-Katanga Company, stopped work there in 1938. Another obstacle is that Kansanshi lies well to the north-west of the Rhodesian copperbelt, so that any ore extracted would attract heavy transport charges to a smelter. Last month Anglo American and its associates announced that they would take up their options to purchase the mine and the surrounding surface and prospecting rights, and Anglo American's report, as the consulting engineers, was published this week. That report makes it clear that the £300,000 recently spent on exploration of the mine has yielded no tangible return. But if prospectors were guided only by the ascertainable facts, some now flourishing mines would never have come into production.

Commodity Prices in 1954

The general level of commodity world prices, as measured by *The Economist* commodity price indicator, rose 7 per cent during 1954, from 93.7 to 100.0 (1952=100). Price movements of the seventeen individual commodities which make up the indicator are shown below.

END-1954 COMPARED WITH END-1953

	Increases %		Decreases %
Tea	+74	Cocoa	-2
Rubber	+63	Sugar	-3
Copper	+20	Gasoline	-3
Lead	+14	Wheat	-8
Zinc	+10	Wool	-9
Cotton	+7	Copra	-18
Tin	+5	Sisal	-26
Coffee	+4		
Jute	+4		
Maize	+1		

Anglo-American consider that "it should be possible" to find enough ore at a mill grade of 3.5 per cent copper to cover new capital expenditure and working costs, and still leave sufficient profit to finance further exploration and development of methods of treating certain ores. Naturally this "should not be regarded, at least in its first stages, as mining for a profit." The mine will be equipped to mine and concentrate 12,000 tons of ore a month, at a cost of about £1 million. The money will be raised by Anglo American and its associates under the terms of the agreement made when they formed the Kansanshi Copper Mining Company to undertake the exploration. By taking up their options Anglo American, Tanganyika Holdings, Roan Antelope and Mufulira will purchase the mine and the surface rights outright from Rhodesia-Katanga; that company will receive £250,000 in cash and 250,000 £1 shares in Kansanshi from the deal. The exercise of the options will leave Kansanshi with £118,750 in new money. A further £781,250 will be raised by an issue of Kansanshi £1 shares at par to the partners. Thus £900,000 will be raised, leaving a balance of £100,000 to be found later. After the announcement that the options would be taken up, the £1 shares of Rhodesia-Katanga rose by 1s. 6d. to 15s., and they now stand at about 17s. 3d.

Good Year for Diamonds

THANKS to a sharp rise in sales of industrial diamonds in the last quarter of 1954, the total value of diamonds sold through the Central Selling Organisation last year amounted to £62.1 million, an increase of £1 million over the previous year. The exhaustion of surplus stocks of gem

HOUSING PROGRESS

Permanent Houses Completed in Great Britain

stones was reflected in a further fall in sales of £370,000 to £10,866,000 in the fourth quarter, but sales of industrial diamonds recovered by £2 million to reach £5.2 million.

" 3rd "	11.2	3.1	14.4
" 4th "	10.9	5.2	16.1

The earlier forecast of a slight fall in total sales last year has been proved wrong; the results are in fact the third highest ever, exceeded only by the record sales of £69.7 million in 1952 and of £65.1 million in 1951.

SHORTER NOTES

A big increase to a new high record is recorded in bank clearings for 1954 and reflects the quickening pace of industrial and financial activity. The total passing through the London Clearing House in 1954 was £144,288 million, a rise of 16.6 per cent, much more than can be explained by the fact that 1954 had one extra working day. The Town Clearing at £112,923 million was up by 19.7 per cent and the General Clearing at £31,365 by 6.7 per cent. The total of provincial clearings at £2,346 million showed an increase of 9.3 per cent. The biggest increases being 16.2 per cent in Liverpool, which doubtless reflects the opening of the grain and cotton markets, and in Birming-

ham, where clearings rose 13.9 per cent, as activity in the motor and engineering trades expanded.

The annual report of the Issuing Houses Association discloses that that body has decided against circulating a memorandum endeavouring to define the rights of preference shareholders. The terms of recent issues, it is claimed, show that both issuing houses and companies are aware of the difficulties caused by recent House of Lords judgments.

The token import scheme for imports of goods from the United States and Canada is to continue in 1955 at the same level as in 1954, that is at 30 per cent by value of the average exports to the United Kingdom in the period 1936-38. The scheme allows the import of limited quantities of manufactured goods in which there is a traditional trade that is restricted because of the dollar shortage.

Year-end pressure in the money market was exceptionally severe, and discount houses were obliged to borrow from the Bank of England on the largest scale since 1929. The Bank return this week therefore shows a sharp rise in "discounts and advances," from £8.9 to £65.8 million.

Mr Graham Page, MP for Crosby, succeeded before Christmas in introducing his Bill to reduce the need for endorsement of cheques. The second reading debate on the Bill is expected to take place on February 18th.

Company Notes

LANCASHIRE STEEL. A month ago the statement from Stewarts and Lloyds proved that Sir John Morison in selling back the steel equities to the public framed the profit estimates in the prospectuses as cautious minima. The preliminary statement from Lancashire Steel now proves that he and the Iron and Steel Realisation Agency framed the dividend estimates with the same thought. To be cautious in a prospectus is to err on the right side, and now investors, seeing how they are working out in practice, may feel that they have been left more to go for than had been apparent in the documents themselves. The latest evidence of conservatism in dividend estimates came with the announcement that Lancashire Steel was to pay an ordinary dividend of 9 per cent, instead of 8 per cent forecast.

• dividend was backed up by a state-showing gross profits almost un-
t, although the prospectus had
for a decline. Indeed, Lanca-

shire Steel's profits rose slightly—from £2,111,996 to £2,170,150—as did the net income of the group—from £1,036,996 to £1,050,150. The £1 ordinary stock units of Lancashire Steel have been the laggards in the recent rise in steel equity prices. These results gave them a very smart fillip. They jumped 1s. 9d. to 25s., to offer a yield of 7.2 per cent. The lesson will not be lost on those who will soon have to consider the merits of the offer from Colvilles—an offer that has now been postponed a week.

TOBACCO SECURITIES TRUST. Tobacco Securities Trust Company is an investment trust holding a portfolio, four-fifths of which is invested in the tobacco industry. On the London market tobacco equities have lagged well behind other industrial shares. On the average their value has risen by no more than 6 per cent, compared with an average increase of 40 per cent in the

leading blue chips. On the assumption that this discrepancy is too wide and may be corrected one day, 1954 was a good year to buy these equities for future growth. And that certainly seems to have been the policy adopted by Tobacco Securities Trust. Its consolidated balance sheet shows that the book value of its investments quoted in British stock exchanges has risen from £3,418,597 to £4,104,169 and the book value of those quoted abroad from £397,168 to £449,288. In all, the total book value of quoted securities has risen from £3,815,765 to £4,553,457 and their market value from £10,055,757 to £11,197,884.

Though 1954 may have been a good year for buying tobacco shares, it was not such a good year from the point of view of income. A few tobacco dividends—notably that from British-American Tobacco—were raised, but in general most dividends were left unchanged. The rise in the trust's investment income in the year to October 31st from £667,252 to £832,742 seems to be a natural result of the growth of the portfolio. It must also owe something to those few dividends that were increased and it may owe a little to the change in

the standard rate of tax in 1953. Its 1952-53 accounts would include dividends on which the rate of 9s. 6d. in the £ was paid while dividends in the latest account would all have been those on which a rate of 9s. in the £ was paid. Whatever the explanation, the slight increase in the consolidated net profit from £493,624 to £520,770 enabled the directors to raise the ordinary dividend from 18½ per cent to 19 per cent. At the current price of 50s. xd. the £1 ordinary shares yield on this dividend 7.6 per cent, just about—as it should be—the average yield for tobacco equities.

CARRERAS. One of the tobacco companies that has paid the same dividend year and year out is Carreras. The directors are continuing that policy. For the year to October 31st they have left the ordinary dividend unchanged at 17½ per cent. This time they have good reason for the decision, since the group's net profit has fallen from £1,033,334 to £820,848. The tax provision deducted before striking this net balance has also declined—from £1,422,432 to £1,164,174. Hence, profits before tax appear to have fallen by about 19 per cent—from £2,455,000 to £1,985,000.

That result can only be described as disappointing in a year in which cigarette and tobacco sales were expanding slightly. The tobacco trade is now more competitive—witness the introduction of new brands of cigarettes—and it would be interesting to know whether Carreras has lost ground to its rivals. But any surmises in that direction are better left alone until the chairman, Sir Edward Baron, makes his statement. The trading results, however, had little effect in Throgmorton Street. The 2s. 6d. "B" ordinary shares had fallen 1½d. to 5s. 3d. before the preliminary results and they remained steady after the announcement. At that price

the shares yield 8½ per cent, a little above the average for tobacco securities which themselves yield a good deal more than most other industrial equities.

JAMES A. JOBLING. The minority interest in the largest of Thomas Tilling's subsidiaries has changed hands. A 40 per cent holding in James A. Jobling, the makers of Pyrex glassware, has been sold by Pilkington Brothers of St Helens to Corning Glass Works of New York. The price is not disclosed. Nor was the sum that Thomas Tilling paid Pilkington Brothers for the 60 per cent majority holding in 1950, though in that year Thomas Tilling's investment in subsidiaries rose by £1.5 million to £3.1 million. The earlier transaction was the most important single step in the transition of Thomas Tilling from a transport company to an industrial investment group. Now Thomas Tilling is not extending its interest in the Pyrex field, though it is still extending in other directions, for example, by the purchase of a two-thirds interest in the Walton Hosiery Company.

The glass deal has two unusual features. First, an important American glass manufacturer makes a substantial private investment in a British glass company without acquiring control. The "know how" of the Corning Company (which also retains close relations with Pilkington Brothers) will be of technical value to the Jobling company. Secondly, Pilkington Brothers, one of the largest private businesses in the country, increases its strength by concentrating its resources on a narrower front. The manufacture of Pyrex was outside the field of Pilkington's main activities, all the remainder of which are concentrated on the production of sectional glass. Finance was not the main object of the sale, but finance has in fact been concentrated on the remainder of Pilkington's activities.

LONDON STOCK EXCHANGE

Next Account begins: January 19th
Next Contango Day: January 19th
Next Settlement Day: January 11th

The stock markets remained firm and active until the market opened on Thursday. Equity prices had climbed steadily, carrying the *Financial Times* ordinary share index up to a new peak of 186.6 by the close on Wednesday. Heavy losses on Wall Street overnight, however, set prices back on Thursday morning when losses occurred in leading industrials. They recovered, however, later in the day. Gilt-edged prices advanced quite strongly this week. Sentiment in the market had been strengthened by the gold and dollar figures and by the reduction in the United States Treasury bill rate. Banking shares were given a strong fillip by the better bank dividends, as were one or two of the discount house shares. Insurance shares remained generally firm. The foreign market was quiet with German issues reacting slightly at the end of the long account.

Just after the week-end industrial equities hesitated slightly as a few profits were taken at the end of the three weeks account. But prices, following the lead of the store shares, soon rallied. On the last day of the old account it was these shares and the building material issues that were prominent; textile and paper shares were rather weak. But on the first day of the new account all the leading shares, with the exception of breweries, shared in the advance. That advance was checked on Thursday morning when most of the blue-chips lost ground but they quickly staged a rally and on Thursday the *Financial Times* Industrial Index reached a new peak of 187.3. Losses were reported in dollar stocks.

The oil market was very active at first and at the close of the first day of the new account prices, with the exception of British Petroleum, closed at the top. They, too, weakened when the market opened on Thursday. Throughout this period tea shares were strong, but rubber shares reacted on Thursday morning on the weakness in the price of the commodity. Kaffirs moved irregularly in a quiet market but copper shares were strong on the rise in the price of the metal.

(1) Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia was for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and are f.o.b. Trade for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th.

EXCHEQUER RETURNS

For the 11 days ended December 31st there was an "above-line" deficit (after allowing for Sinking Funds) of £50,852,000 compared with one of £21,696,000 in the previous week and a deficit of £33,412,000 in the corresponding period of last year—this brought the cumulative deficit to £355,362,000 (£545,694,000 1953-54). Net expenditure "below-line" last week reached £21,715,000, bringing the total cumulative deficit to £643,870,000 (£826,540,000 in 1953-54).

Financial Statistics

THE MONEY MARKET

LOMBARD STREET has been dominated this week by the year-end credit disturbances, which proved to be the sharpest, and the most costly for the market, since the days before the cheap money era of the nineteen-thirties. The banks' need for cash was intensified by precautionary measures required by the threat of a rail strike. But, except on Wednesday and Thursday of last week, the authorities left the market "on its own," with the result that large sums had to be borrowed from the Bank at Bank rate. A number of discount houses were "in" the Bank on the Thursday and all of them on the Friday, when the amount lent by the Bank was believed to have been the highest ever recorded on a single day, and some houses were required to take their loans for periods extending to ten days. In the open market, 3 per cent was readily paid for such "night" money as was offering. The extent of the special borrowings is indicated by the Bank return: discounts and advances rose during the week by £57 million.

This salutary experience provoked yet another, though smaller, rise in the Treasury bill tender rate. The discount houses reduced their bid (for the 91 day bills) by 1d. per cent, and the average allotment discount rate for the whole £260 million of bills rose by a further 1/64 per cent, to £1 17s. 3.82d. per cent. The bullion market has been quiet, with the gold price alternating between 251s. 6d. and 251s. 6½d. a fine ounce.

THIS JUST WENT COMPLETELY OFF THE RAILS

This five-ton steam travelling crane is not the crane it used to be! It raised three tons of stone at a radius slightly less than the correct maximum. A few feet from the ground the load dropped, the crane rocked, and down came the jib, superstructure and all.

What **Vulcan** say about it . . .

There's something deceptively solid-looking about a steam travelling crane chugging along its rails. But steam cranes are as vulnerable to overturn and accident as any other type.

Engineer-Surveyors from Vulcan Insurance spot danger before disaster, and industrial machinery is their happy hunting ground.

Everything, from a boiler to a vacuum vessel, comes under their expert eyes and receives that specialist scrutiny for which Vulcan is renowned. That's why safety first is Vulcan first.

Does Life Assurance serve the Community?

Here are the facts to help you form a judgment:—

British Life Assurance compares well with any in the World: its integrity is taken for granted.

Life Assurance safeguards millions of families, and ensures a comfortable retirement for many people. It encourages thrift, discourages inflation.

Bonuses worth tens of millions of pounds are added every year to with-profits policies.

Life Assurance Offices could not offer favourable rates and favourable bonuses if the money received as premiums were not skilfully invested. The money is well spread over a wide field of investments; nearly a third in industry and commerce, building up Britain's economy and the national prosperity. The rest goes into British Government Stocks, Commonwealth and other Government Stocks, mortgages and investments in properties . . .

The guiding principle behind Life Assurance investment is the security and benefit of the policyholder.

Keen competition between the Life Offices keeps them on their toes: ensures that premium rates are kept at their minimum—bonuses at their maximum.

LIFE ASSURANCE

is in tried and trusted hands.

Let's leave it there!

AUSTRALIA AND NEW ZEALAND BANK, LIMITED

ANOTHER GOOD RESULT

THE HON GEOFFREY GIBBS'S SPEECH

The fourth annual general meeting of the Australia and New Zealand Bank, Limited, was held on January 5th in London.

The following are extracts from the speech by the chairman, The Hon Geoffrey C. Gibbs, KCMG.

AUSTRALIA

During the financial year 1953-54, the Australian economy consolidated the recovery which was achieved in the previous year, and production in many sectors of the economy reached new record levels. Import restrictions, first imposed in March, 1952, were progressively eased, and the increased supplies of materials together with a stable export income combined to check the inflationary spiral. The stability of the economy was reflected in the high level of production and employment, together with steady prices and wage levels throughout the year.

In December, 1953, the Commonwealth Bank Act of April, 1953, came into effect, establishing the Commonwealth Trading Bank of Australia, which took over the business of the General Banking Division of the Commonwealth Bank. The Commonwealth Trading Bank is a separate entity with its own general manager, but is still under the control of the Governor of the Commonwealth Bank. We had hoped that the trading side of the Commonwealth Bank would be made entirely separate from its central banking functions. At present it should be clearly understood that both are responsible to the same board of directors and to the Governor. The necessarily confidential relationship between the trading banks and the Governor and board of directors of the Commonwealth Bank emphasises in our view the desirability of divorcing completely the Commonwealth Trading Bank from the Central Bank.

NEED FOR LIQUIDITY

At the conclusion of the 1953-54 financial year the Governor of the Central Bank in his annual report expressed the view that with the economy fully employed, restraint would be necessary if increasing bank advances were not to contribute to the emergence of excess demand. He stressed the necessity for trading banks to maintain an adequately liquid structure of assets, so that cash, government securities, Treasury bills, and working balances with the Central Bank would comprise about one-quarter of total deposits, allowing for seasonal and other short-term variations. These liquid resources would be in addition to special account balances which would also amount to 25 per cent of deposits making a target of 50 per cent of deposits to be held in liquid resources and special account. While the banking system as a whole has not yet attained the objective laid down by the Governor of the Central Bank, its policies are designed to work steadily towards it.

I suggest that it may be unwise to carry the policy of restricting advances too far in a young and rapidly developing country. Undue restriction could hamper legitimate development and slow down the rate of progress, to the long-term detriment of the country and its people.

During 1953-54, the loan market functioned more effectively than in the previous three years. The two Commonwealth cash and conversion loans were fully subscribed. Interest rates remained unchanged at 4½ per cent for longer term issues, while the rate on semi-government loans was steady at 4½ per cent. Trading bank rates of interest on advances and fixed deposit money remained the same as in the previous year in conformity with the general stability of interest rates.

More recently a large cash and conversion loan was offered by the Commonwealth at unchanged interest rates. The issue for cash was undersubscribed by a significant margin, thereby underlining the need for overseas capital if Australia's ambitious development programme is to proceed unchecked, without resort to inflationary measures. It is encouraging, however, that quite recently a conversion loan for \$25 million has been successfully floated by the Australian Government in New York. Representatives of the International Bank for Reconstruction and Development have also been in Australia recently.

ADVANCES

Advances of the major trading banks in Australia increased by 17.5 per cent in the year ended June, 1954. This large increase was principally a swing back from the previous year, when advances declined by 11.7 per cent due to a running down of excessive stocks accumulated in 1951-52. The present level of advances has provided for considerable restocking and industrial expansion. Deposits over the same period rose by only 7.0 per cent.

The Trading Banks' holdings of liquid items (cash, Treasury bills and Government securities) declined from the high level of 27.9 per cent of deposits in June, 1953, to 21.8 per cent in June, 1954. Whilst the policy of bank lending was more liberal in 1954 than in the previous year restraint was still necessary in order to prevent a recurrence of inflationary pressures.

NEW ZEALAND

The past year of active trading and high employment in New Zealand has been based upon a record level of overseas exchange receipts, which has resulted in the easing and prospective removal of exchange controls from imports, and upon a continuing high rate of developmental expenditure. Despite doubts surrounding the return to free marketing of meat and dairy produce, the prospect is not causing immediate concern but the large and growing surpluses of farm products in the USA must cause some doubt about the trend of future world prices. Restraint upon overall levels of expenditure will be necessary if greater freedom for imports is to be retained.

A favourable balance of overseas exchange transactions amounting to £NZ25 million in the year ended June last, carried the overseas reserves of the New Zealand banking system to the record figure of £NZ139 million. The volume of exports of primary products was a little lower than in the year ended June, 1953, but higher prices were realised for the major items. Import prices declined and

relaxation in exchange control on imports allowed traders to maintain stocks at satisfactory levels after liquidating the surplus that accumulated through excessive imports in 1951-52. Immediate delivery from stock is now obtainable for most goods.

Bank advances increased by £NZ 20 million during the year ended June, 1954, and at the end of the period represented 52 per cent of deposits.

The volume of funds available to the bank for lending has been drastically controlled by alterations which the Reserve Bank has made in the ratio to total deposits of balances which banks must hold as non-interest bearing deposits with them. The ratios are now 25 per cent of our demand liabilities and 12½ per cent of our time liabilities. These ratios have been altered five times since the practice of varying reserve ratios was first introduced by the Reserve Bank in 1952. While it is recognised that the Reserve Bank must have effective means of control, I would stress that too high a reserve ratio and too frequent changes are disturbing, and increase the difficulties of the trading banks in implementing a consistent advance policy to meet the financial needs of the Dominion.

When it is appreciated that these balances earn no interest it will be realised that the banking industry in New Zealand will be seriously handicapped should the present high ratios remain in force.

BALANCE SHEET

The accounts now laid before you reflect the recent issue of 1,700,000 "B" shares. In particular, you will note an increase of nearly £A600,000 in the amount of the published reserve. This increase represents the premium on the "B" shares less expenses of the issue.

A comparison of the 1954 balance sheet with that presented to you a year ago reveals that the principal items have moved in general conformity with the banking trends in Australia and New Zealand, but it should be borne in mind that those trends related in each case to the year ended June 30th last, whereas, our balance sheet is dated September 30th. On the liabilities side, the item current deposit and other accounts has increased by some £A12 million, while increases of nearly £A3 million in balances due to other banks and of about £A5 million in confirmed credits and other engagements on behalf of customers show that the bank has enjoyed a share of the increased business arising from the relaxation of import restrictions in Australia and New Zealand. This factor also reflects in the assets item bills receivable and remittances in transit which, you will see, is up by rather over £A7 million.

In common with other Australian and New Zealand banks the pattern of our assets structure is rather less liquid than a year ago, as instanced by falls of £A12½ million in cash balances and by £A9 million in Treasury bills. There is an increase of rather over £A2 million in the amount of our compulsory deposit with the Central Bank of Australia, and a more welcome increase of nearly £A5½ million in our investments.

As far as our profit and loss account is concerned, it is satisfactory to record that several factors to which I have already made

reference have contributed to a very good result for the year under review, and after providing the full year's dividend on the increased capital and after making adequate transfers to inner reserves, we have been able to increase our carry forward substantially.

The report and accounts were adopted.

SCOTTISH AGRICULTURAL INDUSTRIES LIMITED

SIR WILLIAM GAVIN REPORTS CONTINUED PROGRESS

The twenty-seventh annual general meeting of Scottish Agricultural Industries, Limited, was held in the North British Station Hotel, Edinburgh, on January 6th, the chairman, Sir William Gavin, CBE, presiding. In the course of his remarks the chairman said:

Once again I have to report to you a rise in gross sales, which for the year under review amounted to £21,655,812, an increase of £1,142,796 over the previous year. Gross profits before taxation show an increase for the third successive year, rising this year from £976,147 to £1,138,218. We have set aside £50,000 against possible falls in the value of stocks, bringing up the total provisions under this head to £200,000. £238,800 has been transferred to revenue reserves. The balance carried forward in consolidated profit and loss account was £320,383 compared with £271,846 the previous year. As already announced your directors recommend an increase in the ordinary dividend from 9 per cent to 11 per cent.

We have not been idle in recent years over capital re-equipment. There is still much to be done, however, and you will have noted from the annual report that the directors have on hand three more reconstruction projects which will eventually involve an expenditure of some £3 million. The first of these, the reinstatement of the granary at Aberdeen, is already in progress. We are hopeful that this, with its enlarged storage, handling and drying facilities will be in operation for next harvest, and will be of service to this important cereal-growing district.

The second project is the rebuilding of the Nutrimol Mill in Glasgow which is the company's main manufacturing and distributing centre for feeding stuffs for the West and South of Scotland.

Lastly, we are embarking on the reconstruction and extension of the fertiliser factory at Leith on a new site adjacent to the existing works. Here we propose to erect new buildings to handle and store our main raw materials and to house manufacturing plant of large capacity and new design for the production of high quality compound and phosphatic fertilisers. The present site will then be used to provide storage, packing and despatch facilities for the finished fertilisers. We expect to complete this programme over the next three or four years.

In a seasonal trade such as ours, it is of course difficult to give any firm forecast of results for the current year's trading. We have, however, made a good start over the last three months, and I think I can safely say that prospects are by no means unfavourable.

Your directors have had in mind for some time that ordinary shareholders might welcome the payment of interim dividends. Unless unforeseen circumstances arise, they propose to introduce this practice, beginning in July next.

The report and accounts were adopted and the ordinary dividend of 11 per cent was confirmed.

JOSHUA TETLEY AND SON, LIMITED

CO-ORDINATION OF SUBSIDIARIES

CURRENT SALES WELL MAINTAINED

COLONEL F. ERIC TETLEY'S SPEECH

The fifty-eighth annual general meeting of Joshua Tetley and Son, Limited, was held at 12 noon on December 31, 1954, at the Registered Office of the Company, The Brewery, Leeds, 10, Colonel F. Eric Tetley, chairman of the company, presiding.

The secretary of the company, Mr Robert F. Tetley, read the notice convening the meeting; and Mr W. N. Herald, of Messrs Peat, Marwick, Mitchell and Co., read the report of the auditors.

The chairman then suggested that as the directors' report and statement of accounts had been in the hands of the stockholders for the required period of time they should be taken as read. (This was agreed.)

TRADING RESULTS

The chairman then went on to say:

I have much pleasure in submitting for your approval and adoption the accounts and directors' report for the year ended September 30, 1954. The company itself, apart from its subsidiaries, showed an increase of some £15,000 in sales of beer and its total income of £6,737,524 shows an increase of £12,901 over the figure for last year. The income for 1954 has been absorbed in the following manner:

Beer Duty	61.1
Taxation	5.7
Materials and Production Costs (excluding wages)	10.3
Wages, Salaries and Pension Schemes	6.1
General Trade Expenses	9.9
Depreciation and Reserves	3.0
Interest	1.2
Dividends (net)	2.7
	100.0

As regards our subsidiaries, Reaney and Greaves, Limited, shows a slight profit of £1,616, while Duncan Gilmour and Company, Limited, and its subsidiaries have yielded a trading profit of £96,621 for the seven months from March 1st, the date on which we took over.

The trading expenses of the company have risen by some £38,000, while the charge for interest on loan capital shows an increase of £30,000.

GROUP PROFIT AND DIVIDEND

Trading results of the group show a net profit before taxation of £719,682, but the deduction of taxation at the rate of 11s. 11d. in the £, as against 11s. 8d. last year, reduces the group net profit to £291,527, as against £259,465 a year ago.

We have recommended the payment of a final dividend of 7 per cent on the increased capital, which, with the interim dividend already paid, makes a fractional percentage increase on last year's dividend on a smaller capital. We also suggest that the sum of £50,000 should be transferred to general reserve, and £50,000 to property improve-

ments reserve, and that £216,771 should be carried forward.

As mentioned in the chairman's statement published with the accounts our board has been engaged since last March in co-ordinating the working of Duncan Gilmour & Company and its subsidiaries with the activities of the parent company. We have taken over already the production of beer to be sold by certain of Duncan Gilmour's subsidiaries and over a period of years we hope gradually to supply the demands of the whole Duncan Gilmour group from our Leeds brewery. We are also contemplating the eventual building of a new bottling store in the Sheffield area which should greatly increase our capacity for producing bottled beer. Various companies in the group have substantial interests in the wine and spirit trade both in this country and abroad. These interests are also in process of co-ordination so as to obtain the maximum results therefrom. We are also engaged in the survey of the transport and carriage facilities of the group with a view to effecting economies in this most expensive charge on our trading.

POLICY OF IMPROVEMENTS

Our licensed properties have been maintained in good repair during the year and we are always endeavouring to improve as far as we can both the service offered to the public and also the comforts and accommodation provided for the tenants who manage them so well for us. During the past year we opened two new public houses, one in Leeds and one near Barnsley, giving up licences in the case of one of them taken from other houses which have been closed. In the coming year we hope to start building one or two more houses on new housing estates.

I do not wish to prophesy as to the future but I can tell you that since September 30th sales have been well maintained and it is safe to say that owing to the fall in the price of barley there will be some reduction in the cost of malt. At the same time I must confess that I was too sanguine last year when I forecast that our new drum maltings should be fully employed in the spring of 1955. They will be in partial production during next year but probably not in full operation until October, 1955.

In conclusion I should like to pay tribute to the work done by all the men and women employed by the group. The results achieved are due to a large extent to the devoted services rendered by them. I am sure that all stockholders will wish to join me in saying "thank you."

I now beg to move that the statement of accounts for the year ended September 30, 1954, as audited, together with the directors' report be and are hereby approved and adopted and I will ask Mr M. H. Tetley to second this motion.

The report and accounts were then unanimously adopted, the dividend approved as proposed by the directors and the formal business duly transacted, the proceedings ending with a vote of thanks to the chairman for presiding.

HAWKER SIDDELEY GROUP LTD.

Sir Thomas Sopwith Says:

"IN H-BOMB AGE OUR SOLE HOPE OF SURVIVAL LIES IN SO BUILDING OUR STRENGTH AND OUR AIR POWER NO ONE WILL DARE ATTACK US"

POLICY OF WEAKNESS IS SURE WAY TO DISASTER

The Nineteenth Annual General Meeting of the Hawker Siddeley Group was held on January 5th in London. In the course of his speech, Sir Thomas Sopwith, CBE, the chairman, said:

The trading profits of the Group for the year ended July 31, 1954, after deducting special development expenditure and reserve for increased replacement cost of fixed assets, amounted to £6,961,041, as compared with £5,033,744 last year. I feel sure you will agree that this is satisfactory. Production and sales of both our United Kingdom and Dominion interests show an increase over last year. Excluding the war years, the sales by our United Kingdom interests have attained a record level. We have increased our export sales and, to cope with our present export orders, steps have been taken to expand our already high production.

After providing depreciation of £2,321,393 on the Group's fixed assets, your directors have considered it prudent to charge a further £1 million for replacement of fixed assets. This reserve is thereby increased to £7 million, the whole of which has been provided from taxed profits. The present high rate of taxation, which for too long has been a feature of our national economy, reduces severely the profit which, after making reasonable distributions to shareholders, is available to build up industry's resources. Although the Government has to some extent recognised this problem through the introduction of investment allowances, these are inadequate and go only a small way towards the larger problem. The present rigid system of annual allowances should be modified to give a more reasonable amortisation over the probable life of the asset.

During the year we have spent nearly a million pounds on special development projects. This is yet another example of private enterprise doing its part towards financing today's research problems in order to ensure production orders for the future.

Turning to the balance sheet the increase in the ordinary share capital by £5,822,350 has been explained in the directors' report. This operation did not involve any alteration in the cash resources of the Group.

The profits of the year have been dealt with according to our usual policy. We have transferred to the parent company only sufficient revenue to meet the proposed dividends and debenture interest, retaining and employing the major part of the Group profits in the operating companies.

Your board is recommending a final dividend of 7½ per cent, less tax, which is the maximum final ordinary dividend as foreshadowed in the circular letter dated July 14, 1954. This dividend is payable on the increased ordinary share capital whereas the interim 1953/54 dividend and the 1952/53 dividends were related to the previous capital. The effective increase in the ordinary dividend as compared with last year has already been explained in detail in the directors' report.

During the year we extended our interests by acquiring Canadian Steel Improvement

Limited. Your directors, therefore, decided that a Canadian group of companies should be formed with A. V. Roe Canada Limited as holding company. Its former aircraft and engine divisions are now being carried on as separate businesses by two new subsidiary companies, Avro Aircraft Limited, and Orenda Engines Limited. Canadian Steel Improvement Limited is the third subsidiary of the new Canadian group, and specialises in steel, light alloy, and titanium products. It is one of the most modern plants in Canada. All these Canadian companies continue to be an extremely valuable asset in a vigorous and developing country. Our United Kingdom interests have been expanded since the end of the financial year by the acquisition of Kelvin Construction Company, Limited, which is a company with a fine reputation in the design, fabrication, and erection of industrial buildings.

The year has been one of steady progress and I believe that the world is moving into an era of prosperity. The scars, physical and economic, left by the last war are disappearing and industry cannot fail to benefit from the improving trade conditions. This is why the policy of the Group is one of expanding and widening activities.

The shape of aircraft is rapidly changing and the patterns we shall see flying about the skies in the not-so-distant future will be very different from those we now know. To meet these changes the work of our scientists and technicians becomes ever more important.

Sir Thomas next discussed the many products and activities of the Hawker Siddeley Group—the Hawker Hunter, the Avro Vulcan Bomber, the Shackleton Mark III, the Sea Hawk, the Gloster Javelin and Avro Canada's new and secret C.105 all-weather fighter, the Sapphire and Orenda jet engines, Guided Missiles, Rockets, diesel engines, the Sapphire motor car, alloys and titanium, and Hawksley houses.

He then continued:

There was a time, not so long ago, when our defences were so stripped and so meagre that we were an easy prey for any aggressor. That danger is passing. It takes a long time to tool up for production of an aeroplane in large quantities—although to do so pays handsomely in the long run. You wait a long time before there are any visible results. Then comes a slow trickle of aircraft. And this rapidly develops into a strong flood. The truth of the matter is that many aeroplanes have already been delivered but they have not yet all been assimilated into the Service.

This new breed of aircraft represents a radical departure from previous types. You cannot change from an old type of aeroplane to one demanding entirely new techniques as easily as you change from one make of motor car to another. Remember, we have changed from straight to swept wing aircraft from those which had a maximum speed in the region of 600 mph, to aircraft now flying faster than the speed of sound.

In changing over, there are bound to be unforeseen delays. It has happened in the

past, and it will occur again in the future. A sense of urgency there must be at all times, but, as the Secretary of State for Air has recently stated, "three 'Hunter' squadrons have been formed, and enough aircraft will soon be available to form as many more." In his speech he also said that "the state of affairs is not nearly so depressing as has sometimes been made out."

A major decision which will affect the period of time lag in the future was taken last summer. The Government wisely decided to scrap the long-established method of ordering only one or two prototypes, and to supplement a prototype order with a much larger pre-production batch. This new policy will immensely speed up development and delivery of future new aircraft and certainly greatly accelerate squadron deliveries.

Even before the Royal Air Force is fully equipped with modern weapons, there are voices raised seeking to reduce our protection. And they are powerful voices. They say that at last we can reduce armaments. This must not be allowed to happen.

It should be plain to everyone that we are now in the age of the hydrogen bomb, a weapon of destruction so vast and so horrifying that it staggers the imagination. We hold this weapon—and so do our potential enemies. There are those who say, "If this be true, let us abandon all hope of defence." And these prophets of despair clamour for appeasement.

You cannot turn back the clock—the hydrogen bomb and the horrors of atomic warfare are from now on an ever present menace.

Make no mistake about it. The one sure way to invite disaster is for this country to pursue a policy of weakness. Our potential enemies only understand strength and our sole hope of survival lies in so building our strength and our air power that no one will dare attack us.

And strength in airpower is not only atomic strength but the ability to deal anywhere with local wars, with local tensions whether they be in Korea, Indo-China, Malaya, the Near East, the Arctic or Western Europe.

We hear much talk about push-button warfare, but that is still in the test-tube stage. For years to come there will be a dual pattern to any aggressor's movements and hence we must be prepared for both kinds, all-out atomic warfare and local penetrations. Hence our need for the latest fighters and bombers—and similarly our urgent need to press on with atomic carriers, rockets and guided missiles.

Only one thing is sure, if war does come, it will come with supersonic speed—and probably in an opening sneak attack. And to provide defence against that requires more than courage and faith. It needs equipment and trained manpower, and that policy requires money, time and decision.

If we falter in building up our nation's strength, if we allow our national effort to be sidetracked now, we are asking for trouble.

The report and accounts were adopted.

HOULDER LINE LIMITED

The annual general meeting of Houlder Line Limited will be held on January 31st in London.

The following is an extract from the statement by the chairman, Mr Walter C. Warwick: Shareholders may well be pleasantly surprised to find our trading profits so well maintained during the year when general freight markets were consistently falling until about three months ago.

This favourable position is largely due to the fact that our accounts each year are made up to include completed voyages with moderate estimates on unclosed or uncompleted voyages. In making these estimates we always provide for contingencies and possible delays owing to strike or mishaps, and for the accounts under consideration we have been fortunate in having substantial credits arising from the final closing of these voyages which largely cover trading during late 1953.

The accounts to December 31st last reflect the capital changes consequent upon the issue of £550,000 of additional share capital with a corresponding reduction of reserve accounts to cover this bonus issue to shareholders.

Your directors recommend the same rate of dividend viz., 7½ per cent, less tax. This maintenance of dividend on the larger capital may fairly be attributed to the policy of commendable and uncomplaining restraint that has been pursued for many years past.

Notwithstanding the many troubles and difficulties experienced during the period covered by the accounts reasonable trading profits have been earned, and the improvement during recent months in general freight rates encourages the hope that these favourable trading results may be maintained.

MERLIMAU PEGOH

MR J. L. MILNE'S REVIEW

The forty-fifth annual general meeting of Merlimau Pegoh, Limited, was held on December 30th in London, Mr J. L. Milne, chairman, presiding.

The following is an extract from his circulated review for the year to March 31, 1954:

The accounts reflect the results of the first year of working following the amalgamation of Consolidated Eastern Plantations, Limited, with the parent company. Unfortunately, the year was marred by a continued decline in the price of natural rubber which adversely affected the sale proceeds. Another factor influencing the results was a smaller income, by way of dividends, from our subsidiary companies.

The average spot London price for first quality ribbed smoked sheet for the year ended March 31, 1953, was about 2s. 1d. per lb. compared with 3s. 8d. per lb. for the year ended March 31, 1952. The average for the year under review fell to the low figure of 1s. 6d. per lb.—a drop over the two years of almost 60 per cent.

The parent company's profit and loss account discloses a profit on normal working of £56,700. From this falls to be deducted £11,010 for interest on loan stock and £28,016 for taxation. After taking to credit various sundry items and setting aside for replanting the sum of £44,285 (the equivalent of the refunds of replanting cess and, after taxation, the war damage compensation received), we decided to pay a dividend of 7½ per cent and carry forward £16,137 against £25,668 brought forward from the year ended March 31, 1953. The group profit (before taxation) fell from £107,271 to £65,690.

The report and accounts were adopted.

MERCANTILE CREDIT COMPANY LIMITED

SUCCESSFUL YEAR'S TRADING

The twenty-first annual general meeting of this company was held on January 6th in London, Sir Edward de Stein, chairman, presiding.

The following is an extract from his speech, circulated with the report and accounts for the year ended September 30, 1954:

I am glad to be able to put before you figures which reflect a successful year's trading. The accounts tell their own story of progress in a year which contained over nine months of Government restrictions, for the hire-purchase control order was not removed until July 14th.

Up to the removal of Government restrictions in mid-July, our companies in the British Isles had made steady progress within the limits imposed. Thereafter business naturally expanded, and in order to cope with the situation application was made to the Capital Issues Committee for an issue of capital. Thus, since the end of our financial year we have increased our authorised capital to £1,700,000, comprising an equal number of shares in each class, and have issued 360,000 5½ per cent redeemable cumulative preference shares at a premium of 2s. per share and 63,821 ordinary shares at a premium of £2. This operation results in our now having 650,000 of each class issued; £1,300,000 in all.

The cessation of Government control of hire purchase has amply demonstrated the goodwill which our company has created for itself; the demand for our services has been continuous and almost embarrassing.

The report and accounts were adopted.

KENNINGS LIMITED

(Motor Distributors & Engineers)

TRADING PROFIT EXCEEDS £500,000

The 24th annual general meeting of Kennings Ltd. was held on 31st December in Sheffield, Sir George Kenning, chairman and managing director, presiding.

The following are extracts from his speech:

I think you will agree that we have had another successful year's trading.

The Group's consolidated profit for the year amounts to £526,229 as compared with £399,215 last year. After mortgage interest £2,001, depreciation £54,258, directors' emoluments £13,746, auditors' remuneration £2,295, Pensions Scheme contributions £24,024, and taxation £250,252, the net profit is £179,653 as compared with £151,499 last year.

Out of the net profit of £179,653, the sum of £15,451 represents outside Shareholders' interests, and £22,156 is retained by subsidiaries, leaving a net balance in Kennings, Limited, accounts of £142,046.

INCREASED DIVIDEND

Subject to your approval, your directors propose the payment of a Final Dividend of 17½% (12½%). I feel sure that this overall increase in dividend from 18½% to 25%, which is covered more than twice by earnings, will be approved by shareholders as representing a fair and prudent distribution of the earnings of your Company.

ACQUISITION OF NEW SUBSIDIARIES

Referring to the consolidated balance sheet, you will observe that fixed assets have increased from £1,050,700 to £1,288,664, of which an increase of £110,179 in motor vehicles is accounted for in the main by the acquisition of a controlling interest in Self Motoring, Ltd. This acquisition has proved, and continues to prove, profitable to your Company. Trade investments are reduced from £78,040 to £42,572 owing to the acquisition of Freeman, Oakes & Co. Ltd., and G. Mackay & Sons, Ltd. Issued Capital is increased by £53,502 in Ordinary Shares on this account, and also by the purchase of outside interests in W. R. Sanders, Ltd. and Maude's of Norwich, Ltd. This transaction has, as I forecast at the time, proved very advantageous to your Company. Since the financial year end, we have purchased further shares in Self Motoring, Ltd. and a controlling interest in George Langley, Ltd., Nuffield distributors in Bedford.

Nevertheless, I would draw your attention to the fact that Kennings, Ltd. trading profit alone has increased from £223,699 to £277,278. Current assets at £2,120,522 exceed current liabilities of £1,368,405 by £752,117. Reserves, excluding future taxation reserves of £284,113, total £633,130 compared with ordinary capital of £553,502.

I should like to point out that this achievement has not come to us as a result of a so-called "Motor Boom," but because of the hard work of your directors, management, staff and workpeople in the face of the very real difficulties and disappointments which have continued to beset us.

In particular, we continue to operate important sections of our business at very low profit margins and in the face of fierce competition. I refer to our spare parts business, tyre business, and petrol and oil business. I am glad to say that we are standing up well to competition, and are increasing both our share of the market and the profitability of our activities in these spheres. Contrary to general belief, a low proportion of our turnover in cars (less than 10%) is accounted for by hire purchase business.

EXPENDITURE ON IMPROVEMENTS AND EXTENSIONS

In accord with the policy of our manufacturer friends, we are carrying out substantial improvements and extensions to our property and equipment, and, even more important, to the quality and scope of the services we offer to the public. We have budgeted for an expenditure of £500,000 in the next two years.

It is difficult to forecast the future, but nearly six months of another year's trading have gone, and results have been satisfactory. Our costs continue to rise, but, fortunately so does our turnover.

All your directors are very actively engaged in the business, and the understanding between management and staff is of the best. We are proud of our co-workers, and we shall continue to watch their interests to the best of our ability.

We thank our manufacturers and suppliers for their continued understanding co-operation.

The report was adopted.

THE PLESSEY COMPANY LIMITED

(Manufacturers of Components for the Electrical and Mechanical Engineering Trades)

EXTENDED PRODUCTION FACILITIES

INCREASED VOLUME OF WORK

MR A. G. CLARK'S STATEMENT

The thirtieth annual general meeting of The Plessey Company, Limited, was held on December 30th in London, Mr A. G. Clark (chairman and managing director) presiding.

The secretary (Mr W. F. Cross, BA) read the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

We are now submitting to you the accounts for the year to June 30, 1954.

In spite of experiencing our usual share of troubles, we continued to extend our facilities for production during the year, and from this extension there resulted an increase in the volume of work turned out.

The increased volume of work brought with it an increase in the company's profits, and at £1,125,710 the total profit before taxation is some £180,000 higher than in the preceding year.

As is now usual taxation unfortunately absorbs the larger share of this profit—£652,000 is taken by taxation—leaving £473,000 available for dividends and for ploughing back into the business.

We are recommending a final dividend of 10 per cent, which rate corresponds with the indication of our intention which was given to you when the capital reorganisation took place in May.

CAPITAL STRUCTURE

During the year the capital structure of the company was reorganised to bring it more closely into relation with the capital being employed in the business, and in the course of the reorganisation a "rights" issue was made to the ordinary shareholders which resulted in the subscription by those shareholders of an additional £900,000 of cash.

The liquid position of the company has been strengthened materially as a result of this issue, and we believe that a sound basis has been provided for the further extension of the company's activities.

WIDENING OF INTERESTS

Apart from our immense productive capacity, our research and development staff are well capable of handling the task of maintaining your company's technical supremacy in the many fields in which it operates. In the aircraft industry, for example, we have widened our interests to cover an extensive range of mechanical and electrical components. In the domestic radio and television field our products are equally ubiquitous, and the company has built an enviable reputation for its efforts in the design, development and production of many types of complex electronic apparatus.

Recent work in the field of agricultural equipment has materially broadened the company's operational base, and I look

forward to many interesting developments in this sphere of mechanical engineering.

We are proud, too, of the company's achievements on many projects for Her Majesty's Government both at home and overseas. Whilst many of these are connected with defence work, a great deal of more mundane apparatus is produced to play its part in the everyday life of the country.

So far, therefore, as our technical efficiency is concerned we are well placed and without any real anxieties.

To form any long-term view of our commercial prospects is, however, more difficult, since here we can so easily be affected by matters outside our own control.

RIISING PRODUCTION COSTS

I am not an economist, and I speak as an engineer, but a disturbing feature of the general industrial situation is that the costs of production continue to rise. The rise may be small each year, but the effect is cumulative, and as compared with the costs of five years ago the increase is significant. To the best of our ability we cope with this problem by improvements in methods and in machinery but the plain fact is that, in spite of all that is being done to use the best of plant and the best of methods, the final cost of producing the apparatus or equipment with which we are concerned has increased and is increasing.

For this reason I am not able to look at future prospects without anxiety. It is possible to price oneself out of world markets, and inflationary tendencies involve the risk that slowly but surely we may reduce the market which is open to our products.

And, as that market is reduced, it becomes correspondingly the more difficult to carry the heavy and inevitable research and development charges which must be faced if the technical supremacy of our production is to be maintained.

There is little room for complacency here, and I can assure you that we have few illusions in respect to the struggle which lies ahead of us.

TRIBUTE TO STAFF

I would be ungrateful did I not conclude by saying how much we owe to the efforts of our staff to ensure that everything possible should be done so that the company operates at maximum possible efficiency.

That we are assured of the continuance of those efforts is our strongest guarantee for progress over the years ahead.

The report and accounts were adopted and the dividend, as recommended, was approved.

The retiring director, Mr B. G. W. Attwood, BSc (Econ), was re-elected and the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths and Company, having been fixed, the proceedings terminated.

THE ECONOMIST, JANUARY 8, 1955

MONTAGUE L. MEYER, LIMITED

FACTORS AFFECTING YEAR'S RESULTS

CURRENT TRADING IMPROVEMENT

The annual general meeting of Montague L. Meyer Limited was held on December 31st in London, Mr Montague L. Meyer (the chairman) presiding.

The following is the chairman's circulated statement:

The accounts I am presenting for the year ended March 31, 1954, show a consolidated trading profit of £262,723, and after providing for depreciation, audit fees, staff pension fund contribution and interest on borrowed money, the profit before taxation is £11,305. Due to the heavy excess profits levy which we have paid in the last few years we are claiming substantial refunds of tax which gives a balance for allocation of £66,020.

We have paid an interim dividend of 5 per cent on the ordinary share capital and now propose a final dividend of 10 per cent, making a total distribution for the year of 15 per cent, compared with 20 per cent last year. This leaves a balance of £15,290 which has been added to the profit and loss account, and in addition a capital profit of £11,272 has been carried direct to the general capital reserve.

OVERSEAS DEVELOPMENT RISKS

I must admit my disappointment with the results of the year under review. These are largely due to losses incurred by one overseas and one United Kingdom company which occurred at a time when the margin of profit on imported timber fell considerably. Complete reorganisation of the companies concerned has taken place which has already substantially altered their position although the full effect cannot materialise during current year. I referred in my statement, years ago to the group's new developments in the Colonies and elsewhere. Though the majority of these are thriving the risks of development overseas are considerable and it is the losses made on one of these projects that has had a serious effect on the profit of the group as a whole.

IMPROVED FINANCIAL POSITION

In view of the results for the year under review the directors consider it right to make some reduction in the ordinary dividend. The financial position of the group has been improved during the last four years by £623,763, partly capitalised and partly remaining in reserve and profit accounts, in addition to capital profits of £42,063. In view of this and the alterations already referred to, and in view of the prospective earnings of the group, the board consider that a reduction of the dividend below 15 per cent would not be justified.

A WORLD-WIDE ORGANISATION

The group despite the results of this single year is in a strong financial position and has a world-wide organisation which is capable of making a substantial income. In particular the subsidiary companies acquired or formed in recent years have still not begun to realise more than a part of their possibilities. The full effect of these and the reorganisation referred to above will not be seen in the year 1954/55, although the results should be appreciably better than those of the year under review. Thereafter, however, I am confident that the profits of the group should be once again in line with what our shareholders have become accustomed to expect.

The report and accounts were adopted.

UNIVERSITY OF QUEENSLAND

AMENDED ADVERTISEMENT
Applications are invited for the position of LECTURER (Grade II) IN POLITICAL SCIENCE.
Salary now £A1,100/£A1,250 per annum.
Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.
Closing date January 31, 1955.

B.S.C.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (open to all), which is a valuable qualification for men and women seeking executive appointments in commerce or industry, government or municipal posts. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees; instalments.—Write for Prospectus of U.C.C. Courses to Registrar, 60 Burlington House, Cambridge.

A LARGE MANUFACTURING COMPANY (PUBLIC) with offices in London seeks an outstandingly able export sales manager to play the leading role in achieving its target of £2,000,000 export sales in 1955.

He should have had wide experience of export selling but consideration will be given to an applicant without this if he is outstanding in all other respects. He should be between 32 and 42 years of age and speak at least one major foreign language fluently. This is a unique opportunity and one that can lead to a satisfying and lucrative career involving wide travel. The commencing salary will be substantial and will carry full pension rights.

Applications, which will be treated in strict confidence, should be typewritten, contain full details of education, background, career and present salary, and be sent to Box 801.

WILL BANK RATE BE RAISED?—and should it be? This vital question is discussed in the January issue of THE BANKER. Other topical articles include Who Pays for Pensions? Strains on Business Liquidity, A Marshall Plan for Asia? Sweden's Money Muddle, and Security of Tenure for Tenants. Single copy 2s. 6d. from 72 Coleman Street, London, E.C.2.

STOP THAT COLD meal from becoming unappetising by adding a little Rayner's Indian Mango Chutney.

MARKET RESEARCH (capital goods). A Midland company requires a male University Graduate for general research work, aged 20/25 and trained in Economics and Statistics. This is a new post demanding an alert man capable of setting down the results of his work adequately, yet concisely. A knowledge of report work and of statistics beyond an elementary level would help the applicant. A talent for writing lucidly and in plain English is essential. Salary in accordance with age and qualifications. Prospects will depend on performance.—Box 798.

ECONOMIST, age up to 27, with working knowledge of statistics, required for a position in the Commercial Statistics Department of a large manufacturing company with wide interests. Essential qualifications are a University Degree in Economics with at least Second Class Honours, coupled with a sound practical approach to everyday problems and the ability to produce reports in a clear and concise form. Applications giving full details of previous career are invited from persons possessing the above qualifications, and should be sent to Box 794.

DOUGLAS GLASS

BRITAIN'S GREATEST PHOTOGRAPHER OF MEN

43 Black Lion Lane, W.6. RIV. 7522.

TRADES UNION CONGRESS invites applications for the post of Assistant in its Research and Economic Department. Sound knowledge of economics and related subjects essential. Further particulars of the appointment may be obtained before January 24 from Sir Vincent Tewson, C.B.E., M.C., Trades Union Congress, Smith Square, London, S.W.1.

ECONOMIST (38), six years City, Commerce and Industry. Able linguist—five languages—conversant Shipping, Banking, Insurance, etc., seeks executive appointment.—Box 796.

NORWAY.—A private mixed party, April 2nd to 18th, skiing and spending Easter in a small village, has some vacancies for men. Cost £29 10s., with skiing instruction.—Box 789.

TRAVEL FOR MANAGEMENT.—Pitman Home Study for all Management and Secretarial Examinations; also for Transport and Hospital Administration. Personal tuition; success guaranteed. Details of course required from Pitman Correspondence College, 54 Pitman House, Godalming, Surrey.

A WELL-KNOWN GROUP OF COMPANIES require a first-class Manager to Head up the Personnel Department of a new division. Applicants must be experienced in every aspect of Personnel Management in its broadest conception and capable of dealing with a rapid expansion programme entailing the recruitment and training of all grades of staff.—Write in confidence, giving fullest details of age, education, experience and salary required, to Box 792.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

FREE MEALS from monotony by serving them up with some of that tasty Rayner's Indian Mango Chutney.

ST. ANDREW'S COLLEGE

GRAHAMSTOWN, SOUTH AFRICA

APPOINTMENT OF HEADMASTER

Applications are invited for appointment to this post which falls vacant at the end of 1955. Intending applicants should write to the Warden, Rhodes House, Oxford, from whom details may be obtained.

SOUTHERN GAS BOARD

QUALIFIED ASSISTANT ACCOUNTANT

A qualified accountant, preferably not older than 32 years but not necessarily with experience of the gas industry, is required for the Chief Accountant's Office at Southampton.

The Board is in the process of installing a completely integrated system of standard costing and flexible budgetary control. A knowledge of and a keen interest in these methods of cost control would, therefore, be an advantage, although the duties of the post are not solely connected with this operation. The position offers a good opportunity for a keen young man whose horizon is not limited to the normal accounting routines.

The commencing salary will be in the region of £800 per annum. Applications, stating age, education, qualifications, training, experience and present salary, together with a one-page summary of these particulars, should be sent in an envelope marked "Assistant Accountant," to the Secretary, Southern Gas Board, 164 Above Bar, Southampton, to reach him not later than January 29, 1955.

DO YOU WANT MORE BUSINESS? Then cover more territory and make more regular calls with a 1954 self-drive car. No more waiting for public transport. AUTOHALL have a fleet of over 100 1954 cars, all expertly maintained and serviced to meet your requirements. You can also take advantage of our guaranteed re-purchase scheme. Will you ask your secretary to drop us a line for our new, informative brochure.—AUTOHALL, Dept. 2-B, 302-306 King Street, London, W.6. RIV. 2881. Telegrams: Autohall, Wesphone, London. Cables: Autohall, London.

BUSINESS OFFERS pleasant prospects when you're going home to a meal with Rayner's Indian Mango Chutney.

THE B.Sc.ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretarialship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.Econ. (Final) exams, since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P17, WOLSEY HALL, OXFORD.

CHARTERED ACCOUNTANT, with first-class industrial experience, seeks post as Financial Controller in medium-sized company or senior appointment in large organisation. Salary level £2,500. Enquiries will be treated in complete confidence.—Box 791.

THE TECHNICAL SALES DIRECTOR of a large engineering group requires a PERSONAL ASSISTANT. Essential qualifications are a background experience of economics, the analysis of general market information, and sales statistics in both home and export markets for a wide range of engineering products. Some general knowledge of accounts is desirable, but not essential.

A commencing salary of not less than £750 per annum is offered, depending on the experience and qualifications, and the post offers considerable opportunities for advancement.

Applications are invited from men between the ages of 27 and 37, giving full details of age, education, positions held, salary required, etc., and should be addressed to Box 800.

CROSSE AND BLACKWELL have vacancies in their Work Study Department, which includes Organisation and Methods, for trained Work Study Observers of three years' or more experience. The scope offered by these appointments is unusually wide, owing to the very great variety of jobs covered by the department; and the commencing rates payable vary from £500 to £900 per annum, according to qualifications.—Applicants should write to the Personnel Manager, Crimscoot Street, London, S.E.1, giving fullest possible details of themselves, and if placed on the short list, will be asked to spend a day at the factory and offices for interview, with expenses paid.

A WELL-KNOWN firm of Northern Wine and Spirit Merchants and Bottlers are about to appoint a Joint Managing Director. Applications are invited from Chartered Accountants, 35-45, with first class commercial experience and who have knowledge of budgetary control and standard costing. Experience of the trade would be an advantage, but is not essential. Replies, which will be treated in strict confidence, should give full details including present salary, and be addressed to Box 797.

CONSUMER Research Executive with advanced degree and experience in design, execution and presentation of survey work at national level requires part or full time research work.—Box 795.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30, Queen Victoria Street, London, E.C.4.

Completed in 1954, this furfural extraction unit is a part of the lubricating oil refining facilities of Oelwerke Julius Schindler, G.m.b.H., a German affiliate of the British Petroleum Company Limited. Badger's services in connection with this plant included its design and procurement and supervision of the erection.

To make the office a better place to work in

Many a secretary knows that he or she cannot really manage without a duplicator, but would rightly look upon a large power-operated machine as being an unnecessary luxury. That is the *raison d'être* of the '250' Portable Duplicator—another Roneo answer to a frequently posed office problem. Roneo '250' has fully automatic inking, prints up to foolscap size, is simple to use, easy to carry around and is reasonable in price.

The Daily Telegraph ANNOUNCES

that it has secured exclusive serial rights in this country of 'Stalin's Russia—And After' by Harrison E. Salisbury.

Mr. Salisbury has lately returned from Russia after 5 years there as correspondent of the New York Times.

His articles, just published in America, immediately after his return, and now expanded into a book, were regarded as sensational.

Most things are kept secret in Russia but Mr. Salisbury, by virtue of his long residence and extensive travelling there, acquired an insight not open to the visitor or the diplomat.

He studied all the top men of the Kremlin at close quarters for several years, and he evaluates their relationship. He was in Moscow the night Stalin's death was made known and his story of Beria's moves is fascinating.

These are the most instructive and penetrating articles which have been written on post-war Russia.

Industrialising India with **EUCLIDS**

Large fleets of EUCLIDS are busy on the many phases of the huge Damodar Valley irrigation and hydro-electric scheme for the Damodar Valley Corporation. Embracing the construction of 8 dams and some 1,550 miles of irrigation canals, this great project will end the periodic flooding of the Damodar River valley; will provide adequate electricity from 5 new power stations and will open up India's richest coal and minerals area.

EUCLIDS are specified on the world's most important development projects.

EUCLID Rear-Dump Wagons, Bottom-Dump Wagons and EUCLID Tractors & Scrapers are available for sterling.

A complete After Sales Service is provided for all EUCLID equipment by the distributors:

Taxes, submarines and Seamews

The submarine is now an even greater potential menace to Britain and other countries dependent on overseas supplies. This would be true whether nuclear weapons were used or not. Submarines might be the carriers of such weapons. In any event nuclear motors would greatly increase the range of submarines.

Future anti-submarine operations would inevitably call for large numbers of search-and-strike aircraft, first because coastal defence requires *continuous* air patrolling and, secondly, so that convoys, endangered at sea, could quickly put up an anti-submarine 'umbrella'—off *improvised* carriers—in any weather. In heavy weather, submarines, moving through the relatively calm waters beneath the surface, have a mobility advantage over surface craft

and are, therefore, a greater menace. Britain and N.A.T.O. countries, already heavily taxed to pay for the last war and anxious to guard against a possible next, are turning to weapons like the Short Seamew, designed for fully effective performance in action yet within a nation's capacity to build quickly, cheaply and in large numbers. The Seamew is an ideal aircraft for the R.A.F. task of patrolling coastal waters, apart altogether from its value to the Royal Navy, for which it is in quantity production.

Young men—should they ever again be called up urgently as *reserves* to defend their country—could learn to fly and service the uncomplicated Seamew quickly. Their burdened elders will readily appreciate this Short answer to the problem of keeping down the cost of defence.

Some advantages of the SEAMEW

1 INITIAL COST

Future anti-submarine tactics will call for large numbers of aircraft. Both first cost and operational cost, therefore, are of considerable importance. Initial cost of the SEAMEW is low because it is light in weight and simple in construction.

2 OPERATIONAL COST

Is low because of its simple design, leading to ease of maintenance and to economies in space, spares and manpower. The SEAMEW carries a crew of only two and can be serviced by less skilled mechanics.

3 OPERATION

The lightweight Seamew has the double advantage of a very short take-off and slow approach speed. Its strong, fixed undercarriage enables it to operate from any makeshift airstrip—say, a golf course, or even a stretch of beach. The wheels of the Seamew can be swiftly changed, with differing sizes of tyre to suit the surfaces from which it operates.

4 SEARCH AND STRIKE

It affords exceptionally good view to both crew members for both attack and deck landing. The SEAMEW derives tactical advantage from its wide range of flying speed and its ability to turn at low speed in a small circle. It can operate equally well from escort and merchant aircraft carriers under all weather conditions.

For modern anti-submarine operations..

OFFICE MEMORANDUM

To: All Chairmen and Managing Directors
From: W. McMillan, Manchester Guardian

If your company has the problem of finding trainee executive staff, you will be interested in the Manchester Guardian series of full-page careers announcements. These begin on Monday, January 24th, and will appear every weekday for the following six weeks.

Signed: *W. McMillan*
Advertisement Director,
Manchester Guardian.

DRIVER'S EYE-VIEW OF INDUSTRY

High up in his eyrie, the crane driver surveys the industrial scene . . . a scene which, in its variety, typifies the activities of the Thos. W. Ward organisation. Steelwork supplied and erected by Wards . . . plant and machinery supplied and installed by Wards . . . roads and sidings laid by Wards with materials produced by Wards . . . even the crane he drives is built by

one of the Ward Group of Companies. Indeed, there can be few branches of industry to which the Ward Group cannot make some vital contribution. With such a wealth and diversity of experience behind it, is it to be wondered at that the name of Ward has become a byword in industrial circles throughout the world?

THE TWW SERVICE INCLUDES:—

Iron & Steel • Non Ferrous Metals • Plant & Machinery • Foundry Plant & Supplies • Tractors & Earth Moving Plant
Contractors' Plant & Equipment • Shipbreaking • Structural Steelwork • Excavators and Cranes • Industrial Plant • Rails & Sidings • Granite & Freestone • Roadstone & Roadmaking • Cement • Industrial Dismantling • Wire & Wire Products
Nuts & Bolts • Packings & Jointings • Insulating Materials • Food Preparing Machinery • Factory Planning & Installation

Mould Making. Our tool design staff and tool room is equipped to design and make any type of mould from a simple single cavity to a complicated multi-impression mould.

Compression, Transfer & Injection Moulding. With modern presses from 10 to 750 tons capacity, fitted with the latest pre-heating and control equipment, we produce consistently high quality mouldings. We also have modern injection moulding equipment.

Plastic Mouldings, Glass-Fibre Laminates, Thermo-Plastic Fabrications

WE OFFER YOU the services of a self-contained unit, including research and development laboratories, organised and equipped to design and manufacture economically any class of moulded or fabricated component. We specialise in the design and manufacture of Radomes.

If you are a user of plastics, if your product can be made in plastics, if you have a plastics problem—SEND US YOUR ENQUIRIES or ask our representative to call.

Thermo-plastic Fabrications. We are fully equipped to produce from the smallest to the largest fabrications from sheet thermo-plastic materials. Our high aircraft standard is maintained in this department.

Glass-Fibre & Reinforced Plastics. We are pioneers in high and low pressure Glass-fibre, Asbestos and Paper Laminates, with our own impregnating plants.

**WHAT YOU
CAN MAKE WITH
LUSTREX***

MANY DIFFERENT PRODUCTS, cheaply and well. You can make tool handles, and packages for tools. You can make filing trays, and fittings for refrigerators and radios. In fact you can make almost anything—from instrument panels and picnic sets to camera spools and small cable drums—in Lustrex polystyrene plastic. Lustrex is light yet strong; it resists acids and alkalis; it does not shrink or become brittle. It is made in two grades—Lustrex for general purposes and Lustrex Toughened 1 for particularly tough purposes. Colour choice is almost unlimited. These physical properties give you some idea of the capabilities of Lustrex.

Information for the Technical Man.
Lustrex Toughened 1: Properties at 23°C. & 50% Relative Humidity.

Property	Test Method	Units
Tensile Strength	ASTM D.638-52T	3700-4500 lb/in ²
Elongation at break	ASTM D.638-52T	15-25 %
Modulus of Elasticity in Tension	ASTM D.638-52T	3.5-4.5 x 10 ⁶ lb/in ²
Flexural Strength	ASTM D.790-49T	7000-8500 at yield lb/in ²
Deflection	ASTM D.790-49T	No failure inch
Izod Impact Strength:		
1/2" x 1/2" bar	ASTM D.256-47T	1.5-2.0 ft.-lb./in.
1/2" x 1/2" bar	ASTM D.256-47T	0.7-1.0 ft.-lb./in.
Softening Point	B.S. 1493	86-90 °C.
Water Absorption	ASTM D.570-42	0.03-0.05 %
Specific Gravity		1.05-1.06

*Please Note. Lustrex is supplied only in production quantities for injection moulding: it is not yet available in sheet form. Write for literature to keep ready for your next design job.

Lessons from the Railways

THERE has, after all, been a rumble of discontent across the country against the way in which the railway strike was averted. It has not been a very loud rumble; it is still drowned by the rather obvious cries that railwaymen deserve a "fair wage" (which they certainly do, if they can be enabled to earn it), and that a railway strike (which would have been quickly followed by a coal crisis) would have cut down this year's national income by much more than the £10 million or so that the settlement will cost. But the minority that is angry with the court of inquiry is now plainly an important minority; if a label is to be tied round it, it might be said to include most of the sort of people who sometimes read *The Times*. This is the group to which higher civil servants and the real policy-makers of both parties normally belong.

So far, so much better than appeared at this time last week. But it is going to be much easier for these well-intentioned people—and the Government—to talk about redeeming something from last week's surrender of principles than to effect it. In a few weeks' time, the modernisation programme for British Railways will be published. There will be a tendency then to pretend that this will make everything on the railways suddenly all right, and to forget that the new investment will not get under way for at least three years; that it will fructify only gradually then; and that the margin of what it yields over what it costs cannot ever be expected to be very large. When the modernisation programme is published, there will probably also be an announcement of intent to cut down the huge surplus of redundant labour on the railways; but past experience has shown that very little action can be cloaked by a lot of talk. If a rescue operation—the restoration of the principle that efficiency and earning power must be the determinants of individual remuneration in the nationalised as well as the private industries—is really to be carried through, then men of both the main parties and of neither will need, not only to read and mark, but inwardly digest, the lessons that last week's crash holds out to them. They are very awkward lessons indeed.

For the Tories the principal lesson is that the one positive aim they have been able to proffer to the electorate—that of doubling the standard of living in a generation—will only be achieved if their Government is prepared to do battle against restrictionism, feather-bedding and neo-Luddite obstinacy wherever they show themselves—even when they show themselves in large and powerful organisations commanding hundreds of thousands of votes, like the National Union of Railwaymen. This does not mean that it is a Conservative Government's duty to stand out against higher wages. It can never be too frequently reiterated that the real case against last week's settlement is not that railwaymen should have been doled out with a smaller wage increase; it is that, by sweeping away restrictive practices and cutting down an inflated labour force, railwaymen could have been enabled to earn a much bigger increase. Of course the railwaymen

should have "fair wages." So should every one, and fairer and fairer wages as the years pass. There is no possibility of economic progress without steadily rising real wages. Indeed, an unremitting pressure from the trade unions for higher real wages can be one of the most dynamic elements of a progressive economy—subject always to the proviso that there is rising real output too. A Labour movement that will both urge its members to earn more pay, and see that they get it, is one of the best things that a country could have.

If a Tory Government is going to help the railway-men and other workers to earn higher wages, however, it will have to jettison one of the precepts of emollient administration that it has found particularly useful in the last three years. This is the precept that the Minister of Labour should be a policy-less mediator, more or less "akin to the Attorney-General" as one left-wing newspaper admiringly described Sir Walter Monckton last week. There is no doubt that Sir Walter Monckton's mode of administration has been popular. This is not surprising. If the Chancellor of the Exchequer were to delegate the framing of his next budget to four days' work by a court of inquiry, and if the court were allowed to act on the principle that it was not its business to inquire where the money was coming from, he would no doubt have a financial policy that would be very popular for a time. But he would be throwing the door open to the inflation of the currency and the corruption of politics, and casting away all his high hopes of a forward-looking policy. In the Ministry of Labour, as in the Exchequer, the choice before the Tories is much the same as the choice that should have been laid before the National Union of Railwaymen: between accepting some passing disturbance and irritation to those whom they represent in order to secure real prosperity for them, or remaining innocent of both the pains and the prizes of a modern standard of living.

★

For the Labour Party, the lessons of last week's experience should be even more important, but no party leader has yet spoken out in recognition of the fact. Had not Mr Herbert Morrison been preoccupied at this juncture (in a way that calls for nothing but congratulation), he must surely have been moved in conscience to mourn the passing of the brave concept of nationalisation that he, more than anyone else, led the Labour Party to adopt when it was in office. The doctrine of those days rested on the belief that basic industries would serve the country more efficiently if they were brought under public ownership. The opposing arguments—that public ownership would bring ordinary industrial decisions on to the stage of politics, and that it would so sap incentives to efficient management that nationalised industries would involve the community in loss—were always rebutted and

ridiculed by Labour spokesmen. Today, a part (admittedly, it is only a part) of an originally nationalised industry is so riddled with inefficient labour practices that it has been involving the community in an annual rate of loss of some £20 million at a time of raging boom. It has been doing this while paying its workpeople less than they could get in comparable jobs elsewhere; and, in order to save it from this embarrassing role of a bad employer, a court of inquiry has just recommended that nationalised industries should pay no attention at all to financial checks upon their efficiency.

If this principle is accepted, then one of two things will happen. Either nationalised industries will have to be subjected to the direct checks upon efficiency by the select committees that probe every other body that spends the taxpayers' money, a course that Labour theorists have always rightly rejected; or else an industry that is brought under public control, so far from being more responsible to the community than it was in private ownership, will be much less so. Nationalisation of an industry will come to be taken as absolving it altogether from its main duty to the community, which is to use up less wealth than it creates. Nationalisation and progress will become mutually contradictory terms; and those who continue to preach nationalisation will have to admit that they are trying to cut down the nation's standard of living in order to serve some theoretical end.

Does Labour really want this to happen? Do the young men who were attracted into the Labour Party on intellectual rather than emotional grounds in the nineteen thirties really believe that they would have been attracted by a philosophy of this sort? Do they think that their successors among the thoughtful young people can be attracted by it now? In the last week, while some Labour members have been loudly cheering, a weak Tory Government has garrotted the sweet-heart who originally attracted them into their present vocation; it is intolerable that certain newspapers of the centre, which felt some of the same attraction at the time and may have erred thereby, should be derided as reactionaries now because they pause to mourn at her grave.

★

Finally, what are the lessons for those who are independent of either party? One of these, and perhaps the most obvious, is that the British people cannot hope to progress so long as it is always prepared to yield up its hopes of efficiency tomorrow, in order to avoid trouble today—but if any independent has not learned that already, he is probably not in a mood to imbibe any lessons from last week's experience at all. The other main lesson might have been expressed by saying that those who will the end must will the means—if that well-worked phrase had not been misappropriated. The British people have quite clearly willed the end of

a rapidly rising real national income. Indeed, they have placed so many mortgages on future wealth that they absolutely depend on a rapid and steady growth if they are to avoid insolvency both abroad and at home. But the only possible means to greater wealth is greater efficiency—not necessarily harder work, but certainly more effective work by everybody, with an eager exploitation of every assistance that technology and the intelligent investment of capital can provide. And, in securing greater efficiency, it is now quite clear that there is no substitute for competition.

One of the dreams that finally died last week was the dream that industries could be planned or rationalised or co-ordinated into efficiency. They cannot. No amount of talking about efficiency, or setting up committees to promote it, or inducing trade unions to issue declarations in favour of it—no "efficiency audits" or consumers' boards or productivity councils—will be a quarter as effective in promoting efficiency (which means in promoting a rising standard of living) as the compulsion that competition provides. When road transport began to break the natural monopoly of the rail, the American railroads knew that they had no other recourse than to make themselves competitively efficient. They overhauled the whole of their services; they spent billions of dollars on new capital; they

cut down both their overheads and their labour force—with the result that they are today (as a whole) both prosperous and efficient. In this country the natural reaction was to seek protection—with the result that is now plain for all to see. Even today the only solution that some Labour thinkers can find for the woes of the railways is to subsidise them out of the profits of road transport. This is still called "co-ordination"; but if it is, then the word has come to have no other meaning than the condonation of inefficiency.

This is the lesson for the general public to learn—and it will be as unwelcome to most of them as the more specific lessons that the two parties ought to take to heart. Competition can, indeed, often be discomforting, and sometimes wasteful. But there is no other way of getting efficiency, and if the British people want to make sure of the progress on which they are counting, they will have to make a deliberate decision to return towards competition. This need not necessarily involve abandoning public ownership—on the railways, for example—but it will involve abandoning "co-ordination" and monopoly. A more competitive economy will perhaps be a less secure one; but it will certainly be a more productive one. It might even double the standard of living in a generation. The nation has willed the end; it must will the means.

Argument of Arms

THE middle of January seemed comfortably far away last October, when the Paris conference agreed to equip the new Western European Union with an arms control agency, but to postpone until January 17th further consideration of M. Mendès-France's proposals for an arms production pool. It was hoped that by then the Paris agreements would have had a safe passage through the French parliament, and also that, as soon as French experts sought to reduce to specific terms the bundle of conflicting ideas that made up M. Mendès-France's original proposal, much of the force would go out of French insistence that the arms control agency should be supplemented by a production agency. But the passage of the Paris agreements through the French parliament has been anything but calm so far; consideration of them by the upper house has yet to begin; and the Christmas debate in the Assembly eliminated any hope that M. Mendès-France might prove less determined in January than he was in October. His recent ordeal certainly entitles him to a sympathetic hearing; and the worn spots in the fabric of western European unity must now be repaired by patches of compromise rather than by tearing the whole design apart and beginning again. But what exactly does the French prime minister want, and how much can safely be given him?

Each time the framework for German rearmament

has been discussed, at Brussels, at London and at Paris, M. Mendès-France has appeared to seek a somewhat contradictory mixture of objectives, some technical and some highly political, some domestic and some international. Primarily, he has seemed to want an international system which, by taking positive decisions about the armaments to be produced, would control the character and pace of German rearmament more surely than a WEU agency which could ensure only that prohibited items were not manufactured and that agreed levels of stocks were not exceeded. But at times he has argued this basic thesis in the name of European unity or efficiency of production, at times on straight grounds of French security, with little effort to conceal the fact that it is a precaution against the Germans; and at still other times he has suggested that controlled armament in Western Europe could be made a step towards world disarmament. Nor has he overlooked the known disposition of Mr Dulles to look with favour on collective European action. The suggestion that American aid to the Western Union countries should if possible be channelled through, and in any case co-ordinated with, a European arms organisation, is put forward as a logical counterpart to European co-operation, but it undoubtedly has the added advantage in French eyes of weakening the American influence on the pattern of German rearmament.

Unfortunately, the arguments that appeal to the "Europeans" among the French Christian Democrats are not those that appeal to the Socialist champion of disarmament, M. Moch; those that appeal to strongly nationalist Gaullists are unlikely to find favour in Bonn. The latest French proposals still reflect this mixture of motives, and a desire to sell the same horse, shown from different angles, to too many people. But a number of the ideas put forward have intrinsic merit, as well as being expedient in terms of French domestic politics. The first task of the experts who meet on Monday will be to separate these more practical proposals from the abundant chaff.

★

In brief, the new French memorandum suggests the creation, in two phases, of a European arms community covering Britain as well as the continental countries. In the first phase, there would be two governmental committees, one concerned with military standardisation and the other with production. Decisions on standardisation would be subject to a unanimity rule, but the plan follows the Nato pattern in encouraging partial agreements among small groups of countries, if all cannot agree. The armaments production committee involves a much more ambitious scheme. The basic concept here is of an agency which, in time, would not only determine who, within the Western European Union area, is to produce what, but would also determine capacity levels.

National governments would still prepare military budgets, but rather than procuring equipment directly from domestic or foreign manufacturers they would notify the central organisation of their needs, and it in turn would place the contracts as it saw fit. The advantages seen by the French in such a system are not only the obvious security gains, but also the greater economic efficiency that might be achieved by specialisation and co-ordination of new investment plans. During the transitional period the decisions of the production committee would, like those of the standardisation committee, be taken unanimously; but at the beginning of 1957 the two bodies would be merged into a single permanent committee in which—at least on production matters—decisions could be taken by a two-thirds majority, or possibly even by simple majority.

The French memorandum has been put forward as a basis for discussion, not as a definite proposal. The overtones, and the importance attached to particular features of it, will be revealed next Monday. By then, after this week's talks with the Italians and the Germans, the French hope to have a better idea of where they stand with the two countries which, in the past, have shown most interest in the proposals. But on present evidence it seems clear that M. Mendès-France will gain most if he tries for a few limited and specific steps, and leaves his more ambitious ideas to germinate a little longer. A number of facts which he should have in mind already stand out clearly.

First, the other Western Union countries, and the United States too, feel that if there is a danger of Germany taking armed action to regain its lost territories, the most effective deterrent will be Shape's control of pipe-lines, airfields and reserves of ammunition. These controls, particularly when coupled with the limitations on size of forces already agreed and the German undertaking not to manufacture atomic, bacteriological, chemical and other major weapons, will, they think, be enough. Second, only a Germany that is treated as an equal partner in Western defence can be expected to be a reliable partner in Western defence; indeed, the German government has made it quite plain that it will reject any further discrimination. Third, while the European Defence Community was an idea which meant something new and exciting to many people, to serve up bits and pieces of the EDC plan stuck together without the glue of genuine supranationality is a quite different proposition. Whatever the French may have expected, there is no automatic welcome for any proposal simply because it was a part of the old EDC, even among people, like the Dutch, who are enthusiastic "Europeans." Fourth, no country is now in a mood for further long negotiation on elaborate new schemes of uncertain merit. And fifth, and from the British standpoint most important of all, no action should be taken which tends to set WEU up as a rival to Nato, or in any way weaken the co-operation with the Americans and Canadians in Nato.

★

In addition, there are a number of subsidiary points. The Dutch, for example, are mainly importers, not manufacturers, of arms, and look with disfavour on a system which, with no visible compensatory advantages, might make it more difficult for them to buy from, say, Sweden or Switzerland. As for the German industrialists, as an article on page 200 shows, they are happy to co-operate with their French counterparts, but they are not likely to be willing to have their future production patterns—and certainly not their capacity limits—set for them by agreement between governments. Neither, for that matter, are British industrialists, or even the French.

What then might be salvaged from the French proposals? Three things, at least, should be thoroughly examined in the weeks to come. The first is the standardisation of equipment; the second is the possibility of co-ordinated production of certain items; and the third is the related question of production planning. On all of these subjects the Nato experience is valuable, if not particularly encouraging, and on all of them whatever is done in Western Union must be co-ordinated closely with what is already being done in Nato. In the field of specialisation, Nato has had most success with simple common-use items such as storage batteries, and techniques such as the best method of landing

planes on aircraft carriers. It has left the field of heavy equipment almost untouched. The Western European Union, or at least certain of its continental members, may find it both possible and economically advantageous to pick up where Nato leaves off. Although the possibility of limited standardisation agreements exists in Nato, greater possibilities, and therefore greater encouragement, exist in the narrower circle of Western European Union. Further, the inhibiting influence of standardisation on new invention, a risk which must always be recognised, is very much reduced with the United States outside, and the British, presumably, counting themselves out of many projects.

Co-ordinated production and production planning have also lain on Nato's plate for a long time. Here, too, the possibilities for sensible action are better on the narrower geographic basis. Apart from the security argument, there is much to be said on grounds of plain economic efficiency for greater specialisation and rationalisation of production among the main continental arms producing countries. And if anything is

Who Floats?

AMONG the babies that get ritually kissed at parliamentary elections is one that isn't there—perhaps never was there. Political leaders still often talk as if the middle-class floating vote decides the issue, and in particular decided it between 1945 and 1951. Certainly the floating vote, almost by definition, decides every election; but it is not a middle-class vote. The middle class has long ceased to be in a position to arbitrate, even if it ever was. For the crude electoral figures show that even on a generous enumeration of the middle-class vote, the Conservatives must possess a solid working-class following ever to get a majority. That following must be all the more solid inasmuch as many of the middle class are demonstrably committed Socialists. While Britain has a larger middle class than most countries, and one that is steadily growing, the working-class proportion of the population is also the largest in Europe, because there is no numerous peasant class as in France or Germany to back a conservative parliamentary group. The floating voter must be wooed; but who is he?

To this enquiry, Mr John Bonham has made a most helpful contribution,* analysing Gallup poll data in great detail for the last three elections. If he does not finally show what the floating vote is, he does show the extent to which the middle class contributes to it. Grossing up a sample of 2,000 voters, representing every class in the community, who were asked their party predilections, he has produced a total vote for each party by what he defines as the middle class and the working class. This shows that in 1951, out of 10,500,000 possible middle-class votes, the Tories got 6,500,000 and Labour 1,900,000; while out of 22

*The Middle Class Vote. By John Bonham. Faber. 210 pp. 21s.

ever to be done the obvious time to start is before the German armaments industry is tooled up. But whatever is to be done along any of these lines must grow from small beginnings. To insist on a European "Ministry of Supply" or on a sweeping commitment to take effect at the end of next year is to court immediate rejection, or at best to get indefinitely bogged down in half-hearted working parties.

One clear lesson of the last few months is that although no country is prepared, when it comes to the test, to put domestic politics above western unity, no one country can dictate the conditions of that unity. The essence of its strength is compromise; not compromise of principle, but the homely business of accommodating one's own wishes to one's neighbours' needs. M. Mendès-France needs, and should have, a fair, full and friendly hearing next week. But he would be unwise to press his demands too far. The great enterprise of Western Union has still to be launched. To require it to carry too heavy a top-hamper would be to risk an immediate capsizing.

million manual wage-earners' votes, the Tories got 6,200,000 and Labour 11,300,000 (In each class, of course, a sizeable number of people did not bother to vote at all). The working class figures are perhaps more interesting than the middle class ones; the fact that the Tories got a third of the working-class vote suggests that the "working class" is little more cohesive as a group than a middle class which gave nearly twenty per cent of its vote to socialism; just as it seems more accurate to speak of the "middle classes," perhaps "the working class" should always be used in the plural. Granted that the Tories must gain a substantial working-class vote, it follows that Labour cannot do without the middle class; and both parties, of course, in their search for a majority, go after the Liberal vote of whatever class.

These conclusions naturally turn to some extent on the definition of the middle class. Mr Bonham uses an essentially negative, but simple and practical, one: all the classes other than organised manual wage earners and their dependants. (Even so he is left with a small unclassifiable group, neither petit bourgeois nor "prole.") The "Ten Million Minority" he reclassifies according to the occupation groups in the census, making appropriate allowances for wives, dependants and retired people. There may be little in common between the top business group at one end and the white collar group of clerks and typists at the other; but it is perhaps the best approximation of "the classes" as opposed to "the masses" that can be made.

But there is no real break anywhere in the class structure, and from top to bottom of the "middles" Labour has a widening wedge of supporters. Mr Bonham points out that the Tories gained as many votes

from the working class between 1945 and 1951 as from the middle class; and the way in which different middle-class groups "swung" is significant. The accompanying table summarises what happened at the three postwar elections to the vote of the eight sections of the middle class, set out in order of those whose highest proportions voted Labour in 1945.

Some of the figures may cause surprise—for example how Labour can continue to poll between 8 to 10 per cent of senior business people; but the attitudes of the dependants must be considered, for they enter the total, and there is a considerable margin for error as the division into social class is based on the Gallup interviewers' own estimates. The break-down of a 2,000 sample into so many divisions may also be a little suspect. Yet a convincing and thought-provoking picture emerges. The swing away from Labour between

THE MIDDLE-CLASS VOTE

	Percentage of each section voting Labour.			Percentage of each section voting Conservative.		
	1945	1950	1951	1945	1950	1951
Lower office grades...	30	28	29	33	43	48
Small business people	27	19	15	37	55	64
Managerial grades...	23	19	19	47	57	65
Lower professional grades.....	23	25	24	41	45	52
Higher office grades...	20	15	13	49	60	63
Higher professional grades.....	15	10	6	58	68	78
Middle business people.....	12	10	10	63	71	73
Top business people...	10	9	8	66	72	80

1945 and 1951 was in almost every section far less than the swing to Conservatism from those who had voted for neither of the major parties in 1945. In some sections Labour held its ground well—among the white collar workers who are nearest the working class by origin, intermarriage and relationships; among the managerial grades which include not so much departmental heads as senior shop assistants, supervisors of laundries and the like; among the lower professional people—teachers, technicians, entertainers, journalists, etc. And these groups account for nearly half of Mr Bonham's middle class by number—4.6 million.

If the apparent ten per cent of convinced Socialists among the business men and their families are left aside, the sort of electors who decisively repented their vote for Mr Attlee in 1945 were the small business people—small shopkeepers and owners of one-man or two-men service, haulage or contracting outfits; the higher office grades like branch managers; and the doctors, lawyers, architects, officers of the services and other senior professions. But these, whom some would call the greater part of the true middle class, muster in all 2,600,000 male and female voters; and their big change of heart after 1945 produced only some 500,000 extra Tory votes, which had but a modest effect on party fortunes—certainly not a decisive one. Whereas if the clerical

workers and junior managers could be brought by Labour propaganda to vote in accordance with even the working-class average in 1951 they would produce perhaps a million and a quarter more Labour votes.

Both political parties would doubtless be glad of a similar analysis of working-class voting which would shed equal light on what makes a working man vote Tory. Is it age? Is it experience? Is it regional? Is it occupational? Is it temperamental? What is known of miners perhaps hardly suggests that it will be a simple continuation of the Labour voting pyramid, related merely to earnings. Indeed, there is a widespread belief (it may be a myth) among political workers that Tory votes are more frequently to be found in the very lowest income groups than in those just above them. Furthermore the middle-class analysis prompts many other questions to the pollsters—the voting habits of the countryside, for example, or of the pensioners, and above all of the cohorts of new young voters who are added to the electorate between elections.

★

For it is evident that a voter's social class is only one of the factors that determines his party allegiance. This is remarkable, when it is considered how closely the two major parties are associated in voters' minds with class interests. Though the class party stereotype is demonstrably nonsense, it is fixed in most people's minds; but that does not prevent millions from voting "contrary to class"—which may, or may not be, a sign of inward and inarticulate awareness that parties are to be judged on national not sectional issues. Mr Bonham makes the point that, so far as sample interviews are any guide, those who do not think in terms of class conflict are (naturally enough) those most ready to vote across the conventional class line. Much therefore may depend on whether, in an egalitarian society, inter-class bitterness grows or declines. The example of Australia suggests that irrational class bitterness is perfectly possible in a highly egalitarian society.

But where people either accept or ignore class differences their minds are clearer for assessing and voting on the realities of records and policies. The Tory achievement in raising their working-class vote from 4.4 million to 6.2 million between 1945 and 1951 at least suggests that the myth of class conflict has not eaten too deeply into the British soul. It provides some justification for Sir Winston Churchill's constant theme that the things that unite us are far greater than those that divide us.

The conclusion is that the floating vote comes from all classes—not from one, and not, indeed, from two; but from so many sections of the community as not to be a manifestation of class structure or class consciousness to any significant degree. The ramifications and subtleties of social class colour and distort (and make more amusing) every aspect of British life; but they decide nothing. If this is fully understood, the effect on political parties can only be beneficial.

Election Year in Malaya

THERE has lately been fresh talk of an amnesty in Malaya. The veteran and much respected president of the Malayan Chinese Association, Dato Sir Cheng-lock Tan, has again offered to make an attempt to negotiate with the Communist terrorists in the jungle. In addition, both he and his opposite number on the Malay side, Tunku Abdul Rahman, the leader of UMNO (the United Malays National Organisation), have said that an amnesty should certainly be considered, once the intended general election has been held this summer and a more representative government has taken over the reins of office. Their attitude raises several important questions. The way these are answered depends in part on the view that is taken of the state of the emergency. It also reaches down to the roots of what the British are trying to do in Malaya.

The suggestion that the government should declare a general amnesty ignores the fact that a great deal is already being done to encourage the terrorists to surrender, by promising them fair treatment if they quit the jungle. It also ignores the reason why the government's promises cannot be more generous; many of the men in the jungle have by now committed hideous crimes for which ordinary civil law demands that they should stand trial as individuals, quite irrespective of whether or not they have taken part in a Communist insurrection. On the other hand, some of the men in the jungle are heartily sick of the whole business, but they are prevented from surrendering by the hard core of the party leadership. The task now is to separate the sheep from the goats, to coax out those who do not bear direct responsibility for particular crimes, but to hunt down the rest till justice is done. Britain's first duty in Malaya is to provide a code of law and to see that it is observed.

★

An amnesty would also be ineffective, because the Communists will continue their fight in any case until a change of tactics is ordered from Moscow and Peking. Such a shift is by no means to be ruled out; there have been recent signs that the Communist overlords recognise the extent to which the Malayan terrorists have lately been losing public sympathy. But the dictation of a radical change of policy, such as abandoning jungle terrorism and returning to the towns to pursue constitutional methods of infiltration, would be unlikely to hinge on the Malayan government's clemency. Clemency, indeed, would probably be interpreted as a sign more of weakness than of strength. Consequently on neither the government nor the Communist side does there seem much present

scope for Sir Cheng-lock Tan's proposal to negotiate.

In a broadcast at the end of December the Director of Operations, General Sir Geoffrey Bourne, emphasised that during 1954 the attacks by the Communists had been less hindrance to the life of the country than in any year since the emergency began in 1948. The terrorists are in fact more limited in their areas of operations, and much of Malaya has now been declared "white"; curfew and other restrictions, that is to say, have been lifted. The Communist leaders in the jungle appear to be showing increasing concern about the morale of their squads and about the problem of getting food; this represents success for the government's food denial drive. As a result the terrorists operate less frequently, though when they do attack they take the maximum trouble to ensure that each operation pays them dividends, either in the seizure of arms or food or in other ways. At the same time, the government has been able to get to the point of transferring more security work from the army to the police and home guard—reduced in strength but of improving efficiency; of pushing the troops deeper into the jungle and for longer periods; and of doing more to win over the aborigines, who were at one time under the Communists' thumb.

★

On the debit side of the balance sheet, however, there are some heavy and depressing items. It was only after cold and careful calculation that the government admitted during last year that there are still about 5,000 Communists in the jungle, much the same number, that is to say, as there have been throughout. Nor are the statistics particularly reassuring. In 1954, 713 terrorists were killed or captured, compared with 981 in 1953. Only 210 surrendered, compared with 372 the year before; the Communist victories in Indo-China and the Chinese successes at Geneva reduced surrenders sharply last summer. A major reason for the drop in the figures is that, with fewer operations, the Communists are harder to find. But the hard core of Communist terrorism continues to exist, and in certain areas conditions are actually a good deal worse than in the past. This is proof, if more proof were needed, that though the emergency may be tapering off no end is yet in sight.

The cost has become a millstone round Malaya's neck. In the boom days of rubber and tin at the start of the Korean war, the Federal budget was able to take the emergency more or less in its stride. Now, in spite of grants from Britain and a loan from the Colony of Singapore, there is an unhealthy deficit; it was about M\$173 million (over £20 million) last year

and is estimated at M \$148 million (over £17 million) for 1953 on a total expenditure of M \$755 million. The government has rightly done a good deal to expand its educational and social services in spite of the emergency; indeed some such expansion is vital in terms both of fighting Communist propaganda and of fulfilling the British intention that Malaya's standard of life shall be second to none in Asia. But the other side of the medal is the constantly inflationary influence of government policy, the fact that the Finance Committee in Kuala Lumpur is unable to suggest any satisfactory method of substantially increasing revenue, and the heavy load of taxation imposed on the country's two main export industries, rubber and tin.

As matters stand the whole future of the rubber growing industry is uncertain, in that important long-term decisions are still pending about the government's policy on replanting. Whatever the world market prospects for natural as against synthetic rubber, and whatever the pros and cons about the methods to be adopted for financing replanting, a continuation of present trends would almost certainly lead to a substantial reduction in Malaya's output of rubber during the next decade. This prospect and the need for a coherent taxation policy led the government to appoint the so-called fact-finding Mudie commission which issued its report last October. Its proposals and the principles underlying them, however, have been disputed by a large part of the industry itself. No decision is likely to be taken until the government has considered the World Bank's forthcoming report on Malaya. Meanwhile the position has been somewhat eased for both government and producers by an improvement in the price of rubber. But until an agreed policy can be reached, the outlook for the industry will remain unsatisfactorily obscure.

Though much of the economic front is therefore uncertain, the immediate political prospect in Malaya is fair. Barring accidents, the first general election in the country's history will now take place by about the middle of this year. And to judge by the recent state elections in Johore and Trengganu, a fairly heavy poll will result in widespread success for the Malay-Chinese

Alliance, the only party at present in the field with an effective organisation and adequate funds. Its leaders have lately become reconciled to the High Commissioner's compromise providing for a small elected majority in the Legislative Council; with the support of some of the nominated members, the Alliance will therefore presumably take office in a few months' time as Malaya's first electorally representative government.

It is this prospect which adds particular pungency to the present position in regard to such questions as an amnesty and rubber replanting. For although the British will continue to be responsible—as indeed they must be at least for the time being—for the conduct of operations against the Communists and for long-range economic policy, the new steps towards political evolution will be meaningless if they do not link the government more closely to public opinion. Twenty years ago there was almost no such thing as public opinion in Malaya. Today the problem is not only to create one, but, having created it, to see that it takes a responsible view of its own problems and then to ease it into the saddle. If, for instance, the public would really support the government over the emergency, the terrorist menace would shrink to minor proportions. But equally, if the government is gradually to hand over part of its power to the people's elected representatives, then they must recognise the realities of the Communist struggle as well as the major needs of their country's economy.

At present the weakness of the Alliance as a political party is that it has no social or economic platform at all; it exists merely to work for a transfer of power. Nor is there any group of sufficient size to provide a working democratic opposition. If all goes well, the next few months should provide a heartening exhibition of British colonial policy at its best. But no one should be under any illusions. If the mixed communities of Malaya—Malay, Chinese and Indian—are going to move forward to truly responsible self-government, free of the Communist terror, then the British themselves must be quite as careful as at any time in the past not to surrender power too soon.

Notes of the Week

Return from Peking

THE Chinese deliberately reached out for the headlines when they imprisoned the eleven American airmen for espionage. To retreat from the very public position which they adopted must therefore mean a loss of face, unless it is accompanied by some *quid pro quo* on the American, or conceivably United Nations, side. And it is this spectre which was breathing down Mr Hammarskjöld's neck throughout the negotiations in Peking that ended last weekend. As we go to press, the UN Secretary General is in the air over the Pacific and the outcome of his mission has not yet been made public. But, to judge both from the background of the dispute and from the brief communiqué issued on Monday, it is unlikely that any dramatic result has been achieved.

In the eyes of the American public it is understandable that this may well be a bitter disappointment. And the disappointment may lead men like Senator Knowland to claim once again, and no doubt with full sincerity, that it is impossible to get anywhere with the Peking regime. This is not, however, the attitude of the Administration as expressed by the Secretary of State, Mr Dulles, on Tuesday. Nor is it borne out by the few facts that are available. Mr Hammarskjöld himself is a man given to keeping his thoughts to himself. But it was known before he left for Peking that the most his mission could reasonably expect to do was to make the point of view of the outside world crystal clear to the Chinese, and thus to open the way to negotiation on a basis of reality rather than fantasy.

It may fairly be claimed that this has almost certainly been achieved. The door is now ajar. If the Chinese mean what they said in their joint communiqué with Mr Hammarskjöld, that "we hope to be able to continue the contact established in these meetings," something of real value has emerged. In the past, it has been the downright ignorance of the Peking government, as well as its attitude of mind, that has created the tension in the Far East. If negotiations can now continue, there is a not unreasonable hope that the airmen will in fact be released. If they are broken off, there is virtually none.

No Red Orchids for Mendès-France

AT the end of the ratification debate in the French Assembly, the experts speculated briskly about the Communists' next move. Would they bide their time, or would they launch an immediate attack on the premier? The Communist deputies themselves seemed bewildered

and, evidently lacking instructions, were content to vent their wrath on the Socialists. But now there can be no more doubt about the Moscow line. *Pravda*, the official party paper, has offered its columns to an Ilya Ehrenburg at his most vitriolic for a direct personal attack on M. Mendès-France. After recalling the Paris street traders who towards the close of the year use their brilliant rhetoric "to dispose of their spoiled wares," he goes on to apologise to "the dear booth owners" for comparing them with the French prime minister. Moscow's disillusionment is then couched in flowery language: "The cocks perched on all the belfries of France had not crowed thrice before M. Mendès-France renounced the policy of peace and exchanged it for the policy of strength."

The significant thing about this onslaught, more violent and personal than any before, is the insistence that M. Mendès-France does not represent his country and that only simpletons can fall for his idea of parallel negotiations with Russia. French Communists do not want to be accused of being naïve, and *L'Humanité* has already taken its cue: in its latest issues it refers to the present government as one of "grave-diggers." A few months ago M. Mendès-France had the awkward task of emphatically rejecting Communist support. The tide, however, has now changed (the election of a Christian Democrat as president of the Assembly can be taken as a symptom of the turn) and the Communists' big guns will be turned against the government at every opportunity. At least M. Mendès-France need no longer fear that he will die of asphyxia from Communist embraces.

Triumph for Mr Menderes

MR ADNAN MENDERES seems to have achieved what many a pundit judged to be impossible—a bilateral pact of mutual defence with one of Turkey's Arab League neighbours, and a strengthening of security on Turkey's eastern flank. It is reported from Baghdad, where he was given the honour of addressing the Iraqi Chamber this week, that a treaty of mutual defence between Turkey and Iraq is to be drawn up and signed in the near future and is to be followed by further rounds of visits—by the King and Regent of Iraq to Turkey and by President Bayar to Iraq.

Mr Menderes' visit to Baghdad is only the first stage of an energetic diplomatic offensive in the Middle East that is designed to put some stuffing into the region's flaccid defence planning; he is going on to Lebanon and is invited to Egypt. His activity stems from Turkey's conclusion—which seems to have been a right one—that the better atmosphere created by the settlement of the Suez Canal

and Iranian oil disputes offered a chance of persuading Arab neighbours that defence pacts unsupported by strongly armed allies were no match for the only form of aggression that threatens the oil areas of the Middle East.

Before setting out on his tour, Mr Menderes had prepared the ground still further by delivering himself of some home truths about Middle East defence. In a broadcast delivered in both Turkish and Arabic, he said that peace was indivisible, that what security the region at present enjoyed was solely due to the establishment of Nato, and that it was an illusion to imagine that any regional defence organisation, however perfect and complete, was in itself enough without close co-operation with Nato—"the real shield against danger."

He must have known that his words would not be music to all Arab League ears. The weak governments of the Middle East live under a curse which dooms them to pander to uninformed opinion, and some Egyptian leaders have been proclaiming that no alliances outside the Arab League can be entertained, and that Israel is the only enemy. It would be as much as an Iraqi government's life was worth to deny this last point, but many responsible Iraqis, both old and young, now see it in a new and wider perspective; Iraq broke off diplomatic relations with Russia last week.

The situation leaves the Arab League in a dilemma; either its members must decide, each for himself, whether or not to follow Iraq's lead and to take sides in the cold war, or else the League will fall into two halves—the "have" states who sense danger from Russia, and the "have nots" who prefer to strike old-fashioned attitudes.

Somebody Else's Business

THE Transport Commission met the National Union of Railwaymen on Friday, quickly agreed to its demand for the porters (who had the worst case for an increase), agreed to most of its demand for the lengthmen, and signed a settlement on the spot. The lowest paid workers get an increase of six shillings a week. How the money is to be found, said Sir Brian Robertson, "is not my business." The footplatemen and salaried staff, who will certainly and rightly demand a restoration of their differentials, are now closeted in negotiations with the Commission. When their demands have been codified and agreed, the total bill will probably be more than £10 million a year.

Meanwhile, the London busmen have decided that they cannot accept the offer of an extra 9s. 6d. a week. The busmen, it should be said at once, have a much better case than the railwaymen; there is a shortage of crews for the buses that are available to be run. But whether London Transport should meet this problem by raising wages and fares further, or by cutting down the apparently ample number of bus journeys, or by a re-arrangement of schedules (which the busmen have been guilty of opposing), is open to debate; a report on the efficiency of London Transport is due to be published towards the end of this month, and it may be better to defer judgment until then. London Transport will also have to decide what offer it will make to workers on its underground railway; it is very angry with the NUR for serving notice that it would call these

men out during any national railway strike—in defiance of contractual agreements—but after a stiff exchange of notes negotiations are likely to proceed as before.

Elsewhere on the wages front, engineering employers (who are traditionally next in the firing line after the Transport Commission has run away from it) have stopped all overtime and weekend work for their "spidermen," in retaliation for a series of guerilla strikes; and the building employers want this year's increase to be directed towards skilled workers (a sensible course, which will not have been made any easier by the railway scuttles). Finally, the railway court of inquiry is preparing to follow up its fateful interim report with its full report. This cannot now have much effect on the railway negotiations, but it may attempt conciliation in the dispute that has sprung up between a disturbed section of public opinion and the court itself.

Not to be Discussed

A MILD cheer should be sent up for two Labour MPs, Mr Callaghan and Mr Michael Foot, as a result of their latest dispute with the British Broadcasting Corporation. The cheer can only be a mild one, because they seem to have struck their attitude later than resolute friends of free speech should have done. When preparations were being made for last week's edition of "In the News"—a regular television programme which is advertised as an "unrehearsed discussion on topics of the week"—the threat of a railway strike still hung over the nation; the BBC decided that the topic was *sub judice*, and must not be discussed. This was the moment when the two Labour MPs should have flounced out of the programme—at this first ruling that a dispute of such vital importance to the public should be settled in indecent obscurity between the union and the Government, while the most influential medium of public communication gagged any discussion of the issues involved. Instead Mr Callaghan and Mr Foot waited until the railwaymen suspended their strike notices, when the BBC said the matter was still *sub judice* and they themselves considered that it was not.

It may be that in this particular case, as the teams were already drawn up, and composed of people who would probably all support the Government's retreat, the public did not miss very much. But the incident reveals again the appalling consequences for democracy of the BBC's method of handling controversial issues. This method is to set up an equal number of Tweedledums and Tweedledees from each of the main parties, and to beg them to have as fierce and partisan a battle as possible.

One result of this system is that an independent—who is liable to cause embarrassment by agreeing with all the Government's policies announced in one week, and disagreeing with all those announced in another—must never be allowed to be built up as a broadcasting personality. Another is that whenever some important Government decision is in prospect—an agricultural price review, a budget, or the handling of a labour dispute—people with conflicting opinions are never able to use this medium to say which way they think the Government should turn (as distinct from passing comment, after the event and usually

on strictly party lines, on the way in which Government policy actually has turned). The BBC will not be fulfilling its proper role as an educational force until it can act upon the principle that when a decision of policy is impending, that is the very moment when it should be promptly discussed—exhaustively, and from as many angles as possible. So long as the corporation remains a monopoly, it will never be allowed to act in this way; the parties will insist that it must not interfere, or facilitate anybody else's interfering, with their exclusive rights to propose and oppose. This is why it is so vital that the monopoly should be broken, and so surprising that many genuine Liberals have opposed the basic—if muddled—principle of the new Television Act.

Red Meat Turns Traitor?

IN spite of the freeing of fats, butter and meat in the spring and summer of 1954, the index of food prices stands only 5 per cent above its level twelve months ago. But, as the campaigning in the South Norfolk by-election showed, these prices may still be the chief source of political trouble for the Conservative party. Labour's principal talking points are tea and meat.

Tea is not likely to be a growing issue; the price seems to be at or near the top now. For the next three months, meat may take over the running. Its history since derationing is that it rose in price by an average of about 6d. a lb immediately after it was set free (the better cuts by far more and the cheaper cuts by less), fell in August, and then rose to perhaps 4d. a lb above rationed prices at the turn of the year. It is bound to increase again in the near future, as supplies of beef are thinning out. Home slaughterings were high until Christmas, but will now be low until April. In April too arrivals of mutton and lamb from Australia and New Zealand reach their peak. It is between now and then that the lean period occurs.

It is very difficult to judge how lean it will be. Shipments are coming in from Argentina, but in less than half the prewar quantity. As a cushion to the shortage, the Ministry of Food holds stocks, built up from the tag end of its bulk contracts, which probably exceed 100,000 tons, and importers hold perhaps another 50,000; together these stocks are equal to as much as four weeks' supply. But they are all of imported meat—and demand since derationing has shown a powerful, perhaps irrational, preference for home-killed. It is in the best cuts of beef that the sharpest rise in prices is likely to occur. Whether this is likely to be a factor of real political importance depends presumably on whether marginal voters—in by-elections between now and April—happen to eat this type of meat; or whether they are content with more stable scrag end.

Khrushchev to the Fore

IN recent weeks Mr Khrushchev, the head of the Communist party hierarchy in the Soviet Union, has been busily stealing the limelight from the prime minister, Mr

Malenkov. He has found successive opportunities for front page publicity in his visit to China, in the drive to cultivate virgin lands, and even in a conference of builders. Last week the departure of a new contingent of young people to the empty spaces of Russia's interior provided him with yet another platform. Moscow radio's report of his speech ended with the once classical formula "Thunderous applause—all those present rise," and it was noticeable that, in breach of the current principle of collective leadership, nothing was said about the other members of the party presidium except that Khrushchev spoke in the presence of Malenkov.

The impression that these two men now dominate the struggle for power in Moscow is receiving plenty of confirmation. And, in a week when George Orwell's "Animal Farm" appears as a film in London, one cannot help wondering whether Khrushchev can do better than the loquacious, ebullient Snowball, or whether the patient Malenkov, biding his time like the porker Napoleon, will emerge victorious in the end. It may be worth recalling that, in the struggle after Lenin's death, it was the quiet, calculating man who eventually came out on top.

Soviet Fertility Cult

IN his speech last week, Khrushchev claimed that the taxes imposed during Stalin's reign on bachelors and couples with less than three children were really his own work. He also made it clear that the ghost of Malthus does not haunt the Kremlin. The Bolshoi Theatre resounded to an appeal for national strength through larger families that was blunter than anything of the kind heard since Hitler's day. According to Khrushchev, to bring up three children is the minimum duty of every Russian couple, and the Soviet Union looks to its cradles for at least another hundred million subjects.

It was to young men going east that the party secretary was speaking, and in the wide open spaces of Soviet Asia there should be ample scope for new settlements. The drive to conquer uncultivated lands is part and parcel of the general campaign to increase food production, but it has clearly become something more than an emergency operation. Khrushchev spoke not only of northern Kazakhstan and western Siberia but also of Sakhalin and of the other Far Eastern territories which he had visited on his way back from Peking. He painted pictures of a prosperous Siberia whose name would no longer evoke gruesome associations. The new *Drang nach Osten* is evidently meant to improve the economic and strategic balance of the whole Soviet Union.

If this is to be achieved, the east-bound pioneers must not be content to break new ground and then return home; they must be turned into permanent settlers. Financial inducements and other material privileges will not suffice to get them to stay indefinitely in the remoter territories. That is why Khrushchev's final appeal was, in effect, "Go east, young woman." Families must be founded to populate the empty lands of northern Asia, and it is there that the dutiful Komsomol girl is now urged to set about overfulfilling her three-child norm.

New Danger in Central America

UNTIL a few months ago, most people's reaction to news about any conflict in Central America was to assume that two petty tyrants, both of doubtful reputation, were having yet another private quarrel. Since the Guatemalan upheaval last June, however, the natural tendency has been to see all such conflicts as facets of the anti-Communist struggle. It would be quite wrong to apply either of these concepts to the new outbreak in Costa Rica. This is beyond question the most politically advanced of the Central American republics. The European element in its population is much greater than in its neighbours, and it

possesses a genuine tradition of tolerance and civil liberty based upon a sturdy class of small independent farmers. Inevitably, it has become a refuge for the enemies of neighbouring dictators, and President Somoza of Nicaragua, a "strong man" of the old type, may have had good reason to worry about their presence; the attempt on his life made a few months ago was probably organised by Nicaraguans in San José, the Costa Rican capital.

Inevitably, too, the left-centre government of President Figueres has been branded as pro-Communist by the more authoritarian regimes of the Caribbean area. That is an elementary gambit for Latin American "strong men," and an automatic one when they are pressing Washington for financial aid to their professed crusades in defence of democracy. In fact, Señor Figueres has a much better record as an enemy of Communism than Señor Somoza, and although his pronouncements are occasionally demagogic there is no doubt about his sincere attachment to political liberty. Under him as under his predecessor, President Ulate, Costa Rica has set an example to its neighbours; and if the embittered rulers of neighbouring states succeed in snuffing out its democratic flame, political progress in the whole Central American region will suffer a sad setback.

Reluctance to Convert

MR DUNCAN SANDYS is not going to be outdone as a housebuilder; although between 340,000 and 350,000 houses were completed in 1954, he told a Bir-

mingham audience this week that output in 1955 might well be bigger. Some estimates given by Mr Macmillan at the Conservative Party conference had left the impression that the Government was now going to rest on its oars, and to divert some of the vast resources now being used for housebuilding to other—and perhaps less heavily subsidised—purposes. But it now appears that Mr Macmillan's smaller figure referred to England and Wales and not to Great Britain.

Like his predecessor, Mr Sandys emphasised the need for slum clearance; he is at present waiting for the local authorities to send him their estimates of the number of slum dwellings in their areas and their schemes for clearing them. But he said that in 1955 he wants to turn the spotlight, not on slums, but on modernising old-fashioned houses—on providing suitable accommodation for more people in them, and on attacking such problems as that of the 45 per cent of British families who have no fixed bath in their homes. Since 1944 local authorities have had the power to make grants of up to 50 per cent for improvements and conversions, or up to a maximum of £400 for each dwelling provided. This sounds an attractive offer, yet few house owners have taken advantage of it. From the passing of the relevant Act in 1949 until September, 1954, grants were made for less than 12,000 houses. Then the conditions were somewhat eased and in the two months after the new Act was passed 1,626 grants were made—an improved but still modest rate.

One reason for the reluctance to utilise this scheme is presumably that the local authorities can control the rents charged for new accommodation that is built with their money—although they must allow these rents to yield "a reasonable return." Another reason is the difficulty of housing tenants while extensive conversions are going on—a consideration that may account for the lack of interest shown by large property owners. An approach to the local authority for help might result in some council houses being temporarily used for this purpose. A third reason is no doubt the unwillingness of many tenants to pay higher rents for their new amenities. But the principal reason for the small use of the scheme is undoubtedly, as Mr Sandys suggested, the general ignorance that it exists. The responsibility for this lies partly with the local authorities. Of 1,400 authorities that could have the power, only 800 have used it—probably often because nobody in their area has ever asked them for a grant. The Minister has done his part to make the facilities known, in the booklet* published last week, and he is wise now to urge the local authorities to spread the news. This is a far more economical way of providing new houses than to multiply the housing estates at an ever-faster rate.

Jobs for the "Sudanised"

IT is both thoughtful and efficient to found an exchange and mart to which the officials "Sudanised" out of the Sudan can turn for news of other jobs. But it was not a very good advertisement for Her Majesty's Overseas Service when, in *The Times* this week, a list of wellwishers headed by the present Minister of Supply, drew attention to their

Quebracho

Glance down the list of Britain's imports from Latin America and you will find quebracho extract. The quebracho itself is a tall hardwood tree which grows in the northern forests of Argentina, taking a full century to reach maturity. Its extract, a valuable tanning agent, is shipped to world markets from Buenos Aires, where the Bank of London and South America has long been established. You will find quebracho mentioned from time to time in the

Argentine section of the Bank's *Fortnightly Review*.

This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control received from our 51 branches in South and Central America.

We shall be glad to send you a specimen copy, on application to:—

needs and availability; the letter said that only "a few" were being absorbed into British government service. On November 30, 1953, there were 1,130 vacancies in posts due to be filled in the colonies by the Secretary of State (as many as the whole strength of the British officers in the Sudan), and it was as late as October 1st last that the Overseas Service was launched to meet the changing conditions in colonial needs for British staff. Is it so little able to take advantage of administrative and technical experience in an underdeveloped area that it can offer only a handful of jobs worth the attention of the ex-servants of the Sudan?

It must be admitted that the Colonial Office has tried. It started rather clumsily, but it has made a great effort in recent months to interview every interested party home on leave from the Sudan. It has made a number of appointments. But the rub is that most of the men concerned want jobs at home. In part, this is because they have had their fill of hot climates or of "transfers of power"; that must be the main justification for Mr Selwyn Lloyd's letter. In part, however, it is because conditions offered to them in the Overseas Service are not good enough. Though they can start at the salary level and with the status that they achieved in the Sudan, they rank for promotion well below those for whom the Overseas Service is just the old Colonial Service under a new name. Ought not such a service, working in the difficult conditions that now prevail in Asia and Africa, to make merit the only criterion when it fills senior posts and to regard its less deserving officers as pensionable early? Moreover, apart from the Overseas Service, there are more jobs than candidates for posts, requiring technicians already acquainted with underdeveloped areas available in the United Nations Technical Assistance services, in the Colombo Plan, and through the departments of the Foreign Office that recruit British specialists for foreign governments. If jobs in contracting firms are preferred, it might have been wiser to circularise the well-known range of those servicing underdeveloped areas before making this public appeal.

Family Patterns

THE report on the family census* of 1946 was published only last week. The only trends that it can unequivocally disclose are those affecting the past generation—broadly speaking a comparison between the families of those who married in 1900-1909 and 1920-1924. The settled facts emerging from comparison between these two groups are a decline in average family size; a marked narrowing between the tendency for poorer parents to have large families while richer parents have small ones; and a similar, though less marked, diminution of the influence, on completed family size, of age at marriage. This is much what one would expect from the spread, both horizontally and down through successive social groups, of family planning. What one may call the provisional facts, those relating to later marriages still capable of adding to family size, are suggestive but mixed. Fertility rates in the early years of marriage (necessarily the only rates available for groups marrying in the 1940s) have taken a sharp upward turn;

* "The Trend and Pattern of Fertility in Great Britain." By D. V. Glass and E. Grebenik. HMSO: 2 vols. £3 10s.

by supplementing the census results with later vital statistics, the report tentatively suggests that the "projected ultimate family size" of those marrying in 1943 should be "larger than that likely to be achieved by any other group of marriages since 1923." So far as one can judge from

limited data, the social differential has continued to narrow—though Britain is still far from the Swedish family pattern in which larger incomes and larger families go together.

It is plain—now family planning has become general (although, like all planning, liable to mistakes)—that changes in economic and social conditions have a more important influence in determining each family's size. Both projection of population estimates and the framing of policy based on projection become in these circumstances very much chancier. The pessimistic projections of the 1930s have already been demolished. The optimistic projections of the immediate postwar years look no more secure. Cautiously, the report indicates "a new stability," with no major departure from the small family pattern but no further substantial decline. These are wobbly foundations on which to build estimates relating to "housing programmes, family allowances, social insurance and other measures of social welfare"—to quote Lord Simon's appeal for co-operation to the women approached by the census takers. Policy is a little less blindfold, thanks to the census, than it would otherwise be; but most of its field of vision is backwards.

M. Massigli Leaves

THE French have a tradition of long ambassadorships in London. It is almost as if they had been persuaded that only time could lead them to any proper understanding

of a people so oddly different from themselves as the British. The ten years which have made M. Massigli doyen of the diplomatic corps and one of the best known figures in London, either British or foreign, are not in fact without merit. But they have covered a very unusual, indeed a unique, period of history. And it is to M. Massigli's great personal credit that through it all he has played a curiously important role. Prominent and yet discreet, aloof and yet friendly, mentor and yet interpreter too, he has been at once a loyal servant of France and a firm advocate of the mission with which he was entrusted. It is said of him that the crowning achievement of his work in London was to hear Sir Anthony Eden give the undertaking in Lancaster House last September that, if Western European Union is ratified, Britain will maintain four divisions and the Tactical Air Force on the Continent.

M. Massigli returns to Paris to take over at the Quai d'Orsay at a moment when Britain has never been more deeply committed to the Continent, but when in British minds the Continent is perhaps less clearly identified with France than at any time for half a century. This is largely a reaction to the long delay in Paris in reaching a decision about the new form that Western Europe is to take. Since the result has been to weaken confidence in France and so to undo much that M. Massigli was trying to achieve in London, no one can have regretted it more than he. The one consolation which he certainly will share with many others on both sides of the Channel is that, if Western European Union survives and succeeds, it is likely to prove at once a more realistic interpretation of the European mood and a tighter bond between Britain and France than EDC ever looked like being. It is in any case a fitting culmination to a chapter which saw the signature of the Treaty of Dunkirk, the original Brussels Pact, and the North Atlantic Treaty. For the historian who reads between the lines about them, the name of M. Massigli will be written many times over.

Belgrade in Two Minds

IN its handling of the Djilas-Dedijer affair the Yugoslav regime continues to give a striking demonstration of its ambivalent nature. On the one hand, the two culprits are still at liberty, and their treatment so far has shown a scrupulous observance of legal procedures. But on the other hand, in reacting to the publicity which the affair has received abroad the Yugoslav authorities have fallen back on the worst traditions of Cominform distortion and misrepresentation. It is being alleged that a big campaign to discredit Yugoslavia has been launched by "some western circles" which are hostile to Yugoslavia and annoyed by its successful independent foreign policy; and that the timing of the Djilas-Dedijer affair—during Marshal Tito's absence from the country—was carefully calculated to do the maximum damage to the government's credit.

This story is, of course, completely unfounded. The Yugoslav authorities themselves helped to make nonsense of it when, in their anxiety to show that nothing was being done behind Marshal Tito's back, they issued a careful account of the course of events, beginning last March, which has culminated in the prosecution of Mr Dedijer and Mr Djilas. This account shows that the Yugoslav leaders have

been caught out by a combination of bad luck and bad miscalculation. It was bad luck that Mr Dedijer was not available in Belgrade when originally summoned before the party control commission on November 17th, before Marshal Tito set out for India; and it was a bad miscalculation, although perhaps a very understandable one, to imagine that Mr Dedijer was in the mood to submit meekly to party discipline.

All this, and the publicity and comment to which it naturally gave rise, was no doubt extremely aggravating for the Yugoslav leaders, who seem surprisingly sensitive about the impression they create in the West. But it is sometimes very hard to see what they are driving at. It does not make sense to insist that Djilas and Dedijer are insignificant nobodies who should be ignored, and at the same time to brand them as the instruments of alleged foreign interference and to institute legal proceedings against them. Nor does it seem reasonable for Mr Kardelj to condemn their views as traitorous and slanderous, when he himself has been saying the same sort of thing about the eventual development of more political parties, not in the privacy of the party conclave, but in a lecture to foreigners in Oslo which was reprinted—rather oddly in the circumstances—in a recent issue of *Borba*. It is true that Mr Kardelj's discourse was on a strictly theoretical plane and contained no criticism of things as they are. But if it is merely a matter of timing and means, not of ends, that separates the dissidents from the rest of the party, surely their case could have been handled more adroitly?

Italy Plans Development

A PLAN is one thing, its fulfilment another. During the past few weeks an ambitious investment programme has been prepared in Rome, which has now seen the light of day as the Vanoni Plan. Signor Vanoni is the present Minister of the Budget and is expected to be one of the candidates for the presidency of Italy in the approaching elections. His new plan, prepared in consultation with both Italian and foreign experts, has had the assistance in drafting of the American Foreign Operations Administration, and has been laid before the OEEC. If ever there were scope for a plan which deserved to succeed, this is it; but it may call for a near miracle if it is ever to reach fulfilment.

The aim of the Vanoni plan is to break through the "sound barrier" of Italy's fundamental economic problem. It sets out to abolish unemployment by 1964 by creating four million new jobs. This is to be done through an increase in national income of about five per cent per year over the next ten years and through foreign aid. This increase, in the words of the plan, is believed to "be sufficient to ensure the estimated capital requirement for new investment, but only on condition that a substantial proportion of this increase—appreciably larger than the present one—be used for this purpose." Investment in fact should "absorb more than one third of the total income increment for the entire ten year period." The aim is legitimate enough. But how is it to be achieved? The plan is based on the premise of stable wage rates, a stable cost of living and definite limits on consumption and on profit. It involves both state and private enterprise of a high order, and it begs nearly all the questions of Italy's existing experience.

Any democracy is severely handicapped in comparison with a dictatorship when it tries to pull itself up by its bootstraps, since it has to persuade as well as coerce. In Italy enlightened planning faces several special difficulties even before it starts. One is the implacable and cynical opposition of the big Communist party. Another is the traditional and entrenched distrust of small-market capitalism. Yet a third is the narrowness and impermanence of government majorities. The sponsors of the new plan will need luck as well as faith if they are to pull off the miracle they propose. But that is no reason for not trying.

Changes in Kenya

GENERAL SIR GEORGE ERSKINE—who is to retire from the post of Commander in Chief, East Africa, in May—has had as difficult and frustrating a task as Colonel Young, the former Police Commissioner who is now back in Britain. Like Colonel Young he has had his brushes with the settler community. He bluntly said that bullets alone would not reduce Mau Mau, many months before the Colonial Secretary (then Mr Oliver Lyttelton) decided that he must intervene and institute a political settlement that might become the basis for an alternative to them. But General Erskine at least has the satisfaction of knowing that the combined efforts of the army, the police and the civil authorities have done a great deal to wrest the initiative from the terrorists. The new operation of combing the forests almost yard by yard would hardly be possible but for the ability of the police and the loyalist home guards to maintain law and order in the areas left after the army has deployed its strength in the forests.

Although there are plenty of signs that sheer force, immensely improved organisation, the concentration of Kikuyu in well-defended villages, and the retention of 60,000 detainees have crippled the revolt, there are as yet no definite signs that the mass of the Kikuyu have come down solidly for the Government. The Kikuyu have been cowed and disillusioned with Mau Mau, but they have not been won, and perhaps not yet reached. It is here that the problem of law and order becomes so difficult. Colonel Young has spoken up strongly and loyally for the police against the High Court judges' suggestion that they have

been a law to themselves. Their difficulty, amid the mass of emergency legislation and decrees, has been to find out what the law is; in a situation of "kill or be killed," it is hard to enforce legal safeguards that are taken for granted in Britain. Yet talk of the merits of "rough and ready" justice must always cause uneasiness, and it is evident that there have been many irregularities among loyalists. The Kenya judiciary has done fine work in upholding British standards of justice; it is for the judiciary, with the police and the administration, to work out processes of law that can meet the difficulties of the situation without allowing those standards to be lowered.

Books and Readers

SOME day, perhaps, an electronic professor will describe to an amused class of history students a primitive device, much used until the late twentieth century, to communicate ideas and information, called the printed book;

The Workman in Fetters

Our attention has been called by an esteemed correspondent to the considerable reduction which has recently taken place in the exports of our textile fabrics, which he thinks may be in part caused by the Acts regulating the hours of factory labour and the continual intermeddling of Factory Inspectors. Although there is a more sufficient reason in the overdone markets of Australia from the excessive exports of last year, and in the prostrate credit of the United States from reckless and even fraudulent trading, for the decline in our exports than the Factory Act, yet we quite agree with our correspondent that in the present relative condition of this and other countries the working of this Act requires to be carefully considered. On the 16th ult. we published a letter from "A Wool Spinner," pointing out the mischievous operation of the Act in relation to the large supplies of woollens now required for our sailors and soldiers. The articles wanted could not be procured because the manufacturers could not procure yarn from the spinner, and the spinners' production was limited by the Factory Act. This prcrustean law cuts down production to its own standard, and enlarges not according to the wants of the community. Large purchases of furs have lately been made abroad for our troops—perhaps woollens have been purchased there, too; . . . and the Act may probably have prevented our own people from supplying the wants of their fellow-subjects. . . . Whatever may be the falling off in the export of other articles, there is none in machinery. The value in 1854 exceeds the value in 1853. Other countries, therefore, are now taking into use our machinery. . . . We have a race to run, and we cannot succeed if we tie our legs. Formerly they were tied for the advantage of the landlords, or the advantage of some classes of manufacturers, and very hobbling work we made of it, as increasing poor rates and perennial disturbances testified. Nations, as well as individuals, look very foolish jumping in sacks, and get many a fall. Having got rid of the restriction for landlords and the restriction for the master manufacturer, we must now walk in the workman's manacles.

The Economist

January 13, 1855

Money Making Proposition

"I can save you thousands of pounds" says Private Btu (the British Thermal Unit)

"Even though fuel costs may be only a small fraction of your costs of production."

FUEL EFFICIENCY PAYS For example—A company in Cambridgeshire using a Lancashire Boiler installed a superheater and achieved a coal saving of approximately two tons worth £8 a week. The equipment cost £350 so it was paid for in the first year. Allowing it fifteen years of life this was a most profitable investment.

Superheater Manufacturers' Association 7 Norfolk Street Manchester 2 has many other examples of the advantages of superheated steam and will be pleased to put you into touch with the manufacturers concerned.

but signs of its obsolescence find so far no reflection in the record numbers of new titles and reprints brought out by British publishers. Last year, according to the figures compiled by *The Bookseller*, 19,188 titles were published compared with 18,257 in 1953 and 18,741 in 1952—the previous record. Of this total, reprints and new additions

amounted to 5,846. These figures may be set against the remarkable statistics of personal reading presented recently by Sir William Haley in a lecture, "A Smallholding on Parnassus," to the National Book League. Sir William (keeping a log of his own accomplishments) reckoned that

year in year out, reading three books a week, 150 books a year was as much as an assiduous reader could get through; few will dispute that he set a frighteningly stiff standard. This means that in a lifetime of reading (say 40 years) a man cannot expect to read more than 6,000 books; even if life and eyesight hold out longer "the number of people who have read 10,000 books must be very small." Thus, in Britain alone, new works are being added yearly to the immense geological deposits of books at a rate exceeding a man's total intake of book-print from cradle to grave.

This is a formidable thought even if the greater part of any publishing year's output is relegated to the category of the ephemeral or the specialised. The problem is to increase reading-time; but this is being steadily cut into by the charms of broadcasting and more particularly television. Sir William remained hopeful about this; radio and television can be great popularisers of any books that they mention or dramatise. Their existence increases, if it diversifies, the publishing gamble. It leaves the problem of selecting a lifetime's reading just where it stood—or rather, getting slightly worse every year. By the time most people have read the increasing total of what they must, there is less time than ever for what they would simply enjoy. It is no more than a sign of the times that the output of technical books, and especially books on sociology, is increasing while fiction titles decline. But there is comfort in the fact that the output of children's books is still rising—the young are still being conditioned to some extent to associate reading with pleasure and wonder; and even as a recreation the book still seems to have a future despite the electronic challenge.

Books & Publications

The Still Small Voice

PRINCIPLES OF PUBLIC FINANCE
(4th Edition).

By Hugh Dalton.

Routledge. 255 pages. 10s. 6d.

DR DALTON'S two years as Chancellor of the Exchequer demonstrated afresh the merits, long-recognised, of his well-known textbook. It then provided cogent support for criticisms of Daltonian policy—most noticeably, perhaps, in its strictures on the viciousness of differential taxation of profits. The post-Daltonian edition is noteworthy partly for its second complete deletion of that most valuable one), but principally for its additional chapter—"At the British Treasury, 1945-47." Here Dr Dalton explains what he tried to do, and especially how well he fought inflation; why he was (mostly) right, and his critics wrong; why he was defeated on cheap money, and how victory could be

assured on a future occasion. In defence of his budgeting he quotes repeatedly from *The Economist*—and thereby replies in kind to his own grievance (not specifically addressed to *The Economist*) that he himself was quoted out of context.

Anyone who now reads his quotations would surely assume that this journal was among his most consistent supporters. Yet those same articles protested at the "streak of vindictiveness" in his policies, and expressed (pleased) surprise that he had paid any tribute, however meagre, to the principles of sound finance. He also cites us as saying that he was probably not too complacent about inflation, when the real force of the comment was that he was relying for safety upon the physical controls—and committing the economy to a prolonged continuance of them.

Significantly, *The Economist* is not quoted at all on the cheap money policy. But in its exposition of the policy, as

distinct from its quotation of the criticisms of it, the book is positively naïve in its frankness—and in its glee that the rate of interest for the issue of Transport stock was forced down after the compensation amount had been fixed. There are two ways of forcing rates down—by words (and what a blare of trumpeting they were) and by deeds, in the shape of departmental purchases and credit creation. Departmental operations, says Dr Dalton, are doubly useful: they force prices up in preparation for a conversion, and then the public authorities themselves are "loyal" in support of the conversion when it comes. Unfunding and credit creation were not, however, inflationary—unless the new money was spent. True. But does Dr Dalton really believe that it was not spent, in that phase of engendered boom and of literally "smoking away" the dollar loan? And, in any case, would there have been no dangers thereafter? Happily, the textbook chapters still have the last word on this: "if it is desired to restrict credit indiscriminately, funding part of the floating debt is as good a way as any other." Sound finance and liquidity theory are vindicated after all.

Only three more points—but important ones—can be quoted here from this fascinating apologia. The cheap money drive failed because of the fuel crisis (but was it not seriously faltering three months before that?) and because of the "whispering and talking" campaign—which "quite drowned my small

voice." After that we might shed a tear for poor Dr Dalton—but for the fact that, if he had his way again, he would not trust to his vocal powers alone. In future, there would be a "new gun, specially designed to shoot bears." The Chancellor would take powers to compel all investors having over £1 million of invested funds to invest a prescribed, and varying, proportion of their capital in gilt-edged securities. The only consolation one can discern in that 1984 is that the new Chancellor (Opposition members please note) might also pursue the Daltonian goal, now confessed, of getting the earned income allowance up to one-half. But that would be dear at the price.

Dockland Neurosis

THE DOCK WORKER.

Social Research Series: Editor, Professor T. S. Simey.
University Press of Liverpool. 284 pages. 17s. 6d.

THE mind of the dock worker is a subject of great interest since 25,000 workers in the Port of London recently went on strike for a theoretical grievance, worked up by a union to which only a few of them belonged. There could hardly be a more opportune time, therefore, for the publication of this study by the Department of Sociology of the University of Liverpool, and it throws much light on the enigma. It is a survey of life and labour in the docks of the Port of Manchester during the winter of 1950-51, a period which, as luck would have it, included two strikes—one a lightning affair, the other of six weeks. These events interrupted the research as originally planned, but they add enormously to the interest of the book.

The investigators reject the idea that the strikes were the work of agitators. They allow agitation a part in keeping grievances alive; but that this was possible must be attributed, they think, to causes that lie deeper. Discontents and unrest, the investigators believe, are inherent in the nature of dock work as now organised, and the Dock Labour Scheme, from which so much was hoped, has not exorcised them. The scheme has certainly brought economic security, with its fall-back pay, now £5 4s. 6d., for every registered docker even if he has not found work. But it has failed, in the view of the writers, to eliminate the evils of casual work, in that the men are daily competing against each other for jobs. The system of the call-stand, where the foremen pick their gangs, is indeed reminiscent of the cattle market, and those who are left until last tend to be the same people every day. Not unnaturally they tend also to be the malcontents, and loafing round the docks until the afternoon call, they have plenty of time to brood on grievances. The writers suggest that the display of self-interest on the call-stand may arouse a feeling of guilt which finds its compensation in the dockers' famous solidarity in industrial disputes. Two-

thirds of those interviewed would like to see the system changed, but almost no one, either among workers or employers, had any practical scheme to put in its place.

The persistence of casual work is a negative disadvantage of the dock labour scheme. But it has also, in the view of these Liverpool sociologists, a positive disadvantage. It is so complex that the dock workers interviewed did not understand it and could not distinguish the respective responsibilities of the Dock Labour Board, the union and the company which was their registered employer. They could not even say who employed them. The investigators have some stern words to say about the failure of communication, especially at the time of the strikes, between these three authorities and the men. It is to be hoped that they will not be wasted on complacent ears, for this very valuable and well-written piece of research should prompt searching self-examination and vigorous efforts to eliminate at least some of the causes of dockland neurosis.

The Phoney War

DOCUMENTS ON GERMAN FOREIGN POLICY, 1918-1945: Series D, Volume VIII. *The War Years September 4, 1939-March 18, 1940.*
Her Majesty's Stationery Office. 1,060 pages. 30s.

THIS volume of Wilhelmstrasse documents is of unexpected interest. It shows that those who believed from the beginning that Hitler was doomed for lack of raw materials were not so wrong as they seemed. Indeed one finds here that during the period of the phoney war, as soon as it became evident that the war had not ended in Poland, the German Government indulged in something like a frenzy of economic negotiations wherever it was possible to do so.

On October 9, 1939, Karl Ritter was put in charge of economic warfare, and he, together with Wiehl and Clodius of the Economic Policy Department, were mainly responsible for it, with Göring looming in the background at Karinhall. The documents disclose Clodius travelling more frequently than ever in order to intensify his familiar methods of frightening the smaller powers into the speedy delivery of foodstuffs and non-ferrous metals at prices made convenient for Germany by the manipulation of the rate of exchange; in return these powers were to be allowed, at a delayed date according to their own production and needs, such arms as Germany wished them to receive. When, to Hitler's disappointment, the Galician oil-fields had been swallowed up by Russia according to the partition of Poland, supplies of Rumanian oil became more imperatively necessary although Russia offered Germany the equivalent of the Galician supply. A new trade agreement was signed with Rumania on the very day after the Polish deal with Russia, and another followed at the end of the year. The Germans in fact obtained the pro-

mise of 130,000 tons of Rumanian oil per month, which was more than could be transported that winter.

In August, 1939, Mussolini had justified Italian non-belligerency by Italy's economic straits. Since Hitler intended to bring the Duce into the war on his side by the following spring Germany had to find economic resources, not only for itself, but also for Italy. Its greatest hope, as this volume makes plain, lay in Russia, which agreed on September 28th to work out a programme for the exchange of raw materials against German industrial goods to be delivered *auf längere Zeit*. The Germans hoped, not without a certain justification, that, since they had virtually made a present of eastern Poland and the Baltic States to Stalin, he in return would show them indulgence. It turned out however that by industrial goods he meant military and naval equipment on a large scale; Stalin himself, incidentally, displayed remarkable interest in, and technical knowledge of, naval matters. On February 11, 1940, after immensely hard bargaining, a compromise was reached; the Germans agreed to supply some military material, and the Russians agreed that the Germans should be allowed more time for delivery though the extra time was strictly defined. Many other points had been at issue and were cleared up on the same occasion.

The documents which tell this story in detail are not merely instructive but in their way entertaining. They contain, moreover, all kinds of significant odds and ends—among them Reich Protector Neurath's remarks about the Czechs. It was necessary to rule them with a firm hand, he insisted, "for the Czechs were thick-skulled and treacherous." It is often interesting to observe how the Poles and Czechs were the Jews of the Wilhelmstrasse.

The Bevanite Line

MONEY, TRADE AND INVESTMENT.
By G. D. H. Cole.
Cassell. 423 pages. 25s.

TWO books have been competently amalgamated in this well-constructed, well-written, and ingeniously argued volume. One is a layman's introduction to monetary theory and financial institutions, private and public; descriptive, analytic and historical. The other is a straight (if that is the right word) piece of Bevanite propaganda.

Both are very nicely done. Admiration is equally divided between the clarity with which the nature and functions of money, the interrelations of the banking system, and the monetary element in economic growth and economic instability, are expounded; and the deftness with which, now in pages of overt argument, now in inconspicuous asides and parentheses or by a careful choice, or equally careful avoidance of the loaded word, the desired impressions are built up in the reader's mind. There is the impression that all problems of social justice, of stability, of economic rationality, are purely capitalist problems

which cease to exist as soon as that *deus ex machina*, the Socialist planner, has made his beneficent appearance; there is also the impression that such of Britain's, and indeed Europe's, postwar problems as are not due to the residual survival of capitalism, and indeed most prewar problems too, if not the war itself, are overwhelmingly the fault of that sinister Dark Power, America. Who was responsible for damping down those forces of economic growth which, during the nineteenth century, made capitalist instability tolerable? America. Who landed us in the 1930 slump? America. Who forced us to gyp our creditors in 1946? America. Who sabotaged world full employment policy? America. Who dug the Dollar Gap? America. Who insisted on "an entire subordination of British commercial and monetary policy to American ideas"? Whose political perversity loads the world with armaments? Whose economic ill-health demands a *cordon sanitaire*?

Who, in fact, fills the butchers' shops with large, blue flies? It would be entertaining and instructive, did space permit, to analyse the means by which Professor Cole gets his effects. (Few would deny, of course, that American commercial policy has provided him with plenty of useful material, given due care in selection.) One instance may serve: the sixteen-page philippic on the (inoperative) conditions imposed in connection with the Washington loan of 1946, followed by a colourless two-line reference to Marshall Aid.

On the issue of public versus private control of the volume and main direction of investment, on built-in instability and built-in stabilisers, on the respective fields of fiscal and monetary technique—indeed on the whole central question of the relationship of monetary and investment policy to full employment—Mr Cole makes a number of valid points and fairly (or pretty fairly) poses a good debating case. It all has a slightly nineteen-thirtyish flavour, but he makes a case for that too. On everything relating to America, he is by contrast well ahead of his time, showing himself admirably qualified as script-writer for any number of Two-Minute Hates.

Islam from the Inside

THE ROAD TO MECCA.
By Muhammad Asad.
Max Reinhardt. 394 pages. 21s.

THE writer of this book has had a life unusual in the highest degree and, with his power of expression and outstanding linguistic gifts, has the ability to write well about it. Born a middle-class Austrian Jew, and from his early adult years a successful journalist who became middle-eastern correspondent for the *Frankfurter Zeitung*, he found himself more and more at home in the Arab countries and Persia—and more and more indignantly anti-Zionist—until in 1926 he accepted conversion to the Islamic faith, in which he has found satisfaction for the last thirty years and

upon which he can be taken as an enlightened but never fanatical authority. After many years of residence in the Middle East and Pakistan, with scarcely a backward glance at the West, he entered the foreign service of the latter and was until 1952 its senior representative at the United Nations. With a high intelligence and strong vitality, Muhammad Asad should be uniquely qualified to interpret East to West and vice versa, since he has belonged whole-heartedly to each in turn.

It would in fact be difficult to find a better account of modern Islam as a complete mental and spiritual background and comprehensive guide to living, dominating the life of a particularly sensitive and competent citizen of the modern world. He is indeed somewhat unjust to existing western studies of Islam, which is very far from being a sealed book (as he suggests) to European scholars and thinkers; his attribution to the Crusades of what he feels to be our anti-Islamic feeling cannot seriously be accepted; and his naively hostile attitude to the "imperialist" powers (notably Great Britain) is based on the sketchiest information—for instance, on his absurdly misconceived account of the Wahhabi raids into Iraq in the early twenties.

The structure of his narrative—a detailed account of a cross-desert camel-ride in 1932, with prolonged flashbacks into his own past life and mental development in Europe and Asia—is highly artificial and at times distracting, but it does not diminish the interest of the narrative; a more straightforward sequence of events would have been, to some, preferable—with at times, possibly, a less obvious writing-up of the author's own adventures. His account of many personal friendships with the great and the obscure is excellent, including a long and close acquaintance with King Abdul Aziz ibn Saud, who ultimately disappointed him. In general, his view of current Islamic society, seen from inside throughout many years of complete habituation, is his most valuable contribution.

Economics at Large

THE UNIVERSITY TEACHING OF SOCIAL SCIENCES: ECONOMICS.
Edited by C. W. Guillebaud.
Unesco. 300 pages. 11s. 6d.

THE Unesco-sponsored survey, by the International Economic Association, of the university teaching of economics in a number of different countries might be thought a purely technical piece of documentation, of interest only to university authorities. It is indeed unlikely to be widely studied outside the world of academic administration; and yet there is a good deal in it that deserves a wider audience. Against different backgrounds of national history and academic tradition, the same questions repeatedly recur in the dozen "country papers" contributed from Belgium, Egypt, France, Germany, India, Italy, Mexico, Sweden, the United King-

dom, the United States and Yugoslavia; and these questions suggest others which ramify over the whole field of the social sciences and indeed of education in general.

In France the study of economics is made into a luxury for "perpetual students" by the requirement that a law degree be taken in advance of any serious economic specialisation; in America, on the contrary, a neatly packaged elementary course is taken, in the second university year, by about 40 per cent of the total number of eventual graduates. In India economics is all too evidently regarded as a soft option, in Sweden it is extremely tough. In Italy (as in France) emphasis is laid on abstract and totally neutral *a priori* reasoning; in Egypt and Mexico, on practical, socially motivated knowledge; in the Yugoslav report the sympathetic reader can detect an anguished academic conscience grappling with the inadequacies of orthodox Marxism—"our work in economics is not sufficiently adapted to present-day realities."

There is, in fact, no real agreement about where the centre of gravity of economic studies should lie within that wide range of possibilities which extends from the pure logician's catalogues to the intelligent business man's or administrator's empirical generalisations. Beyond heading his recommendations with the conclusion that economics should be a separate discipline, independent of, for instance, the legal faculty,

the *rapporteur*, Mr C. W. Guillebaud, offers no judgment on this point; though his qualification that economics is one of the social sciences, and must recognise "the underlying unity of the social sciences as a whole" can certainly be read as a warning against both over-abstractness and over-concentration on business technicalities.

The survey of teaching methods, examination procedures, control over the student's progress, academic recruitment, promotion, and pay, the relation of universities and other teaching bodies to the state, is both enlightening in itself and relevant to a much wider range of subjects. Indeed, it is rather surprising that the series—"University Teaching of Social Sciences"—of which this volume forms part should not have begun with such a survey in guise of preface, and so relieved the *rapporteurs* on particular subjects from the duty of repeating one another. For the reader of a single volume, however, this rather wasteful procedure has obvious advantages.

How To be Head

THE INTELLIGENT TEACHERS' GUIDE TO PREFERMENT.

By Marius Rose.

Chatto and Windus. 96 pages. 6s.

THIS is a delightful book, and also a wise one. Written by a county Director of Education, it tells the applicant for a headship how his application will look from the receiving end. It warns him that omissions on the application form ("honours degree") will arouse suspicion. It shows him several ways in which he should not write the covering letter ("If I should be so favoured as to be granted your confidence and final vote . . ."). It shows him how little faith prospective employers will place in the sincerity of the open testimonial, and what unsuspected amplification may follow from the invitation "I shall be happy to answer any questions about Mr Jones." It tells him how to conduct himself at the interview. This involves sizing up the members of the interviewing committee. For example, if they ask his opinion of modern methods of education he must establish himself as a follower of contemporary theories, but insist at the same time that this should not be at the expense of certain basic accomplishments. But if they ask what he thinks of "new fangled methods" he must say that "reading, writing and computation are the best basic subjects, but that manual skill and character training should be their discreet companion."

Such advice is enlivened by delightful anecdotes, and by wittily expressive drawings by Biro. It makes an amusing evening's reading for anyone; for teachers it should be a bedside companion, and it is full of useful lessons for almost anyone outside that profession who desires preferment. The only trouble is that if it is as popular as it deserves to be it will make the task of selectors infinitely more difficult.

The Impact of Science

SCIENCE IN HISTORY.

By J. D. Bernal.

Watts. 991 pages. 42s.

THIS book originated in a course of lectures on "Science in Social History" delivered at Oxford in 1948. While preparing these, Professor Bernal soon found that he had embarked on something bigger than he had bargained for, and later decided to make a detailed study of this fascinating subject. Hence this monumental work, which gives a full account of the impact of science on history from the earliest times.

Judged purely as a history of science, this must be considered an exceptionally good one. The author has an attractive pithy style, and writes clearly in popular language. In so far as any book can make unfamiliar scientific principles clear to the non-scientist, this one succeeds. There can be few men living who possess such an encyclopaedic knowledge of all branches of science, and Professor Bernal has the further advantage of being himself a working scientist. But this is much more than a mere history of science, and the author's grasp of the complex interactions of science with contemporary history is even more remarkable.

Nearly half of this long book is devoted to the twentieth century. This can be justified by the stupendous advances that have taken place in all scientific fields during the last fifty years and their increasing impact on the social scene. But to give 170 pages to a discussion of the social sciences upsets the balance of the book.

Professor Bernal's political views are, of course, well known, and inevitably he stresses the shortcomings of the capitalist system throughout. Here he spoils his case and becomes tedious by his continued gibes at the "upper classes." It is, for instance, unjust to the science of eugenics to say that "it has largely concerned itself with attempting to prove, on genetic grounds, the superior value of upper-class stocks and stressing the need to protect them against the careless breeding of the inferior poor." Nor can it be seriously maintained that Darwin's doctrine of "the survival of the fittest" was fastened on by the wicked capitalists to justify their exploitation of the working classes.

Some interesting illustrations are included, but the standard of reproduction is not as high as they deserve. The comparative tables, on the other hand, are excellent.

Letters to the Editor

Contrary Kenya

SIR—In your issue of January 1st you published Lieut-Colonel E. S. Grogan's reply to your editorial of December 11th. Lieut-Colonel E. S. Grogan implies that clandestine discussion and "backstairs intrigues" led to the Lyttelton proposals. This is sheer distortion of the facts as all concerned know. I have in my possession a record of the discussions and decisions which took place both on the Emergency and on the Constitution among the European Elected Members during the period in which I acted as their Leader. Unfortunately this record must remain confidential. It shows clearly, however, that there is no truth in any allegations of intrigue or secret discussion.

When the appointment exists the Leader of the European Elected Members has other responsibilities than being the spokesman for a body of members of widely differing views—a fact that Lieut-Colonel Grogan ignores. He must advise the Governor on what he believes will be the collective majority view of his colleagues. If in doubt he must refer the matter to his colleagues. It is also his duty in the interests of Kenya and the community he represents to acquaint himself with the views of leaders of the other racial groups and to inform them of the opinion of his own group on contentious matters.

As to Lieut-Colonel Grogan's assertion that the Arabs and Africans would answer emphatically and universally "No" to the question "Are you willing to be ruled by Indians?" I have only to observe that that again is completely unreal. It has never been suggested, and would be rejected by the majority of the people of this country.—Yours faithfully, MICHAEL BLUNDELL
Nakuru, Kenya

Road Haulage Policy

SIR—Sir Norman Kipping (*The Economist*, January 8th) will not need to be reminded of the burden of complaint during the hard times before the war that the small road carrier was undercutting the large and not *vice versa*. Hence the severe restriction on the issue of carriers' licences under the Act of 1933 to prevent wasteful competition. If there are advantages to be got from the very large scale in road haulage, British Road Services are well placed to exploit them, and it is surely in the interest of the trader that they should be permitted to own the number

of vehicles required to give them that opportunity.

The 25-mile limit on public "A" carriers has been lifted from the first of this year and British Road Services have now to apply for "A" licences. Sir Norman should certainly ask for the Act of 1953 to be amended so as to allow the British Road Services to operate as many vehicles as they please, subject always of course to their making both ends meet. He should ask even louder for the Act of 1933 to be relaxed, so that anybody else may get an "A" licence who can provide a service and make a profit. He might go even further and suggest the restoration of the ordinary traders' right to carry for hire and reward in vehicles worked under "C" licences!

Sir Norman shows all too little faith in private enterprise. The best protection against a possible future danger of non-competitive rail and British Road Services rates is not the reconstitution of another tribunal nor yet the limitation of British Road Services to three thousand or so vehicles. It is to make the road-carrying trade really competitive by easing the way in for the ordinary carrier.—Yours faithfully,

GILBERT WALKER
University of Birmingham

Hospital Finances

SIR—I would like to add two suggestions to Sir George Schuster's letter in your issue of January 8th. These, I believe, would result in considerable economies, at least in mental hospitals where my experience lies. The beds in mental hospitals constitute nearly 50 per cent of all beds in the health service.

First, employees have little say in the running of the hospital and as the minutes of hospital management committees are not published, know next to nothing of the hospitals' plans and policies. Thus they do not feel particularly concerned about any extravagances they may chance to notice. Elected representatives of the staff should attend (as advisers not as members) meetings of the management committee unless there are special reasons for excluding them. The minutes should be published as are those of the regional boards.

Secondly, as Sir George points out, there is a great need of a method of assessing work done in relation to money spent. Mental hospitals tend to amble along as they have in the past—humanely but inefficiently. Many more patients could be treated in their homes

or as out-patients (as is now being done in Amsterdam) and most patients stay in hospital far too long. A little re-organisation could greatly alter all this.—Yours faithfully,

JOHN E. DUFFIELD,
Consultant Psychiatrist
Littlemore Hospital, Nr. Oxford

SIR—You noted on January 1st the very low cost (17s. per head per week) of feeding patients and staff in mental hospitals, and you presume that "the very large number of patients to staff, accounts for the small cost per patient." This assumption is invited by the way in which accounts are presented—the cost of staff food added to the cost of food per patient—but the brutal fact is that the cost is low because the standard is low. In one region which is typical of all the others the actual cash spent on feeding one patient in a mental hospital for a week averaged 15s. 9d. in 1954. The same figures for a mental deficient hospital is 14s. 9d., and for a general hospital is 23s. The discrepancy in cost is not accounted for by free extras of any kind—quite simply it is a hang-over from the not so distant past when the mentally afflicted patients were exhibited in cages for the delectation of that portion of the populace which now contents itself with horror comics.

The situation was improving and enlightened management committees would have achieved a reasonable standard but for the recent economy drive and the resulting cuts in estimates. It would be a notable service if you will persuade the administrators that an inefficient hospital is a waste of public money. The sum allotted to the health service for hospitals would suffice if hospitals were used only for treatment and not as waste paper baskets for every unsolved social problem.

There is a large and increasing group of people who are unable to cope with life unaided but who do not need and cannot benefit from expensive medical and nursing care. The fortunate in this group fill beds where others might be cured—at a cost to the taxpayer of £5 to £25 a week; the unfortunate die in the chill and stench of attic or basement—because there is nowhere for them to go. All could be cared for cheaply and effectively by the citizen in his capacity of ratepayer. At present the citizen prefers to fail in his duty as a taxpayer, and is rewarded by the increasing cost and lessening efficiency of his hospital service.—Yours faithfully, London, S.W.3 E. M. PULVERTAFT

Copperbelt in Crisis

SIR—Your article in the issue of January 8th suggests that the policy of the white trade unions in Rhodesia of applying the principle of "equal pay for equal work" to Africans seeking advancement in industry will effectively prevent this advancement from taking place. This may be true today, yet to pay Europeans and Africans at different

The Inter-War Years and Other Papers

A Selection from the Writings of Hubert Douglas Henderson (1890-1952) Edited by the late Sir Henry Clay

Editor of *The Nation* from 1923-30, Joint Secretary of the Economic Advisory Council from 1930-34, adviser to the Treasury from 1939-45, and Drummond Professor of Political Economy in Oxford from 1945-50, the late Sir Hubert Henderson was never far from the centre of affairs. This selection from his writings is more than a tribute to a great economist for, containing several hitherto unpublished papers on current issues, it is also an important historical document. 42s. net

Two reminders . . .

Amen House, Warwick Sq., E.C.4

rates, cannot, in my opinion, produce a permanent or even a long term solution. Far sooner than most people in Rhodesia realise (and in Africa the man on the spot is often the least aware of the speed of development) any such system will cause a storm of protests against "racial discrimination" and will give rise to real discontent, particularly among the leaders of African opinion.

When in 1947 I went to West Africa to start the University College in Nigeria, expert opinion locally and in the reports of Royal Commissions advised the college to adopt a salary scheme in which Nigerian lecturers and professors received lower emoluments than Europeans. The reasons seemed excellent, and I was assured that this could not be called "racial discrimination." Nevertheless it gave rise to much ill-feeling, it made impossible anything like academic solidarity in a multi-racial academic staff, and (perhaps least important) it caused me, as the chief officer of the college, to be subjected to a bitter campaign as an apostle of the policy of European domination. The college now pays all at the same rates.

Only on one condition may Africans agree to higher rates of pay for Europeans. In Nigeria and the Gold Coast they have so agreed for the Civil Service (though by no means unanimously) provided that no European is recruited until it has proved impossible to find an African with the minimum qualifications required for the post. Even so, the difference is only of 20-30 per cent, not several hundred per cent as in Rhodesia.

Of course "equal pay for equal work" must mean that the output of the African is as good as that of the European. Those engaged in industry in the eastern part of Africa think it will be many generations before this equality is achieved. I believe that any half-and-half scheme will reinforce this idea, but that if they are willing to give full responsibility to the African worker who has had the opportunity of proper training, while there may be instances of disappointment they will find that efficient performance will be achieved far sooner than they, at present, are willing to conceive as possible.—Yours faithfully, KENNETH MELLANBY
London, W.C.1

Temptations of Orthodoxy

SIR—Is there not something wrong in your argument about the Budget prospect as elaborated in your article last week? You argue that we might count on a £400 million increase in real income in 1955-56 but that this is likely to be absorbed by a £200 million increase in fixed investment and say £200 million in consumption. Therefore you imply that the Chancellor has really nothing to give away. But on your figures he could safely let the income receivers keep the whole of the £400 million increase. This would not occur if it were taxed. He could therefore give up the equivalent of the tax yield

on the £400 million and that could only be done by reducing existing rates of taxation. Am I right?—Yours faithfully, GEORGE SCHWARTZ
London, N.2

[Consumers should get most (to judge from recent national income figures, nearly 90 per cent) of any £400 million addition to gross incomes; our very tentative estimate that consumption might nevertheless go up by only about £200 million was based on the assumption that they would save only a small proportion (probably less than 10 per cent) of that addition to their incomes, but that the Chancellor would take his present large proportion from it in taxation. If this proportion was not taken in tax, then we would expect consumption to rise by more than £200 million; but please do not let us seem more committed to these wild guesses than we are.—EDITOR.]

The Small Investor

SIR—I delayed replying to the letter from "Small Investor" published in your issue of December 25th until that for January 1st was published as I felt sure that someone better qualified to reply than I would have done so. But this has not happened—hence this letter.

First, your correspondent draws attention to his having to pay stamp and fee on the sale. The reply given to him through his bank is wrong. I feel sure that the vast majority of brokers use every effort to obtain the best price regardless of the size of the order, but where lots are small the jobber gives the broker the option of dealing at the normal price "free," i.e., with the seller paying expenses, or at a special price to compensate the jobber for the loss he would bear if the expenses (stamp and fee) fell on him. The broker then decides which way is best for his client and deals accordingly.

Secondly, expenses are proportionately heavy on small bargains because of fixed items such as fees and minimum commissions—pitched, incidentally, well below cost to the broker of the work involved. For instance in this particular case had he invested the figure of £50 mentioned instead of £20 he would have had a profit of 15s. or £2 7s. 5d. if (as would have happened on a £50 bargain) he had not to pay stamp and fee on the sale. Which brings us back to what we know, that for an in-and-out operation, a 10 per cent rise in price is necessary to cover expenses.

The third point is that of the total expenses 37½ per cent goes to the broker, 12½ per cent goes to the company and 50 per cent goes to the Inland Revenue. Here, in the last figure, we have the real villain. Finally I think your correspondent is "talking his book" a little in quoting a rise in price of about 20 per cent, my mathematics make it 13.2 per cent.

But, details apart, I do agree that the position of the small investor is unenviable. We must encourage him. My firm do their best to warn small investors that it is just not economic to invest in £20 lots. We all have to live and even though it is expensive for the investors,

all his agents—bank, brokers and jobbers—are almost certainly out of pocket in undertaking the work, even though they undertake it willingly. It is far better to save up in fewer but larger units and to obtain the necessary spread of risk through investing in investment trusts or unit trusts, and I for one wish well to the new movements for catering for the small investor initiated by the unit trusts.

One final "dig" (which may perhaps not be a fair one) is that the real need is to encourage the small investor and not the small speculator.—Yours faithfully, SMALL BROKER

Enticing the Scientist

SIR—Mr A. F. Trotman-Dickenson's letter of January 1st draws attention to the time wasted by scientists at the universities over trivial tasks, and states that the "number of qualified workers engaged in producing the present volume of results is certainly excessive." This is not confined to the scientists and mathematicians you mention in your Note of December 25, 1954.

In many other university departments, and in particular those of economics and statistics, the researcher, whether whole-time or part-time with teaching, wastes much of his time on such chores as extracting, computing, typing his own correspondence, etc. In some departments some of the most elementary aspects of office organisation, as the systematic registration of correspondence, are neglected. Frequently the senior highly paid staff outnumber the junior staff by two or three to one.

The universities are increasingly state-aided institutions dependent on the taxpayers' contributions, whether directly through the UGC or indirectly through grants to students. Perhaps an inquiry by the O & M Division of the Treasury would stimulate as much interest in this aspect of university administration as it did in Local Government administration after the Coventry report. In some cases I think it would be found that the halving of the senior staff, with an expenditure of only half of the amount saved on more junior staff and office equipment, would result in doubling the output of useful research and in improving the standard of teaching in the relevant cases.

The individual can do little himself to improve the system. He has no expenses account against which he can charge clerical assistance and not even an income tax allowance, except a trivial amount for essential books. Some of those holding senior university appointments would willingly incur such expenditure if part of it could be recovered by way of tax allowances, although the result of their increased output and usefulness would be to reduce their incomes. The majority would be unable to take advantage of this concession as they could not afford any reduction in their net incomes.—Yours faithfully,

W. H. BECKETT
Balliol College, Oxford

THE STORY OF THE ROBINSON GROUP

Homecoming of a revolutionary

A paper bag with side gussets... it started a revolution in 1873 because it was the first in this country to be machine-made.

The man responsible was Elisha Robinson, founder of Robinsons of Bristol, who brought home from the United States a patent for the special machine that made these 'satchel-type' paper bags. Before long, they were being sold in hundreds of thousands and, like so many packaging developments introduced by Robinsons, they quickly became accepted articles

of daily life. Beginning in 1844 with the supply of wrapping paper to grocers, the business had grown to embrace the printing and manufacture of bags and boxes. Many more innovations were to follow—folding cartons, multi-wall paper sacks, and highly specialised packs for every conceivable purpose. In these and other developments Robinsons have led the way, and today are one of the largest groups in the world specialising in packaging and colour printing.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Quiet on the Potomac

Washington, D.C.

THE Eighty-fourth Congress, after listening to the annual report of the Republican President, has turned to the immediate task of organising under its narrow Democratic majority. The general feeling was that Mr Eisenhower again followed the example of a certain type of successful chairman. Most of the moderately progressive measures which make up his programme have had a long legislative history and have been drafted and examined and revised at session after session. The President is now seeking to crystallise the discussion in the form which, from past evidence, would seem the most positive that can command the approval of a majority. This is a different kind of leadership from that offered by his predecessor; Mr Truman believed in shaking up the pieces and injecting fresh ideas into the congressional system, thus forcing members to take up new positions.

A presidential style is an infectious thing, particularly if the President is a national idol whose name means more than any contemporary political theory. In this Administration a rather heavy air of dedication has replaced the jaunty enthusiasm of the New Deal. It is partly this which commands Mr Eisenhower to the southern Democrats whose length of service gives them most of the committee chairmanships and thus enables them to set the tone of the new Congress. He fulfils their idea of the figure a President should cut in the national life very much more than, for example, Mr Truman. Furthermore, although southern Democrats are often to be found in a "conservative coalition" with the midwest Republicans, particularly when pushed there by a dynamic Democratic President, they are by no means all implacably opposed to fresh federal activity of any sort. They are the kind of men for the most part who, if skilfully handled, would be prepared to give the President's ideas a fair hearing on their merits.

If the optimism which such reflections are inspiring in Washington is justified—it is hard not to feel sceptical about this—then Mr Eisenhower might, after all, fulfil the desire for a social armistice which in some measure guided both parties in their choice of presidential candidates in 1952. In this there are both opportunities and dangers for the Democrats. The frontier between the parties coincides so little with differences of conviction that the President's programme, by acting as a dissolvent of past rigidities, offers the Democrats an unusual opportunity of uniting their own party.

Whether the opportunity will be taken is a different matter. It would imply that an official Democratic stand

against the President should be made, not necessarily only where there is unanimity in the ranks but certainly only where there will be no defection by a distinctive group. This is the policy that Senator Lyndon Johnson, the new Democratic leader in the Senate, followed in the last Congress and which he describes as "a skilful set-up of the issues in such a way that the true middle-of-the-road character of the Democratic party could assert itself." The record suggests that under this kind of leadership the conservatives are willing to oblige the northern liberals over small points—such as opposing an occasional presidential appointment to which the liberals object and voting with them to kill a Bill that both wings of the party are against, even if for opposite reasons. But the Democratic conservatives are not likely to be much help when it comes to the aggressive building of issues, something which the liberals regard as an essential preparation for the next election.

★

The story of a Congress can usually be told in two ways. First, the form in which a measure comes on to the floor is decided by the character of the committee concerned. For example, the Senate Labour Committee is now headed by Senator Lister Hill of Alabama, one of the small but growing group of southern liberals. It has a Democratic membership—and the Democrats now, of course, have a majority on all committees—entirely friendly to the trade unions; there is also one liberal Republican (or two if one counts the senior Republican member, Senator Smith of New Jersey, about whose features there always lurks the thin smile of a contemplated compromise). On the other hand, in the House of Representatives the new chairman of the Education and Labour Committee is Mr Barden of North Carolina, a bitter opponent of trade unionism. Moreover, the Rules Committee in the House, which decides whether and how a measure recommended by one of the other committees is to come to the floor, is headed by Representative Smith of Virginia, whom the American Federation of Labour has labelled as one of its worst enemies. This arrangement suggests that the President will have difficulties if he continues to put forward men unwelcome to the unions for appointments to the National Labour Relations Board, which have to be confirmed by the Senate; on the other hand, it also suggests that legislation favouring the trade unions is unlikely to have much luck. There are many similar examples of the

BRUSSELS

importance of personalities.

The second and related factor which governs the history of a Congress is how an issue is presented ; this must be done by those sponsoring the measure in such a way that enough of the other members, whatever their party, feel that in the last instance they must stand up and be counted in support of the Bill in question. Of all the overlapping groups in the new Congress, the liberals are perhaps in the most difficult position ; this must be particularly frustrating for them, because the election added to their numbers—in the Senate, for example, by the unexpected triumphs of Mr Neuberger in Oregon and Mr McNamara in Michigan. Unless they are to make impotent demonstrations “for the record,” the liberals must formulate their proposals in such a way that they lose as few Democratic votes as possible and win enough liberal Republicans to counterbalance Democratic losses.

Organisation of the Eighty-fourth Congress

THE SENATE

48 Democrats, 47 Republicans, 1 Independent

President.—Mr Richard Nixon, Vice-President of the United States, Republican, has a casting vote.

Majority Leader.—Senator Lyndon Johnson, Democrat of Texas, keeps to the middle of his party's road.

Minority Leader.—Senator William Knowland, Republican of California, disagrees with the President on Far Eastern policy, but has the duty of keeping the President in touch with the Republicans in Congress.

Chairman of the Republican Policy Committee.—Senator Styles Bridges of New Hampshire, a more reactionary and less intelligent conservative than the late Mr. Taft.

DEMOCRATIC CHAIRMEN OF CHIEF COMMITTEES

Foreign Relations (deals with treaties, foreign aid, etc.).—Senator George of Georgia, a conservative internationalist and a revered leader who has served in the Senate for 32 years.

Armed Services (deals with the defence programme).—Senator Russell of Georgia is not sympathetic to reductions in military strength.

Appropriations (deals with all requests for funds).—Senator Hayden of Arizona is likely to be a more liberal spender than his predecessor, but this does not mean that he will be generous with money.

Finance (deals with tariffs and taxes).—Senator Byrd of Virginia believes that the principle of a balanced budget should be followed in practice; a liberal on foreign trade policy but nothing else.

There are 15 standing committees altogether in the Senate and 19 in the House of Representatives (and a number of select and special committees in each). The Democrats will now have a majority on all of these. The chairmen of 22 of the 34 standing committees, most of them experienced in their duties, are from southern or border states and Texas, by providing the majority leader of both houses, has come into its own.

In the Senate the lone Independent, Senator Wayne Morse of Oregon, once a Republican, has been rewarded for the support he is giving to the Democrats with a place on the Foreign Relations Committee, long sought by him and much desired by others. It is his vote which has enabled the Democrats to take over control of the committees.

Senator Alben Barkley, who served as Vice-President under Mr Truman, is the fifth man in American history to come back to the Senate after holding that office. His venerated standing with the Democrats and the upper house has gained him a place on the Foreign Relations Committee and the Finance Committee in spite of his present lack of seniority.

The task of the reactionaries is somewhat easier. They can often tilt the angle of their intent so that old constitutional echoes draw the more open-minded of the southern conservatives into their camp. The most serious danger in connection with the foreign trade programme this year is that Republican protectionists will be able to inject into the debate constitutional doubts about the General Agreement on Tariffs and Trade, which the President has promised to submit for congressional endorsement. It is in presenting the issues propounded in the President's speech in such fashion as to touch off the prejudices of the least number of those whose votes are needed that the Democratic committee chairmen will show in day-to-day operation the degree of their willingness to co-operate with Mr Eisenhower.

In the last resort the fate of each individual item in a legislative programme depends on the relative strengths at the moment of decision of the various factors that determine

THE HOUSE OF REPRESENTATIVES

232 Democrats, 203 Republicans

Speaker.—Mr Sam Rayburn, Democrat of Texas, a beloved member who has already served seven terms, a record, as Speaker; he stands slightly to the left of centre and is the effective leader of his party in the House.

Majority Leader.—Mr John McCormack, Democrat of Massachusetts.

Minority Leader.—Mr Joseph Martin, Republican of Massachusetts, the ex-Speaker and a supporter of the Eisenhower line.

DEMOCRATIC CHAIRMEN OF CHIEF COMMITTEES

Foreign Affairs.—Mr James Richards, of South Carolina, an internationalist with some reservations, especially when it comes to money.

Armed Services.—Mr Carl Vinson, of Georgia, an able and respected advocate of military preparedness.

Appropriations.—Mr Clarence Cannon, of Missouri, an irascible but not very tight-fisted liberal.

Ways and Means (where all tax and tariff legislation must be initiated).—Mr Jere Cooper, of Tennessee, is suspicious of Mr Eisenhower's tax policy but enthusiastic about his foreign trade policy.

JOINT CONGRESSIONAL COMMITTEES

PROBABLE DEMOCRATIC CHAIRMEN

On Atomic Energy.—Senator Anderson of New Mexico.
On the Economic Report.—Senator Sparkman of Alabama.

the votes of a member of Congress. There is the call of party unity and discipline ; one of the interesting points in this session will be whether the conservative Republicans who were bullied into voting for the President's proposals last year will remain as amenable now that their leaders are no longer in control of the *machinery of Congress*. There are regional habits and interests. There are the traditions of the legislative chambers, the legislative history of the measure itself, the customs of the committee in which the member is sitting, and the member's own personal background.

In these circumstances it sometimes happens that one man who is a conservative in most things, but is known to respect the majesty of the presidential office, is looked to by others whose instinct is to vote for caution but whose wish is to do right by the country. Such a man was the late Senator Vandenberg of Michigan, and such a man in this Congress is likely to be Senator George of Georgia, who now restores distinction after too long an interval to the chairmanship of the Foreign Relations Committee. On many matters of domestic reform, as well as on the question of continued foreign aid and on other facets of living within the cold war, his voice will be apprehensively awaited alike by members of the Administration and by fellow-legislators.

Detering Aggression

AT his press conference this week, President Eisenhower continued the clarification of the Administration's present defence policy which he began in his recent letter to the Secretary of Defence. In that letter the President said that to-day the first objective of the United States must be to maintain sufficient military strength

to deter an enemy from attack and to blunt that attack . . . by a combination of effective retaliatory power and a continental defence system of steadily increasing effectiveness.

To keep the national economy strong and to preserve the lives of American citizens, the maximum use should be made of science and technology in military preparations in order to minimise the number of men needed. The United States should, however, be ready with mobile units to aid indigenous forces to deter local aggression. The President has now explained that he wants the United States to help establish such indigenous forces in the unsettled areas of the world so that they can assure ordered government and prevent rebellion. But if a friendly government asks for assistance, light United States contingents, such as Marines, would be able, and should be available, to meet the situation.

This is at least some answer to those who have been asking how the United States would be equipped to counter the local crises that seem likely to arise in Asia—and Latin America—without involving the world in a major war, if reliance is to be placed on air power and nuclear weapons rather than on soldiers. It is also some answer to those who feel that to reduce the number of Americans under arms at a time of international stalemate is to risk breaking that stalemate in favour of the Communists. But there will certainly be many more questions along these lines when Congress begins to consider the new defence appropriations. Indeed, the whole matter may be gone into as soon as the Senate Foreign Relations Committee gets to work on three pending treaties—the Manila pact, the treaty with Nationalist China and the Paris agreements on Germany. Whether or not the argument over military manpower comes up at these hearings, Senator Knowland will have an opportunity, if he wishes to take it, of opening a debate upon his case for a more aggressive attitude to Communist China.

Down But Not Out

ON the day before the new Congress convened, Senator McCarthy held his "swan-song hearing" as chairman of the Permanent Subcommittee on Investigations. His successor is Senator McClellan, a dour and incisive Democrat from Arkansas. Senator McCarthy remains on the subcommittee as senior member of the minority, but he loses the great powers that a chairman has to initiate investigations and select staff. Senator McClellan has already declared that he will run his subcommittee along new lines. Moreover, the Senate as a whole is worried about the methods of investigation used by Senator McCarthy and is prepared once more to consider, and perhaps this time to implement, a new code of fair procedure towards witnesses. Senator Hennings, a Democrat from Missouri, and Senator Watkins of Utah who led the fight to censure Mr McCarthy, are sponsoring new rules. These would do away with one-man hearings, would provide witnesses with a full picture of the case and would prevent the publication of testimony taken in closed sessions without approval of a majority of the committee.

Nevertheless, it would be premature to discount Senator McCarthy's role in the Eighty-fourth Congress. Already forty-one Senators have decided to call for a complete investigation of the Army's promotion and honourable discharge of Dr Irving Peress, a dentist with alleged subversive affiliations. It was this discharge, and the unwillingness of the Army authorities to furnish Senator McCarthy with detailed data about it, that unleashed the McCarthy-Army hearings. There is considerable evidence that the Army mishandled the whole affair and there are even rumours that Mr Stevens, the Secretary of the Army and Senator McCarthy's main target, may soon resign. Should he do so, the prestige of the Senator from Wisconsin would rise once again.

Finally, Senator McCarthy will use his enforced leisure to go to the country on the explosive emotional issue of Communist China and the captive American fliers. He is introducing a Bill to cut off all American aid to countries trading with Red China as long as Americans are held behind the bamboo curtain. With his usual shrewdness, Mr McCarthy has chosen a form of protest which is milder than the blockade preached by Senator Knowland and Admiral Radford and which may therefore rally much wider support.

Aid for Private Atoms

New York.

THE Atomic Energy Commission, recognising that none of the 100-odd firms studying the economics of nuclear power in the United States is willing to bear the full cost of experimental development, has finally decided to offer them assistance. It has called on them to submit, by next April, the terms on which they are prepared to assume the risk of constructing and operating experimental nuclear reactors. Federal aid is expected to take three forms: a free loan of the initial charge of fissile material;

provision for free research and development work in AEC laboratories; and payments to industry for technical and economic data.

This assistance can be of decisive importance. For example, for the 60,000 kW. pressurised water reactor now being built by the Westinghouse Corporation for the Duquesne Light and Power Company, some 15 to 20 tons of slightly enriched uranium will be required, at a nominal cost of \$100 a pound. For the Army's packaged reactor, which will have a power output of only 2,000 kW., the cost of the initial charge, which in this case is the more expensive highly enriched uranium, has been put at \$1 million. Much interest also attaches to a second AEC directive establishing a seven-year guaranteed price which the commission will pay private concerns for the plutonium produced in breeder reactors as a by-product. As these prices are secret it is not clear whether the commission is prepared to follow the "dual-purpose approach" and pay high prices—of the order of \$100 a gramme—for weapon-grade plutonium, or whether all plutonium will be priced at its theoretical commercial value of \$20 a gramme or less.

The impact of the AEC's assistance programme cannot be predicted without more detailed knowledge of what the commission's available funds are. A good deal will depend, moreover, on the comparative costs of atomic power and conventional sources of power; in New England, for example, electricity costs are the highest in the country. Consequently, the Yankee Atomic Electric Company, formed by eleven New England utility concerns and the Monsanto Chemical Company, will probably now go ahead with plans for a 50-100,000 kW "full-scale experimental nuclear power plant."

Armistice on the Waterfront

New York.

LAST year, strikes cost the New York docks over seven million hours of labour and during the longshoremen's strike in March more than a million tons of general cargo were diverted to rival ports. Now the rank and file of the International Longshoremen's Association have at last accepted a new contract from the shipping companies. The trade union has won substantial wage increases and optimists are predicting that there will be peace in the waterfront jungle. But this peace will have been gained at a heavy price. Despite tremendous efforts by the Waterfront Commission, set up by the states of New York and New Jersey, and the attempts of the American Federation of Labour to start a new dockers' union, the old, crime-infested ILA emerges victorious.

The ILA has secured exclusive rights to organise dock labour over the next two years in exchange for a no-strike guarantee and for a promise that it will observe arbitration procedures. The men who tried to break the stranglehold of the ILA have been driven out and will be denied even the right to work. Moreover, there is nothing in the new contract to prevent lightning strikes that arise from vicious struggles between different gangs within the union. The shipping lines must bear part of the blame for this outcome of the long struggle to clean up New York's dockland. Though they claim that they kept to strict neutrality, the

companies—the Cunard Steamship Company among them—gave the impression that they wanted peace at any price. Their readiness to bargain with the ILA strengthened the latter's hand in its fight against the AFL.

The leaders of the ILA insist that they can deal with the notorious elements in the union without outside interference, but basically the whole problem of crime and coercion on the docks now reverts to the Waterfront Commission. It is introducing new regulations providing for the use of regular groups of longshoremen with registration numbers. This is an attempt to eliminate the infamous "shape-up" system under which hiring agents, often under gangster supervision, pick men for any given job from among a large crowd. The commission is hoping, in the long run, to "decasualise" dock labour by striking off the rolls some 15,000 men who work on the docks when their regular jobs are slack. Whether this measure would survive a challenge in the courts is doubtful, since the right to seek work is one that the Constitution guards jealously. Moreover, although the ILA itself is prepared to see a reduction in dock labour, it will do nothing to help the Waterfront Commission.

Springs in the Air

FROM A CORRESPONDENT IN COLORADO

UNTIL the advent of the war, Colorado Springs lay like a newer, sun-drenched Newport on the plain just east of famous Pike's Peak, redolent of pinewoods and retired millionaires. Its introduction into the military age was rather involuntary. An army camp and a military airfield came first; then it was selected for headquarters of the Second Air Command by an Air Force general who allegedly chose it because "Pueblo's too smoky, and Denver already has a general." Ultimately Colorado Springs became the headquarters of the Air Defence Command, charged with the primary defence of the continent under General Benjamin Chidlaw.

In a huge cavernous installation at the Springs is the nerve centre of defence of the whole North American continent, with push-button communication available within seconds to the farthest-flung outpost of the warning and defensive net which has been thrown around the United States and Canada. Thus this formerly sleepy resort has had, since midway in the last war, a military population equal to

or outnumbering its prewar civilian population of about 30,000.

Colorado Springs, thus precipitated into the military age, decided that it liked the military atmosphere, particularly the increased and steady income that came with it. In 1948 and 1949 there was much talk in Washington that the Air Force, then just separating from the army, would sooner or later need a Sandhurst of its own. A Colorado Springs restaurant owner, Mr Joseph A. Reich, saw an item to this effect in a newspaper and took it to the President of the Colorado Springs Chamber of Commerce. What followed is an epitome of an American public relations campaign at work.

★

At first, Mr Reich could get no one to take him seriously. But he finally "sold" the Chamber on beginning a campaign to bring the future Air Force Academy, should it materialise, to Colorado Springs, by arguing that even if the campaign did not succeed, it would give the town national publicity invaluable to a resort. However, once the project got into the hands of the Chamber's military affairs committee, it was taken with the utmost seriousness. This committee had been created by the Chamber early in the war to deal with the onrushing military incursion, and to establish rules of procedure for relations between the military and the town.

In the end the wellnigh impossible came true. The site of the proposed academy, on which architects and engineers are now hard at work with a preliminary congressional authorisation of \$125,000,000, is just north of Colorado Springs. The final choice was made by Mr Harold E. Talbott, Secretary of the Air Force. More than one hundred sites had been eliminated in preliminary surveys. His choice overruled objections by certain critics who said that no air academy ought to be established at an altitude of 6,500 feet above sea-level. Two other towns in Illinois and Missouri did not want the academy although they were among the final sites considered. But Colorado Springs unanimously did want it, and said so on every conceivable occasion and in every possible way.

Its representatives established a permanent Washington headquarters. They were always around whenever the Air Force wanted to know something. They spent \$15,000 on an elaborate survey of the proposed terrain by an engineering firm and more than \$50,000 in all. The site they chose is a pleasant parklike savannah centred just east of the Pike National Forest. The ranch is fronted by through railway lines and a national highway which is the chief traffic artery north and south along the eastern face of the Rocky Mountains. Backed against the Rockies, the buildings of the new academy will present an impressive picture.

The State of Colorado has appropriated \$1,000,000 to buy the land, and the 4,500-acre Cathedral Rock Ranch, named for a tall spire of granite behind its buildings, has become the nucleus of the academy grounds. Colorado Springs looks forward happily to a \$125,000,000 building programme and to an annual payroll of \$100 million flowing into the city's economy when the academy is established. Now the town dreams of new worlds to conquer. Already there is talk, for example, of an alternative capital of the United States to be established somewhere between Denver and the Springs, for safety in case Washington is threatened by inter-continental war.

The Promised Land

IN his Message on the State of the Union, President Eisenhower urged Congress to make revisions in the McCarran-Walter Immigration Act, because it contains provisions "in respect to aliens which are inequitable in some instances and discriminatory in others." The President's request climaxes a series of efforts by his Administration to render the process of immigration swifter and more humane. Although the detention centre at Ellis Island has been closed as part of a general reorganisation of the Immigration Service, many of the rules governing immigrants, aliens and naturalised citizens remain exceedingly onerous. Dr Oppenheimer has recently pointed out that under the McCarran-Walter Act, which was passed in 1952 over President Truman's veto, such men as Dr Einstein and Dr Fermi might never have been admitted to the United States. Regulations which prevent foreign scientists from visiting American congresses, or keep Mr Arthur Miller away from the European premières of his plays, will not enhance American prestige abroad.

Mainly because the immigration procedures have been riddled with security regulations, the Refugee Relief Act of 1953 has not, so far, had much effect. Under this Act, 209,000 refugees were to be admitted to the United States in a three-year period beginning in August, 1953. Only about 15,000 visas have been issued so far. Two weeks ago President Eisenhower appointed Mr Edward Corsi as a special assistant to the Secretary of State for refugee and migration problems. It will be his task to find out whether immigration has been held up by a genuine lack of housing and employment facilities, or by Mr McLeod, who is the chief security officer at the State Department, and who tends to see a potential foreign agent in every refugee.

Efforts will also be made to show in the courts that certain provisions in the McCarran Act that differentiate between the rights of native-born citizens and naturalised Americans—for example, the provision that a naturalised American is in danger of having his passport withdrawn if he chooses to work abroad for any length of time—are unconstitutional. Unfortunately, Congress seems in little better a mood to heed the President's suggestions this year than it has been previously. Mr Kilgore, the new head of the Senate Judiciary Committee, is sympathetic, but Mr Walter, the co-sponsor of the Act, will still be on the lower house's immigration sub-committee.

Machine Voting

FROM A CORRESPONDENT IN OHIO

LAST November's election was notable for the unusually high proportion of narrow victories and for the number of recounts that were demanded. One of the most important of these close contests was in Ohio, where the incumbent Democratic Senator, Mr Thomas Burke, has now accepted the verdict of the recount, that his seat was won by the Republican candidate, Mr George Bender, formerly a Congressman. But the check of the ballots exposed errors and irregularities in the system of vote-counting that have shaken public confidence.

The trouble began, ironically, in the community that calls itself "America's best-governed city," Cincinnati. There an effort was made to repeal the system of proportional representation by which the city has elected its councils for almost thirty years. The official count of ballots showed that the "anti-PR" forces had won by 382 votes out of a total of about 150,000. But the "pro-PR" forces at once demanded a recount, which revealed that PR had in fact been retained by 790 votes.

This reversal quickened the interest of Senator Burke, who had been defeated, according to the official state-wide count in the senatorial race, by only 6,041 votes, out of a total of some 2,500,000. His suspicions had already been aroused by the surprisingly large majority of 37,000 reported for Mr Bender in the Cincinnati area. The Senator demanded a recount in almost 7,000 of Ohio's more than 11,000 precincts, scattered throughout 25 of its 88 counties. Though Mr Bender's victory was confirmed, his margin was reduced to 2,970. Innumerable mistakes, many of considerable size, were also brought to light in the vote-tallying by precinct officials. In one county only one-third of the returns proved accurate.

★

Practically all of the errors, it now seems clear, were the result of incompetence or of carelessness, caused by fatigue. The polling booths in Ohio are put wherever the county authorities can find a convenient place—in suburban garages or cellars, in urban schools, storerooms, barber shops and the like. The legal complement of judges and clerks in each polling place is six, evenly divided between Democrats and Republicans. In addition, there may be several challengers and witnesses present. The "election officials" are not expert computers but faithful members of the party who receive \$15 a day for their efforts. Moreover, the ballots themselves make vote-counting a laborious process in Ohio cities. The "office-type" ballot now in use requires an X mark alongside the name of each candidate who is voted for. In addition, there is a constantly growing number of issues to be decided by referendum. In Cincinnati this year the conscientious voter had to mark 51 crosses on a total of seven ballots. The polls are open from 6.30 a.m. to 6.30 p.m. Counting may not begin until they close. Many election officials worked straight round the clock until dawn of November 3rd before their task was done.

The "scandal of the recounts" has stirred up Ohioans to demand that voting machines be installed. Facing the machine behind a screen, the voter simply pulls levers beside the names of candidates and issues, and his choices are recorded immediately and accurately. Already there are about 2,000 voting machines scattered through Ohio, but they are expensive, costing from \$1,200 to \$1,800 apiece. They must be bought out of limited county funds or through bond issues approved by the voters. More than 2,000 would be needed for the Cincinnati area alone. Proportional representation ballots, moreover, have defied the mechanical brain, although a new scientific marvel, employing the principle of photo-electric cells and a "scanning" process, is now promised, at half the cost of the familiar voting machine. Even so, thanks to taxpayer's resistance and the old tradition of jobs for party workers at the polls, it will probably be some years before all Ohio voters will be pulling levers.

WHAT HAS ELECTRONICS TO DO WITH YOU?

Whenever you turn on your television, you make use of the intangible but vital science of electronics. Whenever you travel by ship or plane, you are brought safely through fog and night to port by radar.

The safety of your child's bicycle—the strength of your wife's nylons—may depend on tests made by delicate electronic instruments. Our modern civilization is dependent at every turn on electronics, and the Cossor Group of Companies has always played a major part in the practical application of this science to domestic and industrial affairs, at home and all over the world.

The World Overseas

Libya's Nationalist Fling

THE Fezzan, which is Libya's third province but is no more than a criss-cross of remote wadis in the deep Sahara, is the newest replica in miniature of that familiar scene—a conflict between nationalism, however penurious, and the presence of foreigners, however much they help to foot bills.

The Libyan Prime Minister, Sayyid Mustapha ben Halim, has just been to Paris to negotiate new arrangements about a tiny French garrison that has survived in the Fezzan since the war; this it has done under a hand-to-mouth agreement which the Libyans gave notice of concluding early in December, and which they allowed to lapse on December 31st; by its terms the French have maintained two airfields, at Sebha and Murzuk, and a contingent of 400 men at Fort Leclerc, looking down on Sebha. In return for this small privilege, France has steadily rendered two services; it has paid 293 million francs a year into Libya's needy exchequer with the proviso that the bulk of it should be spent in the Fezzan, and it has afforded local services—medical, anti-pest, crop improvement, educational and well-boring services—that were far more lavish than a place so remote could have expected at any of the other hands available.

Some notion of the atmosphere in which the Paris talks took place can be gleaned from the fact that Sayyid Mustapha would negotiate only at prime ministerial level, so that M. Mendès-France had perforce to be present; so overworked a man had no time to relish a haggle and the talks lasted only a few days, but they were not fruitless. The two delegations seem to have agreed to negotiate a treaty that will provide for a scaled French withdrawal in due course and under certain guarantees; the details, which are to be worked out with a Libyan under-secretary who has stayed behind in Paris, will be settled at a second session in Tripoli. Presumably, they will include arrangements for the "reactivation" of Sebha in certain conditions, on the pattern of the Canal Zone agreement.

To outsiders, the matter has seemed trifling. The whole Fezzan contains little beyond 40,000 people, mostly underfed, and an estimated 2,000,000 date palms; it is on the way to no place, except the equally remote Tibesti, that cannot more easily be reached by some other route; no through air lines call and, on the helpful handkerchief maps served out in the war to troops and airmen who might get stranded, it is surrounded by dreary areas marked "region of sandhills" and "stony waterless table land."

Till fairly recently its inhabitants, who know little of world affairs, jogged along under family leaders, the most notable of whom became provincial governor when Libya

was granted independence in 1951. He was a man who had fled from the Italians into French Chad and thence helped to guide General Leclerc's army northward to fight on the Mareth Line in 1943; but he died in 1953, and since then a nephew educated in Egypt has chaired the local executive council and introduced several Egyptian technicians in place of Frenchmen whose term was up. No doubt these have not cared for the sight of the French flag fluttering over Fort Leclerc, and a new pattern of thinking long familiar on the Nile has therefore travelled westwards even at this remote latitude.

This Egyptian influence is common on the coast, and would be undermining the agreements with Britain and America reached respectively in August, 1953, and September, 1954, were it not that these two pills are gilded with

money in quantities that the Libyans cannot afford to forgo. The British pay for the bases they lease to the tune of £1 million yearly for development and £2.75 million towards balancing the budget; the Americans are due to pay \$40 million over sixteen years, beginning last year, and both give much indirect financial help

through the local expenditure of their nationals. It has been calculated that the total annual expenditure in Libya by the two governments and their personnel equals more than half Libya's national income as estimated by Uno; that income from their two military establishments alone is in most years 50 per cent greater than the total value of exports; and that merely on construction work, they have in several recent years employed 25 per cent of the entire male labour force working for wages.

By comparison with this outlay, that of the French has been insignificant. It is impossible not to conclude that the Libyans saw in denunciation of the Fezzan agreement a chance to have a rewarding nationalist fling without serious financial loss. The chief ills that they wanted to shake off seem to have been their chagrin at France's unwillingness to establish diplomatic relations and their pique at the slightly proprietary way in which the French contingent—it was hardly a garrison—patrolled the rare oases on the

Algero-Tunisian borders on the watch for helpers of the rebels in French North Africa. In any case, the stand they have taken will look well in the eyes of their fellow members of the Arab League.

What advantage the French have seen in clinging to so meagre an outpost is hard to estimate. The *fellagha* in Tunisia are supplied far less freely *via* Sebha and Ghat or Ghadames than directly from Tripoli, where the Néo-Destour runs an office and whence it transmits fugitives of the Tunisian Resistance Movement to two reception camps in Tripolitania. From the military standpoint, the long desert tracks from Ghat and Ghadames to the Tunisian and Algerian mountains can be more conveniently supervised from within Algeria than from distant Sebha. Admittedly, the Fezzan lies at the junction of four French dependencies, but France's presence there seems to have been prompted more by thoughts of prestige than of practical politics. For it was surely not worth clinging to so small a physical asset when a major French preoccupation is to stand well in Moslem eyes. Postponement of final settlement for a few weeks may be convenient to Paris, for it is difficult for France to deal at diplomatic level with Libya when one of the stumbling blocks to agreement in Tunisia is the latter's claim to be worthy of diplomatic representation.

Murder in Panama

FROM A CORRESPONDENT IN CENTRAL AMERICA

THE assassination of Colonel Remón, the "strong man" president of the republic of Panama, abruptly and unexpectedly increased the anxieties of the State Department in Washington, where there was already mounting concern over the troubled state of the Central American area. Although Panama remained comparatively calm after the murder, many observers are gloomy about the prospects for the republic's future political stability. Many Communist agitators and agents went underground in various parts of Central America after the fall of the Arbenz regime in Guatemala last June, and they are known to be experts at exploiting internal instability in these small countries. President Remón, himself a veteran policeman, had been particularly successful in checking their activities through his undercover police services. The vital importance of the Panama Canal makes it a matter of direct concern to the United States that the murdered president's successors should prove as effective in this respect as he was.

Colonel Remón, long known as a maker and breaker of presidents, had given Panama a period of comparative political peace since he became president himself in 1952. Under his administration, graft had been curtailed, the internal public debt substantially reduced, and with considerable economic progress being made the future looked good. Moreover, he had given much satisfaction to his people by re-negotiating the Panama Canal treaty with the United States. The new terms require the United States to increase its annual payments for the use of the ten-mile-wide zone bordering the canal—according to some reports, the present rental of \$430,000 a year is to rise to \$1,930,000. Many irritating discriminations against Panamanians

employed in the zone are to be ended, and canal employees will be required to make their purchases from local merchants instead of from tax-free commissaries in the zone. The formal signing of the new agreement was to have been a matter for great celebration in Panama. It must now take place under a shadow.

The new president, Señor Ramón Guizado, announced on Monday that the ceremony of signature would be held on January 25th. But with the "strong man" gone, there are possibilities of trouble if members of the Panamanian Congress take exception to points in the agreement. President Guizado, who was formerly vice-president, is a political question mark, and it is far from certain that he can assume the leadership that has been suddenly thrust upon him and obtain the co-operation of opposition parties. Panama's political history during this century does not make for confidence in this respect.

Colonel Remón's chief rival was the former president, Señor Arnulfo Arias, who, although 300 miles away at the time of the murder, was at once arrested with many of his supporters. Señor Arias, whose period in office was turbulent and who was finally ousted by Remón himself, is known to have a large following in the republic and to have been biding his time carefully in a posture of uneasy truce. Unless it develops that he actually had a hand in the assassination, which was apparently carried out by hired professional gunmen, Arias will undoubtedly lead an active opposition to the new president, and his supporters have not hesitated to use force in the past. Moreover, he is known to be very bitter towards the United States on the ground that the Americans backed Remón in 1952 and befriended his administration. This does not augur well for Panama's future relations with the United States, which deteriorated sharply during Arias's presidency, nor for the revised Canal treaty, even after its signature.

As yet, there seems nothing to link the murder of Colonel Remón with the new conflict between Nicaragua and Costa Rica (discussed on page 176); but it gave occasion for an additional exchange of insults between the heads of those two states, for the Nicaraguan government sent a message of condolence, which implied that the assassination might have been plotted in Costa Rica with the blessing of President Figueres—who at once issued a heated denial and a counterblast.

The Ruhr and the Arms Pool

THERE is considerable support among German industrialists for an arms pool and other forms of collaboration with the French. Nationalist slogans such as "German is the Saar" which are pasted up all over Bonn have no place in the board rooms of heavy industrial concerns whose interests range all over the world. Various ways of working with their French counterparts are envisaged. One which looms large in German eyes is the prospect of undertaking joint enterprises in the backward areas (with the British as well as the French and Americans). The two heads of the Federation of German Industries, Herr Berg and Dr Beutler, recently visited the World Bank, with the object of gaining a place for German technicians and equipment in international development projects financed

by that institution. And much the same purpose, among others, led Herr Berg and Dr Beutler to France to talk to French industrialists and traders when Dr Adenauer was negotiating with M. Mendès-France on the Saar and economic collaboration.

A share in developing North Africa, particularly the high-grade iron ore deposits, has been dangled again before the eyes of the Ruhr steel industry, by M. Mendès-France, and by M. Ricard, head of the French steel federation. This is a repetition of what happened when the French were "selling" the Schuman Plan to the Ruhr. In the meantime, however, only very few Germans are left who believe that North Africa offers them a great deal. Apart from the obvious difficulties such as lack of transport and skilled labour, fear of offending Arab nationalists deters the Germans, who gain at present by being free from the imperialist taint.

It may well prove that the German industrialists' idea of an arms production pool is different from that of its French political supporters, though perhaps not so far from that of French manufacturers. That Germans have strong objections to State interference in the enterprises which they cherish (and this attitude, it may be noted, makes them more anti-Nazi and opposed to large-scale rearmament than many critics believe). Having freed themselves from the system at home, they object to placing themselves under an international version of it.

On the other hand, German manufacturers are inclined to find free competition obnoxious, and here they part company with the liberal Dr Erhard. They believe in price agreements, vertical trusts, cartels, national and international and in a system of interlocking capital ownership, in which big firms or industrialists personally hold large blocks of each other's shares. One potent reason why the Ruhr supports the coal-steel pool, in spite of everything, is that the High Authority is permitting the steel industry to reform, on a limited scale, the vertical trusts which were supposed to have been broken up by Allied law.

German Help in Producing Arms

With these fixed ideas, it is understandable that the German industrial world should conceive the arms pool as a way in which individuals and firms would get together across the frontiers, rather than as an "arms community" on the Luxemburg model. Germans would like to contribute to arms production in three main ways. In the first instance, they could supply the sheet steel and similar material for the French to turn into tanks and guns. This would leave the Ruhr free to keep and even expand its exports to the under-developed countries. Secondly, the Germans could supply specialised finished goods, such as precision instruments, in which they excel; and thirdly, they could participate in arms factories outside Germany.

There is no basic objection among German heavy industrialists, on the whole, to more foreigners buying shares, or even controlling interests, in German firms as long as the movement does not go too far and provided there is a flow in the other direction as well. Objections to the "alienation" of German heavy industry have mostly come from German politicians and, latterly, from the trade unions. One reason why the German entrepreneurs and managers do not find it intolerable that twenty-five per cent of their coal and steel should already be in the hands of foreigners is that they realise that the western frontiers are political but not

economic. Before 1914 it was obvious to all that the Ruhr, Luxemburg, Lorraine and the Saar formed a natural complex, and to this day the idea of rejoining the area in the coal-steel community and by means of interlocking capital is not a strange one.

The movement continues. Only recently Herr Alfried Krupp has sold an important coalmining firm to a customer still further afield—the Italian State Railways. And nothing but political objections in Bonn, it seems, has so far prevented the sale of the Röchling steelworks in the Saar to a French combine headed by Schneider-Creusot. This kind of German collaboration with the West may not be the best, but it is far preferable to the forging of links with the East.

Back to the Third Republic?

BY OUR CORRESPONDENT LATELY IN PARIS

ABSENCE, it is said, makes the heart grow fonder and the dictum seems more applicable to electoral systems than to lovers. Less than ten years ago the system of single-member constituencies (*le scrutin d'arrondissement*) was almost unanimously rejected in France as the root of parliamentary chaos and parish pump politics. When the constitutional committee debated a new electoral law in 1946 only three voices were raised in defence of the discredited system branded by others as the epitome of all the vices of the Third Republic. The institutions and habits of the Third Republic, however, are now coming back into fashion and the government proposes to resurrect one-member constituencies. Time and absence have done their work. Indeed, in many quarters the once discredited system is now spoken of as the paragon of all the virtues.

The *scrutin d'arrondissement* prevailed, with brief interludes, throughout the Third Republic and had at the time a strong pro-rural bias. Since the electoral districts are now to be redrawn, however, there is no need to penalise industrial areas any longer. This method of voting, on the other hand, has one permanent feature in France: it weakens the hold of the party machine and puts a premium on popular local personalities. In contrast to the system in Britain, a simple majority is not sufficient to elect a deputy at the first poll and once again the government intends to restore the two-ballot system. At the first ballot an absolute majority is required; if no candidate gets a sufficient number of votes a second ballot is held and only a relative majority is needed to get elected. In the meantime, however, there is a week of bargaining and the field is left to the two or three candidates with the greatest chance of success. Except in periods of *fronts* on a national basis, this method tends to favour loose parties, with vague programmes, capable of all sorts of alliances.

After the war proportional representation was pushed forward under the banner of electoral justice and coherent national programmes. Out of the many forms of P.R. France chose one comparatively beneficial to large parties. The introduction of party lists increased still further the hold of the machine over the individual member. French departments were accepted as constituencies, though seven of them were split into smaller units. Each department or unit elected two or more members according to size and

proportional representation was applied only within each constituency and not on the national level.

Soon the new electoral law came under fire on the grounds that it violated the individual's right to choose and imposed party government on the country. In many cases the critics seem to have confused cause and effect. The tendency towards party rule is a modern trend not peculiar to France. Besides, after the war not only was the *scrutin d'arrondissement* discredited, but the parties backing it were politically bankrupt. The giants which emerged from the resistance to dominate the postwar scene—the Communists, the Socialists and the Christian Democrats (MRP) were all national parties, disciplined by French standards.

Indeed, the electoral law was altered in 1951 for quite a different reason. A Gaullist push coming on top of the Communist battering ram threatened the existing regime. Unchanged PR was likely to deliver the Chamber into the hands of the extreme parties. Under this pressure and after lengthy parliamentary struggles the centre groups rallied to devise a new hybrid law openly aimed at reducing extremism, in particular Communist, representation. Parties were allowed to group into alliances or *apparences*. If an alliance gained an absolute majority in a constituency it pocketed all the seats, which the allies divided among themselves proportionately; if no party or alliance reached it, the seats were shared by PR as before. No bones were made about the intentions of the reformers: in Paris, where the Communists were likely to benefit, the reform simply was not applied.

—The only justification for electoral cooking lies in its success. When the Italians, faced with the same danger, tried a similar *combinazione*, they failed the test. In France, at least the desired result was achieved: the centre parties returned to parliament with a majority. In fact, soon after, the danger itself receded. The Gaullists were conquered from within; the "dissidents" entered M. Pinay's government and the "orthodox" that of M. Laniel. The danger period for the regime is temporarily over. Is this the government's reason for reopening the electoral debate?

Election Prospects

The "liberation" phase ended long ago. Old parties have come back into the limelight and the discrediting of new institutions has added some lustre to the old. Yet, neither fashion nor the traditional Radical bias are sufficient explanations for the government's present move. True, M. Mendès-France has always been in favour of single-member constituencies and the Radicals, on the whole, are still likely to gain from the change. But the prime minister may have had a deeper reason for this move which took everybody by surprise. Next year a new Chamber will be chosen; time is needed to alter the law and M. Mendès-France with a crumbling majority must think of the future. He came to power by a "miracle," against the wishes of party machines. Even the caucus of his own party is hostile to him. The looser the party grip, the stronger may be the chances of his supporters, while the second ballot may provide an opportunity for pro-Mendès alignments.

The government proposes, parliament disposes and there is no guarantee that the government's intention will be carried out. In 1951, when the reform was less far-reaching, the Assembly was littered with bills, six months were

needed to pass one and a government was killed in the process. This is the occasion, if any, when the whip has little effect, since the deputy's political survival does not necessarily coincide with his party's interest.

Even if the project does become law this year, it is unlikely to perform miracles at the polls in 1956. Political ills are seldom cured by electoral prescriptions, this one in particular. It is too often forgotten how little the alteration of the electoral system has improved the stability of French governments. It requires a really good piece of what the French so aptly call *la toilette du souvenir* to believe that a two-ballot system in single-member constituencies is really the panacea for France.

Truce for Soviet Writers

THE second-ever congress of Soviet writers, held last month in Moscow, ended on a note of compromise. The authors and critics who on the morrow of Stalin's death made an impassioned plea for greater freedom did not win the day. But neither were they crushed nor expelled. A bargain was probably struck behind the scenes and the outsider was left with the impression that Soviet literature still has to wear the strait-jacket of "socialist realism," though it can be fitted more loosely than in Stalin's time.

The very organisation of the congress was a proof of a struggle within the party. The original announcement that a writers' congress would be held last autumn, after an interval of twenty years, came not very long after Stalin's death, when men of letters, prodded from above, were launching an all-out attack against "Zhdanovism," and against the adornment of the harsh facts of Soviet reality. But the congress kept being postponed, and in the meantime the diehards hit back, accusing the "rebels" of distortion, of intentional emphasis on the negative features of Soviet life. Since the domain of literature in the Soviet Union is not merely a question of aesthetics, these postponements and *volte-faces* must have reflected the changing balance of power in Moscow's leadership.

When the congress finally opened last month the odds were against the "reformers" and, hence, on balance, they did not fare too badly. True, those who revolted first against "writing to measure"—for example the critics Gurvich and Pomerantsev—are now probably on the index. But many of their early "heretical" strictures have now become common currency and were echoed by all throughout the debate. Furthermore, most of the authors who answered the appeal for more criticism and truth and then were attacked for it were not victimised at the congress. Thus, for example, the poet Tvardovsky, previously sacked from an editorial job, Ilya Ehrenburg, author of the highly criticised novel "The Thaw," and the even more strongly condemned woman novelist, Panova—all three have now been elected to high offices in the writers' union.

At the same time the strait-jacket, though relaxed, has not been taken off. All the "bourgeois-nationalist," "cosmopolitan," "formalist" and other deviations were duly condemned and any departures from the straight path

"Daddy, where does the light come from?"

From electricity, you tell him, which comes from the power station and is brought to the house by cables. When his nursery light is turned on, this electricity makes a wire in the lamp glow white, white hot.

To the child it is just one more marvel that the click of a switch brings him light. He takes the reliability for granted.

The Brush Group has a reputation for reliability throughout the world. The Jamaica Public Service Company, for instance, chose for its new power house at Hunts Bay, near Kingston, turbo-alternators, transformers and boiler plant motors supplied by Brush Electrical Engineering Co. Ltd. This installation provides power for homes and for irrigation. The system has to take the strain of irrigation power loads which vary considerably, according to the rainfall. This station, together with the Brush-equipped Gold Street station opened in 1925, helps to maintain the island's power balance in all seasons.

Crystal Gazing

THE MODERN WAY of making salt—by boiling down brine in closed vessels heated by steam and under vacuum—yields fine, free-running salt crystals which consist of tiny cubes—excellent for the table but unsatisfactory for many important industrial uses. To produce other forms of crystal it has hitherto been necessary to simmer the brine in open pans—a process that has remained almost unchanged since the Roman soldiers introduced it to this country, two thousand years ago. This old method is wasteful alike in fuel and labour, and I.C.I. research workers have long been seeking something better. Now they have succeeded in producing salt crystals of an entirely new kind.

Known as Dendritic salt, these crystals have the advantages of 'open-pan' salt, yet they can be made by the modern, efficient, vacuum process which cuts the fuel bill by two-thirds. They are therefore considerably cheaper. Dendritic salt is moist and absorbent. It does not harden when stored, and it settles to the bottom or rises to the top when mixed with powdered foods. It can be used in humid tropical countries without trouble. For some purposes—curing sausage skins, for example—it is even better than open-pan salt. The production of Dendritic salt is but one of the fruits of I.C.I.'s £8 million-a-year research and development programme.

of "socialist realism" forbidden. The path itself, however, was defined in less narrow terms; novelists, poets or critics have been given more scope to exercise their talent together with a warning not to overstep the limits. The aim was not so much to overhaul the whole Stalinist system of controls as to get rid of its abuses, which were putting such a premium on skilful mediocrity.

One clue to the apparent stalemate may be found in the emphasis placed on international dangers. Speaking on behalf of the union, the writer Leonov reminded the delegates of "the serious and complicated period in which this congress is taking place." Another speaker echoed that "the leaders of atomic imperialism now debate permanently how to resurrect the destructive power of the fallen enemy, how to arm German generals with atom bombs." The Central Committee of the Party addressed the congress along the same lines. The writers were told in fact that, with clouds gathering on the international horizon, this is not the moment to venture too boldly into the uncharted territory of literary freedom. A truce, however, does not last for ever. The second writers' congress is likely to go down not as a turning point, but as an interesting interlude, an important episode of the transitional period.

Battle Over Italian Oil

FROM OUR ROME CORRESPONDENT

FOR some time past the surface of Italian politics has been sufficiently untroubled to keep out of the international headlines. More recently, however, oil has been poured on the waters with incendiary effect; for control of Italian oil is the stake for which the Italian State Monopoly and foreign trusts (mainly American) are now openly contending in round one of a battle which has been going on underground in all senses of the word for the past five years.

Italy is divided into three oil regions—the Po Valley, Sicily and the rest of Italy. In the Po, the National Corporation for Hydrocarbons, or ENI, as it is known here, was given exclusive rights to prospect for and exploit oil, methane gas and hot springs early in 1953 when the corporation was set up under the direction of Signor Enrico Mattei. A self-made man of modest origins, Signor Mattei was the leader of a band of Catholic partisans during the war. In 1945 he was appointed director for North Italy of the Italian General Petroleum Company (AGIP), but with orders to liquidate it. Mussolini's various government projects naturally had a bad press in postwar Italy, and, in any case, AGIP had not found any petrol and no methane gas to speak of.

Signor Mattei, young and determined (he is now only 48), took advantage of the chaotic conditions of the time and started building up the organisation. After initial disappointments, he found huge quantities of methane gas appointments, he found a modest deposit of oil. With and, subsequently, in 1949, a modest deposit of oil. With the support of Signor Vanoni, the present Minister of the Budget, and a few others, he gradually overcame official scepticism and hostility and created one of the biggest and best run organisations in the country. In 1953 AGIP,

together with a number of other similar bodies, was absorbed by ENI. Today, Signor Mattei has raised production of methane to 2,800 million cubic metres (there are over 35 cubic feet to the metre) and by 1956 hopes to reach the 4,000 million cubic metres mark which would be the equivalent of almost two-thirds of present Italian coal imports. A network of 2,375 miles of "metanoduct" distributes the gas to the consumers, mostly in industry. Practically all the big industrial groups in the North are "metanised."

Signor Mattei has also developed the sale of liquid gas for cooking and heating, and built up a large chain of petrol service stations. He has allocated funds for the construction of a Petrol and Methane Studies Centre near Milan and is planning to construct a synthetic rubber factory with a production of 30,000 tons a year (half of which is for export) at the well head of a rich methane gas deposit at Ravenna. This project will also undercut Montecatini, Italy's mammoth chemical combine, in the field of fertilisers. With such a record, Signor Mattei naturally ranks high in the Christian Democrat hierarchy quite apart from having served as an MP for some years.

It is an article of faith among Americans that there are rich reserves of oil in the Po Valley though the evidence for this belief is by no means overpowering. And since last June there has been a campaign to drive a wedge into Signor Mattei's empire. Pressure has been exercised by the Standard Company and by prominent American journals, including those of the Luce group. It now appears, however, that Signor Mattei has come off best.

Pigeonholed Proposals

For the rest of Italy (excluding Sicily) the legislation hitherto in force has had the effect of practically ruling out a serious survey, since everything found under the surface goes to the State. But a new bill, which will give prospectors a square deal has now reached the committee stage. The maximum concession will be 750,000 acres, except in the case of ENI which will be allowed as much as it can take on. There is, however, likely to be pressure for a more severe line towards foreign companies as the measure goes on its parliamentary journey.

Lastly, there is Sicily, whose autonomous government passed a special oil law in 1950, affording all comers generous terms. At least that is what the Sicilian authorities claim. ENI, on the other hand, maintains that its proposals for a joint body to work the petrol have been pigeonholed and that as regards concessions, it has only had the crumbs. The explanation given by ENI is that the regional government, which is in the hands of the Monarchists and right-wing Christian Democrats (with neo-Fascist support when required) has deliberately favoured the foreign trusts and the big Italian companies—none of them in the oil business—which are working hand in glove with them. ENI admits that the first people to strike oil in Sicily were the Italian subsidiary of the Gulf Oil Corporation, an American concern, but claims with some justice that it was AGIP who covered the ground before the war and mapped out the likely oil bearing areas. So far no oil is flowing. The Gulf Oil Corporation, however, puts the probable output at 150,000 tons a year, and the local optimists put the figure for the whole concession (near Ragusa) as high as a million tons. Whatever the future may bring, it is certain that the

Left, which already has 33 per cent of the votes, will raise the pseudo nationalistic cry of "Sicily for the Sicilians" at the regional elections next June, and that petrol may be the decisive issue at the polls.

Hope in Laos and Cambodia

WHILE southern Vietnam has been drifting into anarchy in a fierce spotlight of publicity, there has been a kind of haze over events in the two smaller Associated States, Cambodia and Laos. In Cambodia, enough has emerged to form a hopeful picture; and even in Laos, where the proximity of the "Democratic Republic of Vietnam" is a constant danger, there have been hopeful manifestations of official energy in the past few weeks.

Part of the haze has been due to a familiar tendency for important announcements to be followed by complete inaction. In Cambodia, for instance, it was announced last September that the notorious Nationalist rebel, Son Ngoc Thanh, had surrendered to the royal government with 300 armed men. Shortly afterwards, there were reports that Thanh was preparing to join the government in an unspecified capacity. King Norodom Sihanouk himself was said to have met Son Ngoc Thanh at Siem Reap, near the ruins of Angkor, in mid-October. Yet Thanh has continued to attack the king and his government, and recent dispatches from Phnom Penh have indicated that he is still a rebel against royal authority.

Although Son Ngoc Thanh apparently no longer disposes of an armed force, he still retains a considerable portion of the popular following he built up as a Japanese-supported Nationalist leader in 1945. To that extent, his future status is of importance to the country as a whole. His relative, Son Ngoc Minh, the Communist leader, is believed to have kept a number of armed followers with him in hiding in the mountainous region near the Siamese border. There is no doubt, however, that great strides have been made since the end of the Geneva conference in restoring law and order and in unifying the country under the king. The existence of groups of dissidents or bandits here and there does not affect the essential stability of the regime.

Vanishing Trick

Unless there are unforeseen developments it is unlikely that Cambodia will "go Communist" at the elections. These are due to be held this year, for constitutional reasons not connected with the Geneva agreement. The time-lag is probably too short for the Communists to achieve a decisive success. There are long-term fears, however, that the Communists may gain control of the powerful Democratic party through infiltration. Another disquieting factor is the "disappearance" of a large number of Viet Minh troops believed to have been operating in Cambodia before the Geneva conference. Officially, the evacuation of these troops was completed on schedule, by October 20th. But only 4,000 were evacuated, out of a total estimated at between 6,000 and 8,000. What has happened to the missing ones? Some, no doubt, are still with Son Ngoc

Minh, but many of the others may simply have passed into civil life in Phnom Penh or in Vietnamese-populated rural areas near the Cochinese border. How many of them will act as Communist agents is a question that may worry the royal government as the elections draw near.

In Laos too, an important-sounding announcement has been followed by inaction. In this case, the announcement was made by the "Pathet Lao" rebel leader Prince Souvannavong, who declared on October 28th that his "resistance" forces were ready to co-operate with the royal government to realise the unification of Laos. Since then, however, nothing has happened to fulfil the hopes aroused by this declaration or by the news that Souvannavong had made contact with his brother, the former Laotian prime minister, Prince Souvanna Phouma. Although the Pathet Lao movement is virtually a creation of the Viet Minh, there is no serious indication that Souvannavong is a doctrinaire Marxist. His Vietnamese wife, however, is a fanatical Communist and an influential figure in the movement. This factor, together with the prince's debt to the Vietnamese Communists, may lead him to resist offers that he should join King Sisavang Vong's government except on his own terms.

with the dissidents. The unpleasant reality is that Pathet Lao, the Communist state comprising the provinces of Phong Saly and Sam Neua, is still in existence, and that the rebel leaders show no inclination to surrender their hold upon it. The prime minister's programme, therefore, calls for "negotiations with the Pathet Lao government so as to induce them to work for the progress and prosperity of the nation without partition of the country." A further resolution is "to re-establish administrative power in Sam Neua and Phong Saly provinces and to accept the Pathet Lao personnel into the national community." Recent Viet Minh press comment has accused the Americans of dropping aid to royal Laotian troops hidden within the two provinces—a refreshing admission that infiltration can be a two-way traffic.

All told, then, the situation in the two smaller Indo-Chinese states is healthier than in the non-Communist half of the largest one. It would be rash to forecast the position eighteen months from now, but at least a good start has been made in stabilising the non-Communist regimes.

Mining in South Africa

Precision work in Switzerland

Atlas-Copco puts compressed air to work for the world

Beneath South Africa's Rand and the fabulous new gold-fields of Welkom, Atlas-Copco drills, drilling equipment and loaders are getting out the ores that give the world gold—and uranium. At the other extreme of Atlas-Copco versatility is a range of small pneumatic bench tools—rotary files, cutters, polishers and engraving tools—in use in light industries in Switzerland. From the massive power of mining equipment to the delicate opera-

tions of precision engineering, Atlas-Copco reliability is an international byword. In almost every part of the world, wherever compressed air is working hardest, Atlas-Copco is on the job. Atlas-Copco equipment covers every conceivable application of compressed air. Add to this the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

*Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to THE ATLAS DIESEL COMPANY LTD., Beresford Avenue, Wembley, Middlesex.

Spanning the East

Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

**THE CHARTERED BANK OF INDIA,
AUSTRALIA AND CHINA**
(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

Please ask for our new booklet—*"Capital for Business and Where to Find it"*.

THE BUSINESS WORLD

Profits Ahead

THE bull wandering loose in Throgmorton Street is a friendly brute. It is easy to see why. He has been feeding on the pleasant pastures of higher profits and dividends and they remain as green and as inviting as ever. In 1954 the accounts of 2,756 public companies showed an advance in trading profits of nearly 11 per cent, from £1,501 million to £1,663 million; the net ordinary dividends paid by these companies increased by £33½ million to £203½ million. Quarter by quarter the increase in profits accelerated until the 638 companies issuing their accounts in the last quarter of 1954 reported an increase of 14 per cent—the biggest of all. This raised their trading profits by £36.3 million to almost exactly £300 million. On the average, the profits reported last quarter related to a notional financial year ending at about the middle of August—a time when people were returning from holiday to booming

industrial production and no very troublesome shortages of steel or other constructional materials. The further increase in industrial output in the last quarter of 1954 has yet to be reflected in published company accounts.

What happened to the extra £36 million that these companies netted in their latest year? Nearly one-third of it—£11 million—was added to their tax bills. Just over £7 million was ploughed back into reserves and an extra £6 million in depreciation. All other charges went up by about £5½ million. Most of the remaining £6 million went to supplement the net dividends paid to ordinary shareholders to nearly £35 million. Dividends were pushed up a little faster than the rate at which net earnings were expanding. Last quarter's ordinary dividends, grossed up at the standard rate of tax, represent a return of just under 16 per cent on issued ordinary capital against just under 15 per

THE SHAREHOLDER'S SLICE

PROFITS AND SHARE PRICES

cent in the previous year. This comparison understates the true gain for ordinary shareholders, for there were many scrip issues last year. But the latest dividends represent no more than 6.4 per cent on the net worth attributable to the ordinary capital of these companies, and that return would be very much lower if it was related to the current value (as distinct from the book value) of their net assets.

These latest figures can be regarded as "true profits" in this sense: while they were being earned, prices stayed more or less steady, and the year's results were not seriously distorted by either inventory gains or losses. This broad stability of prices, coupled with a ready supply of raw materials, enabled British industry to ride the boom without adding noticeably to its stocks. Inventories of the 638 companies increased by less than one per cent—by £3½ million to £498½ million. Since work-in-progress must have expanded as production grew, it must be inferred that finished goods flowed more quickly to industry's customers. The reported increase in debtors in the 638 balance sheets from under £308 million to nearly £342 million seems to confirm that view. There was no active price inflation to encourage manufacturers to hoard goods and materials (some forms of steel perhaps excepted) and there was an active demand for everything they could produce.

Industry was able to finance itself to a greater extent by deferring its own payments; in the combined balance sheet of the 638 companies, the item "creditors, etc." increased from £461 million to £489 million. But manufacturers did not besiege the banks for bigger loans and they ploughed more profits into reserves and so improved their liquid balances to the tune of £40 million. But the bulk of their retained profits seems to have been invested in fixed assets. The

gross value of fixed assets went up by £96½ million to £1,019 million, of which some part represents a book increase resulting from the revaluation of assets at current prices. But booming trade, and no doubt the Chancellor's capital allowances, are encouraging British industry to do something more than merely replace its worn out equipment. For example, the motor industry is not likely to remain alone in its intention of stepping up the pace of capital investment.

Industry and the shareholders that own it can rarely have known such a promising new year. There is no sense of 1929 again, but a rosy (perhaps deceptive) conviction that full employment is to be had without undue inflationary perils, and that ever-expanding demand can be expected over the years. Their expectations for equities in the long term remain undiminished, and they are asking what will stop higher earnings, dividends and share values in 1955. On profits, at any rate, it seems possible to speak with confidence; profits will be very high this year, unless some remarkable change occurs in the British economy. They may not increase at quite the same spectacular rate as last year, when the gains were set against a year which bore traces of the recession. But industrial production is still rising; some grades of skilled labour are again seriously short; and industry's demand for raw materials has risen sharply enough to lead to shortages in some primary products.

How, then, will dividends move? A whiff of inflation in the economy usually adds to the cost of financing working and fixed capital. It also gives a boost to profits, as these are conventionally computed. But it seems unlikely that prices will rise in the next few months so rapidly as to tempt industry to rush out of cash and into stocks of materials and work in pro-

gress, or to harry their debtors and rely more heavily on their creditors. Unless inflation on that scale were to emerge, need investors have any serious second thoughts about their next dividends? With healthy profit and loss accounts before them, with a good chance that earnings will go on expanding and with order books comfortably full, few directors will have any excuse for refusing to distribute more to shareholders. In general, they will certainly pay out more.

Dividends and earnings prospects are not the only criteria—though they are among the most important ones—that influence the orders that the investor sends to his broker. He is also concerned with the next budget, election possibilities and the current preoccupations about a higher Bank rate. To judge by the present behaviour of the market—other than the gilt-edged

section of it—investors are not noticeably worried on any of these counts. Their hopes of an easy budget, with some reliefs in taxation, and of a Conservative victory at the polls have hardened almost sufficiently to be classed as basic assumptions. The Funds are marked down on repeated suggestions about dearer money, while industrial equities break through a new "high" almost daily. It would be easy to job back a generation and utter cries of alarm at this spectacle. But unless many sensible people are hopelessly wrong, this is not a boom about to go bust. Can the bulls be so far wrong when a couple of the joint stock banks surprise everyone by again raising their dividends? If banking stocks (or some of them) are after all genuine equities, is anything less than confidence justified for industrial shares at this stage of 1955?

Cigarettes on the Counter

WITH the present level of tax on smoking, no tobacco company would ever admit that it has had a wonderful year. But 1954 appears to have been better than most—at least, for most of the larger firms. Sales of cigarettes, which now make up a good five-sixths of the tobacco business in this country, have been running at their highest level since the halcyon days of 1946. Overseas sales are also up and profit remittances have been somewhat easier to make. The higher home prices for pipe tobacco, generally the least profitable line in tobacco goods, have run now for a full financial year. Bumper crops have been gathered and sold in the principal countries from which British leaf supplies are drawn; auction prices have, in general, tended to be a shade lower, and the quality of non-dollar flue-cured leaf has again improved. Finally, the Treasury has lately seen its way to loosen slightly some of the purse-strings on purchases of dollar leaf.

But costs have continued to eat into manufacturers' margins. The unions have been pressing hard for wage increases. Five separate wage claims have been granted in the last 3½ years, including two in the last thirteen months. Leaf, however, is the major item in production costs and although the average landed cost of leaf was a shade lower up to October, 1954, than in the year before, manufacturers were using leaf shipped in 1953 and earlier, which was more costly than leaf used in previous years.

The tobacco industry is now faced with more competitive conditions than since 1939. The prospect of easier leaf supplies last summer enabled the firms that were still keeping their supplies to retailers pegged by quota to raise them, bringing total supplies of cigarettes very close to what smokers want to buy at the present rates of duty; next week all remaining Imperial Tobacco quotas will be lifted completely.

The appearance of new cigarettes in recent months is the first sign of this return to a buyers' market. The Stephen Mitchell branch of the Imperial Tobacco Company in Glasgow has brought out a Three Nuns cigarette at 3s. 9d., which it is selling at present in Scotland and the north. Carreras has put its successful Dunhill cigarette into nation-wide distribution; this is a 3s. 7d. brand. Rothmans has abandoned its mail-order business and entered the home retail market with two Pall Mall brands, including a new type of filter cigarette priced at 3s. 7d. George Dobie and

Carreras had added Murray and Sons, of Belfast, and R. & J. Hill to its group; and George Dobie had taken over two other pipe tobacco firms. The home market is

now predominantly supplied by four firms, Carreras, Gallaher, and Godfrey Phillips, with the Imperial group as a sort of benevolent big brother brooding over all the rest—big because its near-autonomous branches cater for almost three-quarters of the home market, and benevolent because probably it would be privately as embarrassed by any increase in that share of the trade as it would be by any serious falling off.

Overseas there has never been a lack of strenuous competition. There the principal British combatants are almost the same, with British-American Tobacco Company standing in for Imperial Tobacco. Foreign competition comes mainly from the United States, in certain markets, and from tobacco goods made locally, in nearly all markets. Most British firms have fallen in with this trend towards local manufacture, even in countries where they had not sold at all before. Shipments from this country are now only a fraction of the total sales of between 400 and 500 million lb by British-owned firms.

Since 1938 the industry has had to contend with a sixfold rise in the standard rate of tobacco duty, and a three- to fourfold increase in the average landed cost of its principal raw material—this includes the higher cost of dollar leaf bought since sterling devaluation. All eight duty increases have been automatically passed on to the smoker, but if duty is left out of account the increase in cigarette prices since 1938 has been no more than about 85 per cent.

Unit production costs have been kept down in several ways. Mechanisation has been speeded up—helped by the continued swing away from pipe tobaccos—and this has led to a steady reduction in the number of workpeople, particularly women, that the industry has needed to employ. A certain amount of saving has also come from the pruning of brands that sell only on a small scale. But manufacturers are wary of dropping too many. All the hundreds of brands that are sold on the home market have their devotees. Smoking habits are unpredictable. There are instances of brands that have become strangely popular after bumping along at a very low level for a number of years.

These measures were not enough, however. Rising costs, particularly following devaluation, have forced manufacturers from time to time to make minute reductions in the amount of tobacco used to make some of

their cigarettes. Variations have also been necessary when changes in duty did not coincide exactly with the new retail prices, rounded off to the nearest penny or halfpenny. Inserting filter tips also enabled more cigarettes to be made from the same amount of leaf but despite their much lower price sales of filter-tipped cigarettes have never been more than 2 per cent of total cigarette turnover.

★

What are the prospects for the tobacco shareholder? Ploughing back profits is just as necessary as it ever was. The manufacturer must wait well over a year to recoup the high prices he pays at tobacco auctions, and between six and eight weeks to recover his production costs and the steep duty that he has to pay before he can clear his leaf from bond. Since 1948 the capital employed by the five largest firms in the industry has grown by £175 million, or three-fifths; and all but £45 million of this has come out of retained profits.

The pressure from rises in leaf and paper prices has eased off since 1951. But as soon as they get the chance manufacturers will start to build up their leaf stocks from the present minimum level, equivalent to about 12 months' supply, to the 24 months' supply that was considered normal before the war. One year was generally needed for the tobacco to mature, and two years for the blending of different tobacco grades to be maintained over different crop years. With a product that is as susceptible to weather as tobacco, it is necessary to buy freely when the crop is good and sparingly when it is poor.

The five big companies have over £100 million of short- and long-term indebtedness, some of which they may wish eventually to clear off, though most of this finances the duty element in tobacco manufacture. Tobacco firms have never accepted the present high level of the duty as permanent. The point of "market saturation" today, appears to be some 240 million lb, nearly ten per cent below the level of supplies that smokers eagerly snatched up eight years ago. With prewar rates of duty, tobacco statisticians claim that consumption might by now have reached 300 million lb. Extrapolations of this kind are always suspect—and a Chancellor (who has the biggest interest in the trade nowadays) would probably wait for his revenue to show signs of diminishing returns before he acted. But tobacco consumption in this country during the last fifteen years has increased by only a fraction of the growth shown in certain other countries where tobacco taxes are much lighter. Whether or not young people are smoking less than their predecessors, however, and whether or not there is a connection between lung cancer and smoking—a connection so far suggested more by statistics than by medical research—the tobacco companies will still want to plough back a large slice of the profits they make. "Imps" may be thought of as a first-class preference share with an excellent yield, but "Bats" have evident prospects of growth.

Business Notes

Pull Devil—Pull Baker

INVESTMENT markets have shown an unusual spectacle over the past week, a brisk, even impressive, rise in industrials coupled with a downward sagging in the gilt edged market. Thus the *Financial Times* index of industrials reached a new peak of 191.4 on Tuesday—a rise of 6.2 in a week—and the index of Government securities reached a minor trough at 103.06 on the same day, a decline of a mere 0.36 in a week. These diverging tendencies have sensible origins. The fear of slightly dearer money has still been around. Colvilles offer was in the offing, and the big institutional investors felt justified in holding off from buying gilt edged for a time. The same considerations did not apply to the industrial share market. There the profit and dividend outlook, the political background, and the budget possibilities, still seemed enticing. But the two sections of the market could hardly go on moving independently without a pause. And on Wednesday a break came; the industrial rise was retarded. The gilt edged market turned

firmer. Two separate tendencies reducing the yield on industrials and bringing it down towards that obtainable from gilt edged have been at work; one is long term, the other short. It is the short range movement—that arising from the doubts about money rates—that is depicted in the accompanying chart. Over a period of a year a movement has been in progress that has brought the yield on the *Financial Times* ordinary index down from 5.47 per cent to 4.42 per cent—fall of roughly a fifth. No parallel decline occurred in the yield on 2½ per cent Consols, which fell only from 3.89 per cent to 3.82 per cent—a trifling movement for a longish period. As industry has prospered and boards of directors have untied company purse strings, the investor has progressively been willing to accept a lower

current yield on industrials in the belief that better returns lie ahead. That growth of confidence is probably still at work, but it is not the full explanation of the market movement of the last few weeks.

Colvilles' Prospects

WHEN the Iron and Steel Realisation Agency and its consortium of powerful advisers sold Stewarts and Lloyds shares last June, it seemed that even the best could not excite the public. The ordinary shares of Colvilles come to market next week with the tables turned. It may be a slight exaggeration to say that any ordinary share offer would succeed in present markets; it is no exaggeration to say that something much less good than Colvilles—and Colvilles, though good, is less good than Stewarts and Lloyds—would be assured of success. The offer consists of the whole 10 million £1 ordinary shares of the company at 26s. per share, of which only 5s. is payable on application. The indicated dividend is 9 per cent (including a 3 per cent interim next July) and this is covered nearly three times by the estimated profit after depreciation, fixed charges and taxes. Therefore the dividend yield is £6 18s. 6d. per cent and—thanks to the rise in the market—the agency has for the first time been able to offer a steel equity on a yield basis below 7 per cent. The only Government stock tenderable is the Treasury 3½ per cent 1979/81—at £97 13s. 9d. per cent ex the February interest—and the only difference compared with the form of previous steel offers is that lists remain open for a single day—next Thursday.

* Yield based on 9 per cent.

† Yield basis 10 per cent.

§ Yield based on 8 per cent.

Colvilles is a compact Scottish group with consolidated net assets valued in its balance sheet at £22.2 million; capital expenditure since the war has cost £13 million, all of it financed out of the company's own resources. A further substantial programme is to be completed by

the summer of 1957 at a total cost of £22½ million. After its completion, fixed assets will still stand at a low cost per ton of annual capacity, but further developments are in contemplation including a new plate mill at Clydebridge. Of the expected capital expenditure, £12 million will come from the subscription by the agency of 4 million £1 5½ per cent preference shares (these are at present 5s. per share paid) and from the subscription also by the agency of £10 million 4½ per cent debenture stock at present 10 per cent paid. Colvilles has had no occasion so far to borrow outside. Indeed under nationalisation the company has been an indirect lender of funds to other steel companies and its accounts at October 2nd still showed a loan to the agency of £2.8 million.

It follows that a substantial part of Colvilles' development programme comes rather late; hence, although the expected 9 per cent dividend is well covered, the scope for further increases may be limited. Indeed the prospectus contains a specific warning from the chairman that the group will finance capital expenditure as far as possible out of earnings and that sums beyond statutory depreciation will be set aside for obsolescence and replacement. That does not mean that the ordinary shares at the offer price are unattractive. The yield on steel equities remains high compared with the return on other industrial shares, and if prices continue to rise Colvilles will rise with them.

"Big Seven" Dividends

AFTER the hopes quickly built up in the bank share market last week by the starting of a second round of dividend increases, the remainder of the season's announcements were an anticlimax. Only one more of the big banks made a second increase. Lloyds Bank, having last year raised its payment from the long-stabilised rate of 12 per cent to 14 per cent, has this year added a further 1 per cent. But the bank dashed hopes of still more for 1955 by announcing simultaneously a capitalisation of reserves so as to raise the paid-up portion of the £5 "A" shares from 20s. to 25s., after which the 1954 payment will be equivalent to the traditional rate of 12 per cent; it is intended, profits permitting, to maintain this rate for 1955. The Midland and Westminster banks, the two cautious abstainers of twelve months ago, duly declared final payments at the increased rates already projected—the Midland thus raising its payment for the year from 16 to 18 per cent and the Westminster from 18 per cent to the equivalent of 20 per cent. On the Westminster's capital in its new form (with the £4 "B" shares 25s. paid) this dividend is equivalent to 16 per cent—but the bank is pressing the sensible innovation of describing it in the "no par" guise of 4s. a share. The precedent deserves consideration by the other banks.

The District Bank, like its fellow in the North, Martins, has maintained its payment at the increased 1953 rate. So have Williams Deacon's and its sister in the "Three Banks" group, Glyn Mills, but both these banks followed their parent Royal Bank of Scotland by capitalising reserves during the year, so that their final payments are made on larger capitals. The Clydesdale and North of Scotland Bank, as expected, likewise follows its parent, the Midland

Bank; its dividend is raised from 16 to 18 per cent. Six of the big seven banks, it is interesting to note, have now regained or surpassed the peak rates paid in 1929; the exception is Lloyds, which before its three cuts in the early thirties was paying 16½ per cent.

The Profit Record

ALL the banks, as the table shows, have reported bigger profits for 1954, the increases ranging from 3½ per cent for the National Provincial (which for 1953 reported the exceptionally large increase of 15.8 per cent) to 12.7 per cent for the Midland (2½ per cent in 1953). For the big five, the aggregate increase is £830,000, or 8½ per cent, compared with 6.6 per cent in 1953, but it should be noted that a substantial part of that earlier increase was merely a reflection of the effects of the reduction of the standard rate of income tax. This year's increases in dividends cost about £630,000 net, but the gross cost including distributed profits tax is appreciably more than double that amount.

BANK PROFITS, 1951-54*

* Figures in italics are percentage rates of dividend, calculated on present capital.

The year has undoubtedly been a profitable one for the banks, for although the average level of money and bill rates and of yields on newly-acquired investments has been substantially lower than in 1953, the banks have enjoyed a further expansion of their resources and have been able to employ the increment wholly in the best-yielding assets—investments and advances. The fall in revenues from money market assets must have been more than offset by the decline in the cost of deposit interest, while increased banking turnover and general financial activity produced a bigger revenue from commissions—and in some instances there seem to have been notable recoveries from assets previously

A Yale lift-truck with attachment, handling slag.

All over the world...

... Yale industrial lift trucks are handling heavy materials of all kinds, materials which formerly were lifted and moved with backbreaking, gruelling human effort. But, no matter where Yale trucks are used — no matter where Yale trucks are made; whether in the U.K., Europe, U.S.A., or anywhere in the

world — you can be sure that wherever you buy, they will be Manufactured from American design to the exact same high standards which have been synonymous with Yale & Towne since 1868. When you are considering equipment to solve your handling problems, insist on Yale, your guarantee of quality.

written down. On the gilt-edged portfolio there has, of course, been a further appreciation. In the past year, at least, the favourable influences have enabled the banks to carry the burden of rising staff costs, premises and general charges in their stride.

Trade Record Exports in 1954

IT had been clear for some time that British exports last year would be roughly £100 million higher than in 1953, and the provisional trade returns for December show that the actual increase was £92 million—to a total of £2,674 million fob. Exports have never before reached such a high figure; that creditable achievement follows three years in which the value marked time at about £2,580 million a year. In volume, too, exports were the highest ever—probably 5 per cent higher than in 1953. The

value of re-exports fell by £5 million to £100.5 million in 1954, largely because Russia stopped buying rubber in London. Imports rose by £39.6 million to a total of £3,382.5 million cif, but in volume they were probably only slightly higher than in 1953. The gross visible trade deficit thus fell in 1954 by £47.4 million to £608 million. December trade returns, however,

So far so good. The December trade returns, however, contain two features that may temper jubilation. Thanks to shipments of goods previously delayed by the dock strike, exports in that month rose sharply to an abnormally high figure of £255.7 million, bringing the monthly average in the fourth quarter to £222.2 million. But that average was almost the same as that of the third quarter, and it

was £8.4 million below the average for the fourth quarter of 1953. In previous years exports have always risen in the fourth quarter. Does the negligible rise last quarter mean that a backlog of exports was still waiting to be cleared, or does it point to a halt to the rise. The detailed trade figures may provide part of the answer ; in the meantime, the sharp rise in shipments to the United States in December may be a good augury for British exports to North America in 1955.

The other sign to watch in the trade returns lies in the import figures. Last year's stability in the volume of imports may seem surprising in a year in which Britain produced, consumed and exported more goods than ever before. In fact there was a marked rise in the volume of some imported materials, such as non-ferrous metals, metalliferous ores and crude minerals, chemicals, fuels and pulp, but those increases were offset by smaller imports of certain foodstuffs, particularly cereals, and other items. There are some signs that the growth of production in several fields was at the expense of stocks, though that is a dark corner on which official statistics shed little light. Stability of imports as a whole, however, can hardly continue indefinitely, and a rise may have begun. In the fourth quarter of 1954 the average monthly value of imports was £11.1 million higher than in the third quarter, an increase that may not be fully explained by the distortions of the dock strike or by changes in price.

Britannia and the Seven Seas

THE British Overseas Airways Corporation has asked the Minister of Transport for permission to place an order in California for nineteen Douglas DC 7C aircraft (known as the "Seven Seas") at a total cost of £15 million or more. Its reason for wanting this type of aircraft is essentially simple; it will be the first to be capable of flying the North Atlantic non-stop. Airlines regard non-stop flight as a key development across the Atlantic; they have noted the success of the first non-stop coast to coast flights in the United States; and also the effect of these services on the traffic of airlines that do not operate non-stop schedules. BOAC had originally planned to meet non-stop competition across the Atlantic with the Comet III which, although it could not do the non-stop crossing, would have had its own special advantages over piston engined airliners like the Seven Seas.

Although BOAC is forced to seek permission to buy American primarily because of the failure of the Comet, its action is going to arouse considerable resentment in the British aircraft industry. It reflects the corporation's anxiety to avoid being wholly dependent on the Bristol Britannia—an anxiety that has its roots in the protracted development of that airliner. The first versions of the Britannia were not designed for the North Atlantic, and cannot do the flight non-stop. The long-range version, the Britannia 300 LR, will, the makers expect, be ready for operation early in 1957, but this clearly depends on the successful introduction of the first version. This is expected to receive its certificate of airworthiness this summer, but a number of points, including some with a vital bearing on winter flying, remain to be cleared up.

Douglas, meanwhile, is offering BOAC delivery of the Seven Seas in October, 1956, a few months after it goes into service with the first customer, Pan-American. Since the aircraft is simply a bigger version of the existing DC 7s its development and testing is expected to be largely a matter of routine, whereas development of the Britannia for airline service is likely to be long and costly. If all goes well with the long range Britannia, and it flies non-stop across the Atlantic, there is not much doubt that its operating costs would be lower than those of the Seven Seas.

There is bound to be much speculation, too, about the implications of buying the piston engined DC 7C on BOAC's policy towards its successor, the turbo-prop DC 7D. About 40 per cent of the parts are likely to be common to the two aircraft; BOAC has considerable interest in its development, and may indeed play a leading part in it. BOAC is plainly pursuing a hedging policy; after its painful experiences of the past twelve months it could hardly do otherwise.

Last Lap in Gatt Talks

THE Geneva review of the General Agreement on Tariffs and Trade has now entered its final stage—a stage that may last several weeks. The earlier hopes of ending discussions by mid-February have been abandoned and some of the realists in Geneva are now beginning to talk of end-March as a possible date for the new agreement to emerge. In the present phase of the discussions the clauses of the agreement which had been handed over for study and review to a sequence of working parties, groups and sub-groups are being collected and put together again. Concrete amendments have been formulated and are now being considered at the highest delegation levels.

This is also the stage at which the politicians in their respective capitals are letting fly—partly to encourage and fortify their delegations in Geneva, partly to serve the domestic political causes that may be affected by the Gatt review. Mr Howe in Canada has spoken sadly of every country wanting more trade freedom for itself and more restrictions for everyone else and has even suggested that the General Agreement might collapse. He has also pointed his remarks by leading a delegation to Washington where the Canadians have made the strongest representations against the fundamental conflict between the United States' Gatt obligations and the American legislation calling for restrictions on the imports of commodities supported by the US Government. At the other end of the Gatt spectrum, Mr McEwen in Australia has indicated that his Government's patience is nearing exhaustion and that Australia may decide to get out of Gatt. These tantrums need not be taken too seriously. They are the kind of exaggerations to be expected at this stage of the proceedings.

The review has now reached a point at which it can be confidently predicted that a new and somewhat improved agreement will emerge. It will not be the "regutted" Gatt which the United Kingdom Government had asked for in the opening session of the meeting. The crucial provisions relating to quantitative restrictions on imports for balance of payments recover are unlikely to be greatly

changed. The principal changes will probably be those in the rules for the "underdevelopeds." These are being simplified and also improved by a new definition of the countries to which they are intended to apply. Apart from this, however, the new Agreement will bear very close resemblance to the old. The main change will lie not in the text of the Agreement but in the manner and spirit in which it is administered. Improved administration will be provided by the permanent organisation which will be set up as a result of the Geneva Conference. More effective administration will be secured by the unanimity of views on the basic doctrine of the Agreement that now exists between the principal signatories. The US-UK-Canadian-German-Benelux-bloc which did not exist before, will henceforth make its influence felt.

OEEC Preliminaries

A USEFUL preliminary canter over the course to be run at the OEEC Ministerial Council meeting towards the end of this week was provided by an Anglo-American meeting at Lancaster House on Tuesday. The occasion of this meeting, attended by Mr Harold Stassen and Mr Randolph Burgess, was also used to bring home to the United States Administration some of the growing reservations harboured by the United Kingdom Government on what has become known as the American "aid by dumping" programme. Its basic generosity and the good it is doing to the ultimate recipients cannot be questioned; but the damage it is causing to regular channels of trade has already become a major issue in the Gatt discussions at Geneva, and the opportunity of pressing the point home was not missed.

These Anglo-American discussions covered most of the important items that are to be discussed at this week's OEEC meetings. They include the report of the ministerial group on convertibility and the recommendation of the Steering board for trade that a target for 90 per cent liberalisation of intra-European trade should now be accepted. The way seems clear for a decision in principle by the council on the establishment of a European Fund to replace the EPU once the principal European currencies have become convertible. But, much to the disappointment of Germany, it is already clear that some further extension of the European Payments Union beyond June 30th will be required. Thus, in addition to working out the details of the new European Fund, the managing board will have to consider the terms on which EPU should be extended. It is expected that the new Fund will not only inherit the convertible assets of the EPU, but that its initial resources will be increased by contributions from member countries.

Omelette Unscrambled

IN the act of selling the capital of nationalised steel companies to private investors, the Iron and Steel Holding and Realisation Agency, necessarily and reasonably, enlarges and rearranges their capital structures. Stewarts and

"INSULIGHT" lightens labour

"INSULIGHT" Hollow Glass Blocks transmit light to the dark heart of a building or a room, diffusing it over wide areas in places where ordinary glazing would be undesirable. They cut the racket of the machine shop, the roar of traffic, to a subdued murmur. They hold warmth in and cold out. They keep private places private. In fact "INSULIGHT" Hollow Glass Blocks do the work of walls—but walls of light.

RONALD MORRISON & CO. LTD., EDINBURGH

ACCOUNTANTS WANTED

for the
ARMY EMERGENCY RESERVE

to spend
FIFTEEN DAYS IN CAMP

earning full pay and allowances
plus
a total of

£9

IN TAX FREE BOUNTY & EFFICIENCY GRANT

You can spend fifteen days with your friends, earning full Regular Army pay and allowances. As a member of the Army Emergency Reserve (Cat. IIA) you have no other duties during the year. If a grave national emergency should arise, you may be called up for service in the United Kingdom. You can be called out for overseas service only by Proclamation. Volunteers are accepted from 18 years of age and engagement is for two, three, or four years. If you have served before in a non-commissioned rank there is every possibility of your filling an existing vacancy or of being promoted as soon as a vacancy occurs.

**Lend your skill to Britain,
doing the job you know best**

Send this coupon now for details of how to join to:

**O.C. HEADQUARTERS,
ARMY EMERGENCY RESERVE
R.A.P.C.**

ADDRESS

EO/563

Lloyds has passed through the mill of capital reconstruction twice since 1951—once on nationalisation, when the debentures were repaid and a complicated share capital came down to a single class of £11,786,000 ordinary stock, and again on denationalisation, when £8,214,000 of reserves were capitalised and a special dividend of £10 million from reserves was used to subscribe for the same amount of unsecured loan stocks. The full accounts show that this draft on reserves has left the cupboard far from bare. After the appropriations for the 52 weeks ended October 2, capital reserves stand at £9.2 million, an increase of £1.4 million, and the revenue reserves and undistributed balances at £11.2 million, a fall of £10.5 million. Total reserves at £20.4 million show a fall of £10.5 million, but remain formidable. Ordinary shareholders' funds at £30.4 million (£3 os. 10d. per share) stand substantially above the market price of a shade under 45s. per share.

With the equity in the hands of private investors, though the agency still holds the preference shares and the loan stock, the accounts wear a bright new appearance. Figures have been taken to the nearest £1,000, an abbreviation that hitherto only giants like Unilever have used. The consolidated balance sheet and profit statement—in three colours—has been simplified by a generous use of notes on facing pages. In one matter the group remains conservative. No chairman's statement is included, nor does the directors' report say anything about current trading—naturally it does not mention the £2 million contract just won in fierce competition to supply 490 miles of pipes to US bases in Spain. One figure that the accounts bring out is the present holding in Tube Investments. It will be recalled that the "liaison shares" with heavy voting rights were not reconstituted when Stewarts & Lloyds was de-nationalised. The present holding is £458,808 of market stock valued on the balance sheet date at £1.9 million—not a dominating holding in a total ordinary capital of about £7½ million.

Freer Steel Imports

AFTER some delay, the Government has now agreed to suspend import duties on a wide range of steel products until the end of September. It was advised to do so by the industry's central organisations about a month ago, in order to allow British customers who cannot get all the steel they need from here to buy freely abroad. The advice itself came none too soon; and whether this can quickly ease the fairly acute shortages of some kinds of steel remains to be seen. During the autumn the world market for steel has been hardening fast; and Continental deliveries for various kinds of steel are now nearly as long as British. Customers who begin buying abroad now may find it involves almost equal delays as well as higher cost, though some of those who bought abroad earlier, and in some cases have themselves been paying the duty as well as the foreign prices, have fixed useful contracts for themselves.

The industry itself is fairly confident that its own supplies, advancing well past last year's record, will cover demand with no more imports than last year. Imports are high now; but steelmakers expect them to decline in the second half of the year, as extra capacity comes in. Never-

theless, for the present they are choked with orders, and booked heavily for months ahead. They suspect that some of this is buying for stock, as past experience suggests—which makes the orders no less firm nor any easier to meet in a hurry.

Coal in Hand

AT the beginning of 1953, Britain had just under 16½ million tons of coal in stock, with about 1½ million tons of foreign coal still due to arrive this winter. Most consumers and merchants have rather less than they had a year before—indeed, distributed coal stocks were in all nearly 2 million tons down, and stocks held by the coal industry well over half a million tons lower. The industry is less ready than it used to be to guess at what might be "safe" levels of stocks for various dates through the winter: consumption has risen, while the statistics of stocks are collected from fewer of the industrial consumers. But coal supplies are considered likely to suffice for any normal weather in the remainder of the winter.

For 1955, with no promise and few hopes about any substantial rise in output, the National Coal Board is looking critically at its overseas balance. Last year it exported 13½ million tons and imported 3 million. Because British coal prices are low by world standards, it made a substantial premium on every ton it sold abroad; but not as much as it lost on each ton it had to buy abroad and sell at home prices. Even though British shipowners earn some of the freights and the Foreign Operations Administration may supply some of the dollars, this is dubious business for the Coal Board. The question of a substantial reduction has been raised with the Ministry of Fuel and Power, which decides how much coal should be exported.

To export coal in general while importing particular types can make commercial sense. To continue exports while importing marginal tonnages of the same ranges of coal may still be justified, to keep bilateral customers sweet and to hold on to markets it is hoped to regain. But when those hopes fade, and when the amounts one has to buy abroad to offset exports become substantial, the arguments for continuing to act like a great coal-exporting nation wear thin. The reduction of exports that is being talked about—about 3-4 million tons—would not incidentally enable the Board to dispense with imports. But with imports at about the same level as last year, it should be enough to support a continued increase in British consumption—even if the miners do no better.

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

Council for Consumer Goods

THE British Standards Institution has made a fresh attempt to awaken interest in standards for consumer goods by establishing a new advisory council. Complaints have been made, mainly by distributors, that the views of the ultimate user—the retail customer—have not been getting a fair hearing at meetings where standards for consumer goods have been drafted. The main reason has been the impossibility of getting a strong and coherent expression of what the retail customer wants and expects from a standard article, be it a wash-boiler or a minimum quality level for textiles. An advisory committee consisting of representatives of the major women's organisations in the country has attempted to perform this function but it has been very plain that housewives, who are the interested parties in these standards, do not treat their organisations as trade associations and fail to give their spokeswomen the adequate briefing and backing that the industrial members of trade associations bring to these discussions.

To remedy this defect—in the hope of improving the usefulness of consumer goods standards—the BSI has set up a new advisory council on standards for consumer goods which includes several of the members of the women's advisory committee, a number of other ladies and an important batch of newcomers, independent or representative of retailers and distributors. It is argued that distributors must, by the very nature of their business, have a sound grasp of the views and requirements of retail customers and should therefore be equipped to speak in committee on their behalf.

The new scheme should provide a new and necessary assurance that the standards that are agreed will be useful from the consumers' as well as from the producers' point of view. At the same time, the Council will serve as a channel for complaints about the quality of consumer goods. This new body will offer no redress to shoppers who believe that they have been swindled, nor does it seem to countenance the elaborate conception of testing, examination and critical reporting on consumer goods that is usually understood when consumer councils are discussed. Its functions will not be easy to perform. It ought to be as practical as it can and refuse to lose itself in technical blind alleys. If it succeeds it will deserve all the encouragement that the consumer industries can give it.

Half-time in Wool

THE second half of the wool-selling season has opened cautiously. The weakening in prices of merino wools in December continued when sales in South Africa and Australia were resumed this month, but in later auctions prices held fairly steady, and prices of crossbred wools in New Zealand showed little change compared with the closing levels before Christmas. Sales at the London auctions this week reflected those trends. Crossbreds were firm at a small premium over prices in the dominions, and the fall of 5 to 7½ per cent in

merinos, compared to the last sale in December, brought them into line with prices in the dominions. Firmness of crossbred prices may be partly seasonal, because supplies from New Zealand are not yet arriving in substantial quantities. The testing time will come in the next two months, when offerings in New Zealand will be heavy and the consuming industries should by then be well supplied.

The main reasons for the strength of crossbred wools compared to merinos are the gradual recovery in activity on the woollen side of the industry, which uses mainly crossbred wools, at the expense of the worsted side, and the substitution of crossbreds for merinos to keep down the cost of some worsted goods; those trends do not appear to be confined to this country. As a result, the difference between prices of merino and crossbred wools has narrowed steadily; a year ago merino 64's cost nearly twice as much as crossbred 50's, now they are only about 50 per cent higher.

The prospect for this half of the season will be influenced by several unknowns: the possible improvement in purchases by the United States and Japan; the extent of Russian buying; and—for crossbred prices—on whether the South American producers continue to price their wool above the world market. Prices may continue to fluctuate fairly sharply, for the plentiful supply of wool this season gives the consuming industries a freedom of manoeuvre in buying that they have not enjoyed for some time. But the probable size of the surplus does not suggest that prices will fall much below present levels.

Shell's Gas Turbines

SHELL's gas turbine development has entered a new phase with the decision to turn the tanker *Auris* into a floating research ship. In 1949, *Auris* became the first merchant ship to be fitted with a gas turbine engine. This replaced one of the ship's four diesel sets and as a result of sea trials, including a slow Atlantic crossing on turbine

power only, it was decided to build a new tanker to be powered by a single gas turbine. These plans have now been changed; trials with a single, powerful gas turbine will be carried out, not in a new tanker, but in *Auris* stripped of its present engines. Work is to be pressed ahead on the development of gas turbines giving direct mechanical drive to the propeller, much as they do in a turbo-prop aero-engine. This is a really big technical advance, for hitherto an indirect electric drive has been used which has involved an inevitable loss of engine efficiency. The Admiralty, which has been experimenting with gas turbines, appears to be thinking on the same lines.

The mechanical problems of direct drive remain formidable. It is a measure of the speed of gas turbine development that Shell now seems confident that they can be overcome. The company is interested in the progress of marine gas turbines as a fleet owner rather than as an oil supplier. Mr J. W. Platt, who this week announced the change in research plans, emphasised the same points in favour of gas turbines at sea that have already led to their pre-eminence in the air: the great reduction in the size and weight of engine for a given power output; and the reduction in maintenance from the exchange of a vibrating, reciprocating engine for vibration-free, rotating engine.

The Navy Salvages the 110

THE Navy's decision to place a substantial order for the missile-carrying de Havilland 110 all-weather fighter will be regarded with mixed feelings in the Air Ministry. The RAF rejected the 110 two years ago in favour of the Gloster Javelin, not on the grounds of its performance, which

was superb, but because the design was not considered sufficiently imaginative. The Air Ministry has subsequently been learning at first hand how the tantrums of an aircraft during its development stages can upset delivery schedules and the RAF's own defence plans. The development of the Javelin, with its advanced delta planform, was expected to be protracted, and the date for putting it into service has been tentatively fixed for next year. A number of aerodynamic problems remain to be solved before it can go into quantity production. After its rejection by the RAF, the de Havilland 110 had to be specially modified for operation, off aircraft carriers; with the Navy's order finally signed, delivery should begin in two years.

Borax Deal Off

DISCUSSIONS between Borax Consolidated and the American Group that proposed to buy the company at a minimum figure of £5 per deferred share are off—brought to a sudden end by the Borax directors. Some shareholders will regret that a promising opportunity for selling at a good price has been missed, but there will be shareholders and others who applaud the fact that an important British asset, the sterling area's only considerable source of boron and a big earner of dollars, is not to pass to foreign hands. There may well be some regrets that the board has taken from the beginning of December until the middle of January to reach a decision.

The Board bases its decision on two contentions—first that the offer of £5 per unit was inadequate and secondly that it was not in the public interest. To the latter, the

Second-Hand Car Prices

The table below shows the average price that would have been obtained on a two-year-old car during the past 2 years expressed as a percentage of its original cost, including purchase tax. The prices are those ruling at the end-quarter, so that the latest figures shown are an indication of relative price levels during the next few weeks. Care needs to be taken in comparing them with those of the end of the 3rd quarter, because while a 2-year-old car—in dealers' language—was then one registered in 1952, from the beginning of this year it will be one registered in 1953.

* Model change. † One-year-old or less.

would-be purchasers, who have also issued a statement, reply that a change to US domicile was part of the terms of the deal. That would have needed Treasury consent. The Board might have left it to the Treasury to decide what is the national interest.

On the main point—that the offer was too low—the board has produced useful figures; these show that the United States Potash investment is worth £3.6 million, and that total net assets are over £14 million, excluding all the mineral deposits and the land and buildings outside the United States. It seems to establish that the deferred units are worth over £5 each and may explain why they still hold that price in the market. They also promise a final dividend of not less than 12 per cent, implying a total distribution of not less than 16 per cent (against 11 per cent) for the year that ended on September 30th.

The Board has acted with the best intentions, though it has hardly disposed of the bidders' contention that £5 was the minimum offer and they never had enough information to make a final bid. Shareholders have gained much from the affair—an indication of a largely increased dividend, a promise of "steadily improving rewards," a much fuller statement of assets than they had before, and a hint that the company may still apply to change its domicile if it does not succeed in getting tax relief in this country to cover the mining depletion allowances granted to it in America. The earlier advance in the share price to over £5 has been held. The board may be sincerely con-

The Economist Guide to Weights & Measures

This guide was compiled by the Statistical Department of **The Economist** for use within our own office; it is thought that it might serve a wider public and it is therefore being published at 10/6 (including postage throughout the world).

In 84 pages it provides facts and figures on the weights and measures of the world. For the most widely used units, tables of equivalents are given; for units that are used only in certain countries and trades conversion factors are given.

Applications for copies should be addressed to:

Weights & Measures
The Economist, 22 Ryder Street,
London, S.W.1.

vinced that all those boons would have been forthcoming anyhow, but shareholders will never feel ungrateful to the bidders.

EMI's American Purchase

ELECTRIC AND MUSICAL INDUSTRIES' purchase of a majority shareholding in the American company, Capitol Records, marks another stage in the long-standing rivalry between EMI and its main British competitor, Decca Records. EMI has made an offer of \$17.50 per share for the 248,435 common shares in Capitol which would give the company a controlling interest—and have offered to purchase the balance at the same price. EMI's expenditure therefore can run to \$8 million but the company does not expect to have to increase its ordinary capital to finance the purchase.

Shortly after the war, Decca acquired the right to distribute the Capitol catalogue in this country. This Decca-Capitol agreement runs up to June, 1956, so that EMI will not get any immediate advantage in this country—so far as catalogues are concerned—for at least 18 months unless it comes to some agreement with Decca. In America, EMI has a number of arrangements for selling its own recordings and for distributing those of American companies here. The oldest of them, with RCA-Victor, covers the sale of RCA catalogue in this country and of HMV records in America. Another covers the English distribution of Metro-Goldwyn Mayer records. Then, in 1953, EMI set up its own American distributing organisation to sell British Columbia records under the trade-mark Angel. The arrangements for EMI sales in the US have covered predominantly classical recordings. Capitol will provide, presumably, an outlet in the popular field. EMI lost the American Columbia catalogue in 1952, when Columbia transferred its rights in Europe to the newcomer Philips. Since then, competition in record sales has intensified in this country and in America. The last major change has been the entry of Pye Radio through the purchase of the small recording company Nixa, which has specialised in classical recordings but may broaden its field.

The £100 Million Look

Two building societies passed the £100 million target in total net assets last year. The Co-operative Permanent just lost the race with the Woolwich Equitable to reach it first. Nevertheless the growth in the Co-operative society's figures for 1954 was impressive: total assets were up by £19.6 million at £106.3 million. Last year's rate of growth was faster than in 1953. There was a record inflow last year of £27.2 million of share and deposit money—an increase of £6.7 million over 1953; of last year's total no less than £23.4 million came from share subscriptions. There was also a record outflow of mortgage advances;

these amounted to £24.7 million, an increase of £5.4 million over the 1953 total.

Such growth could not take place without running down the ratio of reserves to total assets. Even though an addition of £418,673 has been made to reserves and undistributed balances, the new figure of £3.8 million is only 3.59 per cent of total assets against 4.12 per cent at the end of 1953. The society has held the outflow of mortgages in check sufficiently to ensure that its liquid assets should rise. At £16.4 million they show a rise of £4.1 million and the ratio of liquid funds to total assets has risen from 14.92 per cent to 15.44 per cent—half of this being held in cash. An interim statement from the Woolwich bringing its figures up to December 31st although its financial year ends on September 30 shows that this society still leads the Co-operatives by a short head. Total assets of the Woolwich were £108.7 million, having risen by £19.5 million in twelve months.

SHORTER NOTES

The Road Haulage Disposals Board has sold 12,576 out of the 18,000 nationalised lorries that have now been put up for public tender. All the general haulage depots outstanding, and the vehicles and equipment that go with them, will be placed on offer in the early part of March. Including 1,400 lorries offered once already but not sold, this list covers about 149 depots and 5,830 vehicles on the trunk

and remaining tramp services not affected by previous disposals.

The Union Discount Company has announced a final dividend of 7½ per cent, making 12½ per cent in all for 1954. This compares with a rate equivalent to 9.63 per cent paid in 1953. Net profits rose by 37.3 per cent from £368,000 to £505,000. This brought the aggregate increase in the profits of the "Big Three" discount houses to £242,653, or 23.8 per cent.

North American hardwood to the value of £3 million fob can be imported into Britain this year. The quota is additional to supplies—amounting to just over £1 million in 1954—that can be imported for specific purposes.

Following the revision of strategic controls over exports, the Board of Trade has now published the consequential changes in export licensing control.

The figures for hire purchase in the radio and television market given in *The Economist* last week were transposed. The hire purchase share for radio rose from 38.99 per cent in October, 1953, to 52.89 in October, 1954, and in television the hire purchase share rose from 51.35 per cent to 65.99 per cent.

Company Notes

MARLEY TILE (HOLDING).

The boom in house building has put a lot more money in the pockets of the ordinary shareholders of Marley Tile. Their dividend for the year to October 31st at 25 per cent was double that paid in 1952-53. And, holding out the promise of still better things to come, that dividend was followed by the announcement of a 150 per cent free scrip issue. The scrip issue was coupled with proposals giving the participating preference stocks a more up-to-date look. With the building boom still racing ahead, it is not surprising that the company's 5s. ordinary shares have been put on a yield basis of 4 per cent at the current price of 31s. 6d. xd.

The bigger dividend has come from much higher net profits. The trading surplus increased moderately from £1,420,000 to £1,516,000, but, as taxation and other charges fell steeply, net profits advanced much more sharply—from £293,605 to £475,356. Shareholders have done well because the group had prepared itself for the boom in trade. It ploughed back the greater part of its earnings; it raised new money through the issue of a debenture by a subsidiary; and in 1952-53 it spent over £550,000 on capital account. While the boom was at

its height the company continued to add to its fixed assets, spending over £865,000 on them in 1953-54. The growth in fixed capital has gone hand in hand with an expansion in working capital and the group has been left short of liquid resources. Fortunately the group's new factories and extensions are coming into production quickly.

WESTINGHOUSE BRAKE AND SIGNAL.

Gradually, but only gradually, the directors of Westinghouse Brake and Signal are breaking with their long tradition of conservatism in dividend payments. In the last three financial years the ordinary dividend has been raised—though only in small steps. For the 53 weeks to October 2nd a dividend of 18 per cent, compared with 16 per cent in 1952-53, has been recommended. The more critical would say that this increase is long overdue and does not look over-generous compared with the rise in net profits from £431,540 to £743,062. The group, whose interests are concentrated on producing capital equipment for the railways, has been adding steadily to its capacity. Its sales have been expanding. Its earnings have been rising. With the trading surplus in the latest year going up from £1.5 million to £1.9 million. Its

order books are full. It has expanded its productive capacity and added to its commitments in working capital without imposing any strain upon its cash balances.

In reviewing the past year the chairman, Mr A. R. S. Nutting, finds only one danger spot—intensified competition from manufacturers on the Continent. This is important for a group which exports half of its output. But the prospect for the current year adds up in Mr Nutting's words to an order book "at a high level" and to "good results." But he still insists that the "board must conserve the financial resources of the company."

WEST RIDING WORSTED AND WOOLLEN MILLS.

This is a growing Yorkshire combine. In 1952-53 it added Wadsworth and Sons and in 1954 John Murgatroyd and Son to its list of mills. The combine is vertically integrated. But in the year to August 31st the directors had to report a decline in profit from a more broadly based business. Trading profits fell from £1,707,146 to £1,520,435. The chairman, Sir John Keeling, offers only half an explanation. He refers to "certain favourable factors that helped to swell profits in 1952-53 without specifying what they were. He also explains that while the mills remained at a high level of activity" profit margins were lower. He associates this drop in margins with the fall in the price of merino wool. Even so, the group's stocks were £200,000 higher at £4.8 million at the end of August. The company has a sto-

reserve of £310,000, covering about 12 per cent of the book value of its stocks.

Net profits also declined—from £762,455 to £602,078—but, allowing for a 40 per cent scrip issue, the ordinary dividend was raised slightly, from 17.1 to 17.7 per cent. Much bigger dividends in the early future seem to be ruled out by Sir John's statement that while sales have been well maintained profit margins are still narrowing. It will be reassuring for shareholders to learn that their chairman trusts they will not be "disappointed" with the current year's results. It would have been even more useful if he could have told them something of the state of the company's order book, which is presumably still healthy. At the current price of 60s. the £1 ordinary shares yield 5½ per cent, one of the more slender yields in the wool textile group of equities.

★

ASSAM COMPANY. The oldest British-owned tea company in India is proving the pivot of the most interesting struggle for control recently seen in the tea share market. The issued capital is £1 million in £1 ordinary units, widely spread among investors. An Indian buyer who has raised the price of the shares from 27s. a month ago to 43s. 6d. is believed in the process to have acquired a holding of the order of 40 per cent of the company. The figure must be accepted with reserve, for no one knows just what holding may have been acquired in the latest and most active phase of the buying. Probably Indian buying is also responsible for the present active market and steeply rising price of Jorehaut Tea Company. These are examples of a phase that had

been expected in the tea share market. Current financial results, and current values of tea gardens justify it. Assam Company closes its year on December 31st and the 1954 results are still far away, though the recent interim dividend of 3 per cent tax free against 2 per cent less tax, points in the right direction. So do the current figures coming forward from other tea companies.

Central Province Ceylon, though it closes its year on June 30th and has therefore not included the best of the high price period, still announces the best results in its history with a net profit before tax of £252,054, compared with £95,877. The final dividend of 20 per cent is payable on a doubled capital so that the total payments for the year are equivalent to 50 per cent on the old capital, compared with 17½ per cent. Several tea estates in announcing their crop figures to mid-December have also pointed out that though costs show a tendency to rise the prices realised at auction have much more than made up for that.

What should the attitude of shareholders of the Assam Company be? They will, like everyone else, feel regret that Indian nationalism should be producing an effort to acquire the tea investments. They will feel also a regret that Indian capital should, with the acquiescence apparently of the Indian Exchange control, be seeking to replace British investments rather than building up the capital assets for that under-developed country. But in terms of hard cash the Assam Company's units, though reasonable in relation to probable break-up values, are high compared with other tea shares. The company's long record is respectable, but not inspiring. It is scarcely reasonable to expect shareholders not to sell.

LONDON STOCK EXCHANGE

Next Account begins: January 19th
Next Contango Day: January 19th
Next Settlement Day: January 25th

ALTHOUGH gilt-edged stocks were depressed at the beginning of this week by the rise in bill rates and talk of dearer money, industrial equities made an extremely strong advance. That advance, was checked on Wednesday but prices hardened on Thursday. Although sales in the gilt-edged market were not heavy at the beginning of the week, uncertainty about interest rates brought prices tumbling down. War Loan, for instance, lost ½ on Monday and then lost a further ½ on Tuesday. On Wednesday, however, the fall in prices was checked and a few stocks closed with a few slight net gains. War Loan remained unchanged at 87½. Prices improved on Thursday when War Loan gained ½ of a point. The early weakness in the Funds was reflected in losses among the Dominion and Colonial issues. Banking and insurance shares were generally easier, but Hong Kong and Shanghai moved very erratically both before and after the announcement of the scrip issue. In the foreign market Far Eastern issues were dull and German issues were unsteady until Wednesday when renewed demand lifted the price of the Potash bonds.

Dealings in the industrial market, which had gone ahead before the week-end, were very active on Monday and the *Financial Times* ordinary share index rose from 188.5 to 191.3. It went up to 191.4 on Tuesday before falling back on Wednesday in the face of profit taking to 190.2. The market was unsettled by the heavy fall in the Funds and the overnight setback on Wall Street. Prices, however, were rallying towards the close on Wednesday and they remained firm on Thursday. Most stocks took part in these movements, but the most pronounced changes were recorded in the engineering and store groups.

Oil shares in an active market followed the pattern established elsewhere in the equity market. Tea shares were firm but rubber shares tended to wilt. Kaffirs were dull at first, cheered up a little on the quarterly reports and then began to lose ground again on Thursday. Coppers, apart from a brief rally on Tuesday, were generally easier.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years with the following exceptions in 1938:—India and Pakistan, year beginning April; Iran, year beginning June.
 (1) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (2) Including the trade of Newfoundland in 1938 amounting to \$36 million in exports and \$31 million in imports. (3) Excluding trade with Taiwan in 1938. (4) Based on two months' data.

Financial Statistics

EXCHEQUER RETURNS

For the 8 days ended January 8th there was "above-line" surplus (after allowing for Sinking Funds) of £96,286,000 compared with a deficit of £10,852,000 in the previous week and a surplus of £18,161,000 in the corresponding period of last year—this brought the cumulative deficit to £259,076,000 (£447,532,000 1953-54). Net expenditure "below-line" last week reached £24,940,000, bringing the total cumulative deficit to £572,524,000 (£746,421,000 in 1953-54).

THE MONEY MARKET

From Thursday of last week until Monday last the discount houses were actively engaged in repaying to the Bank the £55-£60 million borrowed at the year-end at the "penal" rate for periods up to ten days. These repayments were made without renewed stringency. Partly because of a lower take-up of Treasury bills—the offer on Friday last was down from £260 million to £230 million and the market's "proportion" from 68½ to 43 per cent—market supplies of credit were adequate throughout the week to Wednesday last.

The market lowered its bid for the 91-day bills on offer at last Friday's Treasury bill tender for the sixth week in succession—and by the unusually wide margin of 4d. per cent, to £99 10s. 4d.; it bid at £99 10s. 3d. per cent for the 92-day bills on offer on account of the incidence of Easter Monday. Anticipation of a higher Bank rate remains an important factor in the market's dealings.

Business in the London gold market has been more active at prices between 251s. 5d. and 251s. 6½d. a fine ounce.

The Bank return shows a further reflux of notes from circulation of £20.6 million. This brought the total reflux since the Christmas peak three weeks ago to £47.8 million and raised the reserve in the banking department to £64.5 million. The market's repayments to the Bank brought discounts and advances down by £50.1 million to £15.7 million, and bankers' deposits fell by £19 million to £262.5 million, the lowest level reached since August, 1953.

Have at you!

It would be over-dramatic to suggest that Insurance experts fling down the gloves to one another, and fight out duels to the death. But there are duels of other kinds.

Each Insurance Company is, in fact, the rival of all others. They are in constant competition—not only to obtain business, but to make the best use of the funds entrusted to them. That is as it should be—for competition fosters enterprise.

The Insurance expert has the delicate task of investing *your* money—and in doing so he tempers enterprise with caution. Thus he maintains the world-wide reputation of British Insurance—the absolute certainty that the contract will be fulfilled when the claim arises.

The conclusion is clear. Insurance is being responsibly, resourcefully—yes, even creatively—handled by practical people with *your* interests in the forefront of their minds.

MR JAMES MUIR DECLARES 1955 TO BE "YEAR OF DECISION" FOR CANADA

The eighty-sixth annual general meeting of shareholders of the Royal Bank of Canada was held on January 13th at the head office in Montreal. Mr James Muir, chairman and president, in the course of his address, said:

I believe that 1955 will be a "year of decision" in which our solution of immediate problems will have a tremendous capacity for good or evil in the years to come. During 1954 we have seen not only a defeat of inflationary forces in the economy but the reappearance, at least in a shadowy form, of the deflation boggy of the 1930's. In January, 1954, I referred to the fact that the inflationary boom had already become, for some sectors of the economy, a thing of the past. Since then we have seen a rise in unemployment and a reduction of some magnitude in certain components of the national accounts as well as in the gross national product itself. We have seen as well increased competition in home and foreign markets from the revived industry of the United Kingdom, Western Europe, and Japan.

GOALS TO AIM FOR

Within an overall climate of political and economic freedom, our policy decisions in government and business during 1955 should take due account of four inter-dependent goals of an economic policy directed towards the economic welfare of the community. The first of these is to ensure that our human resources are not wasted in involuntary idleness; that is, we should try to maintain a high and stable level of business activity and employment. The second goal is to ensure that our resources, when fully employed, are allocated in such a way as to produce the maximum volume of goods and services and to bring these goods and services to market in the proportions in which consumers want them. The third goal is to ensure that the distribution of the national product and income combines equity with the highest possible incentive to increase the total amount of product to be shared. The fourth and final goal is to ensure that all our policy decisions are consistent with an appropriate rate of economic progress and growth in the economy as a whole.

TRADE PROBLEMS SERIOUS

The problems posed by the high cost economy become more acute with every increase in the competitive threat of foreign industry to Canada's markets at home and abroad. Pressure for protective measures becomes more insistent as the immediate effects of sharpened competition become apparent. I am still of the opinion that Canada's future lies on the side of improving her competitive position rather than isolating herself behind heightened barriers to trade. This is the only policy consistent with her present and future position as a great trading nation.

However, all our export difficulties do not spring from high production costs. First of all, the price of our exports to foreign buyers depends not only on our own costs and prices in Canadian dollars, but on the price of Canadian dollars in terms of foreign currency. Since early in March,

1952, our dollar has been at a premium in US funds and at a corresponding premium in terms of all other currencies. It may be argued, of course, that this is merely the result of a strong balance-of-payments position, and that if we really needed the exports our dollar would sink in the free market to the level appropriate to our internal costs and prices. This would be true were it not for the fact that our overall balance-of-payments position depends not only on our exports of goods and services, but on capital flows, into and out of the economy, for investment in old and newly-floated securities. In recent years, the net flow has been strongly in favour of Canada.

All this is gratifying to Canadians in that it indicates a strong faith on the part of foreign investors in the future of our country. But the plight of Canadian exporters is in no way eased by this otherwise admirable state of affairs, for the resulting high price of the Canadian dollar imposes a tax on exports and a subsidy on imports.

Increased protection is no answer. The disadvantage of our dollar's high exchange value is general; it affects all Canadian producers. Protection helps only those Canadian producers who must compete in the home market against imports: it does nothing for our exporters except to subject them to a further rise in domestic costs and hence to a further limit on their ability to compete in foreign markets. If anything is done in response to the pleas of our producers for relief from the economic consequences of our high-priced dollar, it should not be more protection, or the return to a fixed exchange rate (both of which have been proposed), but simply the use of open market operations by the Central Bank to affect not only the rate of interest but the rate of exchange as well.

CREDIT FACILITIES NEEDED

The noticeable decline in exports since 1952 may also be attributed to a number of interrelated causes: price declines, increased competition from low cost producers abroad, the recovery of industrial capacity in war-torn countries, and the like. All these tend to alter relative cost and price relationships in the world market to Canada's disadvantage. But, in addition to the important matter of relative costs, a new factor has been injected by European suppliers who are able, with government support, to offer long-term financing to their customers in the world market. This type of financing is especially important in sales of heavy equipment; and, in one form or another, notably through the Export-Import Bank of Washington, it has been available for many years to American export houses. We are aware that some very large foreign orders for equipment, which might have been obtained by Canadian firms, were lost to competitors during the year, largely owing to relatively favourable terms of payment. In view of the importance to Canada, today and in the future, not only of maintaining exports, but of maintaining intact her industrial legacy from wartime expansion, it seems abundantly clear that definite action should now be taken to provide our traders with the credit facilities they

lack. These facilities might take various forms; but, in general, they could be provided by a corporation, owned partly or wholly by the government, with the power to discount export paper of longer term than chartered banks can handle. The essential function of such a corporation could indeed be provided very simply by widening the scope and operations of existing government entities now active in assisting trade and industry.

WISDOM CALLED FOR

There will be little need for a new "ministry of economic progress" so long as we premise our economic policy on growth. We should, for example, consider what policy is best in the long run, not for a nation of 15 million but for one of say, 30 million.

We must start today to create the economic environment that will both encourage, and enable us to take full advantage of, that growth in population and capital without which we cannot realise the great potentialities that lie in our wealth of natural resources.

How we meet our problems in this year of decision will profoundly affect the direction and rate of Canada's growth. If the decisions we make are in keeping, both with the realities of the present and with those of that greater Canada which can be seen in outline even now, we may safely leave our doubts behind and, by making the decisions appropriate to greatness, bring greatness itself within our grasp.

ASSETS EXCEED \$3 BILLION

T. H. Atkinson, the general manager, in commenting on the bank's financial statement, noted that the bank's assets have shown an expansion of \$131,039,655 during the year, and for the first time in the history of any Canadian bank, they exceed the three-billion mark—the year-end figure being \$3,026,895,844. Such a substantial total reflects a very great volume of transactions entrusted to our branches and indicates that this bank stands pre-eminent in the opinion of the public. Deposits by the public have increased to \$2,797,548,149, another new high in Canadian banking. Loans increased to a total of \$1,188,022,047, and earnings are again at a new high, having increased \$1,960,903 to a total of \$20,913,511.

Our foreign branches have made further progress and the results have again been most satisfactory. We have opened one branch outside Canada during the past year and in the near future will open three more which will bring the total of our foreign branches to 74. These 74 information centres abroad can be of inestimable value to exporters by assisting them through first-hand knowledge of local markets. During the past 55 years we have built up an enviable reputation abroad and are very much an integral part of the business life of the countries where we operate; in fact, in some cases we are considered a local bank rather than a foreign one.

Branches of the bank now number 813, of which 71 are in countries outside Canada. The report and accounts were adopted.

BASS, RATCLIFF AND GRETTON, LIMITED

68TH ANNUAL GENERAL MEETING

The sixty-eighth annual general meeting of the ordinary stockholders of Bass Ratcliff and Gretton, Limited, was held on January 10th at the registered offices of the company, High Street, Burton-on-Trent. The chairman, Mr C. A. Ball, presided, and was supported by the following members of the board: the Rt Hon Lord Gretton, OBE, Mr A. G. Manners, Mr W. P. Manners, Mr P. D. Manners, Mr F. F. Toone, Mr W. R. Soper, Mr I. M. Lewis and Mr R. D. R. Bateman, MBE, ACA, with Mr T. H. Charles (secretary), and Mr I. M. Taylor representing Messrs Whinney, Smith and Whinney (auditors) in attendance.

The secretary read the notice convening the meeting, and the auditors' report.

The chairman said:

Gentlemen, I have to submit for consideration and adoption the report of your directors, together with the audited statement of accounts for the year ended September 30, 1954.

These were sent to you on December 17th last and have, therefore, been in your hands for the statutory period, and with your agreement, I propose to take them as read.

With the recession of trade in various parts of the country the year has not been without its difficulties. I think, however, you will agree that considering the specific decline in the brewing trade, heavy taxation and the continued upward trend in wages, fuel and freight costs, the results shown constitute a real achievement, particularly as they have been arrived at during a year of exceptionally bad weather conditions.

PRUDENT COURSE

I feel stockholders will agree in view of the remarks in your directors' report relating to capital expenditure made, and to be made, that the course we have adopted in husbanding our resources is a prudent one, and particularly so in view of the uncertainty of the times through which we are passing; you may rely upon it, however, that your directors will diligently maintain their close examination of all possible economies and press the expansion and efficiency of the business wherever practicable so that I feel we can face the future with reasonable confidence.

I should like once more to record our appreciation and thanks for the services and loyal co-operation rendered during the year by officials, staffs and all operatives of our group without which these results could not have been attained.

I now beg to move that the report of the directors and the balance sheet for the year ended September 30th last be adopted, that the half yearly dividend paid on December 31, 1953 and June 30th last on the 5 per cent cumulative preference stock of the company and the interim dividend of 10 per cent on the ordinary stock paid on June 19th last be approved, and that a final dividend be and is hereby declared of 33 per cent on the ordinary stock making with the interim dividend already referred to a total dividend of 43 per cent for the year all less income tax, such final dividend to be paid on or after the fifteenth day of January, 1955.

The report and accounts were unanimously adopted.

The retiring directors, Lord Gretton, Mr A. G. Manners and Mr F. F. Toone were re-elected, and after the remuneration of the auditors, Messrs Whinney, Smith and Whinney, had been fixed, the proceedings terminated.

FIRST GARDEN CITY

The fifty-first annual general meeting of First Garden City, Limited, was held on January 6th in London, Sir Eric Macfadyen, MA, JP, chairman, presiding.

The following is an extract from his circulated statement for the year ended September 30, 1954: The profit is £15,302, after providing £23,000 for taxation. The general reserve is raised from £102,500 to £105,000. The balance of profit carried forward, after providing for the 5 per cent dividend on the classes of stock is £11,967, which is £30 more than last year.

To meet a want which had been increasingly felt by ourselves and other users of current since the power station passed out of our control, we have revived our former electrical contracting and installation department. This renewed activity appears to be appreciated in the town.

The water supply undertaking continues to be run with efficiency. The Fuller pumping station has now been brought into full operation and has freed the site of the original station on the Baldock Road for other use. Supply is ample and the purity of the water is above reproach. Routine chemical and bacteriological analyses are maintained.

The development of the town proceeds steadily. Six of our factories carried out extensions during the year. The UDC made further progress in the Grange neighbourhood where 902 subsidised houses have now been completed and occupied. We provide sites for 77 owner-occupied houses and are now meeting a steady demand. Roadmaking, the laying of new water connections, etc., for these developments keep the company's staff fully occupied. The frustrations of the war and postwar period are beginning to be forgotten and signs of accelerating progress are manifest. The report was adopted.

MOUNT ISA MINES

The twenty-second annual general meeting of Mount Isa Mines Limited was held on January 6th at Brisbane, Mr G. R. Fisher (man of the company) presiding.

The chairman, in the course of his speech, said: The net profit for the year was £2,096,274 compared with £1,668,663 for the previous year.

From the profits for the year the directors have recommended the payment of a final dividend of 10 per cent, absorbing £575,731, in addition to the interim dividend of 10 per cent paid on July 16, 1954, of £575,731. The total dividend disbursement for the year amounted to 20 per cent or £1,151,462.

PRODUCTION AND OPERATIONS

Ore treated for the year was 645,083 tons silver-lead-zinc ore and 565,897 tons of copper ore, making a record total of 1,210,980 tons. The grade of silver-lead-zinc ore milled was 5.8 oz silver, 7.35 per cent lead and 6.3 per cent zinc compared with 5.8 oz silver, 7.4 per cent lead and 6.4 per cent zinc for the previous year. The grade of copper ore milled was 4.16 per cent copper compared with 3.56 per cent for the previous year.

Lead production at 37,926 tons was 610 tons less than last year's production. Silver production was 3,090,936 oz compared with 3,195,374 oz for the previous year. Zinc concentrates production at 40,198 tons was 1,630 tons lower than the previous year. Copper production at 20,407 tons exceeded last year's production by 14,930 tons, but it should be noted that production of copper in the previous year did not commence until February, 1953.

Total operating costs, including delivery of lead bullion and blister copper into ships' holds at Townsville, but excluding all charges

for ocean freight, refining and lead bonus payments, were 85.1 shillings per dry ton of ore treated, compared with 90.6 shillings for the previous year. Increased production rate has been a major factor in the reduction of operating costs.

In August, 1953, a general increase in rail freights came into force. The increase in Mount Isa freights was from 5 per cent to 12½ per cent. This caused a very substantial increase in the company's expenditure, and our rail freight now costs approximately £1,500,000 per year.

ORE RESERVES

The general manager reports that after allowing for extraction for the year, writing off ore deemed to be irreclaimable, and making adjustments to tonnage and grade, the total estimated reserve of silver-lead-zinc ore at June 30, 1954, was 9,900,000 tons. The copper ore reserve was 3,700,000 tons. A small increase was reported in the silver-lead-zinc ore reserves, but a reduction of 211,250 tons, after allowing for extraction, was reported in copper, with an increase in grade from 3.9 per cent to 4.2 per cent.

Diamond drilling has indicated that substantial tonnages of copper ore exist outside present ore reserve limits, but confirmation by further exploration work is required before this ore can be included in published reserves.

THE OUTLOOK

From all information available it appears that the world demand for the metals which we produce will be maintained at a satisfactory level, and that remunerative prices will be obtained at least during the current financial year.

The report and accounts were adopted.

BUKIT KAJANG RUBBER ESTATES LIMITED

The annual general meeting of Bukit Kajang Rubber Estates, Limited, was held in London on January 11th, Mr Jack Addin-sell, the chairman, presiding.

The following is an extract from his circulated statement: The year under review covered a period of low prices for rubber resulting in proceeds from sales averaging 5d. per lb., less than for the previous year. There was also a fall in the crop harvested of 141,237 lb., but in spite of this the drive to reduce costs was successful to the extent of about 3d. per lb., of which ½d. per lb. was in respect of the reduced export duty at the lower price level.

The profit before taxation was £13,055 against £21,014, and the comparison would have been more but for certain arrears of replanting cess refunded during the year. After providing for taxation, the figures are £8,238 compared with £14,131.

The decline in prices, which had already fallen 9½d. for our 1952-53 crop, continued into 1953-54, reaching its lowest point in March last when the London price of spot rubber fell to around 1s. 4d. per lb., since when the market has fortunately shown a steady improvement to over 2s. per lb. In the circumstances the directors feel justified in recommending a dividend of 4 per cent.

During the year 1954 a further 57 acres of old seedling rubber on Bukit Kajang estate has been replanted, but it was not found possible to undertake any new planting or replanting on Rengo Malay owing to continued bad security conditions. The board has long realised the necessity for accelerating the rate of replanting.

The report and accounts were adopted.

TATE & LYLE, LIMITED

AN ANALYSIS OF INCOME AND EXPENDITURE IN 1954.

	£	Proportion of each £1 of Income
GOODS AND SERVICES PURCHASED FROM OUTSIDE:—		
Raw Materials (including Duty of £11,855,576)	96,793,895	16.4

MILK MARKETING BOARD FOR NORTHERN IRELAND

Applications are invited from suitably qualified persons for the under-noted posts in the Milk Marketing Board for Northern Ireland. The posts will be permanent subject to a probationary period of two years. Candidates must be of British nationality. Preference will be given to persons who served in HM Forces during the 1914-18 or 1939-45 Wars.

GENERAL MANAGER

Applicants must have had considerable experience in a senior administrative capacity, of the problems undertaken in a large-scale marketing organisation, preferably in connection with milk. The successful applicant will be responsible, subject to the directions of the Board, for the general control of all the Board's activities. Salary will be on the scale of £2,000 to £2,400 per annum.

ACCOUNTANT AND FINANCE OFFICER

The applicant must be a member of an Institute of Chartered Accountants, the Society of Incorporated Accountants or the Association of Chartered and Incorporated Accountants. Preference will be given to persons with experience of costing commercial processes and who have experience of the operation of mechanised accounting. Salary will be on the scale of £1,200 to £1,500 per annum.

ADMINISTRATIVE OFFICER

The successful applicant will be responsible to the General Manager for the administrative and clerical work of the Board. Applicants must have had considerable experience in a similar capacity, preferably in connection with the milk industry. Salary will be on the scale of £1,200 to £1,500 per annum.

TECHNICAL OFFICER

Applicants must hold qualifications in dairy technique and in the manufacture of milk products. It would be to the applicant's advantage if he has had experience in organising milk transport on a large scale. Salary will be on the scale of £1,200 to £1,500 per annum.

For any of the above posts the Board may pay a commencing salary above the minimum to specially qualified persons. Applications must be made on the prescribed form, copies of which may be obtained from the Acting Secretary, Milk Marketing Board for Northern Ireland, Castlehill Road, Belfast, Northern Ireland. The latest date for the receipt of applications will be January 31, 1955.

SENIOR EXECUTIVE

Shannon Duty Free International Airport requires a Senior Executive to control and develop its rapidly expanding retail, wholesale and mail-order activities. The position offers wide scope for a man interested in international trade, particularly with the United States. A record of successful modern management experience essential. A progressive four-figure salary will be paid and there will be in addition an annual bonus based on results. The successful applicant will have an Irish background and a sound education. Applicants should write in confidence to: Office 61, Shannon Free Airport, Ireland.

BRITISH NYLON SPINNERS LIMITED

Applications are invited from men aged 30 to 38 for an appointment on the commercial side of the Company. The appointment calls for sound commercial experience, gained preferably in a manufacturing organisation; as the successful candidate will be required to absorb some technical knowledge a degree in Science or Engineering would be an advantage. A period of specialised training will be given. The work will concern the commercial development of end-uses for the Company's products and offers considerable scope for initiative and original thought. Applications will be treated in strict confidence and should be addressed to the Personnel Manager, British Nylon Spinners Limited, Portypool, Mon.

CHAPPIE LIMITED, manufacturers of cat and dog foods, require the services of a man or woman graduate to undertake field and office control of the National Consumer Research section of their Market Research Department. An Economics or Sociology degree and/or knowledge of Statistics, especially sampling techniques, would be an advantage. The work entails assisting in the selection of staff, draughting of questionnaires, organising the field staff, office routine, checking field work, and appreciation of findings.

Salary will be in the range £780 to £900 and the post also carries pension, life assurance and sickness benefits under a non-contributory Social Security Plan. This post offers an excellent opportunity for a man or woman seeking first-class Market Research experience. Half the time will be spent in the office at Melton Mowbray and the remainder in the field. Applications should be sent to the Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire.

LEADING firm of Chartered Accountants in Lagos, Nigeria, require Chartered or Incorporated Accountants with good experience. Salary not less than £1,700 per annum, with excellent prospects and local income tax at low rates. Free furnished accommodation, provident fund, car and kit allowances, medical expenses. Passages paid, including family.—Write Box R. 935, c/o Streets, 110 Old Broad Street, E.C.2

APPLICATIONS are invited from Graduates (preferably female) in Economics or Statistics for interesting and varied work with a London firm of marketing consultants. The post calls for a high degree of resourcefulness and involves the collection and analysis of marketing information from published and other sources. Some experience of economic, statistical or information work necessary. Starting salary £500-£600 p.a.—Box 806.

TRAINING FOR MANAGEMENT—Pitman Home Study for all Management and Secretarial Examinations; also for Transport and Hospital Administration. Personal tuition; success guaranteed. Details of course required from Pitman Correspondence College, 54 Pitman House, Godalming, Surrey.

PRESS AND PUBLIC RELATIONS PRACTITIONER (woman) offers her services and organisation to firms or trade associations on fee basis. Ex-journalist, first-class P.R. experience and contacts. London office.—Box 807.

JUNIOR EXECUTIVE (38) requires situation giving scope and outlet for many years' commercial experience, mainly sales administration, some accounts. Pleasing personality and ability to mix well. Own car. Interested any non-static situation.—Box 808.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equal fields such as Education, Jurisprudence and Social Medicine. Values within the range £700-£1,100 per annum (Simon Research Fellowships) or within the range of £1,150-£1,500 per annum (Simon Senior Research Fellowships) according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience. Applications should be sent by March 1, 1955, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF SOCIAL STUDIES

Applications are invited for appointment as Lecturer or Assistant Lecturer in Sociology; the salary on appointment to be according to qualifications and experience; the salary scales are at present under review. Applications (three copies, stating date of birth, qualifications and experience, together with the names of three referees should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than February 26, 1955.

CITY OF JOHANNESBURG

5% REDEEMABLE STOCK 1959/62

Notice is hereby given that in order to prepare the Warrants for Interest due March 1, 1955, the Transfer Books of the above mentioned stock will be closed from February 1, 1955, until February 8, 1955, both dates inclusive.

For BARCLAYS BANK D.C.O.

(London Registrars of the above Stock)
G. A. D. HARRISON, Manager.

Circus Place, London Wall, E.C.2.
January 10, 1955.

GOLD COAST GOVERNMENT

ASSISTANT SECRETARIES IN MINISTRIES IN ACCRA

Applications are invited for several posts.
Duties: To assist senior secretaries in advising the Minister in the formulation of Government policy with possibly some general office administration, and to assist in the general supervision of the execution of policy decisions by Departments, etc.
The work requires accuracy, precision and lucidity in the marshalling of facts.

Qualifications: Candidates must be of not less than 30 nor more than 50 years of age, and must have had considerable administrative experience; for example, in the Home Civil Service or in that of some British overseas territory, in local government, or upon a military staff. A university degree is desirable; but in all cases high standards of general education and intellectual ability, and moral qualities of the highest order, are essential.

Terms of Service: The appointment will be on contract for two tours of not less than 18 months and not more than 24 months, with consequent leave at the rate of seven days for each month of residential service. An officer will enter the consolidated salary scale £990 x £50—£1,490, £1,530 x £60—£1,950 at a point commensurate with his age, qualifications and experience. A gratuity at the rate of £37 10s. (or £25 for a salary of less than £1,000) for each completed period of three months' satisfactory service will be payable on the final termination of the contract.

Free passages for officer, wife and up to three children under 18 years of age. Basically furnished quarters at rentals of £80-£90 p.a. Free medical and dental attention for officer and family.

Candidates should apply to the Adviser on Recruitment, Gold Coast Office, Melbourne House, Aldwych, London, W.C.2, for a form of application.

Note: Persons who applied for a similar vacancy advertised in December, 1954, will automatically be considered for these posts.

BRAINS' TRUST

Sir R. Boothby M.P., Alfred Robens, M.P., H. S. MacLay, M.P. and Geoffrey de Freitas, M.P., comprise the panel and will answer questions on:

"BRITAIN AND THE NINE POWER CONFERENCE."
Caxton Hall, Westminster, 7.30 p.m., January 25th.

ADMISSION FREE.

For tickets apply to:-

U.K. Council of the European Movement,
99a Park Lane, London, W.1.

SLIPPED DISCS

Reports of large increases in the sales of High Fidelity Equipment and Gramophone Records in America are in line with reports of similar expansion in Great Britain. British Hi-Fi Equipment and Records are equal to or better than anything produced elsewhere and we are the Leading Suppliers in this field. Send us for our comprehensive catalogue to: Classic Electrical Co. Ltd., The Hi-Fi Specialists, 352-364, Lower Addiscombe Road, Croydon, Surrey.

MANAGEMENT CONSULTANCY. A well-known company is prepared to train a limited number of suitable applicants for ultimate appointments as executives in management consultancy.

Applications are invited from men between the ages of 25 and 30 years who wish to take up a career in consultancy. They must be University Graduates in Economics or Engineering, preferably with some industrial or commercial experience; willing to travel home and overseas.

Salary paid during training appropriate to qualifications and experience. Please send details and indications of present salary level, in confidence, to Box No. 105, R. Anderson and Co., 14 William IV Street, London, W.C.2.

YOUR MONEY will make more money if you spend one shilling weekly on the *Investors' Chronicle*. Two free issues on request to 30 Grocers' Hall Court, London, E.C.2.

STATISTICIAN, with good knowledge of sales analysis, market research and business organisation, needed by firm of international repute in the Grocery and Confectionery fields. Good scope for the successful applicant. Age 26-35 years.—Box 809.

CANBERRA UNIVERSITY COLLEGE

Applications are invited for appointment to the vacant posts of SENIOR LECTURER OR LECTURER IN ECONOMIC HISTORY, SENIOR LECTURER IN POLITICAL SCIENCE (Public Administration), and LECTURER IN STATISTICS (in the Department of Economics).

UNIVERSITY OF LONDON

A lecture on "Les Tendances Actuelles de la Pensée Economique Française" will be given by Professor L. Baudin (Paris) at 5 p.m. on January 25th, at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. The lecture will be delivered in French. Admission free, without ticket. JAMES HENDERSON, Academic Registrar.

MANAGING DIRECTOR AVAILABLE

Managing Director, well-known company expects to be available shortly (owing to "take-over" negotiations) and would welcome proposals. Young and energetic with considerable administrative and merchandising experience in the marketing of branded consumer products. Only interested in business offering wide scope for drive and initiative. Salary relatively unimportant if opportunity exists (now or later) for capital investment. Would be particularly interested in company requiring reorganisation.—Please write Box 799.

MARKET RESEARCH

A Nationally known manufacturer of consumer goods, with Headquarters just outside London, requires a senior man in the Market Research Department. Essential qualifications include practical experience in initiating and controlling consumer surveys and the preparation of reports. Applicants should give full details of career, present position held, and salary required. All replies will be treated as confidential.—Write Box 802.

AN EXCEPTIONAL OPPORTUNITY FOR A QUALIFIED ACCOUNTANT

A large Insurance Group in the provinces requires a deputy Chief for its mechanised accounting and recording division with a view to early assumption of complete control.

Successful applicant would require a knowledge of punched card equipment and procedures, an interest in future developments in this field and ability to handle a staff approaching 400; it is hoped he would not be over 40 years of age.

Prospects are likely to satisfy the ambitious applicant and initial salary would be very largely a matter for negotiation with a view to attracting the right man; non-contributory pension scheme.

Letters giving qualifications and experience, which will be treated as strictly confidential, should be addressed to Box 805.

THE B.Sc.ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretarialship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.Econ. (Final) exams, since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P17, WOLSEY HALL, OXFORD.

The Brush Electrical Engineering Co., Ltd., requires an experienced man to take charge of its Organisation and Methods Activities. Applicants should have had several years' experience in this field, preferably in engineering and should be University Graduates and/or members of the Institute of Cost and Works Accountants. The post is a highly responsible one and the man appointed will be immediately responsible to the General Manager. A four figure salary will be offered and there are excellent terms of service including non-contributory superannuation. Please apply with full details to the Chief Personnel Officer, Brush Electrical Engineering Co., Ltd., Loughborough, Leics.

DOUGLAS GLASS

BRITAIN'S GREATEST PHOTOGRAPHER

48 Black Lion Lane, W.6. RIV. 7522.

A JOINT PARTNERSHIP that is bound to please is cold same with Rayner's delicious Indian Mango Chutney.

WOMAN ECONOMIST, M.A., seeks post London. Experience report writing, editing, public relations, conference work, economic and survey research. Fluent French.—Box 804.

COMPANY in N.W. London with several associated manufacturing companies requires Accountant (preferably Chartered) capable of assuming responsibility for financial side of business under Joint Managing Director. Applications from man with industrial and/or commercial experience preferred, but essential requirements are sound, up-to-date financial knowledge, and good personality and character. Age 35 to 40 years. Salary according to qualifications. Apply Box No. 370, Dorland Advertising Ltd., 18/20 Regent Street, London, S.W.1.

LADY EXECUTIVE, 32, experienced interviewing, excellent contacts printing, publishing, seeks responsible, interesting post. Loyal, hard-working Scot. Shorthand-typist, car driver.—Box 808.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects. Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

THOUGHTS ON THERMAL INSULATION

Making a material difference

TO READERS whose knowledge of thermal insulation materials goes little further than the lagging jacket on the hot water cistern, these remarks are addressed.

Reactions to previous announcements in this series have indicated that the savings available by means of more effective insulation are widely appreciated, so let us go a little more deeply into the matter of insulating materials. Today they come in a wide variety of forms, from magnesia and asbestos slabs, pre-formed sections for pipe-work, insulation bricks, cork sections, etc., to a sprayed-on asbestos material which follows the contours of the surface to be insulated.

There are others, too, but the point is that these materials offer a versatility which, in skilled hands, can be turned to advantage. Generally speaking, one looks for an insulation material to do one particular job, but very often such material is dual in purpose. It will do two jobs at the same time—in the same application—at the same cost.

Look at it this way. Probably more insulation is used for keeping heat in its place than for any other purpose. But there are many situations where the correct choice will bestow other blessings. Take,

for instance, a records room, or a library. Here quiet from within and without is an essential, so insulation is used to keep down noise. At the same time, for the proper care of books and records, a steady temperature is required. The same insulation material does the two jobs.

All kinds of industrial installations call for insulation in some form or another to suit a given set of conditions. Perhaps a combination of fire-resistance with sound absorption; maybe a matter of keeping cold air in and condensation out; yet again, the material may be needed to withstand vibration and to resist corrosion, in addition to providing thermal insulation. All these needs call for a special kind of experience because, naturally, insulation problems concern cotton mills and oil refineries, ships and churches, power stations and cinemas.

Newalls have concentrated, these last 50 years, on building up a range of materials plus an application skill which, expressed in terms of thermal insulation in all types of industry, makes a very impressive record. This experience is available to any firm interested in insulation as a means to increased efficiency. Newalls are specialists in heat, cold and sound insulation. Write to us on any problem related to these.

Issued in the interests of a better understanding of thermal insulation in industry by:

The truth about the middle man

IN TEXTILES

THE 'middle man' in textiles is a genuine stock-carrying
wholesaler. He selects the pick of the products of scores
of factories and holds large stocks from which retailers
in all parts of the country order in small economic lots.

Each year some £864,000,000 worth of clothing and
household textiles is distributed through the wholesaler.
In any system of supplying the public with textiles, the
cost and work of selection, breaking bulk and distribution
must be undertaken. The textile wholesaler does this
in the most economical manner.

This is the FIRST of a series of four announcements
describing how the Textile Wholesaler helps the Manu-
facturer, the Retailer and the Nation.

CIGARETTES*

An eye for Colour

A wide choice of near-white fluorescent
tubes is available today. Each has its
own particular field of application, each
represents a suitable compromise between
the conflicting claims of accurate colour
rendering and high efficiency. An object
is only revealed in its true colours when
illuminated by a light containing those
colours, and to give accurate colour
rendering the light from a fluorescent tube
has to contain a controlled proportion of
all colours.

But the human eye is most sensitive to the
central or yellow-green range of the
spectrum, so that broadly speaking, the
higher the proportion of light emitted in
this region, the higher will be the efficiency
of the tube. Shades of red or blue will
not be shown to the best advantage, as
the proportion of light of the other
colours has been reduced.

Now, there are many industrial and
commercial plants where high efficiency
lighting is of much greater importance
than accurate colour rendering. There
are others where the matching of colours
plays an essential part. The Osram range
of fluorescent tubes has been carefully
planned to cover every need, and to
provide the highest possible efficiency
with the colour rendering properties
required.

A highly qualified lighting service is
maintained by the G.E.C. and specialists
are available at each of the Company's
branches to advise you, not only on this
question of colour and efficiency in your
fluorescent installation, but also on any
other lighting problem.

FLUORESCENT TUBES

A G.E.C. PRODUCT

THE GENERAL ELECTRIC CO. LTD.

"Yes, he said I needn't take on extra staff after all..."

"YOU KNOW when our orders were going up and up? Our accountant told me we might have to take on more staff. So we decided to call in the Burroughs man. It couldn't do any harm and his advice was free... As it is, I'm more than glad. He went into the details with our accountant, then showed us how we could mechanize our accounting at low cost—and save a lot of overtime. He certainly knew his job..."

The Burroughs man is always at your disposal without cost. He is an experienced adviser on all accounting and

record-keeping systems, and well qualified to work with your accountant and auditor.

He has a complete knowledge of mechanized accounting. But he won't propose changing your accounting methods just to suit certain machines. Rather, after a full analysis of your problem, he will make proposals for a rapid, economical and workable solution.

If he does recommend a new system, he will prepare a detailed plan for it and help you get it working smoothly. He will make sure you continue to get full benefit from any Burroughs machine you install.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve it. Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment.

Call in the Burroughs man as soon as you like—you're committed to nothing and his advice is free. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

FOR EXPERT ADVICE ON BUSINESS SYSTEMS

One Burroughs man solved this problem. The Phonotas Co. Ltd. (weekly telephone cleaning and sterilizing service) have 80,000 separate accounts, and until recently, in London and in provincial offices, figures were copied by hand. As this led to errors and delays, they called in this Burroughs man, Mr. J. G. Winterbottom (left). He showed Phonotas how, with just two typewriter-accounting machines and two abbreviated-description accounting machines, they could halve their accounting time, and obtain up-to-date figures—all without extra staff.

CALL IN THE
Burroughs
MAN

The WORLD was waiting

"The greatest piece of 'selling' of this country that I have ever seen in my life"

LORD LUCAS OF CHILWORTH,
speaking in the House of Lords

THE cast, the settings, and the costumes were there for only a day. There could be no re-takes. It was 'now or never' for sixteen camera crews, eager to capture the breathless moments of Coronation Day.

Twelve of the cameras were set, towering above the crowds, along the Coronation route. Beside each one stood an excited Queen's Scout—ready to rush each reel of exposed film to despatch riders at the street barriers. They in turn roared away westwards along almost empty roads towards the Technicolor Laboratories on the fringe of London Airport. There the entire staff of one thousand worked day and night to process 56,300 feet of film.

That was only the first stage in an elaborate distribution plan. Soon it would involve railways, aircraft, lorries and—in India and Pakistan—even mules and camel-trains. For millions all over the world were waiting to see A QUEEN IS CROWNED.

The Plan becomes reality

Processed, edited down to 7,717 feet, music and commentary recorded, and the first colour print ready within sixty hours of the Coronation ceremony—the making of this momentous film broke all records.

On Friday June 5th (only three days after Coronation Day) A QUEEN IS CROWNED had its world première in London and the first overseas prints were airborne. By midday on Saturday it was delighting packed houses in Canada and the United States. Meanwhile more prints set out for Australia and New Zealand, South Africa, India and Pakistan, Burma and Singapore, Norway, Sweden and Denmark, Finland, France, Belgium and Greece. During the next few days the commentary was dubbed into eight languages.

Within fourteen days of the Coronation, A QUEEN IS CROWNED was shown in every country of the world outside the Iron Curtain.

Into London came cabled comments from the Group's partners and associates overseas. From South Africa: 'Business double any previous film.' From New Zealand: 'Bookings absolutely fantastic.' From Australia: 'Greatest prestige film ever.' From Canada: 'Packed thrilled spellbound

applauding cheering house.' From Norway: 'Film causing traffic and telephone difficulties.' From Germany: 'Public enraptured.'

Ambassador extraordinary

Perhaps no other film has meant so much in goodwill for the British Commonwealth of Nations; has expressed so clearly the solidarity of a people. Certainly no other film has proved so decisively to the world that the function of Britain's film industry is something more than film-making.

Efforts made over the years to open more and more world outlets for British films were repaid in full. The complex machinery of film distribution worked perfectly.

We are proud indeed that the opportunity was ours—not only to make such a film as A QUEEN IS CROWNED, but also to carry it to the farthest corners of the earth in a way never before attempted.

Timing the Election

WHEN Parliament reassembles next week, it will be entering upon an uneasy period both for its own members and for the country. The most absorbing question in British politics today is when the next general election will be; the dominant influence upon that, according to many people at Westminster, is that the great and the less great are looking in different directions. Sir Winston Churchill has his eyes fixed on the "last prize" of peace, while most younger Tories—those under seventy-five or so—have theirs fixed on the recurring prize of electoral advantage. Is there any way in which these interests might be reconciled, and what effect might that have on the interests of the British people?

Sir Winston's path is clearly that of single-minded statesmanship. He is reported to put the hydrogen threat to humanity first, and everything else nowhere; the only disagreement there can be with that is that most other people would put the hydrogen threat first, and several other things somewhere. That this should be the only disagreement shows how far the strength of the West has increased since May 11th of two years ago. Sir Winston's first principle today is that the free world's strength must be further built up by ratification of the Paris agreements; his second is that, once the agreements are ratified, talks should be held with the Russians; his third is that, "because of certain things that have happened," there might be a greater chance of success at these talks if he himself led the British delegation. All these three principles are likely to be supported—at any rate in public utterance—by a majority of the British people.

For professional Tories, however, they carry an awkward implication at the present time. The Tories feel that they have already deserved success at the next election, and that by wise choice of the date of dissolution their party leaders can now command it. There is no general consensus of opinion in the party about when the most appropriate timing for the poll would be; although there is agreement that it should be at one of the five periods when, the tacticians promise, large blocks of voters should not be inaccessible or on holiday—which means late February, late May or late October of this year, and late February or late May of next. The real source of Tory uneasiness is the feeling that, some time in the next few months, the appropriateness of one of these particular dates might become suddenly and blindingly obvious, and that the party leaders should then be free to act swiftly. But if Sir Winston were in the middle of one of the complicated stages of his pilgrimage to peace, they might have to miss this opportunity. This is the real reason for the irritation of certain Tories with the Prime Minister; it is not based on a hard appraisal of the telegenic value of octogenarianism, but on the vague suspicion that he might interfere with their election planning.

The public's interest in this is confused. It is certainly concerned for the preservation of peace; a case can be made out that hopes of this might be brighter if Sir Winston handled the eventual nego-

tiations with Moscow, but that is a matter of opinion. Some people will think that the public might also have an interest, unless Labour can swiftly find a policy, in the continuance of Tory rule; but that is a question on which opinions must be more sharply divided still. What the public clearly does need, however, and this is a matter that should transcend all differences of opinion, is effective government; and unfortunately it seems to be becoming increasingly clear that this means that it should desire a speedy dissolution of this now dragging and deadbeat Parliament.

Two months ago it was still reasonable to call upon Ministers either to resolve or to dissolve; today—after the Queen's speech and the way in which the railway strike was averted—the call to resolve rings a little hollow. Whether or not there is going to be an election this year, it is now quite clear that politics are dominated by the thought that there may be. The effects of this undeclared campaign grow daily more apparent. The Ministers of Transport and Labour may still wish to salvage something from the wreck of the railway settlement, but encouragement to them from Conservative backbenchers will stop short of any measures that would annoy the National Union of Railwaymen. The Chancellor may or may not have some economic justification for tax reliefs, but he will be under great pressure to grant them, in any event, for purely electoral reasons. The Minister of Agriculture bids fair to be the best holder of his office since the war, but across his coming price review will sound the rumble from South Norfolk.

These are the interests at stake. Does there seem any hope of reconciling them? It is not unduly cynical to suggest that two of them can be reconciled, that the aims of the Tory backbenchers and of their leader may already be nearer than those backbenchers suppose. It is easy to see how this reconciliation could work out.

Molotov Turns to Germany

MR MOLOTOV seems to be holding a kind of clearance sale. As ratification of the Paris agreements on Western European Union becomes more imminent, he digs ever deeper into his diplomatic basement, and every few days Moscow's shop window is filled with a fresh "unbeatable offer" or a "never to be repeated" bargain that used to be kept firmly under the counter. The western powers, and the non-Communist world in general, have lately been subjected to alternating threats and blandishments which come thicker and faster each week: invitations to conferences, diplomatic Notes in profusion, apparent concessions on general disarmament, threats to denounce treaties, accusations about gas and germ warfare, offers of co-operation in the peaceful use of atomic energy, and a crescendo of warnings that ratification will increase the

If everything goes well, the Paris agreements should have passed through the Parliaments of Europe by mid-March or mid-April. Soon after that the attempt to negotiate with Russia could begin. If Sir Winston is to lead his party into the election himself—and there is no real reason why he should not—polling day need not be deferred until after the negotiations have been completed. Indeed, there would be an evident advantage, in terms of election slogans if of nothing else, if the Tories should grasp their chance quickly. "If you believe in talks, vote for Sir Winston the peacemaker: if you believe in strength, vote for Churchill, who saw the need for it as long ago as Fulton." It would be a slogan no more dishonest than most, and much more attractive than some. But it would look better while the champion still sat on his charger, waving an olive branch—rather than after he had actually sallied forth upon his mission, and possibly run into a brick wall.

If this is the decision, however—and, apart from its obvious scope for popularity, there is no reason to believe that it is necessarily going to be—then it will be best if it is done quickly. The call will have to be delayed until after the Paris agreements are ratified; everything depends upon that. Given this, it may be very difficult to launch the campaign in time for an election in May or early June, which is one favourite date with the party tacticians; there is no reason, however, why it should not be launched in time for late October, which is another. October would be late enough in all conscience; it would mean another nine months of drift in too many ministerial affairs. The plea to put forward now is that, whether the peace campaign can be launched or not, the delay should be no longer than that. For uncertainty, which may be the spice of life, is already proving the barbiturate of effective domestic politics.

danger of war. The full range of Soviet diplomatic technique has never been demonstrated so impressively—or at such speed.

Last week, Moscow's beam was switched on to Germany. There was no pretence of using normal diplomatic channels; Mr Molotov had reverted to the familiar tactic of appealing to peoples over their governments' heads. He had, indeed, some excuse for doing so this time, for although his statement was addressed to nobody by name, it was clearly directed to the people of Western Germany, whose government Russia does not recognise. It was, in fact, so carefully designed to tempt the German palate that it was bound to alienate French opinion—a defect which Mr Molotov was perhaps too hurried or too worried to make good. And the statement was well timed both to

influence the forthcoming final vote on the Paris agreements in the *Bundestag*, and to reinforce the campaign of demonstrations against the agreements (described in an article on page 282) that is now being organised by the left wing of the German Social-Democrats and by the extremist Bavarian trade union federation.

What substance was there in the Soviet statement? A careful examination reveals one fact. There was nothing offered that Mr Molotov had not already proposed, or at least hinted at, the last time his attentions were focused on the Germans—that is, when he spoke in East Berlin on the eve of the Soviet Zone "elections" last October. All that he has now done is to dress up, in a more eye-catching manner than he adopted when electioneering for Herr Ulbricht, propositions which were little noticed at that time.

In essence, the offers now repeated are two. First, the Soviet government declares itself ready to "normalise" its relations with the Federal German Republic. Mr Molotov used the same phrase in his recent approach to the Japanese government. It presumably means the exchange between Bonn and Moscow first of trade missions (a lure doubtless meant to offset the German industrialists' incipient collaboration with the West) and then of diplomatic missions. Mr Molotov adds that this would make the reuniting of Germany easier; this fits in with the whole tenor of his statement, which serves notice on the West that henceforth Moscow will deal directly with the Germans, and force Bonn for its part to deal directly with the Ulbricht regime. Indeed, he does not say that there will be no Soviet recognition for Bonn if the Paris agreements are ratified; and there is no reason to think this omission accidental. Bonn will probably be wooed more fervently after ratification than before. Mr Molotov's present attitude towards a Japan that is already linked to the United States by a defence pact may well indicate his future attitude towards Western Germany.

The second offer contained in the new Soviet statement, with regard to all-German elections, is most obliquely worded. The Soviet government "deems it possible, in the event of the consent of the governments of the German Democratic Republic and the Federal Republic, to come to an agreement on appropriate international supervision." Although the western powers have long sought to pin Mr Molotov down to precise terms on the question of elections—their last Note, sent on November 29th, asked for clarification on this subject and has remained unanswered—the Russians still avoid giving any clear explanation. The Russian word Mr Molotov uses for "supervision" may be translated as signifying no more than passive "observation"; and it can be assumed that he hopes to stage a profitably long wrangle over interpretation. And even if the Russians were even-

tually forced to state their real terms, does anyone expect that they would allow any international observation of what went on in Eastern Germany of more than the very tenuous kind that the Geneva agreement provided for Indo-China?

To see a decisive concession in Mr Molotov's cryptic words about international observation would be all the more naive after his accompanying statement that any all-German electoral statute must take account of the existing East German law. This reduces all his references to "democratic rights" and "the electors' freedom to express their will" to double-talk. On paper, East German voters enjoy all such rights; in practice, they have less choice than Germans had in Hitler's day. Admittedly, some West German politicians claim that an all-German parliament could cope with a big block of Communist members; but this form of German *hubris*, which Mr Molotov is discreetly fostering, is extremely dangerous.

Again, there is nothing in the new statement suggesting that Moscow is ready to jettison the Ulbricht regime. Indeed, the East German Communist bosses have lately been assuring their followers that Russia will make no bargain with the West that involves abandoning them. And the most obvious feature of the Soviet offer to recognise Bonn is that it would force Bonn to recognise Ulbricht—and as "elder brother." Dr Adenauer's envoys in Moscow would find themselves playing second fiddle to the East German ambassador already installed there: and the way would at once be open for the talks between the two German governments which the Communists have sought for years. Even the Social-Democrats have repeatedly rejected this idea; while most Germans are attracted by the prospect of talking directly to the Russians in Moscow, few even among the perennial optimists relish the thought of talking to Herr Ulbricht on equal terms.

Dr Adenauer himself will never yield to the temptation to ask the western allies to give Moscow one more chance, for he sees plainly that this means abandoning solid reality for a doubtful dream. But every fresh declaration from Moscow—and there will no doubt be more before the Paris agreements are finally ratified—presents the Germans with an increasingly acute problem; and the West must realise, in particular, that it will become more and more difficult for Bonn to go on turning a cold shoulder to the Ulbricht regime. However, it is not only in the West that clear thought is now essential. If any Germans still believe that Mr Molotov might yet offer them genuine unity in freedom, in exchange for genuine neutrality, one is forced to ask: have they never looked back at the record of past years?

Did not the Czechs do their best to be both "democratic" in Moscow's eyes and truly democratic, and fail? Why do Molotov's offers become more tempting as the prospect of Western Union draws nearer? Has

he not made it painfully obvious that Russia wastes no concessions on the weak, and that the policy of negotiating from strength, however fiercely denounced by the Russians, is the one thing that gets results from them? Mr Molotov missed a historic chance of convincing Germans of his sincerity when he failed to offer them really free elections after the collapse of the EDC. After all his tireless canvassing of his "European security" plan—which he again evoked in last week's statement—is it still not plain enough for all to see that there can be no "neutralised" Germany balanced between East and West, because once Western Union had evaporated Europe would not be balanced but tilted steeply in Russia's favour?

It would be equally disastrous for both Germany and the West if the EDC fiasco were now repeated—that is, if another Berlin conference began with the Paris agreements unratified, and the agreements then foundered without the Russians conceding anything in return. There are arguments, and supporters in

Germany and elsewhere, for the bargaining version of German rearmament, that is, for the idea of starting to build up German strength with a view to reducing or limiting it later as part of a general settlement. But there is nothing to be said for throwing away the counters before the bargaining begins.

Fortunately, even the most subtle propaganda can sometimes overreach itself. The very skill with which Mr Molotov has decorated his baits while avoiding all the real issues has irritated many western politicians. To put it bluntly, it is too clever by half. If the Soviet government is genuinely ready to allow all-German elections that would be genuinely free and fair, why has it always refused to say so in a way that would convince other nations? If the Russians were sincere on this point there would never have been, nor would there now be, any need to hold another major conference. All Mr Molotov need do is throw away his calculated obliquities and state his terms in unambiguous language with all the yawning gaps filled in.

Turk Among the Arabs

MR ADNAN MENDERES, the prime minister of Turkey, has completed his round of visits to Iraq, Syria and Lebanon. The trip has had only one immediate outcome, but that a startling one—the announcement that one member of the Arab League, Iraq, is ready to sign a security pact with Turkey.

This news has been received with an ill-grace in Cairo. Not that Colonel Nasser's Egypt has any objection to mere friendship with Turkey; Turco-Egyptian relations, which were bad until a year ago, have lately become almost fulsome. Cairo's primary objection to the Iraqi move is that it cuts across Egypt's proclaimed policy, which is that if the Arab League can get a few new armaments it can look after its own security through its own exclusive collective pact. Both Egypt and Syria have opposed any thought of linking up with outsiders, and the former has been boasting of turning down American military aid because the price is acceptance of mutual obligations. A second Egyptian objection is to the abruptness of the Turco-Iraqi move; this explodes some classic prejudices in an area that venerates long memories, and in which, if prejudices have to be dropped, it is nobler to let them sink into oblivion slowly.

Lastly, the Iraqi move challenges a prerogative that Egypt has always, and with reason, claimed for itself—the leadership of the Arab League. At the last meeting of that body, in December, the Iraqis, who had already strayed from the strict path by accepting American military aid, merely said that they intended to seek a new treaty with Britain, that it would follow the Suez precedent of providing for British evacuation of the air bases in Iraq but also for their "reactivation"

in certain eventualities, and that they wished to include any attack upon Iran as one of these. To this their colleagues agreed, but they opposed any Iraqi inclination to go further and join the Turco-Pakistani pact; Colonel Nasser refused to bring Egypt into such a pact or to use his influence in the Arab League to secure an endorsement for Iraq's entry. In his opinion it was too early to force states whose thinking had been vitiated by years of nationalism into pacts extending outside their own area.

Iraq's action is the more galling to him and his colleagues because they are realists, and know that it points a way that they are bound to go in the end. Any Egyptian who is logical—whether statesman, soldier or cotton exporter—knows that Egypt's fortunes depend on its links westward through the Mediterranean, and Egyptian diplomats have hastened to explain to their western colleagues that though official Egyptian organs have been attacking the Iraqi premier, Nuri Pasha es Said, for his deal with Turkey, their strictures do not imply any animosity to the West. (The effect of the new Canal Zone agreement on their outlook can be measured by reflecting what they would have said before it was signed.) Yet they are awkwardly placed, because before they arraign the absent Iraq at the meeting of Arab premiers which they have called for today, they will have to make up their minds between realism and pique.

The source of their trouble is that Mr Menderes, when he hustled the Iraqis, disturbed a complacency in which most Arabs have been content to moon for years. When he adjured his hosts not to delude themselves either that they can remain neutral—for the

Middle East's oilfields and lines of communication condemn it to be a cockpit—or that they can defend themselves—since such defences as small powers can afford are of no use whatsoever against the only likely aggressor—he may have seemed to them to be advancing something new. But in fact, he was only posing a problem that had vexed them all ever since they became independent, the problem of how best to live in safety. Is the best course a policy of no entanglements, and consequently no bombing, or is it a policy of joining up with a major ally in order to lessen the risk of aggression? All Arabs have liked to think themselves wedded to the first course, but in fact, if they were to cudgel their brains, they would remember that it is their goal only when there is no danger about. In 1936, when Egypt felt the threat of Mussolini's expansionism, it was quick to switch to the policy of resort to an outside alliance. Similarly, today, Iraq, which is the nearest of the Arab states to Russia and to the Asian world that feels Russian pressure, and whose new wealth from oil makes it still more vulnerable, feels the need to take a similar line.

Western statesmen need not feel nettled at the thought that they have time and again made the points that Mr Menderes made, but without success. They are always regarded by the Arabs as tendering their advice mainly out of self-interest, and, inevitably, the Arab response has been that of the doubter to the over-glib salesman. Turkey, however, can lay claim to fellow-membership of the doubting class, and can with all the zeal of the convert proclaim that its doubts were not justified, and that its alliance with the western powers has not impaired its sovereignty or independence. Yet the message will not ring true in all Arab ears because of several fundamental differences between Turks and Arabs. Turks, unlike Arabs, have two centuries of experience of Russian pressure; they feel for the Russians just the sort of animosity that the Arabs reserve for Israel. But just as important is a less obvious difference: ever since Kemal's rise to power, Turkish governments have been broadly enough based upon public opinion to allow of their taking and explaining not only popular steps such as joining anti-Russian pacts, but also potentially unpopular ones such as the readmission of foreign capital, and even of a foreign military headquarters, to a country that turned the foreigner out with contumely less than a generation ago.

The would-be democracies of the Arab world, and Egypt in particular, enjoy neither the unifying influence of an outside pressure nor the advantage of governments based on wide public support. Further, their memories of western tutelage are fresher than Turkey's. Thus their weak governments are obliged to placate a multitude of adversaries on the home front by pandering to prejudice—against outsiders, against

the one-time colonial powers, against Israel. At best, this weakness leads to a foreign policy of drift in a world of make-believe, at worst to action taken at the dictation of ignorant mobs, as occurred in Iraq in 1948, in Egypt in 1952 and in Dr Mossadegh's Iran. There are only two methods of ending a plight in which, in the last resort, a mob is master. The one is to ride roughshod over it in the style of a dictator, the other to attempt the statesmanlike course of dispensing with cant, unmasking prejudice and explaining where the nation's best interests lie. Unfortunately, the Arab states possess very few statesmen endowed with the moral fibre, let alone the political backing, that is needed to put such messages across to unlettered crowds bred on years of fanaticism, bribery by rival factions, and periodic tastes of power.

It must be confessed that Nuri Pasha of Iraq, in taking the step that he has taken, approaches the technique of dictatorship. His generation is out of touch with Iraq's rising middle-class, and the last Iraqi elections conceal the fact that he does not enjoy nationwide support; since then, his government has given short shrift to Communist and left-wing groups. Yet he has not ridden roughshod over all educated opinion; there is support in important sections of a younger generation of Iraqis for the idea that abandonment of neutrality is now in the country's best interests. The theory was advanced by the prime minister of a year ago, Dr Fadhil Jamali, but his cabinet of young men was not strong enough to implement it other than by the acceptance of American aid in April, 1954. This month, during the debate on the budget, the minister of education, Khalil Kenna, who also belongs to the younger generation, advanced logical arguments for a positive line such as Turkey's, as opposed to a negative one of drift into a "political vacuum of neutrality." Perhaps, therefore, the opinion of a few reasonable Iraqis will prevail over the impulse of the multitude of unreasoning ones.

If so, there will be justification for Mr Menderes's belief that the Arab world needs a dose of brusque home truths. He is shortly to visit Egypt. Will he be able there, too, to brush aside the argument that only time can bring awakening to the realities of modern defence? Will he cause Colonel Nasser, as he has caused Nuri Pasha, to act on the basis that there is no time to spare? Whether realism or prejudice will conquer in Cairo may be discernible at the meeting that the Egyptians have called for this weekend. For, although Egypt is nettled at losing the initiative to Iraq, it can pride itself that the fate of any Arab move towards an effective regional defence policy lies in its hands. Upon the lead it gives now will depend whether the Arabs emerge from their dream-world about defence, or dawdle on, clad in prejudices that fit like an old jacket but that are, like most old jackets, out of date.

The Taxation of Personal Incomes

A Second Reading

THERE are rumours that the Final Report of the Royal Commission on the Taxation of Profits and Income, which will inevitably deal with very far-reaching matters, will be published before the Budget. This is, therefore, probably the last opportunity for taking a second look—at greater leisure than is possible on first publication—at the commission's second interim report, which appeared last spring and was the subject of an article in *The Economist* of May 1, 1954. This interim report* was entirely devoted to the taxation of personal incomes. Apart from a number of minor points, it dealt with two main subjects. The first of these was whether the present system of pay-as-you-earn could be changed into something much simpler and perhaps more comprehensive. The second was whether the present structure of personal, children's and earned-income allowances should be reformed. On the first of these main subjects the commission was unanimous; on the second there was a memorandum of reservation from four members.

The objective of simplifying the present very complex (and, to the ordinary man, quite unintelligible) system of PAYE has a wide and obvious appeal, not least to the employers of labour who have to pay for the great volume of paper work. It is a further and equally attractive idea that income tax should not only be simplified but also amalgamated with national insurance, so that the citizen, instead of engaging in several complex financial transactions with the state, in some of which he pays and in others receives, would have only one comprehensive and intelligible accounting. The Royal Commission disappointed both these hopes, both the wider and the more moderate. No one who reads the report can fail to be impressed both by the unanimity of the commissioners and by the force of the arguments they use—which can perhaps be summed up in the one that no scheme that is simple could be fair, and none that is fair could be simple. He would be a bold man (or woman) indeed who stood out against the wider conclusion, that the linking of income tax and national insurance would create more anomalies than it would remove. But this has always been the most complicated and controversial part of the simplifiers' case, and many of those who have seen its attractions have always hesitated, without expert opinion, to pronounce on its practicability.

On the more limited issue of simplifying PAYE,

however, it seems much more legitimate, though it be at the risk of *lèse-majesté*, to entertain continuing doubts whether even a unanimous commission has quite disposed of the subject. The technical apparatus built up by the report, out of materials supplied—and one suspects in largely pre-fabricated form—by Somerset House, is as intimidating here as elsewhere. But there are one or two considerations that can still be urged on the other side. The most powerful of these is that, to those who remember the history of PAYE, it is simply contrary to common sense to believe that the present system is perfect—or, if not quite perfect, the only one possible. For a long time, the Inland Revenue declared that no system of PAYE at all was possible without treading on the toes of its two favourite monsters—the Gog and Magog of Somerset House—Administrative Difficulty and Individual Equity. The arguments used to justify this obstinacy of negation were no less impressive in their marshalling of technicalities than those that are now employed to defend the inviolability of the scheme that was then declared to be impossible. Then, when the pressure became irresistible, it was discovered that it could, after all, be done. Is it reasonable to believe that the transition from impossibility to perfection was completed in one jump?

Moreover, though brevity and concision are great merits in an official report, the Royal Commission's discussion did not by any means cover all the methods of simplification that could be suggested, or that were in fact suggested to it. As one reads this section of the report, the suspicion keeps creeping in that the underlying angle of approach was not (as it should have been) "How can this problem be solved?" but "How can these objections to the present system be answered?" When administrative difficulties are mentioned, for example, it is usually the administrative difficulties of the Inland Revenue that are meant, not nearly so often the very great burden now imposed on the employers of the country. It would be a great pity if, on this subject, the report were taken as the last word.

When it turned to its second main subject, that of the re-casting of the personal allowances, last April's report revealed a difference of opinion between the majority of ten members (including the chairman) and the minority of four, who can properly be called the Labour representatives. All the commissioners agreed that the present structure of allowances was defective in three

main respects, all three of them arising out of the sharp fall in the value of money since prewar days—or, more accurately, from the failure to re-adapt the structure, year by year, in pace with the fall in the value of money.

We doubt [said the minority, but not in this in opposition to their colleagues] whether, if it had not occurred as an automatic and silent consequence of the inflation, Parliament would have sanctioned some of the changes in the incidence of taxation that have, in fact, taken place. . . . We doubt, for example, whether the needs of revenue could justify the fact that the married man with two children who, before the war, on a prewar income of £400 a year, paid an identical amount of tax as the single man at £150 a year and the married man at £250 a year should now [the report is assuming an exact halving of the value of money] be asked to contribute, on the same real income, more than three times as much as the corresponding single man and one-and-a-half times as much as the married man. Equally, revenue considerations would hardly justify raising much the same amount of additional taxation from the man with a postwar income of £1,000 a year, irrespective of whether he is single, married, or married with two children—with the result that the burden of the postwar tax is six-fold the prewar tax in the case of the married man with two children, two-and-a-half fold in the case of married persons without children, and less than two-fold in the case of single persons.

So stated, these are obviously intolerable lapses from equity, and accordingly the whole commission was agreed in recommending (i) that there should be a wider zone of exemption at the bottom of the scale (but ingeniously so arranged that it would affect only those small incomes for which it was designed); (ii) that the children's allowance should be increased, and transformed from a single lump sum into an allowance that would be at least in part proportional to income, and would apply to surtax as well as to income tax; and (iii) that the earned income allowance should have a considerably higher limit. The particular figures proposed are of secondary interest, since they are properly a matter for the Budget, if and when the principles of the proposals are adopted.

So far, majority and minority were agreed. The formal matter on which they parted company was whether or not the proposals should be self-balancing—that is, whether every proposal for a concession to any group of taxpayers should be matched with a corresponding proposal for an increase elsewhere. But this really masked a more substantial difference. For if the proposals are not to be self-balancing, if they are to be presented (at least so far as this interim report is concerned) as involving a net cost to the revenue—which was the majority's view—then almost inevitably they will suffer from timidity. For example, the majority report discussed two schemes for an enlarged initial exemption. The larger, which was confessed to be the more desirable, would cost £56 million a year, and was

therefore rejected in favour of a much more modest—and thus, for its purpose, less effective—scheme costing only £8 million. But once there is a willingness to propose an actual increase of taxation on some groups of taxpayers, the proposals for relief to others can go much further.

Part of the minority's willingness to contemplate such increases—but only part—obviously arose from the class consciousness of their party. The grudging nature of their acceptance of the need for raising the present limit on the earned income allowance and the animus against the £1,000-£2,000 group that occasionally peeped out of their discussion showed how exclusive was their sympathy with the burdens of the wage-earning classes. But these were incidental; on the whole, they made a bolder and more consistent attempt than the majority to meet the needs of equity in re-adapting the progression and distribution of the incidence of income tax on individuals. Thus they not only proposed the more expensive scheme of initial exemption that the majority merely thought desirable, but they made no bones about paying for it by lowering the allowances of single persons and childless couples and by stepping up the rates at which tax begins to be levied when the exemptions are exhausted. Similarly, the proposal to extend the children's allowance, proportionately to income, is accompanied by a proposal to reduce the personal allowances of single persons with incomes of over £1,000. Here again, it is not so much the actual figures that matter so much as the thinking behind them; and it is difficult to resist the conclusion that, if there is to be any return even to the prewar standard of equity as between one class of taxpayer and another (not that the prewar standard was necessarily perfect), something much more far-reaching than the majority's proposals will be needed.

Which line of thought is politically more realistic is not easy to decide. Which is it easier for a Chancellor of the Exchequer to carry through, a re-adjustment of allowances that imposes no extra tax on anybody but costs a lot of money, or one that costs nothing but involves raising the taxes of many hundreds of thousands of people? The answer, no doubt, is that it all depends on what is happening at the time to the standard rate. If a "self-balancing" scheme were carried through in a year when the Chancellor could also reduce the standard rate, it could be devised to provide the maximum of relief where relief is needed without actually increasing (but equally without reducing) the tax on any bachelor or spinster.

Conceivably, this is just such a year. If, therefore, Mr Butler is thinking of incorporating any of the recommendations in last April's report into his 1955 Budget, it is to be hoped that he will not be led by the party colouring of the minority reservation to close his eyes to the merits of its proposals.

* Cmd. 9105. 4s. 6d.

Notes of the Week

Peking's Blind Eye

AT the end of last week the Notes exchanged between Washington and Taipeh on December 10th were made public. This delay of a month in giving chapter and verse for the American claim that the new pact with the Formosa government is fundamentally defensive has been a pity. It was no doubt dictated, amongst other things, by Chiang Kai-shek's own attitude and by domestic political considerations in the United States, aggravated by the Chinese imprisonment of the American airmen. But the delay has enabled the Chinese Communist regime to ignore Mr Dulles's original unsubstantiated statements that America would not back any Nationalist attack on the mainland of China. And Peking has made hay while the sun shone. Now every effort must be made to see that the American security guarantee to Formosa is accepted in its proper setting and to emphasise that, if the Peking regime were willing, a major cause of tension in the Far East could be removed.

With this in view, President Eisenhower and Mr Dulles have this week given dramatic evidence of the new twist in American Far Eastern policy. At the President's press conference on Wednesday, he went beyond Mr Dulles's statement of the previous day in calling directly on the United Nations to attempt to arrange a cease fire between the Chinese Communists and Nationalists. This novel suggestion reflects a determined moderation in Washington, which will not only strike a new note in America itself, but will certainly chasten the firebrands in Formosa.

Far from moderating their own actions, the Communists have this week let their creeping aggression against the Nationalists go a stage further. They have attacked and apparently taken the small island of Yi Kiang Shan, one of the Tachen group 200 miles north of Formosa. This is a relatively unimportant stage in itself; it certainly does not prejudice the actual defence of Formosa. But it is significant of the Communists' determination not to let matters rest and to probe their enemy's military and political position at every possible point.

Thus, in any review of the present situation, two factors should not be forgotten. On their side, the Americans have now laid it down in black and white where the line is that the Chinese cannot overstep without directly involving the United States. On the Chinese side, however, there still appears to be a kind of reckless determination to ignore consequences. This may win revolutions at home, but abroad, in present circumstances, it cannot fail to carry a continued and much wider risk of war than the men in Peking yet seem to realise.

Nervous Return

MINISTERS cannot be relishing the prospect of meeting the House of Commons again next Tuesday. In the next few weeks they will face an ever-lengthening list of awkward issues—rail pay (coupled with the general financing of nationalised industries), the Road Traffic Bill, immigration from the Caribbean, farm prices and the length of national service. On not one is there much political credit to be gained, on several there is quite a lot to be forfeited, and on at least two—national service and farm prices—major electioneering points may be involved.

It is the Government's bad luck (or bad judgment) that on the very day Parliament reassembles one item of business arranged for the Commons—the second reading of the Transport (Borrowing Powers) Bill—will presumably allow MPs to raise the whole question of railway finance. Tory backbenchers are clearly in two minds about the railway dispute. Some accuse the Government of "appeasement" and talk darkly of the need for a "showdown" (whether with their own leaders or with the railwaymen is not always clear); others feel that nothing would have done the party more harm electorally than a national strike. The first group is the more thoughtful, and the second more numerous; but if the Minister of Transport really started an efficiency drive that annoyed the National Union of Railwaymen, both might unite to remind him that the election may be only a few months away.

Nor do the Tories see much chance for profit in the other issues now pending. The annual farm price review will take place next month under the shadow of a swing to Labour in the by-election in South Norfolk. Also next month there will be the annual Defence White Paper, and Labour is likely to try to give the impression that it would cut national service sooner than this Government will; the Tories are under no illusion about the trouble that might cause them at election time. Among the other questions now looming, the Road Traffic Bill, which seemed harmless at first reading, is now arousing intense irritation among affected interests in the constituencies; there is certainly a case for looking closely at the powers which the new inspection regulations might put in certain private garage owners' hands. There will also be trouble about the immigration of Jamaicans. Altogether the business ahead looks so chilling that some Tory pessimists are wondering if the tide which has borne them along so easily for the past three years may at last be about to turn. There is no reason why it should be; but, unless Labour's leaders touch new depths of impotence, Ministers should have reason—and perhaps this will be a good thing for the country—to grow heartily sick of this session before very long.

South Norfolk's Significance

THE Conservatives held on to their seat in the South Norfolk by-election, but by a majority of only 865 compared with 3,239 at the general election in 1951; there was a swing of 3 per cent of the total poll towards Labour. In part, this Labour gain may have been due to the conviction and imprisonment for fraud of the previous Conservative member; despite what has been called the "sporting nature" of British politics it is a fact that in each of the other three by-elections since 1945 at which the previous member had left the House under some sort of a cloud, there has been a swing against the offender's party larger than the current trend. But the suspicion remains that part of the swing last week was due not so much to past fraud as to a dissatisfied farm vote.

If the Government's gains at other recent by-elections have been purely urban phenomena, Labour's election prospects could be brighter than the Tories at present like to think. If the old constituency boundaries are used as a measuring rod, there are 57 Conservative seats that Labour could win with a swing as large as it marked up at South Norfolk last week. Of these, 26 are county seats, including about a dozen in which the agricultural vote is particularly important; indeed three of the five Tory county seats in Norfolk itself were won from Labour only in 1951, with much smaller majorities than the erring Mr Baker had secured in the constituency fought over last week.

On the other side of the medal the Conservatives have hitherto warmed themselves with the thought that if they could gain an additional 3 per cent of the poll from Labour compared with 1951, they would also (by coincidence, the figure is the same as for Labour) win an additional 57 seats; of these, 21 are county seats, although it is true that in only two or three (including one in Norfolk) does the agricultural vote seem really important. All this arithmetic is rashly based on a single by-election fought under arctic weather conditions; but the real significance of South Norfolk—and it is very unfortunate—is that, as the annual farm price review approaches, a swarm of nervous Tories will be buzzing agitatedly in the Minister of Agriculture's ear.

... Parcere Subjectis?

THERE are two main reasons for trying once more to get the Mau Mau terrorists to give themselves up—one good, the other not unimportant. The good reason is that if they are hard-pressed by troops combing the forests to which they are now confined, they may at last be prepared to surrender *en bloc* on promise of an amnesty; and thus a vile conspiracy, which is daily costing blood, treasure and growing bitterness, will come away at the roots. The other reason, which is not unimportant, is that this offer—the third of its kind—shows a critical world that Britain's first intent is not to kill some thousands of degenerate and murderous but misguided savages, but rather to heal the miseries of a tribe and bring back peace and security to a

colony. No question arises of returning those that surrender to society; they must be segregated. But if they are to be unreservedly condemned to the death penalty, which they all almost certainly have incurred under emergency legislation, they have no incentive but to sell their lives as dearly as they can. Some—perhaps many—of them may still decide to fight it out, either because they are suspicious of the government's motives, or because they believe in their cause, such as it is; or even because they prefer a short but vivid life of violence to penal servitude until death. But that does not detract from the wisdom of trying another offer timed to coincide with "Operation Hammer"; according to reports, the leaders of the Loyalists have endorsed the decision, and have not seen in it any betrayal of their interests.

This was, too, the right moment to arrange an amnesty for past misdeeds by Loyalists themselves, coupled with the warning that the law must in future be observed and Mau Mau prisoners or suspects handed over to the prescribed processes of justice, whatever the risk that "smart lawyers" may get them off "on technicalities which Africans can't understand." It was inevitable that many white settlers—equally inevitably led by Mr Humphrey Slade—should protest vigorously at any further attempt to end a process of attrition on "an eye for an eye" basis. There is this to be said for their view: the new offer to the terrorists is an attempt to put a quick end to an African obsession which, in the nature of things African, requires time to subside. It may therefore fail; yet the government will have sought to parley with murderers. This to many settlers is the maddest way to try to govern Africa. But their undisciplined reaction does their cause no good; and the government is right to take the course it judges most likely to end the revolt without breaking faith with those who have suffered and stood firm.

Fairly Quiet on the Western Front

"WE shall do our best to contribute ideas that can be helpful." Sir Anthony Eden could well have a worse epitaph than these words from his broadcast on Monday night; they express much that he has genuinely tried to do as Foreign Secretary. As broadcasts go, however, this one fell rather flat both in delivery and content. The occasion, on the other hand, has become of some interest. About a year has elapsed since the Foreign Secretary last took a quarter of an hour of the BBC's time after the nine o'clock news, and the idea of a broad review of foreign affairs every now and again is a good one. There are two difficulties about it. One is that a rather special Rooseveltian fireside manner is needed to make such an official statement readily palatable. The other is that the BBC justifiably rejects any claim that even the Foreign Secretary has a right to broadcast whenever he likes. His talk must not gain purely party advantage by taking place, for instance, just before an important foreign affairs debate or when public opinion is facing a crisis.

In Western Europe's internal affairs there is at present something of a political lull, and it was characteristic of Britain's attitude that the words quoted from Sir Anthony

Eden were applied to the current discussions in Paris about the French proposals for a European arms production pool. In Rome last week M. Mendès-France gained cautious Italian support for his proposals; this was followed over the weekend by a rather more constructive German attitude which emerged from the French premier's talks with Dr Adenauer. On Tuesday the Paris discussions were adjourned till Friday after everyone, including the French, had made it plain that, while there was no general basis for agreement, no one would think of breaking off the negotiations.

Although the question of a European arms pool will almost certainly take a long time to settle, it looks like being one in which the process of negotiation could consolidate rather than divide the interests of the signatories of the Western European Union. In these conditions the pragmatic Eden approach is at its best.

A Liberal German Arms Plan

THE real star at the Black Forest meeting of Dr Adenauer and M. Mendès-France last week proved to be Dr Erhard. The federal minister of economics was present with a German alternative to the French draft of an arms production community. This has been "sold" to Dr Adenauer and will be considered by the representatives of Western European Union in their talks on the arms pool in Paris. Very little of the Baden-Baden conversations has been revealed, but the communiqué conveyed the impression that M. Mendès-France had not been displeased by the German case. It spoke of "the necessity of standardising arms in consultation with Nato and of exchanging production programmes in order to co-ordinate them and to achieve the best use of resources as well as the reduction of costs—cartels and restrictive agreements being excluded."

The German proposal was drawn up after consultation with German industrialists who say they want a division of labour in arms production, but not one planned by a "supranational bureaucracy." It reflects the liberal policy of Dr Erhard and is, by and large, a version of the agreement he has reached with the future defence ministry in Bonn on ways by which Germany can manufacture arms without reintroducing a system of state controls. It also avoids setting up a new organisation which could discriminate against Germany by majority vote. In short, Dr Erhard seems to have proposed something no more rigid than the steel committee of the OEEC.

Dr Erhard's ideas seem, from what is known of them, an improvement on the French proposals. If German heavy industry is ready to co-ordinate its plans with the French—and, it is to be hoped, with the British and other members of the western alliance—this will after all be a radical improvement on any previous situation in the last few hundred years. Critics might bear the thought of earlier times in mind if they find Dr Erhard's plan falls short of the ideal, or suspect that when two or three industrialists get together, the result is always a cartel.

The Baden-Baden talks also touched on the efforts to increase Franco-German trade which were started as the result of the October conference between the heads of the

two governments. Progress has been made. The Germans have agreed to buy 500,000 tons of French wheat; the previous hand-to-mouth trade pacts have been extended to six months, and talks on a three-year treaty will start in March. Furthermore, a Franco-German chamber of commerce has been set up; and, for their part, French and German members of their respective federations of industry have held a meeting of their joint committee in Paris. Things on the Franco-German business front are moving, not sensationally, but perceptibly.

The Sahara for the Saar?

THE French, some critics say, are offering the Germans the Sahara in exchange for the Saar. In point of fact, the latest talks do not appear to have given shape to the vague French ideas of joint development projects in North Africa. Equally, the Germans do not seem to have gained any compromise on the Saar out of the Baden-Baden talks between Dr Adenauer and M. Mendès-France. The two statesmen are being commendably reserved on their conversations in order not to upset their parliaments, but it has been made clear that they dealt only with elucidating the terms of the Saar agreement, and not with any changes in Germany's favour.

It is perhaps ominous that the talks on the economic aspects of the treaty were postponed. This suggests that M. Mendès-France did not fulfil German hopes of better economic relations with the Saar that were aroused at the time of the original agreement. Fears have even been expressed in Germany that the French are about to sign a separate economic pact with the Saar government which would show how tightly they intend to keep the territory in their grip. Even if these suspicions are not realised, the Saar agreement still does not look the kind of stable arrangement that the British and Americans could safely guarantee.

Gestapo at the Grate?

ONE of the depressing features of the Parliamentary programme ahead is that at least three private members are to introduce bills that should never have been considered suitable for private members' procedure. Unfortunately, the bill that is to be considered first—it will be introduced by a Conservative, Mr Nabarro, and is supported by an alarming number of normally far-sighted people from both parties—looks like being the worst of the lot. It will apparently seek to enforce eight of the twelve recommendations of the Beaver committee on air pollution—all those that a private member's bill could enforce, because they do not involve Exchequer assistance.

There are three points to be made. First, although most people agree that there will have to be some official action to cleanse the air of smoky fog, a large body of opinion is very dubious of the particular recommendations in the Beaver report; among other things, the committee inclined heavily towards controls and never towards the price system, and it envisaged a vast increase in consumption of coke which is not in fact there to be consumed. Secondly, even if these and other criticisms of the Beaver report are unfair, Mr Nabarro—and those who signed their support to his Bill—seem to have given themselves little time to study them; their intention to introduce this bill was announced almost immediately after the report was published. Thirdly, when complicated measures of this kind are in prospect—which could give sweeping new powers to local authorities, affect a large number of industries, and even introduce an army of inspectors to domestic firesides—it is important that Ministries should have reasonable time to weigh the issues and consult the parties concerned. The interval since the publication of the Beaver report, with Christmas intervening, has been precisely seven weeks.

The Government is so scared of being accused of favouring foul air that it may feel compelled to rush out proposals of its own in answer to Mr Nabarro's bill, quite possibly in the course of the next week; in this case, as so often with the initial draft of control measures in this Parliament, they will be ill-digested proposals, and it will not be at all surprising if they do not work. This is not the sort of prodding that shows brisk Tory backbenchers at their best. The proper advice to give the Government is: take as long a time as you need, work out the safeguards and possible incentives very carefully, and determine that—although smog control is urgent—there will be no lack of thought about a measure that might introduce a gestapo to our grates.

Driving Tests Under Strain

THERE is certainly no truth in the rumour that the Ministry of Transport is thinking of abolishing the driving test, or that it intends to waive the regulation whereby learner drivers must be accompanied by an experienced driver. It is however true that the machinery of driving tests has been allowed to come perilously near to

breakdown. The number of applicants for driving tests has risen from some 570,000 in 1953 to 836,000 in 1954 (partly because of the popularity of the autocycle), but the number of examiners has remained more or less constant at about 500. The result is that there is usually six weeks' delay between applying and being tested, and this waiting period threatens to become even longer. It is also possible that, in some areas, the standards of the harassed examiners are slipping so that they are becoming more likely to pass dangerous drivers out on to the roads.

Some steps are being taken to remedy this state of affairs. The new Road Traffic Bill seeks to extend from three to six months the duration of a provisional licence, and would make it possible to turn away the persistent applicant who seems unlikely ever to pass the test. The Civil Service Commission is about to hold a competitive examination to recruit another 160 examiners; it may be asked to recruit more later, and at present salary levels (the inclusive rate in London starts at £544 and rises to £650, with rather lower rates for women and for examiners in the provinces) the Ministry of Transport seems confident that the job is attractive. The easiest and most obvious step of all, however, has still not been taken. The fee that is charged to the learner-driver for a test is a mere 10s., which is actually less than the test costs the Ministry of Transport to run. On every conceivable ground—to discourage the large number of applicants who "have a go" when they know they are not ready, to make a profit out of a service for which there is booming demand, and to pay higher salaries if these should be necessary to attract examiners of the right type—the fee should clearly be doubled or trebled at once. Legislation accumulates, waiting lists lengthen, expensive expedients are used. Must the price system always lag behind?

Mr Manley Wins Jamaica

MR MANLEY and his party, the People's National Party, have been elected to rule Jamaica on a comprehensive policy, but not in any sense on an extremist one. The PNP's manifesto, though it promised action in almost every field—educational, industrial, agricultural and political—did not "promise the earth"; indeed, it alleged that the outgoing chief Minister, Mr Bustamante, had done that at previous elections. Mr Bustamante's electoral appeal was in effect a reliance on the slogan "Trust the Old Firm"; but, after ten years of power, he has had to accept the almost inevitable electoral decision in favour of trying a change. His period of office has shown that it is not always wise to distrust the picturesque. Under his administration, though there has been some corruption, Jamaica has certainly made more progress agriculturally in the past five years than it did in the previous twenty; schools were being rapidly built at a cost per place lower than anywhere in the Caribbean; and the Jamaican Industrial Development Corporation had backed schemes for small processing industries to the tune of some £100,000.

But all this left much of Jamaica's grinding poverty, under population pressure, untouched. Nevertheless, Mr Bustamante has probably retained the support of the very

poor; the big majorities for Manley candidates were largely the result of urban and middle-class backing, and the splitting of the vote by the otherwise unsuccessful Farmers' Party. Mr Manley, with a majority of four, now has to implement his mandate; his first move has been to plan a Ministry of Production, which in fact seems to be more of a production advisory council with local business representation. Quite how it will fit in with the Industrial and Agricultural Development Corporations is not yet clear; but its creation shows awareness of the need to maintain the rate of Jamaica's development.

Mr Manley is likely to insist on maintaining the rate of Jamaica's advance to self-government no less; in fact he will want a rate ahead of other Caribbean colonies, and therefore a rate that may make some difficulties for federation. But the PNP backs federation, and Mr Manley personally is acceptable to the leaders of the other islands. There seems good reason to hope that the PNP policy on most matters will be realistic; and any residual irresponsibility may be a small price to pay for having established, in another British colony, a democratic tradition of "ins" and "outs."

Atoms for Peace-lovers

EVER since Mr Eisenhower presented his "atoms for peace" plan to the United Nations Assembly in December, 1953, the Soviet government has felt it to be a thorn in the flesh. How could Marxist verbiage explain away the fact that the "imperialist warmongers" were offering to use their skill and resources for the benefit of all mankind, while the Soviet Union, which claimed to be ahead of all other countries in exploiting atomic energy for peaceful purposes, had nothing to offer and, indeed, emerged as the main obstacle to the progress of the plan? When the United States and Britain pledged specific quantities of fissionable material to the world pool last year, the Communist dilemma was intensified. Russia's claim to have started up a power station using atomic energy might have been more readily accepted by other nations if Russia had also pledged a few kilograms of uranium to the pool. Instead, silence reigned in Moscow.

This week, however, the Russians set out to regain lost ground. On the eve of preparatory talks in New York for the world conference on atomic energy that is to be held in Geneva this summer, they announced that they would present at Geneva a report on the operation of their 5,000 kW atomic plant. There was no suggestion that they would let foreign scientists see this plant, the very location of which is kept secret; but at least a shrewd propaganda blow had been struck.

Three days later came a second: the Soviet government announced that it was going to help China, Poland, Czechoslovakia, Rumania and Eastern Germany to build experimental atomic piles. For the past week the Communist propaganda network has made this example of Soviet generosity and good will a major theme in its worldwide output. It is undoubtedly a well-timed stealing of thunder. But some observers have been struck by the highly selective distribution of Moscow's gifts, and wonder

why Rumania should be favoured above, say, Hungary or Bulgaria. The answer is presumably to be found in the admission that Russia will obtain "raw materials" in exchange. Even among the satellites, only those that already provide Russia with uranium, or are expected to provide it shortly, appear to qualify. It would therefore seem to be highly optimistic for any non-Communist country to hope for one-way benefits under the new Soviet scheme. Only those willing to hand over their uranium need apply.

Signor Togliatti on Top

ITALY'S huge Communist party, claiming a membership of over two million, has been showing signs of unwieldiness. During the past week a party conference, the first since 1951, has been wrestling with problems which have lately looked like splitting the membership more seriously than at any time for over thirty years. It has been open knowledge for some weeks that the apparent moderation of the official party leadership under its secretary-general, Signor Togliatti, has met with strong criticism, not only from the rank and file, but also from some of his closer colleagues. Signor Togliatti has been accused of mental and physical incapacity for his position, of paying more attention to his latest girl friend than to party affairs, and of squandering the electoral successes of 1953, when the Communists and their fellow-travellers ran up a poll of over six million. These accusations have undoubtedly been helped by a general feeling that Italian Communist fortunes are slipping. Having come almost within striking distance of power, the party has now done less well than hitherto in trade union elections in the north, while its campaign for land reform in the south has been to some extent outflanked by the recent progress made under Christian Democrat leadership.

The outcome of the conference has nevertheless been to confirm Signor Togliatti in office, and to demote his main critic, the former vice-secretary, Signor Secchia. In reality it would have taken a fundamental upheaval to achieve any different result—though this is still not to be excluded for the future. The fact is that the dispute goes deeper than personalities. The Togliatti line has been Moscow's line. It has given priority to foreign questions over national ones; it has concentrated on attracting political allies rather than on standing alone; and it has been operated with "soft" tactics instead of a national campaign of violence. But its critics are no doubt genuinely alarmed about its effects on the party, and are burnt up with the desire to fight more vigorously for what they passionately believe in.

This is, of course, a very old dilemma for Communist parties, to which Moscow is normally quite insensitive and which it has usually been able to ride successfully. The question may well be, however, whether the special conditions in Italy—an unusually large and relatively undisciplined party, improving economic prospects, and a fairly wide support for the main lines of foreign policy—may not after all provoke an unusual crisis in the Communist ranks.

Red Red Tapeworms

MOSCOW'S Whitehall evidently has at least some features in common with less "progressive" bureaucracies. A biting article in *Pravda* last week revealed that Soviet officials have been skipping nimbly out of the way of the financial axe that was meant to descend on them. Although a drastic reduction in the staff of ministries and state organisations was ordered several months ago, the time limits set have long expired and the press is full of reports that the economy drive has failed. In some cases officials have apparently kept the same jobs while camouflaging themselves with more "productive" titles; in others, the old trick has been played of merely transferring staff to other departments. Out of 670 officials theoretically dismissed from the ministry of the oil industry, only 66 have in fact found their way to productive work "in the field."

Yet the very publicity given to these manoeuvres and the stern words with which they are rebuked suggests that the government intends to show no mercy to its servants. Ever since 1917 there have been periodic alarms about the parasitic growth of the bureaucracy, but the post-Stalin regime seems more determined than its predecessors. When Khrushchev announced his new agricultural policy he gave warning that about 100,000 specialists would be moved out of their cosy offices into the bleak countryside; and late last year it was proclaimed that thousands of redundant lawyers, scientists, economists and other officials were to get the sack, two or three months' compensation, and one-way tickets to the Urals, Siberia or the Far East. The government is seeking not only financial economies, but also manpower for factories and farms, particularly in the under-developed parts of the Soviet Union.

Many civil servants, abruptly exiled into remote and barren lands during a Russian winter, must already be pondering on the illusive security and power they once thought they enjoyed. For an uprooted commissar labouring on a Siberian farm, neither three months' compensation, nor Mr Khrushchev's praise of the comforts of life in a mud hut, is likely to prove very consoling.

Frustrated Cities

BRITAIN'S largest cities—London, Glasgow, Manchester, and now Birmingham—are rapidly running out of housing sites; but they have been told with increasing firmness by successive Housing Ministers that they must not go on building in their surrounding green belts. The official remedy—reiterated by Mr Sandys at Birmingham last week—is that their surplus population and industry should be shifted to new or expanded towns some distance away. This advice got a chilly reception at Birmingham, which—like Glasgow, but unlike Manchester or London—is unwilling to contribute to the cost of resettling its citizens in areas where they will no longer contribute to the city's rates or work in its industries. Birmingham

apparently intends to ignore the Minister's warning and is preparing plans for development in its green belt.

The only large authority making progress under the Town Development Act is the London County Council. It has now almost concluded arrangements for housing Londoners at Swindon, Bletchley, Daventry, Basingstoke, Ashford and, less certainly, at Letchworth and Peterborough. These towns are between 30 and 75 miles from the capital, but have good communications with it; this should facilitate the transfer of industry, which the LCC is now busily trying to promote at the British Industries Fair. The council has seven other schemes still under consideration, but the latest indications are that they may be shelved; in particular the development of smaller towns—from which much was originally hoped—has bogged down in financial and industrial difficulties.

Some big cities are undeniably less far-sighted than London. Glasgow has declined to pay part of the cost of the proposed new town at Cumbernauld, although the town is urgently needed for Glaswegians and the city would be given a share in its management. Birmingham seems reluctant to lose a single factory, although the city looks like being choked by a recent renewal of large-scale industrial growth. But, willing or not, no city—London included—can be expected to carry through the desirable

America and the War

The notice we took last week of the proposed mediation of the States referred to the views chiefly of the commercial classes. In the States, however, as in most other countries, the political parties are very different from the great interests. . . . Since 1783 the immigrants from all parts of Europe have carried with them the opinions and prejudices of their respective birthplaces, and if many of them have imported the feelings of the English, a still greater number have taken with them the exasperated opinions and feelings of the Irish and of all the republican and revolutionary parties of Europe. They, with a great portion of the more noisy and bustling natives, are the men who seek public distinction rather than wealth by patient industry, and constitute, as distinct from the national interests, the political party. . . . As England has given no support to the many revolutions that have been attempted in Europe, she has latterly gone backward in their estimation; she has disappointed their hopes; and though they may hate the Czar, the Kaiser, the Emperor of the French, the King of Prussia, and all the monarchs and Governments of Europe, they hate England, too. Though the Government of England be on good terms with several of the Governments of Europe, none of the political parties in Europe, opposed to the Governments, love England, and the general dislike, perhaps we may say envy, of such people in Europe taints the opinions of the political parties in the States. Hence many of the journals of the States—mere echoes of traditional hatreds and of the disappointed feelings of the republicans and refugees of Europe—are filled at all times with diatribes against England; and hence some of them now are more disposed to court friendship and alliance with Nicholas than friendship and alliance with England. We are thoroughly persuaded, however, that these noisy persons are merely politicians; that they represent none of the great interests of the States; and will not permanently, or for any great purpose, influence the actions of the Federal Government.

The Economist

January 20, 1855

policies indicated by Mr Sandys without Government backing and inducements. If the Government wants the big cities to cast their bread upon the waters, why does it contribute so lavishly to flats in city centres and so meagrely to "overspill" schemes? If it believes in some relocation of industry (essentially a national issue), why is it doing so little to bring this about? Until these questions are answered, Ministerial lectures to frustrated cities will continue to invite sharp rebuffs.

Fugitive Virtue

FROM the hubbub which has followed Mrs Margaret Knight's two radio talks on agnosticism, it might be supposed both that Broadcasting House in its corporate capacity had taken up the cudgels for Godlessness, and that lack of faith was a swiftly-striking and hideous disease from whose contagion a hitherto immune community must at all costs be protected by a *cordon sanitaire* of silence. Were the BBC's monopoly powers used to plug atheism, to the exclusion of any reply, there would indeed be cause for alarm; could the doctrine of "clear and present danger" be invoked, in this instance, as an acknowledged limit to the right of free speech, there would be cause for action. There can hardly be any complaints, however, that Christian spokesmen have lacked, or are likely to lack, opportunity to deal on the air with Mrs Knight's "stale rationalist arguments" and educational deductions; nor are the dreaded results of atheism (as manifested in Nazi Germany or Soviet Russia) any likelier to arise from Mrs Knight's talks than a Thirty Years' War is likely to break out as a sequel to Protestant and Catholic apologetics.

The BBC deserves congratulations on its long-delayed courage; and the first to offer them should not be any of Mrs Knight's fellow-agnostics, but the Churches themselves. The Churches are confronted, as an undeniable datum of modern society, with the tacit or explicit abandonment of faith, not only by obviously irresponsible, foolish and ill-conducted people but by innumerable individuals no worse, in any other respect, than the average. In their efforts to counter this drift the Churches are hampered above all by sheer impenetrable public indifference. To make Christianity a live talking point is an essential step towards making the truth about it a living element in the public consciousness. Mrs Knight's talks, whatever one's view on the quality of her arguments, have done more to that end than half a dozen exemplary sermons listened to with the same half-ear as endures the visibility forecast for Rockall. If certain churchmen have recognised this—but it is hard to credit them with so much cunning—they have been wise to advertise her talks by their fuss.

Plea for St James's

THERE is general dismay at the proposal to convert the St James's and Stoll theatres into offices. Already, because of sales and blitzes, London has seven fewer theatres than before the war—indeed it is often hard to

find a home for a play. Of the two losses now threatened, that of the unbeautiful Stoll—although it is the only theatre in central London other than Covent Garden that can accommodate opera and ballet—would be the easier to bear. But the St James's Theatre was built in 1835, is charming architecturally, and has historical associations with famous managements. Why, then, has the London County Council's town planning committee given its consent in principle to its replacement by a block of offices?

The LCC's answer is, first, that the plan to convert it does not clash with its zoning for the area: all this means is that offices are allowed although a factory would not be. But the council has the power to make a building preservation order if it thinks this would be desirable. It has prepared for the Minister of Housing a list of the buildings that it considers to be of historical or architectural interest. It has graded these into three lists in order of priority for preservation—and St James's Theatre is placed in Grade 3. The Minister, on his side, is required by the Town and Country Planning Act to publish his own list of buildings that should be preserved. This is in two parts. The first has statutory force, and no building contained in it may be touched; the second, the supplementary list, merely names buildings whose architectural or historical qualities must be considered before permission is granted to interfere with them. The lists for the City of Westminster will be published shortly, and it will be surprising—not least to the LCC—if St James's Theatre does not appear in the supplementary part. But the council, presumably, has already considered this probability, and would rescind its decision only if obliged to do so by the inclusion of the theatre in the statutory list. If there is a loud enough outcry, however, the Minister may think fit to call in the planning decision (which he can do so long as final approval has not been given by the LCC) and pronounce on it himself. If the planning regulations have any value it was largely because they were intended to prevent despoliations of precisely this kind. It thus becomes a duty to make a fuss.

Two Lessons from Costa Rica

SPEED is often the most vital factor in the prevention of international conflicts. The example set by the Organisation of American States in handling Costa Rica's complaint should be recalled every time any international body has to deal with a similarly threatening situation. Delay and hesitation on the part of such bodies encourage a potential aggressor to get in so deeply that he cannot draw back without humiliation, and they allow bloodshed and anger to mount to a point where warning words are no longer heard. Admittedly the danger with which the Council of the OAS had to deal was one of limited proportions; the government of Costa Rica was menaced only by a few aircraft and small lightly armed columns. But even these modest forces constituted a clear danger to a pacific and almost weaponless state of only 800,000 people. The principles of peace apply equally to states large and small, and the OAS's swift action was no less commendable because it was relatively easy.

A by-product of the organisation's promptness was the flummoxing of the Communist spokesmen throughout the

MORE POWER AT LOWER COST

To add power to an existing diesel installation the simplest and most efficient way is to fit a Napier Turbo-Blower. On a 2-stroke engine power output goes up by more than 50%. A 4-stroke diesel fitted with a Turbo-Blower develops as much power as two similar, but unblown, diesels. And both power gains are made at a lower specific fuel consumption.

The Turbo-Blower is a good example of the Napier principle: more power at lower cost.

D. NAPIER AND SON LIMITED LONDON W.3

world, who, taking their cue from Moscow with automatic efficiency, had already announced that the Costa Rican rebels and their Nicaraguan backers were acting under orders from the United States. The same spokesmen had assured the world, only a few months ago, that the OAS was a United States tool; that, they explained, was why the Arbenz government in Guatemala refused its help last summer. Moscow must now supply its mouthpieces with a quick explanation for the odd fact that US aircraft and facilities have been unhesitatingly provided to enable the OAS to check an attack launched "by Wall Street's orders." The explanation will doubtless be forthcoming—Communist apologists are splendidly supple contortionists—but the lesson will not be lost on the world at large.

Tidying up the Strategic Embargo

RECENT changes in the strategic controls on exports to Communist countries have the effect of tightening up the administration of these controls without, however, adding to the list of items under embargo. This, in fact, is the second phase of the operation begun in October last year to streamline and simplify the lists agreed by "Cocom" (the fifteen-nation consultative group which co-ordinates the controls) while making them more effective. The Americans, in particular, should be gratified with the new

regulations, as they have long wanted to have these loopholes closed.

Two new steps have been taken. As from January 17th, all goods on the shortened embargo list passing through United Kingdom ports to the Soviet bloc, China and North Korea are subject to transshipment control. Moreover, since all the other members of Cocom have simultaneously instituted transshipment controls of the same kind, the entire western embargo system has been made more effective. Henceforth, any goods on the "stop" list which are transhipped through any Cocom country will require a special transit authorisation certificate issued by the authorities in the country of origin, if they are to pass through the net of export controls to the Soviet bloc or China. By this means it is hoped to stamp out the illegal trade in strategic goods, which, it is known, has been carried on in the past by devious and intricate transshipment of the goods through third countries.

The second new arrangement is in the nature of a tidying-up operation. From the same date, January 17th, special export licensing of British exports destined for Hongkong has ceased. This is a sensible and welcome move, for stringent export licensing has often in the past hampered normal legitimate exports of British goods to the colony. Frequently, the United Kingdom's controls, which were designed to prevent possible leakages of strategic goods through to Communist China, have been more strict than those maintained by other countries exporting to Hongkong. It is also a timely recognition by the British authorities that Hongkong's security controls are, for the most part, watertight.

Books & Publications

A Great American Humanist

THE SPIRIT OF LIBERTY: *Papers and Addresses of Judge Learned Hand*. Collected and with an introduction and notes by Irving Dilliard. Hamish Hamilton. 315 pages. 21s.

CERTAIN clichés used by the English in thinking about Americans are so widespread that they can virtually be called the settled English view of the American people. One such is the conviction that the mass mind has reached a further stage of development in the United States than anywhere else. The country *par excellence* of the "common man" has such standardised interests, amusements, activities, prejudices and fears that if you know one, you know them all. Moreover, the type that is produced is not, culturally, of a very high order. Technology and gadgets have swallowed up the higher things of life and the result, to quote the best loved cliché of all, is a society which has passed from barbarism to decadence without any

intervening phase of civilisation. Naturally these prejudices were triumphantly confirmed during the McCarthy era when the Junior Senator from Wisconsin not only appeared to be a symbol of barbarism or decadence (or both) but excluded most other Americans from the world's attention.

It is a pity that those who repeat the catchphrases most confidently are least likely to read the collection of papers and addresses of that great American jurist, Judge Learned Hand, now published together under the title of "The Spirit of Liberty." There they would find a personality, a style and a view of life as far removed from the common, trivial and the under-civilised mass mind as it is conceivable for a man to be. It is not simply a matter of urbanity and wit—as lively and on occasion as irreverent in his ninth decade as in his third—although the direction of that wit, towards modesty and self-depreciation, against pomposity and

platitude, is in itself an essential element in the wise philosophy of Learned Hand. The contradiction to the great clichés about America lies above all in the passionate concern for the freedom, the untrammelled idiosyncrasy of each individual mind that pervades virtually every page of this book. Judge Learned Hand seeks freedom in the ultimate sense of each man being free to discover his own nature and to develop himself not as a unit in mass society but as an unpredictable, unjudgeable, unclassifiable human being who is known only to himself and can be measured only by himself. Now this kind of liberty demands the utmost forbearance from everyone, for among man's dearest occupations is undoubtedly that of "making friends and influencing people"—attempting to mould others in his own image, squeezing neighbours into the social conformity of mass reactions and mass ideas. Yet while this process may give comfort, it does not give freedom. As Judge Learned Hand suggests:

The spirit of liberty is the spirit that is not too sure that it is right; the spirit of liberty is the spirit which seeks to understand the minds of other men and women; the spirit of liberty is the spirit which weighs their interests alongside its own without bias; the spirit of liberty remembers that not a sparrow falls to earth unheeded; the spirit of liberty is the spirit of Him who, near two thousand years ago, taught mankind that

lesson that it has never learnt but never quite forgotten: that there may be a kingdom where the least shall be heard and considered side by side with the greatest.

As these words suggest, freedom is not, however, the unfettered pursuit of individual preference. The freedom Judge Hand prizes is far from the freedom to concentrate solely on trivial pursuits or material success. "There is no democracy in human values, however each may cry for an equal vote. It is the business of the soul to impose her own order upon the clamorous rout." His own dedication is to such supposedly un-American activities as the arts, philosophy, the study of history, the cult of the curious mind, the practice of great "moral fealties." But these things are not worth much unless the individual soul comes to them of herself "to establish a hierarchy appropriate to the demands of her own nature." It is the second-hand, the glibly accepted, the mass-conditioned that is the enemy of freedom. Men must be themselves or they will not be free.

It is not surprising that such a vision of liberty—so far removed from the accepted notion of America's uniform thought and conditioned social behaviour—has consequences far beyond the personal sphere. Since its realisation is inconceivable save in a tolerant—and decent—society, Judge Hand's voice has been raised probably more eloquently than any other in the free world to denounce the evils of McCarthyism—evils which occur certainly not only in America but in any society where the doctrinaire and the ideologue are ready to beat in the heads of those who will not be their brothers. It is not only to Americans that these words might be addressed:

Risk for risk, for myself I would rather take my chance that some traitors will escape detection than spread abroad a spirit of general suspicion and distrust which accepts rumour and gossip in place of undismayed and un intimidated inquiry. I believe that that community is already in process of dissolution where each man begins to eye his neighbour as a possible enemy . . . where orthodox chokes freedom of dissent, where faith in the eventual supremacy of reason has become so timid that we dare not enter our convictions in the open lists, to win or lose.

This is the great tradition of Western civilisation, but in a stream of thought which Western civilisation has often lacked, to its appalling cost. The sceptical Erasmus, the tolerant Montaigne, the magnanimous Lincoln, each working against the grain of hard intolerance in his own age, come to mind in the reading of Judge Hand's papers, and it is to this select company of wise and charitable men that his contemporaries will assign him. As for the cliché-mongers, they can at least reflect that the society which produced McCarthy has also formed, advanced and honoured the most eloquent exponent of liberty and tolerance living our day.

Unfinished Journey

MAGNIFICENT JOURNEY: *The Rise of the Trade Unions.*

By Francis Williams.
Odhams. 448 pages. 15s.

IDEAS are one of the few commodities which normally sell better at second-hand, and it is certainly a most saleable packet of goods which Mr Williams has produced from brands formerly patented by Messrs. Hammond, Webb and Cole. Mr Williams is not to be blamed for following such excellent models, especially in view of the frank declaration of sympathies with which he prefaces his book. But it is a pity that he should have repeated, without qualification, their theories of the significance of the Industrial Revolution. These theories assume a pre-existing harmony of interests between the classes which was shattered by industrialisation and its accomplice, "laissez-faire materialism," which caused Parliament to abdicate its social responsibilities. These responsibilities, according to the theory, were then taken over by the nascent trade union movement. But the view that Parliament, throughout the long formative years of capitalism, recognised and exercised effective responsibility for regulating industrial relations and protecting the standard of living of the masses, will not stand serious examination.

The early part of Mr Williams's story is sketchy, where it is not inclined to be misleading. The necessary general historical background is mostly left blank, and the crucial twenty years between the collapse of Owenism and the rise of the "New Model" unions are passed over almost without mention, Chartism being disposed of in two sentences.

But as we approach the present day, the author's grasp grows firmer and the text fuller and more vivid. There is a very good treatment of the General Strike, which Mr Williams believes—probably correctly—will prove to have been the last great epic battle between labour and capital in this country. And he pinpoints what is surely one of the most significant developments of modern unionism—the rise during the last two decades of the TUC General Council to its present all-powerful position as the very shield and bulwark of Buisckellism. For this he gives full credit to that often underrated figure, Lord Citrine.

The present eminence of the trade unions is not without danger, as Mr Deakin is now finding to his cost. In an inconclusive final chapter Mr Williams shows himself uneasily aware that the present dual role of the trade union leadership may be a difficult one to sustain indefinitely. But he makes only a perfunctory attempt to assess the future. His purpose is to survey, entertainingly if not originally, the past; and most readers will feel that he has succeeded.

Marxism Analysed

MARXISM PAST AND PRESENT.

By R. N. Carew Hunt.

Bles. 191 pages. 12s. 6d.

CRITICISM of Marxism has often been less successful than it need have been because it tended to assume that to demonstrate logical weaknesses in any one part of it would be enough to bring discredit on the whole doctrine. Experience has shown that such intellectual power as Marxism possesses springs from the peculiar way in which the elements composing it are amalgamated into a system. It has shown that Marxism shares with other militant creeds the ability to present now one facet now another; and that when the enquirer has exposed a flaw in one he is immediately shown another, ostensibly flawless, one. The dialectic method, the materialist philosophy, the sociology of the class struggle, the economic interpretation of history (of a very special kind), a primitive Ricardian (or, rather, Smithian) economics, a revolutionary theory of the state: all these elements are to be found in the doctrine, and there are many traps for anyone who tries to show the limits of one, the primitive character of another, or the sheer nonsense in a third, without having the skill and the stamina to deal with them all in turn. For only in this way is it possible to dispose of the theory intellectually. The faithful will, of course, always have the refuge of the *credo quia impossibile*.

Mr Carew Hunt's new book is an excellent example of this more sophisticated criticism. Well-written, scholarly and temperate in manner, yet decisive in substance, it provides an admirable analysis for those who wish to buttress their condemnation of the repulsive aspects of modern Communism with an understanding of the errors of its intellectual foundations. It is based on a thorough and discriminating study of the "scriptures" and of later commentaries, notably of Lenin and Stalin, as well as of many critical writings not easily accessible to the general reader.

The book is especially well-informed and clear on the philosophical aspects. In particular, the shifts to which Marx and Engels and their followers were reduced in their attempts to have it both ways on the issue of determinism against the role of human action, or on the power of ideas against the inexorable march of the forces of production, are extremely well analysed. While more attention might perhaps have been given to recent developments so as to justify even more the last word of the title, the philosophical chapters, and Mr Carew Hunt's conclusion, bring out clearly that the force of Marxism derives from the fact that the inevitable destiny it predicts is in complete harmony with the conduct enjoined upon the believers.

The book is weakest on the economic aspects. The Marxian theory of value and exploitation, which played a vital part in inspiring continental Socialism and later Communism, is hardly discussed, and the reader is, therefore, left

with the wrong impression that the undoubtedly strong influence of Marxism in the labour movement has been entirely due to its extremely esoteric philosophy. Nor is there an adequate treatment of how this economic theory is combined with the sociology of the class struggle and the Marxian philosophy of history to hide the logical deficiency of each part by reference to the propositions of the other. While Mr Carew Hunt's discussion of Lenin's "Imperialism" is useful as far as it goes, his lack of attention to the economic aspect has prevented him from showing the barrenness of Marxian economics, the complete lack of any new contribution since Marx's original theory.

There are a few minor blemishes; e.g., a horrible new word "restructuring" and some misprints in German titles. Also, the translations on page 42 of the German words *bestimmt* and *bedingt* have been transposed.

Keeping out of Trouble

ESSENTIAL LAW FOR JOURNALISTS

By L. C. J. McNae.

Staple Press. 72 pages. 10s. 6d.

THIS is a textbook for journalists. It stems from a comparable work by Mr G. F. L. Bridgman published in 1938 and revised and extended to form the basis for a War Office correspondence course for journalists at the end of the war. This publication now brings its summary reasonably up to date, with the Defamation Act of 1952 included. As a textbook it is comprehensive and succinct. It begins with those courts, tribunals and public meetings to which the journalist has the right of access, continues with the restrictions on what may be published, including the deterrent of contempt of court, discusses defamation and the Official Secrets Acts, and ends with short chapters on copyright and publishing responsibilities. It is unlikely that there exists a journalist who would not learn something from it, probably to his advantage.

But it is also a textbook in that it accepts the law as it is. Its aim is to keep the innocent and the uninformed out of trouble; its tone is of one charting the dangers of life for the young man, not of one moralising on why such dangers exist or on whether what is conventionally described as a danger may not in reality be more of a challenge. That is as well; it would certainly not be helpful to attempt to combine these two functions in the same text. But it is hard to read this book without a suspicion creeping into one's mind that the liberty of the British press, our freedoms of writings and of speech, depend rather more on what might be called the constitutionality of our common habits of thought and behaviour than upon the strict words of the law itself. Given a change in the climate of thought, and the Official Secrets Acts and contempt of court together could close down our horizons to a considerable degree.

That possibility, too, is one of the responsibilities of the journalist. Perhaps the next edition of this book might con-

tain an appendix with a professional view on where and when it would be advisable, on an issue of principle, to turn and fight rather than to bow the head to authority and go submissively away.

Banking in Africa

MONEY AND BANKING IN BRITISH COLONIAL AFRICA.

By W. T. Newlyn and D. C. Rowan.
Oxford University Press. 315 pages. 30s.

HOW different are the economies of tropical Africa today from the self-sufficient village units that characterised it before the first world war. The trickle of export crops and minerals, which began in most areas just before 1900, has become a flood. These exports are carried to the ports by a network of road and rail transport serving the main producing areas. Shifting agriculture for subsistence food production still provides the livelihood of a majority of the peasants, but specialisation and the division of labour have gone far not only in export trades but also in the domestic economy.

The changes are reflected in the monetary system and banking structure of these economies. The manilla and the Maria Theresa dollar, which circulated freely in the British colonies alongside sterling currency and French and Indian money until 1912, have been replaced by regional monetary units based on sterling and controlled by currency boards operating from London. British West African pound notes in circulation in the first year of issue numbered just over £1 million; today they total over £60 million. The banking habit has also taken root. To the British colonies have come representatives of the sterling area banking system, and branches of these banks are to be found in the main ports and commercial centres.

The structure and working of the present highly complex monetary and banking system are admirably set out by the authors of this book. But their account is not merely descriptive. They set the working of these institutions against an excellent survey of the social and economic background, and they provide a critique about their methods of operation and their place in the economies of these territories. To their study of the banks, both extra-territorial and indigenous, the authors add a review of other financial institutions such as the co-operative societies, land banks, money-lenders and expatriate trading firms, the last especially being an important source of credit in these areas. This part of the book provides the first thorough review of the system of money and banking that prevails in the British colonies of Africa. It is informed throughout with a real understanding of the underlying principles at work and is based upon first-hand inquiries of the writers during recent visits to Africa.

The second part of the book analyses colonial economic structure, as revealed by monetary factors, and sets out to assess the implications of the existing financial institutions in relation to the

present needs of the territories. This part is the more provocative. The existing system has served British Africa well in this first half century of rapid expansion, but today, with an increasing tempo of progress, it has many critics. On the one hand, the African community complains of a stringency of bank credit, and indeed bank advances to African customers are both proportionately and absolutely small in relation to the sums lent to foreign traders, including the Syrians. The banks, on the other hand, point to the lack of negotiable security among Africans and to the difficulties of financing the small man. The lack of a money market is one of the difficulties of maintaining a suitable liquidity grading of bank assets. This makes banking expensive for the customer and not highly rewarding for the banker in economies liable to considerable fluctuations in incomes. Two separate reports have been made in recent years, by visiting banking experts, upon the West African monetary system alone. This book provides a reasonable assessment both of various criticisms and of the official reports.

The writers go further than this in attempting limited recommendations for reform. Among the major issues discussed are the case for central banking and the arguments for adopting the practice of fiduciary issues of currency. Although this section of the book will win less general acceptance, the arguments on each side are put forward with clarity and with moderation, which should reduce the opposition to their proposals on specific items. In all, this book is a real contribution to African studies and one which will prove useful to commercial interests, to administrators and to students of African affairs alike.

Letters to the Editor

The Still Small Voice

SIR—I offer three comments on your agreeable review of the new edition of my "Principles of Public Finance." All are on questions of fact.

(1) You say that in this edition I have "completely deleted" my "most valuable" criticism of the "differential taxation of profits." But earlier editions were written in the deflationary decades after the first war. The rentier, rather than the ordinary shareholder, then seemed the profiteer. On page 61 of the new edition I write,

When both prices and profits are falling, the holder of fixed-interest securities gets a windfall; so does the holder of equities when both are rising. Thus in the nineteen-thirties some thought a special tax on income from fixed-interest securities would be equitable, and in the nineteen-forties special taxes on profits.

This, I think, gives a more balanced view.

(2) You say that "in defence of his budgeting he quotes repeatedly from *The Economist*" and "out of context." Repeatedly" is thrice, in broad approval of my second and third budgets, and in broad agreement with my claim at the Labour party conference in June, 1946, that "the worst danger of inflation is passing." All three most strictly and contemporaneously in context, and most helpful to me, in confounding other critics, at the time.

(3) You have misread my reference, in a footnote to page 235, to the rate of interest on the Transport stock. Far from expressing "naïve . . . glee" that this rate "was forced down after the compensation amount had been fixed" (your italics), I express, perhaps naïve, indignation that it was forced up, after the capital valuation, from 2½ to 3 per cent. This success for the propagandists of dearer money burdened British Railways with an additional charge of £5 million a year and has thus noticeably contributed to present difficulties.—Yours faithfully, HUGH DALTON
House of Commons

Lessons From the Railways

SIR—You are hoping for the "restoration of the principle that efficiency and earning power must be the determinants of individual remuneration in the nationalised as well as the private industries." Except where labour is paid on a piece-work basis or benefits from profit-sharing schemes, individual remuneration is surely never determined in this way in either nationalised or privately operated industry, but is paid

to compensate those who provide services for the disutility involved. The adoption of your principle would therefore be more of a revolution than a restoration. This rather inclines me to sympathise with it; but in another way it might dangerously camouflage the uneconomic use of resources. The commonly accepted test of the desirability of any economic activity is whether, after paying its labour and capital what is required to persuade them to work in it, it can still show a profit. But if its labour and capital are only paid what the industry can afford, we can no longer tell which industries should expand and which contract, and the test is blurred. The answer it is designed to give will tend, of course, to come out in another way; for labour will desert the industry for better employment. Perhaps in the case of the railways this would be the best way of getting rid of the "huge surplus" of redundant labour which you have discovered. You do not say this; and in any case would it justify the general acceptance of your revolutionary principle? Your argument that if the railways were more efficient they could afford to pay more, is obviously correct; but what system of logic can turn this into the ossifying principle that an industry should pay, not the economic wage, but only something which will preserve its financial equilibrium?—Yours faithfully, J. R. SARGENT
Worcester College, Oxford

Hospital Finance

SIR—The somewhat laborious journey through your Note on the hospital costing returns was for me splendidly rewarded by its last lines—"These costing returns are full of interesting information but they have little bearing on the main problem of hospital finance"—so I ask to be allowed to illustrate their truth from letters in your later issues.

First comes Sir George Schuster's demonstration of the remoteness of Regional Boards. A board apparently tries to impress upon its Hospital Management Committees the need to indicate by their savings that their previous estimates of expenditure were not as low as they could have been. Regional boards also have the naïve notion that management committees can exercise an efficient control of finance, being able to foretell changes in prices, the state of supply and the curiously whimsical rulings of Whitley councils. Finally the boards hope that this "control" will enable the managements not to end the year with unspent balances. (I once

heard of a hospital finance officer who apologised to his committee because a certain sum remained unspent, but promised that it would not happen again. I suppose he intended to make his "control" more effective—in other words to spend up to his limit.) May I point out that Sir George Schuster's word "unrealistic," applied to questions regarding incentives to hospitals to use beds more fully, is correct but not the fault of *The Economist*? It is unrealistic to raise nurses' wages nationally, not permit overspending, and then expect this to be managed by any other method than employing fewer nurses and having more unused beds. If the attention given to inventing "work units" and "assessment methods" were to be given to providing monetary incentives to management committees and staff for competent management, hospital finance would be less of a problem.

Secondly, the letters in your latest issue seem to show how the hospitals have forgotten that £ s. d. are the initials of management. If responsibility is placed fairly and squarely on the shoulders of the staffs of hospitals and if their earnings are affected accordingly, together with many incidental perquisites—bed-sits, TV, dances, board, transport—meetings about it all would be unnecessary.

It is unfortunate that "the consumer" as soon as he is in hospital is never right, so that the manager is denied the best check on waste. This only makes it more important to apply the whip of monetary incentives so as to affect the manager's pocket as directly as waste affects the remote public purse.

The way to management is responsibility and accountability. The hospitals are the purest examples of accountability without responsibility.—Yours faithfully, Woking
LESLIE E. BARBER

Unesco Undecided

SIR—I must write a few lines of appreciation of your article in *The Economist* of December 25th. In the course of my medical and social work in West Africa I have gained some knowledge of Unesco. Too many of its members are unpractical, professional sociologists, persons of meagre experience but with starry ideas of the scope of sociology. No subject of social importance is outside their scope. I have just read in a Dublin magazine, *The Bell*, an article entitled *What is Cancer?* by a Frenchman of the Unesco Technical Committee, in which he decided that "Unesco shall take a fighting initiative in the struggle against cancer" by "stimulating and assisting research . . . in liaison with WHO and other agencies." The article which follows is sketchy and of very little educational value. And this proposal comes at a time when Unesco cries out that its funds are insufficient for projects already in hand. There could be no more apposite example in support of your criticisms.—Yours faithfully, London, W.1

A Neutral Budget

Washington, DC

AS usual, discussion of the President's Budget for the fiscal year beginning next July will concentrate on the single and, in the view of the general public, dreadful fact that it is slightly short of being balanced. This irrelevancy in most comments on the Budget, which is apparently peculiar to the United States, results in part from understandable ignorance of modern theories of fiscal policy, in part from plain politics, and perhaps most of all from the Budget itself, which seems diabolically designed to produce confusion. To begin with, it is not one Budget but two—requests for appropriations and estimates of expenditures, of which only the former is subject to action by Congress. The expenditure side, which is what most people are talking about when they say "Budget," is largely controlled by programmes and appropriations voted in the past; some two-thirds of all the expenses estimated are either payments for goods ordered with previous appropriations or are virtually automatic under continuing legislation, such as ex-servicemen's benefits and interest on the public debt, for which Congress cannot refuse to supply the funds. Even in the more controllable area of new appropriations, Congress invariably approves 90 to 95 per cent of the sums requested, and actions taken on such appropriations, while they can deeply affect individual plans of political significance, will have little noticeable effect on expenditures for the year in question, or therefore on the broad economic impact of the Budget.

The confusion about the controllability of the Budget is confounded by the government's dazzling system of "trust funds" for social security accounts (pension contributions and so on); although these are not considered as part of the Budget, they produce about \$8 billion of cash payments to the public and, this year, bring in an equal amount of receipts. This system, among other things, requires that the reserves of various social security accounts must be invested in government securities, the interest on which is counted in the Budget; the result is that the Budget includes as expenditures some \$2.5 billion worth of transactions which take place solely within the government. Indeed, there must be a deficit of about \$3 billion in the so-called Budget before there is any true deficit at all in the government's total cash transactions.

Finally, this year the government, in an effort to avoid the public opprobrium of proposing to widen the deficit further, is advocating a vast new programme of spending

\$25 billion on highway development over the next ten years without counting the expenses as part of the Budget at the time they are made. This sleight of hand will be carried out through a special new system of bond issues, with the Budget to be affected only modestly in future years as the bonds are paid off over a thirty-year period.

In these circumstances the simplest thing for the leader writer or politician to do is to glare at the Budget for the flash of red or black ink, and then either raise cries of alarm or purr with satisfaction at what he sees. It sometimes seems, in fact, that virtually the only figure in this Budget that will be remembered and discussed is the estimated deficit of \$2.4 billion—a figure that, besides meaning very little, will turn out to have been wrong when the final sums are done eighteen months from now.

★

If this restricted view of the Budget is the one most expressed, there is much of a more fundamental interest in the thick document that was sent to Capitol Hill by the President this week, covering operations from mid-1955 to mid-1956. The most important thing about it is that it will be economically neutral—neither inflationary nor deflationary. This is because the total cash transactions of the government will be approximately in balance. The estimates, in fact, show a nominal cash surplus of over \$500 million. Yet the Treasury will have to borrow heavily in the autumn to meet seasonal needs, and thus will need another temporary increase in the limit on the national debt; this borrowing will, however, be entirely paid off in just over a year from now.

The labour and liberal economists have been consistently urging a strongly reflationary budget, with both lower taxes and higher expenditures. But, while the cautious and very modern hand of Mr Arthur Burns, chairman of the Council of Economic Advisers, has undoubtedly restrained the budget-balancing enthusiasts in the Bureau of the Budget and the Treasury from fulfilling their dreams too rapidly, there is no doubt that the attitude prevailing in the Administration is balance-for-balance's sake. This theme runs through much of the President's Budget Message as he explains why balance could not be achieved this year.

Obviously, with the intractability of expenditures, the movable scale for achieving a balance was, and is, on the revenue side. For reasons largely political—no doubt

The National Debt

Last August Congress raised the limit on the public debt to \$281 billion, but this authority expires on June 30th, and the limit falls back to the statutory level of \$275 billion. On December 31st last, the public debt stood at \$278.3 billion, and it is expected again to rise above \$275 billion during the first half of the 1956 fiscal year.

Aid for Allies
(\$ billion)

	Expenditures			New appropriations recommended for 1956)
	1954	1955 est.	1956 est.	
Military assistance	3.6	2.7	3.1	1.4
Direct forces support (petrol) uniforms, rations, etc., ...	...	0.5	0.6	0.6
Defence support, development assistance, technical co-operation, refugee aid, etc.	1.3	1.1	1.0	1.5
Total	4.9	4.3	4.7*	3.5

* The total for expenditures in 1956 includes "provision for a programme in Asia" of which details will be given later.

Actual deliveries of military equipment in 1955 and 1956 are expected to continue at "around the \$3 billion level"; the fluctuations in estimates are due to a change in the method of financing and to the inclusion of aid for Korea in this programme instead of, as previously, in the defence estimates.

heartily, though silently, seconded on economic grounds by Mr Burns and his colleagues—the President asked for no tax changes this year, except for a previously-announced demand that automatic reductions in certain excise taxes and in corporation income taxes be postponed for another year. Nevertheless the government's total cash receipts will go up by some \$2 billion, entirely as the result of the anticipated rise in incomes in 1955. The important outcome, of course, is that the economy will not get in 1955 the stimulating injection of over \$5 billion worth of tax reliefs that it got in 1954—but then the economy presumably will not need the hypodermic as badly this year.

Undoubtedly the most significant feature of the expenditure side of this Budget is its strong evidence that the days of sharp declines in government outlays are at an end, even without considering the new highway programme as part of the Budget as, economically speaking, it should be. The President could estimate a reduction in budget expenditures of only \$1.1 billion in fiscal 1956 from the \$63.5 billion total in the latest estimate for the current 1955 fiscal year. This contrasts with the declines of \$6.5 billion and \$4.3 billion in the two previous fiscal years. Not only was the fall in spending the smallest since Mr Eisenhower took office but, more important, the total requests for new appropriations actually increased. Since these will have an important influence on the level of expenditures in the 1957 fiscal year and subsequently, there is a strong presumption that federal spending has stabilised in the range of \$60 to \$65 billion a year for the foreseeable future; this means that any future tax rate reductions can only be made possible, as the President suggested, by increasing revenues resulting from economic growth.

★

Such a cascade of dollars tumbling out of Washington acts, of course, as a sturdy prop under the economy. What is more, this prop in the eighteen months ahead will be a relatively steady one, instead of shrinking with each successive month as it has done for the past eighteen months. It now seems that, barring a serious recession or a sudden warming of the cold war, the government's role as a buyer of goods and services will gradually decline in relation to the economy as a whole because of the economy's expected expansion, but will remain far larger absolutely and somewhat larger relatively than in any previous period of peacetime.

It was scarcely a desire to provide economic props which built this vast bulwark of spending, but rather the demands of the cold war. Defence, including atomic energy and foreign aid, accounts, after all, for 65 per cent of the estimated Budget expenditures. Yet the American budget-makers, despite certain Republican dogmas, despite the almost total confusion in the public mind about the role and significance of the Budget, and despite the inability of an American Secretary of the Treasury to alter taxes virtually by a stroke of his pen, seem to have muddled through the Keynesian age remarkably successfully so far. In the 1954 year of recession, it is true, the cash transactions of the government were almost exactly in balance, in contrast to the sizeable deficit which modern orthodoxy would have prescribed. But during the coming year and a half, if the highway programme is added, this present Budget should have a mildly stimulating effect on the economy, which is presumably just what the Keynesian doctor would order.

Questions of Security

AT his press conference last week, his first since before Christmas, President Eisenhower made trebly certain that the first, and probably the most controversial, concern of the new Congress would be the security procedures of the civil service. All the criticisms of the present regulations—the unfairness to individuals, the varying standards in different departments and, above all, the loss of the best qualified men—had crystallised round the case of Mr Ladejinsky. This Russian-born expert on land reform had been cleared for employment by the State Department, found insecure by the Department of Agriculture and finally engaged for responsible work in Indo-China by the Foreign Operations Administration on, it was understood, the direct instructions of the White House. But Mr Eisenhower, when he was questioned about the case, did not use the opportunity to close it firmly; instead, by thinking aloud and at length, on the basis of incomplete information, he revealed that he himself was not sure about Mr Ladejinsky's reliability. The Senate Civil Service Committee, now headed by Senator Olin Johnston of South Carolina, has ordered Mr Ladejinsky to remain in Washington until it has studied his case. It is expected to do this in a way that will be more embarrassing to the Administration than to him.

Behind the Democrats' determination to make political capital out of these security questions lies their deep resentment at the charges of being disloyal and "soft towards Communism" which the Republicans brought against them during the election campaign. The most outspoken, or at least the most widely publicised, of these charges came from the Vice-President, Mr Nixon. But Mr Eisenhower, at his press conference, put loyalty to his subordinate before the desirability of conciliating the new leaders of Congress and went to what seemed to many to be unnecessary lengths to defend Mr Nixon.

Finally, the President lost yet a third opportunity of taking the heat out of the Democratic disquiet over the Republican treatment of civil servants by refusing to see any need either for major changes in the present security programme or for an independent bipartisan commission to review it. The Democratic Senator Humphrey is now pressing a commission of this kind on Congress but Senator Johnston and the other members particularly concerned may think it more profitable to keep such a partisan matter safely in their own hands.

Disposing or Dumping?

THE Department of Agriculture, it seems, can do nothing right. Its decision to offer 10 million pounds of its surplus butter on world markets at competitive bid prices to appease critics at home has brought a not unexpected storm of protest from Australia, New Zealand and elsewhere. The minimum price of 41 cents a pound set for export sales of butter last June has virtually prohibited trade—only 2 million pounds have been sold—and the department is being criticised by the new Democratic Congress for not selling more of its stocks of commodities abroad. But the

main exporting countries are in no mood to feel sympathetic. They claim that butter markets are "already adequately supplied" and can only be depressed by the American action. Nor are the protests confined to butter; Burma and Thailand see in the rice disposal plan a threat to their foreign trade. And the department has found to its chagrin that it cannot even give away food to impoverished Spaniards without incurring the wrath of local dairy producers.

The new policy for butter will certainly throw its shadow over the conference table in Geneva where attempts are being made to draw up a new General Agreement on Tariffs and Trade. The subsidised exports and import quotas forced upon the United States by its domestic farm policy have already cast the American delegation in the unaccustomed role of chief culprit. A more discouraging consideration for the Department of Agriculture is that the present rate of disposal, which is so unpalatable to the outside world, has made little difference to a stockpile now valued at \$7 billion, compared with \$6 billion when the disposal programme was given legal sanction six months ago. In that period the department has sold abroad—or is negotiating to sell—produce to the value of \$453 million. It has given away another \$125 million, bartered \$93 million against strategic materials and distributed \$150 million for welfare both at home and abroad. At this rate the total authority of \$1 billion, under the disposal scheme, will soon be exhausted although it was meant to last for three years.

The taxpayer can at least take comfort from the fact that the cost of supporting farm prices seems to be waning. According to the budget statement, the net cost will amount to nearly \$2 billion in the year which ends next June, but will fall to under \$1 billion in the following twelve months. Moreover, the Secretary of Agriculture is optimistic that, by continuing last year's reduction in the price guarantees for butter, eggs and cheese for a further year, output of dairy produce can be brought into line with demand by the end of this year.

Unity on Both Sides

THE Democratic leader in the Senate, Mr Lyndon Johnson, has won the gratitude and therefore probably the loyalty, of a second group of freshmen Senators by again doing as he did when the Senate was organised in 1953. He has once more given every Democratic Senator a seat on an important committee instead of following the tradition of handing all the interesting plums to the old residents and leaving the new arrivals to make do with such unattractive assignments as Public Works and the District of Columbia. These are incidentally the two committees to which the Republicans, keeping to the old system, have sent one of their most outstanding newcomers, Senator Case of New Jersey, although he has also won a place on the Civil Service Committee. Each Senator sits on two, and sometimes three, committees.

Senator Johnson has thus been able to put a good liberal, more often to be found among the new than the old Democrats, on each of those committees where it is important for the party's election record that the progressive point of view

should be pressed; such committees are the Interior Committee, where hydro-electric development is discussed, for example, and the Labour Committee which covers trade union matters. And with an eye to the special interests of his constituents, Senator Johnson has seen that there is a Texan on both the committees which deal with the oil industry—himself on the Finance Committee and Senator Daniel on the Interstate Commerce Committee.

Much of the unusual unity shown by the Democrats during their two years in opposition can be credited to Senator Johnson's tact and co-operation in political management. The lesson has not been lost on the Republicans in the Senate. On the excuse that all Senators up for re-election in 1956 should have a seat on the Policy Committee which sets the party line in the Senate, the size of that committee has been practically doubled. This has made it possible to give a transfusion of liberal blood to a group which had long been suffering from hardening of the arteries. On many questions Eisenhower supporters will probably now be in a majority and in any case it should be possible to settle most of the Republican differences in the committee room instead of on the Senate floor.

More for All the Boys

AFTER tactfully urging members of Congress to give both themselves and federal judges increases in salaries, the President went on to bombard the Capitol with a series of messages asking for higher pay for almost five million government workers, whether civil servants, postmen or members of the armed forces. Mr Eisenhower reminded Congressmen that their rise was long overdue, since they have had no addition since 1946. Their present pay is \$15,000 a year and they will hardly have the courage to raise it to the \$27,500 that has been recommended by an independent commission. But an increase of some sort is more likely to be approved this year than it was last, when constituents would have been waiting with awkward questions at election time.

Pay rises for civil servants and postmen are not so seriously overdue, for they received increases in 1951; the cost of living has gone up since then by about the 5 per cent which is the average of the increases asked by the President. The actual amounts recommended vary, however, with the position of the employee and the underlying purpose of the proposals is to relate pay more closely to the responsibilities of the job and to earnings for comparable work in private employment. Similar recommendations were rejected by Congress last year when it voted a flat increase for all grades; it also refused to raise postal charges to cover the cost of higher wages for postal workers. For these reasons the President vetoed the Bill. This year, once more arguing that the Post Office should be a business proposition, not a taxpayers' liability, Mr Eisenhower has again asked for increased postal charges and again he is not expected to get them.

The recommended increases in pay for the armed forces are also designed to reward efficiency, and specifically to encourage volunteers to stay in service longer. At the moment only 20 per cent are re-enlisting; the shortage of

experienced young officers and men is dangerous, and becoming more so, at a time when the cost and complexity of training soldiers, sailors and airmen is going up rapidly. This attempt to make military service a more attractive career is an important part of the new manpower scheme for the armed forces which the President sent to Congress at the same time. That scheme followed the outline already given by officials, with the emphasis on strong and effective reserve units to back up a highly-trained mobile contingent ready for immediate action.

Is Leader a Leader?

FROM A CORRESPONDENT IN PENNSYLVANIA

ON January 18th, a 37-year-old chicken farmer, symbolically named Mr George Leader, became Governor of Pennsylvania, the third largest of the United States. Mr Leader is a Democrat, and he won election last autumn by 279,000 votes, in a state in which registered Republicans outnumber registered Democrats by 800,000, in which no Democrat had won the governorship since 1934 and in which the Democratic organisation was moribund last spring. Mr Leader, a State Senator, was chosen as a standard bearer who could absorb defeat gracefully and who might live long enough to see brighter skies for Pennsylvania Democrats—some day. But he turned out to be a great asset: obviously sincere and friendly, he had the perfect political background—rural honesty, sound business success from small beginnings (he had started with an ex-serviceman's loan and was now producing a million chicks a year), an attractive wife and three small children. In addition, he was an appealing speaker. The Pennsylvania Democrats rallied behind him, led by a new and effective state committee chairman and a finance chairman who raised over half-a-million dollars with which to fight.

Buoyed by these successes, by the apparent national trend towards their party, and by the increasing realisation that the Republicans in Pennsylvania were suffering from all the familiar ailments of a party too long in power, the four major elements of Democratic strength in the state co-operated effectively: the Philadelphia reform administration of Mayor Joseph Clark, who had turned the entrenched Republicans out of that city three years before, and the liberals who follow his lead and who formed the backbone of the "Volunteers for Leader" in the campaign; the regular Democratic organisation of Philadelphia, now in uneasy alliance with the Clark forces; the relatively conservative, orthodox, and long-established Pittsburgh organisation of Mayor David Lawrence; and, as in all industrial states, the trade unions.

By comparison with Mr Leader, the Republican candidate, the incumbent Lieutenant-Governor, Mr Wood, seemed very much a rotund, middle-aged, run-of-the-mill politician. He was carrying a heavy burden, too—the inglorious record of the outgoing Governor, Mr John S. Fine (in Pennsylvania, a Governor may not succeed himself). Under Mr Fine, the old line Republican machine men, whom the previous Governor, the progressive Mr Duff, had tried vigorously to purge, eased themselves back into effective control of the party and the Republican State

Legislature, split between supporters of the machine and Mr Duff's friends, obstructed most of the Republican Governor's programme.

While there were few outright scandals in what the Democrats insisted upon calling the "not-so-Fine Administration," there were several matters that looked questionable. Perhaps more important, there were obvious failures to meet the urgent problems of providing sufficient schools for the postwar flood of children, or to keep up with the performance of other states in such things as provision for mental health; at one point, over a hundred people were lodged in Philadelphia gaols who should have been in hospitals, had there been space. Finally, there was unemployment and discouragement in several areas of the state, most notably in the anthracite coal regions. To meet this, Mr Leader promised action; Mr Wood blamed "Democratic free traders in Washington."

By November, sober prophets like the *New York Times* were predicting Mr Leader's election, but the size of his victory surprised everyone. Pennsylvanians who had watched the Republican domination of Philadelphia crumble in 1951 foresaw another reforming administration in Harrisburg, the state capital; but by now a few doubts have arisen.

★

For one thing, Mr Leader has some very trying problems to solve. Pennsylvania will need to raise perhaps \$350 million in new taxes, if it is to avoid increasing a debt already larger per head than that of any other state. Mr Leader promised to veto the extension of the sales tax imposed by his predecessors; this means a loss of some \$100 million in revenue. He can hardly introduce a state income tax—by far the most logical recourse—unless he is content to have it levied on a flat percentage basis, for the State Constitution forbids a graduated income tax. As for unemployment, Mr Leader has promised an energetic campaign to attract new industry to the state but, as a substitute for income tax, he will probably be forced to increase taxes on corporations, which will hardly make the state more attractive to business enterprise.

For the moment, however, what worries independents, liberals, and labour interests most is that the new Governor's appointments to important state offices have been disappointingly routine and political, especially when compared with Governor Harriman's in New York. This, it has been suggested, shows the influence of Mr William J. Green, Jr., leader of the old Democratic machine in Philadelphia, who is known to have been the Governor-elect's companion during a post-campaign vacation in Florida and whose friends are obviously enjoying some major spoils of victory now. Mr Green, it is said, is thus taking his revenge for the drying up of political patronage in Philadelphia under Mayor Clark's reforming regime there. More recently, Mayor Lawrence of Pittsburgh has been encamped in the state capital, presumably to break Mr Green's monopoly of the new Governor's attention.

This leaves little room, thus far, for Mr Clark, his fellow-liberals, and the trade unionists, all of whom hoped that Governor Leader's administration would mark a further step towards the new Democratic party for which Mr Adlai Stevenson stands, one no longer based upon old fashioned urban political machines, but upon enlightened city

administrations, co-operating with independent reform elements at both city and state levels. It is too early to say that these hopes have been disappointed. Perhaps Mr Leader feels that he must first establish his party regularity, and that reform and mobilisation of the independents can come later. But in politics it is dangerous to let enthusiasm cool after a victory such as last November's in Pennsylvania. Once in the safe hands of the professional politicians, Governor Leader may find it hard ever to live dangerously, or constructively, again.

Merger in Manhattan

IF the shareholders and the appropriate banking authorities approve, and if Representative Celler fails to induce either the Governor of New York, the Federal Reserve Board or Congress to disapprove what he considers to be a dangerous concentration of financial power, the Chase National Bank and the Bank of Manhattan will shortly complete the largest bank consolidation there has ever been in the United States. The resulting Chase Manhattan Bank will still rank second to California's Bank of America but it will be the largest on the east coast, with total resources worth about \$7.5 billion and with deposits of just under \$7 billion. About \$5.5 billion of these will be provided by the Chase Bank, but technically the mountain is coming to Mahomet. The explanation is that the Bank of Manhattan's charter, dating back to 1799, does not permit it to sell its assets without the agreement of all its shareholders. The virtual impossibility of obtaining such unanimity frustrated its earlier effort, in 1951, to go to the Chase Bank.

In return for giving up the prestige of being a national institution, of which there are now only a handful in the banking field, the Chase Bank will gain practical advantages; under a state charter it can make larger single loans than before and its books will be examined only once a year. The new bank is expected to pay dividends of \$2.20 a share. This is the present annual rate of the Chase, but its shareholders are to get 1½ of the new shares for each share now held, while the Manhattan dividend has been only \$1.90. Altogether the new bank will have 85 branches, 57 of them provided by the Bank of Manhattan. This is the main argument for the merger from the Chase's point of view. The emphasis today is on "consumer banking" rather than "bankers' banking," on small loans and individual accounts rather than on big business transactions, and this requires a large number of branches.

Raising the Minimum

Washington, D.C.

BY asking Congress to increase the federal minimum wage to 90 cents an hour and extend its coverage to groups of workers at present excluded, President Eisenhower has come to the rescue of his Secretary of Labour, Mr James Mitchell, who has been battling to prove that a

Republican Administration can be the workers' friend. The present minimum wage of 75 cents an hour is one of three "fair labour standards" to which employees engaged in interstate commerce are legally entitled; the others are time-and-a-half rates if more than a forty-hour week is worked and a minimum age of sixteen for general employment. In practice only 22 million workers, or a third of the labour force, are covered by the law, partly because under it "interstate commerce" is very restrictively defined and partly because there are large classes of workers who are specifically exempted. These include all farm workers and the 7½ million people employed in retail establishments. Although details of the extended coverage proposed by the Administration have not been announced, it is expected to include some shop assistants but no farm labourers.

Even 90 cents an hour is not very much in relation to the American standard of living; the average earnings of the 48½ million factory workers are \$1.80 an hour. But there are particular industries, the bulk of them in the South and many of them employing chiefly Negroes, which will be considerably affected. The argument that in these cases an increase in the minimum wage actually harms workers by depriving them of their employment is not borne out by a recent study by the Department of Labour on the effects of the last increase in the minimum wage, early in 1950, on five industries with low wage-rates. In most cases all that happened was that the differential between skilled and unskilled rates was proportionately narrowed. The department could in fact only track down between 2,000 and 3,000 people who could reasonably be said to have lost their jobs as the result of the increased cost of their labour. These came from two main industries—the oyster canneries of the Gulf of Mexico and the hand cigar manufacturers of Florida and Pennsylvania, who had been able to compete with mechanised firms because of their low wage costs.

Behind the Administration's proposal there will be not merely the trade unions, who have been agitating for a \$1.25 an hour minimum, but many business and civic interests in New England who are worried at the competition from cheap labour in the South. However, in spite of some solid support, Mr Mitchell will be very lucky if he sees his measure sail through without picking up some escape clauses for "special cases" like barnacles on the way.

SHORTER NOTES

When Miss Marian Anderson appeared recently for the first time in opera she was, not for the first time, making a début for her race as well as for herself. She is the first Negro singer to become a member of the Metropolitan Opera Company. The enthusiasm of the New York audience was expected to be repeated at her next performance in Philadelphia, her home town.

Insurance rates against damage by windstorm hazards have been almost doubled in New England as a result of the heavy losses suffered by the insurance companies during the hurricanes last autumn. However, even with the increased rates—which are up by 150 per cent in some places—it will take some time to recoup the losses by hurricane over the past decade.

On the frontiers of human knowledge

Now the Engineer, advancing with the Scientist, finds himself on the very frontiers of human knowledge.

From there he sees with awe the vast potentialities, for good or evil, of atomic energy. Already he is striving with the Scientist to harness it for the benefit of mankind.

At the first atomic electric generating station, now under construction at Calder Hall in Cumberland, the turbo-alternators will be driven by steam, generated — by means of a nuclear reactor — in plant jointly designed by Babcock & Wilcox and the Department of Atomic Energy; and manufactured by Babcock & Wilcox.

Calder Hall, marking the first significant contribution of atomic energy to Britain's electrical power supply, is the forerunner of much larger developments which, by conserving conventional fuel resources, will be of vital economic importance to Great Britain and, indeed, to the world.

FREIGHTERS

MAN'S RESPONSE TO ADVENTURE and high endeavour tends to identify itself with peak performances in aviation. The fastest and largest trans-Atlantic liners have an appeal similar to the most spectacular element in seaborne movement: but in the background are the unostentatious trading activities of the plodding merchantmen. So it is with aviation. The newest turbine aircraft naturally serve to distract attention from the less imposing vehicles. Thus the regular flow of Freighter aircraft from the Bristol factory has been taken for granted, and these big boxcars are now in service in every continent. At home here a substantial and growing fleet of them plods to and fro on thousands of flights to France and Ireland. They are the forerunners of an air transport development that will probably one day supplant the sea ferries. In New Zealand, Freighters perform similar duties on the cargo ferry between the North and South Islands. In Australia they have built up the beef carcass air haulage business in the Northern Territory meat export industry. In Indo-China another Freighter fleet serves the Vietnam airline both for its local passenger services and cargo needs, increased by the demands of War. Pakistan and Saudi Arabia also use the Freighter, and in Nigeria it provides Africans on the West Coast with air travel at one of the cheapest fare-rates in the World. Spanish carriers employ the aircraft for a variety of duties, including continental-type tourist class travel; and now Freighters have introduced the first regular cargo service in Canada. They have also been bought for the Air Forces of eight countries for tactical transport roles.

These Freighters are blunt-nosed, not beautiful. But that is the lot of most heavy haulage vehicles. Merchantmen of all kinds are seldom heard of—only perhaps when they run into trouble. Transport is indeed the blood stream of modern society: Huxley observed that moving things from one part of the globe to another was the sum of man's activity. Aviation claims every year a larger share of the World's carrying trade, so more and larger merchant aircraft will be required.

Bristol's share in the development of every-day air transport has, through the Freighter, been a large one. Some 200 have been ordered—mostly for export in twos and threes—and in six years of sustained production the Freighter has become Britain's best-selling heavy-duty aircraft. These civil and military sales were, incidentally, made in a commercial aircraft market upset by large numbers of war-surplus transports—some in almost new condition—that were available at knockdown prices.

The Freighter weighs 44,000 lb and it can lift up to 14,000 lb cruising at about 170 mph and flying about 1.5 miles per gallon. In many countries the potentialities of the cheap to buy, easy to operate, reliable, capacious and flexible passenger-freighter are being realised, and commodity air lifting on scheduled service or on charter is a widening trade.

THE BRISTOL AEROPLANE COMPANY LIMITED

The World Overseas

Canadian Rescue Operation

FROM OUR OTTAWA CORRESPONDENT

IT was a curious escapade for three Canadian ministers—Mr C. D. Howe, of Trade and Commerce, Mr L. B. Pearson, of External Affairs and Mr W. E. Harris, of Finance—to rush down to Washington on the very day of the President's State of the Union message to Congress and on the day before the opening of the Canadian Parliament for the sole purpose of talking to some members of the United States Cabinet about Gatt. Many puzzled observers are still inquiring whether the stated cause could have been the real one.

It was. However curious the manoeuvre may seem and however improbable the truth, Gatt was what the ministers talked about. The *Winnipeg Free Press* presented the Canadian move in the clearest light—except for one point—in a delightful cartoon which showed a fair damsel, marked Gatt, tied to a tree with a bush fire approaching her defenceless feet, the bush fire being American protectionism. But rushing to the rescue were three horsemen in the uniforms of the Northwest Mounted Police, heroic precursor of the Royal Canadian Mounted Police. And they were Howe, Pearson and Harris. The one criticism of the cartoon, and it is a vital one, is that the Northwest Mounted Police always got their man. The three Canadian ministers returned empty-handed.

Indeed one of the diplomatic comments on the Canadian visit was that the Canadian ministers might have known in advance that they could not get the result they wanted. What they wanted, so far as it can be learned, was to impress upon the "highest levels" of the US Administration the damage which is being done to Gatt in general, and Canada in particular, by American insistence on the agricultural quota restrictions required by Section 22 of the Agricultural Adjustment Act. This is a case which is fully supported by Britain and most of the other Gatt signatories. It is, most observers have supposed, fully understood by the US Administration itself. But the Canadian government evidently felt that it must make one more effort "at the highest level" to resolve the deadlock which threatens to result from the American attitude.

On political grounds, here in Canada, the visit may have been thought necessary to demonstrate that the government was not quietly acquiescing in one-sided American protectionism. This government is inevitably embarrassed, as so many others are, by being asked to accept strict obligations to refrain from harmful trade practices while waiving the application of those obligations to the United States. Many Canadian industries asking for protection have been

told for years that their individual cases, however deserving, must be overruled by the need to preserve the general structure of Gatt. Domestic manufacturers must suffer, in fact, so that Canadian exporters might benefit from the more liberal practices which other countries would adopt in return.

The argument has inevitably suffered over the years from the continued adherence of so many of the Gatt partners to quota restrictions and discriminatory import controls on balance of payments grounds. This source of complaint has been contracting gradually as import controls were relaxed in the sterling area and Europe. The British proposals for tightening the balance of payments escapes, after convertibility, gave fresh hope to Canada that in future Gatt would contain a better balance for this country between "quid" and "quo." That is why, in the early stages of the Gatt meetings, Canadians were talking very hopefully about getting much more support for their government's rather purist adherence to Gatt.

By the time the Gatt sessions recessed for Christmas these rosy views were thickly obscured by cloud. The British proposals on the balance of payments escapes were running into difficulties both in the sterling area and in Europe, and the Americans were sticking to a position on agricultural restrictions which appeared hopelessly inconsistent with their desire for stricter obligations to be binding on everyone else. Moreover, it appeared after Mr Howe's pre-Christmas visit to Geneva, that the Americans' insistence on their own private waiver was undermining the chance of getting better provisions—from the Canadian point of view—in other parts of the agreement.

This no doubt is the general burden of what the Canadian ministers tried to say. But what they were up against was the unalterable political necessity in which the United States Administration finds itself. President Eisenhower is now pledged to submit the new Gatt—if there is anything new about it after the conclusion of the Geneva meetings—to the Congress. True, he says he will submit only the "organisational clauses," but inevitably the Congress must look at the attached "trade rules" too. And the trade rules clearly specify (in Article XI) that the United States may not do precisely what the Congress has directed to be done by Article 22 of the Agricultural Adjustment Act. To ask Congress to accept an international agreement which contradicts its own legislation would be, says the Administration, to ensure its defeat. If Congress is to accept Gatt at all, the Americans must have some sort of

"waiver" from the other Gatt signatories allowing them to continue their policy of excluding those imports which would otherwise be attracted by their high levels of price support.

From this sad fact may well follow all the lamentable results which the Canadian ministers fear. But it was a fact which unfortunately could not be changed by their pilgrimage to Washington.

German Labour in Ferment

LAST week's labour troubles in the Ruhr and Bavaria have two distinct causes. The 24-hour strikes called in the Ruhr were protests against a statement that the unions had secured representation in the management boards of industry through political blackmail. Actually, it was the British who were instrumental in bringing labour on to the boards of coal, iron and steel companies, though the extension of the principle of co-management to other firms was certainly the result of hard political bargaining by the union leaders and Dr Adenauer. The author of the offending remark was Herr Reusch, head of the big *Gutehoffnung* concern, who is an ironmaster of the old school, with no love for the unions. He has now brought about the first political strike in postwar Germany. Co-management is the German unionists' most cherished right, and leaders—pressed to show that they are not supine—would be most naturally inclined to take action on this issue rather than another.

Events in Federal Germany's Deep South, where the tough, hard-headed Bavarians have been making trouble, are of considerable international importance. The Land Trade Union Federation, instigated by the extremist metal-workers union, intends to call for a Bavarian plebiscite on the question of rearmament. The federation was able to do this, while rejecting illegal action, because the local constitution allows for a referendum if ten per cent of the electorate calls for one. No other *Land* has a similar provision, and the Bavarian example cannot be followed elsewhere. The trade union headquarters are against a general strike or illegal actions for political ends. But a vote against the Paris treaties in Bavaria alone, should the strong Catholic influence fail to prevent it, would be a serious blow for Dr Adenauer. It would gratify the East German Communist leaders, who have been calling on the unions and Social-Democrats to demand a plebiscite and call for demonstrations against the western pacts.

How far Communists in the ranks are responsible for the labour trouble in Bavaria and the demonstrations held last week by the Socialist Students' Organisation it is hard to say. But it is certain they are trying very hard to direct moves from below. How vital it is to keep and enlarge the footing of crypto-Communists in the unions was openly admitted by leaders at the recent German Communist party congress. Members were ordered to sign declarations of loyalty if required to do so by anti-Communist union leaders. The party, said one speaker, changes its tactics but not its principles, and Communists must on no account allow themselves to be ousted from the unions or other mass organisations. Moreover, they must not be too doctrinaire about their dealings with Social-

Democrats. They must at all costs work with anyone who opposes the western treaties.

The demonstrations against rearmament may therefore be due in part to crypto-Communists. But quite apart from their influence, there is a very strong body of opinion in the Social-Democrat party which thinks that the leaders are too passive in their opposition. The executive, however, shows no signs of giving way to any demands for undemocratic action outside parliamentary bounds. They know well where this path would lead, and that they would be the first victims if ever the Socialist Unity Party gained power over the whole German workers' movement.

OEEC Meeting in Paris

FROM OUR SPECIAL CORRESPONDENT

THE Ministerial Council of the Organisation for European Economic Co-operation, meeting in Paris last week, added a few more stones to the foundations of convertibility; gave new impetus to the programme of intra-European trade liberalisation; turned the "Green Pool," complete with its Spanish participants, into an OEEC ministerial committee for agriculture and food; and, after hearing a report on the new Italian ten-year development plan by the Italian Budget Minister, Sgr Vanoni, established a working group to see what member countries or the organisation as a whole could do to help implement the plan.

By far the most difficult decisions to reach were those that set in motion what will probably prove to be the last concerted OEEC assault on the quantitative restrictions remaining on intra-European trade. The difficulties of reaching agreement are reflected in seven pages of complicated and highly negotiated text in which the decisions are embedded. In brief, three interrelated decisions, hedged about with reserves, escape clauses and time limits, were adopted, to become effective on April 1st. First, it was agreed that member countries would increase from 75 to 90 per cent the proportion of their imports on private account which can be imported from other OEEC countries without quantitative limitations. Second, liberalisation is to be applied in such a way that at least 75 per cent of the private trade is freed in each of the three categories, agricultural products, other raw materials, and manufactured products. The present requirement for each category is 60 per cent and for a number of countries, such as Belgium and Switzerland, it will be considerably harder to reach 75 per cent in the agricultural sector than it will be to reach the overall figure of 90 per cent. Third, in order that all countries (including Germany, Italy and Sweden, who already meet both the 90 per cent overall and the 75 per cent by-category test) should participate in the new liberalisation effort, it was decided that all countries should free at least another ten per cent of the trade on private account that is still restricted.

The principal qualifications that have been placed on these new decisions reflect the growing feeling of the countries with low tariffs, like the Scandinavians, that further reductions in quantitative restrictions must be matched by tariff reductions. They also point to an increasing tendency

on the part of all OEEC countries to look at the remaining quantitative restrictions not as safeguards imposed for balance of payments reasons but rather as one of a number of devices now being used to protect home industry or agriculture. In this latest decision inequity and lack of reciprocity, as well as balance of payments difficulties, are recognised as valid reasons for re-imposing restrictions. And, in addition to a series of carefully defined modifying provisions to which a country may have recourse after consulting the organisation, any country at the end of eighteen months may withdraw any liberalisation which has been extended as a result of these latest decisions. The cumulative effect of the qualifications and reservations is probably not so much to weaken the basic decisions as to reassure the low tariff countries that they are not giving up all chance of retreat if liberalisation proves too painful, and to make it somewhat easier for them to exact concessions from countries which, through other means, enjoy greater protection. The nature of the new decisions, however, makes it plain that OEEC has now gone as far as it, or any other organisation, is likely to go in removing quantitative restrictions by exhortation. The quotas which will be left at the end of the next eighteen months will have nothing to do with the balance of payments situation; they will be there for protectionist reasons and will only be eliminated in return for real action on other trade barriers.

Restraint Over Blueprints

As had generally been expected, the Council agreed that the EPU should be extended for another year from July 1st and asked the Managing Board to report by the middle of April on any changes which should be made in the Union at the time of its renewal. The Managing Board is also to work out the details of a European Fund to succeed the Payments Union when the principal European currencies are made convertible and the arrangements for the transition from the Union to the Fund. As now envisaged by the OEEC Council, the new Fund will have initial resources of about \$600 million, about half of which will come from the residual capital of the EPU and half from new contributions from members. All the present members of the EPU will be members of the Fund with the technical right to draw upon it, but the new fund is regarded principally as a means of enabling those countries which cannot become convertible at the time of the general move to continue to import freely from their neighbours, and as an additional source of credit for the small European countries. In contrast to the practice in the EPU, drawings will not be automatic.

No appreciable progress was made on either of the other two questions which Mr Butler has usually linked with the European Fund as necessary preliminaries to convertibility—that is the trade rules which should govern in a transitional period after currency convertibility and the organisational arrangements between OEEC and Gatt and the IMF during this period. To some extent, the nature of the OEEC decision must depend on the outcome of the battle on the basic rules governing the use of quantitative restrictions which is now being fought out in Geneva. And to some extent the absence of decisions is the result of a disposition on all sides to avoid too much blue-printing of the future. The approach to convertibility is now both more relaxed and more pragmatic than it was last summer. OEEC is content to get on with its immediate tasks without

seeing the future too clearly. What seems to lie ahead is an easier time than was feared six months ago both for the many who will become convertible and the few who cannot, as well as enough time and good will to allow countries to make reasonably sure in advance that convertibility can be maintained once it is undertaken.

Although the trade decisions were the difficult ones at last week's meeting, the relatively easy step of naming a working group to study the Italian development plan may point the way to the future development of the organisation. Apart from the obvious hope that full knowledge of, and confidence in, the plan by its European partners will result in a larger flow of capital to Italy, discussion of the plan within OEEC, while it is being developed, should have other advantages. It depends for its success on the Italian government's ability to hold down consumption and increase saving, measures which will be far from popular. Experience in the past has shown that the support of OEEC can help governments to take such unpopular steps. And if the OEEC's strong moral support is coupled with action by member countries to enable the Italians to maintain a high level of trade and is sweetened with quite tangible, if short term, help from the European Fund, it should prove particularly effective.

Kafue or Kariba?

FROM A CORRESPONDENT IN NORTHERN RHODESIA

MR R. L. PRAIN, chairman of the Rhodesian Selection Trust, has stated recently that a decision between the rival Kafue and Kariba hydro-electric schemes is vital within about two months if the copperbelt's power needs by 1960 or so are to be met. Many who have listened to the long drawn-out argument over the last two years think it would have been better if the decision had gone in favour of Kariba as originally proposed. The choice of "Kafue first" aroused a parochial glee in Northern Rhodesia which was followed immediately by an equally parochial resentment in Southern Rhodesia; this began first among members of the Southern Rhodesian territorial parliament, gathered momentum with the support of Southern Rhodesian engineers long and honourably identified with the Kariba project, and finally spread to the general public of both Northern and Southern Rhodesia.

There followed much manoeuvring behind the political scenes in which it was generally believed that Kafue's champion was Sir Roy Welensky, Northern Rhodesia's leading public figure and deputy federal Prime Minister, while Mr R. S. Garfield Todd, Prime Minister of Southern Rhodesia, stood for Kariba. In face of this rivalry, the Federal Government went back on its earlier decision in favour of Kafue and appointed a commission of French engineers to report on both schemes. More or less at the same time Northern Rhodesia produced further data which showed that, by adding to the original Kafue scheme a second dam built upstream at Meshi Teshi, the output of Kafue could be expanded until it became slightly greater than that from Kariba and at about the same cost. This new information, supported by British and South African consultants, was sent to the Federal Government's French

consultants midway through their investigations. In their report, however, they mentioned it only in passing, and based themselves on the original Kafue plan.

The argument over Kafue and Kariba has taken place with a mixture of high technicalities and political jobbery under what must be the bewildered eyes of American World Bank officials, who have been asked for financial aid, big copper producers planning future expansion to which power is the key, and that minority of Rhodesian politicians and the general public who are clear-sighted enough to see that failure to have large new supplies of power by the end of 1959 will not only cut copper profits, but may also cut federal revenues by anything up to one-third.

All the words and all the manoeuvring have not altered the essential facts, though they have almost buried them. These are that both schemes are admirably suited to the

production of large amounts of cheap hydro-electric power, and both will be needed in time. Kafue can produce an estimated 400 megawatts of power at a cost of about £55 million in 2½ years, and this output can be more than doubled by a second dam at Meshi Teshi, which would make the total cost roughly equal to that of Kariba. The Kariba scheme could produce about 800 megawatts at a total cost of about £86 million, but it would require two years longer to complete than the Kafue project, apart from the Meshi Teshi extension.

At the end of 1959 the copperbelt will need a little less than 50 megawatts more power than it will then be able to obtain from known sources, and this shortfall will rise sharply until it reaches 100 megawatts in 1961. Since the present power consumption is about 130 megawatts, the urgency of the problem is obvious.

When this timetable is applied to the two hydro-electric schemes, the Kafue scheme offers power which, if work is begun within not more than a year, would be available on the copperbelt just when the power demand substantially outstrips the existing and potential sources of supply. But if the earlier Kafue decision is now reversed in favour of Kariba, the copperbelt faces a period of not less than two years between the period when its power shortfall reaches 100 megawatts and the earliest date at which relief can come from a Rhodesian power scheme.

If the Kariba scheme with its two year time lag is adopted, the copperbelt could get over the difficulty by cutting the present production plans to conform with the

amount of power available. The effect of this could be to reduce copper output from the level at present planned for 1961 by anything up to one-third. Such a reduction would probably cut by a roughly similar proportion the revenues derived by the Central African governments from taxation of the copper industry. At present this taxation provides the Northern Rhodesian Government with about 85 per cent of its revenues and the Central African Federal Government with about 60 per cent. Moreover, last year the mining companies, basing their plans on the then expectation of power from Kafue before 1960, began work on providing electric light in all their African houses. All Northern Rhodesian towns, and some of the smaller Southern Rhodesian centres, have also based their plans to house secondary industries and provide for commercial expansion on the belief that the present irritating restrictions on power consumption would be over by the end of 1959. The postponement of these hopes for at least two years would delay a much needed move to escape from the area's present total dependence on copper mining.

The mines have indicated no alternative to cutting down present plans but they could seek to extend the scope of the arrangements they made nearly three years ago for the supply of power from installations now being built on the Lualaba River in the Belgian Congo. If, however, they do this, it is unlikely that they could obtain a permanent supply of large amounts of power, except at high cost and through a long term purchasing agreement with the Congo authorities. Such an agreement could hardly be operated only for two years and the ludicrous situation might arise whereby when ample power eventually became available from a Rhodesian river its only big-scale user would be committed for years ahead to take power from a source outside the country altogether.

Franco Experiments

RECENT events underline the fact that Spain is uneasily, but clearly, moving towards a new era. That General Franco wishes to see the monarchy restored on his own terms, and through his own will, is now evident. In his negotiations with Don Juan, the pretender to the vacant throne, the Caudillo obtained precisely what he wanted: complete control over the education of the Infante Don Juan Carlos and an implicit renunciation on the part of Don Juan in favour of his son. The latter, who arrived in Madrid this week, will henceforth be trained under Franco's close supervision. In the next six or seven years he will be trained in the army, in the navy and in the air force. His advisers and religious guides will be hand-picked by Franco himself. In return, the Caudillo will soon allow the young prince to bear the title of Prince of the Asturias—the traditional title of the heir to the Spanish crown—and will permit Don Juan occasional visits to Spain. These are trifling concessions, and it is important to note that Franco has not committed himself formally to the restoration of the monarchy. If the monarchist party proves intractable, or if the Falange persuades Franco that it will not accept the change without bloodshed, he can still seek other solutions to the problem of succession.

It is because the prospect of his own retirement must be considered in the next five years that General Franco is initiating carefully controlled experiments in certain kinds of civil liberty. Spain has to be re-educated for the day when the Caudillo's cunning and powerful hand is no longer at the wheel. The fact that monarchist candidates were allowed to oppose official slates in the recent municipal elections is important. They did poorly, and this gave Franco a good demonstration of the strength of the Falange and of the lack of a really organised opposition in the country. It also allowed him to say to the monarchists that the restoration of the crown depended on his will and would have to be prepared very slowly. In order to prevent militant anti-monarchist propaganda, which could be disguised under pro-Falange or pro-Franco colours, the Caudillo has been tightening the press censorship.

Only *Ecclesia*, the powerful organ of the Catholic Church, is exempted from the censorship. It is now waging a strong editorial campaign on behalf of a more general freedom of the press. Spain faces tremendous problems and certain elements in the Church are not happy about leaving all solutions to General Franco. In particular, many Catholics are deeply worried about the threat of "Protestant contamination" that attends the arrival of American troops on the Spanish scene. If the American military programme in Spain has got under way so slowly, it is largely because the Spanish authorities are trying to build a series of *cordons sanitaires* around their dangerous guests. They do not want American troops to be allowed at large in the country, nor do they wish to see American books and magazines made readily available on Spanish news-stands.

This whole matter has blazed into the open over the question of marriages between Americans and Spaniards. It leaked out that the Spanish authorities were insisting that American chaplains should impose canonical regulations on marriages between Catholics and non-Catholics. In fact, it has been rumoured that such regulations were to apply even in the case of two Americans wishing to marry on Spanish soil. The outcry in America has been considerable, and it is expected that the American authorities will seek to arrive at a compromise with the aid of the Vatican.

The Spaniards clearly feel that they are doing the West a great favour in allowing America to build up their air-fields, ports, roads and factories. Part of the truculence displayed by Franco's negotiators is founded on a shrewd guess about the future of peripheral strategy. The Spaniards believe that the extremely narrow margin by which M. Mendès-France obtained ratification of the Paris agreements has lowered France's stock in the eyes of the Pentagon even further. American commentators have been saying that France is a poor military risk. Bases in Spain are equally handy and much safer. Thus Spaniards feel that Washington will have to meet their terms. In addition, relations between Bonn and Madrid have become increasingly close and the Spaniards believe that America will soon realise who its best friends in the fight against "world Bolshevism" really are. Like Marshal Tito, but for opposite reasons, General Franco is prepared to put one careful and expensive foot inside the Western camp while keeping the other boot firmly in place. Like Marshal Tito, too, he is prepared to participate on a limited basis in some of the European economic organisations.

Spain's tone may change abruptly if its perennial economic crisis worsens. But a providential rain and snow-

fall has averted the threat of drought. Unless America is prepared to experience some rude shocks in the future, it would do well to make it plain to Franco here and now that he is not as essential to the survival of civilisation as he sometimes tends to assume.

Turkey's Economic Troubles

THE Anglo-Turkish debt agreement announced this week (and discussed in a note on p. 299) is an encouraging sign that the Turkish authorities are anxious to restore their credit abroad; this is essential if they are to surmount their present economic difficulties. Turkey has, it is true, made great strides forward in recent years, but only at the cost of a yawning trade gap and, at home, an increasing threat of serious inflation, and it is particularly unfortunate that the Anatolian plateau should have been hit by drought at a time when the country's economic stability, both internal and external, has in any case been growing ever more precarious.

According to estimates, which are believed to be reasonably accurate, the cereal harvest is about 25 per cent below last year's record yield. (The cotton and tobacco crops, on the other hand, are expected to be the same, or slightly better than last year.) According to press reports, Turkey, which last year exported about 1.2 million tons of cereals, will this year have to import from 300,000 to 500,000 tons. As early as October the Turks were forced to ask the Americans to send an emergency shipment of 30,000 tons of wheat; and a month later the United States agreed to send Turkey 300,000 tons of wheat and 200,000 tons of fodder grain against payment with chrome ore, Turkish lira, and some of the \$76 million of economic aid allocated to Turkey last year.

Thus the Turks will not have to dip into their foreign exchange to pay for their wheat imports. But the complete disappearance of what has in recent years been Turkey's most important export can hardly fail to widen a trade gap that is already growing steadily wider. In the first three-quarters of last year, exports fell by TL 149 million compared with the corresponding period of 1953, while imports fell by only TL 55 million; the trade deficit rose by TL 160 million to a total of TL 393 million. It is not easy to see how the gap can now be narrowed either by a substantial increase in exports or by a serious contraction of imports. Towards the end of September the government did introduce some new import restrictions which have had some effect; but it probably cannot carry this policy much further without seriously curtailing production at home and thereby increasing the inflationary pressures which are causing a good deal of alarm. Already shortages of imported raw materials and fuels are beginning to affect some industries.

In the first three-quarters of last year wholesale prices rose by nearly 13 per cent compared with the corresponding period of 1953, while the cost of living rose by 10 per cent. Wages continue to rise and the government does not appear to be contemplating any step to hold them down. It has, however, tightened its price controls and seems to

be hoping that these will do the trick. But price controls are bound to break down eventually if the basic sources of inflation are not controlled and here the government does not seem to be trying very hard. It is true that the Central Bank has tried to restrict credit by making importers deposit 10 per cent of the value of their applications for import licences in a special fund. But the disinflationary effect of this has been cancelled out by the expansion of the credit facilities of both the central and the commercial banks. From January to October, 1954, the credits of the Central Bank alone increased from TL 2,033 million to TL 2,608 million; as a result the notes in circulation increased from TL 1,414 million to TL 2,608 million.

These contradictory policies by the Central Bank, together with the cheap money policy (since 1951 the bank rate has been 3 per cent) and the government's unrealistic budgetary policies, all make it hard to contain the inflationary pressures in the economy. The 1955-56 budget, which was introduced at the end of November, provides for an increase in both revenue and expenditure by 30 per cent. The budget is balanced, but there is no provision for the substantial surplus that would be the correct medicine for the country's present economic ills.

There is obviously no short cut out of Turkey's economic difficulties. Devaluation would be a highly doubtful cure for such a primary-producing country; and the government has wisely strongly denied the rumour that it is contemplating any such step. The country is still getting substantial American aid, and last month the Germans proved unexpectedly generous in the provision of further credits, even though they had little cause for satisfaction over their chances of getting a reasonable settlement of their debts. But the prospects of further large credits from any source are not very good. And the flow of foreign private capital into the country under the new law, which amounts to some TL 64 million, is not so far particularly encouraging. The Turkish government can hardly expect the flow to increase if it does not take some more decisive steps to put its economic and fiscal house in order.

Rumania De-Ratjans

BY A CORRESPONDENT

THE recent decision to end rationing in Rumania is, paradoxically, one more sign of the difficulties under which the Prime Minister, Gheorghiu-Dei, is labouring. The struggles among the rival Communist leaders, which have apparently recently been growing more intense, have already led to several postponements of the party congress; thus the Rumanian Communists alone have not contributed to the procession of satellite party congresses that took place last year. And until a few weeks ago they alone had not abolished rationing.

In general prices have now been stabilised at the old free market prices. Some of the new "unified State prices" for instance for beef, pork and milk, are higher than the old free market prices; others, on the other hand, including those of maize flour, kerosene, footwear and many household goods, have been reduced, most of them by from 10 to 20 per cent. The old free market prices were, of course,

much higher than the rationed prices; bread, for example, was more than twice as expensive and sugar more than three times. And the reductions in the prices of some clothing and a variety of household goods will not arouse much enthusiasm among workers who must, in any case, spend by far the greater part of their pay packet on food.

To compensate for the price increases tax-free cash grants, ranging from 33 to 109 lei according to the type of ration card held, are to be paid monthly; it is not clear whether these are to be a permanent bonus or are merely to be paid during the transitional period. In addition wages in the three lowest categories have been increased; the lowest category of all is abolished and absorbed in the second, while the second and third are increased by from about 9 to 23 per cent. But workers in all these categories will still be earning well under the average wage, and the rest have received no regular pay increase to offset the increase in the cost of living entailed by the derationing.

It is impossible, with the information available, to estimate at all exactly how great this increase is. On the assumption that 50 per cent of the bread bought before derationing was obtained at rationed prices, it has been calculated that the increase in the cost of living for a man earning a monthly wage of 400 lei (which is about, or slightly above, the average) would be around 35 per cent. If allowance is made for the man's cash supplement, the increase would be about 20 to 25 per cent. This is a significant increase for someone who is already hard put to it to make both ends meet.

Prodding from Moscow?

The decision to abolish rationing was probably made on political grounds and may have been precipitated—according to some reports—by constant prodding from Moscow. In any case, however, the regime would hardly be anxious to fall down on a promise, made with a great flourish of trumpets late in 1953, that it would abolish rationing by the end of the next year. But on economic grounds, the decision seems to have a very dubious justification. It is claimed that the production of cereals in 1954 reached 9 million tons—that is, double the figure for the annual average production during 1949-53 which was given by the prime minister himself. It is difficult not to believe that this is a deliberate exaggeration, designed possibly to justify the abolition of rationing. The Rumanian Communists claim a rich harvest of maize (from which the bread of the peasants and poorer people is made), but the 3.4 million hectares sown to this crop is still inferior to the pre-war area; and the fact that the new price of maize flour, although lower than the old free market price, is still almost double the former rationed price, suggests that the supply is not all that good.

Moreover the wheat and sugar beet harvests are admitted to have been very poor, which probably explains why bread and sugar are still being distributed on ration cards (but at the new prices) to certain favoured categories. As regards consumer goods, the regime may well feel that it can safely abolish rationing and reduce prices, in spite of inadequate supplies, because people simply have not the cash to buy more than the bare necessities. But it may also hope that by placing a variety of goods more nearly within the workers' reach, it may inspire them to heed the constant call to "redouble their efforts" to increase production.

future imperfect

Wild animals depend for their food on what they can find.

It is a hand-to-mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable,

to produce his food *when and where he wants it*.

He asks only health and strength to work his fields,

peace to enjoy the fruits of his labour and a stable economy

to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years

been chemical fertilizers, to enrich the soils of farms and gardens.

But they make chemicals for medicine and industry too.

Fisons contribute to Britain's harvests, health and wealth.

SHREDS OF EVIDENCE...

But evidence of what? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

THE BUSINESS WORLD

Sea Change for Shipping

AFTER more than two years in the doldrums, the shipping industry is once again running before a fair wind. The first breath of air became noticeable in the autumn, when freight rates broke through the barrier that seemed to have built up at about 80 per cent of the 1952 level. By the end of the year the Chamber of Shipping tramp freight index had reached 115.5 (1952=100). The time charter index has followed a similar pattern. All sections of shipping, tramps, tankers and liners, are busier than they have been for some time.

Demand for shipping space tends to be seasonal, and this is admittedly the busiest season in most trades. Freight rates are still about a third lower than the peaks of the Korean boom, and there is nothing to suggest that they are likely to approach comparable levels. Nevertheless, other indications than the graph of freight rates can be used to form an opinion of approaching weather, and there are many signs that conditions will be good for shipping for some time to come. For one thing, a growing number of ships are being taken on long-term time charter at current rates, which are about twice what they were a year ago; and which are about twice what they were a year ago; and which are about twice what they were a year ago. Some vessels were fixed in December for May loading voyages with grain or coal for several months ahead. Some vessels were fixed in December for May loading in the St. Lawrence, grain to the United Kingdom, and the rate was in the region of 63s. There was no forward chartering for this trade last year, and the rate paid for prompt vessels was only 42s. 6d.

Another sign is the value of secondhand ships. War-built Liberty ships changed hands at £105,000 in 1950, before the war in Korea, and they reached nearly £600,000 at the peak of the 1951 boom. Last year a Liberty ship was sold at about £175,000. Today any number of buyers could be found at £250,000, if there

were any sellers, in spite of the increased age of the ships. Even shipbreakers, who want old ships only for scrap, have been compelled in recent months to raise their bids from £5 to about £8 a ton gross. Second-hand ship values tend to follow the graph of freight rates very closely; but they are also affected by shipbuilding prices. So long as shipbuilding costs continue to rise, so secondhand values will be sustained. Shipbuilding costs are still rising, and therefore it is of some significance that orders for some 300,000 tons gross of dry-cargo ships have been placed with British shipyards during the last four months. These fair winds in the freight market have helped shipping shares along too. This week they have been among the most active sections of the Stock Exchange showing rises that were outstanding even in a market that was rising as a whole.

Since the level of freight rates in a free international market depends on the ratio of cargo demand to available tonnage, the general opinion of owners seems to be that for some time at any rate the demand is likely to exceed the supply. On the supply side, the volume of dry-cargo tramp tonnage laid up through lack of employment (always excluding the American "strategic" reserve) is negligible; and tramp owners are less willing than before to scrap their obsolescent ships. Dry-cargo tonnage, therefore, is again in short supply, and since new ships are not coming from the building berths in any great numbers (well over half the tonnage under construction in the world consists of tankers) any marked increase in the volume of international seaborne trade over last year's levels should at least sustain freight rates around their present levels.

Compared with last year, the prospects of increased movements, particularly of bulk cargoes, can be considered good. Grain and coal are the principal supports of the tramp freight market, and movements of these

commodities are expected to increase. The International Wheat Council, for example, estimated that grain shipments this year would probably be about 5 per cent higher than last, even before it was known that bad weather had interfered with winter sowing in Europe. The estimate was based on the poor quality of the last European harvest, the cutting back of North American production, and the running down of the large stocks held by importing countries. So far as coal is concerned, the United Kingdom, Western Europe in general, and Japan, have already committed themselves to importing large quantities of American coal during the whole of this year; and the higher target for British steel output

capacity had to be laid up in the middle of the year. This may in fact have been overdone; for in the last few weeks a seasonal increase in demand has found the market short of spot ships, and voyage rates have suddenly risen 50 per cent above their level a year ago.

Many of the liner companies rely on chartering tramp ships to supplement their own fleets, and the higher rates which they now have to pay was doubtless one of the reasons which has led most of the liner conferences to announce increases in tariff rates, ranging from 7½ to 15 per cent, to come into effect within the next three months. Liner companies, too, suffered seriously from the London dock strike in October, and similar strikes in New York and Australian ports caused losses to the companies operating services in those areas. Despite competition from the air, and growing air traffic, the liner companies look forward to another record year; demand for ocean travel as well as for cruising holidays appears still to be growing. So far as liner cargo is concerned, this year will see the start of all-cargo air services across the Atlantic as well as on other long-distance routes. But if the liners lose any traffic through this cause their owners will still benefit, since the liner companies themselves are largely responsible for this development.

Shipping is an industry in which Britain is well placed to meet fair competition, even from the many new German and Japanese ships coming into service. But all private shipowners, of whatever nationality, are becoming disturbed by discriminatory practices by governments and the growth of unfair competition—such, for example, as the Cargo Preference Act passed in the last session of the United States Congress. The industry is particularly worried that the British Government should have accepted, apparently without protest, an arrangement by which American coal is supplied for sterling, instead of dollars, on condition that 50 per cent of the shipments must be carried in American-flag ships. The recent report of the OEEC Maritime Transport Committee drew special attention to the detrimental consequences of such restrictive agreements:

Effective and cheap shipping services can only be attained if ships, irrespective of flag, can compete freely for cargoes throughout the world. State interference by governments in this sphere as demonstrated by unilateral and bilateral arrangements results in a general dislocation of any effective

* High and Low prices have been adjusted for scrip issues.

this year, together with the growing output of the German steel mills, means an increased demand for ore imports.

The general atmosphere of expanding industrial production obviously favours a growth of demand for shipping, not only for tramps, but also for liners and tankers. Tankers had a poor time in 1954, with voyage rates falling by 55 per cent between March and July. World consumption of oil was not maintaining the rate of growth of former years; at the same time there was an exceptionally high output of new tankers from the world's shipyards. Over 3 million tons of oil-carrying

and efficient system for the world's shipping trade; it gives rise to unnecessary ballast voyages and generally to the uneconomic use of tonnage, which in turn inevitably leads to higher freights.

American ships have already been fixed to carry this coal—which would have been bought anyway—at rates about 20s. higher than paid to ships on the free market.

Whether the dollars saved by this hastily-arranged deal justify such bolstering of uneconomic competition for British shipping seems doubtful. Given the foreign currency that the shipping industry contributes

Delays to Aircraft

THE aircraft industry is again in a hustle, trying to beat the clock. At Bristol, where the dangers of delay are real and pressing, it is proposed to accelerate the development flying of the Britannia airliner into a marathon relay with four aircraft simultaneously building up the flying hours required for a certificate of airworthiness and for experimental flying along commercial routes. In the military field, the government is proposing to insure against future delivery delays in much the same fashion, by ordering new military aircraft in batches rather than singly as in the past. These drastic measures may succeed in getting an aircraft out of its development troubles, but they do nothing to prevent them from arising.

Time and again during the past months, in and outside the House of Commons, the conspicuous absence of modern equipment in the RAF has been attributed to "development" troubles at the factories as if this explanation was in itself sufficient answer to growing public disquiet. Tempers in the aircraft industry have not been improved by the knowledge that at least some of the development delays for which it is now being roundly criticised are not of the industry's own making. Up till now, the explanations for non-delivery of certain service and civil aircraft have been largely one-sided; that is, they have expressed the customers' disappointment that delivery should have been held up because of development troubles. But why should designs that appeared perfectly satisfactory during their early stages become afflicted with such serious growing pains? The public is left to conclude that these troubles are a form of aerodynamic chicken-pox that some projects catch and some do not.

In fairness to an industry with considerable technical achievements to its credit, it should be made plain that while there have been faults for which the designers are directly responsible the cause of much of the delay rests with the customers. Instead of accepting the delay rests with the customers, they have tried to incorporate into the design each improvement in technical performance. The cost of these modifications in time lost, delivery schedules disrupted and taxpayers' money spent is only now becoming apparent. Had the RAF so

towards Britain's balance of payments—and the same applies to such countries as Norway, Denmark, the Netherlands, Germany, France and Italy in varying degrees—shipowners do not expect governments to cut the ground from under their feet. The Norwegian government, it should be recorded, refused to buy American coal on such terms. British shipowners can only hope that their own Government will not repeat its indiscretion by agreeing to any further extension of a practice that it has already officially deplored in the case of the Onassis-Saudi Arabia oil transport proposals.

chosen, they could have had the original versions of Swift and Hunter in service several years ago—certainly with less powerful engines, less lethal armament and less refined electronic equipment than the improved but much delayed marks of these two fighters that are so slowly coming along today. Improvements and engine changes in the Britannia have had roughly similar results but here the manufacturers bear some responsibility for the changes.

The new approach—the shock tactics of prototypes in batches as in the case of the 20 new P1 English Electric fighter—again seems based on the tacit assumption that development troubles are an inevitable part of aircraft evolution; and that the best means of reducing delay is to provide enough aircraft to deal with them all simultaneously. This is not an argument that the designers themselves accept. A view that is widely held in the industry was put forward with much force last week-end by Mr W. Petter, one of the industry's younger and more controversial designers. Mr Petter has had the satisfaction of knowing that his Canberra bomber is the only British airframe design that has been bought by the American air force—and the frustration of having his Gnat fighter consistently rejected by the Air Ministry on the ground that it does not fit in with present policy. Mr Petter blamed the delays in delivery first on the services which asked the industry to make too big a leap ahead in design, and secondly, on the industry for promising to meet these over-ambitious requirements. This was the mentality that, largely for economy reasons, decided against building a fighter mid-way in performance between the Meteor and the Hunter—a Sabre-class machine. In doing so, the industry was deprived of essential experience that would have made the Hunter easier to develop. The grave danger, as Mr Petter emphasised, is that when a designer is asked to aim too high, as British designers appear to have been asked, the project is in danger of having become obsolete by the time all its difficulties have been overcome. Another serious drawback, not mentioned by Mr Petter, is that having once sunk money in a project, the ministries rarely cut their losses when it runs into trouble. Most

manufacturers feel that they would gain from the stimulus of knowing that failure to fulfil performance promises would be followed by withdrawal of support.

At the beginning of the re-armament programme in 1950-51, when most of these machines were ordered, the ministries greatly under-estimated the difficulties of airframe construction and also of the ancillary equipment of the aircraft. There was an assumption that electronic equipment and armament could be developed rapidly, and need therefore not be ordered until aircraft production was well under way. But a modern aircraft is not like a house into which the furnishings are fitted after it is built. It is a "weapons system" in which engines, armament, electronics and airframe are interlocked in something much more analagous to a chemical bond. It is hardly surprising that when their engine power was doubled and new cannon of unprecedented weight and fire power were introduced, neither the Swift nor the Hunter gave the performance expected of them and that shortcomings in their designs became aggravated into major deficiencies calling for substantial modification. The industry's younger designers are aware of the necessity of working from the outset with all their equipment contractors, but it is not certain that the services and their scientific advisers yet appreciate the need to consider the fully-equipped aircraft as an entity and not as a Christmas tree ready for decoration; or indeed that they have accepted the wisdom of moving by smaller steps.

These are matters of prime concern to the Ministry of Supply, the go-between for the Services and the industry. Its funds are limited and the number of calls upon them apparently unending. Air research and development, whether civil or military, is exceptionally risky, for there is no market for the second-best, however good. Some government support seems inevitable

for civil as well as for military aircraft. Here is the difficulty. The Ministry of Supply may not be able to finance more than one project for any one type of aircraft or engine. The dangers under the present system are only too plain—more promising designs may fail to get support because the Ministry has already committed the funds earmarked for that purpose to an earlier comer. When a company persists and develops the design out of its own resources, it is competing directly with a Ministry-sponsored project and considerable friction can arise. If it drops the design, the services and the country are the losers. And in the civil field, the Ministry today runs the risk of pouring money into a project in which the air corporations may have lost interest by the time it is ready for service.

Such situations might be avoided if the Ministry of Supply were to revise its policy and insist that manufacturers carry out for themselves and at their own risk all preliminary work on a new project up to a point where they have some practical evidence to back the claims they make for it. It is an extraordinary thing that although estimates of costs and performance are bandied about with the utmost confidence long before aircraft are built, their development encounters such difficulty and delay. The cost of designing and building an engine to a stage at which it is ready for bench trials is relatively low; the millions are spent after trials start. The same is true of the aircraft. Such preliminary work is not so expensive that it cannot be borne by the manufacturers—several have in fact done so. But the subsequent development costs are so heavy that few companies would be prepared to carry them and it is at this point that Ministry finance becomes essential. If projects were carried to this stage before the Ministry came to a decision, the competing merits of different projects would be a great deal easier to judge than when they are still a gleam in the eye.

Britain's Capital Formation

EVER since they first appeared the national income figures have failed to answer a crucial question: Is Britain adding to its capital equipment? Each year has seen a big investment in fixed capital assets, but these figures have represented the gross capital expenditure of the year. They have made no allowance for the amount of capital equipment that has at the same time been used up or become obsolete. Until that provision has been made, there can be no measure of the true growth of fixed capital. Mr Philip Redfern has made an important attempt to fill this statistical gap in a paper read to the Royal Statistical Society this week. His analysis and conclusions deserve the most careful study, for the light they throw on the process of capital formation in the British economy and in particular sectors of British industry.

Mr Redfern's conclusions are broadly reassuring;

he finds that there has been a substantial real addition to net fixed assets each year since the war. Suspensions in particular years since the war that no net investment had been achieved find no support in his paper. As the tables show, particular industries have at times burnt up capital faster than they accumulated it, but for the country as a whole net investment has been growing in real terms—that is, after wringing out the effects of rising prices from the figures. By 1953, real capital was growing about as fast as it did before the war. This is not a matter for complacency; but nor is it a disgrace.

How does Mr Redfern reach his conclusions? First, he makes estimates of gross formation of capital assets, class by class, using the official figures for the last few years and adding his own calculations further back. He then constructs price indices for each class of capital

goods and applies them to the gross investment figures, thus turning the gross capital formation at market prices into constant prices based on 1948. Finally Mr Redfern applies to his figures for gross investment at constant prices the wear and tear allowances granted on the different items by the Inland Revenue for tax purposes. He thus obtains a series of figures for the written down value of investment after deducting the appropriate depreciation and at constant prices. The result is the first measure of the real stuff of the country's capital equipment and its changes over a period of years.

Two main obstructions have prevented such calculations before. One is price inflation. As industry knows well, statutory depreciation, based on the original cost of a piece of equipment, does not provide sufficient funds to replace it if prices have been rising throughout its working life. This is the nub of the argument about historical costs and replacement costs. Mr Redfern's method reckons in real—that is, replacement—terms. The second obstacle that he has vaulted is the habit of Chancellors to make arbitrary financial allowances against plant and machinery that do not correspond with the degree of wearing out or obsolescence that takes place in a given year. For example, Chancellor Cripps introduced initial allowances; Chancellor Gaitskell withdrew them; Chancellor Butler restored them and subsequently introduced his investment allowance on a different basis.

Mr. Redfern's results may still be out by appreciable margins, for national income statisticians are still feeling their way and he has had to probe into a period before they even began feeling. Any measures of gross investment totals and price indices except in the last few years must be sketchy. Nor is it possible to make allowance for the fact that the industrialist does not normally replace like with like. Index numbers based largely on the declared values of a given weight of machinery may conceal substantial increases in its productive capacity. The assumed lives of the items of equipment include some allowance for the fact that they often become obsolescent before they wear out physically, but no allowance is made for losses from other causes, except destruction in the war. The figures must include some assets that have disappeared before reaching the ends of their assumed lives, just as they must exclude others that have passed the end of their imputed lives and are still going strong. The total error one way or the other on that account is probably small.

The author adopts the definition of capital used in the national income statistics. All houses are regarded as capital and broadly all that goes into them as consumption goods. The marginal item is the motor car which the statisticians try

to treat as capital when it is owned by a firm and as personal consumption when it is owned by an individual. Mr Redfern has no definition of depreciation ready to hand nor does he attempt one, but the idea runs through the paper that depreciation (which includes a measure of obsolescence) is the amount of investment, whatever the level of prices, that is needed to maintain the country's productive capacity. Any capital creation above that level is net investment. Net investment may imply either of two things—an increase in the actual number of productive assets, or a younger average age among them. In shipping there has been no actual increase in the size of the British mercantile fleets, but there has been net investment because in the process of vigorous replacement the fleets have been rejuvenated. In railways there has been net disinvestment; the quantity of rolling stock has not fallen, but it has been allowed to age. Investment can also occur through excess maintenance of existing plant and disinvestment through insufficient maintenance: it is impossible to make formal provision for either.

One other limitation of the analysis remains. Time and complexity have compelled the omission of certain assets, believed to amount to about 6 per cent of the total. These omissions include the depletion of mineral resources such as coal, coal industry buildings and workings and some of the central government's non-trading activities such as hospitals. The figures in the tables are therefore not completely coterminous with those in the national income blue book. Mr

Net Investment at Current prices								
1938....	1	17	21	85	127	26	...	277
1953....	—7	138	15	260	398	76	...	879

The figures included foreign owned investment in Britain but exclude British Investment overseas.

Redfern makes only a modest claim: "The estimates do indicate broad orders of magnitude and so represent a step forward."

Business men will naturally look for guidance on the question whether depreciation allowances are adequate. Mr Redfern has taken five industrial groups and tabulates depreciation based on original cost against depreciation at replacement cost and he finds that for a considerable range of plant and machinery "depreciation at replacement cost in the years 1948 to 1952 was nearly twice the depreciation at original cost." The industrialist should not be misled. The figures do not show the difference between the Inland Revenue allowances and what the author thinks the allowance ought to be. He has used throughout his paper the "straight line" method of writing off an equal amount each year. Had he used the "reducing balance" calculation in which the depreciation allowance falls as the age of the article increases, the difference "might have been much less marked." Nor has allowance been made for initial allowances and the calculations stop short of the introduction of the investment allowance. For that reason the Inland Revenue basis today is less mean than the bald figures suggest.

Mr Redfern's general conclusion is reassuring. Because of rising prices, a larger proportion of the country's gross fixed investment has been absorbed in covering depreciation than before the war. Roughly two-thirds of the gross figure is now needed to cover depreciation compared with about a half in 1938. Of the gross national product, between 9 and 10 per cent is absorbed in depreciation compared with 7 per cent in 1938. But the war losses that reduced Britain's fixed capital by about £1,000 million (5 per cent) below the 1938 level (at constant prices) had been fully made good by 1950 and by the end of 1953 the net national fixed capital, allowing for the small items that Mr Redfern had to exclude, was about 10 per cent above the 1938 figure. It stood at £26,000 million at 1948 prices, or £34,000 million at current prices.

This total result masks wide divergences between the different classes. Net investment in housing has been impressive—too impressive. In manufacturing

and distributing industry as a whole net investment has also been encouraging though in such an omnibus group some industries will have done particularly well—oil refining is obviously one of them—while investment in certain others may have been low or even negative. The transport and communication group too shows a low—and on occasion negative—investment. That too contains wide divergences, including a net investment in shipping, mere replacement in road passenger transport, and on the railways, ports and roads net disinvestment.

DEPRECIATION ON REPLACEMENT & HISTORICAL COST

Note:—Figures in brackets are actual provisions; others are Mr. Redfern's calculations. The calculations are not on Inland Revenue basis and exclude the effect of initial allowances.

There is plenty of room for discussion about these figures. But in general Mr Redfern's conclusions will be welcome, for they show that the nation's fixed wealth is growing and growing faster. He is to be congratulated on providing the first practical calculus of British investment performance, and for demonstrating that if it is not so good as it ought to be it is not so bad as many have feared. It would be a happy sequel if these net investment figures could find their regular place in the national income statistics.

Business Notes

How Near is Inflation?

ON the economic question now uppermost in stock markets—the extent of the inflationary threat, and whether the monetary authorities will or should take strong corrective action—the investor will not find any forthright or single answer in the annual statements that have so far come from the bank chairmen. But he will find that the warnings clearly outweigh the reassurances. Mr D. J. Roberts, of the National Provincial Bank, who devotes particular attention to this question, seems to be more worried about the broad trend than the immediate prospect. Like his fellow bankers, he is impressed by the great progress that has been made in these past three years, yet through it all the fall in the purchasing power of the pound has "not been arrested; only slowed up." He flatly rejects the "comfortable doctrine" that a mild dose of inflation each year is a small price to pay for full employment and freer trading, and is supportable so long as production increases. Among the dangers he foresees are the loss of exports if other countries are not inflating similarly, and a "yearly battle" for wage increases always "fought and lost on the issue of trying to restore the standards of the workers, instead of that of raising productivity."

Despite an anxiety lest the "great increase" in hire-purchase goes so far as to "stimulate a feverish demand which cannot be sustained," Mr Roberts sees no reason for "immediate alarm." This is also the view of Mr A. W. Tuke, of Barclays, who finds dangerous symptoms only in the labour market and "possibly" in the stock exchange, and who remarks that even the pressure for labour is not general. But he, too, is sure that the danger is not far below the surface, and gives warning that the hopes of a "good" budget may prove to have been a mirage. The verdict of Sir Thomas Barlow, of the District Bank, is at first glance more disturbing. He discerns "ominous signs of overstrain"—in the labour market as well as in the lengthening of delivery dates and in wage pressures. Like his fellow chairmen in the North—Mr A. H. Bibby, of his fellow chairmen in the North—Mr A. H. Bibby, of Williams Deacon's—Martins, and Sir Eric Carpenter, of Williams Deacon's—he is worried about the future competitive power of British exports, and especially about the encroachments of Japan into the textile markets.

But even Sir Thomas seems to think that rising production may keep the immediate danger at bay, and he looks to the budget for a further stimulus. To give concessions that would "unduly" quicken consumers' expenditure would be a "gross misapplication of a powerful incentive"; but, granted that personal savings have been rising, and monetary brakes are available, "need we be too timorous?" On this theme, Mr Bibby makes no such reservations: "all the omens are favourable for the Chancellor, in the next

Budget, to restore the incentives. . . ." This, surely, is an excess of enthusiasm. The only other bank chairmen who so far have offered budget advice are much more restrained. Mr Roberts and Sir Eric Carpenter focus upon the starting point for surtax and the limit of earned income allowance, and Mr Roberts further points out that it would cost very little in terms of revenue, and would bring benefits to the economy in terms of incentive, to ensure that no part of any income was taxed at a rate above 15s. in the £.

Mutiny for the Bounty

THE recently formed stockholders' association of Peninsular and Oriental Steam Navigation has come under criticism by the chairman of the company, Sir William Currie. He names Mr Walter Salomon, the merchant banker, as the only substantial shareholder connected with the association, discloses his holding as about 50,000 deferred shares and declares that Sir Harold Gillet, the distinguished accountant, who heads the association, has no shares in his own name and represents the interests of Mr Salomon. Was it quite impossible to contrive more constructive interchanges between the association and the company? The association has not really shown itself to be a group with get-rich-quick ideas. On the contrary it has claimed that if the shipping assets were separated from the others and shown at the true worth of the capital employed, the rearrangement would show the low profitability of the company's shipping and the unwisdom of investing much more in ships without Government support.

Sir William Currie proclaims that the ideas of the association are not in shareholders' best interests, and his case seems a good one that stockholders should seriously ponder. The group has commissioned an investigation into its structure and organisation by Lazard Brothers and Deloitte, Plender, Griffiths and Co. Their investigation cannot affect the balance sheet as at September 30th last year. But there should be something for the chairman to reveal at the meeting next May. The investigation does not spring from the activities of the association, though it might bring some of the fruits that they aim at. Already this year there has been a free 100 per cent scrip issue and the big liner companies do gradually, if reluctantly, loosen the purse-strings—hence the frequent appearance of ginger groups among the shareholders of the big liner companies. Already it is clear that a pressure group is being formed among the Furness Withy shareholders, too. Perhaps the best counsel for the P and O stockholder is to wait and see what the meeting in May brings. His capital values are not suffering from the delay. P and O deferred rose from 66s. to 73s. 6d. this week.

Woolworth's Dividend

THE appetites of Woolworth's shareholders have been so stimulated since the war that last year's impressive increases in profit and in dividend are judged disappointing. For almost any company except Woolworth the 1954 results would have been greeted with jubilation. Profits before tax increased by 10 per cent, from £18.9 million to £20.8 million. Net profits, thanks to the demise of EPL (which in 1953 absorbed nearly £2.2 million), jumped from £6.8 million to £9.5 million. And, allowing for the 50 per cent free scrip issue, the ordinary dividend has gone up from 40 to 50 per cent. Why, then, the Jeremiads and the fall in the ordinary stock?

EARNINGS AND DIVIDENDS (£'000)

	Years to December 31,		
	1952	1953	1954
Profit, before tax.....	16,300	18,977	20,813
Taxation.....	10,530	12,190	10,968
Net profit.....	5,770	6,787	9,509
Retained profits.....	940	1,766	3,118
Ordinary dividends.....	4,331	4,950	6,187
Ordinary dividends (per cent)*.....	36½	40	50

* Equivalent rates on capital of £22½ million, after 50 per cent free scrip issue.

Part of the answer is that some investors, their hopes inspired by the scrip issue and the death of EPL, had set their sights on a final dividend rate of 40 per cent or even more. A further reason is that profits rose by 10 per cent, compared with 16 per cent in 1953, although last year purse strings were looser than ever. But in 1953 Woolworth's sales and earnings were given a sudden jolt forward by the end of sweet rationing and in 1954 it was the sale of more expensive durable consumer goods that showed the biggest jump. Despite the market's reservations about these latest results, they cannot upset the view that a policy of cash trading, quick turnover, and strict control on stocks and manufacture is still paying handsomely. The price of 5s. units, which offer a yield of £3 14s. per cent at 67s. 9d. xd., still marks them as a growth stock of the first quality.

Fight for Assam

THE Assam Company, the oldest British-owned tea company in India, with a capital of £1 million well spread among 2,800 shareholders, has devised a new technique for dealing with a possible take-over bid. It is to arrange that control is placed almost, but not quite, out of the bidder's reach—to make sure that if there is a bid it shall be both comprehensive and high. This is the plan: First, shareholders are to be given a 50 per cent free scrip issue, for which the consent of the Capital Issues Committee has been obtained. Then they are told what the dividend is to be and the break-up value of their shares.

THE ECONOMIST, JANUARY 22, 1955

The final dividend, including bonus, is to be not less than 12 per cent tax free on the enlarged capital, making a total distribution equal to 36 per cent gross on the present capital compared with 12 per cent gross last year. The estates today are stated to be worth £3 million and the break-up value of the ordinary stock to be in the region of 80s. per £1 unit; even though the ordinary units, recently at around 28s., have rushed upwards under the stimulus of Indian buying to 47s. 6d., that estimate still makes them look cheap.

Finally comes the controversial part of the plan. The directors will issue at par 750,000 (£37,500) nominal of ordinary 1s. shares with one vote per share (like the £1 units) to the trustees of the pension fund, who are nominees of the board. The 1s. shares rank for dividend *pari passu* with the £1 units and are dirt cheap at par, but the pension fund in fact makes no gain. It is a non-contributory fund and directly or indirectly the company has to provide its income. What will happen is that the trustees of the fund will permanently wield one third of the total votes. They are appointed by the board, but they do not automatically go out of office if the board changes. Therefore it is arranged that if there is a takeover bid accepted by holders of 75 per cent of the £1 ordinary stock, by which the bidder would obtain 50 per cent of the votes, the trustees must, if he wishes, sell him their holding. If the Indian buyer gets 51 per cent of the capital through the market, he will not control the company; but if he gets 75 per cent by a general offer to all shareholders, he will. Presumably he will stop buying through the market and he may or may not make a general bid.

An Issue of Principle

THOUGHTS jump back to the Savoy Hotel affair of a little more than a year ago. There the directors sought to transfer the most important physical assets out of the bidder's reach. In the Assam Company the technique is rather different. The directors create a vested interest in votes of which they do not themselves hold a great number. They do not make it impossible for the bidder to bid, nor deny him the fruits of victory if he succeeds, but they make the stakes as high as they can. Moreover, in the Assam Company the whole plan is submitted to the shareholders for their decision. Yet the timing has been carefully arranged not to give the Indian buyer extra opportunities. Transfer lists close at once until after the meeting and the buyer who may have built up a 40 per cent actual holding in the company will be prevented from obtaining transfer on the shares he has just been buying and will therefore have less than that proportion at the meeting on February 7th.

Those facts may blunt the sharpest edge of criticism that the board will incur; they cannot silence it. The whole device of issuing shares with special voting rights to the pension fund is a subterfuge and one that is directed against one particular shareholder. The directors in effect admit it:

The directors make this unusual recommendation for the sole reason that they are apprehensive lest a stockholder, through purchases of stock on the stock exchanges, might acquire effective control of the company's assets at less than

Oft touched by human hand

IN DAYS GONE BY, when disease could sweep unchecked through the land, foodstuffs were passed from hand to hand, exposed both to the elements and to passing dogs and flies. Now those 'good old days' are gone. Thanks to modern packaging and the use of brand names, our food is protected to a degree unknown to our ancestors.

Vital indeed is the part that packaging has

to play in the nation's economy. That is why the demand for "Thames Board" and "Fiberite" Cases is increasing. That is why Thames Board Mills are thinking ahead, planning new ways of increasing production. Already they produce over half the cardboard made in Britain. The new £9,000,000 extensions at Warrington, part of which is already in operation, confirm Thames Board Mills' leadership in this vital industry.

their proper worth, to the detriment of other stockholders who have accepted a policy of conservative restraint in the past.

No argument supported by such special devices can fail to attract criticism. Assam is not the only tea company whose shares stand below their break-up value. Indeed thanks to the Indian bidder its shares are at the moment among the dearer tea shares in the market. Nor are tea shares alone in standing below break-up values.

There are naturally other reasons that make the board of the Assam Company dislike the present Indian buying of the shares: a long family association with the company, the fear that a minority of British investors may eventually suffer Indian transfer restrictions if the domicile is moved, and the established trade connection between the company and the London tea auctions that may be broken if an Indian-owned agency is appointed. But these facts are the occupational risks of the investor in tea shares. If he dislikes them he can sell now at the highest prices in a generation.

Costlier Motoring

LAST week's increase in petroleum prices has aroused some criticism and stirred one local authority to talk of carrying its protest to the Monopolies Commission. The rise—a halfpenny a gallon on both premium and second grades of motor spirit and a penny a gallon on diesel fuel for road vehicles—is partly due to the rise in tanker freights. The "Average Freight Rates Assessment" made on January 1st by the London Tanker Brokers' Panel was "Scale No. 2 plus 12.8 per cent," which implies a rise of about 1s. 7d. a ton (of oil carried) since October. The major element of the increase, however, was the rise in world prices of oil products. This reflects the dependence of British prices upon those in the American market, where the Gulf price still sets the pattern. It is not easy to formulate an alternative to this system of pricing, inadequate as it may seem in some market aspects. The growing divergence in the pattern of growth in oil demand between the United States and European countries will no doubt continue to put the price linkage under strain.

Talks with Brazil

THE departure from strict orthodoxy in payments arrangements reflected in the new commercial agreement with Turkey may also be applied in the review of Britain's payments arrangements with Brazil. A Bank of England representative is already on his way to Rio for exploratory talks. There is no question in these discussions of tampering with the agreement reached in July, 1953, for the settlement of the commercial arrears owing by Brazil to United Kingdom exporters. When the problem of funding these arrears was first considered they amounted to as much as £61 million. By the time the agreement had been negotiated the total had come down to £54 million. Since then the total has been reduced to

about £35 million—largely by the £10 million of sterling bought by Brazil from the International Monetary Fund. Repayment of the commercial debts is taking place according to schedule. One of the results of the repayments, however, is that the amount of sterling available to Brazil for current trade has dwindled so much as almost to stop Anglo-Brazilian trade except in the most essential items.

By contrast, Germany, which was relatively as deeply involved as Britain in frozen credits in Brazil, has been able to secure a much more rapid repayment of arrears and at the same time maintain and even increase the volume of its trade with Brazil. The German achievement has been secured mainly by the device of creating a free market for cruzeiros in Germany, the cruzeiros being put up for auction and dealt in at rates appreciably below the official parity. This was effective devaluation of the cruzeiro in terms of Deutsche marks; it has enabled Germany to take a substantial volume of Brazilian exports. This in turn has allowed Brazil to continue to buy German produce and at the same time to accelerate the repayment of commercial debts to Germany. The repayments have been made at the free market rates and German creditors have taken an appreciable loss. But they have willingly borne it as the price for getting far more rapid repayment of their claims than would otherwise have been possible. Whether some such device can be applied in the realm of Anglo-Brazilian trade will be one of the problems to be discussed in the Rio talks.

Turkey and Bilateralism

ASIGNIFICANT shift in British commercial policy may be detected in the text of the commercial and payments agreement with Turkey signed last Monday. The outstanding feature of this agreement is its toleration and even encouragement of bilateral and barter deals between traders in the two countries. The facts from which the negotiations began were the existence of about £12 million of commercial debts owing by Turkey to Britain and the gradual withering of Anglo-Turkish trade due firstly to the gross over-valuation of the Turkish currency and the consequent high cost of Turkish produce, and secondly to the unwillingness of British exporters to extend their considerable debts in Turkey. Under the new arrangement Turkey has agreed to pay off its commercial debt by minimum annual instalments of £1,500,000 for the first two years and of £2,500,000 in each of the three succeeding years. To make those payments, Turkey is to earmark 20 per cent of its earnings from the sale of traditional Turkish produce, including raisins, dried figs and nuts.

The agreement becomes unorthodox in its provision for supplemental payments through bilateral deals. Creditors of Turkey who are prepared to find a market for such Turkish produce as wheat, cotton, copper in the United Kingdom will be able to get priority in the queue for payment. The proceeds of such special or abnormal exports from Turkey to the United Kingdom will be devoted as to 50 per cent to the repayment of old debts, while the remainder will accrue to the Turkish authorities as current sterling to be used at their discretion but obviously available

for the financing of additional imports of sterling products. Under these arrangements official encouragement is thus being given to importers and exporters to collaborate in order to develop trade with Turkey. There may be many occasions when Turkey will be prepared to pay for British urgently needed manufactures if the operation can be linked with a sale of Turkish produce to the United Kingdom on an overpriced basis.

This is far from the pure milk of multilateralism or of IMF orthodoxy in the matter of banning multiple exchange date practices, however veiled. It also offends against the basic principle that creditors should be paid with some respect to the age of their claims; these new devices will enable the more astute to jump the queue. On the other hand, there is a hard streak of realism and flexibility in the new arrangements, for they acknowledge that the world is not a heaven of convertible currencies and multilateral trade.

Independent Air Enterprise

THE independent airlines are showing enterprise in their choice of projects for expansion and a shrewd approach to the problems of making them pay. Silver City car ferry is to begin operations this year from Birmingham to Le Touquet, supplementing its existing services to the continent from the South Coast, and is also introducing an ingenious extension of the cheap mid-week fares. This company carries predominantly holiday traffic during the summer, which left to itself would go mostly at week-ends. A 10 per cent fare concession during mid-week has encouraged the spread of traffic relatively evenly over the seven days. A similar inducement is now being extended to week-end passengers who travel one leg of their journey in an "off-peak direction"; a cheap flight home will be offered in the early summer when most travellers are flying out, and a cheap flight out in the autumn when most traffic is homeward bound.

Other independent operators have found that there is room to build up passenger services within the limitations that prevent them from competing directly for passengers with the two nationalised airlines. The smaller companies have built up the internal air links between cities in the British Isles; an example of operation on a more ambitious scale is the Northern-based network of Hunting that extends over most of Europe, and the coach-type services operated jointly by Hunting and Airwork to East, West and Central Africa. The frequency of these safari services has been stepped up.

In these passenger developments, the independent operators are restricted by exclusive passenger rights granted to the British corporations, by the internationally observed passenger tariff laid down by the International Air Transport Association, and also by bi-lateral traffic agreements. The difficulties in air freighting, are not so great and in this field they have major projects. Airwork's freight service to North America, due to start this spring, is a full-scale venture that may extend to a network linking Europe and America. Aquila Airways, now associated with Silver City, has applied for a licence to fly freight to Australia as the basis of a Far East freight network, and Hunting has applied for a similar

licence in Africa. These applications are now being debated before the Air Transport Advisory Committee and it may be some months before their outcome is known.

Materials for Packaging

THE packaging industry is staging its fourth International Exhibition at Olympia this week at a time when all its scattered sections are enjoying record business. Output of packaging materials has risen sharply, some delays in delivery appear to be increasing, and large sums of money are being spent to expand capacity. The wide range of materials used, all of which have other uses, and the growing number of different industries that now put their products into packages mean that packaging is more in the nature of an industrial process rather than a recognisable and well-defined industry by itself. As a result figures are hard to come by, particularly for the newer sections; but the Metal Box Company, which is concerned with nearly every type of packaging material, reports that turnover in the first half of its current financial year was 23 per cent up on April to September, 1953.

The can, the bottle, and the carton are still the backbone of the industry. Latest estimates of tinsplate, paper, and glass used for packaging are given in the table:

	1950	1953	1954	Increase 1953/54 %
Paper and Carton—				
Boards for packaging (tons)	600,800	617,400	699,400†	19†
Paper for packing and wrapping (tons)	509,000	541,800	639,600†	27†
Tinplate (tons)	370,000	410,000	485,000	18
Glass Containers (gross) . .	22m.	23m.‡	24m.*	9*

* Annual rate Jan.-Sept.

† Annual rate Jan.-June.

‡ Equivalent to about 850,000 tons.

Sources: Board of Trade, except for tinplate which is a private estimate.

Other packages and containers, made from plastic materials and aluminium, are bringing into the packaging field items that were not packed or pre-packaged before. The output of plastic materials for all uses is believed to have reached 200,000 tons in 1954, including 40,000 tons of PVC (polyvinylchloride), 20,000 tons of polystyrene, and 20,000 tons of polythene. This year production of these three thermoplastics is expected to exceed 130,000 tons, including 35,000 tons of polythene. Twice as much transparent and cellulose film is available now as two years or so ago. But the extent of the growth of metal foil and collapsible tube sales is not known; and even jute figures are sparse and very late. Only supplies of paper and imported jute remain under official control; but import quotas have been progressively eased. Jute firms can now obtain as much as they want, whilst paper and carton manufacturers are now receiving supplies that are not very far below the amounts they believe they could use. The severe shortage of materials that manufacturers and designers suffered when they held their second exhibi-

Compressed air— made to measure...

—and right from the start! Now is the chance for second thoughts on pneumatics—made possible by the new Hymatic Hydrovane compressor. This rotary compressor, light, compact, quiet and smooth running can be directly driven over a wide speed range and thus completely integrated with your power unit. Simplicity of design, few moving parts and perfect lubrication make for long, trouble-free service.

From the first thought to the final product we are ready and waiting to match compressed air to your needs. A word from you will bring our project engineering service to your plant to apply their unique experience in pneumatic control valves and mechanisms just where it's wanted. Your problem may be on a marine engine, a motor coach or a machine tool—it's all the same to us, we like problems.

tion four years ago is now well behind them. In 1950 the packaging productivity team estimated the cost of packaging in this country at "not less than £300 million a year." Output of packaging materials is much higher now and prices have risen. Turnover today may be well on the way to £400 million.

Better Retail Trade Statistics

THE 1950 Census of Distribution confirmed what had long been suspected—that the monthly figures of retail sales are far from perfect. The shops that now voluntarily make sales returns are not a fair representation of retailing as a whole. Last week the Board of Trade took the first step towards improving these statistics by inviting 19,000 independent retailers to join the existing panel, which is about 3,200 strong. If the response is good, this should provide a much truer measure of the trade of the small shops, including, for the first time, independent food retailers.

Further plans for improving the retail trade statistics were described by Mr W. Rudoe, of the Board of Trade, in a paper read last week to the Manchester Statistical Society. The present sample of large-scale retailers is quite large, but not well balanced, particularly in the selection of multiple shops. The Board of Trade is discussing with the trade associations which arrange the collection of the statistics the possibilities of making a more representative choice and an even larger one, covering 70 to 80 per cent of this side of the trade. An important shift in emphasis is also proposed in the statistics for both large and small shops. Instead of restricting returns to those who can make them on a commodity basis, the main attempt will be to aggregate sales figures according to the kind of business and to derive a measure of total retail trade each month.

This encourages the hope that, given co-operation from the trade, the outcome of these changes will be a reasonably accurate monthly measure of the turnover of retail trade and a yardstick against which individual retailers can measure their own experience. But on the other important aspect of retail trade—movements in stocks—the outlook is bleaker. One step at a time seems to be the formula and any plans for improving the figures of stocks are as yet only vague.

A Fuel Conundrum

ONE of the puzzling facts that makes fuel forecasting in the British economy particularly hazardous is the fact that today each British citizen consumes remarkably little more energy than his grandfather did in 1900. For 50 years, as Mr K. T. Spencer, chief scientist to the Ministry of Fuel and Power, recently pointed out, annual energy consumption per head of population in Britain has varied around 4 tons of coal a head—plus, in recent years, petroleum equivalent to about another half a ton of coal a year.

This fact is reflected in calculations of energy consumption and industrial production, such as were reproduced in the supplement "Energy for Success," in *The Economist* of November 27, 1954. As was said there, Britain in the interwar period achieved each one per cent rise in industrial output with rather less than the concomitant rise of 0.6 per cent in energy consumption recorded by other industrialised countries.

The ruling official opinion is that this reflects structural changes in the economy, in which light industries developed more than heavy ones; in postwar years, the more general ratio seems to have become fairly true for Britain also. But the reason why Britain did better has never been fully established; it is certainly not easy to believe that fuel efficiency rose more in British industries and homes than in their counterparts abroad.

Mr Spencer's diagrams of energy con-

sumption in Britain and abroad, reproduced here, chart this economic phenomenon without explaining it (the rate of growth in American consumption may be slightly exaggerated, since it ignores the burning of wood, which probably made a sizeable contribution to American energy in the eighties). His task, however, was not to congratulate Britain upon its efficiency in using fuel, but to emphasise the need and room for improvement.

From a necessarily crude but useful comparison of "output per ton of coal" in various industries before the war and today, he deduced that "productivity in terms of fuel" (which is a one-sided calculation, but no more so than productivity in terms of labour) has slightly improved since before the war. But "yields per ton of coal," within particular industries, varied widely; the best fuel users in certain industries were able to get 15 or 20 times as much out of their fuel as the worst.

Sterling Area Terms of Trade

THE sterling area falls neatly into two complementary economies: Britain, an exporter of manufactures, and the overseas sterling area, an exporter of mainly primary products. As each is the major market for the other, their terms of trade—the ratio of import prices to export prices—move in opposite directions. Hence the overseas sterling area's terms of trade will improve at Britain's expense when prices of sterling commodities rise without any corresponding rise in the prices of British exports. With the non-sterling world, however, the terms of trade of Britain and of the overseas sterling area do not necessarily move in opposite directions. This point is illustrated in the Board of Trade's revised indices of sterling area trade with the non-sterling world. From the middle of 1952 until the

spring of last year Britain's terms of trade with the non-sterling world improved steadily, but those of the overseas sterling area were relatively stable. A slight fall in British export prices was much more than offset by a sharp fall in prices of its imports from non-sterling countries, but the fall in prices of the overseas sterling area's exports was matched by the fall in prices of its non-sterling imports.

When Britain's terms of trade with non-sterling countries do move in opposition to those of the overseas sterling area, the contrary movements go far to offset one another, for the total value of Britain's trade with non-sterling countries is roughly the same as that of the overseas sterling area; hence the terms of trade of the whole sterling area vis-à-vis the rest of the world change by a smaller extent. Between 1950 and 1951, when prices of both sterling and non-sterling commodities rose sharply, Britain's terms of trade deteriorated by 10 points, while with non-sterling countries the overseas sterling area improved by no less than 17 points, and the terms of the whole sterling area improved by 8 points. Those movements were gradually reversed by the collapse of the Korean boom. During the last half of 1953 and the first half of 1954 (the latest period covered by the new indices) the terms of trade of the sterling area remained stable, a slight improvement in the overseas area's terms of trade being offset by the worsening in Britain's.

Rise in Prices of Materials

By the end of last year British industry was paying about 3½ per cent more for its basic materials (excluding fuel) than at the end of 1953; two large groups of industries, mechanical and electrical engineering, were respectively paying about 5½ and 7 per cent more. The Board of Trade's price index of basic materials used by manufacturing industry (other than food) rose irregularly during the year to 146.4 in December (June 30, 1949=100), but the indices of materials used in mechanical and electrical

engineering have climbed steadily since February. Over half the rise of 8 points in the index for mechanical engineering (which excludes shipbuilding and vehicles) is accounted for by higher prices of iron and steel products; these make up 77 per cent of the total "weight" of the index. Most of the remaining rise reflects higher prices of non-ferrous metals. The balance of forces that produced a rise of 11 points in the index for electrical machinery was almost exactly reversed: it was due mainly to the advance in non-ferrous metal prices, particularly copper, which have a larger weight in this index, and to a lesser extent to higher prices of iron and steel products.

Engine Bid from English Electric

THE first of the three competing British aero-engine manufacturers to get a high-powered turbo-prop engine into production is likely to be English Electric. The company's Napier division will be able to deliver small quantities of its Eland engine, with a present power of 3,000 shaft horse power and an anticipated one of 4,000 shp, late this year and will have it in full production next year. By comparison, its closest competitor, the Rolls-Royce RB 109 (4,000 shp) is just beginning bench running (the Eland has flown for several months) and will not be ready for delivery before 1957-58, while the Bristol Aeroplane Company's 4,000 shp BE 25 is roughly a year further behind.

English Electric has no immediate customer for its engine. It is experimentally converting two piston engined airliners, a Convair 340, of which about 300 are in service, and an Ambassador, a type used by British European Airways. It plans to get a certificate of airworthiness for both machines re-engined with Elands and then to offer similar conversions direct to the airlines for service as early as 1957. This plan, if successful, could make serious inroads into the market for the Vickers Viscount even though the cost would be almost half the price of a completely new Convair. Operators have tried to buy the Viscount's Dart engines (which are small by comparison, with 1,500 shp) to do their own conversions, but Vickers have sole rights to the engine until 1958.

Butter v Margarine

FOR eight months the British public has been able to buy the butter and margarine of its choice. After a period of carefree experiment, demand for both fats appears to be settling down. The first result of decontrol was a sharp increase in the consumption of margarine at the expense of butter. The public's appetite for margarine had been whetted by the lavish advertising campaigns heralding the new brands, and it eagerly sampled one after another. Demand was stimulated fortuitously by a further increase in butter prices to between 4s. and 4s. 2d. a lb, for the Ministry of Food, at that time almost the sole supplier of butter, raised its selling prices to check a possible run on supplies. That action succeeded too well and prices were subsequently reduced. Consumption of butter responded, and has since risen steadily to about, or slightly above, the rate immediately before de-rationing. For a time that recovery was at the expense of margarine, but in the autumn sales of margarine picked up, and they are now somewhat higher than before derationing.

From the large variety of margarines available, ranging in price from 1s. 4d. to 2s. 4d. a lb, the public has selected mainly those brands selling around 1s. 9d. a lb. Efforts are now being made to enlarge demand at the upper end of the price scale—from 2s. to 2s. 4d. a lb—where margarine competes more directly with butter. As Britain is

the principal market for the main exporters of butter, decontrol posed a problem: at what price would a fairly inelastic supply be absorbed in competition with margarine? At present that price is 3s. 8d. to 3s. 10d. at retail—though most of the big distributors are still offering a 3s. 6d. grade, and certain grades cost 4s. a lb or more. If demand for butter should rise much farther, prices would almost certainly have to be increased.

Experience so far suggests that butter, which is also being promoted by a joint advertising campaign by the New Zealand, Australian and Danish producers, has maintained its appeal in Britain. One sign of this is the success of the margarines containing 10 per cent of butter. Some "mixture" margarines are made here, but the brands at present selling best are imported from Holland, taking the import duty of 10 per cent in their stride. One such is made by a subsidiary of Unilever NV; that may bring a wry smile to Van den Berghs and Jurgens, much the largest producers of margarine in Britain and a subsidiary of Unilever Limited. Another sign of the appeal of butter is that the promotion of the most expensive margarine is implicitly trying to steal butter's clothes. Its name and advertising both stress its "true country-fresh flavour."

Oil in Balance

EACH year the oil industry produces more oil than before—and manages to locate in the ground still more than it has taken out. This gives comfort to those in the industry who are inclined to glance twenty years ahead rather than two (or two hundred); but most oilmen are at present focusing their minds upon the next few years and the likely prospect of capacity getting too far ahead of current needs. In 1954, proven reserves continued to jump sharply upwards, but the rate of advance in consumption and output once again dropped.

World oil production, according to some early arithmetic done by the Petroleum Information Bureau, rose last year by some 4 per cent to about 710 million metric tons, or 680-685 million tons if natural gas is left out of the count. In 1953 the expansion rate was 5 per cent. A few years ago it was over 10 per cent, but the industry then had a lot of catching up to do and 5 per cent was thought to be a more normal rate of expansion. Undoubtedly last year's figures were upset by the unhappy state of the United States' domestic market, and this year's may be better. Oil output there was cut back by some 6 million tons to about 312 million tons.

Elsewhere production continued to grow. In the Middle East it rose from 122 million tons to an estimated 136 million; in Venezuela from 93 million to over 97 million; and in Canada from 11 million to 12½ million. Middle Eastern oil sheiks have reason to be grateful for the health of the European economy whilst industrial activity in North America suffered its recent chill. Total consumption should be higher in 1955. But it is not going to be at all easy to find markets for the oil all the interested parties would have to sell—particularly as the Iranians have been promised a place in the sun too.

"Some calculations are done
at the speed of light"

explained the chief accountant.

'We've certainly never had important figures so promptly,'

replied the chairman with satisfaction. 'But isn't 'the speed of light'

a somewhat poetic way of putting it?'

"Some calculations was my expression sir. The Powers-Samas

punched card system makes short work of computations that would take

weeks by hand - if indeed they were practical at all.

Where it is advantageous the system incorporates electronic calculation

which, as you know, is done at the speed of light."

There is a range of Powers-Samas punched card equipment for every type of application.

Office Efficiency: Powers-Samas supply a complete range of the latest office equipment. Write for illustrated catalogue.

POWERS-SAMAS

Powers-Samas Accounting Machines (Sales) Limited, Powers-Samas House, Holborn Bars, London, E.C.1.

British steel makes the world's news

"Avanti", "Figaro", "Der Kurier", the "Herald Tribune" — every day the world's news is put into print. And in almost every civilised country British printing presses are there to do it.

British printing machinery even goes to America, the home of giant-size newspapers.

This machinery is steel. Wherever you go the prefix 'British' means steel of the highest quality. New and better steels are constantly being developed, and wherever there is steel there is British steel.

*British steel
leads the world*

THE BRITISH
IRON AND STEEL
FEDERATION

SHORTER NOTES

The fiduciary issue has been cut by £50 million—the first post-Christmas reduction—reducing it to £1,725 million. In the four weeks since December 22 a total of £80.9 million of notes has returned to the Bank of England. This reflux is more than £16 million smaller than that of the corresponding period of last year, but the shortfall is primarily a reflection of the delay in returning notes caused by the threat of a rail stoppage.

★

A plant designed to produce 11 million lb of "Terylene" synthetic fibre a year was brought into operation by Imperial Chemical Industries this week at its Wilton Works on Tees-side. It was on schedule—about two years and eight months after foundations began to be laid. About half its output will be continuous filament yarn and half

staple fibre; of ICI's current output of "Terylene" (some two million lb a year) nearly all the staple fibre and 85 per cent of the filament is being sold at home to the British textile industry. It seems doubtful whether even this year's greatly increased rate of output will enable the company to abandon strict allocation of the new fibre; that must await completion of another unit at the Wilton plant to double its output—at the end of this year or early in 1956.

★

Mr R. P. Morison, QC, has been appointed independent chairman of the British Iron and Steel Federation in succession to the late Mr Frederick Grant, MC, QC.

★

In December the terms of trade moved another point against this country, to reach 102 (1953=100), the most unfavourable figure for nineteen months. The index of import prices rose by one point to 101, while export prices were unchanged at 99.

Company Notes

LANCASHIRE STEEL. The £1 ordinary shares of the Lancashire Steel Corporation were long the neglected counters in the steel share market. Their standing improved on the company's preliminary statement; the price then rose 1s. 9d. to 25s. That statement showed a slight increase in trading profits (from £1,956,580 to £2,074,551) in the year to October 2nd, although the prospectus had allowed for a drop in earnings. And the ordinary dividend was fixed at 9 per cent and not at the prospectus forecast of 8 per cent. The Corporation's full

commitments of £2.1 million with an ample margin to spare. One after another the steel companies are producing excellent balance sheets, and in a strong industrial equity market steel shares are rising. Lancashire Steel now stand at 26s. 3d. xd, to offer a yield of £6 17s. per cent. The market has come a long way from the day just over six months ago when the Stewarts and Lloyds equity was offered to the public; then the Lancashire Steel shares were priced on a yield basis of over 8 per cent.

★

UNITED STEEL. Production ran high in all United Steel Company's works in the year to September 30th; the output of each of the basic products—steel ingots, pig iron and coke—was the highest in the company's history. As already reported, the group's trading profit was £9,136,496 (compared with £9,111,141 in the 53 weeks to October 3, 1953) and the ordinary dividend 10 per cent (one per cent higher than the prospectus forecast).

In the latest financial year the group spent no less than £8,609,000 on capital account, completing the Appleby-Frodingham ironworks in the process. On

	1952-53	1953-54
Income and expenditure:—		
Gross income	80,889,000	82,488,000
Raw materials, etc.	48,839,000	48,904,000
Wages, etc.	18,097,000	18,974,000
Delivery charges	3,232,000	3,570,000
Taxation	5,516,000	4,388,000
Depreciation & retained profits	4,390,000	5,650,000
Net dividends	815,000	1,000,000

September 30th immediate outstanding capital commitments amounted to £4,316,000. The heavy investment has naturally left the group short of liquid assets. But that need cause no concern,

for the Iron and Steel Realisation Agency has subscribed for a £10 million debenture at £98; only £33 per cent had been paid on it on the balance sheet date. The remaining £6½ million is payable at call in instalments before the end of April. Since the last accounts were closed, the compensation value of the company's Yorkshire coal mines, now vested in the National Coal Board, has, subject to minor adjustments, been determined. The full amount of compensation should slightly exceed the company's conservative estimates. They stood at £877,163 on October 3, 1953, but have now been eliminated.

★

JUTE INDUSTRIES. The directors of Jute Industries had two objectives in mind when they reorganised the company's capital structure last August. They wished to facilitate the creation of new capital and they wanted to cut the throttling ties of the participating preference shares on dividend payments. They succeeded by eliminating the considerable element of equity in the preference

	Years to Sept. 30, 1953	1954
Consolidated earnings:—		
Trading surplus	1,052,562	1,308,668
Depreciation	120,000	200,000
Taxation	545,910	592,854
Net profit	408,352	538,507
Total dividends	148,500	181,500
Retained profits	357,204	503,264

shares, giving preference shareholders in return a holding in the ordinary stock. By free scrip issues, the original ordinary capital of £150,000 (in 2s. 6d. units) was replaced by an ordinary capital of £1,050,000 (in 10s. units).

Five months ago the directors were unwilling to forecast anything more than a minimum ordinary dividend of 16 per cent on the new capital. It was on that basis that the market value on the shares was established. Thus, when the directors declared a dividend of 20 per cent

£1 million unsecured notes created in 1949, the remainder by the issue of 140,000 4s. ordinary shares at 15s. each. The directors intend to make a 50 per cent free scrip issue on the ordinary capital as increased by the cash offer. They intend to capitalise £350,201 from the share premium account arising from the cash issue. In the sense that a free scrip issue is nothing more than a book-keeping transaction no justification need to be sought for this step. In the sense—and it is one often adopted by investors—that a free scrip issue is a broad hint of bigger dividend payments to come, then the decision is justified by the steady expansion in Decca's sales and profits. The 4s. ordinary shares are currently quoted at 56s. 9d., to offer a yield of 4 per cent on the last full year's dividend of 5½ per cent.

BRITISH INDUSTRIAL PLASTICS. This company, one of the handful of producers of moulding powders—the raw material of the plastic fabricators—in this country, has just enjoyed the best year in its history. Its trading profits in the year to September 30th went up from £441,987 to a new peak of £762,735. That advance was not unexpected, for last September the chairman, Mr Kenneth Chance, revealed that in the first nine months of the financial year turnover had risen by 40 per cent. The announcement, coming soon after a 50 per cent free scrip issue, put investors on the track of a bigger dividend.

They were not disappointed. In effect, the total equity payments have been raised from 13½ to 17½ per cent by the recommendation of a final dividend of 12½ per cent on the enlarged capital of £1,247,987. Investors had anticipated the dividend reasonably accurately. The 2s. shares rose only 1½d. to 6s. 4½d. after the announcement. Since then the price has drifted down to 5s. 9d. xd, so that the shares yield 6 per cent.

Next Account begins: February 2nd
Next Contango Day: February 2nd
Next Settlement Day: January

INDUSTRIAL equities came to the end of the old account in good heart. Prices again went ahead on the first day of the new account, carrying the *Financial Times* ordinary share index up to another peak of 192.6. In this period the gap between equity yields and gilt-edged yields continued to narrow and on Wednesday the *Financial Times* ordinary yield was only 0.6 of a point above the yield on old Consols. The gap was narrowing because as equities went ahead gilt-edged prices continued to fall. The falls reported in that market, which was unsettled by the weakness in sterling and fresh talk about money rates, were substantial. In banking shares, Barclays were particularly firm on the chairman's statement and insurance shares turned brighter with the new account. In the foreign market the most active issues were Japanese bonds but in spite of a large turnover prices showed little change.

In the industrial market by far the biggest gains were reported in shipping shares. One by one all the principal liner company shares took part in this advance. Another firm section was that dealing in motor and aircraft issues. Steel shares were also active and strong. That improvement owed something to the publication of healthy balance sheets from some of the leading companies and a good deal more to the wide investment interest in Colvilles offer for sale. Over 120,000 applications for the Colvilles equity were reported on Thursday. Paper-making issues were firm at the end of the old account and later on Wallpaper Deferred went ahead on the rise in wallpaper prices.

Oil shares lost a little ground at the end of the old account when some selling orders came into the market. But when the new account opened most of their prices hardened. Rather more interest was taken in rubber shares and prices tended to edge upwards. Tea shares were active and prices continued to advance very strongly.

Kaffirs were quiet and prices tended to slip back when some selling orders from the Cape were reported.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 15th there was an "above-line" surplus (after allowing for Sinking Funds) of £197,221,000 compared with a surplus of £96,286,000 in the previous week and a surplus of £189,579,000 in the corresponding period of last year—this brought the cumulative deficit to £61,855,000 (£257,952,000 1953-54). Net expenditure "below-line" last week reached £18,969,000, bringing the total cumulative deficit to £394,272,000 (£577,130,000 in 1953-54).

* Since end September the capital expenditure of the Post Office has been charged directly on the Exchequer (instead of being financed from the Savings Funds) and is consequently included in "below-line" expenditure and the total deficit. As at January 15th this item stood at £30,400,000.

THE MONEY MARKET

Credit again tightened in Lombard Street in the week covered by the Bank return. Special aid from the authorities was given every day except Tuesday and on Wednesday (the banks' make-up day) one or two discount houses were forced to take seven-day loans from the Bank at the penal rate. Throughout the week March and early April securities changed hands at 1½-1½ per cent.

The rise in the Treasury bill rate that has proceeded since mid-November slackened off at last week's tender. The market raised its bid by only 1d., to £99 10s. 3d. per cent, for the unchanged offer at £230 million, and the average rate of discount on all bills increased by only 7.68d. per cent, bringing it to £1 18s. 11.97d. per cent. Applications fell by more than £31 million to £344.1 million, so that the market secured a higher allotment (61 per cent against 43 per cent) despite its smaller bid.

Gold prices have risen in sympathy with the weakness of sterling; at Wednesday's fixing the price rose to 251s. 9½d.—a record level. These moves reflected the current weakness of sterling but with some recovery on Thursday the gold price declined to 251s. 8d. and was a penny per ounce lower after the fixing. At \$2.78 on Tuesday sterling touched its lowest for two years.

The Bank return shows a reflux of notes of £33.1 million; the fiduciary issue has been reduced by £50 million, to £1,725 million, but the reserve in the banking department still amounts to £47.6 million.

COMPANY MEETINGS

BARCLAYS BANK LIMITED

A YEAR OF GREAT ACTIVITY

RESTORATION OF CONFIDENCE AND BUSINESS PROSPERITY

MR A. W. TUKE ON OVERSEAS BANKING DEVELOPMENT

The annual general meeting for the year 1955 of the stockholders of Barclays Bank Limited will be held at the head office, 54, Lombard Street, London, EC, on February 10th.

The following is the statement of the chairman, Mr Anthony William Tuke, on the report and accounts for the year ended December 31, 1954, which has been circulated to stockholders:

We welcome as an addition to our board one of the country's most distinguished leaders, Field-Marshal Lord Alexander of Tunis, to whose appointment we had been looking forward as soon as he was free from his ministerial obligations. The stockholders present at the meeting will be invited to re-elect him in the usual way. There have been no other changes in the composition of our board since the last annual meeting.

During the latter part of the year Sir Cecil Ellerton, my deputy chairman, has paid an extensive and most useful visit to our banking friends in America and to our own bank in Canada.

Stockholders will have observed from the accounts that we are able to show a further increase in our net profit, thanks mainly to having had additional resources at our command, and to a growth in the more lucrative though risk-bearing assets. We are thus able to allocate £1 million to reserve from the profits of the year, and we have also been able to release the substantial sum of £3 million from contingency account, which is partly derived from certain provisions made before and during the war for debts which have recently been repaid.

As a result of these two transfers our reserve fund has been augmented by a total of £4 million, and now stands at £16,750,000. As compared with two years ago, our capital and reserve fund taken together have been increased from £31,608,217 to £39,664,703. We are recommending a final dividend of 5 per cent, making 10 per cent for the year, together with a special dividend of 2 per cent on the ordinary stock, and, on the staff stock, a final dividend of 10 per cent, making the fixed 20 per cent for the year. The extra dividend on the ordinary stock is intended to be of a temporary character.

Stockholders will remember that in 1953, when we rearranged our capital, we made a substantial transfer from reserve fund to capital account and I then expressed the hope of the directors that it should be possible to pay a dividend of 10 per cent on the new ordinary stock. A dividend at this rate would represent the equivalent of the increase from 14 per cent to 16 per cent, which the former "B" stockholders received in 1953 as part of their consideration for admitting the former "A" stockholders, whose dividend had been limited to 10 per cent, to participate equally with them in all future distributions. The special dividend of 2 per cent recommended in respect of 1954 will, of course, be payable to all the ordinary stockholders without any qualification.

It is the opinion of the board that the issued capital of the bank should be further increased from time to time, at least to keep pace with the growth in the fixed assets, and

that in present conditions this would be best achieved by the occasional capitalisation of reserves. Provided that the rate of dividend were maintained at 10 per cent, this would have the effect of increasing the distribution of profit to the ordinary stockholders.

Your directors, however, do not consider that the time has yet arrived for a further capitalisation of reserves, but they feel that, having regard to the results that have been obtained, an increased distribution of profit can now be recommended. In their view this can appropriately be done by a special dividend of 2 per cent, which, provided that disposable profits remain at their present level, it is hoped to continue until a further capitalisation as described can be made, when the additional amount now being distributed would be absorbed in whole or in part in paying dividends on the increased capital.

LENDING POLICY

Apart from an average increase of about £40 million in our investments, and of about £15 million in our advances, to which I have already referred, there is little of interest to report in regard to our current assets. I would, however, like to say something about certain criticisms which from time to time bankers hear or read of their policy in regard to the granting or withholding of advances to their customers.

In general, it may be said that our critics fall into two classes—those who speak from personal experience in a limited field, and those who take a wider if more academic view, based on what they believe to be the general practice of bankers. It is not impossible, I suppose, that the latter class may include individuals who belong also to the former. I do not at all object to criticisms of the way in which we do our business, especially when they are not entirely destructive in character. If I may adopt an apt though perhaps rather inelegant metaphor employed recently by one of our more friendly academic critics, they may serve to prevent us from growing too many barnacles.

ANSWER TO CRITICS

My first answer to our critics is that, subject only to the operations of the Capital Issues Committee, and to the expressed desire of the authorities that in our lending policy we should conform to the directions issued to that body from time to time, the banks in England and Wales have complete freedom on the question whether an advance should be allowed or withheld, and whether it should be secured or unsecured; and there is completely free competition between them in this field. This is a safeguard to the customer and a salutary stimulus to the banker.

The existence of a governmental body which has the power to prevent a customer from borrowing money which his banker would be prepared to lend to him is regarded by some as a diabolical interference with free enterprise; but to give the devil his due the directives under which this Committee work are not, at any rate today, very readily distinguishable from the doctrines of sound

banking as laid down in the text-books written by eminent bankers of past generations. Even so, perhaps some of us would like to be allowed occasionally to break our own rules.

My second point is that most of us would much rather say yes than no to any request from a customer if we properly can. What is more, it pays us to do so, both because it promotes goodwill, on which the whole of our business depends, and because (I will admit it) advances give us a better yield than any other of our current assets, though allowance must be made for the bad debts which inevitably occur even in the best regulated banks; sometimes in the advances which had earlier appeared to be very well secured.

UNSECURED ADVANCES

It is, I believe, contended by some of our critics that we are not sufficiently ready to make unsecured advances to our customers. I would say, in reply to that, that we are very willing to make such advances in appropriate cases; but this raises the question of the principles by which we are guided on this subject.

A business whose finances are firmly based, in the sense that the quick assets (stock and book debts) exceed the total of the trading and other creditors by a substantial margin, may reasonably ask for temporary finance, especially for seasonal purposes, and the banker will usually be very ready to provide it, often without asking for specific security. The banker must be the sole judge of what he is prepared to do in this respect, but he will not forget that another banker may take a different view.

It is understandable that, as a general rule, the larger the capital resources of a business which I have laid down. But medium-sized and even small businesses are by no means excluded, provided that there is a proportionately large surplus of liquid assets. We do not regularly collate statistical information on the amount of our unsecured lendings, but on a selected date some months ago we found that in fact between one-fifth and one-quarter of the whole of the money advanced to our customers was not covered by security.

A good example of the unsecured advance is the accommodation frequently given to a tenant farmer. There is probably no occupation in which the personal factor is more important than in farming; apart from his financial position the test is the character of the man and his skill and assiduity as a farmer.

Since 1939 the development of agriculture has been very striking, the estimated increase in net output being of the order of 50 per cent, though from the point of view of saving imports this is not a net gain because it has been achieved in part by increased mechanisation, which means greater consumption of imported fuel. The increased production has involved a large outlay of capital, particularly as it followed many years of depression and neglect, but there has been no undue pressure on the banks from their farming customers, and speaking generally we could give them more direct support if they asked us to do so.

We must remember, however, what great activity the agricultural revival has caused in the industries allied to agriculture, which have had to find fresh financial resources, in part from the banks, for their own development.

Though it is true that agriculture has attracted many new investors and much new money, the development has been financed in the main by the thrift of the agricultural community itself. This, I think, is the method which would have commended itself to the poet Horace:

*Beatus ille, qui procul negotiis,
ut prisca gens mortalium,
paterna rura bobus exercet suis,
solutus omni fenore.**

In these days the oxen have, I fear, given way to the tractor, but it may still be true that the happiest man, although perhaps not the most enterprising, is he who has no bank interest nor hire purchase instalments to pay. He might be happier still if he had no forms to fill up for the Ministry of Agriculture. Horace himself puts these words into the mouth of a banker, or money-lender, who is always about to retire to the country, but meanwhile relents tomorrow the money which he has called in today. Thanks to the improvement in transport facilities since Horace's day, a gentleman in the City can now play his trade during the week and enjoy the blessings of the countryside at the weekend.

I have described the typical borrower of money without specific security. On the other hand, broadly speaking, it is not appropriate that a private individual, who is wholly or mainly dependent on his heavily taxed monthly salary, should borrow money unsecured from his bankers. If he cannot make ends meet in the month of February, he is not very likely to do so in March, in which he and his family have three more dinners to eat.

There may well be excellent reasons why, on occasion, his current outgoings exceed his current income. The expenses of illness and education are obvious examples; but with taxation at its present level, few salaried men have any margin for extra expenditure, which must perforce come out of savings, either past or future. A temporary loan may well be justified, especially if the savings of the past are invested in the family home or in a life policy.

Even if the investment is in more marketable form and the price is abnormally favourable, as it has been recently in certain classes of securities, no one likes realising his hardly won capital. Like Mr Micawber, we all tend to hope against hope that something will turn up, or even that a drop of comfort may one day be distilled from the stony heart of the Chancellor to make life a little easier for us before we die; but in the banker's eyes this prospect is rather too uncertain to form the basis for an unsecured advance.

THE CARROT OF PROFIT AND THE STICK OF COMPETITION

Without laying claim to any higher motives, to which I hope, nevertheless, that some of us are not entirely insensitive, I would contend that so long as the banks remain independent, as they are today, the carrot of profit and the stick of competition will together ensure that the customer gets all the credit which his financial position justifies, whether secured or unsecured, and sometimes perhaps a little more.

There is one class of critic who may not be satisfied with my answers: he who says that our methods are altogether too haphazard and unscientific and that everything depends too much on the whim of the individual branch manager. He would perhaps like the prospective borrower to fill up a

* Horace. Epodes II. 1-4.

complicated form and send it to the appropriate planning authority, where a formula, evolved by some clever ignoramus, would be applied to it, and, after a due lapse of time, the bank would be informed how much credit should be allowed to that particular customer.

I cannot offer any answer to that sort of critic because I know that nothing will satisfy him except the figments of his own imagination, but I do wonder whether his form will provide spaces for information about the customer's character, industry and business ability and, if so, how they will be evaluated under the formula. That sort of thing may sound fantastic, but it could easily happen if the planners were able to get the bit between their teeth.

In the meantime, if I were a customer, I would rather put my faith in the decision or recommendation of the manager of my independent, competitive bank, however whimsical and unscientific he might be, and I would hope that, if he made a mistake, it might possibly be in the direction of allowing me a little more credit than I deserved, though no more than I could readily repay in the ordinary course of my business.

There has been a substantial increase in our premises account in the past year, reflecting the fact that it has been possible to obtain licences fairly freely for the reinstatement of war damage, where we nearly always spend much more than the amount which we have received as compensation. In certain cases we have also been able to undertake extensions of existing buildings to provide for increased business.

It will be understood that these extensions have fallen somewhat into arrears in the past 15 years, and we must expect to spend large sums on our premises for some time to come, especially now that licences are no longer necessary. In the first instance, the new buildings are entered in our books at the high present-day prices, but depreciation is applied annually to each of our properties, new and old, in relation to its cost, and we also hold a substantial unallocated reserve which is deducted from the gross total in order to produce the figure which appears in the balance sheet.

Therefore the total of the account, based as it is on costs incurred in most cases before 1939, and in many cases before 1914, is very moderate in relation to the realisable value of the properties in the money of today.

BARCLAYS BANK DCO

Our investments in subsidiaries are shown this year in a simplified form, following the recent reorganisation of the capital of Barclays Bank DCO and the repayment of the notes of Barclays Overseas Development Corporation. As compared with last year, the total at £13,856,946 shows an increase of £375,000 only, this being the amount of additional money which we subscribed in the scheme of reorganisation to which I have referred.

In August last I sent full particulars of these proposals to the stockholders. I need not, therefore, recapitulate the details of the scheme, which was duly approved at meetings of the stockholders of Barclays Bank DCO in September, but it may be well that I should take this opportunity of inviting you to consider to what extent the passage of time has justified the faith of those who initiated this great venture in 1925. None of them is with us today, although my senior colleague, Colonel Sir Edward Bolitho, joined our board only a few weeks after the project was announced.

The moving spirit in the amalgamation, under the aegis of Barclays Bank Limited, of the three constituent banks, the Colonial Bank, the Anglo-Egyptian Bank Limited and

the National Bank of South Africa Limited, was without doubt my distinguished predecessor, Mr F. C. Goodenough. His great energy and vision had hitherto been applied mainly to the expansion of our business in this country, starting from its small beginnings in 1896, when twenty private banks combined for their mutual defence against the all-absorbing joint stock companies until the day, just over twenty years later, when Barclays Bank had itself become one of the "Big Five" joint stock banks of this country.

Much of the expansion at home was achieved by means of the outright purchase of local businesses from their partners or shareholders, either for cash or by an exchange of shares. In the case of the overseas business, the three constituent banks were amalgamated under the name of Barclays Bank (Dominion, Colonial and Overseas); "A" shares and 8 per cent preference shares in this new company were then issued to the shareholders of the old banks in exchange for their existing holdings.

By this means we acquired a minority holding (about 30-40 per cent) in each class, but we did not attempt to buy out any of our fellow-shareholders. It was, however, felt to be desirable that in addition to the combined published and inner reserves of the three banks, the depositors in what was in their eyes a new bank should have the further support of some uncalled capital. This was provided by a special issue to Barclays Bank Limited of 500,000 "B" shares of £5 each, of which £1 was paid up, leaving an uncalled liability of £2 million.

In return for assuming this responsibility at that time, it seemed appropriate that these partly paid shares should carry special voting rights.

After an interval of thirty years the position has changed: the venture is no longer new, and if it ever required such additional support this does not seem to be the case today. We have therefore readily agreed, on the shares becoming fully paid, to forgo the privilege which accompanied the contingent additional responsibility, and to put ourselves, in all respects, alongside the other stockholders in a single class of ordinary stock. In amount we have, and intend to maintain, a holding of rather more than 50 per cent, which is sufficient for all practical purposes.

It is not, however, our policy, as we see it at present, to increase materially the proportion of our present holding, as we feel sure that it is in the interests of Barclays Bank DCO, and therefore in our own interests, that this stock should be held as widely as possible among the members of the public and among those who may be, or may become, its customers.

NEED FOR TAX CONCESSIONS TO NON-RESIDENT SHAREHOLDERS

In this connection it is a matter of great regret that the income tax law of this country is such that the holding of shares in a British company is normally unattractive to a non-resident. It would be of immense value to the goodwill of Barclays Bank DCO if its stock were widely held by investors in the territories in which it operates, but in fact the proportion so held has been diminishing ever since the Bank was formed and has now been reduced to an insignificant figure, solely, I am sure, for the reason to which I have referred. And it is not only the goodwill of the company concerned which is adversely affected.

There are assets more precious than money which are jeopardised when the strong ties of mutual interest between the members of the British Commonwealth and Empire are

weakened by unnecessary inflexibility in a matter of this kind. It is true that certain income tax concessions are allowed to the non-resident holder of such investments, but they are, in my opinion, quite inadequate in amount; moreover, they are calculated on an unrealistic basis, namely, the personal and other allowances enjoyed by a resident in the United Kingdom, which are quite irrelevant to the affairs of the non-resident and in any case do not give any relief to corporate holders.

The position might be quite different if the allowance could in some way be related to the proportion of the company's income which is earned overseas, and it would appear that a practicable solution might be evolved on this basis.

RECORD OF REMARKABLE GROWTH

If we adopt the conventional measuring rod of a bank's progress, namely its liabilities to its creditors, we find that the growth of the business since 1925 has been remarkable. The combined deposits of the three banks in 1926 amounted to £52 million; at September 30, 1954, they were £494 million, or nearly ten times as great.

It must be admitted at once that much of this is due to the increase of prosperity and to the inflation of the price level throughout the world, the one a beneficial and the other a harmful influence. How much is due to each, and how much again to their obtaining a larger share of the business available, it is impossible to say, but it is of interest to observe that the deposits of Barclays Bank Limited, which in 1926 were little more than £300 million, are now over £1,400 million, or more than four and a half times as great, and I would say that all three influences have been in operation in this country also.

Another telling comparison in the record of Barclays Bank DCO is in the number of branches: 426 in 1926; double that number today.

In considering the progress achieved since 1925, a period representing almost a generation in terms of human life but a much less significant fraction of the history of a great trading company, I should like to call attention to some of the words used by Mr F. C. Goodenough in his speech to the shareholders at the annual meeting of Barclays Bank Limited on January 21, 1926.

"We regard the step that we have taken as a practical measure which will promote the industrial and commercial interests of the Empire and will help both its internal and external trade. These territories will need a continuous supply of fresh capital, as they become ripe for development. I need hardly say, however, that the provision of permanent capital is not one of the duties of a bank, our business being that of supplying floating or circulating capital, and of granting credits for the handling of exports and imports and for other temporary purposes, but there can be no doubt that a strong and well-organised banking system can be of great service, by giving encouragement to trade through the use of banking credit and deposits for those temporary purposes, wherever they may chiefly be needed from time to time. This will be all the more advantageous, since the busy seasons in the various territories do not coincide.

"There can be no doubt that as the wealth of those regions continues to increase, there will be a growing disposition on the part of the investing public to supply more permanent capital, as further developments are needed. There will be much to be gained for our new subsidiary through economy of administration and improved organisation, as well as through

the interchange of staff, especially the higher members of the staff, and in these, as well as in other matters, the close co-operation with our own bank, subject, of course, to sound and proper limits and principles, should prove to be of great advantage."

Mr Goodenough died in 1934, nine years after these words were spoken, but if he were here today after the lapse of another twenty years he would not, I believe, wish to alter any of them, and he would, I am sure, rejoice to see how amply his hopes and his prophecies are being justified, and how the income derived by the parent bank from this investment has been slowly but surely increasing throughout the period.

In these matters it is always best to move slowly; to give the digestive process time to work; to allow lesser loyalties to become merged in greater, which can hardly be fully attained in the lifetime of individuals some of whom were formerly in active competition with one another. The Barclay principle of direction through local boards was immediately instituted in the new organisation, and our system of decentralised executive control is being gradually applied in its entirety to the various territories served by our subsidiary.

The interchange of staff has been practised from the start, not only between the parent bank and the subsidiary, but also between the various sections of Barclays Bank DCO itself. Until recently this has mainly concerned the higher members of the staff, as Mr Goodenough envisaged, but the principle has now been extended so as to cover the temporary exchange between home and overseas of selected men of less seniority, to give them a wider experience which will, we are confident, be most valuable to them and to the bank in their subsequent careers.

I would also call the attention of stockholders to Mr Goodenough's reference to the distinction to be drawn between bank credit and permanent capital. The pure milk of this classical doctrine, as enunciated by him, has been somewhat watered in recent years, when the banks have been persuaded to provide a limited amount of what may be called semi-permanent capital for British industry by their financing of the Industrial and Commercial Finance Corporation, and also through their loans to the Finance Corporation for Industry.

This policy is justified provided that the amount of the investment remains moderate in relation to the capital and reserves of the banks concerned, as it is today, and insignificant in relation to the total of their assets; and in so far as these companies relieve the banks of proposals from their customers for credit for which direct bank finance is not really appropriate, they perform a positive service to the banks themselves as well as to their customers.

Following this example, Barclays Bank DCO itself set up in 1946 a small subsidiary, Barclays Overseas Development Corporation, to perform a similar service in the various territories in which the bank is represented, with the intention that it should operate mainly, though not exclusively, in those which are administered from London. This company has made a satisfactory if modest start, and it paid its maiden dividend in 1952.

At one stage we provided it with finance on loan account to the extent of £3 million, and this loan, which was always intended to be temporary, has recently been paid off. The Corporation now has a capital and share premium account of £6 million, all provided by Barclays Bank DCO, and it has just raised an additional £1 million by an issue of unsecured loan stock which has been placed on the London market.

The capital resources of the countries in which it operates are by no means sufficient for their development, and it is most desirable

that the public, not only in this country but in the creditor countries overseas, should be enabled to feel confidence in investing capital in these territories, where there are still surely countless opportunities for combining public benefit with private profit. It is our hope that our Development Corporation has already contributed something to the building up of this confidence, and will continue to do so in the future.

CONTINUED INCREASE IN PROSPERITY

In the business world in this country it has been a year of great activity, though there have been no spectacular events, if we except the recent revelation of the progress which has been made since the war in the application of the principles of atomic energy to peaceful uses; progress which may, for all that we can foresee today, be the forerunner of a second industrial revolution.

We have seen no strokes of genius by governmental or other authorities in home affairs, but more controls have been removed, and industry and commerce have further demonstrated their power to expand when left alone. Even the most obstinate Bourbons must surely see that life in this country has become more agreeable in the last few years, even if it is a little more expensive.

Some anxiety has been expressed in recent weeks about the possible recurrence of inflation, of which there is always a danger at a time of very full employment. Without doubt much of the expansion of the supply of money in the past year has been required by higher production and by the increase in our reserves of gold and dollars. There is in fact no economic barometer for the exact measurement of inflationary pressure.

There are certain symptoms by which danger can be recognised, such as rising prices, especially of raw materials and wholesale goods; shortages in the shops and delays in deliveries; a rapid and continuous deterioration in our balance of trade; in fact, an excess of demand over supply in any field. With the important exception of the labour market and possibly of the Stock Exchange, it cannot be said at the moment that any of these dangerous symptoms is apparent, and even in the labour market the pressure is by no means uniform throughout the United Kingdom.

There are certain places where the supply still exceeds the demand, notably in Northern Ireland, where several subsidiary factories have already been set up by English industrialists with encouragement from the Government. There is, however, a general feeling that danger is not far below the surface, and if this is a correct diagnosis the "good" budget which is so confidently anticipated on all sides may prove after all to have been a mirage.

The continued increase in our prosperity throughout last year was the more remarkable in the face of a distinct recession of business turnover in the United States of America, a phenomenon which might have been expected to provoke serious reactions in this country. In fact we took it in our stride, even if no one can say quite how we managed it. In economic forecasting the only thing that seems certain is its uncertainty. It is, I believe, all a question of confidence, a delicate plant which cannot be forced but which in favourable conditions flourishes like the proverbial green bay-tree, or one might say like weeds in a wet summer.

GROWTH OF CONFIDENCE

A growth of confidence seems to be the only acceptable explanation of the recent favourable turn in the tide of the Savings Movement, which would appear to deny rather than confirm the recurrence of inflation. The full implications of the

which are published on this subject are not easy to comprehend at a glance.

First of all the student must be careful to see whether or not a given total of new savings includes interest accrued. Secondly, a net improvement in a given period may be due to increased deposits or to decreased withdrawals. Thirdly, in withdrawals it is impossible to distinguish capital from interest, and therefore deposits and withdrawals cannot really be balanced against one another. But when one has unravelled these complications as best one may, it is evident that in the past year there has been a most satisfactory change in the habits of a section of the population.

The timing of the change is, however, difficult to understand. At the beginning of the year, when it became clearly marked, there was no specially good news to cause a change in sentiment. One can only say that it had gradually dawned on the man in the street that things were better; that it was worth while to put some money aside for future needs; that prices were no longer going up every day but that, on the contrary, many of the more durable household goods had become a little cheaper. In fact, he had realised that the injection of excessive inflation into the economy had ceased, although he had not perhaps expressed his thoughts quite in that form.

The following simplified table, extracted from the officially published figures of National Savings, consisting of Savings Certificates, Defence Bonds, Post Office and Trustee Savings Banks' Deposits, shows the extent of the improvement which appears to have taken place during the past year. To take a date later than October would be misleading, on account of the raising of the upper limits introduced at that time.

	Jan. 1, 1954, to Oct. 30, 1954. £'s million	Jan. 1, 1953, to Oct. 31, 1953. £'s million
*Deposits	918.2	857.8
†Withdrawals	885.0	916.5
	+33.2	-58.7

*Excluding accrued interest.
†Including an unknown amount of interest on Post Office and Trustee Savings Banks' Deposits.

The truth seems to be that although fluctuations in sentiment are related to fluctuations in real values, their timing is unpredictable before the event and often inexplicable after it. This was well illustrated in the course of events after the change of Government in this country in October, 1951, when Stock Exchange prices continued to fall for several months after the drain in our overseas reserves had been checked and then, in June, 1952, suddenly turned round and started a rise which has continued for over two years without serious interruption.

These phenomena may puzzle the business man, but they do not alarm him because he is accustomed to them. They do, however, make life rather difficult for those who want to order our affairs according to a master plan.

A natural and very satisfactory result of the restoration of confidence and of business prosperity is that there has been a long series of good reports from industrial companies bringing in many cases tangible benefits to shareholders. Unhappily, this has produced an unfavourable reaction in certain quarters where it would seem that logical thought has yielded place to pathological prejudice, or has become clouded with philosophic doubts. I would beg those who are affected in these ways to put aside any preconceived bias and to consider certain questions which I will set out.

Firstly, who are the principal beneficiaries

of an increased industrial dividend or other distribution? Are they a small number of large individual investors who will pay tax at rates up to 19s. in the £ on the increase, or are they a multitude of men and women, individually by no means rich, who are investors in their own right or through the medium of insurance companies, pension funds and other corporate bodies? Secondly, who is going to invest new money in industry, if he cannot expect to get a good return on it when times are good? He is bound to run the risk of getting a bad return, or none at all, when times are bad. Thirdly, when industrial wages have been increased on the average by 200 per cent, compared with 1938, and dividends by only 50 per cent (I am quoting the figures for 1953) has the time really arrived to regard any further increase in dividends as the signal for a "free for all" scramble for increased wages?

PROFIT, DIVIDEND AND WAGE QUESTION

The essential principle in regard to any comparison of wages with dividends is that the expenses of running the business, which include the payment of a fair wage to the employees, including the salaried staffs, who have hitherto done less well than the weekly wage-earners, have to be met in full out of the gross receipts before there is anything at all available for the proprietors.

After that, in theory at least, everything that the tax-gatherer spares should go to the proprietors, either as dividend or as addition to the reserves, which are their property. What is a fair wage at any given time may be arguable, but this at least explains why, on the figures which I have given, wages moved proportionately so far ahead of dividends in the postwar era of inflated prices.

This is not to say that the whole of any further surplus should in fact be paid over to the shareholders. It is likely that, for more reasons than one, the directors of a prosperous business will wish to make service in their company more attractive than service in a rival concern. Whatever form this may take, whether it be a fund to supplement the State pension, or some bright new paint in the works, it will cost money; but it may be expected to give rise to greater contentment and thus to produce ever greater prosperity.

Therefore, the more prosperous a company is the better are the prospects for its employees. This proposition is, I believe, fully accepted by the trade union movement in America. It is a great pity that in this country it seems to be quite widely held in certain quarters that profits are a regrettable, if not a positively wicked, by-product of business activity, and that to be successful is in some way antisocial.

I contend that profits need no moral justification, and if my words should reach the eyes of any doubting Thomas or envious Casca, I hope they may serve to allay his doubts or abate his envy.

PLOUGHING BACK

There is another aspect of the same problem which has received some attention from the critics recently: rather more, I think, than it deserves. They have been saying that industry is not ploughing back enough of its profits in the form of new machinery and equipment.

This criticism has been regarded erroneously as being synonymous with the accusation that industrial companies are increasing their dividends too freely, and some remarks made by the Chancellor of the Exchequer at a city dinner in the autumn of last year appeared to lend support to this proposition. Later the Chancellor in Parliament corrected this misapprehension, making it clear that he had wished to refer to the

disposal, within the business, of that portion of the annual profit which is withheld from distribution and placed to reserve.

What is the guiding principle on which directors should decide this question? I should say that, subject to any overriding need to pay for past extensions which have been financed on borrowed money, or in other ways to improve the liquidity of the business, they will ask themselves whether they are satisfied that the new machinery or equipment will make an adequate contribution to the company's profits. If they are satisfied, they will proceed, but even then the proposition requires some qualification.

When the register of unfilled vacancies is already expanding the emphasis should be on the saving of labour by the replacement of out-of-date machinery. If they are not satisfied that the project will be profitable, they will retain the additional reserve in a liquid or semi-liquid form, which may well be a short-dated Government security, against the day when they can see their way more clearly.

In estimating the profitability of the new machinery, one of the most important elements is its depreciation, and the generous allowances introduced by the Chancellor in his last two Budgets have been a great encouragement to the renewal and modernisation of industrial equipment. Allowances of this kind, apart from the heavy fine which is imposed on dividends in the form of the tax on distributed profits, are sufficient to encourage directors to take far-sighted views in the conduct of the company's business, and are far more potent to this end than any amount of exhortation, however authoritative or eloquent.

There is also the point of view of the shareholder to be considered. The profits all belong to him, as I have already pointed out, and if they were all distributed he might be expected to save and reinvest in industry part at any rate of the surplus, from which he would eventually draw an increased income. If this opportunity is to be denied to him (and let it be remembered that "he" is very possibly an insurance company or a pension fund) he is entitled to complain if he does not receive in due course additions to his dividends at least sufficient to compensate him for the loss of the income which he would otherwise have received from his own investment of the surplus.

POLITICAL UNITY IN WESTERN EUROPE

I cannot conclude this review without a reference to the recent lightning of the clouds which have so long overhung the political atmosphere of Western Europe. Although the final acts of ratification are not yet complete, it would seem that, at the eleventh hour, the nations have at last been able to come into line in regard to their future relations with Western Germany, and so to avoid the risk, which was perhaps imminent, of the whole country achieving reunion under the exclusive protection of Moscow.

We may well feel proud that the agreement was due in large measure to the initiative of our Foreign Secretary at, and before, the recent London Conference, and that we have resumed that moral leadership in the world, which is our undoubted destiny and very heavy responsibility. It is perhaps not too much to hope that having now acknowledged our responsibilities in regard to our neighbours across the Channel, we may find means of gradually leading them towards greater economic as well as political unity.

It is an interesting paradox that, while the peoples of the Commonwealth and Empire become daily more conscious of their desire for independence, the independent peoples of Europe are becoming more conscious of their need for unity, even at the cost of sacrificing some of their national sovereignty.

WILLIAMS DEACON'S BANK LIMITED

SATISFACTORY FINANCIAL RESULTS OF YEAR'S WORKING

DEPOSIT FIGURE AGAIN A RECORD

PERIOD OF MARKED ECONOMIC PROSPERITY

RECENT PROGRESS LEAVES NO ROOM FOR COMPLACENCY

SIR ERIC A. CARPENTER ON THE HIGH LEVEL OF ACTIVITY

The annual general meeting of Williams Deacon's Bank, Limited, will be held in Manchester on Thursday, February 10, 1955. The following is the statement by the chairman, Sir Eric A. Carpenter, OBE, on the report and accounts for the year ended December 31, 1954:

The proceedings at the annual general meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the bank's affairs in advance of the meeting.

As from January 1, 1955, we elected Mr David F. Landale to the board and I offer him in your name a cordial welcome. His personal qualities and great experience will, I have no doubt, make him an invaluable colleague.

ACCOUNTS

I now turn to the accounts, from which you will see that deposits stand at £147,667,137, an increase of £4,939,250 on last year's record figure. They are somewhat swollen by several large balances which are expected to be of a temporary nature.

On the assets side, the liquid items, namely cash, money at call and discounts, amount in total to £46,293,613 or 31 per cent of our deposits.

British Government securities stand at £49,035,158. Gilt edged prices increased steadily, as indeed did most other Stock Exchange securities up to the early part of December, but there has since been a fall though the short dated securities which form the bulk of the investments of the clearing banks still stand at higher figures than they did a year ago. We have valued our British Government securities, in accordance with our invariable practice, at market price or less.

Advances at £45,072,935 show an increase of £7,248,806.

Our net profit, after making the usual provisions (which include contributions to staff pension and widows' and orphans' funds and appropriations to contingencies account) is £311,095 an increase of £19,564 on the year. With the balance brought forward of £181,523 this gives a total of £492,618 to be dealt with. After transferring £150,000 to pension fund we propose to pay dividends at the rate of 14 per cent on the "A" shares and 12½ per cent (the maximum) on the "B" shares and to carry forward £187,071. I feel sure you will agree that these results are satisfactory. Although the rate of dividend for the whole year is the same as last year, the cost will be £13,750 greater because of the increase in the paid-up capital of £400,000 in September. This increase, which took the form of an issue of 400,000 "B" shares of £1 each, fully paid, was accomplished by a transfer from the published reserve fund, which itself was increased by the transfer of £675,000 from inner reserves. The whole operation brings the

capital and published reserves into more appropriate proportion to the assets employed in the business.

During the year branches have been opened at Newbury, Newcastle-on-Tyne and Bournemouth. At the last-named place there is also a trustee branch.

GENERAL REVIEW

I now turn to more general matters. The year 1954 I regard as one for which we can be quietly grateful. In the early months the strength of the bonds which unite the Commonwealth was never more warmly demonstrated than during the extensive tour of Her Majesty the Queen and the Duke of Edinburgh.

At the end of November the celebrations to mark the 80th birthday of our universally respected and beloved Prime Minister have given cause for a broad view of the momentous times through which he has lived and had so large a part in shaping.

The war in Indo-China has stopped, the Trieste problem has at last been dealt with and settlements in Persia and in Egypt have contributed substantially to the tranquillity of the Near East. In the Queen's Dominions, it is true we still have the troubles in Malaya and Kenya but these show some signs of diminishing.

On the whole, therefore, the year has seen a distinct lessening of tension and the Government can claim a good deal of credit for the feeling of greater security which pervades the Western World following upon the London agreements.

ECONOMIC SPHERE

We have much to be thankful for in the economic sphere, though the burden of armaments remains with us. The year started with the Sydney Conference of Commonwealth Ministers, which adopted a cautious attitude in view of the possibility of an intensified recession in the United States. At the same time, the Randall Commission's report in the US itself demonstrated that full convertibility was not going to be easily attainable.

In April the Chancellor encouraged the country to continue with the progress already achieved in economic affairs, and in his Budget added an incentive to investment by granting a new investment allowance for income tax purposes on new agricultural and industrial buildings and on new plant and machinery. It will be appreciated that this new allowance is a real remission of taxation as distinct from the earlier initial allowance which, although extremely welcome, was merely a deferment.

Although exchange control is necessarily still with us, further controls have been abolished, and a great event of the year has been the end of food rationing, nine years after the end of the war. Production in these

islands has increased and we see new records in iron and steel production, in the number of houses built, in exports and in commercial activity generally.

There is, however, no room for complacency. If we have done well in the export market our rivals have done better. Germany and Japan show bigger increases in their exports than we do, and the same applies to the United States. Indeed, the economic history of the United States during 1954 has been remarkable. The Federal Reserve policy of active ease, massively reinforced by an immense public confidence, seems literally to have enabled the economy to ride, and in the end to reverse, what at one time looked like developing into an ominous recession. In this connection also, it has been remarkable—and very different from 1949—that our economy in this country has been able not only to withstand the American recession but to flourish almost unabatedly through it. This is really most stimulating and gives grounds for confidence and satisfaction.

Nevertheless, there is some weight in the view which has been put forward that our ability to remain unaffected by an American recession depends on a great many apparently unrelated factors. For example, it matters a great deal at what season of the year an American recession really begins to bite because, of course, the sterling area trade with the dollar area is to a large degree seasonal and the demand for dollars is not uniform throughout the year. A second consideration is whether the recession on the other side is affecting severely those industries which import sterling area materials.

CONVERTIBILITY

The year has seen continued and steady progress towards the ultimate goal of full convertibility for current sterling. Complete freedom to transfer capital as well as current earnings anywhere at any time, as was the case before the war, must, I fear, remain a very distant objective. There have, however, been some administrative relaxations, including greater freedom for emigrants to withdraw their capital, a gradual release of blocked sterling arising from legacies to persons in Canada and the United States, and, perhaps more significant still, the provision of the necessary exchange facilities to allow of the re-opening of the Liverpool Cotton Market. Moreover, investments by British concerns of not inconsiderable sums have been permitted in the Dollar Area, especially in Canada, the London Gold Market re-opened in March and, most important of all, the increased degree of freedom of transferable sterling, in itself, of course, a measure of convertibility, has strengthened and confirmed the position of sterling—practically speaking—as the greatest international trading currency. As to the approach to full convertibility for current sterling, there are and must be dangers into which I need not enter. It is notable that of late months the pressure, particularly from the Continent,

for an accelerated speed of approach has tended to die down. Indeed, this is a question for the solution of which both patience and caution are alike necessary.

In this connection, the talks now going on at Geneva for the review of GATT are of the utmost importance. It is essential that the rules relating to tariffs, quotas, subsidies and other devices should be clearly laid down and agreed between the nations. If convertibility when it comes is to have a chance of lasting success, but the negotiations are complex and detailed and include such difficult problems as Japanese competition now that Japan is likely to be admitted to membership of GATT.

The improvement in the gold and dollar reserves continued apace during the first six months of the year. This increase was achieved despite declining American aid. At the end of June the total amounted to £1,078 million. Since then in spite of the payment of \$99 million in respect of the EPU settlement, \$112 million to the IMF for the repurchase of sterling and of adverse seasonal factors the reserves at the end of November still stood at £1,044 million. At the end of the year the annual instalments on the United States and Canadian debts caused a reduction to £986 million.

A very satisfactory feature of the monthly returns has been the surplus earned each month, with one exception, in the Sterling Area's trade with Europe. It is true that these surpluses have been small, but none the less they have continued in spite of increased travel allowances and relaxations in our trade with Europe, and are due in large part to increased exports from this country.

Whilst it is right that we should feel solid satisfaction at the course of the reserves during the year, it is as well to remember that they are even now considerably below the amount at the end of 1950, and that the margin for contingencies is still relatively narrow. It cannot be stressed too strongly that these reserves constitute the reserve of the whole Sterling Area.

IMPORTS AND EXPORTS

The figures of imports and exports have been distorted at the end of the year by the dock strike, and it will be some time before the full effects of this and of the ship repairs strike are known.

For the first six months exports rose by some 7 per cent in value over the corresponding period of 1953, a most satisfactory increase under any circumstances though not, as mentioned above, as good as the figures for the same period of some of our competitors, notably Germany and Japan, and even the United States, which derived a stimulus from the recession in their home market. Even so, our export performance was the principal factor in the highly satisfactory outcome of the balance of payments for the first half year, when a rate of increase of £300 million per annum was achieved. Inevitably, exports to North America actually declined a little. In the third quarter, exports rose by only 4 per cent. Imports, unfortunately, followed a reverse pattern, actually falling slightly in value, though not in volume, in the first six months and rising by 1½ per cent in value in the third quarter.

The export experiences of individual industries varied greatly. Cotton and woollen textiles barely maintained their position but other textiles, including rayon, showed an increase, though all were still well below 1951. Vehicles, on the other hand, broke new records, being nearly 9 per cent up, machinery was 6 per cent up and other metal manufactures 7 per cent up. An interesting development was the increase in exports of petroleum products by 12 per cent now that the new refineries approach full production.

PRODUCTION

The increase in the total product of industry has been maintained at a rate nearly equal to that of 1953, when the figure was almost 7 per cent for the year. Once again coal production has hardly increased at all, though output has been maintained with fewer workers available. It is in the manufacture of vehicles that the rate of increase has literally leapt ahead with a figure of 13 per cent following last year's somewhat smaller figure, and this was achieved with an increase in manpower of only 4½ per cent. All the engineering and metal trades showed up well, giving a good return for the additional workers they were able to attract. In textiles, too, the labour position improved slightly and production has increased though it is not yet back at the record figures of 1951, due to the special problems of competition in the export market.

In building, despite the handicap of the weather, the number of houses completed has continued to rise without any increase of any moment in the manpower employed on them. Moreover the proportion of houses built for private owners which do not attract the heavy state subsidies granted to houses built for the local authorities has risen appreciably. Houses are a form of investment which give dividends in extra comfort but do not directly help in the battle for exports, and it may be that the time is approaching when they should not have quite the same high priority as investment in buildings and plant which directly affect our ability to compete in world trade.

I cannot too strongly support the Chancellor in his appeals recently for more investment in industry, with its corollary of greater efficiency, and I am glad to note that industrialists generally have not been slow to respond. The closing months of the year have brought many announcements of big investment programmes, and the banks are playing their part in helping with the necessary finance where it is appropriate.

COMPETITIVE POSITION

The general picture, therefore, for this country is, with the exception of one or two industries, one of very marked prosperity. The same could, I think, be fairly said, now that the United States is clearly emerging from its recession, of the trading world generally. From all quarters of the globe the same reports of greater productivity are heard, and there seems no doubt that much of this derives from a rise in the standard of living in great and hitherto, relatively speaking, economically undeveloped areas. It could well be argued that the immediate future holds the prospect of a very considerable increase in the volume of world trade from which this country could hardly fail to benefit.

Nevertheless, what I said above about our competitors, notably Germany and Japan, should be borne well in mind. We should not let this present progress in what may prove to be a very favourable economic climate blind us to our true competitive position. Neither Germany nor the United States, nor any other trading community, except possibly Japan, has to suffer the burden of taxation which we in this country have to endure, and however much one welcomes the recent investment allowance, the time has surely come when common prudence as well as common sense suggests the lightening of taxation upon individuals. The figure at which surtax starts to be imposed, namely, £2,000 per annum, is certainly too low. The Index of Retail Prices shows us that £855 in 1938 had the same spending power as £2,000 today. If that be so, it seems an extraordinarily modest figure at

which to limit the earned income allowance, and to commence to impose heavy, progressive, additional taxation. It is much to be hoped that the Chancellor will give consideration to this point. In this country, mercifully, we are able to count upon the strong sense of loyalty which exists in the Public Service, in semi-public institutions and throughout industry. Nevertheless, one cannot quite see how this high standard can be indefinitely maintained with a level of taxation so destructive of incentive.

INDUSTRY

Shipowners face the New Year in a much more cheerful frame of mind. Tramp shipping freights, time charter rates and tanker rates have been rising steeply in the last quarter of the year from the unremunerative level at which they stood in the middle of the year. Good profits can now be earned even by older ships, and, as a result of rising freight rates, the value of second-hand ships has risen steeply.

The cost of new tonnage continues to mount, and the 20 per cent investment allowance for new ships is especially welcome to shipowners.

Shipbuilders are now facing severe competition from the Continent, and close co-operation between workers and management will be needed if they are to surmount it when the present arrears of orders have been completed.

The weather has made 1954 an almost disastrous year for agriculture. Although the wheat crop has been practically as large as in the previous year, a larger acreage was planted and the quality of much of the crop is very poor. Coarse grain crops were much lower than the drop in area planted, and potatoes were particularly affected.

The net result is that the farmer's income has dropped slightly in 1954; but, although prices and production have been decontrolled, he still has a measure of protection to his price-level in the form of various subsidies.

It is generally agreed that maximum production is essential in agriculture for strategic reasons as well as for the effect on the balance of payments, and the only question is whether present arrangements give the best results both to the farmer and to the taxpayer.

The output of both steel and pig iron is yet again a record as the large amounts of capital put into the industry in the years since the war come to fruition, and it is expected that the steel target of 18,500,000 tons will be achieved, another increase of nearly a million tons on the previous year. Even so, the engineering and building industries have been able to absorb it all, and shortages have reappeared in some places, particularly of steel sheet, so much in demand by the motor vehicle industry. Further expansion of productive capacity is planned for the next few years, and the industry needs no exhortation from the Chancellor to invest capital for greater and more efficient output.

A new development has been the closer touch established with the continental Coal and Steel Pool.

The coal mining industry shows only a negligible rise in productivity. Manpower, both in numbers on the books and in effective employment, has again declined during the year, but output per shift is a little better and there has been a small drop in absenteeism.

The cotton trade has had a difficult year and is much concerned about competition, especially that from India and Japan. Japan increased her cotton exports in the first nine months by nearly 50 per cent, and of the total

some 40 per cent went to the sterling area but only 19 per cent to the dollar area.

Indian exports to this country increased by several times in the same period, and although they are a help to our finishing trades the fact that they come in free of duty and without conditions enables them to compete directly in the home market.

Nevertheless yarn production in this country is nearly up to the best since the war.

The Liverpool Cotton Market reopened in May, since when trade in the raw material has been gradually returning to private hands.

BANK'S EXPANDED ACTIVITIES

You will not be surprised to learn that as the year came to a close we received favourable reports from nearly all areas where the bank operates indicating a continued high level of activity, and this was particularly so from those districts concerned in the various branches of the engineering industry, and with iron and steel manufacture. So far as the bank itself is concerned, I am pleased to say that there has been a most satisfactory expansion in our connections and in our activities, including those areas where we have opened new branches. Both our foreign and trustee departments have been very active.

I should like to take the opportunity in conclusion of expressing on behalf of myself and of every member of the board, to Mr King, the general manager, to the assistant general managers, and to all members of the bank's staff throughout the service, our best thanks for their devoted labours during the year and our sincere appreciation of their enthusiasm and their efficiency.

APEX (TRINIDAD) OILFIELDS LIMITED

MR MALCOLM MACLACHLAN'S SPEECH

The thirty-fifth annual general meeting of Apex (Trinidad) Oilfields Limited was held on January 20th in London.

Mr Malcolm MacLachlan, chairman and joint managing director, submitting the accounts for the year ended September 30, 1954, said that the net profit for the year was £631,000. The directors recommended a final dividend of 1s. 3d. free of income tax per 5s. unit of stock, making a total dividend equivalent to 1s. 6d. free of income tax per unit of stock on the issued capital of £1,100,000. The production for the year amounted to 3,007,000 barrels of crude oil and 4,085,000 gallons of casinghead gasoline. The company's total production of oil since it commenced operations passed the figure of 100 million barrels. During the year 97,204 feet were drilled.

The cost of the company's deep drilling had been extremely high both in terms of money and of drilling time: the results to date underlined the formidable task involved in the search for deep oil reservoirs in Trinidad, on which the industry during the past nine years had spent over 50 million dollars. In the circumstances it was satisfactory that the company had been able to build up a strong financial position, and the need to maintain it would be readily understood.

There was some increase during the year both in the production and in the price the company received for it, which was on a basis related to United States prices; however, the greater part of these benefits was absorbed by increased costs. The report and accounts were adopted.

ANSELLS BREWERY, LIMITED

INCREASED SALES, OUTPUT AND PROFITS

MR A. E. WILEY'S REVIEW

The fifty-fourth annual general meeting of Ansell's Brewery, Limited, was held on January 18th at Birmingham, Mr A. E. Wiley, chairman and joint managing director, presiding.

The chairman, in the course of his speech, said: It is a very pleasant duty for me to submit to you, on behalf of your board, the report and statement of accounts for the trading year ended September 26, 1954. Although it has again been a period full of continued difficulties and rising costs, your company has, by increasing its sales and output, been able to show a year of expansion and increased profits.

The group trading profit, amounting to £2,248,845, is an increase of £308,815 over the previous year. This has been achieved because of the continued popularity of your company's products, modernisation of plant, and careful management.

TAXATION BURDEN

I must call attention to the necessity of some relief from the penal taxation to which this industry is subjected, by an allowance being given for depreciation of buildings similar to that allowed to manufacturing and industrial concerns; I mean a "depreciation of buildings" allowance should apply to hotels, licensed premises, and other retail establishments, and I hope that the Chancellor will give this matter full consideration.

Other items of expense, to which your attention should be directed, are an increase of £13,126 for depreciation, £21,153 debenture interest (this, of course, being the first full year covering the 5 per cent second debenture stock), and taxation an increase of £170,593.

The net profit for the year is £711,383, which is an increase of £102,541 over the previous year. You will note that there is a disposal balance of £1,033,514.

BUILDING OPERATIONS

In November the Ministry of Works cancelled all restrictive orders on buildings, which means, of course, that we may now commence building new properties where we have held grants for some years. It is impossible to tackle all these grants immediately, but building operations will be commenced where the demand is greatest. The licensing justices will naturally expect us to fulfil our obligations as soon as possible, but this can only be done as circumstances permit, and subject to the necessary labour and materials being available.

Owing to the high building costs we shall have to modify the design of our "New Houses," but we will endeavour to give both comfort and service as in the past, cutting down the cost of building wherever possible. This is a matter to which we will give our careful consideration, so that we shall be able to offer full service to the public, and meet the requirements of the Town and Country Planning Authorities. Where there is the demand, facilities will be given to catering according to the district requirements.

I am pleased to say that considerable progress has been made in remodelling the brewery and bottling stores.

With reference to your subsidiary companies, it is with great pleasure that I am able to report that the purchases made during the last few years have been fully justified.

During the last few years our wine and spirit department has made considerable progress and it is gratifying to report that the profit from this department is increasing year by year, which speaks well for the quality of our wines and spirits, and the management of the department.

REDEVELOPMENT PROGRAMME

During the past year we have done our best to cooperate with the appropriate authorities in the licensing planning areas of Birmingham and Coventry, where we own a large number of licensed premises, both by assisting in their schemes for redevelopment and slum clearance, and by providing the public with licensing facilities on new housing estates. In Coventry, a substantial measure of agreement has been achieved and with the lifting of building restrictions, building operations should soon commence.

In Birmingham the implications to the licensed trade of the Corporation's great redevelopment programme are far-reaching, and as the Corporation is naturally concerned about the cost of these schemes to the public, so your company, anxious though it is to assist in any scheme that will benefit the public, naturally has to watch the compensation to be paid for those licensed premises which the Corporation has to acquire; the enormous present-day cost of rebuilding, whether on the redevelopment areas themselves or on new housing estates, must also figure largely in our plans.

MR WALTER SCOTT'S SPEECH

Mr Walter Scott, JP (deputy chairman and joint managing director), in the course of his speech, said: From the state of our finances, coupled with the further information given by the chairman, there can be no doubt that we have experienced a very successful year's trading resulting in an all-time record.

Much of this is based on our increased turnover, and I am pleased to report that both the draught and bottled beer sales have increased, especially those of our free trade customers. This latter fact is particularly gratifying as it proves that our efforts to produce the best possible products are recognised and appreciated.

We have had difficulty in coping with the extra demand for bottled beers and stout, not so much because of the larger quantity put into bottle, but from the demand for the ½ pint size against the larger sizes. The new stout "Newcrest" is still forging ahead in a very satisfactory manner.

We are fortunate that most of our trade is in busy industrial areas, but even so there are many who would relish to indulge their taste for the national beverage but who are debarred on account of the price; so in the country as a whole, beer production is gradually but surely declining, due to the excessive taxation of around 8d. per pint. Incidentally, we collected and paid during the past year in beer duty and taxes direct to the revenue nearly 10½ million pounds.

Taking all factors into consideration I should venture the opinion that next year we may be able to maintain, if not to improve, our present position—at least we have made a good start.

The report was adopted and a final dividend of 12 per cent, making 19 per cent for the year was approved.

MARTINS BANK LIMITED

STATEMENT BY THE CHAIRMAN MR A. HAROLD BIBBY, DSO, DL

PROSPERITY DEMANDS EXPORTS AT THE RIGHT PRICE

The one hundred and twenty-fourth annual general meeting of members of Martins Bank Limited will be held at Head Office, Liverpool, on February 8th. In his statement circulated to members, the chairman, Mr A. Harold Bibby, DSO, DL, writes:

The results for the year have again been satisfactory, our net profit at £918,477 being £98,556 higher than a year ago. In accordance with the forecast in my annual report in January last, the interim dividend paid in July was raised to 8½ per cent, less income tax, and it is now proposed to pay 8½ per cent, less income tax, as a final dividend. The total dividend of 17½ per cent for the year is the same as for the previous year.

Appropriations from published profits, after providing for the dividend, are £150,000 to reserve fund, £100,000 to staff superannuation fund and £200,000 to premises redemption. The larger appropriation to premises redemption is called for owing to increased capital expenditure on our branch offices generally and the bank's continued policy of expansion.

The balance sheet reveals total assets at £363,655,940 against £359,885,065 last year, the increase being mainly accounted for by the rise in engagements on account of customers of £3,415,764 due to greater business activity.

Customers funds and other accounts at £330,645,237 are slightly higher than a year ago. Increased advances to public utilities and industry and trade generally have brought total advances up to £95,391,176 which compare with £83,248,241. On the other hand investments at £109,074,314 are lower than the previous year when they stood at £120,184,980.

Although there has been a reduction in the aggregate liquid resources which are £109,758,258 (1953—£114,441,224) a sound liquid position is again maintained, the ratio of such resources to deposits being 33.15 per cent compared with 34.60 per cent.

I have to record with deep regret the death of Colonel James Walker, DSO, TD, DL, in December. He became a member of the Leeds board in 1921, of which he was later chairman and from 1939 he also served as a director on the general board. His knowledge of the wool trade was of inestimable value to the bank and he will be greatly missed.

We have suffered a very real loss by the resignation of Mr R. H. Thornton on his retirement from business in Liverpool. His quick, accurate, and forthright reactions to any situation were of the greatest value. This we miss as also his delightful and stimulating personality.

During the year we welcomed to the general board Mr Arnet Robinson, who brings to our deliberations his outstanding experience in all maritime matters. Amongst other wide interests, he is managing director of Coast Lines Limited and chairman of the Mersey Docks and Harbour Board. I am also pleased to record that Mr D. H. C. Briggs, MBE, joined the general board in December. His valued counsel has been available to the Leeds district board, of which he is now chairman, for a number of years. He is vice-president of the Halifax Building Society. Both appointments will require confirmation at the annual meeting.

Our thanks are again, as always, due to our staff, from the chief general manager to the latest recruit, for their loyal and devoted service, which is gratefully and appreciatively acknowledged.

With our continued expansion, promotion and vacancies hold out a bright prospect to all who have the ability and determination to seize the opportunities that lie open to them, and it is our endeavour to give every encouragement to those who wish to fit themselves for the higher positions. We are delighted and gratified that so many are taking full advantage of the facilities available.

STEPS TOWARDS ECONOMIC FREEDOM

Step by step we are moving towards economic freedom. Each time a commodity is released from bureaucratic control, either in this country or abroad, it is another stride towards the goal we all wish to reach. The Government is to be congratulated on the many moves they have taken in the year under review and particularly in ensuring that each step forward was on to firm and solid ground.

The clouds of restrictions, controls and unbalanced economies are slowly dispersing or showing signs of disappearing.

We all hope that the full convertibility of sterling will shine through in the not too distant future, but this must come gradually and only when sterling has gathered sufficient strength to withstand all the stresses and strains inherent in freed international trading.

Martins Bank can take their full share of credit for the support that has been given in the restoration of the cotton and grain markets and, more recently, in the setting up of the Fatstock Marketing Corporation with all the difficulties of widely dispersed control and the short time that was available to bring into being a complex organisation.

After repayment of the balance of debt to the International Monetary Fund there remained a satisfactory net increase in the gold and dollar reserves at the close of last year, which is just one further indication of the greater strength of sterling.

The optimistic official utterances of the Chancellor of the Exchequer and of others speaking with authority encourage the hope that there will be some substantial relief in the present burden of taxation.

The country is earning more, spending more and saving more than for years past; production is running at a high level and there are more people employed than ever before. With all this, inflation is at present under reasonable control, so all the omens are favourable for the Chancellor, in his next budget, to restore the incentives that would carry the country to an even higher level of prosperity.

OUR STANDARDS OF LIVING

So much has been said and written on the need for exports that the man in the street now appreciates that, unless we export sufficient to pay for the food and raw materials that we must import, we shall be reduced to starvation or semi-starvation and that our workshops will close for want of cotton,

rubber and the thousand-and-one things we cannot produce in these islands.

If this should happen, even in a modified degree, all our brave talk about maintaining and increasing our standards of living would go to the winds.

It is also appreciated by nearly every section of the community that, the sellers' market having disappeared and our competitors, especially Germany and Japan, getting back into production, we have to produce what our customers require both as regards quality and also as regards price.

There is no question that we can produce goods of the highest quality so it is mainly in the price and prompt delivery aspects that we find ourselves in difficulties, with the risk of forcing our would-be customers to buy elsewhere which would result in our exports dropping and our standards of living with them. It is no use our complaining that Japanese standards of living are much lower than ours or that the Germans not only work longer hours but work harder than we do.

Our potential buyer in darkest Africa is not in the least interested in our standards of living, how many cigarettes we smoke, whether we have a television set or not, any more than the average worker here is interested in what the customer abroad thinks he should be able to afford.

We buy in the cheapest markets and we cannot deny the same right to others. So it comes down to the simple alternative of producing at the right price or lowering our own standards of living.

There are obviously two parties to all trade—the buyer and the seller—the buyer must have the wherewithal to pay for his purchases and this is where thoughts so often get confused by what is termed "the balance of payments," that economic wilderness where so many lose their way.

Trade is fundamentally barter to which the refinements of currency and the settling of differences by gold have been added, to the great convenience of all concerned.

If every country were willing and able to trade with the rest of the world, the limitation of how much each could buy would be settled ultimately by how much that country could sell to others.

Naturally, and rightly, everyone wishes to see his own country's standards of living rise but this can only be brought about by doing more trade, by selling more and buying more. If we and other countries wish to sell more, for example, to Japan, we collectively must buy more from Japan as, otherwise, she cannot have the wherewithal to pay us and this applies universally. Fortunately for us, we are members of our great Commonwealth and the bankers to the sterling area which, to a degree, simplifies our particular problem but even within the Commonwealth no one member can continue for long buying more than it can sell. The import restrictions into Australia, imposed some three years ago, demonstrated this, if a demonstration was required.

So we come back a full circle, to raise or even maintain our present standards of living each one of us, be it the individual unit, the family unit, or the business unit must collectively produce in value at least as much as we consume unless we can find

someone willing and able to support us on a charitable basis.

Our standards of living are not regulated by what we would like them to be or what we think they should be, or even by the standards enjoyed by others, but solely on what our own labours earn in the international market.

Those engaged in the export trade are the first to feel the impact when we are unable to sell our products abroad, but those engaged in the so-called sheltered industries are equally responsible and later affected as the cost of their services forms part of the price of our export products.

STRONG TRADE UNIONS WELCOME

All this is sincerely understood by most of our trade union leaders but only the more far-seeing and courageous seriously try to drive it home to their rank and file members, hence the misunderstandings which are so largely responsible for industrial unrest.

Today every employer welcomes a strong trade union just as every trade union must welcome an association of employers with whom they can discuss their problems and usually come to a satisfactory settlement.

For this sensible way of settling difficulties, it is essential that both parties are determined and capable of seeing that the arrangement arrived at is carried out, otherwise the whole negotiations become a farce, fall into disrepute and ultimate disuse.

The unofficial strike is the worst enemy of the employee and employer alike. The unions have their constitutionally elected representatives who are authorised to nego-

tiate on behalf of their members. The very foundation of collective bargaining crumbles when agreements freely negotiated by them are repudiated and a splinter union within the union tries to usurp their authority.

This is damaging to the unions themselves and leaves the employers with a very real doubt as to whether the agreements are worth negotiating if they will not be honoured by both parties.

The fault lies largely in the fact that so many trade unionists will not take the trouble to attend their branch meetings, leaving the field clear for the agitator and his fellow travellers.

INTERESTS OF EMPLOYEE AND EMPLOYER ARE ONE

The interests of the employee and employer are one; both depend on making their industry prosperous to enable good pay packets to be earned, to make profits which will enable good dividends to attract fresh capital to the enterprise and to put aside sufficient reserves to ensure the replacement of worn-out machinery.

It would be more understandable if employees tabled complaints, should these three requirements not be fulfilled, on the grounds that the management, their fellow workers, or both, were not giving of their best. The more common practice of making excessive demands or resisting the introduction of modern machinery and methods can only result in pricing the products of their labour out of the international market.

If only these recognised truths could be brought home and acted on, an ever-rising degree of prosperity for all would be within reach.

THE CHARTERHOUSE GROUP

OPPORTUNITIES FOR SMALL COMPANIES

The thirtieth annual general meeting of The Charterhouse Investment Trust Limited will be held on February 9th in London.

The following is an extract from the review of the chairman, Mr H. Nutcombe Hume, CBE, MC, which has also been sent to shareholders of Charterhouse Industrial Development Company Limited:

The outstanding event for the Development Company during last year was the acquisition of the share capital of S. Japhet & Company Limited, merchant bankers. This purchase was made on terms which your directors consider satisfactory. Japhets have now become part of the permanent structure of the Charterhouse Group and will greatly enlarge the range of financial services it is able to offer.

Mr Nutcombe Hume continued: Stock Exchange markets, and to a lesser extent industry, are experiencing almost boom conditions and attempts are often made to draw an analogy between the conditions of today and those of the inter-war years when slumps and booms alternated. On the other hand, it has been suggested that a formula has been found for maintaining a constant state of prosperity and full employment. The truth probably lies between these two experiences gained after the first war is being used to good advantage and agencies having huge resources at their command are helping to increase the demand for our exports by developing the enormous consuming power of the great numbers of people in less developed countries. Conversely attempts by sectional interests to exploit full employment can only lead to a reversal of the present trend and to our products being priced out of export markets.

THE NEED OF PRUDENT INVESTORS

Many chairmen's speeches refer to the rise of competition, the continuance of rising costs and the difficulty of maintaining profits. For this reason prudent investors demand a wide margin between company earnings and the amount distributed in dividends; and we apply the same principle in the case of ordinary shares in both public and private companies held in our Group. In the case of investment companies, the necessity for so wide a margin between profits and dividend does not of course arise, provided always that the income is derived from investments of the type I have just mentioned. In this connection, it is noteworthy that investments having a total book value of £2,603,865 held by the Development Company, i.e. the holdings in Charterhouse Finance Corporation, Japhets, Charterhouse Australia and Charterhouse Canada paid no dividend to their parent in respect of last year, although in the aggregate these companies earned substantial profits.

The question is often asked if this is the day of the big corporation and whether smaller companies will gradually be eliminated by them; and my reply from practical experience is an emphatic "No." There is plenty of room for the smaller business, and there are now and always will be many examples of small concerns growing into big ones. For many years taxation has seriously handicapped growth out of retained profits, but the advent of corporations like the Charterhouse Industrial Development Company has helped to solve this difficulty, and provided always there is good management all other obstacles can be overcome.

NATIONAL PROVINCIAL BANK LIMITED

COUNTRY'S GREATER PROSPERITY

ENCOURAGEMENT TO INDUSTRY ESSENTIAL FOR FUTURE SUCCESS

DISTURBING INFLATIONARY FEATURES OF PRESENT ECONOMY

MR D. J. ROBARTS ON PROGRESS TOWARDS STERLING CONVERTIBILITY

The one hundred and twenty-second annual general meeting of National Provincial Bank Limited will be held on February 10th at the head office, 15, Bishopsgate, London, E.C.2.

The following is the statement by the chairman (David John Robarts, Esq.) which has been circulated with the report and accounts for the year ended December 31, 1954:

Board of Directors.—We have to record with great sorrow the death in November last of Lord Colgrain.

Lord Colgrain was elected to the board of the Bank in 1903 and he occupied the chair from 1933 until 1946. He was also chairman of the committee of London Clearing Bankers from 1938 until 1946. During this long period he rendered great service to British banking as a whole, and his work for the National Provincial Bank will always be remembered with the deepest gratitude. He was regarded with high respect and affection by everyone who knew him.

In July last year we were glad to welcome to the board Mr Edward Raymond Courage, a director of the old-established business of Courage and Company, Limited.

We offer our congratulations to our colleagues, Sir William Fraser, CBE, upon whom Her Majesty has been pleased to confer a barony, and Sir Ivan Stedeford who has received the honour of a Knight Commander of the British Empire. We also congratulate Mr Edward Walters Senior, a local director for Sheffield, who has been made a Commander of the Order of St. Michael and St. George.

We have to record with regret the retirement of Mr Ernest de Garis, OBE, and Sir Victor Gosselin Carey, local directors for Guernsey, who have served for very many years in that capacity. Mr John Herbert Farmer and Mr Frank Wall Poat have been appointed local directors for Guernsey.

Coutts and Company.—The balance sheet of Coutts and Company as at December 31st last accompanies our own report and accounts.

Lloyds and National Provincial Foreign Bank, Limited.—During the year we agreed to sell our half interest in Lloyds and National Provincial Foreign Bank Limited to Lloyds Bank Limited, who in consequence will become the sole proprietors of that bank.

The directors both of Lloyds Bank Limited and of your bank feel that the substitution of sole for joint ownership will carry advantages which will justify this change.

STATEMENT OF ACCOUNTS

The balance sheet and accounts of the bank together with the directors' report are before you.

It will be seen that the liabilities of the bank to its current, deposit and other account holders have risen during the year by £39,900,648 to £909,324,410.

The total of our most liquid assets—cash,

money lent at call and short notice, and bills—now represents 37.2 per cent of our deposit liabilities. This compares with 39.5 per cent twelve months ago.

Investments in securities of, or guaranteed by, the British Government are shown, as is our usual practice, at a figure which understates their market value. The balance sheet value of £280,502,121 gives a ratio of 30.8 per cent to deposits, as against 28.5 per cent last year.

In contrast to the experience of the two preceding years, our advances to customers and other accounts have expanded and stand in the balance sheet at a figure of £249,883,378, that is 27.5 per cent of our deposits. The corresponding figures last year were £244,187,325, or 28.1 per cent of the then total deposits. Full provision has been made for all accounts where there may be any risk of loss to the Bank.

This increase in our advances is broadly based and arises from the high level of industrial and commercial activity at present prevailing throughout the country. In this connection it is perhaps permissible to emphasise the vitally important part played by the banks in meeting the financial requirements of industry. In its lending, this bank continues to be closely associated with the basic industries of the country and, indeed, with all its leading industries. The facilities we make available are an important factor in the export trade and in agriculture. We are also helping to finance the new building in the City and in Greater London, as well as in other cities and towns, including the development of the new towns and their industries.

PROFIT AND LOSS ACCOUNT

The account shows a net profit for the year of £1,827,044, compared with £1,765,768 for 1953.

Together with the amount brought in of £815,909, there is a balance for disposal of £2,642,953. An interim dividend of 8½ per cent has been paid, taking £443,163, leaving available £2,199,790.

It is now proposed to deal with this balance as follows:

To pay a final dividend of 9½ per cent £495,299
To appropriate to reserve funds £1,000,000
This will leave to be carried forward £704,491

The proposed final dividend of 9½ per cent makes, with the interim dividend of 8½ per cent paid in July last, a total dividend of 18 per cent in respect of the year 1954.

These payments restore the rate of dividend to that paid during the years 1925 to 1930.

It is the intention of the directors, in the absence of unusual circumstances, to declare an interim dividend in July, 1955, at the rate of 9 per cent.

These satisfactory results have been achieved by the hard work and skill of the management and staff throughout the bank. We have an asset of immense value in the

fine spirit of our staff which makes possible the maintenance of a high standard of service to our customers up and down the country.

I am pleased to say that a most happy relationship exists between the board and the staff association, and no effort will be spared to preserve the friendly atmosphere in which our meetings and negotiations are conducted.

The complexities of modern life bring many of our customers to our managers for advice upon a large variety of business problems. Therefore, a bank manager needs to have a wide knowledge of the various industries, trades and other activities of his customers so that his counsel may be relied upon as being that of a sound and well-informed man. In this way bonds of mutual respect are forged between the bank and its customers. It is clear that recruitment and training of the men who will be our managers in the future, when great changes may take place in the organisation of banking, is of the highest importance, and we continue to give earnest attention to this aspect of our business.

FUTURE STAFF DEVELOPMENTS

It seems likely that the development of electronic bookkeeping will evolve methods of dealing with some at least of the great number of entries which the bank is called upon to handle. Looking ahead it is reasonable to visualise further changes in the staffing structure of the bank. Almost certainly the number of ladies on our staff will increase, while the number of men may quite possibly tend to fall. If this be so, it will become more important than ever before to ensure that every boy who joins the staff is of the material to become a manager and that he has ample opportunity to study banking in all its aspects.

To this end we have for some years maintained a Staff Training College through which many hundreds of men have passed with, we believe, great benefit to themselves and to the bank. We are now making such facilities available to the younger men in the bank, and they are eagerly grasping the opportunity of acquiring knowledge and skill which will stand them in good stead in the future.

I am glad to report that young men are recognising that banking offers prospects of a happy and useful career with plenty of opportunity, and that we are able to recruit men with the necessary qualities.

IMPROVEMENT OF PREMISES

I would like now to refer to the work which we have in hand and in prospect for the improvement and development of our premises. We take a special pride in our offices and no efforts are spared to ensure that the premises are pleasing architecturally, and well appointed for business purposes. The end of the war found us faced with many years of arrears of maintenance to overcome and with a large amount of war damage to make good. All this had to be accomplished in the face of licensing difficulties, shortage of materials and many other

MARTINS BANK LIMITED

STATEMENT OF ACCOUNTS, 31st December, 1954

LIABILITIES	
Capital paid up	£4,315,096
Reserve Funds	6,150,000
Current, deposit and other accounts (including Profit and Loss Account)	331,162,427
Acceptances and engagements on account of customers	22,028,417
	£263,655,940
ASSETS	
Cash in hand and at Bank of England	£28,606,517
Balances with, and cheques in course of collection on, other banks in the British Isles	21,566,747
Money at call and at short notice	28,181,000
Balances with banks abroad	974,363

HEAD OFFICE: WATER STREET, LIVERPOOL, 2

obstacles. Steady progress was made and some excellent results were achieved despite the difficulties. But we were not satisfied; much remained to be done and many plans were unfulfilled. Now, at long last, with the easing of building restrictions, it has been possible to give attention to the reconstruction of those premises of the bank where re-building is necessary because of damage by enemy action or re-planning schemes by local authorities.

At Canterbury a new building is in process of erection, whilst schemes have been prepared, and plans are well advanced, for the erection of new premises to re-house the branches of the bank at Dover, Plymouth, Portsmouth and Southsea. Elsewhere, no opportunity will be lost of improving our premises as conditions permit.

We are also alive to the necessity of establishing new offices in places where prospects appear to be favourable. The opening of a new branch presents considerable difficulties in the way of premises and staff, apart from the essential problem of building up a satisfactory business. Special qualities of enthusiasm and determination are required of managers and staff and we have been well served in this respect.

BRIGHTER FINANCIAL CLIMATE

The banks with their network of branches and agencies throughout the country provide the arteries and nerves of our national financial life. Their successful operation must, in the end, depend on the financial climate resulting from the direction of Government policies. Happily, during the past year the financial climate has been far brighter than the physical climate which we have had to endure. The country has been enjoying a period of great prosperity. Had it not been for bad weather conditions for the harvest and the occurrence of the protracted dock strike it would have been even better. In the private sector of the economy it is difficult to think of any industry, or section of industry, which is doing badly. Certainly, there is little evidence of unemployment or even of short-time working; nor is there any suggestion that excessive stocks are accumulating. The assumption can only be that, at present, practically everything produced is being sold, and sold rapidly, whether at home or abroad. The trade winds have been mainly fair and a touch of exhilaration has been given by the removal of more controls, the reopening of more commodity markets and the absence of major disturbances abroad. The agreements on Indo-China, Persia, Egypt and Trieste have also helped by relaxing, at least to some extent, international tensions.

For the satisfactory state of the economy the Chancellor of the Exchequer is entitled to much credit. He it was who, at a dark moment in our affairs, had the courage to restore a dynamic monetary policy and to plan his budgets with an eye to the long-term interests of the country. Under his guidance and firm leadership the economy was first put into a condition to take advantage of a favourable shift in the terms of trade or any other fortuitous developments, and then gradually given greater freedom to expand. As a result, the balance of payments surplus grew to £154 million in the first half of 1954, and it has been found possible to relax to an impressive degree many of the technical restrictions on the use of sterling, and much has been done to restore confidence in the pound. On this record the Chancellor is justified in asking the country to "invest in success."

DANGERS OF INFLATION

There are, however, certain unsatisfactory features of our economy which cannot be ignored. The fall in the internal purchasing

power of the pound has not been arrested; only slowed up. Whatever the successes achieved by the new monetary policy, a fall in purchasing power is hardly one of them. Of course it can be argued that such a decline is only a small price to pay for full production, full employment and freer trading conditions. From this it is but a step towards accepting the comfortable doctrine that we can afford a mild degree of inflation each year so long as production increases. But experience has shown that the promised objectives are not necessarily attained by such a policy. The theory implies a precision in economic management that has yet to be displayed: it bumps up against a number of very baffling problems.

In the first place, such a policy—one of tolerating, or even deliberately engendering a yearly dose of inflation—is only possible for a country placed as Great Britain is, if the rest of the world is doing much the same. Otherwise our exports will sooner or later price themselves out of the market, with consequent unemployment, or our currency will have to be devalued again in order to maintain the balance of payments. Secondly, it presupposes a yearly battle for increased wages always fought and lost on the issue of trying to restore the standards of the workers, instead of that of raising productivity. That is not the way to secure either good labour relations or a prosperous economy. Thirdly, unless prices can be kept reasonably stable, the cost of the social services must constantly be increased, with consequent threats to the solvency of the national insurance scheme or of the national budget. Fourthly, what of the outlook for savings which have staged such a spectacular, though somewhat mysterious, recovery over the past two years?

The practical effects of this chronic inflation have been seen in the recurrent unrest which spreads from one industry to another each year. Pressure for increased wages is inevitable when the purchasing power of the currency is continually falling, and every time an increase in wages is granted without a corresponding increase in production more fuel is piled on the fires of inflation. The threatened railway stoppage which has just been averted exposed this problem in its most acute form.

A further stimulant to inflation this year has been the great increase in hire-purchase business. While the abolition of controls, including that of hire-purchase finance, is welcome it is to be hoped that this method of mortgaging future earning power will not be carried so far as to stimulate a feverish demand which cannot be sustained.

GROWING TENDENCY TO INVEST IN EQUITY SHARES

These are not just theoretical questions. They are ones which are giving everyone responsible for the prudent use of funds cause for concern. The growing tendency to invest in equity shares reflects the result of their assessment of the long-term prospect, and their deductions from the trend of money values in recent years. Wherever the process of inflation has been allowed to develop, the private citizen has learnt that the only safeguard is to hold assets such as are represented by equities, instead of Government or other bonds fixed in terms of a depreciating money. Hitherto, the people of this country have been happily free of this contagion but it is a sad reflection on the trend of public affairs that at present, while Parliament is constantly pressing for more and more lavish expenditure, the Government finds it increasingly necessary to look to the banks and other financial institutions rather than to the private citizen, to take up Government securities.

I do not suggest that the present situation

is one that gives rise to immediate alarm, still less do I suggest that the benefits brought about by the new monetary policy are going to be lightly discarded by the Chancellor who has clearly handled affairs with great skill and determination over the past four years. But the long-term implications are disturbing. Nor is there any easy solution at hand. A state can only achieve financial stability in the same way as an individual can—by the exercise of a certain amount of discipline—and discipline is a question of patient education and example. It is of the utmost importance that public opinion should be alive to the dangers of taking the line of least resistance in monetary affairs as well as in everything else.

NEED FOR INCENTIVES

To return to the present, it will be apparent to many that the prosperity of Great Britain depends, as it has done for the past hundred years, on keeping ahead in the industrial race. We may well be on the threshold of an era of startling progress, and it is essential that industry should be given every encouragement to develop new processes and to adopt new techniques. The introduction of an investment allowance in the last Budget was a welcome step in the right direction, and it may be hoped that it will be possible to extend this principle. Although it would be to the general advantage if the standard rate of income tax could be substantially reduced, the prospect of any such reduction must depend on the possibility of reducing Government expenditure. None the less, when the time comes for the Chancellor to consider what, if any, relief he can afford in 1955, I hope that he will keep in mind the necessity to encourage men as well as machines. Taxation beyond a certain point destroys enterprise and initiative. Two cases in particular leap to the mind. In the first place, the level of income at which surtax commences to be levied should be raised; and, secondly, no part of any man's income should be liable to a total taxation exceeding 15s. in the £ as a maximum. It may be hoped that, whatever may be possible in other respects, the Chancellor will see his way to make appropriate adjustments to meet these cases. They would cost very little in relation either to the total revenue of the State or to the benefit to the national economy which would result from the incentives thereby given to a small but important group of individuals.

THE GOAL OF STERLING CONVERTIBILITY

During 1954 progress has been made towards the goal of convertibility of sterling. Because this progress, apart from the raising of the basic travel allowance, has occurred mainly in the technical sphere, the public is largely unaware of what has been accomplished. But, given the uncertainties of the times and the lack of response to suggestions that the United States should facilitate currency convertibility by some modification of their tariff regulations, it seems not only right but inevitable that our approach should be a cautious one. Meanwhile, it was satisfactory to note that action had been taken to settle some of our liabilities to the European Payments Union and the International Monetary Fund. Despite these payments, the gold reserves have shown a healthy buoyancy, although it should not be forgotten that they are still some £395 million below what they were in June, 1951, and that the recovery which has occurred has been due, to a considerable extent, to special receipts from the United States on which we cannot count indefinitely. Moreover, despite some relaxations, we still maintain a number of prohibitions and restrictions on dollar imports and, until these restrictions have been

removed, we cannot tell what strain on our reserves would follow convertibility. The main trouble is the activity in our domestic market. There has been too great a tendency to expand consumption within the country, to the detriment of our balance of payments. The Chancellor of the Exchequer has, therefore, rightly stressed the need for sound internal policies. Convertibility cannot be restored until general

confidence in the stability of sterling has been firmly re-established, and this, in turn, will depend on the evidence that the British Government and British people are determined to maintain it.

To sum up. We have had a good year; the short-term outlook seems reasonably clear; industry's main problem is still a shortage of skilled workers, not—except in the case of shipbuilding—a shortage of

orders; and sterling has gained generally in strength. Now is the time to put forward our greatest efforts not only to recover more of the ground lost because of the war, but also to provide for those occasions in the future, when assuredly the economic tide will not be running so strongly in our favour. We do not want to be regretting in a few years' time that we did not take fuller advantage of the fat years to provide for the lean.

DISTRICT BANK LIMITED

SATISFACTORY LIQUID POSITION: A YEAR OF PROGRESS

THE NATIONAL ECONOMY

NEED FOR HIGHER PRODUCTIVITY

TAX REDUCTIONS AS INCENTIVES

SIR THOMAS D. BARLOW'S REVIEW OF CONDITIONS AND PROSPECTS

The chairman, Sir Thomas D. Barlow, GBE, has circulated, with the report and accounts, the following statement to the shareholders of District Bank Limited, prior to the one hundred and twenty-fifth annual general meeting, to be held on February 11th, at the Head Office, Spring Gardens, Manchester:

As you will see from the report, Sir Kenneth Lee has decided not to offer himself for re-election. Sir Kenneth has long been a prominent figure in industrial and commercial circles, and for thirty-three years the board has had the benefit of his wide experience and business acumen. I am sure you will wish me to convey to him our grateful thanks for his inestimable services, which, fortunately, we are not losing entirely as he has agreed to remain a member of the London committee.

During the year certain changes have taken place among the Bank's principal executive officers, Mr Samuel Higginbottom, chief general manager; Mr Albert Dunn, a joint general manager; and Mr A. R. Capey, general manager (London), have retired on pension after many years of loyal and devoted service. We extend to each one our best wishes for happiness in his well-earned retirement.

Mr William Mitchell, deputy chief general manager, has been appointed chief general manager; Mr Frank Stott, an assistant general manager, becomes a joint general manager; and Mr H. J. Higginbottom, previously assistant general manager (London), is now general manager (London); Mr S. H. Coomer, our secretary since 1949, has recently been made an assistant general manager and has been succeeded in the position of secretary by Mr J. F. Hornbrook.

STATEMENT OF ACCOUNTS

On reference to the balance sheet, it will be seen that current, deposit and other accounts have again increased and are over £3 million above the record figure of £251 million shown the previous year. This upward movement is in keeping with the general trend of bank figures and is mainly due to the increase in industrial activity.

As might be expected, the larger resources and the rising tempo of business have been responsible for important changes in the composition of our assets. The total of the items, cash, money at call and short notice,

and bills of exchange, is higher than at the close of 1953. Our holding of Treasury Bills, on the other hand, has been reduced, but notwithstanding this change our liquid position remains satisfactory.

For the second year in succession we have added to our investments: most of our British Government Securities have a definite date of redemption and their market value is in excess of the figure shown in the balance sheet.

With our advances at £65 million, we have more than regained the ground lost since the peak figure was reached in 1951, and it is satisfactory also to note that our average lendings have been higher than for the previous twelve months. Needless to say, our lendings are made to a representative selection of industries, and I am pleased to observe that, as always, we have been able to afford generous assistance to the various branches of agriculture.

An outstanding feature affecting both sides of our balance sheet is the substantially higher figure for acceptances, confirmed credits and other obligations. This reflects the increased activities of our foreign department, following further relaxations in exchange control and the less restricted use of sterling for trade. In particular, the restoration of a free market for raw cotton has led to a marked expansion in the volume of import credits and to a much greater turnover in foreign exchange transactions, for both spot and forward delivery. Export credits, on the other hand, have remained fairly constant, but there has been an increase in the number of export bills for collection and negotiation.

We have added to property account since, with the easing of restrictions, the rebuilding and extension of premises have proceeded more rapidly. Our new branch at Newcastle-upon-Tyne was duly opened last November and, as the alterations at Derby are now nearing completion, it is anticipated that we shall commence business there within the next month or two.

THE YEAR'S PROFIT

With a lower level of interest rates operating last year we derived less income from our money market resources. Then the maintenance of our properties and higher running costs have caused the trend of expenses to remain upwards. Against this we have been able to employ a higher proportion of our funds in the more remunerative

items, investments and advances, with the result that we show an increase of £29,119 in net profit as compared with the previous year. After making the usual provisions this amounts to £588,863 and, including the sum brought forward, there is for disposal £932,941. Of this we propose to allocate £200,000 to our general reserve and, after providing the amount required for payment of the higher dividend established last year on the "A" and "C" shares and the maximum dividend on the "B" shares, there remains the sum of £422,914 to be carried forward to the next account.

The conduct of the bank's business depends primarily on the keenness and efficiency of our staff. To ensure that the personnel maintains our traditionally high standard of service we attach great importance to careful selection and training. Training, however, is not just a matter of imparting technical knowledge: it is also a handing down of mature experience in banking from seniors to juniors by means of informal discussion or refresher courses. To this end members of a necessarily widely dispersed staff are regularly brought together. But important too, having regard to welfare, are the various social and sporting activities organised by the bank's deservedly popular sports club.

As in other years, our progress has been made possible by the good work performed by both management and staff and in appreciation of this I should like to express my sincere thanks to all concerned.

THEN AND NOW

Last year we passed the 125th milestone in our history. Although the echoes of the Napoleonic wars must still have been audible in 1829 when our doors were first opened, twenty-five years were to elapse before the Crimean war broke the peace which had prevailed since Waterloo. Whilst the Russian war disclosed many defects in military organisation and strategy, its economic consequences were small and easily overcome, and for the remainder of the century this country enjoyed the Victorian summer of prosperity.

Very different has been the experience of the last forty years in which the government, industry and the banks have had to grapple with inflation, deflation and the innumerable problems of war and postwar economic distress. Now, nearly ten years after the close of the second world war, we are begin-

ning to emerge from some of its many and intractable consequences and it is a matter of congratulation that the present government has given our economy much needed ballast and greater stability.

A YEAR OF ACHIEVEMENTS

This last year has added its own quota to the achievements of previous years and has brought the country a perceptible measure of prosperity. As the ultimate test of our progress is that we should pay our way abroad, it is gratifying to see the figures for the first half show that our current payments surplus has continued to increase. Since, moreover, this increase owes little to the terms of trade, we have the satisfaction of knowing that most of the surplus has been gained through our own efforts, as may be gathered from the further improvement in our industrial production and exports. Our payments position has again been supported by higher earnings from shipping, banking, insurance and other invisibles, whilst the addition to our reserves, despite a cut in defence aid, is proof of our underlying fundamental strength, as is also the healthier state of our capital position due to substantial debt repayment.

AN OVERBURDENED ECONOMY

Encouraging as these gains are, and particularly pleasing because they have been accompanied by a further freeing of our economy, ominous signs of overstrain have begun to appear in recent months. To the pressure occasioned by an increased volume of exports there has been added pressure from such other sources as the housing programme, industrial capital projects and the rise in personal expenditure.

Admittedly these accumulating demands have to a considerable extent been offset by the increased output of industry, yet this has not met the needs of the situation. Ever-growing activity is leading to over-full employment and, with more jobs to be filled than workers to fill them, there has been a gradual extension of overtime and a renewal of wage claims. With a thinning out of supplies and a lengthening of delivery dates we are, in my opinion, moving towards a situation wherein there might again be a tendency to accumulate stocks beyond normal requirements—a development which, more than anything else, creates shortages.

INCREASED OUTPUT AT LOWER COST

If, as is inevitable, shortages are translated into delays, rising production costs and rising prices, the threat of inflation will endanger the volume of our output and of our exports. That would indeed be serious for, commendable as has been our progress in both these directions, our keenest competitors amongst other countries continue to surpass us, so much so in fact as to leave to our manufacturers a declining share of world exports.

Clearly we need still higher productivity and more exports and, since we are handicapped in that we lack reserves of manpower, we can only surmount this disadvantage by making the best possible use of our all too limited resources and by quickening productive investment, so that by modernisation and greater efficiency we can at one and the same time raise output and bring down manufacturing costs.

Unfortunately such an increase in investment adds yet another pressure at the very time when our somewhat extended economy will be finding it difficult to cope with further demands. Yet, with other countries deflecting an ever-increasing proportion of their resources to industrial investment, we dare not lag behind.

CHECKING INFLATION

If the inflationary tides were running so strongly that they could not be stemmed, we might feel that there was cause for alarm. But that surely is not how we need view the situation. Some degree of inflation is unavoidable during a period of economic expansion. So far, however, the increase in the volume of money and consumer expenditure has been outpaced by production and there is encouraging evidence of increasing confidence and stability in the recent revival of personal savings. For these reasons prices have remained stable enough to permit real wages to rise, and this, together with increased earnings, has resulted in such an improvement in living standards that the great majority are now better fed and better clothed and enjoy many more amenities.

Nevertheless, a fully stretched economy signals danger and, since it is so much easier to prevent instability than to effect a cure, we ought readily to admit the need for concerted action to avoid the upsurge of inflationary forces which would so greatly increase the strain on our productive capacity. With this in mind, wage claims resulting from a dearth of labour should not be pressed regardless of the ill consequences of perpetuating the chase between wages and prices. Certainly this twist to the inflationary spiral is not something which those who live at the industrial centres can accept without protest. So far the inherent danger has merely been viewed in the light of an oncoming buyers' market. But as this is becoming firmly established it seems more than ever necessary that there should be an end to demands for higher wages unless these are accompanied by greater production. Important also is it that there should be no resistance to methods framed to achieve the best results from existing machinery. Nor should there be opposition to the installation and economical working of new and up-to-date equipment, the cost of which is increasingly burdensome with the advance of science, technology and invention.

TAXATION THE KEY

Given full co-ordination between manpower and machinery, production should continue to keep inflation at bay: it should do more than this, for a high level of profitable production will augment revenue and facilitate those reductions in taxation which are likely to act as incentives to still greater output and productivity.

Taxation indeed controls our economic destiny inasmuch as it has such power to stimulate or stifle saving, capital investment, efficiency and production. In view of the intensive competition that is fast gathering around us, there can be no question of the need for stimulation. And this impetus may yet be possible since a favourable budget, of which there is some prospect, might well permit a lightening of the heavy fiscal burden.

Admittedly tax concessions cannot be contemplated without thought of adverse repercussions. By unduly quickening consumers' expenditure they could aggravate rather than alleviate inflation; they could quicken the wrong kind of industrial activities and they could also deflect precious manpower and materials from exports, and thus place an additional strain on our balance of payments. But this would amount to gross misapplication of a powerful incentive which, if rightly used, could do so much good.

It is in fact entirely a matter of directing tax relief into those channels which will be most beneficial to the business life of the country and, with the monetary mechanism available to check inflation, judicious concessions should indeed invigorate without overstraining the economy. The immediate

need is to catch up with the arrears of investment in manufacturing industry and, this being so, ungenerous relaxations of taxation might mean the loss of opportunities. Granted that a simultaneous rise in the tides of investment and consumption indicates that we should be cautious, need we be too timorous seeing that increased personal savings followed the tax reductions of 1953?

LOOKING AHEAD

Evidence of this country's regained strength is a fixed resolve to go ahead firmly and patiently "towards freeing trade and payments" and a determination to make the pound sterling "increasingly usable and acceptable throughout the world." But because these bids for freedom and convertibility, if pressed too vigorously, would give rise to anxiety, it is reassuring to know that their full implementation will be subject to a soundly constituted "balance of trade between the dollar area and the rest of the world." Nor in pursuance of these aims are we to jeopardise our expanding economy, which is to be kept well braced by a policy of external and internal soundness.

Given these safeguards, I believe we should be able to introduce still more flexibility into our economy and thereby add to those gains which have steadily accumulated over the past two years. During this period there has been an easing of numerous controls and a termination of vexatious rationing of food. Moreover, a great deal has been done towards returning the business of importing to private traders, a development which has given much greater opportunities for individual initiative and enterprise. In addition, import restrictions have been considerably relaxed and, the outstanding problem is that of paying for these increasing imports, it is good to know that the present time is one of prosperity in world trade as a whole. It is good to know also that this prosperity has been achieved despite a set-back in the United States and that its impulse should be strengthened now that she is staging a recovery.

Conditions such as these are an incitement to further progress. There is no denying the risks to this country of venturing too fast and too far along the uncharted road to freer trade and freer currencies, and the buoyancy of the present situation is in itself a danger because it offers a temptation to do that very thing. But our policies, framed as they are with a wise restraint yet allied with the determination to go forward, should, I feel sure, provide sound opportunities, since their whole purpose is to bring about a steady expansion in our domestic and overseas trade.

If the present prosperity here and in other countries can be successfully consolidated, we shall certainly have the chance to embark on the programme which it is suggested could double our standard of living in the next 25 years. A good start alone is sufficient to excite enquiry into the present and future composition of world trade and more particularly the type of goods we shall be called upon to supply. With increasing capital investment here and abroad, the need for industrial building, plant and equipment should keep our constructional and engineering industries well occupied and should counter some possible falling off in regard to armaments. A high level of world prosperity implies also a rising demand for consumer goods. Specially significant, however, are the new forces at work by which it is hoped all countries will be spared the misfortunes of recurrent trade depressions. It remains to be seen just how effective these forces may be but, since the underlying determination is to expand world trade, this augurs well for both our capital and our consumer goods.

LANCASHIRE'S TEXTILES

Meanwhile in this highly industrialised area, where coal and chemicals, heavy and light engineering, iron and steel, oil, paper and many other products and manufactures jostle each other, the outlook on the whole is encouraging, although there is no sign of complacency. On the other hand the textile industry, or at least some sections of it, would feel more confident had the past year been subject to fewer fluctuations and if the future did not hold so many difficulties.

Although the transition to private trading in raw cotton was so skillfully accomplished, the futures market needs to be further expanded before it can cope effectively with all the demands of the industry. The present volume of business is in fact so poor that small sales or purchases produce disproportionately large effects on prices. The remedy lies mainly in the provision of a larger spot market which, it must be admitted, very much depends upon a feeling of reasonable confidence in the trend of values. But more business would be likely if the negotiations for a contract for longer staples were successfully concluded. Pending this, the inadequacy of the only hedge available to users of such cottons in this country is giving rise to great concern.

Obviously the trade has problems to face other than those which relate to its raw materials, and in the forefront remains purchase tax. Needless to say, the possibility of changes in this tax continues to upset the rhythm of buying, but a matter causing increasing consternation is its distorting effect on production, with ill consequences clearly discernible at the end of the year for at least one section of the industry.

Another problem, and one which most forcefully presents itself, is that of big fluctuations in home market demand. The policy pursued by large buying units, either governmental or commercial, in planning their purchases inevitably exercises a substantial influence upon the level of activity. From the industry's point of view as even a flow of buying as possible is clearly desirable, if only to avoid violent fluctuations in demand, since these endanger the acceptance of orders from overseas and also cause a not unreasonable anxiety in the minds of operatives as to continuity of employment.

Good as is the overall volume of home trade for textiles and reliable as might appear its prospect in view of the increase in personal expenditure, there are today temptations to spend in many other directions and it is not without significance that home consumption of textiles fails to keep pace with the growing spending power of the public. Nevertheless the home market should remain in good shape provided it is not unreasonably assailed by foreign imports produced by cheap labour. A cause for present disquiet, and indeed indignation, is the easy entry into this country of Indian cloths whilst ours are subject to such high tariffs in the Indian market.

On the export side difficulties are fast mounting: increasing competition is even being experienced in qualities once thought to be outside the range of our rivals and, as we expected, the inflow of Japanese fabrics into colonial markets is leading to a falling off in demand for our manufactures. What protection may be asked for and provided against these encroachments upon our trade, it cannot be gainsaid that in the long run the industry must depend upon its own competitive efficiency. Encouraging there is the quickening pace of re-equipment in the spinning and weaving sections, as is the statement that in recent years Lancashire has spent more on new machinery than have the cotton industries of other

ARTHUR GUINNESS SON AND COMPANY LIMITED

BENEFITS OF POST-WAR CAPITAL EXPENDITURE

LORD IVEAGH ON OVERALL SALES INCREASE

The annual general meeting of Arthur Guinness Son and Company Limited was held on January 18th at Park Royal Brewery, London, N.W.10.

The Earl of Iveagh, CB, CMG, chairman of the company, who presided, said:

Ladies and Gentlemen.—Speaking to you a year ago I said that I thought there were grounds for reasonable optimism. I am glad that I have been justified. Our overall sales have again shown some increase; the position in Ireland is somewhat improved, although we are still considerably below the level of sales before the heavy increase in duty three years ago; exports have reached a new high level. These improved sales, coupled with the savings in costs which have flowed from the capital expenditure and reorganisation and modernisation in recent years, are primarily responsible for the satisfactory profit and loss account, since the savings in the cost of materials during the year have been more than swallowed by increased costs of manufacture and trading. Taking all things into consideration, your board decided that it would be in line with our, I hope, prudent and conservative policy, to raise the dividend at this stage, after having made a bonus payment to our staff and employees and a rebate to our customers—all those brewers and bottlers to whom in this country we sell in bulk, and those many retailers and bottlers to whom in Ireland we sell direct. The dividend for the year has been accordingly, subject to your approval, raised from 18 per cent last year to 23 per cent this year; all our employees and staff have had a month's bonus and over £150,000 was paid as a special rebate to our customers. At the same time we have decided to increase the pensions of nearly all but very recent pensioners, as some alleviation of the greatly increased costs they have to face since their pensions were fixed. All this has been possible while maintaining and improving our position. Since the war we have set aside over £8 million in depreciation, and in other reserves largely to meet the costs of modernisation and expansion; and £2 million towards building up the pension fund. I think that we have justified once more our claim that Guinness is Good for you.

OPERATING COSTS

All this is satisfactory, but there are no grounds for feeling complacent. Competition is getting more keen, both among brewers themselves and between the brewing trade and all the other producers of consumer goods. Operating costs are at present still rising quite steeply and the scope for further economies though it undoubtedly exists presents a much stiffer challenge. The happy results of this past year will not repeat themselves unless we earn them by continued thought and effort, and that applies to every one of us throughout the organisation. It is perhaps pertinent here to compare the present positions of the various parties concerned in the company with their immediate prewar state. Salaries and wages have doubled and more; the stockholder's return has gone up by one-third; while the company's percentage of profit on selling prices, excluding duty, is much lower than it was in 1938.

SUBSIDIARY COMPANIES

There has been a considerable apparent change in the financing of our subsidiaries as shown in the parent company balance sheet. The two main subsidiaries are the Dublin and Park Royal brewing companies, whose accounts also are made up to September 30th. Whereas the shares of the Park Royal company had been issued before the date of the previous balance sheet, those of the Dublin company were issued during last financial year. The apparently large changes in the parent company's balance sheet in shares and amounts owing by subsidiary companies relate almost wholly to the formal financing of the Dublin company.

You will have noticed in the preliminary announcement of our profits, that a figure of £517,000 was stated as having arisen from interests unconnected with brewing. The corresponding figure last year was £162,000. In 1952 we amended by special resolution our investment clause, to enable us to use some part of our reserves not required for our main purpose of brewing Guinness, to be put into other suitable and profitable activity if the opportunity arose. We have so far only used this widened power in one case. We bought for a comparatively small figure a block of shares in a private company. This in fact gave us legal control; but we have taken no direct part in the management, which we left in its own very satisfactory state. I am glad to say that the results have fully justified our confidence. There are certain developments now proceeding in regard to this business which could be very seriously hindered if we were at this particular stage to divulge full particulars; but I shall certainly do so in due course and in the meantime I can assure you that your board views the position with optimism.

USA

Since I last spoke to you, we have made further changes in our arrangements in America. The American company, in which we are minority shareholders, has ceased brewing; and we have arranged forthwith to re-introduce our famous Foreign Extra Stout into the States where we sold it for a hundred years and more. We have, in association with the majority shareholders, at the same time entered into an arrangement with one of the large American breweries—Messrs Goebel of Detroit and Oakland—to brew, under our licence and control, a Guinness Ale and a Guinness Lager. We are hopeful of the results of these new arrangements, but it is too early to attempt any forecast; we have completely written off our whole investment in the original American brewing project.

ALE BREWERY IN IRELAND

Some press attention has been given to our small ale brewery in Ireland, and to prevent misconception I think I should make the position clear to you. The complicated arrangements involved in our reorganisation included the purchase by us in Ireland of a very small and almost derelict ale brewery at New Ross. We informed both the Irish Government and the local residents that it was our desire to continue operations so as to provide employment; and indeed it is

very far from our wish to see any diminution in the all too few remaining Irish breweries. We have been brewing ale at New Ross for two years, but the brewery has proved unsuitable either for economical brewing and distribution or for even modest expansion; and so we have decided, while ensuring the continuance of most of the present operations at New Ross, to do the ale brewing at Waterford, twelve miles distant, where we have bought the plant and buildings of another old brewery which ceased working some years ago. The whole operation is on a very small scale, and we shall be happy if we keep employment going and earn the interest on our money.

So much for our new activities. The main work is, of course, at the two main breweries, and it has gone on very satisfactorily through the year. Capital expenditure can never wholly cease; but, as I said last year, we are already reaping the benefit of our exertions and expenditure during the post-war years. I believe that we can claim to be reasonably efficient; and here I would like to pay a well-deserved tribute to the staff and employees at both breweries and in all our stores in both countries.

The report and accounts were unanimously adopted and the recommendation of the directors approved for the payment of final dividends on January 19th of 3 per cent on the preference stock and 15 per cent on the ordinary stock, both less income tax.

The retiring directors, Lady Honor Svejdar, Lord Moyne and Captain Ronald Nutting, were re-elected. It having been decided that the remuneration of the auditors, Messrs Turquand, Youngs and Company, should be fixed by the directors, the proceedings terminated with a vote of thanks to the chairman, directors, staff and employees, proposed by Mr Bernard Binsted and seconded by Mr Beer.

CASTLEFIELD (KLANG) RUBBER ESTATE

DIVIDEND 10 PER CENT

The forty-eighth annual general meeting of Castlefield (Klang) Rubber Estate, Limited was held on January 14th in London, Mr Jack Addinsell, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1954:

The profit before taxation was £44,087, against £38,724, but in comparing these figures account must be taken of the substantial loss of revenue from tin tribute on completion of mining as forecast last year; against this there were credits from some arrears of refundable replanting cess. Profit after taxation was £26,905 compared with £43,474 last year. Your directors recommend a dividend of 10 per cent, absorbing £11,000 net, and the transfer to replanting reserve of £15,000.

The crop for the year at 2,276,611 lb showed a reduction compared with the previous year but in spite of this lower output some further reduction in production cost was achieved; this was unfortunately more than offset by the continued fall in the price of rubber, our average proceeds having been down by 5d. per lb on last year.

With regard to the 600 acres of tin-bearing land at Castlefield Estate which the company sold to Petaling Tin Limited, I told you in my last statement that the necessary survey before sub-division of titles might take as long as two years to complete. We have now been advised by Government that it is hoped to make a start on the survey of the areas early in 1955.

The report and accounts were adopted.

SMITH & WALTON

(Manufacturers of and Dealers in Paints, Varnishes, Enamels, etc.)

The twenty-fourth annual general meeting of Smith & Walton Limited was held on January 18th at Haltwhistle, Northumberland, Mr Douglas Smith, JP (chairman and joint managing director), presiding.

The following is an extract from the directors' report:

The past year has been notable for the further development which has taken place in the productive capacity and technical efficiency of the company's factory at Haltwhistle. The plans outlined in the directors' report last year have largely been brought to fruition, and the twin objectives of greater and more economical production are being attained. Sales have again been at a record level; further depots have been opened. At the time of going to press, the plant is working to capacity and order books are well filled. Increases over last year's figures have been recorded each month to date in the current year. There is every reason to anticipate that this upward trend will continue despite increased competition, and that the names of Hadrian and Synflat will continue to be of force in the trade. The subsidiary companies have again made a handsome contribution to the group results.

The directors consider the consolidated net profit of £98,718 (last year £73,677) to be eminently satisfactory. The directors have felt able to propose an increase in the basis of dividend distribution. They have, however, felt convinced that the opportunity should be taken this year to augment the reserves of all companies in the group, and accordingly the increase in dividend is a modest one. The report was adopted.

THE ROYAL BANK OF CANADA

DIVIDEND No. 270

Notice is hereby given that a DIVIDEND of 37½ cents per share upon the paid-up capital stock of this Bank has been declared for the current quarter and will be PAYABLE at the Bank and its branches on and after March 1st, 1955, to shareholders on record at the close of business on January 31st, 1955.

By Order of the Board,

T. H. ATKINSON,
General Manager.

CHAPPIE LIMITED, manufacturers of cat and dog foods, require the services of a man or woman graduate to undertake field and office control of the National Consumer Research section of their Market Research Department. An Economics or Sociology degree, and/or knowledge of Statistics, especially sampling techniques, would be an advantage. The work entails assisting in the selection of staff, draughting of questionnaires, organising the field staff, office routine, checking field work, and appreciation of findings. Salary will be in the range £780 to £900, and the post also carries Pension, Life Assurance and Sickness benefits under a non-contributory Social Security Plan. This post offers an excellent opportunity for a man or woman seeking first-class Market Research experience. Half the time will be spent in the office at Melton Mowbray and the remainder in the field. Applications should be sent to the Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire.

A CHARTERED ACCOUNTANT, not over 35 years of age, is required by an industrial company of repute. Industrial experience and a knowledge of costing is essential. In addition to professional qualifications, a University Degree would be considered an advantage. The prospects are outstanding, commencing with a four-figure salary rising to £3,000 per annum within six years, as increasing responsibility is assumed. Details of qualifications and experience, which will be treated in confidence, should be sent to Box 812.

BUYING. A young man of 23-27 years of age is offered an interesting and progressive career in the buying department of a large manufacturing company. The opening is in the buying group which is responsible for purchasing equipment and engineers' supplies for all the company's factories. On appointment the new man will be given complete training and be expected to begin buying duties at the end of nine months. Applications are invited from young men of good education, not necessarily technical or professional, and will be particularly welcomed from Arts Graduates with an understanding of practical things and an interest in the economics of buying. The post carries a good salary from commencement and has excellent prospects. The company has a pension fund and a non-contributory life assurance scheme. Letters of application, which will be treated in confidence, should give complete details of education and career to date and addressed to Box 813.

HARVARD UNIVERSITY GRADUATE SCHOOL OF BUSINESS ADMINISTRATION

Two Fellowships are available for two years from September, 1955. They are worth approximately £2,000, and the candidate or his employer must provide half this sum. Candidates must be of British nationality, preferably with a university degree. They must have several years' experience in industry. Details from The British Institute of Management, Management House, 8 Hill Street, London, W.1.

MARKET RESEARCH

A Nationally known manufacturer of consumer goods, with Headquarters just outside London, requires a senior man in the Market Research Department. Essential qualifications include practical experience in initiating and controlling consumer surveys and the preparation of reports. Applicants should give full details of career, present position held, and salary required. All replies will be treated as confidential.—Write Box 802.

BRITISH NYLON SPINNERS LIMITED

Applications are invited from men aged 30 to 38 for an appointment on the commercial side of the Company. The appointment calls for sound commercial experience, gained preferably in a manufacturing organisation; as the successful candidate will be required to absorb some technical knowledge a degree in Science or Engineering would be an advantage. A period of specialised training will be given. The work will concern the commercial development of end-uses for the Company's products and offers considerable scope for initiative and original thought. Applications will be treated in strict confidence and should be addressed to the Personnel Manager, British Nylon Spinners Limited, Pontypool, Mon.

SENIOR EXECUTIVE

Shannon Duty Free International Airport requires a Senior Executive to control and develop its rapidly expanding retail, wholesale and mail-order activities. The position offers wide scope for a man interested in international trade, particularly with the United States. A record of successful modern management experience essential. A progressive four-figure salary will be paid and there will be in addition an annual bonus based on results. The successful applicant will have an Irish background and a sound education. Applicants should write in confidence to: Office 61, Shannon Free Airport, Ireland.

RETAIL GROCERY

A group of companies with headquarters in the South of England seeks a man capable of expanding retail grocery interests and, if required, managing a chain of shops. Knowledge of trade and flair for investigation reporting and negotiation required. Present staff advised.—Write, in confidence, to Box E.766, c/o 191 Gresham House, E.C.2.

THE B.Sc.ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretarialship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.Econ. (Final) exams, since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P17, WOLSEY HALL, OXFORD.

DOUGLAS GLASS

BRITAIN'S GREATEST PHOTOGRAPHER

OF MEN
43 Black Lion Lane, W.6. RIV. 7522.

LEADING firm of Chartered Accountants in Lagos, Nigeria, require Chartered or Incorporated Accountants with good experience. Salary not less than £1,700 per annum, with excellent prospects and local income tax at low rates. Free furnished accommodation, provident fund, car and kit allowances, medical expenses. Passages paid, including family.—Write Box R. 935, c/o Streets, 110 Old Broad Street, E.C.2.

TRAINING FOR MANAGEMENT.—Pitman Home Study for all Management and Secretarial Examinations; also for Transport and Hospital Administration. Personal tuition; success guaranteed. Details of course required from Pitman Correspondence College, 54 Pitman House, Godalming, Surrey.

SPAIN.—For sale, small furnished cottage in remote medieval village near Segovia. Three beds., main water and electric light, bathroom. Superb views.—Box 810.

ASSISTANT to the Director required. Min. quals.: good degree A political or social science, ability to write well, some research exp. Salary acc. age and exp. £600-£1,000 p.a.—Appns., in writing, to: Director, PEP (Political & Economic Planning), 16 Queen Anne's Gate, London, S.W.1.

MEMO TO THE MANAGING DIRECTOR. More business and a better business awaits your executives if they have the use of a 1954 self-drive car. Lowest possible rates. Contract hire by arrangement. Free third party, fire and theft insurance. No maintenance costs. You can also take advantage of our guaranteed re-purchase scheme. Ask your secretary to write for our new brochure, which gives full details.—Autoball, Dept. 2-A, 302-306 King Street, London, W.6. RIV. 2831. Telegrams: Autoball. Wesphone, London. Cables: Autoball, London.

FREE MEALS from monotony by serving them up with some of that tasty Rayner's Indian Mango Chutney.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

NOTICE IS HEREBY GIVEN that the SHARE TRANSFER BOOKS of this Corporation will be CLOSED from February 25th to March 11, 1955, both days inclusive, for the purpose of preparing for payment of dividend for 1954.

SCHOLARSHIPS ABROAD 1955-56

Applications are invited from British students for scholarships offered by Austria, Belgium, Brazil, Denmark, Finland, France, Germany, Iceland, Italy, The Netherlands, Norway, Persia, Portugal, Spain, Sweden, Switzerland and Yugoslavia. The awards are mainly for university graduates and undergraduates and are tenable for periods varying from a few weeks to twelve months during the academic year 1955-56. The closing dates for receipt of applications vary for each country, the earliest being March 7, 1955.—Full particulars and application forms, for which a stamped addressed foolscap envelope should be sent, are obtainable from the British Council, 65 Davies Street, London, W.1, or from any British Council office in the United Kingdom.

AN EXCEPTIONAL OPPORTUNITY FOR A QUALIFIED ACCOUNTANT

A large Insurance Group in the provinces requires a deputy Chief for its mechanised accounting and recording division with a view to early assumption of complete control.

Successful applicant would require a knowledge of punched card equipment and procedures, an interest in future developments in this field and ability to handle a staff approaching 400; it is hoped he would not be over 40 years of age.

Prospects are likely to satisfy the ambitious applicant and initial salary would be very largely a matter for negotiation with a view to attracting the right man; non-contributory pension scheme.

Letters giving qualifications and experience, which will be treated as strictly confidential, should be addressed to Box 805.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above Degree (open to all), which is a valuable qualification for men and women seeking executive appointments in commerce or industry, government or municipal posts. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees; instalments.—Write for Prospectus of U.C.C. Courses to Registrar, 60 Burlington House, Cambridge.

THE Brush Electrical Engineering Co., Ltd., requires an experienced man to take charge of its Organisation and Methods Activities. Applicants should have had several years' experience in this field, preferably in engineering and should be University Graduates and/or members of the Institute of Cost and Works Accountants. The post is a highly responsible one and the man appointed will be immediately responsible to the General Manager. A four-figure salary will be offered and there are excellent terms of service including non-contributory superannuation. Please apply with full details to the Chief Personnel Officer, Brush Electrical Engineering Co., Ltd., Loughborough, Leics.

MANAGEMENT CONSULTANCY. A well-known company is prepared to train a limited number of suitable applicants for ultimate appointments as executives in management consultancy.

Applications are invited from men between the ages of 25 and 30 years who wish to take up a career in consultancy. They must be University Graduates in Economics or Engineering, preferably with some industrial or commercial experience; willing to travel home and overseas.

Salary paid during training appropriate to qualifications and experience. Please send details and indications of present salary level, in confidence, to Box No. 105, R. Anderson and Co., 14 William IV Street, London, W.C.2.

BUSINESS OFFERS pleasant prospects when you're going home to a meal with Rayner's Indian Mango Chutney.

ASSISTANT STATISTICIAN, with degree in mathematics and/or statistics (or equivalent), required for work in connection with development and production—investigations. He/she will be directly responsible to the Company's Industrial Statistician. Previous experience not essential. The post offers excellent prospects and carries senior staff status. Contributory Pension Scheme.—Applications, giving details of age, education, qualifications, etc., and quoting Reference T/AS, to Personnel Manager, Ferodo Limited, Chapell-en-le-Frith, Via Stockport.

YOUR MONEY will make more money if you spend one shilling weekly on the Investors' Chronicle. Two free issues on request to 30 Grocers' Hall Court, London, E.C.2.

MEN OF TASTE will enjoy their meals to the full if you give them Rayner's Indian Mango Chutney.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

HOW YOU CAN HAVE VISIBLE RECORDS PLUS MULTIPLE ENTRIES for Ledgers, Wages, Stocks, Hire Purchase

Nobody questions the tremendous value of visible records, especially nowadays. For the rising cost of clerical labour has made any saving in cost (or increase in output) vitally important.

Take the basic factors of any visible record . . . First, you can SEE any one record instantly—without searching. That means instant reference and quicker entry.

Next, the edge of a visible record flashes to your eyes the facts you want to know—without check-up. You see who owes you money—what stocks are short—what credit limits are . . .

In short, visible records are not ONLY far more efficient. They save money as well as time. But now for an even greater step forward . . .

SAVE 66½% CLERICAL LABOUR

Now you can use visible records in such a way as to have three entries with one writing. Take, as an example, sales and purchase ledgers. Now, there is no need to find the account, type the statement, enter into the journal . . . and delay statements until the end of the month. For now you can have the statement WITH the ledger account WITH the Day Book sheet and enter all three with ONE WRITING. That means—surely?—66½% less margin of error, of checking and of posting figures.

The same economies can apply to Wages, Stocks, Hire Purchase, etc.

Just jot 'Multicopying Visible Records' on your letter heading and full details will be sent you by return.

Speed up Building WITH Presweld CONSTRUCTION

TIME is money. Save both by adopting HILLS Presweld system of construction. Your new factory, offices or canteen will be completed in a fraction of the time required for building in orthodox materials. (The factory shown above, covering 38,000 sq. ft., was erected complete in 90 days.)

HILLS Presweld buildings are permanent, pleasing, and most economical. They have been extensively proved and adopted throughout the United Kingdom and overseas. Your Architect is familiar with Presweld. We invite you to discuss it with him, or write to us for full details.

BRITISH EDITION OF U.S.A. BEST SELLER!

For business men, salesmen, lawyers, politicians

★ **Did you ever have to make
a speech at short notice?**

This fastest-selling book of its kind in the States, now published in U.K. for British business men, is a treasury of original ideas and practical aids for successful and effective public speaking. Witty, profound, amusing, sparklingly alive from cover to cover

Have you ever been a Chairman? It describes in concise and stimulating language, your responsibilities, use of successful techniques, fundamentals of successful organisation and chairmanship, and formulas for dealing with every item from the heckler to the non-appearance of an advertised speaker.

If you have to introduce a speaker, it contains a whole series of clever introductions for easy adaptation. If you are being introduced, choose an apt and timely response from the list of pungent and entertaining examples. To start your speech with a skilful story just right for the occasion—a chapter of witty anecdotes to choose from. Plus—400 sparkling epigrams and witticisms, 1,000 apt quotations and 100 unusual stories.

**YOUR ONE-VOLUME
SOURCE OF:—**

411 amusing stories
readily adaptable to any
type of speech.
1,000 quotations for
every speaking topic.
53 Introductions by well-
known Toastmasters.
29 responses by famous
modern speakers.
400 easily-memorised
epigrams and witticisms.

Quotations for every occasion.
1,000, classified for talks on Advertising, Banking,
Business, Economics, Politics, to name a few subjects.
Humorous Anecdotes and Stories.
Instantly adaptable, topical, for speaking on Education,
Famous People, High Prices, Marriage, Sales-
manship, Taxes, etc.—unusual stories for any subject!
Introductions and Responses.
Actual introductions used by able chairmen, responses
of well-known speakers covering variety of person-
alities and subjects—how to introduce and respond.
Planning and Organisation.
How to select time and date for any occasion; word
invitations; prepare, maintain time schedule; get
publicity; obtain prominent speakers—has everything.

36/- The Toastmaster's Handbook gives you un-
erringly right words, phrase story or anecd-
ote; makes your ideas sparkle; enables you
to impel interest; indicates instantly your exact needs
—it is a work of priceless value for all who speak in
public! Book size 9½" deep x 6½" wide. Finely
produced in rich grained red-brown artcraft, embossed
in silver and weighing 1½ lb.

Send me THE TOASTMASTER'S HANDBOOK.

A Poem in Pigskin

At Bury in Lancashire
a small band of
craftsmen is expressing
an age-old tradition
... in beautifully
stitched and hand-finished
briefcases which combine
the capaciousness of a conjurer's hat
with a handsome 'note-case' slimness.

This particular poem in pigskin has an
inside story which is common currency among travellers
in five continents ... a 17" x 11½" briefcase*
with two interior fooscap compartments and zip-sealed section for
overnight things. Capacious exterior zip pocket for newspapers,
books, etc. English lever lock and fittings of solid brass. All
leather handle.

In golden tan or Autumn tan pigskin at 12 guineas; golden tan,
brown or black smooth polished hide or natural coach hide at
9 guineas. (*17" x 14" models, 1 guinea extra.) Matching zip folio
cases size 16" x 10½" available separately at £4.10.0d., £2.15.0d.,
and £3.0.0d. respectively. Post free and tax free in U.K.

*Special vouchers to any desired value can be sent (with an illustrated
catalogue) direct to any address on behalf of
customers wishing to make gifts of Unicorn products.

(U.S.A. orders and enquiries: Sterling International, 225
Kearny Street, San Francisco, Cal.)

Complete satisfaction guaranteed or purchase
price refunded immediately. Obtainable at the

MERCERS OF WOOLLEN CLOTH TO THE LATE KING GEORGE VI

**JOHN G.
HARDY LTD.**

The Big Six

The well-dressed man spends time as well as money on his
clothes. For him, time spent in looking through the six John
G. Hardy speciality cloths is a pleasure—as well as a sartoria
duty. He wants to compare the rugged pure wool tweed of
'Hardithorn' and 'Hardilaine' with the silky luxury of
'Sheltie'. He wants also to feel for himself the resilient strength
and toughness of the famous 'Alspott'. Perhaps he'll decide
finally on the popular new 'Hardiwear' worsted, but almost
certainly he'll have a second look at the Irish Homespuns.

Ask to see these fine cloths (they're known as the John G
Hardy 'Big Six') at our showrooms or on extra-large bunches
at your own tailors.

WALLSPAN—Engineering's Modern Miracle gives you outer walls in days!

If you want your new building finished faster — EARNING SOONER —
discuss Wallspan with your architect

What is Wallspan? A means of providing walls in
an incredibly short space of time. Since the weight
of a modern building is carried on the framework,
the walls are left with two main jobs to do. They
must keep cold and wet out, and heat in. At the
same time, they must give the building an appear-
ance that both the architect and the owner are proud
of. Wallspan does all this extremely well and with
the added advantage of getting walls up very quickly.

Wallspan—like all great engineering advances—
is comparatively simple. To the structural frame of
the building is bolted a grid formed from vertical
and horizontal components. These are made of
strong aluminium alloy that never rusts or corrodes.
Into the spaces of this grid are fixed sheets of glass
or opening window frames. There you have your light
and air. In the other spaces of the grid are put sheets
of solid panelling materials — and there's your solid
wall. There are dozens of different kinds of these
panelling materials in various textures, colours and
thicknesses. With them, an infinite variety of Wallspan
walls can be designed, each exactly suiting the uses
of the building in any climate of the world. That is
all there is to it. One contractor erects the whole
wall and it is fixed for all time. It needs negligible
maintenance and it can go up in a matter of days.

WALLSPAN CURTAIN WALLING

WILLIAMS & WILLIAMS

RELIANCE WORKS - CHESTER

Wallspan starts here

This is the stage at which
Williams & Williams
fixing teams move in to
put up the Wallspan wall.

The grid goes up

The vertical and
horizontal components
are put in place.
Each bar takes about
4 minutes to fix.

Glass, windows, panels, next

Into the grid are put sheets
of glass, opening window
frames and panels of solid
insulating material,
each fixed in five minutes
—weatherproof for all time.

All the light
and air you want

Opening window
frames provide venti-
lation wherever it is
required. Plain glass
sheets are fixed
straight in, giving
all the natural light
you want, exactly
where you want it.
Solid panels
complete the wall.

You'll be using your building sooner — much sooner — if it has Wallspan walls

SMOG is made up of pounds, shillings & poison

Every puff of smoke up the chimney is raw material—wealth—down the drain! For coal is a raw material of great National importance. From it—if it isn't burnt raw—come nylons and medicines, paints and fertilizers, vitamins, motor spirit and many more things. All these things are saved if coal is carbonised, not burnt. And just as important, the gas and coke that result are smokeless fuels—all heat and no smog. Thus with one stone Mr. Therm kills two hateful birds—waste of wealth and a menace to health.

The Old Lady's Amber

BOTH the previous increases in Bank rate since the war have been red warning lights, flashed at a time of desperate economic crisis. The increase announced on Thursday, from 3 to 3½ per cent, is clearly not of this *genre*. On the strictest interpretation, it seems to be an amber light; on the most cynical, its main purpose is to enable the Chancellor to switch back to green in his election budget.

This is not an imputation of sharp practice; there need be no suggestion of improper collusion between the young men of the Treasury and the Old Lady of Threadneedle Street, in order to help the Conservatives to ride back to power on a flood of tax concessions that they could not otherwise afford. At the moment, the economic situation, both internationally and internally, looks rather more inflationary than it did a year ago. This means that either monetary or budgetary policy—one or the other—should be rather tougher in 1955 than in 1954. In 1954 the Budget gave nothing at all away, and if the 1955 Budget were to be any tougher than this, it would have to take back more than it gave. But this sort of Budget—one that, so far from giving way in tax relief any of the £300 million ordinary surplus that is expected for this year, actually set out to increase it—would be a political impossibility in 1955. If there were not increased reliance on the monetary weapon this year, there would not be any reliance on any anti-inflationary weapon at all.

Politics apart, a stricter monetary policy is clearly preferable to stricter budgetary policy at this time. The sterling exchange rate has been bumping along the floor. Commodity prices seem to be on the up-grade, and it would be a pity for Britain to give them a further twist by heavier buying for already plentiful stocks. Treasury bill rates have been rising in London, although not sufficiently to set sterling to rights. The Stock Exchange has been booming. All these traditional grounds put together perhaps make the case for a rise in Bank rate only marginal; but this is a time to have some margin in hand.

Above all, the British economy is already over-taxed. It is true that it is also over-consumptionist, and that an increase in interest rates is usually supposed to restrict investment rather than consumption. It is not at all certain, however, that this neat division of its impact has ever had as much validity as tidy-minded theorists suppose—especially in an economy where so many people are buying so many durable goods on instalment borrowing, and where a few have recently increased their fairly lavish consumption out of capital gains. The levy that will now be laid upon these people may have some effect upon consumption—although the stock exchange's calm reception of the news does not suggest it will be very large. In this case, if spending of all sorts continues at much the same level as before, there will not be so much leeway for tax concessions, come Budget time, as the Chancellor no doubt hopes. But Mr Butler can hardly be blamed for trying to find out.

The Choice Is China's

IN this week's lively public discussion on Formosa there has been a tendency to lose sight of the wood on account of the trees. It is admittedly important for people to be clear about the details of Mr Eisenhower's proposals; in particular, to grasp the fact that he seeks to protect only Formosa and the neighbouring Pescadores, while warning the Chinese Communists that they cannot count on complete immunity for any moves they make along the Fukien coast that clearly foreshadow an invasion of Formosa. But it is even more important that the scanning of maps and hot debate about the military value of tiny coastal islands should not obscure the broad outline of the new American policy, which opens up whole new perspectives of settlement in the Far East.

Mr Eisenhower has not only asked for Congress's authority for any military action that may be required to protect Formosa; he has also undertaken to restrain Chiang Kai-shek from offensive action against the mainland, and he has broached the subject of a United Nations move towards an armistice. As has been shown in Congress, the movement of American opinion is now as clearly towards bringing peace and stability to the China Seas as, two years ago, when United Nations soldiers were still dying in Korea, it favoured "taking the wraps off Chiang." The Chinese Nationalists' dream of reconquering the mainland is ended, and the mood in Washington has shown a marked trend towards "co-existence" with Peking—a trend that is all the more striking in view of the American position at Geneva only six months ago, and all the more impressive against the background of Peking's deliberate exploitation of the captured American airmen and other hostages. It is sadly characteristic of the present state of the British public opinion that, when the Americans take just the sort of step towards moderation that their allies have so often asked of them, the only audible response in this country should be a crabbed and jaundiced bickering on the left, while those who approve and rejoice keep their mouths shut; even Sir Anthony Eden had only very faint praise. One would hardly realise from these judications alone that Mr Eisenhower is in fact leading American policy to the point where a comprehensive settlement in the Far East should be possible.

Yet it takes two to end a quarrel. At present, studied moderation in the United States, where the Administration has to contend not only with Chiang's political friends, but also with the ground swell of anger set up by the Chinese revelation that they still hold Americans prisoner eighteen months after the end of the Korean fighting, is evoking no similar moderation in Peking. On the contrary, the Chinese government's posture becomes more bellicose every day. It was, of course, to

be expected that Peking's first response to Mr Eisenhower's moves would be indignant denunciation of all idea of a standstill; the Nationalists' reaction was precisely the same. But there is a clear distinction between face-saving gestures and acts deliberately chosen to increase tension. Mao Tse-tung is not merely assuring the world at large that he still plans to attack Formosa; he is whipping his own people up to the point of mass hysteria on the same issue. Communist propaganda has taken pains to distort the new understanding between the United States and the Nationalists so that to the millions behind the iron curtain it looks like a conspiracy for aggression, not a defensive freezing of the *status quo*.

Nobody can be sure how much the Chinese are in earnest when they clamour for war. The Americans are wisely taking no chances. The conquest of Formosa is obviously Mao Tse-tung's most immediate ambition; it means to him the logical, if belated, climax of the victories of 1949, the destruction of the only effective focus for anti-Communist Chinese, and the removal of a humiliating reminder of the limits of his power. The Korean conflict provided China with modern armed forces, and the cease fire in Indo-China left them free to concentrate on the coast. Behind them, the whole great mass of the Chinese people is now being worked into a frenzy.

One thing needs to be said with the more clarity because it is being obscured by much of what is being written and said in this country. If there is renewed war in the Far East, it will be because of Communist aggression and because of Communist aggression alone. Chiang Kai-shek, whatever he may have done in the past, is now doing no more than defend himself, and he appears to be accepting the American recommendation to withdraw to territories to which the Peking government, even if it were universally recognised as the legitimate government of China, has no legal claim. The Americans are doing no more than support an ally who is a member of the United Nations. If war comes, it comes because Mao wants it.

Yet it is hard to believe that there is no awareness in Peking of the dangers of a new plunge into war. True, the Chinese rulers are known to be frighteningly unconscious of the realities of the outside world. But Korea must have shown them how costly modern war is, and given them some inkling of the destruction they could bring upon their own heads if they attacked Formosa. And even if they believe that such an attack would provoke only limited retaliation, surely their more far-sighted advisers have the courage to warn the hard-headed, obstinate veterans from Yenan about the political consequences of a new Chinese aggression. Already the differences between the United States and

its European allies over Far Eastern policies have been narrowed by Peking's obduracy. Are the Asian neutralists and the western powers now to be flung together by Peking's folly?

Somebody in Peking must realise that to attack Formosa, even if it did not lead at once to war on a vast scale, would at the very least undo the patient work the Communists have been doing to win for China the leadership of Asia, the status of a great power in the world at large and the reputation of a peace-lover. The Russians, too, have something to say. It has suited them admirably that China should play the more pugnacious role and thereby divide the United States from its allies, but not that they should be dragged into war at the tail of Mao's chariot, or even equip another Korea-style campaign at the expense of their restive taxpayers. Thus, taken together, the arguments against a sudden onslaught on Formosa are strong ones, and some at least of them must be plain to the Chinese leaders. Yet the beating of war-drums grows louder.

★

How long can it go on without leading to war? At this point, one must remember the peculiar nature of totalitarian states, where a nationwide movement of "spontaneous" enthusiasm or indignation can be switched off almost as easily as it was generated. The fate of Formosa does not touch the Chinese peasant or workman directly, and the Peking government could transfer his attention to some other issue whenever it chose. Hardly any "face" would be lost—no more than was lost when Mao Tse-tung quietly dropped the boast that the UN forces in Korea were being driven into the sea. The present mass agitation on the question of Formosa may be snuffed out at any moment; it may equally well be revived whenever the time seems ripe.

If, indeed, the Chinese clearly see the risks that an attack on Formosa involves, and have no intention of launching an invasion at present, what have they to lose by keeping up the pressure of propaganda? They doubtless hope for a serious collapse in Nationalist morale under the double impact of their victories in the small coastal islands and Chiang's tacit abandonment of all hope of reconquering the mainland. But there are other likely reasons for their present exhortations about Formosa to their own public.

The past year has been a disheartening one for China's economic planners, and a year of suffering for many of their people. Even the Communist press has given guarded indications of the strains and stresses. There have been the appalling floods along the great rivers; a million and a half peasant levies are still repairing breached dykes on the Yangtse. Unemployment is still a major problem, and it is admitted that peasant resistance to grain levies and collectivisation is still widespread; in Fukien province alone, over a hundred "mobile people's courts" have been dealing

out punishment in the countryside without stamping out unrest.

Moreover, China's present economic problems coincide with a loss of psychological momentum. The first flush of revolution has already begun to fade, and the Peking government is visibly anxious about internal morale. In the past month it has issued a flood of warnings—warnings that every Chinese must grasp the vital need for strong armed forces, that the class struggle inside the country must become more intense yet, that too many Chinese still suspect Russia's intentions, that subversive groups are still ubiquitous. The New Year was marked by the creation of a new nationwide system of "street offices" and "residents' committees," whose tasks are "to report the opinions of residents . . . to mobilise residents in response to the government's exhortations." The powers of the political police have been officially extended, and the *People's Daily* has been busy explaining that no infringement of personal freedom or democratic rights is involved when the police intercept mail, search private belongings, or arrest people before they commit crimes.

★

A thoughtful study of the new China, published this week,* notes the government's increasing use of "appeals to fear and to sentiment rooted in nationalism as opposed to promises of welfare and reform." From this point of view, Mao Tse-tung has obviously much to gain by focusing his subjects' attention on Formosa while maintaining a veil over the economic five-year plan and suppressing anxieties about China's soaring population. The Peking government may already be convinced that the United States is in earnest, and all the talk of an early assault on Formosa may be a mere "paper tiger." But it is highly unlikely that the Chinese will admit this, even by implication, or have anything to do with a United Nations plan for a cease fire, as long as Formosa remains a useful theme song.

If this is so, then those people in this country who are whipping up the atmosphere of "crisis"—and particularly those, like Mr Attlee, who imply that it is all the United States' fault—are simply playing the Communists' game by dividing the public opinion of the western countries. The moral case, as it happens, is perfectly clear, for if war comes, it will come by a clear act of aggression. But the realistic facts are even clearer, for if Mao attacks Formosa there will certainly be fighting, and the United States would certainly be drawn in, with or without Mr Eisenhower's declaration of this week. That being so, to egg the Communists on, as Mr Attlee is doing, is to work for war. The way to peace is to make it clear that Mr Eisenhower's moderate and defensive position has the full backing of America's allies.

*"The Prospects for Communist China." By W. W. Rostow and others. A review appears on page 360.

Millions for Cinderella

THE Transport Commission's plan for the modernisation of British Railways is carefully thought out, and very diplomatically written. With just the right degree of impatience, it lays before a muddle-weary Government and public a dismal picture of the present railway mess. With just the right political touch, it suggests what should be done about it. It would cost £600 million, says the report, to replace all the railways' run down equipment over the next fifteen or twenty years, in much the same inefficient pattern of operation as now. How much wiser to spend £1,200 million to replace it in a way that will recognise that "the era of steam is near its end," to determine that "in the rapidly changing world of today we must provide for a much faster rate of replacement in order to keep pace with the technical and commercial framework within which the railways operate." From the grime and muddle of 1955, from a very recent piece of politicking which everybody would like to forget, the public is invited to lift its eyes towards 1974. Look, there is an electric or diesel (or, just possibly, atomic) train pulling silently, briskly competitive, smog-free, out of the glistening chromium of the new King's Cross.

This is the stuff to give to a Government which likes to seem forward-looking. Provided certain crucial points are borne in mind, it is also the stuff that the British economy badly needs. Even those who are healthily suspicious of the hypermetropic arithmetic in the report—with its precise estimates of the economies to be expected by 1974—will agree that to invest in railway modernisation about one half of one per cent of each year's national income seems a reasonable bet. Even those who have some reservations to make about the technicalities of this scheme, which are discussed in an article on page 387, will agree that—if railways are not to be regarded as wholly redundant—it will be best to plan vigorously for the new age rather than patch inefficiently for the old. But there is a note of caution that urgently needs to be struck amid the excitement and applause. The mere spending of money does not ensure efficiency; it can be a convenient device for ensuring that inefficiency is chromium-plated. Sober analysis suggests that a scheme of this sort is very necessary. Grim experience suggests that there are at least three ways in which it could go wrong.

The first question concerns the scheme's impact upon the Transport Commission itself. For at least fifteen years the railways have been starved of capital; now, by a sudden switch of policy, they may be going to have much more money to throw about; Cinderella is to be the prodigal daughter. But can the men in charge of the railways make the mental switch? The scheme is an exercise in the economics of capitalism

—none the less so for being applied to a publicly owned industry. But the fruitful investment of capital is a very skilled job; it requires boldness of judgment, a nice discrimination between alternatives, great elasticity of mind and—above all—the instinct to imagine what will be wanted (that is, what the customers will be willing to pay for) a long time off in the future. But for a generation past, whether in private or in public ownership, the railways have not been run on the principles of imaginative capitalism. Ever since the twin decisions were taken, to amalgamate the railways into corporate mastodons, and to deal with the rise of road transport not by competition but by restriction and "co-ordination," the men who run the railways have been turning into bureaucrats and administrators, who spend their lives in committees. Can they really change their spots? To be fair to the report, it shows an awareness of the need, but hardly of the scale on which it will have to be met if the scheme is to be fully fruitful.

The second question concerns the effect of this scheme on road transport. There is comparatively little discussion in the report of whether the proportion of freight that can more economically be carried by road rather than rail is likely to change between now and 1974; the ruling assumption, however, is that, after allowing "for the transfer to road of certain traffics which cannot be carried economically," the railways' receipts will increase by about £1 million a year between now and 1974. This may be the correct assumption; but the danger is that, if it is not, steps may be taken to try to make it appear so. If these gleaming new railways come into existence at a time when there are fewer customers for them than had been hoped, there will be a grave temptation to divert custom from their competitors—either by direct controls (which will be fatally easy if road transport is re-nationalised under the same commission as runs the railways) or by starving the roads of the capital that they themselves so badly need. This is certainly not an argument for rejecting the plan. If progress is to be made, the risk must be run of occasional investment in failure; but the risk cannot be diminished by constant strangling of success. Both in order to keep a continuing check on whether it really is advisable for the railways to spend all this money in the long period between now and 1974, and in order to provide some gauge of whether what is being spent is spent wisely, it will be necessary—in these next twenty years—to keep competition in between road and rail.

The third, and most important, question concerns

the effect on labour. It may seem a little hard to revert here to another attack upon the court of inquiry into the recent wage dispute. In its final report this week, the court states indignantly that the "means" it wanted the nation to will were "effective productivity" on the railways. But it removes the force of this belated avowal by going on to say that economy and efficiency of working "are not immediately germane to the immediate question of wages." On the major issue of efficiency it can suggest only another inquiry. In pursuance of this hint Mr Watkinson is to have further talks with the Transport Commission and the unions, and there are rumours of an exhaustive new investigation into the whole present mess. After the Government's experience with the court of inquiry, there must be some doubts whether this is a question that can profitably be referred to yet another jury of honest outsiders. It calls for decisions of principle and the resolution to carry them through—which are qualities that can be provided, in a nationalised industry, by the Government itself or not at all.

In any case, the modernisation proposals, though they come hot on the heels of the labour dispute, are in no way an answer to the problem of how the railways are to be able to pay decent wages to all the men they now employ. On the contrary, they will tend to make it more acute. There are figures in the report that suggest that by 1974 the number of passenger carriages should be reduced by one seventh, of freight wagons by one third, and of locomotives by a very large proportion. There are statements that "in many cases one modern power box will replace several manual boxes" for the operation of points and signals, and that several uneconomic services will be discontinued. Almost all these changes—which will provide a large part of the estimated economies of £85 million a year by 1974—

will depend on redeployment of staff; it is difficult to believe that some will not involve a reduction in payrolls, in addition to squeezing out the water that is already stagnating there. The prospect of carrying these changes through, humanely and without ructions, hardly seems to have been improved by the contribution of the court of inquiry in averting a railway strike.

★

The railway modernisation scheme and the railway wages dispute, taken together, aptly illustrate one of the major contradictions of our times. More than ever before, we base our faith in the future on the logic of capital. Mr Butler proclaims the target of a doubling of the standard of living in a generation by "investing in success"—and though there is some disagreement about the exact pace of the advance to be counted on (the politicians thinking Mr Butler too cautious, and the economists too optimistic), no one disagrees with the basic doctrine. Indeed, it is so much taken for granted that there is a tendency to eat the fruits before they ripen. If it was true that "we are all socialists now" when Harcourt said it two generations ago, then it is doubly true that we are all capitalists now. But capitalism is not an automatic process. It will work only where its logic is left free to reach its conclusions. It works by saving labour; and unless the labour is in fact saved it does not work. The railway programme, in short, is a firm statement of good intentions. Whether it will ever be much more does not depend on whether it is "accepted" by the Government, or even on whether the money is ever spent. It depends on whether, on the railways and throughout the economy, there is a new resolution not only to plan for efficiency and to pay for it, but to insist on getting it.

Resentment on the Farm

THE mood of the members of the National Farmers' Union, gathered this week at their annual general meeting, was one of gloomy resentment. The farmers were only narrowly restrained by their president from passing a direct vote of no confidence in Government policy; and they did pass a resolution condemning the Government for "gradually undermining the provisions of the Agriculture Act, 1947," which is the farmers' charter of security. These protests could not (as the farmers well know) have come at a more awkward time for the Government. The annual farm price review is about to begin. To concede the farmers' claims for higher guaranteed prices would make nonsense of Ministers' declared intention to reduce by stages the present enormous burden of the agricultural subsidies—a course which is also one of the few honest ways open to the Chancellor for giving tax concessions. But

dare the Government face the farmers' open wrath in an election year—especially after the South Norfolk by-election? It is a dilemma which is bound to cause anxious heart searchings among Conservatives about their whole agricultural policy.

The accusations hurled by the farmers this week are in fact completely untrue. The Government has faithfully observed the Agriculture Act both in letter and in spirit; indeed it is doing far more for agriculture than the Act itself envisaged as necessary under normal peacetime conditions. It has continued to underwrite guaranteed prices in a free market—at a cost of some £200 million in the current year—although the provisions of the Act could have been satisfied with much smaller payments. It has not, as the Act said it might, tied its price guarantees to any upper limit of production. There is an additional subsidy for home-grown

feeding stuffs, which means that livestock products are subsidised twice. Apart from the price guarantees, farmers receive sixteen separate kinds of direct production and improvement grants, costing over £50 million in the current year. Agriculture is handsomely treated for taxation and death duties, and it still pays no rates; yet its basic services (such as water and electricity) are subsidised in various ways by urban consumers or taxpayers. All this may not add up to a featherbed; but it is a long, long way from a couch of nails.

Why then are the farmers so genuinely gloomy and indignant? Partly, of course, the timeworn pessimism of their calling has been exacerbated by a year of shocking weather. But two more fundamental obsessions are gnawing away their confidence, the first of which is based on a simple misconception. Farmers are still thinking in terms of a siege-time economy. They call on the Government to set them "production targets"; they demand a guaranteed level not of prices but of total earnings; they expect public compensation if their crops are poor or their sheep are snowbound; and they put up with the intolerable bullying of their weaker brethren (extending to actual removal from their farms) by Government officials. In no other industry would such a grandmotherly supervision be expected or wanted. The farmers' cry of betrayal is based on a misunderstanding of what the Government can do for them under peacetime conditions. It can underwrite a minimum of stability sufficient to enable any good farmer to get a satisfactory living through his own exertions; it cannot order their lives or their incomes to the last farthing.

★

Secondly, and more important, farmers, as their speeches this week showed, have a dreadful distrust of the future. They envisage Government subsidies disappearing seriatim, to the point where British agriculture will have to compete unprotected with unlimited quantities of cheap imported food. These fears have been strengthened by the remarkable swing of opinion against an exaggerated agrarianism that has been observable in the most unexpected circles in the last few years; many people who formerly seemed ready to give the farmers the moon are now willing to take away much of what they already have. If this swing is to be prevented from going too far, both the farmers and the Government will have to make sure that the policies they demand and follow do not become so internally inconsistent that the public will gradually lose faith in protection for agriculture altogether. This will be the real issue at the coming price review; it will be much more important, both to farmers and the Government, than the getting and giving of small favours at election time.

If the danger of a gradual revulsion of public opinion is to be averted, the ordinary taxpayer must be left in no doubt about why and to what ends he is called upon to continue to support British agriculture. Partly, it

is a matter of honour that farmers who were prevented from exploiting food scarcities should also be shielded from the full impact of the present state of relative abundance. Partly, it is a matter of sentiment that the most lovely countryside in the world should keep a prosperous appearance. More basically, agriculture is subsidised as an insurance against the dangers of interruptions to the nation's food supplies arising from war or from adverse movements in the terms of trade. Whether or not this argument can be defended in terms of strict economic logic, there is widespread agreement—which is unlikely to change so long as the bill does not grow too large—that a nation as vulnerable (economically and strategically) as present-day Britain would be uncomfortably naked if its agriculture were neglected.

While there are sound reasons for a permanent policy of assistance to British agriculture, it is essential that the farmers should understand the kind of assistance that they justify—for the public may come to understand this soon enough. Subsidies directed at boosting current production of anything and everything are

The Conduct of the War

We are now at length approaching such a degree of insight into the state of affairs in the Crimea as will enable the public to form correct conclusions, and will compel Ministers to take vigorous decisions. A mass of testimony of various value and authority, differing in many details, but all pointing in one direction, is now before us, bearing on the condition of our army and the management of the campaign, to which it is impossible any longer to withhold credence. We have been slow to listen to complaints and accusations, because we know how invariably, with or without reason, they always dog the footsteps of men in power. We have made a large discount from the statements of correspondents and declaimers in the daily press, because we know how habitually truth and accuracy are by this class of men sacrificed to the temptation of smart writing and striking painting. We have put aside assertions after assertions as in themselves incredible, and as issuing from sources which have forfeited all character for reliability, and whose voucher carries with it no authority whatever. We are now bound to confess that our discount has been too large, and our incredulity too great. There may have been, and there has been, gross exaggeration; there may have been an animus manifestly had and a tone and language ostentatiously and bitterly malignant; isolated occurrences may have been generalised into habitual facts; some things may have been shamefully misrepresented and others unfairly coloured; there may have been *suppressio veri* and *suggestio falsi*; every sinister art of the penman and the politician may have been put in practice to distort and to defame;—but after every allowance has been made by the charity that "hopeth all things" and the wisdom that doubts most things, enough will still remain to fill us with amazement and dismay, and to wring from us the reluctant conviction that our Crimean campaign presents a scene of inconceivable mismanagement and resulting disaster such as Europe has not witnessed since the expedition to Walcheren and the retreat to Corunna.

The Economist

January 27, 1855

worse than useless as an insurance against emergencies; they deplete the fertility of the soil and foster expensive livestock industries which would have to be cut back drastically if danger threatened. Much the most worthwhile form of aid consists of measures which will contribute to greater agricultural efficiency. British agriculture is still very short of capital, and it is also short of able and progressive farmers—for conditions before the war caused a flight of enterprise as well as of capital into other industries. Since farm production is admittedly a long cycle, these defects are unlikely to be remedied unless farmers continue to get long-term assurances about the level of prices.

But, for precisely the same reasons, these assurances must not be too lavish nor should farmers be wholly insulated from the movement of world food prices. Some Conservatives, casting around for inexpensive ways of appeasing the farmers, may be tempted to yield to their pressure for greater "regulation" of food imports. But to pass the buck to the consumer would not only be politically most foolish—for there are far more housewives' votes to be lost than farmers' votes to be saved; it would be injurious to the best interests of agriculture itself. As the Chancellor reaffirmed this week, an open subsidy—however large—is greatly to be preferred to any form of backstairs protection which hides real costs and eliminates competition.

Competition, just as much as long-term stability, is an indispensable incentive to greater farming efficiency. The problem is to mix the two ingredients in the right proportions. Sir James Turner suggested this week that British farmers would willingly compete with overseas supplies if they had the 33½ per cent tariff accorded to the motor-car industry. The comparison with so truly competitive an industry as motor-cars was hardly

a happy one; agriculture does not—and could not—sell 50 per cent of its output in export markets. But Sir James's figure has another significance; 33½ per cent is, in fact, roughly the present difference between prices of domestic and imported food—so that even a tariff as high as this would not assure British farmers the higher prices they now say they need.

The Government has agreed to include in the coming price review a special review of the effect of the recent wages award on agricultural costs. In all the circumstances, it would be unrealistic to suppose that much, if any, trimming of the agricultural subsidies will be possible this year. But, at the very least, the Government can reasonably balance any concessions that it decides to make in respect of the wages bill with savings on the more extravagant price guarantees. Mr Butler's nice observation this week that in the national farm, as in Orwell's fantasy, the pigs are becoming more equal than the other animals indicates one obvious substantial field for economy; the present pig subsidy may come to as much as £50 million this year, and the cost to farmers of the new wage award will be only one quarter as much. Above all, the Government should leave farmers in no doubt about its long-range intentions. It should say frankly that it will not—indeed cannot—continue to guarantee their total income, or to tell them what and what not to produce. On the other hand, it could and should repeat the assurance that its system of guarantees will be permanently such as to enable the efficient farmer (not the mediocre one) to make good profits through the use of his own judgment and energies. Conservatives ought not to be too afraid of offending the farmers. Plain speaking and not soft soap has always been the way to win their respect.

Prime Ministers Meet

THE symbol of the Commonwealth conference which assembles in Lancaster House on Monday might surely be the sphinx. Never have more prime ministers travelled more miles with less advance publicity about the subjects they are to discuss. This unique group of nations prides itself on having no general commitments, no common policy, no central secretariat and no formal ties—other than the declaration in 1949 that "they remain united as free and equal members of the Commonwealth of nations, freely co-operating in the pursuit of peace, liberty and progress." It is scarcely surprising that when the Commonwealth prime ministers meet they should have "no agenda"; the inquirer is firmly told that they will draw up their own agenda and will discuss whatever they please. (The striking variety of the topics that may arise is reflected in the messages from correspondents in Com-

monwealth countries that appear on pages 379 and 380). But the answer is baffling nevertheless. For, whatever agreements are reached in London next week, they will almost certainly affect the course of world history in the months that lie ahead.

At one time, internal constitutional questions looked like providing the main grist to the mill of this particular conference, the first since the Coronation month of June, 1953, and the fifth since the war. And South Africa looked like being their focal point. If the Gold Coast were up for membership, what would be the South African attitude? Would Pakistan become a republic like India, and, if so, might South Africa too? What would be said about the three Protectorates, Bechuanaland, Basutoland and Swaziland? Any of these subjects may yet be discussed. Indeed it would be odd if none of them was. They all reflect deep

problems of Commonwealth evolution. But the constitutional jurists now look like being disappointed. So do the economists; in spite of the fundamental problem presented by Australia's protest that its exports have lost some of their former preference in the British market, it is unlikely that commercial matters will figure very largely. The colours of the Conference have gradually come to be painted on a wider canvas. It looks, in fact, as if peace, defence and the balance between the Communist bloc and the free world will

"good partners" the British will continue to "play a major role in the great decisions of history." There has been no other partnership in the world quite like the Commonwealth. And although the strength of Britain depends in the last resort on its friendly alliance with the United States, it is through association with the Commonwealth that this strength has perhaps its most significant impact on the events of the age. Similarly, the Commonwealth as a whole, divided and therefore weakened as it is on the best tactics for the cold war, nevertheless has a sense of common aim and purpose. And this gives all its individual members a weight of influence and, to some extent, prestige that they would not possess if they stood outside it.

In Mr Nehru's case such sentiments may be thought to ring untrue. India, it is argued, has chosen to stand apart where defence is concerned; indeed the essence of Indian policy is to play a lone hand, to seek peace between the two great power blocs by mediation rather than participation. And admittedly, in the view of many people in the West, Mr Nehru and much of Indian opinion are under illusions about the true nature of the Communist threat, at least in so far as it concerns countries other than India. But even Delhi can in part take the road it does only because it feels secure in the knowledge that, if India were attacked by an outside power, the rest of the Commonwealth would come to its rescue. And Mr Nehru, although he has watered down the meaning of the Commonwealth, can also lay fair claim to giving it his support.

The Commonwealth, no longer simply bound by common allegiance to the crown or by race, thrives against all the logic which implies its death. It is now riven by more apparent divergences than at any time in its history. The Canadian view has long been that where regional interests seriously conflict with those of the Commonwealth they must take precedence. Today, Canada's special defence position alongside the United States has been duplicated in a lesser degree by Australia and New Zealand's Anzus Pact. And every Commonwealth country is in fact a member of one or more exclusive non-Commonwealth organisations with varying and often highly specific commitments of its own, ranging from the North Atlantic Treaty to the Colombo Plan.

There is not even a similarity of interest or attitude when it comes to rearmament; the underdeveloped countries are crying out for the technical aid and capital, for which the main competitor is defence investment in the more highly developed. Nor is there anything resembling a uniform approach on such diverse but vital questions of foreign policy as German rearmament or peace in the Far East. And the balance sheet of Britain's colonial policy is vigorously attacked from both sides, by South Africans and the Asian members

alike. In fact, when the prime ministers meet on Monday, it would be reasonable to suppose that they will have to leave a good many questions tacitly on one side, if they are to deal, as they should, with the major issues of defence and foreign policy.

What can they do? As they sit down to confer, the morning newspapers will carry headlines about the Chinese threat to Formosa. This threat is nothing new. It has been latent ever since the end of the Chinese civil war in 1949, and it has come further and further into the foreground ever since the Geneva truce for Indo-China last summer. But all the prime ministers of the Commonwealth—except Mr Strydom of South Africa, represented here by Mr Swart—are intimately concerned with differing aspects of the Far Eastern background. To them, the Formosa question is bound to appear not so much as a short-term crisis—though no one should forget that Australia and New Zealand are pledged to support the United States if its forces are attacked in the Pacific—but as a vivid symbol of the long-term danger of total war which hangs over the globe.

It is some measure of the nature of the Commonwealth that there are two ways in which its members can contribute to the struggle for peace. First, and most obviously, those who wish to do so can strengthen themselves by streamlining Commonwealth strategy for atomic and thermo-nuclear warfare; by improving the co-ordination of their plans if war should come; and by a reassessment of defence needs, particularly in the Middle East and South East Asia. This is the first

prime ministers' meeting since anything like a full-scale appreciation of H-bomb war became available. It is the first since the signing of the Anglo-Egyptian agreement providing for evacuation of the permanent garrison in the Suez Canal zone. And it is the first since the development of Seato consolidated a switch of direct interest in Australian and New Zealand minds from the Middle East to South East Asia.

The second way in which the Commonwealth can contribute is really more important than the first at the present juncture. It is over Far Eastern tactics that it is most obviously divided; part of India's most significant contribution to the conference on Monday will be Mr Nehru's interpretation of Chinese aims and abilities. If the Commonwealth ministers were able to agree among themselves not only on the extent and realities of the Formosa danger, but on the minimum that would be needed to resolve it, their joint view could have a considerable impact in both Peking and Washington.

It should even gain in effect from the very diversity of approach of the individual prime ministers, and from the differences in their relationships with the United States, to whom almost all in varying degrees stand committed. For if this common threat cannot produce a significant synthesis of attitudes among men who meet on such a like-minded basis as a Commonwealth prime ministers' conference, then the outlook for mankind is bleak. The usefulness of Commonwealth co-operation must to some extent be judged by its effect on the fortunes of the human race as a whole. And that in the last resort is what is at issue when the prime ministers come to discuss and assess their own internal problems.

* Still under consideration.

be the main issues. If so, this may prove to be one of the most important Commonwealth meetings since the war.

Speaking of Britain's role in world affairs during his Reith lectures last autumn, Sir Oliver Franks made a comparison. Forty years ago, he said, the "traditional foreign policy of Britain . . . was based on our independence and freedom to act as we chose"; it "depended on . . . power." Today, however, "the conditions of Britain's greatness . . . lie in the effectiveness of our association with our friends." As

Notes of the Week

Peace Within Parties

AT Westminster in the next few weeks there is likely to be a series of straight party battles—not, if the leaders of either side can avoid it, two civil wars. When Parliament reassembled on Tuesday, Labour lost no time in thrusting the Government on to the defensive over Formosa and the railway situation. The Far East is the one quarter of the globe about which Labour is more or less united, and Mr Attlee risked no stab in the back when he once again called for the ejection of Chiang Kai-shek and the admission of Communist China into the United Nations. Even Mr Bevan

cannot set a much hotter pace than this. Nor is Mr Attlee likely to be embarrassed about the railways. Labour's present tactic is to counter the implicit failure of nationalisation by claiming that all would have been well if the Tories had not stopped the railways from milking the profits of road haulage.

For the Tories, the rail settlement at first raised the spectre of a back bench revolt. But the publication on Tuesday of the rail modernisation plan and the court of inquiry's final report gave the Government a good excuse for delaying the debate on the Transport (Borrowing Powers) Bill, originally arranged for that day; and the Ministers concerned were able to spend the week laconically stonewalling in public and volubly expounding in private.

To judge by the telegram of congratulation which was sent speeding to Sir Walter Monckton, the backbenchers have allowed themselves to be persuaded that, after all, everything was done for the best. They appear to have extracted an assurance that the Government still does not intend to pay the railway a subsidy, and that it looks to the modernisation plan, the new area boards and the new charges scheme to enable the railways to pay their way. This may be pie in a distant sky, but the distance lends enchantment. At the moment Labour seems prepared to challenge on every issue only on the wrong grounds, while the Tories are already acquiring an obsession for spreading nothing but sweetness and light—even towards their own leadership—in a probable election year.

Peers of Parliament

BOTH the Government and the Opposition this week put a cautious toe into the chilly pool of House of Lords reform, but neither showed much relish for taking the plunge. It is nearly fifteen months since the Government announced that it was going to have another look at the subject; Ministers had a flying start with the scheme agreed at the 1948 all-party talks, and this could have been re-furbished and presented last year if there had been any real wish for early action. Yet this week Lord Salisbury would say no more than that the Government is in labour over a scheme, and he would not give a hint as to a possible date of birth. The Government, in fact, now seems anxious to shelve the whole issue until after the election, and not only for electoral reasons. If it was to put through, or even publish, a scheme for reforming the composition of the House, Labour would not be able to resist out-bidding it at the polls with a scheme that seemed less class-conscious. The whole problem would then become a party shuttlecock in the next Parliament, whichever side won.

After the election the chances of reaching agreement might be better. The 1948 talks produced a sensible scheme for remodelling the Lords, by introducing two hundred life peers (to be called Peers of Parliament) and retaining only a proportion of the present hereditary members. This would weed out the backwoodsmen, and provide a much larger and more representative chamber for the day-to-day work; it would also, incidentally, remove most of the remaining objections to paying the members of the Upper House some sort of an expense allowance. Labour's fear, of course, is that if the House were made to look less obviously undemocratic this might put a check upon the gradual trend to whittle down its powers of delay. But not all Labour leaders want this trend to go much further in any event. The more responsible of them have good reason for knowing the value of the Lords as a revising chamber, and if only they can overcome the deep-rooted prejudices of so many of their followers, Mr Attlee might at some later date be able to wheedle the party into letting him enter fresh talks. It is at least a hopeful sign that this week Lord Jowitt agreed that the Labour peers should enter constructively into any debate in the Lords on the subject of reform. He was careful to limit his promise to co-operation only on the floor of the Lords; and he said that

there should be no question of increasing the powers of the House, nor of introducing an elective principle that would make the House "in any sense a co-ordinating authority with the Commons." Presumably he would not have gone even this far without first getting a nod from Mr Attlee.

Arab League or Egyptian Axis?

FOR nearly a week the premiers of the Arab League countries, less Iraq, were locked in conclave in Cairo, debating Iraq's proposal to sign a defence agreement with Turkey. Egypt exercised every possible pressure on them to censure Nuri Pasha, the Iraqi Prime Minister, for both the manner and the substance of what he did, but had unqualified backing only from Saudi Arabia, which dislikes Iraq anyway. Lebanon, Jordan and Syria resisted its pressure on the grounds that Turkey is a close neighbour and is worth consorting with, that the Middle East has nowhere to get the arms it needs except from the West, and that to ostracise Iraq would be of no advantage to anyone except Russia; Moscow has naturally been attacking the Turco-Iraqi move. The premiers seem to have compromised by agreeing not to follow Iraq's example themselves, and by shifting to the more harmonious topic of joint Arab defence arrangements. As *The Economist* goes to press they await the arguments of Dr Fadhl Jamali, a former Iraqi prime minister, sent to represent Nuri Pasha, who is ill.

The motive behind Egyptian policy is Colonel Nasser's anxiety to prevent any split in his junta; some of its members are averse to even the remote link with the West implicit in condoning an Arab League member's alliance with a Nato state. But Colonel Nasser, even if anxious on this score, has handled his diplomatic problem with needless churlishness, and—what is worse—without regard for the importance of educating Egyptians to behave internationally in an adult way. To call Nuri names, to cry off a suggested exchange of visits with Turkey, and to trump up yarns about Turkish intentions of allying with Israel, is to lapse into gambits reminiscent of Nasser's predecessors.

The likely way out is to evade open disagreement by calling the contest a draw and to leave it, as one Egyptian broadcast has called it, "a story without beginning or ending but filled with knotty problems." The only real knot is whether the policy of a large and vulnerable area is going to be governed by realism, or by the prejudices of the extremist Egyptians who form less than half of Colonel Nasser's team.

New Stage in France?

THE long-awaited government reshuffle in Paris has involved nothing that was not expected. M. Mendès-France has finally relinquished the portfolio of foreign minister; his stay at the *Quai d'Orsay* was always meant to be provisional, and as such tended to drag on. His successor

there, a fellow-Radical, M. Edgar Faure, moves over from the ministry of finance, and this departure will be regretted in business circles, where M. Faure's retention in a post he had held in the Laniel cabinet was interpreted by many as a guarantee of continuity in policy. The new minister of finances—the MRP "rebel," M. Buron—is likely to be more strongly influenced by a prime minister now, at least in theory, free from other departmental cares.

Yet it is doubtful whether for some time to come the prime minister will be in fact able to concentrate on his favourite subject and grapple vigorously with French economic recovery. The dossiers that face him now have a very familiar look: the most urgent concern North Africa and the Paris agreements. The debate on the former topic, scheduled for next week, is likely to be a stiff test, as there is much discontent with the official North African policy among the Radical, Gaullist and right-wing members of the present majority. On the other hand, the prospect of the European debate in the upper chamber may once again save the day for M. Mendès-France. As in December, many of his opponents would like him to remain in office to shoulder all responsibility for the ratification of the Paris agreements on Western Union.

Lobby calculations as well as the reshuffle itself show the precarious position of the government. M. Mendès-France's choice of new ministers was very limited. The wounds of the European debate in the Assembly are still by no means healed. The Socialists, still busy avoiding an internal schism, show no intention of joining the government though they continue to vote for it. This may not be a one-man team, but it is certainly one tremendously dependent on its chief personality. There are dozens of deputies who have no other thought but how to secure the indefatigable premier "a much needed rest."

Liberal Battle Cries

THE agenda for the Liberal Party's annual assembly in April seems to be based on a sensible assessment of where Mr Gladstone's residuary legatees can exert their residual impact on political affairs in this country. The party's hopes of making a better show at the next General Election probably vanished amid the snows of Inverness, for all the gallant efforts of Mr Bannerman; nationalism on the Celtic fringes remains the Liberals' best vote-catcher, but now it is difficult to see where even this can actually win them a seat. But with two or three million voters still keeping at least one ear cocked in their direction, the Liberals may be able to exert some indirect influence on the policies of the two big parties. The agenda for their assembly appears to recognise this. The resolutions from the platform suggest that the leadership wants the party to concentrate on civil liberties, colonial affairs, monopolies, and education; there is also to be a re-statement of the party's ideas on the international situation, which will be published later. The party would be wise to rely on this straightforward mixture. A continued search for such slightly crafty—and highly illiberal—devices as compulsory co-ownership can only give it the same sort of reputation as surrounds certain peculiar religious sects.

For once, fortune has favoured the Liberals by making two of their pet themes topical; Crichton Down and the much publicised activities of one or two trade associations have played into their hands. The official resolution on civil liberties aims particularly at curbing official snoopers, damming the still too fluent stream of delegated legislation, and ensuring a right of appeal for anyone condemned by a departmental tribunal. The attack on monopolies comes in a general resolution on the cost of living; this inevitably has a tilt at tariffs, but the main theme is the restoration of freedom by breaking up price rings and removing all restraints on trade, "whether imposed by employers, trade associations or by trade unions." There is even a special reference to "anti-social labour practices which hamper productivity." No doubt if the Liberals saw the faintest chance of office they would fall back on the cautious platitudes of the other parties, but these defiant phrases will serve their purpose if they arouse the interest of those who support the other parties. It would be nice to have this theme song against restriction reiterated, and loudly.

Seven Stages of Equality

THE Government has acted promptly, though not precipitately, in agreeing to adopt the Whitley Council's plan for the gradual introduction of equal pay for men and women in the non-industrial civil service. Doubtless Mr Butler felt impelled to take the plunge by the Labour party's pledge, made a year ago, to "implement the policy of equal pay" immediately it was returned to power. Yet he can hardly be accused of direct electioneering. Although the women civil servants will get their first instalment immediately, there will probably have been at least two general elections before the seventh and last annual increase is paid—and equality is achieved—on January 1, 1961. In addition, the Chancellor has refused to introduce a similar scheme in the industrial civil service, which employs about 44,000 women.

The women who will immediately benefit by the Govern-

UK WAGES AND PRICES
INDEX NUMBERS JUNE 1947=100

ment's decision number about 155,000, out of a total of 210,000 women, full-time and part-time, in the non-industrial civil service. Most of them are in the clerical, executive and typing grades; about 2,000 are in the administrative grade, where inequality of pay is maintained as high as the rank as Under-secretary. The 28,000 women typists will eventually receive the same salaries as men; but equality will be achieved, not only by raising the women's scale to a level that at the end of the seven years will be considerably higher than their present one, but also by reducing the scale now in force for the small number (about 4,000) of men in this grade. No decision has yet been reached on the 36,000 women, mostly Post Office telephonists and telegraphists, whose conditions of service are different from men's; and some 17,500 women—mostly cleaners—who do not do equal work, together with 1,500 in grades where no men are employed, are excluded from the scope of the new scheme.

When it is in full operation, the cost to the Exchequer is estimated at just under £13 million a year. But, by the time the seven years are up, the total cost to taxpayer and ratepayer will be much higher, for it can be taken for granted that the Government's action will be followed in other spheres of public employment—notably teaching. How soon its effect will be felt in private employment will depend upon the attitude of the unions and the state of the labour market. But there is one repercussion that might well be felt in the next Budget. Now that the Government has lent its bias towards removing one cause of inequality in incomes, there seems all the more reason for transferring, through the tax reforms discussed in a leading article last week, some of the present burdens on the net incomes of the man with a family on to the man—and woman—without dependants.

On the Copperbelt

THE development of the labour situation on the Northern Rhodesian copperbelt cannot be said to be encouraging for the resolution of the basic deadlock over African advancement. The Africans are being told, notably by the Governor of Northern Rhodesia, that they are striking for the wrong thing in demanding an unrealistic wage increase for all Africans, and have thus forfeited support. Some African workers, who are more interested in immediate cash than anything else, are breaking the strike—with help from Europeans who have gone back on their original undertaking not to do production work normally only done by Africans. Reassured of the strength of their position by the growing drift back to work, the companies have issued an ultimatum, under which those who do not now return will be dismissed and lose long service benefits if subsequently re-engaged. Not all of them would be.

But towards European mineworkers the companies seem to be taking a milder attitude; the Rhodesian Selection Trust has postponed its notice to terminate the agreement under which skilled jobs are effectively reserved to Europeans. This may have been done to improve the atmosphere in which a ballot will be taken on the companies' proposals; but the African strike will hardly have improved

it, nor will the pledge of "support" (whatever that may mean) from South African trade unionists for the stand by the copperbelt miners against "undue" penetration by Africans into the field of European employment. If by "undue" is meant the overdue concession that five per cent of skilled jobs should be made available to Africans over five years, the situation may end exactly where it has begun—with the Africans divided and confused, the European miners adamant in defence of their privileges, and even the resolution of the Selection Trust dissipated.

But the ensuing calm of the return to the *status quo* would be deceptive. The genii of African organisation and solidarity will not go back into the bottle—even if their cohesion is temporarily blurred into a smog of growing racial bitterness on the copperbelt. The constructive issue is for the Africans to get a ladder of advancement to take the minds of the best of them off their ill-directed strike. That would not be rewarding irresponsibility, but a shrewd investment in African privilege.

Mr Molotov Prepares His Ground

THE suggestion has been thrown out by a leading member of Dr Adenauer's party, Dr Lenz, that the western powers, including Federal Germany, might usefully start a joint study of all the recent Soviet statements as soon as the Paris treaties are ratified. The proposal may be assumed to be in line with Dr Adenauer's own ideas, and is one which should be adopted. There have been so many declarations of one kind or another from Mr Molotov, none of them crystal clear, that there are ample possibilities of confusion over them; yet they form part of the material on which the western statesmen decide what kind of approach they make to Moscow and how soon after the treaties are ratified. It should be apparent to all four in the West that the first move must be to ask Mr Molotov to discuss German reunion in freedom. Dr Adenauer secured from the other members of Western European Union a pledge that they would work for the reunification of Germany, and he has made a special point of their promise in all his speeches. It would be disastrous if his partners were to show any signs of not being serious about their aim.

In the meantime, Mr Molotov's latest move is causing fresh speculation in the various western capitals. The announcement that the Soviet Union has ended the state of war with both the German states, reserving its rights under four-power agreements, is not unimportant. It provides a legalistic basis for the Soviet Union and the satellites to conclude a formal military alliance with the "German Democratic Republic," and to open the diplomatic relations with Bonn which Mr Molotov has proposed. True, the western powers ended the state of war with Federal Germany as long ago as 1951, and the Soviet Union has already granted "sovereignty" (with the same reservations as are made now) to its East German satellite. But the Russians are not merely evening-up the status of East and West Germany. They are looking ahead to very difficult days when they must try to make their German state an armed ally, and at the same time win over the Federal Republic.

One very remarkable point about the Soviet declaration is that it presupposes that the Paris treaties are a *fait*

An account of Stewardship

At the end of 1954 our Deposits amounted to **£1,245 millions**. Here are four of the chief ways in which we have employed these vast sums entrusted to our care:—

Advanced to Trade, Industry, Agriculture and other borrowers: **£301 millions**

Invested in British Government Securities, including Treasury Bills: **£627 millions**

Loaned at Call or short notice to the Money Market: **£74 millions**

Held as Cash: **£97 millions**

SPOTLIGHT OF REASON ON CURRENT EVENTS

Daily Mail Comment

COMMENT, the Daily

Mail's pungent 'leader', with its candid and sincere summing-up of the day's trends and happenings, provides a sane and balanced survey of contemporary history. In response to popular demand, these illuminating articles will now be available in book form, published monthly as a permanent record of what has been said, thought and done.

MADE AVAILABLE IN BOOK FORM

The first issue of the collated 'Comment' will be on sale on February 8th and will contain all 'Comment' columns from the Daily Mail, beginning with the issue of January 1st. A subscription of 25/6d. will ensure your receiving free postal delivery of the whole of each month's 'Comments' for 12 months—12/9d. for 6 months. You can place your order through your newsagent or send it direct to: Daily Mail Publications, Dept. E., New Carmelite House, London, E.C.4.

PUBLISHED MONTHLY

The case of *Agriotes obscurus*...

Wherever potatoes are grown, wireworms are pretty certain to be encountered and to damage the tubers. In the U.K., for example, this destructive pest populates the soil in some areas to the extent of over a million per acre. In heavy local infestations this figure is probably doubled. Damage fluctuates, but it is nothing unusual to find over half a crop unfit for the table.

With wireworms on the increase, British farmers have welcomed the arrival of *aldrin*. This year in the United Kingdom alone over 90,000 acres of potatoes will be protected, mostly with aldrinised fertiliser. This Shell insecticide is the most impressive destroyer yet discovered for pests in the soil—non-tainting and exceptionally suitable for compounding with fertilizer. Just 2½ lbs. of aldrin per acre guards potatoes from wireworm and other soil pests right through the growing season.

Aldrin is fast becoming recognised as being the best of all soil insecticides. A little goes a long way and lasts a long time. Now in worldwide use, aldrin gives full control of many pests previously difficult to 'get at' economically. Another recently developed Shell insecticide is dieldrin, possessing exceptional persistence. On foliage, dieldrin controls a very wide range of weevils, beetles, flies and other crop-eating insects. It is also extensively used as a residual spray against disease-carrying insects. Have you a stubborn pest problem to be solved?

aldrin

aldrin and dieldrin are  insecticides for worldwide use

accompli. This will not be lost on the Germans, who will see that their Russian suitor has no intention of withdrawing his bouquet from Bonn if the treaties go through. The first benefit which will be expected from the new relationship with Moscow is the release of the thousands of Germans—including a number of generals—who are still held prisoner by the Russians. There is hardly any other action which would do so much to soften German opinion towards the Soviet Union. This is doubtless realised in Moscow, and is the reason why Field-Marshal Schoerner and Rear-Admiral Voss have been released into the East Zone. Both have issued a letter thanking the Soviet government for its magnanimous treatment and giving assurances that they will work for "a profound mutual understanding between your country and the united, democratic and independent Germany for which we long." Mr Molotov, it seems, is not only ending a state of war with Germans; he is announcing a state of friendship.

Right Joins Left in Germany

THERE is reason to be concerned at the propaganda campaign in Germany against the Western Union agreements, which has now reached fortissimo. Communists, ex-Nazis and neo-Nazis are combining with Socialists, Protestant clergy and nationalists of all shades in a final effort to influence the *Bundestag* decision on February 24th. Some of the latest Social-Democrat propaganda is indistinguishable from that of the Communists. One poster, deplored on this account by the *Frankfurter Allgemeine Zeitung*, shows a cripple standing amid ruins against a blood-red sky, with the slogan: "Never again! Therefore, negotiate!" In distortion of the alternatives this matches the recent declaration by Herr Erler, a Social-Democrat leader, that Germany should be "neither a Soviet satellite nor an exercise ground for American troops." Such over-simplification, to give it no worse a name, shows how dangerous it would be if a plebiscite were held on the issue of rearmament—as Herr Ulbricht and some West Germans demand.

The right wing, too, has made its voice heard more loudly against Dr Adenauer in the last few days. Among others, one of the deputy chairmen of the Free Democratic Party, Herr Middelhaue, has come out in favour of direct relations with Moscow. He is said to have ten of his party's MPs behind him. The FDP has been given funds by German industrialists on account of its stand against socialism and trade unionist extremism, and it would add to an already ironic situation if the party were to use these resources against the western treaties, and thus indirectly assist Communism.

Within Dr Adenauer's own party, Herr Gerstenmaier, the speaker of the *Bundestag*, has given a warning against underestimating the extent to which the public will oppose rearmament after the treaties are ratified. He was speaking to a gathering of the Protestant Church, and his remarks were given wide publicity by a press which, on the whole, lends its weight to Dr Adenauer's critics. The warning may be justified. But the German public has more than once shown itself better than its politicians, and it may do so again.

Refusing To Be Hurried

MR MOLOTOV's dynamos are still turning at full speed, and the stream of Russian moves and gestures intended to halt the creation of Western Union is clearly going to continue. There is no depression in Moscow, and the Soviet foreign ministry is not interested in the possibility that the very speed and volume of its activity may produce a trend to diminishing returns. Its ambassadors in the western capitals have been called home for consultations, and are now returning to their posts, doubtless with bulging briefs. The Supreme Soviet has been summoned to do its rubber-stamping duty next week, a break with the more normal time-table of Russian political life which may well indicate domestic strains and stresses but which cannot by any stretch of the imagination be wholly dissociated from the campaign against the Paris agreements. When these developments are taken together with the proposal to end Russia's state of war with Germany, it must be conceded that the pace in Moscow is getting steadily faster, and from now on it seems safe to count on a new move roughly every three days.

In the West, calculated deliberation is the obvious counter to increasing Soviet haste, and it was neatly exemplified this week by the British and French replies to Mr Molotov's threats to break off the wartime Anglo-Soviet and Franco-Soviet treaties. These threats were uttered before Christmas; now the replies, couched in calming and unworried tones, express regret at Mr Molotov's precipitateness, and assure him not only that he is quite mistaken about the nature of the Paris agreements, but also that if he insists on denouncing the wartime treaties his action will give pain but will evoke neither terror nor feelings of guilt in the West. The Russians may, in due course, have reason to be grateful that the western governments are so carefully holding open doors through which they may wish to walk after the ratification of the Paris agreements.

Pools Pay-off

IF the invigorating stimulus of competition is fully operative in the football pools business, the recently published returns showing the percentage deductions for costs and commissions from punters' stakes in the different firms are very interesting economic documents. They show that no pool can be operated for much less than 20 per cent of turnover, irrespective of size, and that there is a close approximation to this efficient minimum. The nature of pools organisation certainly suggests that no very large reduction in administrative costs per punter is to be expected with increasing turnover. But it is remarkable that Littlewoods, which is reputed to do half the business, is unable to pull its costs and commission (at 19.6 per cent) significantly below those of smaller competitors. Indeed some have a slight edge on it. Those who are not certain that perfect competition does rule in this industry will feel a natural curiosity about how much of the undistributed 20 per cent is cost, and how much is profit.

The new Act, which has compelled the pools to reveal this interesting uniformity of operating expenses, and which they fought so hard, is tender to them on this score. Their profits remain a secret between them and the Inland Revenue. But clearly the 20 per cent margin leaves plenty for a reasonably efficient concern, since the Labour party is reputed to believe that it could raise half a million pounds a year towards the party's revenue out of that margin on a fairly large pool. Such a profit margin would seem to leave scope for the pools promoters to meet a variety of other charges—for example, to make a contribution towards the losses sustained by the ailing Third Division clubs whose fixtures are of some considerable importance to them. But if those clubs do succeed in implementing their present proposal to charge the pools for their fixture lists, the money will not necessarily come out of the 20 per cent that goes to meet the pools' costs and profits; since it also cannot come from the 30 per cent that goes in tax to the Exchequer, it is much more likely to come from the 50 per cent that is returned to the punter. It is certainly still arguable, on the meagre statistics forthcoming, that the taxpayer, the punter and the sportsman might do better if this industry were nationalised, the national conscience (or the organised bit of it) permitting.

Planning East Africa

IT may be too much to hope that members of the Trusteeship Council of the United Nations will read, along with the report of the Council's visiting mission to Tanganyika, the £30 million Five Year Capital Development Plan for Uganda, with its admirable annexe on agricultural productivity. The contrast in approach to and insight into the basic problems of African development is marked. The United Nations mission to Tanganyika, after a limited tour, has weighed in with far-reaching criticisms and recommendations—to which its chairman, a New Zealander, took frequent but vain exception—based largely on what Africans said at meetings with them. The mission has simply demanded more of everything—more education, primary, secondary, higher (and multiracial); more economic development; and above all more political evolution with a guarantee of self-government in fifteen years. Its ideas on African agricultural problems seem not to extend much beyond the suggestion that they be eased by handing over much of the land alienated to European settlers; the mission admits that this is but one per cent of the whole area, but severely observes that some of it is very fertile.

It may be true that European farming is not so educative an influence among African cultivators as Europeans in Tanganyika like to think; but to suggest that the area it occupies is a serious factor in African problems merely underlines the very strong bias among the members of the mission to ferret out colour discrimination at all cost, and to minimise complications arising from the not entirely negligible cultural differences between the three races. It is fair that visiting United Nations missions should provide a sounding board of African views; but to swallow them almost whole merely exposes their naivete.

The Uganda plan, on the other hand, is factual, statistical and anchored in technical knowledge of the needs of the

protectorate's basic industry—cultivation of subsistence and export crops. It is the more impressive inasmuch as it is signed by some who have criticised the administration's spending record over the past three years. It recognises that investment in higher agricultural productivity, which is Africa's abiding requirement, is not investment confined directly to agriculture. It notes that "investment in people through education and technical training should in general have priority over investment in material resources; capital and fertile land are wasted if they are not used with skill and efficiency. The growth of new skills and aptitudes is necessarily slow. . . ." Such phraseology should suggest to United Nations missions—anywhere—that realism and humanity are not necessarily divorced.

Births and Deaths

THE most encouraging figure in the provisional return of births and deaths in England and Wales last year is the infant mortality rate. This fell again, to the new low record of 25.5 deaths per thousand live births.

There are, however, two factors to be set against this favourable trend. First, the biggest improvement since 1938 has taken place in the deaths of babies aged one to twelve months. As will be seen from the chart, the

neonatal rate (that is, the death rate of babies under four weeks old) has not fallen to the same extent. In fact, when these neonatal deaths are subdivided, it will be seen that they nearly all occur in the first week of life, a much more dangerous period for the chances of an infant's survival than the remaining fifty-one weeks of its first year. Second, this comparatively high death rate of the first week of life should be regarded in associa-

tion with the continued obduracy of the stillbirth rate; regrettably and inexplicably, this rose last year to the highest level since 1947.

Algeria Next

WHILE France's negotiations with Tunisia proceed towards their climax, an Algerian problem that could prove to be even more complex is brewing next door. For Algeria can be the worst of the two territories to handle because, as part of France, it sends deputies to Paris who there form pressure groups that a weak prime minister has to count as votes that matter on every issue. Algeria is run by the Minister of the Interior—at present M. Mitterand—except in so far as it runs itself under its own Statute. This Statute of 1947 gives it an Assembly that enjoys some autonomy, but in conditions that are heavily weighted in favour of its European population—900,000 strong. Its eight million Moslems are French citizens but do not all have equal voting rights with Frenchmen.

On January 6th, M. Mitterand laid before the cabinet in first draft a scheme of reform designed to carry out unimplemented parts of the Statute. Even his bare outline aroused fierce opposition on the part of the *colons* proper—the élite that owns estates in areas predominantly Moslem. This small but powerful group was until 1947 akin to a feudal aristocracy—in fact, it still is so, for it has since then contrived to spike a good many of the increases in Moslem power that the Statute was meant to bring about.

But the *colons* concentrated their attack on the one Mitterand proposal that would seem to operate the other way about and to secure powers to France. They attacked his proposal to integrate the Algerian police force with that of the home country. His purpose was to meet justifiable criticism, coming from many respected quarters, of the Gestapo-like handling the Algerian police has been giving to suspected terrorists. The *colons'* motive, as unmasked this week in the newspaper *L'Express*, a responsible journal close to M. Mendès-France, is to keep the hands of Parisians who "don't understand" Algeria off the most decisive weapon at the command of the local authorities. They want power in Algeria, but not at the price of secession, because, in a territory where they are outnumbered nine to one, they cannot do without French troops. Their ideal is to have French military backing but to get it on their own terms, and they have hitherto done so, staving off change either thanks to the dependence of weak governments on the votes of their deputies, or by turning periodic unrest to account and arguing that it is inopportune to cede points at such moments.

To-day, when the Aurès Berbers are in revolt and the Berbers of Kabylie in ferment, arguments against ceding anything to rebels look as cogent as ever, except to people who grasp what the *colons* fail to see, which is that all European minorities in Africa are in the same boat, and will have to compromise or else someone's blood will flow. Ought M. Mendès-France to follow precedent and yield to their pressure? *L'Express* thinks certainly not, and M. Mendès-France seems to be following the same line by this week appointing a progressive Gaullist, M. Jacques Soustelle, to the Governor-Generalship of Algeria.

Trial in Belgrade

ONE of the most surprising trials ever held in a Communist country took place this week in Belgrade. Not only did the two accused men, Mr Djilas and Mr Dedijer, walk as free men to the court from their homes, instead of being brought from a prison cell; they left the court equally free men after the trial. They were merely given conditional sentences which they must serve if they commit a further offence within the next few years, and these sentences were, by Communist standards, fantastically lenient—eighteen months for Mr Djilas and six months for Mr Dedijer. It is true that the regime has effectively muzzled its two critics for the time being, and that, by western standards, the trial should never have taken place at all. Yet the striking fact remains that a totalitarian regime has brought itself to take a difficult step in a more liberal direction.

Mr Djilas and Mr Dedijer were sentenced for spreading hostile propaganda. The precise terms of the indictment against them, like the trial itself, have been kept secret. But it seems that they were accused, in effect, of deliberately criticising the conduct of affairs in Yugoslavia to foreign journalists in order to bring foreign pressure to bear on the government to change its policies. If there had been the slightest substance in such a serious charge it is inconceivable that the accused would have got off so lightly. Two frustrated men only unburdened themselves to the foreign press because the domestic press was closed to them. But it is understandable that the government should have reacted sharply to this washing of its dirty linen in public, especially as it is obviously anxious to improve its links with West European Socialists. Unfortunately, it did not stop to think that to clamp down on its critics did it far more damage in western eyes than any number of revelations about internal discords could do. It has now done what it can to repair the damage without too much loss of face. This sensitivity to western opinion may have led the Yugoslavs to strike out wildly and blindly; but at least it is something that they seem to mind what western Socialists think about them. If they continue to feel this way they are much more likely to resolve their internal problems in such a way that eventually people like Mr Djilas can freely air their views in the local press.

Coal Trains Across Europe's Frontiers

THE drafters of the European Coal-Steel Community treaty foresaw that there could be no truly competitive common market unless drastic revisions were made in freight rates, which are traditionally governed by national advantage. They knew it would be difficult to modify these rates, and allowed a period of grace, but even so it has often looked as if they had been too optimistic. Now, however, an important log-jam has at last been broken.

The treaty seeks to end two main kinds of discrimination in freight rates. The first, and the more easily identified,

is the practice of charging more to carry coal and steel for "foreigners" than for "natives." During 1953 the High Authority, acting on complaints, readily obtained the governments' co-operation and all known discriminations of this type, some 32 in all, were abolished. A much more difficult problem, on which it sometimes seemed that governments would not co-operate, is discrimination between traffic which crosses frontiers and traffic which does not. Freight movements across frontiers are subject to heavy charges based on the fiction that the train is unloaded and reloaded at some imaginary terminal station; and railways that charge less per mile the longer the haul treat traffic originating abroad as having started at the frontier. These fictional load-breaking and frontier charges mean that, for instance, the French steelmaker pays more for Ruhr coking coal than a German competitor no nearer to the mine. This form of discrimination has long been recognised as inconsistent with the treaty. But the railways, understandably, opposed any increase in their financial problems. Moreover, as trade in "Community products" represents about 40 per cent of all traffic on railways in the Community, what was done for coal and steel would inevitably have wide repercussions.

On January 20th the Community's Council of Ministers started a process which by 1957 should result in radical changes, and in particular, in cheaper Ruhr coking coal and coke for Germany's neighbours. From May 1st, through rates, instead of rates from the frontier, will be quoted for coal and iron ore throughout the Community, and terminal frontier charges will be cut by two-thirds. On May 1, 1956, similar measures will be applied to scrap and steel and the remaining frontier charges on coal and iron ore will be abolished; and on May 1, 1957, the remaining charges on steel and scrap will go. The Council also took a first bite at the separate problem of national differences in the rate of fall in charges per ton mile (on both domestic and international traffic), by deciding that the rate of fall should be uniform for coal traffic up to 250 kilometres and for steel up to 200.

Last week's decisions may, by 1957, be eliminating about £6 million a year of discriminatory charges. They are also welcome as a sign that the Community is emerging from the doldrums in which the collapse of the EDC left it. The High Authority, having got across one bed of nettles, should now stop walking round the even more prickly cartel patch, and use its new momentum to see that articles 65 and 66 of the treaty are fully implemented.

Poor Record on Refugees

THE habit that governments have acquired of voting for resolutions in the United Nations Assembly and then doing next to nothing about them is damaging as well as absurd. Lip-service, like power, corrupts. At the last Assembly, 44 governments voted in favour of a resolution which urges all member and non-member states to give the fullest co-operation to the UN High Commissioner for Refugees in his new programme. They authorised the High Commissioner to proceed with this programme; but they left it to him to raise the funds. In effect, he was

invited to come round, cap in hand, to see what he could get from the same member states that had nominally sponsored his work. Last week he came to London, and then, after a somewhat inconclusive discussion with the Foreign Office, continued on his rounds to Scandinavia, France and the Low Countries.

This seems a cumbrous and a discreditable procedure. It compels the High Commissioner in person to badger and beseech governments that ought to have made up their minds about contributing to his funds before they voted in the Assembly. It works out to the advantage of the more dilatory and dishonest states, which get full credit for publicly supporting a humanitarian effort and then make their excuses for inaction in private. It is true that there were flaws in the High Commissioner's original proposals when they first appeared last summer. But the Assembly took care to arrange for revision of his plans and for some degree of supervision over their execution. The plight of the remaining unsettled refugees is a very real one, and there is everything to be said for a new effort to help them become self-supporting. Every one of the 44 governments that virtuously backed the High Commissioner in the Assembly ought to have hastened to offer at least a provisional contribution to his bare coffers. It is high time that governments set a better example of honesty to their citizens.

SHORTER NOTES

The Conservatives held on to their seats in the by-elections at Orpington and Twickenham, with swings in their favour of 3 and 2 per cent, respectively. If they can maintain gains of this order at urban and suburban seats at the general election, they could win anything up to fifty seats from Labour; this should more than counteract the dozen or so agricultural seats they might lose if the South Norfolk result was an accurate portrayal of the rural trend.

The accusation of *immobilisme* has often been levelled at Mr Diem, the Vietnamese prime minister. The news that he has at last closed Saigon's *Grand Monde*, the largest gambling establishment in the Far East, despite the immediate loss of revenue and in the face of the opposition of its controller, General Le Van Vien, who also happens to be his chief of police, shows that his hands are at last firmly closed on the prickliest nettle of all. Whether he will now have the courage to defy General Vien's protector, the Emperor Bao Dai, and dismiss the police chief, remains to be seen. But there will be no real political progress in southern Vietnam until he does.

The committee inquiring into the litter problem in London parks has recommended more publicity rather than more prosecutions—a heartening and unusual recommendation for any committee to make nowadays.

The Associated Society of Locomotive Engineers and Firemen is fully justified in submitting its new wage claim to the railways' arbitration machinery. The award given by the tribunal to engine drivers at the end of last year was intended to restore their differentials over unskilled railwaymen. By a shotgun settlement of which the tribunal would have been unlikely to approve, those unskilled men have now narrowed the differential again; it will be a knotty problem for the tribunal to decide what it should do now.

Letters to the Editor

Britain's Capital Formation

SIR—Mr Redfern's interesting figures disclose a disastrous fall in net investment in industry since 1950 from £377 million to £300 million in 1953. Even more serious is the fact that investment in manufacturing and distribution had fallen from £267 million to the inadequate prewar figure (at 1948 prices) of £191 million. In view of the increasing difficulties likely to be experienced by our export trades and the need for further investment in those industries with expanding markets, can these figures be considered, in your own words, as "encouraging"? Am I being partisan in suggesting that the tone of your references to the comparison between investment in industry and in housing would have been far less complacent if the Labour Government had still been in office?—Yours faithfully,

House of Commons A. ALBU

SIR—"Net investment in housing has been impressive—too impressive," you comment. But the figures you quote from Mr Redfern's paper show that as a percentage of fixed capital the stock of houses declined from 41.9 per cent in 1938 to 41.7 per cent in 1953; that even in 1953 real net expenditure on housing was less than in 1938, and that for the period 1948-52 inclusive it was less than half the 1938 rate (£163 million as against £333 million). Surely what does stand out is the high level of net investment by the public utilities, coal, gas, electricity and water: £101 million in 1953 as compared with £38 million in 1938 at constant prices. This is impressive—perhaps too impressive?—Yours faithfully,

RONALD F. HENDERSON
Corpus Christi College, Cambridge

Long Haul and New Look

SIR—In your clear and horribly disturbing analysis of the principal dilemma facing the recent Nato meeting, you say that there is no longer any difference of kind between a hydrogen bomb and a guided missile with an atomic warhead, adding that an enemy is unlikely to observe nice distinctions about the size of the atomic weapon by which he is exploded. You may well be right, with the almost inescapable corollary that every weapon of mass destruction will be used to the full in a major war, but before this conclusion is admitted it is worth while to look for a moment at how this situation has come about.

Chickens have a nasty habit of coming home to roost, and the eggs which produced these particular chickens were not atomic at all. They were the "conventional" bombs which laid German (and other) cities to waste in the late war. And it has, alas, to be admitted that Britain and America bear the major responsibility for the complete abandonment of the traditional distinction, based on chivalry and the Christian idea, between legitimate action against military objectives and the indiscriminate destruction of civilian life and property.

In the public mind there has always been confusion over the moral issues raised by nuclear weapons. A hydrogen bomb is no more evil *per se* than a fifteen-inch shell or, for that matter, a bow and arrow; it all depends on what you do with it. Morally the destruction of Hiroshima and Nagasaki was no worse than the burning of Dresden, the razing of Rotterdam or "carpet bombing" of cities in general. The fact is that all these actions represented a departure from the customs developed by European civilisation over the centuries to mitigate to some extent the major horrors of war.

If this departure had never been made, at any rate by western powers claiming to be fighting for Christian and humanitarian principles, it would have been perfectly possible to use nuclear weapons for the legitimate (and, incidentally, by and large the most effective) military aim of destroying the enemy armed forces, without bringing about indiscriminate mass destruction on the appalling scale now unfortunately feasible.

The object of this letter is to suggest that even now, if only we can think clearly on the issue, it may not be too late to return to well-tried principles of war which were accepted until quite recently. Admittedly the hydrogen bomb complicates matters in so far as—except perhaps at sea—it can hardly be used except indiscriminately against civilians. Nevertheless, while the West retains atomic superiority the Russians have everything to gain in any limitation of the use of such weapons. An international agreement may be too much to hope for as a matter of practical politics. But if the American strategic bomber force refrains from mass destruction, and declares its intention of doing so except in retaliation, it is not impossible that nuclear weapons could be confined to the legitimate object of destroying the enemy armed forces.—Yours faithfully,

H. POWYS GREENWOOD
Fordingbridge

Hospital Finance

SIR—I write as a professional hospital administrator, and I do feel that your observations on hospital finance are much more realistic than those of Sir George Schuster. He states that management committees "need not get into the position of ending the year with substantial unspent balances." And they do not, because we are now spending as hard as we can on anything procurable to make sure that when the Ministry of Health next makes a percentage cut on hospital budgets, we shall have enough left. The answer from firms trading with hospitals is now "we are up against March 31st," and orders in the near future will be politely refused. An order was placed in June, 1953, for a piece of kitchen equipment for my hospital; by using energetic measures we managed to get the equipment in transit by March 23, 1954, and delivery was actually made by the carriers on April 1, 1954. We charged the item to the year ending March 31, 1954, but the Ministry's auditors insisted on charging the item to the following year. I am ashamed when I hear of some of the absurdities perpetuated by purists throughout the hospital world. Much more realism is needed in hospital finance, and if it were found possible to listen to the man on the spot, then the money available would be much better spent, for there is far too much absentee administration.—Yours faithfully,

HOSPITAL SECRETARY

Copperbelt in Crisis

SIR—Dr. Kenneth Mellanby (*The Economist*, January 15th) seems to make the assumption that the alternative to "equal pay for equal work" on the Copperbelt is "unequal pay for equal work," which, as he points out, is an unsound principle on any long-term consideration. But this is not the relevant alternative, and it is not the present aim of the mining companies; rather they want to be able to split up certain types of job, at present exclusively European, among a number of Africans at intermediary wages, and thus they aim to provide a few rungs to the ladder of advancement in between the top and the bottom. The clause in the agreement which forbids any such fragmentation is the real bar to progress, for there is as yet no question of giving "full responsibility to the African worker who has had the opportunity of proper training." Distrust of the natives' ability and sense of responsibility is only one of the reasons: another is that, as proper training can in this context only be by practical experience, no African has that opportunity. It is to be hoped that in time—and it seems improbable that the time will be the near future—a European will be prepared to train and supervise Africans doing part of the job he previously did himself. There would then be at least three rungs to the ladder.—Yours faithfully,

R. J. D. ACHESON

The Seat of Power

BRITISH POLITICAL PARTIES: *The distribution of power within the Conservative and Labour parties.*

By R. T. McKenzie.
Heinemann. 637 pages. 30s.

PLOUGHING a somewhat erratic course between Eatanswill and Tammany Hall the British party system has managed to keep surprisingly clear of the dangers foreshadowed during the later stages of the march towards universal suffrage. This does not mean that it is either fully equipped for its present tasks or fully armed against further perils, and this study—thorough in its analysis, logical in its conclusions—raises a few doubts to be set against the general satisfaction.

Mr McKenzie has in effect picked up the baton that Ostrogorski laid down over half a century ago, and this second study is certainly more reassuring than the first. Ostrogorski feared that political power would fall into the hands of an extra-parliamentary caucus; in the years immediately following his prophecy the Labour party seemed ripe to fulfil it. Today, however, Mr McKenzie makes out a convincing case for arguing, first, that political power rests with Parliament, and, secondly, that the party organisations outside are merely vote-getting agencies for "two competing teams of parliamentary leaders between whom the electorate as a whole periodically choose."

Nevertheless, as regards Labour his case becomes a little less reassuring when one comes to examine how extra-parliamentary control has been avoided. The party constitution to some extent provides a continuing guarantee of independence for the parliamentary party; but it also provides theoretical scope for at least interference, if not domination, from outside Parliament. Mr McKenzie shows that this theoretical danger has been avoided only because the parliamentary party has in practice usually had a majority on the national executive, while at the same time it has had the consistent support of the main union leaders whose block votes control the annual conference. Now the MPs on the national executive are divided, so there, too, the parliamentary leaders are relying on the unions.

Mr McKenzie however, points to one factor that could completely disrupt the present equilibrium. There is nothing in Labour's rules to prevent a union's block vote from being split when its

members are divided on an issue, and in earlier times this was actually done. One can hear Mr Herbert Morrison and Mr Arthur Deakin shuddering in unison.

No such problems arise in the case of the Conservative party. In theory almost all effective power rests with "the Leader," whose position is akin to some eastern god, before whom the High Priest (at present Lord Woolton) periodically lays the humble offerings of the faithful. How far practice differs from theory can be seen from the fact that three Tory leaders in the past half century have been driven out—Balfour, Austen Chamberlain and Neville Chamberlain. Labour has been much less ruthless with its leaders, and Mr McKenzie is himself clearly astonished by the degree of immunity enjoyed by Ramsay MacDonald long after all his chief supporters were convinced of his complete incapacity.

In practice, therefore, Mr McKenzie finds little to choose between the balance of power within the two parties, for all the theoretical differences. They have even evolved similar techniques for producing their leaders; on both sides the future leader usually "emerges" (the author's own word, recalling Low's vision of a Botticellian scene) and the final "election" is normally a formality.

Apart from some defects he finds in the actual machinery, Mr McKenzie's main criticism of present practice is against the growing rigidity which the parties are imposing on their members. He is careful (and rightly so) to say that the Tories are not without fault, but inevitably his words will be read as having special application to Labour. One is struck, however, when reading his well documented history of Labour's evolution by some similarity between the final stages of the Independent Labour Party's break-away and the more aggressive moments of the Bevanites. If the comparison is valid, so is the lesson.

Mr McKenzie's studies run to over 600 pages and he has managed to incorporate a mass of detailed research while preserving readable continuity. The more is the pity, then, that he has laid down such a barrage of footnotes, when so many could have been incorporated into the text without loss of flow. This is, however, a small flaw in a work which is clearly a classic and destined for an honoured place in any political library.

Chinese Puzzle

THE PROSPECTS FOR COMMUNIST CHINA.

By W. W. Rostow and others.
The Technology Press of Massachusetts Institute of Technology and John Wiley, New York; Chapman and Hall, London.
399 pages. 40s.

SOME readers will be discouraged by finding, in the preface to this book, that the first question it seeks to answer is: "What are the operative motivations of the Chinese Communist regime?" But, fortunately, in the book itself hard fact and vigorous argument prevail over jargon. The authors have emerged from a prolonged study of a mass of material with a very useful digest of the essential facts about Communist China: the origins and development of the Peking regime; its handling of the various elements in Chinese society; its relations with Russia; its economic programmes and problems. Little space is wasted on the more sterile forms of Marxist theorising, and the bulk of the book is devoted to drawing together the established facts.

Official Chinese statistics are treated with due caution, and a valuable feature of the economic section is the cross-checking of the scanty data issued by the Communists, which reveals several interesting points. (The book went to press before Chou En-lai punctured the veil of percentages in late 1954 and announced some absolute figures for industrial production; but its findings remain valid.) The only flaw in presentation is the quite inadequate index.

Mr Rostow and his colleagues rightly emphasise that, beneath all the sound and fury, the Communist leaders have really set themselves quite modest goals in industrialisation, and with good reason. They have to build on a base more comparable to the Russian economy in 1890 than to that of the Soviet Union in 1928, which they profess to be their model. The agricultural problem is even more difficult for them than it was for the Bolsheviks. China's population is liable to rise more steeply than Russia's; its pressure on cultivable land is far more intense; and the consequences of what the authors (regrettably) call "an adverse productivity reaction of the peasantry to the regime's agricultural policy" could be shattering.

If the harrassments of collectivisation lead to even a small decline in farm output in the next few years, the Communists may then have to decide between a military adventure into the food-surplus areas of South East Asia and the collapse of their whole development programme. The authors conclude, however, that, with these looming economic problems in mind, the Peking regime is unlikely at present to plunge into any major war—but it will not hesitate to pluck any foreign fruit that comes easily to hand, and its surging dynamism will only be checked if free Asia grows stable and strong.

ROLLS-ROYCE AERO ENGINES LEAD THE WORLD

Would you think they were V.I.P.s?

There they are playing with the children on Hampstead Heath. An ordinary young couple with bags of hope for the future. Not very important people, you might say. But to you they are very important people indeed, for they belong to the up-and-coming generation who are going to have such a tremendous say in your future prosperity. Keen and vigorous, they are receptive to new ideas and can be persuaded by skilful advertising. Even if your products are beyond their price range today, you can give them the ambition to buy them in the future.

With its realistic approach to the problems of our time, the Daily Mirror has gained the biggest daily net sale on earth (it exceeds 4,600,000) and, according to the I.I.P.A. Survey, it has over 1,800,000 more readers than any other national daily. The majority of these belong to the vigorous, "keen to get on" younger generation. Yes, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers today... next month... next year.

Father of the Man

A VICTORIAN BOYHOOD.

By L. E. Jones.

Macmillan. 249 pages. 18s.

AN account of a childhood in a country house in Norfolk at the end of last century, followed by boyhood at Eton, raises some forebodings: has Mr Percy Lubbock founded a school? But the reader can be reassured; Mr Jones's virtues are all his own. This is a strongly individual book, written with great wit and charm, by a man who takes no received ideas for granted but remembers childhood's orthodoxies with pleasure and sympathy and judges them, always kindly but very emphatically, by the light of an attractive and highly personal bunch of enthusiasms. Mr Jones's greatest merit is to remember very exactly the scope of his interests at different ages and to concentrate on himself and on those interests: in early childhood other people appear almost as lay figures and only gradually develop into personalities as his comprehension grows. The only part of his book where interest (to a non-Etonian) may flag is where the schoolboy's interest is concentrated on the personalities of his masters and the familiar figures of Warre, Luxmoore and the rest dominate the scene.

Mr Jones, in his sixties, is a modern man; and this enables him to bring out the more clearly the privilege, if not always the enjoyment, of "an age when history was, for once, holding her breath, and a boy could grow up as slowly as he pleased." Good manners, steady and unforced growth, the absence of many contemporary strains and the capacity to enjoy a large number of different things were what he gained. He was born with intelligence and an enquiring mind. But what of adaptability to changed circumstances? He attributes it largely to education, and it may be so. In any event, he describes a rare personality and a kind of upbringing that will not be repeated.

Mr Jones makes it clear that all this is only a beginning of his life: his really formative days came at Balliol. Let us hope that he will describe them, and his later life, with as much charm.

A Worthy Nation

SWITZERLAND IN PERSPECTIVE.

By George Soloveyitchik.

Oxford University Press. 313 pages. 21s.

MR SOLOVEYITCHIK, as a foreigner living among them, has been fascinated by the Swiss. He admits their almost miraculous achievements and expresses gratitude for their hospitality and friendship, but (or so it seems to one reader at least) cannot bring himself to like them. This book, which he hopes will "put the Swiss in perspective," is an attempt to rationalise his prejudices. It deals in a wayward but always stimulating fashion with their internal history and foreign relations,

and with their domestic and economic affairs. Mr Soloveyitchik is intelligent, well-informed and exceedingly readable; he is perhaps most revealing in the somewhat disturbing chapter "Myths and Realities" where he analyses the causes of the emotional stuffiness and ennui of which the Swiss themselves complain.

As Mr Soloveyitchik says, "if the old hackneyed saw about the Swiss brotherly love for each other were true, it would make them a worthy but dull lot." Fortunately for the reader it is not. Basically the Swiss still feel like the people of Ernen in the Vallée de Conches who refused to lend their gallows for the execution of somebody who did not belong to their own commune ("Our gallows are for us and our children and not for a bloody foreigner"). It was not common affection, as Schiller would have had us think, but common need and common sense which brought the Swiss cantons together and made Switzerland a united and politically stable country. The Swiss do indeed show a genius for moderation and tolerance in public life and in their business affairs; but all the time a conscious effort of self-control has to be made. This effort, Mr Soloveyitchik suggests, leaves them exhausted and accounts for their remarkable censoriousness towards each other in their private lives.

One of the strangest things about the Swiss is their obsession with the past, when, by comparison with most of their neighbours, they have a very tolerable present. Mr Soloveyitchik is severe with them for this, as he is bored by the everlasting "Tell" quotations (like Voltaire, he finds "toutes ces histoires de pommes" rather suspicious) and he is resentful of the frequent sanctimonious references to "Switzerland's mission," "selection by God as a mediator" and the like. Switzerland is neither liberal nor progressive, socially or economically. It is the only European country whose women do not have the vote, and its economic life would be most interesting to a Monopolies and Restrictive Practices Commission. There is hardly a trade or industry without its cartel, price-ring, syndicate or association. Some of this may be necessary and even useful in view of the fact that the Swiss economy is so delicately balanced and so much at the mercy of international fluctuations over which it has no control; but Mr Soloveyitchik wishes that there was not so much talk of private enterprise and free competition, and it is difficult not to agree with him.

Nevertheless, even if not liberal, Swiss democracy does work and, as Mr Soloveyitchik points out, there is no other country where the people have greater rights or more opportunities of using them. Some of Switzerland's neighbours must react to Mr Soloveyitchik's and many Swiss complaints of boredom with the same interested and incredulous air as a modern Soviet audience listening to the Three Sisters proclaiming their thwarted desires to work.

Trend & Pattern of Fertility in Great Britain

A Report on the Family Census of 1946

by D. V. Glass and E. Grebenik

Based on an analysis of fertility experience of a 10 per cent. sample of the women of Great Britain who, in 1946, were or had been married, this report contains the most comprehensive analysis of fertility that has yet been made. This unique and important work is clearly an essential part of the equipment of every worker in this field both at home and abroad.

Just Out THE PROSPECTS FOR COMMUNIST CHINA

by

W. W. Rostow

(Professor of Economic History and Director
of the China Project, Massachusetts Institute
of Technology)

In collaboration with

Richard W. Hatch; F. A. Kierman, Jr.
Alexander Eckstein

In its scope this is a unique book as it is the first to present a comprehensive picture of Communist China's strengths and weaknesses; to analyse the first five years of Communist domination in China; and to provide concrete, authoritative information on present economic techniques, policies and purposes. It also contains a valuable section on Sino-Soviet relations.

CHAPMAN & HALL

Burns the Man

ROBERT BURNS.

By Maurice Lindsay.

Macgibbon and Kee. 299 pages. 18s.

WHEN Burns died in 1796 the task of editing his remains and preparing a memoir fell, rather oddly, upon a Liverpool physician, James Currie, whose ruling passion was temperance reform, and who gravely falsified his picture of the poet's last years in the interest of a homiletic intention. Hard upon this, at Greenock in 1801, the first Burns Club was founded. Calumny on the one hand, and sentimental obfuscation on the other, may be said to have held the field ever since. Scholarly work has, of course, been achieved—notably, Mr Lindsay reminds us, by a Frenchman, a German and two Americans. Much of this is not readily accessible in these islands, and the present study has been aimed, with very reasonable success, at giving us succinctly the man in his habit as he lived. There is only a short excursus on the qualities of Burns's poetry, a subject which Mr Lindsay rightly considers to have been admirably handled by Mr David Daiches in a recent book.

It is not easy to present Burns at once in a full and in a sympathetic light. One difficulty is essentially linguistic. The poet's prose correspondence, and many of the verse-epistles which, following the fashion of his age, he addressed to his more polite acquaintance, are what Mr Lindsay would call "Anglified," being written in a stilted literary idiom not at all in accord with the native movement of his mind. Reading casually, we may fail to penetrate the genuine feelings that underlie the inappropriate rhetoric and cheap elegance. But even when allowance has been made for this, Burns is hardly an attractive person.* The vein of naked and brutal sexuality which he expurgated from much Scots folk-song (but retained and pointed in versions for the delectation of his cronies) was powerful in him; he was less of an amorist than has been maintained, even as he was less of a drinker; but there is no doubt that he was predatory and callous towards his women, quickly transferring to the children they bore him whatever of loyalty and tenderness he possessed.

Nevertheless there was much in Burns's character that earns respect. Placed by his celebrity in a social position of great difficulty, and unable to avoid some uncomfortable ambivalence of feeling towards his wordly superiors, he assented and clung to his economic independence with true Scottish sagacity. The post found for him in the Excise was exacting, but even when mortally ill he performed its duties tenaciously and well. This stoutness of fibre he received from his father, for long heroic in adversity, and transmitted to two canny and—one must suppose—wholly unpoetic sons, both of whom rose to the command of regiments in India.

Favourite Topic

SUN, SEA AND SKY: *Weather in our World and in our Lives.*

By Irving P. Krick and Roscoe Fleming. J. B. Lippincott, Philadelphia. 248 pages. \$3.95.

THE ENGLISH CLIMATE.

By C. E. P. Brooks.

English Universities Press. 221 pages. 12s. 6d.

IN recent months, the press has been filled with stories of flood and tempest and of a summer "not quite the worst on record." With the weather more than ever a major subject of conversation these two books have a distinctly topical appeal. For an account of the mechanism of the weather we must look to "Sun, Sea and Sky"; because it is concerned with the processes by which the weather is made rather than with the American climate itself it is as relevant on this side of the Atlantic as on the other. This book is written in a brisk and popular style by an eminent meteorologist and a journalist in collaboration. From the very first pages the latest ideas of dynamic meteorology are introduced; the reader has the feeling of being "on the inside," of partaking in the most recent discoveries and controversies. From these introductory stages he passes via a discussion of current American forecasting techniques to the most novel and interesting part of the book. This consists of a description of the recently developed techniques of rain production through the "seeding" of clouds. The account gains greatly in interest and authority from the fact that Dr Krick is one of the foremost workers in this field.

Like most American books, this is admirably produced. The photographs are striking, the print is pleasing and the maps adequate; while the heads and tails of the numerous sections into which each chapter is divided are embellished with lively sketches. If any criticism is to be made of this generally reliable book, it is that it makes the science of meteorology appear rather too straightforward and the accuracy of forecasts more certain than seems customary in this country at least.

The second of the two books is concerned with the narrower topic of the English climate, treated not in the old way by a mass of figures but as the living product of contending atmospheric forces. Much of the fascination of this book lies in its emphasis on the unusual, even the catastrophic. Dr Brooks does not, of course, neglect to discuss with great clarity the normal behaviour of winds, temperature, rain and other elements that make up our climate, and he illustrates what he has to say with diagrams and maps which are simple and pleasing to the eye. But he emphasises continually how close is the balance between what is climatically normal and what is outlandish or disastrous. We are shown how the same gently moving tropical air which brings the sluggish humidity of an English

THE ECONOMIST, JANUARY 29, 1955

summer may suddenly deluge us with the prodigy of "blood rain" or snow painted pink by Saharan sand. Similarly his account of the familiar depression leads to tales of great storms, from Defoe's storm of 1703 to those still regrettably fresh in the memory. The necessary instruction is thus enlivened by a history of climatic disasters.

Dr Brooks is also interested in the influence of climate on individual lives. He tells the reader where, in these islands, he will find the climate most stimulating to intellectual or manual activity, where he may take his holidays with the highest chances of good weather, and where he may most agreeably retire when his life's work is done.

These broad decisions made, he may then turn to the chapter on "local climate" for aid in selecting a site for his house which will combine the maximum sunshine with the least danger from fog, tempest or flood. So that whether we wish to know the causes of past disasters, or to avoid being in the vicinity of future ones, Dr Brooks provides the answer in a book which is lively, interesting and authoritative.

Shorter Notice

GREECE: *A Political and Economic Survey, 1939-1953.*

By Bickham Sweet-Escott.

Royal Institute of International Affairs. 215 pages. 18s.

For anyone who wants a clear and concise survey of modern Greece this is an excellent handbook. There is a good account of Greece under the German occupation and of the origins and activities of the resistance movements. But the section on postwar political developments is not so good as the rest of the book. The task of sorting out the twists and turns of Greek politics is, it is true, a thankless one; but this makes it all the more necessary to provide, even within the limits of a short survey like this, a more complete assessment of the underlying causes of the instability of Greek politics. The author has, however, preserved an admirably fair balance in his discussion of the controversies that have dogged Greek political and economic life. The sections on the country's economic and financial problems and the British and American efforts to solve them are very well done; and they are supplemented by a mass of well-arranged statistical material which is tucked away at the back of the book where it does not continually interrupt the flow of the argument. There are also two appendices, which deal briefly with Cyprus and Greece's northern frontiers.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Trade Union Tandem

Washington, D.C.

IN slow stately fashion the two American trade union horses are moving into double harness. The meeting of the American Federation of Labour's executive council which begins at Miami Beach next Tuesday is expected to approve a "working paper" for a united trade union movement, and at the end of a week its members are to be joined under the palm trees by their opposite numbers from the Congress of Industrial Organisations. The merging of the two great labour groups (the mineworkers, the longshoremen, the railway brotherhoods and various Communist-tainted independent unions will still be left out) appears more likely now than at any time since the founders of the CIO were expelled by the AFL in 1938.

In the first place, time has had a mollifying effect on the original causes of disunion, most obviously by the toll it has taken of the irreconcilable personalities involved in the schism. The great heresiarch himself, Mr John L. Lewis, of the mineworkers' union, who took the CIO out of the AFL and then took himself out of the CIO, has diminished, not in style, but in significance. Still willing to make mischief but more used by mischief-makers within the two federations than using them, he tyrannises, a stranded giant, over the fast declining fortunes of his industry. The two other principals, Mr William Green of the AFL and Mr Philip Murray of the CIO, died within a few weeks of each other at the end of 1952 and their rancour went with them. As soon as their successors were elected—Mr Meany by the AFL and Mr Reuther by the CIO—they began the present round of negotiations for reunion.

In more subtle ways time has also helped with the two main points of contrast between the two groups. Since the CIO broke away on the grounds that the AFL was sluggish both in organising the workers in the great mass-production industries and in exploring the potentialities of political action, the exaggerated distinction has often been made between an AFL organised on a "horizontal" or craft basis and a CIO organised on a "vertical" or industrial basis, and between a "socialist-minded" CIO and a politically neutral AFL. There is still just a residue of truth in these distinctions. The CIO's politics have the more theoretical tinge; it is Mr Reuther's intellectual pretensions rather than his actual views that have too often betrayed fellow-unionists into joining the employers in baiting him. And, while there are many industrial unions in the AFL, there are hardly any craft unions in the CIO.

But the AFL has paid its rival the compliment of imita-

tion and, if, as some CIO leaders are demanding, a special "industrial department" is formed in the unified headquarters, the AFL will be in the majority even there. Moreover in their attitude to politics the two organisations have been converging slowly. The AFL, for example, for the first time endorsed a presidential candidate in 1952, while the CIO's readiness to go all out in support of Mr McNamara, a Democratic member of the AFL, in the Michigan senatorial campaign last autumn, made a deep impression. As for Mr Reuther, that ambiguous personality delivered a copybook answer at the last CIO convention when a disgruntled union leader from New York called for a British-type Labour party. He rejected the idea out of hand on the ground that it "would commit the American political system to the same narrow class structure upon which the political parties of Europe are built."

★

While the genuine differences of principle have thus come to appear miniscule, the penalties of continued rivalry have grown more apparent. So long as both federations were expanding rapidly with the connivance of an actively sympathetic Democratic Administration in Washington, these dangers lacked urgency. Now the position has changed. On the surface the trade unions have little to complain of: they have, by and large, obtained full recognition and a strong bargaining position in the northern industrial towns; their political influence expands as they show increasing maturity in their political techniques; the lavish offices many of them are building in Washington are evidence of their capacity for conspicuous consumption.

But the coin has another side. For all their political power the unions have managed since the war to get very little of the legislation they want through Congress. This year they are fighting with their backs to the wall in many of the state capitals to prevent a further spread of "right to work" laws, making all forms of compulsory union membership illegal. In an expanding labour force, total membership of the two trade union groups has remained static at 16 million (about 11 million of whom are in the AFL), which means that only about a third of the non-agricultural workers belong to either. The chemical and oil industries are largely ununionised or dominated by company unions, and in the south there are many areas wholly uncolonised by the unions, where visiting labour organisers are bitterly reviled by the entire community.

Once the necessity for reunion had become manifest,

a procedure was needed that would not be too disruptive of vested interests and would avoid the pitfalls that have been fatal to negotiations in the past. The third reason why hopes of reunion are now high is that a formula has been agreed which calls for the physical merger only of the topmost echelons—the establishment of a single “trade union centre” which it is generally conceded will be headed by Mr Meany—and the preservation of the *status quo* among the member unions. This means abandoning the ideal of a single union for each industry or craft and accepting a system of compulsory internal arbitration of jurisdictional disputes, a technique with which each of the federations has recently been experimenting.

But there are still many obstacles. It is questionable, for instance, whether the AFL, a traditional believer in the velvet glove, will promise that disciplinary action will be taken as forcefully as the CIO wishes against unions accused of racial discrimination or racketeering. Moreover there is always the irreconcilable Mr Beck, who heads the teamsters, one of the biggest unions in the AFL. He has announced that there are thousands of workers he means to take from the CIO, other AFL unions and Mr Lewis, and he has never accepted either the AFL's own arbitration scheme or the two-year no-raiding truce with the CIO which was the first practical move towards unity. His name is one for the sceptics to conjure with, but nevertheless the prospects appear at least reasonably good that a detailed scheme for pulling together will be ready in time for the full AFL convention next September.

No Trespassing on Formosa

THERE were three basic reasons why the President wanted Congress to give him specific authority to do what it has been the declared intention of the United States to do ever since 1950: to protect Formosa and the Pescadores Islands against armed attack, in order to “preserve the vital stake of the free world in a free Formosa.” In the first place, President Eisenhower desired to give a definite warning to Communist China in the face of its increasingly active threat, by drawing a line beyond which it could not go without fighting the United States. Secondly, he wished to show the world that the United States was indeed united against this threat, by associating both Democrats and recalcitrant Republicans with his policy. Thirdly, there was some doubt, now that the Korean war was over, whether in fact the President had power to order armed forces into combat to defend Formosa.

When, however, the original intention of drawing an exact line was found undesirable for both geographic and military reasons, two of the three purposes of the congressional resolution were to some extent frustrated—and the constitutional aspect of the third was in any case doubtful. The Communists were left with some excuse for thinking that they could attack Quemoy and Matsu with impunity, although it is understood that, for the present at least, these are in fact regarded as essential to the defence of Formosa and are therefore covered by the resolution. And to some members of Congress the vagueness of the President's message seemed to be the price paid for Senator Knowland's support for a departure that his

Nationalist friends regard as fatal to their hopes of returning to the mainland with American help. On the other hand, it is also being argued in the Senate that the resolution could be interpreted as authorising American aggression, since it permits the President to take “other

measures” which he considers necessary to defend Formosa and which admittedly might include the bombing of Chinese bases. This, according to the argument, weakens the moral position of the United States and furthermore might involve the country in a major war, perhaps without allies.

What the President has in fact asked for, it has been said, is a “blank cheque” declaration of war, something which Congress can hardly give without failing in its constitutional duty. Similarly, it is claimed that the President, by asking for this resolution, is weakening the constitutional division of power between executive and legislature. None of this means, however, that the Senate, in the present atmosphere of crisis, is going to delay more than a day or two in passing, by a large majority, the resolution that has already been carried almost unanimously in the House of Representatives.

Defence Squeeze

Washington, D.C.

AT first sight the broad totals for military and defence expenditures in President Eisenhower's budget for the fiscal year 1955-56, beginning next July, seem to represent little change from those for the current year, and to give little justification for the fears and doubts now being expressed in Congress and by military commentators about the new direction of American strategic policy. Total expenditure under the broad heading “protection” (that is, for defence, atomic energy, stockpiling, and the various military assistance programmes) is estimated at \$40,458 million or only \$186 million less than in the current year, and the allocation for defence proper, at \$34,000 million, represents a cut of only \$375 million.

The most obvious and most advertised change in policy is the reduction in the strength of the army, and to a lesser extent of the navy and marines, while the air force continues slowly to expand. The army will be reduced by slightly under 25 per cent in the next eighteen months, and its current strength of 19 active and five training divisions will be cut to about 15 active divisions. While the President has not really made it clear whether this policy is based on strategic or economic considerations, it would appear to arise from a synthesis of both; on the one hand, from a recognition that the mobile reserve of ground power which is necessary to deter local aggression can be no larger than the air transport facilities which would give it its mobility; and on the other, that as the proportion of the budget that must be devoted to equipment rises it becomes essential to reduce the costs of American manpower wherever possible.

The army will save \$500 million within the next year on manpower, and would have saved more but for the fact that it has had to increase the scales of pay at a cost of \$730 million to check the decline in service morale and in the rate of re-enlistment. But even this saving is largely offset by increases in the amounts the army is expected to spend on research and development (most of it presumably in connection with its guided missiles programme for continental defence) and in the operation of the new reserve programme. Similarly for the navy, increased expenditure on equipment and research is counterbalanced by slightly lower manpower costs. The programme for ships, not all of which are included on the navy's budget, includes a request to lay down a fifth aircraft carrier of the USS *Forrestal* class and the gradual replacement of other first line ships, while keeping the strength of the fleet at about 400 active and 600 reserve vessels, and the marines at three divisions and three aircraft wings.

PROGRAMME FOR DEFENCE
(\$ million; fiscal years ending June 30th)

	Expenditures		New Appropriations	
	1955 est.	1956 est.	1955 est.	1956 recommended
Army	8,900	8,850	7,788	7,303
Navy	9,775	9,700	10,272	8,937
Air Force	15,200	15,600	12,065	14,536
Other spending and adjustments	500	150	658	2,123
TOTAL	34,375	34,000	30,783	32,899

Expenditure on the air force for 1955-56 is put only a little higher than for the current year. However, the different emphasis being given to this service is shown in the much larger sum that the President is asking Congress to authorise for it to spend in future years. Whereas in this budget the request for new appropriations for the navy has dropped by nearly \$1,335 million and for the army by \$485 million, the request for the air force at \$14,536 million is \$2,471 million more than was voted for the current 1955 year. Against an eventual goal of 137 wings, the strength of the air force now stands at about 118 wings and will reach 120 by July of this year.

The sharp increase in the request for new appropriations

does not, it seems, reflect the cost of equipping the last 17 wings, but rather the fact that the air force is now running into a serious problem of replacements. The heavy bomber wings and other new units which will bring the air force up to its maximum strength have been largely paid for out of funds authorised in previous years, but the elaborate modification process which all large new aircraft seem to

DISTRIBUTION OF DEFENCE SPENDING
(\$ million; fiscal years ending June 30th)

	Expenditures		New Appropriations	
	1954 actual	1955 est.	1956 est.	1956 recommended

Operation & maintenance	9,356	7,869	8,576	9,184
Procurement & production:				
Aircraft	8,334	7,557	7,550	6,064
Ships	1,090	888	999	1,317
Other	6,534	4,182	4,169	2,143
Reserve forces	584	705	927	1,037
Research and development	1,385	1,307	1,369	1,370
Other	2,092	1,622	115	1,172
TOTAL	40,336	34,375	34,000	32,899

have to undergo, in both Britain and the United States, after they leave the production line, is a continuing source of expense; for instance, the modification of the first 730 of the 1,000 B-47s now in service with the Strategic Air Command cost \$300 million. The air force is now faced with the problem of replacing most of its jet fighters, which were of the latest pattern at the beginning of the Korean war, with newer supersonic types.

In addition, the increasing emphasis on defence, both of the continental United States and the North Atlantic Treaty area, involves a switch from pure fighter to interceptor planes, while greater attention to the mobility of the air striking and airborne forces means laying out more money on heavy bombers—to fly from America rather than overseas bases—and transport aircraft. This minor but most expensive revolution within the air force is illustrated by the fact that, of the new spending authority being sought for procurement in 1955-56, aircraft account for two-thirds as against only two-fifths in the year 1954-55.

In the minds of many American conservatives from Senator Taft onwards, one of the principal attractions of a strategic policy which relied primarily on air strength and the principle of “massive retaliation” was that it would be less costly, not only in terms of mobilised manpower but of dollars. It seems probable that the technological revolution in aircraft and guided missiles, which has been gathering pace over the last five years, may invalidate the financial argument, even though it may have strengthened the strategic arguments, in favour of overwhelming airpower. In addition, an increasingly large proportion of the resources of the army and the navy will have to be devoted to anti-aircraft and other guided missiles, radar picket ships and the like. In consequence, it is difficult to believe that the Administration's “long haul” policy—the grounding of defence expenditure on a figure as near as possible to \$30 billion—can be maintained in future years without squeezing the conventional forces to a size which even the loudest advocates of air power would recognise as too small.

Encounter with the Business Cycle

CONTROLLED confidence is the main theme of the reports of the President and his Council of Economic Advisers on what they call the country's "latest encounter with the business cycle." As the charts show, the recession that threatened a year ago developed into no more than a "contraction," which already seems to have been left safely behind as a result of the confidence of consumers and businessmen in the underlying strength of the country's prosperity. They went on buying and building in spite of falling industrial production and increasing unemployment, and quickly took up the slack left by the decline in government spending on defence. The speedy recovery in 1954 has reinforced this confidence in the future and thus the confidence of the Economic Advisers that a continued expansion can be expected; this, they calculate, should bring the gross national product, now running at a rate of \$360 billion a year, up to \$500 billion, at current prices, in a decade. This calculation is based on the prospect of further gains in productivity and in the demands of consumers who already prefer the latest comforts to bargain prices.

The President's insistence that in these circumstances the government should direct its attention in 1955 toward fostering long-term economic growth rather than to "imparting an immediate upward thrust to economic activity" will be contested by the Democrats when congressional hearings open on this economic report. Their argument that unemployment is still a serious problem is likely to be backed up by the statistics next month, for a seasonal rise in the number out of work is to be expected. If this happens, there will be more impetus in the Demo-

cratic drive for a repetition of the tax reductions which were so important a factor in last year's recovery. It will also be contended that the recovery is not mounting fast enough or far enough to ensure full employment for the growing resources of the country and that it should be more actively encouraged by the government. But the Economic Advisers are more concerned lest over-confidence may lead to excessive speculation, particularly in the stock and housing markets, and thus to inflation and disaster.

This is only one of many warnings in the report that there are still clouds on the economic horizon that could become storms if they are not diverted by government efforts. For this Republican Administration is very ready not simply, and justifiably, to give much of the credit for last year's sustained confidence to its own prompt fiscal and monetary actions, but also to insist that Congress must give it more power to take positive steps to safeguard future prosperity and sustain economic growth. The thirty-three economic measures for which the President asked (a few of them are requests to State Legislatures, not Congress) have nearly all been put forward before. They deal not only with increased coverage by unemployment and old age insurance schemes and by minimum wage regulations, designed to put a stronger floor of personal security under people's confidence in the future, but also with plans for providing private enterprise with more opportunity for competitive expansion. Among the latter much prominence is again given to the President's foreign trade policy and to such schemes for expanding the country's "physical stock of capital" as his ten-year highway project.

Personal service the world around

THE NATIONAL CITY BANK of New York maintains a world-wide network of 57 overseas branches and of correspondents in every commercially important city throughout the free world.

Businessmen who consult The National City Bank are thus assured of individual and personal service the world around. Their particular interests can be assisted and furthered by up-to-the-minute reports from the experienced group who man this extensive banking chain.

The London officers of The National City Bank are always happy to advise on all aspects of world trade and banking and are, as well, especially trained to deal with enquiries regarding the dollar area. A visit to any branch of The National City Bank of New York will help solve your problems.

What Price Synthetic Rubber?

New York

CONGRESS can hardly fail to agree that the government has obtained "full, fair value" for the 24 synthetic rubber plants sold to private industry. It will receive \$286 million (nearly 60 per cent of the original cost and more than twice the net book value of these twelve-year-old facilities) as well as synthetic rubber stocks worth \$25 million and \$91 million in cash. If allowance is made for the three plants remaining unsold, the government can claim that its highly successful wartime emergency incursion into the new field of synthetic rubber production has been accomplished at little or no cost to the American taxpayer. Fears still linger that the big businesses, whether in rubber or in oil, which have acquired the plants, cannot be trusted to assure the small fabricators adequate supplies, especially in periods of strong demand; but these fears are not strong enough to hold up for long congressional approval of the disposal programme.

The big question now, therefore, is the price which private industry will ask for its synthetic rubber output. The government has been selling GR-S at a fixed price of 23 cents a pound, plus a flat freight charge, irrespective of destination, of 1.1 cents a pound. In maintaining this price it has been accused, especially by the natural rubber producers, of selling below cost. It has certainly acquired some of its raw materials, particularly its styrene supplies, at exceptionally favourable prices, and has been able to avoid tax liabilities. However, in the long run there is little doubt that the price of synthetic rubber will fall.

Private industry is likely to incur higher selling and transportation charges, and to spend more on research. But if operations in private hands can be concentrated in the most efficient plants, the burden of the highest cost facilities, which swelled the government's average costs, will be avoided. And if the price of natural rubber remains near its present level, the growing demand for synthetic will enable plants to be operated nearer to their most efficient rates. But in the near future the price of synthetic rubber under private control is more likely to rise than to fall, and while the price of a comparable grade of natural rubber remains above 30 cents a pound, synthetic could rise sharply and still remain competitive. Such evidence as there is at present, however, suggests that the rise will be slight.

General Motorama

AGAINST a background of ballet and orchestral music, the General Motors Corporation presented last week the full range of its 1955 automobile models to the American motoring public at its annual "Motorama" at the Waldorf-Astoria Hotel. Into the production of seven experimental "dream" cars and the re-styling of regular GM models has gone the largest programme of short-term capital expenditure ever made by a private company. A year ago when industry in general—and the automobile industry in

THE ECONOMIST, JANUARY 29, 1955

particular—was anxiously watching sales figures, General Motors announced its faith in the future with a \$1 billion investment programme of re-equipment and re-tooling, which has now been enlarged to \$1.25 billion to carry through the corporation's plans to the end of this year.

The rate of growth of this giant corporation shows no sign of abating. It is now responsible for 40 per cent of all new car and lorry registrations in the United States, and is expanding at a similar pace its production of diesel locomotives, household appliances, road-building machinery and aircraft engines. It operates 120 plants in the United States, 6 in Canada and has interests in 18 other countries; and its Buick, Cadillac, Chevrolet, Oldsmobile and Pontiac models are sold by 18,500 distributors and dealers. By vigorously combating last year the 30 per cent decline in its defence orders, and by launching a re-equipment programme, which proved a boon to numerous supplying industries which were themselves faced with a serious cutback in defence contracts, the corporation through its sheer size gave substance to the phrase "what is good for General Motors is good for the United States."

Thanks to the early introduction of 1955 models, GM sales during 1954 of passenger cars and trucks in the United States and abroad numbered 3,450,000 or only 46,000 less than in 1953. The president of General Motors forecasts this year's US market for cars and lorries at 6.8 million, 600,000 more than in 1954. With improved engineering, fresh designs, and colour schemes specially adapted to attract the all-important feminine eye, General Motors is confident it will provide well over 3 million of these. To speed this year's sales drive, it has attempted to meet one of the major problems facing the industry—that of price cutting—by assuring its dealers that it will buy back any 1955 models that are unsold. But dealers wonder whether those who take advantage of this offer may not suffer when it comes to the annual renewal of their contracts.

Coffee off the Boil

New York

WITH the exception of the Democratic Senator Douglas, the members of the Senate subcommittee which investigated coffee trading during the last Congress had the good sense to retract their previous threats to bring the coffee futures market under the control of the federal Commodity Exchange Authority, at least for the time being. In the report just issued the subcommittee recognises that the sharp rise in coffee prices last year partly reflected the crop-killing frosts in Brazil in 1953. But it blames the "irregularities and shortcomings" of the New York Coffee and Sugar Exchange and inadequate and unreliable crop information for grossly exaggerating these fluctuations. However, the Senators took the view that the inter-American study group, set up with the support of the United States to discuss international measures to reduce fluctuations in coffee prices, should at least be allowed to report before unilateral action was taken by the United States. Importance was also attached to the possible outcome of the complaint of unfair trade brought by the Federal Trade Commission against the exchange.

The present more reasonable attitude of Senators no doubt owes much to the fact that coffee prices have fallen appreciably since the original storm in a coffee cup blew up last April. But, as the president of the Coffee Exchange showed in his evidence before the committee, the essential functions of a futures market have apparently not yet been grasped by the Federal Trade Commission, which insists on judging last year's price movements on the basis of this year's knowledge. If Senator Douglas were to have his way, and CEA regulation were imposed, domestic coffee consumers would probably be the losers. For coffee, unlike the other commodities controlled by the CEA, is entirely imported and, since the main speculative functions are usually performed by Brazilian traders outside the United States, it is difficult to see how any limitations on speculative trading could be enforced. A more likely outcome of government regulation, the Coffee Exchange feels, would be the diversion of futures trading from New York to London, making the New York market still narrower.

American consumers would be better served if Congress and the FTC contented themselves with seeking improvements in the coffee futures contract generally in use. The Coffee Exchange itself is seeking to broaden the narrow "Santos" contract by permitting the delivery of other closely defined grades at specific price differentials. If some means of doing this, acceptable both to the trade and to the FTC, can be found, the rest of the latter's charges can safely be forgotten without detriment to the interests of the coffee-drinking public.

Hey, Presto !

New York.

AEROSOLS, a group of products packaged so that the contents spurt out vigorously at the push of a button, are invading almost every counter in America's drug stores. Low-pressure aerosol insecticides, the sophisticated development of the original high-pressure army "bug bomb," are still the most commonly stocked product but, according to a survey by the du Pont Company, more than half of all customers would also prefer their room deodorants and hair lacquers pressure-packed. For a little over a dollar a customer can buy "up to 200 barber shop-smooth shaves" (also advertised as "nine months of shaving"), complete with "whisker wilting" diexin or lanolin. At this price, the aerosols compete with shaving cream in tubes but, for those hardy individuals who refuse to pay a huge premium for convenience, the obsolescent shaving stick still provides a shave at a tenth of the cost.

The manufacture of aerosols presents many difficult technical problems. There are five parts to an aerosol product—the gas or propellant, which is filled into the container either in liquid form or under pressure, the solvent (usually hydrocarbon based), the valve for push-button operation, the container, and the product itself. The chief difficulties are the possibility of destructive chemical action by the propellant on the other ingredients and of the contents corroding the metal container, and the danger that the final product may be toxic. Some of these difficulties have been met by the development of glass and aluminium containers, and by

the end of this year several nylon and plastic varieties are expected to make an appearance.

If the technical difficulties of combining the propellant with the other ingredients can be overcome, toothpaste is expected to provide the next sharp spurt. The ultimate market for aerosols is apparently only limited by the cost of container, valve and propellant, which together still account in some cases for nearly 90 per cent of the total manufacturing cost of the product. Even so, Americans bought, in 1953, 39 million tins of aerosol space insecticides, 32 million tins of aerosol shaving soap (twice as many as in 1952), and nearly 9 million tins of artificial snow for the Christmas tree. The food market offers special attractions for aerosols, especially for the makers of whipped cream, whose sales in aerosol containers jumped overnight to almost 75 million tins. And those few Americans who celebrate Shrove Tuesday can now spray ready-mixed pancake batter into the pan from an aerosol container.

SHORTER NOTES

President Eisenhower celebrated the second anniversary of his inauguration by inaugurating a new type of coverage for his press conference. In the future it will be filmed and the result will be released for television after the film has been edited by the White House. Even the Democrats, who expect that the resultant publicity will be of advantage to their rivals, agree that this is a legitimate concession to a new medium of public information.

★

The State Department has matched the Russian prohibition against Americans travelling in 30 per cent of the Soviet Union by the exclusion of Soviet citizens from 27 per cent of the United States—including Moscow (Idaho), a university town with a lumber mill—on the grounds of "security and reciprocity." The geographical inaccuracies of the new order, which, for example, excludes San Francisco County but not the city of San Francisco (which the county surrounds), and the beaches of Cape Cod but not the Bremerton naval yard, copied a similar capriciousness in the Russian regulations. But the order has provoked numerous complaints, some of them from places which feel insulted at being classified as "open," and presumably insignificant.

★

Both the Republicans and the Democrats have decided, subject to the final approval of their national committees, to shorten the 1956 election campaign by holding the conventions, at which they nominate their presidential candidates, in late August and September; the tradition has become a June or July meeting, followed by almost half a year of expensive and excessive campaigning. If the new schedule is confirmed, the Republicans will be meeting after the Democrats for the first time since 1888; but the Democrats will not be in any doubt about who the Republican candidate is to be—except, of course, in the now unlikely event that Mr Eisenhower does not run again.

The World Overseas

Russian Consumers Still in Doubt

THIS year is the last one of the Soviet five-year plan. There is much speculation now whether the line of concessions to the consumer launched after Stalin's death will be continued or whether it will be revised as part of a big change in Soviet strategy. Indeed, in recent Soviet propaganda there has been a clear shift of emphasis from the "needs of the consumer" to "the primary importance of heavy industry." If a switch is really intended, however, there is no evidence of it in the economic balance-sheet for 1954 just published by Moscow's Gosplan. Last year, it would appear, both the heavy and light branches of Soviet industry proceeded according to schedule. The shortcomings in the output of consumer goods were, on the whole, slight, with the possible exception of foodstuffs. But the lag in the production of, say, meat or butter can be easily explained by well-known agricultural difficulties.

It is claimed that gross industrial production rose by 13 per cent during the year and the plan is, therefore, likely to be fulfilled before the end of 1955. As can be seen in the table below, all branches of basic production will probably reach their targets. Coal extraction last year increased by some 25 million tons and an even bigger jump is expected in the present year thanks to the opening of new mines in the east. Success in oil extraction is also dependent on eastern expansion, particularly in the Bashkir Republic, where output has already risen from less than 2 million tons before the war to about 7 million tons in 1950 and to 15 million tons last year. While pig iron production has fallen behind schedule, output of rolled steel seems to be forging ahead of it.

SOVIET BASIC PRODUCTION (Million tons)

	1940	1950	1953	1954	1955 planned
Coal.....	166.0	260.0	318.0	344.0	372.0

Rolled steel.....	13.1	20.8	29.5	32.2	34.1

* '000 million kWh.

Amid the consumer goods it is necessary to distinguish the staple commodities, such as clothing or shoes, and the semi-luxury goods like sewing machines or wireless sets. When Stalin's successors made their pledge to the consumer they did not alter radically the existing plans for the former;

their real innovation was to promise a "sharp rise" in the output of semi-luxury goods. Last year's results seem on the whole successful in both fields of consumer production. True, the real test for the more sophisticated items will come only this year and the next, but a comparison of the targets for 1954 outlined by Malenkov and Mikoyan with the results now published does not show any very big discrepancies. The scaling down of this year's objective for television sets from 760,000 to 500,000 does not by itself justify the conclusion that a shift away from consumer goods is already occurring.

SOVIET PRODUCTION OF CONSUMER GOODS

	Unit	1940	1950	1954	1955 plan
Cotton fabrics....	mn.metres	3,880	3,800	5,500	6,250
Woollen fabrics...	"	120	165	260	270
Watches, clocks..	'000, units	2,550	7,200	16,800	22,000
Sewing machines..	"	180	500	1,335	2,615
Bicycles	"	270	660	2,510	3,445

The report itself, on the other hand, admits failures in the production of certain foodstuffs, for example, fish and meat, butter and sugar. The full benefits have not yet been derived from the policy of incentives in the countryside, while it is still too early for a substantial contribution from the reclaimed "virgin lands" in Kazakhstan and Siberia. Indeed, the grain surplus from the new areas was barely sufficient to counterbalance poor weather conditions in southern Ukraine and the Volga region. The total grain crop is still a mystery, but it was only slightly higher than the poor yield of 1953. Incidentally, bad weather in the Ukraine also accounts for the poor sugar harvest, since about two-thirds of Russia's sugar-beet is to be found in that region. Mr Khrushchev must hope that next year will bring better news from the agricultural front. Nature may finally smile on the planners; 17.6 million hectares of additional virgin land have been ploughed; the rise in livestock numbers may at last get translated into more meat and dairy products.

With the exception of agriculture, 1954 was a good year for the Soviet economy. All branches of industry are forging ahead towards their ambitious objectives. The ranks of the urban labour force have been swollen by a further two million people. With over 40 million tons of steel and about 47 million workers and employees the Gosplan has a good deal of room in which to manoeuvre. Yet its tasks are gigantic. The drive to improve rapidly

the standard of life of the consumer requires heavy investment not only in agriculture and light industries but in building as well.

The problem facing Russia's leaders is not really whether they should abandon pledges made on Stalin's grave, but whether they should scale them down and to what extent. There are signs that military leaders now have a bigger say in the policy-making of the *Gosplan* and they would obviously insist that Russia's military preparedness must come first. They may get quite a lot of party backing if it is judged in Moscow that the international situation is really getting worse. This is a decisive year in which the current five-year-plan must be completed and the Soviet leaders must make up their minds about the future line of Soviet economic development. Will the hopes of the average Russian raised so high after Stalin's death be once again partly disappointed? Mr Mikoyan's departure from the ministry of trade is one enigmatic clue; the forthcoming session of the Supreme Soviet should provide some more.

Banana Politics

FROM A CORRESPONDENT IN COSTA RICA

COMMUNIST propagandists across the world from Prague to Peking swung smoothly into action this month with the charge that the real villain behind Costa Rica's troubles was the United Fruit Company. No evidence was offered to support this accusation; it was clearly taken for granted that the peoples of the Communist world would accept the guilt of the American company as axiomatic. As a result, the party line took on what was, to say the least, a strangely old-fashioned look; for the accused company, which is the world's largest producer and exporter of bananas, has lately embarked on a new policy in its relations with the governments in whose territory it operates.

United Fruit grows bananas in eight Central American and Caribbean countries as well as on the west coast of Africa. It has been at work for fifty years, and when its operations began most of the tropical terrain concerned was wholly undeveloped. It was therefore obliged to build and operate its own railways and port facilities, and to acquire vast plantations (some 700,000 acres in all), for there were no existing means of getting perishable fruit quickly to distant markets, nor any large-scale local growers from whom the company could buy. Many of its concessions were granted long ago, by Central American presidents whose rule was often despotic. All these circumstances have made United Fruit an obvious whipping boy for Caribbean nationalists; and in the last few years its executives have observed the fast rising tide of nationalism with considerable alarm.

In Costa Rica, where the company operates over 128,162 improved acres of land, the matter came to a head early in 1954 when President Figueres demanded that either the company pay his government 50 per cent of its operating profits or else turn over its plantations to the government and merely buy the produce at the docks; the government would pay for the property out of the profits it received from operating the plantations over a period of years. After

prolonged negotiations, the company agreed to pay Costa Rica 30 per cent of its net operating profits in that republic and to waive exemptions from import duties as well as to give up other favourable concessions.

Subsequently, in 1954, similar contractual arrangements, including the "profit sharing" 30 per cent clause, were offered to and promptly accepted by Panama and Guatemala and company officials agree that it "has set a pattern" which they hope will lead to more co-operation from local governments. They point out that under the new agreements, local politicians and governments are "in effect, our partners," and they feel that local self-interest will dictate that labour trouble and discriminatory legislation shall be kept at a minimum. Whether or not the same agreements will be offered to other Caribbean states remains to be seen. But most observers, including the United States State Department, feel that the company will be forced to do so.

The United Fruit Company's operations, in spite of the risks involved, have been highly successful. In view of its ability to deduct local taxes paid on income from its US tax bill, the new agreements should have little effect on consolidated net earnings. The company's chief worry has been potential interruptions in production due to locally sponsored labour agitation and discriminatory legislation. But it hopes that the new agreements will lessen this risk and take it out of the category of the "foreign imperialists" and "foreign monopolists."

However successful this new programme of "profit sharing" in tropical America may be for the United Fruit Company, it has not apparently impressed the United States Government itself. Last year, the office of the Attorney General lodged an anti-trust suit against the company. This complained that, with the exception of Ecuador, the United Fruit Company controls 85 per cent of the land in the American tropics suitable for banana cultivation, and 75 per cent of all the ships available for banana-carrying; that it imports into the United States 65 per cent of all the bananas sold in America; and that it coerces American banana distributors into not buying from the company's competitors. These charges have naturally given Caribbean nationalists considerable satisfaction; they do not hesitate to proclaim that "even the United States Government has now confirmed the charges we have been making for years."

Chinese Communist Air Power

BY A CORRESPONDENT

THE recent attacks by the Chinese Communist air force on the Tachen Islands, 200 miles north of Formosa, points to a new development of China's limited air resources—the increased use of tactical air power. During the civil war the Communist armies conquered the Chinese mainland without the help of air power. But in the Korean war, the Chinese air force began to show its paces. It is true that during most of the fighting the main part of the Communists' fighter and light bomber forces remained unused at their Manchurian bases; a force of obsolescent piston-engined fighter-bombers was at one time based on forward air fields in Korea, but the repeated bombing of these air-

Starch does surprising things

IN SUCH SURPRISING PLACES

Example:

STARCH IN CARPET MAKING

There are two main parts to a carpet: the wool pile and the backing. After the carpet has been woven, the backing is sized with one of a range of speciality starches, depending on the sizing equipment in use and the type of carpet being made. This operation is called back-sizing. It strengthens the backing and assists in anchoring the base of the pile into the backing. It also prevents curling and improves the handling and wearability of the carpet.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learned a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

THE INDUSTRIAL DIVISION OF

Brown & Polson

WELLINGTON HOUSE, 125/130 STRAND, LONDON, W.C.2

DOWN GOES THE PLUNGER and in the river distance a white, white plume goes up, sudden and silent. Seconds later comes the sound, the crack of the explosion, a thundering, a rumbling. The jam is cleared. The logs are free to jostle and leap and run with the current, glistening, wet, shining as they go, travelling with the river to the mills. It's all in the day's work in Scandinavia where, at Bowaters' groundwood mills, spruce is pulped and pressed, baled and loaded into ships to cross the North Sea, destined for the Bowater paper mills in the United Kingdom.

Every day of the year the Bowater Organisation is at work converting timber into woodpulp into paper. From its mills in Europe and North America comes newsprint in a never-ending stream for the newspapers and journals of the world; other printing papers for the magazines and reviews that carry colour and interest into countless lives; paper for the protection of food and for packages of almost infinite versatility.

fields soon made them untenable. But to many people's surprise, an increasing number of Mig 15s, flown by Chinese pilots, intercepted United Nations bombers during 1951. They provoked the United States Air Force Chief of Staff into saying that China had become one of the major air powers of the world. In most of the Korean air combats, however, they failed to measure up to this flattering estimate.

In spite of local numerical superiority and the tactical advantage of defending the same limited target area again and again, the Chinese fighters remained on the defensive; they operated with great caution and therefore failed to carry out their task of protecting targets near the Chongchun and Yalu rivers. But although the Migs did not plunge recklessly into battle, they were steadily engaged, and, under Soviet tutelage, gained valuable experience in interception operations. They slowly applied the lessons they learnt on making the best use of their early warning system. They gave their air combat units very short spells of duty, and this, combined with cautious fighter tactics, enabled them to build up their strength. Indeed, they seem to have regarded some of the Korean operations as a kind of accelerated combat training. In using their air forces in this careful and conservative way, the Chinese are following in the steps of their Soviet tutors. The Soviet long range bomber force was operated with great caution in the second world war when many of its combat crews, like most of the Chinese pilots in Korea, were very inexperienced.

Shortage of Trained Crews

Since the end of the Korean war there has been evidence that the Soviet Union has been providing China with more modern tactical assault planes—Yak single jet fighter bombers (equivalent to early Thunderjets) and twin jet Tupolev and Ilyushin machines (similar to Canberras). At the same time the Mig 15 fighter defences have thinned out along the east coast of China opposite Formosa and the early warning network, so concentrated in the small battle area over North Korea, has also become diluted. This dispersal and dilution may explain why Chinese Communist fighters have made few successful interceptions of the raids carried out by Chiang's air squadrons on Chinese territory since the end of the Korean war. The Chinese Nationalist Mitchells escorted by Thunderjets should have been vulnerable to Mig 15 attack. But in many sectors of the coastal defence the only fighters available to the Communists are obsolescent piston-engined machines flown by inferior pilots. It was probably two such planes which shot down the British owned Skymaster off Hainan on July 23rd last year.

The operational strength of the Chinese Communist air force is today probably more than 3,000 planes. Numerically it is the largest of the air forces allied to the Soviet Union. But it also has the largest air commitment and relatively it is weak. Because of a shortage of highly trained crews and lack of reserves of modern aircraft it cannot hope to maintain intensive operations of any kind. The raids on the Tachen islands show that the Chinese Communists are slowly building up a modern offensive air force; it was reported that over fifty fighter-bombers and light bombers have been in action at one time. But China must pursue a policy of conservation of air effort for some time to come and must husband its resources. Indeed for the next year or so its lack of air power may limit its Asian strategy and diplomacy more than any other single factor.

Talleyrand of Tirana

BY A CORRESPONDENT

DURING the celebrations earlier this month of the ninth proclamation of the Albanian People's Republic, one Albanian newspaper advised the country's enemies not to forget that Albania belonged to the 900 million strong camp of peace and democracy led by the Soviet Union. This boast may possibly soon be given a firmer foundation than in the past. At the Moscow conference of Soviet satellites last month, Mr Manush Myftiu, the Albanian Vice-Premier, said that his country was ready to adopt collective military measures with the rest of the Communist bloc "to ensure the inviolability of the frontiers of our land from any aggression." Thus if the collective military measures announced at the conference are put into force after the ratification of the London and Paris agreements, this isolated Communist regime will for the first time be brought within the scope of Russia's military guarantees; and Russia itself will give notice in the least provocative manner that it is in its Mediterranean outpost to stay.

Moscow has hitherto been shy of any commitment in Albania, which was left after the war as virtually a seventh federal republic of Yugoslavia and was not thought either important or independent enough to be invited even to join the Cominform. Even after the break with Marshal Tito, the Russians were anxious to keep contacts as indirect as possible, apart of course from their direct control of the Communist party leadership and the judicious encouragement of personal rivalries within it. At various times the Poles, the Rumanians and above all the Bulgarians found that the responsibility of supplying Albania by sea had been delegated to them, along with the organisation of "cultural exchanges" and the training of technicians; but none of these was asked to give it a guarantee of protection in case of attack.

Soviet policy towards Albania was to keep it loyal at the minimum political and economic cost. Industrial plan-

ning was aimed at making the country self-supporting as far as possible—especially in food, textiles, sugar, cement, fuel—in order to save merchant ship tonnage, which was already inadequate and needed elsewhere. The Russians accordingly supplied the necessary factories and equipment for an oil refinery and hydro-electric power stations, taking payment in the form of chrome and copper ore, bitumen and surplus oil production. Two railway lines, the arteries of this economic system, converge on Durazzo, the only port to which serious attention has been paid.

In recent months there have been signs that Moscow has decided to play a more active and direct role in Albania.

Articles and stories began to appear in the Russian press praising the Albanians, culminating on National Day in November with nineteen pictures, seven in colour, in a single issue of the Moscow weekly *Ogonyok*. The signing of the Balkan Alliance, seen no doubt as a menace to Albania, was followed last June by a visit of the Commander-in-Chief of the Soviet Black Sea Fleet with a cruiser and destroyers to Albania, a typically Palmerstonian gesture indicating that Soviet Russia was not prepared to be squeezed quietly out of its Adriatic bridgehead. The warships were followed by a regular passenger and cargo service between Durazzo and Odessa.

It seems to have been felt in Moscow that isolated gestures of cruiser diplomacy are not enough to ensure Albania's stability, particularly now that a somewhat easier international situation and growing naval power allows Russia to profit from its foothold in the Mediterranean with few risks of a clash. However, the difficulties of offering a direct military guarantee to Albania while at the same time professing a desire for "co-existence" and "relaxation of tension" with Yugoslavia and Turkey are obvious. Without rousing their suspicions again, Russia has indicated that it will hang on to its position in Albania.

Some possible implications of this development immediately suggest themselves. Internally, an Albanian regime fortified by proclaimed Soviet support is a far less lonely and vulnerable object, whether as a target for so-called "diversionism" by infiltration from neighbouring countries, or in its dealings with non-Communist States. (It maintains relations at present with France, Yugoslavia and Italy with which it has recently signed a trade agreement.) Being accessible only by sea and air, Albania has also some degree of manoeuvrability even in relation to its protector.

Instinct for Survival

Any deflection however has already been largely guarded against, for good care has been taken to split the authority of the two main rivals for supreme power—Enver Hoxha, who is secretary of the Party, and Mehmet Shehu, the Premier—by a division on the lines of the "collective" settlement established in the Soviet Union itself and elsewhere in Eastern Europe. Hoxha, the Talleyrand of Tirana, obeyed and fulsomely praised Tito, Stalin and Malenkov in turn, and then fell into line behind the powerful Khrushchev. Now he has been received into the capacious bosom of Molotov, who once went on record as saying that Hoxha shows sign of a bourgeois upbringing. Such adaptability and instinct for survival are without rival in the Communist world.

One other method of reminding the Albanian government, as well as the West, of the presence of Russian power, might well be to continue regular naval visits and to begin at last the reconstruction of at least some of the old Italian naval base facilities in Valona Bay. The only evidence of such an intention at present is the decision to turn the flow of crude oil from the Berat district, piped by the Italians to Valona, to a new refinery and transshipment point on a spur of the Durazzo railway, thus removing from Valona its principal *raison d'être* as a commercial port. During the naval visit last June, too, one of the Soviet naval captains was reported in Valona. It is hardly to be supposed that he went there merely to see the beauty of the view.

Health Scheme for Swedes

FROM OUR SCANDINAVIAN CORRESPONDENT

SWEDEN—that *doyen* among welfare states—only introduced compulsory, comprehensive health insurance on January 1st, although social services have long claimed 10 per cent of the national income. Hitherto, two-thirds of Sweden's seven million population were voluntarily insured, compared with 96 per cent in Denmark and 85 per cent in Norway. Although treatment in Swedish hospitals costs a nominal amount, sickness benefits, to compensate for lost wages, have been totally inadequate.

Health insurance had become a well-worn plank in the platform of the Social Democrats, who have governed with brief interruptions for three decades. The Swedes, however, dislike being hustled; and Swedish socialism is empirical rather than starry-eyed. The *Riksdag* finally passed an Act in 1946 to fill the gap. But inflation and preoccupation with other urgent tasks, notably housing, induced the government to keep the Act on ice. Moreover, the traditional caution of the Farmers' Party, the junior partner in the present "Red-Green Coalition," has recently been acting as a brake. But although this year's budget is designed to curb public and private spending, the government finally decided against further postponement.

The scheme's main provisions regulate sickness, medical care and maternity benefits. The basic sickness benefit is 3 kronor (4s.) a day for all over 16 with an annual income of 1,200 kronor (£85); housewives living at home are included. Supplementary benefits are graded according to income; a worker earning 14,000 kronor (£1,000) receives the maximum of 20 kronor (27s.) daily, tax free. Full benefits are payable for three months. Medicine is supplied free for serious complaints, and at low cost for others; and hospital expenses are refunded at the standard rate of treatment in public wards.

The scheme represents a broad advance, although the position of widows and pensioners among others remains unsatisfactory. A linked system of voluntary contributions should, however, alleviate most cases of hardship. The total cost for 1955 is estimated at 738 million kronor (£50 million), of which contributors, employers and the state will pay 44, 27 and 29 per cent respectively. The annual contributions range from 44 kronor (£3) to 164 kronor (£12) for single people, and from 44 to 222 kronor (£16) for married couples. If both parties are working, their maximum joint contribution is 328 kronor (£24). The new service enjoys the support of all parties; only the moment chosen for introducing it has aroused criticism, for Sweden again faces economic difficulties.

COMMODITY REPORTS

Special and regular reports on the supply and demand position and on the price and market prospects for most commodities can be prepared for individual clients by our Commodities Department. Scope, length, frequency and cost are determined by clients' needs.

As the Commonwealth Sees the Conference

(The following notes are contributed by our Commonwealth correspondents)

DESPITE the club-like atmosphere of a Commonwealth conference, each country approaches it with different aims and in different mood. To the British, the most notable change in recent weeks has been the apparent postponement of the need for a precise decision about the Gold Coast. Mr Nkrumah's government is now too preoccupied with domestic political difficulties to press for a decision on its Commonwealth status at the present meeting. This has at the same time put off the questions of South Africa's formal opposition and of any immediate necessity to re-define the status of the Central African Federation.

On the general question of anti-colonialism, which may be raised by the Asian members, the British feel that they have a good case. Progress towards self-government in many colonies has been substantial. Kenya is now conducting an experiment in multi-racial government. In addition to the Gold Coast, Nigeria, the West Indies, Malaya and Singapore have all made further progress along the road towards self-government. And although the constitution remains suspended in British Guiana, the right lessons from that suspension are being applied in British Honduras.

Perhaps the question on which the British are least well placed is that of trade. Many Australians feel that, although the British are not directly to blame, the Ottawa agreements of 1932 have in fact worked out unfairly to Australia's disadvantage. While Britain's preferences in Australia are reckoned in percentages, Australia's in Britain have failed to move with the changes in the value of money because many of them are given in fixed amounts. There is also the difficulty that both the abandonment of bulk buying and an increase in sterling-dollar trade hinder Britain from giving Australians the long-term contracts they want for their agricultural produce.

Australia Talks Strategy

The 1955 Commonwealth Prime Ministers Conference will probably mark a strategic epoch for Australia; for the country's whole strategic outlook has changed since the Commonwealth leaders last met. Until 1954 and the collapse of French power in Indo-China, British and Australian foreign policy met in the Middle East. Australian interest in this region arose out of the paramountcy of European military and economic power. Now, the new tensions in Asia, created by the twin colossi of America and Soviet Russia, have forced Australian foreign policy to fall back from its historic Middle East "frontier" with Britain.

As the Prime Minister, Mr Menzies, recently told Australians, the nation's defensive frontier now rests on the Asian mainland and, in consequence, its first line of defence has been shifted from the African to the Asian side of the Indian Ocean, 7,000 miles nearer home. This is the central politico-military fact which must be uppermost in Mr Menzies' mind. It is not new. It publicly exercised the Australian Premier as far back as 1950, when his government first sent part of the Royal Australian Air Force to assist the hard-pressed British forces in Malaya. By the same token, it was also evident that the old concept of "lines of communication," linking Australia with Common-

wealth partners, notably Britain, had given way to the new concept of self-contained "areas of power."

It was in 1950 that Australia became a "main support area," as Mr Menzies publicly described it, with Malaya as a "key point" in this Eastern strategic region. This meant that Malaya could no longer be regarded as a purely British responsibility. Strategically considered, it had become part of the Australian "area of power." The British Government seems to have taken account of this development in the recent military talks in Melbourne between British and Australian service chiefs. The presence of Australian troops in Malaya would certainly be concrete evidence to South East Asians that Seato was more than a scrap of Manila paper, and this is an objective dear to the heart of Australian diplomacy. There is also the need to make the situation clear to Peking.

New Zealand Looks to the Pacific

There has been rather a belated recognition in New Zealand of the particular importance of the Commonwealth Prime Ministers Conference. The average New Zealander, though he is at pains to be reasonably well informed on international affairs, shows no great interest in them except when obvious crisis threatens. The high level of prosperity in New Zealand conspires with geographical isolation to encourage some over-complacency.

It was only on the eve of his departure for London that Mr Holland indicated that this particular conference was likely to have unusual significance for New Zealand. He then said that he realised New Zealand would probably be asked for some definite material contribution towards the defence of South-East Asia, and Malaya in particular. So far, New Zealand's defence planning has been on the basis that if the country has to send an expeditionary force overseas, it will serve once again in the Middle East. The government has never explicitly defined the commitment, but it has been fairly generally understood that it existed. In recent years, however, there has been a slow but definite change in the New Zealand attitude. The country's participation in the Anzus Pact and the developing threat of Communist aggression proceeding from Indo-China has greatly strengthened the conviction that New Zealand's contribution to Commonwealth defence must be in the Pacific. Public opinion is therefore reasonably well prepared for any suggestions to that end that may be made in London and at Bangkok. But it is doubtful if it is as well prepared for the cost of any contribution it may be asked to make. But if Mr Holland does return from London with a larger defence bill there is little doubt that the country will be prepared to foot it.

Canada Stresses Asia and Trade

The conference is earlier than was convenient for several members, including Canada; but the date was the best compromise that could be reached. As they frequently do, some Canadian ministers are inclined to relate the calling of Commonwealth meetings to the exigencies of Britain's domestic politics. But it is also thought to be quite a good idea to have a meeting with the Asians in view of the forthcoming Asian-Arab and Bangkok meetings. In Canadian eyes the general review of Asian policy will probably be the biggest item.

There has been an unfortunate political background to

380

the conference in Canada, which perhaps makes it difficult for anyone in Ottawa to talk very freely. The Conservative Opposition has been demanding since the beginning of the session that the Prime Minister should make a statement about the conference and provide a chance to debate it. It has for some time been running a rather silly line, urging the Canadian government to take the initiative in summoning a Commonwealth Conference to discuss trade. And it is presumably in support of this line that it wants to inflate the present prime ministers' conference in advance, so that they can later accuse Mr St. Laurent of failing to get increased markets for Canadian products or to wring out any promise of a definite move to convertibility.

Since the September meetings of the World Bank and International Monetary Fund, the official Canadian line puts off convertibility into a quite indefinite future; and the anxieties on this score are at present concentrated on Gatt rather than London. Canadians expect the Australians to ensure that the Gatt quarrel flows over to the London meeting; but they feel that this will be something for Britain to deal with. Mr St Laurent can do little but cheer the more liberal British views from the sidelines.

Pakistan Assumes the Best

The forthcoming Commonwealth Conference has not aroused any particular public interest in Pakistan. This is perhaps on the whole a good thing, as it seems to point to the fact that Pakistanis take the present state of affairs for granted and look on the conference as a routine meeting. Thus, if nothing particularly exciting transpires, there will be no feeling of anti-climax. The main item of public interest will be the discussions regarding Pakistan's position in the Commonwealth under the proposed new constitutional set-up. Generally speaking, the feeling towards the Commonwealth is warmer and firmer than it has been for some years. Some of this arises from the fact that the suspension of the Assembly has deprived politicians of the opportunity to strike attitudes which they hope will curry favour with the mass of the people.

The present cabinet contains a number of men who are actively pro-Commonwealth. Some of them much regret the unavoidable severance of the personal link with the Crown; the royal family and its traditions of service are widely admired. But it is now too late to go back on the idea of a republic, and the mere mention of doing so in public would amount almost to political suicide for any politician. Accordingly, although the Commonwealth occupies a predominant place in Pakistan's mind, at the moment it is slightly in the background because of greater pre-occupation with the Middle East and Seato. Karachi is delighted at the Turko-Iraqi agreement and it is logical that it should concentrate on trying to reach a Pakistani-Iraqi agreement on similar lines.

India's Widening of Horizons

There has been little speculation in India about the Commonwealth conference. This is hardly surprising. Mr Nehru has been away in Indonesia and in his absence interest in foreign affairs always lags. Moreover, it is felt in Delhi that the whole point of the conference is that this is not an emergency; Mr Nehru has been to similar meetings before and everyone hopes that he will go to many more. This lack of excitement is due not to apathy, but to acceptance. Except for the Communists, India's

THE ECONOMIST, JANUARY 29, 1955

membership of the Commonwealth is no longer an issue; it has become as much a part of Indian life as free elections.

There is a general thing; that it is desirable that he should London is a good thing; that it is desirable that he should meet fellow prime ministers who, whatever their domestic and foreign policies, share with India a familiar background of law, education and language; and that he should do so of law, education and language; and that he should do so without observers, interpreters or language-seekers to the press. Indians agree that Mr Nehru will gain from cold war, relations leagues feel about such subjects as the future of Africa, with America, German rearmament and, to make a major And they expect Mr Nehru, for his part, to make a major contribution on China, on the part of the underdeveloped world. conference and on the feelings of the underdeveloped world.

Indians look on a Commonwealth conference as an opportunity for friendly discussions and the widening of horizons; not as an occasion for the settlement of disputes or for quarrelling over painful differences. Mr Nehru is not expected to bring home a solution either for Kashmir or for Kashmir. It is this widening of horizons that Indians particularly value about these meetings, particularly since they are beginning to feel that they will increasingly be able to give as much as they can get. As the *Hindustan Times* says, "it would not be strange if Britain, from influencing the policies of other (Commonwealth) members, came to be guided by their experience and wisdom."

South Africa Holds Its Hand

There is genuine regret in South Africa at the decision of the Prime Minister, Mr Strydom, not to go to London for the Commonwealth Conference; but it is realised that it would genuinely have been very difficult for him to be away so soon after becoming premier and within a week of the opening of his first Parliament as head of the government. Although the choice of Mr Swart, the Minister of Justice, to deputise for him has understandably met with little or no enthusiasm from non-Nationalists, who set great store by the Commonwealth link, it was only logical that Mr Strydom should nominate him because he is also Deputy Prime Minister.

The government press has been strangely silent about Mr Swart's role in London; for the most part he will be an interested observer. But it is not unlikely that he will tell the conference of the Union's willingness to play its part in the fight against the spread of Communism; that it will join in any Middle East defence scheme; that it is opposed to the further admission of "non-white members" to the Commonwealth (its eyes are firmly fixed on West Africa), at any rate without the fullest prior consultation; that it will co-operate in any scheme to further Commonwealth trade; and that it will make whatever contribution it can to the development of atomic energy for non-military purposes.

South Africa is on good terms with all members of the Commonwealth except India, with whom it has no diplomatic relations. The Strydom regime will continue to co-operate with other members of the Commonwealth, "when it is in South Africa's interests to do so." But its ideal remains a republic outside the Commonwealth, as soon as it can obtain "adequate" (the Prime Minister's word) white support in the Union for the project. But Mr Strydom's recent reassurance that no steps in this direction will be taken in the life of the present parliament means that the question has been temporarily shelved.

World-wide technical collaboration

in electrical engineering development

THE DRIVER-HARRIS ORGANISATION

Close liaison between the companies of the Driver-Harris world-wide organisation is a very real and active policy. It continues to yield an impressive dividend of technical progress.

The liaison is expressed in regular communication and exchange of visits between technologists, a pooling of knowledge on every fresh aspect of wire-drawing technique, and continuous research along parallel lines between the laboratories and manufacturing plants in the United Kingdom, United States, Eire, France, Italy, Austria and Spain.

The result of that collaboration is a succession of advances in the production of nickel-alloy resistance materials of profound importance to all development in the electrical engineering world.

ALEXANDRIA: More than three centuries before Christ, Alexander the Great marked out the foundations of the city which was to prove his most enduring memorial. Originally, he conceived it as a naval base to support his army in his Persian campaigns, but he also wished to create a meeting-place for East and West, and a trading centre for all the Mediterranean. The later story of Alexandria is studded with the names of some of the most vivid personalities ever to cross the stage of history; from Julius Caesar to Napoleon famous commanders have sought to possess it. Illustrious philosophers such as Aristarchus and Philo Judaeus taught within its walls; it boasted mathematicians and poets, and all the arts flourished. The city was famous in ancient times for its Library; its lighthouse, over 400 ft. in height, was one of the Seven Wonders of the World.

Business men who require information on current commercial conditions in modern Egypt are invited to get into touch with our Intelligence Department, 54 Lombard Street, London, E.C.3. Up-to-date reports from our branches in Alexandria and elsewhere are readily obtainable on request.

BARCLAYS BANK D.C.O.

THE BUSINESS WORLD

Astringent for the Pound

ON Thursday morning the Bank of England confirmed the gilt-edged market and the money market in their recent suspicions by raising Bank rate from 3 to 3½ per cent. The monetary authorities thus take due note of the sustained weakness of sterling, the incipient signs of inflationary pressure, and the several recent indications that demands for credit are becoming more aggressive. They have wisely decided, however, that what was needed—was a warning shot rather than a broadside. The decision whether to make any change at all cannot, indeed, have been easy to reach, for not all the indicators of underlying financial and economic trends have pointed in the same direction.

Especially has this been true of the influences playing upon sterling. For some time now the rate has been weak over a period when it should have been rallying from its normal autumn relapse with the US dollar quoted at around \$2.78½-1. Without the modest intervention of the Exchange Equalisation Account it might have reached the lower gold point of \$2.78 several times recently. Less than a year ago it was only the massive intervention of the Exchange Equalisation Account that kept the rate below its ceiling. This trend had inevitably raised the disquieting question: Has the dismal sequence of balance of payments crises in the odd years since the war merely skipped 1953 to reappear in 1955? Or has the weakness arisen mainly from technical and even ephemeral influences?

The facts cannot have been easy to disentangle. Sterling is a world currency drawing its strength or weakness not from the United Kingdom alone, nor even from the whole sterling area, but from the operation of all the "transferable account" countries now using sterling for a large part of their current trade. The transferable account area plus the sterling area makes

up the whole world, minus the dollar bloc and the Communist bloc. If Australia is overspending its current income and drawing upon London funds, if the Continent of Europe is buying dollar wheat and paying for it in sterling through the EPU machinery, even if Russia buys Danish butter and pays for it in sterling, all these factors will have an impact on the sterling-dollar rate. Add to this the facts that there is more than £4,000 million of sterling held in London on overseas account at call or short notice, that much of it may give the holders direct access to the dollars in the United Kingdom reserve, and that the international banking mechanism of the City of London is making a substantial volume of sterling available to overseas customers by acceptance and cash credits. The pattern of cross currents then becomes so complex that it is hard to pick out the main stream.

The direction of that main stream, however, as reflected in the behaviour of the sterling-dollar rate, has been unmistakable. It changed in the late summer of last year. The timing of the change and what is known of the operations that contributed to it show that "sentiment" played a large part in changing its direction. It was in September of last year that the rate for sterling in terms of dollars left the neighbourhood of its upper gold point and started its steady decline. Until that month the world at large had assumed that sterling was moving reasonably fast towards convertibility. In the early summer of last year, this belief was accompanied by rumours that either in preparation for the move or even as part of it the sterling rate might be allowed to "float"—either freely or within a wider margin of free movement than the 1 per cent on either side of parity envisaged by the International Monetary Fund.

Spurred by these rumours importers of sterling goods bought sterling in anticipation of their needs. Then

came the meeting of Governors of the International Monetary Fund at which the Chancellor of the Exchequer, who led the British delegation, delivered himself of a most effective damper to those hopes. The Chancellor and his spokesmen at the Treasury can rightly claim that they had never given any justification for the expectation of early convertibility, whether on the basis of fixed or flexible rates; but the important fact is that such an expectation had been widely held and exerted an influence on the sterling exchange. After the IMF meeting in September the sterling pendulum naturally swung. There was no drastic withdrawal of balances held in London but rather a gradual utilisation of what had been accumulated in anticipation of future needs. Commercial purchases of sterling in the latter months of 1954 and in the early weeks of 1955 have in consequence not been as large as they should have been.

The change in sentiment about sterling also affected the rate for transferable sterling. Whenever the margin between official and transferable sterling widens beyond 2 per cent it is through the transferable type of sterling that the transferable sterling countries (and they cover the greater part of the world) conduct much of their trade with North America. That margin has lately been 3 per cent, so that the discount on transferable sterling became sufficient to introduce substantial distortion into the normal pattern of international trade in such commodities as tin, rubber, diamonds, furs—anything where value is high in relation to bulk. Early in 1954 the rate for transferable sterling had climbed within the range of the gold points of the official sterling-dollar rate. By the middle of March, 1954, the transferable sterling rate was quoted at \$2.78½ and by April it had risen to over \$2.79. This was further evidence of the confidence with which the world viewed the prospects of early convertibility for sterling; it was reasonable to buy transferable sterling, for under the convertible regime it would become merged in the one type of non-resident sterling and be freely convertible.

After the Washington douche to these expectations the transferable sterling rate began to weaken and by last December it had dipped below \$2.71. It has since recovered to \$2.72 but even at this rate it shows a discount of more than 3 per cent. At this discount a wide

range of commodity shunting operations, which had vanished while transferable sterling appreciated to within the upper and lower limits of the official rate, has reappeared. Sterling tin, for example, normally sold to the United States direct by British merchants, can be sold a little more cheaply if the transaction is done through Continental merchants who buy the tin with transferable sterling, sell it to the United States for dollars and then reconvert their dollars into transferable sterling at the appropriate discount. In this way the United Kingdom repays sterling debt, since overseas sterling has been extinguished in buying the tin, but the dollars that should have been offered for sterling in the London market in order to pay for the tin have gone instead to the Netherlands or Belgium or Italy.

A similar result followed from the use on the Continent of dollar export incentive schemes which in effect subsidise exports of the local product to dollar markets. French African cocoa, for example, has been pressed for sale in the United States to the disadvantage of British West African cocoa, the sales of which have therefore been directed towards the Continent of Europe. This has helped in the improvement of the United Kingdom account with EPU, but has involved a corresponding loss of dollars.

Commodity shunting plus export incentive schemes on the Continent have eaten into the sterling area's normal commercial inflow of dollars and partly explain why the high prices for sterling area commodities, such as tin, rubber, tea and cocoa, have had so little effect on the Continent have eaten into the sterling area's on the exchange rate. It is flanked by a widening divergence between sterling and dollar wholesale prices illustrated in the accompanying chart. For commodities entering into international trade the relative level of sterling and dollar quotations is greatly influenced, not by the rate for official sterling but by the transferable variety. The widening margin between the American and British wholesale price levels has kept fairly closely in step with the widening discount on transferable sterling.

This divergence in prices may also reflect something more basic—a greater degree of inflation in the United Kingdom and the sterling area in general, than in the

United States. The domestic economy in the United Kingdom has in recent months become so buoyant and voracious that it is beginning to absorb imports of certain products that normally come from home sources (steel sheet, tinplate and coal, are examples). It has also absorbed into domestic consumption some of the products that ought to be exported. This is not another 1948, when the existence of "two-price worlds" heralded the devaluation of sterling. The productive power that lies behind sterling today is much greater than it was six years ago, and the price margins dividing the dollar and sterling worlds are much narrower. But the symptoms, modest though they were, showed the need for the brake of monetary policy.

The recent weakness of sterling has been all the more significant in view of the behaviour of short-term money rates in the London and New York markets. The rise of these rates in London had outstripped the corresponding movement in New York. Helped by the fact that three months forward sterling had remained at only 1/16 discount on the spot rate against the dollar, this disparity in short-term rates allowed a fair amount of interest arbitrage; American money had been coming to London for three months, fully covered by forward sale of sterling and earning appreciably more than could be

obtained from a comparable investment in the New York market. This must have given some support to the spot sterling rate. On the other hand the advance in the London short-term money rate has not gone so far as to deter overseas borrowing on short-term commercial account in London. Sterling acceptance credits are fully utilised, especially on behalf of customers in European countries where money rates are appreciably higher than here, notably France, Germany and Italy, thus feeding additional sterling into the exchange market.

There was no sign of a bear account in sterling, but the world at large was clearly registering a feeling of indecision about the pound. The evidence—slight though it may be—of inflation in the United Kingdom, the steadily mounting level of wages and of wage demands had not escaped it. Sterling was no longer being regarded as a currency that before long would be indistinguishable from the dollar in its hardness and convertible qualities. The world marks all these facts in its assessment of the "proper" rate of exchange. Now, it may be hoped, it will equally mark the implications of the precautionary change in Bank rate—the first clear evidence that the authorities in London will use the instrument of dearer money as a normal regulator instead of reserving it simply for crisis occasions.

The Credit Background

THE spate of facts, opinions and analyses that pours from the banks at this time of year regularly invites attention for the light it may shed on three quite separate questions—the monetary trends, what the City thinks about the business prospect and public policy, and how the banks themselves are faring. Comment may sometimes be rightly focused upon one of these themes, but this time it is necessary to glance at all three.

On the monetary trends, the message from the bank balance sheets is moderately reassuring. Credit expansion continued last year but at a somewhat slower rate than in 1953, although industrial production rose almost as fast as in that year and financial activity was much greater. "Net" deposits of the clearing banks touched a new peak at the year-end, at £6,558 million, showing an increase of £188 million compared with one of £216 million in 1953 and £119 million in 1952.

The source of this credit expansion was, however, very different from that of the two preceding years. In 1952, under the influence of the credit squeeze and falling commodity prices and the localised business recession, the private sector of the economy sharply reduced its indebtedness to the banks, but the credit effects of these repayments were much more than offset by heavy additional demands by the Government upon the banks. In 1953 Government borrowings were again

the source of credit creation; and even though these demands were probably less than half those of 1952, the pace of credit expansion increased, because repayments by the private sector had almost ceased. This relationship between the sectors was almost precisely reversed in 1954: the private sector became an active borrower, while the Government succeeded in making a small net repayment.

Bank advances, which had reached their lowest point in October, 1953, at £1,654 million, last year rose by £191 million, or 11 per cent, to £1,897 million, whereas in 1953 they had fallen by £42 million. This rise, it will be noted, was actually slightly larger than the whole rise in net deposits (the much bigger rise in gross deposits gives a distorted impression, being inflated by the abnormal volume of cheques in course of clearing at the year-end). In addition, the banks' portfolios of commercial bills rose by £35 million, or by nearly three times as much as in 1953. The change in the credit needs of the private sector proper was not, however, so violent as these comparisons suggest; rather more than half the difference was probably attributable to the big fluctuations in the bank indebtedness of the nationalised public utility industries, whose outstanding loans happened to be unusually low at the end of 1953 but high at the end of 1954.

Whatever the precise weight of this factor, it is clear

that central government operations, including those of the "departments," were putting a brake on credit expansion last year instead of pressing on the accelerator. This change was primarily a reflection of the unexpected improvement in the domestic finances of the Exchequer—the big decline in the "above-line" deficit, heavy net borrowings on tax certificates, and a swing from deficit to surplus on "savings" securities. But, large though it was, this improvement would not by itself have enabled the Government actually to reduce its indebtedness to the banking system, because the resources accruing from these domestic channels were being fully absorbed in financing the surplus on Britain's external finances. In other words, the full effect of Government operations in restraining credit expansion was the outcome of deliberate policy—in seizing the chances provided by a generally firm gilt-edged market for funding issues and sales of securities through the "taps." Thanks to the success of these operations in selling securities to the public, as well as to the readiness of several of the banks to add to their own investment portfolios, the year's credit expansion has been accompanied by a tightening of the banks' liquidity ratios.

If their activities are judged over the year as a whole, the monetary authorities are therefore shown to have exerted a sensible restraint; but it is not certain that their policy has been equally alive to the situation that has been developing in the past few months. The big increase in the credit intake of the private sector shown on the annual comparison was, in fact, largely the product of the demands of the autumn—despite the fact that that was a season of boom in the new issue market. There is some evidence that these credit tendencies have been gaining an undue momentum. Yet the monetary authorities chose to make their last conversion operation on "no-change" terms—a decision that scarcely implied any expectation of the rise in money rates and gilt-edged yields that started at that very moment.

Except for the doubts that several of them voice about the growth of hire-purchase, the bank chairmen in their annual statements have not alluded to these credit trends. Two of the three statements that have

appeared this week have indeed matched those of last week in their warnings about the dangers of the longer-run drift to inflation. Lord Harlech, of the Midland Bank, and Lord Aldenham, of the Westminster, have emphasised the dangers for the export trade and for the future of savings of the persistence of a steady pressure of "cost-inflation." There is no doubt that the bankers, as a group, are worried about the underlying trend. But it cannot fairly be said that their statements as a whole have this year uttered any immediate warning, still less that they have appealed for any general tightening of financial policy. Most of them, indeed, still evidently look for "incentive" reliefs in taxation in the coming budget—without making the point that it may be the duty of monetary policy to make such reliefs possible. Lord Aldenham observes, prophetically, that a rise in Bank rate would be "much less undesirable" than inflation; and Lord Harlech seems concerned at the part that last May's reduction of Bank rate may have played in the rise in equities "to a level at which they heavily discount the prospects of continued high activity in industry and trade, a further growth in business profits and larger distributions therefrom."

The third major theme in the seasonal flow relates to the activities of the banks themselves. In their annual statements several of the bank chairmen have this year given more information than usual about their internal policies, problems and organisation. Sir Oliver Franks, the new chairman of Lloyds Bank, has indeed devoted the whole of his statement to a survey of the ways in which Lloyds Bank has been adapting itself to the far-reaching changes that have occurred in the past sixteen years. He shows clearly why the three-fold expansion in deposits since 1938 (and the quadrupling of turnover) is not "an unmixed blessing." During the period of maximum expansion of the resources available to them the banks were experiencing not only a general rise in costs but a fall in the rates their resources would earn. Then, at the very time when the curve of deposits flattened, the curve of costs steepened, so that an increase in commission charges became necessary; and it is only since the swing to a flexible monetary policy that the "downward pressure" on earnings

*Excluding balances from or loans to subsidiaries.
†Excluding "Trade" investments.

has been "mitigated." It is interesting to learn that, despite these big changes, the average rate earned on Lloyds' advances during the past six months was less than $\frac{1}{4}$ per cent higher than in 1938, while commission charges provided about the same proportion of earnings as they did then.

The problem of dealing with a greatly increased turnover has been met by big changes in organisation. In consequence of intensified mechanisation and of a big intake of female staff, now almost three times as large as before the war, the male staff has actually been reduced, yet there are many more managerial posts to be filled, and promotion comes sooner. These changes, Sir Oliver claimed, have "ended the disheartening fifteen-year or twenty-year apprenticeship" that even the ablest of bank clerks used to have to endure.

These and other facts from Sir Oliver's survey deserve to be set beside some of the recent criticisms of the banking system, both in the context of salaries and of the charges that the banks have been slow to modernise their methods and are too timid as lenders.

On the Right Track

PLANNING can easily degenerate into exercises in round numbers, and there are plenty of these in the plan for modernisation and re-equipment of British railways that the Transport Commission has submitted to the Minister. It seems ambitious, but the measures that are proposed will, after fifteen years, put this country's railway system no further ahead than, say, the Dutch railways today. There is nothing of a technical revolution here; the plan merely testifies that in fifteen years British railways may catch up with the facts of railway working as most civilised countries know them.

Broadly, the plan proposes that £1,200 million should be spent on a programme of capital works, starting within five years and to be completed within fifteen years. This expenditure, the Commission expect, "will ultimately attract a return amounting to at least £85 million a year." But these figures (which are based on prices last autumn) imply something more than a gross 7 per cent return. The Commission would have to spend half of the money anyhow, merely to maintain the present services. They reckon that £400 million will be provided from depreciation provisions (evidently only two-thirds of what they should be) and that £800 million will have to be borrowed. So, on another set of assumptions, the plan presupposes a return of 10½ per cent gross on new money.

The plan is given an air of inevitability—nothing much less than this will suffice if Britain is to have a modern railway system. A net investment of about £50 million a year (say 2½ per cent of the country's

To these charges two others among the bank chairmen reply point-blank. Lord Harlech gives an impressive catalogue of the Midland Bank's 27-year record in mechanisation of the basic bookkeeping processes of banking and of its constant search for machine aids for more specialised processes.

To the charge that the banks are timid lenders, Mr A. W. Tuke, of Barclays, has replied that the bank is very willing to make unsecured advances "in appropriate cases"—he explains that these do not usually include salaried customers—and states that such advances accounted, at a recent date, for between one-fifth and one-quarter of total advances. The profit motive and free competition between the banks in this field together ensure, he says, that the customer gets all the credit his finances justify—"sometimes perhaps a little more." The CIC and selective control, he thinks, rarely now prevent bankers from making loans that would be justified by the traditional canons of bank lending—though that body is regarded by "some" as a "diabolical interference" with free enterprise.

gross investment of all kinds) is well short of visionary, in relation to railway assets valued in the books at £1,300 million. If £105 million to be spent on the track secures main line speeds of "at least 100 mph where conditions permit" British railways will be able to look France in the face. The signalling programme, costing another £100 million, is an essential complement to track improvement to secure the fullest and safest use of the lines.

"The end of the steam era is at hand." It is not so long since railway spokesmen were extolling the cheapness and reliability of the steam engine as a power unit. Now all is changed. There is no longer any nonsense about diesel traction being uneconomic ("We have short hauls in this country compared with America") or strategically dangerous ("We must rely on indigenous fuel"). It is not the haul that counts, but efficient rostering. It is not imported oil but inadequate coal that constitutes the threat. The Commission propose to combine electricity and diesel traction "to the best advantage." The difficulty here is to be certain where the best advantage lies. There is a general presumption in favour of electrification of densely occupied tracks, but big engineering works are entailed, and the introduction of new electric services takes much longer than changing over from steam to diesel, which involves no major works on the track. There would be a good deal of logic in the rapid introduction of diesel locomotives on main routes, to give an immediate stimulus to traffic and staff, while the electrification projects are

steadily maturing. That would lose none of the eventual advantages of electrification—for they will be slow in coming in any case—but it would give a clear interim gain over steam working.

THE PLAN SUMMARISED			
TRACK:	£ mil.	PASSENGER TRAFFIC:	£ mil.
Bridges	20	Station improvements	55
Realignment	25	Carriages, electric and diesel multiple unit vehicles	230
Strengthening	35		
New lines	25		
	105		285
SIGNALLING:		FREIGHT TRAFFIC:	
Colour lights, power boxes, etc.	85	Marshalling yards	80
Automatic train control	20	Goods stations	50
	105	Continuous brakes	75
		New wagons	150
TRACTION:			365
Electrification—		SUNDRY ITEMS:	
LMR & ER main lines	120	Ports	12
SR extensions	25	Development and Research	10
Suburban	40		
Diesels—			
Main line locos	125		
Other	25		
	345	Total (say)	1,200

Due allowance must be made, however, for the capacity of the manufacturers of the various classes of equipment. A total of 2,500 mainline diesels over 15 years means turning out one every two days; at the end of 1953 there were four in service. It is difficult to put any reliable figures on capital costs when the order involves a transformation from bespoke work to mass production. The plan says that "the present cost of a diesel locomotive is about two and a half to three times that of a steam locomotive of equivalent power." But surely there should be considerable economies in an output of the scale that is contemplated, and the same consideration presumably applies to other major elements in the scheme. It appears, for instance, that the cost of fitting goods wagons with vacuum brakes would be about £75 each; figures recently quoted by the Foreign Operations Administration for the supply of fitted goods wagons to India put the cost of British vacuum brakes at \$90 or just over £30 per vehicle.

If this plan goes through, the railways ought to rely on outside suppliers for a major part of their motive power though it is not clear that they intend to do so. This would be a change of immense consequence, for they would become customers of industries that ought to be on their toes to supply them efficiently and economically, and could have an important contribution to make towards technical problems of traction and railway working. The United States has shown how important such a contribution can be; and the transport history of this country shows how much British railways have lacked it.

If, in any case, £600 million would have to be found to replace the present system, another £600 million does not seem an outrageous addition to provide a modernised system of railway transport. The implications for the better use of labour are under-stressed in the plan, but at least it is clear that one of the conditions

of greater cooperation and better morale among the staff is a radical improvement in the equipment that they now have to work. Nor is it at all probable that some sections of the travelling public will like what is in store for them. Last year, about 216 million loaded passenger train miles were run. By 1970, the figure might be 204 million. But while the fast and suburban mileage will increase there will be "a marked reduction" in the stopping and branch line services that last year accounted for two-fifths of the total mileage. The fruits of reorganisation, so far as passenger services are concerned, rest on a comprehensive proviso:

Provided that the passenger service as a whole can be overhauled, and that improved and highly competitive services are offered in those fields for which the railway has the natural advantage, the remaining services being either turned over to new forms of motive power or transferred to road, there should be an overall improvement in working results of around £35 million a year.

There will also be a great outcry from those who have long been accustomed to branch line services at fares wholly out of relation to economic costs.

It will be said that the guess of £85 million net from the scheme will give the railways prosperity, holding out glittering opportunities for higher wages and lower charges. It does nothing of the kind. Of the potential gain, £40 million will be absorbed in interest on new capital; another £15 million extra will be needed for depreciation on the new assets; and £25 million or so of net surplus is by no means an excessive provision for the railways to strengthen their resources and keep their fixed capital in a healthy state by continuous improvement. If, as the plan suggests with some optimism, the total return "might conceivably be much greater," so much the better. Some forms of profit-sharing incentives might help towards achieving these gains. But the plan involves such a revolution of minds to march with the improvement of technical means that modest expectations are probably wiser. On such a condition, the Government ought to give it the most serious consideration.

Business Notes

Before the Dust Settles

ON Monday, when the gilt-edged market reached a temporary trough and talk of a higher Bank rate was widespread, some jobbers in the gilt-edged market were putting around this paradox: "The one thing that could make our market move upwards would be a half per cent rise in Bank rate." The Governor of the Bank of England has obliged. Bank rate rose $\frac{1}{2}$ per cent to $3\frac{1}{2}$ per cent on Thursday. The paradox has not worked out—not quite. Long-dated gilt-edged stocks made a brave showing but in the end they fell slightly—usually by $\frac{1}{8}$, bringing $2\frac{1}{2}$ per cent Consols, for example, down to $64\frac{1}{2}$. But the fall was generally smaller than the advance that had occurred on Wednesday.

In the short-dated gilt-edged market a different set of conditions applied. Here prices had to be adjusted to a new series of money rates that had not fully emerged by Thursday evening. In particular it was necessary for jobbers to make a guess at the approximate rate at which the Treasury bills would be allotted not this week but in the weeks that follow. As a pure guess, they made the assumption that the rate might eventually settle down somewhere near $2\frac{1}{2}$ per cent. Prices of short-dated gilt-edged were therefore marked down relatively sharply, but no one supposed that the process had been completed. At what price, for example, will the Government broker be prepared to release Treasury 2 per cent stock 1960? That he will be prepared to meet the change in conditions seems a reasonable assumption, but it will need time for the short-dated market to find its level.

The rest of the market, both gilt-edged and industrial, has suffered a minimum of disturbance. There was no flurry of activity immediately after the Bank rate announcement. The advance in industrials was checked and then quickly resumed, undismayed by Bank rate. How does logic equate a rise in Bank rate to $3\frac{1}{2}$ per cent and the rise in the *Financial Times* ordinary share index to a new high of 194.4 on the same day? There can seldom have been a Bank rate change that has produced less immediate reaction on markets, and therefore since a cause of doubt has been removed the new way seems clearer for steady markets except among the shorts. But experts will watch carefully to see what the effect on the sterling exchange rate may be before they give many hostages to fortune.

The Pattern of Rates

IT will be several days, perhaps, before the full effects upon the pattern of rates can be clearly seen. The clearing banks, as expected, modified the practice that has obtained

in recent years, and have raised the rate allowed on deposit account balances by only $\frac{1}{4}$ per cent, to $1\frac{1}{4}$ per cent, and reduced the minimum notice for deposits from twenty-one days to seven, whereas the minimum charge for short loans to the money market has been raised by the full extent of the move in Bank rate and the differential rates against Treasury bills, commercial bills and bonds are now all amalgamated at $1\frac{1}{4}$ per cent. The margin of deposit rate below Bank rate is thus restored to the 2 per cent that obtained in the nineteen-twenties (the last phase of flexible money)—and since then had ruled only for the recent period of the 4 per cent Bank rate. More significantly, a margin has at last been opened up again between the deposit allowance and the short loan charge—which is a much more natural arrangement than has obtained in these postwar years.

Stag Fodder

IN a sense the offer for sale of 10 million £1 Ordinary shares of Colvilles at 26s. per share marked the climax of a great financial achievement. Of the seven steel unscrambling operations planned for the first stage of the realisation agency's operations only the relatively small Whitehead Iron and Steel equity remains to be sold. It is true that the agency still has a vast amount of work to do: it has to tackle the Steel Company of Wales—though that mammoth operation now looks nearer and is perhaps less than a year away. There remains a host of smaller steel companies many of which may be offered by the agency supported by just one or two City houses. There remain also the prior charges in companies whose ordinary shares have already been sold; some of these will involve public offers, others placings. The consortium of eight leading issuing houses and six leading brokers (supplemented this time by one from Glasgow) is not being dissolved; it will be needed certainly for Steel of Wales and possibly for some of the others.

Yet investors will look upon Colvilles as ringing down the curtain on Act I of the consortium's performance. What an uproarious finale it was. With 150,000 applications for 120 million shares (not counting the firm applications of the underwriters) Colvilles was by far the most heavily oversubscribed of the steel offers. Allotments to the general public were so scaled down that applicants for between 50 and 1,000 shares got only 50, and the maximum allotment was only 100. Former shareholders fared better; applicants up to 200 shares received full allotment, and the big applicants 3 per cent of their requirements with a maximum allotment of 1,750 shares. It followed that when dealings

started on Tuesday an enormous number of tiny holders were waiting to sell. But the buyers outweighed the sellers for many institutions are now happier about adding steel shares to their portfolios. The shares opened at 2s. 1½d.-2s. 6d. premium, advanced to over 3s. premium and then dropped back to around 2s. 3d. premium—all on a dull market day when industrial shares as a whole were declining. They settled down later at a little over 2s. 6d. premium.

Industry and the Railway Plan

WHAT business will there be in the new railway programme for the locomotive, carriage, and wagon builders and the electrical manufacturing industries? Since 1947 British Railways has added just over 2,300 locomotives to its stock to replace obsolete units. But over three-quarters of these were built or assembled in its own workshops, including all or nearly all the 60 electric and 240 diesel-electric locomotives, though the power units and some of the mechanical parts for these were contracted out. The new programme envisages the construction of 2,500 main-line diesel locomotives, 1,100 main-line electric locomotives, and another 1,200 diesel shunting and trip units after the present programme for 573 diesel shunting units ends in 1957 (nearly 100 of these have already been built). Some of Sir Brian Robertson's comments on the plan early this week gave a general impression that the work might come mainly to private manufacturers. That impression—and the resultant fillip given to shares in some of the companies—seems to have been too optimistic.

	Price Dec. 31	Price Jan. 21	Price June 26	Assumed Dividend %	Yield

There are now suggestions that much of the programme will probably be carried out in the railway workshops at Swindon, Crewe, Derby and elsewhere, though the value of bought-out components in the new engines will be much higher than in steam locomotives. The Transport Commission claims that it is cheaper to build or assemble its own locomotives; though this may be so because it does not charge itself any profit on the £15-20 million of capital that is tied up in the workshops. In the Commission's view, its own shops are well equipped to produce most of the 3,275 main-line and shunting locomotives that are to be built.

The programme also aims at introducing 31,000 new passenger coaches and 255,000 wagons by 1970. The first figure includes 3,600 multiple unit electric vehicles and 4,300 multiple-unit diesel vehicles. Recently, two out of every five new coaches have been built under contract. This

share may increase, since the programme implies a substantial increase over the present rate of construction; it also includes an unspecified number of powered electric and diesel cars, which the railway workshops are at present less well equipped to build. The wagon-builders, however, will not have ignored the heavy cut foreshadowed in the freight rolling stock, following more economic wagon operation and the use of larger wagons. As a result, the average annual rate of construction throughout the period of the new programme will drop to a third of the present level, and the lion's share that has gone to outside firms in the past may now be retained by the Commission. This business, furthermore, may come later when the bulk of existing wagons have been fitted with continuous brakes.

At this early stage the future looks least bright for the private wagon-builders, whose export business has never been very large. Locomotive firms may see little benefit in the new programme, too; the broad smiles are on the faces of those who make brakes, power units and other parts for diesel and electric locomotives.

Purchase Tax in a New Light

IT had been expected that when Parliament reassembled Mr Butler would have something to say about the changes in purchase tax that came into operation on Monday; but what he did say was quite unexpected. Last year, the Chancellor created for himself what could have been an awkward precedent by announcing, shortly after a number of purchase tax changes had been made, that no further changes would be made in the Budget due to follow in two months' time. There was general curiosity to know whether he would give the retail trades the same assurance this year, or whether his silence could be taken to mean that he was planning more extensive changes. In fact, he had what seemed to be a principle to enunciate—that, in his view, purchase tax changes should not be confined to the Budget, and that full use should be made of the government's authority to alter the liability of goods to tax at any time by Treasury order.

Both last year's changes and this year's, the Chancellor pointed out, were made to deal with "special situations"; that is, with special cases of hardship or the correction of anomalies. Certainly Monday's adjustments have little financial importance, costing about £500,000 in a full year. But the fur trade will be encouraged by a tax concession that moves it from the luxury class of goods taxed at 75 per cent (which it shared with cosmetics and the more lavish greetings cards) to the less exotic class taxed at 50 per cent. The only other major adjustment was the taxing—at the rate of 25 per cent—of motor units for bicycles, bringing them into line with bicycles sold with the engine already fitted.

If the Chancellor is seriously contemplating announcing future tax changes whenever it seems convenient, then he is returning to a practice that was specifically condemned by the committee which, under the chairmanship of Sir Maurice Hutton, studied this special problem of losses on tax-paid stock. The committee strongly recommended that retailers should know when tax changes could be

FOR NEW IDEAS*

ON MECHANIZED FIGUREWORK

The man from Remington
Rand is highly-trained in all
branches of modern account-
ancy. If there's too long a
time lag in compiling balances,
analyses or statements, if pay-
day preparations are a head-
ache—call him in. He'll get
to the root of your accounting
problem, and provide the
equipment to solve it.

* THIS IS
FOREMOST
—the modern accounting
machine. Easy to install;
easy to operate; adapt-
able at a moment's notice
to any accounting job.
Automatic balances; line
proof of accuracy. Cuts
accounting costs drastic-
ally, yet remains within
the means of quite
modest businesses. In-
terested?

A sherry that is sheer delight

A perfect gift to the most critical palate, Pintail is an exceptionally fine sherry, both pale and beautifully dry. Specially selected at Jerez, this proud product of Spain is available in a trial pack of two bottles at 42/7d; subsequent supplies at £12 per dozen bottles. Your orders will have prompt attention.

Pintail  **SHERRY**

FROM PAKISTAN

A New Airline...

KARACHI VIA CAIRO
UNDER 16* HRS

-Fastest Time Ever!

Now! From Pakistan comes a new airline—Pakistan International Airlines. Flying a fleet of sleek Super-Constellation aircraft, P.I.A. (as it expects to be called) will travel East and West in the fastest commercial flying time ever. Starting February 4th, the new service will link London and Karachi via Cairo in less than 16* hours flying time (West to East 15:50 hrs.; East to West 17:50 hrs.). Regular weekly flights will leave London on Friday, and Karachi on Tuesday. Hospitality aboard will be eastern in style. P.I.A. will bring to East-West air travel an Atlantic standard of luxury aloft. Its domestic network will cover Pakistan, East Pakistan and India, and its booking service will arrange flights to all points East. See your local travel agent for detailed information.

**FLY
PAKISTAN INTERNATIONAL
AIRLINES**

SUPER-CONSTELLATIONS, specially fitted for P.I.A., will bring a new standard of luxury to East-West air travel.

TOURIST AND FIRST CLASS FARES will comply with normal competitive rates. It will cost no more for P.I.A. speed and comfort.

P.I.A. BOOKING SERVICE can arrange through P.I.A. international and domestic networks, or will use other airlines, to fly you to all points East.

expected to take place, and that the time chosen should be the Budget, so that since there had to be uncertainty and speculation over this major revenue tax (which brings in a steady £300 million a year) these should be confined to a known period of the year and not spread over the whole twelve months. It is possible that Mr Butler was nimbly avoiding his own trap—he warned against drawing any inferences from his statement. But if he is not, and if he does mean to make purchase tax more or less independent of the Budget, retailers will regard this as anything but a concession.

Open Market in Copper?

How should copper be priced—by the operation of supply and demand or by some arbitrary means? Fabricators in this country are concerned that prices on the London Metal Exchange are at present much higher than in the rest of the world, to the advantage of some of their foreign competitors. They also fear increased competition from other metals. The London market accurately reflects supply and demand for the copper that it handles, but few would deny that the turnover is too small: hence the very high and fluctuating prices of recent months. Other complaints are that electrolytic copper is only rarely delivered on the market, and then usually at a premium; and that the persistence of the large discount on forward copper makes the market an unsatisfactory hedging medium. Fabricators are naturally attracted by the idea of a stable (and lower) price. Like many industries, they would normally be more interested in stability than in the absolute level of price; stability is convenient, and would fit in with the policy of selling their products at agreed prices. It is hardly surprising, therefore, that consumers recently approached the Rhodesian producers, who provide most of Britain's supplies, to examine whether a stable system of pricing copper could be worked out. The Rhodesian producers are in two minds, as their statements this week have disclosed. The Mufulira and Roan Antelope companies, under the wing of Rhodesian Selection Trust, have expressed their sympathy with the idea, and will continue to examine the question with consumers. The Nchanga and Rhokana companies, operated by the Anglo American group, disagree: they are opposed to any interference with the free market, and consider that the metal exchange price is the best basis for their sales of copper.

Surely this is the right approach. There is little doubt that the market can work satisfactorily, if producers and consumers are prepared to make it work; the technicalities of the contract are of secondary importance. For the consumers, this means that they should fully use the market's facilities—in particular, to buy forward. For the producers, it means that they must feed more metal to the market. The statement of the Nchanga and Rhokana companies implies that they are prepared to do so—otherwise there is little point in their suggestion that the question of a contract for electrolytic wirebars should again be examined. And it would be in consumers' own interests to agree to take rather less copper under their direct long-term contracts with the producers, and more through the market.

Although it is difficult to see how one producing group could sell in Britain at fixed prices, without the co-operation of the other group, there are other reasons why consumers should pause before embracing the principle of fixed prices. They would be surrendering most of their control over price, and the metal exchange—if it could function at all in those circumstances—would be a completely unreal barometer of price. And all parties should bear in mind that it is only a few years since they were governed by American prices and praying for the reopening of the London market.

Par Values and Coronets

ALL discussions on the issue of no par value shares have one feature in common. Those who know the subject support the permissive introduction of no par value shares. The opponents come from those whose knowledge of finance is second-hand. Tuesday's debate in the Lords on Lord Cromer's motion was no exception. It revealed only one confirmed opponent of the NPV share—Lord Pethick-Lawrence—and his main line was the thesis maintained by Mr Beard in the minority report of the Gedge committee—that the TUC would find no par value a difficult concept to explain to its members. The debate revealed several well informed supporters of the alternative view that no par value shares might sweep away the cobwebs of obscurity. Among them an excellent speech came from Lord Balfour of Burleigh; it was well up to his old style—racy yet based on an intimate knowledge of finance. His reply to Lord Pethick-Lawrence was devastating: "It is not only the TUC who have difficulty in explaining company finance to those whom they seek to enlighten." And his case for the NPV share was concise: "If there is a fictitious element at all it is in a 10s. share nominal which is worth £4 on the Stock Exchange, or a £1 share which is worth nothing because the company is bankrupt. That is much more fictitious than a share of no par value, the price of which on the market will correspond exactly with what it is worth in money yield."

Nearly all debates on shares of no par value have another element in common: they fail to mark a definite advance. Unfortunately the Lords debate was also in that class. Lord Mancroft, Joint Under-Secretary of State at the Home Office, who replied for the Government, had to announce that there was no hope of legislation in the present session—a decision that he based on the consequential tax changes that would be needed in income tax, surtax, profits tax, and estate duties. These reservations seem mysterious: Lord Mancroft did not explain them nor did they impress themselves on the Gedge Committee. Naturally that committee did recognise, as Lord Mancroft again pointed out, that an alteration of the companies' capital duty would be involved. Still he left the House in no doubt which way his own and the Government's feelings lay. The Government supports the majority findings of the Gedge report; it believes that a strong case has been made out for alteration of the company law so as to allow companies to issue ordinary shares of no par value if they wish to do so.

Active Year in Lombard Street

THE steady rise in money rates which culminated in Thursday's increase in Bank rate, has been too recent a phenomenon to have had any important impact on the earnings of the discount houses in 1954. That period was still predominantly one of falling money rates, rising turnover in both bills and bonds, and of capital gains in the bond portfolio. The increase in Bank rate will probably now involve the market in some erosion of the capital value of bonds in its portfolio and losses on bills—though to an extent limited by the gradual edging up in the Treasury bill rate for the past two months. This had brought the market rate at the last tender before the Bank rate change to just under 2 per cent, a mere $\frac{1}{2}$ per cent below the rate prevailing immediately before the Bank rate was reduced from $3\frac{1}{2}$ to 3 per cent in May, 1954. What the market gained on the change down in 1954 may not therefore be wholly lost in this week's change up.

In 1954, certainly, the market enjoyed a profitable year. Only three discount houses have accounting years to end—December—the Union Discount, the National Discount and Alexanders, and since these are the giants of Lombard Street their earnings experience is not always an accurate reflection of that of the market as a whole. But in 1954 the rise in their published profits was probably a fair guide. The net profits of the three houses together rose by 23.8 per cent—those of the Union rose from £368,000 to £505,000, those of the National from £370,000 to £452,000 and those of Alexanders from £282,000 to £305,000. Both the Union and the National paid higher rates of dividend on increased capital; the Union's rate of $12\frac{1}{2}$ per cent compared with a rate equivalent to 9.63 per cent in 1953, whilst the 12 per cent paid by the National on its "B" stock compared with a rate equivalent to $7\frac{1}{2}$ per cent. Alexanders made no increase in its total distribution, incorporating the bonus payment of 1953 into the dividend—an interim of $7\frac{1}{2}$ per cent paid on the old capital and a final of $8\frac{1}{4}$ per cent on the full £2.4 million of ordinary shares.

The balance sheets of both the National Discount and Alexanders—that of the Union Discount is due next week—reflect the larger volume of business in Lombard Street. The National increased its bill portfolio by £6 million, more than making good the reduction of 1953, and continued to add to its holdings of bonds. Alexanders also showed an appreciable increase in investments but added only fractionally to its holdings of bills. Sir Eric Gore Browne, the chairman, states that turnover in Treasury bills was slightly less and turnover in commercial bills slightly more than in 1953—a reflection of the more flexible rates on commercial bills obtaining after the reduction in Bank rate of May last.

Tamed Lion

THE National Film Finance Corporation has set up a new company to carry on the film distributing business of the British Lion Film Corporation, which was put into receivership last summer after losing most of the £3 million of public money that it had borrowed from the finance

corporation a few years before. The successor company, British Lion Films Ltd., takes over all the assets of the old, including accumulated taxation losses and the 94 per cent shareholding in British Lion Studio Company. The Shepperton studios owned by this subsidiary will continue to be leased for the making of films by independent producers, but British Lion Films will not itself produce films. As a distributing company it will continue to offer guarantees of distribution to British films; such guarantees, which can be discounted in the City for about 70 per cent of the cost of making the film, constitute the basic financial backing of British films, supplemented by various kinds of "end money," including the producers' own resources but mainly obtained from the NFFC itself.

The operation has cost the NFFC yet more in cash. It has agreed to pay certain creditors and bank loans of the old company, to the tune of £964,000; and it will subscribe in cash for £160,000 in loan stock in the successor company and transfer this to British Lion Studio Company in satisfaction of an outstanding debt. Against this the receiver has repaid the NFFC £555,000. Its outlay on British Lion, therefore, now amounts to £3,569,000, in consideration of which it owns the entire issued capital—600,000 £1 shares—of the new company. It is only fair to say that the whole sorry venture is not an example of the film finance corporation's business judgment in backing British film production; the initial and continued support of British Lion has been a matter of Government policy, cost what it may.

Britain's Best Customers

WHEN Ministers extol the expansion of British exports in 1954, a low bow to the 11 million people who live in Australia and New Zealand would not be out of place. Thanks to the relaxation of import restrictions, Australia spent £65 million more on British goods last year, and New Zealand an extra £26 million, bringing their imports from this country to £278 million and £126 million. The combined increase was equal to the rise of £91 million to £2,673 million fob in British exports, excluding re-exports, last year. To most other sterling markets such as South Africa, India, East and West Africa, where foreign competition was more severe, Britain either made no gains, or slipped back a little. As a result, exports and re-exports to all sterling countries rose by £77 million to £1,346 million fob. Exports to non-sterling countries were only £10 million higher at £1,428 million, but a sharp fall of £38 million in shipments to North America was more than offset by a rise of £28 million in shipments to the OEEC area and by a rise of £20 million in shipments to other dollar and non-sterling countries.

The engineering and chemical industries can take most of the credit for the expansion in exports. Shipments of engineering goods rose by £42 million to a record £1,012 million; sales of road vehicles and tractors were particularly high, but almost all groups shared in the rise. The major exception was electrical machinery, exports of which fell slightly to £170 million. Shipments of "other manufactures" rose by £35 million to £496 million, thanks mainly to the steady growth in exports of chemicals, which were £26½ million higher at a new record of £204 million.

It will not be easy for Britain to maintain its exports in 1955 at the record level of last year. The Australian and

New Zealand markets have lost a little of their bloom, and competition in all markets is plainly increasing. But though it would be optimistic to hope that much headway

can be made in Latin America and the Middle East as a whole, it is reasonable to expect further gains in exports to Europe and a recovery in exports to North America. Even so, Britain will be fortunate if the balance of trade is as favourable as in 1954, when the gross visible deficit fell by £50 million to £605 million. The small rise last year of about one per cent in the volume and value of total imports, to £3,379 million cif, concealed a marked rise in imports of many industrial materials and transient savings from the consumption of some official stocks, notably of grain. The volume of imports as a whole can be expected to increase, and prices are rising.

Analysing the Wholesalers

THE third and last volume of the massive 1950 Census of Distribution taken in 1950 was published this week. It puts the wholesale trade of the country under a microscope and proceeds to list its features in exhaustive, exhausting, but rewarding detail. There were, in 1950, 55,701 wholesale establishments in the country with total sales of £13,000 million. They are broken down here into wholesale merchants, exporters, importers, invoicing and non-invoicing agents, government departments, marketing boards and the buying offices of overseas companies.

The census is not confined to goods going to the retail trades; it covers wholesaling and buying operations in metals, scrap, chemicals, oil products, timber and other industrial materials. Their principal customers (£3,947

Aerosols Under Way

MIX a paint, cosmetic, insecticide or cream with a harmless gas that readily becomes a liquid under pressure; squeeze the mixture into a strong and attractive, hand-size container so that it will be forced out in a fine, controllable spray when a valve is opened; and the result is an "aerosol" dispenser. This pressure can is a peacetime development of the "bug-bomb" first used by United States troops in the Pacific war. Since 1948, when a cheaper and smaller aerosol package appeared on the American market, and the aerosol itself was released by the government, dispensers have been used for a widening range of products ranging from artificial snow for Christmas trees to moulding powders for plastics manufacture. About 40 million aerosols were sold there in 1951; nearly 200 million last year.

In Britain, development has been slower. But materials and equipment have not been easy to get, firms have taken some time to work out the best combination of container, valve, and propellant for each product, and the high initial price of aerosols compared with conventional containers has limited their market.

About 8-10 million aerosols are expected to appear this year (as against a

total of say 3,000 million conventional cans); and present plans indicate production of 30 million or more by 1957. Insecticides and air-fresheners are the largest packs so far, but shaving

cream and hair lacquers are also supplied in aerosols, and the paint spray to touch-up car and furniture surfaces may be marketed soon.

Tinplate makes the best container for most packs other than the most corrosive; but supplies have been tight and still are. Aluminium was used for all British packs before last August; its use is limited, however, by cost, its liability to corrosion, and the present difficulty to ensure air-tight seaming. Glass bottles can be used for highly corrosive and more expensive contents, provided they are first strengthened with a plastic or metal coat or a low pressure propellant is used inside the bottle. A wider choice and volume of valves are now made. But the propellant—Arcton, a fluorinated hydrocarbon compound—is made here only by ICI. Supplies are easier now, but this is still the most expensive component of the aerosol. The mixture of propellant and filling varies with the pack. For insecticide air-sprays as much as 85 per cent of the mixture is Arcton. A butane-propane mixture may be used; it is cheaper, but it is also inflammable and toxic, and its application is therefore small.

Filling the empty container is the other major cost item. Two methods—refrigeration and pressure filling—are used but experience and expensive equipment are needed. It is a specialist business; but about five companies have entered the field as "contract packers," who fill the pressure cans with their clients' products.

CARBORUNDUM and a present for Sir Isaac Newton

IN 1949, BRITISH ASTRONOMY received from the MacGregor Trust of Michigan the gift of a piece of glass. It was special, low-expansion glass—a disc more than 8 feet in diameter, weighing 5 tons and worth more than £10,000. This was the MacGregor Trust's very generous contribution to the 98-inch astronomical telescope that is to be installed at the observatory at Hurstmonceux, in Sussex, as a memorial to Sir Isaac Newton.

Sir Howard Grubb, Parsons, and Company, of Newcastle on Tyne, undertook the work of converting the biggest piece of glass in Europe into a 98-inch telescope mirror whose concave surface would nowhere depart by more than 2 millionths of an inch from a perfect sphere with a radius of some 50 feet. Before they began the job, they consulted CARBORUNDUM—as many highly competent engineering firms do when they are faced with specially difficult or important work that involves the use of abrasives. And

the consultation was fruitful: for the job of shaping this big piece of glass, CARBORUNDUM were able to develop special diamond wheels which eliminated the danger of overheating and cut the glass more cleanly and rapidly than it could have been cut without them. When they were used for machining the edge of the disc the new wheels were able to take cuts up to a sixteenth of an inch deep.

Including the slow, meticulous work of finishing, the making of the mirror from the disc has taken almost 2 years' actual working time, and has involved the cutting away of 1800 lbs. of glass. We were interested enough in this great undertaking to send the CARBORUNDUM Film Unit to make a 16 mm. record of the work, in colour, with a spoken commentary. We shall be glad to lend this film, free of charge, to responsible organizations who may care to see it.

Abrasive and Refractory products by CARBORUNDUM

THE CARBORUNDUM COMPANY LIMITED, TRAFFORD PARK, MANCHESTER

million) were in industry; retailers and grocers bought £3,000 million worth of goods through wholesale channels; wholesalers bought £1,944 million from each other, and sold £143 million direct to the public.

Sales, wages, and turnover of each group and sub-group are all listed, along with the major towns and urban districts where they work (half the wholesale trade of the country was carried out in London, a quarter of the total within the City). Purchase tax paid, government compensation, commissions, sales on commission and on own account, are listed one after the other for different trades and different types of wholesaler. So are the gross margins earned, the size of the stocks carried at the beginning and end of the year. Figures are given for the cost of transport and the method used. Wholesale merchants dealing in industrial chemicals spend £851,000 in transport, £97,000 of it being the cost of operating their own vehicles; the export merchants dealing in the same goods spent £564,000 on transport. The wholesalers' rate of stockturn is also given; in general, it seems plain that the census takers have been able to ask the wholesalers for rather more detail than they did the retailers.

There is, unfortunately, no regular series of wholesaling statistics, except in the textile trades, that would correspond with the retail sales index, and so no means of bringing the figures up to date. The census remains a sharply delineated picture of middlemen in 1950, the first of its kind ever to be taken in this country and a mine of information for those prepared to dig for their data. Now that the retail census has been published in its entirety, the amount and value of the data that the whole compilation provided reopens the question of whether a census of this kind should be taken only once a decade.

On Taking-off Vertically

NO major advance in engineering knowledge can have had such a risible public debut as the Rolls-Royce experiments in vertical take-off, films of which have been released this week. Dispensing with all the aerodynamic refinements normally considered necessary for flight—wings, runway, ailerons and other controls, rotor, or even any pretence of airframe, Rolls-Royce have demonstrated that a structure consisting just of two engines and weighing 3½ tons can be lifted into the air, steered and guided in the normal fashion and brought gently to land on nothing more tangible than hot air.

Having proved the soundness of the principle in this rough-and-ready fashion, the company's next step will be to develop a special vertical take-off engine that will be used simply to lift the aircraft to a certain height (and later to land it) after which the main engines take over and provide forward power. If and when Rolls-Royce can offer such engines to the aircraft industry, the effect on the outward appearance of aircraft is likely to be startling. Much of the present-day wing area is required for take-off and landing purposes only. So at the same time as the vertical take-off principle makes all forms of runway unnecessary, it dramatically cuts the amount of wing required; the ratio is roughly one pound of wing less for every pound of downward jet thrust. The only wing area remaining

will be what is strictly necessary for forward flight; something in the form of a narrow delta has been suggested. A big reduction in the unladen weight of aircraft is expected. This makes vertical take-off economically important to the civil operator as well as to the military.

It may well take as long as 15 years to produce a vertical take-off airliner, but application of the principle to high-speed fighters is likely to be pressed ahead as rapidly as possible. The vulnerability of modern high-speed flight is its total dependence on runways of massive weight and strength. The pressure in Nato for "light" fighters stems from fear of the fate of the fighter bases in Western Europe, built at a cost of £3 million apiece. Rolls-Royce is the first company to produce an engineering formula—as distinct from a make-shift device like rocket launching—that offers a way out of this dilemma.

Prospect for Rubber

THIS is the time when brave spirits in Mincing Lane reach for their crystal balls to see what the new year holds for natural rubber. The exercise is hazardous: last year most forecasts of production and consumption missed the mark, yet on the most vital point—the forecast of a negligible surplus—the crystal did not lie. Instead of declining, world production rose last year by some 35,000 tons to an estimated 1,760,000 tons, but world consumption rose by well over 100,000 tons to a record of about 1,730,000 tons. The figures can only be approximate, but there is no doubt that the apparent surplus was small. With a little absorption into government stockpiles, there was no sign of any rubber seeking a home. From a trough of 16d. a lb in March, the London spot price had almost doubled by the end of the year. Temporary interruptions of supplies and speculation played a part in that advance, but the market is still firm.

At anything like recent prices, production should increase further, perhaps by some 50,000 tons. Will consumption show a similar increase? American consumption and imports into the Soviet bloc and China are the two major imponderables. Forecasts of American consumption are complicated not only by price, but on the effects of the probable transfer of the government's synthetic rubber plants to private industry. The American manufacturers expect consumption to rise by about 30,000 tons to 1,260,000 tons of all rubber this year; that estimate assumes a larger production of motor cars and larger sales of replacement tyres, but it may still be on the low side. How much of the total will be natural? The high price of natural rubber has already stimulated a switch to synthetic; the ratio of natural to total rubber consumption dropped from 49.7 per cent in September to 46.4 per cent in December and may drop below 45 per cent. Hence it seems prudent to assume that America will not use more natural rubber this year, and may use rather less.

What are the prospects for increased consumption in the rest of the world? With a further expansion in the output of motor vehicles, consumption in Western Europe and other countries may well increase by some 30,000 tons. The outcome of the recent negotiations between Indonesia and Russia and China is not known, but they at

least suggest that the Communist countries are interested in obtaining more rubber from Indonesia—it would be foolish to guess how much more. Thus it is probable that part of the increase in world production this year will be absorbed and that the surplus will not be burdensome. It may well be unwise for the natural rubber producers to hope for more than that. Present prices are encouraging the use of synthetic rubber in Europe as well as the United States, but no radical weakening in the market is yet in prospect; for seasonal reasons any surplus is not likely to appear until the second half of the year.

Computers on the Counter

A BIG sales drive for electronic computers has been started by Elliott Brothers with the appearance of an elaborate and most effective brochure describing the company's small "402" computer and its possible uses. Skilled publicity of this kind is needed to break down the general suspicion in industry towards what the layman regards as the brain-children of scientific Franksteins but which are in fact valuable office tools. Although the Elliott computer is put forward as the first "brain" to be marketed as a standard commercial product, both Ferranti Limited, and J. Lyons, the caterers, have, or soon will have, competing designs on the market, and Ferranti intend to start a computing service in London shortly. Such a service is already being operated by Elliott Brothers.

Britain's Share of Shipbuilding

AT the end of 1954 about 37 per cent of the ships under construction throughout the world were in British shipyards; of ships commenced, launched and completed during the year, the British share was a little less than 30 per cent. All of these percentages were slightly higher than in 1953; combined with the record figure of tonnage completed—1½ million gross tons—and recently of ships commenced—75 ships of 437,376 tons in the final quarter of the year—they provide backing for the moderate confidence now evident among British shipbuilders.

How much importance should be attached to the marked rise in orders for British yards during the last quarter of 1954 it is hard to say. During the year as a whole the yards had a net addition to their order books (i.e., allowing for the cancellation of about 300,000 tons of ships, mainly by foreign owners) of only 334,000 tons, about a fifth as much as was completed during the year. British shipbuilders for the most part are sensibly inclined to take that as a welcome reduction in the tremendous amount of outstanding tonnage on order that was built up a few years ago, which inevitably put off new customers in 1953 and 1954. Britain has still far more orders on its books than any of its competitors, and the deliveries it can offer are still longer than shipowners can obtain abroad. But its main rivals, Germany and Japan, have steadily grown busier too; and German shipbuilders in particular, with delivery periods, are developing the same reluctance as British to quote fixed prices.

SHORTER NOTES

Last year's earnings of the Blue Circle Group of cement companies were substantially higher than in 1953, thanks largely to the cessation of the non-profit-making imports of foreign cement. The directors of Associated Portland and British Portland have decided to raise ordinary dividend payments from 17½ to 20 per cent. An up-to-date touch is added to this statement by the decision to revalue the group's assets.

With the provisional trading results for 1954 and the order books of 1955 in front of them, the directors of English Electric have decided to put the ordinary dividend up from the equivalent of 9 1/6 to 12½ per cent. This early announcement is made to coincide with the offer of five English Electric £1 ordinary shares for every six ordinary shares of Vulcan Foundry, and with the offer of one English Electric ordinary share for every five 5s. units of Robert Stephenson's stock held by the public. The new shares to be issued by English Electric, if the offers are accepted, will not rank for the 1954 dividend.

More working time was lost in industry through strikes last year than in any year since the war—nearly 2½ million working days; the industries most affected were transport (counting in the docks), ship repairing, coal, and building. This cost of industrial disputes was markedly higher in 1954 than the average of the last 20 years; though it in no way approaches the average loss of working time caused by strikes in the twenties or early thirties.

Short of cash and with a large loan outstanding, Electric and Musical Industries is financing its purchase of a majority holding in Capitol Records of Hollywood by a preference issue to stockholders of all classes. They are offered 3 million 5½ per cent second £1 cumulative preference shares. The existing 4 per cent Notes (1953-58) are to be repaid at 100½ and their place taken by a similar amount—£2 million—of unsecured loan stock (1970-75).

Tanganyika Concessions has placed privately a £2 million 4½ per cent unsecured loan stock at 99. This new money will be used to finance the purchase of further debentures in Benguela Railways, in which "Tanks" owns all the existing debenture capital and 90 per cent of the equity.

Polyvinyl acetate, which is used in emulsion paints and as an adhesive, is now being made in Britain from indigenous materials for the first time. British Oxygen have spent nearly £500,000 on a small PVA plant at Chester-le-Street, which uses acetylene piped from its industrial gas plant nearby. The capacity of the plant is small, only "a few thousand tons a year"; until last September, nearly all the supplies of vinyl acetate monomer came from Germany.

In three months of booming stock markets, over 800 subscribers have enrolled under the "M and G" Thrift Plan, designed for the purchase of trust units by regular subscriptions. Accounts opened so far range from £10 to

What's the next move?

A recurring industrial problem—and one where *THE FINANCIAL TIMES* is of great help. Sound decisions demand the right background, and decisions are unquestionably easier for the executive who regularly reads this important newspaper. He is well-informed on facts and figures, and well-advised by authoritative writers on the possible future course of events. Recognised as the daily newspaper of industry and commerce, *THE FINANCIAL TIMES* supplies a wealth of vital information—carefully marshalled for quick reference—and absorbing articles and comments on many industrial subjects. What's your next move? Order a regular copy of *THE FINANCIAL TIMES* today, and make certain of getting wise counsel.

ALUMINIZED TUBES

reduce your television costs

REPLACEMENT costs, particularly of the expensive picture tube, are an important consideration when you buy a Television set. That is why you should choose a set that is

WITHOUT ALUMINIZING

Without aluminizing, tubes waste half their light. To counteract this the brilliance must be increased and tube life is shortened.

WITH EDISWAN ALUMINIZING

Ediswan aluminized tubes have a mirror backing to the screen. All the light is thus thrown forwards, giving brighter, clearer pictures and extra life.

fitted with an Ediswan Mazda aluminized picture tube. Ediswan-Mazda aluminized tubes give brighter, clearer pictures than ordinary tubes. Thus the set can be operated with the brilliance control at a lower level, and the tube lasts longer.

In addition, ion burn—the cause of ugly brown patches on the screen; and ion bombardment—one of the most frequent causes of tube failure—are largely prevented in an Ediswan Mazda aluminized tube. It is worth your while to insist on an Ediswan Mazda aluminized picture tube—you get better pictures at lower cost.

£800 a year, with an average of £43. Enrolments continue at a steady rate.

The use of vacuum techniques in the casting of steel, which has been the subject of small-scale experiment for some years, is claimed to have been developed to a commercial scale by the Bochumer Verein steel company of the Ruhr. The German company announces that it has already cast 10,000 tons of high-grade steel under vacuum at its works at Bochum. Removal of air during the casting process can avoid hydrogen embrittlement of steel, and other

impurities caused by nitrogen and oxygen, as well as rendering the whole process of casting, particularly in large sizes, more easily controllable.

Temperance Permanent Building Society announces that total assets in the year ended December 31st last rose by £3.2 million to £33.6 million. Mortgages by £2.0 million to £28.2 million. The ratio of liquid assets to total assets improved from 13.4 per cent to 15.3 per cent. The ratio of reserves to total assets was 5.58 per cent against 5.75 per cent.

Company Notes

DORMAN LONG. Last November the directors of Dorman Long estimated in the offer for sale of the company's equity to the public that the trading surplus in the year to October 2nd would be about £6,000,000. From that profit they expected to pay an ordinary dividend equivalent to 8 per cent for the full year. Their forecasts could not be far off the mark, for the group's financial year was already over. The company's preliminary statement now shows that the comparable figure for the £6,000,000 is, in fact, £6,237,164. After depreciation and a provision for renewals the group's profit is shown to have risen from £6,203,948 to £6,541,130. Net earnings are also up—from £3,378,474 to £3,553,896—and the dividend is 6½ per cent, making a rate of 8 per cent per annum.

Dorman Long has still a heavy capital development programme in front of it, and the emphasis has been placed on profit retentions. Nearly £3,000,000 has been ploughed back. The size of those commitments alone could act as a curb on dividend payments, though the directors are confident that the new assets will add substantially to the earning capacity of the group. The £1 ordinary shares, which were issued at 22s. 6d., now stand at 26s. 6d., to yield just a fraction over 6 per cent.

CARRERAS. Three sets of figures dominate the full accounts of Carreras. They are: the drop in trading profits, from £3,613,572 to £3,367,525; the increase in stocks, from £17,395,559 to £19,471,807; and the fall in debtors, from £8,631,519 to £6,384,145. The decline in the trading surplus is smaller than the company's preliminary statement suggested, but, even so, it is disappointing in a year in which cigarette sales were buoyant and in which the Carreras group distributed Dunhill cigarettes on a national scale. The increase in stocks is a natural result of better supplies of leaf tobacco; the manufacturers themselves seem anxious to build up stocks above the customary minimum of twelve months' supply. The tobacco companies usually collect their debts from retailers

and wholesalers every four or five weeks, so that the fall in debtors suggests that the tobacconists had rather smaller stocks of Carreras's cigarettes on their shelves towards the end of last October than they had a year before.

Taking these three movements in the accounts together, they point to a fall in sales. Costs are still rising in the industry and competition between the manufacturers to maintain their share of the market is keener. If there has been a falling off in Carreras's sales it cannot, on the evidence of these figures, have been large. At the end of last October cigarettes were still in name on quotas to the retailers. But these quotas were

little more than nominal, and recently they have been lifted altogether, so that any decline in turnover is a significant pointer for the trade. It is not so significant for Carreras's shareholders, because that company, like Imperial Tobacco, has a record of steady dividends. That record is unlikely to be disturbed by anything less than a major fluctuation in trade.

AERATED BREAD COMPANY. Mr Garfield Weston, who through Weston Holdings controls Allied Bakeries, has been busy this week. He has made two take-over bids. They are simple bids in the sense that they have been cash offers for the ordinary shares of going concerns at prices above those quoted in Throgmorton Street. They

have one feature in common. They refer to companies which have not been doing particularly well in recent years. Mr Weston is not looking for hidden asset values, but for ageing businesses which new management might rejuvenate.

The offer for the ordinary capital of Meredith and Drew, the biscuit manufacturers, seems to be nothing more than an attempt to add a few more shares to the growth of Allied Bakeries, which already controls a large number of bakeries and biscuit factories and a great number of shops. The offer is of 26s. for each £1 unit, either ordinary or "A" ordinary; the issued capital is made up of £364,097 ordinary units and £414,295 "A" ordinary units. The "A" units on the eve of the offer changed hands at around 20s. 6d. In the year to September 30th Meredith and Drew made a loss of £11,056, compared with a loss of £179,227 in 1952-53; the ordinary dividend has been passed. Some of the directors, controlling more than 10 per cent of the equity capital, are not willing to accept Mr Weston's offer. Some of the other directors are. Mr Weston, if he chooses, can carry the deal through even if less than 90 per cent of each class of equity accept his offer.

More far-reaching than this bid is Mr Weston's offer of 45s. for each £1 ordinary stock unit in the Aerated Bread Company, with an issued equity capital of £1,282,000. The day before the offer was made these units gained 2s. 6d. and after its announcement rose another 4s. 6d. to 42s. ABC, particularly in the London area, is the catering and tea shop rival of J. Lyons, but less prosperous than its bigger rival. Over the last few years the directors, though they have left the ordinary dividend unchanged at 10 per cent, have had to report a steady decline in profits. In 1954 profits went down again—from £313,000 to £220,000. Allied Bakeries does not intend, if the offer is accepted, to change the policy of ABC but more emphasis will be put on the bakery side of the business. As much as £1 million may be spent on modifications and renovations within the ABC group. The number of take-over bids Mr Weston has made recently sets him in the confectionery trades on something like the same pinnacle on which Mr Wolfson stands in the furniture and drapery trades.

Thus Allied Bakeries is offering to buy Aerated Bread Company for £2.9 million

and Meredith and Drew for just over £1 million. After the issue of £1,225,000 5½ per cent preference shares at 21s. last May the group should have substantial funds in hand, but not funds to the tune of nearly £4 million. A further issue seems the probable solution.

JOHN SUMMERS. The John Summers equity was sold by the Iron and Steel Realisation Agency at the beginning of October. At that time, with the company's financial year just completed, the directors were able to make a firm forecast of the year's profits and dividends. After charging depreciation they estimated the profit in the year to October 2nd at "about £3,500,000." Their dividend forecast was 9 per cent. The company's preliminary statement, because of the timing of the offer, was not expected to differ much from these estimates. And it has not.

The ordinary dividend is 9 per cent. Trading profits, after depreciation of £1,577,147 but before tax of £1,636,051, amount to £3,666,535. These figures, which owe much to an increase in steel ingot production at the Hawarden Bridge Works, compare with a profit of £1,471,200, after depreciation of £1,293,732 but before tax of £710,364, in 1952-53. Development of the Hawarden Bridge Works will not be completed until the middle of 1956. About eighteen months must elapse before the plant reaches its full rated capacity. But production will be going up steadily and in the prospectus the directors were confident that profits for the next few years would not be less than £3,500,000 a year. On that basis the ordinary dividend is covered more than twice by net equity earnings. Hence, if the political risks are ignored, there should be an element of

growth in the £1 stock units. Those units were issued at 24s. 6d. each. They now stand at 30s. 7½d., to offer a yield of 5½ per cent.

CABLE AND WIRELESS (HOLDING). Last year was one of those years directors and investors in investment trusts dream about. Equity values rose quickly and steadily throughout the year. Dividends, too, were going up and, what is as important, the prospect of even higher payments was not dimmed. It is the equities in a trust's portfolio that give its accounts their glitter. And at the end of last year a trust's income account would be swollen by the bigger dividends already paid and its balance sheet strengthened by the appreciation in market values. Shrewd switching in the portfolio could add that extra sparkle of capital gains.

No investment trust and certainly not one of the biggest of all, Cable and Wireless (Holding), could avoid doing well. How well can be judged by the rise of just under 28 per cent in gross earnings from £583,000 to £744,000. Net earnings advanced from £317,000 to £399,000. Inevitably, that expansion was followed by bigger ordinary dividends. On a capital of £5,500,000, as increased by a free scrip issue of £500,000, the directors of Cable and Wireless have recommended a full year's dividend of 10 per cent. In 1953 a dividend of 9 per cent was paid on a capital of £5 million. In effect the ordinary dividend has been raised from 8.2 to 10 per cent. On that dividend the £1 stock units yield, at the current price of 48s., 4.2 per cent. That is only a shade under the average yield offered by leading industrial equities and, like that yield, it is justified by the hope of bigger dividend payments to come.

Next Account begins: February 2nd
Next Contango Day: February 2nd
Next Settlement Day: February 8th

Before the change in Bank rate was announced, the see-saw in the market had tended to swing in another direction than in recent weeks. Gilt-edged stocks began to improve, cheered up by the reduction in the US Treasury bill rate and the revenue figures, but equity prices were rather uncertain. After the rise in Bank rate gilt-edged prices dipped, then rallied to close with only slight net losses; equities after a momentary pause continued to go ahead. The early rally in the Funds began on Tuesday and was quite strong, with the undated stocks leading the way. It happened that applicants for Colvilles had most of their money back for re-investment. Dominion and Colonial stocks moved up in the wake of the Funds, but business was light. In the foreign market the Japanese issues were marked down on the news about Formosa. German issues were dull at first but came to life again on Wednesday.

In the industrial market, prices were unsettled temporarily by the news from Formosa, and prices fluctuated quite widely. The *Financial Times* Ordinary Share Index, having fallen from 194.1 before the week-end to 191.9 by the close on Tuesday, recovered to 192.8 in Wednesday's dealings and rose to a new peak of 194.4 on Thursday. The biggest losses at the beginning of the week were reported in store, tobacco and motor shares. Shipping shares also reacted, losing quite heavily when profits were taken. Against this trend, locomotive and electrical equipment shares improved, on hopes of big orders under the railway re-equipment plan. The leading blue chips soon rallied, but tobacco, brewery and textile shares remained in the doldrums.

Oil shares followed the trend elsewhere in the industrial market, not staging their rally until Wednesday. At the beginning of the week, tea and rubber shares were still rising, but the market turned dull later. Kaffirs, notably the OFS issues, were depressed early in the week, but staged a rally when the market opened on Thursday. Copper shares made substantial gains on the high price of the metal and the statement about free market sales.

Financial Statistics

EXCHEQUER RETURNS

For the week ended January 22nd there was an "above-line" surplus (after allowing for Sinking Funds) of £144,323,000 compared with a surplus of £197,221,000 in the previous week and a surplus of £137,440,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £82,468,000 (compared with a deficit of £120,513,000 in 1953-54). There was a net receipt "below-line" last week of £8,918,000, bringing the total cumulative deficit to £241,031,000 (£432,993,000 in 1953-54).

THE MONEY MARKET

BANK rate was raised from 3 to 3½ per cent on Thursday. This followed an almost continuous rise in the Treasury bill rate since mid-November—from 1½ to over 2 per cent last week—a sustained extension of the period of seasonal weakness in sterling into the normally favourable new year, and a fairly steady rise in the Treasury bill rate in the United States (though this week the rate fell from 1.407 per cent to 1.349 per cent). The increase in Bank rate was, as expected, made the occasion of important adjustment in rate margins. The banks raised their deposit rates by only ¼ per cent, to 1½ per cent, but increased their call money rate against Treasury bills by the full ½ per cent, to 1½ per cent. The call money rate against different classes of collateral was moreover unified at this level, so that the rate against commercial bills rose by only ¼ per cent and that against bonds by ½ per cent.

Credit conditions in Lombard Street in the week before the Bank rate change had continued to be difficult. Special aid was needed and given on most days. At the Treasury bill tender on Friday last the market reduced its bid by a further ¼d. per cent, to £99 9s. 1½d. per cent, and the market's allotment fell from 61 to 51 per cent.

The Bank return shows a further reflux of notes of £12.9 million. But as "other accounts" rose by £19.8 million, bankers' deposits fell heavily to £251.9 million, the lowest level recorded since 1946.

A secure future encourages

Efficiency

No worker can put his best into his job if he is worried about the future. The mental burden of provision for himself and his dependants is often a deterrent to efficiency, and although the Welfare State has removed the fear of actual want, it cannot hope to dispel all the financial worries which so often harass those who have retired.

Today it is noticeable that firms with the highest proportion of contented workers are those which have made provision for their employees

by operating Pension and Life Assurance schemes, such as those underwritten by the "Legal and General". Cost is met year by year and the employer's contribution is treated as a business trading expense by the Inland Revenue. The resulting dividends of increased efficiency and greater harmony compensate time and again for the relatively small expense incurred.

Write today for full information and advice on Pension and Life Assurance Schemes.

COMPANY MEETINGS

MIDLAND BANK LIMITED

1954 A GOOD YEAR FOR BRITAIN

GREAT ACHIEVEMENTS IN INDUSTRY AND EXPORT TRADE

LORD HARLECH ON COUNTRY'S ECONOMIC PROGRESS

The 119th annual general meeting of Midland Bank Limited will be held on February 16th at the head office, Poultry, London, E.C.

The following are extracts from the statement issued to shareholders by the chairman, The Right Honourable Lord Harlech, KG, PC, GCMG:

Last October your directors thought it desirable, in the interests of shareholders and in order to remove uncertainty, to announce in advance their intention as to the rate of final dividend to be recommended for the second half of 1954. The payment of 10 per cent subject to tax, if approved by the shareholders at the annual meeting, will bring the total to 18 per cent gross for the year, and this rate it is hoped to maintain with half-yearly payments of 9 per cent. In arriving at their decision your directors were influenced by the improvement in the general economic position of the country and by the more reassuring outlook that had appeared with the clarification of various factors bearing on the earning power and internal strength of the bank.

The net profit for the past year, after the increased profits tax liability arising from the larger distribution, amounts to £2,398,000, roughly £270,000 more than for 1953. Out of that sum we have made somewhat larger allocations to inner reserves, and the higher rate of dividend will absorb rather more than a year ago, as shown in the profit and loss account.

Figures appearing in our balance sheet for December 31st last reflect the general expansion in business activity and in the supply of money. Deposit liabilities have risen to a new peak, roughly £45 million higher on the year, and averaging through the year the increase is of similar proportion—about 3½ per cent, or well within the simultaneous enlargement of the amount of the national income. The increase in deposits is accompanied by a rise in advances by about £55 million over the year, and our analysis shows that this movement is due mainly to the increased borrowing requirements of industry and trade, including the nationalised public utilities, resulting from their expanding turnover and the further lifting or relaxation of Government controls.

The total bill holding has declined somewhat over the year, and the substantial rise, within the total, in bills other than Treasury bills reflects both an expansion of the volume of international trade financing through the London money market and a moderate contraction in the demands made upon bank credit by the Government's short-term borrowing needs. Adding to the bills total the cash and short loans, almost wholly to the money market, it will be found that the increased demand for advances has lowered slightly the "liquidity ratio" between these readily realisable assets and the deposit liabilities. Our holding of investments is almost unchanged in amount, and its composition is well suited to the circumstances of the times in that all of them bear final maturity dates falling within the next eleven years.

Accentances, engagements and forward

exchange commitments entered into on behalf of customers all show very considerable increases. Altogether, then, the balance sheet gives evidence of the maintenance of a healthy condition combined with sustained progress in the service of the country's day-to-day business. Last year's turnover on current accounts with this bank was over 18 per cent larger than for 1953. Our affiliated companies have maintained their gratifying record of progress, and both the Belfast Banking Company and the Clydesdale and North of Scotland Bank have shown a satisfactory growth of business.

The statement describes the extensive use which has been made of a great variety of mechanical aids designed to achieve greater efficiency with no less security and convenience for customers. Early in 1928 this bank took the initiative in installing machines for ledger-posting combined with the preparation of statements of accounts for customers in place of pass-books. The system has since been widely extended and eventually will completely replace hand-posted ledgers. Note-counting and coin-counting machines and high-precision scales for weighing notes in bulk are being brought into use wherever they can be advantageously employed. As long as twenty years ago this bank began to use photography in the interests of efficient operation. Departments responsible for this work are at present filming about three hundred thousand items a day on the average, though on peak days the total far exceeds twice that number, and the latest machine takes its photographs at the rate of nine thousand an hour. Another example of modern installations is the use at head office of punched card methods of recording, computing and checking, which are adapted to a variety of tasks involving large numbers of calculations and detailed recording and aggregation.

It can thus be claimed that the bank has been very much alive to the possible benefits, in saving of labour, in higher standards of accuracy and in service to the customer, of the progressive employment of many kinds of mechanical device. It will be ready to adopt quite new methods, as for example in the field of electronics, when satisfied that the prospective capital and running costs are likely to be commensurate with the foreseeable gains.

Whatever may be the scope for mechanical and scientific aids, however, a large part of the business of banking lies beyond their range. For banking is essentially a personal business, implying the maintenance of high standards of efficiency within the undertaking and of integrity, courtesy and sound judgment in relations between the bank and its customers. In this we are particularly fortunate, thanks in part to our progressive methods of recruitment, training and selection, but still more to the inherent quality of our management and staff. To all of them, from those carrying the heaviest burdens of responsibility to those who have most recently joined the service of the bank, I express, on behalf of the shareholders, cordial appreciation of their unflagging service.

INTERNATIONAL ECONOMIC POLICY

In one way at least nineteen-fifty-four may prove to have been an historic year in international trading and financial relations; for the discussions that have been taking place, with a minimum of publicity, may eventually be found to have set the course of policy for many years to come. On the monetary side, the over-confident, almost excited, expectations of an early restoration of free convertibility of the pound, at least for all non-resident holders, were dissipated by authoritative reiteration of the basic requirements for such a step, which it was plain showed little prospect of early fulfilment. At the same time, clearer recognition of what broadened convertibility was likely to mean in terms of more intense competition in overseas markets tended to modify the enthusiasm with which it had been envisaged. In the end, assessments of political risks and uncertainties at home and abroad contributed to acceptance of probable postponement of action for a period the length of which no one is now prepared to forecast.

The change of sentiment sprang in part, no doubt, from the course of international discussions, beginning with the conference of Commonwealth finance ministers early in the year. Later exchanges of information and views among member-governments of the European Payments Union, concentrated as they were upon practical problems, seem to have brought about some modification of the bold assertions by continental spokesmen of readiness to participate in a concerted venture. The annual meeting of the International Monetary Fund in the autumn provided an occasion for emphasis on the difficulties confronting members in their efforts to undertake or aid the final liberation of currencies from exchange controls and of trade from quantitative restrictions.

On another aspect of international affairs, the stage was being set for the highly significant proceedings which began in the autumn. Representatives of the powers concerned in the Colombo plan for the economic development of south-east Asia met, and took important decisions, at Ottawa in October. At about the same time, under the auspices of the United Nations Economic Commission for Europe, exploratory discussions were taking place at Geneva, among delegates of governments directly concerned, on the possibilities of an enlargement of east-west trade. Meanwhile talks were going on in London among representatives of Commonwealth governments with a view to co-ordinating as far as possible their several attitudes towards Imperial preference, the problems of most-favoured-nation tariff treatment, the appropriateness or otherwise of licensing and other quantitative import controls, various kinds of export subsidy and the operation of bilateral trade agreements. Finally came the meeting, perhaps most important of all, of representatives of the governments associated with the General Agreement on Tariffs and Trade.

We need to remind ourselves that GATT is no more than the surviving part of a far more ambitious and extensive scheme, fought over and shelved in the course of several conferences and diplomatic exchanges in the

early postwar years. The remnant that was salvaged took the form of an interim agreement mainly concerning tariffs, quantitative—often discriminatory—restrictions on imports and subsidies on exports; and in practice it has operated chiefly to guard against competitive raising of tariffs and to bring about, through bilateral negotiations extended in their effect by the system of most-favoured-nation treatment, the reduction of particular import duties and the fixing of some duties and preferences against possibility of increase. Meanwhile the various "escape clauses" have permitted the continuance or imposition of many forms of import restriction other than by customs duties, as well as of direct and indirect subsidies for expanding exports. Moreover, new anxiety has arisen about the possibly disturbing effect of measures to dispose of certain agricultural surpluses. Wide difference of opinion has been aroused also by the proposal to admit Japan into full and equal status among the contracting parties, all benefiting from most-favoured-nation treatment, to the set of "rules" embodied in GATT. Hence the comprehensive and detailed review of the entire agreement which began at Geneva in November.

The outcome of all these discussions cannot yet be foreseen; but their significance draws added strength from the fact that the agreement was entered into, in 1947, in an atmosphere of high hope of rapid liberalisation of trade. Events have largely disappointed these hopes—a fact for which political conditions in the United States and recurrent balance of payments difficulties of the sterling area have both been partly responsible. Thus GATT has tended to become perhaps more a defensive shield against single-party protectionist action than an instrument of removal of trade and payments restrictions. It follows that the whole series of discussions, as yet uncompleted, may well determine whether, over the next few years, the world is to move on towards economic unification or is to revert to the practice of narrow nationalism with no sort of action barred, be it by way of quantitative controls, monetary restrictions or direct or indirect subsidising of exports. It is well that this dividing of the ways should be clearly seen, and that the choice of direction should be made with full realisation of the kind of territory into which each is likely to lead.

ECONOMIC PROGRESS IN 1954
