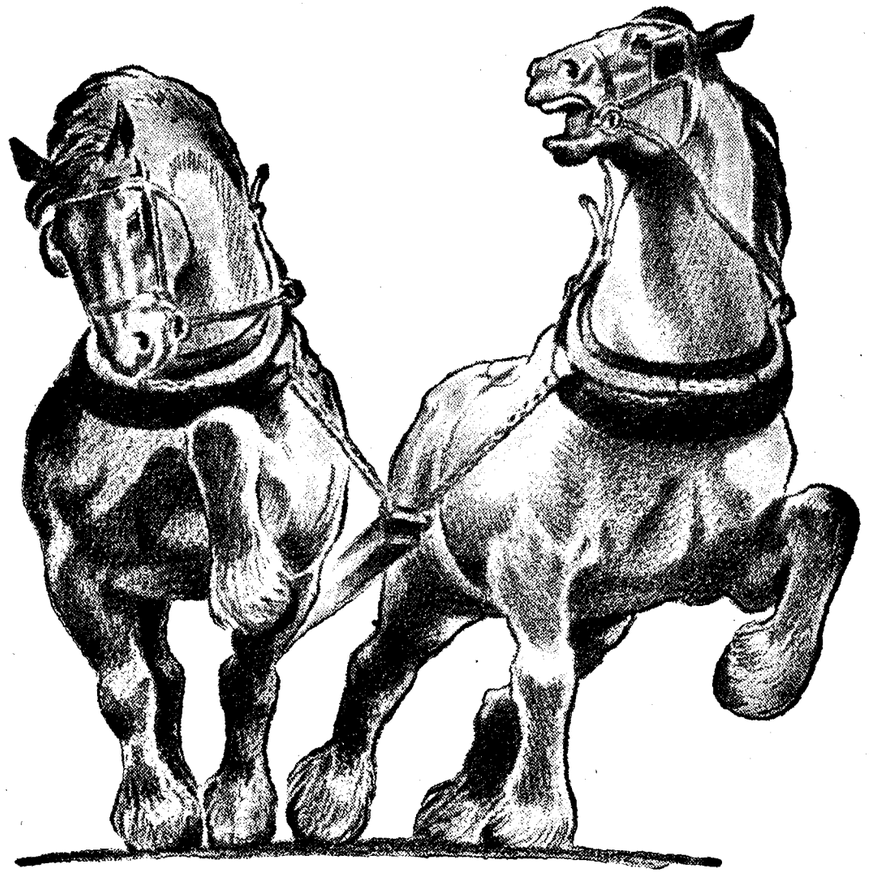
Summa 15

In the hands of the famous Olivetti designers, the Summa 15 - a hand-operated, adding/listing machine of reduced size has all the up-to-date features of the most advanced machines.

Its range of performance has not been allowed to be restricted by size. In addition, it has a simplicity of control and a sturdiness of construction that make it easy to operate and capable of the hardest work.



Hand-operated
Capacity 10/11 columns
Automatically prints proof of its operations
Operates both in sterling and whole numbers
Direct subtraction and credit balance

British Olivetti Ltd.
10 Berkeley Square - London W.1
Sales Branches:
London - 32/34 Worship Street, E.C.2.
Glasgow - 115/207 Summerlee Street, E.3.

WALLSPAN

OUTER WALLS ARE THE QUICKEST WAY TO GET NEW BUILDINGS INTO BUSINESS

How Wallspan goes up so quickly. Wallspan is the logical way of constructing outside walls for modern multi-storey buildings.

Wallspan is a grid of aluminium alloy, formed of box-section vertical and horizontal members, which is readily bolted on the structure of the building. Into it are fixed windows and doors and the rest of the grid is quickly filled with any of a wide variety of durable, weatherproof panelling. You may, if you wish, get business going floor by floor as Wallspan goes up!

The panelling used can be any of a score of different materials in numerous textures and colours—glass, stone, metal, wood and many other substances.

Wallspan gives you more floor space. The weight of a modern building is carried by the structural frame, not the outer walls, which are merely protective and decorative and carry the windows. So the Wallspan grid need be no more than 5 inches thick with panels half that thickness. This means *extra* rentable space all round every floor: hundreds more square feet in any sizeable building!

And more warmth! The slender panels in the Wallspan grid can be constructed to provide up to 50 per cent better heat-retention than cavity brick walls. And maintenance is negligible. There's no pointing or painting. The walls can be washed down occasionally . . . by the window cleaners.

It will be well worth your while to discuss with your Architect the use of Wallspan in any new building you are planning—offices, factory, shop, stores, warehouse, school . . .

1 *Fixing the vertical aluminium members—they are so light in weight that one man can easily handle the largest of them!*
2 *The grid is fixed—floor by floor.*
3 *This is how the panels go in . . .*
4 *. . . and are clipped into place by a neat aluminium beading.*

Extensions to this building had to go upward owing to site limitations. Three floors have been added to the original single-storey office and these have Wallspan walls.

The elevation illustrated is 115 ft. 7 in. long and 27 ft. 9 in. high. The Wallspan grid carries aluminium framed opening casements and fixed glazing. The opaque panels are green Vitroslab.

This Wallspan framework was fixed in FIVE DAYS by a routine-strength Williams & Williams fixing team and without working overtime!

WALLSPAN CURTAIN WALLING

RELIANCE WORKS · CHESTER

You'll be using your building sooner—much sooner—if it has Wallspan walls!

We Can Sell Your Products Throughout the United States

Our 52 branches cover every major market in the entire U.S.A. Each branch is staffed with well-trained salesmen, now available to handle a few European products.

We can warehouse your merchandise in America, and handle every phase of selling, demonstrating, advertising, shipping, etc. Cost is surprisingly reasonable.

Top executives of our firm will travel in Europe during May, and will be available for personal meetings.

If you want big-volume sales throughout the U.S., write at once, giving all possible information about your merchandise, including special sales features, pricing, domestic sales policies, etc. These advance facts will help make a personal interview more productive.

All information strictly confidential. No obligation involved. Write:

LEATHER UPHOLSTERY

MAKES YOUR NEW CAR A LASTING INVESTMENT

Real leather is unique for its enduring comfort and luxurious appearance. So, even if this refinement involves a little extra cost, you will be more proud of your car and, when the time comes to re-sell, your good judgment will be more than rewarded.

"YOUR CAR AND YOUR COMFORT" is the title of a booklet on the virtues of leather upholstery and gives an up-to-date price list of cars that are available with leather upholstery. *Write to:* The Dressed Hide Leather Publicity Committee, Leather Trade House, Barter Street, London, W.C.1

the way I figure

Why do businessmen from Bradford to Boston, from Brighton to Bombay use FACIT, the world's most exported calculator? Why is FACIT the way they figure? For three simple reasons: the Facit ten-key system offers the simplest, most effective method of calculating; anyone can become a proficient FACIT operator *without training*, achieving machine-perfect multiplication and division with only a few minutes practise; every model in the FACIT range is precision-built, robust, and 100% efficient. Add one more reason for Great Britain: every FACIT is backed by expert 'B & A' service from nineteen Branches throughout the country. That's why they figure with FACIT . . . and it is only part of the story. Drop us a line and we'll give you the rest with full details of the FACIT range of hand and electric ten-key calculators. Block & Anderson Limited, 58-60 Kensington Church Street, London, W.8. Tel: WEStern 2531.

London Airport

—A COMPREHENSIVE SURVEY

AERONAUTICS presents a special 18-page survey of the new facilities shortly becoming effective at London Airport. Profusely illustrated, it includes detailed descriptions of this impressive undertaking — the new control tower, the most modern in the world — the up-to-the-minute passenger handling services — the radio, radar and lighting devices—the vast system of runways—the superb observation lounge, restaurant and roof gardens — and other aspects of the great new airport, which this year will handle over two million passengers and operate 80,000 take-offs and landings — and where 14,000 people are employed.

This issue also includes a report on further experiments in the Powered Lift Principle.

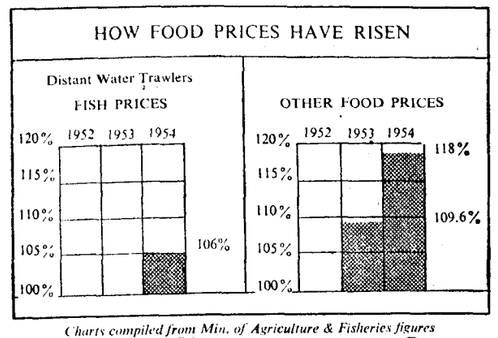
Is the price of Fish too high or too low?

The next time you or your family are out shopping, remember—fish is the best food bargain you can find. It's the cheapest first-class protein food that money can buy. There's been a lot of talk about fish prices — what are the facts?

Suppose you had your own business and you were producing something that cost you 6d. and yet you could only sell it for 5d. If this was your only way of making a living, your only way of supporting your family—you would very soon go bankrupt. You might stand a chance if the situation was only seasonal, if at times you could sell your product for 7d. or 8d., but it would not be an easy life. Working at a loss for long periods would be a constant source of worry—and very bad business.

That is about the situation with fish, mainly Cod, caught by Britain's Distant Water trawlermen. For half the year our trawlers operate at a loss. A recent survey of 80 ships of the Hull and Grimsby Distant Water Fleet discloses that in 1954 they ran at a loss for over half the year. What's the reason for this? Very simple. Current minimum prices for fish sold at the dockside auctions (4.07d. a lb.), are too low compared with the costs of trawling. A modern trawler costs £200,000 and the cost of running it is at least £250 a day!



Trawlermen must sell their catches when they land them, and all too frequently sales are below the actual cost of production. You cannot force people to buy fish. If the housewife doesn't want it, the merchant won't buy it. Last year over 14 million lbs. of fish went unsold.

Fish caught and landed by our Distant Water Fleet is the cheapest first-class protein food money can buy. Quayside prices have risen only 9% since 1951, "a very moderate increase" remarked Mr. Heathcoat Amory, Minister of Agriculture and Fisheries, in the House of Commons on February 10th. On February 14th, in the House, Dr. Charles Hill confirmed that other food prices have risen by 18% since 1952 and 34% in the three preceding years. The truth is that in the face of mounting costs, the price of fish caught by our Distant Water vessels has risen much less than meat, butter, eggs or any comparable food since the war and *this fish is not subsidised*. Other staple foods—meat, butter, milk, eggs and potatoes are heavily subsidised by you, the taxpayer. Last year food subsidies cost £334 million. Not a penny for our fish!

However hard we try it is impossible to keep the same flow of fish throughout the year—both sea and fish are too unpredictable. Distant Water trawling is a dangerous and difficult business—more dangerous than coal mining. In the last 12 months 85 trawlermen were lost at sea, and 6 ships went down. Until some way is found of catching more fish during Winter gales, fish always will be scarcer and cost a bit more for a few weeks around December and January. The amount of fish landed varies from day to day. The same quality and quantity of fish may fetch a different price at public auction on Wednesday compared with Thursday. The price we get for our fish depends on the catch itself, the quality and public demand.

If you are fair, if you consider all the facts about fish and remember the risks and dangers trawlermen face to bring it home, you must agree that the price is not too high. It is really much too low. It will always be too low until minimum prices at least equal the cost of production. The astonishing fact is that fish prices have not risen to meet the soaring cost of trawling. Only a combination of hard work, efficiency, economic planning and competitive private enterprise has kept and can keep the price of fish so low.

The next time you or your family are out shopping, remember—fish is the best food bargain any housewife can find . . . it is the cheapest first-class protein food money can buy.

Charts compiled from Min. of Agriculture & Fisheries figures & Index of Retail Prices.

BRITISH TRAWLERS Hull/Grimsby/Fleetwood

THE BRITISH TRAWLER FEDERATION

"Kindness to cheque books!" say Owners

KINDNESS TO YOUR CHEQUE BOOK begins *inside* the Ford Dagenham Factory. Here are some of the unique ways in which Ford make fundamental savings in manufacturing costs—at Dagenham is the only motor factory with its own blast furnace . . . its own jetty for low cost water transport of raw materials . . . its own electric power house and gas works (incidentally, the surplus is sold). These unique savings are passed to the purchaser, which is why Ford products cost less than you'd expect to pay for their quality, performance and durability. And that is only the beginning. Ford Service is famous. The Ford Dealer Organisation *outside* the factory, with its low fixed charges for spares and repairs, means low maintenance and running costs —more kindness to cheque books! *Now and in the future, it all adds up to the best at lowest cost.*

"All ways" say FORD of Dagenham

Boisterous Survey

IT was Thoreau who said that a man is rich in proportion to the number of things he can afford to let alone. Mr Butler may find himself in wry agreement as he faces up to the dilemma of his pre-election budget. On the one hand, the Exchequer has ended the financial year 1954-55 with an overflowing surplus. On the other, the Economic Survey for 1955, which was published this week (Cmd 9412), suggests strongly that he should leave existing tax rates alone—not because prosperity is fading, but because it is being maintained.

The Survey, whose essential figures are set down on a later page, is an unexpectedly boisterous document. Last year, it reveals, Britain's real income rose by some £625 million; and the division of this very large increase between consumption today and investment for the future, as well as between rapidly rising real wages and more slowly rising property incomes, has been of a pattern that will gladden Conservative election literature in the weeks to come. This year—and this forecast is perhaps the most surprisingly heartening feature of the Survey—the Government believes that once again "industry should have the capacity to increase output appreciably above the present level." Allowing for seasonal variations, that present level of production is already 2 or 3 per cent above the 1954 average; there may be a further small increase in the working force in 1955; three-quarters of the increase in output in 1954 was due to what the Government clearly believes was the beginning of a rising trend in productivity per man year; and, although overtime working may be near its peak, the economy has not yet felt the full benefit of last year's realignment of labour from places where men were not needed to places where they are. The resources should be available for a substantial increase in exports, and in living standards, too.

What, then, of the recent talk of economic crisis, and the 4½ per cent Bank rate that was supposed to be its harbinger? The Survey has a ready explanation of this, which can be summed up in a single statistic. Last year industrial output rose by 6½ per cent, but imports rose by only 2 per cent; they were held down at the beginning of the year by false fears of an American slump. It was inevitable that this gap would have to be corrected; and the correction that set in with heavier importing in and after the late summer, together with the rise in import prices that inevitably accompanied it, had already precipitated Britain into a small balance-of-payments deficit by the end of 1954. The correction is likely to have to be carried further in 1955, and there will need to be a further increase in imports to match the new increase in production on which the Government's hopes are based. Unless the balance-of-payments deficit is to be allowed to widen dangerously, exports will have to take a larger proportion of the increment in production in 1955 than they did in 1954.

But will home demand—even on the basis of present tax rates—gobble the increment in production away? This, of course, is the question that lies at the core of the budget problem. It is also the

question that the Survey most carefully avoids. The Survey says that fixed investment is likely to rise "substantially" this year; that the current rate of consumption is already above the average level in 1954, and must be expected to rise further; that Government expenditure on defence and civil purposes will increase slightly in 1955 (a disappointing forecast, this); and that stocks are also likely to rise, although the 4½ per cent Bank rate is designed as a rein. No figures are attached to this crystal ball, and where Government analysts fear to tread outside commentators would be foolish to rush in. But even approximate "back-of-an-envelope" estimation impels towards the irresistible conclusion that, by stern reference to the economic conjuncture alone, the Chancellor can have little or nothing to give away.

Irresistible conclusions, however, can sometimes clash with equally irresistible forces. And there are at least two active and possibly irresistible forces which must be bearing down upon the Chancellor in these pre-budget weeks of 1955. One of them is allowed to rear its head in the closing paragraphs of the Survey. It derives from the impatient thought that although prudence makes for security in the short run it does not make for progress in the long. If the present crushing weight of taxation cannot be cut at the end of one very good year, and at the beginning of what the Treasury's economists believe is going to be another, then when in all conscience can tax reliefs be made? "Productivity," says the Survey hopefully, "should benefit . . . from the added incentive to effort which the prospect of rising consumption affords"; and, again, "general confidence in the possibilities of expansion will do much to ensure that expansion is in fact achieved." There is surely a hint here that the Chancellor's own confidence in expansion is very highly geared.

The other force is political. This is not allowed to obtrude into the Survey, which is not an election manifesto. But which would be more inflationary: a fair-weather budget that gave, say, £100 million of tax reliefs away, or a foul-weather budget that helped to bring a Labour Government back to power? This is not a question that the Treasury economists can decently put, and it is not one that a Conservative Chancellor can safely be allowed to answer on his own. But it must be hovering in the background, with less reputable political considerations, all the same. It would not be altogether surprising if Mr Butler decided on April 19th to give, say, rather less than half of his estimated budget surplus for 1955-56 away; and if he claimed great credit for not giving away the rest. But the Economic Survey for 1955, though it can be interpreted to provide some arguments that could be used to support such a course, provides no reliable clues to the Chancellor's actual intentions.

Rubicon of Rearmament

THE importance of the vote in Paris last Sunday morning is that it enables the West to regain the initiative. For the past few months, indeed for at least two years, the long hold-up on giving the West Germans their sovereignty and right to rearm has led to a dangerous stagnation in Europe's affairs. It has compelled western statesmen to approach negotiation with Moscow with their hands tied behind their backs. Not only have they been unsure of the real strength of the West; they have continually had to look back over their shoulders to see what effect they may have been having on the irresolution of many of their followers. Now, ratification of the agreements for Western European Union by the French upper house has cleared the way for a new surge forward; admittedly, Belgium, the Netherlands and Luxemburg have still to ratify, but there is little doubt that they will. This is a moment that may, and should, be as significant in postwar history as the start of the Marshall Plan or the signature of the North Atlantic treaty.

What use can be made of it? There are three things to be done. Western Germany must in fact be absorbed into Nato as a free and equal partner; and that means, inside the Federal Republic, going ahead with implementation of the new rearmament arrangements, however slowly it may be politic to proceed after the first cadre divisions have been set up. Secondly, a new look must be taken at the whole problem of dealing with the Russians in the light of the changed position in Western Europe, of the latest thinking on hydrogen bomb strategy, and of the shifts in the Russian rulership since Stalin died. And, thirdly, some effort must be made to re-engage the gears of what for want of better words may be called the "European movement"; even if no great advance can be made in the months immediately ahead, no one should assume that Western Europe will go on consisting indefinitely of a series of archaic national compartments.

The work of rearming Western Germany and of fitting the Germans into Nato has long been prepared, and Dr Adenauer's government should now be able to take the final steps in its stride. In spite of last minute constitutional doubts about the Saar agreement, President Heuss has signed the vital documents. It is therefore the much wider question of trying to negotiate with the Russians, to which the western powers must now switch their top priority. There would, after all, have been no Federal German Republic on the present pattern but for Russian ambitions and Russian obstruction. And while the West is bound to complete the work it began

nearly six years ago when the Bonn government was established, there can be no prospect of stability until the political map of Europe is agreed on both sides of the iron curtain. The West Germans are now on the brink of becoming sovereign allies and they must be treated as such. But, quite apart from the general western interest in the matter, it is almost inconceivable that either they or the Russians will rest till Germany is reunited and its fate determined. And the British, like the other signatories to the Western European Union treaties, are already pledged to work for that larger settlement.

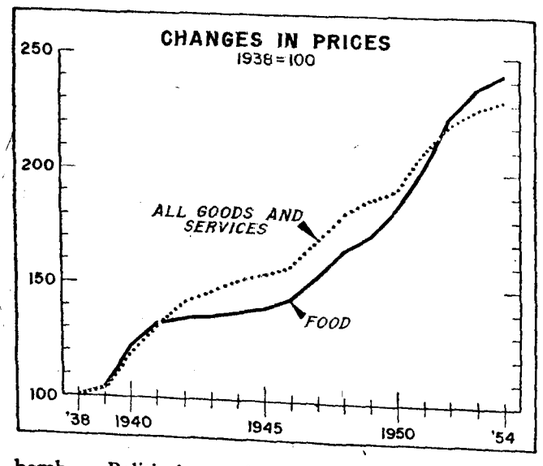
The idea of a four-power conference in May has been quietly put in the dustbin; the process of ratification will in any case barely be finished by then. But there is now far more general agreement that a conference is necessary. The questions are: on what terms, at what level, and how much later on this year? Of the recent statements by M. Faure, Sir Anthony Eden, President Eisenhower and Marshal Bulganin, the main interest attaches to the last two as coming from the leaders of the major powers. Some shift in the American attitude has undeniably taken place, although it is probably less than it seemed at first and it appears to spring more from domestic politics than from the international scene. The President has in effect replied to the new suggestions for a four-power meeting made by Senator George, the Democratic chairman of the Senate Foreign Relations Committee, with a partial dropping of the guarded American approach, which demanded that the Russians should first give evidence of their good intentions by accepting the western agenda. This does nothing, however, to alter the fact that the West is bound to attach the same importance it has always done to its two prime conditions for any settlement on Germany, even if the Russians are not to be required to assent to them before any meeting can take place at all, and even if there can now be less rigidity at the conference table itself. These demands are for genuinely free all-German elections, and no withdrawal of foreign troops at least until a united Germany is in a position to choose its own foreign policy.

There is no evidence for jumping to the conclusion, as many people have, that Marshal Bulganin's weekend statement necessarily reflects a major change in Russian policy. By saying that he took a "positive attitude" to President Eisenhower's statement last week on the desirability of "exploratory talks," the Marshal was being no more than consistent with the Russians' well-known attitude of pressing for talks on their own terms. These are that they would refuse to discuss reunification with the western powers, but would do so with the Germans themselves; they have never excluded a conference on the general question of security.

For the West, as Sir Anthony Eden said in the House of Commons on Monday, the right course is to pursue the present diplomatic discussions among the western powers themselves—including Germany—and then with the Russians "on an official level," following this up later with a meeting between foreign ministers and on "other levels also if all goes well." Whatever happens, Sir Winston Churchill's renewed suggestion for talks between heads of government, without other preparation, must be avoided. The French will now press hardest for talks with Moscow. But they are in a much stronger position to do so than they were, and M. Pinay, the foreign minister, will receive some encouragement when he goes to Bonn in a few days' time. Even if the Russians stick by their word and refuse to budge on Germany or indeed to discuss it at all, the effect of ratification of the London and Paris agreements is to make possible some new attempt to break a little ice in other directions, such as disarmament and general security. The one absolute condition is that nothing should be agreed to, which is based on either the permanent division or the neutralisation of Germany.

★

Amid the new diplomatic flurry, it will be all too easy to forget Western Europe's own problem of "Where now?" Is Western European Union (WEU) to take on where the European Defence Community (EDC) left off, to chart the course, that is, towards eventual political federation? Dr Adenauer is prominent among those who hope it will. Or is WEU to remain essentially what it is now, a military alliance, a pact between governments rather than peoples, a useful department of Nato? This would certainly be in keeping with British policy. And it has behind it the strong argument that, since the key to Europe's survival lies in America's keeping, anything which weakens American interest and the American stake in Western Europe through Nato is bad.



Two things, however, cannot be ignored. One is that there may be no continental Europe to defend, if the French and the Germans cannot seize this fresh and golden opportunity to work out their own salvation together; therefore anything which weakens the impetus behind their sense of collaboration is also bad—as Dr Adenauer recognises. The other is that without the British catalyst the prospects of this process are still by no means good. This is no argument for surrendering, for instance, to the impractical French clamour for an arms production pool. But it does suggest that Sir Anthony Eden, with his unique stature on the continent, should do his utmost during the next twelve months to give a lead, in order to complete the work that he began last September when he salvaged Europe's future from the scrapheap of EDC.

The "European movement" may yet have to lie fallow for a year or two. But a firm statement of intent from Britain, even if no further action is proposed for the moment, would do more to help reassert the spirit of the original Brussels Treaty than anything that has been done for several years. Last autumn's British military commitment on the continent may or may not prove to have been a turning point in policy. What is wanted is a turning point in the psychology of an aloofness that has outlived its sense of reality.

Housewives' Choice

ONE of Parliament's favourite but most stereotyped engagements is its periodical slanging match about the cost of living and food consumption. The Opposition (of whichever party) always claims that food prices have so rocketed that the nation can no longer afford a nutritious diet, while the Government claims that the diet is better than ever before and that food prices have risen less rapidly than under its opponent's rule. Last week's debate on these lines was even less original than usual, since it took place without benefit of the figures that are published this week in the Economic Survey.

It is indeed unsatisfactory that figures showing what the nation eats and how much it spends on food are issued only annually, and that the subsequent detailed analysis in the National Food Survey always appears so late. Up-to-date estimates exist, but they are shuffled round the Ministry of Food in folders labelled Secret as if they were blue prints for the latest

bomb. Political considerations apparently dictate that they shall not be released until they have lost their explosive force. Yet the facts are of great interest, not only to food manufacturers and traders, but also to all who are concerned with public health.

The Economic Survey shows that in terms of calories people are eating more per head than ever before. The average is 3,120 a day, and 3,000 are supposed to be enough for a man doing moderately active work. But mere quantity means little in this connection. Is the diet made up of those foods that contribute to health? According to the standard laid down by the British Medical Association, and used in the National Food Survey, it is, except perhaps in large families of the poorest kind. But it is remarkable how little it has changed since the 1930s, in view of the vastly improved circumstances of the poorest classes.

The figures released this week show that the British in 1954 ate, per head, less meat and fish and hardly more eggs and cheese than they did before the war. In the first months of this year the prewar level for meat seems to have been reached, but compared with North America Britain eats very little protein. The legend of a nation of beefeaters, temporarily on short commons as a result of the war, has finally faded. The shortages have disappeared, freedom of choice has returned, real incomes are higher than ever before; and there are baked beans on toast for supper.

The national diet, as the table shows, also contains rather less fruit than it did before the war—although the poorer classes eat more fruit than they used to. Butter here, as in many countries, has been partly ousted by margarine. Bread and flour are eaten less than before the war, and less every year since 1950—one result, at least, which is to be expected as personal incomes rise. It appears, therefore, that in these days of high wages and full employment the national diet has worsened in several respects; and it would be less satisfactory than it was before the war were it not for two important changes. One is an increase in the consumption of potatoes, and the other is the 35 per cent increase in the consumption of milk, boosted by free milk in schools, the welfare scheme, and by the subsidy. Containing as it does animal protein, fat, vitamin A, calcium and riboflavin, milk can offset a multitude of dietary sins.

Apart from these changes, the average British family in 1954 was fed in much the same way as the average British family before the war. Why has the vast redistribution of income had so little effect on that pattern? The Labour party's answer to this question is that the most nutritious food has become too expensive for the housewife to buy. A glance at the figures shows that this is nonsense.

It is true that the rise in food prices in the last few years has played a part in holding back consumption of certain kinds of food. That would partly explain why, as the table shows, the British people ate more of several important foods in 1950, before inflation gave prices a new push, than they did in 1954. But another reason for this was that in 1950 there were fewer alternative foods to buy. Prices are not the whole explanation, as witness the fact that housewives are chasing some of the very things that have risen most steeply. As a rough rule of thumb from the general price index, anything that costs more than 2½ times as much as it did before the war is relatively dear, anything that has risen by less than that is relatively cheap. Yet tea and sugar, of which more is consumed than ever before, are three times as expensive as in 1938; while bacon, cheese and eggs, in which housewives are no m...

interested than they were then, have only doubled in price. The fact is that expenditure on food as a whole has kept up with prices. The trouble is that people do not choose to buy the kind of food that wise men think is good for them.

Food buying is not the well-considered business that it would be if this were a nation of dieticians. It is to a large extent governed by impulses, and these seem to be of three kinds. The first is the impulse to casual spending—for example, on sweets and ice cream. On these, according to the Minister of Food, the nation spent £297 million in 1954—£49 million more than it spent on milk. The consumption of sweets has reached the astonishing figure of over half a pound a week a

FOOD CONSUMPTION
(oz per head per week unless otherwise stated.)

	Average 1934-38	1950	1953	1954
Milk (inc. processed: pints)	3·9	5·6	5·3	5·3
Cheese	2·7	3·1	2·9	2·7
Eggs (number)	4·2	4·7	4·2	4·3
Butter	7·6	5·2	4·2	4·3
Margarine	2·7	5·2	5·6	5·7
Meat (edible weight)	33·8	29·5	28·6	31·7
Sugar and syrups	33·4	27·4	31·8	35·0
Tea	2·9	2·6	2·9	3·0
Fish	6·7	6·1	5·8	5·8
Flour	59·8	63·3	59·0	56·7
Potatoes	56·0	75·8	68·3	67·9
Coffee	0·2	0·5	0·4	0·3
Fruit (fresh equivalent)	38·2	32·4	35·3	36·5
Vegetables (fresh equiv.)	37·0	39·0	36·2	36·2

This table is mainly based on figures published in the latest National Food Survey and the Economic Survey. The 1954 figures are provisional estimates.

head—1½ ounces higher than before the war, and a world record. It must be feared that a sweet tooth is often a decayed one. The English have long been renowned for their poor teeth, which not even chalky flour seems likely to save against this opposition.

The second kind of impulse springs from the principle that only the best is good enough. Hence the pronounced preference for home-killed meat at any price, and the best cuts of it at that—so embarrassing to the Ministry of Food, knee-deep in its frozen carcases. This preference certainly makes nonsense of those heart-rending accounts heard in Parliament about meat being priced off the working-class table; but the reason for it is anybody's guess. Eating habits, it seems, depend mainly on social class, and changes in income are slow to affect them. Being better off, housewives buy better meat instead of more meat. Any suggestion that they should do otherwise raises a cry of "Scrag end for the workers." Yet if a pound of home-killed meat is richer in nutrients than a pound of frozen meat, it is certainly poorer than two pounds of frozen meat—which, at today's knock-down prices, hardly cost any more. Perhaps a lack of skill in cooking has something to do with the prejudice.

The third kind of impulse that prompts food buying is guided by advertising which, since the working-class housewife has been able to afford more than the necessities of life, has assumed an importance far greater than before the war. A glance at the popular papers shows that food selling has become an extremely competitive business. From half-page advertisements everywhere the saucer eyes and ooh-ing mouths of ecstatic consumers proclaim the delights of somebody's cake mix or somebody's summer-fresh margarine. Thus are one in three of today's housewives—those who had no experience of a free market until last summer—being taught how to spend their money. Some of the interests concerned with the more valuable foodstuffs have realised that they will get nowhere without advertising and have banded together for the purpose. The overseas butter producers have their information council; the New Zealand meat producers have advertised; the trawler owners have vaunted the merits of fillet of cod against those of fillet steak; the Milk Marketing Board has Miss Zoë Newton. Together they make but a small counterblast against the cake mixes and the lollipops. But they have grasped the moral, which is that if the vendors of the more nourishing foods are to keep their hold on the market, and to increase it, they must advertise. Perhaps there is a lesson here for the Ministry of Food also, which might revive its powers of persuasion and start recommending frozen meat for night blindness.

Can We Afford Not To?

If, therefore, says the economist, you insist upon putting an end to the plan of purchasing steps and original commissions in the army—you must be prepared to forgo the £500 or £700 each which you receive for perhaps 500 first commissions every year; you must raise your rate of payment considerably; you must make up your mind to a vast increase of the retiring pension list; and you must pay many hundred thousand pounds yearly for a considerable period for the re-purchase of saleable commissions. . . . We are not in the least dismayed by the amount of the annual sum which it would cost us to get back into a better system. We know the temper of the House of Commons;—how lavish it is on some occasions; how niggardly it is on others;—but we have never known it refuse to sanction a vote which the public service really required, or which was needed to meet the claims of clear justice and good sense. . . . if the Queen, at the recommendation of Parliament, were to revise the system of purchase, we are confident that Parliament would never demur to the expenses entailed upon the country by carrying out that recommendation. To suppose the contrary is an insult to its good feeling and good sense. . . . There is no doubt this would at first be a costly plan. But if you want a good article, you must pay for it—in some form or other. The country has no right to be served for nothing. . . . We will not even attempt to calculate the annual cost of the changes we have been considering. If they are just, and if they would contribute to the efficiency of the service—still more if they are indispensable to that efficiency—the cost has nothing to do with the question. We can well afford it; we can *not* afford to grudge it; and it must be incurred.

Fair Fever

TRADE fairs, like chicken-pox, are infectious. In recent years they have broken out in rashes ; the international calendar is filled with competing attractions. There are literally thousands of trade fairs, big and small, each year, nearly all of which canvass British participation. Every day harassed businessmen are deluged by glossy brochures and tempting invitations. Which fairs should they go to, and how should British industry in general be represented ?

It is, of course, up to individual firms to decide for themselves if it is worth while putting up an exhibit, and there can be few fairs in the world where British firms are not represented. But as the number of important international fairs grows, a bigger problem has appeared. There is a tendency, noticeable in many international fairs, to organise exhibits in national pavilions rather than to divide them up by industries. Here, questions of national prestige naturally arise, and willy-nilly the government is forced to take a hand. As a general rule the Board of Trade, the department mainly concerned in Britain, takes the line that it is up to industry to shoulder the main responsibility. But the Board is prepared to give a certain amount of help and guidance. At many international fairs it provides a central information bureau for British exhibitors, and on occasions the Board itself, as a token of British interest, has organised an exhibit representative of a section of industry or of industry in general. Most reports speak of the high quality and impeccable taste of these exhibits, but there is frequent criticism from visiting businessmen of their modest dimensions.

★

The Board of Trade's Fairs and Exhibitions departments, working as it does on a slender budget, deserves credit for the good work it has accomplished. There is, however, widespread criticism of the government for allotting itself so minor a role. Unfavourable comparisons are drawn with the money and effort expended by countries like the United States and Western Germany. The Americans have recently undertaken a programme in which they will spend some $2¼ million a year to boost American participation in various international fairs. The Board of Trade has a mere £60,000 a year available for this purpose, and this is a modest sum indeed when the Board is faced with so many commitments. Should the government play a more active part in trade fairs ? Clearly it is important both from the point of view of national prestige and for the country's trade that British industry should be represented—and well represented—at the major fairs in the international calendar. There is a case for more liberal spending of government money for this worthy purpose ; but the line must be drawn somewhere.

One obvious place to draw it is between those fairs which are of a purely political character and those which are primarily intended to show prospective customers the range and quality of goods from abroad. There is, for instance, little to be said on commercial grounds for a government-sponsored British exhibit at the Leipzig and other Communist fairs, the primary aim of which is propaganda ; there can, on the other hand, be no objection to individual firms going there at their own expense. The line is less easily drawn in the case of the many new and important fairs, such as those at Delhi and Karachi, where it is planned to arrange the exhibits in national pavilions.

★

The problem here is that someone must undertake the responsibility, as well as the financial liability, of taking up the area allotted to the British pavilion. This explains the fair promoters' enthusiasm for national pavilions, since it relieves them of a great deal of administrative and financial worry and, moreover, enables them to practise a form of polite blackmail on governments. Inevitably a competitive spirit arises and soon the British government, if it is induced to enter the field, finds itself committed to a huge expense for fear that the British pavilion will be put to shame by Eastern Germany or Holland. The Board of Trade is certainly right to set its face against this sort of thing ; if Britain is going to play this silly game it should be a Foreign Office affair, not the Board of Trade's.

Organised industry is equally opposed to national pavilions. Indeed, many British businessmen have yet to be convinced that exhibition at trade fairs of any kind is worth while from a business point of view. Sir Norman Kipping, of the Federation of British Industries (FBI), has recently explained, in a correspondence in the daily press, his organisation's general approach to the problem. In particular, he emphasised the Federation's dislike of the national pavilion technique. It seems that some progress has been made in persuading other members of the Council of European Industrial Federations to accept this point of view. But it is doubtful whether, in spite of British hostility and the pressure to resist this development, the trend can be quickly reversed. In all probability, there will be national pavilions at many fairs in the future. So if British industry is to be represented in these fairs, who is to be responsible for the British pavilion ?

The government's view is that, since the purpose of trade fairs is principally to stimulate sales, it should be the task of industry to run the pavilion. In the case of some of the smaller fairs, it has sometimes been possible to find a British promoter who is willing to undertake the job of organising British participation—hiring the allotted space and letting it out to any exhibitors he can induce to take part. The risks are great and the prospective profit modest. A new departure is the formation by the FBI of a special subsidiary company, Overseas Fairs Ltd., which possesses only nominal capital but has pledges of financial backing and is able to put its hands on fairly substantial sums of money for short-term purposes. Ultimately this type of venture, financed and run entirely by industry, may be the answer to the problem ; but it will need to have access to much more finance than it enjoys at present.

Overseas Fairs was actually brought into existence for the purpose of running the British Fair at Baghdad last autumn, a type of fair which is quite different from the traditional international fair. Its object is to show British products from every walk of industry in places where a concentrated sales effort is likely to pay dividends. A successor to the successful Baghdad Fair is planned in Copenhagen next autumn. But this worthy type of enterprise is not without snags. First, there is the question of selecting a suitable site. Baghdad was ideal ; it had the advantages of novelty, a clear field from possible rival shows, and, most important of all, a market stuffed with money. Copenhagen appears less of an inspiration, since fairs are commonplace, British goods are on the whole well known, and the Danes, good customers though they are, have even fewer dollars than the British. Unquestionably there is scope for the wholly British fair in some foreign countries ; it would be worth while considering the possibilities of Latin America and South East Asia as future sites.

Teething troubles that have been encountered in the matter of organisation should not be difficult to correct. At Baghdad, for instance, though the fair was a brilliant success once it had opened, those who were concerned with it on the spot found it difficult to resist the impression, almost throughout the night or two before the opening, that they were living over again the last frenzied moments before the opening of a parish bazaar. Maybe the hitches and delays that had held things up will not recur in western countries, but, as their outcome, commercial exhibitors and even local British residents, willing but untrained, were giving services that ought not to have been necessary, but without which the fair could hardly have opened on time. Amateurs are often all right on the night, but a British overseas fair is a job for professionals. Admittedly those who went to Baghdad were breaking new ground, and they were handicapped by unexpected transport difficulties ; but in future they ought not to have to call in so much last moment help. It is to be hoped that this will not be necessary even if these British fairs venture away from the familiar trade centres into fresh territory. Moreover, it is essential that better publicity arrangements should be made, and that the organisers should be given more solid financial backing. Nonetheless, in spite of the preliminary alarms, the Baghdad Fair was a rollicking success and Overseas Fairs made a profit. The wholly British trade fair has a future if it is properly handled ; it is a field in which co-operation between government and industry can bring much profit to both.

Notes of the Week

Attack on Matsu and Quemoy ?

THE idea that a *de facto* cease-fire might be developing in the Formosa Straits has received a setback with fresh intelligence reaching American military headquarters. While a Chinese Communist build-up has been evident on the mainland for some time, some people in Washington now think that an attack will be launched on the Matsu group of offshore islands about April 15th, and that a subsequent onslaught will develop against Quemoy about a month later. This appraisal appears to be purely military and President Eisenhower has emphasised that it does not have his personal backing. It does in any case make nonsense of the political argument that Peking will not want to do anything to spoil its own propaganda as a peacemaker, immediately before the Afro-Asian conference in Bandoeng at the end of the month. It also presupposes, from a political point of view, that the Russians are no longer either able or willing to put the brake on the Chinese. On the whole, this seems unlikely. But it is a possibility too serious to be dismissed.

If the Chinese did attack Matsu and Quemoy they would confront Washington and London with the same grim question in two different forms. In Washington, President Eisenhower and the National Security Council would have to decide at what level to pitch America's reaction. As yet, it

is by no means certain whether the United States would do more than supply the Nationalists ; on the other hand, there are strong voices which urge a decisive retaliation with atomic weapons that would smash China's power to make war.

In London, if the United States committed itself to battle, the question would take the form not only of what Britain did, but also of what it said. Given that a prime aim of all Chinese and Russian policy is to split America from its allies, and that no major action is now taken by either of the big Communist powers except in concert with the other, much would depend on the way Britain answered the challenge. For Sir Anthony Eden, possibly about to face a critical general election, it would be hard indeed to give the pledge to America that the situation demands. Yet not to give it could do lasting damage to the alliance and bring untold consequences in its train. The decision might be made less difficult if the country were given a lead and prepared for it now.

Election Latest

WHILE well over three-quarters of British families have been without their usual morning or evening newspapers, the two rumours that dominated the headlines before the great shut-down have strengthened without changing course. Sir Winston Churchill has avoided any direct answer to Parliamentary questions about his retirement with such puckish assiduity (his formula is that the "future is veiled in obscurity") that it is now more widely assumed than ever that that retirement is only a few days off. One factor that might postpone it past next week is the natural, and very proper, feeling that he should not come up for his curtain call at a time when the national press is gagged. Opinion has also been hardening, without any new evidence, that—the Chinese forces opposite Quemoy permitting—the Government wants the general election to be held on May 26th.

Both parties are now covering up their nervousness about the result of the election with an increased bravado. The Tories will have derived some useful material for statistic-mongering, which plays so large a part in a modern election campaign, from the tale of roaring prosperity told in this week's Economic Survey and National Income White Paper. The Labour party has got on slightly better terms with itself, as a result of this week's diplomatic manœuvrings leading up to Mr Bevan's reprieve from expulsion ; and it therefore tends to assume that it has also got on better terms with the public than it was a fortnight ago. Meanwhile, however, the newspaper crisis is likely to blow away what might otherwise be a useful straw in the analyst's wind. One casualty of the lack of newspaper publicity may be the poll at the county council elections, which started on Thursday and which will be continued in various parts of the country until the middle of next week ; the small size of the vote is likely to make it more difficult than ever to judge the significance of the swing to the Tories, compared with 1952, which these council elections will almost certainly show.

Mr Bevan's Rescuers

MR ATTLEE and the Tories seem to have subscribed in about equal parts to the rescue of Mr Bevan from the threat of expulsion from the Labour party. It was the imminence of the election that lay behind this week's final decision to save his bacon, together with some shreds of the right wing's face. The last act of the rescue operation was very carefully stage-managed. Mr Bevan appeared before the special disciplinary committee of the Labour Executive on Tuesday, and presented it with a written statement. The centrepiece of this statement was a magnificent example of how to apologise while actually administering a haughty and condescending rebuke:

> In a great party such as ours there must always be argument about how to apply the principles of Socialism to a particular situation. The essence of democracy in a political party is to enable the argument to proceed while at the same time maintaining the effectiveness of the party in action. It is not always easy to achieve this, but we must always strive for it, and I shall do my best to make it possible.
>
> The charge is that in what I have done, and also in the way in which I have done it, I have created difficulties for Mr Attlee. . . . This was certainly never my intention. But if any action or speech could lend themselves to the interpretation that such was my motive, then I am sincerely sorry and I apologise to Mr Attlee for any pain I may have caused him.

This statement—together with an equally ambiguous assurance that Mr Bevan would "claim no more privileges than and accept all the obligations shared by other members of the party"—was then laid before the meeting of the full Executive on Wednesday ; and one of the trade union members who had argued for Mr Bevan's expulsion last week put forward a face-saving motion. It declared that the Parliamentary Labour party had been fully justified in withdrawing the whip from Mr Bevan, but that the Executive itself should merely warn him that "it will take drastic action against future violations of party discipline." It is a sign of the growing strength of the left that the Bevanites on the Executive felt strong enough to vote against this motion as "too harsh," and that Mr Attlee and Mr Griffiths found it diplomatic to abstain. The motion was carried by sixteen votes to seven.

As a result of this play-acting Mr Bevan is destined to remain in the Labour party. He will also, presumably, have the whip restored to him in time for the election. Only after the election will the party start to reap the tainted harvest of Mr Attlee's manœuvring. If Labour wins, of course, Mr Attlee will be splendidly placed, but what if Labour loses ? Mr Attlee will have lost the trust of the right, while Mr Bevan will be able to put himself forward as the man whom that disloyally maligned leader really preferred. There will be little emphasis on this week's "sincere" apologies then. There has been some argument that Sir Winston Churchill, in his speech at Woodford last Saturday, championed Mr Bevan's case. But Sir Winston laid down the priorities on an MP's honourable service, in their order, as country, constituency, party. He gave no place to "Self."

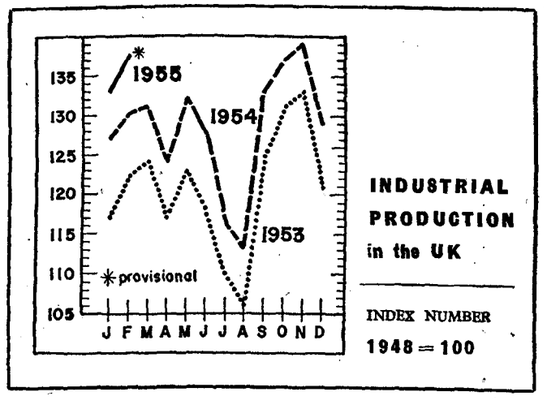
Life Without Newspapers

THE news famine produced by the newspaper dispute in London has fallen on an unprepared public. The provincial papers have explained why they cannot increase their circulations to step into the breach. The BBC is moving only cautiously (but, since Tuesday, less clumsily) towards a more comprehensive news service. In trains and buses the public is thrown back on its powers of meditation —a not unwholesome experience, but only if not prolonged. Will it be prolonged ? The moment has been well chosen. A small number of technicians—from the Amalgamated Engineering Union and the Electrical Trades Union—has paralysed the industry at a time when a great deal of revenue is at stake. At the beginning of the negotiations the Newspaper Proprietors' Association apparently assumed that increases in wage rates which they had amicably arranged with the printing and kindred trade unions—the craft unions—would automatically be acceptable to the technicians. Perhaps as a demonstration that they were as good as the favoured craftsmen, the electricians and engineers have pitched their demands high, and the employers declared them to be out of line with those already granted.

Now the craft unions have turned round and said that their own demands, conceded by the NPA, were only an instalment. The original weekly basic rate of the electricians was £12 5s. 6d. for night work and £10 9s. 6d. for day work. Increases comparable to those granted to the craftsmen would have brought these rates up to £12 19s. 6d. and £11 1s. 6d. respectively. But the AEU and the ETU leaders are asking for at least 58s. 6d. more—£15 4s. for night work and £13 8s. for day work. It is stated that on existing rates an electrician can get £750 a year with overtime ; and this would become his basic rate if the unions' demands were granted. It is understandable that the employers are worried if this sort of increase is to spread back to the other workers ; but, despite differences of viewpoint, they are maintaining a united front and have given notice that they will lay off their strikebound—though not striking—employees after April 15. On Thursday, however, the familiar noise could be heard of Sir Walter Monckton's conciliation machinery attempting to clank into action.

Spotlight on Baghdad

ONCE again this week, Baghdad is the focal point of Middle Eastern diplomatic activity. Negotiations there between the British and Iraqi governments have ended in a new defence agreement whereby Britain adheres to the Turco-Iraqi pact, signed in February ; and, simultaneously, the Anglo-Iraqi treaty of 1930 is brought to an end. One outcome that will please Iraqis will be the hauling down of the British RAF flag that has flown for a generation over the airfields of Habbaniya, on the Euphrates, and Shaiba, near Basra. When these two airfields are transferred to the Royal Iraqi Air Force, the Iraqis will make them, and other fields also, available to their allies for training purposes. The accent of the new arrangements is on joint planning and combined training, and, in the course of these, RAF ground staff will be stationed on Iraqi airfields for purposes of training and maintenance, while British air squadrons will, also for joint training purposes, pay periodic visits to Iraqi bases.



The reasoning behind these plans seems to be that, in modern terms of atomic warfare, ground troops may be cut off by regions of radio activity from what used to be their ground-lines of communication, and will be bound to need servicing by air ; it is important, therefore, that each ally should know the terrain of the neighbour over which he may have to fly.

In announcing the agreement to the House of Commons on Wednesday, Sir Anthony Eden said that he did not expect any other adherent to join the pact in the immediate future ; nor were its signatories pressing anyone to do so. This last remark disposes of some stories about pressure that are coursing round the Middle East, and that are being given currency by both Moscow and Cairo radios.

Austria—Neutral or Neutralised?

HERR RAAB, the Austrian Chancellor, is going to Moscow at Mr Molotov's invitation to discuss the Austrian peace treaty. He could hardly do otherwise, now that Mr Molotov has taken back the extra demands which were put up at the Berlin conference last year. Mr Molotov no longer insists that the occupation troops should stay in Austria until there is a German settlement, and in his latest Note he agreed with Herr Raab that a conference of the powers might discuss Austria separately.

As the matter now stands, Mr Molotov keeps to his demand for an international guarantee to back Austria's declaration that it will not join a military alliance or permit bases on its territory ; he also insists that there shall be no fresh *Anschluss* with Germany. The Kremlin also appears to want some clause in the treaty which would permit troops to reoccupy Austria in the future, if there were a threat of reunion with Germany. It is easy to see that the word "*Anschluss*" could be interpreted very loosely, by

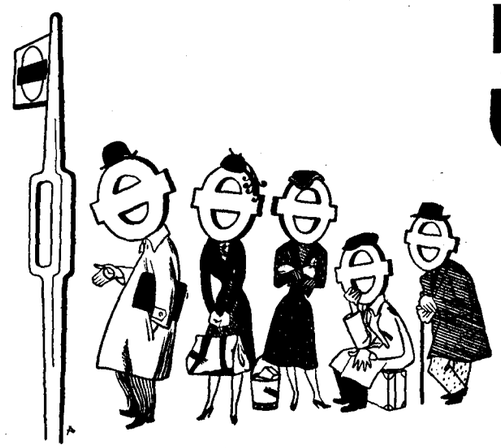
the Communists covering, for instance, a return of former German industrial firms to Germans.

The greatest difficulty, however, revolves round the question whether Austria is to be neutral or neutralised. And there is a world of difference between the two. The distinction is playing a more and more important part in the unending discussions that go on among official and unofficial politicians over the future of Germany as well as of Austria. In essence, neutrality means that a country has the sovereign status of a Sweden, and can abandon its neutrality in time of war if it wishes. Neutralisation, on the other hand, means that a country renounces its right to an independent foreign policy and that the onus for keeping it neutral rests on the other powers. It will be just as well for Herr Raab to explain plainly to Mr Molotov that the western occupation powers oppose neutralisation for Austria and for him to reject the idea himself. Otherwise, a principle would be established that would one day affect negotiations on the future of Germany. In order to set up Austria as a model, Mr Molotov may be expected to offer still more concessions in his *tête-à-tête* with the chancellor.

Two Steps Back, One Step Forward

IN a flurry of leaks, the "secrets" of the Lancaster House disarmament talks have escaped to the world this week and have proved to be very much what the world had expected. Mr Gromyko's statement, issued a few hours after he had left London for Sweden, disclosed the proposals which the Russians put to the conference on March 18th. The various Western delegates have since attacked Mr Gromyko for bad faith in breaking the pledge of secrecy, and have issued details of the Western counter-proposals. *Pravda* has defended Mr Gromyko on the grounds that he was compelled to "correct Western distortions." It seems pointless to debate who sprang what leak first. Perhaps President Eisenhower was technically at fault in saying, when he announced Mr Stassen's recent appointment to a special disarmament post, that the London talks had "again resulted in no progress." But the Soviet delegation was the first to divulge the details of what has been going on, and it must bear the blame for the consequent raising of the temperature at Lancaster House.

It is now possible to measure the gap between the positions of the two sides. Mr Gromyko is entitled to claim that the Russian proposals are an advance on those made before the conference began, which demanded unconditional abolition of all nuclear weapons before a start was made on conventional disarmament. But these earlier proposals themselves marked a big retreat from Mr Vyshinsky's speech to the UN General Assembly last autumn. All the Russians have in fact done in the last month is to stiffen their terms first in order to claim a concession later. The chief differences between East and West remain: the Russians still demand a one-third reduction in conventional forces (which would leave them and the Chinese with a numerical superiority of roughly 5½ million to 3½ million in the West) instead of a reduction to agreed and equal levels on the lines of the naval treaties of the nineteen twenties and thirties. And there are still no signs that the sort of control commission that the Russians want would be a really muscular and independent body.



Walk Off the Barrett Way

MR BARRETT has done it again. Last October he succeeded in bringing out London dockers of the Transport and General Workers' Union on strike in sympathy with his stevedores' union. This week he brought the docks at Merseyside and Manchester to a standstill, and again a number of the rival union's men promptly struck in sympathy. For two days work was held up on nearly a hundred ships at these ports; and the strike was only called off after the stevedores' demands had been met in full.

The background of the dispute was the intrusion of Mr Barrett's National Amalgamated Stevedores and Dockers, which used to operate in London only, into the northern ports, where it started last year to recruit the Transport union's members and continued to do so unimpressed by its consequent suspension from the TUC. Matters came to a head this week when men had to get their new record books for the next six months. For many years the practice has been that clearance cards, showing paid-up membership of the union, are issued to the men by a local official of the TGWU, and that the local official of the Dock Labour Board registers those who can present these white cards. But large numbers of men at Merseyside and Manchester this time turned up with the blue card of the NASD. At Merseyside the Board's officers did not refuse to register them, but told them to come back next Friday. This, presumably, was just playing for time, in the hope that the boards—and the port employers too—could avoid being dragged into a quarrel with which they had not so far been concerned. But the "blue union" men chose to regard the delay as refusal, and came out on strike. With them came many who had not transferred their allegiance, but who walk off the docks, sheeplike and solid, as soon as anyone else does. Work was resumed on Wednesday after the Liverpool Dock Labour Board had agreed to accept NASD men.

The Dock Labour Board has had to make a very difficult decision, which however, one would have thought it could have made in advance. On principle, it is illiberal to insist that men should belong to any particular union; and in practice it would have prolonged the strike and almost certainly spread it to London. But the results of yielding to the NASD may also be serious. It will be a blow to the TGWU, with which the employers have a long-standing agreement, dating from the time when there was no other union in the field; that must seem an odd way of requiting its record of co-operation and responsible behaviour. And it will greatly strengthen Mr Barrett, who can now appear as a victorious David who has slain Goliath with his little sling, and who will be raring to fight —on some other issue—some other day.

Queue Questions **3**

SELF OR CHAUFFEUR DRIVEN?

The private motorist who drives to the shops in Central London is faced with many hazards. There is the exasperation of waiting while the engine idles at the cross roads. There is the need for skill, for a desperate concentration in order to avoid the indiscretions of other drivers. There is the anxiety that, forced to park by the roadside, she may return to find the arm of the law, resting notebook in hand across the radiator . . .

What is the solution? It is surely a chauffeur who will set her down at a convenient place and be ready at any time for the return home in the evening; who will speed her from shop to shop or from hairdresser to the cinema.

And how much does such a chauffeur cost? The price of a ticket on a bus.

By using public transport the motorist will do more than save in money and anxiety. She will be easing the congestion of the streets; *she will be helping the buses to go through;* she will be improving the service she is patronising. A car occupies some 80 sq. ft. of road space and carries at most four passengers. A bus occupying 195 sq. ft. can carry 61 passengers. To the motorist it is the difference between selfishness and self-interest. And by leaving her car at home she will be helping everyone to more efficient travel on the London streets.

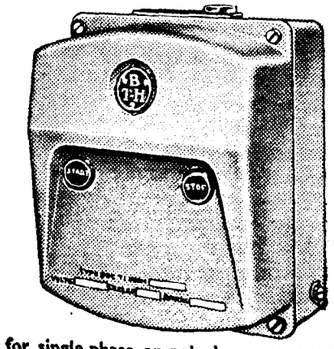
PROGRESS IN ELECTRONICS

Despite its innumerable applications, the magnet is still popularly associated with its use as a navigational aid. This is perhaps not surprising when one considers that the earliest experiments in magnetism were connected with the compass and its use in navigation.

It is said that the Chinese were using a form of lodestone compass in B.C. 2637, but the experimental study of magnetic direction finding devices really began in A.D. 1000 and reached something of a milestone in the 16th century with the work of Dr. Gilbert, who was physician to Queen Elizabeth.

It is only within the last twenty years, however, that revolutionary advances have been made in navigational aids. Radar was, of course, the most important of these advances and it owed its successful development to the invention of an electronic tube known as a magnetron, and this device, in turn, depended for its efficiency upon the "Ticonal" permanent magnet—an alloy having great field strength, stability and uniformity.

Mullard's work in the field of magnetic materials has been particularly outstanding. In addition to "Ticonal" permanent magnets, two other materials now in quantity production are Magnadur, a non-metallic permanent magnet, and Ferroxcube, a non-metallic H.F. core material. These materials are contributing to important developments in other electronic applications such as television receivers and line communications equipment.



Progress in magnetic materials continues, and through this the future may well see developments of equal significance to those which have gone before.

The Liberal Banner

IF the general election is really coming at the end of May, as most people think, then the Liberals have good cause to congratulate themselves on the timing of their annual assembly, which is being held in a fortnight's time. The Liberals are not likely to get many more chances to re-establish themselves on the national political stage, and they will need to use their Assembly for hard tactical planning. One of the main jobs for the party leaders will be to deflate the more windy illusions of the rank and file. There is a resolution on the Assembly agenda, for instance, which urges the party to put up as many candidates as money can buy, based on the fatuous claim that when 475 candidates stood in 1950, "189 deposits were saved." Any more "successes" like the 1950 election will give the Liberals the dubious honour of being the first political party to finish in Carey Street.

It has, in fact, been confirmed this week that the Liberals hope to put into the field between 120 and 150 candidates; this compares with 109 candidates in 1951, so that—if the hope is fulfilled—it may be a small bear point for the Tories. Approaching the problem with a belated sense of realism, however, the leaders have graded the constituencies, and are concentrating resources on the few which do or might return a Liberal MP and the larger number which might furnish a reasonable Liberal poll. The party will not be able to offer itself as an alternative government, but this it has not been in a position to do for nearly a quarter of a century.

The only service the Liberals can now render is to induce the other parties to adopt Liberal policies. The number of electors still retaining the habit of voting Liberal is dwindling and Liberal voters nowadays are mainly refugees from the two big parties. But the natural thing for an elector to do if he is discouraged by the other parties is to abstain; if the Liberals want him to vote for them, they will have to attract him to the polling booth, and that makes the Liberal programme far more important to the party's chances than in the case of the two big parties. The preliminary agenda for the Assembly, when it came out earlier in the year, was noted as offering signs that the Liberals are concentrating on social and economic issues that are inadequately covered by the other parties, such as education and monopolies. The final agenda does not add to the list of distinctive Liberal policies, but it wisely retains in a key position the resolution on civil liberties—which is to be moved by their unexpected new standard-bearer, Mr J. B. Priestley.

Calm Again in Brussels

BRUSSELS is calm again after an exciting weekend during which police manned roadblocks in the city, security measures were reinforced and army leave was cancelled. In the event, these precautions proved to be more than equal to the occasion; the "march on Brussels," organised by the Catholics in protest against the government's new education policy, did not prove successful and there were only a few minor incidents.

The Liberal-Socialist government's proposals for making a cut in the cost of education have evoked strong protests from both the Church and the Catholic Christian-Social party. It is claimed that the proposed cut of 500 million francs in the subsidies paid by the government to confessional schools would virtually "destroy Church education in Belgium." But the battle between clerical and anti-clerical forces has been going on for at least a hundred years and all the arguments on both sides have been heard before. The fact is, that of 96 teacher training colleges 64 belong to the Church, of 800 secondary schools 532 are confessional, and of 1,370 technical schools 1,034 are run by the Church. The present government, whose subsidy bill for the so-called "free schools" is over 3,500 million francs, proposes to stabilise the exchequer contribution at a figure a little lower than this, thus in time gradually shifting the emphasis in the general education scheme towards a greater proportion of state-run schools.

The failure of the recent public demonstrations to influence the government will now give the moderate elements in the Catholic ranks an opportunity of steering the protests into more constructive channels. The government is not unwilling to make compromises. It is in the interests of everybody concerned that the problem should be settled inside parliament.

Mr Strydom Tries His Hand

A CLEAR indication of the South African government's next step in its campaign to resolve the constitutional issue was given this week with the appointment of five additional judges to the Appeal Court bench. They will join the five judges who previously gave a unanimous ruling against the government in the case of the Cape Coloured voters. Apparently a quorum of 11 judges will in future be required for cases concerning constitutional appeals; thus one more appointment may yet be made. There is no mistaking the government's intention of using this manœuvre to break the deadlock, which has for so long embarrassed it with its extremist supporters.

There can, on the other hand, be no certainty that this transparent attempt to pack the bench will be any more successful than the abortive High Court of Parliament, which the government convened in an effort to circumvent the ordinary courts. Indeed, the integrity and the independence of the South African judiciary being what it is, the chances are that the enlarged bench will not in fact be swayed from the compelling arguments of law that led to the earlier decision. For it cannot fairly be said that the new Appeal Court judges are persons necessarily favourable towards the present government; some of them were originally appointed to the bench by the Smuts government.

This latest move runs somewhat counter to Mr Strydom's well-known views on the sovereignty of parliament. He has frequently objected to the so-called "testing rights" of the courts; but strengthening the Appeal Court with the object of again submitting the Coloured voters' case is tanta-

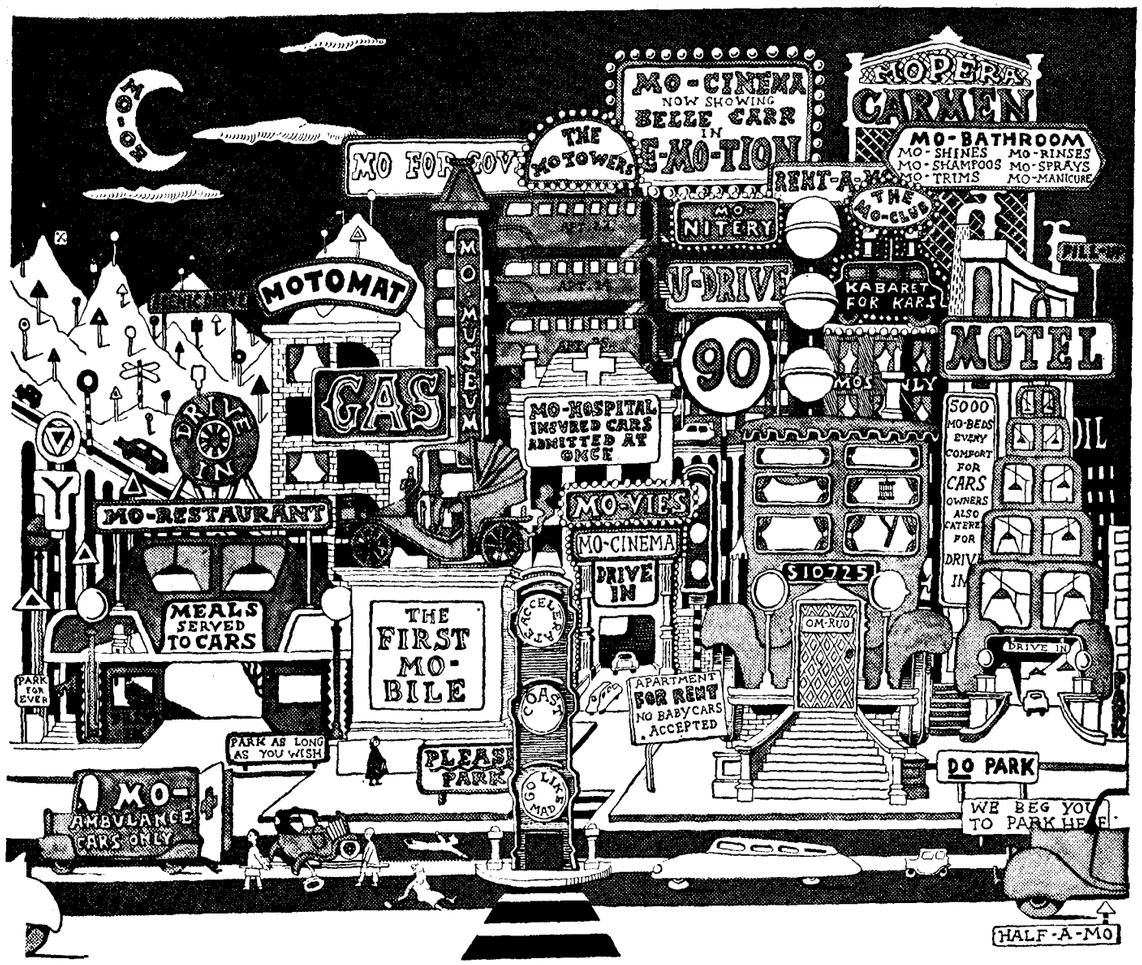
mount to reasserting the prerogative of the judiciary in this matter. Perhaps the charitable—and it may not be wholly improbable—construction to put on it is that Mr Strydom, whose sense of responsibility has been much strengthened by the burdens of office, is secretly hoping that an adverse decision by a packed bench will provide him with a legitimate excuse for dropping the whole fruitless affair.

A Desirable Casualty

ONE of the first casualties of an early general election would be the Road Traffic Bill, which had its third reading in the House of Lords last week. Several members did not conceal their pleasure at the prospect of its demise. From its first drafting, this has been a bad Bill with a good intention; and it has not been much improved, despite searching scrutiny, in the Lords. Whether the House of Commons could do much with it may be doubted. Many of the Lords complained that few of their suggested improvements had been accepted. The most controversial proposal—to set up a vast organisation to test all vehicles, over a period, with the object of cutting down the mere two per cent of accidents directly attributable to defects in the cars involved—has admittedly been watered down; but it has been watered down from a silly proposal to an ineffective one, for the tests will now apply only to second-hand vehicles—which were fairly easily shown to be unlikely to achieve much in the way of permanently improved performance.

Lord Brabazon of Tara rightly described the Bill as being, in reality, a new criminal law amendment Bill, embodying the idea that "by the intimidation of penalties, the roads can be cleared of accidents." It is true that road safety is primarily a matter of motorists and pedestrians, not of conditions; Earl Howe quoted a telling American accident analysis which concluded that "in most accidents the guilty party is man and not machine, mind and not motor, reflex and not roadway." But penalties are likely to be operative and to deter only if a jury regards them as fair and the offender regards them as certain. Under this Bill the penalty for dangerous driving still depends on the results, not simply the culpability, of the accident; and conviction will depend less on facts than the state of the jury's conscience over its own regard for the—lately improved—Highway Code. Whichever Government is returned at the election should reintroduce this Bill with at least two major modifications. It should lay more emphasis on long-term withdrawal of driving licences, and less on prison, as a deterrent; and it should look again at the proposal to test vehicles. If this happens, the long labour of the Lords will not have been wasted.

Stubborn German Trade Unionists



ALTHOUGH last Sunday's voting in the Council of the Republic (described by our special correspondent on page 39) opens the road to German rearmament, Dr Adenauer is still uncertain whether the new forces will be set up in the teeth of German trade union opposition or with their active collaboration. One of the most unyielding obstacles to overcome is the hostility of many German trade union leaders. At a specially convened conference held in Brussels last weekend an attempt was made by Western trade union delegates to persuade the Germans to stop opposing German integration in Nato and to give practical support to the federal parliament's decision. It seems to have had little success. The conference, which was held under the auspices of the International Confederation of Free Trade Unions (ICFTU) and consisted of delegates from the seven countries of the Western European Union plus the United States, spent two days in arguing with the Germans and at the end issued a non-committal statement which simply recorded the subjects discussed. The German delegates of the trade union federation (DGB) stubbornly refused to give their blessing to Dr Adenauer's plans.

The DGB is known to be divided on the matter. An influential section of the leadership is willing to accept the federal parliament's decision as binding, if not actively to co-operate in defence matters; it was presumably this section which, after the *Bundestag* debate, inspired the leading article in the DGB's official weekly paper urging this point of view. The extreme anti-rearmament wing is led by Herr Brenner, head of the metalworkers' union, and Herr Kumnernuss, of the public transport employees. The latter appear, for the time being, to have got their way. At the end of the Brussels conference the Germans seemed to be back on the position they took up at their congress last October: that German reunion—not merely an attempt to negotiate with the Russians about it, but the finished article—must be achieved before they will accept the principle of a German contribution to Western defence. This is a step back from the more conciliatory statement issued by the executive of the DGB after the *Bundestag* debate. If they persist in their stand, they can create serious embarrassment for Dr Adenauer.

Germans in the Air

AFTER nine years of grounding, the Germans are taking to the air in a modest way this week. Their civil air line, the Lufthansa, is beginning by opening purely internal services—without being able to include the lucrative run to Berlin, however, since that city is still under four-power control. Four Convair machines have been bought, and the short haul services will be extended to include London, Paris and Madrid in the early summer. Later on this year four Super-Constellations will be able to start the trans-atlantic run to New York; Buenos Aires and Teheran are on the schedule for 1956. The company has informed the Bonn Finance Ministry that it will have a deficit of DM10 million (about £830,000) for the current financial year but hopes to dispense with subsidies after three years. These are admittedly very uncertain estimates, as the position of the new company when operating abroad is still uncertain.

The prewar Lufthansa had a very good name for efficiency, but rapidly lost its goodwill in Britain because it was misused as a camouflage for Goering's secret Luftwaffe.

SCHWEPPSYLVANIA

the motocracy

Written by Stephen Potter and drawn by Loudon Sainthill

Schweppsylvania, 49th of the United States and more so than any of them, is neither a technocracy nor a republicanocracy. It is a motocracy, misleadingly called autocracy — a government of, by, and for autos, with, practically, an auto for governor.

For their greater honour, motels are for cars, not people. Mo-parks are clustered with charming polishers and mo-manicurists waiting to tempt the appetite of reclining engines with the oiliest oils and the petroly-est petrols; while slender girls inject into the tyres, from lovely bottles, purest Detroit air.

All highways are mo-ways only. Pedestrians who get in the way are removed after a time to the side of the road and imprisoned, when they recover, for dangerous walking. But the damaged car has been driven, long since, by mo-ambulance to the mo-hospital.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

There is a world of difference between those days and this. The new Lufthansa has been lifted into the air with the help of the British and Americans, and it hopes to collaborate particularly closely with Air France. British pilots, lent by British European Airways, are training the Germans and will be taking the first pilot's seat for some time to come. Although, for several years, the airport staffs in the Federal Republic have included Germans as well as nationals of the occupation powers, more Germans will now have to be trained.

There is, of course, some reason to lament the appearance of a new competitor to the British airlines. On the other hand, there is much more reason to consider the advantages of bringing the Germans as closely as possible into the "club" of international air lines, objecting only if they show signs of breaking the rules. When all is said and done, the other companies have had nine years of monopoly inside Germany and the Federal Republic is about to become a fully-fledged ally, a member of Nato. Moreover, British aircraft manufacturers will have a chance of selling Viscounts to the Lufthansa if the company goes over to turbo-props in a few years time; the British put up keen competition to secure the original orders, but these went to the United States chiefly on account of the generous credit terms which the Americans offered at an early stage. Dollars may not be so plentiful when the next German orders are placed.

Horror Comics for the Lords

THE Children and Young Persons (Harmful Publications) Bill has now passed the committee and report stage and was read a third time on Tuesday. Many amendments were proposed: some to extend the scope of the Bill—for example, to cover newspapers—and some to restrict it, for example, by exempting retailers and newsagents from its operation, on the ground that they cannot examine everything that they sell. The Government, however, would make only two concessions. It agreed, first, that the term of the Act, if so it became, should be limited to ten years. That was at least some consolation to the anti-censorship party on both sides of the House, since it guards against the danger that long after the original purpose of the Bill is forgotten, it may be used to censor publications of a different kind. The Government's second concession was to accept an amendment that no prosecutions under the Bill should be instituted without the consent of the Attorney-General. That will be an important safeguard against activity started by busybodies and prudes.

The Bill therefore goes to the House of Lords without any change in its substance or in its definition of a harmful publication. The criterion of Lord Cockburn's judgment of 1868, which has caused such trouble in prosecutions for obscenity, is extended to another field. It is the tendency of a work "as a whole" to "corrupt a child or young person into whose hands it might fall" that is to be actionable. And, as with books and other publications, the intention of those responsible and any evidence of literary or artistic merit are irrelevant to the question of guilt. This is perhaps logical so long as the law against obscenity stands, but it only serves to emphasise the need for amending it. Mr Roy Jenkins's—and the Society of Authors'—Obscene Publications Bill was designed to attempt such an amendment; and it is still not clear why the Government felt unable to accept it, and to incorporate its own legislative tinkering into this wider measure.

Restraining our Servants

LAST Friday's debate in the House of Commons on the compulsory acquisition of land and property was not a strictly party affair. But it is fair to say that most of the Conservative backbenchers who spoke were intent upon developing the idea of controlling the unreasonable use of executive power through some kind of administrative court; that most of the Labour backbenchers present probably agreed with Mr George Brown's view that "If it is to be argued that there is something about a court of justice that makes it better able to look after the rights of citizens than this House of Commons, it is an argument which strikes at the whole basis of Parliamentary democracy"; and that Mr Brooke, who replied for the Government, was rather nearer to Mr Brown's views (which are also the average civil servant's views) than he was to those of his own backbenchers. He appealed for details of all hard cases to be reported to the Minister responsible.

The ideas of the Conservative backbenchers have many antecedents, including Lord Justice Denning's recent suggestion for the establishment of a new court, composed of a judge and two civil servants. But their immediate rallying point is a pamphlet which has just come out of their own stable—called "Rule of Law,"* produced for the Inns of Court Conservative Society by a "committee consisting in the main of practising barristers, including Conservative Members of Parliament, under the chairmanship of Sir Patrick Spens." The authors believe that the chief defect at present is lack of publicity; once the facts are known justice often follows. They call for the establishment of an administrative court because it would be able to secure publicity as a matter of course; it would have power, on the application of a person aggrieved by an administrative decision involving personal or proprietary rights, to call for a statement of the facts and reasons upon which the decision was based. If the court, which the authors consider should constitute a new division of the High Court of Justice, decided that there had been a material error of fact or law, it would be able to annul the decision or to order the rehearing of the case before a tribunal or to make such corrections as appeared necessary. The authors insist that, since a High Court Judge would preside over the court, it must not be involved in policy and they therefore propose that any statement of his policy by a Minister should be binding on the court and unexaminable by it. Parliament would remain the forum for attacking policy. The court would therefore not substitute its own view for that of the Minister, so long as it was satisfied that the facts had been properly ascertained and that any inferences and conclusions were based on reasonable grounds.

* "Rule of Law"—Conservative Political Centre—boards 2s., cloth 3s. 6d.

This system, which would fall far short of a Conseil d'Etat on the French model, would go some way to staunch growing public resentment. One of the troubles about the present system—under which publicity can only be obtained by persistent efforts through political channels—is that the opportunity for making a fuss varies from individual to individual, and perhaps even from constituency to constituency. But, especially in view of the attitude of some civil servants, the reform is not one that can easily be effected by a Government unless it has been committed in advance of its period of office. It would be an excellent thing if the ideas behind this thoughtful pamphlet could find their way into the Conservatives' election programme.

SHORTER NOTES

The High Authority of the Coal and Steel Community, with the concurrence of the Council of Ministers, has increased its control over the importing and distributing of imported scrap within the six countries. From now on, a representative of the High Authority will participate in the Joint Office of Scrap Consumers which sits in Brussels, and, if there is disagreement, he will have the determining voice. Despite French arguments to the contrary, the High Authority, supported by the Council of Ministers, has determined that no absolute shortage of scrap requiring the fixing of allocations and priorities exists. On the contrary it believes that demand and supply are in approximate balance, and that any temporary difficulties can best be ironed out through the technique of pooling imports and directing the imported scrap, as necessary, to meet temporary deficits.

★

The latest news from South Vietnam is bad. After weeks of increasing tension, regular soldiers of the Vietnamese army clashed with armed members of the Binh Xuyen gang in Saigon early on Wednesday. Six loyal soldiers and police were killed; ten Binh Xuyen men lost their lives and there were six civilian dead; the wounded totalled 112, more than half of them civilians. The clash was apparently a spontaneous explosion following an insulting epithet hurled at a Binh Xuyen man by one of the regulars, who this week have seized the police building on behalf of Mr Diem, the prime minister. Until then, the police had been controlled by the Binh Xuyen, a band of privateers about five thousand strong, who are in alliance with the two important armed religious sects in Cochinchina, the Caodaists and Hoa Hao. It may be premature to describe the clash as the beginning of a civil war, but there are ominous reports of fighting in the south-west between Hoa Hao guerillas and government troops, while the notorious rebel Ba Cut has apparently started an economic blockade of the capital.

Letters to the Editor

Capital for the Professions

SIR—In your interesting article of March 19th you mention the progress of a typical professional man's salary. The iniquity of present rates of taxation is well illustrated by calculating the sums this typical professional man would have to pay in income tax, at present rates, throughout his career, and then assuming that the whole of these sums had been steadily accumulated for his benefit at retirement. On the assumption of 5 per cent return and accumulation at compound interest there would be available between £60,000 and £100,000 at the age of 65.

How many professional men will, in fact, be able to retire with even a small fraction of this sum saved for their old age?—Yours faithfully,

A. M. P. BROOKES

St John's College, Cambridge

★

SIR—In your issue of March 19th the excellent article headed "Capital for the Professions" appears to treat barristers as being subject to the same considerations as members of the other professions. This is not in fact the case. The article states that, on retirement, the main asset of the practitioner in a profession will be his professional goodwill—a saleable item.

However lucrative may be the goodwill of a member of the Bar while he is in practice, it is worth nothing when he retires. He is not a partner in a firm which continues after he has gone, and he has nothing to sell at the end of his working days. By building up goodwill members of the other professions can obtain on retirement a capital sum free from the depredations of the tax collector. This privilege is denied to the barrister.

There are, I believe, only 2,000 or so barristers in practice, but it would seem that there is a good case for the Millard Tucker committee to make special recommendations for the Bar.—Yours faithfully,

Cockfosters MARC RYLE

Deficit Finance in Asia

SIR—I have only just seen your issue of March 5th in which Mr Balogh criticises my article which appeared in *Lloyds Bank Review* for January, 1955.

If Mr Balogh has read this article he would have seen that it consists almost entirely of quotations from, or paraphrases of, the report of the ECAFE Working Party. The report was published only in mimeograph, and I thought that it deserved wider publicity.

I did, however, express one or two personal opinions, and my conclusion was precisely the one which Mr Balogh blames me for not drawing, "Finally," I wrote, "it is very clear that a substantial measure of external aid to the area is essential during these critical and formative years."—Yours faithfully,

Rome FREDERIC BENHAM

Graphs or Tables?

SIR—Mr Claydon (March 26th issue) objects to the lucid graphs with which you illustrate many articles, thus benefiting the less literate readers like myself, who are unable to analyse visually the figures given in the "less frivolous third" of *The Economist*. Many people will agree that the accuracy lost in graphical presentation is compensated for by clarity and impact. If one wishes to quote statistics with authority, it is perfectly possible—and preferable—to examine them in full in an official source such as the "Monthly Digest."

After all, are we entirely to forgo pictorial methods? Now deprived of our Horror Comics, must we also lose our graphs?—Yours faithfully,

A. R. WOLFE

Clare College, Cambridge.

Books & Publications

The Cruel Hoax

THE ILLUSION OF THE EPOCH.
By H. B. Acton.
Cohen & West. 286 pages. 18s.

THIS is a very good book. In choosing to write, as his sub-title has it, on "Marxism-Leninism as a philosophical creed," Professor Acton has devoted himself to an important but difficult subject. He has accomplished successfully what might seem an impossible task: to analyse critically and exhaustively the foundations of Marxism in a volume of modest size. Even more remarkable is the fact that although he covers with meticulous thoroughness all the philosophical aspects of Marxism and their relationship to the views of many other philosophers, he has written a book that can be read by the non-specialist. The style, moreover, has a distinction of its own. It is simple, sober and direct, and makes it both pleasant and exciting to follow the author's skilful dissection of the morbid tissues of this modern illusion.

The first hundred pages are stiff going; but any reader tempted to go straight to the last two-thirds of the book is strongly advised to persevere. Marxists always claim that their views are part of a comprehensive *Weltanschauung*, founded on the philosophy of "dialectical materialism." It is, therefore, vital to an understanding of Marxism to be aware of the seductive, but fallacious reasoning about the nature of man, the physical universe, and human knowledge on which it is based. In this part of the book, Mr Acton provides a brilliantly concise and clear account of "Marxist Realism," as contrasted with philosophical idealism, phenomenalism and positivism, which, incidentally, sheds light on many basic problems of philosophy. The subsequent discussion of "Marxist Dialectics," of the relation of the phenomena of nature (and the understanding of them supplied by the natural sciences) to those of human relations, including history (and the understanding of them supplied by the social sciences), is equally rewarding.

The remainder of the book examines the manner in which Marxists apply their philosophical concepts to the analysis of history, the state and society. It deals in particular with the Marxist theory of the relation of the development of mankind's productive powers, first to the "economic base" and, secondly, to the "ideological superstructure." In a final chapter surprisingly, but aptly, entitled "Marxist Ethics," Mr Acton describes the specific prescription for political action related to its own kind of morality which is derived from Marxist social science.

Professor Acton has little difficulty in establishing that Marxism is "a philosophical farrago," a mixture of incompatible elements. Marxists reject speculative philosophy (metaphysics, as they pejoratively call it) in favour of methods taken, by false analogy, from the natural sciences; but at the same time rely heavily on features of Hegelian philosophy that are highly speculative and generally opposed to the scientific methods. This inherent confusion is carefully traced by Mr Acton through all its various manifestations in the doctrines of Marx and his disciples. It is difficult to know what to pick out for special mention among so many good things, but the following are particularly impressive. Mr Acton demonstrates that the celebrated Marxist laws of the dialectic are not scientific laws at all, developing as science progresses, but merely "modes of expression . . . etiquette rather than science." In discussing human needs, which play an important part in Marxist historical materialism, he shows that behind a notion apparently based on sense and fact there is concealed a moral assessment. In analysing the Marxist theory of ideologies and their relation to changing economic structures, he exposes decisively the confusion in the use of the word ideology to denote both a complex of false ideas, developed to serve a ruling class, and any kind of ideological superstructure, including that which might exist in the future classless society. Similarly devastating criticism is applied, *inter alia*, to the Marxist theories of morality and the division of labour in the unregenerate class societies and the future communist order. Particularly valuable is Mr Acton's resuscitation of the ideas of Feuerbach on religion as one of the most potent formative influences on the thought of Marx and Engels.

Professor Acton has not set out to show why, notwithstanding its intellectual shortcomings, Marxism should have had such a considerable influence. No doubt, it would need a psychologist to explain to what deep yearning it supplies the satisfaction. But if this were to lie in the appearance of philosophical certainty that Marxism conveys, Professor Acton's exposure of this illusion is especially salutary. For he has shown that the hoax is perhaps most cruel precisely in the realm of the mind. It is here that Marxism has made an intellectual wilderness and called it science.

Anglo-American Courtship

GREAT BRITAIN AND THE UNITED STATES: *A History of Anglo-American Relations*, 1783-1952.
By H. C. Allen.
Odhams. 1024 pages. 45s.

ANY student of Anglo-American relations has the choice of two methods of approach to his subject. He can stress either the similarities or the differences between his two nations. The second has of late years been the favoured approach by all save the most unsophisticated of after-dinner orators, on this side of the Atlantic at least. Probably it reflects, more than anything else, a discretion learnt in the hard school of the interwar years, when even the crassest of Americo-philes discovered that his suit, to be successful, must never presume on victory until his affianced had been led to the altar-rail, if then. Tactically justified, this approach has the further advantage that it squares easily with certain obvious historic facts, as well as legends: the War of Independence; 1812; "it would be superfluous to point out that this is War"; Sackville-West; the great time-lags (1914-1917, 1939-1941); "they hired the money, didn't they?"; Formosa and the offshore islands. All this may be true, and certainly it lies in 1955, responsive to the slightest touch, across the whole surface of our national consciousness.

But have the virtues of the first approach not been a little underrated? Is the time not ripe for a new history of Anglo-American relations, based frankly on the opposite assumption? This at least is Mr Allen's conviction, as he essays the first comprehensive treatment of the subject in a generation, perhaps indeed the most comprehensive ever. He, too, can claim that it squares with certain facts and legends: Magna Carta; "the language of Shakespeare"; *habeas corpus*; the Resolution of the Manchester Working Men; Henry James; Mutual Aid; Billy Graham; and B.29 bases in East Anglia. His case is strongest whenever he deals with social and cultural intercourse across the Atlantic, weakest when he narrates the often painful story of diplomatic and official economic relations. This is the more unfortunate, for it is the diplomatic story that has been given not the exclusive, but certainly the dominant, place in Mr Allen's treatment. In this respect he follows somewhat disappointingly along the lines laid down by his predecessors, Mowat and Dunning—disappointingly not only from the viewpoint of his own thesis but even more from the essential requirements of the subject itself. The distinctive feature of British-American relations has, after all, been the extent to which the diplomacy of both countries has been subordinated in the last resort to everything else in their relations, to everything that they feel and think about each other. Their national lives have touched not at one point only but continuously at a great many.

Mr Allen, attempting little or no fresh research himself, has necessarily had to build with the bricks made by others, and he should certainly not be harshly judged if the bias of his account follows the main lines of previous treatment. His book remains within its accepted limits a very useful piece of work. It is up to date, lucid, admirably fair, careful and reliable in detail. He has a number of shrewdly perceptive comments to offer, not least when treating of economic issues. And even where his treatment seems inadequate, honesty obliges one to state that it is not likely to be superseded until a good deal more fundamental research has been done in several strangely neglected fields of Anglo-American history.

New Nations' Problems

SOUTH-EAST ASIA BETWEEN TWO WORLDS.
By Tibor Mende.
Turnstile Press. 346 pages. 21s.

THE main problems of South East Asia are those common to new nations emerging from colonialism. Riots, insurrections or civil wars; the disillusionment caused by the inefficiency of regimes lacking trained administrators; the economic stagnation or even retrogression that results from the discouragement of foreign capital; these are symptoms of transition, and to a greater or lesser degree, they have characterised the postwar stories of nearly all the new nations of the area. Tibor Mende's admirable new book deals with these problems both in detail and in their wider context, though the scope of his work is less sweeping than the title would suggest. He has, in fact, concentrated upon three countries—Indonesia, Burma and Pakistan, the inclusion of the third name having the effect, however, of stretching the western boundary of South East Asia beyond its conventional limit east of the Indian sub-continent.

Mr Mende has sometimes been accused of Communist sympathies, and it would be unfair not to point out that his latest book, the bias of which appears to be roughly a social democratic one, makes a strenuous attack upon Communist aims and practices, while it suggests energetic and positive measures to counter the appeal of Communism to the peoples of underdeveloped countries. His method, which combines the attraction of journalism and the more solid merits of scholarship, consists of alternating chapters of personal reminiscences and political analysis. The result is perhaps slightly more readable than authoritative, though it is hard indeed to find inaccuracies. One probable example is the membership of the Indonesian Communist party, which is given as less than fifty thousand—almost certainly no more than one-tenth of the actual figure. Indeed, although the author deals with the Communist threat to Indonesia in great detail, he appears to underestimate it on the basis of facts more recently revealed. Few enlightened observers would quarrel with Mr Mende's general thesis, which is that mere anti-Communism is a sterile and unrewarding substitute for a policy; and that what is needed is a positive attempt to raise living standards, provide an outlet for the energies of discontented intellectuals and discontinue assistance to "unrepresentative and anti-social ruling groups," particularly in Pakistan; but there is a conflict of opinion, still unresolved, between those who, like Mr Mende, advocate economic aid in the form of loans to governments and those who would prefer such aid to take the form of private investment. This conflict is nowhere more apparent than in the discussion still in progress in Washington about the ultimate form of the so-called "Stassen Plan" of aid to Asia.

There are also grounds for disagreement in Mr Mende's gloomy estimate of economic progress in Soviet Russia compared with that of the Western countries. It seems at least highly doubtful whether Russia will overtake British living standards in ten years at the present relative rates of economic growth, as Mr Mende asserts. Mr Mende appears to ignore such factors as the *direction* of Russia's economy, with its emphasis on heavy industry and on armaments, and the fact that an underdeveloped economy tends to grow more rapidly, once the impetus is given, than a more developed one. Besides, the expansion of Russia's economy, rapid though it has been, has not been comparable with American expansion at its peak in the second half of last century. The contentious arguments should be mentioned; but they detract only to a minor degree from the merit of a book which deserves a wide public.

Worse Than the British

THE AFRICAN AWAKENING.
By Basil Davidson.
Cape. 262 pages. 12s. 6d.

RELIABLE, comprehensive and up-to-date information about non-British Africa is not always easy to come by. Mr Davidson's survey could have performed a most useful function for the areas it covers—the Belgian Congo and Portuguese Angola. But it is essentially a political judgment, based on a minimum of evidence. It contrasts the "new colonialism" of the Belgians, based on the enlightened self-interest of large capitalist enterprises, with the "old colonialism" of the Portuguese, based on forced labour and the vilest exploitation and brutality, some of the evidence for which, however, is quoted at second-hand. Mr Davidson is opposed to both, fundamentally; to him the model for Africa is the Gold Coast—apart from the fact that British shareholders are even now drawing tainted dividends from it.

After the Gold Coast solution, however, he commends the Belgians, for

while they grant no political rights, they do train Africans to skilled and even professional jobs and push on with the industrial revolution in the Congo ; this, in Mr Davidson's view, at least leads Africans towards ultimate mastery of their own country, destroys tribalism (but also, he suggests, native agriculture) and shows them to be capable of the same technical proficiency as white men, thus causing gnashing of teeth in South Africa and Rhodesia. The Portuguese method, on the other hand, is a hideous anachronism. Mr Davidson accuses the Portuguese of perpetuating a system little removed from slavery, which is depopulating the country much as King Leopold's methods depopulated the Congo from 1885 onwards. He even denies that the Portuguese are enlightened about race relations, for they are creating a colour bar by pouring poor whites into the territory. But he does not confine his judgments to the Belgians and Portuguese—the French and the British are castigated *en passant* for their iniquities too.

Africa, Mr Davidson insists, is not poor, because some companies are making large dividends—he quotes selected lists of blue chip mining shares. The idea that an immense capital might have been sunk in Africa with little or no return apparently never crosses his mind. Professor Frankel has, for example, shown that railways would probably never have opened Africa up so quickly had it not been for the discovery of the mineral wealth which alone made them possible. That leaves immense areas of Africa still desperately short of capital. It leaves the problem of raising agricultural skill untouched. Mr Davidson never refers to the peculiar problems of cultivating tropical soils. A few companies make good profits—and for him that is proof of a vast exploitation, a conspiracy to rob the African of his country's production, a determination to keep him as a hewer of wood and drawer of water, except where, as in the Congo, it pays even better to make him a skilled machinist.

This is not a fair picture of Africa ; it is an unkind picture, to say the least, even of the Belgians and Portuguese. And if Mr Davidson thinks so ill of the Belgians for withholding political rights and the Portuguese for their entire colonial approach, he might have spared some praise for British efforts. It is certainly true that both the Belgians and the Portuguese (and the French) lose African population to British—even to South African—territories. There is, no doubt, ground for criticism. But to reduce Angola to a racket and the Congo to a well-run but soulless corporation is to oversimplify. Yet Mr Davidson has a perceptive eye, as well as a racy style and genuine power to entertain. Even through pink glasses he saw much of the greatest interest in Angola and the Congo ; and this book can be read with enjoyment if only for the proof it offers that the Colonial Office policy is often right—notwithstanding riots, uprisings, suspensions of constitutions, exilings of potentates, groundnut schemes and all.

Spain Overseas

HERNAN CORTES, CONQUEROR OF MEXICO.
By Salvador de Madariaga.
Hollis and Carter. 563 pages. 25s.

THIS is the second edition of a work published in 1942, and there is no indication that any changes have been made. Sr de Madariaga is certainly the most brilliant chronicler of Spanish America, and his study of Cortés takes its place between his biographies of Columbus and Bolívar. It is founded on Bernal Díaz's *Historia verdadera*, on Bartolomé de las Casa, on Prescott and on a careful use of Cortés's superb letters to Charles V. To these sources, Sr de Madariaga adds his unrivalled knowledge of the minor conquistadors and of the countless petty manœuvres and intrigues that characterised the development of the New Spain.

The dominant note that emerges is the total inability of the Spaniards to get along among themselves or to take a long-range view of the colonial problem. Cortés was hounded at every step by the jealousies, greed and blind stupidity of his countrymen. In the end, he succumbed to their machinations, and Spain's great empire across the seas was doomed by the very Spaniards who set out to govern it. Sr de Madariaga's spirited and often inspired narrative falters when it has to deal with Cortés's weary battles against Velázquez, Narváez, and the rapacious fools who were sent from Spain in order to "assist" him. It is at its finest when he traces Cortés's first march against Mexico and his subtle relations with the captive Montezuma.

The one defect in this book is Sr de Madariaga's refusal to see things Spanish in the perspective of common sense. To him Cortés's admittedly bold campaigns rank with those of Alexander and Napoleon. Cortés's decision to run his boats aground at Veracruz represents, according to Sr de Madariaga, something far more important than Cæsar's march across the Rubicon. Cortés is not just an interesting minor figure, with great narrative gifts and immense pluck, but "a fit symbol of the tragedy of man on earth." It is this unbalance of tone that mars an otherwise fascinating and erudite biography.

Animals, Vegetation and Villages

MAN AND THE LAND.
By L. Dudley Stamp.
Collins. 288 pages. 25s.

IN recent years, the investigations of workers in a number of fields have converged on the topic of the evolution of the landscape under the hand of man. Botanists, for example, have recognised the impermanence of particular plant associations which have hitherto been regarded as "natural" vegetation. One such change in a vegetational cover is occurring beneath our eyes today, as the famous downland pastures are, with the departure first of the sheep, and now of the rabbit, invaded by scrub. Geographers, and some historians, have in their turn begun to study the evolution of what has been rather horridly called the "cultural landscape," the pattern of field, farm, village and town that we see around us.

In making a study of this kind, the writer is "looking at the surface [of the land] and trying to trace there the hand of man in shaping the scenery as we actually observe it today." These words are from Professor Stamp's preface, in which he sets out the scope of this book ; but anyone taking them at their face value will be disappointed. For the treatment of such creations "of the hand of man in shaping country" that happen to be inanimate, patterns of villages or fields for example, is perfunctory and even misleading. The reader may even ask what the distribution of turkeys, brown rats or cockroaches has to do with scenery. It rapidly becomes clear that what occupies the centre of Professor Stamp's attention is not landscape or scenery as a whole but man's influence on the distribution within these islands of animals and plants, both wild and domestic, which is not quite the same thing.

The result is that the central part of the book takes the form of a series of disconnected chapters on such topics as the evolution of farmyard animals, British forests or the introduction from abroad of wild animals and plants. Here is much that is interesting and stimulating, especially as regards the changing use that man has made of the land at various periods of time, but even the Director of the Land Utilisation Survey cannot speak with equal authority on all of these subjects. There can, however, be no doubt about the value of the concluding section of the book, in which the writer draws upon his incomparable knowledge of how land is used in these islands to look into the future. Not all will agree with Professor Stamp's opinions on the problem of the loss of agricultural land to other uses, but nobody will question the sincerity of his concern for the land of Britain shown in these final chapters of a strange, disjointed but extremely readable book.

MR. PITT BUILDS THIS YEAR'S FLATS ..AND NEXT YEAR'S AIRLINERS

As an architect with an international reputation, Mr. Pitt naturally does a lot of flying. And because he invariably flies British, Mr. Pitt is responsible for more building than he knows! For example. His fares help to buy more British airliners — like BEA Viscounts and Elizabethans. Help to pay the men who design and build new airliners. And help pay BEA technicians to lend advice from the operational (and passenger's) point of view. In fact, without people like Mr. Pitt (*and nearly 2 million others who flew BEA last year*) the experts who have put Britain's aircraft industry ahead would get nowhere. But while Mr. Pitt (and all the others) keep on flying British, British Civil Aviation will keep on flying ahead.

Trade in Trouble

Washington, D.C.

SENATOR Byrd of Virginia is certainly justified in warning Mr Dulles that the President's whole trade programme will be in danger unless his coming Message to Congress on the General Agreement on Tariffs and Trade carries conviction. The programme is already in difficulties with the Senate Finance Committee as a result of the volume of detailed evidence from industries allegedly suffering injury from reduced tariffs. Moreover, the disconcertingly close vote on the Bill in the House of Representatives suggests that, thanks to the growth of the textile industries in southern towns and the alarm raised by the current tariff negotiations with Japan, the Democratic party's unity behind low tariffs may be a thing of the past. If a constitutional wrangle is allowed to develop over Gatt, with conservatives in both parties lining up against the Administration, the protectionists might be able to engineer a vote that would wreck the trade programme.

Both the objections to Gatt and the desire to strengthen the "escape clause" mechanism, which inspired the most dangerous amendment in the House, one which might prove even more dangerous in the Senate, stem from a similar approach. Under the Constitution tariffs are Congress's business but, as Mr Watkins of Utah, the leading opponent of the President's policy in the Senate, complained, there has been a "*de facto* abdication" of Congress's responsibility since 1934, when power to negotiate tariff reductions was first delegated to the President. Most people would agree that, when Congress dealt with tariff rates on the debating floor, it was far too responsive to local interests. The complaint against leaving negotiations in the hands of the executive is that it is insensitive to every cry for help except those that come from abroad.

★

Senator Watkins, like his colleagues in the House, Representatives Reed and Simpson, wants to recapture some of Congress's lost authority. He hopes to do so by building up the powers of the Tariff Commission, an expert body originally established to advise Congress on regulating tariffs. By investigations and public hearings it establishes on the eve of trade negotiations the "peril point" below which a tariff cannot fall without "serious injury" to the domestic industry concerned. By the same method the commission deals with claims under the "escape clause" that an existing concession should be wholly or partly withdrawn because "serious injury" is a fact. In putting its case to the congressional committees the Administration laid much stress on the continued presence of these two safeguards. But to many members of Congress they seem a snare and a delusion, since the President is not bound to accept even the Tariff Commission's findings of fact, let alone its recommendations for invoking the escape clause. Since 1948, the White House has acted on only five out of fifteen recommendations for a tariff increase, despite the fact that the commission has been severe enough to reject forty-four other applications for relief.

The protectionist leaders in both the House and the Senate chose wisely when they decided to concentrate on the "escape clause" issue. There is a sense of frustration among companies which have presented a case for relief through a nine-month-long investigation only to have the favourable verdict reversed at a private session between the President and his personal economic advisers. Sometimes the President disagrees with the commission's view that increased imports have damaged the domestic industry concerned, and puts the blame on changes in fashion or technological progress. Sometimes he accepts the commission's findings but rejects the recommendations after hearing from the State Department about the effect which a rise in duty would have on the exporting country. All this seems unlike American justice to the petitioning companies, which are often small and may have been involved in considerable expense by the investigation; their opinion is reflected by their congressional representatives.

Senator Watkins's proposal, slightly different from the plan advanced in the House, is that a rise in duty recommended by the commission should go into effect automatically after sixty days unless vetoed by either the Senate or the House. Mr Watkins combined this with a suggestion that only injury to a particular segment of an industry, not as now to a whole industry, would have to be proved. Thus this amendment would push the roof wide open to the upward revision of all past concessions from the United States. It would also destroy the President's purpose of assuring America's allies of some stability in its trading behaviour.

★

Democrats in the Senate may hold together enough to defeat this dangerous amendment but not unless the Administration speedily clears up the anxieties over Gatt. Fortunately the State Department seems confident that it can demonstrate that the recent conferences at Geneva, so

far from placing a time bomb under the Constitution, amounted to a major victory for American diplomacy. Starting with a very bad hand, dealt by the need to stand by every embarrassing section of the laws on agricultural subsidies, the Americans eventually trumped almost all opposition by the familiar tactic of appearing as arbitrators between other countries and Congress.

Since the new Organisation for Trade Co-operation, which is to take over the policing of the Gatt concessions and trade rules on a permanent basis, cannot exist without American membership, its composition and powers had to be what American delegates said Congress would swallow—and no more. Every effort by underdeveloped countries to write into the OTC charter provisions that would evoke memories of the grandiose International Trade Organisation, which looked to Congress like the first step to World Government and never got as far as a vote in the Senate, was ruled out of court. The trade rules which the OTC will police restrict mainly the kind of devices, such as quotas and special taxes, that are particularly harmful to American exports, while the quotas the United States uses to prevent imports undercutting highly-subsidised domestic farm prices during periods of glut are specifically exempted.

Other nations were willing to pay a high price for the promise of stability that congressional endorsement of American membership would bring. The American delegates were confident of congressional endorsement at this price. Now they must ensure delivery, unless the international reputation of the United States is to suffer a severe setback. The fear that foreigners will fix American tariff rates must above all else be exorcised. It is to be hoped that the rest of the world will turn its deafer ear towards Washington during the coming congressional hearings on Gatt, while American diplomats go through the necessary process of convincing the committees in detail that American views have in all cases prevailed.

Democrats Come to Dinner

PRESIDENT EISENHOWER was a busy host this week: on Wednesday he lunched with members of his Cabinet and leaders of both parties in the House of Representatives, and on Thursday he was entertaining leading Democrats and Republicans from the Senate. At the same time, the President has dissociated himself from right-wing Republicans such as Senator Knowland on the subject of the Yalta papers. Emphasising that "you can never recapture the atmosphere of war," Mr Eisenhower opposes the idea that the records of Yalta should be used as political material. At the risk of alienating extremist elements in his own party, therefore, President Eisenhower has been moving towards a better understanding with the opposition. The Democrats have been complaining that, although they are the majority in Congress, the President has not been consulting them and has been allowing members of his Administration to pursue partisan ends at the expense of unified policy.

Although Mr Eisenhower does not share Admiral Carney's view that an attack on Matsu and Quemoy is imminent—he has indirectly reprimanded the Admiral for airing it—nevertheless the President may be facing grave decisions and is wise to rally the widest possible political support. Mr Eisenhower is embarrassed by talk of war. But the mood in Washington, if not in the White House, has toughened during the last weeks and the argument that no further retreat in Asia is possible has been gaining ground. At the same time, it is felt that Russia and China should be handled differently and that the time may be ripe for a Big Four meeting. The latter was first advocated by Senator George, chairman of the Committee on Foreign Relations, in resolute disregard of the supposed "lesson" of Yalta, and has now been conditionally approved by the White House. More and more Congressmen are becoming convinced that such a meeting is inevitable if European morale is to be maintained after the ratification of the Paris agreements.

Victory Over Taxes

THE President has a handful of conservative Democrats in the Senate to thank for his first major victory in this Congress, on his Tax Bill. Admittedly he and his advisers combined a skilful use of political pressures with some strongly-worded criticism of the Democrats to secure the desired extension of corporate and excise taxes, at present levels, without the income tax concessions which the House had added. But it was five Democrats, led by Senators George and Byrd, who defeated the compromise offered by the official Democratic leaders in the Senate—an increase in taxes on industries and dividends to compensate for the loss of revenue from the House's cut in levies on taxpayers with low incomes. And these Senators' refusal to make any concessions to the representatives of the House ensured that the conference to reconcile the two versions of the legislation agreed on a Bill which was just what the Senate voted and just what the President wanted.

The House can hardly fail, however reluctantly, to approve this Bill before April 1st, since otherwise it could be accused of adding to the budget deficit. For on that date, in the absence of new legislation, excise taxes on petrol, cars, cigarettes and liquor would drop by varying but substantial amounts, and taxes on corporate profits would fall from 52 to 47 per cent on all earnings above $25,000 a year. However, while the Democrats may have lost this particular battle, they have not lost the tax war. In 1956, election year, another fiscal campaign will be fought but, from present indications, it will be on very different ground. The question will not be whether or not taxes should be cut, but whether Republicans or Democrats can manage to cut them more. Meanwhile the Democrats, in spite of Senators George and Byrd, have clearly labelled themselves as the party which favours lower taxes for the people with most votes and which tries to keep the Republicans from "soaking the poor and sparing the rich."

The writing on this label is being firmly underlined in the debates on yet another Tax Bill, which has already passed the House. It repairs retroactively two badly-drafted sections of last year's Act, which have brought unexpected windfalls to businessmen and unexpected losses, of perhaps $1 billion in revenue, to the Treasury. There appear to be many more such "bloopers," although less costly ones, in the 1954 Act and the Democrats are thinking of going over it with a tooth-comb to find other examples of Republican inefficiency and leniency towards big corporations. Meanwhile when the present Bill comes before the Senate there may be yet another Democratic attempt to introduce income tax reliefs.

Employment Guaranteed

New York

THE leaders of the United Automobile Workers will be proceeding from the trade union's annual convention, held in Cleveland this week, to Detroit to negotiate new contracts to replace the wage agreements which expire at the end of May. They will be pressing a demand with significance far beyond the motor industry—the demand for a "guaranteed annual wage" or, as the union now prefers to call it, "guaranteed employment." Such plans have been in operation in some companies for several decades; but these are specialised plans, restricted in scope, and of types which cannot be extended to other industries on a large scale. The automobile workers' scheme is not only far more comprehensive; it is also likely to set a pattern to be followed by the steel, electrical and rubber workers and may eventually lead to the establishment of a new general principle throughout American industry.

Two main complaints underlie the demand for guaranteed employment. One is that the unemployment compensation provided by the states, out of contributions collected from employers, varies in amount from state to state but rarely exceeds one-third of normal earnings, and can never be claimed for longer than 26 weeks. The second complaint is against the strongly seasonal nature of production and employment in several industries, especially in the automobile industry where this year's production race is giving added force to the union's arguments at the bargaining table. With motor car production now running at a current annual rate of over 8 million cars, even record sales of 6,600,000 cars during 1955—General Motors' latest estimate for the industry—will not enable the companies to avoid a substantial reduction in the rate of output during the second half of the year. By its guaranteed employment plan the union intends both to provide employers with a cost incentive to stabilise production in future, and to obtain more adequate compensation for those workers who may still have to be laid off.

★

The union proposes, first, that employers should guarantee a forty-hour week to any employee called to work at all during that week; this is an attempt to eliminate the short work week. The second demand is more far-reaching. After an employee has completed a probationary period of ninety days, the union wants his employer to guarantee him, if he is laid off work, one week's pay for every two weeks previously worked, up to 52 weeks' pay. The pay he receives would consist of two parts (although under some state laws this arrangement seems to be illegal): unemployment compensation from the state, and a contribution from the employer to enable the worker "to maintain the same living standards as when fully employed." While unemployed he would be obliged to accept any other "suitable" employment available.

In bargaining over how this payment should be financed by employers, the union is attempting to reconcile several conflicting objectives. To force employers to stabilise employment and eliminate seasonal fluctuations, the union wishes to make the cost of laying off workers as direct and as heavy as possible. If this were its only object it would demand payment entirely out of the company's current earnings. But to the extent that the union is relying on its plan to deal with cyclical unemployment also, it wants to ensure generous unemployment compensation, which will help to sustain purchasing power, while reducing as far as possible the immediate burden on employers already troubled by a decline in sales. For this purpose a trust fund, built up in good years for use in bad, would be the best solution. And as a practical matter, the union must also keep the cost of the plan within limits that the employers can reasonably be expected to afford. The automobile workers' present proposal, therefore, is a compromise between these different objectives. Initially, lay-off payments must be met by employers out of current revenue, up to a certain percentage, still to be agreed, of their payrolls. Any liability exceeding that percentage would come from a trust fund built up by fixed weekly contributions from the employer.

Until the details of the plan emerge more clearly during the coming bargaining with the employers, only the most arbitrary estimate of cost can be made. But for a large firm like General Motors, it has been calculated that, on the basis of the company's 1953 pattern of production, the cost is unlikely to exceed 4½ per cent of the payroll, in addition to the existing unemployment contribution to the state. If seasonal fluctuations in output were reduced, the burden would be lightened correspondingly; the union suggests that, to achieve this, manufacturers should extend the practice of "banking" automobile parts in times of slack production and should encourage "resort-style" pricing of cars, charging consumers extra for the privilege of buying a car in season.

The question is whether, in the light of the recent history of the industry, the plan provides sufficient incentive to stabilise output. For the cost of guaranteeing one week's pay for each two weeks worked could not exceed the cost of overtime at time and a half. And the exigencies of the automobile production race are such that fluctuations in output have not so far been discouraged by the high cost of overtime. Much has already been done, as the companies have pointed out, to reduce the length of shut-downs during model changes. But the most severe variations in output have occurred when smaller companies have been unable to sell their cars—a problem which the additional costs of guaranteed employment would aggravate.

★

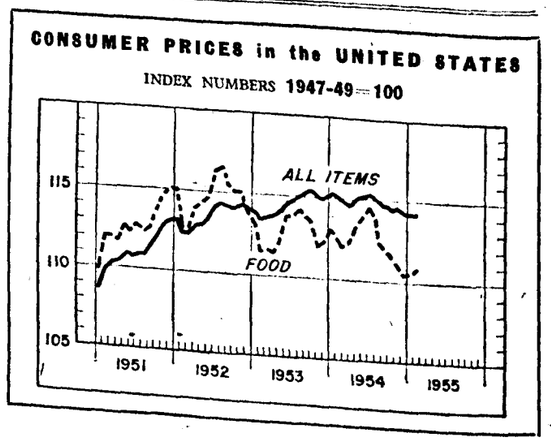
As the costs of the plan are not excessive for the larger motor companies, there is a good chance that the union, which is raising a $25 million fund to back its demands by a strike if necessary, will secure guaranteed employment, at least in principle. But the extension of this principle to other industries raises more fundamental questions. Some fluctuations result from changes in fashion, as in the cloth-

ing industry, from the timing of the harvest, as in food canning—and even from uncontrollable events such as strikes in suppliers' plants. It can indeed be maintained that the cost of seasonal fluctuations in the demand for any product should be borne by those who consume it. But cyclical unemployment is within the control of neither individual employers nor individual consumers. The union argues that guaranteed employment, by stabilising purchasing power, will help to counteract such unemployment, and that it will also encourage employers to support the unions in seeking higher unemployment compensation from the states.

But through its effects on labour mobility and technological change the plan is more likely to weaken than to strengthen the economy. Guaranteed employment will make it more expensive for employers to shut down their least economic plants and transfer production elsewhere, and thus it can only delay the adjustments urgently needed in such industries as coal and textiles. The union relies on guaranteed employment to force employers to give more consideration to the provision of alternative work for men displaced by the machine. But it is equally possible that guaranteed employment, by increasing the cost of labour, will encourage, rather than discourage, the more rapid introduction of automatic methods.

Finally, is labour asking private industry to assume what is, or should be—as it is held to be in Britain—a public obligation? A patchwork approach, providing first for the workers in the strongest unions in the strongest industries, would discriminate sharply against unorganised workers and against the smaller and weaker firms. And if the present unemployment benefits are inadequate, as the President contended in his last two annual Economic Reports, is not the straightforward solution to improve the present system, rather than to ask private employers to make up the deficiency for their own employees only?

Postmen Go On Ringing



IT seems to make little difference whether Congress is controlled by Democrats or Republicans when it comes to rearranging civil service grades or increasing postal charges. The first is needed for the sake of fairness and efficiency, to equate pay with modern responsibilities and, at the upper levels, to relate it to the salaries that could be earned in private employment. Higher postal charges, particularly for letters, which have cost the same for the last twenty-five years, are needed to reduce the Post Office's perennial deficit. The President, reminding Congress that this amounted to $399 million last year, pointed out that a rise in postal rates was a sounder fiscal proposition than a rise in general taxation. He regards the regrading and the higher mail charges as essential companions of any increase in pay for government servants. But Congress, this year as last, is paying less attention to the wishes of the President than it is to the pressures of the well-organised postal workers' lobby and of the businessmen who do not want to pay an economic rate for the Post Office's services.

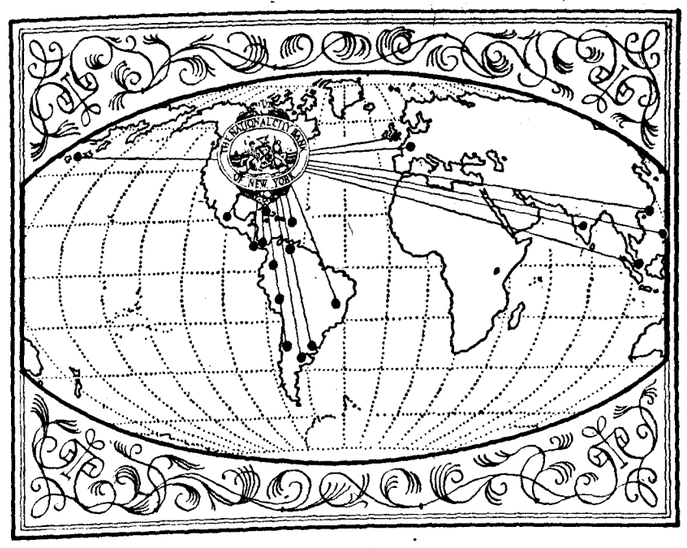
Last year Mr Eisenhower refused to sign a Bill which provided pay raises without either regrading civil servants or increasing postal charges. This year he is apparently prepared to accept an unaccompanied raise, provided it does not put up civil service and Post Office pay by more than 7½ per cent on the average, although in his message to Congress in January he asked for increases of only 5 to 6 per cent, which were considered enough to keep up with rises in the cost of living. The House of Representatives, however, has already indicated that it does not think 7½ per cent is adequate and the Senate last week voted an increase of 10 per cent for the 2,000,000 government employees, including the 500,000 postal workers. This would add $360 million more than the President had proposed to the annual federal payroll. The Senate, moreover, voted down a request for reclassification of civil servants and the Bill seems headed for a presidential veto. It is a pity that civil service morale may suffer yet another setback because the political sensitivities of Congressmen prevent them from accepting the realism of the Treasury.

It Can Happen There

AFTER 114 years of publication, Brooklyn's daily newspaper, the *Eagle*, has been killed by a strike that lasted forty-seven days. The *Eagle* was the only major newspaper in a borough of New York City which contains nearly 3 million people and which is famous for its proud parochialism. The daily circulation reached 130,000, and the Sunday edition often exceeded 165,000, since there is no other good Sunday evening paper in New York. The *Eagle* has had distinguished moments in its history: Walt Whitman wrote editorials for it, it gave New Yorkers their first printed news about Pearl Harbour, and it obtained a Pulitzer Prize in 1951 for its exposure of collusion between bookmakers and police officials.

Some 315 of the *Eagle's* 630 employees belong to the powerful Newspaper Guild of New York and in a series of annual wage negotiations they have tried to obtain the same pay increases as have been given by the seven major daily papers in Manhattan. The publisher, Mr Frank Schroth, said that he could not afford to match the wage-scales of newspapers with circulations and advertisement revenues far above his own. Mr Schroth argued that, if he were to accept the trade union's latest demands, the considerable deficit suffered by the *Eagle* in 1954 would be doubled. He warned his employees that a strike might lead to the end of their paper, but the Guild assumed that he was bluffing. *La morale de cette histoire*: for 630 people in Brooklyn a good job at slightly less pay than in Manhattan was better than no job at all.

Natural Gas in Congress



New York.

THE natural gas producers, clamouring to be freed from federal control, gratefully received support last week from their controller, the Federal Power Commission, which is equally anxious to be rid of its fractious charges. Federal regulation of the 4,000 odd independent natural gas producers who deliver gas to the distributors, the interstate pipeline companies, was first imposed as a result of a Supreme Court decision last summer. Now the producers have gathered their forces and are parading them before a House committee on behalf of amendments to the Natural Gas Act, which, if passed, will effectively revoke the Court's decision. Such amendments have already been officially endorsed by a Cabinet Committee (although the President is not committed to accept its recommendations), and now the chairman of the FPC, with a Benthamite flourish, has approved the arguments of the producers, on the ground that they would bring "the greatest good to the largest number of people."

The commission feels that producers of natural gas, like those of oil, coal and other minerals, should not be treated as public utilities; that the high risks of exploring for gas demand high returns from successful wells to ensure that supplies will remain plentiful; that federal control could diminish deliveries of natural gas to interstate pipelines since producers, rather than accept federal regulation, might prefer to sell their gas only within the boundaries of their states; and, finally, that the commission's powers over the prices at which the pipeline companies buy their gas are sufficient to keep the producers from exploiting the consumers. In Congress the producers have the staunch support of the Speaker of the House, Mr Sam Rayburn, and the Democratic leader in the Senate, Mr Lyndon Johnson—who both come from Texas, which is responsible for over half of the natural gas production of the United States. But in opposition are the representatives of the heavily-populated gas-consuming states of the north and east, led most vocally by two more Democrats, Senator Douglas of Illinois and Senator Kefauver of Tennessee.

Nine states produce 97 per cent of the natural gas consumed in the 48 United States, and of these all but two—Texas and Louisiana—consume more gas than they produce. In an election there are only 4,000 independent natural gas producers with votes—and 30 million gas consumers. The

A BANK WITH BRANCHES ALL OVER THE WORLD

For over forty years The National City Bank of New York has been developing a global network of overseas branches.

There are now fifty-eight of these branches in twenty different countries throughout the world. In addition, nearly one thousand banking correspondents—reporting from every commercially important city of the globe—are in constant touch with Head Office in New York.

The National City Bank can, therefore, offer businessmen with international interests—and particularly those engaged in the vitally important trade with dollar areas—the substantial benefits and invaluable local market knowledge of such a system.

The specially qualified staff of the London office will be glad to place at your disposal the long experience, resources and facilities of the organization. Wherever your interests lie and whatever they may be, The National City Bank is anxious to help.

THE NATIONAL CITY BANK OF NEW YORK

ESTABLISHED 1812

Incorporated with limited liability under the National Bank Act of the U.S.A.

Head Office: 55 WALL STREET, NEW YORK

London Offices—City: 117 OLD BROAD STREET, E.C.2 *West End:* 11 WATERLOO PLACE, S.W.1

FIRST IN WORLD-WIDE BANKING

consumers argue that federal controls are necessary to keep prices down, and it would seem that the producers' only hope of winning their case is to convince the consumers that federal controls will diminish supplies of gas, and consequently raise prices. But Congress is not always logical and the last time a Democratic majority dealt with this problem, the producers won, even though the consumers were certainly not any more convinced at that time than they seem to be now. Then they were saved by President Truman's veto ; Mr Eisenhower is less likely to think that they need to be rescued.

Telephone Spies

FOR a long time suggestions that telephone conversations are not necessarily private have been heard more frequently in the United States than in Britain. Nevertheless New Yorkers who live or work in and around Park Avenue, in the district which houses the United Nations and the head offices of many of the largest business corporations, were shocked to be told a few weeks ago that an extensive organisation for listening in to telephone conversations in the area had been found in a flat on East 55th Street. The exact purposes of this organisation are not yet known, to the public, at least, but it is thought that it engaged mainly in business espionage ; calls to and from a well-known pharmaceutical company were among those intercepted.

The discovery has led to much discussion of the extent to which such practices are used by business firms to keep watch on their competitors and their employees, and by private detectives to obtain evidence in divorce and other cases. The growing prevalence of this type of spying springs, it is said, from the number of young men who leave the army with the necessary technical knowledge and find no difficulty in building up a market for their skills, sometimes, apparently, with the help of telephone company employees. It is also pointed out that such interference is almost impossible to detect and that modern electronic devices make it unnecessary actually to tap telephone wires in order to listen in to conversations.

★

This leads in turn to a question about the adequacy of existing state legislation forbidding wire-tapping except under police auspices ; laws against unauthorised wire-tapping may apply only to physical interference with a telephone wire, not to electronic equipment that can operate from a distance. The New York discovery also leads to a question whether the police are enforcing the laws with sufficient energy, particularly since it was not they, but an official of the privately financed Anti-Crime Commission, who first revealed that the raid on the 55th Street centre had been made. This official has now been sentenced to five days in prison for refusing to tell a grand jury where his information came from. The full ramifications of the whole situation are being thoroughly investigated, by this grand jury, by a committee of the New York State Legislature and by a committee of Congress.

This last committee is primarily concerned, however, with the Department of Justice's latest request for authority to tap telephone wires in cases of treason, sedition and other types of security violation ; it already does this regularly, but at present the evidence thus obtained cannot be used in court. Last year the House insisted that this authority should be granted only on condition that an order was first obtained in each case from a federal judge. The Senate then dropped the legislation after the department had objected that such a condition would make it impossible to act with the necessary secrecy and speed. The Attorney General is now putting his case in the form of a request for stronger controls over wire-tapping ; but even though it is coupled with the new York revelations, this may not be enough to overcome Congress's natural reluctance to allow the Department of Justice to interfere in the private affairs of citizens by such repugnant means.

Flying Neighbours

FROM A CORRESPONDENT IN CENTRAL AMERICA

THE Civil Aeronautics Board appears to have decided that financial participation by American airline companies in foreign airlines, particularly in Latin America, should be gradually curtailed. This policy emerges from official comments on an application, for additional routes to American possessions in the Caribbean area, submitted by the Compania Dominicana de Aviacion. Pan American World Airways has important holdings in this Dominican airline, and also in other airlines south of the border, such as Lacsa, the Costa Rican air carrier.

American financial interest in Latin American airline companies stems from two sources : when the United States entered the last war, it sought to wrest control of certain Latin American carriers, the Colombian company, for example, away from German interests. Secondly, American companies, such as PAA, tried to create domestic "feeder" airlines in the various countries served on their international flights. These "feeders" were often not self-supporting, but they helped supply passengers and cargo to the American aircraft on their long flights south. Now, however, many of these local lines have become economic propositions on their own account and PAA's interest in them is no longer a controlling one. Some of them even compete directly with United States airlines on international routes.

Opponents of the Cab's new policy argue that many Latin American countries would be without safe and modern domestic airlines if technical and financial assistance from United States air carriers had not been forthcoming. The Cab's comments, moreover, seem to contradict the express wish of the present Administration to encourage investment in Latin America. Finally, it is being pointed out that, if American capital is withdrawn, foreign airlines may fill the gap even as Germany did between the two world wars. The Cab did not elaborate on the reasons for its attitude. However, the board may feel that, through association with American airlines which are subsidised, foreign air carriers are, in effect, receiving a subsidy from the United States government, and that this situation should be clarified.

The World Overseas

The Last Act in Paris

BY OUR CORRESPONDENT LATELY IN PARIS

THE curtain has been rung down in the Council of the Republic on the debate over the Paris agreements. In the early hours of Sunday the French parliament finally gave its approval to Germany's rearmament within the western framework. Yet, while the outside world was anxiously watching the last stages of this long drawn out performance, Paris awaited the result with strange calm. There were no demonstrations and no large crowds outside the Luxembourg gardens and some passers-by concluded that the numerous policemen were there to watch over the children "because of the teachers' strike." In fact, the teachers' strike, M. Poujade and the rugger match with Wales seemed to excite more interest than the debate. Probably the excitement of last year's two dramatic acts in the National Assembly—the rejection of EDC and then the narrow acceptance of the Paris agreements—left little interest for the finale. Besides, there was little doubt as to the *dénouement*.

The opponents of ratification themselves had little hope of mustering more than a third of the 320 senators. Too many were aware that a second French veto at this stage would wreck the Atlantic alliance. This, as well as his illness, may explain why General de Gaulle made no last-minute impassioned appeal against ratification. Nevertheless the opponents of the agreements, though resigned, stuck to their guns. They asked for a clarification of the Saar agreements and for more guarantees. They demanded a prior agreement on an integrated arms pool. In their arguments they exploited the fact that some members of the present government had voted against the agreements in the Assembly—M. Palewski, for example—and some, like M. Pinay, had abstained. Their chief plea, however, was for a delay. France should not be bullied into accepting German rearmament, they argued, until a last attempt had been made to come to terms with the Russians.

The issue at stake was too important for the government to trust to optimistic forecasts ; a further delay could be dangerous, and a return to the Assembly fatal. The primary aim was therefore to avoid any amendments, and M. Faure, the Prime Minister, left nothing to chance. M. Pinay, the Foreign Secretary, was of value more because of his prestige among senators than because of his actual performance ; his speech was better to read than to listen to. It was M. Faure who on Thursday restored the balance after a senator opposing ratification had been greeted with great applause. It was also M. Faure who wound up the debate on Saturday evening with a masterly closing speech.

With great skill M. Faure abandoned one of the main planks of the ratification platform ; he said that he personally did not think that Germany would be rearmed without French approval. But he saw no consolation in peripheral strategy, or an "empty chair" for the time being. Above all, he did not think France could play the role of mediator between the eastern and western camps, because it was in fact a member of one of them ; it had linked its fate with that of the Atlantic alliance. It could and should press for negotiation, but it must be done from within the western camp—otherwise its voice would not be heard. Here he adroitly put on the mantle of his predecessor and quoted approvingly from M. Mendès-France's speeches recommending the ratification of the Paris agreements before four-power talks were undertaken.

To sway the senators still further, the government also issued a foreign policy declaration, a sort of contract with the Council of the Republic which morally binds the government to a certain line, but causes no delay in the ratification process. In this, it promises to conclude the Franco-Saar economic convention before the European statute is applied in the Saar. It also pledges itself to press for an arms pool and for a four-power conference "within the shortest possible period." There remained only the formality by which groups explain how they will vote and then the actual voting, which brought no surprises. Having rejected five amendments in succession, the Council then approved the ratification of the four measures which together form the Paris agreements. The modification of the Brussels Treaty so as to allow for the admission of a rearmed Germany into the Western European Union was accepted by 184 votes to 110 ; the end of occupation by 234 to 75 ; Germany's admission to Nato by 200 to 114 ; and the Franco-German agreement on the Saar by 217 to 92.

The historic debate in the usually unimportant Council of the Republic is over. It only remains for the President to sign and France, the "laggard," will be among the first to ratify all the provisions of the Paris agreements. The dilemma—to rearm or not to rearm Germany—is ended so far as the French parliament is concerned. This week the two chambers depart for a parliamentary recess and, with local elections in the offing, public opinion is likely to be more concerned with home affairs than foreign. But when the deputies come back the twin problems of German rearmament and negotiations with Russia will probably remain at the heart of French politics.

Australia Tightens its Belt

FROM OUR SYDNEY CORRESPONDENT

THE Australian Federal Cabinet thought very hard (sometimes aloud) and thought again before announcing late in March a scale of import cuts which was more severe than general expectations. This obviously painful decision to reduce the annual rate of imports by 20 per cent, as well as to reduce the time intervals for import licensing from six-monthly to three-monthly periods, indicates that official thinking has grown significantly more sober. A year ago, in the first flush of Australia's discovery of oil and uranium, it may have been possible to argue that any apparent tendency towards chronic trading deficits would prove to be only a brief prelude to a new era of wealth, expansion and capital inflow. Today, the discovery of really large mineral deposits looks distant and doubtful.

A year ago, too, the Arbitration Court had inaugurated a period of wage stability; there were hopes that time would work in Australia's favour, correcting its relative disadvantages in prices and costs. Now, when Britain has applied some effective brakes on its incipient inflation, Australia has entered a new round of increases in wage margins. An unforeseen result of the Arbitration Court's formula for margins is that in practice the formula is putting at least as much additional spending power in the pockets of white-collar workers as in those of skilled artisans; thus the Court's expectation that costs might yet be held at the previous level, thanks to the stimulus for manual work of better quality and zeal, will be defeated by the total expense of the operation.

A Lengthy Siege

In its disenchantment, the Federal Cabinet has not only moved back towards the conditions of a siege economy out of which it had been gradually emerging since April, 1953, but it clearly accepts the prospect that the siege will be long drawn-out. The new import licensing is aimed at reducing Australia's balance of payments deficit on current account from a probable minimum figure of £A150 million for the year ending on June 30th to rather less than half that amount in 1955-56. Indeed, over a full year these new cuts, together with the slighter tightening of imports announced last September, could reduce the imports bill by the full £A150 million, allowing for the reduced freights and insurance. But Sir Arthur Fadden expects a six months' lag between his announcement of the restrictions and their first effect on shipments, so that the economies to be achieved in 1955-56 may be about £A85 million, assuming unchanged receipts from exports.

The government has therefore taken a remarkable stand on the matter of Australia's overseas reserves. These are still substantial. The gross total of reserves, which is published only at rare intervals, may now stand at about £A470 million. Judging by the Central Bank's holdings of gold and liquid balances abroad—which represent the lion's share of the gross reserves and are freely published—the reserves have suffered a drop of £A100 million in the first nine months of this financial year, and a further loss of perhaps £A30 million is to be expected before the end of June. Nevertheless, the new import restrictions are evidently designed to keep the gross reserves distinctly above the £A350 million mark as far ahead as fifteen months from now—an unusually distant morrow for the Australian government to be taking thought for. When Australian farmers have already enjoyed a statistically improbable run of good seasons and when the capital flow appears to have taken a less favourable trend than earlier this year, a reserve "floor" of £A350 million, representing rather less than a six months' import bill, may not seem at all excessive; but the £A350 million level is still far off.

The decision on imports is therefore not only an official acknowledgment that no mineral, capital or other deities can be expected to spring from the machine; it also asserts the government's intention to fight the battle of the trade gap, even if it should prove a long one, with the weapons of quantitative controls and tariffs. That is, it proclaims, especially perhaps for overseas observers, that it has no intention of bringing the exchange rate into the battle. The arguments against devaluation appear overwhelming while the reserves are good and the markets for Australia's major exports are comparatively inelastic and most of the traditional export industries do not happen to be of a type where labour costs are all-important.

Australia has thus given itself another stretch of time to tackle its disparity in prices. Under a federal system of dispersed powers and responsibilities, it is not clear what use can be made of the time. The drift back to a siege atmosphere should be hardly noticed for some months, because the economy is generally well stocked. Moreover, some new import-replacement industries, notably the offshoots of the British car manufacturers, are expanding under the whip of tariff policy (motor vehicles, together with parts and petroleum, represent one-fifth of Australia's imports bill). But sooner or later the import restrictions are bound to aggravate the price disparity which is their cause. Employment is already very full, and the next federal budget will have to be framed in the political context that it is a pre-election one (for the Senate, and conceivably for both Houses). Though the disruption of the Labour Opposition may reduce the political need for budget softness, the pressure for increased pensions has been intensified by the wage margins decision, and some members of the government already regard it as morally irresistible. The will-o'-the-wisp of abstract fairness, which the wage-fixing authorities have been pursuing at tremendous economic cost since 1950, still eludes Australia's grasp.

Breathing Space in Nigeria

FROM A CORRESPONDENT

AT the moment Nigeria is enjoying a much-earned period of peace in its political affairs. It is difficult to forecast how long this will last; for the surprising speed with which the political climate of Nigeria can change is one of the clearest lessons of the last few years. The unexpected victory of the National Council of Nigeria and the Cameroons in the federal elections in southern Nigeria led to much local prophecy of a new political crisis that might kill the revised constitution at birth. In particular, it was feared that the Action Group, in power in the Western Region, would not submit to being excluded altogether from the Council of Ministers simply because it had won only a minority of seats in the federal elections. In addition, it was also thought that the Northern Peoples Congress might refuse to work with the National Council in the Council of Ministers. In fact, neither of these things happened.

Part of the reason is probably that the results of the federal elections in the North came out so long after those in the South had been over and done with. This gave the politicians in the East and the West time for a calmer look at the situation. As a result the Action Group accepted without protest the role of opposition in the new central Assembly. This was undoubtedly a wise political decision; by the time the next elections come round in 1956 the Action Group's legislation in the West will have begun to bear fruit and, in addition, it need not bear any responsibility for the federal government's actions.

It is more difficult to understand why the Northern Peoples Congress, which, with its allies, forms a numerical majority in the new central chamber, should have agreed to being outnumbered by six to three in the Council of Ministers. Not only has it not shown much partiality for the National Council in the past, but it is also believed to have had personal objections to some of the men whom the National Council has proposed as ministers. It would probably have been possible for the Northern Congress to command sufficient seats in the house to be able to claim all the nine ministries for itself. This would, of course, have meant serious trouble with the National Council, but one suspects that the Northern Congress chose instead to become its partner not because it shirked trouble, but because of a different interpretation of the constitution.

The Role of the Centre

The revised constitution provided for the possibility of full responsible party government at the centre, as in the regions, and provision was made for the post of prime minister if such a situation arose. The Northern Congress was never an ardent supporter of this view, and its chief member in the new Council of Ministers—Malam Abubakar Tafawa Balewa—was the spokesman of the extreme opposite view; he wished the central government to be reduced to the status of a managing agency to carry out certain functions for the regional governments. By thus ignoring the logic of the revised constitution, the Northern Congress has, in fact, recreated a Council of Ministers along the old lines—a consortium of politicians from the three regions held together by goodwill and the skill of the Governor-General. It will be recalled that the last constitution broke down as soon as this arrangement ceased to work. But the feat of holding the team together should be easier than before because it now comes from two parties instead of three.

The team of six National Council Ministers in the Council of Ministers—three from the West and three from the East—is led by Mr Kingsley Mbadiwe, who was a minister in the old council. He is one of Dr Azikiwe's chief lieutenants and a member of the "old guard" of the party. Mr Kola Balogun, another faithful supporter, who is the national secretary of the party, also comes from the West. He has always been an important asset to the National Council because he is a Yoruba in a party that draws its chief support from the Ibo peoples. Mr Adegoke Adelabu, who is also a Yoruba, is perhaps the most interesting of the new ministers. He is now rewarded for his achievement in bringing Ibadan into the party fold; for the past year he has been chairman of the Ibadan District Council, where, it is said, he has shown considerable competence.

Both the central and regional governments are now beginning to absorb the implications of the new federal system. The need to get things done, together with the knowledge that a further review of the constitution is due in 1956, may keep this year free from disturbing political events. Nigeria can well be grateful for its present calm, for the whole of its politicians' attention is needed to deal with the urgent problems of development.

Trade Across the Curtain

DR MYRDAL and his assistants deserve sympathy for the rough handling they received from the East European bloc at the recent meeting in Geneva of the Economic Commission for Europe (ECE). It is not their fault that the statistical information obtainable from behind the iron curtain is so scanty and unreliable. But the Russians and their allies seemed determined to embarrass the Secretariat. The Russian delegate, Mr Kumykin, particularly criticised the section in the Survey for 1954 dealing with East-West trade. He said flatly that certain figures were wrong. He asserted that the figure of the Soviet Union's exports of machinery and equipment to its partners in Europe and China, given as $200 million in the report, was no less than three times too small; and he brushed aside the Secretariat's answer that their figure was contained in an official statement by Mr Mikoyan.

WORLD TRADE BY MAJOR AREAS
(Billion US Dollars)

Exporting Area	Year	Importing Area: Eastern Bloc	Western World	Total World
*Eastern Bloc	1937	0·3	2·0	2·3
	1948	1·6	2·0	3·6
	1953	6·4	1·8	8·2
Western Countries	1937	1·8	23·0	24·8
	1948	2·2	52·4	54·6
	1953	1·7	68·4	70·1
Total World.....	1937	2·1	25·0	27·1
	1948	3·8	54·4	58·2
	1953	8·1	70·2	78·3

*Includes USSR, Poland, Hungary, Czechoslovakia, Bulgaria, Rumania, Albania, China, Mongolia, North Korea.

It is not, however, surprising that the section dealing with East-West trade in the current Survey should land the ECE in hot water. What was attempted was an ambitious but not altogether successful attempt to work out the figures of intra-bloc trade, which are, of course, not obtainable by any direct method. Basically, the technique adopted was to apply figures of the percentage of intra- and extra-bloc trade, which were quoted from Communist sources, to the known figures of western imports and exports to the Communist bloc. The resulting figures of intra-orbit trade were then checked, in so far as that was possible, with any known absolute figures of imports and exports inside the bloc—like the recorded Jugoslav figures of trade up and down on the Danube. But this apparently simple and straightforward method is full of traps.

In the first place, the method depends utterly on the reliability of the percentage data given by Communist spokesmen, which, as was shown by Mr Kumykin's refutation of Mr Mikoyan's statement, are not to be trusted. Secondly, there is an implicit assumption that prices in the Eastern bloc have moved parallel to those in the outside world, or at least that trade between the satellites, the Soviet Union and China is based on prices, which are related to those prevailing in international trade generally. This assumption too is not easy to digest.

The ECE's initiative in attempting to unravel the mystery of trade relations behind the iron curtain is to be commended ; but it is doubtful whether the figures (summarised in the accompanying table) of total world trade, including the Eastern market, can be accepted without considerable reservations. Indeed, the margin of possible error is so great that even the ECE's modest claim that they are "indicative of orders of magnitude" is probably too ambitious.

Party Manoeuvres in Israel

FROM A CORRESPONDENT IN TEL AVIV

THE return of Mr Ben-Gurion to Mr Sharrett's cabinet came as a surprise, not because the public believed that he would be content to finish his career tending sheep in his desert-retreat in the Negev, but because it was expected that he would wait to head the new cabinet after the elections to the third Knesset next July. Although he will be busy at the Ministry of Defence, he has simultaneously announced that as a citizen he will continue to deal with those matters which occupied him while he was out of the government ; these are fostering pioneering, the resettlement of the Negev and electoral reform.

This last point will play an important role in the election campaign for the third Knesset, which is just beginning. Mr Ben-Gurion has come out strongly in favour of the abolition of proportional representation and the introduction of the British system of constituencies, which would bring about the decline and eventual disappearance of the small parties, the emergence of a two-party system and—for him most important—the possibility of forming a cabinet without any coalition partners. He has been irked by the need to co-operate with other parties in the outlining and execution of policy, and for months has been busy expounding in the press and on the platform the benefit of constituency-elections, while blaming on proportional representation all the political ills of the country—splinter-parties, party fanaticism, the strong influence of party machinery. He has been backed by many who are weary of government crises and petty squabbling over party issues.

But Mr Ben-Gurion's attempt to persuade the leaders of several parties to accept his plan has met with severe obstacles. Mapam and the Communists, on the one hand, and the religious parties on the other, not to mention the Progressives and the Arab parties, have nothing to gain and almost everything to lose from the introduction of the constituency system, which is designed to favour big parties. There remain the General Zionists who fought the last election under the slogan of becoming the "alternative party to Mapai." They came forward recently with a complicated proposal of electoral reform of their own which Mr Ben-Gurion accepted as a basis for discussion in a joint committee of both parties on electoral reform. This plan envisages a Knesset of only seventy-one members—the present has one hundred and twenty—sixty of them to be elected in twenty constituencies and eleven on national party lists. If the General Zionists consented to abandon proportional representation, Mr Ben-Gurion would have a majority in the Knesset for his bill. The General Zionists, however, have paused to think twice and the committee has until now made almost no headway.

In any case, if a two-party system is to function properly, there need to be only two major trends in political life, and in Israel this condition is lacking. Even assuming that the small splinter-parties would coalesce into bigger blocs, there would still be at least three political parties. Mapai could attract the left of the Progressives and the labour wing of the religious bloc ; while the General Zionists could find a way to unite with Heruth and part of the Progressives. This, however, would leave intact Mapam and the Communists on the one hand and the religious bloc on the other, not to mention the Arab representatives. On the unlikely assumption that a reunited Labour front, with the exception of the Communists, would be formed, there would still be not two but three blocs.

In present conditions the religious bloc in Israel remains a political reality which cannot be ignored, especially as it has been strengthened by immigrants from oriental and North African countries. It clings both to political influence and to political representation. There is, therefore, a possibility that the abolition of proportional representation might lead Israel into a political deadlock not unlike that which threatened Britain when a third party rose to power while a second was still strong. Moreover, the only party that could gain greatly from the change is Mapai, which has in recent years considerably profited from its control of the governmental machine. Once in power it might grow so strong that it would be almost impossible to oust it again, and the swing from one party to the other which is the essence of democratic government would be severely hampered.

It is not yet possible to assess the prospects of Mr Ben-Gurion's fight for electoral reform. But he has always understood the importance of internal politics and always found time to foster plans he thought essential. He will no doubt push the issue during the election campaign for all it is worth. He might, however, meet the combined resistance of both right and left which find themselves threatened by the intended reform, as well as of the General Zionists once they realise that instead of making them into the "alternative party," the reform could banish them to the political wilderness for many years to come.

Colombia's Ups and Downs

BY A CORRESPONDENT

PARADOXICALLY, the increased political stability of Colombia since President Rojas Pinilla seized power in June, 1953, has recently been accompanied by economic fluctuations not encountered for some years. British and other suppliers of Colombia, who had become accustomed to receiving payment for their goods with a promptitude not altogether traditional in Latin American countries,

THE THINGS WE DO FOR YOU - 2

Are you aware that many concerns with whom you may never do business (perhaps we are one of them) may yet be working for you in various ways? Do you reflect, for instance, how you depend on things made of steel? and how steel-making depends on coke ovens to supply coke for the blast furnaces and gas for the steelworks? In producing many necessities and amenities of your daily life—the structural steel of your office or factory, the car or train you travel by, the tins you buy tobacco in, the steel-shafted putter you miss short putts with—we may have done our bit in the background, for Simon-Carves have built many of Britain's coking plants and many of the washeries that clean the coal that makes the coke.

coal washeries . coke ovens . power stations . heavy chemical and gasworks plants . metallurgical plants . materials handling plants . industrial gears . flour and provender mills and many other specialities.

What you should know about Brandy

V·S·O·P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. *All* Remy Martin Cognac is made from grapes grown *exclusively* in these two areas. That is why people ask for Remy Martin and are never disappointed.

V·S·O·P

REMY MARTIN

have recently been forced to wait for their money. Visions have appeared of a smaller scale Brazil.

Comparisons with Brazil are not, however, altogether fair. Whereas Brazil's difficulties have been to a very large extent self-imposed, Colombia's have been thrust upon it. The one valid point of comparison is the common dependence upon one commodity, coffee, and the effect that the erratic course of coffee prices during the last twelve months has had upon each. Colombia's problems, understandably enough, have received far less publicity than those of its more important neighbour, but it is true that the effect of violent fluctuations in the price of coffee has been more severe upon Colombia, a virtually one-commodity economy dependent upon coffee for over four-fifths of its foreign exchange earnings, than upon Brazil, whose dependence upon coffee amounts to only two-thirds of its trade and which has a range of other products to offer—cotton, cocoa, timber, iron ore and nuts, for example. By reason of its smaller size, too, Colombia has found itself in the unenviable position of a highly interested but almost impotent spectator. It has been forced to adopt what internal measures it could to cushion its economy against price movements which it could do nothing to influence.

This is illustrated by the course of events in 1954. During the first part of the year coffee prices were rising continuously, and with them Colombia's foreign exchange earnings. The Colombian authorities, still mindful of the appalling collapse of the world coffee market in the early 'thirties, and aware of the potential dangers of inflation, were determined, as far as possible, to reap some lasting benefit from the present windfall profits and to keep the economy on an even keel. To this end they imposed a tax on coffee exports and devoted the proceeds, estimated at U.S $12 million, not only to development of coffee plantations, but also to the improvement of livestock, the building of roads, and the expansion of electrical installations. To guard against inflation, they introduced a number of measures, including the restriction of bank credit and the abolition of the prohibited list of imports. The success of these measures is indicated by the fact that the cost of living rose by less than 5 per cent between January and August.

The break came early in August when Brazil decided to revive its declining coffee exports by abolishing the minimum price for exports and by permitting a part of the foreign exchange derived from such exports to be sold, at a much better rate, through the free market, thereby making possible the acceptance of lower prices. Between August 4th and 31st coffee prices fell by over one-quarter and this was immediately reflected in Colombia's balance of payments. A right about turn in Colombian economic policy became necessary. Coffee prices continued to fall, though somewhat more slowly, and in October Colombia had to restrict imports by doubling the tax on less essential goods and suspending for a time the settlement of its commercial payments. Its plight was made worse by the fact that bad weather delayed the harvesting and transport of the new coffee crop, which would normally have been coming on to the market at that time.

The measures taken, however, which were assisted by an advance from the International Monetary Fund, did much towards remedying Colombia's position. Remittances of foreign exchange to cover imports were resumed early in January, and by the end of the month most of the backlog of commercial debts had been paid. But coffee prices fell even further, and stronger measures had to be taken in mid-February to relieve the balance of payments by reducing imports. Over the future of Colombia, however, there lies a large question mark—what will be the trend of coffee prices? Despite wild variations, the year 1954 was on the whole a prosperous one for Colombia. It is still in the insecure position of over-dependence upon one commodity, but a start has been made in remedying this lack of balance. Development plans are under way throughout the country and the achievements during 1954 include the establishment of a large steel mill at Paz de Rio and of an oil refinery at Barrancabermeja. The fulfilment of these plans and, indeed, the maintenance of a moderate degree of prosperity in 1955, are at the mercy of developments in the world coffee market.

Satellite Spies in Sweden

FROM OUR SCANDINAVIAN CORRESPONDENT

AN interesting feature of the latest **espionage affair in** Sweden, which has involved the **expulsion of four** iron curtain diplomats and the arrest **of eleven Swedish and** foreign suspects, is the fact **that only the legations** of satellite countries were **implicated.** The storming of the Rumanian Legation in Berne; the defection of a Rumanian official in Copenhagen; and the uncovering of the Rumanian-Czech spy-ring in Stockholm have all focused attention on the satellites. Russia, whose espionage activities were so embarrassingly laid bare in Canada and Australia, remains in the background.

Neutral capitals like Stockholm and Berne are traditionally popular **espionage centres. This is the third** major case that the Swedish security authorities have uncovered since 1945. One earlier case involved the betrayal of Swedish naval secrets by a disaffected petty officer; the other, spying on the Boden-Lulea fortifications. The Rumanian-Czech ring had the double task of obtaining military and industrial intelligence, and of recruiting as spies—by blandishments, bribery or blackmail—Baltic refugees living in Sweden. Agents had apparently spied on two new Swedish destroyers, *Smalond* and *Halland*, at Gothenburg, which carry robot weapons. Other targets were the Trollhättan factory, where British-designed jet-engines are produced under licence; the naval base under construction in the Stockholm archipelago; and the Bofors armament works at Karlskoga, where contracts for foreign customers, including Britain, are in hand. Sweden's security police are clearly on their toes—one suspect was trailed for 123 days before his arrest. According to some reports, a card-index of agents was seized; if such unlikely amateurishness is confirmed, further arrests in Scandinavia may follow. Observers note that while Norway, Sweden and Finland have uncovered spy-rings in recent years, only Denmark has immunity—or inadequate security services.

One Swedish paper has commented that the espionage affair showed the unreality of pretending that Sweden could stand on the sidelines, unconcerned with events in Europe. Another called the affair a curious expression of the vaunted will-to-peace of the peoples' democracies. There is outspoken criticism of the forthcoming visits of Swedish parliamentarians and trade unionists to Russia. Sweden has refused to accept any more Czechoslovak military attachés and there would be wide support for a further reduction of the iron curtain diplomats, accredited in Stockholm, who now number 200, or at least the restriction of their movements, and the closing of the Rumanian Legation.

Notes from Canada

(With the exception of the first, these Notes were contributed by our correspondent in Ottawa.)

Canada's Role Defined

MR LESTER PEARSON, the Minister for External Affairs, made an unusually important speech in the Canadian House of Commons on March 24th. Speaking very shortly after the visit to Ottawa of Mr Dulles, he laid down a number of trail-blazing principles which redefine Canada's relations with the United States. Taking off from the immediate problem of Formosa, he emphasised the two opposite sides of Canadian policy. On the one hand, he said, "it is possible for friends and allies honestly to hold different opinions." "Canada cannot subscribe to all aspects of American policy in this Asian area"; "we have accepted no commitment to share in the defence of either Formosa or the coastal islands." On the other hand, "Canadians . . . understand and accept the inescapable interdependence of Canada and the United States . . . we cannot therefore isolate ourselves from the implications of that interdependence if either country were attacked by an aggressor." Hence it would be "impossible for either the United States or Canada to be neutral if people of the other country were engaged in a major war."

Mr Pearson in fact had a valiant shot at overcoming the dichotomy of Canada's position. In a sense there is no difference in kind between Canada retaining a foreign policy independent of Washington and any of America's other allies doing so; all will sink or swim together. But Canada's proximity to the United States does make a material difference of degree. With its famous three thousand miles of common frontier, Canada is not in the same situation, for instance, as Australia and New Zealand, which have put themselves under the wing of American power in the western Pacific.

Mr Pearson was able to quote Mr Dulles in support of the view that Canada's place alongside the United States implied no "abdication of responsibility for our foreign policy." The extent to which Canada and America can count on one another depends in part on the moral support and approval that the conduct of each wins across the border. As things stand, Canadians trust Americans not to fight an aggressive war, and they know that, in defence against aggression by "Communist imperialism," their interests are bound together indissolubly.

Budget Headaches

MR WALTER HARRIS'S first budget, which is to be presented next Tuesday, is bound to be a painful contrast to the long series of surpluses which his predecessor, Mr (now Justice) D. C. Abbott, presented throughout the postwar years. The 1954-55 fiscal year is ending with a deficit which may be around $100 million. In a budget of $4,500 million this is not in itself a major amount. It results logically from Mr Abbott's last budget, which allowed for a close balance on the assumption that there would be a pick-up in the economy. In the event revenues have proved sluggish, specially in the field of company income taxes.

But the budget deficit is not the end of Mr Harris's embarrassments. Mr Abbott also left him an "Old Age Security Fund" in chronic deficit. When universal old-age pensions were instituted in 1951 the government resolved to finance them separately from the regular budget on the theory that people should realise that they were paying for them. So an Old Age Security Fund was established to be financed by 2 per cent of the sales tax, 2 per cent of the company income tax, and 2 per cent of the personal income tax up to a limit of $60 a year. This has never been enough to match statutory payments out of the Fund, which has been kept going by loans from the Minister of Finance, treated not as budgetary expenditure, but as "asset-building loans." This was acceptable as long as it could be pretended that the Fund's revenues would soon catch up with its disbursements. But that pretence is no longer possible, and Mr Harris faces the challenge of putting the Fund on a self-sustaining basis.

It seems fairly clear that the federal Treasury will have little reserve for any significant tax reductions in the coming year unless the new Minister is prepared either to be highly optimistic about his revenues or to budget for a deliberate deficit. His first attack on his problems was the orthodox one of paring expenditure estimates. Although the reduction was small, it was the first reduction for seven years and it meant a pretty firm hand on most departments of government.

Expansion and Seasonal Unemployment

ACCORDING to the national accounts figures prepared by the Dominion Bureau of Statistics, Canada had recovered from its nine-month recession by the last quarter of 1954. In spite of a sharp decline in farm incomes because of the poor western wheat crop, the gross national

product for the fourth quarter of the year was at an annual rate of $24,400 million, slightly above the average for 1953. Without this drop in farm income, the non-farm gross national product reached a new peak in the last quarter, slightly higher than the previous peak in the third quarter of 1953.

This cheerful sign of recovery from what was never more than a mild decline provides a remarkable contrast with the postwar peak of unemployment which was reached in February and which has been occupying days of parliamentary oratory by opposition speakers. The number of unplaced applicants at the National Employment Service offices topped 600,000 for the first time since the war. Increasingly serious studies are in fact being made by the government, with trade union and business co-operation, into techniques for mitigating the effects of winter on employment. They give some indication that even the frigid Canadian cold need not inhibit activity quite as much as it does if public habits could be directed into a new pattern which would deliberately create winter work. But in so far as the failure to expand employment stems from more than seasonal factors, it underlines the dilemma of an expanding economy—which is that it must keep on expanding. The population is estimated to have increased by just under 3 per cent in 1954. Employment did not decline, but it remained static. The result was that the gross national product *per capita* fell back from the 1953 level to just below the level of 1952.

Curbing the Backbenchers

THE Canadian House of Commons is likely at long last to do something about its rules, which still maintain the leisurely traditions of the 19th century. In a House of only 262 members, with three rival opposition parties all far enough from office to make their internal discipline difficult, Canada has never yet devised any effective limitations on debate. Opposition members are still holding out for the unrestricted right of individuals to make 40-minute speeches at every stage of every parliamentary measure. An all-party committee on the rules, which has met for several sessions, shows no sign of reaching agreement on how to speed up procedure. If improvements are to be made it looks as though the opposition parties will insist that the government should push them through; and at last the government appears ready to accept the responsibility together with whatever odium or kudos may be attached.

Mr Walter Harris, who has continued as the government's House Leader in spite of his promotion last summer to be Finance Minister, hopes to produce proposals for improving parliamentary procedure before Easter. From the present anachronistic procedures he will not be able to proceed in one leap to any arrangement which Westminster would consider even remotely up to date. It is still not quite certain, even, that the government will decide to enforce a limited number of days for the consideration of Estimates, though a move towards this has been made by the establishment this session of a Committee on Estimates. This lacks the power to send for persons and papers, but it could allow a much more detailed cross-examination of ministers than the Committee of the Whole House can provide.

If something is not soon done to prevent the dreary daily recital of backbenchers' speeches, Canada may turn to the desperate expedient of allowing undelivered speeches and quotations and "extensions of remarks" to be printed in the record. At least, some observers have been arguing, that is one stage better than emptying the House while members drone through their remarks "for the record."

Gas Pipeline Postponed

THE much-discussed plan for a 2,200-mile pipeline to bring natural gas from Alberta to Ontario and Quebec has been shelved for a year. It had been hoped that construction might start this spring, bringing the line as far as Winnipeg this summer, and across northern Ontario to Toronto during 1956. This schedule has broken down because of financial difficulties.

The estimated cost of the whole project, from the Alberta border to Toronto, with a spur from Winnipeg to Emerson on the Minnesota border, is $350 million. The original plan called for financing on the pattern which is usual in the United States; $275 million would have come from loans, $35 million from a preferred issue and $40 million from ordinary shares. The small proportion of equities is considered desirable since at first earnings may not amount to much. The TransCanada Pipeline Company, an amalgamation of American interests with a group of western Canadian financiers, had difficulty in raising the necessary loans in time for a spring start. It also took them longer than they had hoped to arrange contracts for the supply of gas in Alberta and for its sale in the East.

Knowing that the government, or at least Mr C. D. Howe, the Minister of Trade and Commerce, was committed to the all-Canadian pipeline and was anxious to get it started this year, the company asked for a government guarantee of its bonds. But strenuous opposition developed to the idea of guaranteed bonds and an alternative solution was proposed which involved making a substantial issue of convertible debentures. The government, through its Industrial Development Bank, would have been willing to take a good slice of these convertible debentures and to underwrite the rest. The government might conceivably have gained a majority voice in the control of the company. But even this remote possibility was enough to repel some of the private interests concerned, particularly one of the big oil companies which controls a major source of gas. The idea of government help to ensure a start this year has therefore been dropped. But neither the government nor the company admits any weakening of their determination to build an all-Canadian gas pipeline.

Castries, the capital of St. Lucia in the British West Indies, was largely destroyed by fire in 1948. These flats are part of the extensive reconstruction scheme undertaken by Cubitts comprising some 300 housing units, together with commercial buildings, government offices, law courts, police and fire stations, roads and a complete water-supply and sewerage system. Long experience of building and structural engineering on a large scale at home enables Cubitts to plan and execute successfully this and other important overseas projects—'invisible' exports which contribute to Britain's prosperity.

Now, as in the past CUBITTS *build for the future*

DÆDALUS son of Metion, was the supreme mortal craftsman of antiquity. Even his name means "the cunning artificer". Quite apart from his aeronautical experiments, in which he came off better than his son Icarus and for which he is famous, he was remarkable for his skill in architecture, mechanics, sculpture and double dealing. As a result of the last, he was usually in flight from King Minos of Crete and others, but found time to invent the axe, the awl and the bevel. It is hard even to imagine what his achievements might have been had aluminium and its alloys been available to him. With materials of such strength, endurance, resistance to weather and lightness as these, there is no knowing what Dædalus would have got up to.

THE BUSINESS WORLD

Guide to the Economy

The Economic Survey tells fortissimo *the story of Britain's domestic prosperity last year, which carried output, consumption and investment to record levels; but there is a marked* diminuendo *in its account of the disequilibrium that overtook the economy towards the end of the year. Yet the one major new fact about that deterioration stands out with startling clarity. The surplus that Britain enjoyed on its balance of payments in the first half of the year not only disappeared in the second half but gave place to actual deficit. That is a considerably worse performance than the best unofficial guesses had suggested; yet the general tone of the survey is not correspondingly more austere. On the contrary, its mood is one of confidence, even of buoyancy.*

THE external surplus for the first half-year, before crediting £24 million of defence aid, is now estimated at £148 million, whilst for the second half-year there was a deficit of £38 million before £26 million of aid. This contrasts with a surplus originally estimated at £107 million, before aid, for the second half of 1953. Hence for the full year the surplus before aid was £5 million less than in 1953, at £110 million, and after aid £57 million less, at £160 million. The deterioration in Britain's balance on non-sterling payments was even more pronounced. Thanks to a substantial recovery in exports to the overseas sterling area, Britain's surplus on sterling payments rose from £173 million to £269 million (of which £155 million accrued in the second half-year), but its balance with the rest of the world swung from a surplus of £44 million into a deficit of £109 million, after crediting aid; the non-sterling deficit in the second half-year was £167 million.

An even larger deterioration occurred in the balance of payments of the overseas sterling area. On its external payments as a whole there was a deficit of £153 million, whereas 1953 had shown a surplus of £108 million. Rather more than a third of this deterioration was simply the counterpart of Britain's bigger sterling surplus; the overseas sterling area's non-sterling balance dropped from a surplus of £281 million to one of £116 million, a deterioration only slightly larger than that shown by Britain alone if Britain's loss of £52 million of aid is included. The upshot was that the surplus of the sterling area as a whole in its dealings with the rest of the world slumped from £325 million to a mere £7 million.

Moreover, the trend was worsening in the latter part of the year; in the second half-year the whole area had a deficit of £164 million, part of which was attributable to seasonal influences. The changes in Britain's balance between 1953 and 1954, the Survey emphasises, were mainly a reflection of changes in volume of trade rather than in prices. But the worsening of the terms of trade that began last spring had by February reached the point at which a continuance at that level would add £150 million a year to the cost of Britain's imports. In addition, the volume of these had begun to rise steeply towards the end of the year. This trend was, indeed, to be expected, for over the year as a whole a 6½ per cent rise in industrial production had been accompanied by an increase of only 2 per cent in import volume.

"A Prosperous Year"

Production reached a new high level, and fixed investment, stock-building and exports all expanded. But half of the increase in the available resources went in consumption.

The bleakness of these tendencies finds little reflection, however, in the account of the domestic economy. "At home," the Survey records, "1954 was a prosperous year." The gross domestic product rose by 4 per cent, or by roughly the same percentage as it rose in 1953. Valued at the prices of that year, the increment was equivalent to £625 million, while an additional £140 million of resources came from the increase in imports of goods and services, making a total addition of £765 million to available supplies. Of this total, consumption absorbed slightly more than half; rather less than one-third was represented by increased exports and rather less than a quarter by the increase in fixed investment (£125 million), and in stock building (£50 million larger than in 1953 at £175 million). Valued at current prices, the gross domestic product is estimated to have risen from £14,506 million to £15,384 million, an increase of £878 million, compared with one of £850 million in the previous year.

Consumers' expenditure, at market prices, is put at £11,702 million, compared with £11,056 million, but this increase is reckoned to be equivalent in real terms to 4 per cent, the same increase as in 1953. Personal incomes rose by £828 million to £14,408 million, and of this increase, wages and salaries, which rose by 7½ per cent, accounted for £645 million. After provision for taxes, insurance contributions, etc., total disposable personal income likewise rose by £645 million to £12,611 million, or by almost exactly the same amount as the rise in consumers' expenditure. The margin between income and expenditure, described as "balance, *including* personal saving," was therefore virtually the same as last year at £909 million. Despite the fact that spending kept pace with income, the Survey hopefully concludes that "these estimates . . . point to the continuance of the revival of personal saving which began in 1952."

Three-quarters of the real increase in national output —£450 million—came from industry as against services. A third of the extra demand that generated this expansion came from higher spending by the consumer—the boom in motor-cars and household goods, with its indirect demands on many industries, from chemicals to upholstery. A fifth of the extra output went overseas as exports. Government expenditure did not increase in real terms: deliveries of finished munitions, indeed, fell slightly. This implies that fully half of the additional output of industry in 1954 was to meet investment demand—about a quarter for higher fixed investment, and a quarter for the higher level of stocks and work in progress associated with the 6½ per cent rise in production.

Fixed investment in the economy thus rose to £2,484 million—in real terms, a rise of 5 per cent. New building accounted for the bulk of this increase; the balance shifted, as against 1953, with more of the extra building being done for commerce and industry and less for housing. Investment in plant, machinery and vehicles made up the remainder of the increase. Once again the growth in industrial investment was dominated by the nationalised industries—primarily coal, electricity and transport, all of which invested substantially more. Investment in manufacturing rose less and unevenly: investment for defence purposes declined, and the refinery expansion programme was nearing its completion, but investment in iron and steel and other manufacturing industries' expenditure on new factory buildings and deliveries of manufacturing plant were higher than in 1953.

Production Outpaced Imports

Higher employment, plus higher productivity, sustained the industrial boom. To keep this up would probably mean a bigger rise in the import bill in 1955 than in 1954.

Inside industry, more people worked more effectively to meet these larger demands. Civil employment rose by 351,000, more than in any year since 1947; partly because unemployment fell yet further and the armed forces were reduced in numbers, but mainly because unoccupied people took jobs and older people stayed at work, increasing the total working population to a quite unexpected extent. But this rise was less than 2 per cent of the numbers employed in industry; the rise of 6½ per cent in industrial production implied that productivity, measured in output per man-year, rose by about 4 per cent. In the economy as a whole, money incomes rose faster than real output, and final prices of goods and services rose by about 1½ per cent. In manufacturing industry, however, the authors of the Survey conclude that the increase in earnings between 1953 and 1954 was roughly matched by the increase in productivity, so that labour costs remained about constant. With prices of raw materials slightly down over the year and fuel costs up, there may have been little change in unit costs.

In achieving this increase in output, industry built up its stocks more than it had done in 1953; but recorded stocks of imported commodities declined considerably, and the increase in stockbuilding appears to have been mainly in manufactured goods and work in progress within industry. This reduction in stocks of imported commodities—essentially in food and feedingstuffs—was largely responsible for the way in which so big an increase in industrial output was achieved with a rise of only 2 per cent in the volume of imports. Steel imports fell because home production went up; imports of machine tools and of aircraft from Canada (a gift) declined as rearmament settled down. "Apart from these . . ." the Survey records, "the rise in the volume

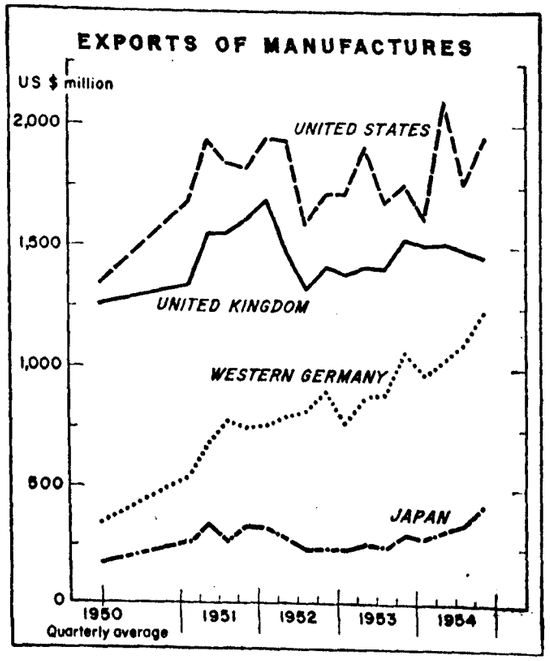
of imports in 1954 was broadly in line with the rise in industrial activity." The performance of 1953, that is to say, looked better than it was because of special elements affecting imports.

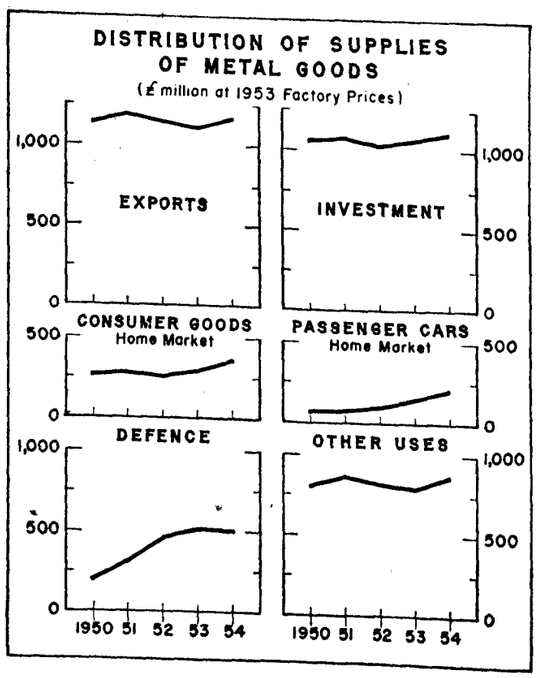
Without tracing any too exact a relation between output and imports, the Survey declares roundly that such good luck cannot be counted upon in future :

> Normally . . . higher industrial activity and incomes at home must be expected to lead to a more or less corresponding increase in demand for imports.

The need for " a considerable increase " in export earnings is therefore inescapable ; on the whole, the authors of the Survey feel, the prospects for such an increase seem moderately favourable.



Prospects for Output



Demand will continue to swell. Industry is already fully employed, but already producing more than last year. Can it achieve " a further appreciable increase " ?

Assuming that " we require additional exports, and that world market conditions provide opportunities for selling them," what of the prospects for home demand ?

Fixed investment, according to the Survey, is likely to be substantially higher : in the nationalised industries the upward trend will continue, some rises can be expected in manufacturing industry, and demand for non-industrial building seems likely to increase, since " the number of new houses completed this year is likely to be at least as great as last," and restrictions on other work have been removed. Government expenditure is expected to go up a little, particularly the spending by local authorities. By the end of 1954, the Survey estimates, consumers' expenditure was already above the average for the year as a whole : " some further increase is probable this year." Earnings seem likely to be higher, and personal income should rise enough to permit more spending as well as " the maintenance of at least the present rate of personal savings." All these elements in demand, therefore, may stake their claims for extra output : stocks and work in progress, too, are expected to show " some further increase," though the Survey does not necessarily imply that this increase will be as great as the rise of £175 million in 1954.

Home and export demand together, then, are counted as likely to show " some further expansion " this year. Can industry meet this ? The Survey, somewhat confidently, notes that production, seasonally corrected, is already 2-3 per cent above the 1954 average, and estimates that industry " should have the capacity to increase output appreciably above this." There may be some slight further increase in employment, though there are no large reserves of labour left, and the full benefits, it suggests, have still to be felt of last year's transfers into engineering. The fuel and materials are to be had—though coal and steel are swelling the import bill. Although the building and engineering industries are fairly fully extended, the authors of the Survey are counting upon " the ability of the building industry to expand its output in step with increasing demand " ; order books in engineering, at the end of 1954, were no longer than a year before, and most industries making capital equipment, the Survey asserts, " are in a position to expand their output and . . . meet a rise in demand for industrial investment, while at the same time providing more exports."

Business Notes

Markets without News

WITHOUT normal supplies of newspapers investment markets have inevitably been curbed, but under the curb they have behaved well. Prices have on the week risen appreciably. The main effects of the absence of news has been threefold:

(1) The whole volume of business has shrunk: just because the average investor has not seen how his holdings were behaving he has operated much less. Consistently through the week the number of Stock Exchange markings has been running at about 2,000 a day less than the previous week ; it has remained at around 7,000 a day except on Monday, always an active day, when it was about 9,000.

(2) Speculative business has been curbed even more than investment business. The close of the old Stock Exchange account and the start on Wednesday of a new three week account that will end on Budget day (April 19) brought much less of a flurry of dealing for " new time " than might normally be expected.

(3) New issue business of the type that involves newspaper advertising is almost stopped. One substantial placing involving an application to deal in 1,700,000 1s. ordinary shares of Abwood Machine Tools is able to come forward with special dispensation from the Stock Exchange Council to use provincial papers only, but the pre-budget weeks are naturally a time when few refinancing operations are expected.

Within those limitations the market has behaved well, both gilt edged and industrials rising slowly but sturdily from Tuesday onwards through Wednesday and Thursday. The rose tinted Economic Survey published on Tuesday afternoon produced some immediate bear closing in the gilt edged market. The movement spread on Wednesday and some buying developed in the industrial share market. It was helped by the news of the settlement of the Liverpool dock strike and doubtless by the firmer tone of Wall Street, though significantly Wall Street's renewed fall on Wednesday night did not produce any weakness in London on Thursday.

NEWSPAPER EQUITIES

	Mar. 25 1955	Mar. 28, 1955	Mar. 30, 1955
Amalgamated Press 10/-	36/3	36/3	36/3
Associated Newspapers £1	26/6	26/6	26/6
Beaverbrook Newspapers 5/-	16/9	16/9	16/9xd

Odhams Press 10/-	30/-	29/3	29/3
W. H. Smith "A" £1	54/6	54/6	54/-

Over the week from Wednesday to Wednesday *The Financial Times* Industrial index has risen from 177.6 to 179.9, and the fixed interest index from 109.25 to 109.86. But the movement denotes no big return of buyers to the market. A little bear closing has supplemented a steady trickle of investment buying by institutions, many of whose portfolios nevertheless remain liquid. Had investors had more news they might have been tempted to deal more freely. For instance, Borax Deferred have risen 6s. 3d. on the week to 107s. 6d. without attracting any substantial buying or profit taking. One enterprising firm of brokers has attempted to fill the news gap by a private circulation letter recording principal daily movements and dividend declarations. But no clearer demonstration of the fact that investors as a whole were not to be drawn in can be provided than the pronounced steadiness of newspaper shares throughout this period.

Bank Liquidity Again Tightens

THE liquidity ratios of the clearing banks were tightened still further, and more sharply than had been generally expected, in the four weeks to March 16th. During this period the Exchequer swung from strong seasonal surplus into small deficit, so that its repayments of floating debt from ordinary domestic sources must have slackened or stopped ; yet the banks' liquid assets declined by a further £124 million, in contrast with a fall of only £13 million

† Ratio of assets to published deposits.

in the same period last year. This decline must, in part, reflect further governmental repayments from the proceeds of sales of dollars in support of sterling during the fortnight or so before the tide changed in the market; but there seems no doubt that an important special factor significantly affecting the banks in recent weeks has been the tendency for large holders of liquid funds to switch them from deposit accounts to direct investment in Treasury bills, for the sake of the higher return obtainable that way.

Despite the contraction of liquid assets, there was a further rise in bank advances—by £24½ million compared with £20 million in the corresponding period last year. This expansion was mainly attributable to three banks, the National Provincial, the Midland, and Barclays, but two other banks which in the previous month had abstained from selling investments have now done so, in order to strengthen their liquidity ratios. The aggregate investment portfolio dropped by nearly £18 million, but, even so, the liquidity ratio for the banks as a whole dropped from 31.3 per cent to 29.9 per cent; five of the eleven banks show ratios below 30 per cent. The upshot of these conflicting influences was a decline in net deposits by £118 million, to £6,139 million. In the corresponding period last year, deposits were little changed whereas in 1953 they rose by nearly £23 million.

Marking Time in Cotton

On Tuesday the Prime Minister temporarily dashed the cotton industry's hopes for a statement of government policy on imports of cheap Indian cloth. But in refusing to be drawn so soon after his meeting with representatives of the industry last week, Sir Winston said that he hoped to make a statement before the House rose for the Easter recess. Meanwhile, a team of merchant-convertors has flown out to India in response to an invitation to study the market for British cotton piece goods there. The team will visit the main centres and then discuss its findings with the government in New Delhi. No doubt the team will emphasise that the prospect of any improvement in British exports depends mainly on a reduction in the Indian import duty from the present penal rate of between 60 and 80 per cent *ad valorem*.

The industry seems confident that recent events have strengthened its case for protection against imports of Indian cloth—at least for home consumption—and for relief from purchase tax. A number of mills suffering from a lack of orders are preparing to give their workers extended holidays at Easter, and the Australian import restrictions have added another touch of gloom. Fears that the American government may introduce an export subsidy on the new cotton crop next August continue to depress raw cotton prices in Liverpool and discourage buying from the merchant-convertors back along the chain of manufacture to the raw cotton merchant. It is difficult to see what purpose a subsidy would serve. Its effect could hardly be other than to bring down prices of foreign growths to a comparable level, thus leaving American prices no more competitive than before, and to unsettle still further cotton growers and cotton users throughout the world.

The Capitalists' Share

Personal incomes as a whole rose by 6 per cent in 1954, the same rate of increase as in 1953. But the increase in wages and salaries quickened from 5½ per cent in 1953 to 7½ per cent in 1954—whilst the share of the personal capitalist fell. Unexpectedly the national income white paper shows that rent, dividends and interest rose by only 4 per cent, to £1,521 million, against an increase of 8½ per cent in 1953; as a fraction of total personal income they fell slightly to 10.6 per cent. The national income statistics certainly do not point to the rentier group as the chief beneficiaries of Mr Butler's boom. Had capital values been under discussion the picture might have been different.

The marked slowing down in the growth of incomes from property, shares and interest is nevertheless surprising at first glance. In fact, the rise in dividends and interest paid by companies and public corporations did not slacken perceptibly last year (rising by just under 10 per cent, compared with 11½ per cent in 1953); but a smaller share appears to have reached the personal investor. Total "property income" paid abroad (which comprises rent, interest and dividends) increased from £347 million in 1953 to £380 million last year, whereas corresponding income received from abroad fell a little from £544 million to £539 million. Total domestic incomes from rent continued to expand moderately (from £561 million to £610 million), but total interest payments appear to have been deflated by the fall in money rates between 1953 and 1954—which reduced in particular the return on Government floating debt and on deposit accounts.

Personal Saving Maintained?

The other surprise in the national income accounts is their suggestion that personal saving—including the saving of farmers and unincorporated businesses, and calculated as a residual between total personal expenditure and income—did not rise in 1954. The revised figures are now put at £273 million for 1951, £690 million for 1952, £910 million for 1953 and £909 million last year—representing an increase in personal saving as a proportion of total personal income after tax from 2½ per cent in 1951 to 7.6 per cent in 1953, and a slight relapse to 7.2 per cent last year.

Yet the expansion of personal saving through all the visible channels—such as national savings, the building societies and the life offices—gathered pace last year, and sufficiently to more than offset the increase in dis-saving through the accumulation of hire purchase debt (the outstanding debt is estimated unofficially to have risen by some £100 million in the past year). The discrepancy between the trend of the aggregates and visible constituents of personal saving (a discrepancy in the national income figures that is by no means new) is in part explained by the fall in the incomes of farmers last year—from £406 million to £378 million.

The savings of companies and public corporations, however, advanced last year, from £1,309 million to £1,437 million, so that total private saving (before providing for depreciation and stock appreciation and excluding net additions to tax and dividend reserves) continued to grow, though the rate of growth was slower. In 1954 a portion of private saving was again mortgaged by the need to set aside funds for replacement of stocks at higher prices, whereas in both 1952 and 1953 savings available for investment had actually been increased by the relief secured from the fall in stock prices. Total private saving after providing for stock appreciation accordingly rose by a mere £14 million, to £2,276 million. But as saving through the budget surplus rose by over £140 million on the calendar year—reversing the downward trend of the three previous years—the nation's total domestic saving available for investment still showed a respectable increase of some 5¾ per cent to £2,819 million. At that level total saving and investment amounted to 18 per cent of gross national product—a figure that has remained remarkably stable since 1948.

Argentina to Begin Paying

A new Anglo-Argentine trade and payments agreement was signed in Buenos Aires this week. It runs retrospectively from July, 1954, for two years until the end of June, 1956, replacing the bilateral 5 year treaty of 1949. The short period during which the new agreement is intended to operate marks it out as an interim measure to be replaced in mid-1956 by an agreement more in character with a regime of convertibility which may by then have been established. But even this interim agreement has had to take cognisance of the substantial freeing of the British economy and advances towards convertibility that have been made over the past three years.

The most important of these developments from the point of view of Anglo-Argentine trade has been the freeing of the meat trade in Britain. As a result, the negotiations leading to the new trade agreement have not this time been accompanied by protracted haggling over the price of meat. The British importing firms will buy directly from the government organisations in Argentina, and the price and the quantity will be their affair. It has been agreed that under the new agreement about 40 per cent of Argentine exports to Britain will be meat. In the reverse direction the British Government has agreed that 40 per cent of sterling exports to Argentina will comprise such essentials as oil and coal. No specific commitments have been given regarding the details of trade in either direction; all the figures merely represent "expressions of intent" in the endeavours. If hopes are fulfilled trade in each direction will amount to £85 million a year.

The agreement reaffirms the credit of £20 million to Argentina which has been available under earlier agreements but which so far has remained unused. It will probably be needed by Argentina in the near future to cover the gap caused by the comparative failure of this year's maize crop. Payments for Anglo-Argentine trade will continue to be made in transferable sterling—but, as in the past, Argentina will have the right of conversion into dollars of any surplus accumulated in excess of £20 million. Argentina has, at long last, undertaken to make a start in clearing the arrears of financial remittances to the United Kingdom. These amount to between £7 and £8 million and are mainly in respect of dividends on British capital. The Argentine government has agreed to a meagre transfer of about £1½ million before June 30th from these arrears. In addition, Argentina is to pay the coupons of the 4½ per cent Province of Buenos Aires Loan of 1910. And the long-standing problem of the Primitiva Gas Company is at last to be sympathetically considered.

New Policies in Coal

The National Coal Board has decided to accept the broad findings of the Fleck Committee about how the industry should be run; this is hardly surprising, since the Board was specifically reconstituted for the purpose. The Committee made no less than sixty-one recommendations, action upon fifty-seven of which rests with the Board; it has accepted fifty of them without significant reservation, broadly agrees with six others, though it has not yet fully decided how to carry them out, and is still considering one last recommendation (the suggestion that it should set up a small separate department to handle its brickworks). The main changes that the Committee recommended and that the Board is putting into operation include the creation of three new departments in the Board to deal with staff, industrial relations and purchasing, and the strengthening of the largely unchanged structure of organisation throughout the industry.

As the Committee emphasised, this strengthening depends primarily upon getting good men by paying for them. It also depends, however, upon re-establishing, for the first time in several years, the principle that the functional heads at each level of the Board's organisation should be better men with a higher status than their counterparts at the next level down in the organisation. This is a significant departure from certain recent policies of the Board, which had tended to put so much emphasis upon decentralisation—which was certainly urged upon them by many of their critics—that the responsibility of officials at headquarters for the policy and the leadership of the industry had been decaying. This process had been accelerated by the directive issued by the Board in October, 1953, to define the responsibilities of the various levels of management within the organisation, and the Fleck Committee recommended that that directive should be withdrawn. The National Coal Board's last note upon the Committee's recommendations accepts this and marks the end of a policy: "A general directive will be issued."

AEI Looks Forward

Associated Electrical Industries is a vast enterprise with an annual output exceeding £96 million ranging from the power plant to the cathode ray tube. It is now actively expanding. A new turbine factory is going up in

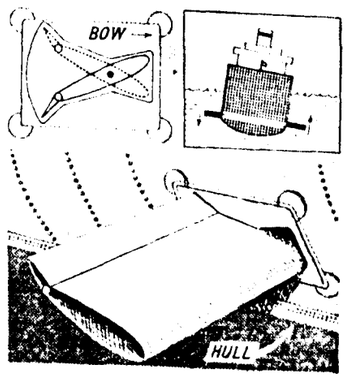
Northern Ireland, where labour is plentiful and the government helps new enterprises. A big transformer factory is being built at Wythenshaw and a new cathode ray tube factory is going up at Sunderland. In addition important extensions are being made overseas. In particular the group has acquired from the International General Electric Company of the United States the other half of the Australian General Electric Company. Later the Australian public will be offered a minority interest in that expanding enterprise.

Lord Chandos (formerly Mr Oliver Lyttleton) recently resumed the chairmanship of AEI and his speech shows that he has brought from statesmanship a statesman's view of industry. He is bent on spreading the ownership of capital over a wider field. Already the group has 36,000 shareholders ; Lord Chandos wants more. The decision to pay quarterly dividends and to make half yearly progress reports should help. For those who like debating points, Lord Chandos happens to be President of the Institute of Directors where some of his colleagues seem less progressive. The first quarterly dividend is to be 2½ per cent and the market will doubtless deduce that there are to be three payments of 2½ per cent each, and a larger final dividend fluctuating with the profit. Quarterly dividends now present no problem in America ; they should not do so here. Shareholders, particularly the small fixed income people should be delighted. The new issue that will raise £10 million towards the expansion programme should also help to spread the ownership. The bulk of it is a rights issue at 40s. per share to shareholders but 215,000 shares are offered at the same price to employees not as rights but subject naturally to the power of the board to scale down excessive applications. The intention is to encourage as many employees as possible to become small shareholders and to grant them loans so that they can apply. The issue price contains an element of bonus (the market price of the existing shares is around 66s.) but it could be argued that the employees are to receive something that is the property of shareholders. It could equally be answered that since the employees' shares, unlike those of his shareholders, are to be non-transferable for three years no one knows what the right price for their part of the issue should be.

The other main problem that Lord Chandos sees is education. He expresses grave anxiety about the flow of physicists, chemists, metallurgists and engineers into industry. AEI employs 4,000 graduate, student, and craft apprentices. It needs an even larger flow and Lord Chandos recognises that since that is an industrial problem, industry must do something about it. His proposal to draw one of the new part-time directors from the field of education shows his estimate of the weight of the problem. He makes three other specific suggestions: industry should release some of its suitable staff with their pension rights into the teaching profession. It should encourage young men on the staffs of universities and technical colleges with money grants to pursue academic research. Lastly, the rising generation in the schools should receive more information about careers in industry.

Claymores at Renfrew

THE 24-hour strike of maintenance engineers at Renfrew airport on Wednesday was called, nominally, as a protest against the Government's delay in deciding on the future of the Renfrew base. But all the parties in the dispute are aware that the union's real complaint is not with the Government's indecision but with the nature of a realistic settlement. Six months ago British European Airways, in face of a storm of Scottish as well as union protests left the matter to the decision of the Minister of Transport. After the remainder of its 35 Vikings were withdrawn from service last October, the only aircraft serviced at Renfrew have been the corporations' 47 rapidly ageing Dakotas and BEA would save about £150,000 a year if it could close operations at Renfrew and move these down to its new maintenance base at London airport.



Local opposition to the transfer was understandable so long as it meant that the 600 men now working on the Dakotas would have to find new jobs. But this is no longer the case. The Canadian Government plans to have the Royal Canadian Air Force machines based in Europe serviced under contract by British operators, and the Renfrew base is ideal for this purpose. But the Canadians cannot award the contract until it is known whether Renfrew will be available.

One of the leading companies in the negotiations with the Canadian Government is Airwork Ltd., and the local Renfrew unions have already announced their opposition to Airwork as a future employer. Their reasons seem to lie in the knowledge that while Airwork is prepared to take on most of the five hundred men left behind if BEA moves south (taking a hundred workpeople with them) it will not give a blanket guarantee to employ every man now working at the base. Meanwhile, local opposition to the retirement of BEA remains as strong as ever, despite the fact that alternative employment at the base could be provided. In such a situation a strong lead ought to come from the Ministry of Transport ; BEA's operations at Renfrew are bound to close when the Dakotas are ultimately withdrawn from service, and the longer the decision is put off, the more bitter is local feeling likely to become. And the Canadian Government cannot be expected to hold up its plans indefinitely while British ministers search for a painless way of grasping the Renfrew thistle.

Keeping Ships Steady

THE *Queen Elizabeth* is the latest ship to install the ship stabilising fins that have recently been installed into many existing passenger ships, and have become a commonplace for new ships. Designed to reduce the rolling of ships at sea, the first set was installed just before the war in the cross-Channel steamship *Isle of Sark*. During the war they were extensively used in naval sloops and escort vessels, and after the war they became standard equipment in new Southern Railway passenger ships. The first large passenger liner to be equipped was the P. & O. liner *Chusan*, and the success and popularity of this installation led other liner companies to equip some of their prewar vessels with stabilisers. This week's voyage of the *Queen Elizabeth* is the first with stabilisers ; owing to its size two complete sets have been fitted, and the work involved considerable rearrangement of the machinery compartments.

The normal installation consists of two retractable fins, one on each side of the ship, projecting from the hull at about the turn of the bilge as near amidships as possible. The action of the fins is similar to that of submarine hydroplanes

or aircraft ailerons, except that the two fins move in opposite directions. Movement of the fins is controlled by two small gyroscopes, one measuring the angular velocity of the roll and the other the angular displacement ; the algebraic sum of the movements is combined in any desired ratio to effect the best control for any particular ship. The latest design of fin incorporates a flap. The fins are tilted by hydraulic machinery, and the force for righting the vessel comes from the motion of the ship through the water, and thus ultimately from the main engines.

When a vessel is rolling, its resistance to forward movement through the water is greater than when upright. The gain in efficiency through the reduced roll, therefore, can be offset against any increased drag due to the operation of the fins. A stabilised ship for the same horsepower, will maintain the same speed when stabilised as when rolling freely. Against the cost of the installation can be offset the fact that a stabilised vessel can be steamed faster through rough water with the same degree of stress (thus enabling time schedules to be maintained) ; that the bill for breakages and injuries is greatly reduced ; and that the absence of roll is an added inducement to intending passengers.

Liquidation Prescribed

MANY an industrialist has complained of the wicked financier—the bloodsucker who deals in his company's shares just to make what he can get out of them. For an industrialist—a successful one—to raise the cry, "Shareholders arise ; get your money out ; insist on liquidation while the till is still well filled," is novel and distinctly controversial. Yet that was broadly the theme developed by Mr W. A. Grierson, chairman and managing director of the cotton spinning firm of Hayeshaw Ltd., in a speech to Bury Textile Society last week.

His thesis rests on two assumptions that command acceptance: he believes that the cotton textile industry in Lancashire must shrink further, and therefore that the disruption should be minimised ; he claims—and he has personal experience to back him—that double day shifts are the obvious way of getting full use out of new machinery and justifying its high cost. Therefore—the argument runs—shareholders in firms that have neither re-equipped nor introduced modern methods of machine utilisation should insist on liquidation. If they acted quickly they would find after fourteen years of a seller's market that capital returns generally would well exceed the nominal value of the shares. Labour would be disturbed, but there would be little hardship because most of the workers would be needed to man double shifts in the surviving mills.

Mr Grierson's argument deserves thought. There is so much in it that is true that it seems surprising that no Mr Clore of the cotton industry has appeared. And yet, as a prescription for Lancashire, liquidation by shareholders is not a sure remedy. It is not necessarily inefficiency that would determine whether shareholders of a particular mill could successfully insist on its liquidation. That would depend most of all on how the shares were held ; the absence of a dominating family holding might be decisive. It would not always be the weakest that would go to the wall, and Lancashire's industry, built up of innumerable special cases, might lose some mills worth preserving. Nevertheless some liquidation may well have to come.

Support for the Gnat

THE Ministry of Supply's announcement of a development order for the Folland Gnat for 20 aircraft, ends a long series of negotiations between the Ministry and the manufacturers. The Gnat has been developed entirely from the company's own funds; a normal development contract would have been of no value at this late stage, and the manufacturers have held out, successfully, for a batch order for a specific number of aircraft. There is, however, almost no prospect of the Gnat in its present form being considered for the RAF. It could not now be in service in any quantity before 1958, when the RAF would have little use for cannon-armed fighters. Provision has been made for carrying both guided missiles and the necessary airborne radar on the Gnat ; but a certain amount of redesigning, particularly of the wing, now needs to be done to give the aircraft the performance, when carrying these substantial extra loads, that the RAF demands. This work will be done on the series of Gnats ordered by the Ministry of Supply. It is surprising that when so much thought is being given by designers in the United States and in France and by Nato commanders in the field to methods of reducing the size and cost of modern military aircraft that the one British experiment in this field should have been refused government support for more than two years while public money was being lavished abortively on other projects.

The Paper Bulletin

This is a new bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The first quarterly issue will be available at the end of April. Full details from :

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

Lower Supply Estimates

THE Ministry of Supply estimates for 1955-56 have fallen for the second year in succession; the net total is down by £16.5 million to £181.5 million. Expenditure on research and development work, the biggest item in the Ministry's budget, is still increasing; it has gone up by £7.4 million to £147.6 million, £102.7 million of it representing work done by industry. The savings have been found from the sums allocated for new buildings and plant. There is, however, a looking-glass quality about these figures. A high proportion of the savings of the past two years arises from the removal of civil atomic research from the Ministry. But the sum for research and development includes the actual production of atomic weapons and since this is getting under way, and the hydrogen bomb project will also begin to make heavy demands on the Ministry's purse, research in other fields, particularly on aircraft, is running on an increasingly tight rein.

Meanwhile, the drop in expenditure on plant and buildings is not likely to be a permanent one. It arises largely because some big projects are nearly completed; other alterations and extensions, estimated to cost a total of £26 million, will barely start during the year under review. The Ministry estimates do not have to meet the cost of equipment bought for the services which will amount to £468 million during the coming year. But it is plain from the Ministry's own figures that industry will soon have to take a far bigger share than at present in the cost of research and of production tooling or put up with a considerable contraction of research from public funds. And in the case of aircraft, this would mean the contraction of the aircraft industry itself.

Disgorge or Pay

MR ERIC LOUW, the South African Finance Minister, has affronted conventional tax ideas in his latest Budget by imposing a tax on undistributed profits, penalising those companies that do not distribute enough to shareholders. The object of this tax is, like that of the "surtax directions" issued to private companies in this country, to prevent the avoidance of surtax. It had the immediate result of sending up the price of most of the quoted South African industrial equities. British investors, who have to bear the weight of a distributed profits tax as well as the undistributed levy, must think this line of policy rather eccentric.

For the South African manufacturing companies 40 per cent and for the other companies 30 per cent of their ploughed back profits will be exempt from the tax. But on the remaining undistributed earnings the tax will be levied at 5s. in the £. The tax will not apply to mines or to foreign companies or to companies whose reserves are small. Even in the other cases the burden of tax upon earnings is likely to be slight, though with a few companies it may lead to higher dividends and free scrip issues.

What are the merits of such a tax, accompanied by no more than normal income tax and surtax on distributed earnings? By encouraging bigger dividends it may make the South African capital market more attractive, attracting new money in the direction it is needed. The growing economy of South Africa needs a wider capital market. But South Africa also needs a high level of industrial investment, and that end may be more easily attained by the ploughing back of profits. If a tax prompts the individual company to distribute its earnings to the hilt, there is no certainty that the dividends it pays out, reduced by income tax and surtax payments, will be saved and reinvested. But equally the reverse policy of taxing distributions heavily does not guarantee that undistributed profits are best invested by the companies that keep them. The old text book maxim of the self-generation of capital may have been thrown out of the window by Mr Louw, but it does not stand too close an examination.

American Copper at 36 Cents

AMERICAN copper producers, who still cling to the concept of price stability, have again been forced to bring their prices more into line with world levels. This week their quotations were raised from 33 to 36 cents a lb for electrolytic, which is still well below other American and foreign prices. American customs smelters are getting 40 cents a lb or more on the domestic market, dealers are charging 43 to 44 cents and exporters 45 to 46 cents (£360 to £368 a ton), which compares closely with the London spot price of about £360 a ton for standard copper. West German consumers, who were caught on the wrong foot by the American restrictions on exports of copper and scrap, have been paying premiums of £15 to £20 a ton for electrolytic over the London standard price.

Little Change in Commodities

PRICES of raw cotton and cocoa have fallen further in the past week, and copper is dearer; other commodities have shown little change. THE ECONOMIST commodity price indicator has dropped slightly to 95.8 (1952 = 100).

	March 24	March 31

ANNOUNCING

NEW INTERNATIONAL BTD-6 DIESEL CRAWLER 505 B.H.P.

NEW RIGHT THROUGH THE LINE OF POWER

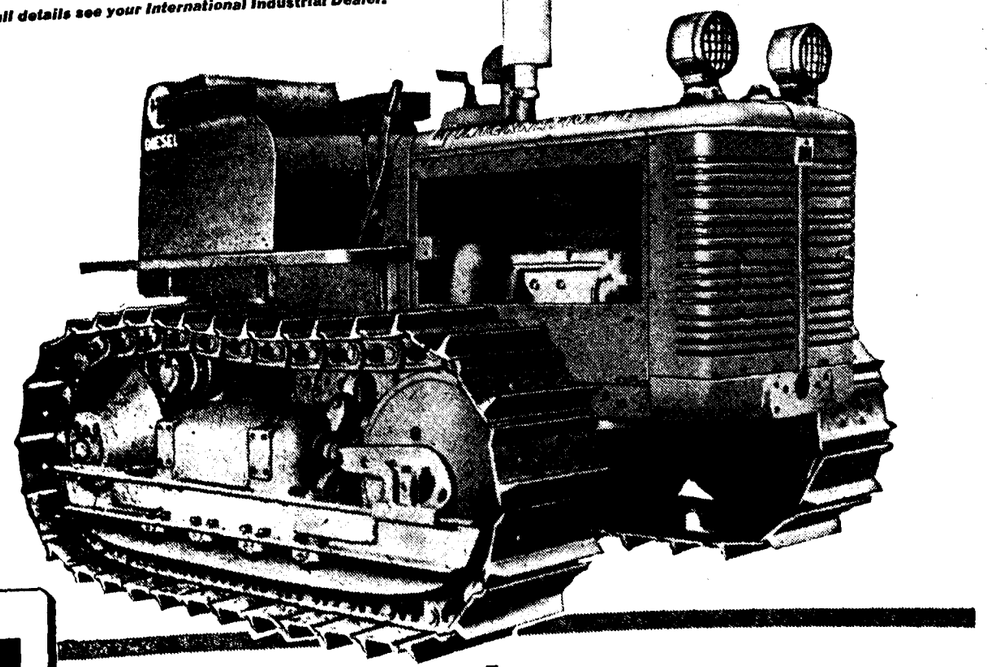
International
Industrial Dealers in Great Britain

JAMES BOWEN & SONS LTD., EDINBURGH
R. CRIPPS & CO. LTD., NOTTINGHAM
SAVILLE TRACTORS LTD., STRATFORD-ON-AVON

NEW in virtually everything but name! *New* main frame... *new* power train... the NEW BTD-6 has been completely redesigned around International Harvester's magnificent NEW 505 horsepower engine!
Its working advantages for you are tremendous. The NEW BTD-6 will roll bigger bullgrader loads, heap bigger scraper loads, lift heavier bucket loads, pull hundreds of pounds more on a winch rope.
And besides all this, it will save you more in time and money on maintenance. Lubrication is simplified. Protection against dirt and water is even more thorough. All wearing and stress-bearing parts are engineered to take whatever is coming for extra thousands of working hours.
Get all the power and performance facts about the NEW BTD-6 from your International Industrial Dealer now. This Doncaster-built crawler is going to be in big demand.

NEW ENGINE
25% more power. New closed-type pressurized cooling system.

NEW CLUTCH
33% more torque capacity. 13" overcentre type with automatic clutch brake.



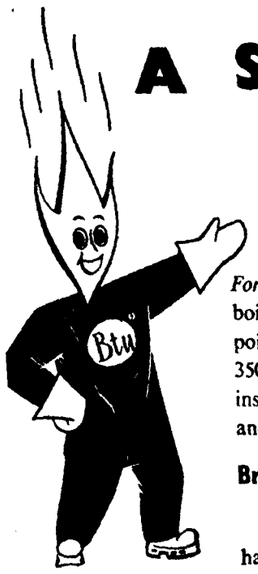
NEW TRANSMISSION
Larger main shaft. 5 new gear wheels. New big-capacity bearings.

NEW MAIN DRIVE
SPIRAL *bevel pinion and gear. Tapered roller bearings.*

NEW FINAL DRIVE
Wider teeth on bull gears. 25% more load capacity.

NEW TRACK FEATURES
Front idlers with combined weight and shield - (available as special equipment). New track rollers. Track shoes increased in section by 25%.

For full details see your International Industrial Dealer.



INTERNATIONAL HARVESTER

International INDUSTRIAL POWER

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED, HARVESTER HOUSE, 259 CITY ROAD, LONDON, E.C.1

A SURE MONEY SAVER

" If your intelligence system is right you can save billions of us," says Private Btu (the British Thermal Unit). *" You must have instruments to detect losses."*

FUEL EFFICIENCY PAYS

For example . . . An establishment in Lancashire installed instruments for their two Lancashire boilers at a total cost, including erection and starting up, of £600. These instruments pointed the way to more efficient combustion and the saving of coal in the first year was 350 tons which, at the current price of 70/- a ton, is a saving of £1,225. The instrument installation therefore paid for itself in a little under 6 months. Fuel savings have continued and have amounted to £1,750 over the last 18 months.

British Industrial Measuring and Control Apparatus Manufacturers' Association

21 Tothill Street London SW1

have other examples of the value of instrumentation throughout the whole factory and will answer enquiries and supply the names of manufacturers in the field of instrumentation.

Issued by **N * I * F * E * S** *National Industrial Fuel Efficiency Service*

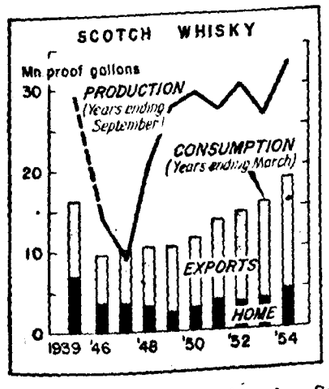
71 Grosvenor Street London W1 Telephone: Hyde Park 9706

GRIP-SEAL CONSTRUCTION makes the Goodyear Tubeless Tyre . . .

. . . THE MOST EFFICIENT AIR CONTAINER EVER MADE

COSTS NO MORE THAN A CONVENTIONAL TYRE AND TUBE.

Precision built to give longer, safer, more trouble-free mileage than ever before possible



As a result of Grip-Seal Construction—the Goodyear Tubeless Tyre is the most efficient air container ever made. In this process, the Rayotwist carcass cords are completely integrated with special rubber compounds. Every element, inside and out, is welded into a single airtight unit—a tube is no longer needed! You get puncture and burst protection of a kind previously unknown. Roadside delays are far fewer! Available with Rib or All-Weather Tread. Fits all rims except wire wheels. Can be mounted singly, in pairs, or sets.

GOODYEAR TUBELESS TYRES

Spring Tide in Whisky

EASTER time is marked in the Scotch whisky calendar for two reasons. It arrives when the distilling season is nearing its end and preliminary estimates of production begin to emerge. In a couple of months, malt distilleries will pack up for cleaning and maintenance after what appears to have been their busiest year for a long time, certainly since the war. Last year a bumper 32.8 million proof gallons of whisky were distilled; 19.4 million gallons of this capacity output were grain whiskies (13.9 million in 1952-53) and 13.7 million gallons were malt (against 12.3 million). In 1938-39 a total of 30 million gallons was produced. Cereal supplies, both home-grown and imported, are far more plentiful now. The last barley harvest was still a little too moist, but much less so than in 1952-53, when only 26 million gallons were distilled.

Secondly, this is the time of the year when the whisky trade makes its annual pilgrimage to the Chancellor. Whisky, particularly the brands advertised on a national scale, is still short in Britain, but the trade feels that its case for a reduction in duty is growing stronger. Last year an extra 1.8 million proof gallons were released to the home market, making a total of 4.8 million gallons, and the trade suspects that saturation point, at the current rates of duty, may be reached in the next year or two at 5-6 million gallons, compared with 7 million gallons or so before the war, when the tax was a third of its present level. The whiskies that were laid down from 1948 onwards, when the industry began to operate much nearer to its prewar capacity, are now approaching the time for marketing, and the trade should soon be able to meet the total demand for whisky here, though the Distillers Company and some others are expecting to be able still to increase their sales of particular brands. Stocks are still large and out of balance—the total last September was 158 million gallons as opposed to 144 million gallons in 1939—but pressure on storage space will be eased by the new warehouses that are going up.

Overseas there is still a vast unsatisfied demand for Scotch, and the United States is still by far the largest single market; it takes over half the shipment. The trade would like to spread its risk over other markets, but none at present takes more than a ninth of the volume that the United States consumes, and a number of these smaller countries have recently been imposing higher duties. Nineteen such increases took place in 1954. This is worrying an industry that now relies upon overseas customers for three-quarters of its business, compared with about half in the 'thirties. It feels that its representations would carry more weight if there was at least a token reduction in duty in Britain. This argument will probably not prevail with Chancellors watching the revenue returns, but, as in the tobacco industry, the distillers may soon be able to argue a case for a reduction that would bring a higher total revenue. With more whisky flowing to the home market, the trade has already been able to recapture part of the market it had lost to table wines and to other spirits.

Trade with Persia under Way

BRITISH trade with Persia, which came almost to a standstill after shipments of Persian oil ceased in 1951, is getting under way. A modest recovery in exports in the second half of last year brought the total value of British shipments to £8.2 million in 1954—still small compared with the 1950 total of £30 million, but nearly double the exports of 1953. In the first two months of this year exports rose to £2.7 million, and that expansion should continue. The Persian parliament recently approved the British five-year credit of £10 million, to be advanced by the Export Credits Guarantee Department for expenditure on British goods, and Persia is now earning sterling from the resumption of oil shipments. Approval of the loan presumably explains why the department has now introduced normal cover facilities for exporters to Persia. In future, short-term cover will extend to the period before the goods are shipped and in certain circumstances the department may not insist that the terms of payment are cash against documents. The terms of payment under medium-term policies will also be less strict. For both types of policy the waiting period before loss can be ascertained is reduced from nine to six months, and the department's gross liability will no longer be limited.

This year Persia will receive about £31 million from the oil companies represented in the consortium, as its share of profits from the export of about 15 million tons of oil, mostly as crude. In 1956 and 1957 oil payments should rise to about £52 million and £67 million respectively. Local expenditure by the companies on wages and materials will bring in rather more than £1 million a month, raising Persia's total receipts to about £44 million this year and to about £190 million over the three years. Under the terms of the payments agreement with Britain of last October, Persia became a full member of the transferable account area; it also has the right to convert sterling into dollars for the purchase of essential goods and services which cannot be obtained from non-dollar sources on equivalent terms. Plainly Britain now has the opportunity to rebuild its export trade with Persia, though competition there—as in the other oil countries of the Middle East—is fierce; the United States, Germany and France have also extended credits to Persia.

Atoms Aiding Industry

THE demand for radio-active materials has trebled during the past five years to an annual rate of 20,000 consignments and a new collective catalogue* of instru-

* Radio Isotope Instrumentation and Accessories. Scientific Instrument Manufacturers' Association of Great Britain.

ments and equipment for use with them was published this week. It lists 44 manufacturers, many of whom are established producers of electronic equipment or scientific instruments. It is much to the credit, first of the Ministry of Supply, and now of the Atomic Energy Authority, that when the country's atomic plants were first constructed, consistent support was given to some companies, then very small, with the special skills needed for the novel types of equipment that the new plants demanded. These companies are now responsible for much of the more complex equipment listed in the catalogue.

Most of the radio-active materials used in industry have so far been incorporated in measuring and control devices, but Sir John Cockroft said this week that Harwell will soon be able to supply for the first time really high-intensity sources of radiation. This suggests the possibility of using radio-activity in chemical production. Radiation has been shown to alter the properties of silicones and plastics ; it is also known that it can bring about such radical chemical changes as polymerisation. Plans are being made to start the production of irradiated plastics late next year. These are developments that the oil refining and chemical industries are likely to watch very closely, for such production methods could radically alter the industrial sky-line.

British Steelworks for India

THE committee that is due to leave London this weekend to advise the Indian Government on a new steelworks represents Britain's second attempt to participate in the considerable expansion of the Indian iron and steel industry that is now planned. Negotiations between the Metallurgical Equipment Export Company of London, an export consortium representing six British plant manufacturers, and a group of Indian businessmen foundered upon the Nehru Government's insistence that new steel works must be largely nationalised. The new British offer that was "accepted in principle" by India at the time of the Commonwealth Conference is for a similar plant, but state-owned, for which the Export Credit department would guarantee credit; the committee is to advise on location, output, and costs of such a plant.

The one Britain hopes to build would probably be located near Calcutta. It would be the third additional plant planned to increase Indian capacity:

	Ingot Tons
Existing capacity	1,600,000
Planned extensions to existing plant (approx.)	1,400,000
Plant to be built at Rourkela (planned by Krupp-Demag though construction will be formally open to competitive tender), revised capacity	1,000,000
Plant to be built at Bhilai; planned and plant supplied by the Russians	1,000,000
Projected British plant	920,000
Projected capacity (approx.)	6,000,000

A fourth plant, to be based upon newly discovered lignite deposits in Madras, has recently been mentioned as a possibility ; in projecting total capacity, the Indian authorities have talked of as much as 10 million ingot tons a year. The programme already projected, raising ingot capacity from about 1½ million tons a year to about 6 million tons, is itself of formidable proportions, compared either absolutely or proportionately with the plans of any steel industry in the world.

Hudson's Bay Pays More

THERE is still a touch of adventure about the equity of the Company of Adventurers of England Trading into Hudson's Bay. It is no longer provided by fur trapping but by the company's interests in the development of Canada's oilfields. It is the possibilities of these investments which have sent the price of the £1 ordinary shares up to 152s. The price began to rise two years ago on American efforts to transfer the company's domicile to Canada but it was the oil prospects that kept the advance going.

Apart from oil, the company is primarily concerned with wholesale and retail trading in Canada, though that business is only as sedate as a bustling economy will let it be. It is largely from these activities that Hudson's Bay earned a gross profit of £3,362,963 in the year to January 31st. That profit is £302,121 higher than that earned in 1953-54. In spite of this increase the tax charge has fallen from £1,740,000 to £1,639,000, thanks to the demise of EPL. Net profits have risen from £1,320,842 to £1,722,963, bringing the dividend on the trading account up from 12½ to 15 per cent. The directors have also again declared a tax free dividend of 2½ per cent on the land account. In calculating the yield on the £1 ordinary shares these two dividends are lumped together, giving a gross dividend of 19.55 per cent, compared with 17.04 in 1953-54. On that dividend, the shares offer a yield of only £2 11s. per cent at the current price of 152s. The only justification for that yield is the company's interest in oil.

SHORTER NOTES

The index of industrial production for January is provisionally estimated at 133, and the February figure is expected to be 137-138. These figures compare with a revised index of 129 for December, and are 4-5 per cent above the figures for January and February, 1954.

★

Iraq has repaid from its buoyant oil revenues the outstanding balance of $6.3 million of the fifteen year loan made by the World Bank in 1950. The loan was for a total of $12.8 million, but Iraq announced in January that the unused portion of $6½ million would not be taken up.

★

The Chancellor of the Exchequer has decided that there is no "present prospect" of modifying the scope of the control exercised by the Capital Issues Committee, but some improvements in procedure are being considered.

"I wondered about our accounting, but he reassured me . . ."

"My business has been expanding quite a lot recently, you know. And I wasn't sure that our accounting department could handle all the extra work. So I called in this Burroughs man. I told him all I could. Then he and our Chief Accountant went into the whole matter together very thoroughly. Later he told me frankly that we'd no need to change yet. Glad I called him in, though."

The Burroughs man is always at your disposal, without cost, as an experienced adviser on all accounting questions—and is well qualified to work in consultation with your accountant or auditors.

If you wish, he will simply examine your existing system. And if he considers it satisfactory he will certainly say so.

But often he is called in because there is a problem to which he can apply his wide experience of business systems and mechanization. But he won't try to alter your routines just to suit certain machines. Rather, after analyzing your problem, he will suggest the most efficient and practical solution—with real savings in time and money.

If he does recommend any change, he prepares a detailed plan for its execution, and helps you get it running smoothly. He will make sure you always get full benefit from any Burroughs machine you install.

Whatever your business, large or small —if you have an accounting problem, the Burroughs man can help you solve it. Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. Call in the Burroughs man as soon as you like—you're committed to nothing, and his advice is free. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Here is how one Burroughs man solved a particular problem: For several years the demand for the expanding range of products made by Storeys of Lancaster had been steadily increasing.

This called for a reorganization of their stock records to give more detailed and readily available information, so that production could be planned to meet the growing demand from both home and abroad. But how, without extra staff?

Mr. W. D. Dwyer, the Burroughs man who co-operated with Storeys in meeting their requirements without extra staff, is seen here with one of the Burroughs Sensimatics that made this possible.

FOR SPECIALIST ADVICE ON MECHANIZED ACCOUNTING METHODS
CALL IN THE Burroughs MAN

Correction : In the table on page 1117 of *The Economist* of last week, synthetic yarn and cloth should have been placed in the Administrative category, not in category B.

★

The directors of Albright and Wilson, the chemical manufacturers, have declared an ordinary dividend of 22½ per cent for 1954, compared with 17½ per cent in 1953. The bigger dividend follows on an improvement in net profits, from £710,305 to £863,070.

★

After two weeks or so of stability, transferable sterling resumed its rise in the middle of this week. The New York quotation jumped on Wednesday from $2.76⅛ to $2.76⅛. As the official sterling rate remained virtually unchanged—at $2.79½-$2.79⅝ spot—the discount on transferable sterling narrowed further, falling to slightly under 1 per cent.

★

The world rail speed record was broken twice this week by two French 4,000 hp electric locomotives, each hauling three carriages, which reached speeds slightly over 200 mph on the famous straight level stretch of track south of Bordeaux. These were test runs to study the behaviour of equipment at very high speeds but one of these locomotives has already proved itself on heavy long distance work, covering the 318 miles between Lyon and Paris at just under 80 mph. French Railways pioneered the use of long distance electric trains. The previous record of 151 mph was set up a year ago by another locomotive of the same type.

★

Typhoo Tea announces a sharp fall in profits for the 13 months ended December 31st. Trading profits after depreciation were £565,558, compared with £849,142. The dividend of 15 per cent is equivalent to an annual rate of 16.154 per cent, and compared with 32½ per cent in the previous year before the 100 per cent scrip issue. The 5s. ordinary shares fell 2s. to 19s. after the announcement.

★

The total assets of the Refuge Assurance Company, whose shares are soon to be available to the public, went up by £5.6 million to £138.7 million in 1954. Premium income rose by £404,000 to £17.3 million and net interest receipts by £373,000 to £4.9 million. The valuation of both the ordinary and industrial branches has again been strengthened.

Company Notes

FORD MOTOR. More than one million vehicles rolled off the assembly lines of the British motor industry last year. Ford Motor sold 291,468 of them, exporting 53 per cent of that number ; in 1953 the company sold 234,379 vehicles. The increase in production brought the value of sales up from £105.9 million to £127.3 million and profits before tax from £15.8 million to £19.3 million. Inevitably it was accompanied by an increase in stocks and work in progress—up from £15.8 million to £18.7 million—and in debtors—up from £5.2 million to £8.8 million. Massive appropriations to reserves and an increase in creditors (from £17.4 million to £21.8 million) balanced the increase in working capital and the group's liquid resources went up from £39 million to £45 million. The group will need liquid reserves of this order to finance its £60 million capital development programme, but those needs have not been given priority at the expense of equity shareholders, for their dividend has been raised from 12 to 15 per cent.

Mass production and a close guard on costs and prices account for the success of Ford and explain why there are waiting lists for some of its models and why it has increased its share of the export trade. The chairman, Sir Rowland Smith, gives the explanation in two sentences: "Lower costs, arising from improved manufacturing efficiency and methods, and higher volume, have substantially offset the effect of increased wage rates and materials costs during the year. Further reductions in export prices were made in 1954, and it should be noted that none of our vehicle prices has been increased during the past three years."

What, then, of the future, particularly in overseas markets ? Sir Rowland answers thus: "Provided that inflationary tendencies here are kept under control, and also that our taxation load is brought to a level closer to that of foreign competitors, I am confident that in quality and value we can meet all competition. The going will not be easy ; it is clear that in Europe we are in a period of intense competition when only the most acceptable products, coupled with the most efficient low-cost manufacture, will survive." The air of confidence in that statement will not fail to be noticed by the investors who put Ford's £1 ordinary shares high on the list of motor equities.

★

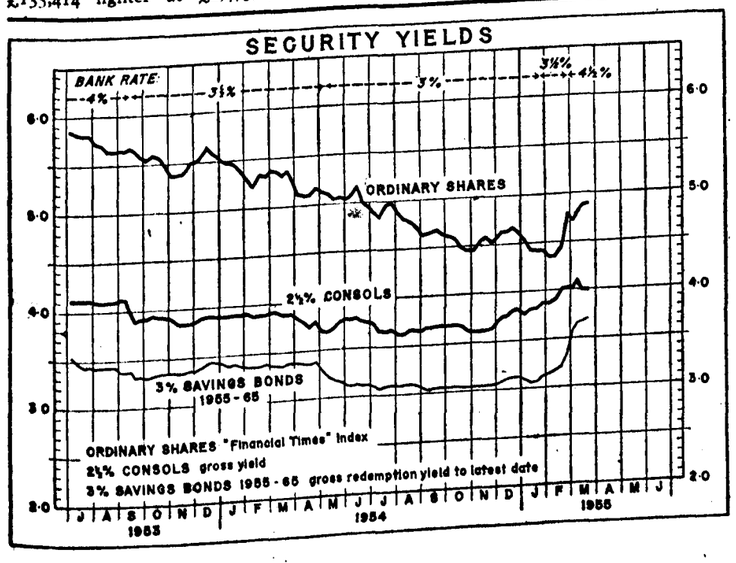
VAUXHALL MOTORS. The Vauxhall and Ford companies have much in common. They have inherited from their American connections the same attitude towards low-cost, mass production. But there are two essential differences. First, Vauxhall is about half the size of Ford. The second is that while Ford's ordinary shares are quoted, Vauxhall's are owned entirely by General Motors. The dividend of £11,240,000 paid on them has been largely utilised by General Motors in subscribing £9,200,000 for additional shares in Vauxhall, which is a formal way of ploughing back profits.

In selling 130,951 cars and trucks last year, compared with 110,141 vehicles in 1953, Vauxhall strained its production facilities "to the limit" and, like Ford, the company had difficulty in meeting the full requirements of its British customers. In value the company's sales went up from £58.6 million to £66.6 million and profits before tax rose from £9.9 million to £12.4 million. The similarity between Ford and Vauxhall does not end there, for Vauxhall exported 54 per cent of its vehicles, compared with the 53 per cent for Ford. Vauxhall, too, has a massive development programme—designed to double production in the next five years at a cost of £36 million—and so, here too, priority is given to the conservation of financial resources. But unlike Ford, Vauxhall will not be able to finance the programme entirely from its own resources. At the end of last year the company had £16 million in cash and investments, but about half the cost of the programme will have to be financed by borrowings ; the placing of £7½ million of an unsecured loan stock last year and the loan of $4 million from General Motors were the first instalments. The confident assessment of the future of the British motor industry revealed by these capital programmes finds more than one echo in the directors' report. They say, for instance, that there is still a full order book for cars and commercial vehicles in the home market and they characterise the current demand in overseas markets as "very strong."

BRITISH ALUMINIUM. Last May in explaining the abnormally low profits of British Aluminium in 1953, the chairman, Lord Portal, spoke of "planning difficulties in the rolling mills and a serious increase in production costs." In 1954, when the consumption of aluminium increased and when the metal commanded a higher price, the company seems to have overcome these earlier difficulties, restoring its profits to a more normal level. Before tax they amounted to £2,854,407, nearly twice as big as the profit of £1,557,769 returned in 1953.

	Years to Dec. 31, 1953	1954
Consolidated earnings:—	£	£
Trading profit	1,557,769	2,854,407
Depreciation	575,652	631,534
Replacement reserves	100,000	223,240
Taxation	409,127	1,185,153
Net profit	*404,124*	*720,151*
Ordinary dividends	275,000	330,000

There has been a corresponding increase in tax, but net profits have risen from £404,124 to £720,151. That increase provides the justification for an ordinary dividend of 12 per cent, absorbing £330,000. In 1953 the dividend had been cut from this rate to 10 per cent. The bigger dividend took investors by surprise and after its announcement the £1 ordinary stock units immediately gained 3s. 10½d. to 42s. 6d. At that price they offer a yield of £5 13s.



★

BRITISH OXYGEN. British Oxygen, that indispensable handmaiden of the British engineering industry, has again left its ordinary dividend unchanged at 15 per cent. That conservative decision was made in the face of a growth in trade and in profits. The group's trading activities at home and abroad continued to expand ; in particular, the larger overseas subsidiaries are making "an increasing contribution to profits." Those profits before tax advanced in 1954 from £6,322,230 to £6,926,474. Taxes were £135,414 lighter at £2,473,278, thanks presumably to the demise of EPL, and net profits expanded quite vigorously, from £1,479,125 to £1,928,079. The net ordinary dividend absorbs £669,710 from these earnings. On the evidence of these figures any shareholder could be forgiven for feeling restive about the extreme conservatism of the board. The disappointment that follows a blighted hope has been reflected in the fall in the price of the £1 ordinary stock units from 63s. 6d. to 62s., putting the yield at £4 17s. per cent.

	Years to Dec. 31, 1953	1954
Consolidated earnings:—	£	£
Trading profit	6,332,287	6,926,474

Ordinary dividends	669,710	669,710
Retained by subsidiaries	485,384	632,154
Retained by parent co..	256,655	558,840

★

THE BRUSH GROUP. The directors of the Brush Group have restored the ordinary dividend to the former rate of 10 per cent, from which it was cut, in 1952, to 4 per cent ; in 1953 it was 6 per cent. The restoration of the 10 per cent came as no surprise, for in the earlier years the company had covered its past and prospective losses in its Indian tube well contracts. With those losses out of the way, the Brush appropriation account has a much healthier appearance, and colour is added to it by more favourable trading in the group's primary business in electrical engineering and diesel engines. In value the group's sales in 1954 went up from £20.8 million to £21 million and the trading surplus rose from £2,069,460 to £2,360,450. Interest payments did not take such a big slice of profits as they did in 1953. Hence net profits rose quite sharply, from £322,230 to £530,032, providing an adequate cover for the equity dividend. After the preliminary announcement the 5s. ordinary units put on 3d. to 8s. 7½d.

LONDON STOCK EXCHANGE

Next Account begins : April 20th
Next Contango Day : April 20th
Next Settlement Day : April 5th

STOCK markets have been thin this week. The absence of almost all the newspapers, the coming of the Budget, the approaching elections and the end of the account all made for restraint. Industrial ordinary shares were moving up before the week-end but immediately after the week-end prices weakened so that on the close on Monday *The Financial Times* ordinary share index was down to 178.4. A rally was staged on the first day of the new account, bringing the index up to 179.9, and prices were still moving up on Thursday. The longer dated gilt edged stocks closed just a fraction down on Monday. Those losses were recovered on Tuesday and later in the week the advance in prices was maintained. Little business was done in foreign bonds at the end of the account but the beginning of the new account brought a little speculative demand for German and Japanese issues. Insurance and banking shares began the week quite well, but made some fractional losses later.

The most pronounced movements, both up and down, in the industrial market took place in the electrical engineering, motor and textile groups. Two of the few stocks that did not take part in the rally were the Unilever issues, on rumours that the Wall Street quotation for the NV units would not be applied for this year. One of the outstanding increases was one of 3s. to 33s. 3d. in Scammell Lorries on "take-over" reports. The beginning of the new account brought the store shares back into favour and Montague Burton went up 2s. 6d. to 37s. 6d.

Oil shares showed losses on Monday but later on a few buyers in a thin market had a disproportionate effect in forcing prices up. Rubber shares were steady, as were tea shares until the new account opened when a few losses were reported. Kaffirs moved uncertainly ; the most erratic movements took place in Free State Geduld. Camp Bird were marked up on the directors' warning to shareholders not to part with their shares.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year; annual figures relate to October survey. (6) Revised series based on Liverpool spot market prices, as from July 1, 1954.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. (3) Average of third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended March 26th there was an "above-line" deficit (after allowing for Sinking Funds) of £1,546,000 compared with a deficit of £39,245,000 in the previous week and a surplus of £4,884,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £454,512,000 (compared with a surplus of £150,292,000 in 1953-54). Net expenditure "below-line" last week reached £32,944,000, bringing the total cumulative deficit to £49,562,000 (compared with a deficit of £283,229,000 in 1953-54).

THE MONEY MARKET

Despite increasing applications at the tenders for Treasury bills the rate continues to hold firm. Last Friday applications rose by £25 million to £410.2 million, the highest this year; the offer was up by only £10 million, to £280 million, so that the proportion of the market's requirements to be allotted fell from 56 per cent to 51 per cent. The discount houses maintained their bid unchanged at £99 1s. per cent for the fifth successive tender; credit conditions had indeed turned slightly easier on the preceding days, but the authorities continued to keep a firm hand on the credit reins.

Market supplies of credit became more plentiful over the week-end. On Monday again acute stringency returned, and despite considerable special purchases one or two houses were "in the Bank" for small amounts. On Tuesday market supplies of credit were adequate, but moderate official aid was needed again on Wednesday. May and June maturities have changed hands between 3⅛ per cent and 3 3/32 per cent.

In the London foreign exchange market sterling has remained almost unchanged during the week, at $2.79½-$2.79⅜ spot, and gold has fluctuated only narrowly, rising on Tuesday by ½d. to 251s. 0½d. per fine ounce. But transferable sterling rose sharply on Wednesday; the New York rate jumped from $2.76⅜ to $2.76⅛.

The Bank return shows an outflow of £13 million.

SOMEBODY JIBBED AT THE OVERHAUL

WHEN the derricking clutch of this electric derrick crane broke, the jib, no longer under control, crashed with considerable damage to the owner's property.

What **Vulcan** *say about it . . .*

This was as much a human as a mechanical failure, for a complete dismantled thorough examination of the crane by a certain date had been most earnestly advised, and this was overdue.

What Vulcan insure, Vulcan inspect. With their highly specialised knowledge, Vulcan's engineer-surveyors spot accidents before they happen, and give the necessary warning. Boilers and steam engines, electrical apparatus, pressure and vacuum vessels, cranes, lifts and hoists — these all need Vulcan's specialised insurance — and the specialised inspection that it implies.

284,837	Investments at Cost, *less* provision	434,815
3,979,009	Total Capital Employed	4,350,108

EXTRACTS FROM THE CHAIRMAN'S REVIEW

The profit after taxation is considerably higher than in the previous year due to cessation of Excess Profits Levy at 31st December, 1953.

The order book maintains a steady level, but may fluctuate in future owing to probable increases in size of Steam Raising Plants.

The output of the Group for the period was well maintained.

The Associated Companies in South Africa, Australia and India continue to make good progress, but competition from other countries is tending to become intense.

Attention is being given to the question of the generation of steam by the use of Nuclear Energy.

Tribute is paid to the work of the Management, Staff and Workpeople.

A secure future encourages *Efficiency*

No worker can put his best into his job if he is worried about the future. The mental burden of provision for himself and his dependants is often a deterrent to efficiency, and although the Welfare State has removed the fear of actual want, it cannot hope to dispel all the financial worries which so often harass those who have retired.

Today it is noticeable that firms with the highest proportion of contented workers are those which have made provision for their employees by operating Pension and Life Assurance schemes, such as those underwritten by the "Legal and General". Cost is met year by year and the employer's contribution is treated as a business trading expense by the Inland Revenue. The resulting dividends of increased efficiency and greater harmony compensate time and again for the relatively small expense incurred.

Write today for full information and advice on Pension and Life Assurance Schemes.

LEGAL & GENERAL

ASSURANCE SOCIETY LTD

CHIEF ADMINISTRATION: *188 FLEET STREET, LONDON, E.C.4*

NOTICES

AUSTRALIA—UNIVERSITY OF SYDNEY

Applications are invited for the position of NUMERICAL ANALYST to supervise the use of SILLIAC, a high-speed electronic digital computer at present under construction in the School of Physics. The appointee will be expected to carry out original work in numerical analysis and in methods of use of high-speed computers, to supervise the work of research students and others who may be writing programmes for SILLIAC, to accept responsibility for enlarging and improving an existing programme library, and to give courses of lectures on numerical analysis and programming techniques.

The salary range will be either £A1,100-£A1,450 per annum, or £A1,500-£A1,750 per annum, according to qualifications, with annual increments of £A50. The salary will be subject to superannuation deductions.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is April 23, 1955.

AUSTRALIA—UNIVERSITY OF SYDNEY

Applications are invited for the position of LECTURER IN ECONOMIC STATISTICS.

Salary for the Lecturer will be within the range of £A1,100-£A1,450 per annum, with annual increments of £A50. The salary is subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful candidate.

Finance available for home purchase under Staff Members' Housing Scheme

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is April 16, 1955.

WESTERN REGIONAL PRODUCTION DEVELOPMENT BOARD OF NIGERIA

INDUSTRIAL MANAGER

The Board is a public corporation responsible for promoting the economic development in the Western Region. Its total assets exceed £10 million.

The Board invites applications for the post of Industrial Manager who will be responsible for advising on industrial policy, investigating industrial projects and supervising the operation of industrial schemes in which the Board is interested.

Candidates should possess a University degree or comparable professional qualification and have had considerable management and industrial experience. Normal age limit 30 to 40 years. Salary to be paid will depend upon the qualifications and experience of the successful candidate and will be in the range of £2,500 to £3,000 per annum.

Applications, giving full details of qualifications and experience, should be addressed to Messrs Binder, Hamlyn & Co., 121 Queen Victoria Street, London, E.C.4 (giving names of three references), to reach them not later than April 30, 1955.

MARKET RESEARCH

Woman Statistician, with some experience of consumer market research, to initiate this activity in a company selling special equipment directly to private users through a team of full-time representatives covering the British Isles. A continuous check is required on the effectiveness of advertising and "follow up," with sample surveys and the general presentation of statistical information to the management. This position offers scope for a person with imagination and enough knowledge in this field to be self-propelled. —Box 886.

MALAYA, BRITISH BORNEO

Director, marketing and publicity expert, leaving May 27th on two-month tour Malaya, Singapore, Sarawak, Brunei, North Borneo, willing to undertake market investigation, visit agents, etc.—Box 883.

AN INTERESTING PROFESSIONAL APPOINTMENT will shortly be made for the first time as Deputy to the Director of courses in advanced Executive training and Development in the London area. Applicants, who should be Graduates with wide executive experience in Industry and of about 40 years of age, must have good knowledge of more than one of the following fields: Industrial Engineering; Industrial Psychology; Operational Research and Statistical work; Work Study and Management Training. The successful applicant will be required to assist in the preparation of Courses in some of these subjects, as appropriate to his special experience, and to lecture on them; therefore lecturing skill will be of importance. The salary will be of the order of £1,900, but for exceptional qualifications this is not an upper limit. Full details will be supplied to candidates whose preliminary application seems to be suitable.—Apply to Box 882.

MARKETING RESEARCH. A well-known industrial Company invites applications to fill an appointment involving responsibility for that part of the marketing research function concerned with consumer and retailer research. A good honours degree in Economics with statistics is an essential qualification. Candidates must have extensive knowledge and experience of the techniques of sampling and the organisation and control of consumer surveys. This is a senior post giving ample scope for experimentation in new methods and the imaginative development of existing techniques. An attractive starting salary will be paid and in certain circumstances housing assistance may be available.—Box 885.

A FIRM of stockbrokers with a mainly institutional business has an opening for a qualified accountant (preferably a graduate), age below 35, with good experience in industry. Commencing total remuneration of about £1,500 per annum. Initially the work would be of a "research" character, but the right man would have considerable freedom to work out his own contribution to the firm, with corresponding rewards.—Replies to Box 887.

A QUALIFIED ACCOUNTANT required by national trade association to train for a business consultancy service. Salary according to qualifications and aptitude for the post. Write, with full particulars of age, qualifications and practical experience.—Box 888.

BUSINESS EFFICIENCY CONSULTANT required by national agricultural trade association. Salary range £1,000-£1,500. State age and details of qualifications and experience.—Box 889.

GOVERNMENT OF THE UNION OF SOUTH AFRICA

DEPARTMENT OF THE INTERIOR

1. Applications are invited from suitably qualified persons for appointment under contract for three years, renewable for a further period, to the Public Service of the Union of South Africa for the posts of:—

2. Assistant Professional Officer. Salary scale: £450 x £30—£540 x £48—£780 (temporary minimum £480 per annum). In addition to the above, married persons will be paid a Cost of Living Allowance of £234 per annum.

3. *Minimum qualification required:* Applicants must be under 30 and must have a University degree or diploma equivalent to a South African University degree with advanced courses in mathematics, economy and accounting. Candidates with Masters' Degree will start on £510 per annum notch and candidates with Masters' Degree plus doctorate will start at the £540 per annum notch. Previous experience will be considered in fixing commencing salary.

4. Successful applicants will be employed on general duties relating to Statistics, finance, accounting, industrial economy, political economy, traffic, etc.

5. *Conditions of Employment* will in the first place be governed by the terms of the Contract and the Public Service Regulations. Successful applicants will be required to acquire within a reasonable time a knowledge of the Afrikaans language.

6. *Transport Expenses* from place of residence to place of employment (3rd class rail in United Kingdom, tourist, cabin or cheapest first class boat to South Africa, whichever is available, and 1st class rail in South Africa) including excess baggage to a maximum of 150 lb per adult and 75 lb per child, and similar return passage on satisfactory completion of Contract, will be paid by the Union Government.

7. *Applications in writing*, giving full details of qualifications and previous experience, should be addressed to Room 102, South Africa House, Trafalgar Square, London, W.C.2, not later than April 23, 1955.

MARKETING

BEECHAM FOODS LIMITED invite applications for the post of MARKETING ADVISORY MANAGER. This is a high level position, reporting to the Marketing Director, and the person selected will be responsible for giving expert marketing advice and service on all the brands produced by the Food Company. Candidates should have wide experience of marketing consumer goods through the grocery and allied trades. In particular they should have experience in fields of media selection, promotion, merchandising and market research. They should also have outstanding personal qualities of initiative, imagination, energy and leadership.

This appointment offers maximum scope for promotion and remuneration. Only men who are already earning at least £2,000 per year should apply. The actual salary paid could be considerably above that figure. Group pension and profit participation schemes are in operation. Applications will be treated in strict confidence. They should include full details of past experience and personal history, and should be sent to the Personnel Director, Beecham Foods Limited, Great West Road, Brentford, Middlesex.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for pensionable appointments. Applications may be accepted up to December 31, 1955, but early application is advised as an earlier closing date may be announced. Interview Boards will sit at frequent intervals. The Scientific posts cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects the number of vacancies is small: individual vacancies exist for candidates who have specialised in palaeobotany, foraminifera, malacology and lichenology.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience.

Candidates taking their degrees in 1955 may apply before the result of their degree examination is known.

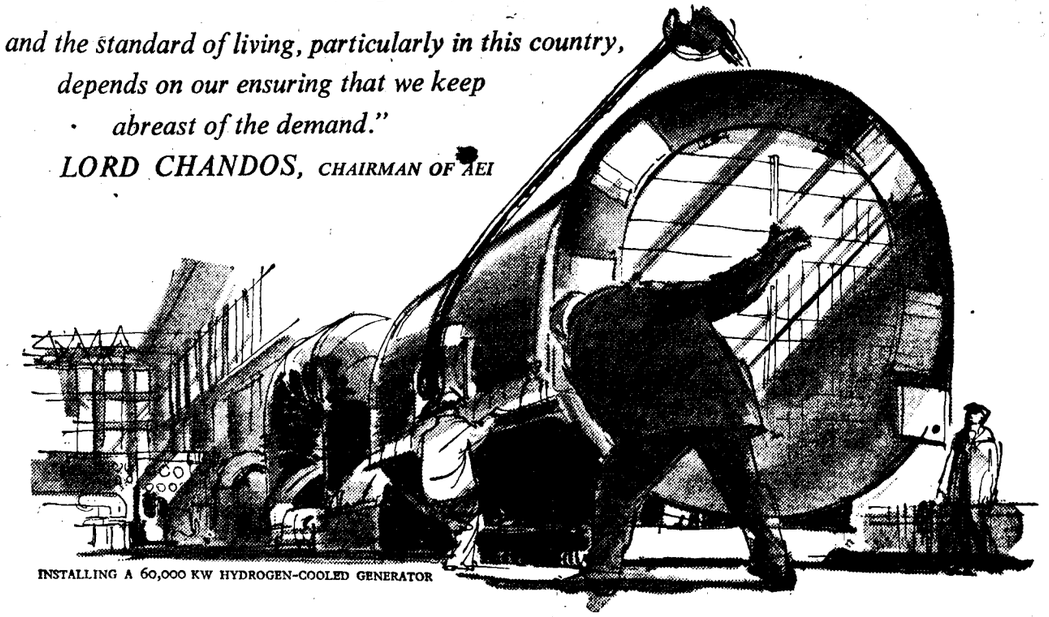
Age Limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted. For Scientific Officers between 21 and 28 during 1955 (up to 31 for permanent members of the Experimental Officer class). Salary (London) Senior Scientific Officers: men, £1,010-£1,185; women, £875-£1,060. Scientific Officers: men, £492-£885; women, £492-£780. Somewhat lower rates in the provinces.

Further particulars from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. S53/55 for Senior Scientific Officers and S52/55 for Scientific Officers.

ROYAL MINT has a vacancy to be filled as Scientific Officer or Senior Scientific Officer according to qualifications and experience. Candidates must have first or second class honours degree in Metallurgy, or in Physics and Chemistry if with metallurgical experience. The general qualifications and conditions are as set out in the main advertisement above. Candidates for this post should quote S4424/53/55 and the closing date for applications is April 30, 1955.

BRITISH NYLON SPINNERS, LTD., Pontypool, has a vacancy in the LIBRARY AND INFORMATION SECTION, the chief duties of which consist of the collecting and indexing of published information, largely of a commercial nature, and the provision of an information service in this field. Qualifications in Economics, Commerce and Statistics are essential, and it will be an asset if candidates can offer previous experience of a similar nature gained in the Library of a financial or commercial organisation. This is a responsible position, with scope for future development.—Apply, in writing, to Personnel Manager.

ORGANISATION and Methods Officer required by well known North Midlands Electrical Engineering Company. This is a senior position and the man appointed will be immediately responsible to the Chief Executive of the factory for all Organisation and Methods activities. He should have had several years experience of this class of work in the engineering industry. A University Degree and/or Cost and Works Accountancy training is desirable. There are attractive conditions of service including a four figure salary, staff bonus and non-contributory superannuation.—Please apply to Box 3E, R 1975, A.K. Advg., 212a, Shaftesbury Avenue, London, W.C.2.



PUBLICITY, REPRESENTATION, etc., in Middle East ex-Foreign Service Officer now at headquarters of a National Industrial Council: seeks outlet for real knowledge Arabic and Middle East, plus experience of industry. Arabic work includes Baghdad Fair Catalogue, brochures, consulting engineers' report to Kuwait Government, Articles of Association, etc.—Box 884.

"Electric power is now one of the essentials of any developing community

and the standard of living, particularly in this country, depends on our ensuring that we keep abreast of the demand."

LORD CHANDOS, CHAIRMAN OF AEI

INSTALLING A 60,000 KW HYDROGEN-COOLED GENERATOR

At the Annual General Meeting of Associated Electrical Industries on March 30th, the Chairman, Lord Chandos, described the important contributions made by the Group to the progress of electric power, and its strong position in the new field of atomic energy. He stressed the future need for a bold policy of capital expenditure, expansion and research, and for greater attention to recruitment and education within the Industry.

Lord Chandos opened his speech by expressing the honour and satisfaction he felt in taking up again some of the responsibilities he had discharged in the past. After describing details of organisational changes within the Company, the Chairman came to the matter of accounts, referring to the statement issued last December concerning quarterly dividends. "The object of such a measure is two-fold. Firstly it is hoped that a regular quarterly dividend will help the small investor over his family budget; and secondly, it should help our stockholders to follow the course of the business. Accordingly we intend to publish as full a progress report as is practicable covering six months of the Company's operations, and we may add to this some smaller progress report quarterly."

Turning to the results of the year, Lord Chandos said: "The year 1954 surpassed the previous record, reached in 1953, of production of electrical apparatus of all kinds, whether judged by volume or value. The total output exceeded in value £96 million compared with £86 million for 1953. The profit margins were, on the whole, well maintained but are slightly lower than they were last year. I regard this as a healthy tendency, and for increased profits we look chiefly to the expansion of turnover, improvement in methods of manufacture and to increasingly efficient modern tools as they become available, rather than to the hope that present margins will continue to be maintained."

How every £ of the AEI income was spent

	£	s	d
Raw materials	7		2½
Wages and salaries	6		4½
Operating expenses	3		3½
Depreciation			3½
Taxation (including tax on dividends)	1		6½
Profits retained in business	1		0
Dividends			3½
Total	£1	0	0

"... the Chancellor of the Exchequer remains by far the principal stockholder ..."

Of financial results, the Chairman said: "The capital employed in the business at the end of 1954 amounted to £51,568,000. The Equity Capital after subtracting £3 million preference capital was £48,568,000. The nominal Ordinary Capital was still only some £17,741,000 after the recent split of one for one.

"The layman, I am afraid, does not always understand the difference between return on the nominal capital and that which the shareholder obtains upon the actual money which he has invested in the business. The latter figure is the only one of significance. The critics of our industrial companies cannot at one and the same time emphasise the need to plough back profits into the business and then complain of a high nominal rate of dividend on the nominal capital. The latter is the result of the former. The dividend return on the actual capital employed in AEI is £5.2.3 per cent."

This year £1,404,000 had been set aside as an extra reserve for depreciation in respect of the increasing cost of plant and machinery and this reserve now stood at £5,906,000. After deduction of this transfer to replacement reserve and all other charges, the year's trading profit, before taxation, amounted to £11,736,000. £7,224,000 was set aside for U.K. taxation, leaving a net profit available for distribution of £4,512,000. From this an ordinary dividend of 14% was proposed taking £1,366,000. £500,000 had been transferred to General Reserve and the carry forward would be increased by £435,000. The profits retained in Subsidiary Companies amounted to £2,368,000. This showed the Chancellor of the Exchequer as still the principal stockholder, taking £7,224,000 compared with £1,450,000 received by the stockholders who had paid for their shares.

Speaking of Sales and Production, the Chairman said that orders taken showed a striking increase. The Group had again made a substantial contribution to the Country's power stations. In the industrial field also business had increased especially in the heavy industries.

More than £28 million worth of equipment had been shipped overseas, and this was once more a record figure. New export orders had risen by one-third over 1953.

One notable new order was for four 138MW water-turbine-driven alternators for the Bersimis-Lac Casse project in Canada, which would be the most powerful in the world.

"In shipping overseas rather more than £28 million worth of equipment we have once again exceeded the previous year's record figure... "New export orders received during the year showed a heartening increase of about one-third over the previous year's total... "M-V continued their successes of 1953 in the Canadian market... BTH too continued their advance in this market..."

Programme of Expansion

Lord Chandos then spoke of the Company's overseas manufacturing plants. Up till the end of 1954 the Australian General Electric had been owned in joint account with the International General Electric Company of the United States, but now their shareholding had been acquired by AEI and a proportion of the shares would be placed with the Australian public. The Company also had substantial manufacturing concerns in India and South Africa. BTH were building up a small manufacturing connection in Canada and M-V had a plant in Brazil, primarily for railway work.

Speaking of plant extensions in the U.K., Lord Chandos referred to the new BTH factories in Larne, N. Ireland where turbo-alternators of over 30MW would be built, and the transformer factory which M-V are building at Wythenshawe, both to increase capacity for these and release space for heavy plant at the main Trafford Park Works. The decision had also been made to build a new factory to produce Ediswan cathode ray tubes of all sizes, on which work was under way at Sunderland and which would release space at Brimsdown for advanced development, including coloured television tubes. Other plant expansions were a new BTH electronics factory to back the Company's lead in this field; doubling and possibly later quadrupling the BTH fractional horsepower motor factory at Newcastle-under-Lyme and a small factory in the Highlands, which it was hoped would arrest some of the drift of labour from these parts. The British Railways' modernisation programme would throw a new load on the already fully employed Traction Departments and these would require expansion. The Government's programme for erection of Atomic Power Stations would mean an expansion in this field also, in which the Company already had a strong team of scientists and engineers working in collaboration with the Atomic Energy Authority and the British Electricity Authority on developments for the power stations of the new era.

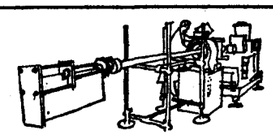
Giving more details of expansion, Lord Chandos said that, during the year, two further companies had joined the AEI partnership — Birlec and Siemens. Birlec Ltd. had been purchased from the Mond Nickel Company for £1,600,000. The acquisition of Siemens Bros. would extend the range of AEI activities, particularly in the telephone business which is a new field for AEI.

New Issue

Lord Chandos gave details of the new issue to ordinary stockholders. Ordinary shares of £1 would be offered at 40/- each in a proportion of one for every £4 of stock held. This would leave some 215,000 unissued shares of authorised capital and in accordance with the policy of the Board of encouraging employees to have a long-term stake in the business, these would be offered to them at the same price.

Future Outlook

Turning to the future, Lord Chandos emphasised the fact that the demand for electricity increased by 7-10 per cent. every year in industrially developed countries and even faster in some others.



"Electric power is now one of the essentials of any developing community and the standard of living, particularly in this country, depends upon our ensuring that we keep abreast of the demand; be it for industry, for railway traction or for domestic appliances." Whether the future demand for energy was met by burning coal, water power or nuclear fission, conventional electric plant for generation, transmission and final use would be needed and the leading position established by AEI in these fields would ensure its full participation.

Of research he said: "The maintenance of this lead demands a far-seeing policy of research and development. The highly successful work of our laboratories on the production and use of Germanium in transistors for electronic devices, has led to the use of this new material for power rectification. The BTH Company completed a Germanium power rectifier of 300 kW capacity in 1953 and it has been in successful commercial operation throughout 1954. It was the first unit of its kind in the U.K. Several are now in service and many others are on order.

"... your Company has an ambitious programme of expansion... although the AEI Ltd. already has more than 12 million square feet of manufacturing space, this is inadequate to deal with the volume of business which we may expect to flow to us in the next few years."

"Similarly the work of another of our laboratories and development sections has resulted in M-V being able to build a 120MW turbo-alternator which will be less than half the weight and only two-thirds the length, yet 20% more efficient than the celebrated 105MW Battersea machine built by them before the war. This is remarkable progress in some 11 years." The Group have a fundamental Research Station at Aldermaston constantly contributing to basic knowledge. The sum spent in 1954 on research and development exceeded £4½ million.

"The maintenance of this lead demands a far-seeing policy of research and development... the total sum spent in 1954 on research and development of new processes, products and new lines of manufacture, has exceeded £4½ million. We intend to maintain the leading position which we occupy..."

Recruitment and Education

A matter fundamental to any future plans, said Lord Chandos, was recruitment and education. It was essential that there should be a supply of the right men, not only to recruit the design and production force, but to sustain the programme of research and development. The Company was taking vigorous measures to increase the flow of graduate, student and craft apprentices into the organisation.

The problem must be attacked from several directions. Industry should facilitate the transfer of suitable staff to the teaching profession. Suitable young scientists in Universities and Technical Colleges should be encouraged financially by industry to pursue their own academic research work.

Lord Chandos then concluded: "We have confidence in the future of the electrical industry. It is difficult to see how it can do other than continue to expand. We also have confidence that in this expansion your Company will take a leading role, as it has done for so long in the past."

NEED FOR THE RIGHT MEN

"We need an increasing supply of physicists, chemists, metallurgists, professional mechanical and electrical engineers and of their supporting technicians and craftsmen for the future.

"I express grave anxiety about our position as a nation in this field. We in this Company are taking wide and vigorous measures to increase the flow of graduate students and craft apprentices into the organisation... and, as I speak, there are over 4,000 apprentices undergoing training in our educational departments, but even this massive effort is not, in our opinion, adequate...."

COMPANY MEETINGS

ALUMINIUM LIMITED

WORLD DEMAND EXCEEDS SUPPLY CAPACITY

MAJOR EXPANSION PROGRAMME SUCCESSFULLY COMPLETED

The following is an extract from the report of Aluminium Ltd., for the year 1954 to be submitted at the 27th annual meeting of shareholders to be held on April 28 in Montreal:

Production of primary aluminium in 1954 was a little above the levels of 1953 and previous years. Ingot production found ready markets but a slightly lower tonnage was available for sale after meeting increased inventory requirements abroad.

Net income for the year 1954, after "straight-line" depreciation, was $34,970,025 or the equivalent of $3.87 per share on the 9,036,382 shares outstanding at the end of the year. For the year 1953, with depreciation on a comparable basis, net income would have been $38,178,053 or the equivalent of $4.24 per share on the 9,013,994 shares outstanding at the end of that year.

The reduction in net income reflects the higher costs of metal produced during the breaking-in period of a new smelter. It is estimated that in 1954 starting-up costs at Kitimat, British Columbia, burdened net income by approximately $3 million.

Capital expenditures of $48 million were made during 1954, bringing total capital outlays to $483 million for the plant expansion programme which has added one million horse-power of hydroelectric capacity and 163,000 tons of new primary aluminium capacity to the company's facilities since 1950.

GENERAL

In 1954 the aluminium industry as a whole again increased its primary smelting facilities and a greater volume of aluminium was produced than ever before. During the year the major expansion programmes which had been under way in several countries since 1950 were completed. World demand for primary aluminium nevertheless remained strong. All of the company's available output was marketed and in the latter months of the year the company was unable to satisfy all the demands made upon it.

The year marked the start of production at the company's Kitimat-Kemano project in the Province of British Columbia. In August, following three and one-half years of construction, this new centre of aluminium production, having an ultimate potential of 550,000 tons per annum commenced operations.

With the increase in production of primary aluminium in North America as well as in many other countries, there was a greater availability of the metal for commercial uses. Applications in the major fields of consumption—transportation, construction, electrical uses, household supplies and packaging—continued to grow. Immediate defence demands appear to have been relaxed further during the year although government stockpiling in the United States was, we believe, an important factor affecting demand.

The company's fabricating plants, broadly speaking, faced keen competition during most of the year with moderate but rising levels of operations and profits. In the closing months of the year there were further substantial increases in demand, particularly in the United Kingdom resulting in improved operations and profits carrying into 1955.

OPERATIONS

The company's mining subsidiaries continued to produce bauxite at close to maximum capacity in 1954, with 2,201,000 tons of all grades of bauxite being produced in British Guiana and 495,000 tons in French West Africa.

In Jamaica the new alumina plant using local bauxite was brought up to the level of 230,000 tons of annual capacity in 1954. The plant started its pioneer operations in 1953 but the year just passed saw the tempo of production greatly increased.

All aluminium smelting facilities of the company's principal subsidiary Aluminium Company of Canada, Ltd., were operated at maximum levels in 1954 and produced 560,900 tons of primary aluminium, 20,500 tons of which were produced in the new Kitimat smelter. Canadian production was 3 per cent greater than the 545,800 tons in 1953 and 12 per cent greater than the 499,800 tons in 1952. Further additions to the Kitimat smelter and hydroelectric capacity have been authorised as noted under "Expansion Programme."

In the latter part of 1954 with the return of a vigorous demand for fabricated products in overseas markets, the company's fabricating facilities, almost without exception, stepped up their operations to a high level of capacity. In the United Kingdom a comprehensive scheme was commenced for the modernisation of the sheet rolling mill at Banbury, Oxfordshire.

MARKETS AND SALES

Sales of aluminium in all forms and from all sources by consolidated subsidiaries of Aluminium Limited amounted to 592,318 short tons. The dollar value of all aluminium sales in 1954 was $280,792,887, compared to $286,477,122 in 1953. Prices for the company's aluminium ingot in major markets were relatively steady throughout the year.

Again in 1954 the company's principal markets continued to be in the United Kingdom, the USA and Canada, but there was also an increase over 1953 in shipments of Canadian aluminium to other markets. Relative to 1953, sales to the United Kingdom increased as a result of an upsurge in demand in that market, where the Company has large contractual commitments.

FORWARD SALES CONTRACTS

Approximately 74 per cent of the company's shipments of Canadian aluminium in 1954 were made against long-term commitments to customers mainly in the United Kingdom and the United States.

All the long-term contracts were made by the company to support its large expansion programme between 1951 and 1954 and to ensure, as far as the company might, a future supply of primary aluminium for those who required it. While no new long-term sales contracts were signed in 1954, the company's commitments have recently grown to sufficient magnitude to require further examination of the company's plant expansion plans.

EXPANSION PROGRAMME

The major expansion programme which has been in progress since 1951 was successfully completed in 1954 and the new facilities are all in production.

At Kitimat the first potline in the new aluminium smelter went into production in August and the second in September. The rated capacity of these units is 91,500 tons of primary aluminium per year, or about one-sixth of the eventual planned capacity of 550,000 tons. For the past several months shipments of aluminium have been going forward to customers in North America and abroad, both by ship from Kitimat's own port and by the new rail line which now links the city with the transcontinental railway system.

In October of 1954 the company announced that the capacity of the Kitimat smelter would be immediately expanded to produce an additional 60,000 tons of aluminium ingot per year to meet the then estimated increase in the near-term demand for the company's aluminium. This involves the installation of a fourth generator of 150,000 h.p. capacity in the Kemano power-house and the construction of additional potlines at Kitimat on which work is now proceeding. The expanded capacity is expected to come into operation early in 1956 at a capital cost of approximately $45 million.

To supply some of the additional alumina required, the capacity of the company's plant in Jamaica is now being raised from 230,000 tons to 300,000 tons of alumina per year. The capital expenditures for this expansion, including additions to railway rolling stock and to storage capacity at the company's Jamaica seaport are estimated at $11 million. The present programme in Jamaica will also lay the foundation for further extension of the plant to a capacity of more than 500,000 tons of alumina per annum.

FINANCING

Of the new capital investment of $483 million during 1951-54, $125 million was required for the Quebec expansion, and $287 million was required in British Columbia, including certain initial expenditures in anticipation of the decision announced in October to add 60,000 tons of capacity. The balance amounting to $71 million was spent on bauxite and alumina facilities and other subsidiary operations.

The principal sources of funds to finance this expansion and the related increase in working capital requirements were the proceeds of the issue of new securities of $360 million ($277 million in debt securities, $30 million in preferred shares and $53 million in common shares), and retained cash income aggregating $195 million ($55 million in 1954). Of the new money, $50 million was obtained in 1954 from an issue in Canada of 4½ per cent sinking fund debentures by Aluminium Company of Canada, Ltd.

GOLD COAST ALUMINIUM PROJECT

During the year, continuing study was given to the projected establishment of an integrated aluminium development based on the water-power of the Volta River in the Gold Coast, West Africa. This development has a potential capacity of 230,000 short tons of primary aluminium per year and is under the joint consideration of the Governments of the Gold Coast and the United Kingdom, the British Aluminium Company, Ltd., and Aluminium Limited. In 1954 the company's engineers and planning staffs examined various phases of the project in detail and its geologists made further confirmation of the bauxite reserves available in proximity to the proposed smelter site. Implementation of the project will be further discussed and negotiated after the reports of the Preparatory Commission, appointed by the two Governments to study all aspects of the undertaking, are completed probably around the end of 1955.

RESEARCH AND DEVELOPMENT

During 1954 an extension to the company's research facilities at Banbury, England, was completed. This extension is enabling the company to carry on a broad programme of fundamental research in the field of light alloys, together with much experimental work in support of process and product development. The results are applicable to many of the company markets but particularly to the United Kingdom where 80 per cent of the aluminium consumed is supplied from the company's smelters in Canada.

WESTERN SELECTION & DEVELOPMENT

CANADIAN INTEREST

The twenty-fifth annual general meeting of Western Selection & Development Company Limited was held on March 24th in London, Major General W. W. Richards, CB, CBE, MC, chairman, presiding.

The following are extracts from his circulated statement: We recommend a final distribution of 12½ per cent, making 20 per cent for the year as against 15 per cent last year. The profit amounted to £128,903.

Addressing the meeting the chairman said: Our offer of shares to members was a complete success and was over-subscribed, applications totalled 1,156,857 shares. We have received Bank of England and Treasury sanction for the formation of a new company in Canada to acquire under option Nickel Copper Claims in Northern Manitoba and Uranium Claims at Higginson Lake, Northern Saskatchewan.

The Nickel Copper Claims, known as the Tow Lake Claims, are situated 36 miles east of the remarkable Nickel Copper deposit at Lynn Lake of the Sherritt Gordon Mines Limited, which has, within the last year, come into full production. With the express purpose of serving this mine, the Canadian National Railway Company completed 147 miles of line at an estimated cost of $5 million. In addition, numerous potential sources of water power exist in the area of the Tow Lake Claims and the Sherritt Gordon Mines Limited is now operating a 7,000 horse-power development.

As soon as an issue of stock has been made in the new company, development work will begin first of all on the Tow Lake Nickel Claims in Northern Manitoba, to test the deposits and define ore reserves. Your board consider this Canadian venture has great potential value.

The report and accounts were adopted

FORD MOTOR COMPANY LIMITED

ANOTHER YEAR OF RECORD ACHIEVEMENT

£60 MILLION EXPANSION PROGRAMME

The twenty-sixth annual general meeting of Ford Motor Company Limited will be held on April 22nd in London.

The following is an extract from the circulated statement of the chairman, Sir Rowland Smith, MIMechE:

For the British motor industry 1954 was another year of tremendous expansion. More than a million cars and trucks were produced in this country by the industry as a whole, and we played a leading part in this great achievement.

During the past two years the home market, after many years of restraint, has come into its own. Total demand has risen so steeply that, for most of our products, it has exceeded our capacity to produce, in spite of the fact that, from factories only slightly larger than before the war, our production has been trebled. More than half of this increase has been achieved in the last two years.

Against this background I have to report yet another year of record achievement in sales abroad and at home, and in profit for your company.

At times it has been necessary to restrict deliveries to the home market in order to give full scope to our markets abroad. During 1954 almost half of our sales of cars and commercial vehicles were to export markets.

FIERCE COMPETITION

There has, of course, been fierce competition for the increased opportunities in export markets.

German competition has intensified still further, and the UK percentage of world vehicle export business declined from the 1953 level. It is gratifying, however, that your company's share increased, with particular success in Europe.

During the year we introduced our 4-cylinder diesel engined trucks. Public acceptance was immediate, as would be expected in a type of business where low cost is of paramount importance. We also extended our commercial range in August last by the addition of a new 5 cwt. van. This vehicle has met with astonishing success.

Tractor production increased by 54 per cent and total sales were the best since 1948, the peak postwar year. Export sales have shown a substantial increase over the last three years, almost equalling 1950 which was an all-time record. An important feature has been continued success in the United States of America where the Fordson Major Diesel is now firmly established as a dollar earner. Since shipments began in August, 1953, over 8,000 units have been delivered there and we are proud to announce that more of our tractors are exported to the United States of America than to any other country in the world.

Tractor sales at home showed an increase of more than one-third over 1953 figures.

In view of the achievements in 1954, certain questions arise. Will British manufacturers, and this company in particular, maintain their share of the greatly increasing world market, and will the German percentage continue to grow?

Provided that inflationary tendencies here are kept under control, and also that our taxation load is brought to a level closer to that of foreign competitors, I am confident that in quality and value we can meet all competition.

Considering the accounts for the year—the value of the group sales rose by 20 per cent, reaching a record total of £127 million.

Lower costs, arising from improved manufacturing efficiency and methods, and higher volume, have substantially offset the effect of increased wage rates and material costs during the year. Further reductions in export prices were made in 1954, and it should be noted that none of our vehicle prices has been increased during the past three years.

Higher sales resulted in an increase of 22 per cent in total profit before tax, to £19,345,654. Taxation took £9,453,000, or 49 per cent of the year's profit, leaving a net profit, after tax, of £9,892,654.

Your directors are recommending a final dividend of 10 per cent, subject to tax, on the ordinary capital, making, with the interim dividend of 5 per cent, a total distribution of 15 per cent for the year.

The latter represents a net return of 3.2 per cent, after tax, on the amount of ordinary shareholders' capital employed.

We have embarked upon a large-scale expansion of our production facilities in order to meet the very substantial increase in demand which we foresee for our products. This scheme involves the expenditure of over £60 million during the next few years, the greater part of which has yet to be earned.

TWO FUNDAMENTAL PROBLEMS

I wish to refer briefly to two fundamental problems which affect our industry today. These are the level of tax upon road transport, and the condition of our roads.

First, let us contrast the effect of tax upon the development of car ownership in the USA with our position in Britain. In the USA there is one car for every three people, compared with one for every 16 in this country. We have, in fact, reached in this year 1955 the position the Americans had reached by 1920, 35 years ago. What is the reason for this astonishing contrast?

I suggest that one of the main reasons is the tremendous weight of taxation which has increasingly been thrust upon the British vehicle owner. He is taxed three times over; by petrol tax, by purchase tax added to the price of his car, and by his car licence.

A progressive reduction in car and petrol taxes would bring car ownership within the means of the great mass of our people, and so provide incentives to increased productivity with results which might pleasantly surprise us all. I suggest that the Chancellor would be far from disappointed at the resulting total revenue receipts.

Secondly, how could our roads contain all these cars? In recent weeks we have seen the beginning of Government interest in the announcement of a new programme for our roads. However, far from meeting future needs, it does not even make up arrears of past neglect, and falls far short of present-day requirements. Unless our people are to lag hopelessly behind other countries in this most important respect, it is essential that we plan our roads now for the future on a scale which will ensure free and unrestricted movement of goods, and people.

The review concluded with an acknowledgment of the co-operation and support received from suppliers and dealers and the spirit of determination and endeavour on the part of the staff and employees.

LEWIS'S INVESTMENT TRUST LIMITED

CONTINUANCE OF CONSISTENT GROWTH

MR S. H. LEAKE ON POSITION OF GREAT FINANCIAL STRENGTH

The twenty-sixth annual general meeting of Lewis's Investment Trust Limited will be held on April 21st in Liverpool.

The following is an extract from the statement by the chairman, Mr S. H. Leake, OBE, which has been circulated to stockholders with the report and accounts for the year ended February 1, 1955:

I am glad to be able to report a continuance of the consistent growth in the profits of Lewis's Investment Trust which has been a feature of the business for some years.

PROFIT AND LOSS ACCOUNT

The profit and loss account of the Trust shows the income drawn by way of dividends, rents, etc., from its subsidiaries. The total revenue of £1,363,279 is substantially over last year and mainly reflects increased dividends from the two principal subsidiaries — Lewis's Limited and Selfridge (Holdings) Limited. Tax and other provisions leave this revenue at £676,042 and with the balance brought forward from last year's accounts, £919,559 is available for distribution.

We propose to allocate the year's net profit in approximately the same proportions as in previous years; namely, one-third to retentions in various reserves, and to distribute two-thirds. This enables us for the third successive year to recommend an increase in the final dividend, on this occasion one of 7½ per cent to 35 per cent, making a total of 40 per cent for the year. This recommendation leaves £295,125 to be carried forward as against £243,517 brought in. Your directors consider that such an increase in the ordinary dividend can well be justified, since it comes out of total group earnings of 176 per cent on the ordinary share capital of the Trust as at February 1, 1955. The dividend is accordingly covered some four and a half times. This is in line with the policy we have long pursued of building up reserves in the operating companies.

The consolidated profit and loss account shows this year a net profit before taxation of £4,813,351, an increase of £232,698 over last year. The consolidated profit, after tax and various provisions, is £2,015,137 and exceeds £2 million for the first time.

The profits retained in the group as shown in the accounts amount to £1,247,355. The retention of this sum is required for various building projects and other developments.

Our expenditure on repairs is more than three times what it was in 1946; and while other items of necessary expense may not have risen in the same ratio, they show a persistent tendency to rise in spite of a rigid expense control.

On the other hand, our rate of gross profit has shown little or no material change as compared with 1946, so that it is essential that the increase in turnover which we have achieved in the last few years should continue to an even greater degree. Having regard to the continuing rise in the level of wages and incomes, your board is convinced that further expansion in trade is possible, and has already taken steps through greater range and variety of stock to appeal to an ever-widening circle of customers. The increase in our transactions encourages us to believe that this policy is meeting with some measure of success.

FUTURE OF DEPARTMENT STORE

The conviction that our group is capable of further expansion in turnover also stems from faith in the future of the department store as an integral part of retail distribution. After fifteen years of controls and restrictions, the shopping public has largely forgotten the traditional appeal of the department store. With the return of free enterprise and of the power to draw its merchandise from wider markets, the department store is now only beginning to take its true place in the pattern of retailing. By the very nature of its activities, at the hub of the principal shopping centre in its city, the department store develops a personality of its own. Although self-service may have a place in certain fields of distribution, we believe that in this country it will never wholly replace the personal relationship between retailer and customer, which seeks to make a pleasure out of ordinary shopping activities.

If these considerations are generally true of department stores, they unquestionably apply to Lewis's, who in their hundred years of growth have acquired and developed a personality in the towns in which they trade which is unique in retailing. We are sure that an even more prosperous future lies ahead for our group, not only in the provinces but in London, if we maintain and develop still further the basic trading principles on which this business has been founded and has flourished.

BALANCE SHEET

The consolidated balance sheet shows that the total reserves have increased by £1,249,426 on the year to £10,661,804. After deducting intangible assets, the balance of £6,622,595 compares with the issued capital of the Trust of £3,890,176. This position of great financial strength is confirmed when it is seen that this net figure of reserves is represented by net current assets of £6,685,961, an increase on the year of £1,325,824. Of this total of net current assets, £5,166,177 is accounted for by cash, tax reserve certificates, and short-term deposits. Thus, although we have embarked upon a formidable programme of building developments, funds are available for that purpose without drawing on the essential working capital of the business.

NEW BRISTOL STORE

It was a tradition in Lewis's, as evidence of its constant growth, that building activity was always in progress in some part of the organisation. That tradition, unavoidably interrupted by the war and its aftermath, has again become a reality. Our principal preoccupation in this field is the construction of our new store at Bristol. All the preliminary work is now complete. At the end of February the main building contract was signed covering a cost of some £1,500,000 and our present estimate is that a total expenditure of £2 million will be involved. We hope that the store will be ready to open for business in the autumn of 1957.

OTHER BUILDING DEVELOPMENTS

Liverpool: In Liverpool the second section of the reconstructed store is almost complete and open for trading, while the demolition of the third section has commenced. The two completed sections represent an integrated unit, and we can now provide our Liverpool customers with the shopping facilities they are entitled to expect from us. Although its eventual cost over and above our war damage claim may well be of the order of £1 million, such expenditure will give us a new and up-to-date store for the further expansion of our trade in Liverpool.

Manchester: In Manchester we have revived a development at the rear of the store which was initiated in 1938 but had to be abandoned at the outbreak of war. When this is complete it will add still further to the profit-earning capacity of our most profitable Lewis's unit.

Leicester: A contract has now been signed for making certain extensions on the upper floors which, when complete, will add some 25 per cent to the available selling space. We have every confidence that this new investment will bring an adequate return.

Glasgow: In Glasgow we have completed another floor in that section of the building which was left unfinished during the reconstruction of the main building in 1936/37.

Leeds: Our Leeds store has had an outstandingly successful year. It is our intention to build a depot on the outskirts of Leeds to facilitate the handling of our growing household trade, and land for this purpose has been acquired.

SELFRIDGES

It is in Selfridges where our greatest activity has taken place during the last year. Selfridges contribute about one quarter of the total net profits of the group, but after three years' experience we are satisfied that it is capable of further development. Its turnover reached record levels during the year and to relieve growing pressure on selling space, we re-opened a selling floor in the building to the north of Somerset Street which had previously been under government requisition.

A contract for the sale of the Wigmore Street frontage is in its final stages of negotiation and work on this development should soon commence. So far as the rest of the northern site is concerned, much time and thought is being devoted to making the best use of its potentialities and plans have been lodged with the London County Council for the building of a ramp garage holding up to 750 cars over an extension of the ground floor selling area. The scheme envisages the diversion by ramps of all our goods traffic underground for loading and unloading. It is an imaginative attempt to solve a growing traffic problem in the vicinity of our store by eliminating stopping, backing and parking at ground level and by maintaining an even flow of traffic at all times.

BRITISH INDUSTRIAL PLASTICS LIMITED

MR KENNETH M. CHANCE ON GROUP'S PROGRESSIVE GROWTH

The annual ordinary general meeting of British Industrial Plastics, Limited, was held on March 31st in London, Mr Kenneth M. Chance (the chairman) presiding.

The following is an extract from the statement by the chairman which had been circulated with the report and accounts: When the second world war came to an end, this country had spent its all in its efforts for victory, and there were many who could see no future for Britain as a great power. The recovery already made has confounded the pessimists. In its small way your company has shown what can be done by private enterprise, and your directors have asked me briefly to relate its history from bankruptcy to the measure of success illustrated by the accounts.

GROUP'S MAIN OBJECTIVE

The statement then reviewed the company's early history and continued: The main objective of your group is still that for which the company was reconstructed in 1927—the manufacture of aminoplastic moulding powders. In the early days it was recognised that the mouldability of these new moulding powders would progress more rapidly if our chemists and engineers could be kept constantly informed of their behaviour in use on the industrial scale, and for this purpose a small moulding factory which became available at Streetly was purchased. As this factory increased in size it became a competitor with other moulders, so that its existence could only be justified by using it as a development factory for the promotion of new lines for moulding, open to their inspection, and as a training factory for those in other countries wishing to enter the moulding branch of the industry. This was done, and within a few years it became clear that success in moulding depends largely on the design and quality of the mould, so in 1936 land was purchased and a small toolroom erected and equipped in Birmingham for the supply of moulds to the industry. That was the position at the outbreak of the war when the issued capital of your company was £442,850, the fixed assets were valued at £296,000 and the excess of current assets over liabilities was £23,000.

When the war ended, orders for aminoplastic moulding powders, both from this country and abroad, increased with great rapidity, and experience at Streetly during the war had impressed upon the managing director of that factory the urgent need for something more than a press; in fact, a moulding machine for thermosetting moulding powders, if mouldings made therefrom were to compete successfully with those from the many new thermoplastic materials coming on to the market. He came into contact with an engineer with an inventive brain and, after discussing with him his ideas, engaged him to put these into practice. Your directors decided that the progress made and patents [illegible] out justified the step of equipping a factory for their manufacture, and the Bipel facto[illegible] and pelleter, both of original design, [illegible]d. result[illegible]

ORGANISATION AND CO-ORDINATION RI[illegible]

Two issues of shares at substantial premiums were made, and provided £1,150,000 of fresh capital, which has resulted in the possession of two chemical factories at Oldbury with two engineering factories elsewhere in the district for the purpose of supplying the plastics moulding industry with aminoplastic moulding powders and with novel equipment specially designed for their use, and a moulding factory at Streetly from which those two engineering factories have developed. There is also a third chemical factory at Oldbury making adhesives and other resins for use in a wide variety of industries, including furniture, paper, textiles, foundries, the paint and lacquer industry and the bonding of glass fibres, and your directors have given much thought to the welding together of this somewhat diverse organisation.

The first step was taken by your managing director in forming a department for development and design, including a consultative and advisory body available free of cost to the moulding industry in this country and abroad. The second was taken two years ago in transferring the sale of Oldbury products from the two subsidiaries, the Beetle Products Company, Limited, and Beetle Bond, Limited, to the parent company. Your directors have now formed a subsidiary entitled BIP Chemicals, Limited, to handle the manufacture and sale of all the products of your Oldbury factories as a further step in the co-ordination of the work of the group as a whole, a step which is the natural sequel to the somewhat opportunist growth that has taken place.

All the shares in each of these subsidiaries are now held by the parent company. The parent company owns the freehold and leasehold land and buildings of all the subsidiaries and each of the latter will be responsible for financing its plant, machinery and working capital. Each has its own board of directors with a common chairman in the person of the managing director of the parent company. Their profits revert to the parent company whose control over finance is absolute. This reorganisation will produce several major changes in the next balance sheet of your company but not in the consolidated balance sheet.

RECORD TURNOVER

Before arriving at the group profit of £571,257, the substantial sum of £180,228 has been taken for depreciation. Thereafter no less than £305,379 is set aside for taxation, leaving a balance of £265,878 from which dividends paid and proposed will take £121,514, the balance retained in the business being £144,364. The surplus of current assets over current liabilities which include the unsecured notes for £250,000 is £1,016,203. I may add that the turnover for the period amounted to £4,820,000 of which £1,116,000 was contributed by direct export, two records which may well be exceeded during the current financial year. The last quarter of the year is normally the best and during the Christmas quarter last year's figures both for turnover and profit were substantially exceeded. Indeed, in November, the flood of orders was so great as to be embarrassing until your managing director through his works council made arrangements for overtime on shift work which proved successful in materially increasing output. The word "boom" is being used in many quarters to describe the present state of industry and trade in this country. I dislike the word for it always suggests its converse "slump" and it is not unnatural to connect this situation with the recent freedom for hire purchase. I prefer to call these "the halcyon days" of business and you must realise that the results in your hands and the present increase production have been achieved at a time of acute shortage of labour so that your debt of gratitude to management, staff and workpeople is greater than ever.

THE FUTURE

Two features are wholly promising for the future. First, the steps that your managing director is taking for making economies in storage and transport, made possible by the completion of the new storerooms. Secondly, the goodwill created by the ability of your group to supply moulders with moulding machines, pelleters and moulds and dies, all of a quality and performance certainly unsurpassed and probably unequalled in the world. This has a very real influence on the increase of orders for moulding powders, especially from abroad. You should also know that sales of melamine moulding powder are now steadily increasing as a result of the excellent quality of tableware moulded therefrom by several moulding firms. Finally you will be aware of the growing interest in this country in products based on resin bonded glass fibres. The resins supplied by your company for this purpose are manufactured under the patents of the American Cyanamid Company for which your company has the British rights and are second to none in quality and performance.

On the all important question of finance, the position is such that your directors have decided to take advantage of their option to repay the unsecured notes to the value of £250,000 while retaining ample cash for all foreseeable requirements, and notice has been given for such repayment on July 1st next.

CHAIRMAN'S RETIREMENT

In these circumstances I have come to the conclusion that it is in the best interests of your company that I should make way for a younger man to take my place as chairman, and Mr Crammond has agreed to accept this responsibility. I have spent my life in your business as managing director for forty-three years and as chairman since 1933, and hope to continue to serve it as long as my health, physical and mental, enables me to be of use. The office of president is nebulous as to duties but I gather that my colleagues have no intention of allowing me to vegetate.

My final words as your chairman are that all is well with your business; its management is first rate; the flow of orders is the best proof of the sales side; your factories are in good order and your directors continue to sanction expenditure to maintain and, where possible, to improve them, at least equal to that written off for depreciation; the prospects are excellent and the only danger I see is that of trying to do too much, to go ahead too fast. Perhaps the nebulous post of president may have some influence on the avoidance of that pitfall.

The report was adopted and the total dividend for the year of 20 per cent, less tax, was approved.

SUN LIFE ASSURANCE SOCIETY

FUNDS EXCEED £100 MILLION

MR C. G. RANDOLPH'S STATEMENT

The annual general meeting of the Sun Life Assurance Society will be held at 63, Threadneedle Street, London, E.C.2, on Tuesday, April 19, 1955. Mr C. G. Randolph, chairman of the society, has issued a statement to shareholders, which in outline is as follows:

FUNDS, INCOME AND OUTGO

A notable landmark was passed during the year when for the first time the society's funds exceeded £100 million. The new figure of £103,422,000 (of which the life assurance fund accounts for £90,270,000) shows an increase of £7,448,000 over that for 1953. The life premium income of £13,211,000 was also a record and exceeded the 1953 total by £735,000.

The gross interest income of the life assurance fund amounted to £3,847,000 representing a rate of £4 10s. 7d. per cent, an increase of 2s. 4d. over the rate for the previous year.

The claims by death amounted to £2,196,000, a figure not only well within the expected amount but actually less than the total for the previous year, although the sums assured in force are greater. The favourable mortality experience is evidence of the success of the system of life assurance without medical examination of which we were the pioneers over fifty years ago.

NEW BUSINESS

Probably there has never been a period when competition for life assurance business was more keen than it is at the present time, and I am therefore pleased to be able to report the completion of a record amount of new business in the past year for sums assured of £44,382,000, all obtained from our connections within the United Kingdom.

HOUSE PURCHASE

We have continued to improve our facilities for advances to owner-occupiers of residential property, and the new loans totalling over £4,900,000 represented an increase of over £1,500,000 compared with the 1953 figure.

Advances up to 90 per cent of the valuation are made on houses built in the past quarter-century, and special arrangements are now available to firms of suitable standing whereby loans up to 100 per cent may be granted to members of their staffs subject to a guarantee by the firm of the excess over a normal advance.

PENSION SCHEMES

A substantial proportion of the new business has again been secured under staff pension schemes, and our specialised staff continues to be available to give advice and service to employers.

Hitherto the vast majority of schemes have been arranged on a without profits basis, as it is generally regarded as essential that the employees' benefits and contributions should be fixed amounts and not dependent on rates of bonus declared from time to time. We are pleased, however, to announce that we have designed a scheme of the group pension type which satisfies these requirements, but at the same time enables the employer to participate in the profits. We are confident that this scheme will have particular appeal to the many employers who wish to enjoy the security afforded by a well-managed life office and to share in its prosperity.

INVESTMENTS

The increase in the society's funds results in our having very large sums to invest, and we are continuously engaged in the endeavour to obtain good security combined with a satisfactory yield.

The balance sheet reflects the substantial increases which have been made in our holdings of mortgages, debentures and ordinary shares, whilst British Government securities show a decrease of about £1½ million.

We made the customary valuation of our Stock Exchange securities at the end of 1954, and I am pleased to say that the market value considerably exceeded the value at which they stand in the balance sheet, without taking into account the investment reserve fund of £3½ million.

NEW CHIEF OFFICE PREMISES

The great expansion of the society's business, especially during the last thirty years, has made the chief office at 63 Threadneedle Street quite inadequate to accommodate the necessary staff.

Your directors felt that the opportunity afforded by the rebuilding of the City to secure a chief office suited to our requirements should not be missed, and I am pleased to state that we have acquired a prominent site in Cheapside on which a new chief office is to be erected.

TRIENNIAL VALUATION

The directors have decided that bonus distributions shall, in the absence of unforeseen circumstances, be made at intervals of three years instead of five years, the shorter period being in their opinion more suited to modern conditions. The valuation, which has been made on a more stringent actuarial basis than on the last occasion, shows a total surplus of £4,388,000, of which £3,437,000 is being applied to provide reversionary bonuses in respect of with profits policies for the three years 1952 to 1954. The new bonuses are at the rate of 40s. per annum for £100 sum assured, which is substantially in excess of the rates declared in 1952 in respect of the previous five years. I feel sure that our policyholders will agree that the results of the valuation are highly satisfactory.

DIVIDEND

The proprietors' share of the divisible surplus is £381,000. The directors have declared a half-yearly dividend of 2s. 9d. per share, free of income tax, payable on June 30th next and, in the absence of unforeseen circumstances, it is expected that this rate will be maintained until the date of the next triennial valuation.

TRIBUTE TO THE STAFF

The results which I have presented to you reflect the very greatest tribute to your staff, as it is the work and devotion to duty of all, from the general manager downwards, which has produced these good figures. I should like to thank them all most sincerely on your behalf.

IONIAN BANK

MR A. H. REID'S STATEMENT

The one hundred and sixteenth annual general meeting of the Ionian Bank Limited will be held on April 19th in London.

The following are extracts from the statement by the chairman, Mr A. H. Reid, CF circulated with the report and accounts the year ended December 31, 1954:

The year under review has seen an expansion of our business in all centres, and our total assets at December 31, 1954, amounted to £15,362,374, compared with £13,408,353 at the end of 1953. The expansion is seen particularly in the increase of our advances from £6,139,333 at the end of 1953 to £6,653,218 at the end of 1954, and in a similar increase of bills receivable from £625,048 to £695,218. This has naturally made a demand upon our liquid resources, but our liquid position remains satisfactory. Cash in hand and balances with bankers and foreign correspondents totalled £1,869,751 at December 31st last compared with £1,879,284 at the end of 1953, a decrease in the cash held in London having been offset by an increase in the cash held at other centres. The main feature on the liability side of our balance sheet is a welcome increase in current, deposit and other accounts from £9,808,171 at the end of 1953 to £10,307,536. As a result of the higher level of activity, the profits of the bank have been maintained, and in Egypt, where more stable conditions now exist, the bank's earnings have increased when compared with those for 1953.

The Greek economy has continued to benefit from the devaluation of 1953, and from the economic policy since pursued by the present Government. There has been a further increase in exports, and invisible earnings have increased, notably from tourists. On the other hand imports also increased. Early this year the Government accordingly brought into force certain measures designed to restrict credit for the financing of imports. The Governme have, however, made it clear that they ha no intention of abandoning their policy allowing imports to enter the country free any other restriction.

Profits have been well maintained. Ne branches were opened during the year a Caterini in Macedonia and on the island of Calymnos. Our two subsidiary companies, the Popular Bank and the Ionian Insurance Company, have again had a satisfactory year.

The signing of the Anglo-Egyptian treaty last October put an end to several years uncertainty. The Government are work on plans designed to raise the count standard of living by investment in capi equipment, which may provide opportunitie for British enterprise. The country's econom had a good year. On the whole the resul on the cotton side of our business have n been unsatisfactory. Good results have bee achieved also by our commercial bankin side, and progress continues to be made by our branch in Cairo.

Once again something like boom conditions have prevailed in Cyprus, where heav expenditure is being incurred by the Bri military authorities. This is throwi increasing burden on local resources. nd cost of labour, and the cost of living, r est larly rents, have continued to rise. en is, however, every indication that the of for ment are well aware of the d p to inflation and that they are determ nd take steps if necessary to alleviate its Last year there was an increase of ex from £15 million in 1953 to £16½ m though imports too continued to incr from £21 million to £23½ million. branches have had a good year.

THE BRITISH SOUTH AFRICA COMPANY

SUBSTANTIAL FINANCIAL COMMITMENTS ENVISAGED

SIR DOUGAL O. MALCOLM'S SPEECH

The fifty-seventh annual meeting of the itish South Africa Company was held on arch 24th in London.

Sir Dougal O. Malcolm, KCMG (the esident), presided and in the course of his peech said:

Overall our total revenue for the year nder review was £9,012,861 and our total tgoings including taxation £5,716,963, so at our net profit for the year under review as £3,295,898, as against £2,988,143 for the ar before, an improvement of a very little ver £300,000.

For the whole year, including the interim ividend of 13½ per cent paid in last October, e propose to pay the same dividend as last ar, namely 50 per cent or 7s. 6d. per unit stock or share, thus increasing the sum of r unappropriated profits from £5,795,846 September 30, 1953, to £7,284,890 at the date of the accounts.

BALANCE SHEET FEATURES

Our total capital and reserves have risen from £15,577,357 to £17,066,401. As against that the book figure of our fixed assets has en only by a little over £150,000 to 815,535. Our current assets at just under 0 million exceed our current liabilities, inding the proposed dividend, by a little er £1,300,000.

The total book figure for all our investents stands at £13,358,890 as against 11,977,196 for the year before, an increase about £1,400,000. Quoted investments at 172,086 had a market value at the date of balance sheet of £19,809,052. A valuation le at the end of last week shows that the ket value of quoted investments at present l, which have a book value of £9,776,900 ounted to £23,046,500.

The large book figure for unquoted investents—£4,186,804—is largely attributable to e fact that it includes £1,700,000 for the ook value of our half interest in New Rhodesia Investments Limited, which is itself unquoted and which, at the date of the alance sheet, held quoted investments of a ok value of £3,629,070 and of a market e at that date of £7,322,048. The latest es which I now have show that investt of a book value of £3,997,100 and a arket value at the end of last month of 519,300, your half interest in which ounts to £4,259,700. That, added to the re of £23,046,500, which I gave you a w minutes ago, makes £27,306,200 in all.

THE CURRENT YEAR

As regards the year now current, the thern Rhodesia copper output for the from October 1st last to the end of dec y has been 122,523 tons. The outtake the months of January and February facte 8,189 and 17,107 tons respectively, pres t a monthly average for the year result ew of 31,469 tons, and is abnor- owing to the African miners' RE- As against our loss of royalty from rce, the price of copper on which yalties are based averaged £246 per r the five months since October 1st as against an average of £205 per ton the same period of last year.

An estimate of copper royalty for the first five months of the current year at £3,536,402 slightly exceeds the final figure for the same period of last year; so that if the price of copper, now very high, is fairly constant and there are no more strikes, we may hope that we shall do considerably better for the year now current than we did for the year under review.

BOARD'S FUTURE POLICY

The position of our company, I think you will agree, is strong. But I hope we shall adhere to our policy of modest dividend distribution with the object of building up during the thirty-one years of our Northern Rhodesia Mineral Rights, which are still left to us, a great body of investments to take the place of our mineral rights which we shall have to make over to the Northern Rhodesian Government thirty-one years hence.

It is indeed our duty and obviously to our interest to do everything we can while our mineral rights remain as they are now to foster and expedite the exploitation of those rights in every possible way. This must involve our having to look forward to substantial financial commitments as against our certainly substantial revenues. The development of the very promising Bancroft Mine is a case in point.

In order to help in the duplication of its promised output as against what was originally contemplated, we have undertaken to advance to that concern during the period from now till the end of 1960 the sum of £3 million, another £2 million being similarly advanced by the Anglo-American Corporation against valuable options on Bancroft shares at 37s. 6d. a share, the present market price of the shares being about 42s. 6d., with very encouraging prospects in view.

There is also the very important matter of hydro-electric power for Rhodesia; and there has been for a considerable time past a rivalry between the Kariba Gorge Scheme on the Zambesi River and the Kafue River Scheme. This, as no doubt you know, has quite recently been decided by the Federal Government of Rhodesia and Nyasaland in favour of the Kariba Gorge Scheme based on a contribution from the United States of £46 million towards the estimated total cost of £54 million of the first stage of this scheme, which involves the raising in Rhodesia of the balance of £8 million. We must look forward to having to play our part fairly, along with others, in the provision of the £8 million.

I have mentioned two very large schemes involving large prospective commitments, and there will no doubt be others. I hope there will; for commitments are the corollary of opportunity and it therefore behoves us to keep a lot of powder dry for them.

The report was adopted and at a subsequent extra-ordinary general meeting the capital of the company was increased to £13,500,000 by the creation of 9 million new shares of 15s. each and the capitalisation of £6,570,376 10s. of reserves, to be allotted as fully paid up in the proportion of one new share of 15s. each for every stock unit or share to bearer of 15s. each held, was approved, the shares on allotment to be automatically converted into registered stock.

THE HALIFAX BUILDING SOCIETY

SPEECH OF MR ALGERNON DENHAM, JP

The one hundred and second annual meeting of members of The Halifax Building Society was held in Halifax on March 28, 1955, the president, Mr Algernon Denham, JP, presiding.

In moving the adoption of the accounts the president said: The balance sheet before you discloses great strength with the distribution of assets totalling £237,786,239 following the pattern of recent years; 84.74 per cent consists of mortgage balances and 15 per cent of liquid funds invested in corporation loans, and in Government securities.

Our liabilities to investors and depositors amount to some £225 million, whilst accumulated reserves total approximately £12 million, or 5.03 per cent of the total assets.

The surplus amounts to the record figure of £932,632 after we have written down the book value of our office properties by £50,000 and made a contribution of a similar amount to the staff pension fund. To this we add a profit of £481,223 on realisation of investments and out of the sum so available £218,723 has been written off the book value of our Government securities.

The sum of £500,000 has been transferred to general reserve and £262,500 to investments reserve and we recommend the payment of a bonus of ¼ per cent to our subscription share and class I shareholders.

We look upon our growth in assets of £23,470,000 as adequate whilst our advances on mortgage at £50,900,000 have been somewhat higher than we would have wished due in no small measure to the attraction of the 4 per cent interest rate which operated from October.

In May last the Government announced through the Minister of Housing their proposals for the encouragement of home ownership. Your society has welcomed the coming into operation of the scheme and given full support within its available resources. At January 31st last we were operating in collaboration with 345 local authorities and had made advances of approximately £1¾ million. Our total advances have since increased to £2¼ million and the upward trend continues.

In postwar years building societies have been operating under what might be termed fair weather conditions and the accretion of assets has been phenomenal by comparison with any other period of our history.

A slower rate of growth by the movement generally, however, would not be disadvantageous particularly as the profit potential of mutual institutions such as ours is inadequate to permit reserve ratios keeping pace with rapid growth.

On March 2, 1955, we announced increases in interest rates allowed to our investing members and charged to our borrowers.

There are two opposing trends of thought about the interest terms which building societies should offer. A large section of the movement believes it has a duty to pay an investment rate which will attract all the funds necessary to finance all the mortgage business available. Others including ourselves hold the opinion that the interest offered should be a fair return for the investor and that mortgage facilities should be granted according to the income thus derived.

Whatever the merits or demerits of varying interest rates may be, they pale into insignificance when compared with the urgency and importance of maintaining and improving the value of the £1 sterling.

MIDLAND COUNTIES MOTOR FINANCE CO. LTD.

The annual general meeting of Midland Counties Motor Finance Company Ltd. was held on March 29th, at Sheffield, Sir George Kenning, the Chairman, presiding. The following are extracts from his statement :—

Sir George Kenning

I feel I can claim that 1954 has been a memorable year in the history of the Company.

Profit Doubled.

The Profit of the Group is £293,393 compared with £165,759 last year, and, after taxation and all other charges, there remains £130,687, more than double last year's figure of £59,152.

I am sure you will agree that these are results of which we can be justly proud.

Increased Dividend.

Bearing in mind the importance of strengthening the Company's reserves, the Directors recommend that a Dividend of 30% be paid on the increased Ordinary Share Capital of £275,000. The total amount retained in the business is £84,734, and the proposed Ordinary Dividend amounts to £45,375. This Dividend is covered 2.8 times by earnings, which are at the rate of 83.2% on the Ordinary Capital.

Liquidity.

Current Assets of £3,141,463 exceed Current Liabilities of £2,319,608 by £821,855 compared with Capital and Reserves of £674,612. These figures demonstrate the liquidity and strength of the Company.

This Year's Trading.

During the year under review Government restrictions were temporarily relaxed, and competition increased as a result. This mainly took the form of increased periods of hiring and reduced deposits rather than reduced rates of interest. Consequently, the amount of money which we had available to lend was spread over a longer period, and this to some extent limited our expansion of business.

Over a quarter of a century of experience in the Hire Purchase business, specialising in the financing of motor vehicles, has been, and will continue to be, invaluable in dealing with this situation and others which are bound to arise in a comparatively new and often misunderstood system of credit service.

I pointed out last year that the increased volume of business in the then current year could be fully reflected only in the subsequent 12 months, and that statement still holds good for the period under review.

We have benefited to some extent from the abolition of Excess Profits Levy. This amounted to £13,640 in 1953. We have also benefited from the reductions in the Bank Rate which took place in September, 1953, and in May, 1954.

The Future—Government Controls.

At the moment this Report is being written the new Government controls have just been announced, and it is too early to say for certain what effect they will have on the Company's trading. The minimum deposit of 15% and maximum repayment period of 24 months are within the general limits which we have been imposing ourselves since the restrictions were relaxed, so that I do not anticipate that these factors will have an adverse effect on this year's trading. On the other hand, the increase in the Bank Rate will mean that we shall have to pay more dearly for our borrowing, on which our volume of business depends. It will also be more difficult to increase the amount of money available for the expansion of business.

Nevertheless, I am optimistic about the immediate future of the Company for reasons which I have already given, and also because I am convinced that we provide a service which is beneficial alike to our customers, the manufacturers of the goods we finance, and to the general public.

Excellent Facilities for Deposits.

I would again draw your attention to the Company's scheme for the acceptance of deposits, which is an important method of financing our business. This service is available to the small and large investor alike and offers an attractive and secure method of earning a realistic rate of interest while still conserving capital values and availability at very short notice. Deposits can be arranged with the minimum of formality and at no cost to the investor on deposit or on withdrawal.

MITCHELL COTTS & COMPANY

OVERALL PICTURE OF INCREASING STRENGTH

The thirty-fifth ordinary general meeting of Mitchell Cotts & Company, Limited, will be held on April 22nd in London.

The following is an extract from the circulated statement of the chairman, Mr H. C. Drayton:

The profit for the year under review of £1,258,152 compared with the figure of £1,504,359 for the previous year can be regarded as satisfactory in view of more difficult trading conditions. Taxation takes £755,000, compared with £830,000, and the final consolidated net profit, after tax, is only some £137,000 less than the previous year.

The result achieved, with some exceptions, is due not so much to any decrease in the total volume of trade as to higher staff and other costs and smaller margins of profit due to keener competition chiefly from abroad.

The high levels of current assets and liabilities reflect the continuance of active trading conditions during the year, but you will note that the net liquid position is stronger in that the total current assets are about £100,000 up, whereas the total provisions and current liabilities are about £250,000 down. The overall picture emerging is one of increasing strength justifying confidence in the group's ability to cope with changing conditions.

OVERSEAS ACTIVITIES

Activity in Southern Africa, which is the group's oldest and largest field of operations, continued at a high level and the present indications are that this will be so during the current financial year as well.

Certain units of the group, particularly those operating in the Middle and Far East, have been affected by political and economic changes in the territories in which they trade, but we hope to see an improved volume of business in future at least in some of the countries concerned.

The parent company and the other companies operating in the United Kingdom have suffered only to a limited extent from the contraction of overseas markets, the total group exports from the United Kingdom amounting to £6,250,000, as against £6,500,000 for the previous year. Our shipping companies show a less favourable position, but better results are hoped for in the current year.

Whilst we are, at times deliberately, limiting the group's activities in certain directions, we continue to consolidate, develop and expand in others. Our group's produce activities are also being successfully developed, not only through inter-territorial transactions, but particularly through the sale by London of grains, oilseeds and cattle foodstuffs from territories where we are established, principally the Sudan, Ethiopia, Aden and East Africa.

The import of food products also into these areas has had our close attention with promising results. Since the end of the financial year we, in conjunction with our overseas offices, have been successful in negotiating large quantities of sugar with the Governments of the Sudan and East Africa and with private concerns in Aden and elsewhere.

In your directors' opinion, notwithstanding some uncertainties and difficulties that lie ahead, you can look forward to the continued prosperity of the group with reasonable confidence.

HARRODS (BUENOS AIRES) LIMITED

IMPROVED LOCAL TRADING

REMITTANCE PROBLEMS AND CAPITAL STRUCTURE

The forty-second annual general meeting of Harrods (Buenos Aires) Limited will be held on April 25th at the offices of Harrods, Limited, Brompton Road, London, S.W.1.

The following is an extract from the circulated statement of the chairman, Mr F. A. Stacpole:

As is well known, we operate departmental stores in Argentina. All the assets of the business as such are located in Argentina, practically all the merchandise is purchased in Argentina and all the sales are in Argentine pesos. The excess of assets over liabilities in Argentina at August 31, 1954, was some 230 million pesos. This figure is, however, only arrived at on the basis of book value of fixed assets, the replacement value of which is several times greater. Our Argentine businesses emerged during the year from the deep trough of depression which affected all retail businesses in Buenos Aires throughout the previous year, making a profit of over 16 million pesos. This brings the total profits in Argentina for the four years to August 31, 1954, which have not been brought into our sterling accounts because they have not been remittable, to over 91 million pesos.

REMITTABLE PROFITS

Before saying anything about the particular remittance position of our two companies, it is essential to emphasise that we have received no significant amount of remittances since 1951.

As a result, however, of prolonged negotiations between our companies and the Argentine authorities, it has now been definitely agreed that our companies are entitled, as and when sterling becomes available to the Central Bank, to remit home, in respect of all periods up to February 28, 1950, a further sum of approximately 16 million pesos. At the current free rate of approximately 40 pesos to £1, the sterling produced would be about £400,000. Specific agreement has yet to be arrived at in regard to the half-year to August 31, 1950, but the sum involved only amounts to about 1¼ million pesos.

Although we still await the corresponding remittances, it is important to have had these earlier figures definitely settled. As such remittances would relate to a period for which all UK taxation liabilities have been discharged, they would not involve any further UK tax assessment on the companies.

For the four years to August 31, 1954, our companies have lodged applications under current regulations for remittances equivalent to about 19 million pesos. It appears probable that remittances in respect of this later period would attract a liability to UK tax, subject, of course, to some reciprocal relief.

To summarise therefore: it is only the amounts referred to in my remarks above, totalling about 37 million pesos, which are remittable in principle; they will only be remitted in practice as and when the Argentine authorities are in a position to make sterling available. The balance of profits appears to be permanently frozen in Argentina.

So much for the position up to August 31, 1954. It is equally important to indicate what we would be permitted to remit annually in future if sterling were available. According to our interpretation of the Argentine regulations this would amount to about 7 million pesos, equivalent, at the present free rate of exchange, to about £175,000.

I will close this section of my statement by emphasising that, while making clear the amount which could be remitted under the present regulations, no one has any idea when in fact remittances will be provided.

CAPITAL STRUCTURE AND DISTRIBUTION OF PROFITS

I am prompted, by a number of enquiries which have been made to me, to clarify the position with regard to our capital structure.

Although the 4 per cent cumulative preference shares have a priority for dividend over the 8 per cent cumulative preference shares, both classes rank *pari passu* for repayment of capital in a winding up, and each share carries one vote whether or not the dividend is in arrear.

As between the ordinary and deferred shares, the ordinary shares, though of a nominal value of 12s., have a right in a winding up, to repayment at 20s. When the ordinary shares have been repaid at 20s., that class and the deferred shares divide the surplus. Those paying a high price for the deferred shares perhaps overlook the fact that before they would be entitled to anything on a winding up, the prior classes of capital would be entitled to claim some £7 million plus arrears of dividends (if any) on the cumulative preference shares.

To pay completely the dividends on the two issues of preference shares with the corresponding profits tax distribution charge and income tax and after taking into account reciprocal tax relief, would require an estimated income of £220,000 per annum. To pay a full 16⅔ per cent on the ordinary shares would call for a further income estimated at £370,000. As I have previously said, the remittable annual profits under the present Argentine regulations for our two companies are running at about 7 million pesos, which at the present official free rate of exchange would produce about £175,000. Out of this sum expenses outside Argentina would have to be paid before anything was available for dividends.

It will therefore be realised that there is no prospect of being able, even were the theoretically permissible annual remittances in fact obtainable, to pay the dividends regularly on the 8 per cent preference shares. In a year when a full year's remittances come home, partial payment might be possible. In the event of a remittance in respect of several years being received at one time, it might be possible to pay more, but in that case provision would have to be made for heavy amounts of profits tax and income tax.

Enough has been said to make clear to you the investment status of the shares in our company under present and foreseeable conditions.

On the one hand, these shares do not meet the requirements of the investor who is looking for a regular and assured source of income.

On the other hand, the shares are backed by fixed assets, having a replacement value several times greater than their book value, by substantial current assets and by the going-concern-value of what is probably the largest departmental store undertaking outside Europe or North America.

BRITISH STEEL CONSTRUCTIONS (BIRMINGHAM), LTD.

FACTORS AFFECTING PROFITS

The eighteenth annual general meeting of this company was held on March 29th, at Birmingham, Mr W. Basil Holden, FCA (the chairman), presiding. The following are extracts from his circulated statement for the fifty-two weeks ended August 28, 1954:

The consolidated profit and loss account shows a net profit before providing for taxation of £136,997, which is £65,837 less than the previous year. After making provision for taxation, there remains £78,676, of which the dividends which your board recommend absorb £39,375, leaving £39,301 to be ploughed back into the business.

Last year I told you that the nature of much of our business enables us to make long-range forecasts with a fair degree of accuracy and also that I expected the results for the year under review to show an improvement on those of its predecessor. In point of fact, we were budgeting for a profit to the order of £225,000, and the accounts for the first four months fully substantiate that view. The results of the accounts before you are some £90,000 short of that amount.

ADVERSE WEATHER

The causes may be summarised under three headings, namely :

1. Loss of building time due to weather conditions.

2. Loss of building time through sites not being available at planned dates.

3. Additional costs arising from the weather conditions in which it was necessary to operate.

The size of the deficit, however, merits some more detailed explanation. During part of January and almost the whole of February, we were compelled to suspend building operations entirely, owing to the severe frosts, for it is impossible to build in these conditions. In common with other builders, we do, of course, make an allowance for loss of building time due to weather conditions and it might have been possible—at any rate, in part—to have made up this leeway had it not been for the almost continuous and exceptionally wet weather which followed.

CURRENT YEAR'S PROSPECTS

It is extremely difficult at this juncture to forecast with any degree of accuracy what the current year's results will show. The best estimates I can make at this stage is that the results for the current year will be much the same as that under review. It is clear that we do, and shall in the future, need more capital, but whatever steps we take in this direction must be such as do not prejudice the interest of the existing shareholders.

Moreover the position is made more difficult in that in calculating the amount which it is necessary to earn, we have to provide over one-third more for profits tax if we distribute it to the shareholders by way of dividend, whereas there is not the same restriction in the matter of loan interest. I am hoping that before the close of the current year we shall be in a position to assess not only what are our long-term requirements, but also the results which will flow therefrom —particularly bearing in mind the principle I have enunciated with respect to the interest of the existing shareholders.

The report and accounts were adopted.

TELEPHONE & GENERAL TRUST

SATISFACTORY RESULTS

SIR ALEXANDER ROGER ON "A UNIQUE EXPANDING UTILITY BUSINESS"

The twenty-ninth annual general meeting of the Telephone & General Trust, Limited, will be held on April 26th in London.

The following is an extract from the circulated statement of the chairman, Sir Alexander Roger, KCIE: The results are again satisfactory. The profit for the year after charging profits tax and income tax is £115,194—an increase of £10,374, despite an additional charge of £33,633 for interest on the £800,000 of 4½ per cent debenture stock issued in November, 1953.

At the last annual general meeting you approved an increase of £600,000 in the authorised ordinary capital, and a bonus issue of 110,000 ordinary shares of £1 each fully paid out of capital reserve. The cash cost of these operations—£3,000 capital duty and £382 expenses of the issue—has been written off.

We are recommending a final dividend of 7 per cent, making with the 3 per cent interim paid in October last, 10 per cent for the year, on the £1,110,000 (£1 million last year) ordinary stock, together with 10 per cent on the £100,000 "A" ordinary stock.

After providing for these payments and the 7 per cent preference dividend, and transferring £20,000 to general reserve, £114,746 is carried forward against £110,659 brought in.

The capital reserve has been restored to the figure of £450,000 at which it stood prior to the bonus issue of capital of £110,000 in April last year. General reserve now stands at £150,000 after the transfer of £20,000 from profit and loss account already referred to.

The valuation of £4,338,152 for quoted investments represents an appreciation of £1,891,807 on the net book cost of £2,446,345 —a substantial buffer against fluctuations in market prices.

Loans to associated companies at £35,972 show a substantial decrease. This reduction results from the repayment of loan by the Anglo-Portuguese Telephone Company out of the proceeds of successful issues of capital made by that company in 1954. The assistance which the Trust gives to its telephone operating subsidiary and associated companies by the provision of temporary loans, which are later repaid by the operating companies out of the proceeds of issues of capital, is of great value in enabling development and expansion to be planned and carried out economically and without interruption.

GROUP ACCOUNTS

The group capital and revenue reserves total £1,325,932 and show an increase of £82,013. The net assets of telephone operating and servicing subsidiary companies have increased by £329,775 to £3,667,055.

PORTUGAL

For the past 27 years the Trust has held a substantial share investment in The Anglo-Portuguese Telephone Company and has been behind the company in all its financial planning and development. In recent years, and particularly since the telephone company's expansion programmes have been accelerated, the services of the Trust have been increasingly valuable and fully recognised and appreciated in Portugal.

At December 31, 1954, the number of stations in The Anglo-Portuguese Telephone Company amounted to nearly 152,000, over 17,000 having been added during last year, a remarkable rate of growth which would have been unprecedented in any country a few years ago.

Portugal is a progressive nation and under the current six-year plan, which is increasing industrial, commercial and social activities in all directions, The Anglo-Portuguese Telephone Company can look forward to a continuity of sound and solid progress.

WEST INDIES

In December, 1945, shortly after the end of the war, the gross plant assets of the West Indies telephone operating companies in Jamaica, Trinidad and Tobago and Barbados, had a combined book value of £926,700. At December 31, 1954, this value had increased five-fold to £4,588,900 and is an indication of the vigour with which the directors and managements of these companies, with the full backing of the Trust, have pushed ahead with the expansion and improvement of their telephone systems to keep pace with and add materially to the economic and social development of these territories. Further large capital expenditure is being undertaken and more is already planned over the next five years.

TELEPHONES AND THE TRUST'S INVESTMENTS

As I told you last year, the directors and executives of the Trust devote much time and thought to its investment policy, both in regard to our general portfolio of market securities and to our equally important investments in overseas telephone undertakings. Our general investments of market securities are under constant review. We have built up a portfolio of securities which is well spread over many industries and we believe it will continue to provide good revenue. The appreciation existing at December 31, 1954, encourages us in the belief that we can face fluctuations in prices with reasonable equanimity.

We continue to believe also that telephones are good investments, and that the substantial interests which the Trust has always had in this field of public utility provides an added strength in good and bad times with steady returns and opportunities of growth which it would be difficult to match elsewhere.

Progress in business, in industrial development and in social standards all call for improved and expanding telephone systems. In fact, progress, expansion and telephone communications are all bound together, each gaining from the progress of the other.

To my mind this unique expanding utility business constitutes a high-ranking investment combining security with remunerative growth.

Great progress has already been made in Portugal, Jamaica, Trinidad and Barbados in the extensive programmes of expansion and development in which all these companies are engaged. These programmes have, of course, called for large capital expenditure, but I am glad to be able to tell you that in all cases the results have justified the management's policy in pushing on with their development plans and providing a service second to none.

UNITED SERDANG (SUMATRA) RUBBER

SIR ERIC MILLER'S REVIEW

The forty-seventh annual general meeting of the United Serdang (Sumatra) Rubber Plantations, Limited, was held on March 24th in London.

Sir Eric Miller, chairman, presided, and in the course of his speech, said: Although the average area in tapping was somewhat greater, the 1953/54 rubber harvest of our estates was about 7 per cent below the record level of the previous year, the reasons for the lower yield being unfavourable weather, latex stealing and the go-slow tactics into which the labourers on some of our estates were persuaded or intimidated by subversive elements.

The back-log of replanting mounts year by year, and must continue to do so until such time as Indonesia puts its house in order and, by deeds rather than words, encourages those who have already contributed so much to the country's past development to re-invest in its future.

In previous postwar years the effect on unit costs of production of successive increases in wages, holidays and social provisions for labour was cushioned in our case by a rising level of output. In the year under review, however, estate cost of our rubber, exclusive of export duties, was higher by almost 1½d. per lb than in 1952/53. Such an increase was most disheartening when world rubber prices were at their lowest level for four years.

After maintaining for three years a dividend rate of 10 per cent, the directors regret that on this occasion they can only recommend a distribution of 6 per cent, less income tax. No remittance has yet been received from Indonesia on account of the year's profit; we are hoping to receive approximately £57,000, but it is possible that the necessary exchange permits will only be granted by instalments.

THE CURRENT YEAR

We are now getting relatively high rupiah prices for our rubber, and the current financial year should show an increased trading surplus, but the eventual sterling result cannot possibly be predicted. One thing is certain, that the tax-gatherers will derive far more benefit from the improved rubber prices than will the stockholders, who carry all the risk.

An extra export duty has been re-imposed with effect from March 1, 1955, at the rate of 10 per cent *ad valorem*.

We are being cruelly mulcted in Indonesia at three points: Firstly, in export duties; secondly, by company tax, which rises to 52½ per cent of fiscal profits; and thirdly, as though that were not enough, by the levy of 66⅔ per cent on the remittable balance.

The yields which our old trees are giving and their general vigour confirm the opinion we have long held that Sumatra is an ideal habitat for Hevea Braziliensis, but in face of such treatment meted out to old and tried investors in Indonesia, can it be wondered at that fair words alone do not evoke the inflow of new foreign investment which the young Republic clearly needs and professes to welcome?

A lasting solution of the problem of illegal occupation of estate land is unfortunately not in sight, and it is feared that no Government unarmed with an electoral mandate will have the courage to tackle the problem with the necessary firmness. When the election is to be held is still in the lap of the gods.

The report and accounts were adopted.

ASQUITH MACHINE TOOL CORPORATION LIMITED

SUCCESSFUL PROGRAMME OF PROGRESSIVE DEVELOPMENT

The thirty-fourth annual ordinary meeting of shareholders of Asquith Machine Tool Corporation Limited was held at the registered offices of the company, Highroad Well, Halifax, on Monday, March 28th.

In moving the adoption of the report and balance sheet, the chairman, Mr Robert W. Asquith, MIPE, said:

In my last year's statement I indicated that since the end of the financial year under review, and during the course of this financial year, your company had acquired the whole of the equity of Drummond Brothers, Limited, Guildford, and because of this acquisition our sales company, Drummond-Asquith (Sales), Limited, Birmingham, also became a wholly owned subsidiary.

FORECAST JUSTIFIED

The accounts for this year show the consolidated position arising from this acquisition, and I think that the statement made last year that your directors were satisfied that this purchase was a wise and sound one and could only have beneficial effects on the status of your company, has been amply justified. In passing, I would draw your attention to the fact that during the past ten years the assets of your company have increased from £404,000 to £1,368,000, and of this increase of £964,000, profits retained in the company and special credits account for £731,000, and only £233,000 is in respect of the introduction of new capital.

The trading for the period under review has been satisfactory, with the accent being more on machine tools for the heavy and the mass production industries, which type of production has a slower turnover than the one to which I referred in last year's statement.

Drummond Brothers, Limited, cater particularly for the mass production industries, and they can look forward to another prosperous year.

William Asquith, Limited, also have a very full order book of the types just referred to, their main problem being the shortage of skilled labour, which has been dropping steadily for a number of years.

FOR HEAVY MACHINES

Your directors have had this position under review for a considerable time, and since the end of the financial year your company has purchased the business of R. Woodvine and Son (Shrewsbury), Limited, Shrewsbury, who, among their various engineering activities have done a considerable amount of sub-contracting work for William Asquith, Limited. We are proposing to continue the activities of the Woodvine Company under its own identity, and expand their activities as far as sub-contracting for William Asquith, Limited, is concerned.

Mr J. G. R. Woodvine, who is well known in the engineering trade, will continue as managing director, and he has joined the board of your operating company, William Asquith, Limited.

It is the intention of your board to extend the manufacturing activities for the heavy machinery of William Asquith, Limited, at Shrewsbury, where productive labour is available. In addition, it will give William Asquith, Limited, the opportunity of erecting a factory more suitable for the production of the heavier type of machine in demand for the future, and for which our existing facilities in Halifax are not ideal.

It is not to be expected that these activities will have any effect on the results of the current year, but I feel it my duty to report to the shareholders the steps already taken by your directors.

Arrangements are now being made to provide any finance which may be required in excess of the resources already available to the company.

Before passing from this subject I should like to make it quite clear that this expansion in Shrewsbury does not detract from the activities in Halifax, and your directors are confident that there is sufficient work to keep the existing manpower fully occupied, and indeed a considerably larger labour force than is available in Halifax at the moment.

THE AMERICAN MARKET

Your sales company, Drummond-Asquith (Sales) Limited, continues to function efficiently, and in addition to their activities on behalf of the manufacturing members of the group they encounter a steady demand for some of the specialised lines of machinery for which they are sole agents.

Modern Foundries, Limited, continues to be fully occupied, not only with castings for the group, but also with orders for other machine tool manufacturers. The availability of labour at your foundry continues to be a problem, but every endeavour is being made to improve it.

As is generally known, the metal working trades went through a difficult period last year in the United States, and your American subsidiary, Associated Machine Tool Corporation, felt the reduction in demand along with most other machine tool distributors. However, your directors feel confident that if we are to remain in the American market, the policy they have adopted is the correct one.

All your subsidiary companies operated at a profit during the past year, with the exception of your American company, and in this instance, the loss was infinitesimal and not unsatisfactory when the state of the American market during the year is considered.

During the year, your directors have visited Australia, New Zealand, Canada, USA, Japan, USSR, and Continental Europe. Your company has exhibited at the European Machine Tool Exhibition in Milan and the Canadian Trade Fair in Toronto.

FULL ORDER BOOK

Your group has a full order book, and although I have felt it advisable to make reference to the shrinkage of manpower in your Halifax works, I am confident we can look forward to another successful year.

As you are aware, during the course of the year the name of your company has been changed to Asquith Machine Tool Corporation, Limited, which is purely a holding company, and I should like to thank all my co-directors of the holding company for their assistance during the course of the year. I should also like especially to thank the executive directors of the subsidiary companies, many of whom have been elected during the past year, in the majority of cases after many years' service with the companies concerned.

I should also like to thank all members of the staff and workpeople of the various companies for the efforts put forward during the year under review.

BROWN BROTHERS LIMITED

RECORD TRADING YEAR

The fifty-eighth ordinary general meeting of Brown Brothers Limited was held on March 28th in London.

Sir Richard Yeabsley, CBE, FCA, the chairman, said:

The sales of the company and its subsidiaries for the year were a record in its history, and the net trading profit of the group amounts to £805,403, compared with £569,697.

The net profit for the year carried to the profit and loss appropriation account of the parent company, including dividends received from subsidiaries, is £256,798, compared with £200,628.

Appropriations recommended are a transfer of £150,000 to general reserve, and an allocation of £5,000 to the staff benevolent and welfare fund.

After payment of the preference dividend, the directors propose a final payment of 12½ per cent on the ordinary capital, which, with the interim of 2½ per cent, gives a total for the year of 15 per cent as compared with 14 per cent.

The balance of unappropriated profits carried to the balance sheet amounts to £315,606, an increase of £44,174. The total taxed profits retained by the group amount to approximately £250,000, compared with £117,152 distributed to the shareholders.

TRADING CONDITIONS

The increasing demand for consumer goods, resulting from full employment and high wages, has been reflected in the very high sales achieved during the year. The tendency for prices to fall was checked, and during most of 1954 we have been operating on a market which, if anything, showed a tendency for prices to increase.

The ever-increasing number of cars and vehicles on our roads again reflected a further expansion in the repair and service facilities of the motor trade.

In the cycle section of our business the sales of accessories and components have again increased and we are now undoubtedly reaping the benefit of the increased range of components carried in all our branches.

Our radio and electrical departments benefited considerably from the relaxation in hire purchase controls earlier in the year. This demand has received some check in the last few weeks since the Chancellor reimposed restrictions. In radio valves, television tubes, and other radio accessories, demand has again increased, and there is no doubt that the radio service trade is now fully conscious of the unique service we render throughout the country.

EXPORT

Last year I indicated that a new company —Brown Brothers (Overseas) Limited—had been registered and that our export business was being transferred to that company. This new subsidiary is now firmly established and its sales showed an improvement over those of our export department in 1953.

BROWN BROTHERS (AIRCRAFT) LIMITED

In the later months of 1953 and the early months of 1954 sales in the aircraft subsidiary were considerably reduced by changes in the aircraft building programme. During the year under review the demand increased, and by the end of the year production of aircraft parts was again reaching peak load.

OUTLOOK

The increase in sales so particularly marked in the latter months of 1954 has continued in the early months of 1955. While too early to make any forecasts, it would seem that in the first six months of the year sales will remain at a fairly high level.

The report was adopted.

BEAUMONT PROPERTY TRUST, LIMITED

LARGER PROFIT AND DIVIDEND

The twenty-first annual general meeting of this company was held on March 30th in London, Mr Cyril W. Black, JP, MP, FRICS, FAI, chairman, presiding.

The following is an extract from his statement circulated with the report and accounts:

The consolidated profit and loss account for the year ended September 30, 1954, shows property revenue, after charging ground rents and other expenses, of £244,051 which compares with £237,146 in the previous year. The profit carried down is £181,270, showing an increase of a little more than £6,000. It is considered that the moderate increase in the profits earned by the companies may be regarded as not unsatisfactory.

Your directors have transferred a sum of £25,000 to the contingencies reserve, bringing this reserve up to a total of £125,000. Capital and revenue reserves of the group of companies amount to £294,555, equivalent to approximately 40 per cent of the whole paid-up ordinary capital of the parent company, or approximately 8s. in the £ thereon. There is a considerable hidden reserve represented by the difference between the present market value of our properties and their book cost.

A final dividend of 6 per cent is recommended and will bring up the total ordinary dividend for the year to 9 per cent.

During the past year legislation has been enacted to enable the owners of rent restricted residential properties to increase their rents on account of the heavily increased cost of repairs and services compared with prewar. The cost of repairs is today more than three times as much as the 1939 cost, and the present cost of providing hot water, central heating, lift and porterage services, etc., is certainly considerably more than double the prewar cost; the price paid by us for boiler fuel in 1939 was about 37s. per ton, whereas today we are having to pay the very excessive price of about 117s. per ton. Until the recent legislation was passed the owners of rent controlled residential properties had to bear the whole of these increased costs and this has proved not only a heavy burden but an obvious injustice.

We are giving a reasonable period of notice to our tenants of our intention to increase rents and we are moderating our demands as much as possible. Your directors are of opinion that our properties should produce a steady and satisfactory income for many years to come.

The report and accounts were adopted.

"SOFINA"

The annual shareholders' meeting of Société Financière de Transports et d'Entreprises Industrielles (SOFINA) will be held on April 28th in Brussels.

At its meeting of March 22nd the board of directors was informed of the resignation of Mr Dannie Heineman, president of the standing committee.

The chairman paid tribute to Mr Heineman, who for 50 years conducted the affairs of the company with outstanding success and assured it an international reputation.

The board then accepted the resignation of its chairman, Viscount Van de Vyvere. It subsequently elected Mr René Brosens in his place and appointed Mr Charles K. Wilmers managing director.

Mr Brosens paid tribute to Viscount Van de Vyvere, who for more than 20 years had assumed the chairmanship of the board. He expressed his thanks for the eminent services which he had rendered to the company.

At the same meeting the board approved the balance sheet and profit and loss account for the year ended December 31, 1954, and determined the appropriation of profits to be submitted to the general meeting of shareholders to be held on April 28th.

The following comments on the accounts are published:

BALANCE SHEET AND PROFIT AND LOSS ACCOUNT AT DECEMBER 31, 1954— APPROPRIATION OF PROFITS

Purchases of securities during the year under review amounted to B.frs. 187,592,000, whereas the book value of securities sold totalled B.frs. 164,219,000. After deduction of B.frs. 92,395,000 for amortisations, the book value of investments, therefore, stands at B.frs. 1,870,270,000, against B.frs. 1,939,292,000 at December 31, 1953.

As a result of these amortisations the book value of shares of associated companies having their principal interests in the Argentine is reduced from B.frs. 248,936,000 to B.frs. 156,418,000.

The estimated value of the portfolio at December 31, 1954, amounts to B.frs. 4,314,606,000, against B.frs. 3,426,191,000 at December 31, 1953. The appreciation in relation to the book value is thus B.frs. 2,444,336,000, against B.frs. 1,486,899,000 at the end of the preceding year.

Liquid assets and short-term investments total B.frs. 707,303,000, or B.frs. 174,375,000 more than at the end of 1953. Amounts due by subsidiaries or by third parties total B.frs. 635,697,000, a decrease of B.frs. 47,716,000. This sum includes B.frs. 381,657,000 owed by associated companies having their principal interests in the Argentine (against B.frs. 392,684,000 at December 31, 1953). The debt of these companies is partly guaranteed by non-Argentine securities, the value of which, at December 31, 1954, amounted to approximately B.frs. 190 million. Liabilities to third parties—including B.frs. 107,771,000 to the pension fund—amount to B.frs. 369,306,000, or B.frs. 34,866,000 less than last year. Net "liquid assets" and claims, after deduction of liabilities, thus amount to B.frs. 973,693,000, against B.frs. 812,170,000 at December 31, 1953.

The balance of the profit and loss account amounts to B.frs. 121,450,028, against B.frs. 98,574,740 in 1953.

The profit and loss account item "General and administration charges" is now entitled "Expenditure involved in the rendering of technical services, administration charges and general expenses" in order to express the fact that this item also includes expenses incurred by the company in connection with its technical services, the gross income from which is shown on the credit side of the profit and loss account. This item shows a total of B.frs. 14,518,000 more than in 1953. But it should be borne in mind that this increase is largely due to changes in the method of recording certain items of income and expenditure so as to adapt the book-keeping to the new title given to the item in question. The true increase in relation to 1953 is only approximately B.frs. 4,500,000.

Earnings appear in the profit and loss account for a total of B.frs. 210,316,534, or B.frs. 24,591,000 more than for the preceding year. This sum includes B.frs. 13,423,464 representing unrealised capital gains on securities received from associated companies in payment of dividends, and B.frs. 13,879,367 representing income due by companies having their principal interests in the Argentine, amounts which must be considered as non-distributable profits.

As regards profits derived from the sale of securities, these amounted to B.frs. 119,858,818, against B.frs. 40,851,656 in 1953. That part of these profits which is not tax free is shown in the profit and loss account at B.frs. 101,585,340 (against B.frs. 32,475,262 in 1953). It is by means of profits derived from the sale of securities that holdings still showing depreciation at December 31, 1954, were written down in the amount of B.frs. 92,395,375.

The following allocation of the balance of the profit and loss account is recommended:

5 per cent per annum on the preference shares: B.frs. 25 gross per share on 40,000 shares ..... B.frs.	1,000,000
First dividend of 5 per cent per annum: B.frs. 25 net per share on the 630,000 ordinary shares	15,750,000
Reserve fund and sundry provisions ..... (including profits considered as non-distributable, i.e. B.frs. 13,423,464 and B.frs. 13,879,367, together with the balance of profit on sales of securities, i.e. B.frs. 9,189,965)	43,000,000
To be carried forward	5,331,607
Directors' and supervisors' profits quota	2,818,421
Supplementary dividend of B.frs. 85 net per share on the 630,000 ordinary shares	53,550,000
	B.frs. 121,450,028

If these proposals are accepted, the following dividends will be payable on or after May 2, 1955:

(a) On the 40,000 preference shares: 25 Belgian francs gross;

(b) On the 630,000 ordinary shares, against coupon No. 26: 110 Belgian francs net.

HADFIELDS LIMITED

LORD DUDLEY GORDON'S STATEMENT

The annual general meeting of Hadfields Limited took place on March 31st at the company's registered office at East Hecla Works, Sheffield. The chairman, Lord Dudley Gordon, presided.

In his statement accompanying the accounts, the chairman referred first to the death of Mr D. D. Hawley, MC, the sales director of the company who, after many years' service with the firm, died after a short illness on May 15, 1954.

He continued: The report and accounts are as before circulated to each of those who have been associated in the work of the company as an employee as well as to the Iron and Steel Holding and Realisation Agency.

This year the report is also circulated to all those who were stockholders of Hadfields Limited at February 14, 1951. For their interest there follows a description of the reorganisation and re-equipment carried out since that date which has amounted almost to the creation of a new works.

Examination of the balance sheet now published shows that the heavy expenditure on capital account since that date has been financed largely by advances from the Iron and Steel Corporation of Great Britain taken over by the present Iron and Steel Holding and Realisation Agency reaching a peak of £3,205,000. At the time of circulating this statement more than three-fifths of these advances have been repaid.

A revised capital structure of the company will in any case have to precede the divesting operation which will take place in due course.

Meanwhile important changes have been incorporated in the accounts. The surplus arising from the 1948 valuation of assets instead of being incorporated in the accumulated depreciation is now shown as a capital reserve at the considerable figure of £2,515,162. Further, it has been decided to adopt the "straight-line" basis of depreciation instead of the "reducing balance" principle used heretofore. The change necessitates the transfer of £361,118 from the accumulated balance of the profit and loss account to cover the additional charge from 1948-1953. The full charge on the new basis for the current year appears in the 1954 accounts at £296,898.

There has also been created a new equalisation of taxation reserve amounting to £1,600,000, which will be available in future years to eliminate excessive fluctuations due to variations in wear and tear, initial allowances and the like.

TRADING CONDITIONS

Our experience during the year has been in line with the general trend of manufacturing business in this country. The expected keener competition was certainly encountered and most vigorous efforts have been necessary to achieve the results reported. Indeed in the end, the value of the sales was the same as for the period ended October 3, 1953, though with a slightly lower realised profit. This is accounted for by the higher cost of materials and wages not immediately recoverable in prices, while at the same time there was some variation in the types of products and fluctuations of loading in certain sections. Under all the circumstances it can be felt that the profit subject to taxation, that is £733,200, reached a satisfactory level.

It will be seen that no less a sum than £490,539 has had to be provided for taxation. I have referred in earlier statements to the heavy burden which the present level of taxation places upon industry and the consequential difficulties in accumulating cash to pay for further necessary developments. It is to be hoped that this heavy burden will receive some measure of relief in the very near future.

After providing for taxation, plus adjustments in respect of previous years, the net available surplus for the year is £371,729 of which sum £95,637 is absorbed by dividends paid or proposed.

Turning to the consolidated balance sheet it will be seen that the position of reserves is very strong, as taking the capital and revenue reserves together these amount to over £3¾ million.

While the current assets exceed £4,500,000 the current liabilities, excluding the figure for equalisation of taxation, which is in the nature of a reserve, amount to just over £3,700,000, thus showing an excess of over £800,000 of current assets over current liabilities, which can be regarded as very satisfactory indeed.

The dividend is maintained at the same rate as for the past five years.

So far as the current year is concerned, it should be possible to benefit from the general atmosphere of confidence which exists in commercial and industrial circles.

It is notable that the value of orders received since October 2, 1954, is greatly in excess of the value recorded during the corresponding period a year ago. At the same time we have to expect more strenuous competition from our rivals both at home and particularly overseas. We are all of us determined to face what lies before us with confidence in our ability to succeed.

The report and accounts were adopted and Lord Dudley Gordon and Mr E. W. Colbeck, the directors retiring by rotation, were re-elected.

BOWMAKER, LIMITED

FURTHER EXPANSION

The twenty-seventh annual general meeting of Bowmaker Limited was held on March 25th at Bournemouth, Sir Arthur Morse, CBE (the chairman), presiding.

In his circulated statement the chairman comments on the further expansion in the company's business, the increased profits and the board's recommendation of an increase of 7½ per cent, less tax, in the total ordinary dividend from 17½ per cent to 25 per cent.

The statement continues: An offer to purchase the whole of the share capital of our subsidiary, Norcon Limited, has recently been accepted at a price which will result in a capital profit to your company of approximately £265,000.

You will all be aware of the Government's restrictions on finance for hire purchase which were in force until the middle of 1954 and of the subsequent easing of these restrictions by the authorities. The figures for the current year to date show that your company has taken full advantage of the opportunities afforded to it. At the time of writing new restrictions have just been announced by the Chancellor of the Exchequer. So far as can at present be foreseen, these new restrictions should not adversely affect the progress of any company conducting hire purchase business on sound and proper lines.

In order to conform with Government policy, our aim has been and will be to utilise our funds in a manner most helpful to the economy as a whole. To this end we are expanding that part of our business most directly concerned with industry, namely, the provision of finance for industrial plant and machinery, agriculture and road transport.

The report was adopted.

FIELDING & JOHNSON LIMITED

FOUNDED 1720

Leicester

SPINNERS OF HOSIERY & HAND KNITTING YARNS

Profit	1954 £	1953 £
Profits after all charges except taxation	290,794	357,143
Add reserve for taxation not required	10,000	10,000
	£300,794	£367,143
Appropriation of Profits :—		
National Taxation	160,776	202,814
Dividends (net)	70,563	72,149
General Reserve	70,000	69 990
Carry forward	— 545	+ 22,190
	£300,794	£367,143

Trading conditions were difficult throughout 1954 with a decrease in demand from the hosiery trade and a further drop in wool values. The directors are satisfied with the profit in view of the keen competition for the available business and increases in some costs, particularly wages.

The dividend of 25% on the Ordinary Stock is equivalent to 8.14% on the funds employed attributable to Ordinary stockholders.

Funds Employed	1954 £	1953 £
Capital issued and fully paid :—		
Preference shares of £1 each	35,000	35,000
Ordinary stock (5/- units)	504,787	504,787
Reserves and undistributed profits	869,522	800,067
Amounts set aside for future taxation	176,500	225,000
	£1,585,809	£1,564,854
These funds were invested in :—		
Plant, machinery, buildings and other fixed assets	390,488	390,460
Net current assets	1,195,321	1,174,394
	£1,585,809	£1,564,854

The figure of £390,488 for fixed assets is after charging accumulated depreciation totalling £436,663 (1954 : £35,015).

The net current assets include £264,138 in cash and £115,050 in tax reserve certificates.

Annual General Meeting

The thirty-third annual general meeting of the company was held on March 28, 1955, at the Grand Hotel, Leicester, when the report and accounts were adopted, dividends approved and the retiring directors re-elected.

THE INVERESK PAPER COMPANY, LIMITED

SUCCESSFUL YEAR

MR C. SNELLING'S ADDRESS

The thirty-second annual general meeting of The Inveresk Paper Company Limited was held on March 29th in London.

Mr C. Snelling, the chairman, after paying a tribute to Sir Bernhard Binder, the late chairman, and Sir Harry Brittain, who had recently retired, in the course of his speech, said:

During the financial year there was a steady demand for the products of the group at prices which remained stabilised in spite of increases in raw material prices and other rising costs. As a result of this demand our mills have been working at full production capacity, in fact, considerable overtime has been necessary at many of them.

The group's trading profit amounted to £3,306,532 and after providing for taxation the net consolidated profit amounted to £1,376,000, an increase of approximately £800,000 compared with the previous year. The present results have been considerably improved through working overtime and are benefiting more each year from our continued programme of capital expenditure. Having regard to all the circumstances, the directors have decided to recommend to you the payment of a final dividend of 7½ per cent free of tax on the ordinary stock, making a total of 10 per cent free of tax for the year.

The investments in subsidiary companies have increased by nearly a million pounds. This is mainly due to the purchase of the share capital of three new companies, Harold Jackson Limited, The Witchampton Paper Mills Limited, and Woodhall Paper Company Limited, and the acquisition of a substantial number of additional ordinary shares in a subsidiary company, Caldwell's Paper Mill Company Limited. The new companies purchased will fit in admirably with our expanding organisation. We are now engaged in developing and expanding these companies.

Capital commitments outstanding total about a million pounds and further expenditure has since been approved. The continuous modernisation of the group's undertakings will result in further substantial expenditure during the next few years. It is, therefore, essential to continue ploughing back a considerable part of the profits earned to enable funds to be available for this purpose, thus continuing our past policy of providing if possible for capital expenditure out of internal resources without the necessity of raising additional capital.

The liquid position disclosed at September 30th last is strong, but there is substantial capital expenditure to be met and expansion at a number of mills inevitably calls for increased working capital. In due course, therefore, all these resources will be required.

THE OUTLOOK

For the first five months of the present financial year the group's profits have continued to be satisfactory.

As a result of higher costs generally, it was found necessary to increase paper prices slightly as from January 1, 1955.

In regard to its main raw materials the paper making industry is in a particularly vulnerable position as these are purchased from abroad and it is restricted in its sterling allocation for the purchase of these materials. During 1954 there was some increase in the sterling allocation available, but any further increase in the price of wood pulp may automatically restrict the amount of imports permitted.

We must do all we can to avoid conditions of inflation similar to those which prevailed about three years ago and which were followed by chaotic conditions in the trade. The immediate future is, however, satisfactory and the present financial position of the group is strong so that we can face the future with confidence in our ability to meet competition and to overcome difficulties.

The chairman concluded with a tribute to all the staff and employees.

The report was adopted.

JAGUAR CARS LIMITED

ENTHUSIASM FOR NEW MODELS

MR W. LYONS'S STATEMENT

FAVOURABLE BONUS PROSPECTS

The twenty-first annual general meeting of Jaguar Cars, Limited, was held on March 29th, at the registered office, Browns Lane, Coventry.

In his speech, which was circulated with the accounts, Mr William Lyons, the chairman, said:

The period under review has been noteworthy for the introduction of new models represented by the new type "M" Mark VII saloon and the new range of XK 140 sports models. These new cars have been received with marked enthusiasm in all markets, particularly in North America where our subsidiary company, Jaguar Cars North American Corporation, has continued to expand our already widespread marketing organisation to such effect that the Jaguar car is not only the highest dollar-earner, but is also the leader in numbers of British cars of one make imported by America.

As will be noted, the accounts for the year's working show an increased profit over that of last year, out of which there has been a greater charge for depreciation brought about by the increase in plant and machinery acquired in pursuance of the policy of efficient production methods.

There are higher charges for taxation required to cover the greater liabilities that will arise on the basis of these profits, but the charges under this heading also include adjustments that have been made necessary by agreement, after protracted negotiations, on the company's liabilities for past years. It was possible to give effect to part of those agreed adjustments for income tax in last year's accounts without any further provision being required, but the last ascertainment of liability fell within, and has increased the income tax charge for, the year under review.

The excess profits levy charge, as well as covering the liability to December, 1953, includes an amount required to cover the balance of the full liability for the whole of the period for which this tax has been in force, and which it has been possible to define more clearly as a result of recent agreement on the standard profits of the company for the purpose of this tax.

Stock-in-trade and work-in-progress still reflect the volume of work of government contracts, and against which progress payments have been received, together with the maintenance of stock and materials on a level required to maintain our production rate.

SALES ORGANISATION

Our position in the industry has been further enhanced during the year by the strengthening of our sales organisation throughout the world, and great strides have been made in expanding our service facilities in all countries. In particular, we have been most active in the institution of service training schemes which, although costly, we believe to be of paramount importance, since good service will go far to ensuring the retention of the goodwill and prestige we already enjoy. That this prestige and goodwill are not misplaced will, I think, be exemplified by the remarkable mileages which are being registered by our famous XK engines. Their longevity is such that the demand for reconditioning is practically non-existent. Records reveal that a very high proportion of our engines have been running untouched for over five years, which is in itself a tribute to the quality of materials made available by our suppliers, to the skill of our designers and to the craftsmanship of our workpeople. To them, and to a loyal and conscientious staff I would like to make grateful acknowledgment.

We find much satisfaction in the good relations which exist between the company and its distributors and dealers who so actively pursue our joint interests by efficient marketing methods.

MANY SUCCESSES

Despite the intensification of competition in the field of racing and motor sport generally, our cars have again earned well-merited distinction for their many successes. Though twice winning the famous Le Mans 24-Hours race in the past four years, the second place gained last year is considered by many to rank almost equal with our past outright successes. The Rheims 12-Hours race was again won by Jaguar who also finished 2nd and 4th, whilst the International Sports Car race at Zandvoort resulted in victory for Jaguar together with a new record for the circuit.

That Jaguar cars do not rely for success entirely on sports models was proved in the Silverstone Production Touring Car race where Jaguar Mark VII saloons finished 1st, 2nd and 3rd. The Malcolm Campbell Memorial Trophy for the most outstanding performance of the year by British drivers in a British car was again won by drivers of a Jaguar. This is an outstanding tribute to the consistent success of our cars since this award has now been gained by drivers of Jaguar cars for four out of the five times it has been awarded since its institution in 1950.

Our plans for the future provide for expansion of our production to meet the increasing demand for our cars. This increase will be attained mainly as a result of the additional plant on which considerable expenditure has been and will be incurred, although some expenditure will be in respect to factory extensions.

We are satisfied that our existing models will continue to capture favour for a long time, but we are very conscious that we must not rest on our laurels and new design and development form a very active part of our organisation.

The retiring director, Mr E. F. Huckvale, was re-elected.

The report and accounts were adopted.

At a subsequent extraordinary general meeting the two resolutions referred to, increasing the capital of the company to £750,000 by the creation of 1 million "A" ordinary shares of 5s. each and capitalising the sum of £240,000 by the issue of two "A" ordinary shares for each ordinary share now held, were carried.

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

101st ANNUAL GENERAL MEETING

The one hundred and first annual general meeting of The Chartered Bank of India, Australia & China was held on March 30th at the Bank's head office, 38, Bishopsgate, London, E.C.2.

The chairman of the Bank, Mr V. A. Grantham, presided.

Mr H. F. Morford, chief general manager, read the notice convening the meeting and the report of the auditors. With the consent of the stockholders present the report and accounts, which had been circulated previously, were taken as read.

The chairman then moved that the report and accounts for the year 1954 be adopted and that a final dividend of 7½ per cent, less income tax, be declared; this, together with the interim dividend of 7½ per cent already paid, made a total distribution for 1954 of 15 per cent.

The resolution was seconded by Sir John Tait and carried unanimously.

Sir William Robert Marshall Cockburn was elected a director of the Bank and the retiring directors, Sir Arthur Atkinson Bruce, KBE, MC, the Right Honourable the Earl of Inchcape and Sir Harry Greenfield, CSI, CIE, were re-elected.

The remuneration for the current year of the auditors, Messrs W. A. Browne & Co. and Messrs Deloitte, Plender, Griffiths & Co. was approved.

TRIBUTE TO DIRECTORS AND STAFF

A vote of thanks to the directors, general managers, branch managers, and staff, both at home and abroad, for their successful conduct of the affairs of the Bank was proposed by Mr F. S. Winterbottom, CBE, and seconded by Mr Joseph Nissim.

Mr Winterbottom said that the widespread activities of the Bank in so many parts of the world were a reminder not only of the home staff, but of the overseas staff whose efforts had contributed so much to the success of the year 1954. Unexpected changes in the political and economic fields in many of the countries in which the Bank has branches had called for particular care and devotion to the Bank's interests and to those of the trading community. The stockholders would wish to place on record their appreciation of the staff abroad, some of whom had worked and lived under what must at times have been difficult and trying circumstances. They had every reason to be proud of the service they had rendered. Referring to the increasing association of the Asian staff in the carrying out of the Bank's overseas responsibilities, he expressed the hope that they would find, with the encouragement of the Bank's senior management, a happy future in the maintenance of that tradition exemplified in the Bank's record of over a century of British banking service in the East

Mr Nissim, in associating himself with Mr Winterbottom's tribute to the staff, expressed the pleasure of the stockholders at the appointment of Mr H. F. Morford as chief general manager.

In replying the chairman referred to the difficulties of conducting international business. He felt that these difficulties could be overcome if the mind was elastic enough and one was prepared to meet new situations with new manners and new ways. To do these things the court of directors knew that they could rely today more than they have ever relied, not only on the loyalty of the staff, but also on their initiative and ability.

THE STEETLEY COMPANY LIMITED

(DOLOMITE AND REFRACTORIES)

The Annual General Meeting was held in Sheffield, on 31st March, 1955.

The Accounts for the years to 31st December, showed:

	1953	1954
	£	£
Trading Surplus (after Depreciation, etc.) ...	844,258	894,062
Taxation	536,918	498,639
Profit	307,340	395,423
Issued Share Capital	2,239,083	2,239,083
Dividends	111,427	141,979
Undistributed Profit	195,913	253,444

The following is an extract from the statement to shareholders made by Mr. N. M. Peech, Chairman:

The progress achieved by the Group in recent years has been maintained during 1954. All three Divisions of the business contributed to the further improvement in results. The demand for the products of the Group remains substantial and, in the absence of unforeseen circumstances, the year 1955 should again show satisfactory results.

LEYLAND MOTORS LIMITED

POLICY OF STEADY DEVELOPMENT AND CONSOLIDATION

MR C. BASIL NIXON ON GROUP'S ACHIEVEMENTS

The thirty-sixth annual general meeting of Leyland Motors Limited was held on March 29th at Leyland, Lancashire, Mr C. Basil Nixon (chairman and governing director) presiding.

The following is an extract from his circulated statement:

During the year our trading activities have continued on much the same lines as in 1953, and in this connection the accounts show a modest improvement.

HOME TRADING

The rate of sales improved steadily as the year progressed. In fact, before its close, demands for our vehicles were so heavy that special and urgent measures were taken to speed up production. The efficiency of these is already reflected in increased deliveries.

Our policy of steady development and consolidation has been energetically pursued during the year. We shall take every feasible step to hold the leadership in design and production of heavy commercial vehicles, and to safeguard our markets against an ever-increasing challenge from competitors both at home and abroad.

NEW RANGE OF PRODUCTS

A new range of all-steel cabs is in production for both Leyland and Albion vehicles. These cabs represent excellent value for money, and we have the advantage of being able to supply chassis fitted with cabs on standard specification. A new design of forward-control Comet goods and passenger chassis was introduced during the year, and there is a big demand for these models, particularly overseas. We are proud to be able to report substantial orders for long distance transport vehicles for British Road Services and for military vehicles for the Ministry of Supply. The company has also been honoured by receiving a high percentage of all orders placed by municipal authorities. An important factor in achieving these successes has undoubtedly been the outstanding performance, reliability, and long life of our 600 type diesel engine. Mileages of over 300,000 have been reported by customers between major overhauls. This represents an achievement that would have been thought quite impossible a few years ago.

The business of West Yorkshire Foundries, Limited, continues to prosper, and new commitments have been entered into necessitating further capital commitments and an expansion in plant and equipment.

Self-Changing Gears, Limited, is making excellent progress. Its products have universal application, and the market for these is extending rapidly. Provision for increased capacity to meet this demand is already in hand.

OVERSEAS

Export continued at a high level and amounted to approximately half the total output, which is a record for the Leyland Group, and in volume a world record in our particular line of business.

Many important missions abroad have been undertaken during the year by directors and other members of the staff. In fact, every country of note in the world, including the USSR and China has been visited.

The Commercial Vehicle Show held at Earls Court last September was a great success for Leyland and Albion, and the range of vehicles that we were able to display there not only attracted favourable comment, but enabled us to secure a large volume of new business. In particular the "Worldmaster" 'bus chassis was an outstanding feature and brought us many orders. We also participated in many overseas shows.

It is our intention to continue our policy to encourage overseas expansion by the development of our own service and sales branches, and in appropriate cases by undertaking some local manufacture where there are prohibitive tariffs or where cost can be saved.

THE ACCOUNTS

The balance brought in from the trading account is £3,135,383 (£2,997,498), but the net profit of the year is £1,056,311 (£771,297), and is a considerable improvement on the previous year.

Capital commitments for the group at the end of the period amounted to £299,792 (£233,353), which, merged with the 1955 capital investment budget, total a provisional forward commitment of approximately £1 million.

The liquid position is stronger than a year ago, and that trend continues today.

In view of the results of the past year it is considered that an increase in the ordinary dividend is justified, and it is proposed that a distribution of 6s. (5s.) per £1 stock unit, less tax, be made.

CAPITALISATION PROPOSALS

For a number of years a portion of the profits have been retained for the purpose of expansion and re-equipment, and as a result the paid up share capital is disproportionate to the total capital employed. At the extraordinary meeting to be held immediately following the annual general meeting it will be recommended, subject to the consent of the Capital Issues Committee, that £3,655,840 of the reserves shall be capitalised by the issue of bonus shares in the proportion of two fully paid £1 shares for each £1 stock unit. The bonus shares will subsequently be converted into stock. This issue does not imply that there will be any increase in the total amount to be distributed by way of dividend.

The report was adopted and the dividend, as recommended, was approved.

At the subsequent extraordinary general meeting the board's capitalisation proposals were approved.

JEREMIAH ROTHERHAM AND COMPANY

DIFFICULT CONDITIONS

The fifty-seventh annual general meeting of Jeremiah Rotherham and Company, Limited was held on March 30th in London, Mr F. Sydney Snowden, chairman and managing director, presiding.

The following is an extract from his circulated statement for the year ended January 15, 1955. Trading conditions have been somewhat difficult during the past year for the wholesale distributing trade. The unseasonable weather experienced, both during the first six months—the summer being one of the wettest, dullest and coldest for some years past—and again the mild weather prevailing during the latter part of the year had a definite adverse effect on trading.

The balance of profit amounts to £20,229 as against £21,920 last year but 1954 included the sum of £903 interest under the War Damage Act of 1943. After adding to this amount sundry tax credits of £1,000 and the balance brought forward last year of £60,459 (which included additional interest under the War Damage Act of 1943, of £7,814), there is an available sum of £81,688. From this amount there must be deducted the profits tax on the proposed distribution of £7,000 and the sum of £79 transferred to reserve fund, leaving a disposable balance of £74,609. The directors recommend a dividend of 6 per cent less income tax.

Orders for future deliveries are coming in satisfactorily and the volume of trade for the current year is in excess of that of last year, and given reasonable conditions, we can look forward to the future with confidence.

The report and accounts were adopted.

J. H. FENNER & COMPANY (HOLDINGS) LIMITED

The eighteenth ordinary general meeting of this company and subsidiary companies was held on March 29, 1955, at the Queen's Hotel, Leeds.

The following extracts are taken from a joint statement by Mr C. Bradshaw, FCA, the chairman, and Mr S. B. Hainsworth, FTI, the deputy chairman and managing director.

FENNER MECHANICAL POWER TRANSMISSION EQUIPMENT

The major line of production of the trading company, J. H. Fenner & Company Limited, the complete Fenner V-belt drive, more than ever justifies its position as the leader in this industry. Yours is the only company producing both the rubber and canvas V-belts made either from synthetic or natural materials and the pulleys themselves, and it is astonishing how often the question is asked, "Do you really make both belts and pulleys?" The answer is "Yes" and it has been so since 1937. Certainly the techniques needed in connection with the producing of mechanical rubber goods and the engineering skills needed for pulleys are quite different, but the manufacturing divisions of the company are kept separate and the products only come together at the stage of selling.

The Taper-Lock bushes and pulleys which we manufacture under licence from our friends, the Dodge Manufacturing Corporation of Mishawaka, Indiana, continue to sell on a satisfactory basis, and our greatest problem so far has been to produce them in the required quantities to meet a rapidly increasing demand.

For some years now the considerable amount of development work on Fenner V-belts has shown itself in a capacity to transmit considerably higher horsepowers per unit belt of the order of 25 per cent to 90 per cent. We have now decided that it is safe that these new horsepower ratings should be adopted in the light of the long practical design trials we have conducted both in our laboratories and in the field, and we do stress the point that users should be most careful in employing higher-rated V-belts to be sure that the grooved pulleys which go with them are designed to take the greater loads. All Fenner pulleys which are, of course, produced in our own factory and to our own designs are capable of taking these increased loads.

During the period under review, new products have been introduced on to the market in the shape of Taper-Lock Couplings and Weld-on Hubs and we believe that these will, in the course of time, secure an adequate market for the production of which we are capable.

"FENAPLAST" COLLIERY CONVEYOR BELTING

The progress which has been made in connection with the development and production of "Fenaplast" flameproof solid woven conveyor beltings for use in collieries can be regarded as exceptional. The National Coal Board was in some considerable difficulty in that underground fires were possible because rubber and canvas conveyor belts were being used and it seems to us that so far the only really satisfactory new PVC belts which have been manufactured are those which get over the ply separation trouble because they have no plies and are solid woven. Your "Fenaplast" belt plays an important part indeed in this field and we hope that its use will be extended and supported by the National Coal Board who have expected companies to undertake very considerable expenditure on development work and the installation of special plant, much of such outlay being only recoverable over some years of trading.

OVERSEAS TRADE

At the end of January, 1954, arrangements were made to divide the activities of the group of companies into two main streams, each to operate independently; the business from the home market to continue with J. H. Fenner & Company Limited and trading abroad to be channelled through the new overseas company. We can report that the separate organisation is working satisfactorily and that some improvements are already to be seen in connection with the handling of our affairs and our business abroad.

Through a new company, Messrs Fenner-Cockill Limited, we are in process of establishing, in conjunction with Messrs A. & F. Harvey Limited, of Madurai, South India, a factory in Kochadai, Madurai, which is expected before the end of this year to be manufacturing a range of solid woven beltings under our well-known brands, together with Fenner industrial V-belts and fan belts, and it is expected that before very long we shall be able to add to the unique engineering service for V-belt drives which we are already in a position to give in India through our agents there.

CONCLUSION

There never have been greater opportunities for expansion than at the present time in connection with the businesses in which we are engaged, as will be seen as time goes on, and our range of interests widens. There can be no doubt but that we must seek to secure our place in the newer fields that are developing or hand over the initiative to others. In these circumstances, we prefer to build up our staff, to take the risk and to endeavour to see that your company plays its part and takes its share of the developments in mechanical power transmission and other directions that are on the way. To seek to know what is going to sell best in future years is one of the most difficult operations which we have to conduct because it involves not only consideration of where markets are moving, but an analysis of competitors' activities also. We can only hope that, on balance, we shall continue to succeed in our forecasts and that the products which we make and the reputation which we enjoy in connection with power transmission equipment will continue at the present high level.

NEW ZEALAND MARKET

A well-established, keen and experienced importing firm with first-class trade credentials and offices in Auckland, Wellington and Christchurch desires to expand its activities. We seek exclusive agencies from manufacturers. Can we discuss the sale of your product in New Zealand? References Bank of New South Wales, London. Write direct to Mair and Co. (Importers) Ltd., P.O. Box 1477, Christchurch, N.Z.

THE BRUSH GROUP LIMITED

Accountant trainees required by progressive group of companies operating and using modern systems of management accounting in which successful applicants will receive special training at various factories of the Group. Opportunities may be available from time to time for the trainee to extend his knowledge in fields outside accountancy, but at least one accountancy qualification is essential and only those with qualifications and attributes well above the average are likely to be successful in their application. The preferred age is 23-28, but candidates outside these limits may apply and will be considered.

A generous non-contributory pension scheme is available after satisfactory probationary service and the starting salary is within a range considered to be attractive to men of the calibre and qualifications expected. Future progress will depend on the trainee's own ability and enthusiasm. Applications, including age, education, qualifications, training, experience and present salary, along with a one-page summary of these particulars, should be sent to: Mr Ian T. Morrow, Deputy Managing Director, The Brush Group Ltd., 32 Duke Street, St. James's, London, S.W.1, marking the envelopes "Accountant."

THE B.Sc ECON. DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretaryship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London B.Sc.Econ. (Final) exams. since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies Dept. P17 WOLSEY HALL, OXFORD

FISONS LIMITED require two Senior Statisticians with Honours Degree in Mathematics. One appointment is at head office, Felixstowe, in work covering a wide range of applied statistics for management including operational research, quality control, design and analysis of experiments. For this post industrial experience is required. The second appointment is at their research station at Levington, Suffolk, and the work would cover the design of field experiments and analysis of yield and crop data. Either previous agricultural research station experience or genuine interest in this work is essential. Applicants between 30 and 40 years of age would be preferred. Salary not less than £1,000.—Applications to Personnel Officer (AB), Fisons Limited, Harvest House, Felixstowe, Suffolk.

COMPANY SECRETARY required immediately by group of companies situated in London, with important overseas associations, engaged in pharmaceutical industry. Must be Fellow of C.I.S., or Chartered Accountant and a Law Degree would be an advantage. Age not over 47.

In addition to normal statutory responsibilities a comprehensive experience in drafting foreign agency contracts, patent royalty contracts, tenancy agreements and various inter-company agreements, together with experience in handling trade mark and patent matters and insurances is advisable.

Must be of suitable calibre for eventually assuming responsibility of Director as opportunity exists for appointment to Board of Directors after a period of five years if Principals and Chairman satisfied appointment justified. Non-contributory group life and pension scheme. Commencing salary £1,750 to £2,000 per annum according to qualifications and experience.—Apply Box 880.

CAN BANK RATE MAKE ROOM FOR TAX RELIEF? A careful assessment of the extent to which dear money has eased Mr Butler's dilemma appears in the April issue of "The Banker." Two further editorial articles discuss the new policy for sterling—the "Uncollective Approach"; and the measure of the strains on sterling emanating from the outer sterling area—the first full analysis of this key question.

"Freedom" Versus Prosperity is the title of a provocative article by Dr T. Balogh, the left-wing economist, also published in this month's issue of "The Banker." Other contributed articles include "The Capital Market—its Mechanism and Scope," by Sir Oscar Hobson; and "Welsh Industry in the Boom," by E. Victor Morgan. Price 2s. 6d. from bookstalls or 72, Coleman Street, E.C.2. Annual subscription, 30s. per annum, post free.

AN experienced energetic Chartered Accountant is required as accountant of a rapidly developing London firm with subsidiaries on the continent and possible developments further afield. Knowledge of foreign business organisation and taxation an advantage.—Applicant should state age, qualifications and present salary to Box 177, R. Anderson & Co., 14 William IV Street, London, W.C.2.

MORE BUSINESS AWAITS YOUR EXECUTIVES if they have the use of a 1955 self-drive car. Lowest possible rates. Contract hire by arrangement. No maintenance costs. Choice of over 200 cars and 12 different models. Also guaranteed repurchase scheme and Autopak self-drive package tours in GB and Europe. Ask your secretary to write for new brochure giving full details.—Autohall, Dept. 2, 302-6 King Street, Hammersmith, W.6. Riverside 2881. Cables, Autohall, London.

OWING TO EXPANSION the leading British Independent Market Research Company requires a Production Manager for the surveys division. Office might be at Berkhamsted.—Write, giving full details of previous experience and salary required, to Surveys, Attwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

TAXATION and Financial Expert, Chartered Accountant, seeks appointment as Financial Director/Manager. Experienced finance companies, investment trusts, engineering, building, property development, etc. Remuneration £2,500 minimum.—Box 871.

STATISTICAL, accounting, calculating facilities available in three months' time: electronic machines, London, W.1.—Write Box 879.

UNIVERSITY OF CAMBRIDGE

Applications are invited for the SMUTS READERSHIP. Candidature at this appointment will be limited to persons whose work would be connected with social and economic conditions in the British Commonwealth of Nations, the words "social" and "economic" being interpreted for this purpose in a wide sense. Pensionable stipend: £1,850 a year, subject to certain variations.—Further particulars may be obtained from the Secretary to the Managers of the Smuts Memorial Fund, the Old Schools, Cambridge. The closing date for the receipt of applications is May 30, 1955.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE
CHAIR OF ECONOMICS

The University of Birmingham invites applications for the Chair of Economics tenable in the Faculty of Commerce and Social Science. Three copies of applications, accompanied by the names of three referees, should be submitted to the Registrar by April 30, 1955.

Further particulars of the appointment may be obtained from the undersigned.

G. L. BARNES, Secretary.

The University, Birmingham, 15.
March, 1955.

STATISTICAL ASSISTANT

An interesting vacancy occurs in the Statistical Department at Kayser Bondor Limited, Baldock. The applicant should be a young Honours Graduate in Economics or Statistics. The work will involve investigations into the distributions and allied marketing problems. A good salary is offered to the successful candidate. Generous pension scheme.—Applications are invited from Graduates both with or without commercial experience and should be addressed to the Personnel Officer, Kayser Bondor Limited, Baldock, Herts.

AMERICAN Oil Company with world-wide affiliations desires male addition to the staff of its small London office. Some travelling, and ultimate career rests largely with individual's ability. Duties will be general, concerned with statistical reports, oil movements, financial arrangements and representation. Principal qualities required are dependability, initiative, judgment, diplomacy and accuracy. Graduate 25-35, experience valuable but not essential in oil, accounting and/or statistical studies. Preliminary to interview, write name, age, address and brief background to Box 873.

MARKET ANALYST required for Export Division of Ford Motor Company Ltd., Dagenham. Degree in economics or commerce essential. Must have analytical mind, good knowledge of statistics and sales, long-term forecasting. Experience of foreign markets and/or motor industry an asset. Age 23/35.—Reply to Salaried Personnel Department, quoting reference FMA/PP.

HIGH calibre man required as Factory Administrator for rapidly expanding organisation in the light engineering field whose factory is located near Glasgow. Main qualifications are a strong personality with organising ability. Applicants should be between 35-40 years of age. Salary no object for the right man. Only applicants who have had at least five years factory experience in a similar capacity will be considered and earning upwards of £2,000 p.a.—Box 881.

APPLICATIONS are invited from lady graduates in Economics or Statistics to compile and interpret the statistical records for the London office of a bank operating overseas. Some practical experience of economic and statistical work necessary. Commencing salary £500/£600.—Write Box S. 416, C/o Streets, 110 Old Broad Street, E.C.2.

IRISH Market. Exports £115,000,000; imports £179,900,000; imports from U.K. £97,000,000. Are your interests in this important market fully covered? Top class established Agent will co-operate. Principals only.—Michael P. Sullivan, Agent/Broker, Crown Chambers, 5 Crown Alley, Dublin. 'Phone: Dublin 78885/72089.

OPENING IN SEPTEMBER—Battlsborough House School. Beautiful position on South Devon Coast. Boys 8-18. Entry 8-14. Individual attention. Resident doctor. Home atmosphere, varied activities. Full care during holidays.—Full particulars from Headmaster, Battisborough House, Holbeton, Devon.

ACCOUNTANTS required for Middle East service with large oil company. Candidates, desirably aged 25 to 30 (absolute maximum 34), should preferably be single and must be qualified Chartered Accountants. Pensionable emoluments commencing from £1,095 (incremental) according to age, experience, etc., plus substantial local allowances and paid home leave with passages.—Write, please, giving details and quoting No. 462, to Box No. 8500, C/o. Charles Barker & Sons Ltd., 31 Budge Row, London, E.C.4.

A GENERAL MANAGER is required for well-established subsidiary of a group of companies engaged in the manufacture of chocolate and confectionery. The duties will include responsibility for the commercial management of the company and supervision of purchasing, manufacturing, marketing and selling. Experience of production control and sales development is necessary. Preference will be given to candidates with a University degree. Good salary and excellent prospects.—Applications, which will be treated in confidence, to Box 872.

SPANISH Evening Classes. All grades.—The Hispanic Council, 2 Belgrave Square, S.W.1. SLO 7186.

THE Economists' Bookshop, 11-12, Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (periodicals excluded).

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects. —Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

SULPHURIC ACID

The first stage in producing Sulphuric Acid takes place in the "sintering" or roasting of zinc concentrates shown above—sulphur dioxide being drawn off to the great acid plants that constitute part of the C.Z.C. works at Avonmouth and Swansea.

The Consolidated Zinc Corporation produce annually over 260,000 tons of Sulphuric Acid, this output represents one eighth of the country's total requirements of this vital product for the nation's industries.

The World is their Market

BRADFORD

In 1800 Bradford had only one spinning mill. The city is now the centre of England's thriving wool textile industry. Woollens from Bradford — particularly its fine worsted suitings—are sought after by those who want the best in all parts of the world. But the people of Bradford know that now, more than ever, they are competing against the products of other countries, and that the demand for fine suitings like theirs must be kept alive.

It's the same in any industry. *Making* products for the world—even the best of their kind—is only half the job. You've got to show them, sell them—and *sell them hard*—wherever a market for them exists. Many manufacturers are doing this very successfully through TIME, The Weekly Newsmagazine.

SELLING IN THE WORLD'S MARKET PLACES

TIME's net paid audited circulation exceeds two-and-a-quarter million copies. 93% of the readers of TIME hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

There are five separate editions of TIME* with the same editorial content. One circulates only in the United States. The other four—the International Editions—are published simultaneously and read by important people in over 100 countries outside the U.S.A. You can buy advertising space in just the editions you want, covering the world markets which interest you most.

Advertising in TIME sells around the world!

MANNESMANN

Due to the steadfast policy of keeping pace with technical progress and constantly improving the basic principles of the Mannesmann brothers' revolutionary invention of the seamless steel tube, Mannesmann pipes today enjoy a firmly established reputation throughout the world for dependability, safety, and economy.

Whether it is a question of conveying gas, water, steam or oil, or providing service connections and plumbing systems, or whether long-distance transmission lines and penstocks – no matter how high the gradients – have to be constructed; Mannesmann tubes and pipes can be relied upon to meet fully the severest requirements of any particular application.

Car output up 87%
since 1949—
769,165 cars built in 1954
—397,896 exported

...it's part of Britain's progress, to which

'ENGLISH ELECTRIC'

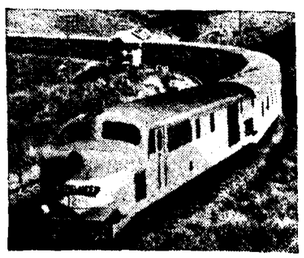
contributes, at home and abroad

The results of Britain's mounting production are now to be felt and seen in every home and High Street. With our industrial output up 20% since 1949, we have goods in plenty of almost every kind.

But this is only half the picture. Britain is producing more for export, too. The value of our exports has risen by 42% since 1949—and Britain must export to live.

Production needs power. Britain's electricity output has risen by 60% since 1948. ENGLISH ELECTRIC has helped to equip many of Britain's new power stations; and also provides the means by which industry *uses* energy for production.

Export enterprise



In addition, ENGLISH ELECTRIC itself exports heavy equipment—and engineering skill; approximately half its business is overseas. All over the world ENGLISH ELECTRIC is earning foreign currency for Britain—and a reputation that helps *all* British exports.

Through its world-wide operations, ENGLISH ELECTRIC acquires a fund of varied *experience*, constantly extended—an asset which adds to the effectiveness of all its work, at home or abroad, for Britain's progress.

POWER FOR INDUSTRY. *An* ENGLISH ELECTRIC *80,000-h.p. steam turbo-alternator in the Birmingham area—a centre of the motor industry.*

POWER IN INDUSTRY. ENGLISH ELECTRIC *motors drive a cold strip mill in a South Wales steel works producing steel plate for car bodies.*

EARNING MONEY OVERSEAS. *This 1,500-h.p. diesel-electric locomotive hauling the "Westlander" on the Queensland Government Railways is powered by* ENGLISH ELECTRIC.

DEVELOPING MARKETS OVERSEAS. ENGLISH ELECTRIC *equipment—like this transformer in South India—is sent to all corners of the globe, and helps to develop markets for British exports.*

bringing you better living

The Captain

SIR WINSTON CHURCHILL is not dead. He has merely retired from the office of Prime Minister. And for this reason, as he himself would be the first to point out, the time has fortunately not yet come to write his obituary. The British people knows grimly well what might have befallen it without Winston Churchill's leadership in the past; what it is wondering today is how it will get on without his leadership in the future. The need—as distinct from the urge—is not to hymn Winston Churchill in his capacity as the greatest personality of our time; but to assess him in his capacity as Prime Minister. If this seems presumptuously early to weigh a giant in the scales, let it be remembered that this is the only means of measuring the problems that confront any giant's successor.

There are three ways in which a Prime Minister makes—or should make—his impact upon public affairs. They are as leader of the nation; as co-ordinator of administration and of policy; and as chief of one of the two great parties in what is nowadays the almost constant electoral struggle. How far will Sir Winston be irreparably missed in all or any of these functions? The answer seems to be that in the first role he has fitted superlatively well; in the second—during his later years—with increasing difficulty; and in the third probably very much better than most of his party realise.

The first of these roles—as leader of the nation—is not easy to describe, and immensely difficult to fill. At its highest, the aim of a great Prime Minister should be to inspire the public with an almost missionary zeal in pursuit of the principal national objectives (which are nearly always uncontroversial); at its lowest, he should be able to ensure that zeal for these objectives transcends all party differences in the House of Commons. A Prime Minister does not always fulfil these functions; but if he does not, nobody else can. There have, in fact, been only two occasions in modern British history when they have been completely fulfilled. They were under the elder Pitt in 1759 and under Winston Churchill in the darkest days of Hitler's war.

Since the war Sir Winston may have fallen slightly below the lofty peak which he bestrode in 1940, but he has remained far above the standard that anybody else is likely to attain. On the most important subjects of the past few years—the need to maintain the American alliance and to contain Communist aggressiveness, the need to have the Germans on our side rather than on the other, and the hope of peace that springs from the sheer horror of the hydrogen bomb—he has made fewer missionary speeches to the public than one would have liked; although even on these no one should underestimate the reverberations from his occasional trumpet calls.

But as a unifying force in Parliament when unity has been essential, as a binding majesty preventing the emergence of dangerous personal antipathies between British parties (as distinct from silly little antipathies within them), Sir Winston has reigned supreme: the work of his Government has proceeded more smoothly because it has often

seemed indecent to Labour to adopt an irresponsible line of argument merely in order to harass him. It was after one of his very few *gaffes* that a Labour member tartly reminded his colleagues that "they had not been sent to Westminster to boo the Prime Minister." Sir Anthony Eden, for all his tried parliamentarism, will not find it easy to fill this role as the leading figure inside party politics who in some peculiar way has risen above them. If he makes a single slip, he will not be as speedily forgiven—on the first mutter of an apology—as is the House of Commons' favourite grandfather. And this may be the most serious consequence, to the essential stuff of British politics, of Sir Winston's retirement to the back benches.

★

If the imprint of Sir Anthony's personality on Parliament proves merely sticky instead of cohesive, it will be very much more difficult for him to fulfil his second new function, which will be as fountainhead and principal co-ordinator of the administration. It is here, of course, that some people are looking for improvements from the change of leader; and it is important to examine why. Sir Winston has, after all, been leader of the most successful wartime administration, and of one of the most successful peacetime administrations, in British history; and it seems a little optimistic and ungracious to suggest that Sir Anthony may do better.

But three criticisms have been levelled against Sir Winston's mode of administration in recent years. The first is that he has favoured a different foreign policy from his Foreign Secretary, from the Foreign Office and from Britain's principal allies. Those who agree with his *penchant* for a meeting, before officials have drawn up an agenda, with whomever it is that is in power at the Kremlin, have a right to express their agreement; but those who have been alarmed by it have no need to hold their tongues in the hush of his retirement. In defence policy, though no such open divergences have come to light, there have been plenty of mutterings about the degree to which Sir Winston has preferred his personal predilections to the carefully considered policies of the service experts. And, finally, in the wide range of matters that are neither foreign affairs nor defence, the report throughout the life of this Parliament has been that Sir Winston would neither show enough interest to get the right decisions taken betimes, nor be content to accept the decisions that his colleagues took in his default. He has often given the impression that domestic matters—and especially industrial disputes—are inconvenient interruptions to the great affairs of state, and that they must therefore be removed from the path without delay. These habits of mind and action have not made for efficient administration.

The fact that these criticisms can be levelled against Sir Winston's administration does not mean that it can necessarily be assumed that Sir Anthony will do any better. Indeed it would be very serious if it could be, for that would be to assume that a Prime Minister with ideas of his own is being succeeded by a Prime Minister with none. Sir Anthony certainly does have ideas of his own, including—if reports be true—some rather peculiar ones in certain branches of economic affairs. He is also a Foreign Office expert of long standing, and this may make it difficult for him to guide foreign policy in outline without unnecessarily interfering in detail. But the reason for supposing that his jerks upon the reins will have less devastating effects than have Sir Winston's lies in a simple fact of history and of personality: the weight behind a new Prime Minister's jerks must be less ponderous than that behind those of the greatest Prime Minister of all time. It is therefore reasonable to suppose that one compensation for the loss of a certain majesty in our affairs may be the gain of more order in them.

Finally, what effect will Sir Winston's retirement have on the Tories' election chances? Some young Conservatives have a ready answer to this. They think that they will get on better without him, but that it is indecent for anybody to say so. The assumption is not indecent, but it is very probably wrong. It is true that Sir Winston can sometimes fall out of touch with the ordinary man, because he himself was born and has been self-manufactured as an extraordinary one. It is also true that Sir Winston looks a very old gentleman on the television screen; but the younger Tories are wrong in supposing that electors vote for those whom they think will be brisk and virile administrators. Instead they vote for symbols; and as a symbol Sir Winston is unique. In particular, there may be many former Liberal voters, especially of the older generation, who have attached to Sir Winston much more firmly than to Conservatism.

★

In broad summary, therefore, the loss of Sir Winston as a rallying force must be bad for the country, the loss of his peculiar administrative methods will be advantageous to it only if Sir Anthony grasps the helm without monopolising the bridge, and the loss of Sir Winston's symbolic electoral appeal is likely to harm his party rather more than that party thinks. There will be many people who will dispute these judgments; there will be many more who will think that they should not have been set down in such a week as this. But the task of a commentator is to state his opinions as he has formed them; and those opinions can in no way diminish, just as mere rhetoric can in no way add to, the greatness of the Prime Minister who has delivered us and of the man who has delighted us through eighty years of imperishable glory. The deliverer passes, the delighter remains. This is why it has seemed inappropriate to cast this article in the reverent cadences of the normal *nunc dimittis*. Long may he bubble, not rest, in peace.

Islands and Wedges

162640

THE seemingly authoritative predictions from Washington of a Chinese Communist attack on the offshore islands in the middle of April, and of American atomic retaliation, were denied, and their authors reprimanded by the President. But it is still the presumption, or at least the hypothesis, that the Communists will launch their attack some time this year. Great as is their capacity for shutting off their propaganda as at a tap, they have hurled so much verbal defiance that they can hardly fail to act. It will be as well for everyone in the western world to think out what will happen, and what attitude he will be called upon to take towards it, well in advance.

The first decision, after the shooting begins, will be America's—and quite personally and particularly the President's. Shall the American forces, which are pledged to defend Formosa, be ordered to defend Matsu and Quemoy as well, where there is no pledge? Nobody knows what answer Mr Eisenhower will give—and that is in itself significant. British public opinion has grown so accustomed to condemning American Far Eastern policy in its entirety that little notice has been taken on this side of the Atlantic of how far it has already moved. Six months ago the prevailing tone of opinion in the United States was so hot on the subject of China that the President was virtually its prisoner. Since then, with great political skill, he has contrived considerable freedom of decision for himself. There is no reason to impugn the sincerity with which he condemns the scaremongers; but the fact is that the war scare is helping him. Every time the risks of engaging in open war over Matsu and Quemoy are paraded before the American people, the party of moderation grows. If, when the time comes, the President's decision is to let the islands go, he will have plenty of support.

But the issue should not be represented as a simple one of obvious sense and moderation *versus* the China Lobby. Even if the President is able wholly to ignore domestic politics (and what democratic leader can ever do that?), it will still be a difficult decision to take. The islands themselves, it is true, are not worth all the fuss. But if they were abandoned, how much of a chain reaction would there be? Could the Nationalist regime in Formosa, with which so much of America's prestige and strategic interest is bound up, survive such a blow, perhaps together with the loss of many of its troops? And if the most formal American undertakings were proved to be unavailing in Formosa, what would happen in the other parts of the Far East where there is reliance on western promises—in Japan, for example, or in South-East Asia? Only those people in the free world who do not care whether the Communists overrun the whole of Asia (including Malaya) can afford to shrug these questions off. Many of those in Britain who are most anxious to restrain the Americans from acting in Quemoy and Matsu might find their immediate peace of mind very dearly bought. They should at least spare a thought for the difficulties of the choice that President Eisenhower will have to make.

★

What attitude should the rest of the free world adopt if the Peking government follows up its threats by armed attack on the islands? For any country that has recognised the government of Mao Tse-tung as the rightful government of China, there is really no choice, for nobody has attempted to assert that the offshore islands are anything but an integral part of China. Even apart from this legal point, there is hardly one of America's allies that does not think it a mistake to try to maintain Chiang Kai-shek's rule so close to the mainland. If the United States acts to do so, it acts alone.

But that is not the end of the story; it is hardly even the beginning. For none of the free countries could safely ignore the dangers of the chain reaction. Still less would it be safe to ignore the fact that the nation thus left to act in isolation is the chief prop and stay of the whole alliance. Simply to say that Matsu and Quemoy should not be defended and to disavow responsibility for what may happen if they are, would be a piece of sanctimonious self-deception. The realistic and proper attitude was admirably stated in a speech two weeks ago by Mr Lester Pearson, the Canadian Secretary of External Affairs, who has been an outspoken critic of American policy. Canada, he said, did not accept some of the American commitments in the Far East. "But that is not saying that they may not involve us," and he made it clear that in any major war threatening the security of the United States, however it might start, Canada could not help but be at America's side. Mr Menzies, for Australia, said much the same thing during his recent visit to Washington; indeed, a major war in the Far East, starting in Matsu and Quemoy, could not spread very far before it involved both Australia and New Zealand under the Anzus Pact.

If this is where Canada, Australia and New Zealand stand, can the United Kingdom's attitude be substantially different? We may legitimately hope that the Communists will not push their expansion so far that any one of the partners in the western alliance feels compelled to pick up the challenge—or alternatively that purely local action by the partner most affected will suffice. But if a major war develops, then we are all in it, whether we like the way it started or not. This is the inescapable logic of collective security. Many people in the United States and in the Dominions dis-

liked and distrusted the course of British diplomacy in 1938-39, with the betrayal of Munich and the foolishness of the Polish alliance. Nevertheless, when Chamberlain decided to fight, he committed the whole of the free world. Similarly, if at any time President Eisenhower decides to fight, he decides for us all. It is this, of course, which gives us the right to urge our views on the Americans about the right and wrong places to make a stand. But whether they accept our views or not we are committed. If we think we can wash our hands of an affair we do not like, we are committing the self-deception that, in its American form, is known as isolationism.

*

If these facts are not as clear to the British people as they should be, the blame lies on Her Majesty's Ministers, who have been very shy for months past of saying what might be unpopular. The result has been to encourage the Communists to think that they can drive a wedge between Britain and America. They know that a major war would force us together—so they will not actually start a major war, yet. But by threatening war over Matsu and Quemoy, and perhaps by actually fighting a small war, they may think they can gain a great deal. They may not gain much territory, but they can make the British people very frightened of what the Americans are going to do next, and the American people very angry about the criticism and the lack of support they get from their allies.

Then, when that manœuvre had been exploited for all that could be got out of it short of major war, the time would come to reverse it. That is when the strange silence that envelops Hong Kong would be shattered. Hong Kong is also an offshore island that the Chinese Communists claim. If it were threatened, the British would find themselves in the grave embarrassment that while they could hardly surrender it (remember the fuss that was made over Abadan, which was not even British territory), they could equally not defend it by themselves. And if by that time the Americans were still smarting over British "neutrality" in Formosa, they would certainly not be responsive to any British claim that Hong Kong was somehow different. And so the splitting process would continue and the nuclear war come nearer. A fantasy? In view of what has happened in the last twenty years, who dares say so?

Is it too late to act in advance to prevent these tragedies? On the contrary, the chance to do so may be just around the corner. At present, Formosa and Hong Kong are the two gaps in the network of collective security agreements. Both of them are excluded by name from the Manila Treaty, and included in no other. No one but the United States is specifically obligated to defend Chiang Kai-shek; no one has specifically undertaken to help the British defend Hong Kong. But if Matsu and Quemoy were once out of the way, would there not be an obvious bargain to be struck? And would not the offer of a bargain be an inducement to the Americans to forget about the offshore islands? The Americans dislike "colonialism" as much as the British distrust Chiang Kai-shek, so there would be no possibility of guaranteeing the permanent status either of Formosa or of Hong Kong. But if America and Britain were to pledge support to each other in resisting any attempt to alter the status of either territory by force of arms, there would be very much less profit to the Communists in making their threats. What is more, a stop would have been put to any possibility of these little islands being used to drive a wedge into the alliance of the free nations.

The danger of the next few months is that, confronted by the threat of renewed fighting off the China coast, many otherwise sensible people in Britain will say that they would rather have peace than the American alliance. Nothing, in fact, could be sillier, for there is no such choice. It is still possible to have both peace and the alliance. It is certainly not possible to have peace for long without it. The first task of the new government in the foreign field is to make that truth perfectly clear to the British people.

The Evils of Purchase

If *all* commissions were purchased, *no* poor men would go into the army; for no man intends to remain an ensign all his life, on pay which will scarcely keep him in uniforms. But as some and indeed several commissions are to be had gratuitously, and as each man expects to have his share of these, poor men are content to enter and to be ill paid. And in order that it may have these gratuitous commissions to distribute, the state does not shrink from the meanness of constituting itself heir-at-law to all who die in its service and from having served it too boldly and too well. Yet it seems certain that, as things now are, it would not do to abolish this shabby and larcenous custom; for if officers of high grades knew that they would receive the value of their commissions at any time and without any hazard, they would never sell out at all till actually laid aside by decrepitude; and the service would be crowded with old valetudinarians and promotion be entirely stopped. At present these men are induced to retire in time from the fear of losing all if they delay too long. Such is the complication and perplexity arising from a system inherently and originally unsound. It is difficult now to know how to set about amending it without introducing evils and confusion nearly as great as those we would reform. The extent to which the system of gratuitous service is carried in the army, may be gathered from a recent return. It appears that the gross value of

			£
216	Commissions of Lieutenant-Colonel	amount to	1,028,925
261	" " Major	"	" 917,225
1,763	" " Captain	"	" 3,669,300
2,320	" " Lieutenant	"	" 1,891,995
993	" " Ensign and Cornet	"	" 501,090
			£8,068,535

This value is calculated at the regulation price: the real saleable value is, as everyone knows, much more—probably not far short of ten million.

The Economist

April 7, 1855

No Newspapers for Lent

THE Court of Enquiry set up to investigate the dispute which has deprived the public of its national morning and evening newspapers will have a tangled skein to unravel. Meanwhile, unless the strikers heed the pleas of Sir Walter Monckton and Mr Robens to return to work pending the Court's report, the Lenten newspaper fast will continue; indeed may well continue after Easter. Unless the Court can make its report to the Minister in a week and put forward recommendations which both sides can promptly accept as a basis for renewed negotiations with an immediate resumption of work, on Friday, April 15th some 20,000 members of the printing unions—compositors, packers, and machinists—will be unemployed. Losses to newspapers, newsagents, and indeed to news-vendors will mount. And by now the absence of newspapers is being felt by the public as far more than an inconvenience; the importance of information both in news and advertisement columns, going far beyond the headline news of major events that can be derived from the wireless, is now being appreciated in the same sense as tap-water is appreciated when the mains supply is cut off.

The dispute is ostensibly about wages, though other motives have brought it to the point of a national stoppage; a solution will have to take into account a variety of claims. The story really begins three years ago when the Newspaper Proprietors' Association, which includes all the London national papers except the *Daily Worker*, made a three-year agreement with the printing unions which are associated in the Printing and Kindred Trades Federation to give a cost of living bonus; this agreement expired last October. The proprietors of the provincial papers, however, made a somewhat similar agreement which does not expire until November this year—which is the reason why the dispute has not so far involved them. When the agreement expired, the NPA and the PKTF started negotiations for a wage increase, and about a month ago the employers' offer was accepted by a major union, Natsopa (the National Society of Operative Printers and Assistants), whose members are being paid at the new rate. The cost of living bonus has been consolidated with the new minimum wage and an increase varying from 9s. to 12s. a week according to skill has been added.

While the other unions in the Federation were considering this offer, it was passed to the district branches of the Amalgamated Engineering Union and the Electrical Trades Union, who have some 800 members employed as electricians and maintenance engineers in national newspaper offices. The AEU men are all classified as skilled; the ETU men are both skilled and semi-skilled. Since before the war these two unions have always accepted the wage adjustments agreed by the printing unions without question; the main reason has been that before the war this ensured that their members, tied to the high wage levels of the newspaper industry, did substantially better than those on comparable work elsewhere.

Last month, however, the North London branches of these two unions objected to the results of the general negotiation. They demanded a wage increase based not on that acceptable to the craft unions, but one which took account of the relative decline in their members' position. This, they argued, is serious and arises from two causes: (*a*) outside the newspaper industry, wage levels, and especially prospects for overtime earnings, have risen for their members and (*b*) in newspaper offices the possibilities of special allowances and overtime earnings are greater for other skilled workers than for electricians or maintenance engineers. There is some substance in these claims; how much will be for the

SOME SKILLED AND SEMI-SKILLED WAGE MINIMUM RATES IN LONDON NEWSPAPER OFFICES

	Basic rates per week, including cost of living bonus		
	1939	1955, before NPA offer	NPA offer
Skilled:			
AEU and ETU—			
Night work	150s	247s 6d	259s 6d (12s 0d)
Day work	120s	211s 6d	222s 6d (10s 6d)
Machine Managers—			
Night work	145s	242s 0d	254s 0d (12s 0d)
Day work	105s	195s 0d	205s 6d (10s 6d)
Press telegraphists	120s	211s 6d	222s 0d (10s 6d)
Semi-skilled:			
ETU—			
Semi-skilled Assistants—			
Night work	112s 6d	203s 0d	213s 6d (10s 6d)
Day work	102s 6d	188s 6d	197s 6d (9s 0d)
Natsopa—			
Brake Hands—			
Night work	107s 0d	190s 0d	200s 6d (10s 6d)
Day work	101s 0d	187s 0d	196s 0d (9s 0d)

Figures in brackets indicate the increases offered by the NPA to PKTF and other Unions.

It should be remembered when comparing pre-war and post-war wage rates that the normal working week has substantially decreased and overtime earnings are correspondingly greater.

Court of Enquiry to ascertain. But when the employers offered to try to meet the AEU and ETU demand by a system of merit bonuses related to the individual job, the reply was that merit money was acceptable only if it was given as a flat rate to all. This makes nonsense of the fact that some electrical jobs are highly skilled, others the merest routine; and that any flat rate increase would disturb the traditional relation between basic minimum wages of all printing workers.

At this stage the attitude of the AEU and ETU negotiators gave rise to the suspicion—to put it no higher—that they were more interested in a strike than in understanding the intricacies of newspaper wage structure and traditional practice. It would appear that no definite

demand for an increase was ever made. It was only after the employers suggested arbitration and the ETU and AEU negotiators refused it, that the claim for a flat 58s. 6d. increase was made. This sum represents a theoretical calculation of what would be needed to put the skilled engineer or electrician in the same relative position as he enjoyed in 1939. It is evident that the AEU and ETU negotiators either did not fully understand, or preferred to ignore, the complexity of the wage structure, and the relation between craftsmen and electricians and engineers.

The basic argument is therefore over "take-home" pay for different categories of men, with differing grades of skill. Apart from compositors, who are paid on piece rates and earn the highest sums of any printing workers (and whose skill is beyond question), electricians and engineers have the highest wages rates. As the table shows, rates for skilled men in all unions have moved together. For a 35-hour week, an electrician on night work was getting £12 7s. 6d. weekly before the new offer, and on day work £10 11s. 6d. for 40 hours. This would be increased to £12 19s. 6d. and £11 2s. respectively. (The figures given in *The Economist* last week were based on a misreading and were incorrect.) Overtime often brought earnings—as was stated in Parliament—to over £15 a week; but it varied very widely from job to job. Moreover members of the other unions might earn much more.

The situation has been further complicated by statements from Natsopa that the employers' recent offer, though partially accepted, was not really satisfactory and that additional demands were on the way. The leaders of the PKTF unions are, however, in an embarrassing position. On the one hand they do not wish to see their 20,000 London members unemployed and in effect sustaining a strike that they did not initiate (and communist-run at that). On the other hand, their members will expect to participate fully in any more wage concessions that can be squeezed from the NPA. This makes the NPA all the more insistent that it cannot make separate agreements on basic rates with the engineers and electricians, though it is perfectly prepared to negotiate with them separately on merit money and conditions generally. (Its position has been complicated by the *Manchester Guardian's* action in offering its electricians an additional advance of 8s. 6d. per week for night workers and 7s. for day workers—to be adjusted to any ultimate NPA agreement). Natsopa has now, moreover, put in for a further increase of 12s.; this at least underlines the proprietors' contention that one section of newspaper workers cannot be considered without taking account of the others.

The employers argue that the strikes are unconstitutional. At the Ministry of Labour talks, the electricians were represented by members of their national executive; the engineers by the district branch only. (Out of five negotiators, four of the AEU had communist affiliations.) Much seems to depend on the attitude of the AEU national executive, recently freed from communist influence. It has decided that the strike is official, and strike-pay will be paid. But it will be under strong pressure from the printing unions, the Government and probably the Labour party to inject some reason and sincerity into the discussions, presumably in evidence at the Court of Inquiry. If there were goodwill, the genuine grievances of the engineers and electricians could be met, though it would take time, and it would have to be done within the accepted relationships between skilled and unskilled basic wages in the industry. The fact remains—and will emerge anew from the Court's analysis—that newspaper printing wages are high, and are about to go even higher. This puts the dispute in a completely different category from that examined by the last such Court which dealt with the railways. Certainly the public is not likely to feel that a demand for an increase of 58s. 6d. can be anything but an opening bid, and a pretty crude one at that.

Fraud at Lloyd's

FOR the first time in history a member of Lloyd's has been sent to gaol for fraudulent conspiracy in his underwriting. He is accompanied to prison by the chartered accountant who audited his books, and the two men have now started on sentences which between them add up to twelve years. The insurance claims that the underwriter cannot pay will certainly be heavy; but they will all be met by the Corporation of Lloyd's and no policy-holder will suffer from the failure. That goes without saying. But Lloyd's has decided—again for the first time in history—not only to pay the policy holders but to free from liability the deposits and personal fortunes of the "names" who were fraudulently induced to join this unhappy syndicate. Everything will be borne by the defaulting underwriter's fellow-members, and the judge at the Old Bailey told the jury that Lloyd's emerges from this episode with an enhanced reputation for fair-dealing and integrity—a notable and well deserved tribute.

The deficiency created by the failure is estimated at something between three quarters of a million and a million pounds. There are many claims on the syndicate still unrepresented and the work of settling them will take so long that the auditor, who has a sentence of four years to serve, will be free again before the last of them has been dealt with.

Wilcox, the convicted underwriter, has had a strange career. He has spent all his working life at Lloyd's; becoming an underwriting member and underwriting agent in 1945. He seems never to have held a prominent position in the market, but by writing bad business at cut rates he built up a fairly large account and greatly exceeded the limits set by the Committee on the extent of his underwriting—a fact that was dishonestly concealed from the Committee and tempted him into some of his criminal devices. On his own confession he has been insolvent for more than twenty years and never once made a genuine profit. But living (as he said himself) only in a style suitable to his station he restricted his personal expenditure to a little over £100 a week and paid in income and surtax about £10,000 a year. He must have had a way with him, for a few months before the collapse three men of experience were persuaded by him to become names in his tottering syndicate—one of them a shrewd bargeowner from Hull, another a London financier and the third a peer of the realm.

★

Year by year the members of Wilcox's marine syndicate were told that good profits had been made and they received handsome cheques as their share of the distributions. In fact the syndicate never made a profit. It lost money all the time and the annual hand-outs to the names were just sops to prevent them from asking awkward questions. If they had become restless and inquisitive and had started an independent enquiry into the books they would have found that Wilcox (trustee though he was of the underwriting funds) was dipping both hands into the till and getting away with large amounts of trust money. He took altogether nearly £90,000 and resorted to all sorts of criminal tricks in the process. He drew a cheque in favour of a non-existent bank, endorsed it with his own signature, and speculated with the proceeds. On every day of the year but one the syndicate's ledgers showed him as a debtor for a very large sum; but on one day—December 31st—his account would be balanced. On that day Wilcox gave the syndicate a cheque on his private account for the amount of the debt. But on the first day of January he would draw a cheque in his own favour on the syndicate's account and the two bits of paper would meet each other at Wilcox's bank, salute each other in the manager's office, cancel each other out and go their separate ways, their purpose in life fulfilled.

In the spring of the year, when the draft accounts were ready, a conference would be held to look at them in their natural unadorned form. They never made an attractive picture. But the balance sheet was submitted at the conference to the same kindly treatment that an ageing woman of fashion gets at a beauty parlour. Blemishes were concealed; weak spots were fortified; and by the time the beautifying process was complete the figures, though never pretty, just passed muster. When the appearance of the document could be improved by additions to the premium income, an imaginary sum of £94,000 was conjured out of the atmosphere and pushed into position on the credit side. When the premium income was inconveniently large, a big block of premiums would be given a new name and called "re-insurance recoveries." If one year's results looked worse than the other's, then assets (irrespective of the year to which they rightly belonged) would be transferred to the weaker spot, and so the blemish would be covered over. As between one year and another Wilcox and his auditor seem to have adopted the socialist principle "from each according to his gifts; to each according to his needs" — orthodox socialism but heterodox accountancy.

★

The main check exercised by the Committee of Lloyd's on dangerous trading by Lloyd's underwriters is the annual audit which has been in existence now for a good many years. It is an elaborate procedure, a good deal more searching and exacting than the audit of a limited company, and it is framed on certain essential principles that were first suggested in an article on Lloyd's that appeared in *The Economist* sixty-five years ago. The procedure was adopted by the Committee and members of Lloyd's in 1908 and its provisions are two-fold: (1) that all premiums must be kept in a trust fund; and (2) that no profits may be distributed unless an auditor (approved by the Committee) has given a certificate that the trust fund is adequate to meet all known and prospective claims on the underwriter's account. It is not left to the auditor to decide on his own judgment whether the funds are adequate. He must be guided by a test of solvency which the Committee gives him every year—a test that must be rigidly applied and satisfied at every point. If for any reason a member's figures fall short of the standard that fact must be immediately reported by the auditor to the Committee, and then, unless the member brings fresh assets into his trust fund and raises it to the required level, he must give up underwriting. In the forty-seven years during which the audit has been at work it has failed only twice and in both cases dishonesty was the cause of the failure.

The reason for the audit's failure in the case of Wilcox is unmistakable. It was the issue year after year of fraudulent audit certificates signed and put forward by a chartered accountant. The auditor was a party to one criminal device after another. He knew that trust funds were being breached; that assets were inadequate; that some of them were invented *ad hoc;* that exchange cheques had been used to conceal deficiencies; and that the Committee's requirements were not being fulfilled. In spite of it all, he signed certificates of solvency both for the underwriting syndicate, which was in a hopeless position, and for Wilcox's brokerage business, which had not been solvent for years.

To policy-holders (who will be paid their claims whatever happens) this is only of academic interest. But the Committee of Lloyd's will doubtless be re-consider-

ing in the light of Wilcox's career their views of the value of audit certificates and discussing what reforms should be introduced to make impossible such a deplorable misuse of them in the future. For Lloyd's itself to undertake the audit of all the underwriting accounts would be neither practicable nor desirable, but the Committee might reflect on the possibility of setting up a small organisation that would do for Lloyd's something of what the Comptroller and Auditor-General does for Parliament. A Comptroller for Lloyd's would hardly need to examine or certify all the accounts of all the members, but he should be empowered to call for accounts when and how he thought fit and audit them to whatever extent he might think necessary. If Lloyd's Committee had had in the past an expert who performed this duty under their authority, auditing a set of accounts here and a set there, then it is highly probable that the Committee would have seen the inside of Wilcox's ledgers, not after the fuse had blown, but years ago when the deficiency was a baby deficiency and the worst of the frauds had not been attempted. Indeed it is probable that no fraud ever would have been attempted, for the knowledge that Lloyd's Comptroller and Auditor-General might call for the accounts at any moment would have been a very powerful aid to honesty.

The Committee of Lloyd's are to be congratulated on undertaking this prosecution and forcing this case into the open. It would have been so much easier for them to hush it up ; but to do so would have been a great mistake. It would be easy too to assume that never again will a criminal or a careless auditor present a fraudulent or a mistaken certificate. But it would be wiser not to overlook the possibility.

Notes of the Week

Under Sir Anthony

By the time that these words are read, the composition of Sir Anthony Eden's Government will presumably have been announced. At the time that they are set down the expectation is that the new Government will hold office for only a few weeks before plunging into a general election. Belief in a May election is now the established orthodoxy. Indeed a rumour began to roll through the corridors at Westminster this week that the poll might be as early as May 19th or May 12th. The party organisers, who have long regarded even the favourite date of May 26th as an indecent rush, are looking disbelieving but slightly frantic.

The main interest in the new Cabinet will centre on the choice of Foreign Secretary. It has been generally assumed that Mr Macmillan has been groomed for this, and he has the most obvious claim to be regarded as Number 3 in the new hierarchy. But several other kites have been flown from the newspapers this week, or rather from some of those newspapers that are not strike-bound. One of these rumours, that Mr Butler might eventually move to the Foreign Office, seems to have been partly rooted in the theory that Sir Anthony Eden's health will not allow him to lead the party for an era of Churchillian proportions ; in that case, it is said, his heir presumptive should get greater experience of foreign affairs than he can have enjoyed during his prewar under-secretaryship to Lord Halifax. Whether or not this was ever seriously considered, it has been rejected, and it is understood that Sir Anthony Eden has decided to take over the Ministry of Defence in order to release Mr Macmillan for the Foreign Office. For the Prime Minister to hold two offices himself is clearly wise only as a stop-gap measure before an early election.

After the election, and if the Conservatives are returned, many people will expect an influx of younger blood into the lower reaches of the Cabinet. The expectation may be exaggerated. The Conservatives have now a larger stock of Ministerial and junior Ministerial material than at almost any previous stage in their history ; if new men are to come in, it is difficult to see which old ones are to go out. Above all, little credence should be given to reports of "Eden men" jostling with "Butler men" in the queue for office. Many of the younger Tories who have made their mark in domestic affairs look to Mr Butler as their spiritual leader, but they look to Sir Anthony as the national figurehead of which Sir Winston's retirement leaves them so badly in need. Sir Anthony is therefore taking over control of a remarkably united team ; in this respect, as in some others, his inheritance will be regarded with envy from the other side of the House.

Rogue Elephant Amok

Anyone in the Labour movement who expected to see a more meek and discreet Mr Bevan emerge from the recent rumpus has had his illusions quickly shattered. Last week-end Mr Bevan visited his constituency at Ebbw Vale ;

and, no doubt intoxicated by a unanimous vote of confidence from the local Labour party, he made a speech which showed just how successful Mr Attlee's recent disciplinary committee had been in securing "assurances of future conduct" from him. "I have disagreed with many of my colleagues and that disagreement has been going on for some years," declared Mr Bevan flatly, "and if there is further disagreement it will go on for more years. I solemnly declare that I am not prepared to buy a successful public life at the cost of a shameful silence about the things I think should be heard." Later he elaborated the theme: "If belonging to the Labour movement means we are going to be driven to vote for propositions in which we don't believe, and in which we think the fate of mankind will be involved, then no discipline in the Labour movement will ever drive me to vote for such propositions. I am not developing a persecution complex, nor am I pretending that my colleagues were always wrong, and I was always right. That would indeed be a piece of immodesty and personal conceit. But I am arguing that this movement would never have been formed, its life would have been short, if the leaders of the Labour movement had not been allowed to have arguments of that kind among themselves. All I am asking from my movement is the same amount of toleration as I am ready to give. I don't want expulsions."

Some Labour MPs claim that this was more reasonable talk than is often heard from Mr Bevan, but that is making a poor best of a bad job. An attempt, probably an unwise attempt, has been made to expel the rebel from the party ; it has been called off in favour of a censure and a warning to Mr Bevan that he must not rebel again ; Mr Bevan has now declared that he will rebel again whenever he pleases. What happens next? There seems little doubt about the answer to that question. Throughout the election campaign, with the unity and precision of a dance chorus, the Labour leaders will be turning a deaf ear towards their rogue elephant's trumpet. After that, if they lose, the hatchets will be brought out for use among themselves.

Talking Before the Talks

Now that the French and Germans have completed ratification of the Paris agreements, there is every reason to encourage the remaining countries, Belgium, Holland and Luxemburg, to follow suit as quickly as possible. For until they do, the forthcoming Atlantic Council meeting must be delayed—probably until the first half of May. Apart from welcoming the Germans as members, that session is bound to be used for talks between all the Nato foreign ministers on the substance and manner of negotiating with Russia ; and, as M. Faure put it last week, not only France but the West as a whole "can wait for a few weeks more or less, but we must not wait too long."

Although the three main western powers, America, Britain and France, are jealous of reserving their right to determine the scope and timing of talks with Moscow, full consultation and complete understanding with their allies is an essential ingredient of the preparatory stage. And several prickly questions of procedure have already appeared. How far is Western Germany now to be included in the inner ring of top level negotiations ? How far is the new Western European Union (WEU) to be encouraged to form a distinct group—part way between the committee of the western "big three" and the Nato club as a whole ? How far can the three be expected to bow to general Nato views anyway ?

The rise of Germany adds a new bite to all these questions, and Dr Adenauer's voice must certainly have a prominent place in the preliminary discussions, even if he can play no more than the role of "consultant" when dealing across the table with Mr Molotov. If the officials cling to the legal position, then they should leave Germany out when that country's own future comes up, since the letter of the WEU treaties stipulates that it is precisely on matters concerning Germany as a whole that the Bonn government is not sovereign and the three former occupation powers retain their rights. Nevertheless, whatever some people in Paris may feel, it is to be profoundly hoped that the other governments will have the good sense at this stage to draw Dr Adenauer in as an equal on all matters in which Germany is concerned. Even before the Federal Republic was an ally, he had come to be regularly consulted. There are now even stronger political reasons for showing the Germans that they have gained from the Paris alliance and are full partners of the West.

Explosions in Cyprus

It is cheerless to hear of bomb attacks aimed at the British military headquarters just established in Cyprus—still more so to think that these marks of disfavour about a Nato establishment come from right-wing Greeks whose freedom from Communist oppression is largely due to the North Atlantic Treaty. But with the perpetrators of the explosions which rocked several towns in Cyprus last week, parochial nationalism comes first: they are known to be right-wing partisans of *enosis* or union with Greece, and are getting support for their methods from somewhere on the mainland. They were furnished with smuggled supplies of dynamite, and encouraged by the inflammatory outbursts which Athens radio still mingles with the more moderate broadcasts (advising against violence) which it has recently been putting out.

The first incidents took place in the early hours of April 1st, when, in a number of places throughout the island, army barracks and installations, police stations and public and private buildings were attacked with home-made bombs and explosives ; the government radio station near Nicosia was put out of action and there was a good deal of other damage, but fortunately very few casualties. These attacks, which were followed later by others, coincided with the closing stages of the preliminary hearing of charges against thirteen men accused of promoting civil war and smuggling explosives last January ; they did not exactly help to substantiate the claim put out by Athens radio that these men are the innocent victims of a British "frame-up," designed to excuse British terrorism in the island. All thirteen have been committed for trial by a higher court next month.

Although the noise was considerable, there is no serious general state of tension. Business is as usual and large numbers of the Greek inhabitants (none of whose premises or businesses have so far been damaged) would

prefer no recurrence ; who wants to be faced with cancellations of bookings for the 1955 tourist season that is just starting now ? There is an element of the Greek population —and one of unknown size—that does not want to see the island turn into another Ireland. Nor, of course, do the British. If the explosions continue, the authorities will not be able to pursue their policy of preparing for a constitution ; the task they have set themselves would be far easier of execution if a few of the silent Cypriots who do not want explosions pipe up and say so.

More Conservative Counties

THE number of seats gained by the Conservatives in the county council elections has been more or less in line with both Tory and Labour expectations ; but, from the Tories' point of view, the gains have been made in all the right places. In most of the mass of rural and suburban counties they control, the Conservatives and their allied Independents have picked up a seat or two compared with their disastrous performance in the last county elections in 1952 ; but it does not necessarily follow that their standing in these areas is back to or above their level of October, 1951, which is what matters from the point of view of the coming general election. But the Conservatives are apt to disregard this point in glee at their successes in the marginal Labour counties. Six of the meagre twelve county councils which Labour controlled up to last week had been Conservative or Independent between 1949 and 1952, and it was at these that the anti-Labour forces most determinedly set their cap. Up to Wednesday morning results in four of the six had been announced—Lancashire, Essex, the West Riding of Yorkshire, and Carmarthen—and in each case Labour lost its majority. The results in the other two —Staffordshire and Northumberland—were expected later on Wednesday.

With their success in Lancashire, which is riddled with marginal Parliamentary seats, the Conservatives are particularly cock-a-hoop, and they have also gleaned good news about marginal Parliamentary seats in Middlesex and Kent. The fact that their gains have been greatest in the areas that have been most bitterly fought over, however, suggests that their superior organisation in local elections has had an important effect. This organisational factor, and the very low size of most of the polls, makes it dangerous for them to draw light-hearted and optimistic conclusions for the general election. And the need for caution is underlined by a detailed study of the poll that can most easily be analysed in Parliamentary terms: namely, the county council elections in London.

Straws from London

IT is to the London County Council poll that the seeker after straws for the general election inevitably turns most eagerly ; for the election here is fought within Parliamentary boundaries, with three councillors being elected from each of London's 42 Parliamentary constituencies. An important point to notice here—as elsewhere—is that only some 32 per cent of the electorate voted at the LCC elections last week, compared with about 75 or 80 per cent that might be expected to turn out at a general election ; it is fairly generally accepted that among those who do not bother to vote at county elections—and especially among the "illiterates" who do not know that these elections are going on at all—there are rather more Labour than Conservative supporters.

With this in mind, the results of the LCC elections were almost exactly in line with the forecasts of those who do not believe that there has been any major shift of opinion since October, 1951. The Labour majority on the council was cut from 55 to 22. Of this cut of 33 in the majority, five were due to accidental previous vacancies and to the rearrangement of constituencies by the Boundary Commissioners. This rearrangement of boundaries in London, incidentally, now seems likely to have cost Labour only one Parliamentary seat instead of the two that some people had expected ; the new marginal constituency of Barons Court gave a majority vote to Labour in the LCC elections, although only by a very small margin and after frenzied recounts. The rest of the 28 cut in Labour's majority was due to fourteen Conservative gains spread through six Parliamentary seats. Three of these six seats were the trio that went Labour (or partly Labour) in the LCC elections of 1952 after voting Conservative in the general election of 1951 ; they included the desperately marginal Conservative Parliamentary seats of Battersea-South and Camberwell-Dulwich. The other Conservative gains were in the marginal Labour Parliamentary seats of Wandsworth-Central, Wandsworth-Clapham, and Holborn-St Pancras. In Wandsworth-Clapham, however, the margin between the bottom Conservative councillor and the top Labour one was only 124, which most people would expect to be wiped out by the larger Labour poll at a Parliamentary election ; while in Holborn-St Pancras, which showed the biggest swing to the Tories of any London constituency, the large Cypriot vote (mostly Labour) is more important in Parliamentary than in local elections.

From these results the best guesses at general election prospects in London might be: (1) Labour may have difficulty in holding Wandsworth-Central, and must feel less happy than it did about Holborn-St Pancras ; (2) the Conservatives might still lose Battersea-South and Camberwell-Dulwich if a Liberal intervenes at either place ; (3) the rearrangement of constituency boundaries is likely to lose Labour one seat ; but (4) the odds seem to be against any change in any other London constituency. These cannot pretend to be accurate forecasts, but they reinforce the main lesson of the county polls: that the coming general election still looks like being a very close-run thing.

Plan for Kenya

IN common with other colonies, Kenya in 1946 prepared a ten-year plan for itself ; it has now consolidated the tag end of this with the many schemes introduced as the result of the emergency into a new development programme for 1954-57. This is described in great detail in a sessional paper that was presented to the Legislative Council this week. It shows the extent to which Kenya has continued to make economic progress despite the Mau Mau revolt ; although that revolt has disrupted parts of the economy and disorganised the government's finances, it has also provided a—perhaps inflationary—fillip to trade and production. Between 1946 and 1953, for example, generating capacity rose from 16,000 kW to 48,500 kW, railway freight ton-miles from 665 million to 1,182 million, and cement consumption from 21,600 tons to 105,800 tons. Unfortunately, export income has shown no such steady advance, but has fluctuated widely with world prices ; one of the mysteries of the matter is Kenya's persistent power to import 150 per cent more in value than it exports. So far the East African statistical office has been unable to work out a probable balance of payments.

This is a weakness, despite the otherwise lavish statistical detail given for the plan. The impression remains that Kenya's development is precarious. The short-term productive part of the new programme has two main features. One is the considerable amplification of the Swynnerton plan for African agriculture to which Britain contributes £1 million annually. The other is the launching of schemes to provide technical advice and assistance, research, storage, transport and other facilities, on the basis of which white farmers may be encouraged to put into operation the Troup report for raising agricultural output in the Highlands ; this would involve their finding some £47 million of privately-raised capital. For the rest, the Government's plan covers the whole economy: education, administration, social services, housing, transport, health—and prisons. Total expenditure in the three and a half years is forecast at £32.7 million. The plan—which depends heavily on British aid in all forms—is intended decisively to raise Kenya's national income (which in fact rose from approximately £53 million in 1947 to £109 million in 1953), and thereby make a contribution to healing racial differences. But it emphasises two things: Kenya's dependence on agriculture, so that expansion of output must henceforward be as much an African achievement as a European one ; and the heavy cost of triplicating so many services (notably education) to permit separate treatment for the three races.

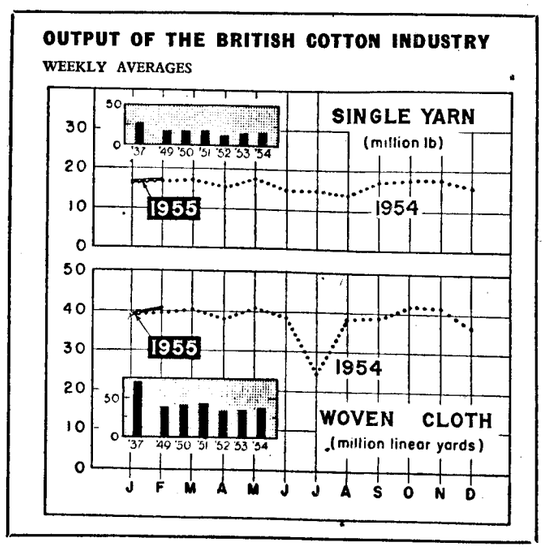
China Purges a Leader

REVOLUTIONS devour their children and China is to prove no exception in beginning violent changes in the top level leadership. It is now disclosed that at a Communist party meeting last month Kao Kang was purged and he has already committed suicide. Suicide or otherwise, Kao Kang was no minor figure in China. A guerilla leader in Shensi, he joined Mao Tse-tung when the latter arrived there at the end of the famous Long March. After the civil war he became the boss of Manchuria, China's industrial base, and when a State Planning Commission was set up in November, 1952, he was appointed its first chairman. Chief planner, vice-premier, a member of the party's *politburo* and vice-chairman of the military council, Kao Kang certainly belonged to the inner ring of Chinese leadership.

His star, however, has been fading for some time, and when last year Liu Shao-chi, the secretary of the Communist Party, violently attacked provincial overlords for growing too big for their boots, it was generally assumed that he had Kao Kang in mind. It is not so far possible to tell what was the real cause of the actual purge, whether Kao Kang had shown too great a degree of independence or whether he had taken a wrong view of the pace of industrialisation in China's first Five-Year Plan. The facts merely are that nothing had lately been heard of him until the present accusation that he was trying to transform Manchuria into "the independent kingdom of Kao Kang." Economic issues almost certainly played a key role in the quarrel since, according to Moscow radio, the conference which decided to purge Kang also agreed to carry out changes in China's economic plans.

The nature of these changes should throw some light on the struggle that has gone on behind closed doors, but it already seems that the purge will not end with the death of Kao Kang—or the fall of yet another "overlord," Jao Shu-shih, boss of Shanghai and Eastern China. Writing recently in *Pravda*, the chief Chinese prosecutor announced that the fight against "economic wreckers" will have to be stepped up ; the purge of Kao Kang in fact coincided with the creation of a special control commission on the Soviet model to watch over the activities of party members. Although Mao Tse-tung certainly sits in a more comfortable position than Mr Khrushchev, it appears that in China, too, changes in the party line cannot be carried out without victims.

Ad infinitum in Palestine . . . .



AS year succeeds year, the most depressing feature of the news from Palestine is its unchanging nature. Two weeks ago, just as the Security Council was unanimously condemning Israel for wilfully engineering the raid of February 28th on Gaza, the United Nations Mixed Armistice Commission, meeting in Jerusalem, was censuring Egypt for a "brutal and murderous" attack on a wedding feast in the southern Negev. In both cases, the alleged culprit decries the verdict. Just as in the old days of the British Mandate, so in the new era of the United Nations, the only course available to the umpire is to urge the contestants not to let it happen again. Even so, further incidents have taken place this week.

The pattern of events leading up to these frontier affrays also lacks variety. Each time the Israeli army has staged one of its rare but potent army attacks, the incident has been preceded by murders perpetrated during infiltrations so deep into Israel that Israeli morale needs a boost ; on the Jordan frontier, after each major reprisal, the Israeli frontier police can show, by the graphs they keep, a marked drop in the rate of Arab infiltration. The hill Arab, however indigent, hesitates to bring retribution on the heads of villages that are full of his relations. But on the Egyptian frontier the panacea may not produce the same result. For the Gaza refugee bears no blood relationship to the Egyptian soldier on guard in the area. On Israel's southern frontier, therefore, sparring may prove much more difficult to eradicate.

It is not only in and around the frontier that the pattern of emotions is unvarying. In the United States there has been a small but sharp reminder that none of the modern changes in the Middle East—the birth of Israel, the reve-

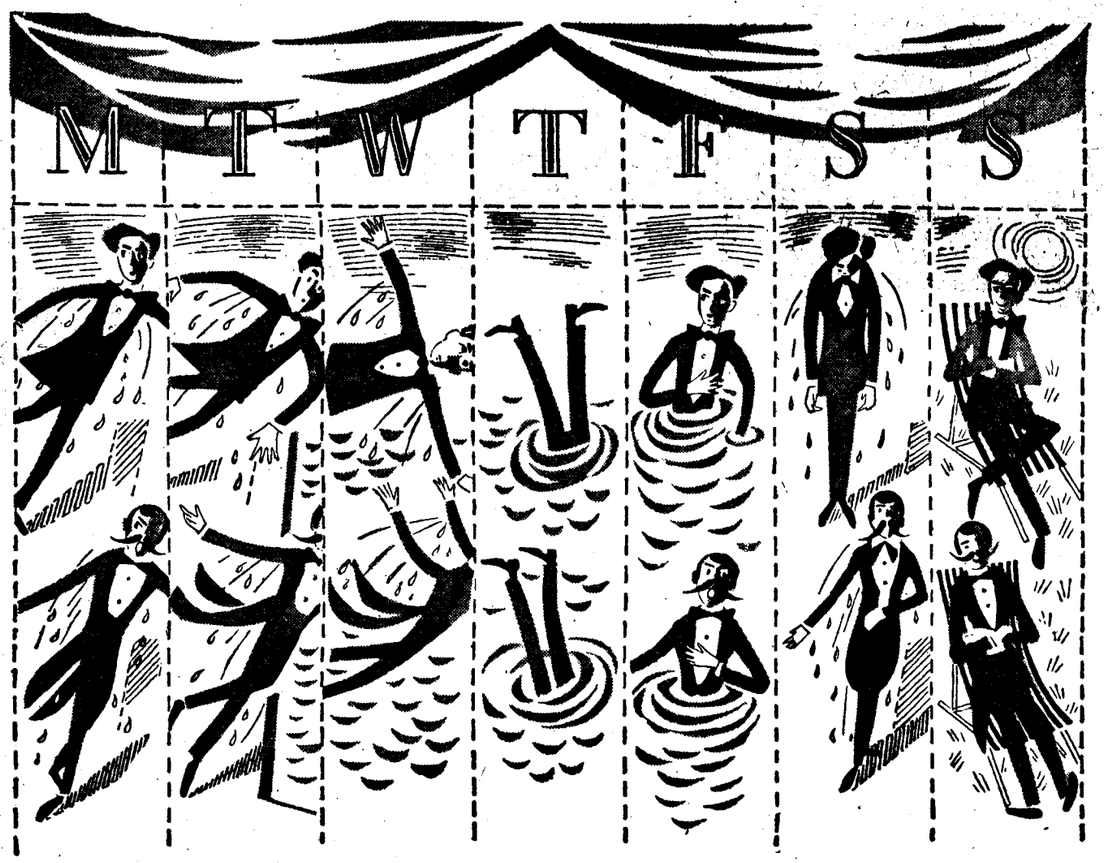
lation of the extent of Arab oil reserves, the modern tempo of the cold war in Asia—has altered the pulls and counter-pulls that are exercised in the course of American domestic politics. On March 25th Mr Harriman, the Governor of New York State, addressing an important Jewish audience belonging to the largest single colony of Jews in the world, that of New York City, drew loud applause by attacking the Secretary of State, Mr Dulles, for his recent statement that Israel's behaviour at Gaza had made the Middle East more difficult to stabilise, and had "forced the United States to change its timetable on defence arrangements." Stability is elusive if one leading American speaks thus while another thunders, as Mr Harriman did, that Israel "will be defended if necessary with overwhelming help from the outside."

On Monday the House of Commons approved Britain's accession to the Turco-Iraqi pact after an acrimonious discussion during which the main point debated was whether or not this accession harmed Israel. Israel's champions put its point of view, which is that the pact is harmful. They say that it affords to an Arab state guarantees Israel does not possess, that Israel's enemies will get arms at cut rates, and that it will therefore make the Arabs even more unwilling to conclude peace than hitherto. They also voiced opinion that the pact, by being partisan, undermines the Tripartite Declaration of 1950 which provides for immediate action against a violator of the armistice line. Sir Anthony Eden countered these arguments with a reminder of his undertaking, given in November, that Britain upholds that Declaration and would "most certainly" go to the help of Israel if it were attacked by an Arab state. But it is clear that the Israelis and their champions are out for an even more specific guarantee than this. They are in no mood to take in the obvious point that both Britain and Turkey have long been countries Israel can count among its friends, and that both are far more likely to restrain than to provoke an Arab ally.

Herr von Bonin's Heresy

THE real moral of the case of Herr von Bonin is in danger of being lost in the debate about the merits of his plan for defending western Germany. Herr von Bonin is a former German staff officer with a distinguished war record who, until his recent dismissal, was head of the planning section of the embryo German War Office. He was dismissed for submitting to outside military experts a defence plan which did not accord with that of his chief, General Heusinger. Herr von Bonin believes that the defence of western Germany should not be left to a highly-mechanised Nato force which would conduct mobile warfare inside Germany, probably retreating through a devastated country and returning one day to liberate it. His own idea, which has been publicly advocated by former generals and staff officers, is to set up a national militia under German command which would be armed with anti-tank guns and would defend the zonal frontier to a depth of about forty miles.

This Bonin plan is the product of a school of thought which holds that Germany's interests are not properly protected by Nato and the Western European Union. It is a school that will undoubtedly grow in strength, and Herr von Bonin's ideas have been supported in newspapers close to the Democratic party. The Social Democrats liked the plan at first but have become chary of it, now that the rumour is being spread that the militia might be a new "Black Reichswehr" to be used against strikers. Its advocates say that, unlike the official plan, it does not presuppose the continued division of Germany and a civil war between east and west Germans.



The incident shows that when the Germans are armed many of them are going to have awkward ideas of their own. But the important thing is that Herr von Bonin was dismissed. His plan was rejected by General Heusinger in favour of one drawn up by the European-Atlantic alliance and accepted by a body—the interim committee of the EDC—which included German generals. The affair demonstrates how right it is to rearm Germany within the framework of a western coalition; otherwise, Germans would one day have to set up a national army with an independent strategy.

More for the Health Service

THE brake applied to expenditure on the health service has been considerably eased for the new financial year. The net cost to the taxpayer is expected to be up by nearly £25 million, an increase of almost 6 per cent on estimated expenditure (including supplementaries) in the year just ended and of over 7 per cent on the original estimate. If the year 1952-53 is excluded, because it had to bear the back payments of the Danckwerts award to general practitioners, this is the biggest increase since the carefree years when Mr Bevan was at the Ministry of Health.

As will be seen from the accompanying table, all the main branches of the health service show some rise in

Policyholders and Agents, unless shareholders, are not entitled to vote.

Every week-night for 8 months,
two West End actors were pushed fully clothed into a swimming
pool on the stage. Strange as it may seem, the wardrobe mistress

Never wet on Sundays

was not a bit perturbed, because the men were clad from head to foot
in garments that did not shrink,
always retained their creases,
and were fully dried out and ready to wear
by the next performance. The secret was, clothes made entirely of 'Terylene' polyester fibre.
This new all-British fibre has a great future.
All sorts of things – from fishing nets to trousers, from curtain fabrics to women's underwear –
can be made from it, and every day brings an extension of its uses.
At Wilton, in North Yorkshire, I.C.I. has built a 'Terylene' plant
which started operations early this year,
and during 1956 production will
reach a rate of 22 million lb. annually.

Thus, and in a thousand kindred ways, I.C.I.'s research and production are serving the Nation.

ICI

their estimate. The sharp check to the cost of the dental service that was apparent when the charges to patients were first introduced is evidently weakening, and the gross cost is slowly climbing back to its earlier level of over £40 million. The pharmaceutical service needed a supplementary estimate in 1954-55, and a further tiny increase is expected this year. Similarly, more people are having

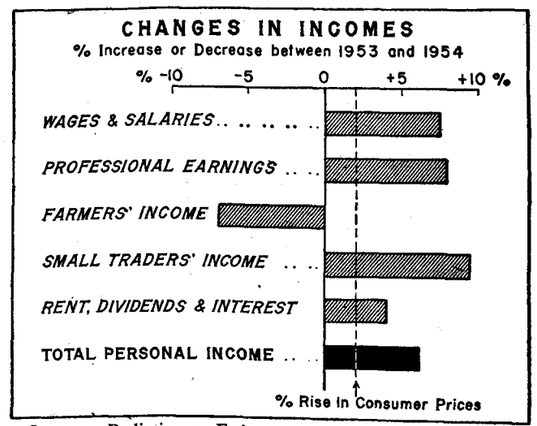
their sight tested and being prescribed spectacles—or else many of those who obtained them in the early days of the health service are now being prescribed a new pair.

But, as usual, it is the hospitals that account for most of the increase. Over £4 million of the rise in their estimated maintenance expenditure is the result of the recent award to nurses, and "other" salaries and wages (excluding doctors' salaries) are expected to rise by about the same amount. The estimate for ordinary capital expenditure is only slightly higher; the promised grants for new hospital building and large-scale plant conversion schemes, announced in February, will not be forthcoming until 1956-57.

State Farming in Practice



NATIONALISATION of the land was once regarded as a political issue, yet the modest experiment in state ownership of farmland since 1945 has gone its way with little comment—adverse or favourable. As a result of Crichel Down, it is now Government policy to sell off by stages most of the 225,000 acres for which the Agricultural Land Commission and its Welsh Sub-Commission were made responsible. Before this happens it is worth putting on record the lessons of this experiment, which have been underlined this week by the report of the Comptroller and Auditor General upon the commissions' latest accounts.

State farming lost £281,000 on current account in the six years 1948 to 1954. Admittedly, many of the properties taken over were semi-derelict, and the repairs bill was enormous; considerable capital improvements were also undertaken, especially during the period when it was Government policy to foster food production irrespective of economic return. Thus the state emerges as a conscientious landlord which has provided the financial backing that was a prime reason for its intervention. It has also, however, evidently been as conservative and afraid of its tenants as any private landlord. It has not raised rents to the levels which its repairs and improvements patently justify, nor has it followed the alternative approach of reorganising its holdings to experiment with new and possibly more economic forms of farming—for instance, large-scale cattle ranching in the Welsh hills. Administrative costs have been high—amounting, in the case of the Welsh Sub-Commission, to no less than 77 per cent of agricultural rents in 1953-4. Possibly there is scope for some state farming—if it is bold and experimental. But if the only difference is to be that the state can afford a loss which the private owner cannot, the experiment must be deemed a failure.

Federation Step by Step

THERE will be general relief that the conference on the control of inter-island migration in the British West Indies has found a workable compromise between the Trinidadian view that control should be left primarily in the hands of the islands, and the Barbadian view that it should be a Federation matter. Trinidadian fears of an influx of migrants from Barbados and the small islands threatened to set back all the progress so far made. The conference has now resolved that while migration shall be concurrently an island and a federation subject, the islands' present legislation will have to be revalidated at the end of five years, if the Federal government does not take the initiative earlier. This gives a period for settling down; after five years the Federal government might be able to use the growth of a sense of West Indian nationhood to bring about freedom of movement.

But difficulties lie ahead in Trinidad. An election is due in September and the prospects that the anti-Federa-

Source: Preliminary Estimates of National Income and Expenditure, 1948-1954 (Cmd 9423).

tion, East Indian section of the Legislative Council might gain power through the divisions in the other parties are not inconsiderable. The East Indians want, above all, to keep out migrants of African race. Before this form of Indian nationalism makes a bid for control of Trinidad, it is therefore highly desirable that Federation should be virtually signed and sealed, if not delivered. This can hardly be arranged until after the conference of plenipotentiaries which will decide upon the West Indian Federation Bill to be presented to Parliament in London; the earliest the plenipotentiaries can come to London is January. But it is possible that the discussions of a committee on Trinidadian constitutional reforms might be taken as a justification for postponing the elections. It is clear that the next six or nine months may be decisive for West Indian federation.

East Indian attitudes may also have something to do with the deepening split in the People's Progressive Party in British Guiana. Dr Jagan's main support is East Indian and rural, though he has some African allies. His rival, Mr Burnham, is mainly backed by Africans and a few urban Indians, and this section of the PPP is emerging as the slightly more moderate party; it is to have its own newspaper. Dr Jagan, on the other hand, is said to be anxious to declare himself as fully Communist. If this schism forces the PPP to re-examine the true aims of its ambitious leaders, and to see the constitutional crisis of October, 1953, in the light of them, much good may result for the colony.

Communists on the Building Sites

THE ratification of the Paris treaties was a great blow to the local Communist parties of Western Europe. Having doubtless received scorching rebukes from Moscow, they are now pledged, it appears, to frustrate the defence effort more effectively than hitherto. The Communist-led World Federation of Trade Unions (WFTU), with its individual industrial sections, exists to give a lead in such a campaign. Plans for organising trouble were discussed, for instance, at a recent meeting in East Berlin of the WFTU branch which covers the building and building-materials industries. One of the more interesting points from the speeches was a proposal from a French trade union leader that "it was necessary to uncover the speculations of finance companies which were exploiting small savers under cover of assisting them to build their own homes." There was general agreement that the organisers must be active on the actual building sites and must make their tactics fit local conditions. They must also put up programmes of "peaceful" work, to be undertaken instead of building for defence purposes. It is evident that the WFTU campaign is directed mainly against Federal Germany, where a shortage of builders is expected when the first barracks go up.

The WFTU's action programme is to consist of demands for more money for subsidised and state building; cuts in the "profits of trusts" and in building prices; a ban on speculation in building; and a cut in the rate of interest on borrowed money in order to stimulate building by private persons and small contractors. The conference also resolved to work harder inside other international organisations, particularly in the industrial committee of the International Labour Office. It will be interesting to see the results of the pledges undertaken by the earnest comrades in East Berlin—and whether they are also reflected in the careful tally which is kept in Moscow of man-hours lost in Britain and other "capitalist" countries.

Singapore Goes Left

SINGAPORE joins the lengthening list of colonies which, given adult franchise, promptly votes for the more extreme parties. Despite the warning from the West Indies and elsewhere this seems to have surprised many British residents in the colony. Mr David Marshall, noted for his trenchant socialist speeches, will become chief minister, heading the Labour Front which has ten seats in a House of 25. But the Government's majority will be secured by the three ex-officio ministers, the Chief Secretary, the Finance Secretary and the Attorney General, who, under the constitution, are bound to vote with the government. But the two other Left-wing parties, the splinter Malay-Chinese Alliance with two seats and the anti-colonial People's Action Party (PAP), should generally side with the Labour Front; the moderating influence of the opposition will probably be confined to six members, unless the ex-officio ministers are influential behind the scenes. The more usual form is for the officials to find themselves excluded from the inner cabinet of elected members. But Singapore evidently could go still farther left. It should have lively politics, which is what has been prescribed, and these should give Mr Marshall and his colleagues the training in practical politics that is the object of the exercise in developing local leadership.

Much of the programme on which the Left-wing parties were elected—it can hardly be called a true mandate—is more or less impracticable in an island-city based on the profits of entrepot trade, and not always on good terms with the mainland from which its importance is derived. The Labour Front in fact wants reunion with the Malayan Federation, repeal of the emergency legislation and a rapid advance to independence. The PAP bluntly asked the electorate to vote out colonialism, which it saddled with responsibility for slums, poverty, disease and insecurity—the very things the British have done more than any neighbouring Asian governments to remove.

Pakistan's Rule of Law

THE confused constitutional position in Pakistan was made no easier to understand by the declaration of a new state of emergency by the Governor General, Mr Ghulam Mohammed, on March 27th. But it did pave the way to a solution of the legal tangle, and there is at least a good chance that Pakistan is now back on the road to a more settled form of government. The need for a new state of emergency, may not seem apparent when it is recalled that the previous state of emergency, announced last October, was still in being. The Governor General's action, however, represented practically the only way in which the legal record could be got straight and the chain of Pakistan's constitutional procedure be retained unbroken. The calm with which Karachi has since accepted this fresh move indicates that it was less of a crisis measure than it appeared at first sight. While there are undoubted political pressures under the surface, the army is still in full and effective control.

What had happened was this. Although Mr Mohammed and his emergency cabinet were vindicated by the Federal Court in the Governor General's action of dissolving the Constituent Assembly last October, a further ruling also invalidated all the 46 laws which had previously been passed by the Assembly but had never been signed by the Governor General. This threw the country's legislation into such confusion that the further emergency had to be declared to end it.

Pakistan has done well to pay such attention to the rule of law. Admittedly, the little group of conscientious men now in power represents no popular movement and its rule depends on force. But the exercise of power is always a trust, and so far the present cabinet has not abused it. Several essential measures are being carried out during this period, including the amalgamation of the provinces of West Pakistan into a single unit and the passage of the budget. The government's big test, however, is yet to come. This will be in the drawing up of a constitution and its successful introduction without too much delay. Promises have been made. They have yet to be kept.

SHORTER NOTES

By 379 votes to 219, the French National Assembly has declared a "state of emergency" in Algeria. The vote followed a plea by Minister of the Interior, M. Bourges-Manoury, that the measure was essential on account of "persistent insecurity" in certain areas. The difference between a "state of emergency" and martial law is that the special powers entailed are put into the hands of the civil, as opposed to the military, authorities. The Governor-General of Algeria is from this month vested with powers to ordain forced residence, and local prefects can forbid the right of assembly or of movement from place to place. The measure, which will apply only to defined "zones of protection or security," is intended to stop recruitment for the rebels. But it is causing much misgiving among liberals in both France and Algeria, who have for months had good reason to criticise the excess of zeal, alias brutality, that has been shown by the local police.

★

The Labour Party Executive is understandably worried by a state of affairs now prevailing in many constituency parties that are choosing their candidates for the election. The latest instance of irridentism has been the decision of the Liverpool Exchange Divisional Party not to support Mrs E. M. Braddock, who has represented the constituency since 1945. Mrs Braddock was apparently asked two questions at her adoption meeting. How did she vote when the Parliamentary party withdrew the whip from Mr Bevan? And did she share the Bevanite views of her local party? As she does not share those views, and as there is internecine war in Labour's ranks in the Exchange Division, the local party want a new candidate. The Labour leaders will almost certainly have to take strong action to meet this sort of challenge; at the moment the main qualification required from a Labour candidate in some areas seems to be a promise not to follow the official Labour line.

★

The Government has, after all, made a third concession to those who fear that the Harmful Publications Bill comes dangerously near to censorship. When the Bill was considered on report last Monday the Under Secretary to the Home Office moved an amendment making it a defence for a newsagent or retailer to claim that he had not examined the contents of a publication claimed to be harmful, and that he had had no reason to suppose that it was so. This goes half-way to meet an amendment which was rejected last week—namely that the Bill should apply only to those who printed and published horror comics, and not to those who sold them. It is a welcome concession, for a poisonous publication could easily be contained within a harmless cover; and the aim of the Bill is to ensure that children do not read horror comics, not that newsagents do.

★

The Ministry of Education's estimates for 1955-56 forecast a net expenditure of £271.2 million, an increase of £16.7 million on the figure for last year. Almost all the increase goes in larger grants to local authorities, of whose expenditure on education the Ministry meets roughly 60 per cent. It is needed to provide, among other things, for the still growing school population and for last year's salary increases to teachers, including the bigger allowances now to be paid to those who teach advanced work. The estimates presumably do not allow for the small increase that will be necessary in the maintenance allowances for children who stay at school beyond the leaving age, on which an announcement is expected shortly. Nor do they include higher grants to teachers in training or more generous provision for university students, with—dare one hope?—a higher ceiling of parental income above which no grant is paid. But an announcement on these lines is also expected in the near future.

★

The Requisitioned Houses Bill has now passed its third reading with the amendment that the Minister will be able to require local authorities to establish a pool of vacant requisitioned houses, to operate between the passing of the Bill and 1960, when derequisitioning would be complete; this pool would be used to rehouse families who might be displaced by a court ruling that any particular owner should regain possession. This amendment is designed to deal with the Labour objection that such families would otherwise have to get council houses ahead of the queue. It may slow down derequisitioning meanwhile, but Mr Sandys insisted that by 1960 the pool would become unnecessary. He made an offer to extend the period of requisition by a further two years "in difficult cases," in response to an Opposition amendment extending the period to 1965, provided the Opposition did not vote against the third reading. The Opposition did vote against it, however, so it is to be hoped that the Minister will not fulfil his side of the bargain. The amendment could only encourage local authorities to treat the problem with less urgency than it deserves.

Letters to the Editor

Price Maintenance Defended

SIR—Mr Wiles being able to define "the whole *raison d'être* of trade associations" in half a dozen words will bring wry smiles to those learned colleagues at his own university, and in other universities and research stations up and down the country whose "whole *raison d'être*" is tied up with one trade association or another. The definition? . . . "to protect the average (firm) from the best." As a consultant to various trade associations, I cannot think of any association where the formation, driving force and encouragement to better standards of production and distribution did not come from the "best" firms and undertakings in the industry.—Yours faithfully,

J. FORDHAM SADLER

Woldingham, Surrey

★

SIR—In your issue of March 19th, Mr Collin Brooks suggests that Mr Harris (*vide The Economist*, March 5th) is somewhat in ignorance as to how a modern trade association works. Mr Brooks then proceeds to describe how a price ring functions but, unfortunately, he does not recognise the difference between the theoretical and practical operation. His arguments would not convince a professional industrial purchasing officer who is daily confronted with this problem of price maintenance.

I recall an order being placed a year or so ago for a piece of equipment with a ring member firm at an order price of approximately £140, the supplier invoking the protection of the price ruling clause. When the equipment was delivered a few months later a price of over £190 was charged and, when he protested, the buyer was informed a new ring price had been fixed. Even though he had been obliged to accept the price ruling clause, the buyer maintained that, in equity, this only permitted the price charged to include extra costs arising during the contract period and these could never justify the considerable increase represented by the new price. To do them justice, the suppliers accepted this reasoning and a figure approaching £160 was agreed, and at the same time the buyer was assured that this price gave the suppliers their usual margin of profit. If we accept Mr Brooks's explanation, then the price of over £190 would have been based on the average efficient cost figure set by the association, thus the highest cost producer might have found a price reasonable to him in the region of £240: given a liberal degree of inefficiency, that price seems hard to swallow. I admit this is only one example and could not be regarded as applying throughout price fixing, but it did happen.

Mr Brooks contends that any member of a price ring who cannot get down to the efficient cost figure set by the members may have to sell at a loss or go bankrupt. If Mr Brooks will give only one or two examples of ring firms which have suffered either of these indignities in recent times, say the last twenty years, one would be more ready to accept that he is not in such ignorance of real price fixing practice as it appears he would like us to believe. You will notice, Sir, I use the term "price ring" as opposed to Mr Brooks' "trade association." This is because the latter does not always imply price fixing and a trade association, which has no price fixing arrangements, is an eminently desirable industrial institution.—Your faithfully, A. ELLIOTT

Hale, Cheshire

Housewives' Choice

SIR—You have not got to the bottom of this imported beef business in your article of April 2nd. My butcher tells me that he will not stock frozen beef because it is practically inedible. The Ministry of Food, he says, has been keeping it for four years, and he will start selling this kind of meat again when the Ministry has made up its mind to throw its old stocks away.

In any case, even the best frozen beef is tough, and was hard to sell before the war. Ask the Australians. They have been trying for decades to get their beef to this country in a condition that will make it compete with chilled Argentine beef. It is all very well for you to cast doubts on the cooks. Your writer has perhaps not had to throw away the precious ration of beef during the rationing times, because it was still too tough to get the teeth into after hours of casserole cooking.—Your faithfully,

CORDON BLEU

Gas Pipeline Postponed

SIR—There is a small inaccuracy in the map accompanying your Note of April 2nd. The map shows the pipeline originating from two points in Alberta, one labelled Pincher Creek and the other Peace River. In fact the Peace River fields are in no way connected with the Trans-Canada project but are destined to be the source of supply for a completely independent pipeline, Westcoast Transmission. This will be built through British Columbia to Vancouver, and will connect at the International Boundary with a pipeline system to be constructed by US interests, to supply the Pacific North-West states and other parts of the USA. It is hoped that construction will start this summer, if the Federal Power Commission approves the application which is being filed by the US companies concerned.

The Peace River fields are not, as shown in your map, in the centre of Alberta, but on the northern boundary of Alberta and British Columbia—indeed, the greater part of the reserves in this field is in British Columbia.—Yours faithfully, ERLEIGH

Staplefield, Sussex

New Chance for Nepal

SIR—The article in your issue of March 19, 1955, contained some strictures on the Rana regime, which, if merited, must imply a remarkable deterioration during the past ten years.

When I visited Nepal with my wife in 1945, we found the people friendly and prosperous looking. The temples and palaces were in fairly good repair, and could have compared favourably with those in India. In the villages we found standposts marked Glasgow, 1892, with piped water from the hills around. We were told that, after a cholera epidemic, a much beloved Maharani had asked how to prevent another such epidemic. She was told piped water supplies, and so she arranged to have standposts with waste-not taps in half the villages of the central plain.

Altogether, in 1945, Nepal could compare not unfavourably with many Indian States, the best of which, again, could compare favourably with any British Province or Presidency. If the happiness of the great majority of the inhabitants is more important than so-called political development, the Rana regime in Nepal had much to be said for it.—Yours faithfully, A. C. Keeping Europe Going

SIR—You lay down as one of two prime conditions of a settlement on Germany genuinely free all-German elections. What form of "free election" can accurately represent public opinion in a country where the State controls every man's economic future, and punishes opposition opinion? How many candidates in Eastern Germany would dare to offer themselves for election on a programme of re-union with Western Germany and a free economy? How many voters would dare to hold public meetings, or even talk to their friends, in support of such candidates? If candidates from Western Germany could be allowed to stand in the Eastern zone, the situation might be more hopeful but it would still be far removed from anything that could fairly be called a "genuinely free election."—Yours faithfully,

HENRY MEULEN

Books & Publications

The Sociology of Abundance

PEOPLE OF PLENTY.
By David M. Potter.
University of Chicago Press (London: *Cambridge University Press*). 246 pages. 26s.

NATIONAL character is a tricky concept; national characters are a topic wonderfully fertile in pernicious nonsense. Professor Potter handles the concept with extreme wariness and the topic with a remarkable blend of imaginative insight and scientific scruple. His thesis, at once simple and many-faceted, is that the distinctive American attitude to life, the distinctive American system of political and social relationships, the distinctive American tensions and dissatisfactions and the distinctive American role in world affairs, have been shaped above all by American "abundance"—by the existence in America, from its earliest days, of an unprecedented amount of economic elbow-room.

This has something in common with the well-known "frontier hypothesis," but Mr Potter convincingly argues, in a particularly brilliant chapter, that the frontier represented merely a special instance of a general environmental influence. The frontier was "the lowest threshold of access to America's abundance; it ceased to be primary when other thresholds were made lower, and not when the edge of unsettled land had ceased to exist." Abundance, he makes plain, should not be identified with potential resources alone; lacking the technological key, one may live as meagrely in the midst of locked-up wealth as did the Red Indians themselves. Given an initial combination, however, of potential resources and technical alertness, cumulative economic and psychological processes are set in train; and the tracing of these processes, their mutual repercussions, their relevance to political theory, their unsuspected place in the pedigree of this or that sacred cow, is the main task of his book.

The most important moral that he draws is an international one. Democracy, in the full American sense, is "one of the major by-products of abundance," and cannot take root when abundance is lacking. "Our message to the world has become involved in a dilemma; to other peoples, our democracy has seemed attainable, but not especially desirable; our abundance has seemed infinitely desirable but quite unattainable"—since it has been manifested to the world "primarily in the form of consumer goods which excite the international envy of those whose needs they satisfy, without in any way removing either the sources of envy or the sources of need."

The argument, however, is too close-knit and organic to be fairly rendered by odd quotations. It is not entirely free from ambiguity; abundance as standard of living and abundance as pace of progress, which are not the same thing, melt into one another here, leaving unanswered such questions as why the British masses today, enjoying much higher standards than the American masses of, say, forty years ago, display so little of the psychology of abundance which should, on the American analogy, go with those standards. Occasionally, too, Professor Potter teeters on the edge of the nineteen-thirtyish fallacy, "the problem of production is solved, we need only concern ourselves with the problem of distribution." But these questionable points count for very little beside the percipience, the originality (for all acknowledgments of indebtedness to anthropological scholarship) and the comprehensive organising power here displayed. "People of Plenty" deserves a wide audience on both sides of the Atlantic.

Nuclear Messages

EXPLAINING THE ATOM.
By Selig Hecht and Eugene Rabinowitch.
Gollancz. 224 pages. 12s. 6d.

THE MAN IN THE THICK LEAD SUIT.
By Daniel Lang.
Gollancz. 218 pages. 13s. 6d.

HERE are two books that belong inextricably to the nuclear age. Neither could have been conceived before 1945, or written in its present form before last year. When Professor Hecht wrote the first, he thought of it as a book that would guide the complete layman through the mysteries of atomic physics to their culmination in the explosions of Hiroshima and Nagasaki. Since his death in 1947, the mushroom clouds have become denser and their menace has gained in scope and viciousness; Dr Rabinowitch, the editor of an American atomic journal, has added four chapters encompassing the "progress" from A-bomb to H, from fission to fusion.

One finds it hard to avoid being suspicious of a recommendation of a layman's book by Einstein, and one suspects, in particular, that "attentive" must be

BASIL BLACKWELL

the operative word in his comment that this one "can be understood by any attentive reader." At the same time, one does not need to be an Einstein to read the book from cover to cover with interest and a degree of profit that will vary with the amount of attention one is prepared to spare. There is a beguiling neatness and logic about the mathematical arrangement of the elements which does much to persuade the uninitiated that he is acquiring wisdom painlessly. And indeed this is a reasonable and incontrovertibly up-to-date course in lifemanship which will enable the man or woman whom physics had by-passed to hold his own in after dinner conversation, and perhaps to dazzle his intellectual superiors.

"The Man in the Thick Lead Suit" is, if he would permit the comparison, a horse of somewhat different hue. He stands guard over a collection of articles that first appeared in the "New Yorker." Mr Daniel Lang has called on Wernher von Braun, the man who built the V-2 and dreams of interplanetary flights; he has dropped in on the atom-conscious citizens of Las Vegas; he has sounded the opinions of people who claim to have seen flying saucers. He has driven in the rugged country of the Colorado Plateau in the company of men whose job is to seek uranium, and talked with the inhabitants of towns that would not exist if America had not decided to build atom or hydrogen bombs.

Mr Lang records conversations drily and factually, with a minimum of comment; his merit lies in faithful reporting rather than in literary elegance. One has difficulty, once having begun it, to put this book down; and it is hard not to feel a shock of revelation at the insight it gives into the transformation that has affected all our lives.

Story of Farming

THE ENGLISH COUNTRYMAN. *His Life and Work, AD* 1500-1900.
By G. E. and K. R. Fussell.
Melrose. 172 pages. 30s.

THIS book is basically a history of English farming and covers a great deal of ground already over-familiar to students of rural life. Indeed, the authors have themselves written several works of a similar character; thus to that extent this one is a pot-boiler, although there is no question about its authority. Mr G. E. Fussell helped to found the British Agricultural History Society, and there are few who can equal his knowledge and industry in this particular subject. Furthermore, the bones of the story are amply covered by a wealth of data and illustration which make the book informed and entertaining. It is divided into six main periods—each bulging with facts about the character, appearance, work and social habits of the countryman, be he rich landlord like Coke of Holkham or modest labourer of the kind dispatched from Tolpuddle to Tasmania.

It is evident that there is still much to be learned, not only from private records, but also from publications that never reached a wide public and are now out of print, and the authors have done useful research in this field. For example, we all know that George III was a keen farmer, reclaimed part of Windsor Great Park, and contributed to Arthur Young's "Annals of Agriculture." Much less credit is given to the Prince Consort, who did far more a century later. In twenty years he improved and added to all the royal estates in the most admirable fashion. He made Osborne and improved Windsor and Balmoral, built farmsteads and cottages, fenced, drained, reclaimed, afforested, and patronised and encouraged the leading agricultural societies. By contrast there are earthy anecdotes of humbler folk—the village parson who farmed his own glebe to supplement a tiny stipend, the shepherd so idealised in polite literature, and that indefinable person the yeoman, who might be a wealthy freeholder with 300 acres or a poor tenant with less than 50.

This, then, is the story of landlords, farmers and labourers. It is not the story of all countrymen: craftsmen are hardly mentioned, and yet at one time they made up the population of almost half the village. The title "countryman," therefore, has been given an arbitrary meaning, but, for all that, the book is a solid and reliable contribution to the history of the countryside.

Sudanese Pedigree

A HISTORY OF THE SUDAN FROM THE EARLIEST TIMES TO AD 1821.
By A. J. Arkell.
University of London: *The Athlone Press.* 267 pages. 21s.

ONCE upon a time, nationalist Britons must have felt about the Romans much what nationalist Sudanese now feel about the British—glad to see their backs. Yet after their exodus, as time rolled on, education mounted and tolerance set in, there grew to be an appreciation of the Roman share in forming British native tradition and character. The same change of heart may take place in the Sudan and this admirable little book will help it to do so.

For Mr Arkell has done for the Sudanese teacher and undergraduate a job of genealogy and history that the Sudan's own thin sprinkling of educated men will be far too overworked to do for years to come. He has told in simple but scholarly form the story of their roots, or what is known of them.

As Sir Harold Macmichael points out in a preface, the work is so well done thanks to a rare blend of talents. Mr Arkell is not only an archaeologist and historian (he holds the readership in Egyptian Archaeology in the University of London); he also has much practical experience of managing men. He spent the greater part of his working life as an administrator in the Sudan, and therefore knows and likes the various races whom he is providing with a pedigree. His book, though necessarily compressed, is a human document because he has probed their monuments and chronicles, tombs and quarries, not with the impersonal efficiency of a surgeon, but in the sympathetic role of family genealogist. The only criticism of a book that is beautifully printed, and is well illustrated with maps, line drawings and photographs, is that it is much too expensive for most Sudanese teachers to afford. It ought to be the Sudan's first Penguin.

The Salt Trade

ENGLAND AND THE SALT TRADE IN THE LATER MIDDLE AGES.
By A. R. Bridbury.
Oxford University Press. 216 pages. 21s.

LITTLE has been written hitherto on the salt trade, especially during the Middle Ages, though it was of great importance when the eating of fish was widespread for religious, nutritional and economic reasons, and when the autumn slaughtering of cattle made salted meat a staple article of the winter diet. The English salt trade can only be appreciated in its continental setting; indeed, Mr Bridbury's work deals rather less with the English and rather more with the continental trade than its title might imply. He sees a commercial revolution in the fourteenth century marked by the decline of salt production at Lüneburg, in the Low Countries, and in eastern England, and by the rise of production on the Atlantic seaboard of France, especially at Bourgneuf. This rising French production led to a great export trade in salt with England, the Low Countries, and the Baltic.

The details of these changes are often obscure, and Mr Bridbury's interpretation of the commercial revolution is sometimes very speculative. He assumes that salt production in eastern England declined in the fourteenth century through the diversion of resources into the cloth industry, and that the decline was followed by increased imports of French salt. That may be true, but it is not proved by quoting a single case of the high wages paid to a Lincolnshire salt-boiler in 1396. It is surely possible that English salt production, if it declined at all, declined because of competition from imported French salt. Similarly Mr Bridbury sometimes pushes his statistical interpretation much too far. His estimate of the value and volume of the salt carried by the Bay Fleet in 1449 is reached by a process that reduces statistical manipulation almost to the level of a parlour game: take a number, halve it, and so on.

It would be unfair to suggest that this book is wholly or even largely devoted to such speculative interpretations; it is, in fact, firmly based on a wide range of printed and manuscript material. On the whole that material has been handled judiciously, and has been made to yield an interesting picture of a very important aspect of medieval commerce.

EXCLUSIVE TO B.O.A.C.!

double-decked

Stratocruisers

for both First and Tourist Class across the Atlantic!

Whether you book First or Tourist Class by B.O.A.C. across the Atlantic, you can enjoy the double-decked spaciousness and unrivalled comfort of *Stratocruiser* travel! Nothing finer flies the Atlantic than these giant airliners, operated by B.O.A.C. *Fly First Class by luxury "Monarch"* direct to U.S.A. or Canada; and to the Caribbean. A King's Ransom for the KIDNAPPERS

There's a price on their heads. It runs into millions. It will be paid in more than half a hundred currencies. The two small boys who play the leading roles in THE KIDNAPPERS are capturing the hearts of cinemagoers everywhere.

• 'BOX-OFFICE GEM'

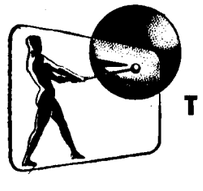
A TALE of a Nova Scotia settlement during the early days of the century, THE KIDNAPPERS has an immediate appeal for the Canadian market. That means important dollar earnings. And it is being given a good showing in Canada helped by the Odeon circuit there—built up by the Rank Organisation to more than 100 theatres within seven years.

In Toronto THE KIDNAPPERS ran for 15 weeks, in Ottawa, for 17. In Vancouver province it created an all-time record—159 days against the normal playing time of 42 days.

Reports from Canada say that the film was 'the box-office gem of 1954 and is continuing to be the same thing in 1955'.

PAID IN DOLLARS

IN THE United States THE KIDNAPPERS appeared on 'ten best films of 1954' lists in New York's *Times, Herald Tribune, World Telegram and Sun*, as well as in *Time* magazine. America's National Board of Review of Motion Pictures placed it fourth in its list of the ten best foreign films.



Yet this enchanting and highly successful film was created by a small cast of actors, an unassuming story, and the simplest of settings.

THE CHOICE IS THEIRS

THE pattern which the Rank Group has laid down for film exhibition in Canada is repeated throughout the Commonwealth: but nowhere are there hard and fast rules as to the films shown. The final choice is always with the country concerned.

That the British can make good films is proved by past and present successes in all parts of the world. But the making of films is only one aspect of a vast industry. Success in distributing and exhibiting them world-wide is clear from the fact that last year 50% of the Rank Organisation's film earnings came from abroad.

THE J. ARTHUR RANK ORGANISATION LIMITED

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Stock Market Goes Steady

Washington, D.C.

THE stock market, with lusty disdain, continues to hover near the record high levels it reached just before Senator Fulbright began his much-publicised inquiry into its operations over a month ago. It was made plain by practically every witness at the hearings, which have now been completed, that neither Senator Fulbright nor anyone else can say whether this steady refusal to be discouraged is because the market is inherently sound or because too much speculative buying is going on. Indeed Mr Fulbright and his colleagues on the Banking Committee were told so many times how impossible it is to analyse the market that any desires they may have had to buy stocks themselves must have been thoroughly dampened.

"He's Perfectly Healthy—Just Terribly Sensitive"

Herblock in the *Washington Post*

What Senator Fulbright hopes, of course, is that there may be the same reaction from a share-buying public which he fears has been unduly gullible. It became clear early in the famous hearings that his purpose in launching them was two-fold: to bring to light the degree of the stock market's feverishness during the winter, and to warn the public that the stock market is not a place where easy money is to be made. Neutral observers (and many Republicans) agree that the Democratic Mr Fulbright's purpose was not, as the intensely Republican Senator Capehart alleged, to undermine confidence in the national economy in order to bring on a slump and discredit the Eisenhower Administration.

The extent to which his true purposes were accomplished is of course as impossible to analyse as the market itself, but there was a strong feeling among many of the committee's witnesses that a hearing such as this one in 1928 might have prevented the 1929 boom and the subsequent crash. Assuming, as practically all the witnesses believed, that another 1929 is most unlikely, then it may be unlikely in part because the committee has injected a note of caution into a rather runaway situation.

It was brought out on the very first day of the inquiry—though scarcely emphasised by the witness, Mr Keith Funston, president of the New York Stock Exchange—that on two recent "sample days," when transactions were analysed no fewer than 52 per cent of all the trades by individuals were on margin. With the assistance of Senator Douglas, Mr Fulbright also carefully developed statistics on the sharp rise in "short term" trades—sales of stocks held less than six months—and the rise in daily turnover, to show that the market has been far more speculative in 1954 and 1955 than in the earlier postwar period. And Mr John Kenneth Galbraith, the articulate Harvard University economist who has just published a history of the 1929 disaster, added the necessary spice with his sharp remarks about the unchanged "capacity for self-delusion" of the American (and any other) public. Shortly after Mr Galbraith's testimony, in which for the first time doubt had been thrown on the market's good health, prices tumbled fairly sharply for a few days; but they have since recovered most of the losses.

Fully half of the testimony during the three weeks was devoted to such technical or statistical matters as the operations of "specialists" in a stock on the floor of an exchange, the regulations of the Securities and Exchange Commission, and the economic reasons for the scarcity of new equity issues in recent years. Unlike such eye-catching items as Senator Capehart's accusations and Mr Walter Winchell's market tips on television, these matters seldom found their way into the daily newspaper stories. Another large section of the time was devoted to such apparent irrelevancies as whether the General Motors Corporation prices its cars properly and whether the depressed level of farm income is a threat to the economy. Yet out of it all emerged at least a sprinkling of genuinely new information and analysis—enough to give the experts as well as the public reason

to re-examine some of the clichés that have grown up about the market in recent years.

The testimony cast doubt on the widespread assumption that "institutional buying" has been a major factor in pushing up share prices. A combination of purchases by insurance companies, pension funds, private trusts handled by banks, and investment companies (the so-called "mutual funds") was supposed to have injected a heavy new demand in the market over the past two or three years, to have reduced the "floating supply" of stocks, and at the same time to have constituted a stabilising influence in the event of a severe setback to the market. While the hearings brought out that these institutions now hold some $66 billion worth of equities, or 28 per cent of the value of all the stocks listed on the New York Stock Exchange (much less for other exchanges), it was also shown that their net annual purchases are surprisingly small. The value of institutional holdings has doubled since 1949, but about 80 per cent of this increase reflected merely the rise in market prices and only 20 per cent—or some $7 billion over a five-year period—came from net new purchases.

Net purchases of all the mutual funds on the New York Stock Exchange last year, for example, amounted to only $281 million, or 1.2 per cent of total purchases. Mr John J. McCloy, chairman of the board of the Chase National Bank, made the often forgotten point that institutions sell stocks as well as buy them; he said the various personal trusts and industrial pension funds for which his bank is trustee recently went through a period of sixteen months in which they were net sellers. With a few other witnesses, he concluded that the rise in the market simply cannot be attributed in any important sense to institutional buying.

★

What, then, is the cause of the rise? The answers—all preceded by the customary disclaimers of expertise—cited a range of factors, from the ending of the excess profits tax to inflation, from "confidence" to increased speculation. Whether or not, however, the rise has been "sound," as maintained by most of the witnesses from the securities industry itself, the hearings left no doubt that yields have sunk amazingly low for a wide range of "blue chip" stocks and others not so gilt edged, and that from here on the market can advance at the recent rate only at its peril. Even Mr Funston, whose staunch defence of the existing situation opened the hearings, conceded that a continuation of the upward pace of the past eighteen months

> might be a danger to the economy unless it were accompanied by a corresponding amount of expansion in earnings or business prospects which seems improbable at this time.

This rate of increase of some 50 per cent over eighteen months would, if continued, bring average stock yields down to about 2.7 per cent by the end of this year, or lower than the yield on high-grade debt issues; Mr Funston believed that "as a practical matter" no such rise would occur, and his analysis was supported by Mr Bernard Baruch and a number of others.

But that was really the central issue of the hearings. To Mr Galbraith, to Mr Fulbright, and to several other witnesses, the question was whether there is or will be anything at all "practical" about the market if once the speculative fever takes hold. Mr Galbraith, in an excursion into psychology for which his studies of 1929 presumably qualify him is convinced that there will not be, despite the important reforms of the past twenty-five years. A "flight from reality" seems to him just as possible now as then, and not one of the other witnesses was prepared to maintain that somehow human nature has been improved by the purge of depression. To Mr J. A. Livingston, a highly regarded financial columnist, it is cause for concern that last winter's activity has made large numbers of people "look at the stock market page before the comics."

And yet if Senator Fulbright was able to dispel some of the complacency emanating from Wall Street, Wall Street had its innings, too. The public was reassured—with no challenge from the committee—that the market is thoroughly honest today, in contrast to the widespread rigging of the earlier era. There was a great deal of impressive evidence that market prices today are in no way comparable to the excesses of 1929. To anyone who troubled to look or listen, the hearings undoubtedly supplied the most complete assessment to date of the invaluable place of the stock exchanges in a capitalist economy. And, after all, the market itself has proved much sturdier than the house of cards which was pictured in some of the testimony.

Guide to Anti-Trust

A COMMITTEE of sixty experts, lawyers, economists and government officials, has just finished a detailed examination of the whole network of anti-trust laws—the Sherman and Clayton Acts, the many subsidiary Acts and amendments, the court interpretations of the legislation—woven during sixty years of legal efforts to promote free competition in the United States. The 400-page guide to the present shape of the laws will be useful for years to students and businessmen, but for some time to come it will apparently be almost as useful to the Democrats in Congress. In their search for sticks to beat the present Administration with, they have snatched at a report which, to the unprejudiced observer, seems to have very little political strength. For the committee was appointed by the President only to study and advise; its 75 recommendations, some 12 of which would require legislation, have little practical meaning unless and until the Department of Justice decides whether to act on them.

But many of the legislative proposals deal with changes in legal procedures and penalties, for anti-trust violations, of a complicated technical kind. It is thus easy for the Democrats to argue, with little fear of any contradiction that will be understood by the general public, that the committee has shown the Republicans new ways in which they can favour big business at the expense of a competitive economy. This interpretation has been helped by the minority report from five professors of law, who claim that, if the views of the majority are accepted, the anti-trust laws will be weakened.

In particular the Democrats distrust the committee's failure to find any inadequacy in the laws controlling corporate mergers; the committee refuses to condemn such mergers in principle, but they have recently been increasing at a rate which many other people find alarming. Although the committee would have nothing to do with

proposals that trade unions should be brought under the anti-trust laws, it did rather vaguely suggest that union activities directly restraining commercial competition should be controlled—a suggestion out of which political capital will surely be made. Another question with which the committee dealt inconclusively, although at length, was the relationship between the American anti-trust laws and international cartels, foreign business agreements and government regulations in other countries.

The main criticisms of the committee centres round its generally negative satisfaction with the present state of competition in the United States, but its one really positive proposal for a change is also being widely criticised. The committee considers the legal immunity granted to "fair trade"—the American misnomer for resale price maintenance—to be an "unwarranted compromise of the basic tenets of national anti-trust policy." The committee recommends, with the support of the Department of Justice, that the federal laws permitting fair trade agreements be repealed. It has thus pulled down on its head the congressional spokesmen for small business and the well-organised lobbies of druggists and other retail trade groups.

Tale of Two Editors

LAST week died two of the most celebrated and contrasting figures in American journalism — Mr Joseph Pulitzer, editor of the *St Louis Post-Dispatch*, and Colonel Robert R. McCormick, editor of the *Chicago Tribune*. Both men were born into newspaper dynasties and acted as editors and publishers of their respective papers. Both men made the Middle West a centre for professional journalism and ran their papers with an eye to the nation as well as to the cities where most of their readers live. But that is where the resemblance between Mr Pulitzer and Colonel McCormick ends.

Mr Pulitzer, whose father created the famous Pulitzer Prizes awarded each year for outstanding achievements in the fields of American literature, entertainment and journalism, carried on the liberal traditions of the *Post-Dispatch*. His paper is famous for its crusades against corruption and racial discrimination on the national scene as well as in its own city, and for its extensive coverage of foreign affairs. Resolved "never to belong to any party," the *Post-Dispatch* has deliberately opposed the instincts of its midwestern and largely Catholic audience by being ferociously anti-Franco and extremely objective about Russia.

The *Chicago Tribune*, on the contrary, is the standard-bearer of right-wing Republicanism, isolationism and anti-liberalism of every shade. It has waged a decade-long campaign to convince its 900,000 readers that Roosevelt, Stalin and Sir Winston Churchill, usually in that order of diminishing villainy, have been the agents of a world revolution calculated to reduce the United States to servitude and socialism. Frequently pro-Nazi in sentiment, the *Tribune* tends to print "British" as "Brutish" and sees in the Rhodes Scholarships the first step towards America's re-integration into the Empire. Most of these doctrines, and the virulent style in which the editorial columns of the paper are written, have been due to the personality of Colonel McCormick. A brilliant showman, the colonel once flew an American flag with only 47 stars because an event in the state of Rhode Island had offended him. Nor would it be fair to overlook the fact that in its coverage of sports and local affairs the *Tribune* is one of the most competent papers in the country.

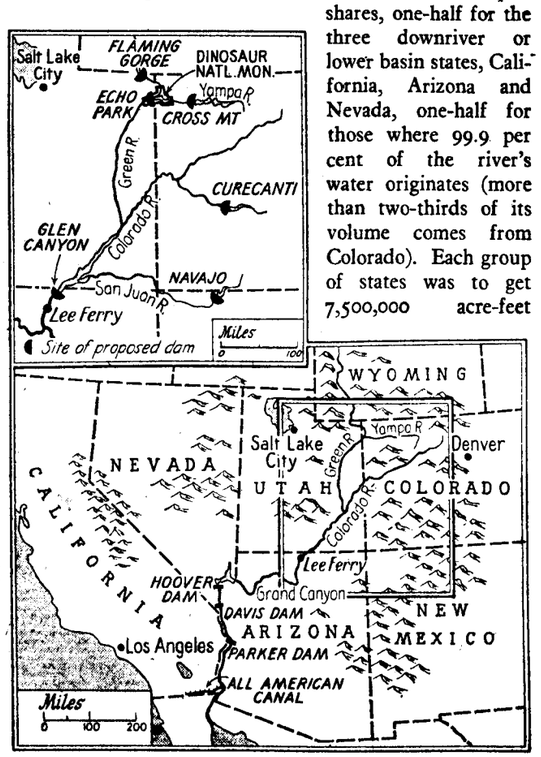
On its daily masthead, the *Post-Dispatch* carries a statement by its founder that the cardinal principles of the paper do not depend on the life of its editor. Whether the same will be true of the *Tribune* is uncertain, and it has been suggested that the paper may be given to its staff, many of whom are more liberal than the irascible colonel.

Admiral *versus* Commander-in-Chief

Washington, D.C.

THE story of Admiral Carney's war is a striking instance of the way news is frequently "made" in Washington, to the confusion of the American public and still more to the dismay of the rest of the world. It has long been the pleasant practice of senior American officials, helpful within limits both to them and to the press, to share their thoughts over dinner with selected groups of journalists, who may print anything they are told provided they do not identify its source. This explains the mysterious way in which authoritative analyses of the Administration's views on one particular topic, domestic or foreign, suddenly appear on the same day in all the leading newspapers and in virtually identical language.

This is all very well in cases where the policy of the Administration is firmly established and when the "leak" carries with it genuine authority. But it is a very different matter when the source represents one side of an unresolved conflict within the Administration and when the more unwary among the invited journalists become, by taking on themselves the responsibility for the views expounded to them, the auxiliaries of a faction. The appearance of Admiral Carney, the Chief of Naval Operations, at such a dinner party two weeks ago seems to have been a case in point. With varying degrees of self-assurance the papers announced the following day that there had been a hardening in the Administration's attitude to Communist China, that an attack on Matsu was expected on the eve of the meeting of the Afro-Asian conference at Bandung, and that American participation in the fighting could be regarded as certain. The opportunity would be used to smash Communist China's war potential with precision atomic bombing, with a calculated risk being taken that Russia would not intervene.



After that, tough noises were made in the American press throughout the weekend, with the Scripps-Howard organ, the *Washington Daily News*, perhaps taking the prize with its headline "War Showdown Date is April 15," and this seeped through to President Eisenhower. On the following Monday his press secretary, Mr Hagerty, arrived at another press dinner, at which he was supposed to discuss domestic political matters, bursting with presidential indignation at the Admiral's alleged indiscretion. Next day the authoritative analyses reversed themselves.

They explained that the President did not see any signs of a big Communist build-up opposite Matsu, thought the eve of the Bandung conference the last moment the Communists would choose to provoke war, and considered the Admiral's views "Parochial." And it is rumoured that the President has disciplined his Chiefs of Staff sternly.

Sharing the Waters

FROM A CORRESPONDENT IN COLORADO

THE Colorado River geologically is divided into two parts, above and below the Grand Canyon, and its development has been divided in the same way. The lower reaches of the river have been tamed to control floods, and put to work producing electric power, and water to irrigate millions of acres of land, while little or nothing has so far been done in the upper basin to make use of the water that is so badly needed there. The development of the river was undertaken under a bargain, or compact, arrived at in 1922, between six of the seven states that share the Colorado River Basin, under the benevolent sanction of Mr Herbert Hoover, then Secretary of Commerce. (Arizona was prevented by its historic distrust of California from joining until much later.) The flow of the river was estimated at more than 16 million acre-feet annually (an acre-foot would cover one acre one foot deep); this is only about one day's flow of the Amazon, but every drop is precious since the Colorado runs for virtually all its length through an arid region, where economic development is dependent on water. The 1922 compact divided these waters into two equal shares, one-half for the three downriver or lower basin states, California, Arizona and Nevada, one-half for those where 99.9 per cent of the river's water originates (more than two-thirds of its volume comes from Colorado). Each group of states was to get 7,500,000 acre-feet annually, plus one-half of any surplus there might be.

The symbol of the development of the lower basin was the Hoover dam, which backs up the world's largest artificial lake, Lake Mead, and produces 1,250,000 kilowatts of electric power. California has been the chief beneficiary of the scheme, which is largely responsible for Southern California's amazing growth. California was required to pass a self-limiting act restricting itself to 4,400,000 acre-feet annually, plus one-half of any surplus that might ultimately develop; but just before Mr Hoover left the White House in 1933, the state obtained a contract from the Interior Department purporting to give California 962,000 acre-feet more a year at once. In a suit at present before the Supreme Court, Arizona is claiming that California has exceeded even this extra allowance. Another and very vital aspect of the compact is that under it, in 1962, the river's waters may be re-divided and the "surplus" determined. Under western water-law the first beneficial user gets the water, and even water-lawyers of long experience are puzzled and disturbed as to whether this general rule of law might not supercede the compact's explicit provisions for division of the water. For this reason, it seems to be to California's advantage to delay development of the upper basin as long as possible, so that the four upper basin states, Colorado, New Mexico, Utah and Wyoming, have no chance to use their share of the water.

Hundreds of millions of dollars have been spent by the government Bureau of Reclamation on the downriver development, including the All-American Canal, an artificial river that supplies water for irrigation to southernmost California. But almost nothing has been spent on development upriver, partly because the upper basin states could not decide among themselves how to share their water. They did not settle this until 1949, in an agreement by which Colorado gets approximately half. But then the Korean war cut down internal development, and was followed by the Eisenhower Administration's drastic reduction of spending on reclamation. So Congress has not yet even authorised the so-called Upper Colorado Basin Storage Project which would both safeguard deliveries of water down river as promised under the compact, and would make it possible for the upriver region to use the water to which it is entitled.

The plan is an extensive and grandiose one which even the present Republican Administration admits can only be attempted under government auspices. Altogether there would be about six big dams and a number of smaller ones; about 300,000 acres of land would be irrigated for the first time and there would be more water available for another 450,000 acres, or even more, that is already irrigated. The first steps would cost something like $1.2 billion. They would involve first a high dam at Glen Canyon, just above the point (Lee Ferry) where the river flow is measured and divided between the two halves of the basin; this would cost nearly $500 million, would store up to 26 million acre-feet of water, and would provide 800,000 kilowatts of electricity. After that a second key dam, Echo Park, on the Colorado-Utah border far upriver, would cost about $175 million, would store up to 6.5 million acre-feet, and provide 200,000 kilowatts of electricity. But when President Eisenhower recommended this project to the last Congress two years ago, while it slipped through the Senate without opposition, it ran into trouble in the House and ultimately stuck there.

The trouble was in fact four-pronged. The Republicans

were pledged to cut federal expenses wherever possible. Some engineers doubted the feasibility and economic desirability of some of the projects. The scheme was openly opposed by Southern California, which is the natural heir to the benefits of the river should the upper basin project fail; that area calculates that it will need a million more acre feet of water by 1970 for the four million more people it expects to have by then. California has only two Senators to twelve from the other basin states, but it has thirty members of the House to their twelve.

Last, and by no means least, the wildlife societies and nature lovers of the United States have been aroused to a barrage of protest against the Echo Park dam, with the sympathy and aid of some of the nation's most powerful publications. About 25 miles downstream from the site of the dam one of the world's foremost deposits of dinosaur skeletons was long ago discovered. Originally an 80-acre area was set aside as the Dinosaur National Monument, with a museum, but in 1936 the protected area was extended upstream to include the junction of the Green and Yampa Rivers and the unique canyons of these rivers. Later the Bureau of Reclamation decided that the main stream just beneath the two tributaries was an essential site for a dam; it has refused to accept any alternative. In November, the massed wildlife groups decided again to oppose the whole project with all their might unless the Echo Park dam were taken out, on the grounds not only that it was unnecessary in itself but that it might set a precedent for further invasions of the national parks.

Since President Eisenhower again recommended the project, unchanged, to the Eighty-fourth Congress, a good deal of local activity is going on to publicise its advantages and its necessity to the country; "aqualante" groups (a term derived from the old western word "vigilante") have been organised and there have been ceremonial dances by the Navajo Indians, whose reservation would benefit from irrigation made possible by the big dams. Now the Senate Interior Committee, with only the Californian Mr Kuchel dissenting, has recommended a Bill which would authorise almost the whole of the Upper Basin Storage Project, not just the two dams with which the President wants to begin. A hot fight seems to be coming on to the floor after the Easter recess.

Dogfights in Albany

ON the eve of its adjournment, the New York State Legislature, controlled by Republicans, set up a "watch dog" committee to keep a sharp and hostile eye on the activities of Mr Averell Harriman, the state's Democratic Governor. This gesture of ill grace marks the close of a legislative session which accomplished more than had been expected, but far less than had been hoped for.

The Legislature's main action was the approval of a $75 million programme for highway construction to be financed by a state bond issue and by increases in the tax on petrol and diesel fuel. It also extended for another two years, and with only minor modifications, the present rent controls. Governor Harriman gained approval for a housing plan designed to combat racial discrimination and to encourage the construction of some 170,000 new housing units annually until 1965. The Governor disclosed that more than a seventh of the state's inhabitants lived in houses that did not come up to basic standards of safety and sanitation. Finally, a compromise agreement was reached between the Governor and the Legislature on state aid to schools. The amount for the education of non-English-speaking children was doubled, and the present grant of $13 per pupil per year was extended to 1956.

But many important measures were buried in committee or had to be left aside because of lack of time. Among them were revisions in the state's divorce laws, compulsory third-party automobile insurance and a genuine overhaul of "public employee ethics," a programme first sponsored by the Dewey administration when widespread scandals were discovered at the racetracks.

The session of the Legislature which has just adjourned proved to be the most expensive in the state's history. It voted appropriations totalling more than $1¼ billion, and yet it slashed $36 million off the Governor's initial request. Of all this money, the $75,000 voted for the committee to "keep watch" on Mr Harriman until the Legislature convenes again next year is probably the worst spent. But, at least, it will give Mr Harriman, who has spent most of his life in the world of high diplomacy, a real taste of low politics.

The Cost of Harmony

New York

WHEN a hundred-man symphony orchestra, once conducted by Maestro Arturo Toscanini and sponsored by the National Broadcasting Company, makes a courageous bid to stay alive without a permanent conductor, a sponsor or a home, its progress has more than passing interest. For in "The Symphony of the Air," as the orchestra is now called, the economics of American symphony orchestras are seen in the raw.

More Americans are listening to classical music than ever before. Twice as many people go to symphony concerts, it is even claimed, as attend first division baseball games. But the real growth is in the demand for "potted" music—the long-playing, "hi-fi," classical recordings that now account for over 30 per cent of total sales of gramophone records. Meanwhile attendance at "live" concerts has failed to keep pace with the growth of population, and those recitalists who can still fill New York's Carnegie Hall are a sadly diminished company. Scarcely one of the 26 major symphony orchestras in the big cities—those organisations with an annual budget exceeding $100,000—could survive without the help of their "friends of the orchestra." These non-commercial "angels" are relied upon to cover operating losses running frequently as high as 25 per cent of total costs.

To maintain one of the biggest symphony orchestras, such as the Boston Symphony or New York Philharmonic, costs over $1 million a year. Yet this year the New York Philharmonic expects to have a net operating deficit of $300,000. Musicians' salaries have nearly doubled, under trade union pressure, since 1940, and now cost the orchestra nearly $600,000 a year. In almost every case, both the

regular winter concert season and the long tours and festivals are a sure addition to the deficit. There is no question, therefore, of the one subsidising the other. The Boston Symphony Orchestra, for example, loses $235,000 on its winter season, $40,000 on its summer festival and an average of $1,000 on each of the thirty concerts given during its nation-wide tour. Only from broadcasting, television and occasional film fees, and—for the larger and better known orchestras—from recording royalties can net earnings be supplemented. The Symphony of the Air, indeed, regards these royalties as its greatest potential source of income.

Commercial sponsors for orchestras, whether desirable or not, are hard to find, and in practice, in America, unlike Britain, outside help comes mainly from private sources. Some cities provide assistance, either directly in the form of grants, or indirectly by providing a " home " or concert hall. Within the United States the only aid granted by the federal government to symphony orchestras is relief from taxes, although this adds, in effect, 20 per cent to box office takings. Some direct government assistance to music would have been provided in two Bills presented to Congress last year but neither Bill was strongly supported. The major orchestras, with one or two notable exceptions, are conservative bodies, with strong objections to any government interference in music or the arts. As long as voluntary contributions can be relied upon to fill the gap—however precariously—the spectre of a politician nominating the player of the French horn can be invoked in opposition to proposals for federal aid.

SHORTER NOTES

The Senate gave its almost unanimous consent on April 1st to the ratification of the Paris Agreements on German sovereignty and rearmament. The only dissenters to the accord were the Republican isolationists, Senators Langer and Malone.

★

To fill the vacancies on his three-member Council of Economic Advisers, the President has nominated Dr Raymond Saulnier, an expert on monetary policy, and Dr Joseph Davis of Stanford. Dr Davis's special knowledge of agricultural questions may mean that more attention will be given to what is today the country's most troublesome economic problem and one which the council has been accused of neglecting.

★

On his putting green behind the White House, President Eisenhower was recently being stymied by squirrels. Three of the offenders were trapped and exiled to the Virginia woods. Promptly, Senator Neuberger, Democrat of Oregon, where the protection of natural resources and wild life is a major political issue, invoked a law providing fines and imprisonment for squirrel-trappers in the District of Columbia. This protest brought happy responses from nature lovers throughout the land and forced the White House to rescind its policy.

Lines of money literally ran around Wall Street when the two biggest bank mergers of the year were completed on Monday. Because a New York law prohibits banks from having dual head offices, the Chase-Manhattan and National City-First National mergers involved a physical transfer of millions of dollars in cash and securities. To liven matters further, the Seaman's Bank for Savings also moved to a new site. In what must have seemed like a bank-robber's nightmare, hundreds of uniformed and plain-clothes guards raced around Wall Street carrying little bags and big guns.

★

By 283 votes to 132, the House of Representatives last week approved the sale of 24 government-owned synthetic rubber plants to private industry. The next day, the Senate followed suit by a vote of 56 to 31. Thus ended, surprisingly easily, a long struggle, first begun under a Democratic Administration, to get the government out of a wartime business undertaking. Actual transfers begin on April 21st.

★

The competition among the five major aircraft manufacturers for production of a jet tanker for the Air Force has been won by the Boeing Airplane Company, which was awarded a $460 million contract. This gives the Boeing Company a monopoly in this field and puts it well ahead in the race for the production of a commercial jet airliner.

★

The machine tool industry seems to be as well on the road to recovery as is the rest of American industry. In February new orders for machine tools reached their highest level for sixteen months, and in March did even better.

★

Motorists will soon be able to match their tyres to the upholstery of their cars. The US Rubber Company is hoping that its second experiment in marketing tyres with brightly coloured sidewalls will be more successful than its initial attempt in the nineteen-thirties; the hope seems likely to be fulfilled since now colour seems to be one of the most important factors in the American car owner's life.

★

The Post Office has returned to the Los Angeles book dealer who purchased it from a bookshop in London a rare illustrated copy of Aristophanes' *Lysistrata*, which it had seized under the authority of the postal censorship law. The book dealer, however, not content with merely recovering his " obscene, lewd and lascivious " purchase, proposes to test the constitutionality of the censorship law by offering the book for sale.

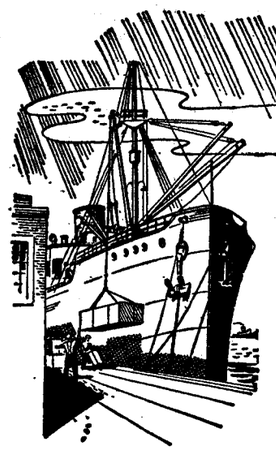
★

Correction.—The first sentence of the last paragraph on page 37 of the issue of April 2nd should read:—Nine states produce 97 per cent of the natural gas consumed in the 48 United States but of these only two—California and Pennsylvania—consume more gas than they produce.

Let Catesbys free your knees

A standard size desk is apt to be unaccommodating as well as unbecoming to a man of stature — cramping his legs, banging his knees and generally interfering with the smooth flow of the day's work.

Catesbys Contracts make it their business to provide desks and chairs of the dimensions and dignity that befit both the position and the proportions of men of importance. And they will just as readily make for you any other special piece of office furniture you need.



Tell us what you want and we will see that you get it without undue delay—or undue expense.

The World Overseas

Fast Train to China

BY A CORRESPONDENT

THE coast of the Chinese mainland confronts the coveted island of Formosa like the arch of a bow pointing at a target. But, if the metaphors of archery are permissible in terms of modern warfare, the bow has hitherto lacked the logistic string from which missiles could be confidently launched. This is now to be supplied by the completion of direct railway communication from Siberia in the north to the Gulf of Tonkin in the south. At present Russian supplies for China have to be carried by slow boat around India and past Nationalist naval patrols, or else by the already overburdened Trans-Siberian railway. On reaching the Manchurian frontier, this line doubles back on itself in an enormous semi-circle, almost touching the coast between Mukden and Tientsin, and thus leaving rail as well as sea links between the two allies at the mercy of a superior enemy navy.

To remedy this, a new line is now being hastily constructed across the Mongolian Republic to Peking; and only a comparatively short stretch now remains to be laid. The track should be working before the end of this year. It will provide a shorter and safer supply route for the Chinese, and it will take a heavy burden from the Soviet railway system. For in view of the Communist habit of linking separate strategic areas with their own industrial sources of supply, it must be assumed that the Baikay industrial complex will be called on to satisfy a large proportion of China's needs. This would explain why Bulganin, Khrushchev and Mikoyan, on their way home from Peking last autumn, stopped on the way to observe progress and encourage the workers on the Angara River power scheme, near Irkutsk, a vast project which even in its early stages is to include the third largest hydro-electric power station in the Soviet Union.

The supplies promised by the Russian delegation were evidently substantial enough to induce the Chinese, whose section of the line reached the Outer Mongolian frontier last December, to announce in January that they intended to tear up the tracks they had only just laid in standard gauge and relay them in Russian broad gauge, which will thus reach a point within 300 miles of the Yellow Sea, compared with more than 600 at present. (It will in fact stop almost within sight of the northern face of the Great Wall of China.) The Chinese have recently set up a preparatory committee to arrange for international through traffic to Mongolia and the Soviet Union, and at the Harbin railway works locomotives and other rolling-stock are being altered for use on the broad-gauge line. While all this has practical advantages for both parties, it can hardly fail in the long run to simplify Russian penetration into Chinese Inner Mongolia; and it is a further step towards the attainment of the old Russian ambition of direct access to the ice-free seas of the Far East, perhaps in the neighbourhood of Taku.

The strategic importance of the Mongolian line is obvious, and its effects will be felt immediately; but it is not the only new link planned. A line is already under construction from Lanchow in China to Alma Ata in Russia, following and modernising the Silk Road of Roman and mediaeval times. This is a greater undertaking, for it will be about 2,000 miles long and pass through much mountainous country; but it is not being pressed forward with the same urgency. The Chinese have been adding to it at the rate of about 100 miles a year since 1952, and the Russians did not begin alignment work at their end until last autumn.

While this railway, too, will be strategically valuable in providing a new link, and one even less vulnerable to attack, its main importance will be economic. It will open up the mineral resources of Sinkiang and the oil of Kansu, and so will enable the Chinese to develop new industrial areas in the north-west. While it is being constructed, the Chinese are also linking up existing stretches of line southwards from Lanchow, so that eventually the railways from Alma Ata and Baikal will meet at Hanoi in northern Indo-China, thus forming a great logistic triangle, and permitting the Communist bloc, if it so wishes, to turn the Gulf of Tonkin into its principal naval base for the south Pacific.

While railways are the backbone of the emerging communications system in China, and a further 600 miles of them are to be added during 1955, roads are also being built with great speed. Two new roads, for example, each 1,300 miles long, converge on Lhasa, the capital of Tibet, one from central and the other from north-west China. It is now possible to reach Lhasa from Peking in three weeks instead of three months; and this result was thought to justify a truly frantic pace of construction. During the winter the supply system to the snow-bound mountains broke down, and the Chinese themselves admitted that some of their workers had to live on roots and rats and even return to the Neolithic Age for their artifacts, for they were forced "to make their own tools with their bare hands from materials available in the neighbourhood." At one period they had to be supplied from the Tibetan end of the project with rice bought at scarcity prices across the Himalayas.

The urgency with which these roads were built, like the dogged effort going into the Lanchow-Alma Ata railway, suggests that the Chinese are determined to extend their control as far and as fast as they can into the border lands where foreign influences—above all Russian and British—have often proved too strong for Peking in the past. But this does not mean that short-term needs are being sacrificed to long-term calculations. The way in which the Chinese have swallowed their pride over the gauge of the Mongolian railway is evidence enough of this; so too is the announcement of road building both on Hainan Island, where the Chinese Communist Navy is generally believed to have set up an operational base, and behind the Fukien coast, directly opposite Formosa and the Nationalist-held offshore islands.

The Chinese road and rail projects are, in fact, carefully thought out to serve both present logistic and future industrial needs; and they are presumably one of the new burdens that have induced the Kremlin leaders to turn the gaze of the Russian worker away from the shop windows and set his feet firmly back again on the treadmill of still higher output from heavy industry.

The Red German Army

THE Soviet government capped the announcement that the French Senate had ratified the Paris treaties with another reminder that it is planning an Eastern version of Nato. There have been many such warnings since the beginning of last December, when the Soviet bloc, including representatives of the Pieck Republic held a security conference in Moscow to decide on joint defence measures. The latest meeting, according to the communiqué, agreed on the principles of a treaty of "friendship, co-operation and mutual aid" and the organisation of a unified command. On both occasions, a Chinese representative was present to underline the military alliance between the Soviet Union and Mao Tse-tung's Republic. In December, the East German premier, Herr Grotewohl reported that the Peking spokesman had told the conference that China would render aid in a European war. And China's position was brought out officially in the declaration of March 22nd, which ended with the words: "The Government of the Chinese People's Republic, which expressed its full agreement with the measures outlined, took part in the consultations of the governments of the eight countries."

In between the full meetings of the bloc special gatherings of the East Germans, Poles, Czechs (and presumably Russians) have been held in Czechoslovakia. For this reason, among others, it is thought in Bonn that the Soviet plan is to set up a combined German-Polish-Czech force, which would be under the command of Marshal Rokossowski, acting on behalf of the Soviet army chiefs. This force would be something like the still-born European Army of the West, while the full Soviet coalition would be intended to resemble Nato.

An Embryo Air Force

The chief new element of the plan is the inclusion of the East Germany army as an ally. The whole Soviet bloc, without the East German Republic, has been linked by military pacts for years past, and the command has presumably always been unified in Moscow. But hitherto the Russians have not wanted to press the Czechs and the Poles to accept the Germans as allies, though they are constantly pushed forward by Moscow as reliable "democratic peace-lovers" and Herr Grotewohl a long time ago formally renounced all claims on the Oder-Neisse or Sudetenland territories. The first move to set up a German Communist army was made in 1948. Under the camouflage name of "barrack-based police," the force has grown slowly, and now includes an embryo air force, under the name of "Aero Club," and a small naval arm. It now totals about 110,000 men, of whom 85,000 are in the army. There are two army groups, "North" and "South," each of three divisions, one of them armoured, and an extra division garrisoned in Potsdam. The land forces have tanks and armoured vehicles, though not of the latest types, and the air force is not supplied with jet fighters. Young men are attracted by good pay and food to volunteer to serve for two years. After the revolt of June 17, 1953, a purge of unreliables took place and the gaps have only gradually been filled.

Desertions to the West are a good indication of the state of morale in the East German force. According to the Federal German Ministry of All-German Affairs, it is not bad and will improve with years of indoctrination. Less than 3,500 had deserted to the West up to the end of 1954, and of these only about 2,500 were still actually serving. The number of deserters has, moreover, been dropping. Most of them are under 21 and the officers—a mere 320—had left mainly because they could not stand the political intrigues and pressure. One of the chief reasons which drive all kinds of refugees to the West is the feeling that no one can talk freely for fear of being denounced.

The East Germans are commanded by various categories of officers. There are the German Communists who fought in the Spanish civil war and are Soviet citizens. Supreme Commander General Hoffmann is one of these. The second category consists of politically reliable Germans who have risen from the Wehrmacht ranks, as, for instance, the

supreme commander of the Soviet German navy, who was a petty officer during the war. The head of the air force represents the third kind of officer who held a commission in the Wehrmacht. Most of this group are men who were indoctrinated while they were prisoners of war in the Soviet Union. The chief of staff, Lieut-General Vinzenz Mueller, is one of them. He was actually a commanding general in the Wehrmacht; and there are several former divisional commanders now in the Soviet German service. Field-Marshal Paulus does not seem to have a command, but is very active in appeals to the former Wehrmacht officers in the West. Last but far from least among the men who control the German force are the Soviet officers who are attached to each regiment in Germany and in the satellite states. The Germans in higher ranks and the staff officers are trained in Soviet colleges, though in addition a staff college now exists in Dresden.

The question now arises—will conscription be introduced and the Soviet German force built up into a mass army? So far, the Russian intentions are not clear. Far more officers have been trained than are needed for 110,000 men; and preparations have been made for a call-up, but the indications are that attempts will be made to avoid open conscription. Increased efforts are being made by the para-military organisation called the "Company for Sport and Technology," which trains men under a German graduate of a Soviet war academy. This source will certainly be used to secure volunteers for the army and for the factory guards, and the young Communist party members are being urged to enlist. Herr Grotewohl, however, has given an assurance that any West Germans who come over to avoid conscription will not be forced into the Eastern army—which is one reason no doubt why conscription (by that name) will be avoided as long as possible. There are other obvious reasons for hesitation. They are distrust of the Germans as a whole, and the serious shortage of man-power on the land and in the factories. If conscription is adopted, it may be expected that many national servicemen will at once be drafted on to the farms, to sow maize, drive tractors and learn Marxism-Leninism in their spare time.

Diem Tackles the Sects

THE all-seeing eye of Caodai, the supreme being, sees more from its vantage point above the altar of the temple than do the curling dragons within the pink and blue interior. Beyond lies the residence of His Holiness the Superior, sometimes known as "the Pope," Pham Cong Tac, and beyond that the staff headquarters of the Caodaist army, the twin centres of power in the sprawling, overgrown village of Tay Ninh in Cochinchina. No government in Vietnam can afford to ignore this power; wisdom dictates that its alliance be sought, but not to the extent of allowing it to gain the upper hand.

In the latest crisis in southern Vietnam, as in last year's Army crisis, the "Sects" are playing a dominant role. Last September, when these politico-religious groups sided with the rebellious Chief of Staff of the Vietnamese Army, General Hinh, the Prime Minister, Mr Diem, was forced to offer half-a-dozen portfolios each to the most important of them, the Caodaists and the Hoa Haos. Last month, the direct challenge to his authority came from the sects, who formed a "United Front" and issued an ultimatum giving him five days to broaden his government or face the consequences. This time, he has been saved, at least in part, by the fundamental disunity between the members of the "United Front."

For the purposes of official tidiness, the sects are regarded as including the gang of former river pirates known as the Binh Xuyen (the name of a village near Saigon where the movement began), but only the Caodaists and the Hoa Haos can claim the religious basis implicit in the word "sect." Both describe themselves as "reformed" or "renovated" Buddhism, but whereas the Hoa Hao movement is a return to the simplest precepts of the original, Caodaism is an extravagant and baffling mixture of the world's major religions, borrowing from Taoism, Buddhism and Confucianism in equal measure, with elements of Christianity (particularly in the hierarchial pattern), Islam, spiritualism and Theosophy thrown in for good measure.

Caodaism grew out of spiritualistic seances conducted in the 'twenties by a Cochinchinese customs clerk named Chieu, who later became the sect's first Pope. It has an impressive and bewildering collection of saints, with the French poet Victor Hugo in an honoured place. The Caodaists claim that a reincarnation of the poet lives at Tay Ninh and the "posthumous" works of Hugo, dictated by spiritualist means, are still being collected. The Hoa Hao movement is roughly a contemporary growth. Its founder, originally a Buddhist priest, became known as "the Mad Bonze" after a spell of mental derangement. Later, stories of his miraculous cures brought disciples flocking to his side.

Tough Private Armies

The power of the sects is manifested in three directions—spiritual, social and politico-military. To its two million adherents, Caodaism clearly fulfils a deep-seated need, as does the smaller Hoa Hao sect among its followers, who number about half as many as the Caodaists. Among the Caodaists in particular, a kind of primitive Communism has made the area apparently immune to the virus of the international variety. But the power of the sects to make mischief rests on the more material foundation of their private armies. Both were associated with the Vietminh in the days when its Communist direction was less in evidence than its nationalist aims; both broke with the Vietminh when they became aware of the reality behind the façade. The Hoa Haos have particular reasons to hate their former associates who massacred thousands of them in punishment for their defection. General Tran Van Soai, the picturesque, moustachioed Hoa Hao commander-in-chief, led a mass uprising against the Vietminh and signed a pact of alliance with the Caodaists under which the two sects vowed war to the death against the Communists.

The French found this situation profitable and offered arms and subsidies to the sects, whose armies, toughened by guerilla fighting, ensured the safety of the areas under their control until the end of the Indo-China war. The pattern, however, was not as tidy as the French Union High Command might have wished, owing to the existence of dissidents from the main bodies of the sectarian armies. One of them was the fanatical Caodaist Trinh Minh The, once the Caodaist army's chief of staff, who broke with the official movement in 1950 and fought the Vietminh and the French with indiscriminate efficiency while terrorising his co-religionists in Tay Ninh province. Of the five or six dissident Hoa Hao groups, the most notorious is that of Ba Cut,

the driving force in the present challenge to the Diem government. When the Geneva agreements were signed, Ba Cut cut off the top of his right index finger and has since allowed his hair to grow in sign of mourning. A few months ago, he commanded only a thousand poorly armed men; since then his army has grown to 5,000, with a more than proportionate increase in armaments, apparently with the connivance of the Hoa Hao leader, General Soai, who, until the recent crisis, was a minister of state in the Diem cabinet.

In itself, the Binh Xuyen movement is of less importance, but its leader, General Le Van Vien, who enjoys the friendship of the Emperor Bao Dai, bought for his group the control of the Vietnamese *Sûreté* and of the Saigon-Cholon police during the premiership of Prince Buu Loc, the last pre-Geneva prime minister. This gave the Binh Xuyen a disproportionate voice in affairs of state which, however, has now been reduced by an imperial decree creating a new prefectural police for Saigon-Cholon and by the seizure of the police building by soldiers of the National Army. But General Vien still seems to control the *Sûreté*.

At the root of the present crisis is the threatened loss of their feudal autonomy and privileges by the sects. The French subsidies ceased last November and the sectarian armies are now faced with real incorporation into the National Army, instead of the paper integration which left them masters in their own houses. The irrational element in southern Vietnam makes any prophecy hazardous. But now that the Caodaists have rallied with some of their 25,000 men, including General The's 5,000, it seems doubtful whether the 10,000 Hoa Haos and the 5,000 Binh Xuyens can indefinitely defy the central government while it enjoys the complete support of the Americans.

Mr Diem's position is still extremely precarious, but in the long run, the scales are weighted on his side—if he can survive the initial shock of rebellion and if he retains Bao Dai's approval. Perhaps this was the inner knowledge the Caodaist Pope saw in the all-seeing eye when he ordered his men to march through the streets of Saigon to make their formal submission to Mr Diem in the Palace of Independence.

No Rest for M. Faure

SINCE the ratification of the Paris agreements, M. Faure has had no time to rest on his laurels. He had to turn at once from the Council of the Republic to the Assembly, to plead there for the extension of the special powers to act by decree that had been granted to his predecessor; in fact, this was really the sequel to the recent debate dominated by M. Poujade from the public gallery. Once again fiscal reform was the chief subject of discussion; but this time the government scrambled home and was finally empowered, by 303 votes to 268, to act by decree in the economic field. These powers were not granted without a battle, however, in which the government was compelled to carry out a further retreat on fiscal control and inspection. Indeed, the day was probably saved only by a promise that, under a new system, retail shops assessed at a turnover of less than £15,000 would not be resubmitted to tax inspection. This concession might well steal some of M. Poujade's thunder.

Although the present French government has therefore now inherited the wide decree powers granted to M. Mendès-France, together with special limited powers to reform the fiscal system, both are valid only until the end of this month and no major changes may be expected. At the same time, for the specific task of alleviating the growing pains of the underdeveloped regions of France, the Assembly has authorised the government to act by decree until the end of June. On paper, assistance to these regions is the natural complement to an equitable reform of the fiscal system. Yet it is doubtful whether, with the motley coalition supporting him, M. Faure can do very much in either of these fields. There is, in fact, an increasing tendency to revert to the Third Republic practice by which wide powers were granted to the government to act by decree, but the government did not then use to the full the very powers for which it had asked.

In Paris, the two chambers have now recessed, and, with local elections in the offing, M. Faure can rely on a parliamentary respite till the beginning of May. He has, however, another important date, an April *rendezvous* with workers and civil servants for the revision of their wages. The government, burdened with a substantial budgetary deficit, has decided not to increase the statutory minimum wage, but to raise the bonus payable with the lowest wages by Frs. 4.5 an hour. Although the unions are quite pleased with one of the government's other proposals—aimed at a reform of collective bargaining—they regard the new award as ridiculously small. M. Faure is likely to find the wage-earners no less of a problem than the shopkeepers behind M. Poujade.

Mr Holland Talks About Defence

FROM OUR WELLINGTON CORRESPONDENT

THE chief reaction to the new defence proposals announced two weeks ago by the Prime Minister, Mr Holland, is that a lot of fuss has been made about comparatively little. It now appears that New Zealand's immediate contribution to strengthening the ground defences in Malaya is to be a special commando unit of 100 to 120 men recruited as volunteers. Fiji, it has already been pointed out, is already providing a battalion in Malaya. Apart from this, New Zealand is to transfer the fighter aircraft it was maintaining in Cyprus (one squadron), to return half of a transport squadron which had formerly served in Malaya, but which had been brought back to New Zealand and to transfer from Fiji half of a reconnaissance squadron. It is also to make two naval frigates available for service in Malayan waters. It already has one serving off Korea. Mr Holland's only other immediate proposal was that New Zealand will accept the transfer of another cruiser from the Royal Navy and undertake its modernisation at an estimated cost of £4 million. The cruiser already on loan to the New Zealand navy from the Royal Navy is well overdue for replacement and New Zealand would have had to obtain another replacement in any event.

There is a strong feeling that these proposals fall considerably below the contribution this country could make and which many New Zealanders expected it to be asked to make. There is also a strong feeling that Mr Holland

talked unnecessarily about the cost of these commitments and that, in view of their modest dimensions, he might have made less parade of the financial aspects. There is, moreover, some feeling that the addition of a modernised cruiser is not the best means of strengthening New Zealand's naval defences. It is possible that better value could be obtained for the money by obtaining light modern frigates and corvettes to act in co-operation with land based torpedo and bomber aircraft. One cruiser, however much it is modernised, has a limited radius of activity against what is held to be the most probable naval threat to New Zealand—long-range submarines and fast surface raiders.

Mr Holland's announcement that New Zealand has now been released from its previous commitment to provide troops for service in the Middle East in the event of hostilities in that area and that, in future, the country's defence effort will be directed towards the Far East, was not unexpected. There has been a growing feeling that New Zealand's responsibilities as a signatory to the Anzus Pact made it essential to revise this Middle East undertaking. This country has every desire to remain within the British orbit but it is felt that as a Pacific country it must concentrate its defence effort in that area. There are some misgivings, too, about the wisdom of continuing to base the training of the New Zealand Air Force upon British machines on the grounds that if trouble occurs in the Pacific, the Air Force will be forced to rely for its supplies upon the United States.

In his speech, Mr Holland placed considerable emphasis upon the need for New Zealand to cultivate good trading and general relations with Japan. Though many New Zealanders concede the soundness of this argument it is not likely to receive a very sympathetic hearing. There is still more residual antipathy to Japan than there is to Germany. There is also considerable fear of Japanese trade infiltration though no reluctance to sell New Zealand wool or any other exports to Japan if it can find the sterling to buy them.

Though he devoted some time to talking about the threat of atomic weapons, Mr Holland said nothing on this subject that has not been said before, and said better. There was little real urgency in his speech and his assertion that New Zealand's chief role in any future conflict would be that of a food producer was simply a concession to those who very willingly accept this as the basis of any contribution to Commonwealth defence that New Zealand should be called upon to make.

Burying the Hatchet in Schleswig

FROM OUR SCANDINAVIAN CORRESPONDENT

LAST week, in Bonn, declarations of principle on the treatment of minorities were exchanged by Dr Adenauer and the Danish Prime Minister, Hr H. C. Hansen. The declarations are the outcome of Danish-German talks which began in Copenhagen early last month (see *The Economist* of March 5th, page 802). They reaffirm the political, cultural and educational freedom of the Danish and German minorities in South and North Schleswig and supersede the Kiel Declaration and Copenhagen Note of 1949. In addition, they contain a series of important provisions designed to redress specific grievances.

The Germans have gone far to meet Danish wishes on both the form and content of the declaration, and it is they who have made the main concessions. The German minority in North Schleswig enjoys a relatively privileged position, and 9,700 voters return a member to the *Folketing*. By contrast, the "hard core" of 42,000 Danish electors is unrepresented in the Schleswig-Holstein *Landtag*. The Federal government undertakes to support modification of the Schleswig-Holstein electoral law which, unlike the Federal law, does not except national minorities from the so-called "five per cent clause." (This clause, intended to eliminate splinter parties, robbed the Danish South Schleswig party of its four seats in the *Landtag* at last autumn's provincial election.) Among other things, both governments will support equal status for minority schools, and recognise their right to hold examinations. *Land* subsidies to Danish schools in Schleswig-Holstein, which were cut last year, will be fully restored. The Danes will look sympathetically on higher education schemes in North Schleswig.

Regrets in Kiel

The concessions to which the Federal government subscribes lie outside its competence, as *Land* electoral legislation and education are matters for Kiel. The Kiel government was, however, represented at the Copenhagen talks; and the Christian Democrat Prime Minister, Herr von Hassel, attended the concluding stages in Bonn. As the Social Democrats in Kiel also support the minority's claims, the Danish South Schleswig party should be able to secure representation at the 1958 *Landtag* election. Meanwhile the Danes will be allowed to join committees set up by the local government authorities in proportion to their numbers. Herr von Hassel has been more conciliatory than his predecessor, Herr Lübke, but he is not satisfied with the agreement. On his return from Bonn, he expressed regret that the Danes had not finally acknowledged the frontier and had, indeed, refused to discuss the question. They had also rejected the German desire that the rights of minorities on both sides should form part of a State treaty.

Since 1945 the fortunes of the Danish minority have fluctuated. Before the currency reform, they polled 100,000 votes. They then hoped to re-draw the frontier on the Eider, and to re-incorporate South Schleswig in Denmark. But as the Federal Republic regained prosperity and prestige minority support decreased. The continued presence of 150,000 refugees in South Schleswig swamps the native population; and since 1947 10,000 Danes have emigrated. The disastrous operation of the electoral law last autumn caused much bitterness. *Programm Nord*, an ambitious scheme for land reclamation and refugee resettlement immediately south of the border, constitutes a further grievance. On the other hand, the Danes' lavish "cultural offensive"—they have 91 schools and 20 kindergartens—is a source of irritation to Germans.

The extreme demands of Danish nationalism—administrative separation of South Schleswig from Holstein; removal of all refugees; and eventual self-determination for South Schleswigers—remain unsatisfied. Nevertheless, the accord marks a new and encouraging phase in relations between future Nato partners, which should please all but "professional patriots" on both sides of the border.

CHRISTIES

Telegrams: Christiart, Piccy, London.

CHRISTIE, MANSON & WOODS, LTD.

8, KING STREET, ST, JAMES'S, S.W.1.

Sales commence at ELEVEN O'CLOCK PRECISELY. Catalogues may be had price 3d. per copy (prepaid) post free.

ON THURSDAY, APRIL 14.
ENGLISH and CONTINENTAL FURNITURE, PORCELAIN, OBJECTS OF ART, EASTERN RUGS and CARPETS, from various sources.

ON FRIDAY, APRIL 15.
MODERN PICTURES and DRAWINGS, mainly of the 19th century British and Continental Schools, from various sources.

ON WEDNESDAY, APRIL 20.
OLD ENGLISH and CONTINENTAL SILVER and PLATE, the Property of MRS. LOUIS FLEISCHMANN and others, including an Elizabeth I Ostrich Egg Cup with silvergilt mounts, 1591, a Charles II plain Tankard, 1682, and a German Tankard, Hamburg, circa 1680.

ON THURSDAY, APRIL 21.
OLD ENGLISH and CONTINENTAL FURNITURE, OBJECTS OF ART, ASTERN RUGS and CARPETS, from various sources.

ON FRIDAY, APRIL 22.
At 11 a.m. ANCIENT and MODERN PICTURES and DRAWINGS, the Property of the EARL OF DERBY, M.C., and others.
At 2.30 p.m. ANCIENT and MODERN PICTURES and DRAWINGS, the Property of L. C. WALLACH, ESQ., and others.

ON MONDAY, APRIL 25.
EUROPEAN and ORIENTAL CERAMICS and OBJECTS OF ART, from various sources.

ON TUESDAY, APRIL 26.
OBJECTS OF ART AND VERTU, MINIATURES and COINS, the Property of the late MARY, LADY COLMAN, the late H. S. GUINNESS, ESQ., and others, and a Collection of Old English Watches, the Property of JOHN VINCENT, ESQ., J.P., and including an Italian Violin by Tononi circa 1700, works by Carl Faberg, and a German gold filigree box, circa 1600.

ON WEDNESDAY, APRIL 27.
FINE JEWELS, the Properties of MRS. B. DONALD, MRS. A. MARTIN and others, including an Old English Diamond cluster Ring, circa 1780, and a Diamond cluster Half-hoop Bracelet.

ON THURSDAY, APRIL 28.
OLD ENGLISH and CONTINENTAL FURNITURE, OBJECTS OF ART and EASTERN RUGS AND CARPETS, from various sources.

ON FRIDAY, APRIL 29.
OLD PICTURES and DRAWINGS, the Property of P. J. WESTWOOD, ESQ., and others, mainly of the 17th and 18th centuries, British and Continental Schools.

ON MONDAY, MAY 2.
FINE ENGLISH and CONTINENTAL PORCELAIN, the Properties of The VISCOUNTESS BERTIE OF THAME, ROBERT VON HIRSCH, MISS M. SAUNDERS STEPHENS, MRS. M. A. RASH, MRS. M. FALCONI, including an Important "Flying Fox" pattern Meissen Dinner Service, fine Meissen groups modelled by J. J. Kaendler, J. F. Eberlein and others, fine Chelsea porcelain including a red anchor set of the Seasons, and Worcester porcelain from the MISSES GARWOOD, formerly in the Collection of the late Frank Lloyd. Ill. Cat. 5/-.

The seat-of-your-pants test

FILL up with Shell with I.C.A. Find an open stretch of road. Press hard on the accelerator, without looking at the speedometer. When you feel that you're doing (say) fifty-five, look at the dial.

You will be going several m.p.h. more.

Try it the other way round, too. Accelerate to fifty. Then feel how much less fast you seem to be travelling than you usually feel at this speed.

These tests mean that Shell with I.C.A has made your car accelerate more rapidly and more smoothly than you're used to. It means that on Shell your engine reaches and maintains a fast cruising speed with less fuss and less strain.

There are several reasons for this.

The I.C.A in Shell smooths out your engine's performance, and lets it develop its full power with the least possible effort. (If you haven't used Shell before, I.C.A may take a little time to work.) At the same time Shell's perfectly balanced volatility gives it the most vigorous pulling-power. And Shell's anti-knock quality is high enough to satisfy every car on the road.

SHELL WITH I.C.A

the most powerful petrol you can buy

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

Please ask for our new booklet—"Capital for Business and Where to Find it".

Well-padded Cell

Senior executives condemned to spend long hours sitting on committees should consider this new Heal chair, especially designed for conference and boardrooms. The well-padded arms and well-sprung seat will see you through even an all-day meeting in a very high degree of comfort indeed. There is a choice of covering materials—though we particularly recommend hide for long wear—and a special high-backed version to preserve the dignity of the Chair. Come and try out this chair in our Contracts Showroom, where you can always see a wide selection of Heal furniture for boardrooms and offices. Your visit will show you just why so many of today's leading and most progressive companies—both in Britain and abroad—bring their furnishing and decorating problems to Heal's. If you cannot call, please tell your secretary to write for our booklet, *Furniture for Special Needs.*

THE BUSINESS WORLD

Balance of Payments

ONCE again the balance of payments has proved to be the Achilles heel of the British economy. That fact has been acknowledged in all discussions of the recent deterioration of the economic position and in the measures taken to remedy it. It dominated the Economic Survey published last week. More details about the directions from which the threat has developed and about the damage that has been inflicted are provided in the White Paper on the United Kingdom Balance of Payments 1946 to 1954 published last Tuesday.

Seasonal factors upon the balance of payments normally make the second half of each year less favourable than the first half, but the pressures that developed in the latter part of 1954 make it more than ever necessary to scrutinise the two half years separately. The differences between them, and the out-turn of the year as a whole by comparison with 1953, are shown in the table opposite. It should be emphasised that the estimates for the second half of 1954 are provisional and may have suffered more distortion than usual—partly because of the sharp changes that were then taking place in the flow of Britain's international payments and partly because of the impact of the dock strikes on the normal rhythm of both export and import trade. But any such distortions cannot have destroyed the main outlines of the picture. These are all too starkly apparent. In 1954 as a whole the surplus on the balance of payments was £110 million, only £5 million smaller than the 1953 surplus. But between the first and second halves of 1954, the balance of payments of the United Kingdom deteriorated by no less than £186 million, while there was a swing of £337 million in the balance of the sterling area as a whole with the rest of the world —changes that go far beyond the differences that may be shown between "provisional" and "final" estimates.

The deterioration in the second half of last year was partly accounted for by the full-year interest payments, totalling £38 million, on the US and Canadian loans that fall due in December, and also by the seasonal tendency for the exports of the rest of the sterling area to decline in the late summer and autumn. But much more important quantitatively were non-seasonal influences: the increase in imports (in Britain largely on account of higher prices but in the overseas sterling countries as a result of a sharp increase in volume); the fall of just over 2 per cent in Britain's exports; and the fall in Britain's net invisible income on private account. The deterioration in the balance of payments between the first and second halves of 1954 was divided almost equally between the visible and the invisible balance. It is disturbing to find that

the steady fall shown in recent years in net earnings from interest, profits and dividends, primarily in consequence of a steep rise in out-payments, continued last year. In 1954 as a whole gross earnings from this source increased by £8 million, to £293 million; but the corresponding payments rose more sharply, namely from £226 million to £258 million. This was a combined result of the increases in dividends distributed by British companies and of the substantial stake of

overseas investors in the equity of these companies. The United Kingdom's net overseas investment income thus reached only £35 million—compared with £59 million in 1953 and £154 million in 1950.

Another disturbing feature is the swing in the regional balance. More than five-sixths of the increase of 6 per cent in Britain's exports in 1954 as a whole went to sterling countries, while virtually the whole of the increase of £118 million in imports came from non-sterling countries. The distinction between currency areas is less important than it was; but it is plainly an unfavourable omen that Australia, which has this month been forced to make substantial cuts in import quotas, bulked so large in the increase in Britain's exports last year. British exports to western Europe rose too, but sales to North America fell by 5½ per cent. Britain's current deficit with the non-sterling world increased in the full year from £58 million to £159 million—before crediting defence aid totalling £102 million in 1953 but only £50 million in 1954.

The surplus of the rest of the sterling area with the non-sterling world fell from £281 million in 1953 to £116 million in 1954—of which all but £3 million was earned in the first half. Yet, as Table II shows, the overseas sterling area's contribution to the central gold reserves actually rose slightly over the year as a whole—totalling £166 million, against £165 million in 1953. There were two principal reasons for this. In the first place, the surplus of the colonies with the dollar area was all but maintained—at £99 million. Secondly, whereas the dollar balance of the independent overseas sterling countries financed through London deteriorated from a deficit of £15 million to a deficit of £72 million, gold sales in Britain rose almost sufficiently to offset that deterioration—from £79 million in 1953 to £130 million in 1954. This represents for the most part the diversion of gold sales to London following the reopening of the gold bullion market in March of last year and the disappearance of the premium that had previously been quoted on gold in the overseas "free" markets. The gold producing countries (particularly South Africa) which used to finance some of their dollar imports from gold sales in the free markets accordingly now have greater recourse to the dollar pool in London. On balance there may be little net gain or loss arising from the diversion. What is surprising is that the deterioration in the rest of the sterling area's current account with non-sterling countries appears to have been almost fully covered by a larger inflow of dollar capital.

The current deficit of the United Kingdom itself with the dollar area, excluding defence aid, increased from £110 million in 1953 to £151 million in 1954. But the deterioration would have been much greater but for the marked increase in special indirect military receipts, which are included in the commercial balance. Offshore sales to the United States were more than doubled, at £37½ million, and receipts from spending of American and Canadian forces in Britain rose from £55 million to £62½ million. Together these receipts now bring in more than one-quarter as much as the proceeds of all commercial exports and re-exports to the dollar area combined.

The out-turn on capital account is shown in Table III. Britain's current surplus for the year, including aid, provided it with £160 million (compared

TABLE III

* Current surplus plus defence aid. † Calculated as a residual.

with £217 million in 1953) available for external financing or strengthening of reserves. The increase in the gold reserves absorbed £87 million of this (compared with £240 million) and repayments to the

European Payments Union and to the International Monetary Fund absorbed £113 million. Sterling liabilities to countries, however, rose by £195 million (of which only £80 million represented non-sterling balances), suggesting that all other capital transactions resulted in a net outflow of funds totalling some £150 million—compared with some £200 million in 1953. This figure for "balance of investment, borrowing, etc.," includes a large residual item that is subject to a considerable margin of error. But, after allowing redemptions and sales of investments, the Economic Survey concluded that "over the last few years gross [private] long-term investment abroad has averaged a little over £200 million a year, of which much the greater part has been in the sterling area."

In its financing transactions Britain therefore still appears to be borrowing "short" in the form of sterling balances, principally from the sterling area, in order to lend long. Although sterling balances held by non-sterling countries rose by £80 million during 1954, they are still, at £852 million, £216 million smaller than they were at their peak at mid-1951. Total balances held by the rest of the sterling area, however, at £3,049 million, are no less than £368 million above their level at end-1952, and are only some £50 million below the peak reached at mid-1951. Moreover, in this past year the whole of the increase has been concentrated upon the balances of dependent territories; these may have taken a substantial part of Britain's exports of long-term capital, but in return they have accumulated an additional £124 million of funds on deposit or in liquid assets in London—bringing their balances to the extraordinary total of £1,226 million.

Business Notes

Markets Ride Ahead

ALMOST to a man market experts have supposed that when an election approached doubts and fears in the markets would grow. That may still come about, but at the moment the reverse is happening. This week as the intention of the Prime Minister to resign became an accomplished fact, as the County Council elections showed a moderate swing away from Labour, and as the probability of an early general election increased, markets have taken events in their stride. It has not been an active market. Deprived of their normal sources of news, investors have operated little and the jobbers have kept small books. It was not until Tuesday, when the number of Stock Exchange markings rose to 8,750, compared with 7,583 a week earlier, that there was a clear sign that the volume of business was broadening. Even that modest increase found the jobbers with uncomfortably short books. But the trend of prices has been steadily upwards through this quiet period. The *Financial Times* industrial index reached 186.4 on Tuesday, compared with 178.9 a week earlier. The rise springs from a steady and slightly increasing volume of investment buying in which the pension funds continue to play a big part. Nearly the whole industrial list advanced. Steel shares, despite their political risk—or perhaps because of it—have led the rise. The strike seems to have restricted business less than it did in its first week. For instance, it has been possible for Philip Hill in conjunction with Joseph Sebag to place, subject to permission to deal, a £3 million loan stock issue for United Drapery Stores.

In the gilt-edged market the rise has been less pronounced, and conflicting currents underlie it. The rise has affected the long dated stocks, but by no means all the shorts. The market experienced a steady but not impressive flow of investment buying for the pension funds. It was also encouraged by the sharp reduction in the monthly gold loss to the comparatively modest figure of $14 million, and it had some bear closing to push it on. War Loan 3½ per cent is an example. There were known to be some bears of War Loan in the market. The stock is due to be quoted ex-interest on April 25th and the interest is paid without deduction of tax. Even the hardiest of bears could hardly relish the prospect of paying out £1 15s. per cent in interest if he did not close before that day. But with short-dated stocks the picture is different. Some selling of these by banks has continued. The banks need to restore their liquidity ratios by turning investments into cash, and the shortest of all their stocks, the 3 per cent Serial Funding Stock 1955, is the obvious choice. It is equally obvious that official funds ought not to absorb those sales, for if they did so the working of the normal Bank rate corrective would be vitiated. Therefore some of the sales have gone outside normal market channels and the stock has probably found homes with industrial companies seeking a temporary repository for surplus funds.

The Exchequer's £430 Million

THE Exchequer surplus for the fiscal year 1954-55 has matched the very best of the hopes raised in recent weeks. Ordinary revenue exceeded ordinary expenditure

(including sinking fund) by £433 million. This contrasts with a realised surplus of £94 million in 1953-54 and with the mere £10 million that was envisaged in the budget estimates for 1954-55. To this abnormally wide divergence between expectation and performance revenue and expenditure contributed almost equally. Revenue had originally been expected to rise by £165 million, but has actually risen by £370 million. Expenditure had been expected to rise by £249 million, but has in fact risen by only £30 million—actually by less than the decline in the portion of defence expenditure that is debited against "counterpart" receipts from dollar aid (these receipts were estimated at £85 million, compared with £125 million in 1953-54). Although details of supply expenditure are not yet available, there is no doubt that the bulk of this shortfall of £218 million in total expenditure has been attributable to lags and changes in the defence programme.

"Below-line" net expenditure*	407	— 16	391	501‡	—110
Overall deficit	**397**	**—100**	**297**	**67‡**	**+230**

* Increases in deficit or net expenditure shown *minus*; decreases shown *plus*
† Revised to £3,981m. by supplementary estimates. Estimates compiled after crediting sterling "counterpart" receipts of defence aid—£125m. in 1953-54 and £85m. in 1954-55.
‡ Includes £45·1m. of capital expenditure of Post Office—financed until end-September, 1954, indirectly through the Savings Funds. Excludes net receipts of £5m. from Civil Contingencies Fund (£10m. in 1954) and £2m. received on account of war risk insurance.

Expenditure "below-line," however, rose rather sharply —from £573 million to £692 million, instead of by the originally expected amount of only £25 million. Below-line receipts, as officially shown, exclude certain credits that are taken into account in the customary tabulation in *The Economist* (see the table on page 153 and the footnote to the table above); and on the official basis the net below-line deficit is £500.6 million, compared with £391 million in 1953-54 and with an original estimate of £407 million for 1954-55. Roughly half this difference between estimate and out-turn is due to the fact that since last September the below-line account has been burdened by the capital expenditures of the Post Office, which can no longer be financed indirectly from Savings Funds (and which absorbed £45 million during the half-year). The remainder of the increase is explained by the heavier reliance by local authorities upon the Public Works Loan Board during the latter part of the year. Net outgoings from the Exchequer on this account rose over the year from £278 million to £328 million, whereas they had been expected to fall to £275 million. The upshot of the whole account is an "overall" deficit of £67 million—a deficit roughly £230 million smaller than that for 1953-54 and £330 million smaller than the original estimate for 1954-55.

Revenue—Past and Prospective

ALMOST all the normal revenue items contributed to the gain in revenue. The greater part of the improvement upon estimate was divided almost equally between income tax on the one hand (£93 million above estimate and £162 million above 1953-54) and customs and excise on the other (£90 million above estimate and £108 million above 1953-54). Stamp duties and death duties also far surpassed estimate, thanks to the rise in prices and activity on the Stock Exchange. The only decline in tax revenue occurred in Profits Tax (including EPT), but this fall was almost precisely in accordance with the budget forecast. EPL, on the other hand, contributed £10½ million more than in 1953-54 (the first effective year for this shortlived tax), at £76½ million, surpassing estimate by £17 million. The one big shortfall occurred in miscellaneous receipts, from which an additional yield of no less than £109 million had originally been expected, in consequence of the liquidation of stocks by the Ministry of Food on the cessation of trading. But sales have lagged and have also secured lower prices than had been hoped. Total receipts under this head, though £59 million larger than in 1953-54, fall short of original estimate by £49 million.

TREND OF REVENUE

	Actual receipts 1954-55	Change on 1953-54	Deviation of out-turn from budget estimate
Income tax	1,893	+162	+ 93
Sur-tax	135	+ 2	+ 3

The big surplus achieved above-line in 1954-55 makes it certain that existing tax rates promise a substantial prospective surplus for 1955-56. But it is also certain that the surplus in sight will be much less than the surplus realised in the old year. Estimated expenditure, if the estimates for Consolidated Fund Services are put at no more than the original estimates for 1954-55, will be some £220 million more than was actually spent last year. The yield from direct taxation, on the other hand, will be substantially increased both by the rise in incomes and profits that has already taken place and by the higher level that will rule in the coming twelve months. But the Exchequer will face the first effects of the ending of EPL and the full effect of the restoration of initial allowances two years ago (plus the additional cost, small as yet, of the substitution of investment allowances for most of them under the terms of last year's Finance Act). In addition, the revenue will suffer from the loss of last year's non-recurring receipts from liquidation of stocks.

Gold Loss Lower

THE measures taken last month to check the outflow of gold and dollars from British reserves and to strengthen sterling have, as a whole, had immediate results. Last month the fall in the gold and dollar reserves was reduced to $14 million, compared with the loss of $82 million in February. During March $21 million was received from the United States in defence aid and $3 million from the European Payments Union in respect of the February surplus; on the other side of the account $8 million was paid as the quarterly instalment on the Canadian wartime loan. The residual deficit was thus $30 million (of which $2 million comprised the usual payment to EPU creditors). This compares with a residual deficit of no less than $103 million in February. This deficit is still heavy for a seasonally favourable month; but Britain's payments difficulties are not piling up, as so often happened in earlier crises.

TREND OF DOLLAR BALANCE

* E.P.U settlements depend on balance with Union in previous month. † After payments totalling $189 million on United States and Canadian loans. ‡ After payment of $112 million to IMF for "repurchase" of sterling. § After payments totalling $99 million to E.P.U. creditors in initial settlement of part of UK's overdraft with the Union. ‖ After paying $8 million in quarterly instalment on Canadian wartime loan.

The gold figures were accordingly received with satisfaction by the City and the Treasury alike. Spot sterling topped $2.79½ on the news for the first time this year. It is recalled that in the early days of March both transferable and official sterling were still in need of sizeable supporting operations—operations that must have been considerably greater than the residual dollar deficit for the month as a whole, though towards the end of the month the Exchange Account was recouping some of its earlier losses.

Another cause of satisfaction is the substantial surplus, of £9 million, earned by the United Kingdom with the European Payments Union last month. This will be settled next week 50-50 in gold and in reduction of debt to the Union. Taken in conjunction with the current movement of the exchanges, this is a good augury for the gold and dollar figures in April. It does not appear that the improvement in the European balance—or in the dollar balance as a whole—was to any large degree the result of capital movements, which appear to have had little net effect in the month as a whole.

The Cost of Labour

AT the end of October last year the average earnings for a man working in British industry—that is, in manufacturing and the main non-manufacturing industries—were £10 4s. 5d. a week, which was 8 per cent more than a year before. Earnings for all workers—including young men, women and girls—averaged £8 11s. 9d. a week, a rise of more than 7 per cent in the twelve months. Wage rates had risen in almost exactly the same proportion during the period. Last week's *Economic Survey*, attempting some assessment of changes in costs in British industry, estimated the year's "change in average wage and salary earnings in manufacturing industry" as a rise of 6 per cent, and deduced that since output per man-year rose probably as much, labour costs probably changed little during the year.

RONALD MORRISON & CO. LTD., EDINBURGH

The autumn census of industrial earnings, published this week by the Ministry of Labour, puts the rise in manufacturing earnings at 8 per cent. The accompanying table draws together figures showing the movement of manpower between industries, changes in industrial output, and increases in earnings. The twelve months' periods are not exactly the same, and the earnings census, in particular, is based on a sample (though a very large one); nevertheless, these three indicators of industrial change offer some interesting comparisons.

The Ministry of Labour Gazette, in publishing its census figures, duly notes that earnings show an increase of 201 per cent since October, 1938 (men's earnings have multiplied rather less, with an increase of 174 per cent). On the basis of the prewar index of industrial production recently compiled by Mr B. C. Brown of the Board of Trade, it can be calculated that industrial output in 1954 (building and contracting excluded) would have been perhaps 70 per cent higher: and output per man-year perhaps 35-40 per cent more than in 1938. This would imply that labour costs of production may now be, on the average, about 115-125 per cent higher (in money terms) than before the war.

Prelude to Atomic Agreement?

SIR WILLIAM PENNEY and the other British, Canadian and Nato observers who went to Nevada this week were the first visitors invited to see an American atomic explosion since the Bikini trials in 1946. Their journey is one outcome of the revised MacMahon act, which permits the Americans to give information about the effects of atomic explosions to selected allies. Sir William and the other visitors, most of whom come from the Services, will be shown the effects of the atomic weapons likely to be used in Europe, and the demonstration is of considerable practical importance. Data about the effects of explosions is the main reason for staging atomic trials.

Nothing official has been said about the talks that will follow the demonstrations, but both Sir William and Sir John Cockcroft, who is also in the United States, are expected to sound the prospects for a fuller exchange of atomic information between Britain and America. As matters stand, the Americans can give some data about civil developments such as the design of reactors and some about the effects of atomic weapons, but they can give no details about the weapons themselves. Missiles like Corporal which are being bought for training purposes by the British Army will be shipped without their atomic warheads and fitted and fused in this country. There is doubt and much speculation on both sides of the Atlantic about how much British scientists could tell Americans that they do not know already. The coming talks may show Britain's bargaining strength. This country is stockpiling its own atomic weapons, working on its thermonuclear weapons and pressing ahead with atomic power faster than the Americans. When the United States is so generous in sharing information about its work on guided missiles and on aircraft, on a strictly practical basis the continued secrecy about atomic weapons is rapidly losing its point. Atomic weapons are becoming the "conventional" high explosives of modern forces and the American legislation is creating such anomalies as the delivery of short-range army weapons without warheads. The American atomic scientists are reasonably well disposed towards a fuller exchange of data with Britain, but the American government, to carry Congress with it, may want some assurance from them that the traffic in information will not all be one-way. The American scientists' talks with the visiting British members of the Atomic Energy Authority may have considerable influence on how this expert sector of American opinion advises its government.

Profits in the Air

THERE were profits in the air last year for both the air corporations. British Overseas Airways Corporation has broken even for the fourth year in succession, with a net surplus of £260,000, and an operating profit of £1,360,000 before paying interest. This is smaller than in 1953-54, but is a very creditable performance considering that it was achieved in spite of the grounding of the Comet.

The full figures for British European Airways are not yet available, but there are signs that the corporation has made a net surplus for the first time ever. Figures for the 12 months up to the end of February show a 14 per cent rise in revenue, to £17 million, and a 10 per cent fall in operating costs. The total load factor, that is the proportion of space sold to the amount offered for sale, went up to 64.7 per cent, which is about the level at which air lines usually manage to break even. In its last financial year, BEA had a deficit of £1.8 million. It seems probable that when the full year's figures for 1954-55 are available, this deficit will have been wiped out by the combined rise in revenue and fall in costs.

Hire Purchase Flouts Control

THE Finance Houses Association, the body that represents the more substantial houses in hire purchase finance, has protested that it was not consulted by the Board of Trade when controls on hire purchase were brought back. The National Caravan Council has protested that caravans have been included in the scope of the new order, though they were outside the previous one. HP Information meanwhile has produced its monthly figures of numbers of contracts, and the dispassionate reader may be pardoned if after

NUMBER OF HP CONTRACTS

	Mar. 1954	Jan. 1955	Feb. 1955	Mar. 1955
Cars	25,627	24,095	29,261	38,308
Commercial Vehicles	4,858	6,106	6,049	7,258
Motor cycles and side-cars	14,457	9,624	15,155	19,715
Caravans	1,059	573	904	1,428
Tractors	1,015	718	1,005	1,433
Farm Equipment	499	327	448	630

Source: HP Information.

reading them he wonders what is the necessity for so much protesting. Under control, hire purchase has continued to bound ahead. The number of contracts in March was 69,256 compared with 53,322 in February and with 48,354 in March last year. This is partly a seasonal movement. The limited range of goods over which HP Information collects figures contains both motors and caravans. The holiday demand springs up in the weeks before Easter.

The hard fact is that the seasonal demand has not been curtailed and that in all groups, without exception, hire purchase contracts in March this year remain well ahead of March, 1954. Caravans provide a useful example. Before control was suddenly imposed the normal contract was around 36 months, though the deposit was far higher than the minimum that has now been imposed. Vendors like to keep monthly payments down to a quarter of the purchaser's income. Forcible shortening of the length of contract therefore places the caravan out of reach of some of the less wealthy customers. Yet last month's number of hire purchase sales of caravans has only once been exceeded —in July last year.

A New Goldfield Tested

A STATEMENT by the South African Minister of Mines at the end of last week pointing to an early start on mining operations around Bethal has moved the focus of interest in the gold share market from the far west of the known gold bearing area to the far east. Bethal is 100 miles east-south-east of Johannesburg and 65 miles east of East Daggafontein, the most easterly of the existing mines. It has been known since long before the war that a little gold existed there. In the early days most of the big groups took an interest, direct or indirect, in the area and most of them decided that the values were just a shade too low to justify major development.

Much work has since gone on elsewhere and rich new mines have been found and financed at the very opposite end of the gold-bearing strata, but a few of the Bethal protagonists have stuck to their hunch. Union Corporation is prominent among them, and with it a number of smaller groups including Anglo-Rand. The last Union Corporation statement showed that drilling operations had found the Kimberley Reef with payable values over a limited area. Kimberley Reef suggests uranium as well as gold ; it suggests, though it is a matter of surmise, that uranium accounts for the difference between the disappointment of the prewar years and the promise of today. Union Corporation, which seems to be the most promising of the prospectors in this limited field, has worked so far through its internal company, Capital Mining Areas.

Becalmed on the Baltic

OWNERS of tankers and cargo ships have had a good winter, their best for two years ; but their good fortune has now come to an end. Tramp shipping rates began to ease off in the middle of last month and spot tanker rates have been dropping like a stone for four weeks now. The Chamber of Shipping index of tramp freight rates climbed from 79.7 in July last year (1952 = 100) to 115.5 in December. There was a slight pause in January, but the index reached 120 in February and rose still further in early March. Then the decline set in. Owners, however, have little early tonnage for offer, and have thus been able to resist the efforts of charterers to hold out for still lower rates.

All the main props to the market during the winter have now weakened. The grain market is very quiet ; owners expect to carry bigger shipments later this year following the poor European harvests in 1954, but there is no sign of this traffic yet. The coal trade has also fallen away. Much tonnage was fixed well forward and the remaining fixtures for the planned import programme have now been completed. Again, however, there should soon be a revival in chartering for the heavy shipments that Europe will need to buy from the United States this autumn and winter. Ore freights have kept up after some fluctuation ; but the curtailment of United States scrap supplies will cut this useful standby for tramp owners. A slight revival in grain chartering last week stemmed the slide in North Atlantic rates, but elsewhere there has been little new business and the slow decline has continued. There is no reason why the summer should be an unusually bad season this year ; and a resumption of chartering for grain and coal should revive the market by the autumn, if not earlier.

But the prospect for owners of tankers on voyage charter is less warming. They were prepared for a fairly normal summer off-season, but not for the sharp depression that has swept spot rates from the two-year peak last December to the present level, which is the lowest at this time of the year since before the Korean war. Earlier this year there were some wide fluctuations between Gulf and Caribbean rates, but they are now more or less in balance. Few of the major oil companies have appeared in the market recently, which has had to depend upon desultory inquiries from smaller charterers. The time charter market is still dead, although some period fixtures have recently been made by private arrangement. The winter will bring the usual seasonal increase in oil shipments to Europe and the Atlantic seaboard of the United States, but this seems a very long way off to tanker owners with idle tonnage piling up.

Splitting the BIF

FROM 1956 onwards, the British Industries Fair is going to be held in two stages. One exhibition for consumer goods, including textiles, will be held at Earls Court in February ; the balance of the Fair will be held as usual in April and May, divided between light industries like chemicals and packaging at Olympia, and heavy industry, at Castle Bromwich.

The new BIF management, which took over the administration of the London sections from the Board of Trade last year (Castle Bromwich has always been privately run) has made this radical break with the tradition of 40 years to win back support for the Fair. The consumer goods which do most of their business in the winter, not the spring, have deserted the BIF wholesale in favour of specialised trade fairs ; their main complaint has been the inconvenient timing of the BIF. Some of the capital industries have found the bazaar-like atmosphere of the old Fair undignified and the chemical industry agreed to support last year's BIF only when its section was moved from London to Castle Bromwich.

The split in the Fair, as well as the change in its timing, should meet both points of view, but the specialised trade fairs have become strongly established during the period of the BIF's decline. The trade papers play a big part in their organisation, and have been largely instrumental in drawing away the textile industries that were by tradition the bulwark of the London sections of the BIF. It will take all the blandishments of Mr Horne, the new Fair's managing director, to woo these back from the Festival Hall to the concrete acres of Earls Court.

CDFC and Tasman Pulp

THE Tasman Pulp and Paper Company of Kawerau, New Zealand, is an obvious outlet for the investment funds of the Commonwealth Development Finance Company. By producing 75,000 tons of newsprint and 38,000 tons of pulp it will cut the dollar import bill of New Zealand and Australia. That full capacity rate will not be reached until 1957, but the company should soon earn profits, for its new machines will begin to run later this year. The project has already gained the support of the New Zealand Government, of local investors and of a British company, Albert E. Reed. The Commonwealth Development Finance Company is thus in good company.

The company has lent at an attractive rate, for it is subscribing for £2½ million of 5¼ per cent 15 years debentures at par. That is a higher rate than that on the 10 years 5 per cent debentures, totalling £2 million, offered by Tasman Pulp and Paper to New Zealand investors last August. But the terms are unavoidable, for CDFC has to borrow at prevailing rates in London, and those are now higher than in New Zealand. Another £1 million of debentures will be issued in New Zealand this year, bringing the total issue of debentures up to £5½ million out of an authorised amount of £7 million. The new debenture easily fits in the category of investments that CDFC may one day pass on to the institutions.

In addition, CDFC will subscribe for 500,000 of £1 ordinary shares at par ; in the next few weeks another 500,000 of these shares will be offered to New Zealand investors. The authorised ordinary capital of £6 million will then be fully subscribed, with the New Zealand Government holding two million, Fletcher Holdings one million, New Zealand investors one million, Albert E. Reed 1,500,000 and CDFC 500,000 shares. Thus most of the new money will have been provided towards the estimated total of £17½ million needed to build the plant and to provide the initial working capital. The ancillary cost of about £13 million to provide housing, railways and port installations in the Murupara area around the mill will be met entirely by the New Zealand Government.

The Paper Bulletin

This is a new bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The first quarterly issue will be available at the end of April. Full details from :

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

Course of Commodities

COMMODITY prices continue to fluctuate within narrow limits. Tin is a little cheaper, owing to the prolonged uncertainty over the future of the Texas smelter, and copper has weakened on the news that the strike at the Chuquicamata mine in Chile had been settled, and that the American government would release 17,500 tons of copper to the market in the second quarter ; lead and zinc prices are firm. Cotton futures in Liverpool have rallied slightly, mainly because American interests have bought futures on the expectation that the American government will not introduce an export subsidy on the new crop, and that prices in Liverpool, therefore, will gradually rise nearer to parity with the New York market.

	March 31	April 5
Copper, prompt, per ton	£364	£351 10s.
Tin, " "	£717	£715
Lead, " "	£104	£105
Zinc, " "	£88 5s.	£90
Rubber, spot, per lb.	27d.	26¼d.
Wool futures, May, per lb.	121d.	120½d.
Cotton futures, May/June, per lb.	30·66d.	31·03d.
Jute (mill firsts), April/May, cif per ton	£106/108	£105/108
Sisal (1 E. African), April/May, cif per ton	£83/85	£83
Wheat (1 Manitoba), May, cif per ton	£29 12s.	£29 12s.
Barley (Canadian 2 feed), May, cif per ton	£23 17s.	£23 5s.
Cocoa (Accra); April/June, per cwt.	295s.	295s.
Coffee (Santos extra prime), cif per cwt.	475s.	475s.
Tea (plain broken pekoe), per lb.	4s. 11½d.	†
Sugar (Cuban raw), cif per cwt.	31s. 3d.	31s. 3d.

† No auctions in London.

Tea prices have fallen sharply at Colombo (the London tea auctions are closed until April 18th). Prices of raw sugar have been held at the higher level established by purchases by Russia and East European countries. Prices of Canadian and other barley have weakened in face of a slack demand.

Changes in Air Freight Charges

SUBSTANTIAL changes will be introduced into air freight charges in the North Atlantic in July in a bid to attract new traffic to the air. There has been some difference of

opinion among the air carriers on this route about how the bid should be made. One group, led by Pan-American, has argued for considerably more than a year for a cut of about 30 per cent in the basic freight rate, and twelve months ago it won a concession of a 30 per cent general discount on consignments of 200 kilos and over. At the most recent meetings, however, these airlines have been outvoted by carriers who favoured a scheme of special rates for different cargoes. There already exist several thousand "commodity" rates introduced over the years for this purpose; they have been created on application by individual carriers, but once filed with the International Air Transport Association are observed by all the airlines.

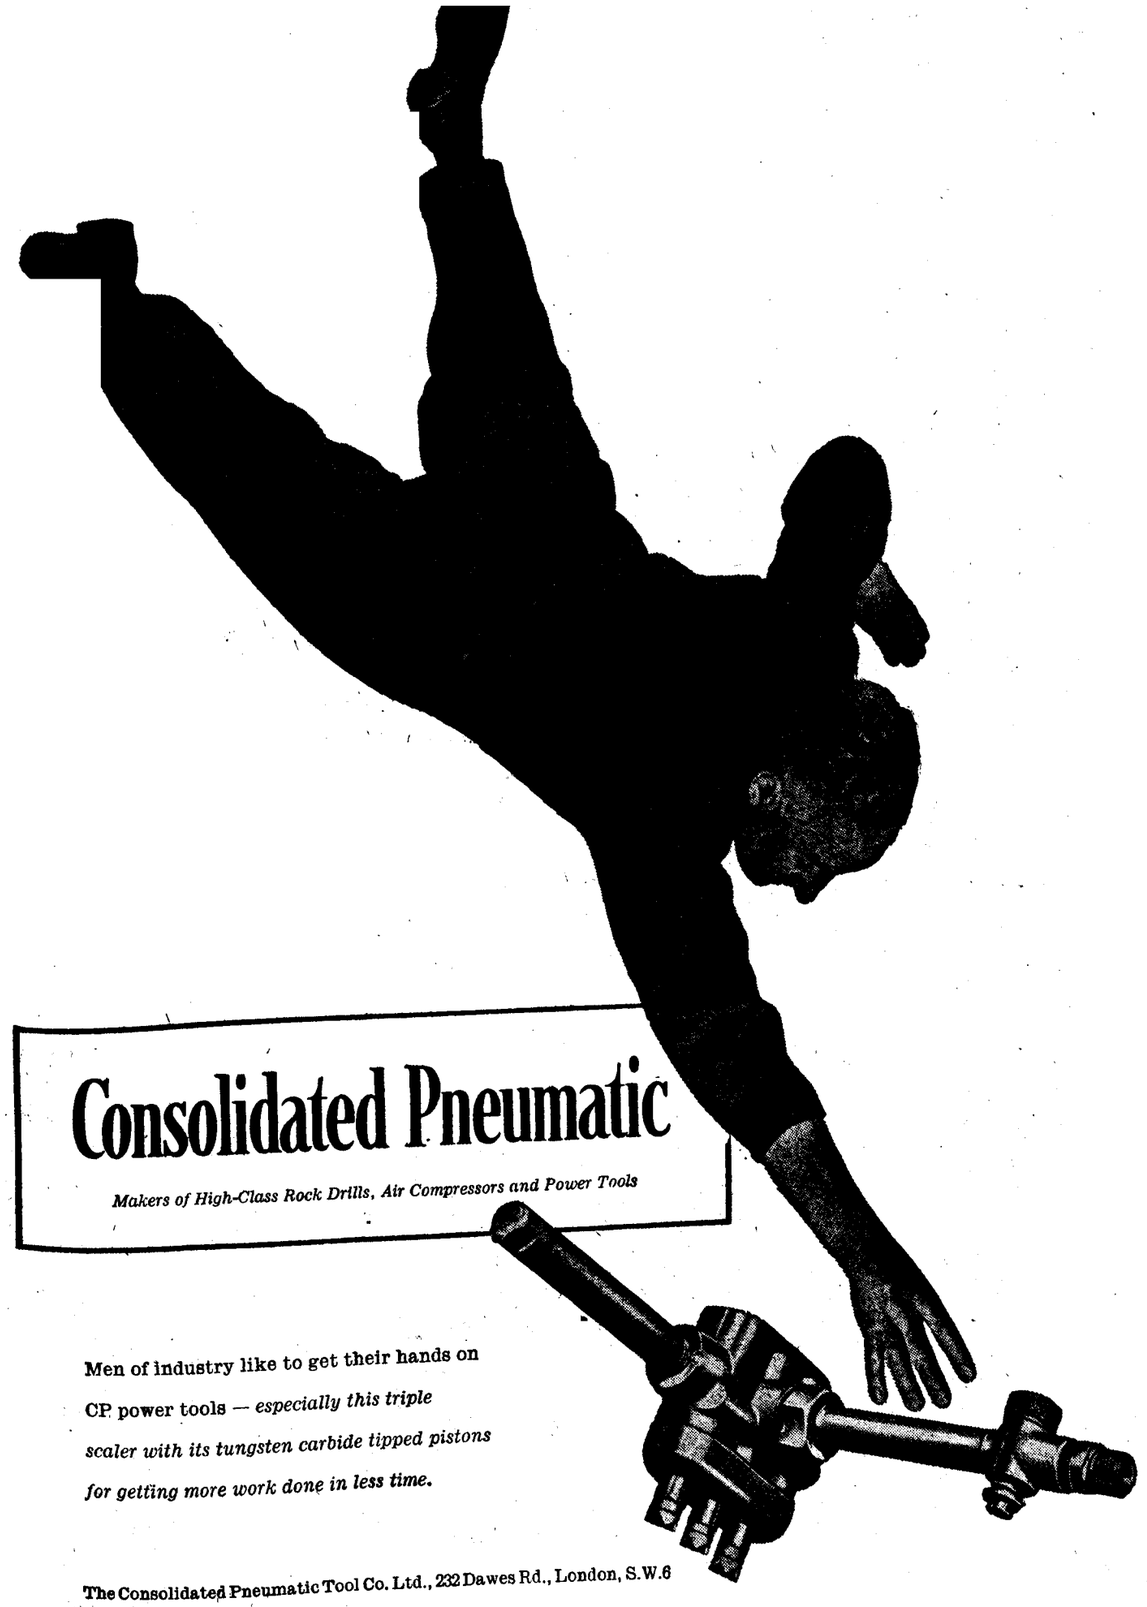
The new rate scheme cancels the 30 per cent bulk discount introduced last year, and in its place gives the airlines greater freedom to make special concessions for new traffic. The commodity rates, which are themselves bulk discounts, are being consolidated into about 50 broad classifications, and the airlines are allowed to offer additional specially low "development" rates. The airlines which support this system have argued that the cuts proposed in the basic cargo rates would have halved existing revenue without any guarantee of fresh traffic; the new system leaves present revenue untouched and allows them to make concessions where they will give the best results. The difference between this and the old commodity rate system is first, that by putting commodities into broad classifications it cuts out fiddling little differences in rates for slightly different types of goods and, secondly, that it gives the airlines a new freedom to negotiate with shippers. It is probable that the new development rates will work out at around the lower-level of the existing commodity rates, that is, at about 25d. per short ton mile, at present most of the commodity rates are nearer 30d. per short ton mile. The change comes in time to help the British independent all-freight services, which should be able to bid for the kind of traffic that does not fit into the freight hold of a passenger aircraft. Compared with the freight volume carried by BOAC, Airwork's capacity is small, but it has this advantage of special loading doors and a whole fuselage devoted to freight. It is curious to see the airlines adopting a charges scheme that the railways are just abandoning, but when the railways were young there was probably the same justification for making special concessions to lure freight from the roads and canals.

Growth of United Drapery

THE growth of the multiple empires, which have been pushing out into many sorts of trades, began long before the boom in hire purchase reached its height and is still continuing under the present regime of hire purchase restrictions. United Drapery Stores has just provided a prime illustration of this trend. It is placing through Philip Hill & Partners, subject to permission to deal, £3 million of 4¾ per cent unsecured loan stock dated 1966-75, at 98½. United Drapery's recent purchases have left the company short of cash, but the £3 million issue cannot be simply a plan to restore liquidity: it hints that growth must continue.

The biggest accretion to the strength of United Drapery, the absorption of Prices Trust, has only just been revealed in full—in the accounts for the year to January 29th. Those accounts are still subject to audit. The dividend, as forecast when the group purchased Alexandre Limited, is 50 per cent, compared with the equivalent of 25 per cent. The absorption of such a large unit as Prices Trust makes any comparison of one year's figures with another an indication of a trend rather than a precise arithmetic measure. At the end of January the book value of the group's fixed assets was £10,094,692, compared with £5,616,396. That expansion does not seem to be simply a reflection of the itemisation of the "shares at cost" of Prices Trust (£4,686,851) into physical assets in the latest balance sheet. Partly balancing that increase, which is accompanied by a sharp expansion in stocks (from £1,931,277 to £6,127,190) and in debtors (from £3,573,155 to £4,796,399), are the reinforcement of revenue reserves (up from £2,671,596 to £3,745,240), the growth in preference capital owned by outside shareholders (from £1,211,353 to £2,896,170) and by much bigger mortgages on fixed assets. "Mortgages and debentures secured on certain land and buildings" have risen from £114,500 to £1,484,420. About £700,000 was outstanding on other loans and the group was left with under £250,000 in cash.

There are two elements in those figures: the absorption of new subsidiaries and a straightforward expansion in trade. That expansion cannot be measured in these accounts but the growth in stocks and debtors—and in creditors from £1,027,099 to £2,804,738—points to its existence. Similarly the upsurge in trading profits from £2,781,541 to £4,545,587 must be largely a reflection of the earnings of Prices Trust in a full year, but there, too, an expansion in trade over the whole of the business must have played its part. Growing, growing but never fully grown seems to be the motto.



Record Sales of Diamonds

THE world diamond market is a fickle maid: in the last six months it has been busily disproving the authoritative forecast that the boom had come to an end. In the fourth quarter of last year sales by the Central Selling Organisation recovered to £16.1 million, and this week

SALES BY THE CENTRAL ORGANISATION
(£ million)

	Gem	Industrial	Total
1954, 1st quarter.....	11·8	4·9	16·7
,, 2nd ,, ...	11·8	3·3	15·0
,, 3rd ,, ...	11·2	3·1	14·4
,, 4th ,, ...	10·9	5·2	16·1
1955, 1st ,, ...	15·2	6·9	22·2

De Beers Consolidated Mines Ltd. announced that sales in the first quarter of 1955 rose by no less than £6.1 million to a record of £22.2 million. Sales of gem stones were inflated by the 2½ per cent advance in prices at the end of last year, and by the shipment of about £1 million worth to the United States to replace the diamonds that

typewriters

Quick work—well done

Imperial

There are 2,400 hand assembled parts in every Imperial '66' typewriter. A precision instrument, yes. But a tough customer, too. Has to be, to remain a precision instrument for many years of hard use.

were temporarily lost in the air crash last December. But the "net" rise of some £3 million leaves in no doubt the strength of the market for gem diamonds; as stocks are said to be at a minimum, it also indicates that production has increased. Sales of industrial diamonds have benefited not only from the recovery in American industry, but more particularly from the revival of purchases for the American strategic stock that began in the fourth quarter. Whatever the remainder of 1955 may bring, the year has opened extremely well.

Sugar Above the Minimum

PURCHASES of sugar by Soviet countries have put new life into the "free" world market. Russia has been the largest buyer. Counting the original purchase of 200,000 tons of Cuban raw sugar last February, Russia has now bought nearly 400,000 tons, the latest purchase being 100,000 tons of refined sugar from Cuba. Other Soviet countries which, like Russia, are normally exporters, have also bought refined as well as raw sugar. Doubtless these imports reflect the poor beet harvest in Eastern Europe last year, smaller perhaps than the published figures disclosed; though it may also be that consumption of sugar is being deliberately encouraged. Thanks to these unexpected purchases, and to a better demand from other countries, the world price has risen in the past month from 3.17 to 3.31 cents a lb fas Cuba—six points above the minimum of 3.25 cents in the International Sugar Agreement (the maximum is 4.35 cents).

The Cuban Sugar Institute is understood to have made its sale of refined sugar to Russia, at 4.20 cents a lb fas, conditional on a relaxation of the international restrictions on exports. A short time ago the Institute sold to Cuban operators all the sugar remaining under its quota for the world market; the price was not more than 3.20 cents a lb. If the Institute now had to buy back sugar at a higher price to meet the Russian order, its refining margin would be squeezed. Instead, it hopes to persuade the Sugar Council to increase the effective export quotas, so that it could use its surplus sugar. At present export quotas are fixed at the minimum of 3.7 million tons, and Cuba's at 1.8 million. The danger is that if export quotas were increased the price, which languished below the minimum for so long, might fall below it again. The executive committee of the Sugar Council will meet again shortly, and will probably decide to call a full meeting of the Council to review the prospect in May.

Savoy Pays Out

ALL is quiet now on the Savoy front, but from the controversies of last year one fact clearly emerged: the directors could not fail to liberalise their dividend policy. The preliminary figures for 1954 show that they have done so. The dividend is to be 10 per cent and the bonus 5 per cent. This is the same nominal rate as in the previous year and, allowing for the previous scrip issue, is equivalent to an increase from 13⅓ per cent in all to 15 per cent. It is by no means all that shareholders are to receive. There is in addition to be a cash capital distribution of 6s. per share (30 per cent) that does not attract tax. There is also to be a free scrip issue of one new 5s. "B" ordinary stock unit for every 10 ordinary £1 stock units now held. Finally, the existing £1 ordinary stock units are each to be split into two "A" units of 10s. each.

High profits have been earned to support the increased distribution. Trading profit was up from £525,684 to £654,438. A net profit of £151,648 compares with £99,960. There was in addition a surplus on the sale of a property (mainly offices) of £267,000. The new proposals are none the less unusual. The new "B" stock ranks equally with the "A" except that the "B" carries 10 votes per 5s. unit. All other stock of any class at present holds one vote per £1 stock. Thus control can be maintained with a much smaller investment if the majority holders who took over Mr Samuel's and Mr Clore's purchases concentrate their investment in the new "B" stock.

SHORTER NOTES

The Government has not found it possible to announce before the Easter recess its policy on imports of Indian cloth and other matters raised by the cotton industry.

★

Montague Burton, the multiple tailoring company, has sold its business in Southern Ireland consisting of 16 retail stores and a clothing factory in Dublin to the Cussins group of Sheffield. It is understood that Great Universal Stores now has a substantial investment in the Cussins group.

★

One of the last acts of the old government was to announce that it would abolish the Road Fund. This was one of several minor amendments that the government intends to table to the Road Traffic Bill, which is now beginning its passage through the Commons. The Minister described the fund as "no more than an accommodation address for a good many years." In fact this name has been an anachronism ever since motor taxation became part of the general revenue in 1937. It had, of course, been raided by Chancellors of the Exchequer before then, the first to do so, in 1926, being Mr Winston Churchill.

★

In a further attempt to stabilise coffee prices, representatives of the Brazilian and Colombian governments have agreed on minimum prices based on 57 cents a lb (spot, New York) for Brazilian coffee and 60 cents a lb for Colombian; to withdraw 7 million bags of coffee from the current crop on June 30th (Brazil 5 million, Colombia 2 million); and to invite Central American producers to co-operate in the withdrawal of 3 million bags from the 1955/56 crop.

Company Notes

F. PERKINS. F. Perkins, Ltd., the manufacturers of lightweight high speed diesel engines, is one of the products of hard work and small beginnings to which the Finance Corporation for Industry lent its support. It has succeeded admirably. In 1951, when the company was made a public one and its capital structure reorganised FCI converted part of its prior charge into ordinary shares. Subsequently it sold off most of its holding on a rising market and now has only about 60,000 of the 10s. ordinary shares left. For those who bought the shares from FCI the preliminary report for 1954 makes good reading. Trading profits have gone up from £778,645 to £1,169,340 and those figures understate the real improvement for the 1954 surplus is struck after charging £200,000 for exceptional depreciation. The tax charge is much heavier, up from £451,872 to £736,862, but net profits are £105,705 higher at £432,478. The directors have given reserves the first bite of the cherry, leaving the ordinary dividend unchanged at 20 per cent. But the 100 per cent free scrip issue, even though it is accompanied by the usual warning that it carries no implication as to future dividend rates, must surely contain a hint of assurance about the future.

The company led the way in the development of diesel engines for lorries and tractors and recently, when fuel taxes helped to create a good market for diesels, the company's enterprise has received its reward. Like an opening batsman on a good wicket Perkins has knocked up a high score, but there are other batsmen coming in—the motor manufacturers making their own diesel engines. They may be able to collar some of the bowling at some cost to Perkins's rate of run-getting.

★

COURAGE AND TAYLOR WALKER. A further fall in beer sales has aroused fresh anxiety among many brewers. Beer output fell by about 4½ per cent last year, but the fall makes an even sharper decline in draught beer sales throughout the country and notably in the London area. Hence it is that two London and Home County brewers, Courage and Taylor Walker, have reported little change in profits in 1954 and no change in their ordinary dividends. Courage and Company experienced a slight drop in trading profits from £1,223,856 to £1,209,132 and has left the dividend at 22½ per cent while Taylor Walker reported a slight increase in gross profits—from £1,213,052 to £1,228,064—and a maintained dividend of 8½ per cent. The apparent stability of profits in both companies owes something to bigger sales of wines and spirits.

The two chairmen single out the boom in hire purchase as the competing factor that kept the shillings out of the public houses last year (nor did the bad weather help matters). Both spokesmen also see the housing drive not only as an opportunity for expanding trade but also as an adverse factor, for house rents and the costs of furnishing attract the shillings away from the publicans' tills. Behind these immediate concerns both Mr J. H. Courage and Mr W. H. Kingsmill seem to recognise a change in social habits that they must meet. Naturally both of them urge a reduction in the beer duty. On that score brewers can only make representations. In concentrating more heavily on bottled beers, in making the public houses more comfortable whenever trade justifies, and in redeploying and re-equipping the brewing plants they can make the best of the world as they find it. They have done so, and Courage has taken logic one step further by agreeing in principle to an amalgamation with Barclay Perkins.

★

PRESSED STEEL. The preliminary report of Pressed Steel for 1954 presents a paradox. For a year when the motor companies were nearly all earning bigger profits and when the industry produced over a million vehicles, Pressed Steel, one of the major motor body manufacturers, reports a slight dip in profits before tax, from £3,176,510 to £3,115,485. These profits are presented after unspecified provisions for depreciation, so that the apparent decline may be due to a higher depreciation charge. But may not this decline in profits also signify the pressure of rising costs on margins? But all's well that ends well for the equity shareholder in Pressed Steel. The happy ending has been brought about by the death of EPL. The tax charge has been reduced from £2,121,962 to £1,714,154; last year there was no charge for EPL, whereas in 1953 the levy absorbed £348,000. Hence net profits, after the repetition of the appropriation of £250,000 to replacement reserves, have risen from £804,548 to £1,151,331. That handsome though fortuitous increase has its sequel in a bigger ordinary dividend, which has been raised from 17½ to 22½ per cent. A bigger payment had been discounted in the market, because investors had seen that EPL was dead and that the motor industry was booming. Thus the 5s. ordinary shares gained only 4½d. to 22s. 3d. on the dividend announcement; at that price they yield just over 5 per cent.

★

HADFIELDS. This year Hadfields has again paid its dividend of 17½ per cent to its single shareholder, the Iron and Steel Realisation Agency. But its directors have sent a copy of the annual report to the company's employees and its former stockholders as well as to the Agency. That seems to be a preliminary step to the offer of the company's shares to the public. In his report, Lord Dudley Gordon anticipates the day by saying: "a revised capital structure of the company will in any case have to precede the devesting operation which will take place in due course."

Such a reconstitution of the company's capital is made the more necessary by the fact that the development and modernisation programme is now almost completed. That programme has been financed by advances from the Agency; at their peak these loans totalled £3,205,000, but by the beginning of this month three-fifths of them had been repaid. The chairman reports that the heavy expenditure has been "fully justified by the results." But the savings in costs that can be expected from new equipment do not seem to have worked their way through to the profit and loss account by October 2nd last. That account shows a slight decline in trading profits, from £1,344,155 to £1,157,708, although the total value of sales remained almost unchanged. The chairman attributes this result to the higher cost of wages and materials and to fluctuations in loading in certain sections of the works.

★

REYROLLE. The boom in the electrical engineering industry continues apace. Investors have been looking for bigger dividends from many of the companies that make up the industry. Reyrolle, the switchgear specialists, was one of that number. On the eve of the company's dividend announcement the £1 ordinary stock units rose 1s. to 92s. 6d. The bigger dividend duly came; the payment for 1954 is to be 15 per cent on a capital of £3,052,941. In 1953, an interim of 6¼ per cent had been paid on a capital of £2,035,294 before the "rights" issue and a final of 7½ per cent on a capital of £3,052,294 after that issue, the proceeds of which enabled Reyrolle to take up its quota of shares in C. A. Parsons.

The bigger dividend is backed by a rise in net profits; from £1,159,105 to £1,647,107. Much of that improvement is simply due to the demise of EPL, which in 1953 took £420,000 away from profits. The provision for all taxes is down from £1,888,153 to £1,519,294, so that the real increase in profits before tax was only £119,143. At the current price of 92s. 6d. the £1 ordinary stock units offer a yield of 3¼ per cent, which suggest that investors are still hoping for something more.

★

ALUMINIUM LIMITED. Aluminium is a metal that has been making great strides and conquering many new fields, yet the big producers have recently suffered some growing pains. British Aluminium has just announced a striking recovery from a period of reduced earnings. Aluminium Limited, the big Canadian producer, announces slightly reduced earnings for 1954 which was a year of rapid expansion and voracious demand. Net earnings for 1954 were $34,970,025, equal to $3.87 per share. The comparable figure for 1953, if depreciation had been calculated on the same basis, would have been $38,178,053, equal to $4.24 per share. Two factors seem to have entered into this drop in net revenue. Far the most important was the £3 million starting up cost at Kitimat in British Colombia, for the year marked the completion of the first stage of the Kitimat project. A secondary cause was the need to hold larger stocks outside Canada to meet the needs of various markets. Thus the group's sales from all sources amounted to 592,318 tons, compared with 597,779 tons in 1953, even though the group's production of primary aluminium in Canada advanced from 545,800 tons to 560,900 tons and although in the words of the president, Mr Nathanael W. Davis, "all the company's available output was marketed and in the later months of the year the company was unable to satisfy all the demands made upon it."

The company's long-term plans are not at all disturbed by the minor setback in earnings. With 74 per cent of its Canadian output hypothecated to long-term commitments to customers mainly in Britain and the United States the company is re-examining the adequacy of its expansion plans—at a time when the great Kitimat programme is still only up to one-sixth of its ultimate capacity.

★

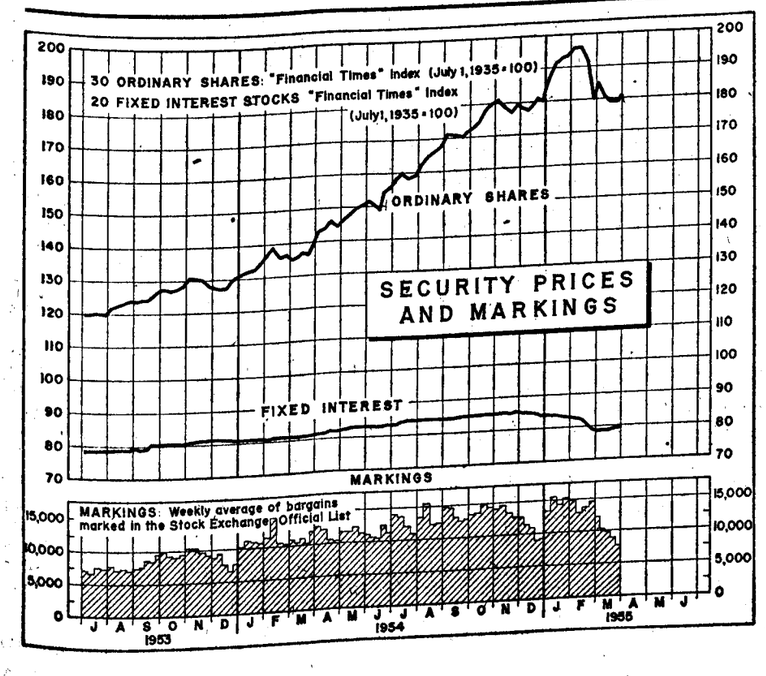
CANADIAN PACIFIC. Three small items catch the eye in the massive annual report of Canadian Pacific Railway for 1954. (1) There was a net deficit of $2 million on shipping operations. The directors explain that the tonnage of westbound cargoes was reduced, while eastbound cargo rates, particularly on grain and flour, were at a low level. More passengers were carried but there were less patrons for cruising and total passenger revenue declined.

(2) Dividend income increased by $1.3 million. That increase was the natural sequel to the rise in the dividends paid by Consolidated Mining and Smelting from $1.20 to $1.35 a share.

(3) Gross receipts from petroleum rents, royalties and reservation fees rose by $1.1 million to $8.4 million. The company earned royalties on 13.6 million barrels, compared with 9.9 million in 1953.

Those items look small when set against railway receipts but they are of the greatest importance, for they largely provide the true element of equity in "Canpacs."

★



VAN DER BERGHS. Two members of the Unilever group, Van der Berghs and Jurgens and John Knight, have reported higher profits and have paid bigger dividends to the parent company. Reporting an increase in net profits from £975,170 to £1,209,299 in 1954, Van der Berghs has declared a tax-free dividend of 15 per cent, compared with 10 per cent in 1953. John Knight has raised its tax free dividend from 20 to 30 per cent, following an increase in net profits from £167,487 to £203,885.

★

BRITISH ROLLMAKERS. British Rollmakers has raised its ordinary dividend from 13 to 15 per cent though its profits before tax were slightly down, from £538,323 to £532,107, in 1954. Thanks to smaller taxes, however, net profits have risen from £210,207 to £275,101, of which the ordinary dividend absorbs £81,765.

★

WHITEHEAD IRON. The directors of Whitehead Iron and Steel have declared a final ordinary dividend of 11¼ per cent, thus fulfilling the forecast in the offer for sale to pay the equivalent of 17½ per cent, following an increase in net profits from £334,254 to £390,943.

LONDON STOCK EXCHANGE

Next Account begins: April 20th
Next Contango Day: April 20th
Next Settlement Day: April 26th

MARKETS as a whole have continued to rally strongly this week. Long-dated gilt-edged and industrial ordinary shares have joined in the upward movement which has never been abrupt. But it has been steep because jobbers were short of stock and markets narrow. In the gilt-edged market the feature has been the rise in the long-dated stocks. War Loan 3½ per cent which reached 85¾ at the end of last week touched 86¼ on Tuesday. The bears were obviously squeezed by the knowledge that the stock will go ex dividend on April 25th. Short-dated gilt-edged stocks did not rise with the longs. There the influence of some bank selling to restore liquidity ratios was still being felt. The whole gilt-edged market however drew fresh support from the end of March gold and dollar figures, showing that the measures to support sterling were having some effect.

Almost as a whole the industrial share market rose. The volume of business remained small despite some increase in volume on Tuesday when the number of markings rose to 8,750 compared with 7,583 a week earlier. Steel shares made particularly sharp advances, following the announcement of the County Council Election results. Stewarts and Lloyds gained 2s. 9d. on Tuesday to 53s. 3d. The stores group was also well supported although the hire purchase figures had not up to the middle of the week been made public. Although some market optimists had hoped for a larger dividend from United Drapery than the 50 per cent that was in fact declared as forecast, the shares rose 3d. to 43s. 3d.

Strong features appeared in the electrical manufacturing and engineering groups. Lancashire Dynamo rose 2s. 3d. to 59s. on Monday, following the dividend announcement and Associated Electrical Industries, which were standing at 66s. a week ago, touched 71s. Hoover Ordinary, which were 45s. at the end of last week, touched 47s. 6d. on Tuesday. The *Financial Times* ordinary share index has risen steadily to 186.6 on Tuesday, compared with 178.9 a week earlier. Coppers were supported.

(1) Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia is for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. (2) Copper and tin refer to metal production. (3) General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. (4) Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th. (5) Including foreign investments.

Financial Statistics

EXCHEQUER RETURNS

For the five days ended March 31st there was an "above-line" deficit (after allowing for Sinking Funds) of £21,346,000 compared with a deficit of £1,546,000 in the previous week and a deficit of £56,654,000 in the corresponding period of last year. This brought the cumulative account to a surplus of £433,166,000 (compared with a surplus of £93,638,000 in 1953-54).

THE MONEY MARKET

The offer of Treasury bills at the tender on Friday last was down by £10 million, to £270 million; and total applications remained high—falling by less than £2 million, to £408.5 million. But the firm hand maintained by the authorities in the money market dissuaded the discount houses from raising their bid of £99 1s. 0d. per cent, which has remained unchanged at every tender since the increase in Bank rate on February 24. The market's allotment fell from 51 per cent to 48 per cent. At the tender on Thursday the offer was further reduced to £250 million.

The market was again "in the Bank" on Monday, despite a fair amount of official aid. As on most occasions in recent weeks, only one or two houses were affected and only for small amounts. On Tuesday conditions were more comfortable, though some official help was still needed. May and June maturities changed hands at 3⅛ per cent and 3⅛ per cent.

In the foreign exchange market spot sterling rose on Monday to $2.79½, the highest of the year. The rate for transferable sterling in overseas markets however fell back slightly, to $2.76⅞-$2.76¾.

Following the reduction in the New York price of silver from 88½ cents to 87 cents an ounce after the week-end, the London price fell on Tuesday by 1½d. an ounce to 75¾d. an ounce. On account of uncertainty over future movements in New York however few dealings took place.

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SEVENTY-FOURTH ANNUAL REPORT OF THE DIRECTORS FOR THE YEAR ENDED DECEMBER 31, 1954

TO THE SHAREHOLDERS:

The year 1954 saw a decline from the high levels of economic activity which characterized the two previous years, and an intensification of competition in business generally. Gross railway earnings decreased $48 million, or 10% from the previous year. The decline in the volume of freight traffic in terms of revenue ton miles was 14%.

The greater part of the reduction in traffic volume was accounted for by a decrease of about one-third in the movement of grain and grain products because of reduced export demands. It is significant that while decreases were also recorded over a wide range of manufactured and miscellaneous goods, there were many commodities which showed increases. After mid-1954, an improvement occurred in the trend of traffic.

The decrease in traffic necessitated a strict control of expenses. The reduction in outlay for maintenance was greater proportionately than the drop in traffic volume. This was accomplished by the elimination of all but the most pressing maintenance work. Substantial operating economies were effected through a further increase in the use of diesel power. By these means, the decrease in net railway earnings was held to $1.9 million.

The results for the year represent a return on net railway investment of 2.15% as compared with 2.40% in 1953. The continuing low level of results of recent years, due to the failure of revenues to increase as rapidly as expenses, has been of great concern to your Directors.

Net Income, after providing for payment of dividends of 4% on Preference Stock, was sufficient to pay $1.50 per share on Ordinary Stock and leave 44 cents per share as retained earnings.

The Income, Profit and Loss and Land Surplus Accounts of your Company show the following detailed results for the year ended December 31, 1954:

INCOME ACCOUNT

Gross Earnings		$422,642,423
Working Expenses		395,609,497

The equilibrist of Lombard Street . . .

Delightful as it might be to finance trips to the moon or devices for perpetual motion—would you do it with money entrusted to you for safe-keeping?

The investment experts of the Insurance Offices are sometimes criticised for not indulging heavily in so-called 'risk' investments. But the funds which they handle are, in the main, the savings of millions of policy-holders. These funds *must* be safely and shrewdly invested.

The Insurance Offices are really much more enterprising than their critics believe. They are by no means wedded to 'gilt-edged' for life. One third of their assets are invested in Industry: and in 'equities' alone £500 million.

In fact a happy balance is preserved between security and enterprise. Because Insurance funds are vast and safe, people trust Insurance. And only because people trust Insurance are the funds vast and safe. Insurance is being responsibly, resourcefully—yes, even creatively—handled by practical people with *your* interests in the forefront of their minds.

British Insurance Offices

SAVINGS SERVICE and STABILITY

". . . It is in the regular collection of small savings and their investment in productive enterprises that life assurance, particularly 'home service' life assurance such as we supply, is so prominent and of such value to the economic stability of the country . . ."

From the Chairman's Statement at the Company's Annual General Meeting, March, 1955.

COMPANY MEETINGS

BONDOR LIMITED

MR JOHN GOODENDAY'S STATEMENT

The following is Mr John Goodenday's statement circulated with the report and accounts:

The accounts now presented differ in one material respect from previous years. The consolidated balance sheet and profit and loss account include the figures of our Australian subsidiary, Kayser Proprietary Limited.

HOME TRADE

I will, therefore, deal with our affairs at home first. The volume of sales achieved by Kayser Bondor Limited was almost 10 per cent higher than in the previous year. Trading conditions in the hosiery division continued to be satisfactory although competition has been keener. There was no difficulty in disposing of the output of the factories but we reduced profit margins. Business in the underwear division has continued to be highly competitive, but we have made good progress and, as in hosiery, increased volume and profits have been achieved. Our merchandising and designing departments have produced outstanding styles, which were readily accepted by the trade and the public.

Despite the buoyancy of the national economy, there is a buyer's market in all divisions of our business, but the fact that I am able to report the highest volume and profits in our history is evidence that your company's position in the fields in which it operates is sound.

Whilst the company's policy of expansion in recent years has involved a very large expenditure on new machinery little has been spent on building. An opportunity occurred last year to acquire the freehold of the Portslade factory and the adjoining land. To meet the increased manufacturing requirements of the brassiere and corsetry division, this factory is to be rebuilt and considerably extended. Work has just started, but will not be completed during the current financial year. Mainly due to licensing restrictions it has hitherto proved impossible to meet the growing demands for warehouse accommodation at Baldock. The existing capacity is inadequate in relation to current turnover and we are, therefore, in process of building a new warehouse, which will provide an additional 53,000 sq. ft. of space. The canteen now in use was built during the war, when most of the Baldock factory was requisitioned, and does not provide facilities compatible with our welfare standards. A new canteen is, therefore, in course of construction. Owing to the development of the warp knitting department, for which we dye and finish the fabric, an extension to the dyehouse has become essential. A further air-conditioned building is in course of erection to house new full-fashioned hosiery machines, which should be in operation in the second half of this year. The estimated cost of this building programme is £275,000 and will be met out of the company's resources.

During 1954, we expended £225,000 on new machinery, and stockholders will be interested to know that all plant, machinery and equipment acquired prior to 1946 has now been entirely written off.

AUSTRALIAN COMPANY

I have recently returned from a visit to Australia, where I was able to see our two factories and meet members of the board, the executive, the sales force, and other members of the organisation. It is satisfactory to be able to report that our business in the Commonwealth is well managed. I also had contact with many of our principal customers and they all spoke well of our products and of the company's prestige.

The hosiery and underwear business in Australia is more competitive than in Britain and we have to meet the challenge of several capable and aggressive competitors. I am glad to report that our organisation in Australia is competent to meet this challenge, and stockholders can be assured that, although there may be fluctuations in the earnings of that company, we have made a good investment in this acquisition. During the past year the name of the company has, for convenience, been abbreviated and changed to Kayser Proprietary Limited.

It will be recalled that this investment was acquired on December 15, 1953. Since then, we have purchased the small minority interest and the company is now a fully-owned subsidiary. Although the financial year of that company ends for fiscal reasons on June 30th, audited accounts have been received from the company in respect of the calendar year 1954 and, as stated above, these results are now incorporated in the accounts submitted. It is the policy of our Australian company not only to modernise its equipment, but also to enlarge its range of products, and these developments will be financed out of its own resources. No dividend has therefore been declared in respect of 1953-54 profits.

ACCOUNTS

The trading profit as shown in the consolidated profit and loss account at £1,982,053 is not comparable with last year's figure of £1,209,472, due to the inclusion of the Australian results on this occasion. The net profit after providing for Australian taxation but before United Kingdom taxation amounts to £1,472,451 and the net profit after all taxation to £752,664. The preference dividend and the interim dividend of 10 per cent, less tax, already paid required £80,437. Your directors now recommend the payment of a final dividend of 15 per cent, less tax, and a bonus of 5 per cent, less tax, making a total distribution on the ordinary stock of 30 per cent, less tax, which together will absorb £173,250.

It is proposed to transfer the sum of £137,333 to capital reserve, which, with the other amounts now standing to that reserve totalling £125,167, will bring this reserve to £262,500. It is also proposed to transfer a sum of £75,000 to general reserve, thus increasing this reserve to £1,075,000. After these appropriations have been made there will remain £6,770 to increase the amount carried forward on the profit and loss account in the parent company; and £337,624 to increase the balance of profits carried forward by the subsidiary companies, the latter reflecting the profits earned by Kayser Bondor Limited and Kayser Proprietary Limited which have been retained in those companies.

It is also proposed to utilise the capital reserve of £262,500, already referred to, by distributing this amount to stockholders in fully paid ordinary shares of 5s. in the proportion of one new ordinary share for each four 5s. units of ordinary stock held by them on April 12, 1955. The new ordinary shares will thereafter be converted into stock ranking *pari passu* with the existing ordinary stock. Fractions will be sold and ordinary stockholders will receive the appropriate amount in cash. This distribution is subject to obtaining the consent of the Capital Issues Committee. In view of the fact that all but £200,000 of the existing authorised capital has been issued, it is proposed to increase the authorised capital from £2 million to £2,250,000. The necessary resolutions to cover the increase in the authorised capital and the issue of the new shares will be submitted at the extraordinary general meeting.

The ordinary capital of your company is low in relation not only to the reserves, which have been built up over the years, but also to the intrinsic value of the assets, and it is for this reason that your board feels justified in recommending this distribution. Nevertheless, it is our policy to continue to augment the revenue reserves, and also to maintain a healthy cash position. There is continuous change; mechanical and electronic development is unceasing and the need may arise at some time to make drastic alterations in our methods of production. It is to meet such contingencies that this general reserve has been created out of profits, which have been retained in the business.

Whereas the consolidated profit and loss account includes the Australian figures in respect of the past year only, the figures in the consolidated balance sheet are comparable in both years. Apart from an increase in the stock figure of £416,176, the assets call for no comment. More than half the increase in stocks relates to the Australian subsidiary where, due to the growing demand for nylon underwear, larger quantities of this more expensive raw material have to be carried. Virtually all the raw material utilised in the Australian factories has to be imported and it is for this reason that larger stocks have to be held there in relation to turnover than is the case at home. The smaller increase in stocks in our domestic business calls for no special comment.

The issued capital of Bondor Limited remains unchanged. In my statement last year, reference was made to a capital reserve, which would appear in the 1954 accounts, representing the difference between the cost of the Australian investment and of the book value of the assets as shown in the balance sheet of that company. In fact, the difference is £415,534, as shown in Note 3 attached to the balance sheets. The taxation equalisation reserve of £93,000, which is now free, has been transferred to capital reserve in connection with the proposed bonus issue already mentioned. The £239,044 of 4½ per cent secured loan is a long-term borrowing of the Australian company.

CHANGE OF NAME

At the time of the acquisition of the Australian business in 1953 the vendors, Julius Kayser and Company, of the USA, agreed that, as part of the purchase consideration,

the right to use the "Kayser" name in the British Isles should be permanently vested in your company. Previously the contract governing our relations with Julius Kayser and Company provided that in certain circumstances the name would revert to them in 1975. Under these conditions your board considers it appropriate that the name of your company should be changed to Kayser Bondor Limited—our Trade name and the name with which our products are associated in the minds of the public. The name of the sales company will simultaneously be changed to Kayser Bondor Sales Limited. This proposed change of name requires the consent of stockholders and is, therefore, the subject of the necessary resolution at the extraordinary general meeting.

THE FUTURE

As far as the current year is concerned, I am as usual reluctant to make any forecast. Assuming that business generally continues at the same level as in the past twelve months, the volume of our domestic sales should again increase, but with competition intensifying it may be optimistic to anticipate a maintenance of profit margins.

It was with very great regret that the board accepted Mr G. L. Touche's resignation as a director last autumn, due to his desire to reduce his commitments. His counsel and advice will be missed.

With our activities expanding year by year, the responsibilities falling on our executive continue to increase. The results are due to their enthusiasm, ability and hard work, aided by the staff and employees of the group at home and in Australia.

I know that stockholders will wish to join me in expressing our sincere thanks to every member of the organisation.

THE MONOTYPE CORPORATION LIMITED

YEAR OF INCREASED ACTIVITY

SIR GEORGE HARVIE-WATT'S SPEECH

The forty-seventh annual general meeting of The Monotype Corporation Limited was held on April 5th, in London.

Brigadier Sir George Harvie-Watt, Bart, TD, ADC, QC (the chairman) presided, and in the course of his speech, said: The year now reviewed has fulfilled the promise shown last year when I was able to report an encouraging increase in our order book. In my last statement I drew attention to our results during the period 1948-52 as being indicative of the abnormal conditions which then prevailed throughout the postwar world. This was reflected in the subsequent falling away in sales during 1953. I am accordingly all the more pleased at being able to report now upon a year of increased activity despite the existence of competitive markets everywhere.

A substantial portion of this increased business has come from our export markets where we have long-established and well-spread selling organisations aggressively seeking trade. The continent of Europe has provided a good volume of orders notwithstanding the continuing complications of currency restrictions. In Germany, we are benefiting from the steps which we took to reorganise our affairs there after the end of hostilities. Despite internal difficulties, France also maintains a satisfactory trading position. Sales to Switzerland—a country which is most prosperous and active—have increased. Holland, whose economy has been successfully adjusted to her changed conditions, has provided increased sales. In Belgium, Austria and Italy, our trade has been satisfactory. Sales in Scandinavia over all have remained steady. A decrease in sales to Sweden has been offset by increases to Denmark. Some countries, including Spain and Yugoslavia, which since the war have been closed to England, are now importing our machines.

BENEFITS FROM GROWTH OF EDUCATION

In countries further from these shores we are benefiting by the developments of printing and the growth of education. In India, Pakistan, Ceylon, Burma and Thailand, we have been working in close co-operation with those nationals seeking to overcome the difficulties of spreading the printed word throughout areas where a multiplicity of tongues and dialects is deeply rooted. We are sure that the time will come when our efforts will prove to have been justified. Pakistan, regrettably, has found it necessary to apply severe import restrictions. These remarks apply with equal force to Indonesia, where we could send more of our machines if the economy of that country allowed the necessary licences.

In the Union of South Africa, together with other territories in the African continent, business has increased. I have recently returned from a visit to these areas, where I have had discussions with the management and close contact with many customers. In the Union itself there are still difficulties through import restrictions. In a country which is so national in its outlook it is surprising to find that despite a campaign being carried out at the moment to buy South African goods, a considerable number of books and posters are being printed and published in Holland where it can be done more cheaply than in the Union itself. It is hoped that these conditions will be of short duration.

STRONG LIQUID POSITION

Turning now to the consolidated balance sheet, you will see that our liquid position continues to be strong. The excess of current assets over current liabilities at the end of the year, at £1,639,092, was £192,688 higher than at the end of the previous year. Nevertheless, during the year expenditure on fixed assets was £132,547. Some of this is due to the rebuilding of our premises in Fetter Lane, E.C.4. I am happy to say that these are now complete and are in course of being occupied. The item of £110,000, appearing in the notes to the balance sheet as capital commitments is largely due to this rebuilding.

Notwithstanding the setting aside of an increased amount for repayment of dividend, we have been able to allocate to reserve an amount of nearly £180,000. In the consolidated balance sheet this leaves us carrying forward the sum of £625,077 by way of general reserve and accumulated balances of profit and loss accounts.

Having regard to this, we feel fully justified in maintaining the dividend for the year at 9 per cent on the increased capital. Accordingly, we recommend the payment of a final dividend of 7 per cent, less tax. The total dividend of 9 per cent amounts to approximately 6 per cent on the true capital employed in the business.

RESEARCH AND DEVELOPMENT

Our company is operating, and operating with success, in a highly progressive industry; an industry in which research is constantly making new ideas practicable, and in which competition is an additional incentive for us not only to move with the times, but to anticipate them. It is essential, therefore, that we devote an increasing proportion of our time, energies and resources to research and development. Costs of research are bound to be high and must be incurred long before any real reward can be obtained. It has always been the policy of your company to expend considerable sums on research and development, and this year is no exception.

The photo typesetting machine—"Monophoto"—to which I have referred in previous reports has reached an early manufacturing stage. Several machines are completed and are now receiving a thorough test prior to being made available to the trade.

We are also developing items for use in the lithographic field. One of these is a small simplified offset press which, together with the manufacture and processing of printing plates, is being sold under the trade mark "Rotomaton" through our subsidiary company, Printers Machinery Accessories (London) Limited. At the moment, a prototype of a larger machine is at the testing stage in our works. We shall be able to give full attention to these developments now that the defence work upon which we have been engaged is coming to an end.

We devote to our developments and new products the same care as to quality and reliability as that which has characterised our products for many years. We are well equipped for fine engineering in our works at Salfords, and you will notice that the annual report this year includes some photographs taken inside the works, which I am sure will be of interest to you.

The Tenth International Printing Exhibition will be held at Olympia in London from July 5th-16th this year. It will be nineteen years since a similar exhibition was held in this country. We shall, of course, be exhibiting and look forward to meeting there many of our friends and customers from all parts of the world.

INTERNATIONAL CONDITIONS

International conditions today unfortunately appear to be as unsettled as ever and the period of postwar re-equipment has passed. We are suppliers of capital goods to a world-wide market. It follows that the result of our business should be examined over a period rather than year by year. It is always dangerous to make forecasts of future prospects, but with all our resources I can say with confidence that our company is well equipped to meet any normal difficulties. We have many problems ahead. We have the increasing fact of competition. There is the problem of increasing costs of manufacture which cannot always be passed on to the customer or overcome by greater efficiency, and there is the continuing and cumulative burden of taxation. Despite these difficulties, I am sure that we shall give a good account of ourselves in the current year, a view supported by the fact that the sales for the first few months of this year maintain the level of last year's corresponding figures.

The report and accounts were adopted.

THE BRADFORD DYERS' ASSOCIATION, LIMITED

SATISFACTORY RESULTS DESPITE DIFFICULTIES

MR JAMES EWING ON TRADE FEDERATIONS

The fifty-seventh annual general meeting of The Bradford Dyers' Association Limited was held on April 6th at the Midland Hotel, Bradford.

Mr James Ewing (the chairman), who presided, in the course of his speech said: A year ago, in my annual address, I hinted that we could not ignore the effect upon international trade of the entry of Japan and India into our export markets nor the effect of rising costs upon our profits. Costs are still rising and it has not been possible or desirable to pass these increases on to our customers. These two factors are mainly responsible for a fall of 15 per cent in the gross earnings of our home branches. The actual drop in yardage over the year was only 5 per cent, the greater part of which occurred in the second half of the year. The fall in the earnings of our home branches was partly offset by an increase of 15 per cent in the earnings of our subsidiary companies overseas, with the result that the total trading profits fell by £147,000, or 6 per cent. These results may be considered satisfactory, having regard to the circumstances prevailing in the second half of the year in several sections of the industry.

DEMAND FOR NEWER FIBRES

The first quarter of this year shows a further falling off in volume in nearly all sections of the business, but mainly in the spun rayon section. The demand for fabrics containing the newer synthetic fibres is growing and our speciality branches engaged in that section are well employed, fully justifying the policy of your board in equipping these new works with the most modern machinery available for the sole purpose of dyeing and finishing fabrics containing these fibres, which, enhanced by colour and ornamentation contributed by the skill of the dyer and printer, are now making their presence felt in the fashion world.

It is not easy to forecast the future of the textile industry, which is so dependent upon an adequate volume of exports. I fear that this year the industry will be faced with still keener competition in overseas markets due partly to domestic production and partly to imports, still growing, from countries such as Japan and India. But is there any reason for adding to our difficulties by allowing imports from India to undermine our home market? Notwithstanding these difficulties, I am confident that our inherited skill, our wide experience and our ability to produce goods of the highest quality will command a substantial volume of business and keep our shrunken textile industry well employed. There is much uncertainty, particularly in Lancashire, about the Government's policy on this difficult subject of imports of grey cloth from India and Japan, and there is much anxiety about the effect of the deliberations in Geneva upon the General Agreement on Tariffs and Trade. We of the finishing industries share these anxieties.

ACCOUNTS

During the year effect was given to the capitalisation of reserves in the amount of £1,129,397, in accordance with the resolutions passed at the extraordinary general meeting held on July 20, 1954, thereby increasing the issued share capital to £5,937,428.

We have been able to add to our reserves an amount of £345,516, mostly by appropriations from profits, which, together with the increase in the carry forward on profit and loss account of £63,152, makes a total increase of £408,668. The total of our reserves now stands at £1,708,017 and, including our share of the reserves of our subsidiary companies, at £3,909,126.

Capital expenditure during the year on new plant and machinery and buildings amounted to nearly £550,000. This is an indication of the demand on our resources necessary to keep our equipment up-to-date and secure the advantage of the latest developments, and to provide facilities for processing the new man-made fibres which are becoming of increasing importance.

COTTONS AND RAYONS

In 1954 the UK production of cloth, both cotton and rayon, was larger than in 1953, the recovery continuing from the depression of 1952. The volume of cotton cloth exported was, however, much lower and, notwithstanding a slight rise in rayon cloth exports, the industry has had to depend to a large extent on the home market for its offtake. Despite the very unfavourable weather, the home market, fortunately, remained buoyant.

Exports.—Exports of cotton piece goods from the United Kingdom decreased in volume by 10 per cent, compared with 1953, and were lower than in any year since 1947. Rayon and synthetic fibre piece goods exports were slightly larger in volume than in 1953, and considerably better than in 1952. The overall (cotton and rayon) export volume in 1954 was lower than in the previous year.

Imports.—The volume of cotton cloths imported into the United Kingdom in 1954 was more than two and a half times the total of 1953, and was rising towards the end of the year. There has been considerable concern of late in connection with the spectacular increases in the importation of Indian grey cloth which is entering this country, duty free, and of which a large proportion is finding its way on to the home market at prices well below those at which similar goods can be produced in Lancashire.

TRADE FEDERATIONS

As regards trade federations in general, I am a believer in their value in regulating industry; but in my view all trade federations should be registered and should be subject to review by a Government department. Federations should have nothing to fear from such supervision.

The control of competition is the modern way out. During the war, we had a large measure of price control, or Government auditing of prices. Few industrialists would wish to return to unbridled competition with all its degrading effects.

I see a future in well organised trade federations, responsible to industry and to Government, and if these federations conform to the following general principles, they should satisfy the consumer, the employee and the investor:

(1) The federation should in no way restrict output.

(2) The employee, both operative and managerial, should receive an adequate reward for his services.

(3) The industry must provide a fund to enable it to replace wastage and for future development.

(4) Prices should be based on cost of production of an efficient unit working to a normal capacity, and prices should be subject to Government audit.

(5) The investor should receive a fair reward for the capital invested in the industry.

The report and accounts were adopted.

HOOVER LIMITED

CURRENT YEAR'S EXCELLENT START

MR S. ROBERTS'S SPEECH

The annual general meeting of Hoover Limited was held on March 31st at Perivale, Middlesex.

Mr S. Roberts (managing director) presided and said:

It is my intention this year and in future years to take the opportunity afforded by the annual general meeting to bring shareholders up to date on the progress of the company, during the first quarter of each financial year.

We are in the final week of the first quarter and I am pleased to say the results are excellent and constitute a new record in our history.

You will understand that the figures are not yet complete, but I am able to say that for the first eleven weeks of 1955 our turnover is 21 per cent higher than for the record first eleven weeks of 1954.

I must point out, however, that during the quarter we have had to face rising costs of materials and a further wage award. It is our intention to absorb these higher costs and maintain our present low prices which, of course, will have some effect on our profit.

The hire purchase restrictions reimposed on February 25th do not appear so far to have had an adverse effect on sales in the home market—in fact the record week at home for all time took place two weeks after the announcement of the new restrictions.

It is a little early to judge yet but we think it quite possible that the restrictions over a period will have some effect—we shall do our best to offset this.

SUCCESSFUL DEBUT OF NEW WASHING MACHINE

The new all-electric Mark III washing machine was introduced in March and has had a most successful debut. It has proved a great attraction at the "Ideal Home" Exhibition and in cities and towns throughout the country—it looks as if our problem will be to produce in sufficient volume to meet the demand we have created.

The new import restrictions imposed by the Australian Government will mean a reduction of 33⅓ per cent on domestic appliances and 20 per cent on our industrial motors in our overall exports to Australia. This coming at a time when we have just launched our steam or dry iron with tremendous success in that country is most unfortunate. However, we are making rapid progress with production generally at our Australian factory and this new regulation will spur us to greater efforts in this direction.

In general we are more than happy about the first quarter's results—there is still much to do—but with the tremendous loyalty and regard that has been shown to me and my colleagues by Hoover men and women everywhere, we are confident in our strength to expand our activities still further.

The report and accounts were adopted.

BANK OF SCOTLAND

AMALGAMATION FINALISED

CONSIDERABLE EXPANSION OF BUSINESS

The annual general meeting of the Proprietors of the Bank of Scotland was held on April 5th within the head office, Edinburgh.

The Right Honourable Lord Elphinstone, KT, governor of the Bank, presided, and in the course of his speech said:

Since our meeting a year ago the final steps in the fusion of the Bank with The Union Bank of Scotland Limited have been taken. The two Banks were united on March 1, 1955, under the Name and Constitution of the Bank of Scotland.

The consolidated balance sheet of the Bank shows that considerable expansion in business and resources took place during the year. The total assets of the Bank are greater by over £11 million at £222 million and the customary strength of the balance sheet is fully maintained.

The consolidated profit and loss account of the Bank includes for the first time the results of a complete year's trading by both Banks. In comparing the results it should be kept in view that last year's figures included only eleven months' trading of the Union Bank.

The combined net profits after provision for taxation, contingencies and all known bad and doubtful debts amount to £630,614. Of this amount there was retained by the Union Bank £142,213, leaving £488,401, to which is added the balance brought forward of £186,311, making available £674,712. From this there has been transferred to reserve for contingencies £100,000 and staff pension fund £40,000, leaving £534,712. The interim dividend of 7 per cent actual less income tax paid October 15, 1954, required £173,250 and the final dividend of 7 per cent actual less income tax now recommended will require £173,250, together £346,500, leaving a balance carried forward by the Bank of Scotland to next year of £188,212. To the profits retained by the Union Bank of £142,213 there falls to be added the balance brought forward by that Bank of £65,629, making a total of £207,842, of which there has been transferred to reserve for contingencies £100,000, pensions and allowances fund £40,000, a total of £140,000, leaving to be carried forward by the Union Bank £67,842, making a combined balance carried forward to next year of £256,054.

GENERAL CONDITIONS

For the greater part of last year the country's economic and financial position continued to develop satisfactorily. The last two months of our financial year, however, saw a complete and largely unexpected change in the situation. It became apparent that a sudden reversal in the terms of trade was adversely affecting the foreign exchange position. With internal trade activity and consumer demand at new high levels an inflationary position was rapidly growing which unless checked held danger for the country's financial stability. There followed two increases in the bank rate and the adoption of measures to control the movements of transferable sterling. How successful these actions will prove remains to be seen and their effect will be carefully watched. But however successful they may be for the time being they are at best technical expedients which cannot remove the fundamental causes of the present situation. Government spending must be curtailed and the crushing burden of taxation substantially reduced before our internal economy will be fully restored to a sufficiently healthy state to withstand without undue concern the ebb and flow of a constantly fluctuating foreign trade. It cannot be too strongly emphasised that the need to stimulate and increase exports is as great as ever. In addition the rising level of wages must find justification in greater production if genuine progress is to be made in the establishment of an improving standard of living and even if the present standard is to be maintained.

The report and accounts were adopted and the dividend, as recommended, was approved.

Referring to the election of the governor and deputy governor, Lord Elphinstone intimated that the time had come when he had decided to relinquish the duties of governorship of the Bank. It was a matter of great satisfaction to him that he was able to hand over to his successor the governorship of a Bank which had been tested and found strong and which had now increased its stature and especially its closer identification with the West of Scotland by the amalgamation with the younger but equally virile Union Bank.

He proposed that the present deputy governor, Sir John Craig, CBE, DL, LLD, be elected governor and that The Lord Bilsland, KT, MC, DL, LLD, an ordinary director of the Bank, should succeed Sir John as deputy governor.

The appointments having been unanimously approved, Professor George A. Montgomery, QC, MA, LLB, on behalf of the stockholders, paid a tribute to the services rendered by Lord Elphinstone.

THE RIO DE JANEIRO FLOUR MILLS AND GRANARIES LIMITED

The sixty-ninth ordinary annual general meeting was held on March 31st in London, Mr G. McT. Sheppard (the chairman), presiding.

With regard to the group accounts, the chairman emphasised that the Brazilian profits had been converted at the free rate of exchange as at September 30th last of Cr$174.00 to the £ compared with Cr$106.80 in the previous year. Despite this heavy burden the group, in terms of sterling were able to show a net profit of £179,264 compared with £113,135 in the last accounts. It was, he said, gratifying to be able to record the greatly increased cruzeiro profits compared with the previous year.

A Presidential Decree on May 1st announced the doubling of the minimum wage and, notwithstanding efforts on the part of the government to curb inflation, the cost of living continued to rise and further wage adjustments had already become necessary.

Brazil was now in the throes of an economic crisis but the present government had already taken certain steps to restrict banking credit and had also legislated for increased taxation.

Under the circumstances, the chairman said, he found it difficult to make a forecast of what the current year had in store for the group. Apart from the necessity of increasing cruzeiro earnings, for which they would obviously strive, so much depended on the trend of the free exchange rates in Brazil and the outcome of the steps taken by the government to overcome the crisis.

The report was adopted.

REFUGE ASSURANCE COMPANY LIMITED

INCREASED ALLOCATIONS OF SURPLUS TO POLICYHOLDERS

The chairman, in a statement submitted with the 1954 accounts, referred to a remark by the Chancellor that "The great and continuing need of Britain is for the savings of the many—small but regular and in the aggregate a powerful contribution to future prosperity." He said that it was in the regular collection of small savings and their investment in productive enterprises that life assurance, particularly "home service" life assurance as supplied by the company, was so prominent and of such value to the economic stability of the country.

The combined new sums assured of £31,700,000 in the life branches was the greatest yet written by the company in any year and the sums assured and bonuses in force had advanced to £323 million. An encouraging start had been made in the business of the fire and accident branch.

ALLOCATIONS TO POLICYHOLDERS.

In the ordinary branch a surplus of over £1,400,000 was allocated to policyholders to provide a bonus on with-profit policies at the rate of £1 12s. per cent on the sum assured in respect of each year's premium due in 1954 and paid. This rate was an increase of 2s. per cent over that of 1953.

In the industrial branch £1,888,000 was allocated to policyholders. This sum, together with balances from previous allocations, was being used to provide additional benefits in the form of a reversionary bonus, that is, one under which the additional benefit is payable on death or maturity of a policy without any limitation as to the time within which the claim must occur. The bonus was granted to premium-paying and paid-up policies (with certain exceptions) dated prior to January 1, 1951, and ranged from £3 per cent of the sum assured for policies dated 1950 to £11 14s. per cent for policies dated 1928 or earlier. These bonuses were additional to permanent increases in sums assured already granted to the majority of policies dated prior to 1928, and would increase by over £9 million the benefits which the company had contracted to pay

The conditions under which paid-up policies were granted at advanced ages had also been improved and certain other increases in benefits continued.

INVESTMENTS

The company's investments in ordinary shares increased by £3,400,000 to some £14 million—10 per cent of the total assets.

This large sum represented the aggregate of investments—often of quite modest size—in many companies covering a wide range of businesses. Holdings in debenture stocks now aggregated £18,300,000, an increase of £2,700,000, and mortgages on property £18¼ million, an increase of £1,900,000. The latter item was largely made up of house purchase advances to policyholders. The total assets of the company had increased during the year by over £5¼ million and included British Government and British Government guaranteed securities of over £50 million—36 per cent of the total assets.

The chairman concluded with an expression of appreciation of the work of the staff during the year.

BIRMINGHAM & DISTRICT INVESTMENT TRUST, LIMITED

LARGER REVENUE AND DIVIDEND

The seventy-first annual general meeting of this company was held on March 31st in London.

Mr H. C. Drayton, chairman and managing director, in the course of his speech, said: I am not certain why in a company as successful as this shareholders should expect to have a good speech as well as a good report, as it throws a little too much strain upon the chairman. However, I suppose you will expect me to say something about the company.

For the year ended December 31, 1954, our gross revenue was £596,500, as against £561,498 in the previous year, an increase of approximately £35,000. That was made up by a small increase from the investments in associated companies of £2,000-odd, while the general investments yielded some £32,000 more than in the previous year. After deducting expenses, debenture interest and taxation we have a net figure of £306,980 available, as against £261,552 last year. We propose that the dividend should be increased to 30 per cent and, if you agree with the directors' recommendation, there will be an addition to undivided profits account of £40,665.

NEED FOR INCREASED FARES

Since the close of the year on December 31st last our main associated company, The Birmingham and Midland Motor Omnibus Company, have had to pay increased wages. That has necessitated, much to their regret I am sure, an application for an increase in fares. It was the proud boast of four associated omnibus companies that up to a few years ago they had not had to increase fares above those charged to the public prior to 1929. They went right through the war like that, but I am sorry to say that since the end of the war they have had vicious—one might almost say penal—taxation put upon their fuel and, of course, there have been several wage increases.

A considerable amount of the increased costs have been absorbed by economies and increased efficiency, but they could not all be taken up in that way and the companies have had to appear a number of times before the Traffic Commissioners to ask for an increase in their fares. They did not get all they wanted in one or two cases, and sometimes they got nothing, but by and large the Commissioners have recognised the justice of their claims and treated our associated companies in a right and just manner.

Our quoted investments stand at £3,244,000, and the market value on December 31st last was £5,722,000. I do not think that you should pay a great deal of attention to that figure; it is always fluctuating and today, with no newspapers, I should not think that anyone knows quite what it is.

This year the directors have been a little more generous in their distribution of revenue than they have been in the past. They have put to undivided profits account only some £40,000. That is, of course, a net figure, after tax, and I would just add that their generosity was prompted this year because your directors think that there will be a reasonable increase in the revenue of the company for the current year.

The report and accounts were adopted.

JAMES PASCALL, LIMITED

STRONG AND BUOYANT DEMAND

MR E. CASSLETON ELLIOTT'S ADDRESS

The fifty-eighth annual general meeting of James Pascall, Limited, was held on April 1st in London, Mr E. Cassleton Elliott, CBE, FSAA (the chairman), presiding.

The following is an extract from his circulated address:

Once again I am able to report to you a record year for James Pascall, Limited, both in terms of sales and of net profit. Our trading profit for 1954 shows an increase of 38 per cent over the previous year, and net profit before taxation has also advanced by 38 per cent. These figures have been achieved in face of growing competition and in a completely free market, and I think you will agree with me that they are a striking testimony to the strong position which the company has now built up in public favour.

In my report to you last year I gave warning that, in common with the rest of the industry, we were likely to find it increasingly difficult to maintain the sales and profits level achieved in the, at that time, record year of 1953. Although competition has proved keen, the demand for Pascall products continued strong and buoyant throughout the year, and we can now say that whatever difficulties may have been encountered elsewhere in the industry they have not so far fallen upon us.

I am glad to advise you that we have again increased our export sales, both to dollar and soft currency markets.

The profit on trading was £598,535 as compared with £433,007 last year. The total charge for taxation is £249,695 as against £235,000 last year.

Last year the surplus of current assets over current liabilities was £468,517. This year the current assets amount to £1,344,621 and the current liabilities are £708,790, so that the surplus is £635,831—a substantial increase. The general reserve of £200,000 is now double that of last year and the carry forward is increased by £19,909.

Last year a dividend of 40 per cent was paid on the ordinary shares, and your directors have decided this year to recommend a dividend of 50 per cent on the ordinary shares.

BONUS ISSUE AND INCREASE OF CAPITAL

The policy of the board is to bring the issued capital of the company into line with the capital employed in the business and, with this in view, your directors have again decided to submit to you a proposal that £44,567 of the general reserve shall be utilised in paying in full at par for 891,335 ordinary shares of 1s. each and that such shares shall be distributed as fully paid to the ordinary shareholders at the rate of one share for every four shares held.

When this transaction has been completed the authorised ordinary share capital with the exception of £2,166 will have been issued. Your directors think it advisable to increase the authorised ordinary share capital to £500,000. Your directors have no intention of raising new capital by an issue of ordinary shares as they hope to be able to continue to finance the business from its own resources, by ploughing back into it substantial reserves from time to time and the issue of bonus shares as has been done for several years past.

The report was adopted and the board's capitalisation, scrip issue and increase of capital proposals were approved.

ERICSSON TELEPHONES

RECORD SALES

The annual general meeting of Ericsson Telephones, Limited, was held on March 31st in London.

Sir Harold A. Wernher, GCVO (the chairman), in the course of his speech, said: It is very gratifying to your directors to put before you another very satisfactory report. Our invoiced sales in 1954 constituted a record—no mean achievement. The sales were well spread, both at home and overseas, which was noteworthy bearing in mind the increasing competition which has developed abroad and the currency difficulties which still tend to restrict export business.

During the past few months the home demand has improved. Approximately 400,000 more telephones were connected by the British Post Office in the past year, leaving just under 400,000 applications outstanding. A long waiting list seems to be a lasting feature in postwar economy. New applications are in the region of 400,000 a year. One can appreciate that saturation point, if there is one, must be a long way off.

Telephone practice is not static and research is always going on with the object of improving or cheapening the service or providing additional benefits. This constitutes an important phase of our work.

The trading profit, before charging taxation, but after allowing for all operating expenses, amounts to £1,272,732. Out of this we have to reserve £694,738 (or nearly 55 per cent.) for the Exchequer, leaving £577,994. We propose to pay a final dividend of 12 per cent and bonus of 4 per cent, free of income tax (making 20 per cent for the year).

The report and accounts were adopted.

JOHN EMSLEY LIMITED

The eighth annual general meeting of John Emsley, Limited, was held on April 4th at Bradford, Mr Harold Jaques, ASAA, chairman and joint managing director, presiding.

The following are extracts from his circulated statement: The profit for the year, although showing a decrease on last year, is deemed to be satisfactory. It should be remembered that from the opening of the wool sales in September to our stocktaking date there was a fairly steady decline in wool prices, amounting in fact to approximately 12½ per cent. This lower basis has been fully taken into account in our stocktaking prices at the end of November. In addition production at two of the subsidiary companies was handicapped by major plant and building reorganisation during the year. This work is now completed and the new plant is fully employed.

The building, plant and machinery have been maintained in good condition, and it will be seen that capital additions have been made during the year of nearly £83,000. Full time running has been maintained throughout the year for all machinery that could be adequately staffed but production has been affected by the alterations.

Our American companies, distributing our goods throughout the States, have increased their sales by 25 per cent.

In regard to prospects for the coming year, it is far too early to forecast, but it is general knowledge that competition is very keen in all sections of the trade and that there is a tendency for profit margins to be reduced. We are still well employed and have shortened our delivery dates, and our existing orders will ensure full running for some months. The report was adopted.

TAYLOR, WALKER & COMPANY

DIFFICULT TRADING CONDITIONS

EXPANDING EXPORT SALES

LT. COL. W. H. KINGSMILL ON CRUSHING TAXATION

The forty-eighth annual general meeting of Taylor, Walker & Company, Limited, will be held on April 21st in London.

The following is the circulated statement of Lieutenant Colonel W. H. Kingsmill, DSO, MC (chairman and managing director): Ladies and Gentlemen,—I stated in my last report that trading conditions were continuing to grow more difficult, and you will have seen in newspapers recently that the beer trade in the country as a whole continues to decline. There is little doubt that this is partly due to the changing fashions of the public. There are now many alternative forms of relaxation of which television is at present an important factor. It has to be remembered that the majority of those purchasing television sets and other household utensils and furnishings have done so on the hire purchase system and this has affected the amount of money available for spending in other directions. In my opinion this situation is comparatively transitory at its present volume, and when these extra weekly out-goings have been completed we feel that the public will once again turn to the licensed house for relaxation and good fellowship.

There is also a further restriction on spending money in the very much higher rentals charged nowadays for accommodation, which look like being a permanent factor in the family budget.

The standard of comfort in the home today is far ahead of that which obtained prewar and therefore considerable expenditure on the refurnishing and redecoration of licensed premises is necessary to keep pace with the higher average standard of comfort expected by our customers.

CONCENTRATION OF PRODUCTION SCHEME

Last year I stated that a major scheme had been formulated for the concentration of production, but I regret to say that the company was unable to proceed with this owing to the fact that the necessary building licences could not be obtained and until building became free in November of last year we could not commence. I am happy to say that we have now obtained all the necessary consents for the alterations envisaged in my last report and they are well under way, but it will mean that the financial benefit may not come into operation until six months later than I anticipated.

During the latter part of last year we placed on the market in bottled form our famous "Main Line" beer at its prewar gravity, which has been very well received.

The new additions to the Alperton Bottling Company's premises have now been completed and are in full production. This, we expect, will show considerable extra profit to your companies.

In the export markets our sales are expanding and we are satisfied that the products are being more and more appreciated in those markets to which they are exported.

You will see that we show a higher profit in the group consolidated accounts, but in view of the alterations taking place under the major scheme, to which I have referred, it was thought prudent to maintain the dividend, for this year at least, at the same level as last year.

TAXATION BURDEN

I referred last year to the effects of the crippling taxation on the industry through the duties on beer. There is little doubt that the public require and will pay for a first-class article providing the price—and therefore the tax—is not exorbitant. I only hope that when the Chancellor presents his budget on April 19th he will see "The writing on the wall" and will take some steps to alleviate this crushing burden on those who wish to partake of a wholesome national beverage.

May I again take this opportunity of saying how much we owe to the loyalty and hard work of the staff and employees, who are the backbone of any company and without whose co-operation even the best management must fail.

AMALGAMATED BANKET AREAS

The nineteenth annual general meeting of Amalgamated Banket Areas, Limited, was held on April 5th in London.

Major General W. W. Richards, CB, CBE, MC, chairman, presided, and the following is an extract from his circulated statement for the year ended September 30, 1954: It was not until the closing weeks of the year under review that the full benefits of the amalgamation with the Fanti and Tamsoo Mines were reflected in our overall production and profit figures. We then, in September, 1954, witnessed an advance of nearly 6,000 tons to 78,092 tons in the monthly throughput of ore and an increase of £24,251 to £49,728 in the monthly mine profit.

Although these very much improved figures continued for the following six months to date, they were only enjoyed, as I have said, for one month of the year under review. For that reason, we are recommending a dividend of 2½ per cent for the year ended September 30, 1954, as compared with 5 per cent for the previous year, but, at the same time, we are proposing to pay, from the profits already earned in respect of the current year ending September 30, 1955, an interim dividend of 5 per cent.

The total ore reserves, as at September 30, 1954, were computed at 3,332,541 tons. Of this tonnage, 1,816,905 tons averaging 5.564 dwts over a width of 40.70 inches, represented the underground ore; and 1,515,636 tons averaging 1.845 dwts over a width of 123.01 inches the surface deposit of the Pepe open-cast section.

A satisfactory feature of the year's work has been the continued increase in efficiencies in each department of the mine.

The report and accounts were adopted.

ORGANISATION AND METHODS

British European Airways require a Senior Methods Officer to study and develop office methods, accounting procedures and paper work systems throughout BEA. This is a new and progressive appointment, offering wide scope for ability. Applicants should have a University Degree or an appropriate professional qualification, and the capacity to deal with people at all levels. Knowledge of office machines, including punched card equipment, and good experience of methods study techniques essential. Starting salary within the range £1,075—£1,375 per annum. Pension scheme. Air travel concessions.—Details of qualifications and experience to Chief Personnel Officer, BEA, Keyline House, Ruislip, Middlesex, quoting Reference A.16.

CHAPPIE LIMITED, manufacturers of canned dog and cat foods, invite applications for the position of Statistical Officer.
This is a new position and the successful candidate (male or female) will be directly responsible to the Chief Statistician and will be concerned both with general commercial and industrial statistics and with particular problems. Preference will be given to graduates under 25 years of age, with good honours degrees in mathematical statistics or in mathematics with a recognised qualification in statistics. Post graduate experience in the application of contemporary statistical techniques to practical problems in industry or research is desirable, but not essential.
The starting salary will not be less than £750 per annum, plus non-contributory pension, life assurance and sickness benefits under a comprehensive Social Security Scheme.—Applications, giving details of career to date, should be addressed to the Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire, and the envelope endorsed "Statistical Officer."

A LARGE COMPANY in London requires at its Head Office a Qualified Accountant, preferably Chartered or Incorporated. He must have a wide knowledge of accounting techniques, of punched cards operations and other office machinery. Applications are especially invited from those with industrial experience or with advisory experience in large professional firms and who wish to specialise on system installations. Previous experience in this field will be an advantage.—Box 895.

CARIBBEAN AREA REPRESENTATIVE. Engineer/Commercial type seeks appointment representing British Company. Number years experience home/overseas, covering all aspects production, sales, buying, stores, transportation, etc. 38 years, keen, and just waiting for the right opportunity. Interviews London.—Box 892.

UNIVERSITY OF ABERDEEN

Applications are invited for three posts of Lecturer in Statistics :—One on Scale (c), £1,350 per annum, rising to £1,550 per annum ; or on Scale (b), £950 per annum, rising to £1,350 per annum, for work in connection with mathematical statistics.
Two on Scale (b), £950 per annum, rising to £1,350 per annum ; or Scale (a), £650 per annum, rising to £950 per annum, for work in connection with economic statistics and medical statistics, respectively.
All posts carry Superannuation (F.S.S.U.) and Children's Allowance. Part of removal expenses refunded.
Conditions of appointment and forms of application should be obtained from the undersigned, with whom applications (eight copies), giving the names of three referees, should be lodged not later than May 7, 1955. Applicants outside the British Isles may submit one copy only.
The University, Aberdeen. W. S. ANGUS, Secretary.

PERSONNEL OFFICER TRAINEES required by the Philips Group of Companies. Several young men, and possibly one or two women, will be engaged in the near future to work on a variety of personnel management jobs in different establishments in the Philips Group. Trainees will be employed on specific jobs during their period of training, and, if they prove suitable, will be offered permanent appointments wherever possible at the end of a training period. In any case, it is thought that the training time will be valuable experience. Candidates should, if possible, have taken, or be taking, the one-year, full-time personnel management course, or the part-time evening course, and should be of degree standard. They should be prepared to move to any part of the country, although probably most of the training time will be spent in the London area or in Lancashire.—Applications should be sent in writing to Mr. D. F. Hutchison, Chief Personnel Officer, Philips Electrical Industries Ltd., Century House, Shaftesbury Avenue, London, W.C.2, marked P.O./1.

INDUSTRIAL ECONOMIST seeks contact with London area firm. His object is to operate a system of market investigation for which the research machinery is already established and which unearths potential outlets for industrial goods and materials. Method of remuneration for discussion but could include working within the framework of the firm.—Box 891.

SPACIOUS AND LIGHT first-floor office, Knightsbridge. All services included. Suitable professional man. Modest rental.—Box 893.

EXPERIENCED WOMAN PERSONAL ASSISTANT, with German-English Shorthand, versed in every kind of administrative and office work, seeks congenial position.—Box 896.

FOURAH BAY COLLEGE SIERRA LEONE
(UNIVERSITY OF DURHAM)

Applications are invited for the following posts which will be vacant in October, 1955:
SENIOR LECTURER in ECONOMICS, to be responsible for organisation and supervision of courses for Durham degree of B.A. (Econ.).
LECTURER in ECONOMICS.
LECTURER in ACCOUNTING to teach accounting at all levels in Durham degree of B.A. (Econ.). Qualifications: degree in commerce or economics or membership of professional accountancy body.
LECTURER in LAW to teach law at all levels in degrees of B.A. (Gen.) and B.A. (Econ.). Candidates should be graduates and/or barristers at law.
The College, reconstituted in 1950, retains the Christian traditions of its foundation by the CMS 128 years ago.
Posts are permanent and pensionable but temporary appointments could be made. Salary scales (gross) : Senior Lecturers £1,370-£1,800 p.a., Lecturers £790-£1,500 p.a., consisting of basic salary (£880-£1,200 and £510-£1,000), expatriations pay and c.o.l.a. Point of entry according to qualifications and experience. Furnished houses provided, rent 10 per cent of basic salary. Free passages, one each way for each tour of service, for persons appointed, wives and up to three children under 10 (or an allowance of £50 p.a. for up to three children under 16). Generous home leave, normally annual, on full pay.
For further information apply to Secretary, Advisory Committee on Colonial Colleges, 1 Gordon Square, London, W.C.1. Closing date for applications (six copies), April 25, 1955.

THE ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS

The Council of the Institute invites applications for the SIR HENRY PRICE RESEARCH CHAIR OF INTERNATIONAL ECONOMICS at Chatham House.
The Sir Henry Price Professor will be expected to undertake research within his field of study. He will also advise on economic subjects in the research programme of the Institute, and, where required, contribute on this subject to the annual Survey of International Affairs.
Candidates, who must be British subjects or Commonwealth citizens, should be recognised authorities in the field, capable of making an original contribution to the study and understanding of economics and economic history in their bearing on international relations. The possession of practical experience of the conduct of affairs in addition to appropriate academic qualifications, will be an advantage. Salary in accordance with experience and age. There is contributory staff superannuation scheme.
Applications, giving full details of qualifications and experience, together with the names of three referees, should be made in writing to the Secretary of the Institute, Chatham House, 10 St. James's Square, London, S.W.1, and should be received by May 2, 1955.

FOREIGN SERVICE: Principal Instructor at the Middle East Centre for Arab Studies. Applications are invited for this post Shemlan, Lebanon. The Centre, which is under the aegis of H.M. Foreign Office, trains members of the United Kingdom and Commonwealth Foreign Services and commercial organisations for service in the Arab countries of the Middle East.
Applicants must have at least a second class honours degree, preferably in Oriental Studies or History, and a good knowledge of modern Arabic and of Arab countries. Experience of teaching adults is desirable.
Salary (subject to U.K. income tax) is on the scale £695 to £855 (men) and £665 to £750 (women) and a foreign allowance (non-taxable) (which varies according to the cost of living in the Lebanon) is also payable. The allowance is higher for a married instructor, and takes account of dependent children up to the age of 18 years. Free furnished accommodation is provided.
Further particulars and application forms may be obtained from the Personnel Department, Foreign Office, 8 Carlton House Terrace, S.W.1. Closing date for receipt of application forms, April 30, 1955.

CAN BANK RATE MAKE ROOM FOR TAX RELIEF ? A careful assessment of the extent to which dear money has eased Mr Butler's dilemma appears in the April issue of "The Banker." Two further editorial articles discuss the new policy for sterling—the "Uncollective Approach" : and the measure of the strains on sterling emanating from the outer sterling area—the first full analysis of this key question.
"Freedom" Versus Prosperity is the title of a provocative article by Dr T. Balogh, the left-wing economist, also published in this month's issue of "The Banker." Other contributed articles include "The Capital Market—its Mechanism and Scope," by Sir Oscar Hobson; and "Welsh Industry in the Boom," by E. Victor Morgan.
Price 2s. 6d. from bookstalls or 72 Coleman Street, E.C.2. Annual subscription, 30s. per annum, post free.

ORGANISATION and Methods Officer required by well-known North Midlands Electrical Engineering Company. This is a senior position and the man appointed will be immediately responsible to the Chief Executive of the factory for all Organisation and Methods activities. He should have had several years' experience in this class of work in the engineering industry. A University degree and/or Cost and Works Accountancy training is desirable. There are attractive conditions of service including a four figure salary, staff bonus and non-contributory superannuation.—Please apply to Box 3E, R 1975, A.K. Advg., 212a, Shaftesbury Avenue, London, W.C.2.

MARKETING RESEARCH. A well-known Industrial Company invites applications to fill an appointment involving responsibility for that part of the marketing research function concerned with consumer and retailer research. A good honours degree in economics with statistics is an essential qualification. Candidates must have extensive knowledge and experience of the techniques of sampling and the organisation and control of consumer surveys. This is a senior post giving ample scope for experimentation in new methods and the imaginative development of existing techniques. An attractive starting salary will be paid and in certain circumstances housing assistance may be available.—Box 885.

UNIVERSITY OF CAMBRIDGE

Applications are invited for the SMUTS READERSHIP. Candidature at this appointment will be limited to persons whose work would be connected with social and economic conditions in the British Commonwealth of Nations, the words "social" and "economic" being interpreted for this purpose in a wide sense. Pensionable stipend: £1,850 a year, subject to certain variations.—Further particulars may be obtained from the Secretary to the Managers of the Smuts Memorial Fund, the Old Schools, Cambridge. The closing date for the receipt of applications is May 30, 1955.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above Studentships, tenable for one year in the first instance and renewable for a further period not exceeding two years. The Studentships are normally of the value of £250 or £300 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than June 1, 1955, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for the newly created post of DIRECTOR OF BUSINESS STUDIES. Salary £2,000 a year with F.S.S.U. provision and family allowance. The appointment is a new one: the Director will be required to take over and develop University studies in the field of Business Administration and Management.—Further particulars should be obtained from the Registrar, the University, Sheffield, 10, to whom applications (16 copies) should be sent by May 14, 1955.

METEOROLOGICAL OFFICE, SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for permanent posts. Applications will be accepted up to May 31st, but early application is advised. The duties include research in atmospheric physics, covering the study of cloud structure, synoptic and dynamical meteorology, large and small scale diffusion and turbulence, climatology, and development of instruments. There is a limited number of posts for forecasting work at the more important centres. Successful candidates will be given a course in meteorology before being assigned to a research or forecasting establishment for further training and experience. In some instances candidates with national service obligations can be commissioned in the RAF for forecasting duties at RAF stations. Further information may be obtained from the Director, Meteorological Office (M.O.10), Air Ministry, Kingsway, London, W.C.2.
Candidates must be between 21 and 28 during 1955 (up to 31 for permanent members of the Experimental Officer class) with a First or Second Class Honours degree preferably in physics or mathematics. Salaries £492-£885 (London rates for men; somewhat lower for women and in the provinces). Opportunities for promotion to Senior Scientific Officer (£1,010-£1,185) and higher posts.
Application forms from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. S52/55 (Met.).

MANAGEMENT ACCOUNTING. A leading British concern, with diverse interests at home and abroad, invites applications from Economics and Commerce graduates who wish to enter industry this year. Candidates should preferably have had studies in Accounting, Law and Statistics, and be interested in taking a professional accounting qualification. Vacancies are available in London, the Midlands and the North, and after completion of training there will be opportunities elsewhere, both overseas and at home. Men of ability who are looking for a progressive career should write in confidence to Box 890.

BRITISH NYLON SPINNERS, LTD., Pontypool, has a vacancy in the LIBRARY AND INFORMATION SECTION, the chief duties of which consist of the collecting and indexing of published information, largely of a commercial nature, and the provision of an information service in this field. Qualifications in Economics, Commerce and Statistics are essential, and it will be an asset if candidates can offer previous experience of a similar nature gained in the Library of a financial or commercial organisation. This is a responsible position, with scope for future development.—Apply, in writing, to Personnel Manager.

ENTERPRISING AND QUALIFIED MEN required for responsible posts in Management. Show initiative by working now for a professional qualification. Expert training available by means of Pitman Home Study Course.—Write for details to 41, Pitman House, Godalming, Surrey.

MARKET ANALYST required for Export Division of Ford Motor Company Ltd., Dagenham. Degree in economics or commerce essential. Must have analytical mind, good knowledge of statistics and sales, long-term forecasting. Experience of foreign markets and/or motor industry an asset. Age 23/35.—Reply to Salaried Personnel Department, quoting reference FMA/PP.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

PORTUGUESE EVENING CLASSES. All grades.—Portuguese Language Committee, 2, Belgrave Square, S.W.1. SLO 7186.

THE ECONOMIST, 1944-1954, including indexes, for sale ; unbound ; good condition.—Offers to Box 894.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects. —Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

PROPANE DEASPHALTING

This propane deasphalting and decarbonizing plant went on stream recently at Shell's Refinery, Pernis, near Rotterdam (N.V. De Bataafsche Petroleum Maatschappij). With a maximum oil charge rate of 12,000 barrels per day and a propane circulation rate of close to 100,000 barrels per day, this is one of the largest propane deasphalting installations in the world. The plant was designed and engineered by E. B. Badger & Sons Limited in collaboration with the Stone & Webster Engineering C[illegible]on.

Railway Experts

They're on the look-out for a crack express—but they call it a 'streak'. Below them, a stolid shunting engine rolls unnoticed into a factory siding, hauling its vital load of raw material. The story of these factory sidings—hundreds of them up and down the country—is the story of Britain's industrial development. It is a story in which the Thos. W. Ward organisation has played an important role, for many of these private railways have been built by Wards.

Wards hold an unrivalled position in the specialised field of laying and maintaining industrial railway sidings. They can advise on and contract for installations of every kind, ranging from a simple run-in to an intricate network. Wherever rails are needed to move the goods, Wards are the people to provide them.

THE TWW SERVICE ALSO INCLUDES:—

Iron & Steel · Excavators & Cranes · Shipbreaking
Foundry Plant & Supplies · Food Preparing Materials
Contractors' Plant & Equipment · Granite & Freestone
Structural Steelwork · Tractors & Earth Moving Plant
Insulating Materials · Plant & Machinery · Cement
Nuts & Bolts · Non-Ferrous Metals · Rails & Sidings
Industrial Dismantling · Wire & Wire Products
Industrial Plant · Packings & Jointings.

Marconi himself was the first to apply his discovery to the safety of seafarers. In the company he founded his successors have vastly developed his initial research over the past half century. Today Marconi equipment in ships and shore stations contributes to the accuracy of navigation and the efficient operation of both warships and merchantmen, as well as the comfort and convenience of those who trade or travel by sea and the forces which protect them. The mariner is warned of hazards, guided into safe channels and guarded from "the dangers of the sea and the violence of the enemy" by Marconi's.

A clean soft dry towel for every pair of hands

How does the Towelmaster work? A pull. Here's a length of laundry-fresh towel, enough and to spare for a really good dry. And as you pull, the used portion automatically winds into a separate compartment of the gleaming white Towelmaster cabinet. Nothing more efficient. Nothing more hygienic.

How much does the Towelmaster cost? 5/- per roll of towelling. Minimum usage only one roll per cabinet per week. Installation is free. Maintenance is free (two or more cabinets). No replacement charges. In fact there are no other charges whatsoever.

How much is the Towelmaster worth? Those few shillings give 180 pairs of hands an honest-to-goodness dry. Benefit staff and visitors alike. Give you 45 yards of *goodwill*. And what an infinitesimal price to pay for a clean bill of health!

What are your particular needs? We'll be glad to discuss them—without obligation.

THE CHAIRMAN SPEAKS

'Our potential enemies only understand strength'

SAYS SIR THOMAS SOPWITH

C.B.E., Hon.F.R.Ae.S

"Even before the Royal Air Force is fully equipped with modern weapons, there are voices raised seeking to reduce our protection. And they are powerful voices... Make no mistake about it. The one sure way to invite disaster is for this country to pursue a policy of weakness. Our potential enemies only understand strength and our sole hope of survival lies in so building our strength and our air power that no one will dare attack us."

Sales commence at ELEVEN O'CLOCK PRECISELY. Catalogues may be had price 3d. per copy (prepaid) post free.

ON WEDNESDAY, APRIL 20.
OLD ENGLISH and CONTINENTAL SILVER and PLATE, the Property of MRS. LOUIS FLEISCHMANN and others, including an Elizabeth I Ostrich Egg Cup with silvergilt mounts, 1591, a Charles II plain Tankard, 1682, and a German Tankard, Hamburg, circa 1680.

ON THURSDAY, APRIL 21.
OLD ENGLISH and CONTINENTAL FURNITURE, OBJECTS OF ART, EASTERN RUGS and CARPETS, from various sources.

ON FRIDAY, APRIL 22.
At 11 a.m. ANCIENT and MODERN PICTURES and DRAWINGS, the Property of the EARL OF DERBY, M.C., and others.
At 2.30 p.m. ANCIENT and MODERN PICTURES and DRAWINGS, the Property of L. C. WALLACH, ESQ., and others.

ON MONDAY, APRIL 25.
EUROPEAN and ORIENTAL CERAMICS and OBJECTS OF ART, from various sources.

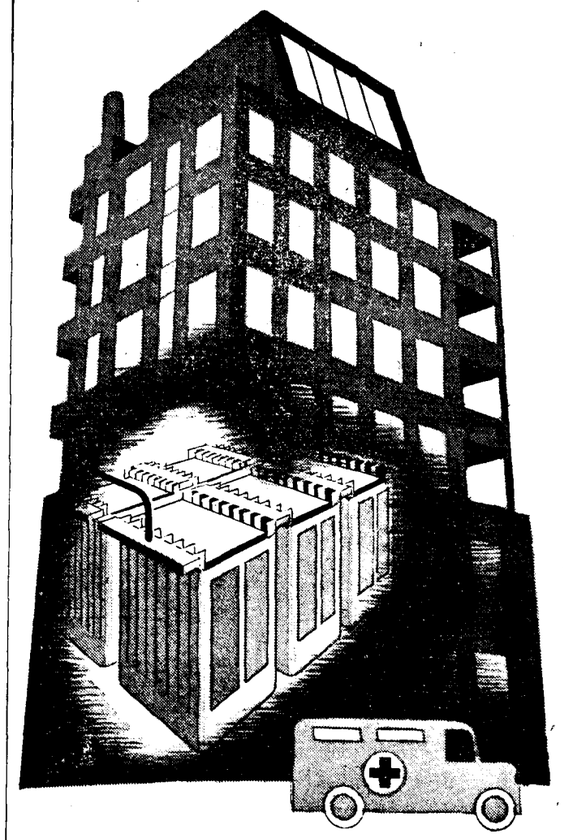
ON TUESDAY, APRIL 26.
OBJECTS OF ART AND VERTU, MINIATURES and COINS, the Property of the late MARY, LADY COLMAN, the late H. S. GUINNESS, ESQ., and others, and a Collection of Old English Watches, the Property of JOHN VINCENT, ESQ., J.P., and including an Italian Violin by Tononi, circa 1700, works by Carl Fabergé, and a German gold filigree box, circa 1600.

ON WEDNESDAY, APRIL 27.
FINE JEWELS, the Properties of MRS. B. B. DONALD, MRS. A. MARTIN and others, including an Old English Diamond cluster Ring, circa 1780, and a Diamond cluster Half-hoop Bracelet.

ON THURSDAY, APRIL 28.
OLD ENGLISH and CONTINENTAL FURNITURE, OBJECTS OF ART and EASTERN RUGS AND CARPETS, from various sources.

ON FRIDAY, APRIL 29.
OLD PICTURES and DRAWINGS the Property of P. J. WESTWOOD ESQ., and others mainly of the 17th and 18th centuries, British and Continental Schools.

ON MONDAY, MAY 2.
FINE ENGLISH and CONTINENTAL PORCELAIN, the Properties of The VISCOUNTESS BERTIE OF THAME, ROBERT VON HIRSCH, MISS M. SAUNDERS STEPHENS, MRS. M. A. RASH, MRS. M. FALCONI, including an Important "Flying Fox" pattern Meissen Dinner Service, fine Meissen groups modelled by J. J. Kaendler, J. F. Eberlein and others, fine Chelsea porcelain including a red anchor set of the Seasons, and Worcester porcelain from the MISSES GARWOOD, formerly in the Collection of the late Frank Lloyd. Ill. Cat. 5/-.



ON WEDNESDAY, MAY 4.
OLD ENGLISH and FOREIGN SILVER and PLATE, the Property of the late MISS G. C. HUE (Sold by Order of the Executors), and others.

ON THURSDAY, MAY 5.
18th CENTURY ENGLISH and CONTINENTAL FURNITURE, OBJECTS OF ART and EASTERN RUGS and CARPETS, the Property of the late MISS G. C. HUE, and others.

ON FRIDAY, MAY 6.

The heart of the matter

The electric storage battery plays a vital part in modern life, and lead is vital to economic battery production. Batteries provide the means of storing electrical energy for motor cars and for emergency lighting in hospitals, cinemas, and wherever there is absolute dependence on continuity of electrical supply. Emergency signalling systems on railways, and standby systems for communication and alarm on ships depend on the electrical storage battery, of which the lead plates are a most important part.

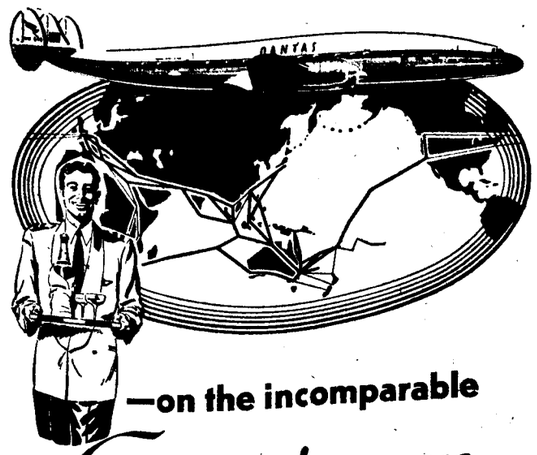
Whatever the building or the business **WALLSPAN**

outer walls serve your purpose precisely!

WALLSPAN is the most versatile outer wall construction material in use to-day. Wallspan walls can be built to serve a wide variety of different needs.

In a storage warehouse, Wallspan will give you all the strength and solidity you could ask. In a factory—vastly more daylight with an unusual degree of heat insulation, plus facilities for partitioning, sub-dividing or expanding. In a modern school—the maximum measure of fresh air and sunshine. In a laboratory it could combine special ventilation with rigid requirements in temperature control. *And give you all these things, please remember, at very competitive cost!*

What Wallspan is. Wallspan is a system of vertical and horizontal aluminium alloy members, formed into a grid to carry windows, doors and the glass or other panelling. Wallspan walls give you complete protection against the weather in any climate. The glazing and panelling can be constructed to afford a comfortable working temperature even in extremes of heat and cold.



Beauty with minimum maintenance. Wallspan also offers your architect fresh opportunities in design, with exciting combinations of glass, metal, plastics and other materials. The grid is a non-corroding aluminium alloy. With a suitable choice of panelling, maintenance is reduced to an occasional rub-down by the window cleaners.

Finally, Wallspan walls go up in a matter of *days* to get your building into use much sooner.

WALLSPAN CURTAIN WALLING **WILLIAMS & WILLIAMS** *RELIANCE WORKS · CHESTER*

You'll be using your building sooner—much sooner—if it has Wallspan walls!

What would grandfather say, Mr. Horsefall?

The development of plastics has given industry and the home many useful materials. Polyvinyl chloride is a case in point. Already familiar as curtains and garments and cable coverings, it now provides flexible belting for coal mines which is singularly unaffected by hard wear and tear. In an allied form it is a floor-covering material of exceptional durability. Organic Phosphorus Compounds (*for which Albright & Wilson supply the intermediate*) are often used as the plasticizers to maintain the flexibility and to make the finished plastic flame-resistant.

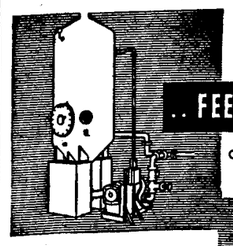
The Textile WHOLESALER helps the NATION

THE Wholesaler reduces waste of manpower, time and money. He provides a centralized service for the distribution of the pick of the products of hundreds of factories to shops in every town and village in the country.

By buying in advance of the seasons and holding large stocks, he provides a buffer against rising and falling prices. His stocks are invaluable, too, in meeting sudden demands. He aids the manufacturer by prompt payment and gives helpful credit to the Retailer.



The Textile Wholesaler plays a vital role in the economy of this "Nation of Shopkeepers".

This is the FOURTH of a series of four announcements describing how the Textile Wholesaler helps the Manufacturer, the Retailer and the Nation.

The Duchess eats off paper!

Yes she really does—those clean bright table tops we find in the world's gay places are made from sheets of specially prepared kraft paper treated with synthetic resins and pressed together. These are the laminated plastics now so widely used for wall panellings and furniture surfaces in ships, trains, bars, restaurants — and, of course, the modern kitchen. Beauty and virtual indestructibility in one! They are just one more example how the famous Aylesford Kraft made by the Reed Paper Group contributes to the world's well-being.

Mr Bountiful?

WHEN Mr Butler opens his Budget on Tuesday, Parliament will be throbbing with election fever. Either the election date will already have been announced, or most people will be expecting that the announcement is just about to be made. In these circumstances the Chancellor will face three problems: the parliamentary and the electoral as well as the economic. The best advice that can be given to him this week—in his own interests as a party politician, as well as in the wider interests of the country—is that he should ignore the first two problems, and concentrate on coming to grips with the third. He can do so with the greater ease because, thanks to the success of some of his past policies, there are no grim furies looking on.

His parliamentary problem—the awkwardness of the timetable—can be ignored because it is not very serious. The general expectation at the moment is that three weeks in May, part of which would otherwise have been taken up with consideration of the Finance Bill, will now be devoted to an election campaign. One consequence of this is that Mr Butler is unlikely to be able to incorporate all the proposals of a normal Budget into a completed Finance Act before Parliament dissolves. There are several ways in which he might surmount the difficulty: the two most likely are either that he will have to divide his proposals between one pre-election and one post-election Bill, or else that he will rely on the summary budget resolutions that will be passed next week to tide the country over to June—which would then have to be a month in which finance debates crowded most other business off the floor of the new Parliament.

In either event, however, the difficulty set by the timetable is not a hurdle in the way of a controversial or imaginative Finance Bill. It is in the way of a long one. Scope for delay by a Labour Opposition, on either side of the election, will not depend on the subject matter of clauses in the Finance Bill, but on the number and length of them; while, if the argument against a controversial Budget is that a Labour Government might be returned at the election and then have to carry through or discontinue a Finance Bill of which it disapproved, Mr Butler can justly reply that that should be Mr Gaitskell's worry. For these reasons the timetable should allow the Chancellor to introduce any changes in the rates of existing taxes that he wants, although he might find it more difficult to make extensive changes in existing tax law; for example, carefully drafted—and no doubt lengthily debated—legislation to enact the Millard Tucker proposals about taxation of pensions might consume more time than he could conveniently afford. Even in these matters, however, the Chancellor should not be deterred from action if he thinks that action would be economically right.

Much the same considerations apply to the Chancellor's second problem—the electoral search for votes. Mr Butler seems to be in a fortunate position here. Nobody now expects that he will have to take back more in new taxes than he will be able to give away in new reliefs;

and in these circumstances there are probably only two ways in which he could make a serious electoral *gaffe* next week. One would be if he were so extravagant in his reliefs that he could be accused of bribery before the polls ; the other would be if his budget were so immobile that it suggested to the electorate that his economic dynamism—which has been an important feature of renaissance Conservatism in the last few years —had begun to fade. The Labour party is waiting to bill him as either the spendthrift or the Scrooge, either the corrupter or the curmudgeon. He will be wise to try to steer between these opposite roles ; and for this course economic forces provide him with a rather bewildering, though not altogether unsatisfactory, compass.

★

For Mr Butler's economic dilemma is in many ways similar to his electoral one. His signposts are pointing in different directions. Britain is in balance-of-payments deficit, but in ordinary budget surplus. From one point of view the British people are spending more than their current level of production should allow them to afford ; from another they are being allowed to deploy less spending power than the Treasury could afford to let them have. It is very difficult to set a figure to either magnitude for the year ahead. But the balance-of-payments deficit in the second half of 1954 was running at an annual rate of some £25 million ; it is probably now running at double that rate, at least. The ordinary budget surplus in 1954-55 was just over £430 million ; without any change in taxation, it will be smaller—but still sizeable—in 1955-56. If anybody could suggest a budget that would induce an increase in production that was some £50 to £100 million higher than the increase in spending that it stimulated, and yet that gave away some £200 to £300 million in tax reliefs, he would solve both Mr Butler's economic problems for him. He would also become a very popular figure in the Conservative party, and qualify for the international circle of magicians.

The fact that no such budget can be framed means that Mr Butler will presumably search for a compromise. A possible politician's compromise was suggested in *The Economist* two weeks ago. Mr Butler might be tempted to give away anything up to half of his budget surplus for 1955-56, and then to claim loudly that he had not been guilty of election bribery because he had not given away the rest. Economically, this would be defensible on one condition only: namely that the reliefs were designed in a way that would stimulate production as much, and consumption as little, as reliefs of this size (say, up to about £100 million a year) could do. Are there any specific proposals that the outside analyst can suggest which would fit into this formula ?

There are two points that can be made. First, in the field of income tax, this recipe suggests that it might be wiser this year to concentrate on changes in allowances rather than in standard rates of tax ; in any event, the money to make a reduction of 6d. in all three rates of income tax can be only barely—if at all—available. One possible device might be to increase the earned income allowance in order to encourage overtime and harder work ; and then to change the pattern of single and married persons' allowances—so that the spinster or bachelor got little or no advantage from the new relief, the married but childless couple got average advantage, and the married taxpayer with children a special gain. This would certainly accord with social justice ; compared with 1938, as the Royal Commission on Taxation recently pointed out, the married man with two children and an income of around £800 a year has seen his real burden of taxation increased by three times as much as the single man who used to be in the same tax group. It might accord with good electoral tactics ; married taxpayers (with their dependants) are probably twice as numerous on the voting registers as single taxpayers. It ought also to accord with incentives to save and work ; a marginal increase in these incentives will probably have more effect on family men than on tax-paying single men and girls. If Mr Butler has revenue to give away, there therefore seems a strong case for urging him to make some such reform the centrepiece of his budget.

★

The other point that needs to be made is more general. It concerns indirect taxation. For some time now the trend in purchase and entertainment tax has been to grant relief only to those industries that are inefficient or uncompetitive enough to be in difficulties. The most obvious claimant in the queue this year is the Lancashire cotton industry, which has the capacity to increase production if demand is stimulated by a cut in purchase tax ; although there are others—such as the organisers of professional sport who bear rates of entertainment tax that are not paid by their amateur competitors—who are jostling close behind. There are dangers to a competitive economy in this policy of tempering the wind to every shorn lamb, but at least these are lambs that the Exchequer is still fleecing. The time to worry will be if Lancashire starts fleecing the Exchequer through subsidies—or the consumer through further restrictions on competing imports—instead.

With the election ahead there will be a temptation to send a pinnace from the open seas to shrimp for votes in these and other troubled inlets. But it is by his success in keeping his main ship in sober trim and moving forward, rather than by these subsidiary diversions, that Mr Butler's budget will deserve to be judged. And, as the world wants to cast judgment on the last act of his first Chancellorship, it would be unfair not to draw satisfaction from the thought that Mr Butler now has a reputation to maintain rather than to mend. As he comes to the dispatch box next Tuesday, many people will be ruminating that, in more senses than one, it is the swan of this Parliament who is about to sing.

Council of Asia

THE conference of twenty-nine nations that is to open on Monday at Bandoeng in Java promises to prove historic in concept, doubtful in execution, and unsatisfactory to almost all parties in effect. The concept of a high-powered conference of Asian and African governments is undoubtedly an historic one. This will be the first time that strong delegations, including a rich leavening of prime ministers, have come together from countries throughout the Orient. It will be the first great council of Asia—with a scattering, too, of African representation, for its long arm has stretched out far enough to draw in one of Mr Nkrumah's ministers. Indeed, in sheer geographical scope the gathering at Bandoeng makes all the congresses that Europe has held over the centuries look like a neighbourly chat over garden fences. When Asians foregather they must travel thousands of miles, and the lush equatorial island which is their rendezvous must seem exotic and remote to men from the vast, arid continental heartland, whether they come from Tehran or from Peking. True, modern science has shrunk distance so that Colonel Nasser and Mr Nehru can reach Java in much less time than it once took the statesmen of Europe to assemble at Vienna or Utrecht. But the mental distances between peoples have not yet been reduced as drastically ; and here the doubts about the Bandoeng conference begin.

Certain common denominators can indeed be found even in an assemblage which brings together political leaders from Japan and Libya, from Turkey and the Philippines. Most of the states concerned are "new" nations, their sovereignty being of recent, and, in a dozen cases, of postwar date. And even the most ancient sovereign nations of the Orient share their yearning for a more clearly asserted status in world affairs. Memories of European dominance die hard, and in many Asian eyes it is not enough to have equality of status in world institutions such as the United Nations ; Europe, it is pointed out, has its own institutions—the Assembly at Strasbourg, for example—and Asia has every right to follow suit. Nobody in the West would contest this claim. The mere fact of the holding of the Bandoeng conference thus gives great satisfaction to countless people in the East ; and nobody in the West would grudge that.

Nevertheless, a conference in the true sense is not like a flower show. It ought to create, not simply demonstrate. Certainly the Southern Asian powers that sponsored the Bandoeng conference did not have in mind a mere exchange of garlands. They called for a political discussion, and they are to have one. But they never seemed either agreed or clear about the aims of this discussion. Never, perhaps, have the representatives of so many governments assembled with so little idea of what they are going to do. Unlike the Strasbourg delegates, the Asians are meeting neither as joint venturers in an experiment in political and economic unity, nor under the shadow of a near and common peril. Nobody is coming to Bandoeng to preach Asian federal union, or even a coal-steel community ; certainly nobody expects to found a new defence alliance there ; and whereas Europeans have lately been thrown together by Communist pressure, the Asians have billed Communist China as a star performer at their conference. What concrete result, then, is expected by the participants?

The sad fact is plain that most of the delegations are coming with expectations so different from each other as to be virtually contradictory. The Indonesians, who initiated the whole project, are perhaps the most likely to achieve their purpose, which was primarily to gain prestige and to divert attention from their domestic rifts and failures by playing host to a glittering assembly ; and even they may lose their prize, particularly if some new breakdown of internal order should disrupt the conference much as the Pan-American meeting at Bogotá was disrupted in 1948. For the rest, so many different harps are being brought to this party that few can expect general applause. If the Arabs, for example, inveigh against Israel they cannot hope for much enthusiasm among the Far Eastern delegates ; if the Siamese expound their fears of Viet Minh infiltration they are likely to encounter non-committal politeness. Obviously, a conference so lacking in common positive purpose is all too likely to fall back on the negative—to descend to its lowest common denominator and stick there. And when Asians are gathered together, the natural lowest denominator is anti-westernism.

In Asia, anti-westernism is still usually labelled anti-

ASIAN AND AFRICAN STATES REPRESENTED AT BANDOENG

colonialism, in defiance of the hard fact of the dramatic withdrawal of colonial power in the past decade. One of the greatest ironies of our day is that, while the only European power that still rules an empire in Asia is the Soviet Union, Asian "anti-colonialism" has been made into a stick to beat the traditionally anti-colonial United States. It is a simple and appealing slogan, and no less valuable politically for being absurdly outmoded; it is an excellent lightning conductor for any government that fears its own people's anger; and there is even the cheering thought that a carefully modulated beating of anti-western drums may produce a new loosening of western purse strings. It may thus be assumed in advance that the Bandoeng conference will voice strictures, possibly in varying degrees of severity, on continued Dutch presence in New Guinea, French in North Africa, Portuguese in Goa, and British in Malaya.

For the Communists, naturally, nothing could be more convenient. At the curtain-raising Asian "peace" conference which they staged last week in Delhi to Mr Nehru's chagrin, Peking's faithful mouthpiece, Kuo Mo-jo, laid down the formulæ that the Bandoeng meeting will be urged to endorse. One of these is the identification of American support for Formosa with the surviving vestiges of colonial rule on Asia's other fringes. China's real objectives emerged somewhat nakedly from Mr Kuo's speeches in Delhi: he seemed quite uninterested in the African problems which preoccupy many free Asians, and his list of colonial territories for denunciation significantly omitted Hongkong. (Since Hongkong is one of the very few territories in the whole area that is still officially designated a colony, the omission was quite obviously only tactical, and nobody in London ought to be deceived by it.) The Communists at Bandoeng will doubtless show their usual skill in concealing their aims. The Chinese and the Viet Minh cannot hope to carry 27 non-Communist governments along with them in a full statement of their case, and they are far more likely to seek to insert in the final communiqué sentiments that are only obliquely anti-American. If they cannot convert, they can at least hope to divide; and the obvious difference they will seek to exploit is that between the Asian states that have defensive links with the West and those that insist on non-attachment.

*

This difference cuts right across the membership of the Bandoeng conference, separating Turkey, Iraq, Pakistan, Ceylon, Siam, the Philippines and Japan on the one hand from Egypt, Persia, India, Burma, and Indonesia on the other. It makes it possible for the Communists to paint a picture of "pro-western" governments confronting the rest, and thus to pose as the closest friends and sympathisers of the "unattached" Indians, Burmese, Indonesians and Arabs. The atmosphere of an Asian conference is favourable to such manœuvres; not only is general applause assured for speeches recalling the West's past sins, but there must also be a general reluctance to admit that Asia can be divided against itself without interference from outside. Yet the more clear-sighted delegates at Bandoeng will be painfully aware that Asia is in fact divided in precisely this way.

For the real division of Asia today is the same as that of Europe. China, with its vassal states and Soviet Asia, is divided from the rest of Asia just as the Soviet sphere is from the rest of Europe, by its own acts, by barriers it has itself set up. Since 1950 the peoples of free Asia have had no more contact with the Chinese than western Europeans have with people behind the iron curtain. No news comes out of China except what Mao Tse-tung blesses. Asian governments may recognise Peking and seek to win its good will, but their envoys live there as in isolation wards.

*

The first aim of the Communists at Bandoeng must be to disguise this cruel fact, partly by issuing plentiful assurances of good will and peaceful intent and partly by diverting attention from their own activities in the direction of the old empires' retreating backs. How far are they likely to succeed in their aim? Impressively strong delegations are coming from several free Asian countries, and Mr Chou, who was once expected to dominate the Bandoeng proceedings, looks like having to contest the limelight with a number of rival stars. But he enjoys the support of an unrivalled propaganda machine, and, in the background, a military power unrivalled in Asia. Those who confront him will be divided, sometimes bitterly, among themselves. Will they allow the Communist team to play on their divisions and thus make them into involuntary puppets? Or will they look behind the broad smiles of Mr Chou and Mr Dong, noting Peking's admissions this very month that its vaunted drive for industrialisation has bogged down, its revelations only a few weeks ago of continued peasant resistance to collectivisation, the fact that China's revolution, like Russia's, has begun to devour its own children—such as Kao Kang?

It is, indeed, possible that this confrontation with the genial, slick, relentless monster that is Communist diplomacy may disillusion a number of free Asian statesmen about China's claims to represent their continent's "wave of the future." Not a few of them are steeped in liberal ways of thought, and not a few have already had lengthy experience of Communist tactics on their home grounds. If the Chinese put on too much pressure at Bandoeng, they may come away as disappointed as many other delegations will; and some useful lessons in realism will then be taken to heart. But one would be rash to count on any definable gain from the conference that would offset the danger of a welter of inchoate, and in part harmful, rhetoric. This first Council of Asia has an inauspicious setting.

Bringing Germany In

THE theme of talks with the Soviet government now preoccupies the western foreign offices, but they have not yet got beyond the delicate problems of procedure. Before any actual meetings with the Russians, there must be discussions among the western allies about the "how" and "when" of the conference, and about the proposals to be made at it. There is no decision yet about who should participate at this first stage. Should it be the "big three," with Germany included only when Germany is directly concerned, or should it be all the seven members of the Western European Union with the United States and Canada? Public opinion will be grossly unfair if it grows impatient with the officials who have to wrestle with these questions. They are not just fiddling with diplomatic niceties while the clock ticks on. Mistakes at this stage could still jeopardise the whole precarious structure that the Paris agreements represent. But early decisions are needed—and, however their outcome is presented, the basic decision involved concerns the vital issue of Germany's new relationship with the West.

It will be a mistake if the British, French and Americans decide that their preliminary explorations should take place without representatives of Bonn, except when Germany is the direct subject of discussion. It will be a mistake both psychologically and practically. The French, inclined, as so often where Germany is concerned, to be right in diagnosis but wrong in treatment, are anxious for early talks with Moscow largely because they fear that the Germans will themselves start negotiating directly with Mr Molotov if matters are not kept firmly in the hands of the "big three." As far as Dr Adenauer is concerned, the French fears are unjustified. He will not play at bargains with the Russians. If he were ever to deal with them it would be with more healthy mistrust than is found elsewhere, except perhaps in the bosom of Mr Dulles. Dr Adenauer, moreover, is not going to allow himself or his representative to be received in a Moscow in which Herr Ulbricht's "ambassador" is in residence. He claims that the Federal government at Bonn is the only one that legitimately represents Germany. This flat assertion is written into the WEU treaty, and is the ground for Dr Adenauer's demand that any future negotiation with the Russians should be a five-power gathering, with himself in the fifth seat.

*

Clearly, this particular claim is not realistic politics, because Mr Molotov would doubtless stipulate that the East German Democratic Republic should be represented too. It is the prior aim of Soviet policy in Germany to secure recognition of the puppets of Pankow and to make Bonn negotiate with them. Nothing, therefore, would come of any demand for West German representation at the actual conference with the Russians. But the preliminary talks among the western allies themselves are a different matter.

Dr Adenauer is a safe ally. But he is criticised for his one-sided, western orientation by politicians who think there should be something called a "German policy." Men who believe that Germany could secure its reunification by playing off the West against the East are to be found in all the German political parties. Their attitude has nothing to do with sympathy for Communism or for Herr Ulbricht; it is rather due to a suspicion that it is after all only Germans who really want the reunion of their country, and not all Germans at that.

*

The call for direct dealings with Moscow will certainly grow in Germany. Indeed, such dealings already exist in some fields. German trade officials as well as businessmen have been meeting Russian and satellite traders for some time past at Geneva, Warsaw and elsewhere; evangelical church leaders of neutralist persuasion have made the trip to Moscow, and, at their invitation, the Metropolitan Nikolai has just visited Bonn. Contacts have also been made by various *Bundestag* members. The most likely path to German hearts is through the Red Cross, and the Russians have indicated that they will take it. They are holding out the prospect of allowing the head of the German branch to visit Moscow in aid of the Germans who are still in Soviet prisoner camps. It is, indeed, evident that the way the Russians have been dealing with the Japanese and the Austrians—offering trade and the release of prisoners as preliminaries to diplomatic relations—is to be applied to the West Germans, in the hope that though they may have ratified the Paris treaties, they will never implement them.

Dr Adenauer, it must be repeated, is firm in his resistance to Muscovite wiles and threats. But he is faced with a dilemma. He has proclaimed to the Germans not only that a Germany powerless and friendless would never secure its reunion in freedom, but also, more positively, that by joining the western alliance they will have a better chance of securing their goal than before. The first proposition is almost self-evident. The experience of the past few years is available to show that the Russians do not lift a finger to concede anything until they are pressed. Indeed, Mr Molotov probably missed a historic moment when he failed to make a good offer to the Germans last August when the European Defence Community collapsed. He made no such move, and gave the Germans one more reason to think that they would never gain any-

thing from weakness. But the positive side of Dr Adenauer's policy is more difficult to establish. He has now to convince the Germans that they will be actually nearer to reunion when they are allied to the West. And many of them will be hard to convince of the truth of this. Last week Professor Hallstein claimed with justice that the ratification of the Paris agreements meant that three essential aims of the government's foreign policy had been achieved—recovery of sovereignty, security against the Soviet threat, and emergence from isolation. The fourth essential yet to be achieved was national reunion, and, Professor Hallstein said, the Federal Republic could now take the initiative more strongly in that direction. To this, newspapers linked with the Social-Democratic opposition retorted that the government had no plan for reunification on which it could insist as the basis for negotiations with the Russians, that, instead, it found itself "in the antechamber of the great powers," standing with empty hands and in the supplicating posture of a small nation.

Even this is only one horn of the Chancellor's dilemma. The other is that, were he to be proved right, and Germany reunified, the western alliance would automatically be at an end. Reunited Germany would not be bound by the Paris treaties. Whether this Germany were neutral, neutralised or free to re-enter a western alliance, the Paris treaties would be void. Dr Adenauer, if he were still in charge, would have to start his lifework afresh at an age at which no man could expect to be able to do more than conclude a task.

★

In practice, the Chancellor is likely to be caught only on the first horn of the dilemma. Whatever happens, the Germans must be shown that the treaties are leading towards reunion and not away from it. Therefore, Dr Adenauer must demand—and the other western powers, if they see their interest clearly, will support him in this—that the next conference with Moscow should deal with German reunification. In turn, this means that Dr Adenauer must be brought into the preliminary conversations between the western powers, whatever topic is discussed. There is not likely to be any subject which does not involve Germany. It would be illusory to regard the question of disarmament—which plays a large part in British and American thinking—as not concerned directly with Germany. On the contrary, it has a very vital bearing on that country's future. It involves the question whether any proposed disarmament agreement will be based on the continued existence of two Germanys, one to be in the Western European Atlantic grouping and the other in the Soviet counterpart of Nato. The Italian ministers in Washington have proposed that a pact should be offered the Russians which would extend the WEU system of controls to the eastern bloc, and Mr Dulles has indicated approval of the idea. Perhaps the proposal has not been thought out, but the suspicion will at once be aroused in Germany that it is a revival of M. Mendès-France's plan for a pact between the two blocs, which could perpetuate the division of Germany. This may not be so, as ideas are still very confused on the subject. But in any case it involves Germany and should only be discussed with German participation.

Even Austria is of direct concern to the Germans. It may be said in the western Foreign Offices that Austria is a conference topic which concerns only themselves, the Russians and the Austrians and is perhaps the most urgent topic because it is the one which Mr Molotov is most likely to want to talk about as a start. But the Soviet *démarches* to Vienna have shown quite plainly that when Mr Molotov makes proposals about Austria, he is thinking chiefly of Germany. Wherever one turns, indeed, the problem revolves itself into a German one—or, if it does not to the British, French and Americans, it certainly does in German eyes.

★

The French are right in thinking, that, unofficially now and officially later, the Germans will talk direct to the Russians. They are wrong if they think that the way to avoid the danger is to talk now with the Russians but without the Germans. But, it may be objected, if the Germans are brought into the preliminary discussions, the Italians and the other members of the WEU will demand to be there too, and that this would not be in keeping with the special position of the former occupation powers and their present responsibility in the world. But it may be the price which has to be paid to prevent the Germans from one day taking the lone road to Moscow. Sooner or later, the smaller powers are likely to rebel against the Big Three making the political decisions which will determine whether and for what cause their armies may be thrown into battle. There is much to be said for taking steps now to develop a common political strategy for Western Union to match its strategic planning.

No Newspapers for Lent

Last week's article with this title contained the sentence "Out of five negotiators [at the meeting at the Ministry of Labour on March 25th] four of the AEU had Communist affiliations." The interpolation of the words "of the AEU," which made nonsense of the sentence, was due to the misreading by a compositor of a manuscript alteration. But the obscurity of the manuscript, and the failure to correct the mistake in proof, were editorial responsibilities, for which regret is expressed.

Comment on later developments in the newspaper strike will be found in "Notes of the Week" on a later page.

Notes of the Week

Night Watchmen?

ALTHOUGH no announcement had been made by Thursday afternoon, it is still probable that the general election will be held on May 26th. Indeed, it is believed that at one time arrangements had been made for Sir Anthony Eden to broadcast an announcement to this effect this week; the fact that he has not yet done so has given rise to reports that the newspaper strike or some other circumstance may have caused him to dither. But unless the dithering is more than tactical, his modest Government reshuffle last week-end is important chiefly as an earnest of what he may do if he is returned to Downing Street in six weeks' time.

Looked at in this light, the changes make an unexpectedly favourable impression. Most people thought Sir Anthony would err on the side of caution. Instead he has produced the most experimental and imaginative list of appointments seen for some time. If an election is so close, of course, Sir Anthony is unusually well placed to take risks; but at least one of his selections—that of the youthful Sir Edward Boyle as Economic Secretary to the Treasury—could be quite sharply tested in the next few weeks if Labour decides to fight the telescoping of financial business.

★

Sir Anthony should particularly please his party by his promotions from the back benches. The disappointed are never really happy about the men promoted over them, but during the past three years the Tory backbenchers have had some genuine grievances about the men selected for office. Now Sir Anthony has thrown out his net and raked in a few men, chiefly from the business element, who have built themselves lively reputations; the four entirely new faces in junior ministerial posts are Mr Browne, Mr Harmer Nicholls, Mr Kaberry, and Mr Erroll. There may be failures even in this short list, but Sir Anthony has given notice to his party that back bench enterprise, even if sometimes critical of the front bench, will be rewarded. Nor can there be many complaints of his promotions along the front bench. Mr Selwyn Lloyd (the new Minister of Defence) and Mr. Maudling (his successor at the Ministry of Supply) were almost automatic choices for advancement, even although the former's succession to a post that Sir Anthony originally intended to fill himself seems to have been a last minute—and wise—change of plan. Among the other appointments, Dr Hill should fit in well at the Post Office, and may even make future exchanges about commercial television amusing; while, whatever doubts may be harboured overseas and in one of the muted empires of Fleet Street, Lord Home should bring to the Commonwealth Relations Office a contemporary and vigorous approach.

The Foreign Secretary

THE crucial new appointment, however, is necessarily that at the Foreign Office. When Mr Macmillan was Minister in North Africa during the war he showed initiative and a flair for diplomacy among both primas donnas and rough customers; he won the warm personal friendship of General Eisenhower at that time, and later became an ardent supporter of European unity. When he went to the Housing Ministry in 1951 he showed debating skill, administrative ability, a fair degree of vision and a shrewd sense of public relations in the widest sense. Had he moved straight from there to the Foreign Office, there would have been few doubts at his accession.

Unfortunately, however, his interregnum at the Defence Ministry proved rather disappointing. In part, this was due to the difficulty of succeeding a non-political incumbent in that office while still being expected to turn his enviable talents of knock-about against the Opposition in non-defence debates; it is therefore perhaps not surprising that he unnecessarily riled the Labour party by sometimes seeming to carry the idiom of a largely political housing drive into the problems of peace and war. He also gave the impression that his undoubted capacity for imaginative running of his own show melted away when an august superior was breathing down his neck. It so happens that these two qualities—for achieving bipartisanship in the House of Commons and for maintaining his own impress upon a department that is of particular interest to his leader—will be even more obviously needed at the Foreign Office. To display them may be his most difficult task. Provided he can do so, he has all the other natural ingredients that suggest that he is the best available choice for this job. At the age of 61, eight years older than Mr Butler, Mr Macmillan now presumably stands at the summit of his career; nine-tenths of his previous record suggest that he will stand there with lustre.

Little in Limbo

IF there is a swift dissolution of Parliament, it will not find much legislation left in the pipe-line. From now on the Commons will be fully occupied with getting through essential financial business, but of the 30 Government Bills which have come before it this session, 21 have been passed on to the Lords and all should reach the Statute Book even if Parliament dissolves early in May. Most of the Bills left with the Commons, together with two just introduced in the Lords, would have to be axed, but the time already spent on them need not be lost. In the new Parliament

the unfinished Bills could be re-introduced and the stages already passed taken again more or less formally.

The most important measure outstanding is the Road Traffic Bill ; it has passed through the Lords and has had a second reading in the Commons. The County Courts Bill has been through the Lords, but has only just reached the Commons ; a companion piece, the Criminal Justice Administration Bill, has only just been introduced in the Lords. The Rating and Valuation Bill has only reached its committee stage in the Commons ; and the other, lesser measures have not even got that far. All these Bills, then, seem unlikely to go further this Parliament. The one that might be completed is the Oil in Navigable Waters Bill, which has passed through the Lords and has finished its committee stage in the Commons. Under normal circumstances, and without obstruction, another hour or two would suffice to polish it off.

But this raises the question of Labour's attitude towards an early election. In 1929, when the then Tory Government called a similar summer election, the then Labour Opposition gleefully co-operated. This is the reaction one would expect from any Opposition. On the eve of the recess, however, the present Opposition leaders seemed to have made up their minds to fight any truncating of financial business by the Government. If Labour sticks to this attitude, the Tories will presumably be delighted. By using the closure and other Parliamentary devices the Government will still be able to wind up the session in time, and the Opposition will be branded as having fought to avoid an early election. This is the last impression Labour can afford to create. In the past two months alone, Labour has censured the Government's policy on foreign affairs, defence, monopolies, transport and cotton. In theory, therefore, it should be anxious to save the country from all these bad policies. Only last week, when congratulating the new Prime Minister, Mr Attlee said, "We on this side cannot, of course, wish him a long tenure of office. Indeed, it is our duty, as soon as opportunity offers, to try to give him a period of rest." If opportunity is now to be offered, Mr Attlee will look pretty foolish if he and his party do not at least make a pretence of welcoming it.

Verdict on a Strike

THE report of the court of inquiry into the newspaper dispute was restrained but firm—unexpectedly so. Its analysis of the causes of the strike confirms the general impression that it is unreasonable. The court has not sought to find a compromise solution to end a stoppage that is now greatly inconveniencing the public, doing no good to the country and promising to inflict heavy losses on newspaper proprietors and employees alike. The demand by the Electrical Trades Union and the Amalgamated Engineering Union for an increase of 58s. 6d. a week was, on the evidence, found to be "unrealistic"; nor did the court suggest that any advance on the employers' present offer is called for, though this is perhaps qualified by the recommendation that new negotiating machinery should be set up to negotiate jointly for the whole industry. It may be that, if such a body can be set up (and the suggestion is not likely to be very acceptable to the printing unions), the employers' willingness to meet it for negotiations can be made to hold out a prospect of further increases later on. But until this central negotiating body is set up by all the fourteen unions involved (i.e. both the printing unions and the ETU and AEU) the court flatly concludes that the engineers and electricians should go back "without prejudice on the basis of the employers' present offer."

This offer is, of course, in line with that made to the printing unions, and accepted by four of them (some retrospective wage payments have already been made). The court turned down the engineers' and electricians' claim that their degree of skill entitled them to special treatment, and it did not comment on the employers' offer of merit bonuses for jobs of special skill. The court considered that the inclusion of the engineers and electricians in the traditional arrangements made for negotiating wage increases on the basis of existing differentials has been to their interest in the past and would be best for them in future. Nor did it uphold the ETU's argument that it had seriously suggested any alternative to the traditional procedure. It sympathised with the feelings of members of the ETU and AEU that there had been "no proper negotiation" with their unions on this occasion, but held the "precipitate action" of their leaders in calling the strike to be quite unjustified. It has, in fact, told the strikers that their leaders are utterly in the wrong.

It will not be easy for the union leaders to accept the umpire's whistle and the ruling that they are offside. Only the court's recommendation for a new negotiating body offers the strike leaders any means of saving their faces. Discussions between the employers and all the unions on the court's verdict began on Thursday, and as everyone (except the Communists) is now sick of the affair, and unemployment is threatening, perhaps a formula for a return can be worked out. But, unless they feel that their ranks may split, the leaders of the ETU are unlikely to welcome it.

Austrians in Moscow

THE Chancellor of little Austria is being accorded the Muscovite welcome for Great Khans. Met at Moscow airport by a distinguished gathering, Herr Raab was later entertained to one of the famous Russian banquets. When the moment for negotiations arrived, Mr Molotov evidently hoped that the Austrians would be in the right mood to play the role for which he has cast them. The Soviet intention is obviously to make Austria serve as an example for Germany, and to link a four-power conference on the long delayed Austrian treaty with decisions which would affect the future of the big German prize. In fact, Soviet tactics but not the Soviet aim have changed. At the Berlin conference in 1954, Mr Molotov made the Austrian treaty dependent on a German settlement ; now he has attacked at the other end of the line, where the breach may be made more easily.

The three western occupation powers must watch Mr Molotov negotiating with the Austrians while they wait outside the door, fretting as Mr Molotov presumably did when Herr Raab was in Washington last year. Their somewhat undignified position was reflected in the declaration which they handed to Herr Raab to take with him to Moscow. It is an effort to strengthen the Austrians' hand by recalling the western standpoint and authority. The western declaration delicately stresses two points. One is that Herr Raab and Mr Molotov have only been "clarifying" the Soviet intentions, not negotiating a treaty, and the other is Austrian independence. The western powers cannot admit that the Austrians are negotiating bilaterally with the Russians, and they have formally declared that if the Soviet government offers proposals which hold out the promise of Austrian independence, these should be discussed between the four ambassadors in Vienna with the participation of the Austrian government. They are thus reverting to the proposal made in their Notes to Moscow on November 29th, which have never been answered.

The insistence on Austrian independence in the western declaration veils the crucial question whether Austria is to be neutral or neutralised. The Austrians are already prepared to declare that they will not allow foreign powers to have bases on their territory, that they will keep out of military alliances, and refrain from a new *Anschluss* with Germany ; but it seems that Mr Molotov wants more than this. He demands, it seems, guarantees from the other powers, to be written into the treaty, which would remove Austria's independence. The western governments will have to accept a neutral Austria, although the Americans have poured money into the country and it is solidly pro-western in sympathy. This would mean that Nato's lines of communication from Italy to Germany would have to be abandoned. But they cannot allow Austria to be used by the Soviet government as an instrument for securing the neutralisation of Germany. It would place the western powers in a very awkward position if the Austrians' urge to be freed from occupation should lead Herr Raab and his Socialist vice-chancellor to give way to Mr Molotov in Moscow.

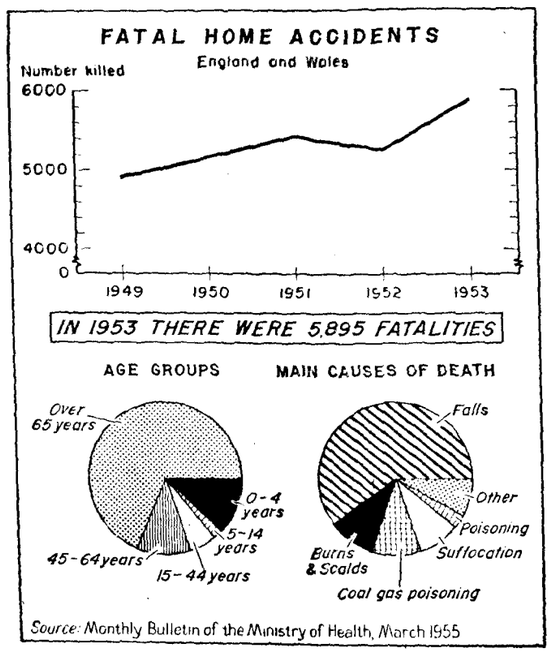
Finland Asked into the Parlour

ONCE again Mr Molotov is trying to draw Finland into the "security" arrangements of the eastern European bloc. An invitation has been sent to the Finnish Minister of Defence, Mr Smil Skog, to attend a conference in Moscow, and it seems likely that the Finnish cabinet will give him permission to accept. If Mr Skog goes to Moscow the Russians will have achieved something that they have already tried, and failed, to do twice in the past six months. Last November, when the Finns were asked to Mr Molotov's all-European conference, they sent a skilfully worded reply which appeared to encourage the Russian plan, but in fact let the Finns back out of the conference when it became clear that there would be no other guests from west of the iron curtain. Shortly afterwards, during Mr Mikoyan's visit to Finland, the Russians unsuccessfully suggested setting up a joint military study group. But life is bleak on Russia's north-western doorstep, and the Finns were unlikely to be left in peace for long.

The Russians would like to strengthen the defences of Leningrad, the most exposed of their great cities. In particular, Finland lies athwart the line of approach of American bombers based on Thule in Greenland, and among the questions the Finns may eventually have to face are requests for radar posts along their north-western coast and, possibly, air bases on Finnish territory. Presumably the Russians will claim under Article Two of the 1948 Russo-Finnish mutual aid pact that joint consultations are necessary because they are threatened by aggression across Finland. The Finns will need all their skill to keep out of this entanglement. Over the years they have learned how to direct warm smiles and friendly gestures in Moscow's direction while granting the minimum of real concessions ; but the latest Russian approach comes at a difficult time, as the Finnish coalition is shaken by labour troubles and Russia's economic grip on the country grows tighter. Once Mr Skog gets inside the Kremlin's parlour he may find it difficult to get away without yielding something.

The Shah to the Fore

THE resignation of General Zahedi, Prime Minister of Iran since the fall of Dr Mossadegh in 1953, is more likely to lead to change in home affairs than in foreign policy. His successor, who is the Shah's Minister of Court, Mr Hossein Ala, is retaining the principal ministers from the old cabinet—Mr Abdollah Entezam at the Foreign Office, Dr Ali Amini at the Ministry of Finance and Marshal Hedayat at the War Ministry; he seems likely, therefore, to uphold the policy that prompted his predecessor to reach the oil agreement and the recent financial and frontier agreement with the Soviet Union. Rumours that the Iranians may join the Turco-Pakistani pact are unlikely to be fulfilled by a country that shares an undefended thousand-mile frontier with the Soviet Union.



Within Iran, by contrast, a change of pace and direction may set in. Theoretically, development, as well as all the oil revenue, is in the hands of a planning organisation at the centre of which sits a human dynamo, Mr Abol Hasan Ebtehaj (he is the one-time director and to a large extent the father of the efficiency of the National Bank of Iran). In practice, of course, the planning body must see eye to eye with the cabinet, since its job is to start operations which ministries will in the course of time take over. Under the Zahedi regime a clash of personalities precluded the necessary harmony, with the result that each of two men was in a position to baulk the other, and stalemate followed. It was clear that one of them must go, and the Shah, fresh from his holiday in America, seems to have had no hesitation in deciding which ; he has preferred to retain Mr Ebtehaj, who, though not always an easy colleague, has ideas which are constructive and possesses the experience that tells him which of them are practicable. General Zahedi's health, which is bad, provided a pretext for his dismissal, and he has left in a shower of compliments for a clinic in Germany. He is replaced as Prime Minister by the Shah's most trusty servant, and as Minister of the Interior by Asadollah Alam, a young aristocrat who is the Shah's friend and contemporary and shares his zeal for improving the peasant's lot. If the Shah were to furnish unflinching support such appointments could lead to the war on corruption and the expenditure on economic development which have been lustily preached, but scantily practised, for more than a decade.

A Success Against Polio

On Tuesday, the tenth anniversary of Franklin Roosevelt's death, American doctors and scientists were told that tests of a new vaccine against poliomyelitis had proved its effectiveness. The vaccine, developed by Dr Jonas Salk of the University of Pittsburgh, was given last year to 440,000 American children in 44 states, with comparisons provided by children given a "dummy" vaccine and by children not vaccinated at all. The results are complicated because poliomyelitis can run such a widely differing course, with such dramatically different effects, in different people, and because it is caused by three different types of virus. But since the public's dread of polio arises not from the infection itself but from the paralytic symptoms it may cause, the importance of the American tests lies in the proved effectiveness of the vaccine against paralytic poliomyelitis.

In America, in fact, the Salk vaccine is considered successful enough for a nationwide inoculation of school children to start this spring. In Britain, where epidemics of poliomyelitis are less frequent, less severe and less widespread, at least two drug firms are developing vaccines by the same technique as has been used by Dr Salk. Small field trials of the American and British vaccines are shortly to take place in Britain, but there is not yet enough for a general inoculation of children. British medical authorities take, as usual, a somewhat cautious view of the American tests; indeed, Dr Salk himself will be the first to admit that, for all the parental gratitude he has justifiably earned by his vaccine, it represents a big step forward in the prevention of polio, not journey's end. How long its protection lasts is still not known, but periodic boosting doses will probably be necessary. Further research, it seems, will concentrate on prolonging the protection conferred, possibly by the development of a vaccine derived from a safe "live" virus rather than a "killed" virus like the Salk vaccine.

Another point which the public health authorities must be asking themselves is where all this immunisation is leading us to. With actual or potential immunisation available against smallpox, diphtheria, whooping cough, tuberculosis and poliomyelitis (not to mention the enteric fevers and tetanus), some of them needing more than one injection and periodic boosting doses, future children are going to live at the point of a needle. Can more than one immunisation campaign be kept going at the same time? There is a danger that with poliomyelitis, as with diphtheria, a successful initial campaign that eliminates a disease gives people a false sense of security. Then a generation of children will grow up immunised neither artificially nor naturally by a mild infection—and therefore highly susceptible on the sudden appearance of an epidemic. But this is rather a distant danger to set against this week's access of great hope.

New Deal for Modern Schools

In a speech to the conference of the National Union of Teachers on Wednesday the Minister of Education made the Government's first statement of its policy for secondary education. The slogan is "selection for everybody," and the keystone an improvement of the secondary modern schools so that they, no less than the grammar schools, may offer "a general education plus something special." The something special is to be a variety of advanced courses —many of them technical and vocational—such as the best modern schools already offer. Parents will then, in the towns at least, be able to choose the school that seems most suitable—subject to the advice of the teachers and, it must still be admitted, to the results of the examination at 11 plus. Sir David's hope is that the examination will be shorn of most of its terrors if "failure" means, not an educational dead-end and a working-class job, but a schooling that leads to various kinds of further education and offers good career prospects of a technical kind.

The Minister's statement bears the hallmark of a preview of part of the Conservatives' election manifesto. It is not, however, a policy that will please everyone. First, it will displease the advocates of comprehensive schools. Sir David thinks such schools are suitable only in certain conditions, and then only as an experiment: for example, in rural areas where the grammar school is small, or where a large comprehensive school could be built without closing down any existing school. Secondly, his policy will displease the enthusiasts for secondary technical schools, for he thinks that it is better, as a rule, to distribute the new technical courses among modern and grammar schools than to build new technical schools. Thirdly, he will grieve those who deplore vocational training at school and those who say that "technical education is the way to materialism and perdition." Yet, as Sir David pointed out, the incentive to liberal, academic learning is invariably the career to which it opens the door; and in any case it is no part of his policy that technical courses should squeeze out general education. Fourthly, he will offend those who want to see a much bigger output of university graduates (as in the United States) and, therefore, a higher proportion of grammar school places. Sir David's view is that "our traditions and our assets are not capable of so swift and expensive a transformation."

It remains to be seen whether those who are offended will include many marginal voters. One suspects that they will not. For what it is worth, some analysts of the recent local election results claim to have found a bigger swing against Labour in those councils where the struggle against comprehensive schools was a focal point of interest.

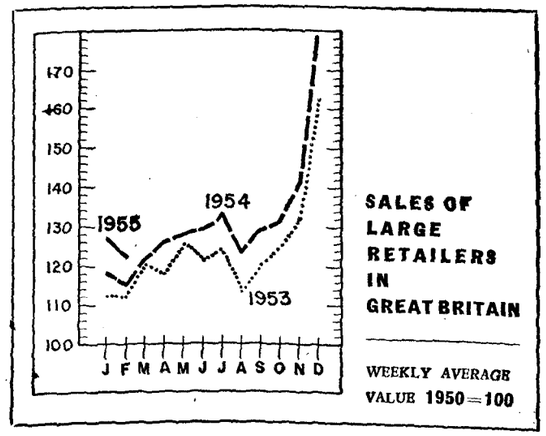
Signor Nenni's New Bid

Signor Scelba, the Italian Prime Minister, has returned from his visit to Washington to find the political tide lapping at the feet of his new government. With only a fortnight to go before the election of a new President of the Republic, to be followed by the government's formal resignation, the present coalition is being eroded from both within and without. Inside, the disagreements between its four parties, which were already apparent over the question of land reform before Signor Scelba left, have deepened and widened. Outside—and this has also heightened the internal crisis—the most important political development in Italy for several months has been the bid by Signor Nenni's left-wing, pro-Communist Socialists to open discussions for an alliance with the big government party, the Christian Democrats (this is further discussed in an article on page 210).

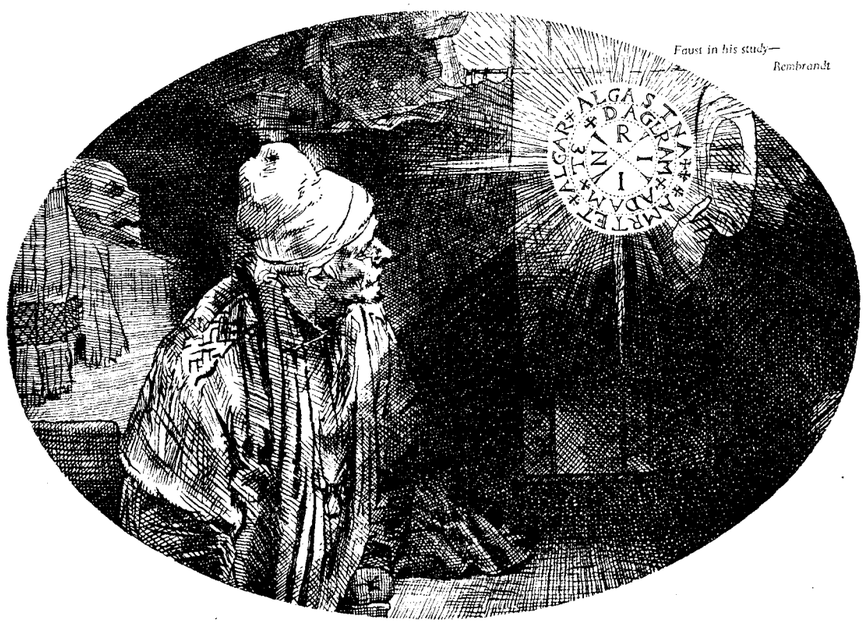
This revolutionary move is a shrewd Communist tactic. It comes at a moment when Communist fortunes in Italy itself have been ebbing; for the first time, loss of votes in shop-steward elections in Lombardy and Piedmont, notably at the Fiat works, provides firm evidence of the slackening of the Communist grip in this key industrial area. The move also takes place against the current Moscow background of a worldwide party line pinned to the ideas of the national front, co-operation between all working class parties, exploitation of intellectual sympathisers, and the refurbishing of the wartime "resistance" appeal. The Cominform journal has just delivered a blistering attack on those Communist party members who have what it calls

> a negative attitude towards the tactic of a united popular front, an underestimation of work in trade union, co-operative, peasant, women's and youth organisations . . . and a supercilious, distrustful attitude to Social Democratic and Catholic working people.

Communist parties, it adds, "must be able to combine illegal forms of activity with legal forms."



As an instrument of the Communists, Signor Nenni has no intention of simply joining the present predominantly Christian Democrat government. But, by coupling his move with better sounding and more modest conditions, his aim will be to try to see that a government is formed after the presidential election that will weaken Italy's ties with Nato and Western European Union. So far, Signor Fanfani, the Christian Democrat secretary, has rejected the Nenni approach. But the bid has already sent right-wing Socialist morale reeling and the coalition must strike back boldly or go under. Although the decline of Communist industrial strength is a good omen, the forthcoming Sicilian local elections will provide more of a directly political test.



Saar Spanner in the Works

The French, remaining true to their conception of the Saar as tangible reparations and their one really effective means of reducing German heavy industrial power, are clinging to its largest steel works, the Völklingen plant, which produces 850,000 tons of steel a year, or about a third of the Saar output. During the ratification debate in the French Senate M. Pinay promised that the former German owners, the Röchling family, would never be allowed to return to Völklingen, and that, if negotiations with the Röchlings failed, France would impose a solution of the steel works' ownership.

Last week, M. Pinay went further. He announced that the instruments of ratification would not be deposited until the matter was settled and the Franco-Saarland economic pact finally interpreted and agreed. Little difficulty is expected over the pact with Herr Hoffmann, the Saar Premier, which is already initialled, but the Völklingen settlement is a thorny affair. The French have based their claims on an argument that recalls the worst days of dismantlement and the strange decisions taken by the Inter-Allied Reparations Agency at the time. Like the Russians in the Soviet Zone, the French say that they could have removed the machinery at Völklingen as reparations, but instead left the plant intact and sequestrated it for France. Sequestration is to end when the Saar Statute is in force, and the questions arises—who will now own Völklingen? The Germans say that the property should of course revert to the Röchlings, because that is their interpretation of the phrase "will be liquidated" in the Statute, which referred to sequestrations. But the French have a totally different idea of the meaning of the words. They say they now own 60 or 70 per cent of the Röchling works because that is the value of the plant they could theoretically remove. "Liquidation" of sequestration means that they must now acquire the ground and buildings which belong to the Röchlings. The elder Röchling, they allege, is a war criminal who supported the return of the Saar to the Hitlerite Reich.

Negotiations for purchase of the Röchling shares by a French syndicate were in progress some months ago, but fell through. Now they are proceeding again. The French and German industrialists concerned have been keeping

Faust in his study—
Rembrandt

Man loves to wonder, and that is the seed of his science—

RALPH WALDO EMERSON (1803—1882)

Ever since he watched his first-meteor trail, man has been wondering—about what makes the sky stay up, or why a kettle-lid jumps. From his first uncertain, casual thoughts whole branches of science have been born, and great industries have sprung. His ideas have become facts, and his facts have guided nations.

In the research departments of modern industry today, scientists are experimenting and speculating. Molecular structure, the behaviour of light, the mysteries of temperature—their study of these problems helps to sow the seeds for new sciences tomorrow, and to build finer products today. In the great world of man's economic creation, his power to wonder is the secret of his power to advance.

Esso

Esso Petroleum Company, Limited

In the Sudan, the South was Christian and weak, the North Moslem and strong; the problem was to prevent the North exploiting the South—indeed to divert enough resources to Southern development of any kind. In Nigeria it is the North which feels in need of care and protection; the two Southern—and mainly Christian—regions have hitherto provided the leadership, both political and administrative. Sir James—who speaks Arabic—will feel at home in the Northern emirates, whose problems and poverty may recall to his mind the Sudan thirty years back; but it is absolutely vital to his mission to understand the South and to interpret it to the suspicious Northerners. Luckily, the Federal Council of Ministers has made a good start. Moreover the problems of transfer of power will not be new to Sir James, and in Nigeria he will not be plagued with considerations of external policy as he was—or perhaps should have been—in the Sudan. In the Sudan he obtained the love and trust of great numbers of the people, as well as of the aspiring intelligentsia and political cadre. His greatest contribution in Nigeria may be to animate the same degree of trust and confidence—for this, in such different circumstances, should ensure the retention of Britain's largest colonial territory in the Commonwealth.

Overflow in the Midi

THE southern wine-growers barricading roads and their *maires* tendering resignations in protest against falling wine prices have provided a fresh reminder that the French wine industry is undergoing a serious crisis. Too much cheap red wine is flowing in the country, and in spite of substantial state purchases for distilling it has proved impossible to maintain the level of prices. The south is the chief sufferer because vineyards are here the main culture, but their share in total French wine supplies has declined from about one half before the war to less than one third. Imports from Algeria and the expansion of output in regions lying near to urban centres have tended to squeeze the southern producer out. As soon as production had recovered its prewar level it was clear that the state would have to tackle the problem of surpluses.

It is not a new problem, though the Algerian surplus of about 18 million hectolitres has rendered it more acute. Before the war the government already had to transform wine into industrial alcohol at a substantial loss. Indeed, an economist returning from Indo-China once calculated that if a southern wine-grower became a coolie and transported people in a rickshaw the operation would be economically more profitable than his cultivation of wine to be transformed into motor fuel. The issue, however, cannot be viewed in purely economic terms. It affects the lives of thousands of French peasants.

Overproduction cannot be offset by shipments abroad, for the *vin ordinaire* is not suitable for export; nor can it be solved by cutting down prices to increase consumption, as this would only encourage the alcoholism that is already a scourge in France. The only solution lies in the reduction of the cultivated area partly through its transfer, wherever possible, to other crops, partly through the elimination of vines of poorer quality. On paper this forms part of the government's plans of "reconversion," but lack of effective propaganda in the countryside and state purchases of surpluses have prevented any big rush of volunteers. The government, in fact, looks like falling between the two stools of planning and free enterprise.

Yemen Tables Turned

THERE are few countries left in which justice, vengeance or clemency are exercised in the twinkling of an eye and the culprit's head rolls from his body as he leaves the audience chamber, but this year, as during its revolution in 1948, the Yemen has proved to be one of them.

Last week its ruler, the Imam Ahmed, announced to foreign powers that he had abdicated for reasons of health that impelled him to "remain indoors." Apparently he was besieged in Taiz, the southern town where he has always made his headquarters; throughout his reign, which has lasted since his father was murdered in 1948, he has never set foot in Sana, his capital. According to the instrument of abdication his successor was his brother Abdullah, who was also his foreign minister, and therefore a figure well known at international conferences. But hard on this announcement came the news that his son, Prince al-Badr Mohamed, had rallied loyal tribesmen and that he in person, incensed at a proposal to search the ladies of his harem, had seized a weapon and turned on his besiegers, who changed sides at sight of his valour. He has now named this loyal son as his successor, and his brother, when last seen, was being carried forth by four strapping slaves.

For years the Yemen has been a scene of struggle between a ruling family that monopolises all government offices and most business opportunities, and an anti-feudal group whose members, for lack of openings at home, live and operate abroad. They helped to finance the last revolution, which failed in that its leader was executed and the only change it produced was to enthrone a ruler slightly less averse to foreigners than his predecessor. The pretender, Abdullah, was one of the advocates of opening a window on to the world; it remains to be seen whether the new ruler's interests lie in the old direction or a new one.

Within the Arab League the Yemen belongs to the anti-Iraqi clique formed by Egypt and Saudi Arabia, and officials from these two countries quickly bustled south to ensure that its new regime would stick to the party line.

New Watchdogs for Russian Farms

MR KHRUSHCHEV, Secretary General of the Soviet Communist party, has now announced yet another move in his drive to increase Soviet agricultural production. Speaking in Voronezh in southern Russia—a name well-known in the war—he disclosed a joint decision by the government and party to change the chairmen of the 93,000 collective farms or *kolkhozy*. The new chairmen are to be recruited among party cadres and agricultural experts, having often been, up to now, merely outstanding local men. The aim of this change is evidently to strengthen

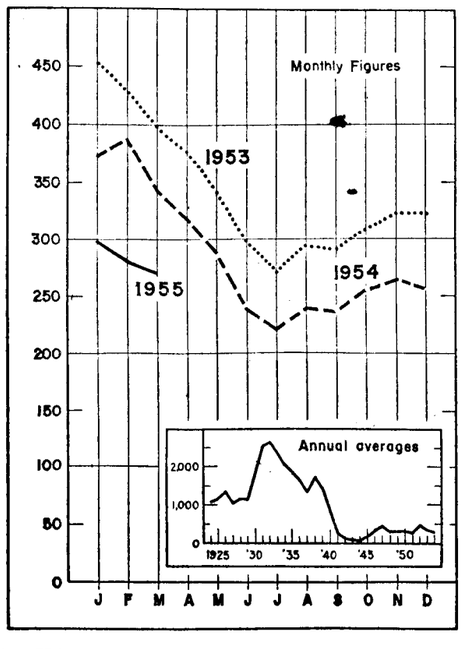
control over the farming community. Experts and "outsiders" can be relied on to resist, with greater determination, the traditional local pressure to cut down supplies to the state in favour of sales on the more profitable "free" market.

Once again, Mr Khrushchev thus proceeds with a dual policy of relaxation and closer control. He undoes screws in one place and tightens them in another, as has happened ever since Stalin died. Originally, the new policy of incentives—of lower taxes, smaller compulsory deliveries and higher prices—was coupled with the strengthening of state outposts in the countryside, the so-called MTS or Machine and Tractor Stations. More recently, a certain amount of decentralisation in agricultural planning has been accompanied by a transfer to these state-owned MTS of the control over supplies. Now, as if to complete the tightening process, more efficient and trusted men are to be placed at the head of the collective farms themselves.

There is always the risk, however, of losing on the swings what may be gained on the roundabout. Men trusted by the state will tend to be mistrusted by the farmers, and the latter's passive resistance may outweigh the expected advantages of the new system. This has always been the leaders' dilemma and Soviet policy has usually oscillated between the two extremes. If Mr Khrushchev has now decided in favour of closer control, it is largely due to the planners' disappointment with food supplies; at the recent parliamentary session of the Russian Republic, for instance, it was revealed that in 1954 both meat and dairy produce had fallen far short of expectations. Mr Khrushchev may rely on other concessions to please the peasant. But he will need watchful and expert supervisors to run the farms and to go on seeing that the state gets its planned share of agricultural output.

More of a Good Thing?

THE Ministry of Housing is considering increasing the intended size of some of the new towns. The arguments for this course are beguilingly simple. Industrially the new towns are booming and socially they are popular. Bigger new towns would make an increased contribution to the desperate housing problems of the London local authorities, and probably do so at lower cost than any other approach. Some of the new town corporations, whose staffs are growing restless, are favourably inclined to the idea. After all, they can argue, why not have some more of an admittedly good thing?



It would be fussy and wrong to stick blindly to original plans. But the populations of several new towns in the London region have already been revised upwards (Basildon and Harlow, for instance, are to have 80,000 each). It is plain that, whatever the planners intend, some new towns will in any event grow gradually beyond their stipulated limits—particularly when their present enormous broods of children grow up and marry. The new towns are already undesirably close to the capital and to each other. A further artificial fillip to their growth would run grave risks of converting them, eventually, into distant suburbs and fostering a continuous sprawl in the vulnerable London area.

For these reasons—and despite the political difficulties—it would be wiser to create some additional new towns rather than spoil the existing ones. London, Birmingham and Manchester are all compelled to house large numbers outside their boundaries, and in each case the development of a compact new town would be preferable to the endless sprawl which successive Housing Ministers have struggled to restrain. But the big cities ought to be given a share in the management of any further new towns and also made to pay part of the cost. Across the border the Secretary of State for Scotland is still struggling to get Glasgow to accept this view, but Mr Sandys will find London and Manchester amenable—if he will give them the opportunity. It is worth noting that, despite the Conservatives' housebuilding successes, the number of people who have stagnated for a long time on housing waiting lists are still a Labour election issue in some areas. Almost all of them are areas where there is simply no room to put new houses up.

Irish Bank Settlement

OUR correspondent in Dublin writes: The dispute between the Irish banks and their officials, which began with the officials' "go-slow" movement at the end of November, has been settled at last. The settlement came only at the fourth attempt; and it will not have escaped notice that the banking system managed to carry on for nearly four months in spite of restricted hours. This must serve to strengthen the popular impression that Ireland has too many banks and too many branch offices.

UNEMPLOYMENT IN GREAT BRITAIN THOUSANDS

In general, however, the officials probably feel that the struggle has been very worth while. The new agreement has three main features. The bonus has been consolidated with the basic salary, which means a substantial increase in pension rights; there has been a general increase in salaries; and provision has been made for arbitration in future disputes. It is agreed that salaries will not be subject to review until the consumer price index, which stood at 126 in November last (mid-August, 1947 = 100), rises above 138 or falls below 112. The new salaries appear to represent an increase of something between 8 and 10 per cent on the existing scale. A clerk without any promotion will now receive nearly £1,000 a year in his twenty-second year of service. To many in trade unions or professional groups this will seem to be an enviable salary in Irish conditions. The settlement applies only to officials in the Republic, but it will certainly become a matter for immediate discussions in Northern Ireland. No doubt it, and the methods used to achieve it, will also be studied with interest further afield.

SHORTER NOTES

The weighty machinery of the International Court at The Hague last week finally cracked the legal nut that had been placed in its jaws many months ago by Guatemala and Liechtenstein. Connoisseurs of the bizarre have watched this rather Lilliputian tussle with natural fascination. It concerned the complaint made by a Mr Nottebohm that his estates in Guatemala had been seized when that republic declared war on Germany, although he had acquired Liechtenstein nationality in 1939. The Court's judgment expressed doubt whether this was anything more than a device to secure neutral status in wartime, and dismissed his claim for $3 million in compensation. It seems unlikely that Guatemala, encouraged by direct experience of the Court's ability to mete out justice, will now take up Britain's long-standing offer to test the Central American republic's claim to British Honduras at The Hague. But British officials who have patiently rebutted Guatemala's demands over the years may take comfort in the reflection that there are little fleas to bite even the smallest of states.

★

The Union of Shop, Distributive and Allied Workers, at its annual conference at Blackpool this week, was less rebellious towards "right wing" Labour party policy than might have been expected. Last year the conference was almost unanimously against German rearmament, and it seemed likely that this year it might oppose the manufacture of the hydrogen bomb in Britain. But a motion declaring that the policy of manufacturing the bomb was out of keeping with the spirit and traditions of the Labour party was lost by 110,000 votes to 56,000—though more than 100,000 abstained. The union, of course, tends to be ardently Bevanite, and Mr Bevan is not against the manufacture of the bomb either. Even its support for Mr Bevan, however, was not pushed to the furthest extreme. A motion that the whip should be restored to him was carried, but one which deplored that it was ever taken away was defeated

The Clerical and Administrative Workers' Union, on the other hand, which has been in conference at Bridlington, passed a resolution regretting that its own executive had issued a statement in March supporting the withdrawal of the whip from Mr Bevan; and it refused to pass one which deplored the flouting of majority decisions by "certain Labour members."

★

The last phase of the shooting war against Mau Mau has been reached, according to General Sir George Erskine, the retiring Commander-in-Chief, East Africa. He stated that the situation before the outbreak of terrorism in 1952 should be restored in Kenya during 1955, with the additional security provided by closer administration and policing. He declined, however, to forecast an end to the official "state of emergency"; and admitted that dealing with the remnants of the hard core terrorists, now on the run, might be difficult. If the emergency could be ended, of course, this would unfreeze the political situation and make new elections possible.

A Negotiated Peace?

It is not to be denied that, in our attempt to reduce Russia to submission, we have encountered more serious obstacles and a more obstinate resistance than we anticipated. . . . She has poured reinforcements to the seat of conflict far faster than we have done; and she has strengthened her fortifications twice as fast as we have damaged them. It must be admitted that we have failed before Sebastopol—*hitherto*—as signally as she failed before Silistria. What we *may* do, cannot be foreseen: but up to the present moment her progress has been greater than our own. We are not of those who regard the expedition to the Crimea as a mistake. We urged it early in the day. We rejoiced when it was decided upon. But we never expected or intended a long siege. If we had not believed that a *coup-de-main* would have been resorted to at once, we should have felt more than doubtful as to the wisdom of an invasion of the Russian territory. As it is, however, we must admit that it has turned out unfortunately. From some cause or other our losses have been frightful and our profit has been microscopic. We have displayed marvellous valour in fight; marvellous patience in suffering—but we have made no way. We have lost 20,000 men, and we have not gained land enough to make them 20,000 graves. . . . These considerations may well make us reflect whether a reasonable though not a glorious peace may not be preferable to the continuance of such a disastrous and unadvancing war. May not negotiations which will bring us some profit, be better than hostilities which bring us nothing but gladiatorial renown? . . . Now we do not say that these considerations are *conclusive* to our minds in favour of accepting terms of peace far less satisfactory than those which a year ago we should have sturdily insisted on. But they are considerations of great weight, and which well deserve to be deliberately pondered, and which naturally enough may seem even more grave and powerful to the Ministers on whom lies the responsibility of the decision, than to the people who have merely to endure the burdens which that decision will effect.

Books & Publications

From Pithecanthropus to Pythagoras

A HISTORY OF TECHNOLOGY: *Volume I, From Early Times To Fall Of Ancient Empires, C. 500 B.C.*
Edited by C. Singer, E. J. Holmyard, A. R. Hall.
Oxford University Press. 882 pages, 8 maps and 36 plates. £7 7s.

THIS is the first of a projected five volume history of technology endowed by the Imperial Chemical Industries. It is magnificent as a sheer piece of book-production, with large type and a profusion of drawings and plates that suggests the era of the great nineteenth-century quartos. It represents the collective science and erudition of archæologists, curators, ethnologists and historians from the United Kingdom, Norway, Kenya and the United States. Moreover, the fact that the first four volumes will not go beyond the period of the French Revolution emphasises the strongly historical, and even antiquarian, bias of the whole work. Like Dr Needham's history of science and scientific thought in China, this "History of Technology" interprets its terms of reference as widely as possible.

The present volume starts with a consideration of the use of tools by animals and ends with a chapter on ancient mathematics and astronomy. It goes from Pithecanthropus nearly to Pythagoras. It is obvious that the evolution from *homo* into *homo sapiens* and, more essentially, into *homo faber* is more revolutionary than any that has since taken place. The first volume of a history of technology, therefore, must deal with the great and mysterious insights or accidents or cerebral readjustments that gave man speech, a wheel, a pot, a roof, a measure of time, a way to cross water and his first glimpse of order in the stars.

As is bound to happen in a co-operative venture, not all the chapters in this book are equally satisfying. But, in part, this is due to the subject-matter itself. Our knowledge of the origins of speech, for example, remains little more than unfounded conjecture. Professor Sommerfelt starts his discussion with an analysis of the relatively elaborate and advanced Arunta language of central Australia and passes rather quickly over the more recent archæological finds in connection with "pre-alphabets." The whole problem remains one of deep mystery, and it is paradoxical that some of the ancient guesses about connections between letters and stellar configurations are again being taken up seriously.

One of the most brilliant chapters deals with rotary motion. In it, Professor V. Gordon Childe draws on anthropology, archæology and technology to write an account of how men came to conceive of a wheel. Probably the first picture ever drawn of a wheeled vehicle is a pictograph from Erech in Mesopotamia, showing a sleigh on wheels. It can be dated as approximately 3500 B.C. A triumphant combination of comparative archæology and knowledge of primitive tools has enabled Professor Childe to construct a table showing average diameters of cartwheels from the third millennium onwards. By the fifteenth century B.C., we can follow Egyptian wheelrights at their precise work, and a find at the lake-dwelling of Mercurago in upper Italy gives the first hints of a transition to a wheel with more than four spokes. This transition probably did not take place much before 1000 B.C.

Equally fascinating is Mr G. M. Crowfoot's chapter on textiles, basketry and mats. It is now possible to construct a chronology of textiles which is often as sensitive as that furnished by pottery shards. Impressions on pot-bases have allowed scholars to reconstruct the kind of plait or weave used as early as 5000 B.C., and a horizontal loom is depicted on the inside of an Egyptian dish dating back to 4400 B.C.

Wherever one turns in this book, there are fascinating pages, showing how the minute techniques of excavation, carbon analysis and photography fit pieces into the great puzzle of the past. For the general reader there is every incitement that narrative and illustration can provide; for the scholar there are bibliographies, notes and special sections in which the very latest archæological evidence is adduced and evaluated. If subsequent volumes of this history match the standard of the first, a great piece of collaboration between science and humanism will have been accomplished.

Jew-Haters

WORKING-CLASS ANTI-SEMITE. *A Psychological Study in a London Borough.*
By James H. Robb.
Tavistock Publications. 253 pages. 15s.

THERE are always two approaches to every study of socially objectionable behaviour—be it drunkenness, crime or race prejudice; and investigators tend to sort themselves out according to which of the two has the stronger appeal to them. What, asks one group, are the environmental conditions that favour the growth of such behaviour? And why, in these conditions, asks the other, do some people fall, while others remain uncorrupted?

Dr Robb inclines towards the second line. He has, however, prefaced his researches into anti-Semitism in Bethnal Green with a useful sketch of life in that district, and he shows keen sensitivity to the cultural differences between social classes. He himself worked as a part-time bartender ("participant observer") in a local pub, and got to know many people at varied social levels; in addition he conducted prolonged interviews (including in some cases Rorschach tests and other modern techniques) with a random sample of about 100 subjects. These naturally included some with anti-Semite feeling of varying degrees of intensity and others classified as "tolerant" personalities.

The theory that emerges finds the anti-Semite's attitudes to be the reflection of his own emotional frustration and insecurities: the Jew-hater directs against the Jews the grudges he nurses against life in general. Such a "scapegoat" interpretation antedates, of course, by a long way the days of formal social investigation. Whether it gains much from being dressed up in a rather formidable array of psycho-analytic language and personality tests is perhaps open to argument. More distinctively modern is the further elaboration that the origins of prejudice are to be traced back to infantile experiences:

> The first step in the formation of a prejudiced personality seems to be the establishment of a poor relationship with the parents in infancy and childhood, probably through the medium of some form of rejection of the child by the parents, usually associated with erratic discipline, thus laying the foundations for a belief that the world is an unfriendly, unpredictable place.

Here Dr Robb follows lines which his colleagues in the Tavistock Institute have made widely familiar; though it is fair to say that he does allow greater weight in the making of a prejudiced personality to the shocks of later life (such as dismissal from a job in circumstances felt to be unjust) than would the more extreme adherents of the "maternal deprivation" school. Actually, however, Dr Robb gives very little evidence in support of the damaging effect of parental rejection. Some of his extreme anti-Semites had strict fathers (sometimes admired, sometimes not), and several were reticent about their parents; but the same is true of some of his tolerant group, and the material presented is quite insufficient to establish any valid generalisations. What does appear is that the anti-Semites were embittered, generally rather unsociable, people, not conspicuously more unfortunate than their neighbours, and that neither the extent nor the quality of their personal contact with Jews had much to do with the violence of their anti-Jewish sentiments.

It follows from Dr Robb's thesis that even the mild anti-Semites are unlikely to change their spots as the result of the well-intentioned but, to him, naïve activities of educationalists, or of appeals to their better nature by rational, liberal-minded persons. Prejudice, in Dr Robb's view, will yield only to "therapeutic activities" of the type already practised under the auspices of the Tavistock Institute in the fields of marriage welfare, child guidance and industrial relations.

Coal without Fire

THIRTY YEARS IN COAL.
By William Alexander Lee.
Collins. 256 pages. 16s.

IN spite of a voluminous literature and a vast accumulation of statistics about its operations, the British coal mining industry has been unfortunate in its scribes. There is Mr Nef's history of the early period and Professor Court's excellent account of coal in the second world war. But the long years between are arid. In particular, there is no adequate account of the period between the publication of the report of the Royal Commission in 1925 and the outbreak of war in 1939. For this period, there are novels and reminiscences; there are polemics galore; there is a fascinating unpublished thesis by Branton; and there is the serial story published in the annual reports of the Secretary of State for Mines. But there is no adequate single book on the fortunes of the coal mining industry in those all-important years. No one could have been better placed to write such a book than the man who was the chief executive official of the Mining Association of Great Britain for thirty years. But Mr Lee has not done so.

Within the coal mining industry there has grown up a prose style which is the antithesis of "Plain Words"; after thirty years in coal, it is perhaps not surprising that Mr Lee should make history sound as dull as a wages agreement. By the time a conference has revealed "a satisfactory consensus of opinion on fundamental principles" and the Mining Association has decided "to address a letter" to district associations asking them "to prepare a statement showing the units into which undertakings in the district could best be combined for the purpose of constituting them into the smallest number of units consistently with proper regard to practical considerations," one is not surprised that events in the coal mining industry sometimes overtook the thoughts of its leaders.

This book is presumably indicative of the thought of the leaders of the coal mining industry in the inter-war years. It is a book written by an "insider"; it has the blessing of the President of the Mining Association; it has been welcomed by the technical press. By analysing the contents of the book, one may therefore fairly infer the relative importance of various aspects of the inter-war industry in the minds of its leaders. The resulting summary reads rather like something out of "1066 and All That"—with the influence of Communists on the mineworkers a bad thing, mechanisation a good thing, and its failure to affect productivity a bad thing. The coal owners had, too, lots of difficulties to contend with. These included nature, the miners, other coal owners and foreigners. Foreigners were a bad thing. They always preferred to buy cheap coal rather than British coal. But eventually an agreement was reached with foreign competitors. This would have been a good thing but, by that time, Britain's chief competitor was having a war with us. After the war, it was decided to have a plan. And so on. . . .

It is in the files of the Mining Association that the stuff of coal mining history will be found. One hopes that, one day, a historian will be given access to the material. He will, no doubt, have a chapter on labour negotiations. For that, he will be able to draw, in part, on "Thirty Years in Coal." But for his other chapters—on price policy, on markets, on technical developments, on investment and on research—he will have to go to the raw material. And he may, perhaps, uncover some clues in a mystery that Mr Lee leaves entirely unsolved. The coal industry in 1913 was at its zenith; the coal industry in 1947 was at its nadir. What really happened in between?

A Dull Cromwell

THE LORD PROTECTOR.
By Robert S. Paul.
Lutterworth Press. 438 pages. 35s.

IT would seem difficult to write a dull book on Oliver Cromwell, that basalt figure dominating a volcanic age, but Dr Paul has succeeded. His book, ponderously written and weighted with extensive footnotes, bears the marks both of its origin in an Oxford thesis and of its author's preoccupations as Assistant Director of the Ecumenical Institute at Bossey.

Dr Paul justifies himself for writing yet another biography of Cromwell by his contention that recent historians have underestimated the part played by religion in general and by Cromwell's personal faith in particular. Those who interpret Cromwell as a dictator, Dr Paul argues, are reading contemporary history into the seventeenth century. Yet when he suggests that "the Cromwellian settlement of religion was a practical experiment in a federal conception of the Catholic Church which may very well be the way ahead in ecumenical relationships," he is using language which would have horrified the Puritans and is interpreting the past in terms of a speculative future. He makes much of what he calls the "dual ethic" as the answer of Cromwell and his colleagues to the problem of religion in politics; but he concedes that this was an "unconscious answer," and finds an important clue to Cromwell's acceptance of this answer in the publication of "The Souldier's Pocket Bible" in 1643. His own comment, derived from Firth, on the value of this clue is devastating enough: "there is no reason to suppose that Cromwell had any hand in the compilation of this little book, or even that it was in any general circulation among the Parliamentary soldiers."

Dr Paul is concerned with motives rather than with causes and consequences, and with moral issues often isolated from their context. Political and social radicalism played as important a part as religion in the unsettled years after the defeat of the king. Dr Paul analyses minutely the Biblical references in Cromwell's speeches, but pays less attention to the light those speeches throw on Cromwell's sensitivity to the challenge from the radicals. Again the author's sympathy with the morality of the militant Puritans makes him deal harshly with the constitutionalists who urged the crown upon Cromwell as a means of excluding the army from politics. Acceptance would have meant for Cromwell, Dr Paul considers, "exchanging the experience of Christian friendship learned in the only real Church fellowship he had experienced for the dubious loyalty of the lawyers and sycophants."

Dr Paul's laborious narrative occupies 377 pages, adduces no new evidence and is highly selective in its emphasis. No serious historian since Gardiner and Firth has doubted Cromwell's dependence upon religious sanctions. But it is unsafe to judge a statesman predominantly by the criterion of sincerity of belief. In 1937 Sir Ernest Barker devoted 96 short pages to the issues now raised by Dr Paul. Like Dr Paul, he

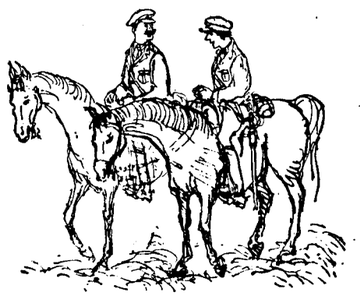
held that the core of Cromwell's doctrine of the nature of the people was a religious core: unlike Dr Paul, he commented on Cromwell's conception of government that: "It is a dangerous doctrine—this doctrine of a Divine leading. It consecrates; but it consecrates too widely." Just how widely it consecrated, Dr Paul does not allow us to see.



Explaining Nazi Germany

THE THIRD REICH.
Weidenfeld and Nicolson. 925 pages. 50s.

THIS book, which appears with no editor's name, is a collection of essays by scholars of various countries under a project sponsored by the International Council for Philosophy and Humanistic Studies and published with the assistance of Unesco. The project was agreed upon as long ago as the end of 1948, and some at least of the essays were written fairly soon afterwards if we are to judge by the remark of Professor Gerhard Ritter, made in a footnote, that he has altered some of his ideas since then on the basis of new material that has become available. On the other hand, the volume may be said to have gained something by the long delay; for the problem of interpreting the Third Reich and its politics is a much more living one now, when Western Germany, at least, is on the eve of armed independence, than it was during the period of foreign control. The German landscape is changing fast as the snows of occupation melt; and many familiar objects will soon be sticking up above the surface. Will these include the swastika?

Undoubtedly the essays here presented, many of them from scholars of justified reputation, provide material for assessing the chances of a peaceful and democratic Germany emerging to confound such suspicions. But there is no guiding principle to give unity to the explanations offered; and since so many important aspects are dealt with over and over again, the reader is likely to suffer severe mental indigestion, if he undertakes to read the volume straight through. Indeed, one could go further and say that on certain issues the contributors are in actual disagreement. Nearly the whole of the first part of the book is given up to accounts of those nationalistic and racist thinkers who are often talked of as the precursors of National Socialism. It includes, from Professor Roy Pascal, an excellent essay on Moeller van den Bruck, only marred by Professor Pascal's curious tenderness for Marxism—which makes it essential for the reader to turn at once to Mr Alan Bullock's chapter, "The German Communist and the Rise of Hitler." On the other hand, we find Professor Ritter denying that authors like Moeller or Spengler have any connection with National Socialism at all. One clear line of division indeed appears: that between writers, like Professor Edmond Vermeil, who regard Nazism as merely a culmination of long-standing tendencies in German thought and feeling, and writers, like Professor Ritter, for whom Nazism is only one among the totalitarian movements characteristic of this century and who claim that "Hitler's intellectual background certainly bears little relation to the general intellectual history of Germany." To some extent, these opposing views can be reconciled by theories like those put forward by Karl O. Paetel; he calls attention to the transformations which the movement itself underwent in the course of its history, culminating in what he called the SS Counter-State—the realm of dedicated terrorists with no genuine ideology of any kind and united only in virtue of the dominant human type it embodied.

The point at which many of the particular themes treated appear to converge is the willing self-deception of so many Germans when faced with the Nazi phenomenon. Mr A. J. P. Taylor, in a characteristically forceful analysis, pins the responsibility for the Nazi rise to power where it belongs and points out the role of the so-called Centre Party, which, unconcerned with any but sectional interests, voted the powers that Hitler needed in order to produce his legal revolution. It is a frightening thought that the same sectional interests should be so heavily represented in the party upon whose assumed allegiance to the West British foreign policy has been so exclusively based in the last few years. For the rest, argument will continue about how far the German people's acceptance of the unacceptable was due to the series of shocks which Germany had received, from defeat in war to inflation and depression—even the ghost of ill-treatment by the Allies raised its head again—and how far it happened because the whole German history had given a pull of its own to any movement that could play upon a delight in militarism and a preference for a strictly hierarchical ordering of society. But all of these explanations fall short of the truth. A country that employed mass murder as a deliberate instrument of policy and found it easy to recruit the murderers is difficult to classify in any ordinary language of social or political analysis. If the Germans today complain that they are mistrusted by their neighbours, they must at least admit that their neighbours have excellent reasons for this mistrust.

'We never smoke during battle' he said angrily

GOING TO THE WARS

John Verney

"A work of literature. Will recall both Edmund Blunden and Siegfried Sassoon. One of the funniest war books yet published. Also one of the kindest."—DANIEL GEORGE

B.B.C. Critics' Choice:

"A very light-hearted book, as well as an exciting and extremely well written one."—MARGARET LANE *12s. 6d.*

COLLINS

Shorter Notices

THE STRUCTURE AND GOVERNMENT OF LABOUR UNIONS.
By Philip Taft.
Harvard University Press. (London: *Geoffrey Cumberlege*).
312 pages. 48s. $6.00.

Professor Taft's latest book on American trade unions is not, as its title might imply, a study of the trade union movement in general or of the relations between unions and their employers. These subjects have been extensively reviewed in his earlier writings on the history and contemporary politics of trade unions in the United States. The present volume comprises a collection of essays dealing with a particular institution, policy or problem of one or more of the unions. Five of the essays provide some welcome information on several neglected aspects of trade unionism, including the problems of union elections, dues, initiation fees, salaries of union officials, and discipline and appeals within the union organisation. The other three essays are case studies of the organisation and government of the Seafaring, Automobile, Steel, and Teamsters' Unions. Of particular interest, for a comparison of British and American labour practices, is the development of the Teamsters' Union, now the largest member of the American Federation of Labour, towards the concept of a general workers' union along the lines of the British Transport and General Workers' Union. Much of the information regarding the unions selected for detailed analysis is not readily available elsewhere and should provide a useful basis for further studies of this sort.

PROFITABLE EXPORT MARKETING.
By Martin Madden.
Newman Neame. 192 pages. 15s.

There can hardly be an industry that is not finding it progressively harder to sell in export markets—and there must be few firms capable of exporting directly that are not trying to do so. Mr Madden's very practical book, then, may well be what the more enterprising directors and senior executives have been looking for—a thoroughly up-to-date and readable guide to specific research in export markets. Certainly, the many examples of how research has paved the way to bigger and steadier sales abroad should stir his more energetic readers to action. Of course, the scope of the book is limited, and the techniques described will not be news to up-to-date exporters. But its commonsense approach should appeal to the many senior people in industry who do not believe in market research. What the book does not do is to make clear that the economic climate of particular markets abroad can change as quickly as it does at home and that this need not take the exporter by surprise, as it so often seems to do. The systematic review of business conditions in overseas markets, preferably by an independent organisation, is just as important for profitable export marketing as making specific surveys.

Letters to the Editor

No Newspapers for Lent

SIR—I would like to know the grounds for your assertion last week that the newspaper strike is now causing the public "far more than an inconvenience." My own little bit of mass observation has yet to find a disinterested member of the public who cares a tinker's cuss. Admittedly, the gamblers have to wait for the 6 o'clock news to hear their fate, but is this far more than an inconvenience? Against this we have gained the inestimable advantage of more time—including time to read the "less frivolous third" of your paper—and are freed from the obligation to be well informed and from any worry about bombs and the Russians. We can now take our weather as it comes to us, and how we wallowed in the Bank Holiday sunshine, the more enjoyable because unheralded by headlines.

Next winter, the public may suffer far more than an inconvenience when it lacks the raw material for lighting its old-style open fires. But not now.—Yours faithfully, F. W. P. DEANE
London, S.W.3

Housewives' Choice

SIR—Your correspondent "Cordon Bleu," whose letter appeared in your issue of April 9th, has been misinformed by her butcher. The Ministry of Agriculture, Fisheries and Food is not selling frozen beef that it has been keeping for four years. All frozen meat put into store before March 31st, 1954, has been disposed of. Most of the frozen meat now being sold by the Ministry has been less than six months in store.—Yours faithfully, MARY GEORGE,
Principal Information Officer
Ministry of Agriculture, Fisheries and Food

Guidance for Retailers

SIR—Articles urging the use of census statistics in connection with retail trade productivity are most valuable, but your illustrative examples are greatly weakened by an unfortunate confusion of shops with "establishments"—by no means the same thing.

Out of the 89,000 clothing "shops" referred to, only 71,000 are fixed retail shops. The rest are a mixed set of market stalls, street traders, pedlars, etc., most of whose sales per "establishment" may be less than £1,000 per year. Some 3,000 secondhand dealers are included whose gross margin is quite abnormal; and some 500 furriers and 14,000 footwear "shops," most of which are of course fixed shops.

The curious "fact" needs noting that the clothing "shops" with less than £1,000 sales in 1950 sold £8½ millions of goods, at a gross margin of 31 per cent, and yield gross profits per "shop" of £130! And this to cover wages, overheads, taxes and profit! What sweated labour! What lucrative trade!

The paradoxes that abound can be resolved, and a proper basis for practical work or journalism be gained, only if market stalls, etc., are separated, as also, and more important still, should be all those *new* shops and others who traded for only *part* of the year. It remains a mystery why this necessary information has not been published with the reports (only global figures appear by type of trading); without this data all the distribution tables by size of establishment can be seriously askew, and often seriously misleading for practical decisions. So, too, not too much can be read into regional variations. The global figures for Bristol, which you took as your example, may include substantially more or less than the average number of "mixed bag" shops.

I write this not to discourage or disparage such estimates, but rather to show how careful one has to be and how difficult it is to obtain the right data that business men need, in hopes that future sampling or census work will be more fruitful. Meanwhile, could not the Board of Trade publish a special tabulation for the "shops" doing under £2,500 business by type of trading and number of months' sales?—Yours faithfully, J. I. MASON
Thornton Heath

[The article was intended to show in a general way what use could be made of the census figures; for that reason one trading group was used as an example and all calculations were based on that group alone. Sales of shops and businesses with a turnover of less than £1,000 a year represent only one per cent of the total, whereas the miscellaneous traders to whom Mr Mason refers account for about 5 per cent of total sales. Average sales by most of these traders exceed £1,000 a year, and in the case of credit traders they exceed £12,000 a year—which is higher than the average for the whole group. Mr Mason's comment about the difficulty of distinguishing these traders from fixed shops is fair, but the proportion of trade that they do is not very significant.—EDITOR.]

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mechanising the President

Washington, D.C.

SINCE Mr Eisenhower has been in the White House, the President's office has been radically reorganised. Officially this has been done in order to make the Administration more efficient and to lift some of the routine burdens from the President; this is not only humane, but also gives him more time for thinking. An underlying purpose is to make the top job one which Mr Eisenhower will be willing to take on for a second term. The new design adapts current principles of public administration to a unique purpose. The unexpected result has been the introduction of automatic handling into the White House, where man-killing toil is the beloved tradition. It is not certain the public is going to like push-button government. It is not quite good taste yet to be really outspoken about the President's golf and vacationing, but the voters are not wholly convinced that he is thinking all the time that he is away from his desk.

The most important innovations are the introduction of a military-type, chief-of-staff approach, the revision of Cabinet procedures, a Cabinet secretariat, and a new reliance on special consultants to deal with massive problems which cut across departmental lines. The chief of staff is "The Assistant to the President," Mr Sherman Adams, whose power is measurable by the fact that in most matters he can speak for the President, and can act on almost anything except a crisis of such dimensions that the Secretary of State, for example, would move in on it. There is no precedent for the formal grant of such broad authority to an officer whose duties have no constitutional basis nor statutory description. Mr Adams, under existing arrangements, can in turn delegate this power to his deputy, General Wilton Persons, retired, and General Persons can pass it to Colonel Andrew J. Goodpaster, the able staff secretary; this is sharing responsibility in depth.

The staff Mr Adams commands is divided into functional units handling presidential appointment schedules, the press, liaison with Congress, liaison with executive departments, legal questions, the writing of speeches and papers and day-to-day economic problems. These people are the secretaries and administrative assistants. The style of organisation is carried over from other Administrations; the definition of lines of command and the creation of a staff secretariat to co-ordinate it and do its housekeeping are new. Under this arrangement much decision-making and policy-forming can be stopped short of the President. The concept frankly follows a pattern to which Mr Eisenhower became accustomed while in uniform and his relationship to the staff appears to be somewhat aloof.

The aim of the new procedures for the Cabinet is to avoid the haphazard, superficial, and hasty methods of the Roosevelt inner council. An all-important task of the new secretariat is to prepare a written agenda circulated in advance with relevant papers to members of the Cabinet; it is asserted that no previous United States Cabinet ever had a written agenda. Members are held responsible for "doing their homework," and the President is stern with delinquents. The Cabinet continues to serve only as an advisory group, and in this business-minded Administration is referred to as a board of directors. The power of final decision is wholly the President's, and he can reject the collective judgement of his Cabinet. It is never strictly true to say that the Cabinet has "decided" something. No votes are taken; proposals are made and dissents freely expressed; the sense of the meeting becomes apparent in discussion. The President gives such weight to it as he likes and when he has heard enough, says in effect: "We'll do it this way." From then on the team is required to support him.

★

Mr Eisenhower is making intensive use of Cabinet committees which work hard and produce reports which have no authority unless he chooses to support them. A most ambitious report on fuel and energy policy came to nothing recently, and at least one other on the local problem of more airport space for Washington was savagely condemned. The Cabinet also acts now as a test area for legislative proposals, which are given a kind of pre-trial there before going to Congress and the public. It is claimed that, as a result, after passing the challenges of the President and all the members, a programme in final form has solid support, and that no department head need worry about attacks on his flank.

Mr Eisenhower has enlarged his Cabinet by inviting regular attendance from the holders of a number of special offices, such as the Ambassador to the United Nations and the Director of the Budget, in addition to the Vice-President and the heads of the permanent departments. The new authority of the National Security Council, a smaller group at Cabinet level which advises the President on foreign and military policy, curtails the deliberations of the full Cabinet in those fields. An entirely new sub-structure, a "little Cabinet" made up of Under-Secretaries with Mr Adams

presiding, works on subjects that almost, but not quite, merit Cabinet attention. Below that is a "sub-sub-Cabinet" of Assistant Secretaries, who have the duty of seeing that their departments follow through what has been decided at Cabinet meetings. Still another group in this elaboration of administrative apparatus maintains White House liaison with other Assistant Secretaries who conduct liaison with Congress for their departments.

Mr Eisenhower himself recently explained his regular use of special consultants, in commenting on Mr Stassen's assignment to foster disarmament: each department of government and almost every citizen has an idea and a different approach; there is nobody in the government responsible for putting them all together; so someone is needed with a small staff who can co-ordinate these different views into a short, easily expressed programme that all can accept. There are part-time and full-time consultants, and their missions indicate what problems are worrying the President. A steel-maker works three days a week on foreign trade policy, a banker wrestles with the organisation of foreign economic activity, and a magnate from the food industry works on farm-surplus disposal. The chairman of the supposedly independent Atomic Energy Commission is a presidential adviser on the subject, and there are justifiable complaints that such a connection is inconsistent with independence. There is a consultant on speechwriting and another on psychological strategy, a mysterious function which seems to explain actions like offering wheat for Albania to turn down.

The new machinery has a high theoretical efficiency, looks pretty and sounds smooth at most speeds, but it has yet to match in quality of product the performance of older models made from salvaged parts held together with baling wire. Designed to spare the President, it ends up by permitting too many other people to do the thinking for him; the Administration, which should have the juice of human personality, becomes an impersonal institution; authority at the top exists principally to ratify decisions ground out below. Amid the mechanical apparatus, the presidency is insulated from the information and pressures which stimulate imagination, feed inspiration, foster insight and develop sensitivity. Too much reliance is placed on briefing, and briefing is not enough; it has only recently led to several mistakes which Mr Eisenhower has had to admit and experience proves that an *aide* might conceivably mislead the President intentionally. There is too little room for the exciting play of politics. For improvisation which can be brilliant there is substituted over-elaborate thought, producing intricacies which Congress sometimes finds impracticable, illegal, and incomprehensible. The lesson is that the President ought not to be spared much more than routine; the inescapable requirement of the job is that it should saturate him and he should saturate the job.

Stevenson in the Straits

ON Monday Mr Adlai Stevenson spoke, as brilliantly as, and more seriously than, usual, of the peril to the free world's alliance of the Administration's ambiguity over Matsu and Quemoy, the offshore islands in the Formosa straits. There are more reasons for this ambiguity than Mr Stevenson admitted but he crystallised the doubts of a growing number of Americans by his three questions: Are the islands essential to the security of the United States? Are we prepared to use nuclear weapons to defend these islands? Are we prepared to fight in China, "standing almost alone in a sullen and hostile world?"

Americans only began to face these questions a short time ago, when they read the now discredited report that a Communist attack on the islands was to be expected this week. But already, before Mr Stevenson's speech, the public disquiet had brought what looked like a shift, but may merely have been a clarification, of the Administration's policy. Previously the impression had been given that the President would probably decide that the United States must defend Quemoy and Matsu, and perhaps also attack the mainland directly, if Formosa were to be defended. Now it is suggested that he is prepared to abandon the islands, and to delay aiding even Formosa until he is sure that American aid is essential. Mr Stevenson's case against the Administration is therefore not now so sharp as it would have appeared a few weeks ago.

Nevertheless the Administration has tacitly admitted the strength of his attack in a detailed reply from Mr Dulles, the main target of his censure. The Secretary of State pointed out that he had been moving towards a permanent settlement of the Formosan question in the direction advocated by Mr Stevenson, although along different and, many people believe, less promising lines. Mr Stevenson's constructive proposals for organising a collective defence of Formosa and for leaving its future to the United Nations should provide the rallying point which until now the critics of the Administration have lacked.

★

That, of course, is exactly what Mr Stevenson wants to do. For he is a politician as well as a statesman. In making his first important speech for four months, his purpose was not only to embarrass the Republicans but to push his own party into more active opposition. He was speaking for the many Democrats outside Congress, and the few in it, who think that their leaders were carried away by bipartisanship last January when they supported so uncritically the resolution authorising the President to defend Formosa and, if necessary, the offshore islands. These Democrats feel that their party then lost the only real vote-winning issue that has developed during the present session of Congress, one that might have enabled them to steal Mr Eisenhower's Korean peace making laurels.

But Mr Stevenson is in the convenient position of having no executive and little political responsibility. Maybe President Eisenhower is making unnecessary and dangerous concessions to Senator Knowland and the other Republicans who believe that all Asia will fall to the Communists unless Quemoy and Matsu are defended. Maybe he is, as Mr Stevenson suggests, unwise in relying on his sole judgment to determine whether or not an attack on the islands must be countered immediately by American force if Formosa is to be saved. But these are decisions which must be taken by the leader of the Republican party and the President of the United States. There is no justification for supposing that Mr Eisenhower is deciding wrongly just because he seems to have handled the affair ineptly.

Vaccine *versus* Virus

New York

THE new vaccine against poliomyelitis, which is one of several under investigation, is the latest in the series of dramatic discoveries in medicinal chemistry made since penicillin was introduced in 1942. Its dramatic success—it is claimed to be "eighty to ninety per cent effective against paralytic polio" — has already raised acute problems of equity in distribution. The National Foundation for Infantile Paralysis, which sponsored last year's field test, has underwritten the production of enough vaccine to give free inoculations to some 9 million American children. Six pharmaceutical companies will provide it and will also be able to supply, commercially, an additional amount, variously estimated as sufficient to inoculate between 9 million and 21 million more children. As there are about 60 million in the under-twenty age group—the group most susceptible to polio—the possibility has been envisaged of limited supplies of vaccine, sold under the counter at black market prices by unscrupulous manufacturers, wholesalers and retail druggists, to the wealthier parents willing to pay far more than the $6 required for the complete vaccination.

But even if a temporary shortage exists—necessitating strict export controls to all countries except Canada—the steps already taken by the pharmaceutical companies to expand their output of the vaccine can be counted on to ensure sufficient stocks for 60 million people by the end of this year, and Europe as well in 1956. The willingness of the industry to take this calculated risk, in advance of the official findings, is another example of the swift commercial development by American firms of new vaccines and drugs discovered in the research laboratories of Europe and North America. Antibiotics, the mainspring of many of the foremost pharmaceutical companies, have branched out into the new "broad spectrum" drugs such as tetracycline, whose introduction in 1953 brought an entirely new range of diseases under control. Tuberculosis, already treated with much success for over ten years with streptomycin, is now being fought by a broad spectrum antibiotic, cycloserine, in the attempt to obtain a complete cure.

In the field of hormone therapy, cortisone may be replaced in the treatment of 7½ million sufferers from rheumatoid arthritis by other synthetic drugs many times as potent. Hardening of the arteries, high blood pressure, and similar diseases, which together cause more than half of the deaths in the United States, are now being effectively treated by new drugs. Perhaps the most significant development of all during recent years was the discovery that some forms of mental illness can be influenced by drugs which counteract high blood pressure. The importance of a potentially successful chemical approach to mental illnesses must be measured against the fact that these fill more than half of the hospital beds in the country.

Reflecting the speed and scope of these new developments is the rapid growth of the pharmaceutical industry. It is not unusual for half of a firm's current sales to consist of products absent from the catalogue five years ago. And in few industries is competition as keen as between the makers of these "wonder drugs." Tetracycline, for example, one of the most potent of the new broad spectrum antibiotics, was introduced almost simultaneously by two companies and is now being sold—to the confusion of both chemist and public—by five different companies under five different trade names, in the face of constant patent litigation. This competitive stimulus, although it has undesirable "side-effects," in the guise of secrecy and commercial espionage, is not without its impact on price. As new companies have entered the field, the discovery of competitive drugs, of cheaper methods of making existing drugs, or of means of circumventing patents have brought cuts in both costs and profit margins. Penicillin, for example, once expensive, now sells for a fraction of its original price, having dropped so far that the package costs as much to make as its content.

Lesser Part of Valour

THREE months ago, Mr Edward Corsi, a former Republican candidate for Mayor of New York and a nationally known expert on immigration, was persuaded by Mr Dulles to join the State Department as special consultant on refugees and migration. At the time, the Secretary of State described Mr Corsi as his "old friend" and "the best qualified man in the United States" to deal with this delicate and urgent problem. Last week, Mr Corsi was abruptly informed that his appointment had been a temporary one and that his services were no longer required.

This dismissal is the latest instance of the Administration's tendency to lose its courage and its head at the first sign of extremist opposition, from whichever party it comes. Mr Corsi's job—to speed up the operation of the Refugee Relief Act passed in 1953 so that 209,000 immigrants, mostly from Eastern Europe, might find a haven in the United States by 1956—involved him in constant friction with the restrictionist group in Congress and the State Department. Representative Walter, a Democrat and co-sponsor of the 1952 McCarran-Walter Immigration law, and Mr Scott McLeod, chief of the State Department's Bureau of Security and Consular Affairs, tend to see in every immigrant a potential spy and in Mr Corsi a dangerous radical. Their suspicions were confirmed when he took his job seriously and sought to improve the security-ridden procedures under which only about 22,000 visas have so far been issued under the Act. Mr Walter then brought unsubstantiated charges that Mr Corsi had associated with Communist-front organisations in the nineteen-thirties. No one in the State Department offered Mr Corsi any support, and a short time after he found himself dismissed.

The State Department had naïvely overlooked the fact that it would stir up a political hornets' nest in dismissing a prominent Republican and a man with great influence in New York's Italian and Jewish communities. Rushing in where more experienced politicians would fear to tread, Mr Dulles quickly offered Mr Corsi a less controversial job and then accused him of seeking powers beyond his terms of reference. Mr Corsi indignantly rejected both the offer and the charge. As so often before, President Eisenhower knew nothing about the whole affair until he read about it in the press. Repeated incidents of this kind do not make it any easier to persuade distinguished men to work for the government. They also explain why the facts of America's immigration programme lag so far behind the ideals set forth on many occasions by the President.

Bombs and Genes

FOR a long time, Mr Lewis Strauss, chairman of the Atomic Energy Commission, has been making reassuring noises about the dangers to health of radiation from the nuclear tests being conducted in the United States. Nevertheless, the chorus of public disquiet and scientific doubt has been growing louder. Scientists at the University of Chicago, at Brandeis University and in California have issued warnings that present precautions against radiation are based on insufficient knowledge and that "disease, malformation and mental disability" might be the fruit of unchecked nuclear explosions. At the same time, the Defence Department grudgingly admitted that past tests in the Nevada desert had caused injuries to at least four men. Sheep farmers in Utah, moreover, have filed claims against the government for the death of animals allegedly exposed to passing atomic clouds and there have been rather disturbing variations in recent statistics for leukemia in human beings.

In view of these developments, the AEC had to agree to co-operate fully with a projected study of the effects of radiation to be undertaken by the National Academy of Sciences. This is the most powerful and respected scientific body in the United States and is far above political suspicion. Dr Bronk, president of the academy, has stated frankly that biologists and geneticists are in frequent disagreement on the subject of radiation and that far too little is known about atomic fallout to justify any complacency about the explosions that have been taking place since 1945 in various parts of the world.

Meanwhile, the latest series of tests in Nevada is continuing, and is now being watched by Sir William Penney and a group of British and Canadian scientists. Among the weapons detonated have been a fantastic atomic missile fired from a plane and exploding six miles above the earth, and several small "trigger" devices. It is against a background of multicoloured flashes in the western sky, and of a trip to America for plastic surgery of twenty disfigured "Hiroshima maidens," that the scientists must decide whether the nuclear arms race or the potential genetic threat takes first priority.

Too Little Wheat?

WHEAT provides the latest example of the inconsistencies that spring from attempts to protect the American farmer. This week's estimate for the 1955 harvest forecast a total wheat crop of some 840 million bushels, about 130 million less than last year and small enough to make it probable that some inroads will be made on surplus stocks to meet requirements during the 1955-56 crop year. This is the combined result of the cuts in acreage, forced on farmers by the law, and of the now serious drought in Colorado and nearby states. The Department of Agriculture might have been expected to welcome such a satisfactory outcome of its efforts to reduce the government's agricultural obligations to manageable proportions; both losses on farm price supporting operations and total commitments under them are still increasing, and for this wheat is largely responsible.

But in fact the department is now concerned that the pendulum has already swung too far and that in the summer wheat farmers may reject government controls altogether for 1955-56, as they nearly did last year. For with the amount of land that may be planted to wheat likely to be cut and with the level at which prices may be supported due to drop again, farmers may feel that government assistance is not now worth the unpopular restrictions it brings with it. But, if they reject controls, the legal level at which wheat prices may be supported in 1956 falls to about $1.25 a bushel—this year it is $2.06—and many farmers will not be eligible even for that. Moreover, in an attempt to make up for losses by increasing output, wheat acreage may be greatly expanded. The final effect might be a collapse of the wheat market and perhaps also of the government's whole farm policy, originally designed to prevent just such disruptions. It is not therefore so surprising that the Secretary of Agriculture, Mr Benson, is now thinking of ways of making price supports more attractive to wheat farmers and of easing the impact should they spurn these supports.

Docks Run Dry

New York

IF the American merchant marine were in robust health there would be little cause for concern about the American shipbuilding industry. But the American merchant fleet, overloaded with operating costs, is sailing dangerously near the rocks. How, therefore, can American shipyards be kept afloat?

A merchant shipbuilding industry capable of expansion to meet the wartime needs of the United States must employ continuously, in time of peace, a minimum skilled labour force of 36,000 men. To keep this employed a shipbuilding programme of 60 ships a year, which would just about replace the present American merchant fleet over a twenty-year period, has been set as a target. But in the eighteen months to August, 1954, not a single order for an ocean-going merchant vessel was placed by private interests in an American yard. Only 16 merchant ships are now on the slipways, and of these 12 have been ordered by the government. By contrast 52 ships are at present being built in foreign shipyards for American-controlled companies—all but one for operation under foreign flags. As a result American shipyards capable of building ocean going merchant vessels now employ less than 6,000 men. Thanks to lifebelts thrown by the Navy, and to a new government assistance programme for the merchant marine announced late in 1954, renewed activity in some yards is expected later this year, but the annual goal of 60 ships is still far off.

Some ships have been built in American yards for foreign owners since the war, owing chiefly to the attraction of earlier delivery than the crammed European shipyards could offer. Naval ship construction and repairs, moreover, can always be counted on to provide employment for part of the required nucleus of skilled labour. But the standby of the American shipbuilding industry is, of course, the replacement of the merchant fleet under the United States flag. Those shipping lines which receive operating subsidies are required to replace their ships, in American yards, after a life of twenty years. They are assisted by a construction subsidy designed to offset the extra cost—usually between one-third and one-half of the total expense—of constructing a ship in an American, instead of a foreign, yard. In addition, they receive special compensation for "defence features," such as extra speed and troop-carrying facilities, incorporated into the ships at the government's request. They also have the advantage of tax deferment, which in practice provides a substantial tax saving, on sums set aside for ship replacement. Yet with both construction and operating costs made competitive with those of their foreign rivals, with membership of shipping conferences precluding rate cutting, and with cargo preference legislation to assure them cargoes, American shipping lines are still reluctant to build new vessels.

★

The explanation is that this assistance is not so complete as it appears to be. In the first place, nearly 80 per cent of the American merchant fleet tonnage does not receive an operating subsidy, and although, since 1952, construction subsidies have been made available to all ships employed in foreign service, the advantages of tax deferment are confined to the lines receiving operating subsidies. The second difficulty, common to both American and foreign shipowners, is that of rising replacement costs. For the Americans, however, this problem is particularly acute since they can charge depreciation only on the original cost of their vessels, most of which were acquired from the government after the war at cut prices. The depreciation funds of American shipping companies are consequently even more inadequate than those of their foreign competitors, and no accelerated depreciation is allowed on new vessels.

There are as many grounds for arguing that the construction subsidy is excessive as there are for claiming, which the subsidised lines do, that it is insufficient. But they can certainly justify their main complaint—that the subsidy is uncertain. For each of the three largest passenger liners built in America—the *SS United States* built for the United States Lines and the *SS Independence* and the *SS Constitution* built for the American Export Lines—the portion of the cost borne by the government was recalculated at a substantially lower amount after the contracts were signed, and in two cases is still not settled four years after the ships first went to sea.

The central difficulty lies in the fact that nearly all the ships now in the American merchant fleet were built during the last war. Consequently, between 1961 and 1965 over 80 per cent of the fleet will become due for replacement, requiring a peak employment of more than five times as many slipways and men as a steady 60-ship a year replacement programme. It was clear, therefore, that something had to be done to spread this "block obsolescence" over the intervening years when both slipways and workers would be idle, and to avoid the loss of skilled labour to other industries. Government action was sought, but not until late in 1954 was a beginning made.

The first fruit was the negotiation of a long term "package agreement" between the government and American President Lines, in which the company agreed to carry out a large ship replacement programme if it received approval for an additional subsidised route. Taking a leaf out of the motor industry's book, the government then offered an oil tanker "trade-in-and-build" programme, for tankers over ten years old, in the hope of encouraging earlier replacement. A similar programme for dry-cargo vessels is proposed for this year. In addition, the Navy was called upon to order four new tankers on its own account, and to offer charters through the Military Sea Transportation Service for another fifteen new tankers to be built by private companies.

The Maritime Administration, for its part, announced its intention of building seven special purpose ships, for military use, to serve as "mobilisation ships" in any future emergency. It began modernisation and repair programmes for ships "mothballed" in the reserve fleet. Construction subsidies were appropriated for four new combination passenger-cargo ships, two each for the Grace and Moore-McCormack Lines, to replace five over-age ships. Subsidies were also provided for the conversion of several new government Mariner vessels, a by-product of the Korean war, into cargo and passenger vessels for private operation. Finally the extension of operating subsidies to four more shipping lines, if their applications are approved, will ease their vessel replacement problems. Taken together, these varied aids to private shipping constitute a significant attack on "block obsolescence." But, at best, they will provide only a fraction of the 60 ships a year needed by the yards.

★

The new programme has been very slow off the mark. Conditions imposed by Congress have delayed the construction of tankers. The dry cargo trade-in building programme is unlikely to succeed unless the government's trade-in allowance meets the price companies can obtain by selling their ships for foreign flag operations. Moreover, the Administration is a prisoner of its own economic philosophy—the preference for private over government financing. Formerly the shipping companies made a down payment of only 25 per cent of their share of the cost of building a new ship. The balance was financed by the government, and repaid by the company over a 20-year period at relatively low interest rates. Now the shipping companies are required to finance their entire share of the cost of the vessel, with the assistance of a government guarantee of the mortgage. But the government, except for special purpose vessels, will guarantee only 90 per cent of the mortgage, which in turn must not exceed 87½ per cent of the cost of the ship. Short of a 100 per cent government guarantee, it is claimed, no private financing can be obtained in a market traditionally suspicious of erratic shipping earnings.

Thus without much greater government assistance than any yet in prospect, a civilian shipbuilding industry employing 36,000 men is not even within range. Perhaps the only appropriate solution to the problem of retaining a skilled shipbuilding labour force is that already sought by several of the larger shipyards—diversification. Skilled machinists can produce hydraulic turbines and other heavy machinery

for use by other industries; offshore oil drilling platforms provide another valuable market; and some shipyards have even begun to fabricate structural steel for building.

Points of Labour Law

IN a series of complex, but important, rulings the Supreme Court has added new touches to the structure of legal relations between trade unions, employers and the state courts. In reversing a decision by the Missouri Supreme Court, it affirmed that state courts do not have the power to issue injunctions against picketing as long as the dispute in question involves inter-state business and falls within the terms of reference of the Taft-Hartley Act. In effect, this signifies that employers must refer their case to the National Labour Relations Board and cannot circumvent "the tribunal which Congress has selected for determining such issues" by appealing to state courts.

In a further decision, the Supreme Court ruled that a union is not empowered to sue in a federal court for back pay claimed by union members. Such a suit must be brought by individuals. This interpretation of the law, which arose out of a dispute involving employees of the Westinghouse Electric Company in Pennsylvania, was carried over the dissent of Justices William Douglas and Hugo Black. They held that a union was a bargaining and, therefore, a suing agency for its members. Justice Frankfurter, on the other hand, argued that Congress had nowhere "shown any recognition of the type of suit involved here" and that the federal courts could not take it on themselves to do so. This suggests that the law may be modified in future and that, as often before, the dissent of today may become the ruling of tomorrow.

★

Finally, the Court decided, over the strong dissent of Chief Justice Warren, that a federal court—such as itself—could not issue injunctions against proceedings *sub judice* in a state court. After the completion of appeals in a state court, it may review the whole case and decide that the state court went beyond its jurisdiction, as it did in the Missouri case referred to above. But until these appeals have been made, it has no authority to enjoin a litigant from pursuing his action. In its 5-to-3 ruling, the Court defeated an attempt by the Amalgamated Clothing Workers to set aside a temporary injunction against picketing issued by the Common Pleas Court of Ohio. Paradoxically, the Missouri case suggests that the Supreme Court will, in the end, rule that the Ohio court went beyond its jurisdiction in granting this injunction.

After a lapse of fourteen weeks, the NLRB once again has a general counsel, Mr Theophil Kammholz of Chicago. It is his function to act as the government prosecutor in cases involving violations of the Taft-Hartley labour law by unions or employers. Five hundred cases already await his attention and, no doubt, the Supreme Court will have much to do with them in the future.

SHORTER NOTES

On Monday, the Supreme Court opened hearings on how and when it shall implement its historic decision of last May outlawing racial segregation in state-financed schools. Several southern states have filed briefs requesting unlimited time in which to carry out the ruling and have urged that the entire school system might be jeopardised if the Supreme Court's decision were enforced in the near future. Attorneys for various Negro groups, on the other hand, point out that desegregation has already taken place in the District of Columbia and much of Delaware and that further delay will merely aggravate racial tension.

★

Congress reassembled this week after its Easter recess at what should be the half-way point of the session. It is probably no further behind with its programme than it usually is at this stage; but this year the President has set it an unusually heavy programme. He sent in about 175 recommendations for legislation, but so far Congress has dealt with only about 30 Bills. Congress will therefore either have to stay in session beyond July or shelve much of the programme. The latter seems more likely, as already some of the most controversial items—aid for highway development, federal funds for school building, the health reinsurance plan—have run into such difficulties that their passage seems problematical.

★

Democratic hopes have been given a boost by electoral victories in Michigan and Chicago. Although he was seriously challenged by Mr Robert Merriam, the Republican reform candidate for the mayoralty, Mr Richard Daley and his Democratic machine won in Chicago by a margin of more than 120,000 votes. Mr Daley has been associated with Mr Adlai Stevenson and received his support during the campaign. This may have influenced "liberal" and floating voters in Mr Daley's favour.

★

Last week began crucial contract negotiations between employers in the motor industry and representatives of the United Automobile Workers. The latter are hoping to obtain a guaranteed annual wage, and have hinted that they will strike if their demands are turned down. The automotive industry, which is in a highly competitive boom period, must work out an arrangement by June 1st, when the present contract, negotiated in 1950, expires.

★

After a lapse of four years, the Federal Reserve Board has decided to resume purchases of bankers' acceptances—a short-term bill of trade. This move, which eases credit, is primarily intended to help foreign trade. Last year outstanding acceptances rose by $300 million to $875 million, an amount appreciably below the $1.7 billion figure attained in 1929.

The World Overseas

Europe's Bounding Economy

THE sixth report of the OEEC published last week is of unusual interest.* Unlike those of many international organisations, the yearly reports of the OEEC are documents which reflect not only the expert analysis of the technical staff of the organisation but the agreed views of the member countries. This tradition of agreement by national governments on the text of the document has sometimes resulted in reports so peppered with cautious qualifications and explanations of why more had not or could not be done that none but the government officials who helped to write them could bear to read them. This year's report is a welcome exception. The first half succeeds admirably in assessing with freshness and candour, as well as with a high degree of technical competence, past progress and future problems. Some of the chapters which discuss in detail the specific tasks of the organisation are of less general interest. But the interweaving of the analysis of economic trends and policies with descriptions of the operations of the OEEC, although it makes for a repetitive presentation, conveys an impression of the process by which national policies are reinforced, or modified, by international action.

The most striking thing about the report, and the most refreshing, is its ebullience. Although the hard facts of the progress reported are impressive, it is the tone of voice in which successes are described, and the fact that shortfalls are simply admitted without pages of apology, that gives this report its remarkable air of confidence and well-being.

Looking backwards, the OEEC finds that the ambitious targets drawn up in 1948 for accomplishment by 1952-53 were met, and sometimes exceeded, in 1953. As compared with the prewar year 1938, the volume of Western Europe's exports increased some 70 per cent between 1938 and 1954, while the rise in imports was held to 12 per cent. Industrial production increased by more than 50 per cent, agricultural production by about 30 per cent. The increase in intra-European trade was particularly striking; in 1953 it was half again as large as in 1938 and in 1954 it increased by another 10 per cent.

Reviewing in more detail the record of the last two years, the report contrasts the strong expansion in production in 1953 and 1954 with the stagnation of 1952. In 1953 industrial production in member countries increased by 5 per cent and is provisionally estimated to have risen another 8 per cent in 1954; the real gross national product is estimated to have risen by 5 per cent in each year. The OEEC countries hope that these trends will continue but they are not blind to the problems ahead. The report points out that there is much less slack in the European economy than there was at the beginning of 1953, and shortages of both productive capacity and trained manpower are developing in those branches of production where demand is strong. For the long run, the need to improve productivity in both agriculture and industry is heavily underlined: "In the 1930's the great common problem was unemployment, and in the postwar years it was reconstruction; today, however, the problem of raising productivity has pre-eminence." Any possible smugness at the fact that productivity in Western Europe is now 15-20 per cent above prewar is punctured by contrasting this change with the rate of change in the United States (about double the European rate) and by illuminating descriptions of some of the reasons for the difference.

Turning to the internal financial situation of the member countries, the report records a period, since 1953, of rising production and stable prices, and of notable relaxations in internal controls and restrictions. And on the whole the report finds that financial policies have been correctly adjusted to the tempo of production. For most of the two-year period official policies were generally expansionary, but recent signs of inflation have led the United Kingdom and a number of other governments to take steps to damp down demand. For the future the signs are mixed. But even in those countries where demand is still rising and resources are already fully employed the OEEC seems confident that the inflationary pressures can be mastered by "small but timely adjustments of policy."

The report deals at length with Western Europe's trade and payments. Again, although problems are not minimised, and the dimensions of American aid and military expenditures are calculated with commendable caution, the outlook is generally optimistic. And, in particular, the report goes out of its way to dispose of the bogey that when the United States sneezes the rest of the world has influenza. If an American recession coincided with a European recession, rather than with a time of rising economic activity in Europe, or if raw material prices were particularly sensitive, "serious consequences could only be averted by strong government action." But the authors conclude that the inevitability of a serious blow to Europe's balance of payments and level of activity from a slight American recession "was too easily accepted on the strength of the 1949 precedent."

*Sixth Report of the OEEC, *From Recovery towards Economic Strength*, Paris, March, 1955. Obtainable from HMSO, 6s. net.

Despite the fact that a marked deterioration in the current balance of payments of member countries developed in the latter part of the year, and that final information is expected to reveal a small deficit (excluding military receipts) as compared with a surplus of $0.4 billion in 1953, gold and dollar reserves of member countries continued to rise in 1954, and with reserves around $12.5 billion at the end of the year the OEEC is outspoken in prescribing for the future a larger dose of dollar liberalisation and the substitution of the discipline of competition for that of government control.

Throughout the report, as a guide to both internal and external policies, expansion, liberalisation, and competition are given an emphasis which is strikingly new.

> *Expansion* and *liberalisation* are the two watchwords of European economic policy for the future. . . . In linking a policy of internal expansion with one of liberalisation culminating in convertibility, Member countries aim at achieving something new.

No precise timetable for convertibility is given, and no secrets are revealed, but convertibility is discussed in considerable detail, not as a distant goal but as the culmination of a process already well under way.

Both in overcoming the remaining obstacles to convertibility and in establishing convertibility on a lasting basis, the OEEC lays emphasis on the need for close international cooperation. Although dodging, for the time being, the exact rôles varying international organisations will have once convertibility becomes general, the report confirms what was already apparent from the recent decisions on the future of Gatt ; that is, that the burden of formulating and applying world-wide rules must then rest with global, rather than regional, organisations. But although recognising that its role in trade and payments will change in the future, the OEEC countries are perfectly clear that the method of cooperation which they have evolved is a pattern which must endure. René Sergent, the new Secretary General of the OEEC, inherits from his predecessor Robert Marjolin an organisation which may, for the time being, be very short of economic crises ; but it is very well stocked with goodwill.

Japanese-American Discords

FROM OUR TOKYO CORRESPONDENT

THE ineptitude and amateurishness of Japanese foreign policy reached an appropriate climax when Mr Dulles rebuffed the casually confident proposal that the Foreign Minister, Mr Shigemitsu, should visit Washington. The official voice of this proposal may appear to have been the voice of the *Gaimusho* (Foreign Office), but the hands were certainly the fumbling hands of the Prime Minister, Mr Hatoyama, whose slapdash approach to foreign affairs is the despair of Mr Shigemitsu and the *Gaimusho* career officers.

The rebuff also reflects the hardening American attitude towards Japan as relations between the two countries uneasily deteriorate. It would have been absurdly naïve not to have expected bland and probing Japanese objections to certain aspects of American policy ; but the evidence of a growing passive resistance to and positive obstruction of Washington hopes and wishes has already passed far beyond realistic expectations. The trend was there before Mr Yoshida—whose strong, if intolerant, hand is sorely missed in the Diet—fell to the knives of vendetta intrigue. But "trend" is too mild a term today, when the left-wing Socialists are infuriated by Mr Hatoyama's calm and triumphant appropriation of their policy of friendship with Peking and Moscow, and when American businessmen in Tokyo are shrugging their way out under pressure of rising taxes and bureaucratic excesses.

Negotiations on practically all issues between Washington and Tokyo are at present either stalled or limping along painfully. When there are no Japanese demands for special concessions, there is plenty of the toughest haggling and bargaining. There is the fundamental question of defence, on which the Japanese continue to drag their feet, demanding reductions in their 30 per cent contribution to the joint defence pool. The proposal has been made that the United States should accept a $65 million cut in this contribution, which the Japanese would divert for the stipulated small build-up in their armed forces for the coming year. This arrangement would have the happy dual effect of facilitating pledged tax cuts and of shifting the defence budget cost to Washington. More than dollars are involved. The Americans are impatient to pull their remaining ground troops out of Japan, but the Japanese want to concentrate on the reconstruction of modern heavy industry "for basic rearmament" rather than on the training of manpower.

Haggling and Stonewalling

A second point is Japan's indebtedness to the United States. Japan owes nearly $2,000 million for help received during the Occupation. The Americans have offered to settle this, on the generous basis of the German formula, for about $600 million, spread over 37 years with nominal interest at 2½ per cent. But the Japanese jibbed at signing and the talks have hung fire for six months. In addition, the Japanese are demanding substantial advantages over other nations in the purchase of surplus American agricultural products. The American terms, accepted by other countries, were: $100 million worth of products, for which only $85 million would be charged—$59.5 million on loan at 4 per cent for 30 years and $25.5 million to meet American military expenses in Japan. The Japanese want a 40-year term at only 2½ per cent interest and are haggling over repayment conditions.

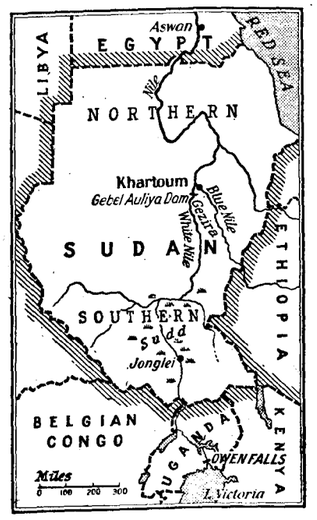
There are many other straws of discord in the wind. The Japanese have refused an application for an additional weekly flight by an American airline into Tokyo. They have turned down requests for the assembly of two makes of American cars in Japan with Japanese labour and American capital—a facility which has been granted to British and French firms. They have refused to grant American consular officials the normal exemption from customs duties ; and they have said "no" to an offer by American interests to supply capital and technical know-how for a merger with Japanese sewing-machine interests. They have also turned down urgent American air force representations for the lengthening of dangerously short airstrips for jet planes at bases leased to the United States.

It is impossible to say to what extent all these irritations and frustrations are part of a fixed pattern, or are merely coincidental and indicative of an irresponsible attitude of mind rather than of a calculated attitude of policy. The

effect on the United States Embassy here, however, has been cumulative and profound ; although he has personal sympathy for the harassed Mr Shigemitsu, the US Ambassador, Mr John Allison, himself recommended Mr Dulles' firm refusal to allow the present negotiations to bypass his Tokyo staff—to the political advantage only of the government.

The hardening Washington line will not help Mr Hatoyama in his exuberant overtures to Communist China and Soviet Russia. The delicate game of playing off one side against another depends, of course, to a large extent on the willingness of both the other sides to play along. The industrial interests behind the conservative forces in the Diet know only too well how essentially committed they are to the United States. The risk for the West is that the feeble and fumbled showing of the divided conservatives, since the eclipse of the redoubtable and patriotic Mr Yoshida, may stimulate the resurgence of the Socialists, whose "neutralist" instincts would promote even greater recklessness in approaches to Peking and Moscow.

The Southern Sudan and Egypt's Water



BY A CORRESPONDENT

WHETHER the Nile waters are to be a source of unity or discord between Egypt and an independent Sudan is still an open question. Last week, the first talks held on the division of the waters broke down almost at once on an issue irrelevant to the main question of how two populous countries are going to divide their main source of life. Even at the height of the tiff, both parties seemed to remain aware of the importance of agreement. A point that occurs to them less frequently is the extent to which the successful execution of any plan conceived between them hangs on the attitude of the Southern Sudan.

The representatives of the South hold a quarter of the seats in the Parliament at Khartoum, and the local "Hansard" shows them as mainly concerned with the extraction of more funds for their local needs from the budget of the central government, and more rapid advancement for individuals as the price of their adherence to one or other of the main parties, the NUP (pro-"link") and the Umma (anti-"link"). Some of them are also already making considerable play with the obvious fact that the South is not yet ready for self-determination, and are demanding federation in place of union with the North. "We are a backward people of different race ; we need development, economic and cultural," the argument runs, "and if the North will not provide the money to pay for it, we will not follow the lead of the North." What precisely they will do is less clear ; but it seems likely that they will at first give their votes to whichever party promises most to the South or to its representatives. The equally insistent demands of the northern MPs, together with increasing financial stringency, make it improbable that both sides can be satisfied for long.

But the future of the Southern Sudan rests very insecurely with those who represent it at Khartoum. A few of them are northerners by race and/or nominees of the NUP ; the rest are nearly all products of the Christian mission schools, though several, in switching their activities to politics, have also adopted Islam. In certain areas, away from the river, where development schemes have been started, some realisation of economic factors has penetrated, but to the unsophisticated millions who live among the swamps that clog the White Nile beyond the 12th parallel, northerners and their nominees mean nothing ; the young men from the mission schools mean little more. To them nothing in the world matters except cattle. So long as they can be left to tend and contemplate their cattle they are content. The occasional payment of taxes, and abstention from throat-cutting, are no doubt more acceptable than they used to be, but interference with their ancient grazing-rights would seem a gross and wanton act of tyranny.

And yet it is in their country, and among their cattle, that all the great irrigation schemes so long planned by Egypt are to materialise. So far these have not reached the stage of construction—indeed, the practicability of some of them is still in dispute. The great dam at Owen Falls has been built, but it cannot operate to the benefit of Egypt until the Jonglei Channel has been cut through the wide marsh area called the *sudd* so that the vast new supplies of water can pass downstream. When the Gebel Auliya dam was made in 1937 to preserve existing supplies until the time of their release to Egypt, the resultant flooding and displacement of population for 300 miles upstream was offset by the provision of canals linking the triangular area between the White and Blue Niles called the Gezira, by the installation of pumping schemes and by the resiting of villages ; but this was in the Northern Sudan where the people are of an advanced and progressive type. The cutting of 175 miles of channel through the *sudd* will flood 900 miles of the country of the Nilotic cattle-owning negroes, and the task of reconciling them to this apparent catastrophe, and of introducing a novel regime of life, will be a colossal one.

If the project materialises, the administrative process will fall upon the government of the Sudan, the cost being met by Egypt. But imagination boggles at the measures of enforcement that may be called for. Neither the deliberations of the politicians at Khartoum nor their verbal reassurances on the spot will greatly affect the issue, and the gap between South and North will inevitably be intensified. If, on the other hand, the project is abandoned, it will mean the end of Egypt's hope of millions of additional acres to be cultivated in Egypt to support the ever-growing population ;

the Owen Falls Dam will be of little benefit, and the vast new High Dam projected at Aswan will cease to be an economic proposition. Some fleeting compensation would accrue from the fact that Egypt would not have to find the huge sums required for building the dam.

But the main problem remains: what is to be done with Egypt's surplus population, and what permanent security will it have that there will be an undiminished supply of water even for its existing population? When the Sudan government decides, as it certainly will, that it must increase its own quota, whether Egypt consents or not, that will be bad enough; but if, in addition, the South turns nasty, the position will be far worse. Egypt dare not push matters too far for it is obvious that the Sudan holds the hostages, and if the unpredictable Southerners play rough there is little that Egypt can do about it even if it has—and it may not have—the goodwill of the Northerners. Ironically enough, Egypt's one real way of salvation lay in the continuance of British control safeguarding its vital interests, but instead it preferred systematically (and in the end effectively) to intrigue for the dissolution of British control before alternative guarantees could be devised and made effective.

Holland and the WEU

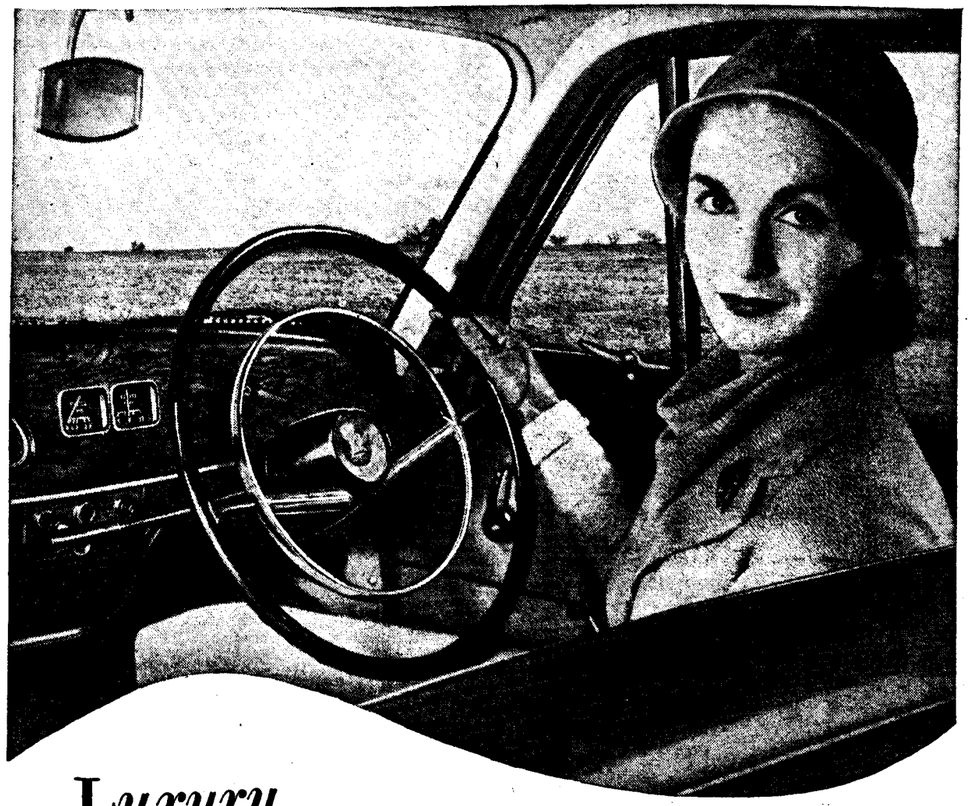
FROM A CORRESPONDENT IN HOLLAND

NEVER has Holland ratified any treaty with less enthusiasm but less opposition than the Paris agreements. At the end of last month the Second Chamber passed the bill of ratification with only the six Communist deputies voting against, and the first Chamber will complete the process by the first part of May. There is virtually no doubt about the outcome. But since Holland ratified the EDC not primarily for military reasons, but rather as a means to further European integration, it is obvious that a substitute that does not offer the semblance of integration, even in the military sphere, is not likely to arouse much enthusiasm.

Holland has no neutralists in its parliament—not even among the Socialists. For all except the six Communists, the real significance of the Paris agreements lies in the fact that they provide a way of rearming Western Germany within Nato. In spite of the widespread feelings aroused by the German occupation during the last war, Holland is more keenly aware of the urgent importance of rearming Germany than any other European country except perhaps Denmark. Dutch territory cannot be defended unless the defence line is shifted back to the Elbe. No amount of faith in the effectiveness of the Western alliance can remove Dutch concern about the indefensible eastern border of the country.

Naturally enough, the Dutch are worried about the lag in Western European integration, for they regard this integration as a development made necessary by technological progress. And within the framework of the Western European Union integration appears to be out of the question. Both the government and the politicians realise that Britain will never follow the European integration road by way of the supranational institutions that the Dutch believe to be indispensable. The government has plainly told the Dutch parliament that the WEU is a military organ, not a device for general integration; all attempts to refloat the stranded integration boat must take place outside the WEU.

According to the Foreign Minister, Mr Beyen, a new initiative towards integration will be taken by the Benelux governments. There is soon to be a meeting of the foreign ministers of the six Schuman pool countries, and it is hoped that this will lead to a new resolution directing the dormant *ad hoc* Assembly of the Six to redraft the statute for a European political community in the light of the EDC's rejection and the WEU's birth. This would mean a statute without military provisions, and with more leeway for economic and monetary integration than was provided in the draft presented to the six governments in March, 1953.



Finally, during the recent parliamentary debates it was plain that there was much concern over the forthcoming East-West negotiations. It is, perhaps, more fully realised here than in some bigger countries that previous talks have been poorly prepared and that Western statesmen are still largely in the dark about what can or should be attempted. Moreover, some feel that the suggestion of talks with the Russians has been used by the West as little more than a bait to encourage France and Western Germany to accept the Paris agreements. A spokesman for the biggest government party expressed this concern when he said: "The small countries know that their interests are hardly secure even in a big conference in which they themselves partake. We read in the Yalta documents what happens if the problems are tackled by "these exclusive clubs to which only those are admitted who can pay an entrance fee of five million soldiers." The spokesman continued: "I believe that there is only one thing worse than a conference which fails, and that is a quasi-successful conference." That is what Holland fears.

"Operation Nenni"

FROM A SPECIAL CORRESPONDENT

"OPERATION NENNI," Signor Nenni's new formula of an "opening to the Left," with its offer of collaboration between Socialists and Christian Democrats, was launched on the eve of the Italian Socialist party's conference at Turin at a time when the Scelba coalition government is menaced by dislocations and divisions. It was received with relief by many Italians who are worried about the future of democracy in their country. Fear of a Christian-Democrat coalition with the right-wing (Monarchists and neo-Fascists of the MSI) together with the inexhaustible *combinazione* power of the Italian mind, served to build up what to the Italian looks like the best logical solution for the political instability from which his country suffers.

The fact that Nenni's "proposal" was fully debated during the four days of the Turin congress furnished further material for this wishful thinking. But there is an air of unreality about it all. For Signor Nenni is not a free agent. He is too tied to the Communists and his party is in their hands. Since the time of the split in the Italian Socialist party in January, 1947, Pietro Nenni and the then theoretician of the party, Lelio Basso, have lost so much ground to Rodolfo Morandi, Deputy Secretary and head of the "organisation and cadres commission," who is gener-

ally believed to be hand-in-glove with the Communists, that the latter is practically the boss of the "old house."

The extent to which Nenni is dependent on Togliatti is best shown by the development of the conflict which took place between him and Morandi over the organisation of the party, after the June, 1953, elections. Morandi, who thought the moment ripe to show his hand, proposed new statutes, which were in fact copied from those of the Communist party, with the object of obtaining a "more efficient machine." Nenni, who was against the project, had no other recourse than to bring the matter before Togliatti for arbitration. His old friend, who in any case preferred the *status quo*, which makes him the arbiter of the internal life of the Italian Socialist party, decided in favour of Nenni. But as discussion within the party had gone too far for Morandi to be able to withdraw his project, it was arranged that some of the "Morandists" should vote against his project so as to bring Togliatti's verdict in officially. Morandi did, however, get his way to some extent and was able to present to the delegates at Turin a modified draft of the new statutes which condemns the existence of factions and strengthens the authority of the Communist bureaucracy inside the Socialist party.

The terror reigning in the party is such that every sign of real life has died out. To discuss even unimportant events, such as the departure of Malenkov, the old members have to go to a café. Only tactical considerations enabled "The Trotskyist," Lelio Basso, to speak from the platform of his own party's congress, and even then it was only after long discussions in which the official Communist representative at the Congress had the last word. And the editor of *Avanti* could be heard accusing Lombardi, an important figure in the party, who advocated an enlarged version of Nenni's point of view, of "right deviationism," an accusation without precedent in a free socialist congress.

In order to maintain their positions, Nenni and his friends have to indulge in a never-ending courtship of the Communists and repeatedly, and often in a not very dignified manner, have their reliability impugned. Not long ago, the Communist president of the youth section of the peace movement, who was troubled by his conscience, sought advice from the adult chairman of the movement, who was a Socialist. Next day, to his surprise, he was summoned by the chairman's Communist deputy who had been told everything and proceeded to ask for his resignation. The chairman of the peace movement is none other than Pietro Nenni.

Yet all those followers of the famous Italian "Maximalism," who are suffocating in the new atmosphere of the party, remain at their posts. They argue paradoxically—pointing to the Social-Democrats' experience—that in Italy, if one is to work with the Christian Democrats without inevitably becoming their instrument, one must be the ally of the Communists. And they say this although they themselves have demonstrated that the Socialist party is anything but independent. The second paradox of Italian politics is that in spite of this, Signor Nenni's party still represents a centre of attraction for part at least of Signor Saragat's Social-Democrats. The Social-Democrat party is, unfortunately for Italian democracy, losing its battle, and in the confusion of the moment the men on its left are more or less ready to go back to the "old firm." Some who have left Saragat have already rejoined and one of them, Antonio Greppi, even made his confession, Moscow fashion, at the Congress.

The leaders of *Unita Socialista*—the left wing faction in Saragat's party—sent a telegram of sympathy to the Congress, which was very badly received by the delegates, the majority of whom were "Morandists," but received an encouraging reception from Signor Nenni in his final speech. He hopes to increase the number of his supporters in his internal struggle with Morandi by absorbing the *Unita* into the party. Their presence would not, however, change the existing balance in the party. The Communist-Socialist alliance is "definitive," said Nenni. The Communist fraternal delegate summed up the relationship between the two parties even better: "They are two in one and one in two," he said. What he did not say is that one of the two is the master, while the other is the obedient servant.

The Paper Bulletin

This is a new bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The first quarterly issue will be available at the end of this month. Full details from:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, London, S.W.1. Whitehall 1511, Extension 144.

Coal Price Dilemma

AGAIN, as last year, maximum prices for Ruhr coal have been extended by the High Authority of the Coal and Steel Community into the new coal year which began on April 1st. And again, as last year, the underlying reason for this action is that no settlement has thus far been reached on the basic problem, the dominant position of the German monopoly sales agency, GEORG, in the Ruhr.

Last year, the Dutch, who thought prices would fall unless attracted to the ceiling by the setting of maxima, and who felt that the High Authority was dragging its feet on the cartel problem, appealed to the Court against the action of the High Authority. However, at the end of March, the Court found in favour of the High Authority, thus clearing the way for the latest extension of the maximum prices on Ruhr coal. Given the changed market situation and the pressures from the German mine owners for higher prices, the Dutch representative this year was willing enough to agree with his colleagues on the Council of Ministers that the High Authority was right to maintain the present ceilings.

The decision to extend the maximum prices in effect rejected the contention of the German mine owners that existing wage rates (that is, before the agreement reached last week on further increases) required higher prices. Although last week's agreement between the operators and miners on wage increases averaging 9.5 per cent averted the threatened strike of some half million miners in the Ruhr, it will undoubtedly lead to renewed pressure by the mine owners for higher prices. It may also mean pressure for a reduction in the levies which, in accordance with the

transitional provisions of the Schuman plan treaty, are collected from the more profitable enterprises within the common market and used to assist less fortunate mines to become competitive.

In any case, on the High Authority's own arguments, the maximum prices will have to be reviewed whenever the larger question of the "organisation of the market," a euphemism meeting the position of GEORG, is finally determined. Discussions with GEORG have now dragged on for almost a year and it is difficult to see how the High Authority can face the next session of its Assembly in Strasbourg in May, without something more definite than the assurance that it is investigating the problem with which it has thus far bought time.

Canada's Budget Deficit

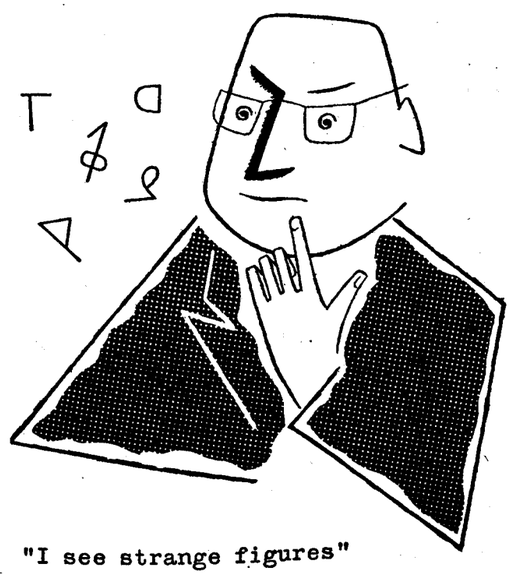
FROM OUR OTTAWA CORRESPONDENT

THE Canadian government has produced a shining example of fiscal planning on the strictest lines of economic theory. But instead of boasting of it, the government publicly disavows any such intention. Mr. Walter Harris, the new Finance Minister and a possible successor to Mr St. Laurent, has adopted the text-book device of a budget deficit to be distributed in tax cuts as a means of stimulating economic expansion. The deficit is moderate—barely 4 per cent of estimated revenues, but then the government's view is that only moderate stimulus is required. Indeed the size of the deficit has been determined—for the public eye anyway—by the standard of what revenues would be if the economy were fully employed.

Mr Harris spelled this out in his budget speech. He said that if there had not been a period of slackness last year, the gross national product would have been $25 billion, instead of $24 billion. In that case the 1955 gross national product would have reached $26 billion. So the Finance Minister accepted $26 billion as representing the 1955 level of the economy in a state of full output and employment. At that level, he said, his tax revenues would be about $200 million higher than he actually expects them to be. This $200 million is the measure of his deficit and his tax reliefs.

The hypothetical calculation of where the economy ought to be in terms of overall output if it were expanding at a "normal" rate of growth is an exercise now very popular among economists, especially those of the Keyserling school in the United States. This may be the first time a national budget has avowedly been based on it. Mr Harris's figures reveal that the Canadian government has assumed the "normal" growth for this country to be at an annual rate of 3½ per cent. That is the percentage increase applied to 1953's record gross national product to give the $26 billion figure for 1955.

Actually 1954 declined from 1953 by nearly 2 per cent (mainly because of a bad crop and poor wheat marketings), and Mr Harris's best guess for 1955 is that it will actually show an increase of 5 or 6 per cent over 1954. This gives a national product for 1955 of $25¼ billion (instead of the optimum of $26 billion); and most observers think it is decidedly on the optimistic side, though it was a figure produced after the most careful prognostication by a group of the government's economic experts. By basing his revenue forecasts on this $25¼ billion forecast of g.n.p., the Finance Minister could have balanced his budget at the existing level of taxation. Even after including last year's deficit of $62 million on the Old Age Security Fund in next year's expenditures, revenues on the old level of taxation would have very nearly matched them. So the budget has been pushed into deficit deliberately in order to provide some tax cuts.



Three quarters of the tax reduction has been given to personal income tax payers and it is concentrated on the lower income groups. The economic defence of this is that it is the quickest way of showing results by increasing consumer spending which incidentally has been much the strongest element in the Canadian economy throughout the period of slackness. A 2 per cent reduction in the corporation tax (from 49 to 47 per cent) is the other major tax cut, together with lower excises on cars, tyres and tubes.

On the assumption that Canada needs some stimulus to get back to its proper rate of expansion after last year's modest setback, this financing of tax cuts out of deficit is easily defensible. The budget speech in fact made it perfectly clear that this was the intention. But the government refuses to say so explicitly. It has never admitted that anything was wrong with the Canadian economy that required artificial stimulus, and it will not do so now. It would rather do good by stealth. The result is to leave it without any logical defence of the plunge into deficit financing.

Unemployment Goes Up

Politically this is unlikely to be a liability. In the eyes of the public, tax cuts are perhaps always their own justification. Certainly to understand them is no help—and may be a hindrance—to forgiving them. Moreover the Conservative opposition has been calling for tax reductions, and is left in something of a dilemma. But once you cross the line from solvency into debt it is always more difficult to set a limit. In preparing the 1955 estimates of expenditure Mr Harris was very hard on a number of government departments, and his colleagues accepted a reduction in their votes on the ground that the government was facing a deficit. Since the budget has not been balanced anyway it is much more difficult to support the cuts in expenditure. From the other side also—as already from some people on the left—comes the complaint that the deficit is not big enough.

There seems very little doubt that just one thing led Mr Harris and Mr St. Laurent to propose this deficit budget. That is the high rate of unemployment this winter. Until the end of 1954, it really looked as if this winter's unemployment would be no worse, and might be less, than last winter's. This impression was fortified by the undoubted pick-up in all the production indices in the last three months of 1954. And the production indices are still rising satisfactorily. But the number of people without jobs and seeking work jumped in January to nearly 7 per cent of the labour force. It rose again in February, and probably (though no figures are yet available) in March. In the face of a barrage of complaints in the House of Commons the government refused to acknowledge undue alarm about the figures. But it has now become very clear that it is not prepared to face another winter of the same kind without trying to do something about it. Hence the curious dualism of buoyant forecasts of economic progress coupled with a deficit budget designed to stimulate greater expansion.

"I see strange figures"

observed the Chairman,

"figures that will change our whole policy for the South.

Why did we never have them before?"

'Because we were in our pre punched-card era, sir' explained the accountant.

'These figures would have taken weeks by hand but with Powers-Samas machines we now get them in hours,

especially since we have installed their latest electronic equipment.'

There is a range of Powers-Samas punched-card equipment for every type of application.

Office Efficiency : Powers-Samas supply a complete range of the latest office furniture.

Write for illustrated catalogue.

ROOM FOR ALL

Looking at London from the top of a bus is an instructive pleasure for both Londoner and visitor. But while the stranger is looking for a glimpse of history or the picturesque, the Londoner is frowning at the surge and stop of the traffic. He will see side streets neatly halved by lines of parked cars. He will see his own bus hemmed in and slowed to the speed of the traffic around him. And he will notice that more than half the cars belong to private motorists who are going the same way as his bus, at the same speed, suffering with him the frustration of delay.

He may be excused for wondering if they would not do better to leave their cars at home and travel with him on the bus.

But would there be room?

Yes. Except perhaps during the rush hours, when everyone needs transport at the same time, there is always a seat on the bus. Moreover, as things are, if a particular route is hard-pressed, putting on extra buses is merely adding to the congestion, increasing the delay on the buses already in service. But were all private motorists to leave their cars at home, then congestion would largely disappear and *the buses would go through.* Not only would existing routes regain the regularity and efficiency for which they were planned, but extra buses could be run where needed, reducing the service interval, giving an even better service, and restoring to the Londoner his pride in the appearance of his city.

ISSUED BY LONDON TRANSPORT

SHREDS OF EVIDENCE...

But evidence of what ? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres ; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

THE BUSINESS WORLD

A Cry from Lancashire

A DECISION on the claims of the cotton industry for government assistance is expected to be announced after Parliament reassembles next week. One of the last acts of the Churchill government was to receive a deputation from the industry to hear its case for protection against imports of cheap Indian cloth and for the abolition of the purchase tax on cotton textiles. Will the Government agree to restrict imports of grey cloth for processing and sale on the home market? It would prefer instead to see India reduce its high tariffs on British cotton textiles—and there was a hint of that possibility from New Delhi this week. Will the Government abolish, or reduce, the purchase tax ? Even if Lancashire's whole case were conceded, no one will suppose that that would reach the heart of the cotton industry's main problem.

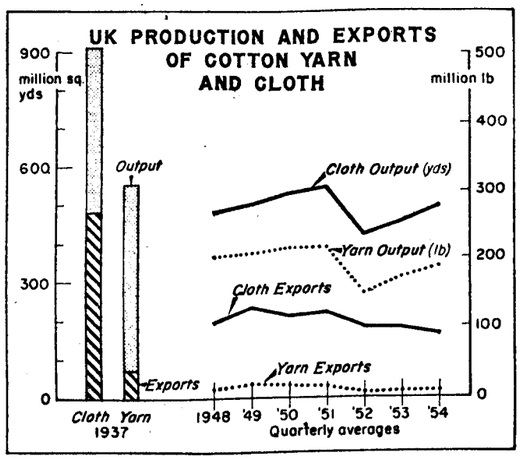
That problem is to recapture a larger export trade. Only thus can a further painful shrinkage in production be avoided. There is little prospect of an expansion of sales in the home market—which now absorbs over three-quarters of its output—to offset the decline in exports. In Britain, as in the United States and other Western countries, rising living standards have not in recent years brought a higher consumption of textiles, and the British population has been relatively steady. The production of more attractive goods at lower prices might relieve, but could hardly reverse, that stagnation.

Nor can the cotton industry count on an expanding world market to assist a recovery in exports. World consumption of textiles is still growing, but world trade in them is smaller than before the war, because demand is being fed more and more by domestic industries sheltered behind high tariffs. And Lancashire's share of world exports is being squeezed—mainly by competition from the relatively low-wage industries of India and Japan. It was Lancashire's fortune to give birth to the first industrial revolution, and its misfortune to see that revolution imitated all over the world.

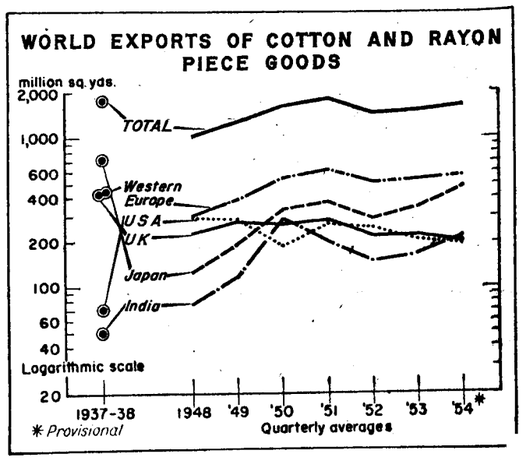
The postwar expansion of Lancashire's exports was cut short in 1953. In that year British exports of cotton piece goods failed to recover from the "recession" level of 711 million square yards in 1952, while other countries' exports did recover, and in 1954 British exports fell sharply to 637 million yards ; that was the lowest figure for seven years, and less than half the 1937-38 average of 1,450 million yards. In Lancashire, full employment does not rest upon the home market. It depends upon this marginal export trade and the recent decline in exports is the reason why the industry now hesitates on the brink, as many fear, of another recession. Other factors—the import of Indian cloth, the "D-scheme" of purchase tax, and the fear of a subsidy on the new American cotton crop—are irritations, not root causes.

Can exports be increased? There is indeed no assurance that the most resourceful efforts will be adequately rewarded ; there never is. But no responsible industry can fail to try—by reducing costs, and by specialising on the production of goods in which it can hope to retain the greatest competitive advantage. The big opportunities of clothing the teeming masses of Asia with the products of Lancashire's looms no longer exist. But there remain two categories in which Lancashire has worth-while chances. The first, and smaller, is the luxury article, in which Lancashire's skills are still supreme. The second is the medium-priced article which succeeds because price is still secondary to the quality of design and finish (the poplin shirtings in which Lancashire still beats all comers provide a good example). A number of vertical organisations producing the second type of article under their own brand

names have carved out for themselves profitable and expanding niches in world markets. And the growing range of synthetic fibres made in this country—at prices that are as low, or lower, than any in the world—offers Lancashire the opportunity of beating a new path to the world's doorstep with fabrics that exploit the blending merits of the newer synthetics.



*

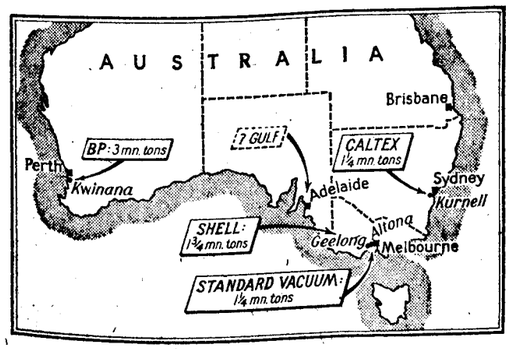


The path to reductions in costs—through the use of new machinery and of techniques that obtain the maximum efficiency from machines and labour—has been pointed by the working party under the chairmanship of Sir George Schuster, the productivity missions to the United States, the special departments run by the Cotton Board, the spinners' and weavers' associations and the Shirley Institute. But while many mills have taken full advantage of modern techniques—some ring departments in spinning mills, for example, have matched the productivity of American mills—it remains unhappily true that the industry as a whole has done too little to bring itself up to date. Rough indications of the lack of progress can be given. The proportion of mills in the Spinners' Federation that are using work study methods in one or more departments is little more than 40 per cent. Only about one-sixth of the weaving mills have introduced the wage list that was devised to facilitate improved methods of production. The number of spinning mills that have gone over to two shifts is negligible.

Why has too little been done? Many firms lacked the will to advance when the sellers' market provided the money. And Lancashire, still sore from the blows of the thirties, often shies away from expansion, to take refuge in the restrictive agreements that have grown up in all sections of the industry except the weavers (who would like one if a workable scheme could be devised) and the merchant-converters. Such agreements may not be as vicious, nor, indeed, as effective, as they are sometimes said to be, but they do coddle the inefficient: to that extent they are helping the industry to dig its own grave.

Another reason is the restrictive attitude of labour, which naturally tends to be exaggerated by managements that will not lead: there was some truth in the claim of one labour leader that seldom has a management been unable to introduce new techniques when the workers were properly consulted. But the unions could help in three ways: by making greater efforts to exorcise hostility to re-deployment where it still exists; by agreeing to streamline wage structures that are fiendishly complicated; and they could assist the introduction of double-shifts by conceding a shift of 40 hours a week for the same wage as for a 45-hour single-shift week, in place of the present minimum of 37½ hours.

The emergence of a buyers' market should speed up the changes that have been taking place in Lancashire since the war—the concentration of the industry into larger units, and the move away from the still dominantly horizontal structure of the industry towards vertical organisation. The pace may indeed quicken and Lancashire may show more mettle than its critics suspect. But there is little reason for optimism. Whatever the fate of the restrictive agreements at the government's hands (the calico printers' scheme already stands condemned), the defensive attitude behind them will die hard. The same attitude lies behind the appeal to the Government for protection against Indian grey cloth. If the Government concedes the protection asked for, it will have set a precedent that it may well regret. Imported goods will reappear in the home market, next time perhaps from the Continent, and the industry's main problem will have been brought no nearer solution. It may not be possible to avoid some further shrinkage, but for the good of Lancashire and of the British economy it is to be hoped that the industry will fight for a place in the sun, rather than accept a minor role in world markets.



Oil for Australia

IN a country's economic development, there are some well recognised symbols. The first sign of dawning industrialisation is likely to be a cotton mill, to which presently a cement works is almost bound to be added. At a much later stage, there are two gleaming landmarks of industrial arrival—the continuous strip mill and oil refineries. Australia is getting both, and neither can be dismissed as a theatrical gesture. The hot strip mill which is now being completed by Broken Hill Proprietary at Port Kembla, together with the finishing lines that are being laid down by two other companies nearby, are so clearly right, given Australia's resources and the prospects for future demand, that they do not call for argument. So, probably, is the oil refinery programme, which in essential outline will be completed this year.

This programme will have cost the major oil groups well over £A100 million, and although the oil industry

does not shy at millions, a hundred millions is a matter for passing thought. Nearly two-fifths of this total will have been spent by British Petroleum's new refinery at Kwinana in Western Australia, and there are three other major projects completed, or near completion, each costing up to £A25 million. The total costs, including ancillary works and housing, must be stretching out towards £A140 million. It is never easy to say when a refinery starts or where it finishes. Shell's refinery at Geelong, near Melbourne, came on stream nearly a year ago, but next year the catalytic cracker, which is now being built, should be turning out high grade gasoline, complementing the distillation unit. The Geelong plant is planned to take 1¾ million tons of crude oil a year. Standard-Vacuum's remodelled refinery at Altona, Victoria, was officially opened by Mr Menzies last week and will have a capacity of 1¼ million tons, and the Caltex refinery now being completed at Kurnell on Botany Bay, will have a similar throughput. Outstripping all these in size, the Kwinana refinery will be capable of processing 3 million tons of crude.

Thus the major groups are completing the first stage of a programme that will give Australia a total refining capacity of about 8 million tons when the present projects are on full stream. In all oil products, Australia should then be self-sufficient, save perhaps for highest grade gasolines and some lubricants. There will be a notable saving in foreign exchange—how much, it is impossible to guess, for until crude oil is found in Australia itself, it will have to be imported from the Persian Gulf and the East Indies. The landed cost of oil supplies has been running at about one-sixth of Australia's total import bill—say over £A100 million—and a guess at the saving from home refining might be a quarter of this. But since there is the clearest expectation that demand for oil products will continue to increase—last year there was a jump of the order of 10 per cent—there is not likely to be much net relief until commercial oilfields are discovered; and experience has shown how much time and money will still be needed. After last year's excitement and disappointments at Rough Range, Australian speculators in Ampol Exploration shares have been in a distinctly chastened mood. Indeed, this is no field for the uninformed speculator. Ampol Exploration's strength, like that of other ventures in which British Petroleum, Standard Vacuum, Zinc Corporation, and Shell are concerned, rests in its powerful connections, for Caltex has an 80 per cent interest in this company and continues to spend with a free hand on exploration. It is not tracing oil that matters, as at Rough Range I, where oil was found at 3,000 feet, and nothing else down to 20,000 feet: it is the proving and opening up of a payable oilfield. No doubt this will one day be done in Australia and New Guinea, too; but the cost and effort promises to be great.

Meanwhile, the new refineries will provide the foundations of important oil and chemical industries. Coming comparatively late into this field, Australia has the advantage of many improvements in design and petroleum technique that some of the well-established refineries in this country and elsewhere cannot boast. In the compactness of its design, and in the economies that result when even cat crackers seem almost to be mass produced, BP's new refinery at Kwinana can be reckoned "cheap." It has taught many lessons to local craftsmen and contractors, whose work during 1953 and 1954 was uninterrupted by any significant labour dispute among the 3,500 men employed at the site.

That it should have been built near Fremantle must have owed something to the big bunkering business that BP has long done at that port. It involves a

shorter haul of crude from the Middle East than the south and east coasts, and would be convenient for back-hauling refined products to South Africa or South East Asia if the markets favoured such movements. But the main markets are bunkers at Fremantle and elsewhere (fuel oil will represent more than half the output), gasoline diesel fuel and gas oil in Australia and New Zealand. Save at Kwinana, where the bunkering business occupies such a large place in the economic scheme, the Australian refineries emphasise the high and increasing demand for motor spirit. A projection of demand into next year suggests that imports of half a million tons of gasoline will still be needed to meet total demands perhaps exceeding 3 million tons.

If that figure is reached in 1956, it will mark a 50 per cent increase in five years. Yet motor spirit is a highly competitive and sensitive market. When Shell started the "single pump" policy in Australia in 1951, there was much concern among other oil companies and much raising of eyebrows by the state and federal governments. The single brand station, as American experience has shown, is an economical station to supply; the filling station with six different brands is not. Where Shell and Vacuum started, the others were bound to follow in developing exclusive sites. The governments—which until lately have regarded oil and beer as the key commodities that the Australian consumer should enjoy at a controlled price—have not warmed to the idea that oil companies in Australia compete with each other, nor to prices varying with quality.

It is possible to see the distant prospect of a young petro-chemical industry based on the new refineries. Shell have a plant in contemplation for fertiliser production; the more elaborate chemicals rest on the development of an Australian market capable of absorbing them, and other companies have laid a foundation for new chemicals that does not rest exclusively on oil refinery practice. On the best assumptions, petro-chemicals on any sizeable scale in Australia will remain a long way off. The more immediate question for the refineries is how to earn their reasonable keep in a country where distribution costs are high, where public opinion keeps a critical eye on what the big oil groups do, and where the motorist is completely tolerant of the idea of a more or less standard, and not especially high-grade, gasoline. There is no rapidly expanding inland market for fuel oil, and discriminatory taxes on road haulage have virtually strangled the development of a trucking industry on the scale that Australia needs and could otherwise afford. It might be something of an exaggeration to say that Australia has secured a complicated oil refining industry to meet needs that are commonplace by comparison with those of America or Europe. But it is necessary to make the fullest use of these new resources if they are to produce a fair return on what has been spent on them, and if they are to be expanded as Australia's own needs for oil expand.

Business Notes

Strength of Sterling

STERLING has this week again shown reassuring signs of strength. The quotation against the dollar in the official market has moved from \$2.79⅜ to \$2.79⅞. All the evidence suggests that this strength is natural, and that the movement would have gone further had not the Exchange Equalisation Account been an occasional seller of dollars against sterling in the market. Although the strength of sterling is unaided, part of it springs from further movements of short-term capital. With the three months' bill rate at about 3¾ per cent in London as against 1⅝ per cent in New York, short money continues to be attracted to London. The persistence of this factor is reflected in the recent widening of the premium on forward dollars, which are now quoted 1⅛ to 1 cent premium for three months, as the buyers of spot sterling insure an exit for their money by simultaneously buying forward dollars. Expressed as an annual percentage rate, this premium nearly obliterates the margin between the prevailing level of bill rates in the two markets.

Some of the dollars gained by Bank of England intervention in the official market have probably been spent in giving support to the rate for transferable sterling, which this week has risen to \$2.77¼. Since this intervention began on February 24th, the supporting operations have in the main been focused on Zurich. In that market the rate for transferable sterling has over the past six weeks strengthened from \$2.72 to \$2.77¼, the highest level quoted for nine months past. The British authorities appear to be endeavouring to maintain the margin between the transferable and the official sterling rates at a figure that will remove all incentive for commodity shunting. The dollars that have recently been spent on supporting operations appear to have been only a small fraction of those gained in the official market, and must also have contributed to the strength of official sterling. The official market is once more gaining dollars against direct exports of such sterling commodities as rubber, tin and cocoa to the United States, now that the dollar proceeds of such exports are no longer diverted through shunting to merchants in transferable account countries. The recent strength of sterling has been evident not only against dollars but against most European currencies. Against the Belgian franc the rate has risen to 140.20 and against the guilder to 10.64⅞—each of these being the best levels reached for more than six months.

Markets Hold Firm

VALID reasons point towards quiet and narrow markets in the period between Easter and the budget. The added expectation this year of an early election makes operators even more disinclined to operate, and, though the newspaper strike has still done nothing to depress markets, it has certainly helped to restrict business. Thus the volume of Stock Exchange business has been abnormally low this week. The number of bargains marked on Tuesday was down to 7,830, an exceptionally small figure for the first working day of the week, and on Wednesday it fell further to 7,298. By contrast, in the first two days of last week, when business was by no means active, markings were 9,707 and 8,750.

But a narrow, even a neglected market, does not mean a weak one. The market has been steady and even firm with prices, at least until Thursday when some industrials eased off, edging slightly upwards. The *Financial Times* industrial index has gained ground gradually; on Wednesday it was 188.4. The rise was only 1.0 on the week, but still the index was at its highest point since February 17th, which was before the latest Bank rate increase. Gilt-edged securities have this week given the lead. The fixed interest index at 110.23 compares with 109.97 a week earlier. A small but steady volume of investment buying by the institutions that have held off the gilt-edged market as long as they dared, has held the market under-pinned. The pronounced strength of sterling, particularly on Wednesday, has added a spice of faith that the dearer money policy is doing its work.

Nearly all sections of the market—gilt-edged, industrials, steel shares, and even gold shares—have joined in the general firmness, though the narrowness of jobbers' books on the one hand and the small volume of public investment on the other, leave that firmness largely untested. One section at least has shown itself liable to a quick change of direction. Copper shares that had held persistently firm up to Tuesday, fell abruptly on Wednesday when the Government announced the release of 45,000 tons of copper and the spot metal dropped £27 a ton. Selection Trust fell 3s. to 70s. and Rhokana 17s. 6d. to £37 12s. 6d.

Mixed Blessing in Copper

THE government has finally yielded to pressure from consumers and decided to release 45,000 tons of electrolytic copper from its trading stock. Rather less than half that quantity—almost all of which is of Rhodesian origin—has already been sold to the British agents of the Rhodesian producers, and the Board of Trade is now discussing the disposal of the remainder with agents, merchants and representatives of consumers. The intention is to deliver the copper over the rest of this year at an even rate. The copper already sold will be priced on the basis of the average spot price ruling on the London Metal Exchange during the month of delivery, and the remainder will probably be sold on a similar basis. The price of copper in London, which had recently fallen to £332 a ton for spot, fell sharply after the announcement to close on Wednesday at £305 a ton for spot, and the discount for three months' copper narrowed to £5 a ton.

Consumers are naturally delighted at being able to buy 45,000 tons of government copper, an amount roughly equal to the loss of Rhodesian copper during the strike of African labour and the Rhodesian producers, who have been consulted, will not be sorry to see copper fall to a more reasonable price. But the government may come to regret its decision. It is true that the copper had to be disposed of some day, unless it was to be absorbed into the strategic stock, and when the government withdrew from the market last May, it carefully avoided committing itself on future policy. Now was the time to sell, if sell it must.

But having resisted the cry for help from the copper and other industries during the dock strike, the government has set a precedent that will make it harder to resist similar pleas in the future. Consumers will not be impressed with the argument that releases from trading stocks are quite different from releases from the strategic stock, and may well tend to hold smaller stocks in the future, thus increasing the potential strain on the strategic stock.

Bill Rate Tactics

THE bill rate eased sharply last week, showing its first perceptible movement since rates were abruptly raised in response to the increase in Bank rate to 4½ per cent on February 24th. The average rate for the Treasury bills allotted at the tender just before the holiday was about 3 23/32 per cent, compared with a little under 3 31/32 per cent in the six preceding weeks. This move does not mean either that there has been any change in official policy or that a new trend of rates has begun. In recent weeks the wide margin between bill rates and deposit allowances, and even between bill rates and average rates for floating short money has stimulated a strong demand for bills from many investors who normally have no interest in the money market. The discount market has been meeting this demand by profitable resales, but the rising competition at the Treasury bill tenders was preventing it from sufficiently replenishing its portfolios.

The market obviously welcomed the wide margin as the means of enabling it to make good the losses sustained through the sudden rise in Bank rate; and although it had no reason to fear a further rise in that rate, the tight-money policy pursued by the Bank of England emphasised the desirability of keeping market rates firm. But the pressures of demand were mounting, and the satisfactory gold figures—among other reassuring features—gave an opportunity to meet the competition by reducing the bill rate

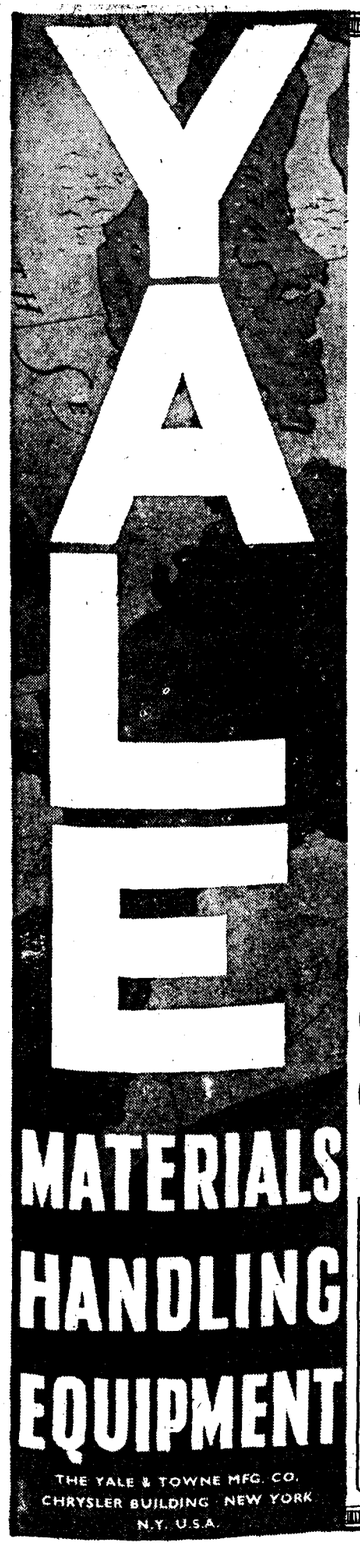
without undue risk that the reduction might be misunderstood. It would be regrettable, however, if the movement proceeded much further, for there is no evidence yet that the dearer money policy has already imposed a sufficient restraint upon the economy. And the surest way of maintaining the restraint is by keeping the Treasury bill appreciably more attractive to big holders of liquid funds than money on deposit. For their switches into bills are helping to prevent seasonal influences from easing the banks' liquidity ratios. If the tautness of those ratios is sustained, the banks will be obliged to keep a firm hand on lending policy—unless they are prepared to sell more gilt-edged securities, as some of them still appear to be doing.

February in the Shops

RETAIL sales dipped in February as they always do, but beneath the seasonal pattern, two sharply conflicting trends are at work. One is the persistent buoyancy of the demand for durable household goods, furniture and furnishings as well as television sets and electrical goods ; the other is the slackness of trade in clothing. The retail index (1950 = 100) stood at 122, five points lower than in January, seven points higher than in February, 1954. Retail sales as a whole were 6 per cent higher in value than they were in February, 1954, which—excluding food sales—is the same increase that was recorded then on sales for February, 1953.

Sales of nearly all the durable goods were much better than the total figures suggest, reaching values from 10 to 20 per cent higher than a year ago ; even sales of jewellery and leather goods, which usually lag well behind other departments, showed the same substantial increases in turnover. The one plain lesson of these figures is that the public has lost interest in the popular occupation of beat-the-Chancellor. For the first time in years people are not hedging against the possibilities of changes in purchase tax in the budget. The contrast with clothing sales is marked. Turnover in clothing business in February was up a little on the year before, but it is noticeable that wholesalers' deliveries of spring goods to retailers were no higher in value than they had been in February, 1954. Much the same trends were at work in January. If they persist, retail sales are not likely to rise as much this year as they did last.

Unilever's Dividend



THE ordinary dividends from the Unilever twin companies may set a pattern for other equity payments. They have been increased, but only moderately so. They are within the bounds that a cautious investor could have expected after the diarchy announced the 25 free scrip issues last December. Then the directors left the interim rates unchanged on the enlarged capital (6 per cent for Unilever, Ltd., and 5¼ per cent for Unilever NV), and it was a reasonable guess—though not an over-optimistic one—that the final dividend rates would also be maintained on the bigger capital. That is what has happened, with Unilever, Ltd., declaring a final payment of 9¾ per cent and NV 8¾ per cent. Allowing for the free scrip issues, the total payments have been raised from 12.6 to 15¾ per cent for Unilever, Ltd., and from 11.2 to 14 per cent for NV. Scrip issues often tempt the optimists to look for something more than is immediately probable ; their zest has been checked by the Unilever dividends, for after their announcement the price of the Unilever, Ltd., £1 stock units fell by 1s. 7½d. to 79s. 6d. and that of the NV Fl. 1,000 shares by 1s. to 90s.

In part, the optimism was based on the boom in consumption last year. That boom meant for Unilever higher sales and profits over its wide range of edible and washing products as a whole though not necessarily on every one of them. And duly they have been recorded. The turnover of the diarchy has gone up from £1,310,121,000 to £1,437,429,000 and its gross profit from £61,584,000 to £70,095,000. Taxation has risen (from £33,821,000 to £38,218,000), but the net profit is £31,854,000 (including £2,677,000 of non-recurring profits), compared with £25,799,000 (including £575,000 of non-recurring credits) in 1953. The net profits of Unilever NV, up from £8,908,000 to £12,737,000, show a bigger proportionate increase than those earned by the British twin, which have risen from £16,891,000 to £19,117,000.

Dearer Money in New York

AMERICA'S business recovery and the slight hardening of Federal Reserve monetary policy that began at the end of last year have lately produced a notable hardening of money rates. The upward trend was temporarily checked in early March, following the Treasury's refinancing operation of early February. Since March 8th, when US Treasury bills were allotted at an average rate of 1.231 per cent (compared with 1.088 per cent a month before) there has been a continuous rise. The sharpest movement in the series occurred at last week's tender, when the rate rose from 1.466 to 1.652 per cent. Market rates for commercial paper have naturally kept roughly in step with this movement, and on Wednesday last dealers raised quotations by ⅛ per cent to 1⅝ per cent for 30-90 day paper and 2¼ per cent for six months.

This latest rise carried rates beyond the level of the rediscount rates of the Federal Reserve Banks, which had been unchanged at 1½ per cent since their reduction from 1¾ per cent in April and May last year. In the American market, unlike London, the rediscounting conventions make it possible for rates to stand above the official rate without provoking undue pressure upon the Federal Reserve Banks. But recent indications of official policy, including a speech by Mr Allan Sproul, president of the New York Federal Reserve Bank, early this month, have been taken to mean that a general rise may be impending. The Federal Reserve Bank of Kansas City did in fact raise its rate to 1½ per cent with effect from Thursday. It should be observed that the contrary trend of market rates in New York and London has greatly narrowed the gap for "covered" switches of New York funds to London.

In Amsterdam (*Holland*)

Objects so cumbersome and unwieldy that they almost defy safe handling, are lifted and moved quickly and safely as these two YALE fork-lift trucks team up to transport this 5½ ton box at the **Royal Dutch Lloyd,** in the port of Amsterdam.

In Coventry (*England*)

Just one man, with a YALE **Worksaver,** motorized low-lift pallet truck, lifts and moves an 850 pound load of completed automobile engines. Contrast this effortless mechanized handling method with the outmoded, slow, back-breaking manual way — Photo by courtesy of **Humber Limited,** Coventry.

In Milan (*Italy*)

Here, a YALE **Yard-King** pneumatic-tyred fork-lift truck stacks kegs containing chemicals at the **Luciano Cambiaghi** warehouse in Milan. This and many other YALE truck models can make possible increased productivity for you, through greater speed in handling your product.

harvests and health

The snake was an ancient symbol of Time
and the turning year, with its earth-seasons
of spring planting, summer growth,
autumn harvest and winter sleep.
And the snake of Æsculapius has,
since classical times, been a symbol of healing.

Agriculture to produce man's food,
and medicine to care for his health ...

The improvement of crops
has been the main business of Fisons
for a hundred years and more,
almost since the science and production
of chemical fertilizers began.
And, in recent years, Fisons have struck roots
in the field of chemicals for medicine.
Fisons today contribute to the harvests
and health of the world.

FISONS LIMITED · Harvest House · Felixstowe · Suffolk.
FERTILIZERS · HEAVY CHEMICALS
Fisons are among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for Industry. Many of Fisons products in these fields are household names

it's all in **FISONS** field

Rubicon for Lorry Sales

NEXT Wednesday is the closing date for tenders for the big list of general haulage lorries and depots that the Transport Commission and the Road Haulage Disposals Board put up for sale on March 9th. Full results will not be known for a few weeks yet, but the success of this sale will be critical for the Government's denationalisation policy. The list was a large one; it contained altogether 5,800 vehicles (including 1,400 already offered but not sold) distributed amongst some 150 depots up and down the country and comprised the main trunk operations of British Road Services.

Up to now sales have been going moderately well, if somewhat more slowly than the Government had hoped. So far 14,020 lorries have been sold out of the 32,500 scheduled for disposal under the 1953 Act; only 2,000 or so have not yet been offered. But over half of these sales have been in penny packets of between one and four vehicles each, and the omens have never augured well for the sale of the larger units. Previous pilot offers have not been taken up at all well, and the response has been consistently poor for even the small units that had premises attached. Undoubtedly there are a large number of hauliers willing to add to their fleets by buying a few state vehicles at a time, but ownership of the trunk network and its depots was not intended to be transferred in minuscule units.

If the latest list is a flop—and there are strong indications that results may be disappointing—then the recent moves in the Conservative party and amongst road hauliers and users towards finding some compromise solution will probably gather momentum. But an early election will not be the best background for political second thoughts.

Interdict at Renfrew

A SURPRISE move by the maintenance engineers at Renfrew Airport has landed their reluctant employer, British European Airways, in the Scottish courts. Before Parliament rose, the Minister of Transport said what most people hoped were the last words on an affair that has dragged on through 18 months of argument. Mr Boyd-Carpenter told the House that since Scottish Aviation, Ltd., had received the contract from the Canadian government to overhaul its European-based fighters and was prepared to take over the Renfrew base from BEA, there was no longer any reason for asking the corporation to stay at the airport. The transfer of the remaining Dakotas based at Renfrew to BEA's new maintenance centre at London Airport would be dove-tailed with the start of servicing on the Canadian Sabres and there would be no risk of redundancy.

The 600 engineers, however, appear to like the prospect of working for Scottish Aviation, a local company, no better than that of being employed by Airwork Ltd., which at one time seemed the most likely candidate for the Canadian contract. Two engineers and one local citizen, representing the flying public, have gone to the Edinburgh Court of Sessions and obtained an interim interdict preventing BEA from leaving Renfrew on the grounds that the move would be a breach of their statutory duty under the 1949 Civil Aviation Act. This surprising claim is based on estimates that BEA would lose financially by the move and so be obliged to raise fares, although the Minister had told the House of Commons some days earlier that the transfer of maintenance work to London would save the corporation £800,000 over five years. BEA may have no difficulty in demonstrating this, but it has to go to Court in order to do so, and its plans for the transfer of the base will have to be postponed yet again. It is in keeping with the strong local feelings aroused in the Renfrew debate that a legal device peculiar to Scotland should have been used to try and keep the corporation from transferring its remaining aircraft to London. The choice of Scottish Aviation as the tenant to replace BEA at Renfrew might be expected to mollify local feelings more than the choice of Airwork would have done. Scottish Aviation has plans for using the base for production of its Pioneer civil transport. This gives some guarantee of further employment should the Canadian servicing contract not be renewed after its initial two-year period. But it is plain that in local eyes these opportunities do not have the same attractions as work for a nationalised air corporation.

Cunard's Modest Dividend

THE final dividend from Cunard Steamship Company for 1954 is infinitesimally higher. The profit is lower. The reserve appropriations are lower. All these consequences might reasonably have been expected. Most of 1954 was a time of lower earnings in shipping, but the Cunard Company has much fat on its back and the 66⅔ free scrip issue, though without any promise of a more liberal dividend policy, at least showed that the board felt some confidence. And then there was the enterprising Mr L. M. Childs nagging the board for a more liberal dividend and threatening to contest the election of directors.

It cannot be claimed that either Mr Childs or the weight of the Cunard Company's resources has been able to push the dividend policy far. The final payment is 7 per cent on the increased capital. With the two interim dividends of 2½ per cent each on the old capital it makes the equivalent of 10 per cent in all on the present capital. The 1953 dividends, amounting to 16 per cent on the old capital, were equal to 9.6 per cent on the present capital. For that small mercy shareholders may be the more thankful, in that the consolidated surplus for the year was only £2,517,266, compared with £3,065,339, after allowing for depreciation, and for a sharp drop in tax which cost £2,069,936, compared with £3,076,318. Allocations to reserve have been sharply cut from £1,200,000 to £700,000. The shares, however, fell 2s. on Thursday to 30s. 6d.

Small Savings Rise

THE national income statisticians have estimated that total personal saving actually fell fractionally in 1954, from £910 million to £909 million; direct evidence how-

ever suggests that through the chief institutional channels, at least, personal saving continued to increase. The building societies show record increases in their shares and deposits, whilst saving through the funds of the life offices has plainly risen more steeply than in 1953. Now Lord Mackintosh reports the success story of the national savings movement, of which he is chairman. Net new saving through national savings certificates, defence bonds and through the Post Office and Trustee savings banks reached £60.4 million in the year ending on March 31st, quite the best for seven years. In the year to March 31, 1954, receipts had fallen short of repayments by £63.4 million, whilst in 1952-53 the net dis-saving amounted to no less than £122.1 million. All these figures exclude provision for repayments of defence bonds on maturity, as well as accrued interest.

NATIONAL SAVINGS REVIVAL
(£ million)

	Net Receipts		
	1952-53	1953-54	1954-55
National Savings Certificates....	+ 20·8	+19·0	+ 45·8
Defence Bonds	− 11·3*	+ 0·3*	+ 50·0*
Post Office Savings Bank.....	−116·9	−89·5	− 59·7
Trustee Savings Banks.....	− 14·7	+ 6·7	+ 24·2
Net Saving	**−122·1**	**−63·4**	**+ 60·4**
Net interest accrued.....	88·3	87·4	86·2
Total saving.....	− 33·8	+24·0	+146·6

* Excludes redemptions on maturity, totalling £45·5 million in 1952-53, £38·4 million in 1953-54 and £28·8 million in 1954-55.

The year's improvement, as the table shows, was most marked in defence bonds. But receipts from savings certificates and the Trustee savings banks also increased, whilst net withdrawals from the Post Office savings bank were again reduced. The increase in sales of certificates and, to a less extent, of defence bonds, was demonstrably boosted by the raising of the permitted limits of holdings on November 1st last; but even this increase does not appear to have been at the expense of existing savings in other forms. The prospect continues bright; improvement has not been checked in recent weeks by the attractions of the higher rates on bank deposit acounts. In the first week of the current financial year net small saving amounted to £1.6 million, against net repayments of £0.7 million in the corresponding week of 1954.

No Turbo-Props from Lockheed?

COMPETITION among airline manufacturers for the custom of the world's airlines has been given a new look by a change in the strategy of Lockheed, one of the four or five major manufacturers of civil airliners. Lockheed appears to have abandoned the idea of a high-speed turbo-prop version of the Super-Constellation, the Lockheed 1449, which it has been offering the airlines for delivery as early as 1957, because of trouble with the engines. These were T34s built by Pratt and Whitney, and they are likely to be replaced now by much the same kind of Wright compound piston engine that both Lockheed and Douglas have used for several years.

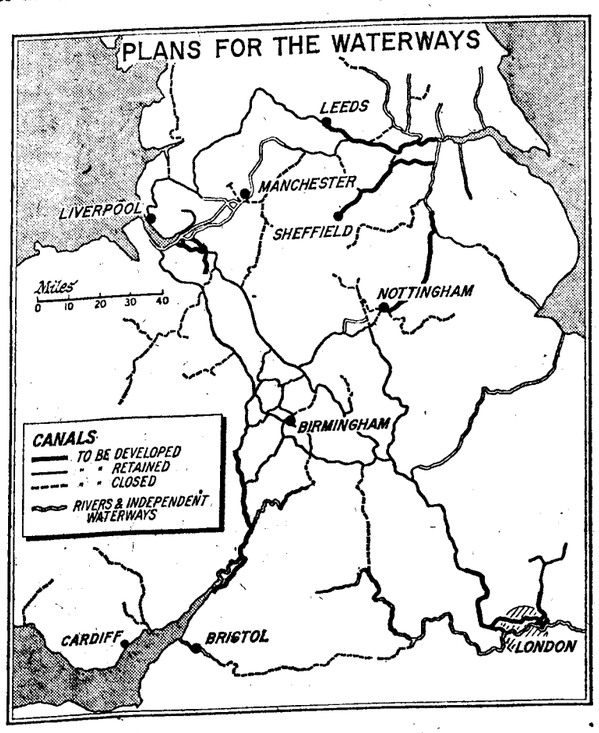
The Lockheed 1449 was an interim design intended to meet the competition of the long-range Douglas DC7 series that was causing Lockheed some concern. The reversion to piston engines now means that the Bristol Britannia becomes the only long-range turbo-prop civil transport available for delivery for several years. The decision to drop the Pratt and Whitney engines strongly suggests that no American-built turbo-prop engines are likely to be available for civil use for some time; Lockheed has made a close study of the Bristol big BE 25 engine and is at least likely to experiment with this when it becomes available in 1958-60. Whether Douglas will pursue its plans for the much-discussed DC 7D with Rolls-Royce turbo-props is a matter for speculation.

Benign Monopoly

THE speech of the chairman of the Bradford Dyers' Association nearly always contains matter of wide interest, and this year is no exception. Mr James Ewing has treated shareholders to two encouraging news items and a defence —surprisingly woolly for so straight a thinker—of regulation by trade federations. The news items show that even when the path is not easy in the textile trades Bradford Dyers is still in the forefront of progress. The company has made an agreement with Albright and Wilson, the Birmingham chemical manufacturers, for the formation of a joint company to develop in all countries except the United States a non-inflammable finish for cotton and viscose rayon textiles. Because of its cost the new finish is likely to be confined at first to protective clothing used in hazardous industries, but Mr Ewing looks forward to the reduction of costs to a level that would make it available for other purposes, such as night wear. The second item concerns Bradford Dyers, The Bleachers Association, and Joseph Bancroft and Sons of Wilmington, Delaware. The three companies will promote a new process — developed independently by the British companies—for producing controlled ruffles and puckers in patterns on dress and furnishing fabrics.

Shareholders will welcome those progressive developments. What will they feel about Mr Ewing's expression of faith in control by trade federations, provided those federations are properly registered with the government, which would stand as trustee for the consumer? The monopolistic powers of the federations, as Mr Ewing sees them, would not be used to restrict output, but to "maintain" output and regulate prices, with the third party—the consumer, protected by the State. Every section of industry, he believes, should have such a federation; its duty would be "on the one hand to prevent prices from falling too low to recoup all the proper costs (including the service of capital), and on the other hand to prevent prices from rising excessively." Who decides what the proper costs are? Is it the Government official protecting the consumers? Who decides what shall happen when demand falls off and the price obtainable does not cover everybody's "proper costs"?

Narrow Future for the Canals



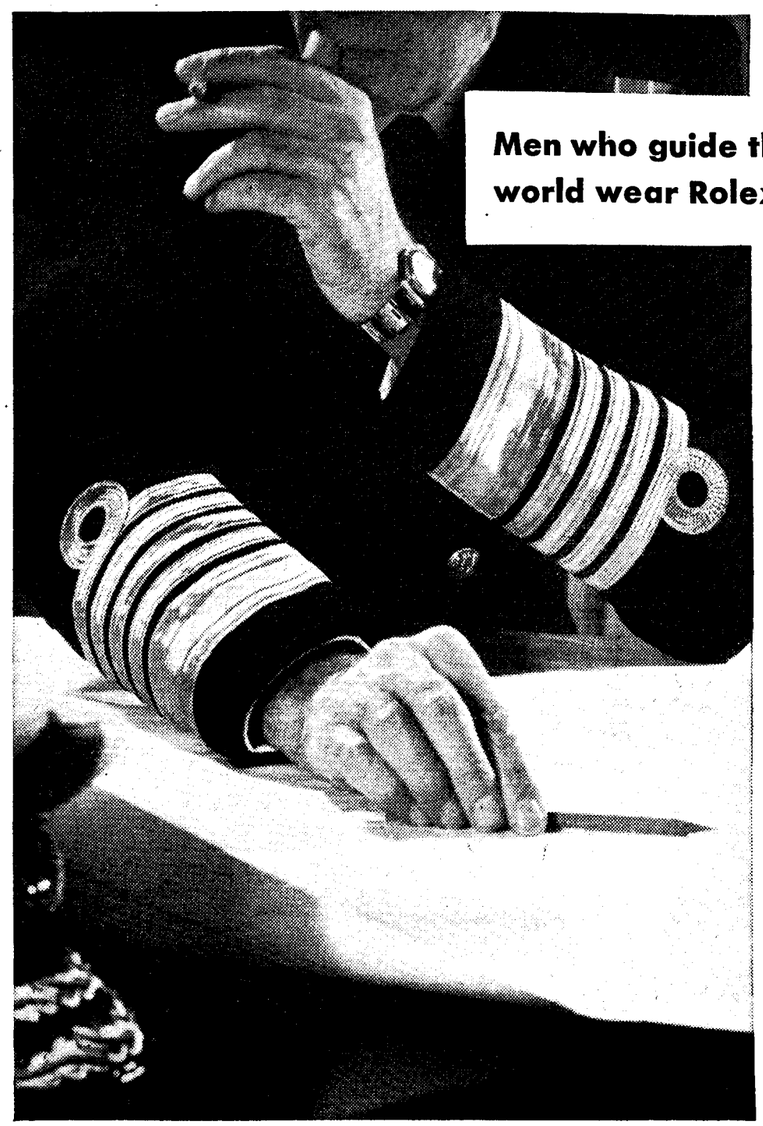
IT took about 70 years to construct Britain's canal system, from 1760 to 1830. By the time that the system was completed—roughly as it exists today—the railways had arrived, and the canal era was over. Their monopoly of goods traffic once breached, the inland waterways lost heavily to railway competition; later, to the roads as well. In more than a century, this decline of the canals has never been generally checked. This week's decision by the Transport Commission to cut its losses on a large proportion of the canals does not mark a new stage in that decline as much as a cold-blooded acceptance of the stage so far reached.

During the canal era a huge network of canals —guessed to have been about 4,000 miles in length—were cut across Britain. Effectively, the inland waterway system today consists of the 2,000-odd miles of canal owned by the commission, plus the Manchester Ship Canal, the Bridgewater Canal and the River Nene. In their heyday, the canals carried almost the whole of inland freight. By the turn of the century, their share was down to about an eighth of the total; and by 1952 the inland canals carried only one per cent of total inland tonnage.

In 1953, 12,747,000 tons were carried on the commission's canals; about 54 per cent was coal, and a sixth "liquids" — mainly petroleum in bulk. For coal, and other traffic, the canals connecting with the ports offer a very competitive form of transport, as handling charges and port dues are lower; but the Central Electricity Authority, one of the largest inland customers, expects its waterborne deliveries to go down. Rent for the use of water from the canals—in particular for industrial cooling—is a significant item of revenue for certain waterways.

The 2,172 miles of canals that the commission took over in 1948 have proved an embarrassing legacy. Since then it has lost £2 million on operating them (without counting any contribution to charges on their book capital value of £22,370,000). By cutting expenditure and obtaining some increase in revenue —mainly tolls and dues, handling charges, and water rent—it managed to reduce its annual deficits on them in recent years, from £574,000 in 1951 to £102,000 in 1953. On the commission's own carrying activities—it handles about 15 per cent of the commercial barge traffic—it lost another £47,000 in 1953.

However, the reduction in losses over the whole systems blurs the fact that only about a dozen of the commission's canals, with about a third of the total mileage, make profits—in 1953, some £302,000; all the others, some 1,300 miles in length, showed losses (£404,000 in 1953). It is not surprising that since it took over in 1948 one of the ways in which the commission has sought to reduce expenditure has been to disembarrass itself of canals that do not pay.



This week's decisions by the commission, in accordance with the recommendations of a "board of survey" that investigated the system last year, include the closing of 771 miles of canals, a third of the total mileage taken over in 1948. This is little more than has already happened. More than 250 miles of these canals have been abandoned or closed, and nearly 500 miles more are out of commercial use. As a group, these waterways were involving the commission in a "dead loss" of £200,000 a year. The Scottish canals fall into the same category—the Caledonian and Crinan canals lost £43,000 in 1953—and the commission hopes to be able to transfer these, as the board suggested, to the Secretary of State for Scotland.

In concentrating its financial and commercial efforts on the remaining two-thirds of total canal mileage, the commission has accepted its board's view that active development, involving heavy expenditure, should be concentrated on seven of the most used waterways: the Acre and Calder Navigation (including Ouse Lower Improvement), the Gloucester and Berkeley Canal and River Severn, the Grand Union (but only the Regent's Canal Dock and Brentford-Berkhamsted sections), the Sheffield and South Yorkshire Navigation, the River Lea (below Enfield Lock), the River Trent, and the River Weaver.

Those canals total 336 miles in length. The remaining 994 miles, "seem to be worth retaining for transport purposes" and are to be "maintained for the present to an adequate standard of efficiency," with "every encouragement" given to the development of traffic.

The board also recommended and the commission has agreed, that a new management should be set up to run the waterways separately from the docks that it owns. In general, the board thought the abandoned canals would not be wide or direct enough to be converted into roads; and it was also anxious that the commission, in handing over control of these canals, should not be saddled with continuing financial responsibilities for them. About the nostalgic hopes of a canal revival nurtured by the Inland Waterways Association—whose president, Sir Alan Herbert, was quoted on the radio as condemning their report before he read it—the board was curt: "unrealistic and impracticable."

Men who guide the destinies of the world wear Rolex watches

YOU KNOW their names as you know your own. You know their faces from a thousand newspaper photographs, their life stories from a hundred magazine articles. You have seen them and heard their voices on newsreels and on your television screen. Their actions and decisions influence the pattern of our lives.

We cannot mention their names, or show pictures of them. It would not be fitting to do so, for they include royalty, the heads of states, great service commanders. But we invite you to look carefully at the next pictures that you see of them, at their wrists as well as their faces and clothes. You will notice that in almost every case they wear a wrist-watch. That watch will most likely have been made by Rolex of Geneva.

We are proud of the service given by Rolex watches to so many eminent men. It is scarcely necessary to point out that the performance of these watches is, in the highest degree, accurate and dependable.

The Rolex Oyster Perpetual Datejust, the most remarkable achievement in watchmaking today. The extraordinary accuracy of its chronometer movement is attested by the fact that every Datejust is awarded an Official Timing Certificate by a Swiss Government Testing Station, with the added distinction "Especially good results." This movement is protected from all hazards by the famous waterproof Oyster case, invented by Rolex. It is automatically self-wound by the Perpetual "rotor" mechanism, another Rolex invention. This keeps the tension on the mainspring constant and makes for even greater accuracy. The date is shown on the dial, changing automatically each night at midnight, and magnified by a "Cyclops" lens for easy reading.

A ROLEX RED SEAL CHRONOMETER

The Rolex Oyster Perpetual—culmination of three Rolex triumphs. In 1910 Rolex gained their first Official Timing Certificate for a wrist-chronometer. Now Rolex have produced 250,000 Officially Certified wrist-chronometers—three times as many as the rest of the Swiss watch industry combined. In 1926 Rolex invented the Oyster case, the first truly waterproof case in the world. The rugged and sturdy Oyster protects the movement, permanently, from water, dust and dirt. In 1931 Rolex invented the first "rotor" self-winding mechanism. A new refinement of this Perpetual "rotor" powers the Oyster Perpetual, silently and automatically, actuated by every slightest movement of the wrist.

Lancashire, with a generation of experience of what does happen, knows the answer. The sections with the tightest federations, the dyers, printers and the bleachers can continue for a time, but not for long, to base their charges on their estimate of costs and the less federated sections—the spinners and the manufacturers—will recover, not their "proper costs," but what is left.

Work for Shorts

CANCELLATION of orders for the Swift fighter has had unfortunate repercussions in Belfast, where Short Brothers and Harland had been sub-contracting sections of the aircraft for Vickers-Armstrongs. The company has been faced with the prospect of dismissing about 900 men, a tenth of its total labour force, knowing that these men have little prospect of finding alternative employment. This has prompted the Ministry of Supply to place some additional orders for Canberras with Shorts, which already has a Canberra line in being; the orders will mean work for a total of 600 men. There is still likely to be some redundancy unless Shorts can find additional short-term contracts.

The company has had more than its fair run of bad luck in the search for work to fill its 1,500,000 square feet of factory space. A production line laid down for Comet IIs is now useless; work on the Swift has been stopped, and plans to duplicate the Britannia production line at Bristol have been held up until Britannia orders come in more quickly. An order has been obtained from the RAF for eight trooping Britannias, and that will employ about 1,500 men next year. Shorts have been prepared to try almost any kind of jobbing engineering that will give local employment; unemployment in Ulster since the war has rarely fallen below 6 per cent and risen on occasions to 10 per cent. The Government as the majority shareholder in Shorts (69½ per cent) is under some obligation not to add unnecessarily to local difficulties, but it is not easy to find work for aircraft factories that are not themselves major designers.

Spring Cleaning the CIC

SLOWLY the powers of the Capital Issues Committee to bless or forbid capital transactions are being whittled down, but the process is exceedingly slow. Last week the Chancellor of the Exchequer announced a list of types of transaction that no longer require the Committee's approval. They are all operations in which no new money is involved and therefore in theory contain no risk of inflation. They include:

Acquisitions and amalgamations of companies.
The formation of new holding companies.
Issues to parent companies for cash.
Issues of shares to extinguish loans.
Issues of shares to secure unsecured loans.
Conversions or renewals of securities.
Postponement of redemption dates.

Impressive though the list looks its real effect is only to relieve the CIC and incidentally the companies and their advisers of a large volume of paper work. An amalgamation that involves one company in increasing its nominal capital for the purpose of a share exchange with another, an internal arrangement whereby a parent company provides cash for its subsidiary against an issue of shares, or a conversion of a maturing debenture when not more than £50,000 of new money is also raised are routine operations that go on frequently. In future the paper relating to them will no longer have to clutter the desks in the CIC.

But the tight hold that that committee has over operations where money in excess of £50,000 is to be raised remains unaffected, and naturally the new freedom for acquisitions and amalgamations between companies does not extend to the raising of money for such an acquisition—for example by a take-over bid. The City will welcome this small step towards reducing the functions of the CIC and will continue to feel that a larger one could safely have been taken.

Easter Traffic in the Commons

THE Parliamentary Secretary to the Minister of Transport let fall some rather ambiguous remarks last week about possible restrictions on motor traffic in London. In replying to a debate on the adjournment in the House of Commons dealing with London traffic, he argued that "indiscriminate use and parking of cars by every individual coming to work in one" could not be accepted.

"Even if we were able to provide, as we hope to be able to provide, additional parking accommodation in the centre of London, it would still be impossible on any roads one can possibly imagine to cope with the influx in the morning and the efflux in the evening of the vast number of cars, each one of them occupied by a single person. . . ."

Previously the government has stopped well short of

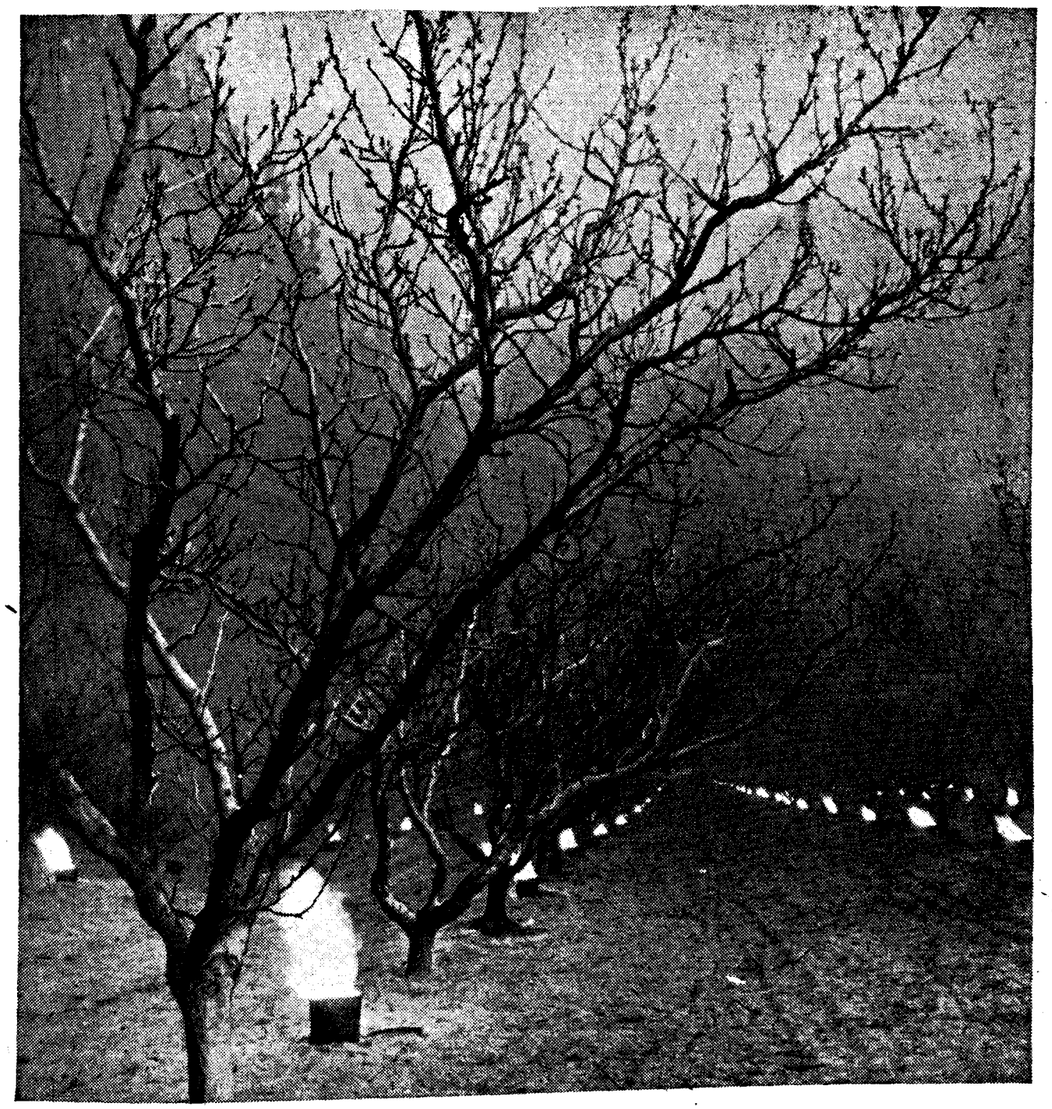
advocating any restriction on the use of private cars in the congested streets of big towns, and Mr Molson was careful to add that he was speaking "only by way of a warning." Whether or not his remarks need be taken seriously, they were addressed to the problem of moving commuters in and out of London at peak hours. General congestion in the central area—of which internal local traffic may be the main cause—is to some extent a separate problem, though linked to the first by the cars that "long-term parkers" leave in the streets.

Members speaking in the debate were mainly concerned with congestion in Central London, and they pressed the Minister to set up yet another committee to prepare a long-term plan for London traffic routes. The Parliamentary Secretary stolidly refused to do so, arguing that there were enough plans in the Ministry's dusty pigeon holes already, and that the government had even started to implement some of the proposals in the more recent ones: the report published in 1951 by the London and Home Counties Traffic Advisory Committee and the County of London Development Plan produced by the LCC in the same year. It is true that the road schemes the Minister of Transport intends to authorise under the £97 million programme to be spent by 1959, which he announced last February, include some of the proposals contained in these two reports, but both Committees drew them up under the shadow of financial stringency, and their proposals were deliberately restricted in comparison with what they felt was really needed. The LCC plan was estimated in 1951 to cost £48 million by 1961 and £90 million over its full 20 years, but even so it was confined to improving the existing road network. It contained no schemes for cutting express ways nor even less ambitious ring roads. Assuming a 50 per cent increase in traffic over 20 to 30 years, which seems conservative enough, the Council then thought that it would need to spend £190 million in the inner area and another £100 million in the outer area. These gigantic sums provide some measure of the need in contrast to what the government is doing.

Maybe in Gold



DEVELOPMENT does not always pay off. If it did there would be no risk in risk capital. Over the whole of the Orange Free State goldfield development should pay handsome dividends, but there are a few mines that have lagged behind and may never earn the profits hoped for when they were planned. Freddies Consolidated, the product of the merger of Freddies North and Freddies South, already falls into this category and Welkom may do so. The question mark about the future of Freddies still looks as big as ever after this week's interim report, but the announcement by Welkom of a new issue may do a little to dispel doubts about its prospects.

The interim report from Freddies is an essay in "maybe's." The decision to confine development to the northern area, where the values though not high have been higher than in the southern area, is an implicit admission that one of the main purposes of the merger has failed. Nor can uranium ever wholly redress the shortfall from gold. The directors believe, however, that as only a small part of the northern property has been explored further development operations should be continued so long as there are "reasonable grounds" for hope. Money will be needed for that development of the mine, but it has been provided by the sale of the No. 2 shaft to Free State Geduld and the plant, machinery, buildings, the two reduction plants and the three shafts remaining will provide "ample facilities for operations on a scale which can prove profitable." It is difficult to see how the directors could have made any other decision while hope, however faint, remained.

Welkom, like Freddies, has run into development troubles. Faulting, water, and a lack of adequate stoping reserves has kept profits down in the development of the central part of its properties. But there have been modest profits; Welkom is also scheduled as a uranium producer but so far uranium values have not been high enough to justify extensive production. Now a decision has been taken to develop the south western section of the property, where borehole results have been reasonably encouraging. That will involve the sinking of a new shaft system and an expansion of the capacity of the reduction plant. Money for this development will come from the Anglo American Corporation. That finance house will subscribe immediately for 1,250,000 shares at 22s. 6d. each and use the proceeds to repay outstanding loans. Anglo American will also provide fresh loan facilities of up to £2,500,000 at 6 per cent until end-1959; in return the Corporation will have the right to subscribe for 1,250,000 shares at 27s. 6d. each before the end of 1958 and to use the proceeds to cancel the loans. Anglo American's willingness to put more money into the mine is itself encouraging, and after the announcement the shares rose 1s. 1½d. to 22s. 3d.

Refugees from Band III

THERE has been so much bitter argument about where the users of mobile radio will go in the ether when they are eventually displaced from their tenancy of Band III wavelengths by the Independent Television Authority's commercial television transmitters that a committee was appointed last May to report on the matter to the Postmaster-General. It will be some time before the ITA has so many transmitters operating that it will need the mobile users' wavelengths, but the committee has meanwhile reported that room can be found for all the displaced users in the frequencies that lie between 165 and 174 megacycles; that is, just above the Band II wavelengths earmarked for frequency-modulation sound broadcasts and just below the television wavelengths of Band III. The report has been accepted by the Postmaster-General, but it is not likely to be received with much warmth by the mobile users themselves. One of the members of the committee, Captain Orr, MP, who served as the representative of the Mobile Radio Users Association, did not sign the report at all. In his minority report he raised the question of compensation where new equipment is required and of greater security of tenure than that proposed by the committee (five years), but the real quarrel between the displaced mobile radio

BP GUARDS THE CROPS

NOT ONLY IN Britain do BP products guard the crops. In the rich apricot orchards of New Zealand, BP fuel oil protects the fruit from the ravages of frost. During 1954 this oil saved a large part of the apricot harvest when one of the worst frosts ever recorded threatened complete disaster.

And BP helps in other ways. Oil for lubricants, for grass-drying and grain-drying; for the warmth that hatches chicks and the power that draws the plough—BP provides all this and more. The BP sign is a friend of the farmer in Britain, in Europe and in many countries throughout the world.

The BP Shield is the symbol of the world-wide organisation of

users and the committee is the belief that the wavebands available could have been better allocated. There is some jealousy about the amount of space given to marine radio and to special government services. But someone must weigh the relative priorities of the different classes of user, the taxis, ambulances, navigational services and the rest, and there is plenty of room available in the ultra-high frequencies for those who feel cramped on their new wavebands.

Prosperous Insurance

So far only the purely life insurance offices have published their 1954 accounts. But from the dividends announced by the composite companies it can be deduced that they, too, have enjoyed a good year ; it seems also a fair deduction that the heavy losses resulting from the American hurricanes rejoicing in the names of "Carol," "Edna" and "Hazel," though they must have affected the fire accounts of those companies that operate in a large way in North America, have been offset by satisfactory results in other countries and in other classes of insurance. Perhaps even motor insurance, so long the Cinderella of the business, has at last yielded a worth-while profit. The table brings up to date the list of insurance dividends since *The Economist* of March 26th. It shows that offices with the smallest stake in fire insurance have on the whole increased their dividends more generously than the others. A bumper year on the Stock Exchange must naturally also have helped materially to supplement underwriting profits.

Company	Total Dividends 1953	Total Dividends 1954
Alliance £1	3/-	3/3
Britannic 5/-	3/-*	3/3*
Caledonian 10/- paid	5/-	5/6

Sugar (Cuban raw), cif per cwt.	31s. 3d.	31s. 3d.

Brazilian coffee have firmed because there is not much good coffee left from the current crop ; cocoa has also recovered a little ground, and wool futures are higher.

SHORTER NOTES

The fiduciary issue was raised last week by £25 million to £1,750 million. Although the pre-Easter outflow of currency has been considerably larger than last year, totalling £40.4 million in two weeks against £32.1 million, the increase in the fiduciary issue is both smaller and later this year. In 1954 the issue was raised by £50 million in the middle of March. The explanation is primarily that the post-Christmas contraction in the note circulation this year continued until mid-February.

★

The text of the proposed Charter of the International Finance Corporation was submitted to the governments that are members of the World Bank on Thursday. None of them is yet committed to its details. The Corporation will, it is proposed, have a capital of $100 million in gold or US dollars, the US participation being $35,168,000 and the British participation $14,400,000. The President of the World Bank is to be chairman, but the Corporation is to be a separate entity from the Bank, with its own president.

★

In the Business Note "The Cost of Labour" last week it was incorrectly stated that industrial earnings in October 1954 were 201 per cent higher than in October 1938, and that labour costs of production might hence be 115-125 per cent higher. In fact, earnings were 223 per cent higher than in October, 1938, and labour costs in industry, calculated in the same way, would be 130-140 per cent up.

Company Notes

THOMAS TILLING. Since 1948, when it sold its transport interests to the British Transport Commission for £24,800,000, returning £5 per share to the shareholders, Thomas Tilling has taken a new and highly promising lease of life as an investment holding company—not an investment trust standing aside from the companies in which it invests, but as a real *entrepreneur* buying big blocks in promising concerns and nursing their growth. Profits and dividends have been rising steadily as the development proceeded. This year the ordinary shareholders are to receive 10 per cent, compared with 7½ per cent last year and with only 5 per cent in 1949 when the company started out on its new career. The group net profit attributable to the parent company is again sharply higher at £454,221, compared with £380,040. Only about half that profit is being paid out to shareholders. A sum of £213,801, against £196,227, is retained in the subsidiaries, whereas the net cost of the dividends is £235,675, against £179,025.

★

HUDSON'S BAY. The bigger dividend from trading (12½ compared with 15 per cent) declared by Hudson's Bay owes something to the cessation of EPL but seems to owe a good deal more to a sharp increase in retail sales and a "sudden strengthening of the fur market" in the last two months of the financial year. "Much of the improvement in earnings" from £3,060,842 to £3,362,963 came from this abrupt resurgence. Most of Hudson's Bay's profits are earned in its retail stores, and there, although "economic conditions were not as good as in 1953 for every store," the ratio of net profit to sales was maintained.

	Years to Jan. 31, 1954	1955
Sales and Profits:—	£	£
Total—		
Sales	55,441,000	57,058,000
Profit	3,060,842	3,362,963
Retail stores—		
Sales	34,186,000	35,251,000
Profit	1,997,000	2,044,000
Fur trade—		
Trade sales	7,318,000	7,716,000
Consignment sales	14,358,000	19,759,000
Profit	320,000	585,000
Wholesale department—		
Sales	13,937,000	14,091,000
Profit	322,000	279,000

Commenting on the sharp increase in furs, notably of ranch minx, consigned recently for auction, the governor, Mr W. J. Keswick, warns the proprietors that the trading results were "very much above the average." Although the company's wholesale department maintained its sales, its profits were lower, for losses were made on stocks of raw coffee. Earnings were also affected by "a general price war on tobacco products throughout the year in Canada." But all in all no one can quarrel with Mr Keswick's description of 1954 as "another good year." This year may not be as good for a "very poor harvest on the prairies" has followed a series of bumper crops.

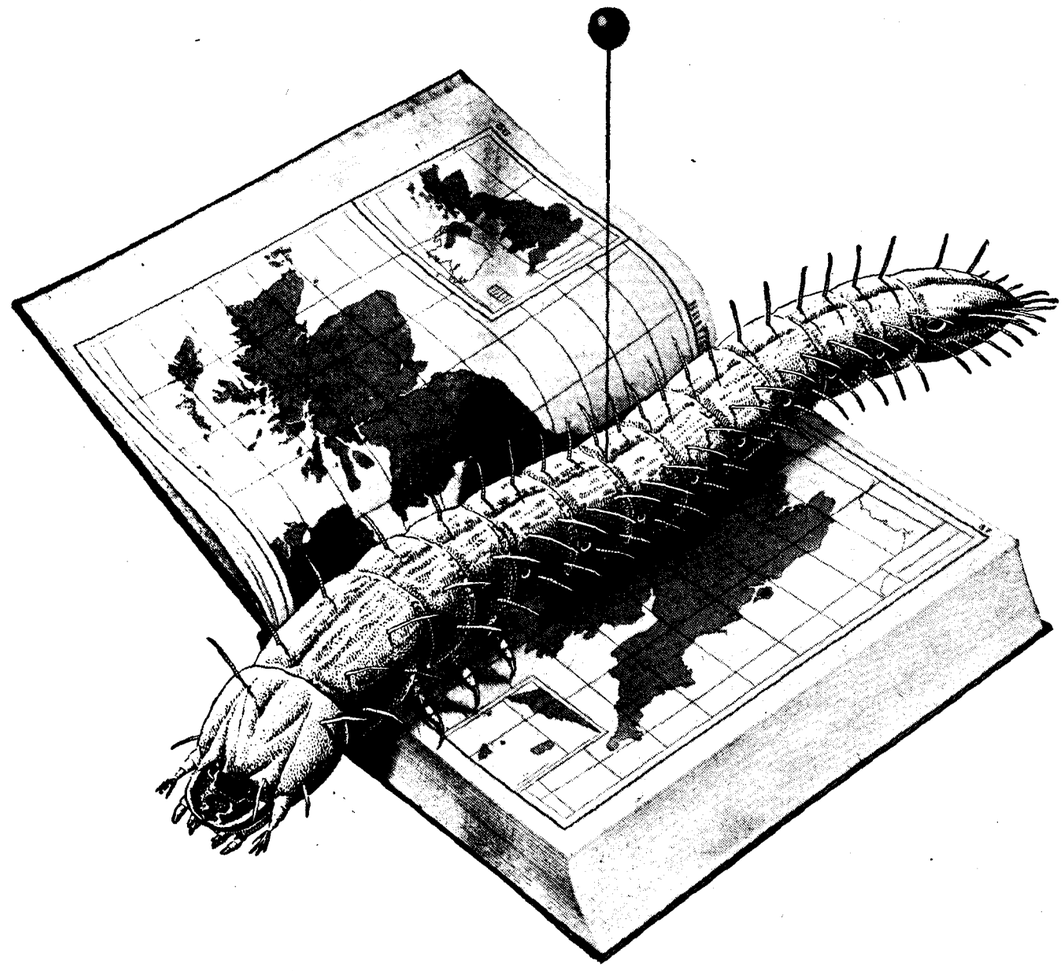
It is from the retail stores, fur trading and the wholesale department that investors receive their dividend while they are waiting to see what Hudson's Bay's interests in the developing oilfields of Canada will yield. It is upon the hopes of a good return from oil that the present high price of the £1 ordinary shares is based. Hudson's Bay owns 25 per cent and Continental Oil the remaining 75 per cent of the 2 million shares of Hudson's Bay Oil and Gas Company. That company is expanding rapidly and in 1954 there was a 48 per cent increase in the number of producing wells and of 59 per cent in the daily rate of crude oil production. In 1954 the company spent $16,600,000 on development and exploration, compared with $11,754,000 in 1953 and $7,182,000 in 1952. Development is moving forward all the time and this year arrangements for long term borrowings by the Oil and Gas Company to replace present bank advances and to finance an extensive drilling programme should be completed.

★

SWAN HUNTER AND WIGHAM RICHARDSON. For many shareholders the most significant piece of information in the full report of Swan Hunter and Wigham Richardson (for the year to December 31st) is not the increase in trading profits from £2,449,332 to £3,002,549 but the chairman's comment that the shipyards have still "about two years' work in hand." A timely word from Mr J. W. Elliott also warns them not to read too much into a sharp fluctuation in profits as earnings are at the mercy of the number of ships actually delivered in the financial year. But Mr Elliott's earlier reference to "another successful period of trading," the decision to raise the ordinary dividend from an effective rate of 10 per cent to 12 per cent and a healthy balance sheet suggest that no reservations need to be made about last year's results.

In commenting on these results Mr Elliott points out that, although steel deliveries are now "almost normal," the earlier steel shortages still had a dislocating effect on the completion of ships in 1954. Indeed, the gross tonnage of ships launched from Swan Hunter's yards last year was slightly smaller than in 1953, notwithstanding the full order book. But the production of machinery went up last year while ship-repairing "again contributed substantially to the year's profit."

Looking ahead, Mr Elliott, like other British shipbuilders, appears to be anxious, but not unduly so, about the state of the order book. The improvement in shipping freights during the year led to a number of contracts being placed with British shipyards, particularly in the last quarter, but still the "output of merchant ships from British yards is greatly in excess of new contracts placed." And foreign competition adds to the significance of a shortening of the order books. Much of Swan Hunter's two years of work in hand is for oil tankers, and the recent improvement in this market leads Mr Elliott to the hope—he puts it no more strongly than that—that there will be "further contracts, if not in the immediate future, then at some time prior to the completion of the existing programme."



★

JOHN CROSSLEY—CARPET TRADES HOLDINGS. High prosperity has been the recent fortune of the carpet manufacturers whose market grows as the houses spring up. John Crossley-Carpet Trades Holdings is in that class. Business, the profit, and the dividends all expanded in the year ended December 4th which was the first full year since the merger of John Crossley and Sons with Carpet Trades brought the factories at Kidderminster and Halifax under one management. The final dividend this year of 13¾ per cent is payable on a capital increased by the recent one for one scrip issue. The interim payment of 7½ per cent was made on the old capital and the previous year's 25 per cent was based on the pre-merger capital. It is approximately fair to regard the latest year's rate of dividend as being equal to 17½ per cent on the present capital and to compare it with the equivalent of 12½ per cent last year.

The board has given shareholders a set of accounts from which the special factors arising from the merger at the end of 1953 have been ironed out: the previous year's figures have been adjusted. They now show a group trading profit after depreciation for the year ended December 4th of £1,560,603, compared with £1,452,727. For a bumper year and with the benefit of the profits from a small further acquisition—E. Illingworth and Co.—for part of that year a profit increase of £107,876 seems small. But the balance sheet is heavy with stock and the chairman, Mr Maurice Lubbock, records that the order books are well filled and the factories working to capacity. He nevertheless feels it necessary to sound a note of warning. The group may, he believes, feel some effects from the recent hire purchase regulations in its home demand. And he is still more worried about the new Australian import restrictions. The subsidiaries of the group do large business there and must feel some effects, however slight. It must be those fears that have decided the directors to reserve more heavily than usual against the big stocks now held. Stocks have risen by over £1 million from £2,660,554 to £3,707,642, and to match that increase the appropriation to stock contingency reserve has been raised from £130,000 to £400,000.

★

JEREMIAH AMBLER. The Bradford and Ulster mills of Jeremiah Ambler, the worsted yarn spinners, are running at full capacity and the chairman, Mr Edward Beddington Behrens, reports that "the physical turnover of the group

The case of *Agriotes obscurus*...

Wherever potatoes are grown, wireworms are pretty certain to be encountered and to damage the tubers. In the U.K., for example, this destructive pest populates the soil in some areas to the extent of over a million per acre. In heavy local infestations this figure is probably doubled. Damage fluctuates, but it is nothing unusual to find over *half a crop unfit for the table.*

With wireworms on the increase, British farmers have welcomed the arrival of *aldrin.* This year in the United Kingdom alone over 90,000 acres of potatoes will be protected, mostly with aldrinised fertiliser. This Shell insecticide is the most impressive destroyer yet discovered for pests in the soil—non-tainting and exceptionally suitable for compounding with fertilizer. Just 2½ lbs. of aldrin per acre guards potatoes from wireworm and other soil pests right through the growing season.

Aldrin is fast becoming recognised as being the best of all soil insecticides. A little goes a long way and lasts a long time. Now in worldwide use, aldrin *gives full control of many pests previously difficult to 'get at' economically.*

Another recently developed Shell insecticide is dieldrin, *possessing exceptional persistence. On foliage,* dieldrin *controls a very wide range of weevils, beetles, flies and other crop-eating insects. It is also extensively used as a residual spray against disease-carrying insects.*

Have you a stubborn pest problem to be solved?

aldrin

aldrin and dieldrin are SHELL insecticides for worldwide use

continues to increase." Yet last year the group's profits before tax fell from £263,110 to £238,950. The explanation seems to be an intensification of competition, accompanied presumably by a trimming of margins. The group is expanding its direct export trade but it had to compete with the cheaply produced yarns exported from Japan. More recently other competitors have made their presence felt; they come from France where, Mr Beddington Behrens says, they are "indirectly given a subsidy on exports." But competition has not worked its way through to net profits, for these profits rose last year from £93,561 to £114,754. That increase, however, is simply due to a reduction in tax liabilities owing to the tax reliefs granted on machinery installed last year. As in 1953 ordinary shareholders receive a dividend of 20 per cent and as in the two previous years a 3 per cent free scrip issue. Thus, in effect, dividend payments have been gradually increased.

Since the end of the financial year the company's new factory at Peterlee, County Durham, has been opened. Modern in its machinery and lay-out, tapping a new and ample source of labour and enjoying the benefit of not having to pay a full rent in the first years of its existence, the new factory is a low cost producer. It is not yet up to full production but it should soon make some contribution to earnings.

★

ANGLO-PORTUGUESE TELEPHONE. Britain has always been a big exporter of goods and capital to its "oldest ally," Portugal. It is appropriate, then, that the telephones in Lisbon and Oporto are owned and run by a British company. That company, Anglo-Portuguese Telephone, is linked financially with the Telephone and General Trust. That close tie enables Anglo-Portuguese Telephone to look towards the trust for temporary loans and to find a ready subscriber for permanent capital. It is that tie which, perhaps, explains the peculiar dividend policy of the company. Its ordinary stock can hardly be described as true equity capital, since the ordinary dividend has remained at 8 per cent for the last 27 years—though that rate has serviced a growing amount of stock. Only last June 255,000 £1 ordinary shares were issued at par, followed immediately by the offer of 1 million £1 preference shares at par.

The new money was used to finance the expansion of the company's telephone system and the gradual conversion of the system from manual to automatic exchanges. That expansion continues and temporarily, as usually happens, the money to finance the development has been provided by the Telephone and General Trust. By the end of March these loans had risen to £550,000. But it is the company's policy to back its fixed assets with long-term capital. Hence yet another new issue is on the way; it will consist of a one-for-ten "rights" offer of 280,500 ordinary shares on terms to be announced. The success of the company's latest development programme is illustrated by last year's increase in total revenue, before charging operating expenses, from £1,820,525 to £2,029,814, accompanied by a growth in the fixed assets, from £7,259,105 to £8,609,385, and by the increase in profits from £323,156 to £492,846. The company's intention to go on expanding is illustrated by the £1,454,000 of outstanding capital commitments at the end of December and by the decision to revise the development plan so as to install 60,000 new lines, against the 51,000 originally planned. But for the shareholder in Anglo-Portuguese the expansion in the value of his equity would seem to turn not on the rate of dividend but on the "bonus" element in the "rights" issues, on an advance in earnings, and on an improvement in "break-up" values. This is a stock for the trusts.

LONDON STOCK EXCHANGE

Next Account begins: April 20th
Next Contango Day: April 20th
Next Settlement Day: April 26th

With the Budget only a few days away and with the possibility of an early election there was every reason for quiet trading conditions in Throgmorton Street after the Easter holiday. Prices were not fully tested in a market where the jobbers were short of stock. Even so prices were firm immediately after the holiday in most sections of the market. The gilt-edged market was inactive, but the gentle rise in prices, encouraged in part by the strength of sterling, continued. Foreign bonds were neglected, German Potash bonds having attracted most of the interest on Tuesday. They and other German issues turned dull on Wednesday when some of the buying interest switched to Japanese securities. Dollar stocks were marked up in line with Wall Street.

Industrial equities, too, continued to climb in a narrow market. By the close on Wednesday the *Financial Times* ordinary share index had risen to 188.4, compared with 187.4 immediately before the holiday. On Thursday, however, prices were a little easier. Almost all sectors joined in the gentle advance earlier in the week, with steel shares and brewery issues (on the hope of a cut in beer duty) catching the eye the most. Paper shares were notably firm. Among individual features in the market were another rise in Borax (quoted 120s. 6d. at the close on Wednesday) and the sudden jump in Hudson's Bay by 6s. 9d. to 160s. 6d. on Canadian buying. At the close on Thursday Daily Mirror were quoted 4½d. down at 20s.; the company's dividend has been raised from 20 to 22½ per cent.

Oil shares were firm on the encouraging report from Standard Oil, but turned a little weaker later. Tea and rubber shares were given some selective support. The Kaffir market began the week rather unsteadily, but on Wednesday prices took a turn for the better. Copper shares were marked down sharply on the fall in the price of the metal.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. Cost of living in Paris based on 1949=100, and wholesale prices in Western Germany on July-December, 1948=100. (2) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (5) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced. (6) Average for third quarter. (7) Beginning Dec., 1954, figures include foreign investments. (8) 1937.

Financial Statistics

EXCHEQUER RETURNS

For the nine days ended April 9th there was an "above-line" deficit (after allowing for Sinking Funds) of £23,983,000 compared with a deficit of £21,346,000 in the previous five days and a deficit of £11,162,000 in the corresponding period of last year. Net expenditure "below line" was £20,038,000 bringing the total deficit to £44,021,000 (£20,002,000 in 1954-55).

THE MONEY MARKET

THE discount houses raised their bid at last week's Treasury bill tender by the unusually large margin of 5d. per cent (or nearly ⅛ per cent) to £99 1s. 5d. per cent (or 3.12 per cent). This move took outside tenderers by surprise, and despite the reduction in the offer by £20 million, to £250 million, the market's allotment rose from 48 to 61 per cent. The average rate of discount fell by only just over ⅛ per cent, to £3 14s. 5d. per cent. Rates on three months commercial bills were reduced by ⅛ per cent after the tender.

Credit in Lombard Street was generally short before the holiday, but on Tuesday conditions turned more stringent; relief from the authorities came only in the form of a number of special orders, and one or two houses were forced to take a trifling amount of seven-day loans at the Bank. On Wednesday market supplies of credit were adequate, though business was exceptionally quiet. June bills have this week changed hands at 3½ per cent, compared with the prevalent rate of 3⅜ per cent before last week's tender.

The price of gold in the London market has fallen steadily with the rise in sterling. The price at the fixing fell from 250s. 10½d. an ounce on Wednesday before the holiday (when spot sterling stood at $2.79⅛) to 250s. 7d. an ounce on Thursday of this week (with sterling at $2.79⅛).

The fiduciary issue was raised last week by £25 million to £1,750 million.

THE LONDON OMNIBUS

A VEHICLE
OF INFORMATION

WHEN Shillibeer's omnibus first clattered its way through the city streets in 1829 the citizens of London realized that here indeed was a public service worth knowing and using.

Likewise, the London Assurance offer the public another kind of useful service by journeying into print with selections from their own omnibus collection of insurance policies.

Better Terms
When school fees come in, some fathers find themselves wrestling with sums. Others have discovered, however, that the right answer to this particular problem is to take out an Education Policy with us well before schooling begins. It's just a matter of good arithmetic.

"How to be Well Assured"
The many different kinds of Life Assurance we provide deserve a volume to themselves—and they have one. Our booklet "How to be Well Assured" has helped many people to find the Life Policy that suits them exactly. Would it help you?

Valuables Advice
"Rings on her fingers and bells on her toes, she shall have cover wherever she goes" if her jewellery, furs and other valuables are safeguarded by our All-Risks Policy.

There's more to be said . . .
If you would know more about any of the policies outlined here, if we can provide any information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department X6, London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

REPRESENTATION THROUGHOUT
THE UNITED KINGDOM
THE BRITISH COMMONWEALTH AND
ELSEWHERE ABROAD

The Company undertakes the duties of Executor and Trustee

THE BOWATER ORGANISATION

The Bowater Corporation of North America Limited announces that a new company, The Bowater Power Company Limited, (incorporated in the Province of Newfoundland, Canada) has been formed with the object of acquiring and operating the hydro-electric development, at present owned and operated by Bowater's Newfoundland Pulp and Paper Mills Limited, and of acquiring the undeveloped water powers and the water power rights at present owned by that Company.

The value of the assets now to be taken over by the Power Company have been appraised at a sum in excess of $34,000,000.

The directors of the Power Company will include Sir Eric Vansittart Bowater (President)—Chairman of The Bowater Paper Corporation Limited and President of The Bowater Corporation of North America Limited, G. S. Currie (Vice President), Gordon R. Ball, President of Bank of Montreal, Paul Bienvenu, President and Managing Director of Catelli Food Products, Eric Cook, Q.C., H. M. Spencer Lewin, Vice President of Bowater's Newfoundland Pulp and Paper Mills Limited and John H. Price.

The existing hydro-electric plant, which has an installed capacity of 150,000 horsepower, supplies the entire power requirements of Bowater's Newfoundland Pulp and Paper Mills Limited at Corner Brook, Newfoundland. In addition, it supplies the regional requirements of The Newfoundland Light & Power Company Limited, the Buchans Mining Company Limited, and other industries in the area.

The demand for electrical energy in this area is increasing rapidly and one of the objects for which the new Power Company has been formed is the further development of the water powers within the drainage areas now to be acquired by the Power Company.

SAFETY-FIRST INVESTMENT

2½%

per annum

Income Tax paid by the Society

Equal to £4.10.10 per cent to investors subject to income tax at the standard rate

The current rate of interest on share accounts is 2½%, and on ordinary deposit accounts 2%, with income tax paid by the Society in each case. Sums up to a total holding of £5,000 are accepted for investment in Abbey National. For further particulars apply for a copy of the Society's Investment Booklet.

Total Assets exceed £213,461,000

UNILEVER LIMITED AND UNILEVER N.V.

The Boards of Unilever Limited and Unilever N.V. RESOLVED to-day to RECOMMEND to the Annual General Meetings of their respective Companies, which will be held on 26th May, 1955, the DECLARATIONS of FINAL DIVIDENDS on the Ordinary Capitals in respect of the year 1954 payable on 9th June, 1955, as follows:

1. In the case of Unilever Limited a DIVIDEND of 9¼% actual (1/11.4d. per £1 of stock) less income tax, making 15¼% for the year ended 31st December, 1954, PAYABLE TO STOCKHOLDERS REGISTERED in the books of the Company on the 14th May, 1955.

2. In the case of Unilever N.V. a DIVIDEND of 8¼% actual (Fl. 87.5 per share of Fl. 1,000) making 14% for the year ended 31st December, 1954.

The total dividends are at the same rates as for 1953 but are payable on the ordinary capitals as increased by the one-for-four scrip issues in December, 1954 and, in the case of N.V., by the ordinary capital issued during 1954 to meet the conversion of 3½% Convertible Notes. The dividends for LIMITED and N.V. are equivalent in value under the terms of the Equalisation Agreement between the two Companies.

Trading conditions continued generally favourable in 1954 and results were satisfactory. The value of turnover at £1,437,429,000 compares with £1,310,121,000 for 1953.

The combined trading profit of the Group's operations throughout the world was £70,095,000 (1953 £61,584,000). Taxation for the year amounted to £38,218,000 (1953 £33,821,000) and the consolidated net profit to £31,854,000 (1953 £25,799,000). The consolidated net profit for 1954 includes £2,667,000 (1953 £575,000) of exceptional items and non-recurring profits.

The N.V. figures included in the profits and taxation for 1953 have been adjusted to a conversion rate of Fl. 10.64=£1, the same as used in 1954.

The results for the Groups separately were:

	Consolidated Net Profit	*Profit of Parent Company*
Unilever Limited	£19,117,000 (£16,891,000)	£9,067,000 (£7,325,000)
Unilever N.V.	£12,737,000 (£8,908,000)	£6,141,000 (£4,707,000)

The Reports and Accounts of both Companies will be issued on 3rd May, 1955.

13th April, 1955.

COMPANY MEETINGS

THE ANGLO-PORTUGUESE TELEPHONE COMPANY

SATISFACTORY PROGRESS CONTINUED

EXCEPTIONALLY HIGH RATE OF DEVELOPMENT

SIR ALEXANDER ROGER'S STATEMENT

The sixty-eighth annual general meeting of The Anglo-Portuguese Telephone Company, Limited, will be held on May 2nd at Strowger House, 8 Arundel Street, London, W.C.2.

The following is an extract from the statement by the chairman and managing director, Sir Alexander Roger, KCIE, which has been circulated with the report and accounts:

ACCOUNTS

The accounts for the year ended December 31, 1954, show clearly the continued satisfactory progress of the company. The exchange rate has remained stable at Esc.80.50 to the £ since September, 1949, and for the fifth successive year all currency figures have been converted at that rate.

The increase in total revenue from £1,820,525 in 1953 to £2,029,814 in 1954 is the direct result of the large-scale development of the company's systems in Lisbon and Oporto in recent years.

Total expenses, including renewals and depreciation, royalties, taxation, debenture and loan interest, sinking fund instalments and the expenses of the capital issues during the year amount to £1,707,276, and are £102,973 higher than in the previous year.

The company's contribution to the State and certain municipalities in Portugal in 1954, in the form of royalties payable in cash, and telephone services supplied without charge or at reduced rates, represented a sum of 16,709 contos, equivalent to £207,567.

The net revenue of £322,538 is £106,316 higher than in 1953, and it is proposed to pay a final dividend of 5 per cent on the increased ordinary stock which, together with the interim dividend of 3 per cent paid in November last, makes 8 per cent for the year. It is also proposed to pay a dividend of 8 per cent on the "A" ordinary stock.

The above dividends, together with the dividend on the preference stock, account for £135,623, and after transferring £150,000 to general reserve, the carry forward is increased by £36,915 to £139,238.

In June, 1954, 255,000 unissued ordinary shares were offered to existing stockholders at par. Stockholders took up over 96 per cent of their rights and applications for excess shares greatly exceeded the number of shares available.

Also in June last the company offered one million 6 per cent cumulative preference shares of £1 each at par to the public. This issue was heavily oversubscribed, necessitating substantial scaling down of applications.

These capital issues enabled the company to repay temporary borrowings from Telephone and General Trust, Limited, and to purchase new equipment for the telephone systems in Lisbon and Oporto. At the end of the year borrowings from the trust had been resumed and amounted to £35,393.

Our consulting engineers have made their annual investigation of the telephone plant and equipment. In accordance with their recommendations the provision for renewals has been increased to £1,999,458, representing 24 per cent of the cost price of installed plant, which they state is, in their opinion, adequate.

The provision for renewals, together with the company's reserves, continues to be invested in the business.

During the year telephone material to the value of £794,700 was shipped to Portugal from the United Kingdom, while purchases of materials manufactured in Portugal exceeded 27,800 contos, say £345,300. The total value of shipments over the past five years was £2,625,200, and the value of purchases in Portugal in the same period totalled 89,800 contos, equal to £1,115,500. These figures show that the company makes a substantial contribution to the industrial interests of both the United Kingdom and Portugal.

GENERAL PROGRESS OF THE COMPANY

It will thus be seen that we are an important entity in the business and social life of the community and the Portuguese Government looks to us, not only to supply an efficient service, but to expand in step with the development of the country.

To do this and to meet the heavy calls upon us, it was decided eighteen months ago to prepare the four-year expansion plan for 1954-1957, the introduction of which I announced in my statement last year.

The demand is such that we have already had to revise this plan and we propose to increase the objective number of lines to be installed from the original 51,000 to 60,000 over the period.

During 1954, 17,297 new stations (which include 14,581 exchange lines) were added, representing an exchange line growth of 14.5 per cent per annum. This is an exceptionally high rate of development and in excess of the achievements of telephone undertakings in most countries in normal conditions. The number of stations in service at December 31st last was 151,883.

It is world-wide experience that the telephone business never ceases to expand in a progressive community. As is being proved in our case the greater the facilities we provide the greater becomes the demand for service. During the last four years, 1951 to 1954, over 50,000 stations have been added and yet the present-day demand is at the rate of over 1,500 applications per month.

This constant and increasing demand for telephones is a measure of the economic progress in Portugal and is a healthy sign of the future development and expansion lying before the company.

EXTENSIVE DEVELOPMENT

In the course of the year, five new exchange buildings were completed and work started on a further four buildings.

In Oporto the new Lapa Automatic Exchange, with an initial capacity of 4,000 lines, was brought into service during March when the opening ceremony was presided over by Dr Domingos Braga da Cruz, Civil Governor of Oporto, in the presence of the Military Governor, the British and American Consuls, senior officials of the Government and Municipality and leading members of the industrial and commercial community.

Later in the year, in October, the Bonfim Manual Exchange, also in Oporto, was converted to automatic working, and at the same time the capacity was increased from 2,400 to 3,400 lines.

In Lisbon the unique operation was undertaken of bringing into service on the same day in January of this year, three new automatic exchanges at Sacavem, Pedroucos and Algés. As the result of well-planned organisation, this was completed smoothly and efficiently.

At the inaugural ceremony of this multiple cut-over the company was honoured by the presence of the Minister of Communications, Colonel Manuel Gomes de Araujo. We were also pleased to welcome the Civil Governor, the Postmaster General, together with a number of his principal assistants, and the British Chargé d'Affaires.

The newspaper reports were highly complimentary and the Minister of Communications is quoted as saying in the course of his speech that it was his duty, in the name of the Government, to convey his congratulations to the company for the development of the networks and for the meritorious work which had been accomplished in the past two years. He went on to say that it was clear that the company, despite difficulties, had made great efforts to fulfil its obligations and to give the cities of Lisbon and Oporto the telephones they required.

Also during 1954, equipment was brought into service at three of our largest exchanges to accommodate additional subscribers, namely, 5,000 at Campo Pequeno, 3,200 at Estrela, and 2,000 at Norte.

Throughout the year the installation staff were working to a very tight schedule but successfully completed all projects ahead of time.

The company is well served by the contractors who are entrusted with the extensive building construction now being undertaken. The new buildings are architect designed and solid in construction and the builders can always be relied upon to complete their work by the scheduled date, thereby making it

possible for the installation programme to be adhered to without costly delays.

FINANCE

In carrying out its plans, the company is assured of financial support from Telephone and General Trust, Limited, by means of temporary loans. These invaluable facilities in conjunction with the ever-ready co-operation of our two great associated manufacturing companies, Automatic Telephone and Electric Company, Limited, and British Insulated Callender's Cables, Limited, who supply the bulk of our telephone and cable equipment, provide a closely integrated finance and manufacturing service at the British end.

Once the engineers' and technicians' plans have been approved by the London Board, the smooth working of the programme depends on co-ordination of financial and manufacturing, building and installation schedules. Frequent conferences are held between our engineers and the representatives of the manufacturers, both in Portugal and in Britain, to settle problems and adjust timetables, and by this means deliveries of equipment are assured precisely when required. At the same time, temporary finance must always be available to meet obligations and day-to-day commitments.

At December 31, 1954, the total borrowings from Telephone and General Trust, Limited, amounted to £35,393, and by March 31, 1955, the figure had risen to £550,000 approximately. The successful fulfilment of our plans requires substantial purchases of plant and equipment necessitating increased finance. A part of this finance is supplied from within the company, the reserves being fully invested in the business, but it is necessary to repay temporary loans by offering permanent capital from time to time.

As part of our financial plans it is proposed to offer 280,500 of the existing unissued ordinary shares to ordinary and "A" ordinary stockholders in the proportion of one new ordinary share for every £10 of stock held. Details will be issued in due course.

STAFF TRAINING

As our networks expand additional technicians and mechanics in substantial numbers must be added to the staff. For the past six years a technical school has been maintained within the company and all new staff assigned to our technical establishments receive an adequate training.

The company provides opportunities for young men who have studied in technical schools to attend evening classes to take an intensive course over a period. This is followed by an examination and successful candidates are admitted to service and receive further training in day classes. After completing the general course, trainees with particular ability are encouraged to take specialised courses and in the thirteen months prior to December last 647 passed out qualified.

The training in the company not only provides a thorough grounding in telephone technique but also gives the instructors an opportunity to select trainees and assign them to the work for which they display the greatest aptitude.

VISITS TO EXCHANGES

Portugal receives an increasing number of visitors each year including many from Great Britain. It is probable that some of these visitors are stockholders of the company and I extend to them a hearty invitation to visit one of our main exchanges in Lisbon or Oporto. Our administration in Portugal is always glad to welcome stockholders and those who have had the opportunity of seeing something of our system are full of praise of the company's enterprise and the organisation behind it.

PORTUGAL

Portugal today is in a strong position not only for the advances it has made in its planned national economy, but also as a respected member of both the North Atlantic Treaty Organisation (Nato) and the Organisation for European Economic Co-operation (OEEC). Substantial reserves of gold and foreign exchange have been accumulated, the balance of payments is satisfactory and the escudo ranks among the hard currencies of the world.

This picture is in sharp contrast with the position of a quarter of a century ago and the transformation of Portugal is largely based on the far-seeing vision of H. E. Doutor Antonio Oliveira Salazar, the Prime Minister.

When in 1932 Dr Salazar first assumed the responsibilities of government leadership and created the "New State," Portugal had passed through a long period of political and economic uncertainty. It fell to Dr Salazar to introduce a clear financial policy and to impose rigid measures to implement it. Through the awakening of interest in Portugal's extensive overseas territories and by sound financial and profitable industrialisation at home, economic recovery is being achieved under the management and leadership of their great Prime Minister.

The overseas territories, among them Angola and Moçambique, are a potential source of great wealth, and large sums of money are being spent by the Portuguese Government in their development. Portugal is already reaping much benefit from this policy.

Before the advent of the "New State," Portugal was using up reserves to buy goods on the world market which could have been obtained with escudos from her own territories overseas where heavy surpluses existed. Similarly other goods were being bought abroad which could have been produced within the escudo area. Now over 15 per cent of all Portugal's imports are received from the overseas territories, who take 27 per cent of her exports in return.

Sufficient olive oil is now produced to satisfy the home demand, leaving a small but growing surplus for export, and it is probable than an exportable surplus of rice may be available in the near future.

By careful afforestation, over 28 per cent of the country's surface has been converted to timber production and now over one quarter of all Portugal's exports derive from forestry. Under this heading come timber, cork and the valuable by-product resin.

Although Portugal is still mainly an agricultural country, considerable industrial growth has been achieved and an increasing proportion of the surplus man power is being absorbed.

Exports of manufactured goods are now over eleven times greater than in 1930.

A large nation-wide hydro-electric scheme is under construction to produce cheap power from the country's natural resources, and the benefit of this enterprise is already being felt; imports of anthracite are now only one-tenth of the tonnage imported twenty years ago. Plans are well advanced for the construction of iron and steel plants which will provide an entirely new field of activity in Portugal.

The United Kingdom maintains a steady position at the head of the list of countries trading with Portugal, supplying between 15 and 16 per cent of her total imports and taking over 14 per cent of her total exports.

Furthermore, the United Kingdom is by tradition a heavy investor in Portugal and large sums of British capital are invested, not only in this company but also in tramways, mining, cork, the port wine industry and, in recent years, in telephone equipment and cables.

The cordial relations existing between the governments of the two countries provide the greatest encouragement to all the British companies operating in Portugal. Speaking for the company it will be appreciated that our future prospects are in many ways allied to the financial and economic expansion and stability of the Portuguese nation and I see no reason to doubt why these should not be maintained and strengthened.

VISITS AND PERSONNEL

I made two visits to Portugal during 1954 and on both occasions was received by H. E. Doutor Salazar. My conversations with him, as always, were conducted in an atmosphere of great cordiality. His Excellency continues to show a keen interest in the company together with a ready appreciation of its achievements and understanding of its problems.

I also had the pleasure of meeting and exchanging views with several of the Ministers of the Government and the foremost figures in Portuguese banking and commercial circles, and I am happy to say that your company continues to enjoy a high measure of goodwill in its endeavours to improve and expand the telephone service.

All my colleagues also paid comprehensive visits to Portugal at various times during the year.

Your company is particularly indebted to the Minister of Communications, Colonel Manuel Gomes de Araujo, who, by his frequent presence at the inauguration ceremonies which precede the opening of the company's new exchanges, shows his understanding and recognition of our efforts to widen and develop telecommunication services.

The London board acknowledges the invaluable collaboration between our esteemed chairman of the board in Portugal, Senhor Engenheiro Antonio Branco Cabral, CBE, and his colleagues on the board, and Doutor Antonio Bustorff Silva, CBE, our legal adviser.

We take this opportunity to congratulate both Senhor Engenheiro Antonio Branco Cabral and Dr Antonio Bustorff Silva on having had conferred upon them during 1954 the honour of Commander of the Order of the British Empire, a distinction which has given great pleasure to all their many friends in England and Portugal.

I would like, on your behalf, to thank the personnel of the company at all levels in Portugal and in London for their strenuous work throughout the past year. The extent and rapidity with which your company is expanding places a severe task upon the company's forces and calls for clear-headed administrative and executive leadership. Based upon my own personal knowledge, and on that of my fellow directors, the confidence which we have in Mr R. S. Thorp, our general manager in Portugal, and in all our officers and staffs, has been, and is being, well earned.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

MANCHESTER OIL REFINERY (HOLDINGS) LIMITED

INCREASED TRADING PROFITS

ENLARGED RANGE OF PETROLEUM AND CHEMICAL PRODUCTS

MR RUDOLPH DE TRAFFORD'S STATEMENT

The annual general meeting of the Manchester Oil Refinery (Holdings), Limited, will be held on April 29th in London.

The following is the statement by the chairman, Mr Rudolph E. F. de Trafford:

It is with a sense of deep regret that I have to report that within the last few days death has taken from us a valued colleague in the person of Dr Franz Kind. He was a man whose warm personality and great ability commanded our respect and earned the affection of all his colleagues and, indeed, of all who worked with him. He will be sadly missed and we shall none of us forget the great debt which we owe him for his services to the company, which his inspiration and vision were so largely instrumental in creating. I have no doubt in my mind that amongst all his important activities in the petroleum industry his association with our company was the one to which he was most attached, and certainly no one was more cheered than he was by our improved results for 1954 and no one had greater confidence in our company's future.

A MATERIAL IMPROVEMENT

Turning to the results for the year, the consolidated profit and loss account shows an increase in trading profits at £330,363. This trading profit has been struck after bringing into account the provision of £61,570, referred to in my statement last year, which was created to offset the difference between the ruling freight rates and the element of freight (carried at cost) in the refinery company's stocks at December 31, 1953. The group profit before taxation at £174,349 shows an increase of £123,180; after providing for taxation other than the profits tax arising from the distribution of the preference and ordinary dividends, and after deducting the profits attributable to outside shareholders, the group net profit of £112,447 compares with £21,692 in the previous year.

In view of this material improvement your directors recommend the payment of a final ordinary dividend of 8¼ per cent, less tax, which with the interim dividend of 4 per cent, less tax, involves a total distribution of 12¼ per cent, less tax. The final ordinary dividend requires £18,232. Preference and interim ordinary dividends already paid required £18,411, and profits tax payable on these distributions amounts to £13,325. The transfer to debenture redemption reserve has absorbed £7,098, and it is proposed to transfer a further £50,000 to general reserve, leaving a balance of £43,979 to be carried forward on the consolidated profit and loss account, as compared with £43,777 brought forward from the previous year.

WORKING CAPITAL POSITION

Before leaving the accounts, reference should be made to certain aspects of the consolidated balance sheet. The amount invested in fixed assets increased by £71,282 during the year, but after providing for depreciation the book value of these assets remained virtually unchanged. Trade investments have risen from £55,597 to £122,895, the increase arising principally from the subscription of additional capital in Albatros SA Belge pour le Raffinage de Petrole at Antwerp, in which we were already interested, and to which further reference will be made later in this statement.

The net working capital position shows little overall change. Whereas oil stocks and materials, stores and engineering work in progress show a reduction of £116,196, debtors have risen by £86,704. Balances at bankers and cash in hand at £208,832 show an increase of £180,211, but virtually the whole of this additional amount was utilised early in the New Year in remitting the funds for the subscription to the new capital of Albatros SA Belge pour le Raffinage de Petrole, and in paying for a cargo of crude which was afloat at the accounting date; these two items more than account for the increase of £148,263 in sundry creditors at the end of the year. On the other hand, it may be noted that the bank loan has been reduced from £250,000 to £225,000, that the unsecured loans of £24,000 appearing in the previous balance sheet have been repaid, and that the bank overdraft was reduced at the close of the year by £17,473, making a total reduction of £66,473 in borrowed moneys employed by the group. The only other item in the balance sheet which calls for comment is the increase in the capital general reserve from £3,087 to £20,953; the details of the various movements making up this increase are set out in the notes annexed to the balance sheet.

PETROLEUM SULPHONATE

In my statement at the last annual general meeting I referred to certain developments on which I am now able to give you further information. Your company, which was amongst the pioneers in the production of petroleum sulphonates in this country, has now satisfactorily concluded research and pilot plant work on the production of a new high quality range of these materials, which are of growing importance in the manufacture of metallic soaps for additives and cutting oils, detergents, etc. The work has been somewhat protracted, but I am hopeful that the arrangements which we have made for the expansion and improvement of our output of these products will be completed during the current year, and will bear fruit in 1956.

Our new wholly-owned subsidiary, Trafford Chemical Developments, Limited, started operation during the first half of the year under review. Its plants, which are situated at the refinery, are now producing a limited range of fine chemicals which are meeting with a satisfactory reception from customers.

We have acquired the former minority shareholding in Petroleum Inventions Limited, and this company thus becomes a wholly owned subsidiary. It is successfully engaged in the development, production, and marketing of various types of additives.

PRODUCTION AND SALES COMPANIES

The production company, Manchester Oil Refinery, Limited, operated satisfactorily throughout the year, and not only increased its output of the more specialised products, but achieved material operating economies, especially in its chemical consumption; its overall shipping rates have been in line with market prices.

The sales company, Manchester Oil Refinery (Sales), Limited, has continued to open new accounts and to maintain its position under highly competitive conditions.

Raven Oil Company, Limited, which is responsible for purchases of raw materials and the refinery's exports, had a successful year. As in previous years, this company also did business not directly connected with the operations of the refinery, and these dealings continued to be profitable.

Flexibox, Limited, in which we own two-thirds of the issued capital, again had the best year in its history. The arrangements entered into in the previous year for the promotion of its business in the United States, France, and Germany have produced gratifying results, and the company, which counts amongst its customers in those countries the major oil companies and other leading manufacturing concerns, looks forward to increasing benefits in these markets. A further capitalisation of the undistributed profits of the company has taken place, and the issued capital has been raised from £18,000 to £25,000.

BELGIAN REFINERY RECONSTRUCTION

Reference has previously been made to Albatros SA Belge pour le Raffinage de Petrole of Antwerp. Our first interest in this continental refinery was acquired in 1948 on very favourable terms. The plant, which originally consisted of a simple distillation unit, was damaged by enemy action during the war, and after its reconstruction was operated under a four-year processing arrangement (which expired in 1952) for one of the major oil companies. It became apparent that it would be necessary to modernise the installation if it were to operate economically and meet present-day demands, and the Board of Albatros therefore decided in 1951 to increase the capacity of the refinery and to install a catalytic cracker. The new plants, which produce, *inter alia*, high octane gasoline, jet fuel and liquid petroleum gases, came on stream in the autumn of 1954, and are now operating under a fresh long-term processing contract with the same major oil company. The cost of the reconstruction work was considerable, and was financed partly by loans provided by banks in Belgium and partly by the subscription of additional capital. It is our policy to maintain certain close and valuable connections on the Continent which in the past have proved remunerative and accordingly when Albatros SA Belge increased its ordinary capital by B.Frs. 25 million in 1954, and made an issue of B.Frs. 50 million participating preferred ordinary shares at the end of the year, we participated to the extent of B.Frs. 1,500,000 in the former and B.Frs. 10 million in the latter, at a total cost of nearly £85,000. The present contract does not fully utilise the capacity of the refinery, but allowing for the continued growth in the demand for petroleum products, and taking into account the fact that our total investment both direct and indirect in the ordinary,

capital of the company stands in our books at considerably less than its par value, your board is of the opinion that the longer-term outlook of this company is satisfactory and that therefore the investment will prove profitable.

CURRENT YEAR'S PROSPECTS

As far as the current year is concerned, our results to date are in line with those achieved during the past twelve months, and it would therefore be disappointing if profits could not be maintained at the present level.

It is our policy to enlarge the range of both our petroleum and our chemical products. Our programme provides for the production during the current year of certain materials which have not hitherto been produced in this country and, while we do not anticipate any marked contribution to our earnings from this development policy in 1955, it is our hope that in 1956 material benefits will accrue from our broadened activities.

In conclusion, I would like to thank my colleagues on the board, the directors of the operating companies and all the members of the organisation for their excellent work. In addition to their day-to-day duties of running the business, the principal executives have visited the United States and Germany in connection with the developments to which I have referred. Our thanks are due to them for their material contribution, both to the results of the past year and to our plans to increase the group's earning capacity.

CO-OPERATIVE INSURANCE SOCIETY, LIMITED

BONUS INCREASED

EXPENSES REDUCED

Mr S. Leonard Kassell, chairman, at the eighty-seventh annual general meeting held on April 13, 1955, said:

The CIS is an exceptional office, since not only is its paid-up share capital of £52,500 extremely small in relation to the size of the business, but it has only two shareholders, the CWS and the SCWS. No advantage from the continued expansion and prosperity of the CIS accrues to either of these shareholders, because the rate of dividend is limited by rule to 5 per cent, yielding only £2,625 per annum.

All the divisible surpluses in the ordinary and industrial life departments are distributed directly to our policyholders. The profits in the collective life and fire and general departments are disbursed to co-operative societies—of which millions of our policyholders are members. Coupled with this wide distribution of surpluses is the fact that we are one of the most economically managed insurance offices in Great Britain as the expense ratios in all our departments demonstrate.

Clearly, therefore, the CIS functions as a co-operative insurance organisation ought to do—for the benefit of its policyholders.

Our premium income during 1954 was £35,170,709, being an increase of £2,380,789 over the previous year. Our assets increased by £14,378,888 to £148,408,406.

The growth in our assets is due mainly to the expansion of our life funds of which during the past ten years over £90 million has had to be invested for the benefit of the policyholders for whom the society holds these funds in trust. These figures provide a measure of the magnitude of the investment problem which continually faces your directors.

At the end of 1954 we had over 11 million life policies in force and it is for the sole benefit of the holders of these policies that the investments in British Government and other Stock Exchange securities are made as well as the investments in properties and mortgages, and it is they who benefit eventually from any increased dividends which may be earned, for as I have already shown, the shareholders administering the business gain no profit from the investments held by the society.

As I indicated last year, the growth of the CIS shows that a great body of the general public is steadily acquiring a direct personal interest in the capital assets of this country, and your directors bear this important factor in mind when framing their investment policy.

New advances under the house purchase scheme amounted to £2,788,589. During the year we made certain alterations in our scheme in order to meet changing circumstances and to encourage applications from reliable borrowers on sound properties.

ADMINISTRATIVE COSTS

Our endeavour is to reduce costs without impairing efficiency and I think we can claim some success in this respect.

In 1954 our overall commission and expense ratio showed a further reduction from 24.02 per cent to 23.64 per cent.

The figures recently published by the Industrial Assurance Commissioner showed that in 1953 the CIS had the lowest expense ratio of any of the companies or larger societies this despite the fact that we transacted the second largest volume of new business in that class.

LIFE DEPARTMENT

During 1954 we were able to show a further increase of £3,357,033 in the new sums assured completed in the ordinary section—the total being £25,154,652, which is a record for the society.

In the industrial section the new sums assured increased by £2,006,598 to £45,586,782.

There is still an urgent need for individual life assurance protection to cover family needs which are not met by group life assurance and private or state pension schemes. In the ordinary section the special CIS policies which we put on the market last year as "Children's Plan," "Women's Plan" and "Mortgage Protection Plan" have proved a great success with the public.

The development of our industrial life business proves that there is a continued demand for this class of life assurance. As we all know, many people still prefer to pay their premiums weekly, or monthly, because this is the basis on which they are paid and on which they budget for all their household expenditure. Since it is our endeavour to provide facilities for the insurance requirements of all classes of the public, our industrial section tables are designed with this preference in mind.

INCREASED BONUSES

It gives me great satisfaction to announce an increase in the rate of reversionary bonus in the ordinary section by 2s. from 32s. per cent to 34s. per cent. This increase is very largely due to the improved interest earnings arising from the active investment policy carried out by your board.

In the industrial section also, additional reversionary bonuses have been granted.

MOTOR DEPARTMENT

This account showed a further increase of £208,817 in premium income during 1954, when the total premium income amounted to £3,502,281.

Economy of management, coupled with sound underwriting, has once again enabled us to show a profit of £185,749 in this department.

FIRE DEPARTMENT

The results in the fire department have once again been very satisfactory, and this account is making a very substantial contribution to the surplus which is being distributed by way of dividend to co-operative societies which are insured with the CIS.

The premium income was £1,573,707, which showed an increase of £114,190 over 1953. The surplus amounted to £363,110.

ACCIDENT DEPARTMENT

In the general insurance account, which includes miscellaneous business such as public liability, burglary and employers' liability, the premium income was £1,480,757 and in the personal accident account £124,739, making a total premium income in this department of £1,605,496, which is an increase of £156,269 over 1953.

Both accounts have run satisfactorily. There was a surplus of £38,621 in the personal accident account and £176,653 in the general account.

PROFIT AND LOSS ACCOUNT

It will be observed that the sum of £1,210,000 has been transferred to the profit and loss account from the departmental revenue accounts, of which £750,000 has been applied to writing down investments.

After making this transfer and making adequate reserves for contingencies, the total amount to be distributed to policyholders in respect of our operations for the year 1954 is £4,357,329, of which £3,933,505 is due to our ordinary life and industrial life policyholders, and £423,824 is payable to co-operative societies as a dividend on the fire and general and collective life premiums paid to the CIS during the year.

TAXATION

Our total tax liability in respect of our transactions during 1954 amounts to £808,652, which is £111,839 in excess of the previous year. Of this total £220,001 has been reserved for taxation on the profits in the fire and general departments and the balance of £588,651 was paid during 1954 by deduction from interest earnings.

The report and accounts were adopted.

BRITANNIC ASSURANCE COMPANY LIMITED

ANNUAL INCOME OVER £15,500,000

£1,917,000 ALLOCATED TO POLICYHOLDERS FOR BONUSES

Mr J. A. Jefferson, FIA, presiding at the eighty-ninth annual general meeting on April 1, 1955, said:

It gives me pleasure to report another year of steady progress in all branches. In the life branches premiums increased during 1954 by £449,000 to £11,678,000. Our gross interest income increased by £384,000 to £3,826,000, and our total funds increased by £5,975,000 to £91,345,000. Policies in force in the life branches now assure, with bonuses, £203,699,000—exceeding the £200 million mark for the first time. Increased surpluses have enabled us to improve the bonuses to policyholders in both the ordinary and industrial branches. The over-all allocation to policyholders this year is £1,917,000, compared with £1,742,000 a year ago.

ORDINARY BRANCH

New policies issued in the ordinary branch in 1954 assured over £7,262,000 after deducting reassurances. The premium income increased by £116,000 to £3,903,000, and the assurance fund rose by £2,151,000 to £33,655,000. Net interest increased by £94,000 to £1,097,000 and the net yield by 1s. 7d. to £3 8s. 3d. per cent. Expenses were at the moderate rate of 11.54 per cent of the premiums. Mortality was favourable, and the death claims at £366,000 were actually £31,000 less than in 1953. Claims under maturing endowment policies resulted in payments of £1,432,000 to surviving policyholders. Surrenders and lapses were lower than in the previous year.

A year ago I expressed the hope that the Chancellor of the Exchequer would implement the recommendations of the Millard Tucker Committee with regard to retirement provisions made by self-employed persons, and so remedy the injustice under which this class suffers. Nothing was done for them in 1954, but we are hoping they will not be overlooked in the 1955 Budget. Tax concessions to those who save for the provision of pensions would be entirely consistent with the curbing of inflation which, if unchecked, could so seriously undermine our export effort upon which so much depends.

In the industrial branch the premium income at £7,774,000 showed the satisfactory increase of £333,000 while the fund rose by £3,342,000 to £49,681,000. It is interesting to note that the increase in the industrial branch fund in the year 1954 was as much as the total increase in the fund made during the first 55 years of the company's existence. as the total increase in the fund made during the first 55 years of the company's existence.

Death claims amounted to £1,599,000 and were only £14,000 more than those of a

The net rate of interest earned again increased and at £4 4s. per cent was 1s. higher than the rate earned in the previous year. The expense rate was 26.02 per cent, a reduction during the year of .64 per cent. This has been achieved by constant attention to efficiency. The expenses of collection and the new business expenses have risen in amount and it is in the expenses of management that we have achieved a reduction. We are therefore keeping a tight control on the overall expense ratio, and at the same time increasing the individual earnings of our staff.

A gratifying feature of this year's results is a reduction in the number of policyholders who discontinued premium payments on their policies. Lapses have for ever been a matter of concern to us, but for many years now they have been at a low level. Last year only three out of every hundred policies in force were discontinued. In 42 per cent of the cases which lapsed the policyholders received a paid-up policy for an amount proportionate to the number of years' premiums paid; in 31 per cent of the cases they received a cash surrender value generally in excess of the minimum statutory requirements; the remaining 27 per cent were policies of under one year's duration and they received life assurance cover for periods much in excess of the actual periods of premium payments.

The "home service" insurance industry continues to play an important part in the economic life of the country. Some £150 million a year in premiums are being collected, and policyholders' funds are increasing at a rate of over £40 million a year. These are real savings and are an important factor in the nation's effort to keep a check on inflation. In addition, some part of the £30-odd million paid out on maturing endowment claims each year to policyholders, whose thrift has reaped these returns, will no doubt be retained by them in some form of savings.

In the ordinary branch the surplus earned in the year was £1,114,000—nearly £100,000 more than in 1953. The directors have declared a reversionary bonus of £1 14s. per cent—against £1 12s. per cent in the previous year—at a cost of £857,715.

INDUSTRIAL BRANCH

In the industrial branch the surplus earned in the year was £1,935,000, and the directors have allotted £1,060,000 for bonuses to policyholders which enables them to improve the schemes again. This is the first time that over £1 million has been allocated to our policyholders in any one year, and it brings the total set aside for industrial branch policyholders' bonuses to over £10 million. This is a suitable opportunity to remind you again that these contracts do not entitle the holders to bonuses, and these allocations, which have now been made for very many years, are entirely a voluntary sharing of prosperity with our clients. It is right that they should so share, and we are pleased to be able to announce increased bonuses this year. Accumulated bonuses now go up to as much as 35 per cent added to the sums assured for policies which have been in force for 35 years or more.

Nineteen fifty-four was not an easy year for those of us concerned with long-term investment. Throughout the year prices of all classes of securities were rising until checked by hints of a rise in the Bank rate. This corrected what many of us felt to be a certain unrealistic trend in fixed-interest securities, but it still left ordinary shares at prices which seemed to have been inflated by the natural optimism of investors in ordinary shares and which paid little regard to the possibilities of disappointment.

I am no pessimist about the economic strength of this country, but I view with concern any tendency to ignore the hard economic facts of our position in a highly competitive world. Over-confidence can be as damaging as lack of confidence, and I therefore welcome the Chancellor of the Exchequer's recent timely reminder to us all by his action in raising the Bank rate again.

Thoughts such as these were present in our minds through most of 1954 and are reflected in the way we have laid out our new money during the year. The bulk of it—£3,659,000—has gone into loans to local authorities. £1,640,000 has been invested in carefully selected ordinary shares, in which class we now have 16.76 per cent of our assets, and £1,727,000 was retained liquid as cash at the bank.

The recent drop in prices on the Stock Exchange is a clear example of how quickly a change can come about. As you know, we have always regarded financial strength as of primary importance to an assurance company. As we grow so must we continue to maintain the very strong financial position we have built up over the years. This year we have increased our transfers to the investment reserve funds, and the transfer of £475,000 brings these funds up to £6,575,000. Although the present market value of our assets is very much in excess of the balance sheet figures, we must always take a long-term view and build steadily for the future. Nor must we forget that the brightest of futures is always liable to have its cloudy patches.

We again had a good year in the fire and accident branch. Premium income increased by £45,000 to £678,000, and the gross profit of £45,569 was again a record, being £4,538 more than in the previous year. The British General Insurance Company, who manage this business for us, have been as helpful and efficient as ever, and we thank them for all they do for us. I am sure they value highly our association—as indeed we do ourselves.

The transfer to staff pension fund has been increased by £20,000 to £220,000. Our liabilities under the scheme continue to grow, and I feel you will be interested to know that we now have 549 retired servants of the company enjoying the benefits of this scheme. In addition, although it is only just over three and a half years since the scheme was extended to include widows and their children, 113 widows and seven children are already benefiting.

Most of the credit for the year's results must go to the staff. I have said before that we regard them as our greatest asset, and that is as true today as ever it was. I express to them on behalf of us all a sincere word of thanks for their good work. I would also like to add a special word of thanks to those of them who have given their time to serve on local committees of the Industrial Life Offices. In our industry's campaign to spread a wider understanding of our business, these committees have done invaluable work. The status of our industry today, and public appreciation of our contribution to the national well-being, is higher than it has ever been. Our staffs themselves by their conduct and their activities have done much to bring this about.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

THE 125th ANNIVERSARY

PREMIUM INCOME EXCEEDS £1 MILLION

EXCEPTIONALLY HIGH BONUSES

NEED FOR SOUND AND STABLE CURRENCY

MR KENNETH A. E. MOORE'S REVIEW

The annual general meeting of The National Mutual Life Assurance Society was held on April 6th at the head office, 39 King Street, Cheapside, London, E.C., Mr Kenneth A. E. Moore, FCA, the chairman, presiding.

The actuary and manager, Mr G. H. Recknell, FIA, FFA, having read the notice convening the meeting, the minutes of previous meetings and the report of the auditors, the chairman said: Gentlemen,—This annual general meeting is something of a milestone in our affairs in that it marks the 125th anniversary of the society. It is, therefore, one of those occasions on which we should remember and pay tribute to the wisdom, initiative and foresight of those who founded the National and the Mutual Life Assurance offices which, by amalgamation, formed The National Mutual Life Assurance Society.

Perhaps the best tribute one can pay to our founders and to the soundness of the mutual principle is that all the storms of the last one-and-a-quarter centuries—the major wars and economic and political crises—have been successfully weathered and the affairs of the society today, as you will see from the accounts and report submitted to you, have never been in better shape. In fact, the two years covered by the actuarial valuation and report have been the most successful and prosperous in the long history of the society.

RECORD BONUS

After the most careful review of our affairs your directors came to the conclusion that, in all prudence and after taking into account all foreseeable contingencies, it was their duty to give tangible expression to this remarkable prosperity in the shape of the exceptionally high bonuses of 55s. for whole life policies and 50s. for endowment assurances recently declared which, I would remind you, are compound bonuses. After provision for these bonuses and some strengthening of actuarial reserves, our reserve fund now amounts to the very substantial figure of £1,775,000, as shown in the balance sheet, thanks to continued good mortality experience and to substantial appreciation in marketable investments.

At the same time, we have thought it wise to restrict the rate of interim bonuses to the more normal levels of 46s. and 41s. respectively, that is 9s. lower than the rates now declared, to emphasise the fact that the latter are unusually high and must be so regarded. To put it even more clearly, 9s. of the 55s. and 50s. arises from the exceptional prosperity of the last two years and, in order to hold the scales reasonably between present and future policyholders, we felt it right to make this additional distribution now. Nevertheless, we do not altogether rule out the possibility that special bonuses may be forthcoming from time to time in the future, if justified by exceptionally good results.

DANGERS OF INFLATION

We meet today on the eve of a Budget and with every prospect of a General Election in the comparatively near future. None of us can foretell what their effect will be on our fortunes but, in the meantime, as you are all aware, the raising of the Bank rate in February to 4½ per cent halted, and for a time reversed, the long-sustained rise in stock markets. We should be grateful that action was taken when it was to deal with disquieting symptoms of persistent and increasing inflation. The alternative of mere drift would undoubtedly have led to serious consequences. For myself, I feel it a duty to put it even more strongly and to say that, taking a long view, next to the hydrogen bomb the most serious threat facing this country and all that it stands for is creeping inflation, which comes like a thief in the night to rob people of part of their life's savings before they realise it. What is wanted is not inflation or deflation but a sound and stable currency honestly managed. Any political party that fails to tackle the deceptive and disruptive monster of inflation deserves to forfeit the confidence of the electorate.

You will be interested to know that, thanks to the flexibility of our investment policy and the spread of our investments, which include a proportion of dollar and other securities which have appreciated since the turn of the year, the net reduction in market value of our entire portfolio following the rise in the Bank rate has not been such as to cause us concern. However well our affairs are managed, of course, we cannot be entirely immune from economic trends and political factors and the consequential fluctuations in stock markets, but the rise in interest yields on new moneys now being invested is, I need hardly say, a compensatory factor.

PENSIONS FOR SELF-EMPLOYED

Whatever else the Chancellor may propose in the forthcoming Budget, it is very much to be hoped that he will now find it possible to give effect to the recommendations of the Millard Tucker Committee in respect of retirement benefits for self-employed persons. It is something of an anomaly in the Welfare State that, under present taxation law, the establishment of pension schemes for employees is very wisely encouraged by tax reliefs and is in fact rapidly becoming the general practice, whereas no corresponding relief and encouragement is given to self-employed persons such as professional men, partners in firms, executive directors in private companies, and so on. This puts them at a grave disadvantage when it comes to making provision for their own old age.

One can, of course, quite understand the dilemma in which the Chancellor finds himself—on the one hand he has a very comfortable surplus and, in the ordinary way would, no doubt, wish to dispose of part of the surplus by reducing taxation in one form or another. On the other hand, having recently had to take steps to damp down consumption and to keep hire-purchase within sensible limits, he may feel that tax reductions might undo his efforts to curb inflation. However, if he gives effect to the reforms suggested by the Millard Tucker Committee, which have been supported by representations from many quarters, including some of the leading professional bodies, he will not only be bringing about a measure of social justice, but also, so far from releasing purchasing power, will give an impetus to investment for pension purposes and thus swell the total of savings so essential to the economic health of this country.

THE SOCIETY'S SCHEMES

The society, as you may remember, has specialised in recent years in the provision of pension schemes for the staff of medium-sized businesses where it is necessary to cater for the particular domestic circumstances of the business concerned and of those who work in it. We have not attempted to compete in the field of pension funds for the big industrial companies, which are more properly the field for the very large life offices. The experience which we have gained in providing "tailor-made" schemes to fit the often quite peculiar requirements of the smaller type of business has been most useful and our service in this has been much appreciated.

If, as I hope, the field for schemes of this kind is widened by revision of the taxation law to make it practicable for the principals in firms and other self-employed persons to make adequate provision for their own old age, then the society is standing by with skilled and experienced personnel to provide whatever may be required to cover the subject in the most convenient and practical way.

I hope our members, whether present here today or reading the account of our meeting today, will bear this in mind in case the society can be of help to them should this new opportunity arise.

THANKS TO MANAGEMENT AND STAFF

It remains for me to express, on behalf of the board, our thanks to our management and staff, both at head office and branches. In spite of the volume of new business, our expense ratio again shows a reduction from the postwar peak and, at 14 per cent, is back to about prewar level, which is an indication of the efficiency with which the society's affairs are conducted.

Incidentally, a new land-mark has just been passed in that total premium income, for the first time in our history, is now running at just over 1 million pounds per annum.

For all these reasons and because, in this 125th year, it is meet that we should remember the staff who carry the day-to-day burden, we have provided in the accounts for a special cash bonus of 12½ per cent of their salaries. This tangible expression of our gratitude will, I am sure, have your warm approval.

The report and accounts were unanimously adopted; the retiring directors, the Right Honourable Lord Layton, CH, CBE, the Right Honourable the Earl of Rothes and Mr Nicholas Davenport, were re-elected; the remuneration of the auditors, Messrs Ball, Baker and Co., and Messrs Bolton, Pitt and Breden, was fixed, and the proceedings terminated with a vote of thanks to the chairman.

NATIONAL PROVIDENT INSTITUTION

INCREASED RESERVES AND HIGHER BONUSES

The annual meeting of the National Provident Institution for Mutual Life Assurance will be held on April 19th at 48 Gracechurch Street, London, E.C.

The following are extracts from the address to be submitted by the chairman, Mr L. E. D. Bevan:

We deal in financial security, which can be measured, and in peace of mind—which is beyond calculation. The word "Mutual" in our title is important. There are no shareholders in the National Provident, and all the profits available for distribution belong to the with-profit policyholders.

I would particularly emphasise that there is a substantial margin in our favour between the market value of our investments and the figures at which they appear in the balance sheet, even after writing down individual securities where necessary. The capital position is therefore one of great strength, and is quite unshaken by the movements in stock exchange values since the end of 1954. The conservative basis on which our securities are valued is in part responsible for the excellent rates of interest, namely, £6 10s. 6d. per cent gross and £4 18s. 8d. per cent after deduction of tax. Nevertheless, there has been a remarkable increase in the rates of interest actually earned over recent years.

SPREAD OF ORDINARY SHARES

I have previously drawn attention to the fact that our investments in ordinary shares are widely spread. Of our total holding of ordinary shares at the end of 1954 about one-half represented activities carried out in the United Kingdom or controlled therefrom. About one-third represented investments in the United States, about one-tenth in Canada, and about one-twentieth in Australia. The benefit of investment in ordinary shares reveals itself in improved interest earnings on the funds and, as in our case, in better bonuses.

The following table gives examples of the rates of bonus for full profit policies per £100 assured:

Type of Policy	Annual Rate of Bonus declared for 1952-54	Increase over Rate for 1949-51
Endowment Assurance		
Maturing at age:	£ s. d.	s. d.
50 and below ...	2 2 6	7 6
55	2 5 0	7 6
60	2 7 6	7 6
65	2 12 6	8 9
70 and above ...	2 17 6	10 0
Whole life assurance	3 0 0	10 0

I would emphasise that these increased rates of bonus have been allotted after strengthening the basis on which our liabilities towards our members under life assurance and annuity contracts are valued.

PENSION SCHEMES

Our traditional duty is to offer personal life assurance on attractive terms, and this side of our business grows steadily. A newer development lies in the institution of pension schemes arranged by employers for the present and future welfare of their employees.

Here let me add that during the past year we have evolved an entirely new type of policy for pension schemes which combines the guaranteed benefits which many employers desire with the great advantages of sharing in the profits earned by the institution—the Perfected Pension Scheme.

ESTATE DUTIES

Certain alterations in the law affecting policies effected under the Married Women's Property Act, 1882, in England and the corresponding Act in Scotland were introduced in the 1954 Budget, there are still good reasons why full use should be made of MWPA policies for the proper protection of the wife and family.

At the same time, I hope that the day is approaching when the Chancellor will create facilities for a man to build up a reserve for the duties on his estate at his death. Such a reserve irrevocably made over to the Estate Duty Office and acknowledged by way of "Duty Reserve Certificates" might be relieved of duty, say, after one year and thus give the testator during his lifetime the inexpressible relief of knowing that at his death his estate need not be broken up at a time of family bereavement and possibly unreal values.

Estate duties to-day are heavy, and provision should be made in advance for them. The traditional way (though not the only way) is by life assurance, but at present a policy effected with this object in view only serves to increase the amount of duty payable. Some system, as I have suggested, of "Pay as you live" might well reward the Chancellor.

We are now advancing into the first year of our new triennium. We count on the continued support and recommendations of our policyholding proprietors, and with their help we expect to serve an increasing number of members whose savings represent a valuable asset to their country as well as to themselves.

BEANS INDUSTRIES

(General Engineers and Ironfounders)

The twenty-first annual general meeting of Beans Industries, Limited, was held on April 4th at Tipton, Staffs, Mr J. H. Bean, CBE (the chairman), presiding.

The following is an extract from his circulated statement: The profit for the year after all charges except taxation at £282,824 exceeds that for the previous year by nearly £50,000. Taxation amounts to £155,000, leaving a net profit of £127,824, compared with £94,165 last year.

During the year substantial sums have again been spent on additions and improvements to plant and equipment without impairing the liquid position, which has improved.

The year has been a very busy one and a healthy increase in the volume of turnover was attained in all departments. This result is particularly gratifying in that it has been achieved in the face of continually rising costs, particularly as regards our foundries. The capacity of our foundries has been and is fully extended and still the demands of our customers are far from satisfied. To cope with this situation your board has decided to provide additional capacity and at the same time increase the efficiency of the existing plant.

The demand for our general engineering products continues at a high level.

As to the future, there appears to be every prospect of another successful year's trade.

The report was adopted and the dividend distribution of 22½ per cent (interim dividend of 10 per cent on £150,000 capital and final of 12½ per cent on increased capital of £600,000) for the year was approved.

WESLEYAN & GENERAL ASSURANCE SOCIETY

ONE HUNDRED AND FOURTEENTH ANNUAL GENERAL MEETING

PREMIUM INCOME EXCEEDS £4 MILLION

The annual general meeting was held on April 5, 1955, at Birmingham. Mr A. H. Sayer, MC, JP, the society's chairman, in moving the adoption of the reports, said:

In the ordinary department new sums assured amounted to £4,527,000, being over £500,000 more than a year ago and constituting a record for the society. The average sum assured per policy was greater than in former years; it has grown steadily since the war from £350 in 1946 to over £700 in 1954.

In the industrial department (home service) total new sums assured amounted to £3,592,000.

Over £60 million has been paid in claims in all departments since the commencement of the society.

The society's new Act of Parliament extending its powers of investment became law on July 30, 1954.

At the beginning of August the directors were much exercised in their minds whether the time was ripe for a change in the policy, to which they had been forced by the restraints of the society's earlier Act, of investing only in fixed interest securities. The earlier part of the year had shown a very marked surge forward in the prices of almost all equity securities, and, as every investor knows, timing is the essence of sound investment. The directors decided that there was still scope for further improvement in British industrial equities, and that an immediate selective investment would prove profitable. The society invested more than one million pounds in equities in the five months between July 30th and the end of the year; this was in 90 different ordinary stocks and shares. Large though the investment was, it still only forms about 3 per cent of the society's assets, which is much lower than the comparable figure for almost all other insurance offices.

Little if any part of the benefit that is expected to be derived from this new class of investment was realised in 1954. Nevertheless, the gross rate of interest earned on the whole of the society's funds increased to £4 10s. 4d., and the net rate of interest to £4 2s. 8d.

There has been a steady reduction in the ordinary department expense ratio. There has also been a reduction in the industrial department expense ratio.

The surplus in the ordinary department is sufficient to enable the directors to declare a reversionary bonus at the rate of £1 12s. per £100 original sum assured. The cost of this bonus is £299,000.

The allocation to industrial department policyholders is £100,000.

The directors regard the investments reserve of £2,900,000 as adequate at present, in relation to the total assets of £32 million.

The general reserve has been increased by £25,000 to £175,000.

The fire and accident departments continue to make good progress. The premium income is £218,000, showing an increase of over £19,000. The year's operations resulted in a small profit of £8,800.

Advances under the house purchase plans during the year 1954 amounted to £1,667,000: an increase of more than 25 per cent.

The report and accounts were adopted.

FINE JEWELS AND JEWELLERY, of LADY ESME GORDON-LENNOX, LADY MARGARET DRUMMOND-HAY, and other owners, including an important English eighteenth-century diamond spray, and a pair of eighteenth-century diamond foliate sprays. Illustrated Catalogue (2 plates), 1s.

FRIDAY, APRIL 29
FINE PAPERWEIGHTS, GLASS, CARPETS, CLOCKS, AND ENGLISH FURNITURE, of the RT. HON. LORD HAMILTON OF DALZELL, the RT. HON. LORD PARMOOR, and other owners. Illustrated Catalogue (1 plate), 6d.

MONDAY, MAY 2
OBJECTS OF VERTU AND BYGONES, FINE PORTRAIT MINIATURES, GOLD BOXES, and ENGLISH AND FRENCH WATCHES, of L. C. WALLACH, ESQ., MRS. BEATRICE GROSVENOR, and other owners, including miniatures by Engleheart, Smart, and an early miniature by P. Cross. Illustrated Catalogue (2 plates), 6d.

TUESDAY, MAY 3
ITALIAN MAJOLICA, GERMAN STONEWARE, TURKISH FAIENCE PEWTER, MEDIEVAL AND RENAISSANCE WORKS OF ART, of SIR ARUNDELL NEAVE, Bt., and other owners, including a set of 16th century Flemish stained glass panels.

WEDNESDAY, MAY 4
EIGHTEENTH CENTURY AND MODERN PAINTINGS AND DRAWINGS, of MAJOR V. ST. JOHN PLEVINS, and other owners.

THURSDAY, MAY 5
ENGLISH AND CONTINENTAL SILVER AND PLATE, of R. T. YOUNGMAN, ESQ., and other owners, including an Elizabethan silver-gilt pricent sprinkler, 1577. Illustrated Catalogue (2 plates), 6d.

FRIDAY, MAY 6
CHINESE CERAMICS, JADES AND WORKS OF ART, MUSICAL INSTRUMENTS, CARPETS, TAPESTRIES, and ENGLISH AND CONTINENTAL FURNITURE, of the RT. HON. LORD PARMOOR, and other owners, including a set of four Brussels panels of the Story of Alexander, and an important harpsichord by Kirckman, dated 1768. Illustrated Catalogue (1 plate), 6d.

SALES ON VIEW AT LEAST TWO DAYS PRIOR (NOT SATURDAY)

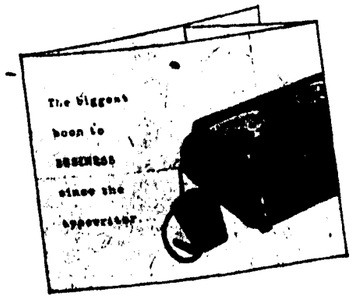
GRUNDIG brings the advantages

of the dictating machine to every

office — large or small . . .

THE STENORETTE does all that is required of a dictating machine—takes a full 25 minutes' dictation per spool; records meetings or conferences verbatim; records both sides of telephone conversations; notes down your engagements and other information that cannot be left to memory. It automatically adjusts the level of the recorded voice, suppresses background noises and plays back with an even, well modulated clarity that makes transcription clear to you as well as your typist. The tape can be used over and over again. Because of its robust construction, the Stenorette is genuinely portable and can be used for recording meetings or reports away from your office.

Whether you employ one typist or many, the Stenorette can double their output while saving you time and money. Its operation is simplicity itself.



A fully descriptive folder is available, or your supplier of office equipment will be pleased to arrange a demonstration.

With the amazing Stenorette

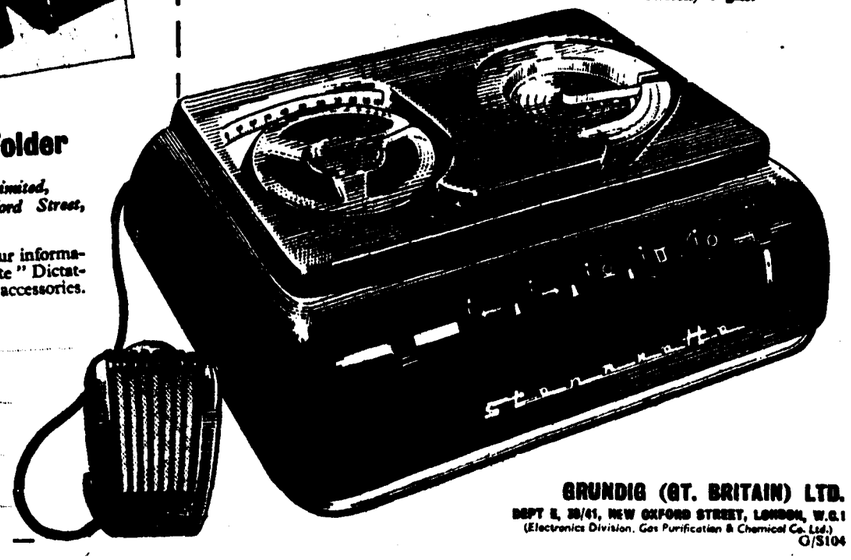
at a basic cost of

35 GUINEAS

With tape, spool, and dust cover. Dictating Outfit (microphone and dictation pads) 6 gns. Transcription Outfit (earphone and foot switch) 6 gns.

Write for this Folder

To: Grundig (Gt. Britain) Limited, Dept. E, 39/41 New Oxford Street, London, W.C.1.



Please send me a copy of your informative folder on the "Stenorette" Dictating Machine and its useful accessories.

"I wondered about our accounting, but he reassured me . . ."

"My business has been expanding quite a lot recently, you know. And I wasn't sure that our accounting department could handle all the extra work. So I called in this Burroughs man. I told him all I could. Then he and our Chief Accountant went into the whole matter together very thoroughly. Later he told me frankly that we'd no need to change yet. Glad I called him in, though."

The Burroughs man is always at your disposal, without cost, as an experienced adviser on all accounting questions—and is well qualified to work in consultation with your accountant or auditors.

If you wish, he will simply examine your existing system. And if he considers it satisfactory he will certainly say so.

But often he is called in because there is a problem to which he can apply his wide experience of business systems and mechanization. But he won't try to alter your routines just to suit certain machines. Rather, after analyzing your problem, he will suggest the most efficient and practical solution—with real savings in time and money.

If he does recommend any change, he prepares a detailed plan for its execution, and helps you get it running smoothly. He will make sure you always get full benefit from any Burroughs machine you install.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve it. Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. Call in the Burroughs man as soon as you like—you're committed to nothing, and his advice is free. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

Here is how one Burroughs man solved a particular problem: For several years the demand for the expanding range of products made by Storeys of Lancaster had been steadily increasing.

This called for a reorganization of their stock records to give more detailed and readily available information, so that production could be planned to meet the growing demand from both home and abroad. But how, without extra staff?

Mr. W. D. Dwyer, the Burroughs man who co-operated with Storeys in meeting their requirements without extra staff, is seen here with one of the Burroughs Sensimatics that made this possible.

FOR SPECIALIST ADVICE ON MECHANIZED ACCOUNTING METHODS

CALL IN THE Burroughs MAN

DAVID BROWN AND AGRICULTURE

To an engineer, "David Brown" means gears and foundry products. To farmers all over the world, the name means Tractors. A range of 6 David Brown Tractors and 60 Implements gives the world new standards in mechanized farming. David Brown Tractors are typical products of the 10,000-strong David Brown Companies — their success derives from superior engineering skill, advanced technical knowledge, large resources, and an enterprising outlook.

THE DAVID BROWN COMPANIES

An alliance of engineering specialists in gearing, steel and bronze castings, automobiles, and agricultural tractors and machinery.

DAVID BROWN & SONS (HUDDERSFIELD) LTD. — THE DAVID BROWN FOUNDRIES COMPANY — DAVID BROWN TRACTORS (ENGINEERING) LTD. — THE DAVID BROWN TOOL COMPANY — DAVID BROWN TRACTORS (BIRR) LTD. — DAVID BROWN GEARS (LONDON) LTD. — THE COVENTRY GEAR COMPANY — DAVID BROWN MACHINE TOOLS LTD. — THE KEIGHLEY GEAR COMPANY — DAVID BROWN-JACKSON LTD. — LAGONDA LTD. — DAVID BROWN & SONS S.A. (PTY.) LTD. — DAVID BROWN PRECISION EQUIPMENT (PTY.) LTD. — DAVID BROWN (CANADA) LTD.

'Behind the ears'...

Keeping things clean — not just superficially but 'behind the ears' as well — must be someone's responsibility. If cleaning arrangements are one of your business or professional worries, you should get to know Teepol. This master detergent developed by Shell is now recognised as being the most effective and economical cleaning aid for use in commercial and industrial premises, and in municipal, institutional and public buildings of all kinds.

Modified Raptures

A BUDGET is a political act as well as a set of fiscal decisions, and to apply to it the standards of criticism that would be proper if there were no such things as political parties, elections and self-interested voters would be absurd in any year—and grotesque when a general election is less than six weeks off. Let it therefore be said once (and once said, forgotten) that by strict economic reasoning this is a poor year to remit any taxes—unless, indeed, it can be assumed (as it is easy to assume in the realm of pure economics) that expenditure will be cut to match. Even this academic judgment is not certain, for strict economic reasoning, especially of the fashionable arithmetical kind, finds little place in its system of notation for the fourth dimension of economics, for the degree of confidence, of buoyancy, of incentive and initiative, in the economy; and if the past three years, with Mr Butler's help, have taught any lesson at all it is that this fourth dimension can entirely upset any predictions that are based on mere figuring. Thus whether the modern economists really know what they are talking about or not, it is not they alone who should sit in judgment on a Budget. It must be judged by the standards of political economy. So judged, Mr Butler's fourth Budget deserves a high mark—though it is not entirely immune from criticism.

It has been clear for months that Mr Butler, looking forward into 1955-56, would find himself with a large prospective surplus on the existing basis of taxation (he estimated it at £282 million) and that the only important questions for him to resolve would be how much of this surplus it would be right to give away, and which taxes should be reduced. On the first issue, Mr Butler's decision was to give away just less than £134 million of the surplus and to keep £148 million in hand. This decision was justified by the neo-classical method of comparing the real resources that are likely to be available with the demands that are likely to be made upon them ("for once," the Chancellor conceded, "the language of the economists is intelligible, because it means exactly what it says"). Mr Butler judged that, in view, on the one hand, of the prospective rise in total output (the scope for which, he thought, was "at least as great as it has been in the past, if not greater") and, on the other hand, of what is likely to be the demand upon these resources arising from government expenditure ("about the same"), from investment ("increase by about the same amount as last year"), from stockbuilding ("will not take more of our resources than last year") and from personal spending and consumption on the present basis of taxation ("I do not expect them to rise as rapidly this year as last"), he could make his concessions to the taxpayer while still leaving a margin of resources for the essential increase in exports.

No one can say with any dogmatism (for the fourth dimension comes in here) that Mr Butler's guesses will not come out right; and it is true that some of last year's judgments which were thought to

be bold were justified in the event. Nevertheless, there is a distinct flavour of optimism about the calculation as a whole, especially where it relates to the rate of spending by the public. Many people would have felt happier about the general balance of the Budget if the portion of the surplus to be given away had been put rather lower. But that the right figure, in all the political and economic circumstances, lies somewhere in the middle range between giving nothing at all away and eliminating the surplus altogether hardly admits of doubt. To have given nothing would have proved Mr Butler too much of an economist to survive in politics; to have given the lot would have shown him too much of a politician to have charge of the national economy.

★

The size of the total remission having been determined, to which taxes should it be directed? Here again there can be little doubt that the decision to concentrate it almost entirely on direct taxation was broadly right, though here again there is room for some dissent on detail. The one exception that the Chancellor made in favour of indirect taxation was to halve the rate of purchase tax on certain cotton and linen goods, at a cost of £2½ million this year and of £3 million in a full year. The smallness of the cost suggests two reflections: that purchase tax cannot be as dominant an influence on the fortunes of the cotton industry as its spokesmen claim; and that the Chancellor might just as well have gone the whole hog and removed it completely from these categories of goods. It is a little surprising that he did not make another exception in favour of the beer duty, which might actually yield more with a lower rate, and which would at least enable him to claim that he had done something for some of the people who do not benefit from reductions in income tax because they do not pay any. To have rejected such a clear bid for votes should be ascribed to him for honesty—and possibly for shrewdness.

There should, however, be no criticism of the decision to concentrate the great bulk of the relief on direct taxation, for the reason that reductions in excise duties directly stimulate consumption, while there is at least a chance that part of the money saved to the taxpayer by reduction of income tax will not be spent. Where criticism can perhaps enter in is on the particular means chosen to lower the burden of direct taxes. Mr Butler made two distinct sets of proposals. The first was a rearrangement of the personal and children's allowances together with a narrowing of the band of income taxed at the lowest rate. The net result of these changes is that the single person and the childless married couple will find themselves paying tax at the standard rate some £26 and £13 earlier than they do at present. Taken by themselves, in abstraction from the reductions in the rates of tax, these changes are thus an increase in the burden on the single and the childless, matched by a rather greater reduction for families with children. Mr Butler has, in fact, gone some way in the direction urged by the second report of the Royal Commission on the Income Tax. But both equity and the need for direct incentives point so strongly in the direction of re-casting the allowances (including the earned income allowance) that Mr Butler might well have gone much further along this road. As it is, this part of his proposals will cost, on balance, only £29 million—which, in this context, must be taken as a mark of timidity.

★

The Chancellor has preferred to keep his big concession, costing no less than £102 million, for a straight cut of 6d. in the standard rate of income tax and of 3d. in the reduced rates charged on the earlier slices of income. The standard rate, although nowadays it is only an arithmetical convenience, still keeps its mythical ascendancy in the realm of taxation. "Sixpence off" means that every income-taxpayer gets something, and Mr Butler may well be right in calculating (if that is his calculation) that his hundred millions will make a greater impact on the public consciousness in this way than in any other that he can devise. Whether the impact will be wholly favourable or not remains to be seen, for Mr Gaitskell is already complaining that a straight cut throughout the range of income tax gives most relief to those who pay most tax—which, in this strange world, can be made to look unfair.

It is a far more valid criticism of a straight cut in the standard rate that, just because it is so widely diffused, its economic effect is likely to be spread thin. From the incentive point of view (which was the argument the Chancellor used), much of the cost of a reduction in the standard rate is wasted. It is true, as Mr Butler said, that "to the individual it lightens the burden of tax on any extra income which he or she may earn by greater personal effort," but only at the cost of equally relieving the burden on existing incomes, earned and unearned. If incentive is the object, much more effect could have been achieved at smaller cost by concentrating the reliefs on the earned income allowance, and in particular by adopting the Royal Commission's proposal that it should be extended into the range of incomes above £2,000. So far as company profits are concerned, a reduction of the standard rate, which accrues to the receivers of interest and dividends as well as to the retained earnings of companies, will lead to more spending and less saving than the same amount of money applied to profits tax. Nor should the total removal of another 2½ million individuals from the ambit of the income tax—although, as Mr Butler said, it will please the Inland Revenue as well as the exempted taxpayers—be regarded with unalloyed joy. It will not be a good thing for the honesty of the British democracy if the paying of direct taxes once again becomes the privilege of a small minority. It is impossible to resist the conclusion that Mr Butler has chosen the easiest rather than the best way of reducing direct taxation. Electoral politics shows more clearly in what he has not done than in what he has.

★

Mr Butler closed his speech with a brief review of the whole period of his stewardship at the Treasury, where he has now lasted longer than anyone else since the war. He was quick to acknowledge that he has enjoyed good fortune, but he can also rightly take credit for what has been achieved. More progress has been made in three and a half years in restoring British public finances and in easing the burden of taxation—not to mention liberating the general economy from the stifling network of controls—than seemed at all probable when the present Parliament first met. Politics is the art of the possible, and Mr Butler has done about as much as a Chancellor with so exigenous a majority could have done.

But to say that is only to illustrate how little has been possible, and how much remains to be done. The First Butler Period is now coming to an end and it may be that the second is about to start. It may be (one must beware of prophecy) that Mr Butler will soon find himself with a securer tenure, with the positive approval of the electorate for his policies and—it must at length be supposed—with the final report of the Radcliffe Commission in his hands. If all this should come to pass, progress will have to be bolder and more sweeping than has been possible in these last four budgets. There are still grave injustices and inefficiencies in the incidence of income tax on individuals. The present system of company taxation is still obstructing the way to full industrial efficiency. The absurdities of profits tax remain, and a substitute for the clumsy purchase tax has yet to be found. On the expenditure side, apart from the general need for economy, there is still plenty for a strong Chancellor to do in reviewing the finance both of the social services and of the agricultural subsidies to make these policies serve their purposes more effectively at less cost to the patient bearer of burdens.

With four budgets already to his credit and the possibility of more to come, Mr Butler is on the way to rivalling in the middle of this century the record that Gladstone set up in the middle of the last. But if he is to make a Gladstonian mark on the efficiency of British state finances, he will have to regard his first four budgets as no more than a prelude to what is yet to come.

Bluebird from the Vienna Woods

VIENNA has hung out its flags, and throughout the free world people are glad that Austria should see its deliverance at hand after seventeen years of ill-usage by two totalitarian regimes. Herr Raab, the Austrian Chancellor, is confident that year's end will see the return of the last Austrian prisoner of war from the Soviet labour camps (or at least of the last whose existence the Russians will admit), the end of kidnappings and arbitrary acts in the Russian occupation zone and Vienna, and the withdrawal of the Red Army from his country. Some of his fellow citizens are still wincing at the prospect of presenting a further $150 million worth of goods to Russia, in addition to deliveries of oil over a term of years, but most Austrians were surprised by Moscow's readiness to modify its economic demands. Few of them, after years of experience of Russian ways, are prepared to take Russian declarations at their face value, and they are looking carefully at the vaguer passages in last week's Moscow communiqué. But hopes are high in Vienna, and partly because the Austrians can see that the Russians regard them as a sprat to catch the German mackerel.

The Russians would, of course, have gained something if they could manœuvre the western allies into resisting an Austrian settlement—if, to be precise, they demanded guarantees about Austria's neutralisation that the western governments were loth to give. But that would jeopardise the bigger stakes for which Moscow is playing, which is Germany and, ultimately, Europe. It is thus perfectly possible that it is really willing to pull the Red Army back a little for the first time—*reculer pour mieux séduire*. If so, it seems that the "hard" men of the Krushchev-Bulganin regime are ready to concede what was consistently refused by the supposedly "soft" Malenkov government.

At Berlin, early in 1954, the Russians insisted that the threat of West German rearmament compelled them to stay on in Austria. But now that the Paris agreements on western defence have won parliamentary approval in all the countries concerned, now that the alleged West German "menace" is even more acute, Marshal Bulganin has assured the Austrians that the Russians no longer regard the Austrian and German problems as one, and all Moscow's former arguments are quietly buried. It is a revealing instance of the flexibility and bland self-contradiction that distinguish Soviet diplomacy. In its abruptness and its disregard for all that has gone before, the new *volte-face* recalls the Chinese reversal of policy over Korean prisoners which, just two years ago, reopened the path to an armistice. If this offer to free Austria had been made at that time, soon after Stalin's death, it would have been widely interpreted as proof of his heirs' benign intentions.

Moscow's motives in holding out the offer now are

plain enough. German public opinion is fascinated by the prospect of Austria regaining its freedom and getting rid of the Red Army. The Russians have carefully made it appear that the way to obtain such prizes is to make pilgrimage to Moscow, and that sight, too, is not lost on the Germans. *Pravda* and other Soviet organs have laid out a simple, engaging pattern: Austria should follow Switzerland along the path of comfortable neutrality, and Germany should follow Austria. The German Social-Democrats have lost no time in leaping to the conclusion they were meant to reach. Their spokesmen attribute Austria's success to the fact that it had not bound itself to the west, and it is further argued that Austria has shown the impossibility of securing both national reunion and allies.

As well as the Social-Democrats, many other Germans are clearly inclined to think along the same lines; some of them are members of the coalition parties, and the BHE (refugee) party is particularly rent on the issue of *Bündnislosigkeit*, or freedom from alliances. Dr Dehler, the Free Democratic leader, although prompt to declare that Austria does not provide an example for Germany to follow, has also publicly favoured the idea of bilateral dealings with Moscow. Thus the many parliamentary hurdles which Dr Adenauer must still get over in order to provide a West German contribution to Nato will not be easy jumps.

*

Yet a coach and four can be driven through the kind of facile reasoning which last week's events have evoked in Germany. The simple historical record reveals that the encouraging terms now offered to Austria are the product, not of an Austrian refusal to attach itself to the West, but of the West German decision to do so. No hint of such a good offer was held out by the Russians until they became resigned to the parliamentary ratification of the Paris agreements. Indeed, if Austria now wins its freedom, posterity may record that as the first fruit of the agreements.

Moreover the cases of Austria and Germany, superficially so alike, are in essence utterly different—as the Austrian Social-Democrats have been quick to point out to their West German counterparts. In terms of the crudest *Realpolitik*, a small country like Austria can be "carried" by a strong and united West; although disarmed and helpless under the shadow of totalitarian power, it can hope to maintain its democratic life because stronger democracies have an obvious interest that it should do so. But Germany is too big a weight for the West to carry in the same way; and if Germany became a power vacuum, how could the West support even the smaller neighbouring democracies? It is not surprising that Austrian voices should now be raised begging the West Germans not to follow Austria's example.

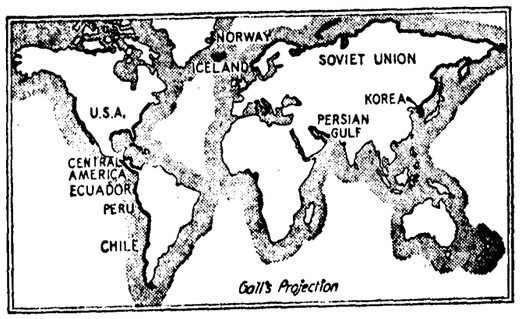
Fortunately Dr Adenauer is not alone in the Federal Republic in seeing these things clearly. But there is no denying the strength of the psychological pull that Moscow's Austrian policy must exercise on German minds. The benign treatment accorded to Herr Raab last week was well designed to make Germans as well as Austrians see Russia as the great potential benefactor of tomorrow rather than as the merciless withholder of yesterday. The prospect that the Austrian prisoners will be home this year stimulates intense personal longings among thousands of Germans. And it is one of the enduring ironies of politics that whenever a firm and resolute attitude produces undreamt-of concessions, the reasons why those concessions were made are always apt to be overlooked, while the hunger for more leads men to exchange firmness for imprudence.

*

But common sense may yet prevail, and keep the people of the Federal Republic on a steady course. There is one glaring flaw in the whole Communist performance—the East German regime. The Austrians are not being asked to come to terms with puppets of the Ulbricht type, to let down the bars between their unarmed selves and the militarised forces of a Communist dictatorship, to adulterate their democracy with "popdemocracy." The squeezing tactics which the Pankow puppets are at present using on West Berlin may be a logical method of inducing Bonn to begin dealing with the Ulbricht regime as an equal; but they are also an ugly reminder of the naked power techniques that West Germans can expect to encounter in all such dealings. The interpretation of "democracy" that the Communists hope to foist off on Germany will evidently bear a "Swiss" label, but resemble in reality the transient and doomed Czechoslovak democracy of 1945 to 1948.

Germans who are attracted by Moscow's latest gambit would do well to work out some elementary logic in their heads. Why should Russia suddenly be ready to relax its grip on a sizeable territory, at a time when it claims that international tension has risen, not fallen? There can be only one answer: because Russia thinks this a price worth paying for a decisively valuable objective. A genuinely democratic reunited Germany would clearly not be worth such a price to Russia. Only a reunited Germany that was contaminated and later won over by pro-Soviet forces, and behind it a Western Europe so weakened as to assure ultimate Communist domination of the Continent, would justify such a price-tag.

It is surely unthinkable for any German who sincerely values his regained democratic liberties to play along with Moscow if that is its goal. Much may be done, within the framework of broader arrangements, to reassure Russia about the limits to German armed strength; but there can be no compromise about the fundamentals of political liberty, and if these are to survive in either Germany or Western Europe there must be enduring unity between the two.



Whose are the High Seas?

NOT for many years has the freedom of the seas been so imperilled in time of peace as it seems to be today. The most glaring, but not the only, instance of the present dangerous trend is the claim made by three governments to sovereignty over a belt of ocean 200 miles wide and extending down virtually the whole Pacific coast of South America. None of the world's chief maritime nations recognises this claim, and Britain, the United States and the Scandinavian governments have taken the lead in protesting against it. But the claimants, Chile, Peru and Ecuador, have not given way; and a state of anarchy now appears to exist in fact in an area that comprises about a million square miles of open sea. Only a short time ago this situation suddenly became uncomfortably warm when Peruvian bombers and warships attacked and seized part of the impetuous Mr Onassis's whaling fleet.

A United Nations technical conference on the conservation of the living resources of the sea opened in Rome this week. Its effects on the wider problem, if it has any at all, are likely to be indirect; but it inspires the question whether this sort of scuffling is the best that the world of 1955 can do, equipped as it is with a host of international mechanisms for mediation, conciliation and arbitration, with an International Court, a Security Council, regional organisations, multilateral conventions, and a sempiternal succession of conferences—a world knee-deep in promises to settle disputes peacefully, to help other nations at all times and to obey the law. Comforting voices may reassure the world that what has been happening off the Peruvian coast is a minor affair in a remote part of the ocean, affecting only very limited interests. But international anarchy is a fungus that spreads swiftly, and the Pacific seaboard is by no means the only breeding ground that offers it attractive conditions.

In this year's Antarctic whaling season nineteen fleets, three of them British, have been operating in waters parts of which are already subject to claims and counter-claims. One of the claimants is Chile, whose foreign ministry has declared the 200-mile limit to apply to all its territories, including the Antarctic sector which it insists is Chilean. What if the new contagion spreads to this far south? Whalermen are not a meek race at the best of times, and it is not hard to imagine fresh conflicts arising. Nor need one go as far afield as Antarctica to find possibilities of trouble. Several of the Central American states have espoused the 200-mile doctrine as enthusiastically as Chile and Peru. The Philippines has defined its territorial waters so as to embrace vast areas of sea, and South Korea has used armed force against Japanese fishermen who appeared within the arbitrarily drawn "Rhee line," which lies many miles from the coast. In recent years, Scandinavian fishermen have painfully learnt that Russia's claim to twelve miles of territorial waters now bars them from nearly all the south-eastern shore of the Baltic; and Norway and Iceland themselves have stiffened their claims to exclude foreign fishing vessels from certain well-stocked coastal waters. Meanwhile, the doctrine of the "continental shelf" has been proclaimed not only by the United States but also in areas ranging from Latin America to the Persian Gulf.

The present picture thus seems a disconcerting one of piecemeal encroachment in one form or another in almost every one of the seven seas. Admittedly, there is still a long way to go before peaceful Portuguese fishermen find themselves blasted off the Grand Banks, before Spain tries to levy tolls from ships entering the Mediterranean in the way that the Danes once did in the Sound, before a new Van Tromp flies up the Thames claiming the whole estuary as falling within

the Dutch 200-mile limit. Admittedly, too, there are important differences between the various claims now advanced. In the South Pacific, the Latin American governments assert that they have full sovereignty over the huge sea areas in dispute. The "continental shelf" claimants confine themselves to earmarking for their own use the resources of the sea bed, without prejudice to the legal status of the waters above them.

Yet, while the more modest claims deserve to be distinguished from the more absurd, the general trend remains ominous. It is true that all the governments concerned are profuse in reassuring statements. They all declare their respect for the right of "innocent passage"; and even the Peruvians express themselves as willing to let foreigners fish in their wide waters if permission is obtained and conservation rules observed. But it is a sad truism that claims, once accepted, are seldom renounced, while assurances prove less enduring. Seafaring nations like Britain have long experience of the way in which pledges of tolerant behaviour lapse in periods of international friction.

There is nothing sacrosanct about the three-mile

limit, except in so far as custom has made it so. People are entitled to ask why in an era of rocket missiles the distance a gunshot will carry from the shore should form the basis of international custom. Again, there are venerable exceptions to the three-mile rule: the Norwegian four-mile claim, for example.

In 1951, in the Anglo-Norwegian dispute, the International Court of Justice at The Hague recognised the validity of " economic interests, peculiar to a region, the reality and importance of which are clearly evidenced by long usage." In short, international law on the freedom of the seas has never been doctrinaire or absolute. Nevertheless, it has survived in the past, with local quirks and minor variations, because it seemed clearly to serve the general good. Now some countries have come to the conclusion that they have more to gain than to lose by breaking the established customs.

What is to be done ? There are some ardent theoreticians who think that an international conference might settle all these disputes once and for all, or even that the United Nations might take on the task of policing the high seas. They are surely optimists ; no means of enforcing such a settlement lie readily to hand. In 1930, the League of Nations failed to codify the law on territorial waters. The chances of success today are much slimmer. And the Americans, for instance, would find it embarrassing to be drawn into an international debate in which they might be attacked for closing large sea areas in the Marshalls and Carolines for the testing of atomic weapons. But is there no other way of tackling the problem ? If systematic codifying and enforcement by a central agency is too Utopian to hope for, is anarchy the only alternative ?

★

It would be absurd to think that the choice was as limited as this. The fact that the law is defective does not point straight to the arbitrary use of force. Surely it is not too late to point out that there are good precedents for compromise between the interested parties, and that if this fails it is still possible to have recourse to international arbitration. The present UN and FAO conference in Rome has on its agenda two items dealing with possible means of resolving the world's fishery problems. The Peruvian ministry of foreign affairs provided an expert for the advisory group which drew up the agenda ; and it was anxiety about the fish resources of the Humboldt current which chiefly led Peru, with Chile and Ecuador, to claim the 200-mile limit.

If the Rome conference can determine in what kind of conditions conservation measures become necessary, and recommend the sort of measures that might be taken, it will have done much to prepare the ground for agreements between the various governments involved in some of the outstanding disputes. Conventions for the preservation of fish resources work well in many parts of the world ; it is tempting to believe that only an over-sensitive nationalism prevents them from doing equally good service in other regions.

If stubbornness persists, it may be worth recalling that the International Court still carries considerable moral weight. The Latin Americans, in particular, have not yet rejected an invitation to test their claims before the Court. Would this not make a worthy test case ? As members of the United Nations and of the western camp, these three countries have an obligation to settle their disputes peacefully. To appear before the Court is no slur on sovereignty, as Britain has shown by its offer to put its case over the Falklands to the test. Admittedly, the Court has no powers of enforcement, and will not easily find firm ground on which to base a ruling. But at the moment nothing is easier than to mark off huge volumes of ocean. It might at least be worth trying to make these proceedings legally tiresome and morally embarrassing for the encroachers.

The Budget

More than ordinary interest was attached to the Budget of the Chancellor of the Exchequer brought forward last night. Already it had become known, by various statements which have been made, that the expenditure of the last quarter had proceeded at the rate of twenty millions, or eighty millions in the year. The army, navy, and ordnance estimates already voted by Parliament alone amount to £40,700,000. And it was evident that, including the interest of the debt and other changes, an entire sum considerably exceeding eighty millions would in all probability be required for the year. And inasmuch as the outside that could be expected to be derived from the actual taxes in operation could not be expected to furnish much above £63,000,000, it was evident that there would be to be made up in one form or another a deficiency of upwards of twenty millions. . . . In selecting the description of taxes which he proposes to impose, the Chancellor of the Exchequer has had especial care to carry out that great and important principle, that as far as possible, taxation should be spread over every class of the community in such a way as to reach all somewhat in proportion to their ability. And this principle is more especially important when provision is made for the expenditure of a war. It is impossible to deny that direct taxation has much to recommend it: it is simple and in general is easily collected ; and, moreover, evasion and fraud are generally more difficult. But the principal ground upon which direct is preferable to indirect taxation, is that it does not interfere with trade or industry, which the latter to a certain extent, less or more, must necessarily do. But it is impossible to adhere to direct taxation only or wholly without committing a manifest injustice to large classes of the community, and entirely relieving other still larger classes from any share of the public burdens. The classes which it is possible to reach by any description of direct tax are comparatively small ; while those whom it is impossible to reach by any such tax are extremely numerous. The great masses of the people can only be reached by some indirect tax ; and the chief thing which it becomes a statesman to consider, is, in what way such indirect taxes can be imposed upon articles of consumption, so as to interfere as little as possible with the course of trade.

The Economist

April 21, 1855

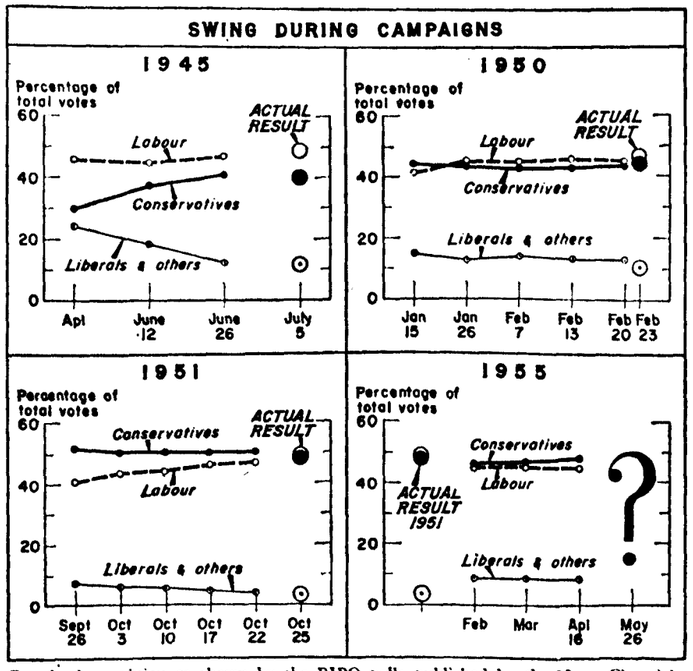
The Election of 1955

For the next few weeks comment upon the course of the election campaign, based partly upon despatches from correspondents in the constituencies, will be presented in this special section of *The Economist*.

The Unreliable Voter

THE first thing to note about election prospects is that although the Conservatives can legitimately be regarded as current favourites, they are much less firm favourites than at a similar period before the general election of October 25, 1951. In the fourth week of September, 1951, the " Gallup poll " taken by the British Institute of Public Opinion, and published in this country by the *News Chronicle*, had suggested that the Conservatives had a 10 per cent lead over Labour. By the time that the Institute took its last pre-election poll, on October 22nd, this suggested lead had dropped to 3½ per cent, and when the election took place Labour actually had a lead of 0.8 per cent in total votes cast. Similarly, the last nine by-elections before the general election of 1951 showed an average swing of 5.7 per cent to the Conservatives compared with February, 1950 ; when the general election took place on October 25th, the average swing to the Conservatives compared with February, 1950, was only one per cent.

This time the Gallup poll—taken on April 16th and just published in the *News Chronicle*—suggests a Conservative lead of 3 per cent over Labour. Admittedly, this is double the lead shown in the poll of a month ago. Admittedly, too, the effective lead may be still greater, for in the Gallup poll (unlike the election) anyone who wants to vote Liberal has a chance to do so. An interesting subsidiary poll taken by BIPO in March suggests that when the votes of frustrated Liberals are re-distributed between the two major parties, the effect is to increase the Tory lead by 1½ per cent. Nevertheless, the 3 per cent lead for the Conservatives that appears upon the face of the figures is directly comparable with the 10 per cent lead they were said to have at the beginning of the campaign of 1951. Moreover, the seven by-elections since and including the Conservative victory at West Derby last November have shown an average swing of only 0.6 per cent to the Conservatives compared with October, 1951, and therefore of about 1.6 per cent compared with February, 1950. The number of seats gained by the Conservatives in the recent county council elections was not out of line with a swing of these proportions. It is at once obvious that if there is a movement of opinion back to Labour in this election campaign—compared with these samples provided by by-elections and opinion polls, and commensurate with the swing that apparently took place during the campaign of 1951—then Mr Attlee will again be Prime Minister of Britain by the evening of May 27th.



Is there likely to be such a movement in Labour's favour during the next few weeks ? Or is the swing of opinion during an election campaign more likely to be in favour of the Government of the day ? These, of course, are the questions on which the result of the election will depend, and they are the reasons why the *News Chronicle* polls in the next few weeks will be awaited with such devouring interest. At this stage no analyst can do more than outline the nature of the problem. And this involves closer consideration of two groups of people whose position is equivocal: the 10 to 40 per cent of the electorate who normally vote at general elections but not at by-elections, and the proportion of those interviewed by the Gallup pollsters whose replies are either obviously unreliable or else who reply: " I don't know." The experience of the pollsters suggests that this latter proportion—the " Don't knows "—varies from 3 to 15 per cent, depending on the time the poll is taken. Not all of these people under consideration, be it noted, are " floating voters," liable to switch from one party to another ; a better generic name for all of them is that of " the unreliables."

★

If by-elections are used as a measuring rod, there is reason to suppose that these " unreliable " voters can be divided into two groups. One group consists of those who do not turn out to vote at by-elections through sheer sloth. There is evidence, stretching back well into prewar days, that a majority of these people —when the issue is finally set before them—tends to vote at a general election for the Government of the day. This is not altogether surprising ; most of them, almost by definition, must be people with no burning grievance against their present lot.

The second group of those who absent themselves from by-elections, however, have become a factor of

importance at general elections only since the war. Not to put too fine a point on the matter, they are the political "illiterates"—people who may not vote at by-elections or local elections because they have no very clear understanding that those elections are going on. Among them Labour supporters probably predominate; and in 1950 and 1951 Labour managed to bring a surprising number of them to the polls. This apparent division of by-election absentees is a very awkward circumstance for the prophet. It suggests that on May 26th two groups of people representative of those who have not bothered to vote at by-elections will come to the polling stations—one group mainly Conservative, and the other predominantly Labour. Some analysts are tempted to say that these two groups should cancel out, and that the result will be in line with recent by-election trends—which would mean (using the average swing in by-elections since last November as a guide) the return of a Conservative Government with a majority over Labour increased to about 50. But this assumption of "cancelling out" is not based on anything as respectable as a guess; it is simply the cover for baffled ignorance adopted by excessively tidy minds.

Pre-election opinion as shown by the BIPO polls published by the News Chronicle.

Use of the public opinion polls as a measuring rod presents different problems. In the first place, there are the "Don't knows." The BIPO's usual practice when presenting its results is to redistribute these proportionately among the parties, as this corresponds surprisingly closely to the way they split up when they are asked the further question, "Even if you don't know, which party would you be inclined to favour?" This enables the polls taken during the campaign to be compared with the final result; it is the method adopted in presenting the trends during previous elections in the adjoining charts. Of those who say they don't know, some 10 per cent—or one per cent of the whole sample—usually persist in complete uncertainty. But it must be remembered that, through sampling errors alone, even so scientific a body as the *News Chronicle* Gallup poll may be 2 per cent out—an error that may vary from one poll to the next. Thus the difficulties of dealing with the "Don't knows" are increased by the possible sampling error.

Moreover, there are at least two other problems in the pollsters' way. The first is set by the really "awkward types," for whose vagaries no niceties of sampling can correct. There is reason to suppose that some of those who vote for the Government at general elections but not at by-elections put themselves on record as "against the Government" in non-election time polls, but discover that they do not really mean it when it comes to the point. This, at any rate, is the most logical explanation of one of the most interesting facts shown in the accompanying charts: namely, that there has been a swing back to the Government in all three postwar elections—not only to a Labour Government in 1950 and 1951, but also, and indeed in sharper measure, to the Conservative Government in 1945. Secondly, it seems probable that even the final pre-election polls tend to underestimate Labour's strength. This, again, has been the experience of recent elections. One reason may be that some of the "illiterates" record themselves, stony-faced and uncomprehending, as "Don't knows" to the end—and then vote Labour; while some other "illiterates" are so baffling to interview that they may not get into the public opinion polls at all, although most of them probably vote Labour too.

*

This, then, is the best summary that the analyst can make on the eve of the election campaign of 1955. From past experience one would expect that there should be a swing to the Conservatives both in the country and in the public opinion polls in the next few weeks; and that the Conservatives, with a reasonable lead already tucked underneath their belts, therefore deserve to be ranked as favourites at this stage. But if by the week of May 26th they have not held on to a lead as large or nearly as large as the 3½ per cent lead shown in the last pre-election BIPO poll of 1951, then many outside analysts will rate Labour as favourites on the day. The composition of the new Parliament—and with it the course of British history—is still poised on a knife edge; there are a large number of seats which could be affected by a slight swing in votes either way. It is to a study of the marginal seats that could be affected by small movements of opinion that an article in *The Economist* next week will be devoted.

Liberal "Nuisance Value"

THE annual Liberal Assembly at Llandudno raised just sufficient of a revivalist spark on the night to leave the detached well-wisher feeling more depressed than ever on the morning after. The spark was lit by the party's discovery of a new and attractive salesman of its wares in Mr Grimond, the Liberal Chief Whip in the Commons. Despite the latter-day iconoclastic tendencies of Liberal MPs, Mr Grimond can never have been strained to "whip in" a party of six, and he has hitherto been rather a dim figure in the Liberal hierarchy. But the illness of Mr Clement Davies forced Mr Grimond into the centre of the stage at Llandudno; and his racy, forceful common sense was a delight to a party normally fed on a diet of Welsh platitude and senior common room dialectics. For a moment, for one moment of hope in the sunshine, the party felt that it just might have found a Scot able to lead it out of the wilderness into which the Welsh condemned it.

Away from all those eager faces, however, the hope necessarily fades. Certainly the other two parties do not expect to lose votes to the Liberals compared with 1951; indeed the Tories think that they may gain significantly from them in constituencies where they reappear, while Labour believes that it may be able to capture one of the Liberals' remaining six seats. (Mr Hopkin Morris had a majority of only 467 in a straight fight with a Labour opponent in Carmarthen in 1951.) The big parties' main interest in the Liberals rests on how far they are "going to make a nuisance of themselves" by putting up candidates in marginal seats. At the moment the Liberals seem likely to put about 120 candidates into the field, compared with 109 in 1951, but their list of contested constituencies will probably remain uncertain right up to nomination day. Liberal candidature is a hobby rather than, as with the other parties a serious hope of eventually taking up an MP's job; and "hobbyhorse candidates," in the face of discouragement, are disturbingly apt to last-minute changes of mind.

Despite this uncertainty, new Liberal contestants are unlikely significantly to affect the result of the election. On the average, a Liberal candidate in a new seat tends to get about 6 per cent of the vote, of which—to take an extreme view of their nuisance value to the Tories—about 4 per cent may come from the Conservatives and 2 per cent from Labour. There seem to be 14 seats that the Conservatives could lose to Labour by a loss of 2 per cent of the total poll. It will be bad luck on the Tories if many of the possible net addition of eleven or so Liberal candidates appear in these critical 14 seats, rather than in the other 500 or so constituencies that Liberals also did not contest in 1951—and where their entry will make precious little difference. On the rules of random selection, and Liberal selection is still pretty random, one suspects that the changing pattern of Liberal candidature between 1951 and 1955 should not affect the tenure of more than two or three seats.

While the Liberals' effect on the fortunes of other parties may be uncertain, their own prospects are clearer and stark. They have virtually no chance of capturing another constituency unless one of the bigger parties stands aside. It became known at Llandudno that a very informal approach had been made to Transport House, and had been turned down flat. The Liberals are thus thrown back on hopes of local alliances with the Tories, similar to those which have let them in at Huddersfield West and Bolton West. Negotiations are now taking place in a handful of constituencies, and there is some hope of the Liberals getting a clear run in another Welsh division. The burning question before the party, however, is not whether it can increase its membership of the House above the present paltry six, but whether it may actually suffer further losses. Apart from Carmarthen, this depends on a renewal by the Tories of all the arrangements and abstentions that they agreed to last time. In the last election only one of the Liberals returned had been opposed by a Tory. The exception, oddly enough—or perhaps not so oddly when one recalls his brilliant performance last week—was Mr Grimond himself.

At the Starting Gate

THE announcement of the election date found the party organisations not merely lined up at the starting gate, but in some places actually through it. In many areas, for instance, the local parties booked halls for eve-of-poll meetings on May 25th several weeks ago. Both the main parties are left with about 30 or 40 candidates still to be selected, but in most marginal constituencies candidates have been picked well in advance. All the Tory leaders seem to be safely placed, but three prominent Labour figures have still to be found seats—Dr Summerskill (this year's party chairman, no less), Sir Frank Soskice and Mr Woodrow Wyatt. In addition, two sitting Labour members have been rejected by their local parties—Mrs Braddock, in Liverpool, and Mr Kinley, at Bootle. Transport House is fighting the local decision in the first case.

The main task of the central party offices is to set out the propaganda lines for poster and leaflet purposes, and to organise the speaking tours and broadcasting appearances of the national figures. Both sides believe that the television screen holds the key to a frighteningly large number of votes. The Tories have been alarmed by some embarrassingly enthusiastic rumblings

from Sicily, but Sir Winston Churchill is expected to be one of the party's leading "steam radio" attractions, leaving the younger and brisker-looking leaders to appear on television. It also seems likely that the Tories will have packed off their manifesto to the printers before Sir Winston gets back; they are inclined to resent the helpful suggestion that this document should be called "The Old Statesman and One Nation"—in order to show that the party has not lost the attractions of each.

Both manifestos are expected to be out before dissolution. Labour has been going through some policy-making birth pains this week, with a meeting on Monday of the policy sub-committee of the National Executive, which submitted a draft manifesto to a full Executive meeting on Thursday. Theoretically the Labour manifesto should be based on "Challenge to Britain," but in reducing that document to handy size there should be plenty of room for surreptitious —and very necessary—amendment.

Ninety Years On

In only one general election since the Great Reform Bill has a Government increased its majority after holding office throughout a Parliament. The occasion was a summer election in 1865, and the historical contrasts with 1955 are rather startling.

The outgoing Government in 1865 had been led by an eighty-year-old Prime Minister of great popularity and renown. His methods of administration had been extensively criticised in *The Economist* and other newspapers, and certain of his colleagues had been urging him to retire for several years; but Lord Palmerston stayed on and undoubtedly attracted votes from the older generation during the election. His majority was increased from 20 or so to about 60. This was good for his party but not so good for him; under the strain of office, and before he could form his new administration, he died on the eve of his eighty-first birthday. An important feature of the election was that the Chancellor of the Exchequer, Mr Gladstone (who was hailed by *The Economist* as the outstanding figure of that Parliament), had managed to secure what this journal called "a surplus of the first magnitude—a surplus of £4 million" in his budget accounts. He gave all of this away, chiefly by a reduction of income tax rates from 6d. to 4d. in the pound.

The Economist was chary of this pre-election budget. It expressed the fear that the Chancellor "does more than he should, that the *extent* of his operations is excessive." It agreed that some readers might feel that this objection arose "out of an obstinate caution which is habitual to us in money matters," and admitted handsomely that it had been wrong in opposing Mr Gladstone's tax reductions two years earlier. On this occasion, however, it was not wrong. Following this budget, and as the election campaign raged, an economic crisis developed with alarming rapidity. By May of the following year, as Overend, Gurney and Co. crashed, the Bank rate stood at 10 per cent. The great advantage of this story is that all parties should be able to find suitable passages to quote from it during the coming election campaign.

Voters and Strikers

The threat of a railway strike on May 1st may make some electors very angry indeed. Who will they be angry with—the Government, for letting this trouble fester, or the Labour Party, half a dozen of whose Parliamentary candidates will be financed by the engine-drivers' union?

An important point to remember is that if a strike does start on May 1st it will almost certainly be over by election day; the country's essential business cannot easily be carried on with only skeleton railway services for more than three weeks. In so far as this does become an issue, therefore, voters on polling day are likely to be influenced by the settlement of the dispute, not by the dispute itself. If a settlement is reached by surrender after some days of stoppage and dislocation, then the Tories seem bound to be harmed; there will be a feeling that they should have settled things with less fuss earlier. If a settlement is reached before a stoppage takes place, then much may depend on whether the Government appears in the role of a responsible mediator or of a whipped dog.

In either event, Labour should only lose votes if it managed to make itself look more irresponsible than the Tories are made to look inept. It should be difficult for any but the silliest Opposition politicians to fall into this trap. During a recent television discussion of the newspaper stoppage, however, Dr Dalton showed how it could be done; he came down wholeheartedly on the side of the Communist-led strikers, just before the court of inquiry came down wholeheartedly against them. Labour's tactics in the face of this issue will have to be to keep its Daltons on the leash.

Nonsense Corner

The fact that London newspapers were not appearing when the election date was announced may have brought insufficient publicity to statements made in welcome to it. These statements included one example each of the odd and the tortuous which it would be a pity to miss. The odd statement, which deserves careful re-reading, came from Mr Aneurin Bevan:

> It is an extraordinary thing for Sir Anthony Eden to announce an election before the electorate has had time to pronounce either on his policies or his conduct.

The tortuous statement came from Mr Sydney Elliott, Editor of the *Daily Herald*, which has often complained in the past of the dominance of the capitalist press:

> It is an amazing distortion of democracy to announce a general election at a time when there are no London national newspapers. . . . It is not the first time Sir Anthony has offended against the spirit of the Constitution. When forced to resign from the Foreign Secretaryship by Mussolini, according to the best authorities he should have resigned from his party and roused the country. . . . He is not a faithful custodian of the Constitution and never has been.

It would be nice to know what each of these utterances is supposed to mean.

Notes of the Week

The Bamboo Curtain

The Bandoeng conference very nearly created an admirable precedent for all international assemblies; it was seriously intended, in its first hours, that the prepared speeches which all heads of delegations had brought with them should simply be handed round. Somebody's nerves unfortunately gave way before this revolutionary suggestion could be carried out, and the conference settled down, as conferences do, to several days of speechmaking. At first it seemed that by tacit agreement there would be no mutual name-calling, but gradually the margins of restraint became blurred. General Romulo of the Philippines executed a *tour de force* by avoiding direct mention of Communism while delivering a blistering attack on one-party rule, control of the press, and police states. For Pakistan, Mr Mohammed Ali urged adherence to "seven pillars of peace"—a formula akin to the five points sponsored by India and China, but replacing the grey phrase "peaceful co-existence" by the more clear-cut principles of negotiated settlement of all disputes, self-determination, and single or joint self-defence. Then Prince Wan, the Thai Foreign Minister, directed himself openly to China with a straight question about Pridi Panomyong's activities there and subversion among Chinese in Thailand.

Mr Chou En-lai waved all such doubts affably away. The "autonomous Thai movement" was, he said, no threat to Siam, Burma or Laos; China would readily discuss the dual nationality problem of the Overseas Chinese with the governments concerned; the common task for Asians was to do away with colonialism, and Communists and non-Communists should work together to that end without any mutual suspicion or fear. There was, he said, no "bamboo curtain" round China, and he invited any or all of the delegates to come and see for themselves. Probably Mr Chou did not see the implicit contradiction in these last words. It is precisely the fact that only the invited are able to enter China, and that they can then see only what their hosts wish them to see, that makes the "bamboo curtain" a reality and a scar across Asia—as the iron curtain is a scar across Europe. The tone of the speeches hitherto made at Bandoeng suggests that most of the Asian and African delegates will not be led by mere honeyed words to forget this sinister fact.

Riddles of a Lost Airliner

Each fresh piece of information about the Indian aircraft that crashed last week while flying from Hongkong to Java seems to complicate the mystery. The evidence of the survivors, all members of the Indian crew, strongly suggests sabotage. The Chinese government, which had chartered the aircraft to fly eleven Communist newspapermen and minor officials to the Bandoeng conference, issued a flat accusation of sabotage long before any evidence was available, and branded the Hongkong authorities (whom it said it had warned of the risk of sabotage) with complicity in an act which it attributed to the Chinese Nationalists and the United States. But it now emerges that Peking sent only a vague, and obvious enough, intimation that its representatives might meet with some trouble in Hongkong, and that the authorities there, taking no chances, placed guards on the aircraft throughout its stay. Thus, if the Nationalists managed to plant a bomb in it, they were being at the same time very clever and very foolish; foolish because they would gain nothing by the death of a few minor Communists but must suffer a further loss of Asian goodwill by such an act on the eve of a great Asian gathering.

Nor is that the only factor that makes one pause before assuming the Nationalists' guilt. The speed with which Peking issued its accusations was odd; the chartering of a Constellation with a crew of eight to fly only eleven unimportant passengers was odd; the fact that Peking gave no hint of its apprehensions to the Indians (who are understandably resentful about this) was odd too. One would like to know a good deal more about an incident which has provided Communist propagandists with such timely and dramatic material. Lack of newspapers may have prevented many people in Britain from realising how quickly and systematically Peking's wrath was trained on Hongkong after the crash. A Chinese minister at once declared that the situation in Hongkong was "intolerable"; it is described as a "hornet's nest" of hostile agents who are "a grave menace" to China. More will doubtless be heard of this before the Bandoeng conference is over.

The Footplatemen's Turn

Having been delivered from one strike in time for the general election, the Government is now faced with another which, if it comes off, could have a much more damaging effect on Conservative prestige. For the strike that the engine drivers and firemen threaten to start on May 1st is, far more than the strike of the newspaper workers, the Government's direct concern. And whichever way the elector looks at it he is likely to think that a sorry mess has been made of wage negotiations on the railways.

The crisis is the end to which the court of inquiry into the railway dispute last January provided the direct means; indeed, it is not even the end, but only one stage on a

relentless roundabout. The strike is threatened because the Associated Society of Locomotive Engineers and Firemen is determined to hold fast to the wage differentials, as between locomotive men and other grades, that were established by an award of the Railway Staff National Tribunal last November. Those differentials were threatened when the National Union of Railwaymen promptly put in another claim for its members ; and they went by the board after the court of inquiry advised yielding to the NUR. The inevitable result of surrender was another claim by the ASLEF—for a maximum of £10 os. 6d. for engine drivers, compared with the £9 15s. offered by the Transport Commission. The railway tribunal, which in November had harkened to the men's argument that the rewards of extra skill were sadly diminished, this week agreed with the commission. The engine drivers' job had not changed, so why should their pay ?

The Government and the commission are now faced by the fact that a vicious spiral is in full twist on the railways, for if there is a surrender to the ASLEF the NUR will certainly follow shortly behind it ; they must also recognise that the machinery of negotiation in this industry will be still further weakened if the Railway Staff National Tribunal, for the second time in little more than a year, finds its award brushed aside as a result of Government intervention under threat of a strike. But the machinery is desperately weak already ; and the public may also feel that so long as a porter on a good beat for tips can earn more than an engine driver, there is much to be said for the ASLEF claim. Since the Government and the commission helped the court of inquiry to make this bed of nails, it is for them to choose how they will lie in it. The essential lesson, however, is that, sooner or later, the country will have to stand up to a national railway strike. The second essential is that this battle should be fought at the right time and place. There will be many economists who will feel that the right place will be against the redundant mass of unskilled men who burden the railways, rather than against engine drivers who are relatively underpaid and in short supply ; and there are certainly many politicians who feel that the right time will be after the election and not before it.

Newspapers Return

A SETTLEMENT between newspaper proprietors and employees has been reached on terms which manifestly could have been worked out without recourse to a destructive strike. All that the strike has achieved is to demonstrate the power of Communist leadership in charge of small groups of men in key positions ; so far as the national press is concerned, the fact must be accepted that they retain that power. It is evident that the Communists have heard some home truths from other trade union leaders in the course of the negotiations and left in no doubt of their considerable unpopularity. But that has not prevented Mr Haxell, a member of the National Executive of the Communist party, from being elected general secretary of the Electrical Trades Union while the strike was on ; it is perhaps significant that less than 25 per cent of the members of the union bothered to vote either for or against him.

The final negotiations were complex ; but, broadly speaking, the employers have at least gained the victory for their stand after the Court of Inquiry. The report of the court was so flatly opposed to the strikers' case, and in effect so strongly in favour of the employers' arguments that it left indeed little ground for fresh concessions by the Newspaper Proprietors' Association. In the negotiations which followed on Thursday of last week, however, the gap was ultimately narrowed to the point at which the NPA offered new negotiations—implying some wage increases—by June 30th, while the unions, abandoning their specific demands, nevertheless insisted on a firm promise of increases in advance, and an immediate resumption of wage talks. The breakdown at this point led to heated discussions between the Electrical Trades Union and the Amalgamated Engineering Union on one side and the printing unions on the other, 23,000 of whose members became unemployed as the result of the obduracy of the ETU and AEU ; over the weekend the leaders of the London Typographical Society deplored the strikers' "continued intractable attitude," while Mr Deakin's remarks on blackmail were at least partly pointed in the same direction. This week the TUC, at the request of the Minister of Labour, took a direct part in further negotiations. These finally produced the formula that the men should go back on the basis of the acceptance of the existing offer and the initiation of new wage talks in eight weeks' time, any increases agreed thereafter to be dated back to the middle of June. This, incidentally, involved the withdrawal of the demand of Natsopa (the largest of the printing unions) for 12s. on top of the existing offer ; some hours of discussion served to dispose of other points at issue with NPA which that union had said would need to be settled before it recommended its unemployed members to return to work.

Loss and Profit

THE upshot for the press, therefore, is that the proprietors face a new round of discussions on wage claims in the near future ; though they will find this process less of a diplomatic marathon if a unified negotiating body has by then been set up, as recommended by the court. The engineers and electricians have had four weeks on strike pay, and they must face the fact that differentials have been upheld. The craftsmen have had a week on the dole. The proprietors have put their losses at the end of the third week at £2 million—presumably a net figure which sets off losses in sales and advertisement revenue against reduced costs in wages and newsprint and the prospect of regaining some of the advertisement revenue by larger papers. The public's reaction in terms of circulation has yet to be measured. But it is clear that the industry as a whole has suffered a heavy blow, and it is already known that the London evening newspapers, at any rate, are to put up their prices. So in the end it is the public that has to pay.

But the public will also have some questions to ask. How is it that in 26 days the press has been unable to offer even the smallest substitute for the free press whose importance it ceaselessly urges? Why, indeed, has it done just the reverse, seeking to restrict the circulation of that part of the press which continued to appear ? Has it, in fact, shown a spirit commensurate with its own conception of its high office ? And is it doing anything to meet a possible recurrence of a situation in which the country is largely deprived of independent news and comment ? The comments in the press on Thursday morning suggested that only a few papers were giving these questions some thought.

The upshot as far as the structure of collective bargaining is concerned is more cheering. For the first time since the war a court of inquiry has acted—in the middle of a strike—as a court of inquiry and of judgment, not as a body that sought merely to find the lowest common denominator of agreement between parties with whose ethics it would not be concerned. And the judicial approach has worked. There is an almost welcome irony in the thought that its success has been shown in the same week as the chickens of the famous railway court of last January have come home to roost.

Soviet Riposte in the Middle East

EVEN a novice at soothsaying could anticipate what Moscow would say about British accession to the Turco-Iraqi pact, and sure enough, out came *Pravda* last week with the expected phrase—"colonialism in the guise of defence." The official Russian protest, which followed in a special statement issued by the Ministry of Foreign Affairs last Saturday, was rather less hackneyed in form ; it threatened to lay before the United Nations a complaint against the western powers for exercising undue pressure on Asians in order to force them into "aggressive blocs."

The threat to arraign the west at Uno is probably an idle one. It would in any case bear little fruit ; if a grouping that includes Britain should not, perhaps, be classed as one of the "regional arrangements" for which the Charter provides, it can be justified, as Nato is justified, as one of the "measures of collective self-defence" that are permissible under Article 51. The Soviet statement was issued not for legal but for propaganda reasons, and was timed to reach Asian ears just as delegates were mustering at Bandoeng. If Britain and America can there be branded as militarist, and Russia as, by contrast, neutralist, a propaganda victory of some dimensions will have been scored, if not with Middle Eastern rulers and soldiers, at least with the many more lowly Asians who hope to survive on the side lines in the event of an east-west war.

In fact, no pressure has been exercised by London on any Middle Eastern government. The potential adherent most frequently mentioned by wishful thinkers is Iran, but its new Prime Minister has been quick to deny a rumour that he is "studying adherence" to the pact. It should be remembered that the Iranians have, as part of their age-old balancing act, maintained since 1921 a treaty with Russia which has re-insured them against incursions—presumably hypothetical British ones—from the south. This treaty binds them not to allow any organisation or third party hostile to Russia to set up installations on Iranian soil as a "base of operations" against the Soviet Union. It also affords Russia the right to "advance its troops into the Persian interior" in the event of incursion by any hostile third party. If the sanctity of old treaties has any meaning, Iranian accession to the new pact might prove to be anything but a blessing.

M. Pinay Tours the Horizon

M. PINAY seems to have inherited from M. Mendès-France not only the office of foreign minister but also a preoccupation with deadlines and rapid movement. After coming to London on Thursday at Mr Macmillan's invitation, he is due to meet Dr Adenauer at the end of next week, and there is talk, too, of a journey to see M. Spaak, partly in connection with new projects for European integration now being mooted between the Belgians and the Dutch. The brief visit to London clearly represented a good deal more than a courtesy call on the new Foreign Secretary. To begin with, M. Pinay was known to be anxious to secure as much alignment as possible of British and French views on Indo-China. American eagerness for bilateral discussion with the French of differences of approach to the problems of both North and South Vietnam has not been well received in Paris, where there is a strong desire that Britain should also take part in any such discussion and an equally strong hope that the British, as signatories of the Geneva agreements, will strengthen France's hand.

M. Pinay must have been much less hopeful of securing support from Mr Macmillan for France's immediate tactics on the European stage. Britain has not matched the speed with which the United States and Germany deposited their final instruments of ratification of the Paris agreements on Wednesday ; but there is as much eagerness in London as in Washington to complete the whole formal basis of Western Union without further delay, so that the foreign ministers and the Atlantic Council can proceed in early May both with Western Germany's admission to Nato and with the question of a meeting with the Russians. The British also sympathise with the American preference for completing the ratification procedure before getting down to systematic discussion of the new situation even on the official level. Here, M. Pinay's pledge to the French Senate that final ratification would be delayed until France has got its own way on the outstanding Saar issues is an obvious stumbling block. However rapidly the French Foreign Minister continues his diplomatic circuit he can hardly escape the necessity to modify his insistence on this issue, unless he is, indeed, ready to jeopardise the whole western timetable.

Electoral Hors d'Oeuvres in France

THE electoral season has opened in France too. Last week over six million Frenchmen went to the polls to cast the first ballot in their cantonal elections. Half the

departmental, or county, councils are renewed every three years, and the fate of over 1,500 councillors was being decided. In France, where the centralising heritage of the Revolution and of Napoleon is still strong, local government plays a more modest role than in Britain, and the present voting is attracting attention mainly as a signpost for the senatorial elections this summer and the elections for the National Assembly next year. The signs have to be read with care. Local issues, and heavy abstentions, are both distorting factors. The layout of constituencies, with a strong bias in favour of small rural *cantons*, is a handicap to the Communists, and the two-ballot system is usually supposed to be another one. This year, moreover, comparisons are made difficult by the disappearance of many Gaullist candidates; in 1952 the Gaullist label was a fashionable one, but now many candidates are reverting to more traditional colours.

The first ballot revealed several interesting trends, one being the Socialists' slight gain from the Communists in the industrial areas of the north; the Communist percentage of votes fell from 23 to 21, as the Socialists gathered the fruit of their years in opposition. Another was the fact that the Conservatives rather than the Christian Democrats (MRP) gained most from the receding Gaullist wave. But the most significant phenomenon is one that has been taking place this week in the interval between the two ballots: the forming of local electoral alliances between Socialists and Communists.

The second ballot is held wherever, as is common, no candidate wins an absolute majority at the first poll. Its outcome is largely determined by the candidates who withdraw during the intervening week and urge their supporters to vote for another party. The Communists, adopting the role of champions of the whole Left, have offered in many constituencies to withdraw in favour of candidates better placed to oppose the Right. In some areas the local Socialists are ready to repay the compliment and back Communist candidates. This new trend is opposed by the Socialist leadership, and it will not have any dramatic direct effect. But it has given food for thought to all those in France who have been urging that in parliamentary elections the present system should be scrapped and the prewar method of single-member constituencies with a double ballot revived. The shadow of "popular front" alliances will now hang over any such project.

Speech Day Prizes

SURPRISINGLY, the budget was received by the Tory backbenchers with only moderate acclaim; certainly at the end of his speech Mr Butler was not swamped by the almost unprecedented applause that gushed out behind him after his first budget three years ago. The explanation of the difference is to be found in the setting rather than the subject matter of his performance. Three years ago everybody had expected an unpopular budget, and Mr Butler had deliberately angled for cries of delighted anger from a gloating Opposition by announcing his food subsidy cuts and Bank rate increase first; the tax reliefs he announced at the end of that speech whipped back on a discomfited Opposition with the force of stretched elastic. This time he made some play for the same sort of success, and he roused early Labour hopes of national disappointment by referring to Mr Bevan's recent description of himself as an "unprepossessing personality." "This," said Mr Butler, "seems to me the one attribute vital to the post which I hold." Long before he wound up, however, the sunshine nature of his budget was clear. His actual concessions were announced in a manner reminiscent of an efficient headmaster handing out prizes to the boys on Speech Day, and they were received on the Tory benches with the demure applause suited to such an occasion.

Mr Gaitskell's speech-making activities this week have been very different. Indeed, from the Tories' point of view, he has handled some singularly unpromising material aggravatingly well. His broadcast on Wednesday evening was a magnificent example of how to quote statistics without actually—well, more or less without actually—cheating; his aim was to make the marginal voter feel vaguely uncomfortable about both the stability and the share-out of Tory prosperity, and it could not have been more seductively pursued. His speech in the House of Commons earlier in the afternoon had deployed the same statistics, but had salted them with wild accusations against this "reactionary Government" which would have left any marginal voter present who had ever voted Conservative antagonised and annoyed; the aim here was to raise Labour members behind him to a pitch of enthusiasm and admiration, and it was achieved in one of the warmest moments of Mr Gaitskell's Parliamentary career. From a long term point of view, this week's spectacle of the whole army of Labour MPs wildly cheering Mr Gaitskell was perhaps no bad thing. But if he is to continue to have different types of speech for two different types of audience, he had better make sure that he does not ever get the two mixed up. This will be of some importance when he comes to exert his influence on Labour's election manifesto.

Death Throes of a Parliament

THE dying Parliament is having to transact the rest of the annual financial business at a brisk canter instead of the usual leisurely amble right through the summer. Before dissolution on May 6th it needs to pass a Finance Act and an Appropriation Act. In addition, the House of Commons will have to pass a motion legalising the reduction in the number of supply days from the normal 26 to the ten that have so far been fitted in plus four more that are to be arranged as a reasonable ration for the Opposition. Supply days provide the Opposition with its one chance of initiating debates; but Labour should feel that it has been very fairly treated, especially as it will be able to have a further tilt at the Government before the election by choosing a topic to be debated on the Appropriation Bill.

To fit in all this business before May 6th the Government has had to take over the three Fridays set aside for private members' business. Even with these additional days, the Government will still be pressed for time, and a good deal of ingenuity has clearly gone into the precise

Quebracho

Glance down the list of Britain's imports from Latin America and you will find quebracho extract. The quebracho itself is a tall hardwood tree which grows in the northern forests of Argentina, taking a full century to reach maturity. Its extract, a valuable tanning agent, is shipped to world markets from Buenos Aires, where the Bank of London and South America has long been established. You will find quebracho mentioned from time to time in the Argentine section of the Bank's *Fortnightly Review*.

This publication is an invaluable guide for all who wish to enter Latin American markets, whether as buyers or as sellers, for it summarizes the latest reports on trading trends, import regulations and exchange control received from our 51 branches in South and Central America.

We shall be glad to send you a specimen copy, on application to:—

drafting of the Budget Resolutions and the Finance Bill. In particular, Mr Butler has left out the usual concluding resolution, which authorises general amendment of taxation law and so opens the way to the tabling of dozens of amendments and new clauses to the Finance Bill. This year amendments to the Finance Bill will have to relate to its provisions, and these in themselves are precious few. Normally the Finance Bill may contain as many as 80 clauses and a dozen schedules ; this year it has just three clauses (one merely setting out the title) and no schedules.

Discussion on the committee stage of the Finance Bill is "exempted business"—in other words, no time limit applies. A government could theoretically curtail debate by moving the closure, or even imposing a "guillotine" timetable, but this would be quite exceptional on a Finance Bill. Nor, in the present case, should such expedients prove necessary ; with a Finance Bill so restricted, there should be time enough for proper debate unless there is the most blatant obstruction. There is no reason why Labour should not accept the curtailed arrangements. Any objections can immediately be referred to the electorate—this is, in fact, the only circumstance under which the restriction of debate on a Finance Bill could be accepted—and if Labour is returned to power it will be free to bring forward a second Finance Bill in the autumn or even, if it likes, later this summer.

"As You Were" for Hungarians

A PICTURE of Mr Nagy, crowned with flowers, was carried through the streets of Budapest during the recent celebrations of the tenth anniversary of the "liberation" of Hungary. But any speculations that his story might be given an unusual twist have now been squashed ; he has duly met the fate that has hung over him ever since he was reported sick two months ago and a few weeks later was uncompromisingly censured by the central committee of the party. Last week he was dismissed both from the premiership and from all his party posts: unlike Mr Malenkov, he was not consoled with a minor ministry.

Among the accusations levelled at Mr Nagy last week were that he had "striven to put a brake on the engine of socialist construction," especially on the development of heavy industry and of collective farming. Mr Nagy was made premier in June, 1953, precisely because such a policy was considered expedient. But the "new course" economic policy has clearly not succeeded in rescuing Hungary from its troubles, and Mr Nagy had to pay the penalty for failure. Even if he had been more successful, the switch in policy in Moscow would probably have made his position untenable. He is also accused of trying to "push into the background the leading role of the party," in favour of the Patriotic People's Front, the new popular organisation started last October in an attempt to whip up popular support for the regime. Whether or not he has really been trying to undermine the party, Mr Nagy does seem to have enjoyed some popularity ; and that perhaps accounts for the delay in disposing of him. It rather looks as if it needed Marshal Voroshilov's recent visit to Budapest for the "liberation" celebrations to prod the Hungarian Communists into decisive action.

Although Rakosi remains in the background, the new office-holders are believed to be his men. The new premier, Andras Hegedues, has been concerned with agricultural problems and since 1953 has been first vice-premier ; recently he has been emerging rapidly into the limelight. His successor as first vice-premier is another up-and-coming Communist, Joseph Mekis, who as chairman of the trades union council has recently been plugging the Rakosi line against right-wing deviationists. Mekis and Istvan Kovacs, the party boss in Budapest, have been promoted to the Politburo ; the latter was formerly a supporter of Nagy who has been very obviously working his passage back to Rakosi. But none of these new men is to be envied his promotion, for they will be forced to carry out policies whose bankruptcy and unpopularity were proved years ago.

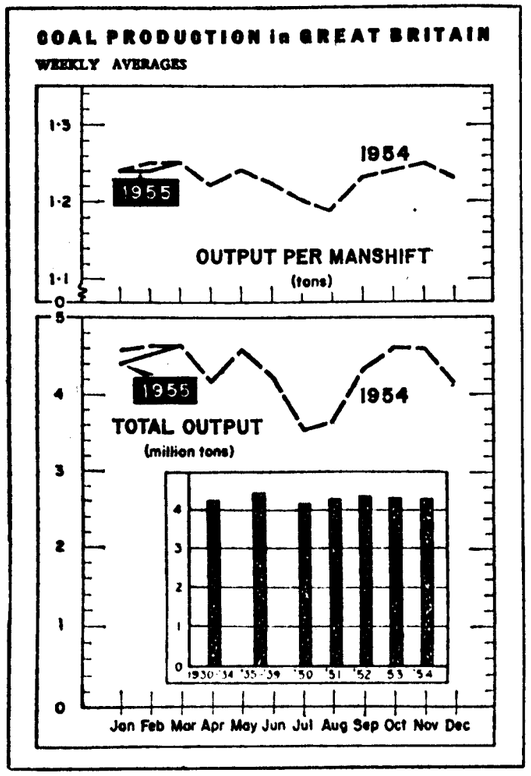
Two and a Half Thousand Million

THOSE who like their statistical path to be dotted with milestones will note that, according to the newly published United Nations Demographic Yearbook for 1954,* the world's population has now topped the 2,500 million mark. In the three years up to the middle of 1953 nearly 100 million were added to the UN Statistical Office's roll. Not all of these represent new and hungry mouths, for it is thought that the various censuses taken around 1950 contributed some of the apparent increase by putting a more accurate count on existing heads. Even so, the Statistical Office believes that the real total is increasing annually by well over one per cent, which is enough to set neo-Malthusian heads shaking.

Contrary to the familiar notion, the most bustling expansion in recent years has taken place not in Asia, but in the Americas. Since 1940 the population of the American continent has grown by about 27 per cent, compared with roughly 16 per cent for Asia (excluding the USSR, for which figures are not given) and a meagre 6 per cent for Europe. Even if the figures for eastern Asia, which consists largely of China, are taken separately, the rate of expansion seems to have been matched by that in central and southern America, and even to have been exceeded in the last three years. Statesmen as well as demographers should be interested in this tendency of the western world's centre of human gravity to shift towards South America.

Some hitherto unpublished figures about expectation of life give a startling illustration of the changes that medical science can bring about. Shortly after the end of the war a campaign to control malaria was undertaken in Ceylon. The Yearbook shows that within a single span of 12 months, between 1946 and 1947, the expectation of life of a Ceylonese child at birth increased by nine years, and has gone on rising ever since. It now stands at more than 56 years, compared with 32 in India. Any increase half as sudden over Asia's vast land masses would raise some frightening economic problems. It would be interesting

* Available from HM Stationery Office. 729 pages. 45s.



to have figures from China to compare with these ; but perhaps expectation of life is a concept which the Chinese regard as somewhat lacking in "Socialist realism."

Greek Opposition Manœuvres

AFTER years of unsatisfactory coalition cabinets, the Greeks have for three years enjoyed a stable government under Marshal Papagos, the leader of the Greek Rally; but the necessary corollary of a stable opposition is still far to seek. The opposition parties, which in the present Greek parliament muster only 87 out of a total of 300 seats, add to their own ineffectiveness by their discords and by their internal manœuvrings, the latest example of which was provided last week by the prominent Liberal, Mr Venizelos.

About a year ago Mr Venizelos handed over the leadership of the Liberal party to Mr Papandreou and ostensibly retired from politics ; but for months past he has been trying to stage a come-back as leader of a united opposition front. Nothing, however, came of his efforts, partly because of divided counsels within the other opposition parties, and partly because of disagreements over how far to the left the united front ought to extend. Mr Venizelos is resolutely opposed to any collaboration with the fellow-travelling EDA, but he has affronted some of his fellow Liberals by his desire to work with the less extreme left-wing Democratic party ; and this party, in turn, maintains that a united front that does not include the EDA is no good.

The resignation on March 30th of twelve Greek deputies from their respective parties, including eight from the Liberal party, was the signal for Mr Venizelos to try a possible new path to leadership of the opposition. He returned from a visit to Egypt, resigned from the Liberal party (of which he had remained honorary chairman) and, to the indignation of Mr Papandreou and his supporters, announced the formation of a splinter Liberal party, the Liberal Democratic Union. He hopes, no doubt, to attract enough deputies to make this the largest opposition party ; he himself would then automatically become the official leader of the opposition, and thus be in a better position eventually to unify it. But so far only seventeen deputies, including the twelve who had resigned on March 30th, have joined the new party. Far from uniting the opposition, Mr Venizelos' activities look like increasing its already lamentable fragmentation.

Time Must Have a Stop

A SCIENTIFIC congress has been scheduled for July in Berne to mark the fiftieth anniversary of the special theory of relativity. At this congress, physicists will show how this theory opened the new kingdoms of atomic and sub-nuclear science ; astronomers will describe how it explained the motions of Mercury and how it carried the awed mind to the curving limits of the universe ; philosophers will acknowledge, with rueful gratitude, that special relativity forced them back into the very beginnings of metaphysics and let the darkness in where space and time had held comfortable sway. Spectators at this congress will, perhaps, be unable to follow the arguments and the formulas, but they will know that their world is as profoundly the product of the new science as the eighteenth century was of Newton's cosmogony. It had been hoped that the author of the small monograph on special relativity, and of a number of other scholarly papers equally slight in format, would honour the congress with his presence. But Dr Albert Einstein now belongs to the history of man.

That history goes beyond his pre-eminence as a scientist. It includes his unwearying opposition to political tyranny whether it took the form of Nazism or of McCarthyism, his combination of the complex roles of a citizen at home in all lands with one for whom Israel was a great hope, and his unfailing moral insight in the face of the terrible military consequences of his discoveries in the physics of energy. But, above all, Dr Einstein kept alive in the small minds of millions of ordinary people the realisation that truth for truth's sake, and the most forbidding pinnacles of pure research can become the great forces shaping practical experience. It is his special glory that for men to whom the word "relativity" means nothing, the name Einstein will always mean a shock of white hair, a violin, and wisdom in our time.

Correction : In the note on "New Watchdogs for Russian Farms" on page 191 of *The Economist* of last week, the sentence referring to "the decision by the government and party to change the chairmen of the 93,000 collective farms . . ." should have read ". . . in about one-third of the 93,000 collective farms. . . ."

Letters to the Editor

No Newspapers for Lent

SIR—How right you were to say the newspaper strike was causing the public "far more than an inconvenience" and how wrong is F. W. P. Deane to suggest, on the evidence of what he calls his "own little bit of mass-observation," that the public does not care a tinker's cuss! If your correspondent judges rightly, how is it the provincial dailies are receiving many orders with cheques to send the paper to would-be subscribers for the duration and are being implored to send big extra editions to London ? And when the provincial papers explain that they cannot do this, owing to their defensive agreements against strike sabotage, how is it they are accused of putting commercial prudence above the public interest ? The continuous information and discussion in the Press have become in business and public life an indispensable element, far beyond the power of the BBC to supply, excellent as it is, when the great national papers are silent.—Yours faithfully, LINTON ANDREWS

"Yorkshire Post" Office,
Leeds, 1

*

SIR—Mr Deane says that he has been undertaking his own "little bit of mass-observation" on the newspaper strike. You may be interested in the results of an "official" Mass-Observation on the same subject which was commissioned by the BBC for television's "Panorama."

A week after the strike had started less than one-quarter of Londoners said that they had not been inconvenienced at all as the result of the strike and two-thirds said that the inconvenience was not serious. What was most often missed was sports news. A second general check-up at the end of last week showed, however, that one-third of Londoners regretted having missed the news of Churchill's retirement. Sunday papers are missed much more severely than daily papers.

With regard to the lighting of fires, Mr Deane feels that this is not serious at this time of year. But already 35 per cent say that they are having difficulties of this kind ! —Yours faithfully,

LEONARD ENGLAND

Mass Observation Ltd., W.8

*

SIR—It has now become clear that the prestige of our national daily press is considerably lower than many of us had thought.

The House of Commons itself treated with complacency—even with amusement—the plight of the press. MPs seemed to consider that a nuisance had been temporarily gagged and that it might have a healthy chastening effect. This is an astonishingly shallow reaction, which is probably in process of revision by now. Radio quiz and answer programmes have revealed a disparaging view of Fleet Street which editors will surely find very difficult to disregard. Even if such evidence be considered trifling, it is apparent that the nation has managed well enough without the press during a change of leadership in the Government, during the Budget and debate upon it, and at a time when a general election has been announced.

Are we to take it that a free and forthright press is no longer essential in the life of a democracy ? Or is it that British newspapers have fallen short of the needs of the times ?—Yours faithfully,

Twickenham JUSTIN LONG

New Chance for Nepal

SIR—A letter in your issue of April 9th, based apparently on a brief visit to Nepal in 1945, suggests that the Rana regime at that time compared favourably with any British Province. May I correct such a misleading impression, on the basis, not of a brief visit, but of 30 years' administrative experience in a British Province, followed by 7 years (1940-1947) in Nepal.

The administration in Nepal at that time was quite incredible, an anachronism that had survived from the Moguls and the Indian Rajas before Clive, and which two centuries of British administration had done its best to eradicate elsewhere. Your article of March 19th mentioned that the whole country was treated by the Maharaja as a huge private estate. This is literally true. Large tracts of land, usually with magnificent and valuable forests, were given in perpetuity to the Maharaja and his relations and favourites. A recurring annual gift of one million rupees (£75,000) from a grateful Indian Government for the services of the Gurkha regiments in World War I went into the Maharaja's private account. Consider Justice. No Habeas Corpus Act, no trial by jury ! A young member of the Koirala family wrote an article in an Indian paper against the Ranas ; his innocent old father was put into prison until he died. Medical services were non-existent in 90 per cent of Nepal villages. I have seen dogs and vultures quarrelling over cholera corpses, and on occasion my wife objected to various camping sites when there were too many skeletons lying about. Bribery and corruption were universal, on a scale beyond anything in India. Your correspondent mentions the happy and friendly character of the people as evidence of good administration. The fact is absolutely true, a characteristic that the Nepalese share with the somewhat similar inhabitants of Burma, Thailand, Bali, and other countries where time and the teaching of Buddha have shaped the national character, but the assumed reason is not true. The happy character exists in spite of, not because of, the administration.

It is remarkable, and rather pathetic, that the last of the Ranas, who was the first to put the interests of the people before self, had no time to introduce his reforms, and arrived too late to save the regime. He is now in exile. If the young King succeeds (as your original article hoped) in producing order and an efficient administration from the existing chaos, it will be an achievement far beyond the fabled labours of Hercules.—Yours faithfully,

Tralee, Ireland. E. A. SMYTHIES

A Cry from Lancashire

SIR—In your article of April 16th you stress that the heart of the textile trade's problem is to recapture exports, and at the same time stress that the best hope for this is for the trade to concentrate on the luxury article and still more on the medium-priced branded article where "price is still secondary to the quality of design and finish," and on those articles made from the newer synthetics. Yet it is precisely the production of all these articles that is actively discouraged, and in many cases entirely prevented, by the operation of purchase tax on textiles, which is levied exclusively on the medium quality to luxury end of the trade.

Your other article suggests that it is dangerous to give tax relief only to those industries in difficulties, implying that the textile trade, primarily because of its present difficulties, is wanting some special concession in regard to purchase tax, whereas what in fact it is wanting is, for the sake of its long-term future, to get rid of a special disability from which it suffers. It alone of the major exporting industries suffers from purchase tax in the form of the "D" Scheme which discriminates against better quality. It has been shown beyond doubt that this affects its ability to export such qualities, even granted certain successes which have been achieved in spite of the difficulties. Any action taken to eliminate this distortion can only be considered both equitable and prudent. The Chancellor in his Budget, whilst reducing the amount of tax borne by certain textiles, has left intact the particular type of discrimination against better quality textiles which, under the "D" Scheme, causes the basic distortion from which its evil effects chiefly flow.—Yours faithfully,

Carlisle J. W. F. MORTON

Books & Publications

The Wood and the Trees

SURVEY OF INTERNATIONAL AFFAIRS 1952. By Peter Calvocoressi.
DOCUMENTS ON INTERNATIONAL AFFAIRS 1952. Edited by Denise Folliot.
Issued under the auspices of the Royal Institute of International Affairs by *Oxford University Press*. 481 pages 45s. and 546 pages 55s. respectively.

YEARS are the most unsatisfactory historical divisions: and the greatest disadvantage of the many to which the authors of the Chatham House Annual Surveys of International Affairs are subjected is that they are obliged to begin their narrative on January 1st and end it on December 31st, while the events they are describing do not start and stop so neatly. Nineteen fifty-two, moreover, was an untidy year: the Korean armistice was still not concluded; Stalin was not yet dead. True, the European Defence Community treaties were signed, but in an atmosphere of such hesitation and misgiving that it is hard to regard the event as a dramatic climax. In the circumstances Mr Peter Calvocoressi and his colleagues, Mr Kirk and Dr F. C. Jones, have done very well. During his too brief period in charge of these annual surveys Mr Calvocoressi has done much to cure some of the defects of the series. The volumes are appearing sooner after the events they describe; some of the Toynbeean trappings have been dropped; we are no longer obliged to see drab and trivial events *sub specie æternitatis*, and we are spared misleading comparisons with past ages. Mr. Calvocoressi even goes so far in his preface as to poke a little fun at the pedantic transliteration of Arabic which Chatham House has tried to impose on us.

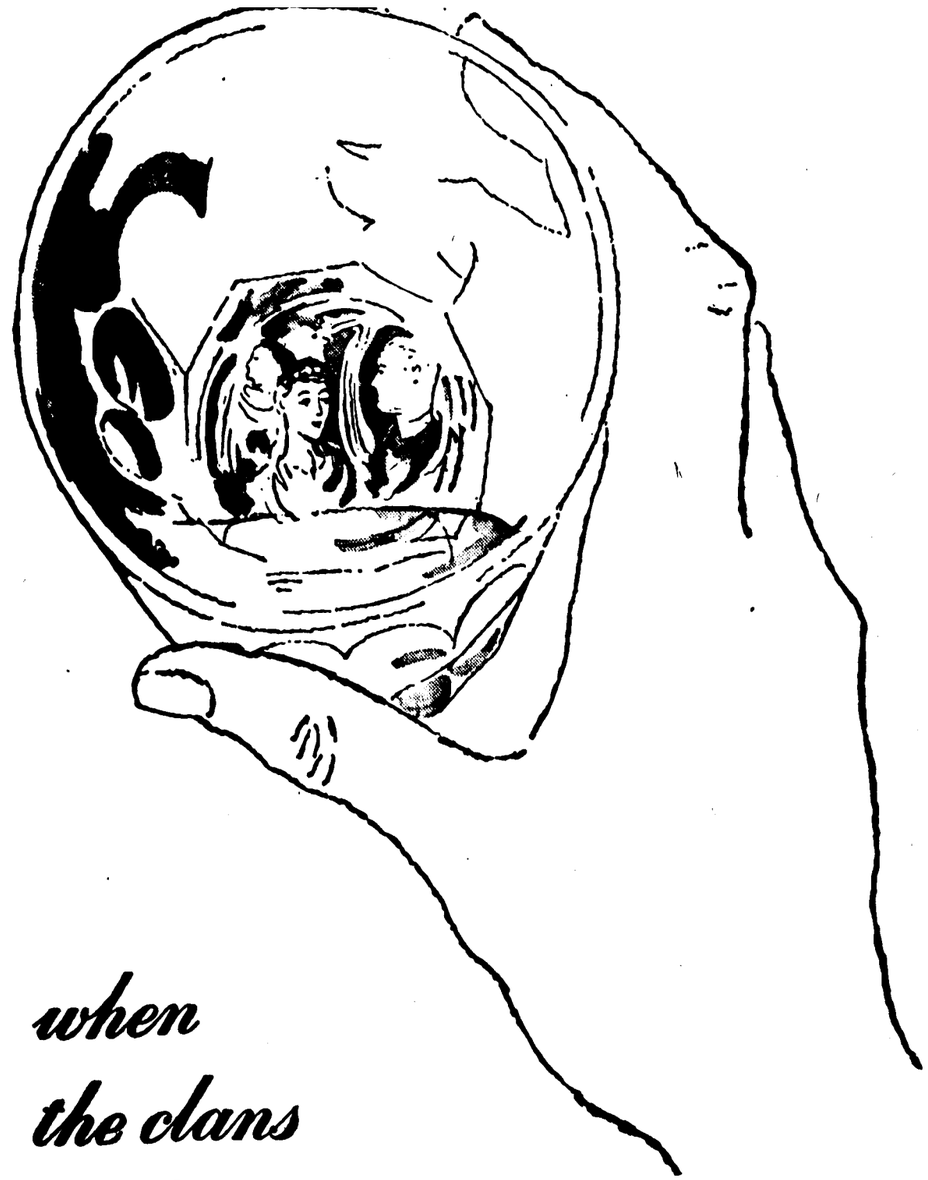
Mr Kirk's sections on the Middle East and the Arab West provide an interesting contrast to the rest of the volume. Mr Kirk has deliberately chosen a rather different manner of writing contemporary history from that of his colleagues. For while they have adopted a lucid, colourless, detached style, recording without comment, not speculating, on motives, drawing few conclusions, Mr Kirk is bolder. He describes characters, often in highly critical terms ("The notoriety of King Faruq's profligacy, which had given him at the age of thirty-three the outward appearance of a middle-aged debauchee . . ."); he analyses the intrigues of Arab politicians with obvious and infectious enthusiasm. His chapter is certainly the most interesting to read in the volume. The reason may be, of course, that the subject matter is intrinsically more interesting, that Arab politics are more fascinating than the endless discussions about German rearmament and the procedural deadlocks of the Korean armistice negotiations. But perhaps it is also that Mr Kirk, by breaking the Olympian calm and detachment of the usual Chatham House style, is in fact writing contemporary history rather in the way in which the best real history is written. By attempting to judge characters and assess motives he is doing what the historians of the more distant past constantly attempt; and it is more than a flat chronicle of events compiled from newspapers and official publications. The result is both illuminating and enjoyable.

One of the most urgent tasks for the new Director-General of Chatham House will be to decide what is the purpose of these surveys. Mr Calvocoressi's clear narrative, his objective presentation of facts and figures, are admirable in their way; yet much of the information he conveys would perhaps be as usefully presented in the form of chronological and statistical tables, and much of it is only duplicating what is already to be found in the excellent accompanying volume of documents. Perhaps it would be more valuable if Chatham House produced historical studies of particular topics—EDC or the Korean War, for example—so that the story did not have to be broken off in the middle. An annual survey of this kind, already three years old, has a curious unreality about it, especially when it is written with the eyes conscientiously closed to all that has happened since December 31st of the year with which it deals. The Royal Institute of International Affairs should make up its mind whether it is to write contemporary history or produce the raw material from which someone else will write it. So far it has not been entirely successful in doing either.

Against Bureaucracy

THE BATTLE OF CRICHEL DOWN. By R. Douglas Brown.
The Bodley Head. 192 pages. 12s. 6d.

THERE have been many libertarian causes as worthy as Commander Marten's claim to Crichel Down. Why did this one case attract so much attention? From Mr Brown's fair and balanced account, the short answer seems to be that the injured party was not only very determined, but sufficiently wealthy to afford the luxury of patience and sufficiently well-connected to bring pressure to bear at the point where it could hurt. In addition the affair produced a personal drama guaranteed to appeal to the popular press; a village Hampden challenging an all-powerful minister. The fact that the minister, although clearly culpable, was well liked and in fact far from powerful merely added an agreeable flavour of pathos to the story.



But how many other sufferers from bureaucratic incompetence are likely to enjoy Commander Marten's advantages, or be lucky enough to touch Fleet Street on its tear ducts? Mr Brown's careful report of the crazy pirouetting of the bureaucrats may leave the reader dizzy, but it shows clearly enough how almost imperceptibly a minor piece of stupidity can grow into a major injustice. The importance of the Crichel Down case lay not in the righting of this one wrong, but in the prospect it opened up of similar wrongs being inflicted on other private citizens less favourably placed to seek redress. Crichel Down revealed a chink in the citizen's armour against injustice and, for all the good resolutions thrown about like confetti at the time of the final explosion, this has still to be mended.

Mr Brown too easily accepts, particularly for a Liberal, the inevitability of continued state interference on the land; the price mechanism might just as effectively ensure a proper use of resources. But in this and other spheres of British national life the evils of delegated legislation seem likely to be with us for years ahead, and Mr Brown usefully considers how the citizen might be better protected. He examines in passing the possibility of improving both the quality and the supervision of the civil service, but he sees only two real sources of stronger safeguards—Parliament and the courts. The value of Parliament was proved in the Crichel Down case itself, but action, whether on the floor of the Commons or in some investigating committee, must depend on the initiative, inevitably capricious, of individual MPs. Mr Brown, in the end, reaches much the same conclusion as the recent, more technical, report of a group of Conservative lawyers—that the machinery of the courts must be strengthened. He adds the important rider, however, that nothing will protect an indifferent public.

Pigment and Prejudice

THE COLOUR PROBLEM.
By Anthony H. Richmond.
Penguin. 370 pages. 3s. 6d.

THIS book traverses much familiar ground, but it is an up-to-date survey which illustrates familiar liberal principles with the results of many recent researches into race relations. This is, indeed, a field so fruitful for the methods of applied sociology that the flow of new facts is continuous. The treatment of colour problems in Britain is perhaps the most interesting and challenging part of Mr Richmond's study; partly, perhaps, because a thorough review of race relations elsewhere in the Commonwealth leaves the reader without any very obvious clues to policy. But this is a colonial problem

*FOR NEW IDEAS** ON BUSINESS LIST-PRINTING

Stock, price and parts lists, mail-order and membership lists, inventories and internal telephone directories: how are they produced in your business? Is it a full time job for someone to keep them up-to-date and accurate, to check proofs, to supervise printers and publication dates? Send for the Man from Remington Rand. He'll show you a way with business list production which is quicker, cheaper and more accurate altogether.

**THIS IS FLEXOPRINT* Remington Rand's equipment for rapid, low-cost list-printing. Flexoprint turns your own typist into a compositor — does away with all typesetting charges. Flexoprint lists are maintained, amended, paged up in any format, and proof-read in your own office. They are always up-to-date, always ready for your printer or your own offset-litho department. Does Flexoprint sound like a solution to your listing problems? Let us prove that it is.

that has been brought to the average Briton's doorstep—or at least it may reach his doorstep or the one next door at any time. Mr Richmond's estimate of the number of coloured people permanently domiciled in Britain is 100,000, of whom 10,000 are British-born; by inter-marriage and immigration the number is mounting steadily.

Modern psychological therapy is based to some degree on the hypothesis that anxieties and fears lose their force if brought into the conscious mind and frankly discussed. Mr Richmond makes a contribution to easier relations between white and coloured Britons by discussing just what it is so many people dislike or envy in the African and by bringing the trouble into consciousness—whether the anxieties are economic, cultural, sexual or the projection of personal maladjustments. This part of the book could have been longer with advantage, since the book seems essentially designed for the general reader now becoming aware of his coloured fellow-citizen.

Mr Richmond gives more extended treatment to the elaborate forms of discrimination which the coloured person encounters in Britain. It cannot be doubted that this country is far removed from the time when people will be blind to each other's skin pigment. But there also remains in Britain considerable consciousness of social class, upbringing, regional differences and a hundred other peculiarities for keeping people out of one's set, or for wanting to penetrate theirs. Caught up in the nuances of a subtle culture which is only politically democratic and materially egalitarian, the coloured visitor often sees slights where none are intended—or are intended for white as well as black skins. Unfortunately black skins are thinner than white. Yet, by and large, the coloured immigrant finds it easy to create his own circle and way of life in a basically tolerant community. What more, at this stage, can he expect in an imperfect world? The position of children born of coloured fathers and white mothers merits careful consideration. Gradually, as they increase in number, they should form a bridge between the races; for they will be given the full social and educational endowment of the welfare state. Will they be accepted enough to feel at home? Or will they later on fill the rebellious and revolutionary role of those who in the past in childhood felt oppressed by "the ruling class," and have sought ever after to get even with it?

Education and Anthropology

EDUCATION AND SOCIAL CHANGE IN TROPICAL AREAS.
By Margaret Read.
Nelson. 139 pages. 8s. 6d.

PROFESSOR MARGARET READ is head of the Department of Education in Tropical Areas in London University's Institute of Education. Until 1952 this was called the "Colonial Department," and the change in title marks a significant change in its emphasis and a great extension of the meaning of "education." Miss Read is herself a distinguished anthropologist, and the theme of her teaching and writing is that "the problems posed for the educationist cannot be solved without the help of the anthropologist."

The present book contains some of Miss Read's comments on current educational problems in tropical and underdeveloped areas. It consists of nine separate papers, mostly lectures delivered to different conferences over the last twelve years. As the material has been prepared at different times for different audiences, the result is a very unsatisfying book. Too many points are raised but not driven home; too many problems are indicated but not analysed; there is some lack of cohesion and much repetition. Yet if the author's case is deprived of impact, she has many stimulating things to say, opening up for further research the field of relationship between indigenous traditional cultures and a modern system of education. It is a comparatively new field of study, and of its very nature it is changing while the specialists are at work in it. The degree of social change in most African communities has been so great that many of the elements of indigenous culture susceptible of incorporation in the new educational structure have themselves to be reconstructed. In West Africa they are already being partially reconstructed, with some artificiality. Just as the educationist needs the anthropologist, the latter needs the historian.

The U-Boat War

THE SEA WOLVES.
By Wolfgang Frank. Translated by R. O. B. Long.
Weidenfeld and Nicolson. 262 pages. 21s.

THIS book is concerned with the resurgence of the "Sea Wolves"—the German U-boats—as a vital part of Hitler's navy and with their rapid expansion under Admiral Doenitz. By the end of 1942 the Germans had hundreds of operational U-boats, and until these could be defeated it was evident that there could be no Allied victory in Europe.

According to the author the ultimate defeat of the U-boats was not due to any failure of morale, but could be ascribed to a variety of causes. Before the war had even started, Admiral Raeder, who believed in a "balanced fleet," would not heed Doenitz's plea for a vast increase in U-boat numbers to the exclusion of other less effective naval weapons. If only Doenitz could have started the war with 100 U-boats. . . . If only he could have obtained aircraft from the powerful *Reichsmarschall* Goering. . . .

The author was one of Doenitz's staff officers, and candidly admires him for his leadership and for the devotion he inspired among subordinates. When Raeder resigned in January, 1943, Doenitz succeeded him as head of the Navy, but still retained direct control of the U-boats—the only weapon, as he believed, that could defeat the Allies. Moreover, Doenitz was on far easier terms with Hitler than his predecessor had been, and so could at last secure his much-needed priorities.

But it was too late, for within a few months—in May, 1943—the crisis came, the U-boats suffering enormous losses without achieving adequate sinkings. What bothered the Germans at that time was that they were often in the dark about the cause of these losses. Thereafter the ever-growing allied countermeasures forced the U-boats to put their own survival before the destruction of shipping. In the last phase of the struggle the Germans were driven to adopt various revolutionary designs and methods, such as new propulsion with hydrogen peroxide, acoustic and "pattern-running" torpedoes, decoys against radar and asdics, and the use of the "snort." Fortunately many of these hurriedly improvised inventions came too late to influence the course of the war, but it should be noted that some of them have since been acquired by other navies. In the description of these devices there is much that has not been available hitherto. There is some disquieting evidence about weaknesses in allied cypher security.

The preface by Admiral Sir George Creasy, Commander-in-Chief, Portsmouth, reminds us that submarines are in the armoury of the nuclear age. A decade has elapsed since the events described in this book, and Doenitz, its central figure, is nearing the end of his term of imprisonment. Now Western Germany is once more to be allowed to build submarines, though limited in size and numbers, and this grim but informative book serves to underline the wisdom of the recent Paris Agreements in so far as they provide safeguards against any unilateral rearmament by Britain's former enemy.

Segregation in Court

Washington, D.C.

WITH its usual dignity and calm, the Supreme Court last week moved into the final stage of its deliberations on racial segregation in state-financed schools. On May 17th of last year, in a dramatic and unanimous decision, the Court ruled that separate schools were "inherently unequal" and therefore violated the Fourteenth Amendment to the Constitution which assured "equal protection of the laws" by states to all their citizens, regardless of race, creed or colour. This decision went to the very heart of southern traditions and prejudices, and in their serene way the "nine wise men" were continuing a social and human revolution begun with President Lincoln's emancipation of Negro slaves. Despite outcries by extremists and threats of a dissolution of the state school system made by several southern Governors, the South has responded to the impending transformation in its way of life with watchful calm. In order to determine "when and how" its ruling, based on five specific cases but ultimately applicable to all southern communities, was to be enforced, the Court invited lawyers representing southern states, the federal government, and Negro interests to appear before it last week.

On the question of whether the Supreme Court should itself issue detailed decrees or whether it should remand the cases to the courts of first instance, all three parties were agreed. The cases should be remanded: the Supreme Court should not try to behave like a "super-school district." The three-way clash occurred over the degree of latitude to be left to the district courts which, though more capable of taking account of varied local conditions, are also more exposed to local prejudices. The Negro lawyers want the Supreme Court to give precise instructions, including a deadline for the end of segregation which should preferably be next September, but at the latest September, 1956. The attorneys-general from southern states pleaded for an "open decree," with no deadline and practically no instructions. The United States Solicitor-General, Mr Sobeloff, representing the federal government, asked that states and school districts be required to draw up plans within ninety days. Once the district court had established the good faith of local officials by holding its own hearings on the plan, it should have wide discretion in deciding the exact timing of the transition, but it would have to report periodically to the Supreme Court, which would retain jurisdiction. If no plan appeared, the court should order the end of segregation at the beginning of the next school term.

Developments during the year since last May suggest that there will not be too much trouble in the border states. In Kansas and the District of Columbia, where two of the five test cases were brought, the issue is practically resolved, with segregation rapidly becoming a thing of the past. Of the two main cities of Missouri, St Louis integrated its schools on February 1st, with only one minor racial incident, and Kansas City will follow suit in September. In Maryland, Baltimore, after some initial trouble, seems to be settling down to a mixed system and other counties are beginning the change. Even Delaware, where the third test case originated, and where an ugly situation developed last year, is probably not going to have too much difficulty, and the state board of education is on the side of integration. A good deal of integration is happening quietly in West Virginia, and Kentucky seems fairly receptive.

But the Deep South is a very different matter and there is a dreary prospect of repetitive litigation and evasion of the law by local councils with the connivance of state authorities. Spokesmen for these states made little pretence before the Supreme Court of being willing to conform to the decision. Most of them contented themselves with referring to "the attitudes of the people" as the controlling factor. Their briefs were spiced with quotations from public opinion polls hostile to integration and with suggestions that attitudes may have changed by the year 2045. Only the attorney-general of Virginia—the fourth and fifth test cases came from there and from South Carolina—scorned such detachment and identified himself eagerly with the substance of racial prejudice. In his eyes, the Negroes' higher illiteracy and illegitimacy rates and their lower health record marked them as a separate and inferior race; to this the Negro representatives swiftly riposted that it was separateness which had created inferiority.

The southern lawyers emphasised, as reasons why the Supreme Court should stand aside, the traditionally local character of school administration; the moral impropriety of over-riding the parents' wishes on so basic a matter as the mixing of their children with those of other races; and the priority of the individual states' police powers, which embody the elementary right of any government to preserve good order and public morals. The lawyers also cited the large sums of money which the taxpayers have recently agreed to spend on bringing Negro schools up to standard so as to conform in good faith to the Supreme Court's previous and long-standing position that separate facilities were constitutional when they were equal. With this came the warning that, since the issue of bonds for school construction normally requires a local referendum, enforced integration might cut off this source of funds.

★

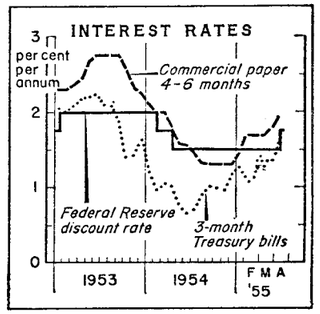
In three states, Georgia, Mississippi and South Carolina, the voters have by now gone beyond that threat by amending the state constitution to allow the abolition of a publicly-financed school system. It would, presumably, be replaced by segregated private schools whose students would receive "indirect" subsidies. But this is a last resort and in most of the South sullen contumacy is more likely than dramatic defiance. Only in South Carolina—where a test case could result in a school board being ordered to create mixed schools in which Negro children outnumbered the whites by ten to one—has the State Legislature moved nearer a drastic solution. It has repealed the law making school attendance compulsory. In Georgia and Mississippi the belief still seems to prevail that, by rapidly improving the standards of the Negro schools, the evil day of integration can be indefinitely postponed. Elsewhere, state legislatures have been wrestling with ingenious schemes to delegate powers over the assignment and enrolment of pupils to the local school boards, with criteria and procedures that would produce a *de facto* continuance of segregation. Such a scheme was passed in North Carolina with the help of the Governor, but vetoed by the Governor of Tennessee, while the local variant in Arkansas did not get beyond the State Senate.

The Supreme Court will need courage and subtlety if the decrees which it intends to issue before its present term ends in June are to produce results in hostile states. At the same time, it must not retard the southern educational system at the very moment when it is at last emerging from a dismal tradition of backwardness. The ultimate and dramatic question of enforcement in the face of continued local disregard is one which nobody seems ready to face, and which everyone hopes will not arise

Aid for Asia

TIMED to coincide with the Afro-Asian conference, the President's request for new foreign aid funds stresses, as it was expected to do, "the critical needs of Asia," where "the immediate threat to world security is now concentrated." Most of the money for which he is asking will be used to meet that threat and to strengthen "the arc of free Asia." A detailed geographic breakdown is not yet available, but no further economic aid is considered necessary for the original Marshall Plan countries, a testimony to the success of that plan for Western Europe which should encourage Congress to persevere with something similar in the Far East.

The President recognises, however, that the situation there is much more complex than it was in Europe, and that greater diversity and flexibility are needed to deal with it. He suggests that he should be given a special fund, of $200 million, for Asian economic development with only broad rules governing its use. This will enable the United States to take advantage of constructive opportunities as they arise over a number of years. Another sign that foreign aid is now being put on a comparatively permanent basis is that it is in future to be handled through the Department of State instead of by an independent agency. The new International Co-operation Administration within the department will deal with all aspects of foreign aid except the purely military.



MUTUAL SECURITY FUNDS
(Requested for Year beginning July 1, 1955)
$ million

Economic programmes:—		
Technical co-operation	172·0	
Special programmes	175·5	712·5
Development assistance	165·0	
President's special fund	260·0	
Defence support		1,000·3
Military assistance and direct forces support		1,717·2
World-wide contingency fund		100·0
Total		**3,530·0**

A large part of the funds for the latter purpose is to be devoted to building and maintaining the military forces of America's allies in Asia, including a substantial contribution to the defences of the Nationalist Government of China. Asia is also to receive much of the money for "defence support," which helps allied countries to make military efforts that are beyond their economic capacity. All of this, mixed with the President's emphasis on the use of private enterprise and of loans rather than grants wherever possible, makes up a recipe designed to appeal to Congress's taste. Possibly, in the present atmosphere of crisis in the Far East, the legislators may bring themselves to swallow most of it. But the total of $3.5 billion is a little more than the President requested for the current 1955 fiscal year, which ends in June, and about $700 million more than he got.

Discounting A Rise

THE rise in the discount rate, from 1½ to 1¾ per cent, introduced by the Kansas City Reserve Bank ten days ago, has now been authorised for other regional banks. The rise came immediately after the week's issue of 3-month Treasury bills, carrying interest at 1.652 per cent per annum, the highest since the end of 1953, had pushed through the Federal Reserve discount rate, the charge member banks must pay when they borrow. The central bank dislikes to fall behind in this way, since banks can then borrow from the Federal Reserve and reinvest in Treasury bills at higher interest. Member banks had in any case been seeking an increasing amount of loans from the Federal Reserve, to meet the rising demand from business for credit during the current economic expansion.

Federal Reserve spokesmen insist, however, that the increase in the discount rate is a technical, not an economic, move, that it is not intended to check incipient inflation, but only to catch up with the rise in short-term interest rates which has resulted from the central bank's own recent policy of "less easy" money. The change in the discount rate had been expected, and allowed for in advance, so that in fact it may not have much influence on the money market. But doubts whether the Federal Reserve is really taking a back seat are encouraged by some remarks earlier in the month from Mr Allan Sproul, of the New York Bank and the Federal Reserve's Open Market Committee. He suggested that during a period of recovery interest rates needed to be watched closely, and that eventually a rise in these rates might become a "ready weapon of monetary policy," instead of a "ponderous" symbol.

Boom in Sight

THE economic recovery, which bank officials do not so far find disturbing, is making Mr Sinclair Weeks, the Secretary of Commerce, even more optimistic than usual. With gross national product at an annual rate of $369 billion, the highest ever known in the first quarter of a year and only just below 1953's record second quarter, with disposable personal income actually at a record level—$260 billion a year—and with consumers spending it very satisfactorily, Mr Weeks can be excused for arguing that those who prophesied a recession before the end of 1955 look like being proved wrong. He points out that the business expansion, which began almost entirely in the automobile and housing industries, is now more broadly based and so strongly sustained that this may well be the best year in United States history.

Even the Democratic economist, Senator Douglas, agrees that the recovery is genuine, but he fears that both cars and houses are being produced in excessive quantities and draws attention to the continuously heavy unemployment concentrated in a few places, mainly textile and mining towns. Moreover, the employment picture is not yet so bright nationally as is the general economic outlook. March did indeed show a satisfactory increase in jobs and a seasonal decrease in people out of work. But the number in the labour force was smaller than a year earlier, in spite of the growth in the population of working age, and the number of non-farm jobs had risen by less than half a million. The present boom will not be entirely satisfactory until it reaches the labour market—and by then it may be dangerously near bursting point.

Democratic Braves

DESPITE their capture of Congress in last November's elections, most of the Democratic braves have been sitting warily around the camp-fire, looking up at President Eisenhower high on his totem pole. Last week, however, the tom-toms began sounding the call to battle and there is every indication that the Democrats will soon go on the war-path that leads to the presidential elections in 1956. On the tenth anniversary of his death, the spirit of the great father from beyond the happy waters, Franklin Delano Roosevelt, was conjured up to inspire the tribe. With more tangible ferocity, former President Truman returned to Washington swinging his famous old tomahawk against what he called the Republican Administration's "cynical behaviour," the "bare-faced political fraud" of its Formosa policies, and the myth that it would prove invincible at the polls. Gathering in honour of Mr Sam Rayburn, the Speaker of the House of Representatives, some 3,400 Democrats cheered Mr Truman, Mr Adlai Stevenson, Governor Harriman and all the other chiefs who hope to ambush the Republicans.

This great pow-wow and war-dance, coming on top of Democratic electoral successes in Illinois and Michigan, has convinced many dispirited members of the party that the Eisenhower Administration is vulnerable and should be fiercely attacked between now and November of next year. Principally, the leading Democratic Senators, who have been emphasising bi-partisanship and who have been reluctant to challenge the President, will now be called upon by their party to wear war-paint and risk battle. The more militant elements among the Democrats feel that their leaders have lost golden opportunities by smoking the peace-pipe. The Administration's release of the Yalta papers, its confusion over the Quemoy-Matsu issue, Mr Dulles's continual concessions to reactionary influences in the State Department, and the possibility of major troubles on the labour front, are arrows for Democratic quivers. The Democrats know, moreover, that every sign points to their continued majority in Congress after the next elections, and they are taking heart, since in a presidential election year no party has ever won Capitol Hill and at the same time lost the White House. From now on, therefore, hatchets will be swung and not buried.

Plague on Both Their Houses

ONE of the most colourful and ardent battles in the history of American business is being decided this weekend. On Friday of this week some 68,000 shareholders in Montgomery Ward and Company, the nation's second largest mail-order house, were to vote either directly or by proxy to elect a nine-man board of directors. When the votes, representing some 6,700,000 shares, have been counted, Montgomery Ward will be controlled either by its present chairman, the venerable Mr Sewell Avery and his acquiescent colleagues, or by the flamboyant Mr Louis Wolfson and his team of business-raiders. If Mr Wolfson is victorious he will have shown that personal good looks, $750,000 spent on advertisement, squads of famous ex-athletes, and comely young ladies going from one shareholder's door to the next, can decide who should control a firm doing an annual business of nearly $1 billion.

In 1931, Mr Avery took over Montgomery Ward on the rim of bankruptcy. Today the firm is free of any funded debt and has total assets of nearly $700 million and cash reserves of $327 million, including some $304 million in government securities. But in recent years Montgomery Ward has increased its sales by only 52 per cent, while its great rival, Sears, Roebuck and Company has become the top mail-order house in the country with an increase in sales of 186 per cent. In addition, Montgomery Ward has some 80 fewer retail stores today than it did in 1940, while its competitor has been acquiring new outlets. Mr Avery has long been persuaded that a serious recession would follow the present boom and that his company, with its enormous liquid reserves, would be in a position to weather the storm and expand during such a period of low building costs. In arriving at his decisions, Mr Avery has rarely consulted either his shareholders or his board of directors and he has even remained aloof from the present battle.

Mr Wolfson claims that he is seeking control over the Montgomery Ward empire in order to strengthen "corporate democracy," return some of the great cash reserves to shareholders, acquire new retail outlets, and modernise the entire technique of merchandising. He sees in Mr Avery an old man ridden by memories of the 1929 depression and unwilling to run the firm as a team. In his opinion excess liquidity is bad for Montgomery Ward and bad for the country. He points proudly to the fact that when he captured Washington's Capital Transit Company surpluses of $230 million were transformed into dividends. To back his contention that "Wolfson means expansion," he points to the fact that Montgomery Ward shares have risen by more than twenty points since his campaign began.

★

It is exceedingly difficult to predict who will win control. Under a system of cumulative voting, shareholders multiply the number of shares they own by the number of directors to be chosen, but can allocate their votes as they wish. It is thought that Mr Wolfson will have his votes cast for five directors only in order to gain a majority, whereas Mr Avery will have distributed his strength over a complete slate of nine men. Before the ballot, Mr Avery's side claimed control of 51 per cent of the shares outstanding and some of the more responsible investment trusts had announced their support for the present management. In a brilliant manœuvre, moreover, Mr Avery signed a labour agreement with the Teamsters' Union which covers some 15,000 of his employees, owns 13,500 shares in his firm, and can probably influence 125,000 proxies in his favour. Mr Wolfson, on the other hand, gained great prestige when the Illinois Supreme Court ruled that all nine directorial places must be contested instead of only three, as would have been the case under Mr Avery's system of staggered elections over a three-year period.

For the shareholder it will have been a difficult choice between an old-fashioned and perhaps inflexible management whose plans and habits are thoroughly known, and a brilliant challenger whose previous business record is not above suspicion, but whose future is full of dynamic possibilities. For the outsider it will have been a grand show and proof that the spirit of battle is still alive in the empire of the business moguls.

When Chiefs of Staff Disagree

Washington, D.C.

AMID all the flurry and confusion that the now almost metaphysical question of United States intentions about the defence of Quemoy and the Matsu Islands has produced, one fact has become increasingly clear: the system of the Joint Chiefs of Staff is not working as its originators—General Eisenhower among them—intended that it should. In the past two months the President of the United States has described the views of two of the four members of the Chiefs of Staff (Admiral Carney and General Ridgway) as "parochial." One of these, the Chief of Naval Operations, has attempted to put forward, as Administration policy, his own estimate of Communist Chinese intentions in the offshore islands and possible measures to counter them, and the other, the Chief of Staff of the Army, has discreetly but publicly disputed the whole trend of American military policy. The agreed strategic advice to the civil authorities, which the JCS system was created to provide, is obviously not forthcoming.

The United States tackled the almost insoluble problem of creating a unified system of strategic planning much later than any other great power. It was only after the second world war, when the Air Force had become a separate service, that the necessity for a new general staff system became inescapable. The organisation then set up, whose statutory basis is the National Security Act of 1947, as amended in 1948 and 1953, is midway between the old German pattern of a supreme General Staff dominating the different services, and the modern British system of linking the three service chiefs of staff by means of a military secretariat responsible to the Minister of Defence. The Act united the Chiefs of Staff of the Army, Navy and Air Force into a corporate body known as the Joint Chiefs of Staff under a chairman who has no service responsibilities and no vote, with a small Joint Staff drawn from the three services. The same Act nominated the Joint Chiefs of Staff, in their corporate capacity, as the principal [illegible] of the Secretary of Defence and the President, thereby giving them, by implication at least, direct access to him.

When the Eisenhower Administration took office, a minor reorganisation was put into effect. This strengthened the powers of the chairman, including the grant of full control over the Joint Staff, while bringing the Secretary of Defence and the three service Secretaries, who had increasingly become mere administrative drudges, into closer contact with the planning of higher strategic policy. At the same time the importance of the National Security Council was deliberately enhanced. While the Secretary of Defence (in common with his colleagues of the State and Treasury Departments) is a statutory member of the NSC, the chairman of the Joint Chiefs is now asked to attend its weekly meetings as a matter of course, if not of right. The word went round Washington eighteen months ago that henceforth the President would not tolerate any public displays of inter-service rivalry or disagreement; he and the NSC would accept only agreed recommendations and papers from the Joint Chiefs.

★

However, the developments of the past year have shown that no amount of directives, or of good intentions either, can produce an agreed JCS position if its component members do not start from the same premises. There were many divergences of opinion among the Joint Chiefs of Staff under the Truman Administrations, with the Air Force as the consistent opponent of the concept of "balanced forces," but they tended to turn on means rather than ends. Now two new difficulties have exacerbated the problem.

Firstly, the Joint Chiefs are both by law and by administrative custom supposed to confine their advice to the purely military aspect of a problem in foreign or strategic policy referred to them by the National Security Council. But the dissent of General Ridgway from the views of his colleagues, as exemplified in the split recommendations about an American commitment to the defence of Dien Bien Phu last April, and to Quemoy last September, and again this year, is based not only on differing military premises but on a differing approach to foreign policy. This gives the argument more than just military importance. The belief of senior Army officers that the American public is prepared to accept a higher level of both financial and personal obligations, if it could be clearly demonstrated that it enhanced the long-term prospects of peace, reaches down to the bedrock of differing social and political philosophies.

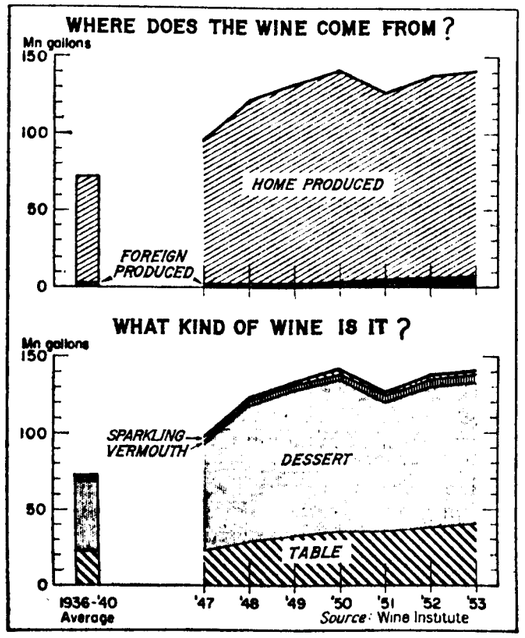
The second difficulty is that the growing importance of guided missiles has tended to increase inter-service rivalries. There is no clear rule of thumb by which development of different types can be allocated to the different services, and each is therefore tempted to make extravagant claims for its own favourite projects. It is partly to prevent the services from practically issuing the working blue prints of new devices and missiles to the American technical press, and thereby to the Russians, that Mr Charles Wilson, the Secretary of Defence, has recently imposed his much disliked "blackout" on news from the Pentagon.

There is little doubt that the Joint Chiefs of Staff exercise less influence, corporately, over the framing of American policy than they did under President Truman, whose respect for all generals except General MacArthur was well known. Though the influence of Mr Wilson and the three service Secretaries upon strategic policy does not seem to have increased noticeably, the importance which President Eisenhower attaches to the National Security Council has given the civilian members of the Administration a much closer scrutiny over military planning. But the most important factor is that President Eisenhower himself does not feel bound by the military advice he receives, and does not feel inhibited from disputing its soundness, sometimes with the asperity of a colonel towards his subalterns; full admirals and generals are apt to find this somewhat galling.

As was confirmed in the budget hearings before the Senate Armed Services Committee on April 5th, the decision to reduce the size of the Army and, to a lesser extent, of the Navy and Marine Corps, was not based on ideas of the Joint Chiefs. It was in fact taken by President Eisenhower last December entirely on his own judgment. Similarly, the positiveness with which the President rejected the idea of using atomic weapons in "police actions" last autumn, but was accepting them as conventional this spring, suggests that the decision to base American strategy on atomic weapons was made in the White House, for budgetary as well as strategic reasons, rather than wrung from it by the Pentagon. Finally, the President's speedy rebuttal of Admiral Carney's estimate that the Chinese would attack the offshore islands in mid-April confirms the fact that he does not rely primarily on the JCS for his intelligence.

Nor does Admiral Radford, however much he may be admired by Senator Knowland, command the same respect with Congress as did his predecessor, General Bradley. Though the Admiral does appear to have considerable influence with Mr Dulles, he has little ascendancy over the President. His influence has, if anything, grown less since he more than once strained the JCS system to its utmost by promoting his own views instead of co-ordinating and representing those of the three service chiefs.

The two-year terms of all four members of the JCS expire this summer, though under the law the chairman can be reappointed for another two-year period. There are, as yet, not even the usual Washington rumours as to who the new "team" may consist of, but it now seems clear that General Alfred Gruenther remains so indispensable in Europe that he cannot be recalled to succeed General Ridgway. It will be interesting to see whether the theory of rotation by which an Admiral succeeded a General as chairman means that an Air Force officer will succeed Admiral Radford. The increasing importance of continental air defence, which embraces elements of all three services, makes such an appointment quite probable.



Taste for Wine

New York

AMERICANS, who can rarely tell a claret from a Burgundy, are the despair of the connoisseur, but the delight of the Californians who produce wine in bulk. For California supplies over 80 per cent of the increasing amount of wine now being drunk in the United States. About a dozen other states, led by New York, provide most of the rest, leaving only about 5 per cent of the market to imports. Consumption is greatest in California itself, in the eastern states, and in big cities in other parts of the country where a large foreign-born element in the population provides a steady demand. Topping the list, with the assistance no doubt of the foreign embassies, are the residents of the nation's capital, who each consume on the average

nearly 2½ gallons of wine a year; for the country as a whole, the annual average is about nine-tenths of a gallon a head.

Most Americans, when they do drink wine, prefer the "fortified" dessert wines, the sherries and ports of higher alcoholic content than table wine. But the red, white—and popular pink—table wines, although still accounting for little more than a quarter of all the wine drunk, are increasing their share. Among these table wines—the

familiar clarets and Burgundies, the sauternes and Rhine wines—imports play a greater part. Imported table wines, mainly from France, Italy, Germany and Chile, have tripled in volume in the last five years. But to customers who happily drink carbonated "champagne" in bottles with rubber corks, the aroma and bouquet of a vintage wine has little meaning, and the appeal must be not to their palates, but to their pockets. Although some Californina producers—unhappily the smaller ones—make wines that compare very favourably in quality with some of the best European names, the great bulk of the wine produced and consumed in the United States is of poor quality, sold, often in gallon containers, at very low prices. On the east coast, where imported wines make their greatest impact, and the Californian wines bear the greatest transport cost, some importers are reaching the low price market with palatable French and German vintages selling for under $1 a bottle. The import duty on table wines is only 37½ cents a gallon—less than a third of the duty on dessert wines—and it costs no more to ship wine to New York by sea from France than to send it by rail from California. But, in general, imported wines can compete, as can the premium wines of California and New York State, only for the much narrower market formed by those Americans with discriminating palates.

To give more Americans a taste for wine the industry is sponsoring educational campaigns for a generation which, in the words of one trade association, "is not familiar with the history, the virtues, and the entertainment values of French champagne." Consumers are invited to enrol in free study courses, and special attempts are being made to train the staffs of liquor shops and restaurants whose ignorance of wine is frequently as great as that of their customers. But even the wine industry, in a country where prohibition dies hard, has little hope of converting those 20 million Americans who, it fears, are still "morally dry."

SHORTER NOTES

Shortly after it was shown by a Gallup poll that Chief Justice Warren was the favourite Republican choice for President if Mr Eisenhower did not run, Mr Warren issued a firm statement that he would not take the nomination under any circumstances. He pointed out quite rightly that the dignity of his office would be undermined if his name were used in connection with the most political of ventures.

★

Last week, President Eisenhower strongly urged Congress to approve America's membership in the proposed Organisation for Trade Co-operation. He argued that the General Agreement on Tariffs and Trade, which OTC will administer, was to the advantage of American business and was vital to its foreign policy.

★

President Eisenhower has approved a plan for the exchange of certain categories of classified atomic information among the 14 member nations of Nato. The information will bear mainly on the training of personnel and on atomic artillery tactics suitable for Western Europe. The President's approval had been made possible by a revision of the Atomic Energy Act in 1954.

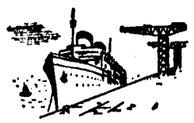
★

Miss Frances Knight, who has been in government service since 1936, has replaced the notorious Mrs Shipley as chief of the State Department's passport division in spite of a number of protests. Like her predecessor, Miss Knight is thought to belong to that school of opinion which sees in a passport a reward for loyalty rather than a courtesy extended between nations.

★

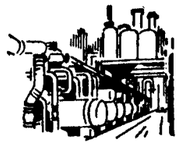
A report prepared for Congress by the General Services Administration reveals that the government owns more than one-fifth of the total acreage in the United States. Nearly 90 per cent of Nevada is government property—perhaps because no one else really wanted it—whereas in Connecticut only one half of one per cent is federal land. In the east, particularly, ground values have risen satisfactorily since 1789 when Uncle Sam first entered the real estate market.

HOW MUCH MONEY ARE YOU WASTING ON FUEL?



The heat energy from at least 5 million tons of coal evades British Industry every year!

Anglo American Productivity Report on Fuel Conservation



VERY few industrial firms are run as economically as they could be with better thermal insulation. Factories all over Great Britain are eating up fuel in a way that saps both their own profits and the nation's economy. Maximum fuel saving and the economical distribution of heat energy depend largely upon first-class insulation. Indeed, improved thermal insulation can save up to nine-tenths of present heat losses.

THE CHEMICAL AND INSULATING CO. LTD.—plays a major role in reclaiming heat energy previously dissipated through inefficient insulation. This leading organisation in the specialised field of thermal insulation maintains sales and contracting offices throughout Great Britain. It manufactures insulating materials, for sale in bulk or in prefabricated shapes, for temperatures as high as 2000° F. *The head office or your nearest branch office will be pleased to answer any enquiries.*

THE DARLINGTON INSULATION CO. LTD.—a subsidiary company of The Chemical & Insulating Co. Ltd., is a contracting organisation for the supply and installation of all types of heat, cold, or sound insulation. Power Stations, Oil Refineries, Shipping and Industrial Plants are all achieving higher efficiency per ton of fuel since consulting this company. Requirements are so diverse that each problem is individually studied, to ensure an efficient, economical and lasting installation.

IPSCOL LTD., another subsidiary company, makes automatic industrial process control equipment, and S. T. TAYLOR & SONS LTD. make sheet metal and light plate structures and casings for all types of insulation.

Most exciting **RILEY** *ever—the brilliant* **'PATHFINDER'**

Here is the latest, the most exciting car of a great English breed - the brilliant Riley 'Pathfinder.' Powered to put it in the 100 m.p.h. class with all the dash and spirit that goes with it. Styled for roomy comfort for six and with really generous luggage space. New coil spring rear suspension and torsionic front suspension, 12" hydraulic brakes, telescopic dampers, new steering entirely free from road reaction and a host of other advanced features. It's a new expression of a great Riley tradition.

The Riley 'Pathfinder' is fitted with Safety Glass all round.

Moroccan Impasse

THE Minister for Tunisian and Moroccan Affairs in the Faure cabinet, M. Pierre July, is paying his second visit to Morocco within a month. The cheerful part of his purpose is to open a spectacular new dam, complete with attendant power stations and irrigation canals, in the Atlas region to the south-east of Casablanca—a network of public utilities that has been under construction for nearly fifteen years. The gloomy part of his assignment is to grope for a way out of the Franco-Moroccan political impasse. For when he turns to politics, M. July is between the devil and the deep sea. He is torn one way by his Premier, who promised to pursue the Mendès-France policy of progress towards self-government; but the other way by party orthodoxy. As a loyal member of M. Duchet's group of independents, he must heed the demands for local rights that are forever on the lips of the French settlers in North Africa; in the days of the last government, therefore, he regularly cast his vote against M. Mendès-France's liberal notions. The easy way out of his dilemma would be to keep professing new intentions, but in fact to do nothing. And this, alas! is all that is expected of him by most Moroccans, and many Frenchmen.

For even the ordinary traveller in Morocco today cannot fail to get wind of an expectation of French bad faith. This is admitted with cynicism by Frenchmen, and is at its most distressing among the many Môslems who would love a partnership arrangement with France. The kind of comment that they utter is: "I hold no brief for the ex-Sultan; I recognise that he was a bar to the kind of reforms that would suit our business affairs and our people, and I believed the Frenchmen who said that he was all that stood in their way. But who am I to believe now that he has been gone twenty months and no reforms have taken place?"

They exaggerate, but only slightly. Theoretically, democracy has inched forward, in that the absolute power which the old Sultan used to wield through his sole right to accept or reject decrees was modified when his successor agreed to accept a cabinet; in this body, which consists half of Moroccan viziers, half of French officials, the Moroccan Grand Vizier holds the casting vote and a two-thirds majority can override the royal veto; even though the present Sultan is a French rubber stamp and the Grand Vizier is over 100, the pattern is less medieval than it used to be. Minor reforms are also being inaugurated in the realm of village councils and of the judiciary. But, in practice, any change of note is withheld for various reasons of which the most compelling are: the changes of hand at the helm in Paris; the prior need for settling Tunisia's claims as being senior to those of Morocco; the impossibility of negotiating while terrorism persists and, last but not least, the deadlock over the throne.

For although M. July has categorically stated that the question of the throne is a closed matter (*ne se pose pas*), large numbers of Frenchmen are now prepared to admit that it has become an issue that bedevils all others; they see that, however great the demerits of the ex-Sultan, the manner in which he was unseated in August, 1953, was a political blunder that needs adjustment before any new and firm relationship is attainable between French resident and Moroccan nationalist. The way in which he was bundled off at the hands of a queer combination of French officials and Moroccan tribal leaders has vested him with a mythical virtue even in the eyes of Moroccans who recognise his faults, and the fact that his successor is an elderly recluse who dislikes reigning only adds to the aura of uncertainty and impermanence that surrounds the throne. Sensitive to this feeling, the French Resident-General, M. Francis Lacoste, is known to have bestirred himself, while working under the benign eye of the Mendès-France regime, over a plan to bring about abdications by both ex-Sultan and Sultan, and the establishment of some kind of regency council that would have saved face all round. It was even rumoured that he had drafted a plan for an all-Moroccan Council of Viziers, to be attended by French officials merely in a supervisory capacity, and for the election of two Moroccan chambers, one based on educational qualifications and one consisting of representatives of regional assemblies; the second would be the only place in which French residents would sit as of right in order to regulate the affairs of the French community.

But both these plans, like so many of their forerunners, never got beyond the thin air stage because they came up against the classic snags already cited. One of these was the change of government in Paris; the other was the problem of the throne. On March 6th el Glaoui, Pasha of Marrakech, who is the chief feudal opponent of the ex-Sultan and so the chief protagonist of the new, proclaimed that he would brook no change of ruler; hard on the heels of his statement came one by Si Bekkai—who is the ex-Pasha of Sefrou and the most notable Moroccan to resign office when the former Sultan was exiled. Settlement of the dynastic question, he said, was the *sine qua non* of successful reform. He added a point that is very prominent in Moroccan minds today—that the reforms, when they came, must be freely negotiated and voluntarily accepted, and not simply imposed from the French end.

His statement was supported by leaders of both the main political parties. It is difficult to see how any French ministry can worm its way out of the dilemma constituted by this clash between Moroccan opinions of note.

For the present, terrorism in the cities—in Casablanca in particular—is adding to the difficulty of introducing change ; its perpetrators range from Moroccan nationalists to Frenchmen bent on reprisal, and its victims from Moroccan "collaborators" with France to French police officers at work to curb French gunmen. Indeed, it sometimes seems that, politically and sociologically speaking, nothing can go right just now in Franco-Moroccan relations. For instance, Moroccan labour leaders have, with the blessing of both the ILO and the International Confederation of Free Trade Unions, lately been seeking to set up Moroccan unions on the non-Communist model of the Tunisian UGTT. That they were taking preliminary soundings was well known to the French authorities, but the meeting at which they sought to found their new organisation was held without the necessary permissions. Their body has therefore been declared illegal and the sense of brooding resentment that pervades the Moroccan air is enhanced.

A note of irony prevails, therefore, as M. July opens the great new waterworks that are to irrigate 80,000 fresh hectares of central Morocco and to generate more kilowatt hours than are used by Paris. For the gesture whereby he switches the lever is dwarfed by the immensity of the conundrums that await him on his return to Casablanca—problems which, owing to his political affiliations, he is in no position to solve. His programme for the week symbolises the whole of French postwar effort in Morocco—so estimable in the realm of economics, so abortive in that of politics.

Shocks at Königswinter

FROM OUR SPECIAL CORRESPONDENT

NEUTRALISM was much in the air at Königswinter last weekend, strengthened but not caused by the "triumph" of Herr Raab in Moscow. One visitor to the conference of the *Deutsche-Englische Gesellschaft* remarked bitterly that he had heard of rats leaving the sinking ship, but never of them deserting one that has just been launched. But that was the impression gained by the British from the Germans at the meeting—that they were planning to leave the western alliance before the ink on it is dry.

The shock felt by the British members of parliament was considerable. They had known about the German desire for reunion, and sympathised with it, but had not realised that there was any considerable sentiment for a deal with the Russians in which Germany would accept nôt only neutrality or neutralisation, but also not-quite-free elections. They heard with some indignation German arguments that they must contract out of Western European defence, while somehow keeping cultural and political association with the West. The neutralist Social-Democrats were reinforced by others of the same persuasion but different parties. Herr Pfleiderer of the Free Democratic party was at least as extreme as the Socialists. He spoke for the politicians who demand an immediate resumption of diplomatic relations with the Soviet Union, and said that—to save Russian face—the Germans must be content to accept imperfect democratic conditions in a reunited Germany. His idea was that Germans would achieve full freedom step-by-step after the Americans and British had withdrawn from the neutralised Reich, leaving it isolated to face Communist pressure.

Protests against these illusions and appeals to defend freedom came from the British speakers, led by Mr Herbert Morrison. Their reaction somewhat alarmed the Germans whose final speeches, therefore, gave reassurances that Germany was really on the side of the West, in every way but militarily. And the few representatives of Dr Adenauer's party present tried to cast doubt on the representative character of the neutralists in the gathering. But as a spokesman of the reunification lobby explained, Germany's partners must realise that their new ally is a "problem child."

Strategy for a Neutral Germany

The Bonin plan played a big part in the discussions. This is the scheme drawn up by the head of the planning section of Herr Blank's office, who was dismissed—not because his scheme did not agree with the Nato strategy—but because he had spread his plans around the town, to generals and politicians outside Herr Blank's office. His scheme has been taken up as the strategy for a neutralist Germany. His army would be outside Nato, and some of its backers imagine that it would eventually merge with the Soviet German forces. In the meantime, it would not provoke the Russians because it would not be capable of a counter-offensive, let alone an offensive. Herr von Bonin's original plan was not, it seems, a semi-political one, though it contained the idea that it gave young Germans some reason to fight ; but it has been elaborated to fit the neutralists out with a military uniform. Whether he likes the use to which he is being put by politicians is doubtful. It is also open to question whether his plan has swept the country as its champions allege ; it may, however, eventually do so, as various popular papers have taken it up with the zeal they reserve for anti-western causes. "A national or a Nato strategy" may well become a slogan soon.

The Königswinter gathering will have served a salutary purpose in waking the British up to the fact that public opinion is being roused in the cause of reunification by a group of men who are determined to saw away at the nerves of the British and Americans until they take up the same cause themselves. It also showed that these men are thinking about the price that Germany should pay for unity. The suspicion was roused among the British that the Germans have gained what they want from the West—sovereignty and the right to rearm—and think that now is the time to sell it to the East. Mr Denis Healey, MP, warned them that, after building Germany up in peace and freedom with western help and protection, they are treading a path which will deprive them of both. If the Bonin episode proves how essential it is to rearm Germany inside a western framework, because the Germans would have rearmed themselves anyway, the Königswinter discussions show how necessary it is for the West—including the Adenauer government—to keep the initiative in reunification, because the Germans will otherwise reunite themselves inside a Russian cage.

Spain in Transition—I

FROM OUR SPECIAL CORRESPONDENT

SPAIN today is a country that bears many signs of being in transition: toleration of religious criticism of the censorship, the emergence of differences on the organisation of the worker-employer syndicates, tentative moves towards an eventual restoration of the monarchy. Over each there hangs a question mark, for if the signs of transition are visible, the direction of any impending changes remains obscure. A larger question mark, indeed, hangs over the signs as a whole, for it is by no means clear whether they do amount to the beginnings of a gradual change, or merely to the releasing of a set of safety valves by the ruthless but prudent man who guides the destinies of his country from the *Palacio de El Pardo*.

One thing is patent: the regime is softer, less oppressive today than on the terrible morrow of the civil war, when executions after often arbitrary denunciations fertilised the seeds of bitterness so freely sown during the fighting. The Spaniard who talks, even in Spanish, to the foreigner in a tavern near the Puerta del Sol does not bother to throw a glance over his shoulder, even when he is attacking General Franco. At the back of his mind, perhaps, is the knowledge that successive amnesties have reduced the political population of the Spanish prisons to a fraction of its peak.

The chief of state can indeed point with satisfaction to the developments of the past few years, such as the emergence of Spain from its old isolation with the beginings of American military and economic aid, and a decided progress in social welfare. It would be straining the truth, however, to claim that Spain is any more democratic—in the western sense—than it has been since the days of the Republic ; and it is pertinent to ask how far democratic processes are relevant to the needs of a country of intense individualists whose dislike of regimentation created the Anarchist movement and whose divisive tendencies created chaos out of the democratic ideal.

The Bishop and the Censor

The average Spaniard, even if mentally in opposition to the regime, will always give Franco credit for one thing at least, *tranquilidad ;* for many, this is worth a good dose of constitutional liberty. It is said that General Franco flew into a rage at the news that his Minister of the Interior, Sr Blas Pérez, had turned the strong-arm men of the *Guardia de Franco* loose at last November's municipal elections in Madrid, with orders to remove the ballot papers and beat up voters as they thought fit. What is not certain is whether his rage was directed at the Minister for losing his head at the strength of feeling on behalf of the Monarchist candidates, or at the breakdown of a modest experiment in democracy designed to impress the American missions in Spain. At any rate, the Monarchist candidates had no chance to win, and the Monarchist paper *ABC*, which had refused to publish the official version of the elections, was penalised by the reduction of its ration of low-priced newsprint.

The censorship of the press remains, indeed, one of the most obnoxious features of the regime. It is both negative (through the suppression of material considered offensive) and positive (through the enforced inclusion of official articles). Here again, however, there have been signs of possible change, though at the snail's pace of Spanish political development, it would be rash to forecast a definite relaxation in the near future. As might have been expected, the initiative came from the Church, since the Catholic Action paper *Ecclesia* is the only uncensored publication in the country. The opportunity, however, was provided by a prominent Falange leader, Sr Arías Salgado, Minister of Information and a man known both for his piety and for his intransigence in matters of censorship. In a speech at the press congress at Barcelona last December, Sr Salgado reaffirmed the party's belief in a controlled press. On January 8th, *Ecclesia* attacked the speech and the principle of censorship, quoting from a speech by the Pope about the evils arising from the absence of public opinion in any country.

The theme of the *Ecclesia* article was taken up in passionate terms by the Bishop of Málaga, Mgr Angel Herrera, a former journalist, in a letter to the Minister of Information. The notable thing is that the Minister then allowed the publication of the letter and of his own reply, first in the Catholic paper *Ya*, on March 11th, then in *El Español*, the Ministry of Information's weekly, and finally in the Monarchist *ABC* on March 13th. The Bishop did indeed recognise the need for censorship, to guard against such evils as Communism or obscenity, but he attacked the system of press directives and complained that the Press Law of 1938 gave the state excessive powers over editors. The original *Ecclesia* article had, in the meantime, been endorsed by the Cardinal-Primate of Spain, Archbishop Pla y Daniel, and by the Bishop of the Canaries, Dr Pildaín, a Basque who, as an MP during the Republic, had fought against its anti-religious dispensations. It is by no means certain, however, that the Church as a body will follow up these individual criticisms by a formal request for an amendment of the 1938 Press Law ; and it is even less certain that the regime would permit a change, even if requested by the Church.

It should be remembered that the attitude of the clergy as a whole is bound to be conditioned by its gratitude to the regime for re-establishing the Church, after the anti-clerical manifestations of the Republic. While individual clerics may take it upon themselves to criticise or suggest, the Church as a body may be expected to tread cautiously in a path that might be regarded as anti-Franco.

(To be continued)

The Paper Bulletin

This is a new bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The first quarterly issue will be available at the end of this month. Full details from :

THE ECONOMIST INTELLIGENCE UNIT,

Perón's Hardest Battle

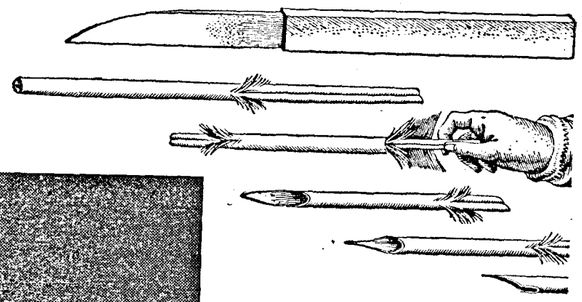
IN an Argentine city, called Evita Perón, a triumphal arch of costly Italian marble is being raised to commemorate the lives and exploits of General Perón and his late wife. When dictators begin immortalising themselves in stone it is either because they are clear-sighted enough to anticipate the end of their régime or blinded by power to the point of self-infatuation. The present situation in Argentina suggests that it is blindness rather than a sense of prophecy that is afflicting the Peronista régime.

On April 14th the teaching of Catholic doctrine and morals was stopped in all Argentine schools that receive government support. At the same time, the Minister of Trade, Dr Antonio Cafiero, resigned from President Perón's cabinet. He is known as an active spokesman for Argentine Catholicism. These two developments were the latest in the battle between Church and State that has been waged in Argentina over the past six months. Hundreds of Catholic students, a score of priests and a number of lay "activists" are now in prison; church processions and festivals have given rise to fierce clashes between Peronista police and the faithful; the Catholic press has been all but muzzled; prominent Catholics in every walk of life have been resigning their functions; and relations between General Perón and the Vatican are near breaking point.

A Serious Blunder?

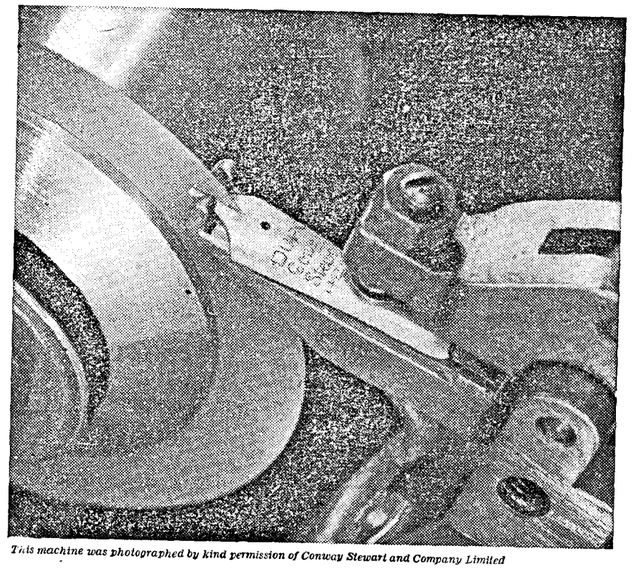
There have been many attempts to explain exactly why it is that President Perón should have chosen to start his fight against the Catholic Church, whose prestige in Argentina, and place in the lives of the Argentine people are nearly as great as those of Peronismo itself. It is not satisfactory to argue that economic difficulties and the inertia of oppression inherent in autocracy compelled General Perón to find a scapegoat. The Catholic Church is too dangerous an opponent to fill this rôle, and it had preserved toward the Perón regime an attitude of often benevolent neutrality. Rather, it would appear that General Perón has lost, since the death of his wife, what slight instinct he had for popular feelings and has blundered into a battle that may sap the foundations of his dictatorship.

If anything, political tyranny in Argentina has been worsening. Since the seizure of *La Prensa* the last voices of anti-Perón feeling have been all but stifled. The Radical party, which has tried to muster an active minority, is merely tolerated under the incessant surveillance of Peronista police. It estimates that there are nearly 700 political prisoners being held in Argentine gaols with little prospect of a trial and far less of an acquittal. The explosion of a number of bombs during May Day demonstrations in 1953 was followed by waves of arrests, and under Peronista "justicialism" there is absolutely no protection for freedom of opinion. The Catholic Church—as it too often will—watched this state of affairs with tacit disapproval but did not use its great spiritual influence to bring about a change. Nevertheless, certain Catholic universities and priests, particularly in the province of Córdoba, were beginning to look beyond the end of Peronismo and were penetrating certain of the more intellectual centres in the trade unions. This appears to have been the signal for the Peronista attack on "ecclesiastical subversion," and it is in the nature of a police state that such attacks turn swiftly into campaigns of mass suppression.



Dark Economic Background

What renders the present situation so crucial is the fact that the church-state battle coincides with grave economic troubles. The working-class cost-of-living index, whose basic figure of 100 is equated with 1943, stood at 644 in the first quarter of this year. There have been grave budgetary deficits in every year of the Peronista régime with the exception of 1950-51. Argentina is showing the classical symptoms of a fundamentally wealthy agricultural nation in which autocratic planning and rapid over-industrialisation have undermined the monetary system. Output per man-hour has declined and the costs of production have risen steadily. The supposed "social revolution" has had some meaning only in so far as the poorest strata of Argentine society are concerned. Despite recent trade pacts with the United Kingdom and Spain and efforts to attract foreign capital by a liberalisation of exchange controls, foreign investors have been wary of entering a country in which confiscation and hopeless, state-initiated litigation have been frequent. In fact, it has largely been support given by the United States government for rather confused political and strategic reasons that has held Peronismo suspended over its fiscal abyss.



It would be premature, however, to conclude that the rule of General Perón is in its last stages or that it will be replaced by a democracy, in any ordinary sense of the word. The army remains attached to the dictator, and it is doubtful whether the larger trade unions have as yet woken up to the realities of the "syndicalist" myth. But there is no doubt that Argentina is in a critical state, and that General Perón has taken on a formidable task in his wish to secularise the country. It takes more than the Evita Perón foundation for orphans or marble effigies of the distinguished lady to oust Catholicism in a strongly religious land.

Austria's Long Road to Freedom

MR MOLOTOV'S apparent decision to lift the barriers in the way of an Austrian peace treaty comes all the more surprisingly after the ingenuity shown by the Russians in blocking negotiations during the last five years. As long ago as December, 1949, the deputies of the foreign ministers of the four great powers had reached agreement on 47 o. the 52 articles of the draft treaty, and the remaining fi dealt with only minor points. At the Berlin conference la year Mr Dulles, with the support of the British and Frer delegates, offered to accept the Russian text of these ar A final agreement has been delayed until now only b the Russians have on various times laid down unac conditions for the resumption of talks. o open discussion on agreed clause simply failed to reply to

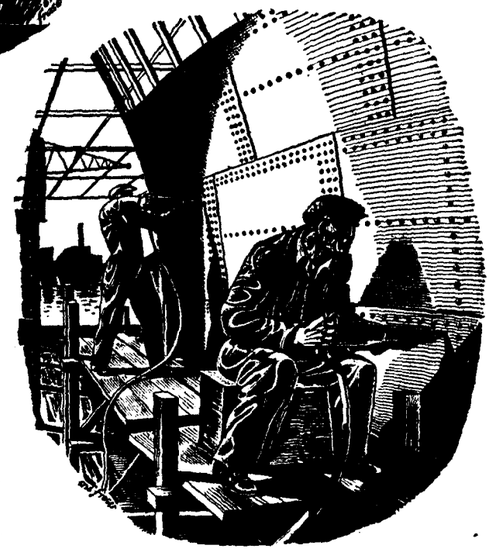
Twentieth-century penknife

WHEN PENS WERE FEATHER QUILLS, penknives really were *pen* knives, but the nearest thing to a penknife that modern pen makers use is this machine in our illustration. They use it for slitting nibs for modern fountain pens. The blade of this twentieth-century penknife is an abrasive cutting wheel about three inches in diameter and one two-hundredth of an inch thick. It is made of rubber-bonded silicon carbide, and is mounted on a shaft which revolves at 20,000 revolutions per minute. When the wheel is stationary it is fragile and slightly flexible. At 20,000 revolutions per minute centrifugal force keeps the wheel perfectly rigid and steady, and the cutting edge moves at some 170 m.p.h. Gold nib blanks, stamped to shape and tipped with iridium, are presented to the edge of the wheel point foremost, and fed smoothly forward. The wheel cuts a fine, highly finished slot, clean through the iridium tip and along the centre line of the nib.

Beside these small abrasive wheels for nib slitting, The Carborundum Company Limited make abrasive cutting-wheels of many kinds and sizes: wheels that can cut through a Nimonic-steel bar, three and a half inches in diameter, in 45 seconds; wheels that can cut through red-hot sections of high-speed steel in the rolling mill, at temperatures up to 1,000° Centigrade; wheels that can cut concrete; wheels that can cut plate glass; wheels that can cut an eggshell cleanly into two pieces without damaging the skin of the egg inside it.



These cutting wheels are finding new uses every year, but they are still only one small group in our much wider range of abrasive wheels for a thousand and one other industrial purposes—grinding, polishing, and honing wheels, of every kind.

Tunnelling in Peru

Riveting in Scotland

Atlas-Copco puts compressed air to work for the world

If you could talk to the contractors responsible for Peru's most important tunnelling schemes they would tell you that their pneumatic equipment is supplied almost entirely by Atlas-Copco. And in Peru's largest copper mine you would learn that Atlas-Copco tools have increased output by 50%. Go then to Scotland, and you would see Atlas-Copco riveters and chipping hammers in shipyards, Atlas-Copco stone-breakers in quarries.

As in Scotland and Peru, so in almost every part of the world—Atlas-Copco is on the job wherever compressed air is working hardest. Atlas-Copco provides equipment for every conceivable application of compressed air. Add to this, the servicing and delivery facilities of allied companies* in 37 countries, and you realise why Atlas-Copco are among the world's leading compressed air specialists.

* *Atlas-Copco embraces companies trading under the names Atlas, Atlas Diesel, Atlas Polar, Atlas-Copco, Copco, Delfos and Sampa. Enquiries in the U.K. should be addressed to* THE ATLAS DIESEL COMPANY LTD., *Beresford Avenue, Wembley, Middlesex.*

The Moscow Declaration of 1943 set forth the aim of the United States, Russia and Britain to re-establish a free and independent Austria, and at the Potsdam conference in 1945 it was agreed that reparations should not be exacted from Austria. Negotiations for a treaty began in January, 1947, when the deputies of the four foreign ministers began a series of 258 meetings which finally broke down at the end of 1950. This four-year series of talks among the deputies was interrupted by three meetings of the Council of Foreign Ministers, in Moscow, London and Paris, and on both levels some genuine progress was achieved. In particular, at the Paris meeting of the foreign ministers in May and June, 1949, two of the knottiest problems were overcome. The Russians stopped insisting on Jugoslavia's demands that Austria should hand over parts of Carinthia and Styria and pay $150 million as war reparations (the Jugoslavs had recently been expelled from the Cominform) and an agreed definition was worked out showing which of the former German assets in eastern Austria the Russians were entitled to appropriate. It was decided that they should receive 60 per cent of the oil concession areas in Austria, much of the Danube Shipping Company's former property, and $150 million in convertible currency.

It was in late 1949, when the gap between the two sides seemed to have been almost closed, that the Russians started to obstruct in earnest. First they refused to discuss the five outstanding articles of the draft treaty until the Austrians had paid compensation for the relief supplies provided by the Russians since 1945; and yet a series of attempts by the Austrian government to open negotiations on this very subject went unanswered by Moscow. Then the Russians accused the western powers of encouraging the revival of Fascism in Austria and tried to renegotiate Article 9 of the draft treaty. Finally, they refused to implement the treaty until the Trieste question had been dealt with. These tactics led to a breakdown of the meetings of foreign ministers' deputies in December, 1950.

An Invitation Ignored

In March, 1952, the western powers offered to get the discussions moving again by proposing a shorter treaty. When the Russians asked for a number of additions to this shorter version, the western powers agreed to all the Russian suggestions. However, Moscow replied by calling for the complete withdrawal of the shorter treaty and by repeating its demand for a settlement in Trieste. When the western governments offered to withdraw the abbreviated version provided the Russians promised not to introduce any extraneous issues, the Soviet reply stated that the West was imposing conditions "which were bound to lead to new complications and delay." An invitation to the Russians in 1953 to submit the precise text they would be willing to sign was ignored.

The negotiations then began which led to the four-power conference on the German and Austrian questions at Berlin at the beginning of last year. At this conference the West offered to accept the Russian text of those treaty articles not yet agreed upon. In answer to this Mr Molotov introduced a new condition—that even if a peace treaty with Austria were signed the occupation forces should be kept in the country until a German peace treaty was concluded. The Austrians offered, "as a sacrifice," to accept occupation up to the middle of 1955, but the Russians rejected this. Mr Molotov's insistence on linking the German and Austrian treaties persisted all through 1954, and as late as last December 29th an article in *Izvestia* declared that ratification of the Paris agreements "would render talks on either the German or Austrian questions pointless."

Whatever motive the Russians had for changing their policy was a powerful one. It also seems to have persuaded them to relax the economic conditions which the Paris meeting of the foreign ministers in 1949 allowed them to impose on Austria. Under the agreement which Herr Raab has won in Moscow it appears that Russia is to hand back the former property of the Danube Shipping Company and will take deliveries of crude oil in place of certain oil fields and installations. All prisoners are also to be repatriated. Benevolence is, indeed, the order of the day.

Notes from South Africa

Juggling with the Judiciary

PUBLIC concern at some of Mr Swart's judicial appointments is growing. To begin with, the Minister of Justice has apparently decided as a matter of policy to confine his choice to Gentile barristers, thereby excluding some of the country's most brilliant lawyers. Worse still is the growing suspicion that he appears to be allowing political considerations to influence many of his decisions. There have, of course, been exceptions and there will doubtless be more. But a few of Mr Swart's appointments have caused grave misgivings in legal circles, and it is known that the Bar Council of South Africa has been seriously concerned at the course of events.

The composition and nature of the Bench is being radically altered, and there is a fear that the standard of the judiciary, which has always been extremely high in South Africa, may suffer through the appointment of inexperienced and, in one or two cases, ill-equipped lawyers. Mr Swart's nominees to fill the five lower court vacancies caused by his enlargement of the Appeal Court Bench will therefore be scrutinised with more than ordinary care. Political observers in South Africa believe that the Strydom regime is now acting on the assumption that it is engaged in a fight for White survival, and that the end justifies the means. It is feared that this whole attitude will strike a blow at the conception of the rule of law and do irreparable damage.

The South African government's decision to enlarge the Appeal Court by nearly doubling its size and at the same time to establish a quorum of 11 judges for constitutional and five for civil and criminal cases, was greeted with dismay in non-Nationalist circles. And the fact that the Minister of Justice ignored Parliament in making his original announcement—which was given to South Africa through the medium of a party political newspaper—is regarded as evidence of the Nationalists' basic contempt for parliamentary institutions, and their disregard of the wishes and feelings of all except their docile and obedient followers.

Chains of Freedom

SOUTH AFRICANS with a feel for Western traditions are growing perturbed at the gradual shrinkage of civil liberties. But persistently though they charge the government with reducing the area of personal liberty and freedom, the government and its apologists with equal persistence deny that there is any threat to anyone—except to "Communists," statutory and otherwise.

There are often encroachments upon individual rights, either through a system of permits for anyone who wishes to leave the country; or through the power given to a minister to close down a newspaper or deprive men of their livelihood by banning them from certain jobs; or through additional powers given to the police to enter meetings, public and private; or through restrictions on the right of access to courts of law. But every time, the government's reply is that these restrictions are essential to "fight Communism" and are only aimed at "Communists and fellow-travellers." Mr Strauss, the leader of the Opposition, has strongly warned the country against the whittling away of personal liberties, and showed how the path to a police state might well be strewn with good intentions. The speech infuriated the government.

Mr Strydom went on record as saying that he knew of no civilised country in the world which was more democratic than South Africa or where the people had greater freedom. As a score of critics at once pointed out to him, his statement was untrue even if it applied only to the White population of less than 3 million out of a total population of 13 million. It was plainly ludicrous when applied to non-Whites as well as Whites. What nationalist spokesmen refuse to concede are the dangers inherent in legislation which gives ministers draconian powers, and in which party politicians and bureaucrats are given the right to decide what is and is not good for the individual.

★ ★ ★

Mr Strydom's Dilemma

THE growing manpower shortage, which manifests itself in all spheres of life, from the public service to mining, in industry and commerce as much as in the trades and professions, is beginning to worry the government more and more. It knows that the solution is to be found in immigration, but it is so frightened of the effects of bringing in large numbers of workers—if it can find them—that it still blows hot and cold on the issue and has once again decided against state-aided immigration.

The Prime Minister recently told a German newspaperman that while South Africa wanted skilled workers, there would be no large-scale importation of unskilled workers from anywhere, for that would simply create unemployment. As the demands of an expanding economy grow more and more insistent, and as the ideology of *apartheid* refuses to countenance the more intelligent use of non-White workers through a relaxation of the economic colour bar, the government's dilemma grows more embarrassing. The Minister of Labour, Mr de Klerk, who is very close to the Prime Minister, has spoken in emotional terms of the threat to White *baasskap* (dominance) unless the country can find sufficient White labour to maintain the position of the White man. He has condemned the traditional White approach to unskilled work and has urged White South Africans, men as well as women, to roll up their sleeves and get down to work. There is no reason to believe that White South Africans will take Mr de Klerk seriously or need his advice as long as they have sufficient Black labour to do the work.

A new bogey is now being held up to faithful Nationalist followers: that the growth of a Black proletariat threatens the very existence of the White man. Beyond saying that the number of Black workers must be restricted no positive steps have yet been taken to reduce the size of the existing Black proletariat. Nationalist theorists see the solution in complete territorial segregation, but the politicians are becoming more and more chary of talking about total *apartheid*. In the meantime the government has raised the retiring age of its civil servants, temporary and even ill-equipped teachers are being drawn into service, and private enterprise is hiccoughing along with insufficient men to man the machines or to fill the jobs that need to be done if the tempo of economic development is not to be slowed down disastrously.

Afrikaner Trek into Towns

AN analysis of the 1951 census figures, just published as a special report, gives some significant revelations. The drift of the Afrikaans-speaking population from rural to urban areas has become a new Great Trek, involving the movement of nearly a quarter of a million people. In 1936, 48 per cent of Afrikaners lived in the rural areas, another 27 per cent in the smaller urban areas, and only 25 per cent in the cities. Four years ago only 31 per cent lived in the rural areas, 32 per cent in the smaller urban areas and 37 per cent in the cities. From an almost entirely rural, land-owning, employer community, the Afrikaner has been urbanised, with incalculable social, economic and political consequences. Another interesting phenomenon is that the percentage of English speakers in rural areas rose from 13 to 16 per cent between 1936 and 1951.

One of the indirect consequences of this migration—these figures do not refer to the Africans, who have been drawn to the towns by industrialisation on a far greater scale even than the Europeans—is that nearly 75 per cent of the Union's population is now bilingual, compared with about 50 per cent 30 years ago. Since 1918 the number of unilingual persons has declined—those who speak only English from 30 to 15 per cent and those who speak only Afrikaans from 27 to 11 per cent.

One of the intriguing political questions arising from this trek to the towns by the Afrikaner is what influence urbanisation, and the trade unionism that goes with it, will have on the political outlook of a people to whom Nationalism has become a way of life. The Nationalist party has, of course, followed them into the towns and already holds most peripheral urban seats; and so has the Dutch Reformed Church. But the employed, rent-paying urbanised Afrikaner is a different being from the employing, land-owning rural Afrikaner, and his political philosophy is undergoing modification. Towards what?; that is the question. And, finally, of course, urbanisation is also producing a more homogeneous people, with a community of interests that did not exist when one language group lived in towns and the other on the farms. Will the new pressure towards homogeneity lead, in time, to political divisions on economic instead of racial lines, as at present?

Let Catesbys take this headache off your hands

When an old-established business takes on a new lease of life — or when a fast growing business is ready to blossom out into bigger and better offices: that's the time when Catesbys Contracts can be very useful. Catesbys can take off your hands all the pains and problems of furnishing, decorating and generally modernising old premises or fitting out new ones. We have our own team of specialists and craftsmen to do the whole job, from preliminary plans to final cleaning up. They'll provide all that's needed, *do* all that's necessary, in intelligent co-operation with you or your architect. They really have reduced the whole formidable business to a very fine art.
Why not ring Museum 7777 and set the ball rolling!

THE BUSINESS WORLD

The Budget Analysed

ALTHOUGH Britain's economy is now even more fully employed than it was twelve months ago, Mr Butler's budget this year is as optimistic as last year's was restrained. He estimated the prospective increase in home demand at less and the possible increase in production at more than many private guesses had suggested, and thus contrived to justify the granting of tax reliefs costing £134 million this year, or slightly less than half the amount of his prospective above-line surplus on the old basis of taxation. Dispassionate readers of the budget speech are likely to conclude, however, that this optimism stemmed from his own sincerely held economic philosophy rather than from any bid for electoral popularity. The budgetary problem, he remarked, should be analysed " in as objective a manner as our various temperaments permit."

Thanks to last year's boom and this year's further rise in wages; the Chancellor could count upon a substantial gain from the buoyancy of revenue. He estimated that income-tax, which bettered estimate by £93 million last year, would this year have provided an additional £116 million at the old tax rates, despite the increased cost of the initial and investment allowances. From purchase tax, which last year exceeded estimate by £47 million, he expected an additional £28 million ; from tobacco, which had gained £17 million, an additional £10 million ; from beer and spirits, which had gained £9 million, only a further £1½ million ; from import duties, £8 million ; and from Customs and Excise as a whole £58 million, or slightly less than half their actual rise in 1954-55. Only an additional £7 million is expected from profits tax, while the ending of EPL in the budget of 1953 will this year exert its first perceptible effect on the revenue, involving an estimated loss of £51½ million. Little change is envisaged, on balance, in the yield from other taxes, so that the net gain from tax revenue as a whole was put at £128 million, at 1954-55 rates. Despite the dwindling of sales of stocks of food and raw materials (which last year provided £62 million and £37½ million respectively), the prospective loss of miscellaneous receipts is put at only £20½ million. The net expected gain in ordinary revenue was £106 million.

The prospective increase in supply expenditure was, of course, already known ; it amounts to £223 million, after deducting £18 million less for defence aid (estimated at £43 million). The details of expenditure in 1954-55 now disclosed make it possible to apportion this increase between defence and civil outlays. Gross defence expenditure, at £1,497 million, last year fell short of estimate by £143 million (or by £119 million net), while civil expenditure, at £2,204 million, fell short by £96 million—as a result of " savings spread over a large number of items, but shared mainly by the Ministries of Food, Materials and Supply." Because of last year's lag, gross defence outlays now show a prospective increase of £40 million (£58 million after defence aid) despite the revisions of the defence programme, while civil outlays are expected to rise by £165 million, without reckoning the £14 million addition that will be required to meet the agricultural price review. Provision for this and for " other changes likely to be necessary in the existing provision for food and agriculture " will be made by supplementary estimates. A large part of this rise in civil expenditure reflects the " natural " growth of the social services, the cost of which is expected to rise from £1,278 million to £1,315 million, and the increase in the Exchequer contribution to the National Insurance Fund. Production grants and subsidies for agriculture and food are estimated at £323 million, of which £246 million represents " support " for agriculture, £41 million is for bread subsidy and £36 million for " welfare " subsidies.

For Consolidated Fund services an additional £34 million is provided, almost wholly because of the effect of "recent developments in the money market" upon the interest cost of the debt. Total above-line expenditure is therefore estimated at £257 million more than was spent in 1954-55 (but at only £39 million more than the original estimate for that year). Of this, £106 million is offset by the prospective gain from revenue, so that the Chancellor envisaged an above-line surplus, at the old tax rates, of £282 million, compared with the £433 million actually realised in 1954-55. Gross expenditure "below-line" is expected to rise by £84 million, principally because of increases of £49 million in compensation payments under the Town and Country Planning Acts, of £27 million in advances for capital expenditure by the Post Office, and of £20 million for coal, partially offset by an assumed reduction of £33 million in new lendings to local authorities.

Deficit and Surplus

Mr Butler rightly took the external balance of payments as the starting point for his analysis of "how much, if any" of the prospective surplus could be relinquished in tax relief. He reiterated here the two familiar needs: that Britain must not only pay its own way abroad but must earn a surplus—he mentioned no target amount — sufficient to enable it to "resume its traditional position as the main supplier of capital for the development of the Commonwealth." This could be done only in a world of expanding trade, and only if British industry had "every chance" to share in this expansion. Earlier in his speech the Chancellor had drawn attention to the deficit into which Britain and the sterling area had fallen in the second half of last year, and to the rising cost of British imports this year. But he did not point to the widening of the deficit that this implies, nor did he say that he expects the money measures of last February to prevent the widening. Confronted with the need to "moderate the growth of imports and to encourage exports," he had unhesitatingly rejected the expedients of restrictive controls and had chosen the flexible method of restraint by "fiscal and monetary policy which, without cramping or distorting the natural vigour of the economy, maintains the disciplines which are essential to an expanding community." Pointing to the improvement in sterling, he thought that these measures had "brought the situation under control"—though he admitted that they would take some time to make themselves "fully" felt on the balance of payments, and that "we cannot be satisfied yet."

Against this rather uncertain background he was prepared to imply, later in his speech, that all would be well. Although some export markets, such as Australia, would be difficult, world markets as a whole would offer "substantial opportunities to increase our exports"—if they are competitive, and if productive capacity, after allowing for home demand, leaves room for the opportunities to be seized. The Chancellor then argued that there would be such room, though the policy of "incentive and expansion" must be combined with "continued restraint in the demands which we make on that expansion for our own personal satisfaction."

Mr Butler then estimated that Government demands for goods and services would be "about the same" as in 1954-55; that fixed investment as a whole would rise at least as fast as last year, when it rose by £125 million at 1953 prices (though housing would rise less fast and productive investment faster); that the present rate of stockbuilding should be "at least enough to meet the needs of expanding production" thanks partly to the pressure of the higher Bank rate; and that personal consumption, which rose by £390 million last year, should rise less rapidly this year—despite the substantial increases in wages. The slackening assumed in the rise in consumption is evidently substantial, for the Chancellor concluded by estimating that the increase in home demand as a whole should be "appreciably less" than it has been in these past two years. Last year it rose by £525 million. On the other hand, despite the near approach to the limits of full employment, Mr Butler believed the scope for increased production to be "at least as great as it has been in the past, if not greater." The increase in gross domestic product in 1954 was estimated in the Economic Survey at £625 million. It seems that the Chancellor is counting upon a larger increase in output per worker than occurred last year, when the increment was 2½ per cent.

On this basis he satisfied himself that, "taking into account the resources of a flexible monetary policy," domestic demand would indeed leave a margin of potential output available to meet an increase in exports. From this he deduced that there was likewise scope for tax relief "directed towards increasing production and, therefore, this margin." This condition ruled out any general easing of indirect taxes, which would encourage spending; but to accept the contribution that no concessions at all should be made "would be a timid policy which might prevent us from achieving the full increase in production of which we are capable." Above all, there was need "to lighten the sheer burden on the economy." This Mr Butler has done to the extent of reliefs that will cost nearly £134 million this year and £155½ million in a full year, in the hope, apparently, that those who benefit will "save rather than spend as large a proportion as possible of what they gain." To the extent that they do so, the new strain upon the Chancellor's assumed "margin" for exports will be correspondingly lessened. But the effect on his budget accounts will be to cut the prospective above-line surplus to £148 million—or to roughly one-third of the amount actually realised last year—before taking account of the coming supplementary estimates for expenditure.

"A Simple Orthodox Reduction"

THE Chancellor prefaced his changes in direct taxation by stressing the limited amount that he could give away, by recognising the need, before all else, for fresh incentive to the forces of growth and expansion, and by admitting that his proposals this year must be "of classical purity and simplicity." On those canons, he chose a straight reduction of 6d. in the standard rate, from 9s. to 8s. 6d. in the £. This reduction would relieve industry of £40 million; individuals would benefit (to the extent of £76 million in a full year) at all levels of taxation and would pay less "on any extra income earned by greater personal effort" (though the same is true of increased investment income); and those paying the heavier burden of tax would have the greater opportunity to save since they would enjoy the greater relief.

This reduction of 6d. in the standard rate is accompanied by a reduction of 3d. in the reduced rates (which in 1953 were reduced by the full 6d. then taken off the standard rate). This, the Chancellor claimed, is a return to "the tradition that reductions in the general rates of income tax should be broadly proportionate to the rates already borne." Mr Butler has ingeniously combined this remission of 3d. in the reduced rates with changes in the personal allowances in order to raise the levels at which tax becomes payable but he has claimed

back part of the benefit by narrowing the band of income taxed at the lowest rate from £100 to £60. He has, in fact, secured the essence of a higher exemption limit without extending the benefits through the range of incomes. The essence of the change will be to take out of the PAYE files some 2,400,000 taxpayers, though the complications of coding mean that they—and other taxpayers—will have to wait until the first pay day after July 5th for the benefit.

The two ingredients of this change can be summarised in the following tables:—

Personal Allowances

	£	£
Single	120 raised to	140
Married	210 raised to	240
Child	85 raised to	100

Reduced Rate Changes

Old Rates	£ s. d.	New Rates	£ s. d.
First £100 at 2/6	12 10 0	First £60 at 2/3,	6 15 0
Next £150 at 5/–,	37 10 0	Next £150 at 4/9,	35 12 6
Next £150 at 7/–,	52 10 0	Next £150 at 6/9,	50 12 6
First £400....tax £102 10s.		First £360....tax £93	

Since Mr Butler has not pursued his incentive budgeting by improving the earned income allowance, the benefits of his " sixpence off " and the net effects of the changes in the allowances impartially enure to those with earned or unearned incomes and because unearned incomes pay more, they will also save more tax. The earned income allowance remains at two-ninths of earned income subject to maximum relief of £450—that is, with no additional allowance for earned incomes exceeding £2,025. Hence the raising of the allowances raises the exemption limits for earned incomes, as follows:—

Exemption Limits for Earned Incomes

	Formerly £	Raised to £
Single	155	180
Married	270	309
Married, one child	379	437
Married, two children	489	566

Earnings above the new and higher exemption limits will, however, be subject to a more steeply graded reduced rate system; the first £360 of assessable income under the old arrangement would have borne tax of £88 10s., but under the new system the tax will be £93. One important consequence of the new scales will be that the additions to personal allowances will be tempered for those with earnings more than £360 above the exemption limits by the liability to pay at full rate on the next £40 of income. This explains why the single man at £600 will still be paying £81 15s., compared with £83 16s. 8d., and why the married couple at £700 will save only £5 6s. 1d. But taxpayers with families and with incomes running well into liability at the standard rate, will find obvious advantages in Mr Butler's proposals.

These proposals are rounded off by raising the limit for the small income relief of two-ninths of total income from £250 to £300. Parents of families " on whom the present load of taxation falls with especially discouraging severity, especially when they have several children to educate," will note that although Mr Butler has raised the child allowance from £85 to £100, he leaves unaltered the limit of £85 for the child's own income, thus wholly depriving the parent of the increased relief if the child's income is above £85. It is something that the apprenticeship income allowance should be raised from £52 to £85; any parent with a child earning £100 a year under articles will have to beseech the employers to impose a £15 cut so that he can get the benefit of the child allowance.

Boon for Lancashire?

The Chancellor has made only one change in purchase tax—to halve the rate of tax on certain piece goods and household textiles from 50 to 25 per cent. The reductions are estimated to cost £2¼ million this year and £3 million in a full year and apply to sheets, towels, curtains, tablecloths and other household textiles and furnishings as well as to cloths sold by the yard so long as these do not contain 15 per cent or more of wool by weight. The benefits of the concession therefore extend to silk, nylon, plastic sheet, linen and other high-cost yarns as well as to the bread-and-butter cottons and rayons whose plight has recently been so well ventilated, and Mr Butler made particular reference in his speech to the assistance that the cuts would give both to high-quality fabrics in general and to the Ulster linen industry. The items so relieved bore about £6 million before the reduction, out of an annual total of £40 million on all textiles and clothing and a total yield of about £300 million for all purchase tax.

★

A high proportion of the cloth woven in Lancashire already bears no purchase tax and sales of such cloths will not be affected either at home or abroad by anything that the Chancellor decides to do about purchase tax. Since the introduction of the much-welcomed and later much-abused " D " scheme in 1952, textiles selling below a certain price have attracted no tax, while those that cost more have attracted tax only on the amount by which they exceeded this " D " level. A wholesale price of 4s. a square yard is laid down as the tax-free limit for all non-wool goods (those that contain less than 15 per cent of wool) with two exceptions; these are linen, which is given a higher limit of 6s. per square yard, and furnishing fabrics that weigh more than 6 oz. a yard, which also have a limit of 6s. All cloths with 15 per cent or more wool in them enjoy a limit of 14s. 6d. per square yard. A high proportion of the cheaper cotton, rayon and wool mixture cloths was either already below these limits and so exempt from tax altogether, while others were so little above them that they attracted tax of a few pence a yard. Only the really expensive fabrics attract enough tax to create noticeable sales resistance at home. There may have been justification here for the textile industry's complaint that the effect of purchase tax on the home market was to restrict the production of quality goods for export—although Lancashire is prone to confuse the effects of purchase tax with those of competition.

Mr Butler sprung an unexpected surprise on retailers by reducing the tax on these textiles to the same rate, 25 per cent, as that charged on made-up clothing. Since purchase tax was introduced in 1940, the rate of tax on piece goods and household textiles has always been twice that on made-up goods, in order to make the tax on customers' cloth or, the tax on clothing made up at home, roughly the same as that on similar clothes bought ready-made. If this differential is now to be eliminated for cotton textiles, there is chance of a revival in retail sales of piece goods, which have been relatively depressed for several years.

Steel in Demand

IN the first three months of 1955 more than 5 million ingot tons of steel were produced in Britain, far more than ever before—and still there was not enough. This record output, plus imports equivalent to perhaps 300,000 ingot tons of steel, does not appear to have moderated the burden of demand on the industry: the order load at the end of the quarter seems likely to have been higher than at the beginning, and the volume of applications for import licences indicates a further increase both in the industry's own buying of ingots and semi-finished steel and in consumers' ordering of finished steel abroad. Orders for export, too, are more than the steel makers can accept. It is hardly surprising that the industry has recently been wondering whether higher bank rate and restrictions on hire purchase are likely to reduce demand for steel.

Most of that demand comes from industries whose output has risen in recent months even more than that of steel, and which have certainly a larger labour force than they had last year and probably somewhat more capacity. Production in the metal-using industries in 1954 as a whole was about 8 per cent higher than in 1953. In the fourth quarter of the year it was up by nearly 10 per cent over the last quarter of 1953 and was, after rough allowance for seasonal factors, perhaps 6 per cent higher than the average of 1954. This last form of comparison was used in the " Economic Survey " as some indication of the lead with which output began in 1955 over the 1954 level, but a further " appreciable increase " was also expected, and this too largely from the metal-using industries.

★

Steel deliveries were not quite matching the increase of output in those customer industries in the closing months of 1954, but they may be by now. In 1954 as a whole deliveries were about 4 per cent higher than in 1953, and in the last quarter of the year, as demand swelled, about 6-7 per cent higher. Only production figures are as yet available for the quarter just ended; but a rough estimate, as in the table, suggests that record output, supplemented by higher imports and depleted by higher exports, will have allowed home consumers a weekly average of about 360,000 tons of ingots, or 265,000 tons of finished steel, during the quarter. That would be about 8 per cent more steel than in the first quarter of 1954, which on the conventional " 8 to 10 " rule of thumb used in the industry would have supported about 10 per cent more output in the industries using steel.

No close correspondence between output in the metal-using industries and actual consumption of steel can be expected over short periods, however, not least because consumers normally carry about three million tons of steel products in stock. Moreover, deliveries depend upon orders, and orders reflect customers' expectations about future output—or sometimes simply their anxiety not to go short even if others do. Some of that anxiety was evident last autumn, when orders for a few products shot up to three or four times the level of a few months before. Nevertheless, consumers as a whole were in fact using more steel than was delivered to them; they reduced their stocks slightly (by some 100,000 tons) in the second half of the year.

STEEL SUPPLIES AND CONSUMPTION

	Annual: million ingot tons			Weekly: thous. ingot tons	
	1953	1954	Forecast 1955	First qtr. 1954	First qtr. 1955 (est.)
Production	17·6	18·5	19·6	361·1	390·3
Re-usable material	0·4	0·4	0·4	6·9	7·0
To (–) or from (+) producers' stocks	–0·3	+0·1	...	+5·5	+3·0
Imports	1·1	0·5	1·4	16·6	23·0
Total supplies	**18·8**	**19·5**	**21·4**	**390·1**	**423·3**
Exports	2·7	2·9	3·0	53·1	60·0
Home Deliveries	**16·1**	**16·6**	**18·4**	**337·0**	**363·3**
To (–) or from (+) Merchants' and Consumers' Stocks	–0·4	+0·2	...	N.A.	N.A.
Apparent Home Consumption	**15·7**	**16·8**	**18·4**	**N.A.**	**N.A.**

No doubt there is still some ordering to fortify stocks. But no steelmaker can complain about any consumer who is prepared to order abroad and pay the world price—often markedly higher than the British—to insure his future output, and the extra cost of doing

so is likely to moderate hoarding of steel. The industry has revised its estimates of demand this year; though there may be the capacity to produce 19¾ million ingot tons of steel rather than the 19½ million tons that the Iron and Steel Board is cautiously forecasting, the main flexibility in supplies still open to the industry lies in the wide margin of imports that is planned.

The Board is forecasting that imports may in fact reach 1,400,000 ingot tons—600,000 tons in ingots and semis, and 800,000 tons in finished steel imported by consumers. Assuming that exports are kept down to 3 million ingot tons (though more could be sold), the increase of about a million tons that it expects in output during this year would offer the British economy well over 18 million tons of steel—almost 10 per cent more than was used last year. Home deliveries, that is to say, could rise by 1,800,000 ingot tons, half from extra imports and half from extra output.

It would require considerable optimism to question whether that will be enough; the steel industry, characteristically, is more concerned to question whether in fact it will all be required. Nevertheless, the orders with which steel makers have been unable to keep pace this winter have piled into a formidable current backlog comprising many more weeks' output than they normally have on their books at this time of year. This continued excess of demand is fairly general for most steel bought for processing, in particular flats and light rolled products; demand for the structural steels, rails, and for steel used in mining is steadier, but also high.

A "substantial" increase in fixed investment, and more of it industrial investment than last year; no further increase in defence demands on engineering; strong demand abroad for most types of capital goods, cars and metal consumer goods, and capacity in engineering to supply more exports as well as more investment—these prospects for 1955, set down in the "Economic Survey," include the main determinants of steel demand. But any marginal clipping of the fringe of investment by monetary policy could be reflected in steel; and so might a slackening in trade in metal consumer goods at home through hire purchase restrictions. The question would then remain whether exports of metal goods would take up the slack, and whether output of metal goods can possibly rise enough to need 10 per cent more steel. The steel industry, therefore, is not quite convinced that by the second half of the year consumers will necessarily be wanting all the steel it can now promise them—on paper. But that makes it no easier to satisfy their demands today—in steel.

Business Notes

The Budget in the City

It is broadly true that the City liked the Budget. It is also broadly true that markets did not respond to it. There is nothing necessarily contradictory in the contrast. The whole of the new Stock Exchange account that started on Wednesday, and the whole of the account that is to follow it, will be dominated by electioneering. The bald indices slightly obscure what happened immediately after the Budget; the *Financial Times* industrial index made another small advance; at 189.3 on Wednesday it showed a rise of 0.6 on the day and of 0.9 on the week. The index of Government securities, on the other hand, showed an insignificant fall from 99.82 to 99.79 on Wednesday and a slightly larger fall from 100.02 on the week. But the first reaction of jobbers on Wednesday morning was to raise prices in all sections of the market, and both gilt-edged and industrial prices later slipped back again almost to where they started, because investors failed to produce the volume of buying orders that had been expected. Prices fell more sharply on Thursday.

As a short-range market tipster, Mr Hugh Gaitskell ("I have no doubt that the Stock Exchange boom will continue now") is proving a disappointment. "What boom?" the investor might well ask as he noticed that an indecisive Wednesday was followed by a fall in gilt-edged and leading industrials on Thursday. But to be fair to Mr Gaitskell it must be accepted that it will be June, and the election will be over before the forces that Mr Butler set to work on Tuesday can have any free play on prices. What will happen then? There are two views. Mr Gaitskell's view has some adherents. The Budget was a little more favourable to the wealthy taxpayer than the market had generally foreseen. The reduction in the standard rate of tax without an increase in the earned income allowance and without a regrading of surtax had not generally been expected, and it puts a little more money into the hands of people who are likely to use it in the market than, for example, the expenditure of the same revenue on widening allowances at the lowest range of income, as a vote-catching Budget might have done.

But the most general feeling in the market, even among those who liked the Budget, is not one of wild optimism about prices. Assuming the return of a Conservative government, shrewd observers are still inclined to allow considerable weight to the Chancellor's intention to make the higher Bank rate work, and no one supposes that if that happens all implications are yet fully reflected in present prices. It will be surprising if that view does not prevail to the extent of keeping business small and prices narrow over most of the time as the election approaches, even though some excited short-term movements on the few days following the poll must naturally be expected.

The Response of Sterling

The recovery of sterling in the exchange market stopped a few days before the Budget, the rate in the official market slipping back from $2.79⅛ to $2.79⅛. The rate for transferable sterling moved correspondingly from $2.77½ to $2.76⅛. This modest reaction was attributed, in part, to the unfavourable impression created by the March overseas trade figures which showed a gap of £92.4 million in visible trade, about twice the figure for March, 1954. It is also significant that the drop in the sterling rate followed immediately on the news of the increase in the Federal Reserve rediscount rate in New York. This movement, by giving fresh impetus to the rise in short-term money rates in the United States, brings with it the suggestion of some diminution in the modest flow of money from overseas to the London market. For the time being, however, the relative attraction of London persists. With the 3 months' bill rate in London at 3¾ per cent and in New York at 1.6 per cent, the differential is still greater than the cost of selling sterling forward. The American bank buying sterling for short-term investment here must now pay 1¼ cents for covering its exchange risk through a forward sale of three months' sterling. This represents 5 cents for a year or 1.8 per cent on the spot rate. After allowing for this cost the American bank would still earn 2 per cent net on its short-term sterling investment as against 1.6 per cent in New York. Certain discount market houses continue to do appreciable business on overseas, and especially on Canadian, account.

The Budget, with confidence prominently in the shop window, led to an immediate recovery in rates. The official rate immediately moved up to $2.79⅜ and the transferable rate to $2.77 1/16. These improvements were not being fully maintained towards the end of the week and on Thursday the official rate fell to $2.79⅛ and transferable sterling to $2.77. These may be the reflection of second thoughts on the Budget and lucubrations in certain banking quarters on the possibility of a major sterling crisis in the autumn—whatever may be the outcome of the General Election. The uncertainties concerning that election and the dialectical exaggerations and extravagances that may be expected during the electoral campaign may lie heavily on the pound until May 26th.

Soaring Trade Deficit

The weapon of Bank rate needs time to do its work, and time is money when Britain is over-importing at the present rate. That is the rub—as the latest import figures make plain. Imports in March rose by no less than £56 million to £365.4 million cif, an even sharper rise than might have been expected for a lengthy month. This total has only once been exceeded in the past four years, and it raises the average cost of imports in the first quarter to £335.5 million a month—nearly £62 million (23 per cent) more than in the same quarter of 1954. The high rate of imports has completely swamped a gratifying recovery in exports.

In March exports rose by £27.5 million to £260.3 million fob, and the average for the first quarter, at £247.3 million a month, was £22.8 million (10 per cent) more than in the same period of last year. The comparison exaggerates the real recovery, for the first quarter's figures were swollen by shipments delayed by the dock strike last October. Comparing the monthly average of the last six months with that of the same period of 1953-4, exports were only 3 per cent up. With re-exports at £12.7 million in March, the gross visible trade deficit jumped to the uncomfortably high figure of £92.4 million. The average deficit in the first quarter of £77.6 million a month was also high, for it compares with a deficit of £59.4 million a month in the fourth quarter and of £40 million in the first quarter of last year.

It is small comfort that shipments to the United States—which were not significantly affected by the dock strike—recovered further in the first quarter to reach £13.9 million a month, equal to the mid-1953 peak. The recovery in shipments to Canada has been slower, and may have been masked in the first quarter by the closing of the St Lawrence.

Planning More Coal Imports

When the "coal winter" ends on April 30th, Britain is unlikely to have more than about 12 million tons of coal in stock. During the winter these stocks will pro-

bably have fallen by nearly 7 million tons, in spite of the import of some 4 million tons of foreign coal. Winter coal consumption seems likely to be about a million tons higher than in 1953-54. Production during the winter, however, will probably have been about 2½ million tons lower.

In these circumstances, coal budgeting for the coal year 1955-56 comes down to deciding how much coal should be imported or how much exports can be cut. Production must not be hampered for lack of fuel ; this means that provision should be made for an increase of 3 million to 5 million tons in inland consumption (though weather can modify this margin quite considerably). The current programme of exports and bunkers still seems to be about 14 million tons, some 1½ million to 2 million tons below the level of recent

COAL SUPPLIES, CONSUMPTION, AND CHANGES IN STOCKS, BY COAL YEARS, 1951–52 TO 1954–55
(Million tons)

years. If that amount is exported, the total demand would be for about 233-235 million tons during the coal year 1955-1956. So far this year production is down, and it needs some optimism to hope that it might increase even as much as 2 per cent in the coming twelve months. And even if it did, there would be a need for perhaps 6 million tons of imports during 1955-56 ; while assuming the "worst," i.e. no increase at all in output and a rise in home demand to the top of the bracket, Britain might need to import (or make available in part by further cutting exports) as much as 13 million tons of coal. The mining industry is no longer dignified with the danger of becoming a brake on the boom ; it is assumed to be inadequate, and imports to be automatically required. But it has become one of the more expensive imports required to support rising industrial output, and the question whether coal exports should be maintained at their present level is being reviewed.

Copper Confused—Tea Distressed

THIS week the British Government created further confusion in the copper market by releasing more copper from its trading stock. No formal announcement was made ; the news first leaked out in New York, and was later confirmed in London by the Board of Trade. The quantity is 20,000 tons ; it is blister copper which originated from mines in the Rhodesian Selection Trust group, and it has been sold back to that group for delivery in the latter part of this year and early next year. Last week copper dropped by about £30 a ton on the announcement of the release of 45,000 tons of electrolytic copper from the Government's stock ; prices subsequently recovered, only to fall again by about £10 a ton on the news of the second release.

The committee of the London Metal Exchange has justly criticised the Government for the inept way in which it has handled disposals. In a statement issued on Thursday, the committee defends the market against the charge of instability by pointing out that its function is to reflect all developments affecting trade in copper, and it expresses the hope that in any future disposals the Board of Trade will consider market stability. No doubt the committee finds it difficult to understand why the second release could not have been made at the same time as the first. No one would expect the Government to tie its hands indefinitely, but it should have been possible to say how much copper is to be released this year. Such a statement is needed.

Meanwhile, tea prices fell quite sharply when the London auctions were resumed this week. Medium and common qualities of Indian tea dropped by between 2d. and 5d. a lb, and clean common tea was quoted nominally at 4s. 6d. a lb, compared with 4s. 11½d. a lb at the end of March. Despite the smaller weight of tea on offer, a good deal was withdrawn

Sugar (Cuban raw), cif per cwt.	31s. 3d.	31s. 6d.

* March 31.

from the auctions, though some of it was sold privately later at prices in line with earlier bids. Prices of Ceylon tea also fell, except for the best qualities, and subsequently the market learned that the Ceylon government has reduced the export duty by 30 cents to one rupee (1s. 6d.) a lb.

Saved by the Bell

THE newspaper strike stopped just in time for some newsagents and advertising firms. They have lost four weeks' income, and those that were operating on very tight budgets had fallen into serious difficulties. But nobody appears to have been pushed out of business ; most had other lines that helped to keep them going. Newsagents sold an enormous number of magazines and periodicals,

ROLLS-ROYCE

'You'll be reading this tree when you grow up...'

TWENTY YEARS from now, when that five-year-old southern pine seedling is fully grown, it will be cut down and made into newsprint. Then another seedling will take its place, for the forest must be repaid for the riches it yields. In the past year alone, Bowaters have planted no less than five million seedlings to serve their new mills at Calhoun in Tennessee.

And far to the north—in the great Bowater forests of spruce and fir in Canada, Norway and Sweden—as the trees fall so the cycle of growth begins again. In these latitudes the harvest will not be gathered again for seventy-five years. But during these silent years constant guard will be kept against the pests and diseases that would harm the trees, the fire that would devour them. By husbanding, by protection, so is the bountiful forest repaid.

Every day of the year the Bowater Organisation is at work converting timber into woodpulp into paper. From its mills in Europe and North America comes newsprint for the newspapers and journals of the world; other printing papers for magazines and reviews; paper for packages of almost infinite versatility.

Bowaters

THE BOWATER PAPER CORPORATION LIMITED

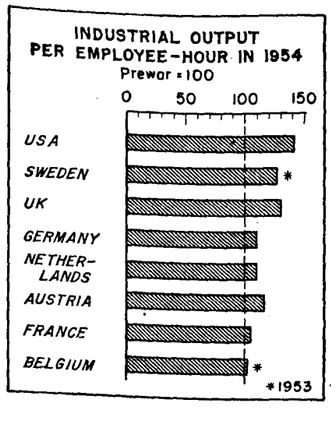
Great Britain United States of America Canada Australia South Africa Republic of Ireland Norway Sweden

though their customers quickly became much more discriminating than in the first few days of the stoppage when they frantically laid their hands upon almost anything readable, including back numbers. Altogether about £1-£1½ million in their margin on newspaper sales appears to have been forgone by newsagents and distributors, less the income from extra sales of other publications. The street-seller and the paper shop subsisting upon local delivery services were the worst hit.

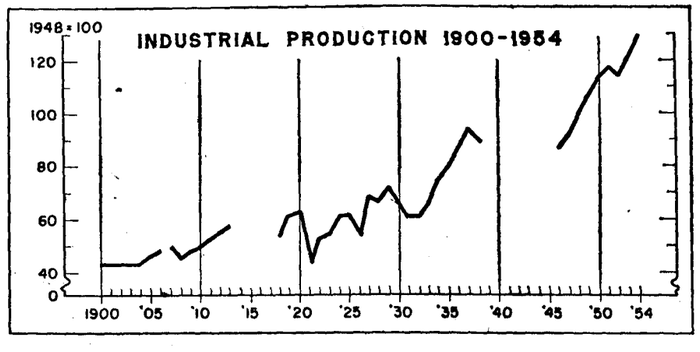
That revenue is lost for ever. Advertising agents, on the other hand, hope to recoup a good part of the £350,000 or so they have lost in commission, and their anxiety may well assist the newspapers' own chances of recovering the advertising revenue forgone. Seasonal promotion campaigns, however, have been scrapped, and some at least of the £2½-£3 million that would have been spent upon advertisement space in the national daily and Sunday papers has been diverted to other media. One of the big London stores ventured to Radio Luxembourg for the first time; more spring catalogues have been issued by direct mail; and commercial television may have a little more money coming its way in the autumn. Only about one-sixth of total advertising turnover arises from advertisements in the national press (which account for a quarter of all expenditure on press advertising), but this proportion is considerably higher for most of the leading agencies. One or two had insured against a strike, but most agencies had to rely upon their bank managers or upon their own resources; and this is a business that does not normally require a heavy working capital. Another week or two, therefore, and more than a few would have been forced to scrutinise their payrolls.

The strike has had a more varied effect upon trades that use the national papers to stimulate their sales. Sections of the mail-order business were badly hit, but some firms were lucky enough to have launched their campaigns well before the papers stopped printing. The remarkably fine weather has been a great help for retailers; but Easter fashions and the particular lines that the stores had intended to promote this month have suffered, and many shoppers appear to have remained in the London suburbs rather than visit the West End of London. Cinemas have enjoyed good business, so have some of the new plays in the West End, strangely enough, as theatre attendance in general has been poor. Relief at the reappearance of London papers will also be felt by estate agents, personnel managers with lengthening vacancy lists—and, indeed, by butchers and fish and chip shops, though possibly it will react adversely on the turnover of the firelighter industry.

Quotas Against Japan?



THE British Government has now issued a statement of policy on the question about Japan's accession to the General Agreement on Tariffs and Trade. It is made clear that quotas against imports from Japan will continue to be imposed in accordance with negotiations to be conducted from time to time with the Japanese government. Negotiations recently conducted in Geneva between Japan and a number of members of Gatt will certainly lead to Japan's



Productivity in the Long Run

INDUSTRIAL production in Britain last year was probably about three times as much as at the turn of the century, according to an index of production since 1900 that Mr T. M. Ridley has constructed on the same basis as the current official index. The 1900 figure is given as 43, against last year's index of 129: this is equivalent to an annual increase of just over 2 per cent compound over the whole period. Since the turn of the century, on a very rough calculation, employment in the industries covered by the index may have risen by about 75 per cent, but the hours worked have dropped sharply. This would imply that during the 54 years output per man-year would have risen by some 70 per cent and output per man-hour would have about doubled.

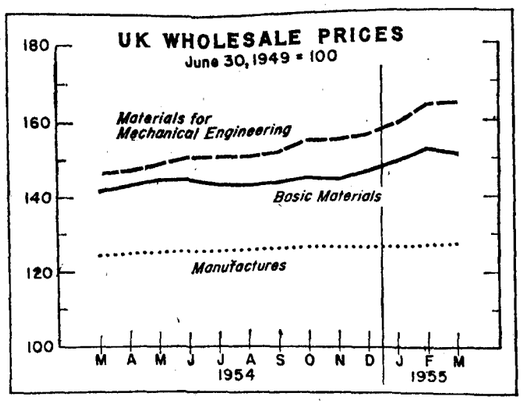
Mr Ridley produced the index from a variety of estimates over different periods during this century, adjusting these to give approximately the same coverage as the official index and putting them on the same 1948 base and weighting; his index is shown in the larger chart.

A more recent, but no less tentative, estimate of increases in man-hour productivity in Britain and other countries was published last week by the Treasury, based upon estimates by the United Nations. These suggest that Britain has achieved a larger increase in output per man-hour since before the war than any other West European nation except Sweden. The smaller chart shows the comparative increases. It needs to be borne in mind that since before the war labour productivity in the United States seems to have increased more than anywhere in Europe: the Transatlantic lead is hardly being narrowed yet.

accession to the Agreement since the necessary two-thirds majority is already assured. Even so, the British Government has now decided that it must exercise the right to invoke the provisions of Article 35 in the Agreement by which it need not treat Japan as a contracting party.

Britain, however, declares itself sympathetic to Japan's desire to accede, holding that it would be wrong to refuse "fair and reasonable" opportunities for Japanese trade and disclaiming any intention to injure Japan's efforts to expand exports "in fair competition." But the British Government is not prepared to tie its hands in advance by accepting the obligations of Gatt towards Japan. It first wants greater assurances that the "fair competition" is indeed fair. For some time past the quota arrangements for Japanese trade with Britain have been mutually agreed with the Japanese government. The Colonial territories have been free to fix the level of their imports from Japan, but always "with due regard to the balance of payments between Japan and the sterling area" and in the light of advice from London. That practice will continue. The British Government has again expressed the hope that a high level of trade between Japan and the sterling area will be maintained and has even envisaged the time when "the United Kingdom and the Colonial territories will in due course accept the full application of the provisions of the General Agreement to their trade with Japan." The statement, issued on the same day as the purchase tax concessions on textiles, has a domestic political flavour, and a thoroughly unsatisfactory result is likely to emerge after Japan has formally acceded to Gatt, and the United Kingdom Government has invoked Article 35 allowing it to "look through the new member." The British Government seems to have realised this and has invited the Japanese government to enter into negotiations for a long-term commercial treaty "embodying mutual undertakings with respect to shipping and establishment matters, protection of industrial designs and tariff matters."

Shell Does the Obvious



As with the Unilever dividend there is a ring of inevitability about the dividends of Royal Dutch and "Shell" Transport and Trading. They are just what cautious investors predicted when the two companies announced their 20 per cent scrip issues. And the profits that back them follow the line indicated by the half-yearly report of last September. The directors of Royal Dutch-Shell like those of the other Anglo-Dutch diarchy, Unilever, decided to maintain the old rates of dividend on the capital as increased by the free scrip issues.

For 1954, Royal Dutch have declared a dividend of 16 per cent and Shell a tax free payment of 15 per cent; after the scrip issues these payments represent an increase of 20 per cent in the amounts to be distributed as dividend, subject to the fact that Shell will save on the lower rate of British income tax. Where there is a steady expansion and where free scrip issues are about, there will always be some optimists. Some of them pitched their hopes too high and after the oil dividends were announced the Royal Dutch Fl. 100 stock units were marked down by £1 to £56½, rallying later to £57, while Shell £1 units fell from 127s. 6d. to 126s. 3d. At the ex-dividend price of 125s., and grossing up at the new standard rate of tax of 8s. 6d. in the £, the Shell units offer a yield of £4 3s. 6d. per cent.

That yield is supported by the continual growth of this leviathan of oil, shipping and international trade. Over the last four calendar years the group has spent £800 million on capital account, of which half has been devoted to crude oil production and exploration. In 1954 alone the group spent £226 million, £6 million more than in 1953. Yet at the end of the year it still held £346 million in cash and securities, £31 million more than in 1953. The accretion in assets is matched by a growth in sales. On the average the prices realised by sales of oil by Royal Dutch-Shell were lower last year than in 1953 but the volume of sales rose by 8 per cent, so that total proceeds from sales and other income rose from £1,700 million to £1,850 million. Sales taxes, excise duties and similar levies absorbed £406 million, £58 million more than in 1953 and tax liabilities went up from £115 million to £129 million. The net income of the group at £134 million was £4 million higher than the 1953 figure. The two parent companies share out dividends from those net earnings of the subsidiaries in the ratio 60 to Royal Dutch and 40 to "Shell" Transport and Trading. The sum they have drawn this time is £26.8 million, compared with £22.2 million for 1953.

Prices of Materials in March

The Board of Trade's price index of basic materials, excluding fuel, fell by nearly one per cent in March to 150.9 (June 30, 1949 = 100). The fall—the first for three months—reflected the decline of 11 per cent in the price of rubber, and smaller declines in cotton, wool and

jute, which together more than offset a further rise in the price of copper. The indices of materials used in the mechanical and electrical engineering industries, in which copper has a much bigger weight, rose respectively by 0.2 and 0.5 per cent in March. In the first quarter of the year the index of materials for mechanical engineering has risen by 5.4 per cent to 164.2, and the index of materials for electrical engineering by 9.4 per cent to 184.2. The index of all manufactured products, excluding fuel, food and tobacco, rose again by 0.2 per cent to 127.5 last month, bringing the total rise in the first quarter to one per cent.

More Security Arbitrage

The Stock Exchange Council is believed recently to have been considering the problem of dealings between members of the Stock Exchange and the London offices of New York stockbrokers. It has taken no action so far and that in effect means that it reaffirms its existing rule which requires London Stock Exchange members to treat the London offices of American brokers much as the English provincial broker is treated: the London jobber must be given the first opportunity of dealing and only if he cannot do so may the broker offer the business outside. That in itself is normal; the jobbers seldom fail to see that their proper interests are protected. But the fact that it has been considered just now marks a considerable growth that has recently been taking place in the scope of London arbitrage dealings.

Basically the change is that whereas formerly London found itself able only to arbitrage American stocks between London and New York and therefore to switch only against American stocks already held by British residents, it now does a substantial arbitrage business in American stocks with Continental countries, in particular with Holland, Belgium and Switzerland, often for settlement in New York. In effect, though not in name, this means that Continental residents can switch in the London market. They can sell dollar stocks in London against premium dollars and London can sell them other dollar stocks in exchange and the fact that dollar stocks in London command a premium of about 1⅜ per cent—representing the difference between security sterling at $2.76¼ to the £ and official sterling at $2.80—makes no difference if both transactions are at the same premium. There may on occasion be slight money advantages to the Continental investor in dealing through London rather than through New York. But the main attraction of London (which includes the London offices of American brokers) seems to be one of timing. London's market hours are nearer to those in which the Dutch or Swiss investor wishes to operate, than are New York's

British Cars in America

The announcement of a $20,000,000 repeat contract obtained by the British Motor Corporation for further deliveries of the Nash Metropolitan car that they are making for the American market adds one more to Sir Leonard Lord's laurels. The figures published for new registrations in the American market include the Nash Metropolitan among the other sales of Nash cars (which last year totalled 82,000), and one can only guess at the volume of sales of the Metropolitan. A reasonable surmise would be that its sales may be of the order of 10,000 a year. Such a figure would be a welcome addition to the turnover of Nash which, in spite of its merger last year with Hudson into the American Motor Corporation, is, like all the manufacturers other than the General Motors, Ford and Chrysler, having a hard struggle.

In last year's registrations of cars of European make (excluding the Metropolitan) the Volkswagen went handsomely into the lead, with a total of over 6,000 units. The MG, which in 1953 recorded a similar total, had a sad decline to 3,454 units, but still kept ahead of Jaguar in unit sales (3,365), though not of course in dollar volume. Declines of the order of 50 per cent compared with 1953 were the fate of the other established leaders in British registrations, viz., Hillman, Ford and Austin. The Austin Healey, however, made a spectacular success with sales of just over 2,000, while the other newcomer to the list of sports cars, the Triumph TR2, was within striking distance of the 1,000 figure. It seems likely that both will show better totals for 1955.

Apart from the Nash Metropolitan, which is tailored for the American family market and enjoys the advantages of a strong dealer organisation to take care of sales and service, it is clear that the best hope of the British manufacturer lies in the sports car field (though Standard, in obtaining a contract to supply pick-up trucks to American forces here, has found another way of earning dollars with motors). Both the Austin Healey and the Triumph give an excellent performance at a not unreasonable price, while the Jaguar XK140 gives, of course, an altogether outstanding performance at a very fair price. The MG, however, has exploited for all its considerable worth the rather indefinable qualities of "character," with something of a nostalgic

Mr. Butler said:

"... In general, there are good prospects that world markets will offer us substantial opportunities to increase our exports this year."

Budget Speech, April 19th 1955

Our 50 three-monthly reports on business conditions in over 70 countries regularly review market prospects for capital as well as consumer goods. In addition, we carry out investigations into the markets abroad for specific products and services. We also investigate methods of attacking particular markets and how to finance exports.

Full particulars of our comprehensive services for those with business abroad from:

The Economist Intelligence Unit

22 Ryder Street, London, S.W.1. Whitehall 1511 Ext. 144.

appeal, rather than serious speed or acceleration. The drop in its sales volume last year shows that this vein is beginning to be worked out. But the announcement that MG, who have not appeared for many years in the serious European racing field, are this year to resume competitive racing, may well presage a sports car which would give a really fine performance even though, if its body design is reasonably functional, it must inevitably forfeit some of the charm of the present MG, that miniature bottle of a vintage car.

Burnt Diamonds

THE recovery of most of the great consignment of diamonds lost in the BOAC stratocruiser "Cathay" that crashed at Prestwick *en route* for America last Christmas morning is remarkable among salvage operations. Of the 26,000 carats on board, the insurers—British insurance companies, Lloyds and to a less extent American companies—thought that 23,000 carats might be recoverable. Actually 90 per cent of that target was recovered after an unprecedented salvage operation in which more than 20 tons of ash and debris and all the turf and topsoil from the area were sifted. Messrs Tyler and Co., the surveyors employed by the underwriters, the diamond experts who have helped them, and the picked workmen who have sifted and washed the debris, have a most creditable operation to report. The underwriters who paid in full the £950,000 claims of the owners of the diamonds before the end of January now have a large quantity of diamonds to sell that should recoup part of their losses.

How much will the underwriters realise ? That question remains unanswerable until the recovered diamonds are sold and their preparation for sale is another remarkable story. In the great heat of the aircraft fire—believed to have reached 2,000 degrees centigrade—some diamonds were embedded in metal ; a few have perhaps disintegrated ; many suffered discoloration. Many of these stones so laboriously extracted from South African mines have had to be sent back to South Africa for examination and any necessary treatment in the experimental laboratories of the De Beers group. They are now in London again, their faces cleaned and waiting to be sold for the account of the underwriters. It appears that there is still a doubt about the effects of great heat upon the internal structure of the diamonds and that therefore they are likely to be sold separately from newly mined diamonds. They may command a slightly lower price than unburnt stones, for no one is quite certain that these uncut stones will behave quite like other diamonds when the time comes to cut them. But the experts have done a good job and the risk to a buyer is believed to be slight.

SHORTER NOTES

Leo, the digital computer built by J. Lyons, Ltd., at Cadby Hall, worked out the PAYE tables for weekly and monthly salaries on the new income tax rates during the night after Mr Butler's budget speech. "Programmes" for the computer had been prepared for a variety of possible changes in rate, ranges and allowances ; the actual changes in this budget required only a few coded characters on its paper tape. This is the second year that the electronic lion has been ready to help the Inland Revenue ; but last year, with no changes in income tax, its services were not required.

★

The executive committee of the International Sugar Council has decided to raise the effective export quotas from 80 to 90 per cent of the basic tonnages, thus increasing the supply available to the "free" world market by 445,000 tons to 4,133,000 tons. Following that decision, Cuba has confirmed the sale to Russia of 100,000 tons of refined sugar, and Russia has bought a further 50,000 tons from Cuba for April/June shipment.

★

Thorn Electrical Industries is to raise £1,250,000 by a "rights" issue of "A" ordinary shares, carrying limited or no voting rights ; the date and price of the issue will be announced later. In addition, £528,750 will be capitalised from reserves to make a 100 per cent free scrip issue of 5s. ordinary shares. The two classes of preference shares are to be merged into a single class of 5 per cent stock, compensation being offered to the holders of the 6 per cent stock for the loss in dividend and priority. The coupon rate on the unsecured loan stock is also to be raised from 5½ to 5¾ per cent and the redemption dates, 1959-64, will be changed to the single date of 1964.

★

Vaal Reefs requires another £4,400,000 to bring it to initial production. Of this sum £350,000 will come from temporary borrowings and the remaining £4,050,000 by an issue of 5s. shares. Shareholders will be offered 2,190,000 of these 5s. shares at 30s. in the ratio of three for every ten; the issue has been underwritten by the Anglo-American Corporation for a cash commission of 2½ per cent on the issue price. For the same commission Anglo-American has offered to subscribe for 510,000 shares at 30s. each.

★

Jessel, Toynbee and Co. and Smith St Aubyn and Co., the two discount houses with accounting years to March 31st, have both announced final dividends of 5 per cent, making payments of 10 per cent for the year, thus maintaining the increased payments of 1953-54. Both houses also report a fall in published profits (after provision for all contingencies) ; profits of Jessel, Toynbee fell from £115,918 to £73,793 and those of Smith St Aubyn from £206,374 to £66,908.

★

With effect from April 18th, specified brands of zinc ingots, slabs and plates can be exported under open general licence to any destination other than China.

★

The issue of 708,334 ordinary 5s. shares of Bowmakers as rights at 17s. was over-subscribed. More than 670,000 were taken up as rights. Small applications for excess shares were allotted in full and larger applications scaled down.

Starch does surprising things

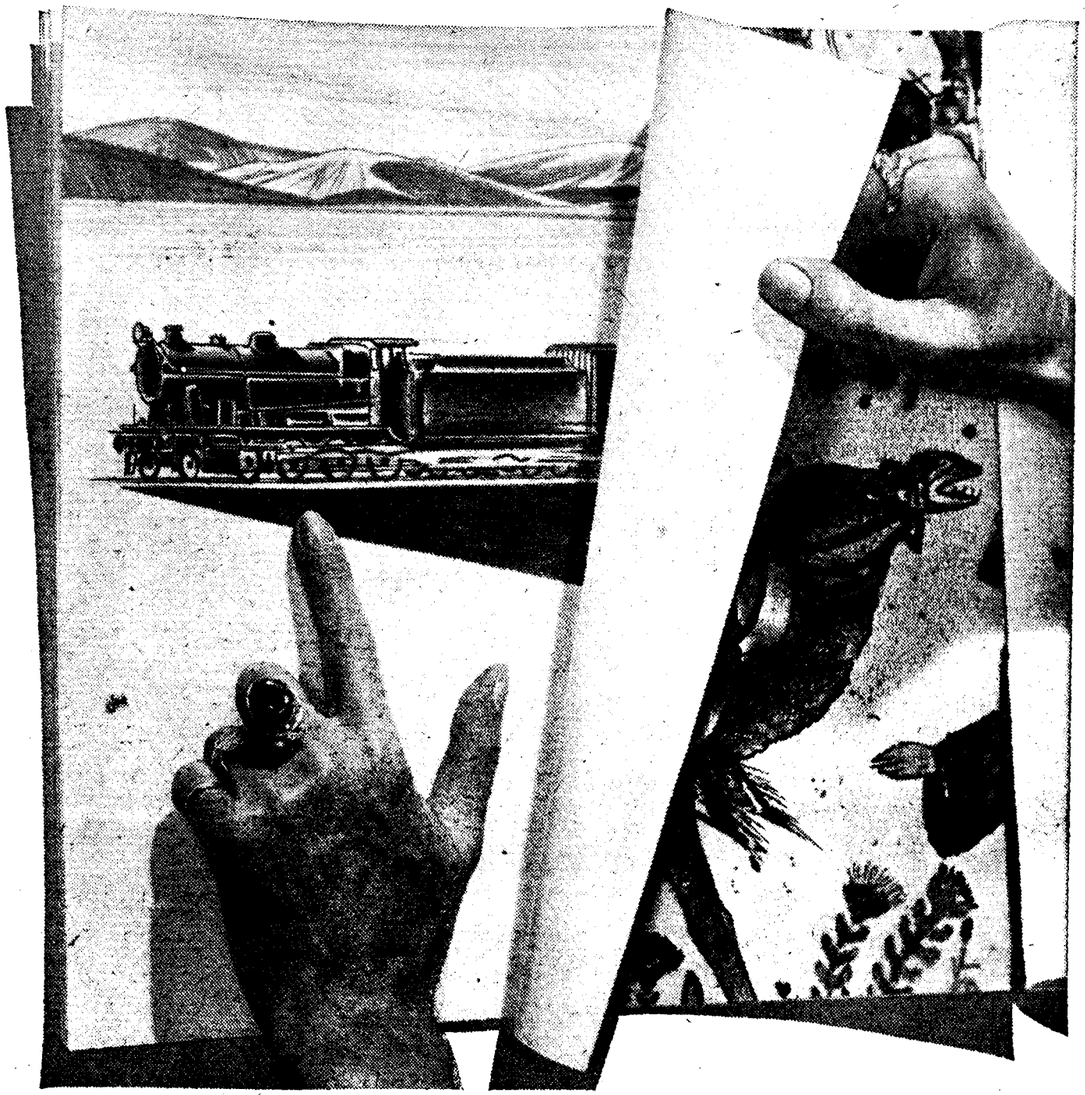
IN SUCH SURPRISING PLACES

Example:

STARCH IN CARPET MAKING

There are two main parts to a carpet: the wool pile and the backing. After the carpet has been woven, the backing is sized with one of a range of speciality starches, depending on the sizing equipment in use and the type of carpet being made. This operation is called back-sizing. It strengthens the backing and assists in anchoring the base of the pile into the backing. It also prevents curling and improves the handling and wearability of the carpet.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learned a lot about the industrial uses of starch products, and our advice is freely at your disposal.



CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED

Brown & Polson

British steel builds Persia's railways

Persia wanted steel rails — 100,000 tons of them for the Tabriz-Maineh and Meshed-Shahrud routes. Several European countries were keen to supply them. But the contract came to Britain. British steel and goods made from steel are in demand all over the world.

Wherever there is steel there is British steel.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION

Company Notes

PENINSULAR AND ORIENTAL. No one could describe the fractional increase in the Cunard dividend as generous; no one could fail to describe the increase in the P. & O. dividend as handsome. Effectively the deferred ordinary dividend has been raised from 11 per cent—the previous year's rate was 22 per cent before the issued capital was doubled by a 100 per cent scrip issue—to 16 per cent. Throgmorton Street blew hot and then cold on this dividend. A bigger payment had been in prospect since the scrip issue was made and that prospect became stronger when a ginger group of P. & O. stockholders was formed. But the general slide in the market brought the price of the P. & O. deferred down from this year's peak of 76s. (touched after the formation of the stockholders' association) to 68s. on the eve of the dividend announcement. Its prologue, a bigger payment by P. & O.'s subsidiary Orient Steam Navigation, sent the P. & O. stock units up to 70s. 3d. They fell back to 69s. after the P. & O. dividend was made known. But the most recent movements are small enough to suggest that investors' dividend estimates were near the mark.

	Years to Sept. 30, 1953	1954
Consolidated earnings :—	£	£
Trading surplus	17,079,901	17,860,872
Other income	994,864	1,008,100
Total income	18,074,765	18,868,972
Depreciation	9,240,477	10,172,594
Surplus, before tax	*8,476,052*	*8,235,500*
Taxation	3,522,059	3,058,986
Profit, after tax	*4,953,993*	*5,226,514*
Tax credits	467,669	950,793
Net income	*5,421,662*	*6,177,307*
Replacement reserves	2,128,076	1,960,693
Minority interests	802,028	757,997
Net surplus	*2,491,558*	*3,458,617*
Retained by subsidiaries	1,405,460	1,764,624
Surplus available to parent co.	*1,086,098*	*1,693,993*
Preferred dividends	83,600	83,600
Deferred ordinary dividends	833,542	1,212,425

The P. & O. board holds that the stockholders' association is not in the company's best interests and before its formation they had started a review of the structure and organisation of the group. But, on the face of it, the stockholders' association, in which Mr Walter Salamon is the substantial stockholder, has secured something that it did not ask for—a higher dividend. If the directors need to find a justification for the higher dividend they have no need to look beyond the profit and loss account for the year to September 30th.

The trading surplus is up—from £17,079,901 to £17,860,872; profits after tax are also higher. Ignoring the non-recurring tax credits, net earnings on the deferred stock after deducting preferred dividends and minority interests work out at £4,384,917, some £316,552 higher than the 1952-53 figure, the net ordinary dividend is £378,883 higher at £1,212,425. The calculation can be taken one step further on the assumption that the appropriations to replacement reserves (£1,960,693, against £2,128,076) attempt to make good depreciation charges calculated on historical costs. If those appropriations are treated as charges to be deducted, then earnings on the equity were £2,424,224, that is £483,935 higher than the 1952-53 figure. That argues that the increased dividend is within the bounds set by the rise in true earnings.

★

THOMAS TILLING. Preliminary figures for 1954 from this progressive industrial holding company had already shown a rise in profits and an increase in dividend from 7½ per cent to 10 per cent. Mr W. Lionel Fraser, the chairman, points out that, in the matter of dividends, shareholders now stand as they did before the Tilling transport interests were nationalised in 1948; the company then paid a regular 10 per cent per annum. Mr Fraser, indeed, understates the achievement for shareholders have in the interim received in cash £5 per share out of nationalisation proceeds. But 10 per cent again is a landmark, and in celebration the chairman announces a change in dividend policy. If all goes well the company will this year pay an interim of 5 per cent; its pre-nationalisation habit was to pay an interim of 5 per cent followed by a final payment of the same amount.

The achievement of 10 per cent does not mean that expansion is over. Mr Fraser proclaims the opposite. The policy is to develop and expand the company's existing interests, to broaden and expand its participation in industries in which it is already represented or in kindred ones, and to consider any new propositions that appear to hold attractive possibilities. In particular he states the company's preference for majority holdings in the companies in which it invests (it has just turned its minority interest in Lime, Sand and Mortar into a majority as well as adding to its minority holding in the Brush Group).

The sequel is inevitable. Thomas Tilling has used up its liquid resources and is going to the shareholders for over £2 million of new money. The consolidated balance sheet at the end of 1953 showed cash and deposits, less bank overdrafts, at £1,112,425. At December 31, 1954, net cash holdings were down to £351,592, and that was before the latest acquisitions. Mr Fraser reports that the funds have been fully absorbed and the company now has an overdraft. It will rectify that by creating 2,700,000 new £1 Preference shares of which 2,200,000 are to be offered for subscription by existing shareholders.

★

BRITISH INSULATED CALLENDER'S CABLES. Competition, notably in overseas markets, has presented its keen edge to British Insulated Callender's Cables, slicing away more than £1 million in profits in 1953 and another £1 million in 1954. A sharp drop in production and exports over the whole of the cable industry lies behind these figures. In 1953 the trading profit tumbled from £9,522,076 to £8,344,074, and last year it took another fall, coming down to £7,362,580. The normal provision for taxation also declined (from £3,636,990 to £2,866,497) but the tax credits relating to liabilities in previous years (including an EPL refund in 1953) fell sharply (from £817,595 to £130,335) so that the net provision for taxation declined by only £83,233 to £2,736,162.

Hence the profit attributable to the members of the holding company fell nearly as abruptly at the trading surplus, declining by £807,394 to £2,854,502. But the directors had no difficulty in maintaining the ordinary dividend from trading at 10 per cent. That dividend absorbs £702,406 (£23,156 more than the 1953 dividend disbursement owing to the change in the standard rate of income tax) and is covered nearly four times by net profits. In addition ordinary stockholders again receive a tax free payment of 2½ per cent from capital profits. Reserve appropriations are inevitably lower. On the lower profit the £1 stock units fell 2s. 6d. to 47s. 9d., to offer a yield of 3¼ per cent on the 10 per cent dividend.

★

BRITISH ROPES. Wire and fibre hawsers and ropes of every kind, canvases and tarpaulins, and a 50 per cent interest in Templeborough Rolling Mills make up the business of British Ropes. Last year, for the first time since the war, the group's activities were unhampered by shortages of hemp, sisal and jute; and as to steel it had regained its interest in Templeborough. The group came through the year with colours flying, reporting another advance in trading profits, which rose from £1,830,781 to £1,904,693. During the year, however, the prices of hard fibres were sliding and at the end of December the market replacement value of the group's fibre stocks was below cost. To cover this gap, the directors, following their normal practice, have transferred £125,588 from amounts set aside for stock contingencies. It looks as if this is only a paper loss, for in the current year the market value of the stocks has risen above cost.

	Years to Dec. 31, 1953	1954
Consolidated earnings :—	£	£
Trading profit	1,830,781	1,904,693
Total income	2,005,997	2,098,201
Depreciation	365,357	395,791
Taxation	875,129	884,558
Net profit	*762,738*	**767,295*
Ordinary dividends	225,544	250,604
Ordinary dividends (per cent)	13⅓	15
Retained by subsidiaries	106,670	242,812
Retained by parent Co.	325,575	428,930

2s. 6d. ordinary stock at 7s. yields £5 7s. per cent.
* Excluding £200,000 written back from tax provisions no longer required.

The provision has had no effect on the ordinary dividend. Last September the directors pushed up the interim dividend from 3 to 4 per cent. At that time they said that the decision was designed merely to narrow the margin between the interim

and final payments, but they have now raised the final dividend from 10½ to 11 per cent, making the total payment for the year 15 per cent, compared with 13½ per cent in 1953. Ignoring the non-recurring credit of £200,000 from tax provisions no longer required, the net profit of £767,295, against £702,738, covers the new dividend about three times. After the dividend announcement the 2s. 6d. stock units remained unchanged at 7s., to offer a yield of £5 7s. per cent—a yield merited by a sound, if unspectacular, ordinary share.

★

MONSANTO CHEMICALS. As befits a subsidiary of an American company, the full accounts of Monsanto Chemicals are full of statistics and charts. It is an attractive report both in its layout and its content. Last year, to quote the chairman Mr Edward A. O'Neal, was one of "consolidation and steady progress." Sales receipts went up from £10,852,854 to £12,634,616, the trading surplus £2,354,084 to £2,940,407

Consolidated earnings :—	1953 £	1954 £
Sale receipts	10,852,854	12,634,616
Other income	59,227	27,437
Total receipts	10,912,081	12,662,053
Raw materials, fuel etc.	6,967,443	8,006,220
Depreciation	491,756	669,382
Loan interest	142,370	175,000
Wages etc.	1,876,023	2,020,368
Taxation	763,629	984,584
Retained profits	303,735	402,249
Preference dividends	70,125	70,125
Ordinary dividends	297,000	334,125

and the ordinary dividend from 20 to 22½ per cent. Monsanto is a supplier of basic raw materials for many British industries and last year it continued to expand its capacity, operating most of it to the full in spite of increased competition both at home and abroad. In particular it expanded the plants making materials for the plastic, rubber and detergent industries, and also those making chemical additives for lubricating oils.

Expansion is still the keyword for the company. Its directors have authorised the spending of another £2,800,000 on capital account, to finance "substantial development during the next few years." Looking more closely at immediate prospects Mr O'Neal says that "forecasts for 1955 indicate a further growth in the tonnage of goods to be produced and sold." He makes no firmer statement than this, merely reminding shareholders that profits also depend upon the trend in costs of all kinds and upon competition in prices between the chemical concerns.

★

CEREBOS. In a year free from controls and restrictions the food and grocery trades did reasonably well, for housewives were spending more in the shops. But no investor had foreseen such a big jump in dividend as that reported by Cerebos, which manufactures a wide range of commodities as well as salt for the table. The directors have raised the ordinary dividend from 25 to 30 per cent. That, following the bigger payment made in 1952, is a further break with a conservative past. Since the announcement the 5s. ordinary stock units have made a net gain of 2s. 3d. to 30s., putting them on a 5 per cent yield basis. The dividend is backed by higher profits. Before all charges except tax, the consolidated profit has risen from £1,358,560 to £1,536,279. But, thanks to the end of EPL, the tax provision has not risen proportionately, going up by only £22,178 to £897,179, and net profits have advanced sharply, from £480,287 to £630,718. The ordinary dividend takes £330,000 from these earnings.

LONDON STOCK EXCHANGE

Next Account begins : **May 4th**
Next Contango Day : **May 4th**
Next Settlement Day : April 26th

THERE was little activity in Throgmorton Street before the Budget and, indeed, the market remained thin after Mr Butler's statement. Markings of the first day of post-Budget account (at 7,856) were running at about their recent daily average. The biggest movement immediately before the Budget was the drop in gilt-edged prices on Monday, when the market was unsettled by the prospect of a railway strike, by a weakening in sterling and by the belief that the Budget on the following day would not bring much cheer for the City. On Wednesday the gilt edged market was inactive, with prices tending to drift slightly lower ; on Thursday prices dropped sharply, with War Loan losing a point. The Budget debate, fears of lighter money policy and perhaps more than anything the appearance of newspapers to remind investors that they had profits, were the cause. In the foreign market Japanese issues remained firm but German issues fell slightly when the new account opened.

Before the Budget, industrial equities marked time, though brewery shares hardened on hopes of a reduction in the beer duty. On Wednesday, prices opened higher on the Budget statement but as trading failed to expand the initial improvements were not fully held. Nevertheless, the *Financial Times* ordinary share index went up by 0.6 of a point to 189.3, the highest level for over two months. Motor and engineering shares were firm—a rise in Ford Motor on American buying being the most notable feature of this market in the last few days—but steel shares, having opened strongly, fell back when profits were taken. Some sectors of the market, particularly those dealing with cinema, brewery and cotton textiles, weakened after the Budget had failed to give the reliefs that some had been expecting. Interest in rubber shares continued to broaden, with some buying stimulated by recent dividends ; teas were dull on the lower auction prices.

[1] From August, 1953, the index has been revised to show a more representative wheat price. [2] Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. [3] The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. [4] Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. [5] Surveys made twice a year; annual figures relate to October survey. [6] Revised series based on Liverpool spot market prices, as from July 1, 1954.

US Statistics

Monthly averages or calendar months except where annual rates are shown.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 16th there was an "above-line" deficit (after allowing for Sinking Funds) of £40,357,000 compared with a deficit of £23,983,000 in the previous nine days and a deficit of £31,215,000 in the corresponding period of last year. There was a net "below-line" receipt of £4,001,000, bringing the total deficit to £80,377,000 (£59,759,000 in 1954-55).

THE MONEY MARKET

THE recent easing of bill rates in London has proved short lived. At the Treasury bill tender last Friday the market reduced its bid per cent for the £250 million of bills on offer from £99 1s. 5d. per cent to £99 1s. 1d., after having raised it from £99 1s. at the previous tender. Outside tenderers bid more than the market, and as applications rose by £18.3 million the market's allotment fell sharply from 61 to 33 per cent. The average rate of discount on all bills rose by only 3/64 per cent to £3 15s. 3.09d. per cent. At yesterday's tender the offer was cut by £20 million to £230 million. The excess of new bills over maturities next week will thus fall from £20 million to £10 million.

The Bank of England has continued to keep credit taut in the market. Last week the market was in the Bank borrowing on Tuesday was followed by further penal loans on both Thursday and Friday—whereas this week some houses were in the Bank on Monday, Tuesday and Wednesday. The amount involved on any one day was never large, but in total it was considerable: it is in part reflected by the rise of £27 million during the week ended Wednesday in the Bank's "discounts and advances," to £35.8 million. The Bank of England is giving hardly any special aid, but it has passed on some special order for bills. June maturities have taken place at 3⅛-3⅛ per cent.

The Bank return shows a post-Easter reflux of notes of £6 million.

CAN THE INDUSTRIAL DEVELOPMENT BANK HELP YOU IN CANADA?

Businessmen who are considering establishing or expanding a manufacturing or processing business in Canada and have a project that meets practical requirements for success, but have not been able to finance it by standard methods, might find it worthwhile to know more about Industrial Development Bank (a subsidiary of Bank of Canada) and its wide experience with unusual problems. Industrial Development Bank's credit officers and technical specialists examine proposals before the Bank provides financing. If a term loan is granted, it may make for a more efficient and profitable operation. On the other hand, it may uncover factors which make regular commercial financing feasible.

For further information we suggest you communicate with :

INDUSTRIAL DEVELOPMENT BANK

Office of the General Manager

901 Victoria Sq., MONTREAL, CANADA.

COMPANY MEETINGS

BRITISH-AMERICAN TOBACCO COMPANY, LIMITED

ACCOUNTS DISCLOSE SATISFACTORY POSITION

EXPANSION OF OVERSEA ACTIVITIES

UK TAXATION A DETERRENT TO ENTERPRISE

MR D. M. OPPENHEIM ON THE OUTLOOK

The fifty-second annual general meeting of the British-American Tobacco Company, Limited, was held on April 15th, at Westminster House, 7 Millbank, London, S.W., Mr D. M. Oppenheim, the chairman presiding.

The chairman said: Ladies and gentlemen, with your approval, we will take the notice convening the meeting, the report of the directors and the accounts which have been circulated, as read, and the secretary will now read the auditors' report.

The secretary (Mr A. D. McCormick) accordingly read the report of Messrs Deloitte, Plender, Griffiths and Company, chartered accountants, appended to the accounts.

The chairman continued: Since our previous meeting Mr W. G. Matton, who had been a member of the board for twenty-one years—three of them as a deputy chairman—retired after a total service with the company and its associates of forty-two years. We shall miss his wise counsel, based as it was on long experience and expert knowledge of the tobacco business and of conditions generally in the western hemisphere, where your company's interests have flourished, largely due to his untiring efforts and devotion to duty. We wish him well in his retirement.

NEW DIRECTORS

I have also to report the appointments in July of last year of Messrs E. M. Bruton, R. F. Ridley and J. G. L. Wells as deputy chairmen, and of Messrs D. R. N. Clarke and G. F. Gelsthorp as directors in December last.

I may say that all these appointments have been made in furtherance of our policy of ensuring a succession of directors experienced in the many and varied aspects of your company's business. I am confident that your new directors, who have spent all or nearly all of their working life with the company or its associated companies, are well qualified to contribute to the formulation of major policy which is the function of the board.

I should also, at this point, like to refer to the recent retirement from active business of Sir Russell Kettle, until March 31st the senior partner of the company's auditors, Messrs Deloitte, Plender, Griffiths & Company. Of his fifty years' service with that firm, Sir Russell has been associated with the audit of your company's accounts for something like a quarter of that period, during which time there has been the happiest relationship between the auditors and the staff of your company concerned with the difficult and complicated business of preparing accounts for presentation to you.

I am sure you will join with me in acknowledging the services which Sir Russell and his firm have rendered to the company since the late Lord Plender was appointed as the first auditor of the company in 1902.

DATE OF MEETING ADVANCED

You will have noticed from the preliminary announcement of the results for the year to September 30, 1954, issued on February 22nd, that on this occasion we were able to make the announcement without the qualification that the figures were "subject to audit," and that it has also been possible to advance the date of this meeting by three weeks; but for Easter, the date would have been advanced four weeks.

With the coming into force of the Companies Act, 1948, and the obligation then imposed upon us of publishing consolidated accounts, it became humanly impossible for the financial results to be announced and the annual accounts to be issued as soon after the closing date of the company's financial year as stockholders are entitled to expect.

The preparation of consolidated accounts imposes a very considerable burden of additional work not only on our own accounting staff in London, but also upon the staffs of our subsidiary companies, and it is largely due to the assistance of our friends abroad and the ready co-operation of the company's auditors that it has been possible to achieve our accelerated programme this year. I am, nevertheless, hopeful that there is still some scope for improvement on this year's dates and I can assure you that ways and means of expediting the date of the preliminary announcement and of the annual general meeting are receiving our most careful attention.

The report of the directors and the accounts have now been in your possession for some time and I believe that they, together with the explanatory statement and the unavoidably extensive notes will adequately inform you of the company's general financial situation, and it is not my intention to take up your time with specific references to individual items.

CAUSE FOR CONFIDENCE

I think you will have found that the position as disclosed by these accounts gives cause for satisfaction and continuing confidence in the fortunes of your company.

There are still areas of the world in which subsidiary companies operate where inflation or exchange control regulations—sometimes a combination of the two—leave the directors of these companies no option but to retain and plough back the profits earned by their companies, with the result that the figures for "transfers to fixed asset and stock replacement reserves," "appropriations to reserves" and "balance carried to balance sheet"—i.e., Items XI, XIII and XVI—appearing under the column headed "group" are substantially greater than would otherwise have been necessary.

Where these two adverse factors do not apply or apply only to a limited extent, the holding company is beginning to reap the benefits of the very considerable appropriations to reserves which, almost without exception, the subsidiary and associated companies found it necessary to make in the immediate postwar period, partly to finance rehabilitation and inflation, partly—and more happily—to finance expansion of business.

WIDE-SPREAD ACTIVITIES

From time to time I receive suggestions that, in my annual address, I should give you more detailed information about the company and its associated companies. My colleagues and I have given very careful consideration to these suggestions.

You are, no doubt, aware that your company's activities can roughly be classified under two main heads. First, there is its own production in this country of the many well-known brands of cigarettes and smoking tobaccos owned by the company for export and for sea and air stores, and the sale of that production to many widely scattered markets overseas.

Secondly, there is the investment in subsidiary and associated companies operating in almost every territory abroad still open to private enterprise. It is in this sector of the company's business that the significant expansion is taking place, as will be readily seen by a comparison of the company's balance sheet with the consolidated balance sheet.

The field is very wide and varied both as regards the nature of the business and competitive relationship. It might be most misleading to stockholders to select one or even several of those territories for more detailed information. Yet, for political and other reasons I am satisfied that such information could only be given on a selective basis and for that reason alone I must refrain from acceding to these suggestions. I believe it is wiser in a company which largely derives its fortunes from subsidiary and associated companies incorporated and operating abroad to continue to follow the policy I have indicated. What must ultimately concern the stockholders is the global result as disclosed in the consolidated profit and loss account and in particular Item XII—the group available net profit as apportioned to the parent company.

EVENTS IN CHINA

I am happy to be able to report that in the middle of last year all the remaining covenanted staff of our associated companies in China were granted exit permits and left the country. Now that their welfare is no longer in jeopardy, I am able to make a somewhat fuller statement than it was advisable for my predecessor to make when he addressed you in May, 1952.

On that occasion he referred to the press reports which stated that our associated companies in China were handing over their assets to a Chinese government sponsored company. A fully documented record of the events leading up to this transaction has been prepared for possible use on a future occasion. The record shows beyond doubt that what appears, on the face of it, as a voluntary transfer of assets was indeed a confiscation of a major order.

Shortly after the Communists took Shanghai in 1949, it became clear to the directors in Shanghai that it would soon become impossible to carry on the business, which was heading towards insolvency. This was due to a combination of factors, such as strict control of selling prices at uneconomic levels, inadequate allocation of leaf tobacco and other materials to the factories, arbitrary methods of taxation, and the excessive size of the labour force which it was obligatory to retain on the payroll, and who were continually making impossible demands and imposing restrictions on the management. It was decided, therefore, to take steps to dispose of the business.

TSINGTAO AND TIENTSIN

In April, 1950, proposals were put to the Central Peoples Government in Peking and certain discussions took place but nothing transpired immediately.

In July, 1951, when all means of carrying on were exhausted, the manager of the branch in Tsingtao received a suggestion that, if he petitioned the government to take over the assets of the branch as a voluntary gift, the government might accept the offer and take over the liabilities of the branch. After protracted negotiations, an agreement was signed on January 13, 1952, but it was some months later that the branch manager was permitted to leave China.

Early in 1952 a similar suggestion was received in respect of the branch at Tientsin and in May of that year an agreement was signed on the same lines as that for Tsingtao. In the following month it was announced that everything was in order and that the manager and his assistant could apply for exit permits. Nevertheless, it was four months before the manager received his exit permit and nearly a year before one was granted to his assistant.

In the cases of both Tsingtao and Tientsin branches the fixed assets far exceeded the liabilities in value.

SHANGHAI

In the meantime, conditions had become desperate in Shanghai and great pressure was being brought to bear upon the directors in Shanghai to continue the business there and, if necessary, to obtain funds for this purpose from the shareholders abroad. Closing down was not permissible.

The record shows the extraordinary pressures brought to bear on the staff in Shanghai, especially during the so-called "Three Anti" and "Five Anti" movements which started towards the end of 1951 and under which managers were made personally responsible for payment of wages under pain of imprisonment and other penalties.

As a result of these pressures, considerable sums had to be remitted by the shareholders to the associated company in Shanghai, in order to enable the current liabilities to be met pending the signing of an agreement. In March, 1952, it was indicated by the Chinese authorities that negotiations about the taking over of the company's assets in Shanghai would be considered and in April, 1952, a provisional agreement for take-over was signed. A final agreement was signed on July 28, 1952. Under these agreements all the assets in China and Manchuria not already ceded under the earlier agreements were ceded, on the understanding that the transferees would, as from the date of the provisional agreement, assume the liabilities, except those to foreign companies and persons.

LONG DRAWN-OUT SETTLEMENT

As it turned out, the only obligations which were actually assumed were those in respect of remuneration to workers and local staff and for taxes. This left considerable claims to be met by the shareholders. As the value of the fixed assets (represented by eight fully equipped cigarette factories and other properties, quite apart from trade marks of very great potential value) was greatly in excess of the liabilities taken over, the transferees, in order to put a more reasonable face on the transaction, classified and arbitrarily valued many of the assets as "Japanese additions," to which they alleged the company had no title, although this matter had already been negotiated and finally settled with the Kuomintang Government, who had issued a formal receipt. When this receipt was produced, it was not only repudiated but impounded.

Settlement of the claims which were not accepted by the transferees was long drawn out. Exit permits for the chairman and his five colleagues who remained in China at that time were not granted until one year after all the claims had been settled; namely, in May, 1954—nearly two years after the original agreement had been signed.

Under a Communist regime local officials are reluctant to take any decisions, and our associated companies were greatly impeded by the difficulty, absent in happier times, of approaching those in real authority in the capital. In these circumstances, they received valuable assistance from HM Chargé d'Affaires in Peking, successively Sir Lionel Lamb, KCMG, and Mr Humphrey Trevelyan, CMG. It was largely through the able intervention of Mr Trevelyan that the last six exit permits came to be granted. I would like to record our gratitude to the Foreign Office, and to these gentlemen in particular, for the help they rendered.

TAXATION BURDEN

This year I am addressing you before the date on which the Chancellor of the Exchequer is to present his Budget, and I am, of course, unable to foresee what he may have in store for us as a company and as individuals.

During your examination of the accounts now under review, however, I am certain that the heavy burden of United Kingdom and oversea taxation to which the group is subject—the figure falls just short of £24 million, as expressed in sterling—will not have escaped your notice. In particular, there has been a sharp relative rise in the total of oversea taxation. This reflects the tendency for oversea rates of tax on companies to rise to the level of United Kingdom rates.

It is, in my view, essential to encourage investment in the Commonwealth and elsewhere. Such investment would, in due course, add to the volume of our invisible exports; and, so far as it would help to raise the standard of living of the peoples of underdeveloped countries, it would expand markets for this country's direct exports. One of the principal deterrents to such oversea investment is the United Kingdom tax assessable on dividends and other income derived from oversea companies, as well as on the profits of oversea branches and permanent establishments of United Kingdom companies.

In particular, as I have said before, in a group such as our own, the assessment of such dividends discourages the mobility of resources between territories, since it cuts down the balance available for reinvestment.

RELIEF NEEDED

I am, therefore, still firmly of the opinion that the basis of complete exemption from United Kingdom taxation of oversea income should be given serious consideration by the Chancellor. It may well be that, as a result of the rise in the rates of oversea tax, the actual cost to the United Kingdom Exchequer of such action might not be excessive as compared with present methods of relief.

If the Chancellor is prepared to encourage both this country's invisible and visible export earnings in the manner I have indicated, then the way will be clear to remove from the Statute Book Section 468 of the Income Tax Act, which, through longevity, is in danger of acquiring an air of respectability. The undesirability, from your company's point of view, of this section—commonly known as the "Ring Fence" section—is as great today as when it first came on the Statute Book in 1951, as Section 36 of that year's Finance Act.

All who have seriously and conscientiously in mind the continuing welfare of this country and its inhabitants must agree that excessive taxation has a deadening and frustrating influence on initiative and enterprise, and yet it is largely by the exercise of these two attributes that we can hope not only to maintain but to improve our standard of living.

PROBLEM OF STAFF TRANSFERABILITY

Apart from these general aspects of heavy taxation, there is a particular aspect which affects this company very materially. The main channel of advancement to the higher administrative posts here and to the board of directors is through service with one or more of the subsidiary or associated companies abroad. In circumstances as they are today, it often means that on promotion to one of these posts an employee is faced with a considerable reduction in net remuneration, as a result of the heavy burden of United Kingdom taxation. This seems to me to be putting an unfair strain on his loyalty, and in practice it means that our choice of men to fill the senior posts here is bound to be circumscribed, whereas in the best interests of the company and of the country—for which we earn substantial foreign exchange—this choice should be of the widest.

The only way of improving the rewards of employees in the higher brackets of taxation is to establish retirement benefits to the full extent permitted by the Inland Revenue; but this, in my view, is not an effective substitute for the incentive that can be offered in the shape of immediate financial reward. In particular, it does not meet the problem of transferability, which I have just mentioned.

I should add, in case of misunderstanding, that the tradition of loyalty in this company is so strong that, so far, it has surmounted these difficulties to a remarkable degree, but this fact, to my mind, does not detract from the seriousness of the problem; indeed, it enhances it. A level of taxation, which does not bear too hardly and even unfairly on senior employees is an urgent requirement for the country as a whole and, for the reasons

stated, a particularly acute one for your company.

CURRENT YEAR'S GOOD PROSPECTS

The future prospects of a company are never accurately predictable. At the annual general meeting last year I mentioned that the total volume of sales of the group for the first six months of the year to September 30, 1954, had continued to expand. The expansion was, in the final result, maintained to the end of that year and has continued for the first six months' trading of the current financial year. This points to the possibility of a new record volume of sales for the Group during the current year. Given fair trading opportunities wherever your company and its associates operate, and no major international upheaval, I predict that the results for the current year will be at least as satisfactory as those of the year we have just reviewed.

I now beg formally to move the adoption of the report and accounts for the year ended September 30, 1954, including the payment on May 31st next of a final dividend of 8d. per 10s. ordinary stock (free of United Kingdom income tax) on the issued ordinary stock of the company.

Mr F. H. St C. Sargant seconded the resolutions and, in the absence of questions or comments, it was carried unanimously.

The retiring directors, Mr Frits George Bodde, Mr Andrew Scott McAra, Mr Junius Walter Prince, Mr John Crisford Wren Stewart, Mr John George Lancaster Wells, Mr Denzil Robert Noble Clarke and Mr George Frederick Gelsthorp, were re-elected, and the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths and Co., was fixed.

The proceedings terminated with a vote of thanks to the chairman, directors and staff at home and abroad.

HANDLEY PAGE LIMITED

INCREASED PROFIT

The annual general meeting of Handley Page, Limited, was held on April 20th in London, Sir Frederick Handley Page, CBE (chairman and managing director), presiding.

The following is an extract from his circulated review of 1954:

At our Cricklewood and Radlett works your company has concentrated on the construction of Victor and Canberra bombers for the Royal Air Force. As well, Hastings transports have been overhauled for the RAF and Hermes airliners equipped for service with independent airline operators.

At the Woodley works of our Reading subsidiary our technical and production staff have been engaged on a new feeder-line transport, the Herald. Prototypes have been under construction and production lines are being set up to meet the demand which is expected for this versatile new aircraft. At this works, in addition, Marathons have been re-equipped and modified as RAF navigation trainers.

POWER IN THE AIR

The recent official Statement on Defence makes clear that the primary task of the RAF is to build up its V-bomber forces; of these the Victor is built to the most exacting specification.

The performance of the Victor is still on the secret list, but the Under Secretary of State for Air, Mr George Ward, in the recent debate on the air estimates, said that it had flown within a small fraction of the speed of sound at over 50,000 feet.

Our maximum effort is being made to deliver Victors to the operational squadrons of the RAF at the earliest possible date. The recent statement on defence has emphasised the supreme importance of the Victor. Highest priority is today being given to nuclear weapons and their means of delivery. The Victor, as the premier V-bomber, may well be claimed to be the most important aircraft being produced in Britain today.

The design of the new Herald transport being built by your company at Woodley was preceded by a world-wide, on-the-spot survey of airlines operating over short to medium ranges.

All the information gained on thorough tours was analysed; from it emerged the specification of the Herald. It is designed as a robust, versatile aircraft to carry passengers and freight and to operate from primitive airfields under a wide range of climatic conditions.

FINANCE

The group net profit, after providing £382,846 for taxation, is £291,024 for the year. This is an increase of £47,459, of which £26,044 is attributable to our subsidiary company at Reading.

After due consideration to your company's recent trading results and to the heavy capital expenditure to be incurred in the near future, it was decided to pay an interim dividend of 5 per cent on the ordinary stock of the company and to recommend a final dividend of 10 per cent, making 15 per cent for the year. This is an increase of 1½ per cent and involves an additional net distribution of £10,268. It is hoped that this rate of dividend will be maintained for the current year.

As in the past, we have received assistance and encouragement from government departments and official organisations and, in particular, from the Air Ministry and the Ministry of Supply.

The report and accounts were adopted.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1954.

After providing £603,900 for United Kingdom taxation the profit for the year is £1,091,379, plus £388,791 brought forward, making a total of £1,440,070. The Directors have placed £375,000 to the credit of Exploration Reserve Account and £81,000 to Pension Fund Account and have declared a final dividend of 1s. 10d. United Kingdom currency per share, less United Kingdom Income Tax, absorbing £408,875, leaving £382,095 to be carried forward.

For the last eight years dividends have been declared free of tax. There is reason to believe that this method has led to confusion in the calculation of yields and accordingly it has been decided to revert to the more normal method whereby the dividend is declared gross and paid after deduction of United Kingdom Income Tax at the standard rate. The final dividend of 1s. 10d. per share less tax was declared on March 22nd, 1955, and makes, with the interim dividend (6d. per share free of tax), a total dividend of 2s. 8.909d. per share less tax for the year compared with 2s. 5.091d. per share less tax for the previous year.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under but in no case above the market value of December 31st last, or, where no market price exists, above the Directors' valuation. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price.

The Directors record with deep regret the death on November 5th last of Mr. P. M. Anderson, Deputy Chairman and Managing Director of the Corporation. Mr. T. P. Stratten, who has been Deputy Managing Director since November, 1950, has succeeded Mr. P. M. Anderson as Managing Director.

A copy of the Corporation's Annual Trade Cycles Chart, revised to date, is enclosed with the Report.

GOLD MINING INTERESTS.

Summary of the operating results for the past year of the Companies operating in the Transvaal and Orange Free State in which the Corporation is largely concerned :—

	East Geduld Mines, Ltd.	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	St. Helena Gold Mines, Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled ...	1,863,000	1,122,000	2,185,000	800,000	1,041,000	840,000
Yield per ton dwt.	6.15	3.27	4.27	5.10	4.52	3.43
Working Costs per ton	31s. 5d.	33s. 11d.	29s. 2d.	40s. 4d.	41s. 10d.	42s. 5d.
Working Profit per ton	45s. 4d.	8s. 11d.	24s. 1d.	23s. 3d.	14s. 7d.	5d.
Total Working Profit	£3,770,000	£386,000	£2,633,000	£930,000	£758,000	£20,000
Net Profit ...	£1,772,000	£935,000	£1,274,000	£487,000	£687,000	£23,000
Dividends: Total	£1,587,000	£895,000	£1,192,000	£450,000	—	—
Per Stock Unit or share	3s. 9d.	12s. 3d.	2s. 1d.	2s. 0d.	—	—

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1954 on its shareholding in The Grootvlei Proprietary Mines was £56,000 and Geduld Proprietary Mines' dividend income in 1954 on its shareholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £657,963.

St. Helena Gold Mines. It has been decided to sink a vertical shaft (No. 2) to a depth of about 5,500 feet to serve the North-Eastern section of the property, and to extend the reduction plant by a further 50,000 tons to a total capacity of over 150,000 tons per month. Half of this extension should be in commission by the end of the current year and it is planned to treat the balance after the new shaft has been completed. The cost of the new shaft and the extensions to the reduction plant will be financed by the Company out of profits. The ore reserves at December 31st last were estimated to amount to 9,750,000 tons, assaying 5.9 dwt. per ton over a stoping width of 55 inches.

THE WITHOK PROPRIETARY COMPANY.—The Corporation retains a substantial interest in the Company which owns the mineral rights over 4,928 morgen on the Farm Withok No. 7, District Brakpan, Transvaal, and certain freehold rights thereon.

Interests in Gold Mining Companies not under the administration of the Corporation :—

STILFONTEIN GOLD MINING COMPANY.—Profits increased steadily during the year and the Company declared a maiden dividend of 6d. per share in December last. The capacity of the reduction plant is being extended to 110,000 tons per month.

WESTERN HOLDINGS.—The Company made impressive progress during the year under review and is earning substantial working profits. Development work on the basal reef horizon continues to disclose high payability with good values.

OTHER MINING INTERESTS

SAN FRANCISCO MINES OF MEXICO.—This Company earned a Working Profit of £766,000 in the year ended September 30th, 1953, and paid a dividend of 4d. per 10s. Stock unit in respect of that year. In the year to September 30th, 1954 a record tonnage of 728,800 tons of ore were treated. The results of operations for the year have not yet been published.

CHROME MINES OF SOUTH AFRICA.—Production and sales were again restricted by the limited number of trucks made available by South African Railways and the net profit for the year ended June 30th, 1954, after making provision for taxation and depreciation, amounted to £117,299. Since the close of the Company's financial year the rapid stockpiling of the excess of output over railings has necessitated a further curtailment of production and retrenchment of employees.

The Corporation is also interested inter alia in the following Company :—

TSUMEB CORPORATION.—The net profit for the year ended June 30th, 1954, was £2,486,681 compared with £3,196,522 for the previous year and dividends totalling 10s. 6d. per share were declared. During the first nine months of the current financial year dividends totalling 12s. per share have been declared.

OTHER INTERESTS

BAY HALL TRUST.—The net profit for 1954 was £103,825. A dividend of 15% less tax (against 13.64% last year) was declared. The Trust's investments as at December 31st last showed an appreciation of £922,042 over book cost of £2,470,018.

BRITISH ENKA.—The recovery in the textile trade which began in September, 1952, continued through 1954 and the Company was able to return to full production and to sell the entire output. The net profit for the year to December 31st, 1953, was £350,660, compared with a loss of £117,994 in the previous year; £100,000 was appropriated to General Reserve; a dividend of 10% was paid and the carry-forward was increased from £26,978 to £184,119. The results of operations for 1954 have not yet been published.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—Production at the Tugela Mill began in July, 1954, and by the end of the year a considerable tonnage of material of satisfactory quality, mainly for the corrugated packaging industry, had been produced.

The net profit from operations at both the Enstra and Tugela Mills for the year ended December 31st, 1954, was £324,557 as compared with £334,947 for the previous year. The Company paid an interim dividend of 1s. per share.

Since the end of the year the Company has experienced difficult trading conditions. Whilst these commercial difficulties are believed to be only temporary, in order not to weaken its cash position the Company did not declare a final dividend for the year.

EXPLORATION

Drilling operations by Capital Mining Areas, Limited, during the year under review have indicated that the area underlain by payable Kimberley Reef is larger than visualised in last year's Annual Report. Drilling operations are still in progress, but it is anticipated that during the current year the Company may be in a position to apply to the Government for a Mining Lease over part of the area. The Company has exercised certain of its options to purchase mineral rights.

Some values in the Kimberley Reef, sufficiently encouraging to warrant further work, have been obtained in boreholes drilled by one of the Corporation's subsidiary exploratory companies operating also on Capital Mining Areas. None of the other subsidiary companies in the Bethel and adjoining districts has so far encountered anything of economic interest, though further drilling remains to be done. Options over large areas have been abandoned.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, E.C.2

ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LIMITED

(Incorporated in the Union of South Africa)

GOLD MINING COMPANIES DIRECTORS' REPORTS FOR THE QUARTER ENDED 31st MARCH, 1955

(All Companies mentioned are incorporated in the Union of South Africa)

FREE STATE GEDULD MINES, LIMITED

ISSUED CAPITAL. In shares of 5s. each.....£2,199,663 5s. 0d.

During the quarter the Company purchased from Freddies Consolidated Mines, Limited, the No. 2 South Shaft of that Company, together with its ancillary equipment and buildings, and approximately 1,300 claims on the southern boundary of the Freddies Consolidated Mines, Limited, lease area. The consideration payable by the Company was £1,500,000, which has been met by the issue of 300,000 shares in the Company.

UNDERGROUND DEVELOPMENT.—During the quarter a total of 18,667 feet of underground development was accomplished, and the following were the results obtained :—

Sampled : 2,225 feet, averaging 110.52 dwts. over 5.80 inches equivalent to 641 inch-dwts.

Payable : 2,005 feet equal to 90.1 per cent. of the footage sampled, averaging 121.63 dwts. over 5.78 inches, equivalent to 703 inch-dwts.

The intersection of water-bearing fissures necessitating cementation continued to retard development operations.

The results obtained in the vicinity of individual shafts were as follows :—

No. 1 SHAFT AREA :

Sampled : 1,520 feet, averaging 75.36 dwts. over 6.25 inches, equivalent to 471 inch-dwts.

Payable : 1,330 feet, equal to 87.5 per cent. of the footage sampled, averaging 82.60 dwts. over 6.38 inches, equivalent to 527 inch-dwts.

No. 2 SHAFT AREA :

Sampled : 705 feet, averaging 208.90 dwts. over 4.83 inches equivalent to 1,009 inch-dwts.

Payable : 675 feet, equal to 95.7 per cent. of the footage sampled, averaging 228.48 dwts. over 4.60 inches, equivalent to 1,051 inch-dwts.

DRIVE FROM WESTERN HOLDINGS, LIMITED.—Development in 41 Haulage North from No. 1 Shaft of Western Holdings, Limited, continued during the quarter. A total of 419 feet was advanced, of which 164 feet was on reef. 175 feet were sampled, all of which proved payable, averaging 333.00 dwts. over 5.00 inches, equivalent to 1,665 inch-dwts. As all this reef development was accomplished on the Company's property, the results are included in the development figures for No. 2 Shaft Area.

CAPITAL EXPENDITURE.—Capital Expenditure for the quarter was £598,663.

VAAL REEFS EXPLORATION AND MINING COMPANY, LIMITED

ISSUED CAPITAL. In shares of 5s. each.....£1,825,000

DEVELOPMENT.—The development footage for the quarter totalled 11,471 feet and gave the following results :—

Sampled : 2,365 feet averaging 96.75 dwts. over 6.16 inches, equivalent to 596 inch-dwts.

Payable : 2,035 feet, equivalent to 86.0 per cent. of the footage sampled, averaging 108.80 dwts., over 6.25 inches, equivalent to 680 inch-dwts.

No. 1 SHAFT SYSTEM—SHAFT SINKING.—No. 1 Ventilation Shaft : During the quarter under review the shaft was sunk 1,817 feet to a depth of 2,568 feet below the surface. In addition at a position 975 feet below the collar, a cable pocket and a temporary pump chamber were cut, and at 1,958 feet a station cut on the elevation of the future permanent intermediate pump chamber. At an approximate depth of 1,176 feet the shaft passed out of the dolomites of the Transvaal System into the lavas of the Ventersdorp System. During March, the shaft was sunk 667 feet, a world record for shaft sinking.

No. 1 Vertical Shaft : Following upon the completion of the headgear, the erection of hoists, sheave wheels and construction of the shaft collar, sinking operations began in February 1955. At the end of March, 1955, the shaft had reached a depth of 159 feet from surface. The intersection of water-bearing fissures requiring cementation retarded shaft sinking operations. In addition to the work of sinking, an air inlet station was cut 95 feet below the bank and a sinking platform suspended in the shaft.

No. 1 Sub-Vertical Ventilation Shaft : The shaft was advanced 802 feet in the footwall quartzites below the Vaal Reef Horizon to a depth of 2,748 feet below the collar. During the period under review sinking operations were handicapped by broken ground. In addition to sinking, stations were cut on the 62 and 65 levels and a total of 319 feet of crosscutting was accomplished on these two levels.

No. 1 Sub-Vertical Shaft : The headgear excavations were completed and sheave wheels erected. The main station on the 4,000 foot level was fully excavated and a chamber cut to accommodate facilities for skip and cage changing. Preliminary sinking operations were started and the shaft was sunk 69 feet below the elevation of the collar. In addition, 344 feet of crosscutting and winzing was done to provide the arrangements necessary to maintain rapid sinking operations.

MINE BUILDINGS.—Work started on the building of a permanent store and on the foundations for four additional workshops. A fourth 500-case explosives magazine was completed.

COMPOUND.—At the No. 3 Joint Shaft a further 22 rooms were occupied, bringing the total occupied at the end of the quarter to 84.

At No. 1 Shaft the completion of an additional 14 rooms provided a total of 56 rooms now available for occupation.

REDUCTION PLANT AND URANIUM PLANT.—Excellent progress has been shown with the construction of the gold reduction and uranium plants.

EUROPEAN HOUSES.—In Orkney, a further 42 houses were completed and occupied during the period under review, thus providing a total of 52 houses now completed and occupied. At No. 1 Shaft a total of 48 houses and 50 rooms of the single men's quarters have been completed.

CAPITAL EXPENDITURE.—£960,968 (including expenditure on the Uranium Plant amounting to £85,248).

WELKOM GOLD MINING COMPANY, LIMITED

ISSUED CAPITAL. In shares of 5s. each.....£2,750,000

TONS CRUSHED.....226,500

			Per ton milled s. d.
Working Revenue	£592,986	...	52 4.3
Working Costs	568,932	...	50 2.8
Working Profit for Quarter	£24,054	...	2 1.5

No taxation and no share of profit is payable to the Government.

CAPITAL EXPENDITURE.—£185,129.

Capital Expenditure on the construction of the uranium plant amounted to £116,430. Of the underground development costs incurred during the quarter, an amount of £16,000 was charged to capital account. Both of these amounts are included in the total of £185,129.

DEVELOPMENT.—The development footage for the quarter totalled 14,135 feet, and gave the following results :—

Sampled : 4,590 feet, averaging 74.81 dwts. over 4.89 inches equivalent to 366 inch-dwts.

Payable : 3,580 feet equal to 78.0 per cent. of the footage sampled, averaging 88.44 dwts. over 5.00 inches, equivalent to 442 inch-dwts.

SHAFT SINKING.—No. 1 Shaft : The shaft was sunk 156 feet during the quarter to a depth of 3,347 feet below the collar. The cutting of 32 station was completed, together with the rock loading arrangements, thus allowing development to be carried out on this level concurrently with shaft deepening operations.

URANIUM PLANT.—The uranium plant which was commissioned towards the end of January 1955, has worked very satisfactorily. Operations are confined to the treatment of slimes from Freddies Consolidated Mines, Limited.

CAPITAL EXPENDITURE.—£245,446.

Capital expenditure on the construction of the uranium plant was £157,548. Of the underground development costs incurred during the quarter, an amount of £67,500 was charged to capital account. Both of these amounts are included in the total of £245,446.

DEVELOPMENT.—The development footage for the quarter totalled 18,146 feet and gave the following results :—

Sampled : 3,945 feet, averaging 71.69 dwts. over 8.48 inches, equivalent to 608 inch-dwts.

Payable : 3,765 feet, equal to 95.4 per cent. of the footage sampled, averaging 75.37 dwts. over 8.39 inches, equivalent to 632 inch-dwts.

URANIUM PLANT.—The uranium plant commenced operations towards the end of January, 1955, for the treatment of slimes from your Company and President Brand Gold Mining Company, Limited. The plant has operated satisfactorily from the start.

The date on which loan repayments will commence has not yet been finally determined and, as a result, no provision is being made for the time being for the redemption of the loans granted to finance the construction of the plant.

LORAINE GOLD MINES, LIMITED

ISSUED CAPITAL. In shares of 10s. each.....£8,226,686

(*Note*.—As consideration for the subscription of shares and the provision of loan facilities, the Anglo American Corporation of South Africa, Limited, has been given the right up to and including 31st December, 1957, to subscribe for 2,750,000 reserve shares in the Company at the price of 20s. per share.)

UNDERGROUND DEVELOPMENT.—During the quarter a total of 27,163 feet of underground development was accomplished, and the following were the results obtained :—

Sampled : 5,280 feet, averaging 30.25 dwts. over 8.16 inches, equivalent to 247 inch-dwts.

Payable : 4,085 feet, equal to 77.4 per cent. of the footage sampled, averaging 35.33 dwts. over 8.16 inches, equivalent to 288 inch-dwts.

The results obtained from development in the vicinity of individual shafts were as follows :—

No. 1 SHAFT AREA :

Sampled : 2,350 feet, averaging 44.51 dwts. over 6.27 inches, equivalent to 279 inch-dwts.

Payable : 1,950 feet, equal to 83.0 per cent. of the footage sampled, averaging 50.16 dwts. over 6.28 inches, equivalent to 315 inch-dwts.

No. 2 SHAFT AREA :

Sampled : 2,930 feet averaging 22.85 dwts. over 9.68 inches, equivalent to 221 inch-dwts.

Payable : 2,135 feet, equal to 72.9 per cent. of the footage sampled, averaging 26.70 dwts. over 9.86 inches, equivalent to 263 inch-dwts.

Satisfactory progress has been maintained in the connecting haulages between Nos. 1 and 2 shafts and a holing was made earlier this month.

REDUCTION PLANT.—The plant operated for metallurgical and test purposes during the quarter.

CAPITAL EXPENDITURE.—Capital Expenditure for the quarter was £628,626.

TRADE INDEMNITY COMPANY, LIMITED

RAPID GROWTH OF ACTIVITIES

SIR JOHN MAKINS ON CREDIT INSURANCE

The thirty-seventh ordinary general meeting of Trade Indemnity Company, Limited, was held on April 15th at 24 Cornhill, London, E.C.

The following is an extract from the statement by the chairman, Sir John Makins, which has been circulated with the report and accounts for the year ended December 31, 1954:

The gross premiums earned in 1954 came to £1,422,731.

The turnover of transactions underwritten in 1954 at £840 million was 40 per cent higher than the corresponding figure for 1953. Claims paid less salvages at £389,298 are up 45 per cent, but the ratio to gross premium income is still only 27 per cent and is no worse than the ratio for 1952.

Our retained premium was £450,254 and our share of gross claims £94,452.

If we divide the premiums and claims over the three accounts, we get a similar result to that which I referred to a year ago. Thus, under 2 per cent of the premiums and roughly 29 per cent of the claims relate to 1952 policies, about 49 per cent of the premiums and 59 per cent of the claims to 1953 policies, and about 49 per cent of the premiums and 12 per cent of the claims to 1954 policies.

The expenses of management in 1954 came to £140,331, which is just under 10 per cent of the gross premium income.

We now come to provision for outstanding claims and the balances of the underwriting accounts. In so far as 1952 (including previous years) is concerned, we are satisfied that £48,037 will suffice to look after outstanding claims and unexpired liability. This leaves us with a balance of £213,761, which we propose to transfer to the profit and loss account.

As regards 1953 and 1954, it is too early to be definite and we are carrying forward the balances of £233,580 and £80,392 as is customary. These two balances include provision for outstanding claims, unexpired liability and taxation, and should be adequate. We can, as usual, expect substantial additional premiums on the 1954 account.

Turning next to the profit and loss account, interest on investments and other income (gross) comes to £34,359, to which must be added £213,761 transferred from 1952 underwriting account. Against this total of £248,120, taxation on income in the account will absorb £167,419 as against £137,786 for 1953. The increase arises on income tax (plus £7,653) and on the excess profits levy of £37,500. Against that profits tax shows a decrease of £15,520.

In the result, taxation absorbs roughly two-thirds of our gross profit for 1954, leaving us with £80,701 to which must be added a carry-forward of £159,739 less £50,000 capitalised and applied in paying up 50,000 £1 shares issued to members in 1954. We therefore arrive at a figure of £190,440 from which £30,000 has been transferred to contingency reserve, bringing this up to a round figure of £100,000. The directors recommend payment of a dividend of 10 per cent less income tax. On the present paid up capital this will absorb £24,750, leaving £135,690 to carry forward.

I will again anticipate the proceedings of the extraordinary general meeting which follows after these proceedings by mentioning the proposal to increase your company's capital by £50,000 for the fifth year in succession, thereby bringing it up to £500,000 in fully paid £1 shares.

GENERAL REMARKS

The nation has recently experienced a fairly sharp tug on the reins by the Chancellor of the Exchequer with the object of forestalling a tendency for inflationary trends in the economy to get out of hand, and I think it may be useful if I endeavour to explain where we think that credit insurance stands in this respect.

In our opinion, credit insurance should not be an inflationary factor if it is properly directed and controlled. Its object is to protect merchants and manufacturers against losses due to the insolvency or protracted default of their customers to whom they sell goods on credit terms, and it should enable the insured to develop and expand his business on sound lines. That is not inflationary unless it leads to an increase in the size and period of credits which is not properly related to the efficient manufacture, sale and movement of goods.

When restrictions were removed from hire purchase business in July, 1954, we were asked to consider a form of credit insurance for hire purchase finance companies and dealers and retailers selling goods on the "never-never" system. We decided against the proposal because we could not see the basis of a sound demand for credit insurance in this respect.

Naturally, there are exceptions when expensive machinery or equipment is purchased on extended credit terms, but these medium term risks, as we call them, are in a category of their own.

EXPORT CREDITS

It is obviously in the national interest to extend the volume of export credits insurance and we shall continue our efforts to achieve this, with every expectation of success; but probably more could be done if their existed some closer form of co-operation between the export credits guarantee department and ourselves. With the advantages of co-operation in mind, we have joined the Union d'Assureurs pour le Controle des Credits Internationaux, which is concerned with the activities of governments in the export credits field.

At the same time, we continue to play a leading part in the affairs of the International Credit Insurance Association, of which our general manager, Mr Patrick, has now been president for nearly three years. Through these two channels we are able to keep in close touch with changing conditions which may affect our role.

Meanwhile, we are under pressure to help the development of credit insurance locally in Commonwealth countries, and there we are confronted with a dearth of trained personnel. As you will appreciate credit insurance is a very specialised business and the rapid expansion of our own activities in this country has absorbed our young men as fast as we have trained them. The process still continues.

In order to accommodate our growing staff, we have had to look for larger offices and we expect to move to a new building, 31/45 Gresham Street, before the end of the year. When we do that there will be more room for training and expansion, and we confidently anticipate that we shall increase our efficiency and widen the basis of our operations. The report was adopted.

LEGAL AND GENERAL ASSURANCE SOCIETY LIMITED

REVIEW OF OPERATIONS FOR THE YEAR 1954

STATEMENT BY THE CHAIRMAN, THE HONOURABLE W. B. L. BARRINGTON

The one hundred and eighteenth annual general meeting of the Legal and General Assurance Society Limited will be held on May 11th at Aldwych House, Aldwych, London, W.C.

The following is an extract from the circulated statement by the chairman, the Honourable W. B. L. Barrington:

LIFE ASSURANCE AND ANNUITY FUND

The society's achievements in the field of life assurance can be regarded with much satisfaction in the light of yet another record total of new business. This, for the first time in our history, has exceeded £100 million. The actual figure—£101,157,391—of net new sums assured includes substantial increases arising under existing group policies and also reflects a material increase in new production in every major section of life business, not only in the United Kingdom, but also in Southern Africa.

The total net premium income amounted to £30,597,751, an increase of £2,733,425 over the previous year.

OVERSEAS BUSINESS

Steady progress in our South African affairs, with a contribution to our new life assurance business in 1954 of £17,527,789 net sums assured, which is again a record.

MORTALITY EXPERIENCE

An investigation has, as usual, been made into our mortality experience and I am glad once again to be able to report a favourable result. Death claims during the year were less than those expected under the mortality table used in valuation. While the experience under our pension business was good, it was rather less favourable in respect of privately purchased annuities.

RATE OF INTEREST

The gross rate of interest earned on the life assurance and annuity fund, excluding the amount invested in purchased reversions, was £4 14s. per cent as compared with £4 11s. 5d. per cent in the previous year. The corresponding net rates were £4 1s. 4d. per cent and £4 0s. 10d. per cent respectively.

EXPENSES OF MANAGEMENT

The total cost of commission and expenses of management expressed as a ratio to the life premium income was 9.34 per cent as compared with 9.41 per cent in 1953 and 9.49 per cent in 1952. I think you will agree that this represents a very modest level of expense which, I hope, we shall be able to maintain. We do not, of course, take into our calculation of the expense ratio the large total of consideration monies received for immediate annuities, which amounted last year to £1,210,028.

FIRE INSURANCE ACCOUNT

The net premium income of the fire insurance account amounted to £2,111,502. This represented an increase of £63,165 and was achieved in spite of a substantial reduction in the amount of business received from other companies under reinsurance treaties.

After making provision for unexpired liabilities and after transferring the sum of £20,000 to exchange reserve, the underwriting surplus amounted to £214,469, which is 10.16 per cent of the premium income.

The balance of £85,194 represents the net profit on the account and this has been added to the additional reserve, which now stands at £465,150.

ACCIDENT INSURANCE ACCOUNT

The net premium income of the accident insurance account amounted to £1,481,076, an increase for the year of £100,829.

After providing for unexpired liabilities the underwriting surplus amounted to £135,343. After adding £58,898 representing interest on the funds the total surplus was £194,241. The balance of £68,914 represents the net profit on the account and has been added to the additional reserve, which now amounts to £283,980.

The totals of our combined fire and accident accounts were therefore—premiums, £3,592,578; claims paid and outstanding, £1,482,187 or 41.26 per cent of income; commission, expenses of management and overseas taxation, £1,593,130 or 44.35 per cent. Profit, after providing for unexpired liabilities and before deduction of United Kingdom tax, was £374,777 or 10.43 per cent, which, I think you will agree, is a satisfactory result.

MARINE ACCOUNT

The actual fund at the end of 1954 was £730,522, as compared with £532,479 at the end of 1953. The 1952 account has been closed and the balance on that year of £37,504 has been retained in the fund. This compares with a final balance of £25,149 on the 1951 account.

PROFIT AND LOSS ACCOUNT

The balance brought forward in the profit and loss account is £468,396. The directors now recommend the payment of a final dividend of 5s. 6d. per share. This, with the interim dividend paid on January 1, 1955, will make a total of 8s. per share, as compared with the total of 6s. 9d. per share paid for the year 1953. The amount carried forward is £1,037,704, which includes the sum of £750,000 to which I shall refer later.

ASSETS

The assets of the society amounted to £230,295,107, representing an increase during the year of £22,341,609, and the investment of our growing funds engages the constant attention of the board.

ARTICLES OF ASSOCIATION

I will only refer briefly to the proposed adoption of new articles of association, as this is the subject of a separate letter explaining in detail what is involved. The position in short is that following the important alterations which were adopted last year, we feel that it is now desirable to bring the society's articles up to date and into line with the Companies Act of 1948. They had been virtually unchanged since 1922, and the adoption of the new articles is, in the directors' opinion, very desirable and is recommended.

SHARE CAPITAL

Lastly, in connection with the society's share capital, I have to refer to the directors' proposals which are embodied in the resolution now in your hands. At present this capital is £1 million, in one million shares of £1 each, of which 5s. per share has been paid, and it is recommended that these shares should now be made fully paid.

Coupled with this is the recommendation previously mentioned, that the final dividend should be increased to a total of 8s. per share. The dividend at this level is more than covered by the existing balance in the profit and loss account. The shareholders will appreciate that a transfer of profit from the life assurance and annuity account cannot be made until after the quinquennial valuation at the end of 1956 has been completed. The above proposals are submitted by the directors in the confidence that they represent a proper and desirable course of action.

In conclusion, I should like once again to express to Mr G. W. Bridge, our very able general manager, and to all members of the staff, both at home and abroad, my own and the directors' very sincere thanks for, and deep appreciation of, the splendid work they have done in helping the society to sustain such a high level of activity and progress.

PROCEA PRODUCTS

The eighteenth ordinary general meeting of Procea Products Limited was held on April 18th in London, Mr D. W. Kent-Jones, PhD, BSc, FRIC (the chairman), presiding.

The following is an extract from his circulated statement:

The profit for the year ended August 31, 1954, was £32,049. The larger profit this year—indeed, the highest actual profit figure so far achieved by the company—is largely due to the extension of our own baking interests.

The Wrapped and Sliced Small Procea Loaf: Last year I discussed the many reasons why we had decided to produce this loaf ourselves, and it is sufficient to say that the proposition has been a most successful one. The coverage will be extended as soon as possible until we hope the whole of the country will be catered for. This means the provision of suitable production centres, but it would be impossible to start up a large number at one time without the provision of additional working capital.

To enable us to do what we want, it is, therefore, necessary to raise further capital, but at this stage I cannot say what form this is likely to take. If and when we issue further capital it is our intention to apply for a quotation on the London Stock Exchange.

I feel that we have now met and overcome the principal difficulties we knew that we would meet after the end of the war, such as decontrol, changed food habits, etc. There seems now no reason why there should not be ready expansion on profitable lines.

The report was adopted and a total dividend of 7½ per cent for the year was approved.

JAS. WILLIAMSON & SON LIMITED

A SUCCESSFUL YEAR

LORD PEEL'S STATEMENT

The twenty-fourth annual general meeting of Jas. Williamson & Son, Limited, was held on April 20th at The Royal King's Arms Hotel, Lancaster. Mr F. E. Winmill presided in the absence of the chairman, the Right Honourable the Earl Peel, who is abroad, and presented Lord Peel's apologies for his absence.

The secretary (Mr L. Beswick) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated to stockholders with the report and accounts for the year ended December 24, 1954:

Nineteen hundred and fifty-four was the first year since 1938 in which, with very minor exceptions, the company was able to trade without restriction. I am glad to be able to report that it was successful. Our net profit before tax at £926,464 is the highest in the company's history, and this was earned on a record turnover in spite of having reduced prices of most of our products at the beginning of the year.

CAUSES OF SATISFACTORY RESULT

This satisfactory result may be attributed to three main causes; to the generally favourable conditions in the building trade; to hard and steady work in all departments; and to the increased output flowing from the new and improved plant on which we have spent large sums of money since the war. It is true that some markets where we used to do a substantial turnover have been closed to us. It is true also that the dock strike in the autumn prevented us from shipping many goods we had on order. By and large, however, both domestic and commercial building has been very active, not only in this country, but in Europe, America and many other countries, and we have not been slow in meeting the consequent increased demand for floor coverings, table coverings, and other coated fabrics.

Having said this it is only right for me to say that trading conditions may not be quite so favourable in 1955. Our costs are rising again; the expense of maintaining and replacing machinery and buildings grows no less; and many of our raw materials are now dearer. Linseed oil, for example, which after having been freed from control fell by the middle of 1954 to its lowest price since the war, has risen considerably during the past six months. Nevertheless we prefer to have a free market, and even though trading may not be as profitable in 1955, I see no special reason why the demand for our products should fall off. Our order book after the first two months of the current year is healthy and we have equipped ourselves, and continue to equip ourselves, to meet the increased competition which we know is bound to come.

PLANT REPLACEMENTS AND IMPROVEMENTS

I have referred to the large sums of money we have spent on plant and machinery. Since the beginning of 1946 this has amounted to £2,547,383 and even though a large part of this was for replacement of old plant, always at higher cost and usually in improved form, a considerable part nevertheless represents expansion. This expansion has been paid for out of past profits, or, to put this another way, much of our reserves and surplus which stood in the balance sheet at the end of 1953 at £1,733,133, and to which your board have added £269,547 at the end of 1954, is permanently invested in plant and buildings. Your board consider it desirable to recognise this fact by capitalising that part of our reserves.

You will find enclosed a notice convening a meeting to consider resolutions to increase the nominal capital of the company to £4 million, and to issue 1,330,848 new "A" stock units in the proportion of one new "A" stock unit for every three units of ordinary stock at present held. The new stock will be in every way equal to the present ordinary stock except that it will not carry the right to vote and will not be entitled to the final dividend declared in respect of 1954.

INCREASED DIVIDEND

Your board have given much thought to what the dividend should be for 1954. The profits were good and they feel it right that the shareholders should receive some benefit from them. They therefore propose to recommend a final dividend of 12½ per cent which, together with the interim dividend of 2½ per cent declared in October, makes 15 per cent for the year against a total of 12½ per cent paid in respect of 1953.

I should like to make clear that this increased dividend and the scrip issue are in no way connected. It has become customary and is regarded by some as almost perfunctory to remark that a scrip issue does not imply an increased distribution of profits in future years. I would, however, go further and say that, whilst your board consider the above dividend a proper distribution in relation to the profits for 1954, they will not hesitate to recommend a lower distribution if they consider profits in any year do not justify its maintenance.

You will be asked to confirm the appointment to the board as from January 1, 1955, of Mr Harry Priestley. Mr Priestley entered the company's service in 1935 and was appointed commercial manager in 1952. Your directors feel certain that he will prove to be a valuable addition to the board.

THANKS TO MANAGEMENT AND EMPLOYEES

Finally, I must express our thanks to the management and to all the employees of the company for the work that they have done during the past year. The majority of them have been with us for many years and the results we are able to show would have been impossible to obtain without their loyal cooperation.

The report and accounts were adopted; and the proposed dividend was approved.

The retiring directors, the Right Honourable the Earl Peel and Mr F. E. Winmill, were re-elected; the appointment of Mr H. Priestley to the board was confirmed; and the remuneration of auditors, Messrs. Viney, Price and Goodyear, was fixed.

At a subsequent extraordinary general meeting of the company resolutions were passed increasing the authorised capital and approving the proposed scrip issue.

NORTH BRITISH AND MERCANTILE INSURANCE

SATISFACTORY QUINQUENNIAL VALUATION

The annual general meeting of the North British and Mercantile Insurance Company, Limited, will be held on May 12th in Edinburgh.

The following is an extract from the circulated statement of the chairman, the Right Honourable Lord Brand, CMG, DCL:

Fire Department.—During the past year this most important section of our business has, I am sorry to say, failed to maintain the satisfactory rate of profit to which we have become accustomed. Premiums at £16,401,469 show a modest increase of £161,547. Losses at £8,670,504, 52.87 per cent of premiums, against £7,811,461, 48.10 per cent in the previous year, have also increased by £859,043.

The amount of profit to be transferred to the profit and loss account is £60,047, 0.37 per cent of the year's premiums, compared with £963,414, 5.93 per cent in the previous year.

Casualty Department.—Total casualty premiums amounted to £5,368,247, being £290,981 in excess of those for 1953 of £5,077,266.

The underwriting profit is £367,260, 6.84 per cent of premiums, compared with £366,374, 7.22 per cent for 1953.

Marine Department.—The Marine Premium income for 1954 was £1,566,197, which compares with £1,702,750 in 1953.

Claims totalled £1,024,919 against £1,321,578 in 1953, and expenses of management and overseas taxes amounted in 1954 to £266,038, the corresponding figure for 1953 being £294,922. We have transferred the sum of £260,071 from our marine fund to profit and loss account.

Life Department.—The year 1954 completed another quinquennium.

After deducting reassurances, the new business completed during 1954 amounted to the satisfactory total of £11,403,255, which represents an increase of 10.9 per cent on the previous year's figure of £10,283,433.

As you will see from the report submitted by the Actuary the valuation result is very satisfactory. The surplus has justified the recommendation that a bonus at the rate of £2 per cent per annum be declared for each of the five years covered by the investigation.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Net interest on investments amounts to £998,173, compared with £945,913 in the previous year. The transfers from the fire, accident and marine accounts total £687,378 as against £1,546,643 in 1953. Credit has been taken for one-fifth of the shareholders' portion of the profit from the life department Provision has also been made for the transfer from the annuity branch of £750,000 and from the sinking fund branch of £20,000.

The proposed dividend of 11s. per share and the preference dividend will absorb £704,000. United Kingdom taxes absorb £452,714 and overseas taxes charged to this account £43,180.

We are left with a final balance on the account of £14,587,322, representing the aggregate amount carried forward in the accounts not only of the "North British" but also of its associated companies at home and overseas.

MENTMORE MANUFACTURING COMPANY

INCREASED HOME SALES

The nineteenth annual general meeting of the Mentmore Manufacturing Company Limited was held on April 19th in London, Mr A. Andrews (chairman and managing director) presiding. The chairman said:

The profit for the year, before providing for tax, is £190,579, compared with £206,225 for the previous year. The actual reduction in trading profit, however, is £10,568, the remaining difference of £5,078 being the amount which was added to our profit figure last year because of the settlement of a loss of profits claim arising from the fire at Wood Green in 1952.

CONTINUED AND STRENUOUS COMPETITION

The year under review has been one of continued and strenuous competition in the export markets, both from Japan and Germany. It has been necessary for us, in many markets, to produce special lines at prices which will meet this competition. We have, in addition, been faced with rising costs in certain of our raw materials and also an award negotiated with the unions which has increased our wage bill in the year by approximately £15,000.

Despite these increases in our costs, we have not raised the price of our products on the home market and, in fact, have introduced new lines which show considerable price reduction to the public. These increases in our costs and the price reduction to which I have referred, have been, to a large extent, offset by savings in costs made possible by improvements in design and production.

Although we have had these problems with our export markets, the sales of our Platignum and Mentmore products on the home market have increased considerably during the year.

DIVIDEND MAINTAINED

Turning to the accounts, you will see that owing to the cessation of the excess profits levy, our net profit, after paying tax, notwithstanding the reduction to which I have referred, is only £1,294 lower than last year. Therefore, it is possible for your board to recommend a final dividend of 20 per cent, less tax, which will keep the ordinary dividend at the same level as last year, that is, 40 per cent for the year, transferring £42,756 to reserve and still carrying forward £61,728.

From the profit and loss account it will be observed that taxation absorbs about £14,300 less than last year. £6,500 of this is due to the fact that excess profits levy was payable only in respect of the profits of the first quarter of the year under review. On income tax the saving was £7,500 due, of course, to our assessment being made on a smaller figure and for the same reason profits tax is down by £300. Next year we shall reap further benefit by the abolition of excess profits levy to the extent of £3,000.

CAPITALISATION OF RESERVES

The amount of issued capital employed in the company is £245,233 and, as you will see from the report, it is proposed to capitalise from the company's general reserve and distribute amongst members, two new ordinary stock units of 1s. each for every three ordinary stock units held by them on March 21, 1955.

As I have already mentioned, your directors propose to transfer to general reserve from the profit and loss account £42,756, making this figure £214,489. When the proposed bonus issue has been deducted from this amount it still leaves a figure of £100,000 for general reserve.

Last year, you will remember, I spoke to you about the proposal to build at Stevenage New Town. Plans for the new factory have been drawn up and this matter is well in hand. As you will see from the balance sheet, we have sufficient cash reserves to finance this project, apart from the fact that we own one freehold factory at Wood Green and our leasehold factory at Hackney which should, according to estimates which we have received from property surveyors, realise a sum considerably in excess of the amount shown in our balance sheet.

We have again had a satisfactory year in our plastics division, which continues to expand steadily.

At our last meeting I told you that it was proposed by your board to alter the name of the company from Mentmore Manufacturing Company Limited to Platignum Pens Limited, because it was believed that owing to the very good name which our Platignum products enjoy, it would be to our advantage to make this change. However, although our products have such a good reputation under the brand name Platignum, our customers in the retail trade and in the markets overseas are so familiar with the name Mentmore Manufacturing Company Limited that it was eventually felt it would be undesirable to make this alteration.

GENERAL REFRACTORIES LIMITED

GENEFAX HOUSE, SHEFFIELD, 10

A comprehensive range of refractories serving all industries is produced by the Company and its Subsidiaries at their Works and Quarries situated in many parts of England, Scotland, Wales, and in Belgium. Research and technical field service facilities are available. The Company has offices and representatives throughout the United Kingdom and Agents in all parts of the world.

SUMMARISED CONSOLIDATED BALANCE SHEET OF GENERAL REFRACTORIES LTD., & SUBSIDIARIES

Based on figures as at 31st December, 1954

	£		£	£
Issued Capital	1,040,000	Fixed Assets	3,507,117	
Capital Reserves	178,473	*Less* Accumulated Depreciation	1,778,546	
Revenue Reserves and Unappropriated Profits	891,559			1,728,571
Liabilities	1,629,274	Trade Investments, etc.		13,138
		Current Assets		1,997,597
	£3,739,306			£3,739,306

SUMMARISED APPROPRIATION ACCOUNT OF GENERAL REFRACTORIES LIMITED.

	£
Profit for the year after providing for Depreciation, Taxation, etc.	223,042
Net Distribution for year to Stockholders	100,100
Retained in the business	£122,942

EXTRACTS FROM THE CHAIRMAN'S STATEMENT

Turnover in the Home Market reached a very satisfactory level and your Company continues to maintain its leading position in the industry. Considerable progress has again been made in Overseas Markets and the orders booked in 1954 showed an increase of no less than 56% over 1953. Large tonnages were booked in the last three months of the year for delivery in 1955 and recently we have been able to resume business with the Argentine Republic as a result of some relaxation in currency and import restrictions.

The Trading Profits of the Group amounted to £685,181. The Group Surplus for the year, after providing for Depreciation and Taxation amounts to £245,554. Your Directors recommend the payment of a Dividend of 17½%, less Income Tax.

It is clear that we are on the threshold of a new era—the atomic age—with all its immense potentialities. Out of evil good may come. Out of the development of the atom bomb our scientists are daily making new discoveries which, if harnessed to peaceful ends, may well revolutionise the economy of the world within a generation. Whether the threat of inflation and international uncertainties will imperil the prosperity of the country only time can tell. Come what may, I can say with confidence that your Company is in a very strong position to take advantage of favourable developments or to withstand any strains which may be thrust upon it.

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Genefax House, Sheffield, 10.

CURRENT YEAR'S PROSPECTS

Our trade at home continues to increase, but on the export markets we are still faced with serious problems. In addition to the Japanese and German competition which I have mentioned, and which is most intense throughout the East and Near East, we are faced with what I am beginning to think is likely to be a recurrent recession in our Australian market. As you will have read, the Australian balance of payments is not considered by the Government of that country to be satisfactory and a programme of curtailment of imports has commenced. Unfortunately, our type of product is amongst those, the importation of which will be affected. We are, however, confident that the steps which we have taken to meet the competition in our other export markets will result in our obtaining a fair share of the business to be done.

We have also met with considerable success in the home market with certain of our new lines, amongst which I will mention our Platignum Kleenpoint Ball pen, which, owing to a special ink formula, has been particularly successful. All of the foregoing leads me to feel that I can give you a reasonably optimistic forecast as to the current year's results.

Finally, on behalf of the board of directors, I wish to express thanks to all of our staff and employees for their loyal services throughout the year.

The report and accounts were adopted.

Resolutions were also passed approving (1) the increase of the capital of the company from £260,000 to £500,000 by the creation of 4,800,000 ordinary shares of 1s. each; (2) the capitalisation of £114,488 18s. of the general reserve and its allotment to ordinary stockholders in the proportion of two new ordinary shares for every three ordinary stock units of 1s. each held; and (3) the conversion of the said new ordinary shares into stock as and when issued.

MONSANTO CHEMICALS LIMITED

The following is a précis of the circulated statement of the Chairman, Mr. Edward A. O'Neal, Jr., which will be presented at the Annual General Meeting on 12th May, 1955.

OPERATIONS/Net sales in 1954 reached the record total of £12,634,616, an increase of £1,781,762 over 1953.
Exports were also a record at £4,799,179 and represented 38 per cent of total sales.
Net profit was £806,499, an increase of 20 per cent over 1953. Dividend for the year on the ordinary stock totalled 22½ per cent on the nominal value of the stock.
The record sales which were achieved in face of increased competition both at home and abroad enabled most plants to be operated at full capacity. Continuous effort was directed to improving manufacturing efficiency, the quality and properties of products and to expanding facilities for giving technical service to customers.
During the year the number of employees increased from 3,435 to 3,683.

EXPANSION/Plans have been laid and construction begun for substantial developments during the next few years. Capital expenditure during 1954 totalled £471,471. The board has also authorised further capital expenditure of £2,800,000.
Expansions were carried out in a number of manufacturing plants at both factories to give increased production of polystyrene plastic, chemical additives for lubricating oils, chemicals for the rubber industry, intermediates for detergents and raw materials for the paint and plastics industries.
Expansions under way include facilities for producing rubber-like resins for synthetic shoe solings and emulsion paints, also a major plant for the manufacture of maleic anhydride. Maleic anhydride is the basic raw material for the manufacture of alkyd and polyester resins employed in the paint and plastics industries.
A major project has been launched for the production of cyclohexylamine.
Research facilities have also been expanded.

SUBSIDIARY AND ASSOCIATED COMPANIES/Monsanto Chemicals (Australia) Limited showed increased earnings. Profits were ploughed back to assist expansion programme.
Monsanto Chemicals of India Limited showed a satisfactory increase in sales volume against heightened competition.
Forth Chemicals Limited is making good progress with the doubling of capacity for manufacturing styrene monomer. A project for still further expansion has been authorised.
The Tororo Exploration Company Limited interested in the commercial development of Uganda phosphate and niobium deposits has made very good progress in solving preliminary technical questions.

Copies of the Annual Report are available on application to the Department of Industrial and Public Relations.

MONSANTO

THE IMPERIAL TEA COMPANY LIMITED

CAPITALISATION OF RESERVES

MR R. A. SIMSON'S STATEMENT

An extraordinary general meeting of The Imperial Tea Company, Ltd., was held on April 18th in London to consider resolutions for the capitalisation of reserves.

Mr R. A. Simson, CBE, chairman, said: The object of today's meeting is to consider resolutions to provide for the capitalisation of reserves and the issue to ordinary stockholders of one new fully-paid ordinary share of £1 for each two £1 units of ordinary stock. We have recently received strong representations from a large body of preference stockholders that the proposals are inequitable having regard to their effect upon the position of the preference stockholders as a class.

As the Articles stand at present the preference stockholders are not entitled on a winding up to any preferential repayment of capital but are entitled to share in the surplus assets *pari passu* with the ordinary stockholders. As regards voting rights they have one vote per share and are entitled to vote at all meetings of the company. They are not entitled to participate in an issue of fully-paid shares resulting from a capitalisation of reserves. The effect of the present proposals would be to reduce their proportionate voting power and their share of the surplus assets on a winding up.

In the circumstances it has been represented to us that it would be more satisfactory from every point of view if the rights attached to the preference stock were revised to provide for a higher rate of interest and for a preferential right to the repayment on a winding up of £1 per £1 unit in lieu of the existing right to share *pari passu* with the ordinary stockholders in the surplus assets.

PROPOSED REVISION OF RIGHTS

The board, now being aware that a large body of preference stockholders would favour a revision of their rights on the lines I have indicated, has reviewed the position afresh. We have come to the conclusion that such an adjustment of the relative rights of the two classes of stockholders would be reasonable from the point of view of both classes and that the right course is to take early steps to invite stockholders to approve proposals for such an adjustment providing for, amongst other things, an increase in the rate of dividend payable on the preference stock from 5 per cent to 6 per cent and some limitation on the circumstances in which the preference stockholders would be entitled to vote.

I wish to make it clear that having regard to the representations which have been made the board feel that the capitalisation proposals should only be proceeded with today on the basis that members will as soon as practicable be invited to approve the adjustment of the respective rights of preference and ordinary stockholders I have outlined to you.

A detailed statement of the proposals will be circulated to members as soon as possible, together with notices convening separate class meetings of the preference and ordinary stockholders and an extraordinary general meeting of the company.

The resolutions capitalising £200,000 of the reserves and approving the distribution of one share for each two units of stock and the conversion of these shares into stock were duly passed.

GRESHAM LIFE ASSURANCE SOCIETY LIMITED

ANOTHER RECORD YEAR

HONOURABLE W. B. L. BARRINGTON'S REVIEW

The one hundred and sixth annual general meeting of the Gresham Life Assurance Society Limited was held on April 14th at 188 Fleet Street, London, E.C.

The Honourable W. B. L. Barrington, the chairman, who presided, said :

It is with deep regret that I refer to the death, on December 11, 1954, of Major General Sir John H. Davidson, KCMG, who had been a director since 1923, and was deputy chairman from 1938 to 1951, a position which he held with conspicuous ability and charm. All who knew him could not fail to appreciate his high character and outstanding personality. To succeed him the directors appointed Sir Ronald Matthews, DL, a director of the Legal and General, whose re-election is to be submitted to this meeting.

I should like to take this opportunity of extending our warm congratulations to Viscount Harcourt upon his appointment as Her Majesty's Economic Minister in Washington. This appointment means, of course, that Lord Harcourt's valuable services will not be available to the society for a time, but I am happy to say that he has acceded to the request of the directors to retain his position as deputy chairman of the society during the currency of this very important appointment.

I am pleased to report that our new business during 1954 again constituted a record for the society. The total sums assured under life and endowment policies of all types, after deducting amounts which we reassured with other companies, amounted to £12,502,000. This is an increase of £1,491,000, or 13½ per cent over last year's figure of £11,011,000, which, you may remember, was the previous highest total sum assured in the society's history.

Three-quarters of the increase in net sums assured last year was attributable to our home business, which increased by £1,120,000, or nearly 20 per cent, from £5,715,000 to £6,835,000.

Our overseas production increased by £370,000, from £5,297,000 to £5,667,000.

I should like particularly to congratulate our French branch on increasing its new business by over £600,000, almost 50 per cent of the 1953 figures. The production of new business in that branch received a considerable impetus from the celebrations of the centenary of our commencing operations in France. A small delegation, including Lord Harcourt, attended from London.

The value of life assurance to the community cannot be over-emphasised. Although the primary purpose of our policies is to protect dependants in the event of early death and to provide for retirement in old age, life assurance plays an additional and important role in the country's economy. Life assurance premiums are a form of saving and they find their way, via the assurance company, to the capital markets to assist in the re-equipment and expansion of industry upon which the well-being of the community ultimately depends. Our increasing new business is an indication that these features of life assurance are appreciated, and the society's branch managers and representatives in this country and abroad can justly feel proud that they are serving, in various ways, the community in which they live.

THE SOCIETY'S FUNDS

A further improvement occurred during the year in the quotations on the stock exchange of most sections of our investments, and I am glad to report that the usual valuation of the society's stock exchange and other investment assets revealed an increased margin of appreciation over book values as at December 31, 1954.

The average rate of interest earned during the year on the society's funds increased from £3 16s. 4d. per cent to £3 18s. 9d. per cent after deduction of income tax. This further increase, following on that of last year, is, needless to say, most welcome.

LAST YEAR OF QUINQUENNIUM

As 1955 is the last year of the current quinquennium, the customary valuation will be made by the society's actuary as at the end of the year. The results and the directors' recommendations will be made known at the next annual general meeting.

MANAGEMENT AND STAFF

In conclusion I should like once again to put on record our high appreciation of the services of the management and staff at head office and to express our thanks to them, as well as to our overseas managers and their assistants and staff. The work of all has been in every way admirable.

The report and accounts were unanimously adopted and, the other formal business having been transacted, the proceedings terminated with a vote of thanks to the chairman.

THOMAS TILLING LIMITED

CONTINUED GROWTH OF THE GROUP

MR W. LIONEL FRASER'S REVIEW

The fifty-eighth annual general meeting of Thomas Tilling Limited will be held on May 18th at Crewe House, Curzon Street, London, W.1.

The following is an abridgment of the review by the chairman, Mr W. Lionel Fraser, CMG, in respect of the year ended December 31, 1954, circulated to stockholders with the 1954 report and accounts :

The results of the year 1954 reflect the continued growth of the group both amongst individual companies, and through the acquisition of new interests by the parent company.

The group profit before taxation is £1,636,901 (1953 £1,457,860) and after allowing for the interests of minority shareholders, the proportion of this profit attributable to Thomas Tilling Limited is £1,013,000 (1953 £911,000). After allowing for taxation, the profit attributable to Thomas Tilling Limited is £454,221 which is an increase of £74,181 over 1953.

The preference dividend for the year amounting to £9,075 has been paid and your board have pleasure in recommending the payment of a dividend on the ordinary stock of 10 per cent as compared with 7½ per cent for 1953

INTERIM DIVIDEND

For many years prior to 1948 your company had paid an annual dividend of 10 per cent, of which 5 per cent was paid as an interim and 5 per cent as a final, but following the sale of the company's road transport interests to the British Transport Commission in that year, the payment of interim dividends was discontinued. In view of the above proposal again to resume the payment of a dividend of 10 per cent per annum, your board now feel justified in reverting to the previous practice and it is accordingly their intention, provided no unforeseen circumstances arise, to declare an interim dividend of 5 per cent, next November, in respect of the current year's trading.

After referring to the two companies in which a majority interest has been purchased since the end of 1954, namely Mutual Finance Limited (hire purchase finance, brokerage and banking) and Walton Hosiery Company Limited (manufacturers of fully fashioned nylon stockings), also to Lime-Sand Mortar Limited (ready-mixed mortar and ready-mixed concrete manufacturers, sand and gravel producers), in which additional shares had recently been purchased increasing the company's holding to a majority interest, the chairman dealt with the activities of the other subsidiary companies :

Bagshawe and Company Limited (manufacturers of conveyors and elevators, mechanical chains and malleable iron castings).
Cornhill Insurance Company Limited.
Daimler Hire, Limited.
Mark Dawson and Son, Limited (worsted spinners).
Hobourn Aero Components, Limited (manufacturers of light engineering components, textile machinery, electrical convection heaters).
James A. Jobling and Company, Limited (manufacturers of "Pyrex" brand glassware).
Newey and Eyre, Limited (industrial electrical engineering suppliers).
Spray and Burgass, Limited (dyers and finishers).
Stratstone, Limited (distributors of Daimler and Lanchester cars).
F. Troy and Company, Limited (building and painting contractors).

and of the Associated Companies :

John H. Ashton, Limited (mahogany and hardwood merchants).

(*Continued on page* 342)

ANNUAL MEETING OF THE BANCO DI ROMA

The annual meeting of the shareholders of the Banco di Roma, held under the chairmanship of H.E. Prof. Costantino Bresciani-Turroni, on the 31st March, 1955, having heard the reports of the Board of Directors and of the Auditors, has approved the Balance sheet at the 31st December, 1954, the profit and loss account and the allocation of the profits of the year.

Here are some data from the report to the shareholders (the figures between parentheses are the ones of 1953).

The net profits of the year, after the convenient appropriations and sinkings, amount to Lit. 672,819,272.— (Lit. 475,429,808.—) and allow the distribution of 7% to the shareholders and the appropriation of Lit. 600,000,000.— to the Reserve which thus ascends to Lit. 2,000,000,000.—.

The report of the Board of Directors, after having briefly outlined the international political and economic situation, deals with the general one of Italy, emphasizing its main problems and describing the action of the Institution with regard to the national economy. Particularly salient are the sensible global development of the business of the Bank and the valuable results achieved in all the fields of activity.

The grand total of the items of the balance sheet, equal to about 923 billion lire, shows an increase of 123 billion, viz. of almost 15·5% in respect of the balance sheet 1953 (Lit. 800 billion approximately).

The means collected rise to 478·8 billion with an increase of 15·2% on the amount at the end of 1953 (415·6 billion).

The larger amount of funds available allowed the increment of investments which have thus attained Lit. 332·8 billion with an increase of 18·8% in respect of 1953 (280·1 billion).

Owing to the passing of the Director Comm. Giovanni Alfredo Pattison, the meeting has elected Prof. Avv. Carlo Venditti.

The Board of Directors, after the meeting, confirmed as Chairman: H.E. Prof. Costantino Bresciani-Turroni ; as Deputy Chairman : Baron Prof. Francesco Mario Oddasso ; and as Managing Director : Gr. Uff. Ugo Foscolo.

Chairman : Bresciani-Turroni. *Managing Director* : Foscolo. *Chief Accountant* : Nazareth.

Auditors : Matteucci (*Chief Auditors*), Bossi, Foschini, Mazzantini, Obber.

The dividend of L. 7.— per share will be payable, from the 4th April, 1955, at all the Branches of the Banco di Roma in Italy.

British Steam Specialities, Limited (manufacturers and distributors of valves, gauges, etc.).
Heinemann Holdings, Limited (book printers and publishers).
Timothy Hird and Sons, Limited (worsted combers and spinners).
E. R. Holloway, Limited (comb manufacturers, plastic goods, etc.).
Stevensons (Dyers), Limited (hosiery dyers and finishers).
Western Motor Holdings, Limited (motor-car distributors).

Having mentioned the company's interests in freehold and leasehold properties and a recent addition to its holding in The Brush Group, Limited, the chairman then continued :

The above story speaks for itself. We are progressing and gaining experience, and your board remain expectant and confident. The idea of Tillings as a Family of Firms is unfolding and, as I said last year, provided Great Britain continues to flourish and prosper, as more profoundly than ever I believe it will, this group of companies, with its widely diversified interests in British industry, should share in that prosperity. Our companies are managed by a fine body of men: the spirit which animates them is right, and that seems to me an essential prerequisite of enduring success in any company. This spirit will be priceless should care and anxiety beset us.

Once again our numbers have increased and I give a warm welcome to our new friends. Your board's policy stands unaltered, i.e. to develop and expand our existing interests, to broaden our participation in industries in which we are already represented, or in kindred industries, and to consider any new propositions which appear to hold attractive possibilities. We feel that in this way we can perform a useful and constructive purpose, upholding in new fields the great traditions of the name of Tilling, and aiming over the years to reward our stockholders in fuller measure.

INCREASE OF SHARE CAPITAL

Since the end of 1954 our available funds have been fully absorbed and we now have an overdraft with our bankers. We must therefore replenish our resources. It is accordingly proposed that the company should raise additional capital by the issue of preference shares. In order to implement this, you will be asked at an extraordinary general meeting to follow immediately after the annual general meeting to approve the creation of 2,700,000 new preference shares of £1 each Subject to the passing of the requisite resolutions, 2,200,000 of these new preference shares will be offered for subscription by members of the company. Permission to make this issue has been granted by the Capital Issues Committee.

NATIONAL FOUNDATION FOR EDUCATIONAL RESEARCH

RESEARCH OFFICER required in September, 1955, for work in SECONDARY SCHOOLS with special reference to TECHNICAL EDUCATION. Salary up to £1,100 per annum according to qualifications and experience. Teachers' superannuation scheme (or alternative scheme). Candidates should be Honours graduates and should have had adequate teaching experience. An academic qualification in psychology or education will be an advantage.

Application for the above post on the special forms provided and giving the names of three referees must be in the hands of the undersigned not later than Friday, May 6, 1955. Forms and further details on request.

BEN S. MORRIS, Director.

79 Wimpole Street, London, W.1.

A LONDON Advertising Agency has a vacancy in its Market Research Department for an experienced Executive who seeks increased scope, responsibility and salary. He (or she) must be capable of taking charge of consumer and retailer investigations from the planning stage to the finished report and will be encouraged to take an active part in the expansion of the department. Academic qualifications in statistics are desirable. Salary according to capabilities.

Apply, giving details of experience and qualifications, to Director of Research, Lambe & Robinson Ltd., Sceptre House, 169 Regent Street, W.1.

AN unusual position is open for a man under 40 years of age with the right experience and personality. The General Manager of a well-known printing factory in central England is due to retire in 1957. The position is one of responsibility and trust and offers fine scope and prospects. It is intended that his successor shall have ample time to study the job and acclimatise himself before taking over and that a Directorship would in time be considered. Thoroughly sound technical background essential with administrative ability and the qualities that make for leadership. Apply, with full details of career to-date, to Box 911.

GENERAL MANAGER required by a light engineering group of companies to operate an electrical instrument manufacturing business in Southern England which has a full order book, excellent equipment and very substantial development prospects. The successful applicant will be a man with a wide understanding of and technical imagination in the weak current field. He must be a factory trained man with knowledge of management practices and the problems of the precision light engineering industry, whilst these qualities must be combined with a flair for business. The post carries a generous salary commensurate with the experience and substance of the selected candidate, and is pensionable.—Applications will be treated in strict confidence and should be made with details of age, qualifications and career to date to Box E.T.283, c/o 191 Gresham House, E.C.2.

ORGANISATION DEPARTMENT of major motor manufacturing organisation has vacancy for honours graduate (preferably commerce). Should be interested in management and organisation problems and have flair for dealing with people. Previous industrial or other administrative experience advantageous. Age 21-30. Good starting salary. Generous pension scheme.—Reply to Box 917, quoting reference OTW/2.

GRADUATE in Economics "first" or good "second" degree required for research work in Department of Economics, International Wool Secretariat, starting salary £500-£600 according to qualifications, with superannuation benefits. Apply in writing, giving full details of qualifications and experience to the Secretary, International Wool Secretariat, Dorland House, 18/20 Regent Street, London, S.W.1 marking cover: "E.C. Confidential."

THE Granada Theatres Limited require Chartered or Incorporated Accountant as Chief Accountant of its Commercial Television Organisation. Exceptional opportunity for keen and resourceful man. Age 30 to 40. Salary £1,500 per annum upwards according to ability and experience. Write stating age, education, career to date with salaries earned, to Managing Director, 36 Golden Square, London, W.1.

MARKET ANALYST required for Export Division of Ford Motor Company Ltd., Dagenham. Degree in economics or commerce essential. Must have analytical mind, good knowledge of statistics and sales, long-term forecasting. Experience of foreign markets and/or motor industry an asset. Age 23-35.—Reply to Salaried Personnel Department, quoting reference FMA/PP.

CENTRAL OFFICE OF INFORMATION: Require SAMPLING OFFICER for Social Survey work. Should have mathematical or statistical qualifications of degree standard and be familiar with sampling theory and practice. Post graded Temporary Information Officer. Salary £860 to £1,030 (men); £757 to £890 (women). Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates) to AC.525, Appointments Officer, Ministry of Labour and National Service, 1-6 Tavistock Square, W.C.1, by May 14, 1955. No original testimonials should be sent. Only candidates selected for interview will be advised.

DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH: SENIOR SCIENTIFIC OFFICER (SOCIAL PSYCHOLOGIST). The Civil Service Commissioners invite applications for a pensionable post at the User Requirements Division of the Building Research Station, London, W.1.

The officer appointed will undertake research into the relationship between the design of buildings of all types and the requirements of their occupants.

Age at least 32* on December 31, 1955. Candidates must have either a first or second class honours degree with Psychology (including social and industrial psychology) as a main subject, with experience of field experiments or surveys, or a degree in some branch of Science, and have had subsequent training and experience in psychology. Exceptionally a candidate without a degree qualification may be admitted if his other training is eminently suitable.

Inclusive annual remuneration for a 45½-hour week: (Men), £1,091-£1,279; (Women), £964-£1,162. Exceptionally a starting pay above the minimum may be granted according to qualifications and experience.

Further particulars and application forms from the Civil Service Commission, Scientific Branch, 30 Old Burlington Street, W.1, quoting No. S4450/55. Applications must be returned by May 31, 1955.

*Candidates under age 32 on December 31, 1955, may be considered but must apply through the open competition quoting No. S4450/53/55.

CHAPPIE LIMITED, manufacturers of pet foods, require an Office Organiser and Methods Specialist with responsibility for clerical methods used throughout the company. A man or woman between 28 and 35 years of age with graduate qualifications in Commerce, Economics or Statistics would be preferred—but above all, the appointed person must possess a capacity for clear thinking and for an analytical approach to office organisation and office jobs. Experience of the applicants in office organisation and methods is essential. The starting salary will not be less than £1,500 a year, and in addition the selected candidate will be a member of the company's comprehensive non-contributory social security plan which includes pension, life assurance and sickness benefit schemes.

Applications, giving full details of education and experience to date, should be sent to the Personnel Officer, Chappie Limited, Melton Mowbray, Leicestershire, who will supply further information.

APPLICATIONS are invited for a senior post in the Purchase Department of a large engineering company in the Midlands. The applicant should be between the ages of 28 and 40 years. Previous experience of buying is not necessarily required, but a sound engineering knowledge is essential. The salary is commensurate with the experience of the applicant, and there are opportunities for early promotion at least to the post of Deputy Purchase Manager. Apply, giving age, qualifications and experience, to Box 912.

BRITISH TITAN PRODUCTS COMPANY LIMITED, a rapidly expanding Heavy Chemical Industry, wishes to engage an ECONOMIST/STATISTICIAN for its office at York, to develop a market research section which would be concerned with the world-wide uses and marketing of Titanium Oxide pigments.

Applicants must have good academic qualifications in Economics, Mathematics or other appropriate main subject combined with Statistics.

Conditions of work and service are very attractive and there is a contributory superannuation scheme and a non-contributory life insurance scheme, in addition to which a staff bonus scheme is in operation.

Assistance in house purchase and removal expenses is available for the successful applicant.

Applications should be made to the Personnel Manager, British Titan Products Company Limited, Coppergate, York, quoting reference S.8.U.

QUALIFIED ENGINEER required as assistant to the Production Director of an expanding light Engineering Group in the motor components trade. The factory concerned is situated in the Thames Valley and at present employs 1,600.

This is a senior appointment with considerable future prospects; salary will be paid accordingly.

It will require a man of calibre with experience of modern management methods and a proved ability to lead a flexible production team. Broad production engineering experience essential, knowledge of presswork an advantage.

Please write, in confidence, giving full details of age, qualifications and experience, to Box 918, quoting PE.

SENIOR EXECUTIVE, go getter, 41, top level qualifications as General Manager in clothing or textile manufacturing seeks London appointment offering scope for initiative and development. Used to responsibility, contacts at board level, basic salary £2,000. Would consider re-establishing firm in difficulty.—Box 914.

NEW Luxury Hotel opening Whitsun. First-class cuisine. Every comfort. Californian swimming pool, cinema. Dominating views of sea yachting harbour, Sandbanks. Readers of "The Economist" welcomed.—Greystoke Hotel, Canford Cliffs 77256, Bournemouth.

THE CUNARD STEAM-SHIP COMPANY LIMITED

NOTICE IS HEREBY GIVEN that the TRANSFER BOOKS for ORDINARY STOCK and PREFERENCE STOCKS will be closed from May 4th until May 17, 1955, both dates inclusive.

By Order of the Board,
J. C. TOMLINSON,
Secretary.

Offices: Cunard Building, Liverpool.
April 21, 1955.

THE AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOLARSHIPS

Applications are invited from postgraduate students with research experience for Scholarships in Anthropology and Sociology, Demography, Economics including Economic History and Economic Statistics, Geography, Australian History, Far Eastern History (China and Japan)*, Pacific History, International Relations, Law, Political Science including Public Administration, Philosophy including Social and Political Philosophy and Statistics including Mathematical Statistics. The Scholarship tenure is for a period of two to three years.

The present value of a Scholarship is £A705 p.a. Married scholars with dependent children may be granted additional allowances, and the University will make a contribution not exceeding £stg.115 towards a scholar's fares to and from Canberra.

Application forms and further information may be obtained from The Secretary, The Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. Applications should be lodged with the undersigned by May 31, 1955.

Applications will again be invited in September, 1955.

*A substantial knowledge of the relevant language is a prerequisite.

D. K. R. HODGKIN, Acting Registrar.

MATHEMATICIAN

MATHEMATICIAN with Honours degree and several years' applied engineering experience is urgently required for our rapidly expanding Scientific Instrument division. Excellent prospects and substantial salary to a really first-class man. Apply, Personnel Officer, Louis Newmark, Ltd., Prefect Works, Purley Way, Croydon.

LAW GRADUATES

Applications are invited to fill an appointment in the Secretary's Department of large manufacturing company, the principal duties of which will be to assist in the general legal work of the department, with particular responsibility for advising on the applicability of current Acts, Statutory Instruments, local By-laws, etc., to the company's operations. This is not a post which requires qualifications as a Solicitor or Barrister, but will probably be filled by a man in the age range 26-33 who can offer a good University Law degree followed by commercial or industrial experience analogous to the duties outlined above.—Box 909.

EDUCATION OFFICER WANTED for branch factory in Liverpool area of large, light engineering group, with full range of educational provisions. The appointment offers an unusual opportunity for a keen man, able to initiate and develop training schemes at all levels. Qualifications include university degree or equivalent experience in education and in industry (preferably engineering), with knowledge of modern management development techniques.—Applications, giving all relevant particulars, including present salary, will be treated in strictest confidence, and should be forwarded to Personnel Officer, Lockheed Hydraulic Brake Company, Limited, Tachbrook Road, Leamington Spa.

MANAGEMENT ACCOUNTING and Industrial Administration. Qualified Accountant wanted quickly to operate and help instal Management Control and modern administrative systems in rapidly expanding manufacturing group in the Home Counties. Good practical experience of standard costing, budgetary control, machine accounting and of up-to-date administrative methods desirable though not essential; training in these subjects would be given. Strong interest in these subjects essential together with drive and administrative ability. Fine opportunity for the right man. State age, qualifications and full particulars of education, Service career, professional, industrial and administrative experience, to Box 899.

CHARTERED ACCOUNTANT wanted by rapidly expanding manufacturing group in the Home Counties, to be Chief Financial Accountant of the parent company. Good professional, industrial and administrative background important, and experience of controlling staff. Practical experience of punched-card and machine accounting desirable. State age, qualifications and full particulars of education, Service career, professional, industrial and administrative experience to Box 900.

AN EXCLUSIVE TERRITORY, comprising part of Greater London and neighbouring counties, is available for the appointment of a Sales Representative of proved ability to sell. This qualification is essential since the territory is important and the post offers an opportunity for the successful candidate to build up a valuable clientele. Some engineering experience an advantage but training will be given. The product provides a service to manufacturers which in recent years has become established as an effective means of reducing production costs. It is already used by leading manufacturers. In order to attract the right calibre of man, we are offering a good basic salary and commission, with expenses and a car. Applications indicating briefly a background of successful selling, will be treated as strictly confidential and should be sent to Box 910.

THE Granada Theatres Ltd. require experienced administrator as Office Manager and Personal Assistant to Senior executives. Qualified Accountant preferred but not essential. Progressive position calling for first rate organiser. Salary £1,200 per annum upwards according to ability and experience. Write, stating age, education, career to date with salaries earned, to Managing Director, 36 Golden Square, London, W.1.

AM I THE RIGHT MATERIAL FOR YOU ? Honours in economics and law, very successful record at high level in public service and in publishing, including sales, experience of accountancy and finance and with an international manufacturing company, 29, earning £1,200 annually but seeking permanent, progressive opening.—Box 916.

THE ROYAL BANK OF CANADA

DIVIDEND NO. 271

NOTICE IS HEREBY GIVEN that a DIVIDEND of 37½ cents per share upon the paid-up capital stock of this Bank has been declared for the current quarter and will be PAYABLE at the Bank and its branches on and after June 1, 1955, to shareholders of record at the close of business on April 30, 1955.

By Order of the Board,
T. H. ATKINSON,
General Manager.

April 14, 1955.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited from candidates with qualifications in mathematical economics for a Lectureship or Assistant Lectureship in Economics. Salary scale, £650 x £50—£1,350 (Lecturer), or £600 x £25—£650 (Assistant Lecturer). FSSU and children's allowances.—Applications should reach the Registrar, The College, Keele, Staffs, from whom forms and further particulars can be obtained, not later than May 15, 1955.

STAFFORDSHIRE COUNTY COUNCIL

COUNTY PLANNING AND DEVELOPMENT DEPARTMENT

Applications are invited for the appointment of a Planning Assistant (Research) on APT Grade III (£600-£725 per annum).

Applicants should have an Honours Degree in Geography or Economics and should preferably have had research experience in the public service, with a Research Institution or in Industry.

Applicants should give details of age, education and training, qualifications, present and previous appointments and experience, and the names of two persons to whom reference can be made. Applications, in which relationship to any member or senior officer of the County Council must be disclosed, should be sent to D. W. Riley, County Planning and Development Officer, 41a Eastgate Street, Stafford, not later than May 18, 1955.

T. H. EVANS,
Clerk of the County Council.

LONDON COUNTY COUNCIL invites applications from women with suitable experience for appointment as Deputy Warden (resident) of Gisburne House Approved School, Watford. The school is being re-organised to provide for 40 girls of good intelligence, age 15-17 on admission a full programme of physical and mental activities, including home-making. The Children's Committee are seeking to appoint a woman capable of directing the home side of the school (a domestic management qualification would be an advantage, but it is not essential) who will join with the warden in creating a sympathetic approach to the problems of adolescent girls and who understands the advantage of a psychiatric approach to juvenile delinquency. Salary scale: £691 to £866 less a charge at the rate of £108 a year for emoluments. Six weeks' annual leave. Only single accommodation is available. Further details and application form (s.a.e.) from the Children's Officer (CH/A2/408), L.C.C., County Hall, S.E.1.

THE ASSOCIATION OF INCORPORATED STATISTICIANS LIMITED (BY GUARANTEE), 55 Park Lane, London, W.1. Examinations for Registered Statistical Assistant, Intermediate and Final Associateship will be held in London and certain other centres on July 6th, 7th and 8th.

Entry forms should reach the Assistant Secretary by May 6th for home and May 13th for overseas candidates.

AUTOHALL SELF DRIVE CARS offer their new fleet of over 200 1955 cars to promote your business. Competitive rates, special contract and long term offers and discounts. Re-purchase scheme and self-drive package tours. All arrangements made for continental touring. Write for full particulars and colour brochures, Autohall, Dept. 2, 302/6 King Street, Hammersmith, W.6. Riverside 2881. Cables: Autohall, London.

CHARTERED ACCOUNTANTS in Northern Rhodesia have vacancies for young qualified accountants. Three year tours with cumulative leave. Passages paid out and home. Excellent prospects in growing practice, good starting salaries. Apply in own handwriting to Box S 482, c/o Streets, 110 Old Broad Street, E.C.2.

APPLICATIONS are invited for the position of General Manager to the Independent Television News Company.

Applicants should have experience in television, films, electronics or newspaper publishing and have the capacity to exercise budgetary control.

Write, giving full particulars as to age, present salary and qualifications, to Box 922.

AN interesting post is offered to a graduate with an honours degree in psychology together with experience in the field of industry or commerce. It is envisaged that the post will involve:

1. Applying psychological techniques to research which will throw light on people's attitudes and behaviour with respect to their buying and using of everyday consumer goods.
2. Acting in a consultative capacity in the application of the findings to commercial problems.

Applicants should be between the ages of 28 and 40. The salary envisaged is in the region of £1,000 per annum, but could, of course, vary, according to the qualifications and experience of the applicant. —Apply Box 913.

MAN in early 40s, graduate in economics, training and experience in secretarial work and personnel administration, seeks better prospects and/or salary. Acceptable, reliable worker.—Box 915.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B., and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects. —Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

So many of Britain's Steelworks* rely on Mitchell for Mechanical Handling...

. . **AND WITH GOOD REASON.** Under inevitably hard working conditions, the efficiency of Mitchell mechanical handling equipment—transporters, conveyors, tipplers, crushing and screening plant and the like—is such that it is first choice in this field. The many years of design and installation experience behind them become doubly important when every job requires individual planning. Mitchell's other activities include all kinds of civil engineering work, cooling towers, boiler plant, wagon marshalling plant, and coal preparation plant.

WALLSPAN

can give you more floor space all round!

Wallspan Outer Walls can add 100 sq. feet to every floor of an office block like this

1 Conventional Wall Construction is 11 inches thick.

2 Wallspan members are only 5 inches thick*. So they give you an extra 6 inches of space the length of the wall. In a building 100 feet long—with elevations similar to the one illustrated—Wallspan walls will give you 100 square feet extra rentable space on each floor.

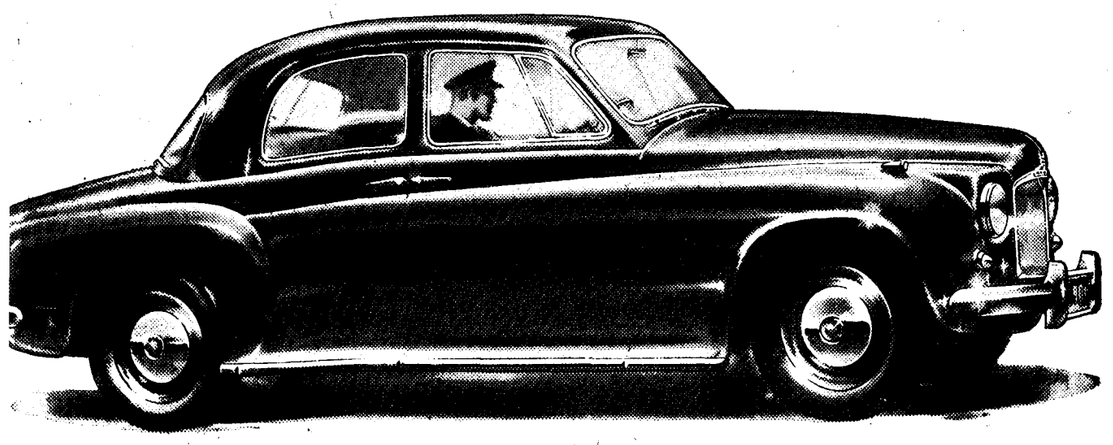
*Wallspan members are made in various thicknesses for different ceiling heights. The 5-inch one is usual for offices and other buildings needing only normal headroom.

Wallspan is the most remarkable building development of modern times. It offers substantial gains in construction time, insulation and design—*and gives appreciably more floor space.*

How Wallspan gives more space. In today's buildings, the steel-and-concrete framework carries the weight. The outer walls simply keep out the weather and keep in the warmth. And, of course, provide the setting for windows and doors.

Wallspan is a grid of aluminium alloy, light in weight, slim in section, which is bolted to the structural frame. Into it are fixed windows, doors and panelling. In suitable installations the vertical and horizontal grid members can be as little as five inches thick, with solid panelling two inches thick — compared with the eleven inches of a conventional wall.

The drawings, above, show how much *extra* rentable floor space this means on every floor of your building.



Wallspan keeps more warmth inside. The 2-inch-thick panels of a Wallspan wall can easily be constructed to give 50 per cent better heat-retention than cavity brick. It goes without saying that Wallspan walls are weatherproof and durable!

Wallspan goes up in DAYS. Wallspan construction is extremely quick. The grid is easily bolted on. Into it go sheets of glass or window frames to give you light and air. It is then completed with your own choice of panelling from a range of materials that offer new beauty of appearance and design!

WALLSPAN CURTAIN WALLING WILLIAMS & WILLIAMS *RELIANCE WORKS · CHESTER*

You'll be using your building sooner—much sooner—if it has Wallspan walls

By Appointment to the late King George VI
Manufacturers of Land-Rovers
The Rover Co. Ltd.

It's revealing to drive a ROVER . . .

You'll be astonished at the way the car takes rough surfaces smoothly in its stride. Ruts and potholes seem almost non-existent as the car glides over them.

The Rover co-ordinated suspension system allows plenty of vertical road wheel movement, while spring tensions and shock absorber settings ensure a smooth ride. The central bearing to the propeller shaft checks 'whip' and vibration.

You'll enjoy having both pace *and quiet* at your command. Even at high speeds, engine and transmission noise has been reduced almost to vanishing point.

The special cylinder head design of Rover engines sets the Rover pace, whilst the extensive use of rubber pads and mountings, spraying with sound-absorbing material and heavy carpeting make the naturally quiet engine almost inaudible.

You'll appreciate the infinite care and thought that have been paid to the comfort of driver and passengers.

All passengers sit well within the wheelbase, with front seat adjustable for height and rake and wide centre arm rests front and rear. Heating, demisting, ventilating and draught-proofing are exceptionally efficient.

You'll feel confident even in the thickest and trickiest traffic, because a Rover is such a well-bred, obedient car to handle.

Direct central gear change with synchromesh on 2nd, 3rd and top, controlled free wheel for clutchless changes and well-planned dashboard layout make clumsy handling of a Rover practically impossible.

ROVER

Sixty · Seventy-Five · Ninety

Body and chassis are identical throughout the Rover range. However, three different engine sizes give motorists a made-to-measure service in which design and workmanship are uniformly high. New features common to all 1955 models include re-shaped luggage boot, larger rear window and flashing type direction indicators.

across the world

Wilmot Breeden door locks and handles are giving constant, enduring service. The particular lock and handle forming the theme of this design were developed together to give such service, but with new standards of strength, elegance and quietness of action.

The strength of the push-button handle lies in its being *fixed* — and at both ends. But this demanded a new kind of lock, one which could be tripped by the thumb's limited movement and pressure. To achieve this two simple mechanical principles were used, the ratchet and the rack and pinion; these give easy release, a quiet action and complete door security.

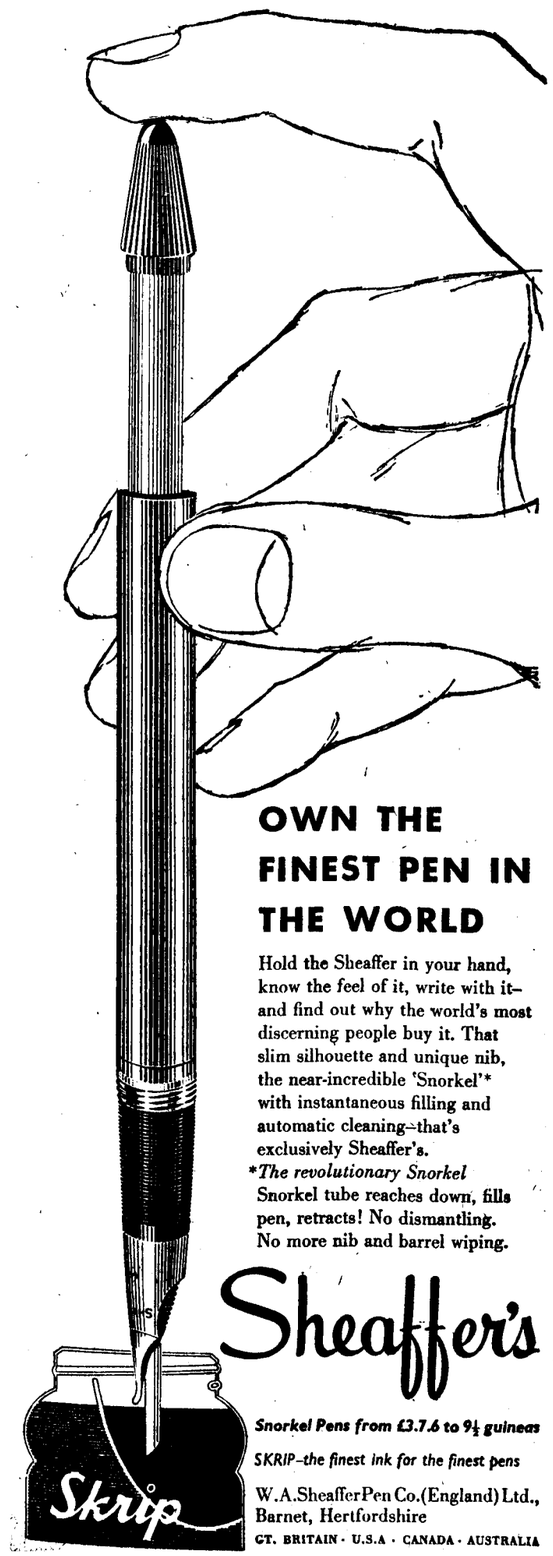
STOP MONEY *going up the chimney*

"*Badly designed flues are as good as choked with charred pound notes,*" says Private Btu (the British Thermal Unit). "*It's worth looking into.*"



FUEL EFFICIENCY PAYS

For example . . . At a factory in Greater London, due to an increased steam demand, two Lancashire boilers were added to the original one with inefficient independent flue systems. The overall thermal efficiency was then found to be 58%. The existing flues were replaced by a properly designed main flue connected directly to the chimney shaft at a cost of £620. As a result the thermal efficiency was increased to 67% saving £1,600 per annum in fuel costs.

The Association of Boiler Setters, Chimney and Furnace Constructors 21 Devonshire Street London W1 have other examples of how, by correct installation of boilers, etc., increased fuel efficiency can be achieved and money saved. They will be pleased to put you in touch with members of the Association who will call on you and discuss your problems fully without any obligation on your part.

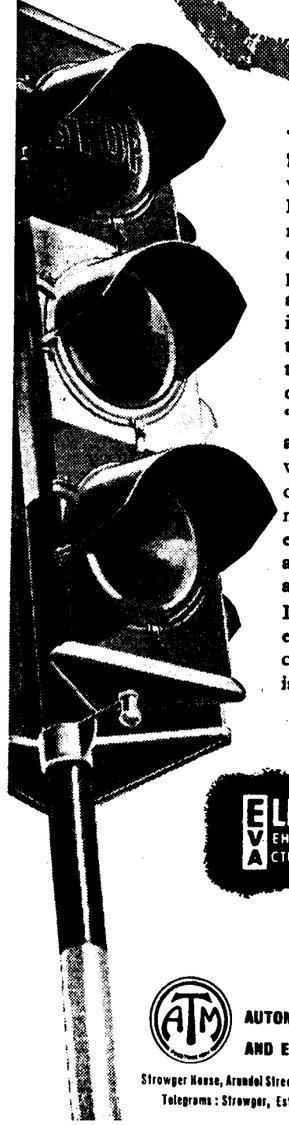
This year . . . next year they'll want your product



Any moment now he's going to ask her to marry him and their plans for the future will start. Will they have a flat or will they buy a house? What sort of furniture will they choose—contemporary or traditional? They'll have a vacuum cleaner, of course, and they'll want T.V. They'd like a refrigerator, too, and maybe after a year or two they'll be able to run to a small car.

Can you give them the ambition to buy your product, too?

With its lively presentation of the news . . . . its realistic approach to the problems of our time, the Daily Mirror appeals particularly to young readers like them. In fact, the majority of the 4¾ million people who buy it every day belong to their generation. With the biggest daily net sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies. And, Daily Mirror readers are young readers. This year . . . . next year they'll want your product.

ALL WORK and no pay!

This sturdy robot works 24 hours a day . . . draws no wages . . . never takes a holiday. Consider, for a moment, its advantages in cost alone as compared with police control. Effective all-day traffic control at a busy intersection requires the full time services of at least two police officers; total cost, £1374 every year. An "Electro-matic" installation, at an initial cost of £1750 with £175 per year covering depreciation, running and maintenance, will in two years effect an economy of £300 and incidentally provide a 24 hour service.

It is obvious that the only economic form of traffic control at busy intersections is with

Restrictive Practices in Fish...*Nonsense!*

Anyone who tells you that Britain's Distant Water trawling industry is a monopoly is talking through his hat. Pure, undiluted bunk! Anyone can buy a trawler and go fishing—if he's got the cash (but remember, it's a dangerous and risky business). YOU, anyone, can buy fish from any ship at the dockside tomorrow. You'll have to get up early though, because the public auction starts around 7.30 in the morning.

Restrictions or bans on foreign landings are nonsense, too. Did you know that any foreign trawler, except an Icelander, can and does land her catch in any British fishing port? But it's virtually impossible to land our fish at foreign ports. Believe me, plenty of foreigners are landing fish in England now—Danish, Faroese, Dutch, Belgian, German and Norwegian. Last year foreigners landed 1¼ million cwts. of fish at our three big ports for £5,880,835—nearly one third of the value of the total landed by our own Distant Water Fleet. Why no Icelanders? Well, that's another story as the mermaid said to the sailor. We are not frightened of competition. High quality foreign fish sold at competitive prices keeps us on our toes. We are ready to back the skill and daring of our own trawler captains and crews against those of any other country.

You find small firms as well as big ones in this industry. A really big firm may own as many as twenty distant water trawlers—and there are owner-skippers with just one or two. It makes me boiling mad when I hear charges bandied about by ignorant or malicious folk that we are a closed shop, a monopoly, full of restrictive practices. Certainly we have a minimum price for our fish, and why not? Our minimum price is *below the cost of production* but the Government's own Herring Industry Board also fixes minimum prices for fresh Herrings and in their case the minimum price is *higher* than the cost of production. We just try to bring back the fresh fish that the housewife wants and we are proud of our record for keeping the price of fish down below all other first-class protein foods. It's the cheapest of the lot. It's the best bargain any housewife can find.

BRITISH TRAWLERS

The pen that fills itself

Esterbrook **447** Writing Set

This is the graceful pen you see on the desks of so many busy people. It is, in effect, a fountain pen—with the ink in the base instead of in the barrel. The pen refills itself immediately it is returned to the socket and is always ready to write a full page without redipping. There are no less than 28 personal writing points to choose from so that you can be sure of a pen that is exactly suited to your handwriting. The writing set is available in Black, Grey or Ivory, 33/3d. and 36/9d.

1 Pen closes spill-proof base, prevents evaporation.
2 Combined ink-feed and writing point (28 to choose from).
3 Exclusive filling device also cushions point against damage.
4 Reservoir holds 40 times more ink than a fountain pen.

The Economic Issues

ON the tenth anniversary of Victory-in-Europe Day Britain is entering its fourth postwar election campaign. In the three previous elections it was legitimate to doubt whether, with the sole exception of nationalisation, there was very much to choose between the economic policies offered by the two major parties. And the exception of nationalisation, though it was the banner under which many famous battles (or at least shouting matches) were fought, was never an issue that had nearly as much substance as symbolism in it. The only general conclusion that could be drawn from the campaigns themselves was that, on each occasion, the attacking party (Labour in 1945, the Conservatives in 1950 and 1951) showed a little more awareness of the economic problems before Britain than did the entrenched, but gave no convincing explanation of what it intended to do about them. It was therefore possible to suppose that the essential machinery of economic government would be about equally safe or unsafe in the hands of either party.

Is it possible to adopt the same comfortably neutral attitude before the election of 1955 ? Or can one say, this time, that the victory of one or other party is likely to make a real difference to the wealth and welfare of the British people as a whole ? In facing the economic issues of this campaign a journal which is jealous of its independence meets a frank difficulty from the outset. For even if it should be right to be neutral about the prospects for the immediate future, it cannot be right to be neutral about the record of the immediate past. In economic affairs the Conservatives have clearly done much better as a Government, and Labour has done very much worse as an Opposition, than most people in 1951 had reason to expect.

There is, indeed, only one honest answer that Labour can make to the record of the last three and a half years—namely, that it has been one of those rare periods of British history when it has been easier to govern than to oppose. The Tories have had a great deal of good luck in 1951-55 and Labour had a great deal of bad luck in 1945-51. This is the beginning and the centre-piece of Labour's justification, but it cannot be the end of the elector's dilemma. For the important consideration, from the elector's point of view, must be the effect that this varying luck in the immediate past is likely to have on the attitude with which Labour and the Tories would face the task of forming Her Majesty's Government in the immediate future.

The problem can most conveniently be examined under two heads. The first question mark hangs over Labour's attitude towards the things that have gone right in the last three and a half years. The rise in living standards under the Tory Government has been partly due to the obvious and paramount good fortune of more favourable terms of trade. But it has also been partly due to the surprising success (as surprising to the Government as to anyone else) of the economic experiments—not all of them distinctively Tory experiments—that have been tried since 1951. Would Labour now flout these lessons

merely because history has given them a temporarily Tory stamp. The second question mark hangs over Labour's attitude to the problems that have not yet been settled. In most elections an Opposition should be in a better position than a retiring Government to offer solutions to the problems which that Government has failed to put to rights. Is this true of the election of 1955? These are the questions that should be weighed in the electors' minds on May 26th; the best service that *The Economist* can undertake is to set down its own ruminations about them in summary form.

What Went Right

There are four principal lessons of good cheer that should have been learned since 1951.

(1) The experience of the past three and a half years has shown that it is possible for Britain to increase its **industrial production** at a rapid rate under conditions of full employment, even when industry is having to produce only the things that people want (as distinct from the years of immediate postwar inflation when people would buy anything it turned out), and even when the labour force is not being increased by a large reflux of demobilised soldiers into civilian employment (as occurred in the early years of Labour rule). Almost certainly it is the sustained high level of new investment in industry that has done the trick. And the fruits of investment seem to be larger, and to ripen faster, when its distribution is determined by the market than when it is "planned" by the varying political and institutional pressures of Whitehall.

A high level of industrial investment is not, of course, a Conservative specialty. The Labour party sincerely professes the same object. One might even, with some charity, go further and believe that Labour would not seriously hamper private capital investment so long as things went well. What Labour's policy towards industrial investment would be in a crisis is anybody's guess—save that private industry would clearly not be given priority over either consumption or "social capital." The question whether a Labour victory would slow down the rate of economic progress therefore turns on whether Labour could avoid the biennial crises from which it suffered last time. And that depends on whether it has taken the other three principal economic lessons of 1951-55 to heart.

★

(2) The second of these lessons is that the **removal of controls** has been of much less harm to the poorer consumer and to the balance of payments, and of much greater benefit to production and to general living standards, than could have been foreseen in 1945-51. In particular, there can now be no doubt that controls over raw materials under Labour rule led to a maldistribution rather than to a proper rationing of stocks; similarly, controls over prices and imports often merely created an artificial scarcity of supply in relation to demand, a series of silly little dams behind which economic pressures piled up in strange distortion and disarray. It is now quite clear that this muddle contributed substantially to the economic crises of 1945-51.

There is no logical reason why a Labour Government should re-impose controls while things are going well; it is worth remembering that it was a Labour Minister who invented the phrase "a bonfire of controls" and who first set one alight. And if things started to go badly again, there is reason to fear that even a Tory Government might return to specific restraints; Mr Butler's measures against hire purchase last February were a warning and a mistake. It would therefore be a misrepresentation to describe the Conservatives simply as the party of economic freedom and Labour as the party of restriction and control. The difference is not between black and white but between shades of grey. Nevertheless it is a real difference. In the event of trouble, Labour would revert to controls with much more alacrity and much less reluctance than the Conservatives—and thereby run a much greater risk of turning a temporary difficulty into a permanent reversion to the siege economy.

★

(3) **Bank rate** and a more active monetary policy have been extraordinarily effective allies in Britain's climb back to solvency during the last three-and-a-half years. There is no doubt that without them the Chancellor's progressive relaxations of controls and his three bouts of tax relief would have been impossible; it is because Mr Butler has restrained some people from borrowing money that he has been able to allow others to keep back and spend more of their own.

There is no inherent reason why a high Bank rate should be regarded as a Conservative weapon; the sort of spending that it chiefly cuts down is marginal business expenditure and personal consumption by the rich. Moreover since it is a flexible instrument, which can be varied on any Thursday of the year, it is less likely than is a stern budget accidentally to carry disinflation too far. Indeed, the use of Bank rate for purposes of general economic control used to be regarded as an essentially left-wing notion. But in the last ten years the Labour party has not only allowed the Tories to run off with this piece of its clothes, it has adopted a silly attitude of glorying in its nakedness of responsibility, from which it will have difficulty in recanting. So long as this is true, the Socialists will be definitely less able to control the fluctuations of the economy, either up or down, than the Conservatives.

★

(4) One of the most obvious reasons for the Conservative Government's success in the last few years has been that business men and foreign dealers in the currency have expected that it is going to be successful; there has therefore been no precautionary piling up of expensive stocks, and little flight from sterling, at any moment when the economic barometer has seemed unsteady. The importance of **confidence** should come as no surprise to political economists, whether or not they think that this confidence in Mr Butler has been misplaced. It is an ancient Keynesian adage that if business men thought that the arrival of swallows in the early summer was good for business, then the arrival of those swallows in the early summer would be good for business; the trouble now is that many business men, at home and abroad, think that the arrival of a Labour Government in the early summer would be bad for business instead.

This will be one of Mr Gaitskell's gravest immediate problems if he finds himself in control of the Treasury at the end of May; it could easily spark off another September crisis to celebrate Labour's return to power. The proper way to meet it would be to try to reassure the business community that it has no needless irresponsibilities to fear if there is a change of government; unfortunately there are some Labour members who believe that the proper way to capitalise upon it is to sharpen their spears, and explain to the capitalists exactly what they will do to them if they get on the other side of the cage. In particular, Labour should realise by now that its threat of compulsory dividend limitation in its last summer of office was one of the causes of, not one of the correctives to, the crisis of 1951. But there is no reason to suppose that this lesson has been learned even by Mr Gaitskell himself, still less by those upon whose votes he would have to depend.

★

The fairest conclusion under all these four heads seems to be that a Labour Government need not by definition get in the way of rising living standards; but that the present Labour party seems to be obstinately wedded to a number of conceptions and prejudices that might well be very harmful. It may be, of course, that the Socialists do not mean what they say. But that would be an odd reason for voting for them.

So far, however, the debate has been conducted on the Tories' home ground, in the ambit of the things that have gone right in the last three-and-a-half years. Can the conclusion be significantly changed by examination of Labour's proposed cures for the things that it says have gone wrong?

What Went Wrong

The three principal economic charges that Labour intends to lay against the Government in this election are that it has failed to stop the rise in the cost of living; that it has not allowed a sufficient share of the increase in national wealth to accrue to those who most urgently need it; and that it has adopted the wrong policy towards agriculture, cotton textiles and other British industries that are feeling the pinch of competition from abroad. These are genuinely felt grievances. How far is it possible to make sense of the ways in which Labour and the Tories say that they could be put right?

(1) The only way in which sense can be made of the **cost of living** issue is to propose a new policy for the Ministry of Labour. Between 1951 and 1954 Britain's total output of goods and services rose by a little over £1,000 million in terms of constant prices; its wage and salary bill rose by over £1,600 million. The rise in wages and salaries in the last few years has not been the justification for the rise in prices; it has been its principal cause.

The only way in which the rise in the cost of living could be stopped would be if the rise in pay packets was confined within the limits set by the rise in production. As many rises in production are reflected in higher piece work or overtime earnings, this would mean holding down the annual rise in basic wage rates to some 2 or 3 per cent—say about 3 or 4 shillings a week. There is much that can be said against such a policy. For one thing, a higher wage economy is often a more dynamic economy, and it may be worth tolerating a slow rise in prices in order to enjoy a faster rise in production; for another, nobody knows how a policy of government-controlled wage restraint could be made to work.

If the country really wants an attempt at such a policy of restraint, there is something to be said for the view that Labour might have slightly more chance of success than the Tories; if the Tories' advantage of inspiring businessmen's confidence is counted as an asset to them, then it is only fair that Labour's possible advantage in inspiring co-operation from the trade unions should be entered in the lists on their side. But so far Labour has not committed itself to any such policy. In these circumstances, its claim that it could check the rise in the general cost of living—including its hints about subsidies (which would have to be paid for by higher taxes on other things) and about price controls (which would merely divert demand and cause price increases elsewhere)—must be written off as a cruel hoax.

★

(2) The only way in which sense can be made of the issue of **"fairer shares"** is after defining carefully which of two things that slogan is supposed to mean. One thing it may mean is that the ordinary workers of this country ought to enjoy a higher standard of living. It should be obvious that there can be no significant contribution to this aim by further levelling down. The only way progress can be made is by levelling up, by pushing British workers' living standards up nearer to those of American workers—which can only be done by pushing their producing standards up, too. Neither of the parties is very clear about how this is to be done; but at least the Conservatives have made moves in the right direction in the last three years.

The second thing that the slogan "fairer shares" can

mean is that more should be done to make real poverty impossible. The common factor between the people who are really badly off in these mid-1950s is not that they are all horny-handed sons of toil. The common factor between them is much more complex: it is that they nearly all suffer from being lumped together with less harshly treated cases in the same class. For example, there are a number of old-age pensioners who will still be very hard hit indeed even after the recent increases ; the real obstacle to amelioration of their lot is the tradition that better-off pensioners would have to share any money given to them, which would make increases so expensive that employed workers would jib at paying the higher contributions required. Again, there are many people—especially young married couples—who are still atrociously housed, and who have not received their fair share of the benefits of the postwar state ; the real reason for their plight is that the severe under-pricing of housing—artificially induced by rent restriction on old houses and subsidies on new—is keeping the demand for houses permanently above the supply. If the housing subsidies were confined to those families that really could not afford to pay an economic rent, the housing problem would be solved at once. It is greatly to the Conservatives' discredit that they have not done more to tackle these specific problems ; but it is equally to Labour's discredit that it is clearly unwilling to propose the necessary—and unpopular—steps to relieve real need. On this issue of fair shares there is little to choose between the parties ; if anything, there is a slight balance on the Conservatives' side.

*

(3) There is a great deal that can be said against the Conservatives' **agricultural policy**. Much of the £250 million a year of taxpayers' money that is currently given away to farmers goes to men with a very comfortable standard of life, and with a very poor production record in relation to the output that their land could achieve. But Labour's policy for agriculture is not that these subsidies should be re-directed ; it is that they should be disguised. It proposes to appoint commissions which would buy both home-produced and imported foodstuffs, and which would "average out" (which, after a time-lag of subsidy payments, must mean to put up) prices to the housewife. This is a policy for transferring the burden of supporting a wrong pattern of agriculture from the taxpayer to the consumer, and it ill accords with Labour's professions about keeping down the cost of living. Labour's policy for **cotton** textiles is rather similar, except that here the appointed commission would buy as few cheap imported textiles as possible ; this would eventually lead to retaliatory import restrictions abroad, harm Lancashire's export trade, and make the last state of the industry as well as of the consumer much worse than the first. This facet of Labour's policy is a resurrection of old-fashioned Tory protectionism, which sometimes makes the Tories themselves almost look like free traders.

Which is Left?

There can be no doubt that the old Radical tradition of this country is still very much alive. Whatever they may be in their economic habits, in politics the British people are still instinctively inclined to the Left. This is a feeling that has helped Labour in election after election ; there have been millions of voters who would scorn to be on anything but the "progressive" side.

It will be interesting to see how much of this emotion survives in the election of 1955—the result will largely turn upon it. For it should be clear that it is now no more than an emotion. Which is the left wing party now ? Is it the party that allows its every utterance to be crabbed by asides in favour of egalitarian stagnation, or the party that claims to follow a policy of expansion for all ? It is a strange election in which the nominally progressive party is calling for a defensive, feeble and featherbedded economy ; while the nominally conservative party is being allowed to monopolise the battle cry that a great prize awaits the bold. Indeed, one can almost construct a paradox by saying that the parts of Tory policy in the past three and a half years that have been most right have been those that have been most Left ; while the parts of the current Labour programme that are most wrong are those that echo the protection-mindedness which in the past has been the hall-mark of the Right.

*

On the face of the issues, as thus presented, there is no doubt about which way radicals should vote. If they believe that Labour would do what it is saying it would do, if they believe that the present Government would continue even in rainy weather with the policies that it has pursued in the sunshine, then they should all vote Tory. But this is the judgment of things as they appear on the surface. How would the reality turn out, perhaps in circumstances quite different from today's ?

This is the radicals' remaining dilemma. The question is not merely which party would be most likely to run away from the things it now professes if conditions turned less sweet than in 1951-55, but in which direction each would be likely to run. And this question may be even more crucial in foreign than in domestic policy. Certainly every elector should look further than the Conservatives' imposing array of economic slogans in high summer before deciding that theirs is the side to support. It is with these other issues that subsequent articles in *The Economist* will be concerned in the course of this campaign. All that can be said is that, on these economic issues alone, the Tories—although not achieving a knock-out, nor even winning every round—pile up a large lead on points.

Asian Afterglow

HOW much did the Bandoeng conference contribute towards the loosening of the international logjam over Formosa ? There can be no final answer yet. Mr Dulles, on Tuesday, expressed the belief that confrontation with free Asians who strongly opposed any violent breach of the peace had had a restraining effect on the Chinese. It seems equally clear that both Chou En-lai's restraint at Bandoeng, and the comparisons drawn by delegates there between Chinese suavity and the State Department's too brusque statement last Saturday, influenced Mr Dulles's decision to offer bilateral discussions to Peking. On both counts the sponsors of the conference are entitled to claim some credit for a hopeful development in the troubled Far East.

Bandoeng was evidently not the only new factor in the situation. The evolution of American domestic politics has made it easier—although not easy—for the Secretary of State to take a further, perhaps an irretraceable, step away from the rigid posture of the Eisenhower Administration's early days. The crassness of the Nationalists, epitomised by their foreign minister, Mr Yeh, when he rebuffed the State Department on Sunday, saying that he would never sit down at the same table as the Communists, has lost them further ground. And the fact that the attack on the offshore islands predicted for mid-April failed to materialise meant that doors remained open which any such act by the Communists would have slammed tight. The approach of the Bandoeng conference may have decided Peking against an attack—and it is likewise most improbable that the Chinese will now launch one while their words of peace are still echoing in Asia's ears—but other considerations, some of them purely technical, may equally well have held back the assault.

On the other side of the ledger, it is obvious that no final solution to the Formosa problem is yet in sight. The logjam has stirred, but the river is far from clear. Chou En-lai took pains, at Bandoeng, to reassert China's "sovereign right to liberate Formosa." He and other Peking spokesmen continue to protest their peaceful intentions, as they have done in the past ; but they have made it clear that in saying that Formosa can be "liberated" peacefully, they are not thinking of plebiscites, provisional autonomy, or neutralisation, but of the way in which Peking itself was "liberated" during the civil war—that is, surrendered by its commanders when their military position became hopeless. Thus, although Americans and Chinese may now be able to sit down at the same table, they do not intend to discuss the same subject. In the absence of the Nationalists, which is insisted on by both Chou and Chiang, the Americans can discuss nothing that implies betrayal of their allies ; the Chinese propose to talk only about withdrawal of United States protection from Formosa, which they can then digest in their own good time. There is no common ground here, and unless some can be found—as it may yet be—a bilateral meeting could only register deadlock.

Yet willingness to appear willing is in itself something when a long conflict has led to a stiffening of all parties' attitudes ; and Bandoeng undoubtedly fostered this willingness. History may record the Asian-African conference as a turning point in the long postwar struggle in the Far East. But history will also record the notable fact that neither Formosa nor Communist China's other claims figured on the Bandoeng agenda, or in the conference's long final communiqué, which, indeed, was somewhat overshadowed by Mr Chou's last remarks. Particularly in western countries, there are signs that this week's developments in Sino-American relations have diverted attention from the Bandoeng proceedings themselves. It will be unfortunate if the results of a conference concerned with a field so much wider than the Formosa Straits go unremarked ; for it may be that the less spectacular of the events at Bandoeng will prove the more important in the long run.

*

What, then, really happened at Bandoeng ? Exultation about the success of the conference is not universal among the 29 Asian and African nations that took part, but it is surprisingly widespread. Delhi dwells on Mr Nehru's achievements, Peking on Mr Chou's, and the countries that stood up to Communist China boldly at the conference are also awarding themselves laurels. Can such contradictory claims all be considered justified ? At first glance it seems that the Chinese are claiming to have led the Indians and others up the garden path, that the Indians feel they have tied the Chinese down, and that the Turks, Iraqis, Pakistanis, Ceylonese, Siamese and Filipinos are confident that they succeeded in puncturing Peking's propaganda balloons. After any international conference, however, it is as natural for the participating governments to claim victory as it is for political parties to forecast it before an election. Discounting this tendency, what does one find ? Not all of the harvest is yet gathered in ; but it can already be seen that almost all the participants got something of what they wanted—and that none attained all his aims.

The whole Asian-African world has had the immense satisfaction of seeing its first great council held in an atmosphere of dignity and sanity. In this respect Bandoeng challenged comparison with any gathering yet held on a world scale, and bettered many such.

Compromise was the order of the day. This in itself suggested a growth of political maturity among those of the participants whose habit in the past has been to see life in crude blacks and whites. Moreover, compromise at Bandoeng did not mean universal lip-service to meaningless platitudes. Punches were not all pulled in the debates ; and the unanimity required for the final communiqué was painfully reached after many lively tussles.

Quoting liberally from the United Nations Charter and repeatedly insisting on Uno's authority, the communiqué set out ten principles of good neighbourliness which, in realism and practicability, improve on the virtuous but woolly five-point slogan previously in vogue in Asia. The ten Bandoeng principles begin with respect for basic human rights and end with respect for international obligations. In between there is no reference to the misty concept of peaceful co-existence, but a set of terser warnings against aggression, threats of force and racial discrimination ; insistence on the rights of small nations and on peaceful settlement of disputes ; and specific recognition of every country's right to join in arrangements for collective self-defence, provided that these are not made to serve the private interest of any great power.

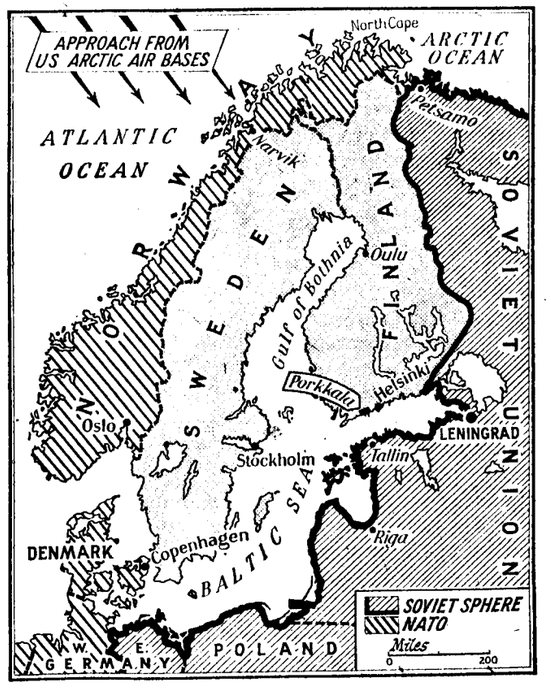
*

Colonial issues found the Asians and Africans torn between a natural tendency to rake up all the wrongs of the past, and a streak of realism which led to the Gold Coast being represented on an equal footing with other participants while the Mongolian People's Republic, that allegedly sovereign but almost invisible entity, was not even invited to Bandoeng. Colonial rule was, of course, condemned in the communiqué ; so was "the subjection of peoples to alien subjugation, domination and exploitation." One cannot tell what Chou En-lai was thinking of when he agreed to this separate category, but several Asian and Arab delegates showed that they had in mind, *inter alia*, the Moslems of Soviet Asia and the peoples of Eastern Europe. Under other headings, the conference declared its support for Indonesia's claim to West New Guinea, Yemen's " position in the case of Aden," Tunisian and Moroccan demands for independence, and " the rights of the Arab people of Palestine " ; but in each case it was content to urge fresh negotiations and peaceful settlements.

In calling for new efforts to achieve world disarmament—with repeated emphasis on effective controls—the conference adopted Mr Nehru's suggestion of a suspension of tests of nuclear weapons, despite the Soviet prime minister's rejection of this idea in February. It upheld the UN Declaration on Human Rights in the face of Chinese objections. It called for the admission to Uno of nine nations among which North Vietnam was the only Communist one, and said nothing about the Chinese seat, or indeed about any of China's demands. To judge by the formal record, then, Chou En-lai made little headway at Bandoeng. But the formal record is not everything at any conference, and it certainly was not in this case.

It is evident that the Communist delegates came to Bandoeng with little hope that they could force through the kind of resolutions they had secured at their earlier gathering of fellow-travellers in Delhi. The Chinese came to show how mild and accommodating they were, and to let the free Asians do all the arguing between themselves. And in this they very largely succeeded. Mr Nehru was unfortunately provoked into moments of unworthy childishness by those of his fellow delegates from free Asian countries who spoke their minds openly about Communist tyranny. He was also led to declare himself neither Communist nor anti-Communist—a slogan, uttered in anger, which it would be unfair to interpret as a denial of faith in democratic ways, for in Asian mouths such words twist themselves, and it is western dominance, not liberty, that is really—if unnecessarily—being spurned. Nevertheless, Mr Chou had the satisfaction of sitting back quietly while Mr Nehru took on the outspoken critics of Communism, and then of giving private audience to Mr Mohammed Ali. Equally well deployed were the invitations to a frontier inspection tour which the Chinese issued to their nervous small neighbours, and the announcement during the conference that they had agreed with Indonesia on the status of the host country's Chinese population.

*



Yet to say that is not to suggest that Bandoeng was the walkover for the Chinese which had been predicted. The free Asians argued among themselves, but they did not fall apart ; the ideals that are common to most of them but anathema to the Communists emerged. Self-appointed interpreters are fond of depicting Asians as so absorbed in their struggle against want that they are willing to forget all about the other three freedoms. Bandoeng demonstrated the falsity of this picture. Even the emotional pull of pan-Asian solidarity did not silence the pleas for liberty and the assaults on totalitarianism that came from " uncommitted " nations as well as from members of Seato and Nato.

At Bandoeng, new forces took the centre of the world's stage for a moment. Nothing new was created ; but the emancipation of the greater part of southern Asia was solemnly placed on record, and the lines along which this vast area of the world hopes to advance were made a little clearer. The more exaggerated claims made by some of the participants on their return home can be discounted. But judged soberly, whether by Asian eyes or by those in other parts of the free world who wish Asia well, the conference was an encouraging spectacle—and those who earlier entertained the darkest doubts must now applaud the sane and healthy symptoms that were displayed at Bandoeng.

The Bear at Finland's Door

WHERE other small countries have wolves at the door, the animal that troubles the Finns is the bear. Apart from Turkey, Finland is the only democracy in the world that shares a major land frontier with Russia, whose hulking presence lies along 800 miles of its eastern frontier. The perennial preoccupation of Finnish statesmen is to win Russia's toleration for their freedom and independence, and to avoid its regular attempts to enfold them in a furry embrace. Of late this has required considerable skill and agility, for the Russians have been applying themselves to the business with unusual subtlety.

Finland's importance to Russia is twofold—strategic and political. Russia's second largest city, Leningrad, lies uncomfortably close to the frontier, exposed on the north-west to possible air attack from the American bases in the Arctic. The Leningrad defences would be given some welcome padding if the Russians had the use of radar posts and fighter stations along Finland's north-western coast, as well as the base at Porkkala, uncomfortably close to Helsinki, which they have been occupying since 1944. But the Finns stand guard stubbornly over their sovereignty, and the Arctic bases are at best a long-term objective for the Russians.

At present they are more interested in a political objective, the exploitation of the Finns as a stepping-stone towards the new Soviet order for all Europe. Mr Molotov has long sought to make Finland the first non-Communist country to attach itself to his " European security " plan, *pour encourager les autres*. It is worth noting that there is a contradiction between this pressure on Finland and the present Soviet sponsorship of neutrality " on the Swiss model " as a goal for Austria and Germany. Mr Molotov is assuring the Austrians and Germans that they can attain pure non-involvement of the Swiss type ; yet Finland, which clings to non-involvement, has been repeatedly urged by the Russians to come out of its corner. There is food for thought here among all who assume that the " Swiss position " which Moscow now urges upon Germany and Austria can be a permanent one. Finnish experience suggests that it would be only a phase, succeeded by Soviet pressure for a descent from the fence.

Last November Finland turned down Mr Molotov's invitation to his " all-European " conference on security when the other democracies declined to attend. But in the past nine months the Russians have tried on three occasions to persuade the Finns to sign a declaration approving the Molotov plan and promising to co-operate with it. The first occasion was the visit to Moscow last July of the present prime minister, Dr Kekkonen, to sign the new five-year trade agreement between the two countries. The second was Mr Mikoyan's visit to Helsinki in November, which was ostensibly for trade and goodwill purposes only ; the third was the Finnish independence day celebrations at their Embassy in Moscow last December 6th. In each case the Russians more or less presented the Finns with a dotted line and a ready-filled fountain pen ; in each case, however, the Finns argued, qualified, referred to Helsinki and in the end got away with mild and innocuous statements saying that it was " imperative to combine the efforts of all countries " for peace. Mr Mikoyan's suggestion of a military liaison group was politely ignored.

But the Russians remain eager for a propaganda victory which they can exploit elsewhere in Europe, and they have some formidable cards to play. It was not by accident that Helsinki was chosen as the site for next month's Peace Assembly, with all its opportunities for displaying the blessings of " co-existence." Finland is militarily feeble ; its armed forces, limited by the peace treaty of 1947, total only about 30,000 men. Economically the Finns are dependent on Russia's good will, for their engineering and shipbuilding industries were artificially expanded after the war to satisfy Russia's demands for reparations, and their costs are too high for them to sell to the West. If the Russians chose now to close their markets, they could, for a time, cause serious unemployment.

Moreover, the Russians are busily making friends at the moment with Finland's largest political party, the Social Democrats, who are one of the two partners in Dr Kekkonen's coalition. The party secretary, Mr Leskinen, was entertained in Moscow last year by Mr Molotov; before he went he was a staunch opponent of Russian policy, but since he returned his speeches have been markedly more friendly. Now a further invitation to Moscow has been extended to the head of the party, Mr Emil Skog, who is also minister of defence. It seems that the Russians have despaired of obtaining results from the Finnish Communist party, although it holds nearly a quarter of the seats in parliament. But given Social Democratic good will they might well get the Finns to sign the required declaration of support and co-operation, and they might even persuade them to implement the clause in the mutual aid treaty of 1948 which speaks of consultation if Russia is "threatened" over Finnish territory.

It is one of the ironies of Finland's position that, with so many diplomatic worries, it is economically as viable as any Scandinavian country, and at present healthier than Norway or Denmark. After the post-Korean slump the prices of timber and paper industry products, which make up three-quarters of Finland's exports, have recovered well, and Finland has benefited from the recent building boom in Europe. The result is that, despite a relaxation of import controls last year, it managed to keep a small but comfortable export surplus. The national income increased by six per cent in 1954, an unprecedented rise for Finland, and industrial production continues to mount—by as much as 42 per cent since 1948. Unemployment is only half what it was at this time last year, and the exporting industries have the prospect of firm markets for the rest of 1955.

Among the roses there is one prominent thorn, the continuing inflationary pressure on prices and wages. Finland shares the problem with all the other Scandinavian countries, but in its case it has been enough to threaten the life of the government. In Dr Kekkonen's present administration his Agrarians and the Social Democrats together hold 107 seats in the 200-seat Diet, but they represent widely dissimilar interests. Last autumn the government decided to lower the cost-of-living index by increasing subsidies and cutting the purchase tax on various goods. This has brought the cost of living down to below its 1951 base-level, but it added a heavy burden to the budget and severely displeased many Agrarians.

Nor did it bring an end to wage claims. Several trade unions have since won rises for their members, and last month's strike by 24,000 civil servants, which virtually halted the country's economy for twelve days, ended in capitulation by the government. It was followed a few days later by an agreement to pay the farmers the higher prices they were demanding for their produce—another concession which in turn angered the Social Democrats. The coalition stays in office only for want of a workable alternative. An alliance between the Agrarians and the three small middle-class parties would be even more fragile than the present one; and the Communists ruined their chances of being invited to join a left-wing coalition by their behaviour in office before 1948, when they tried to seize control of the police and other departments by the familiar tactics of infiltration.

Finland's place in the world forces on it a Janus role, facing both ways. Under the shadow of the Iron Curtain it remains a vigorous democracy where speech is as free as anywhere in the western world, and criticism of Russia can be voiced without fear—although both press and politicians are sensibly restrained in this respect. Despite the recent expansion in its economic relations with Russia, Britain was still its chief trading partner in 1954. Most of Mr Molotov's advances in recent years have been delicately but decisively rejected by the Finns, and the free world should give them credit for a courageous performance. But it may not be easy for a small country so placed to hold out indefinitely if the Russians maintain and perhaps intensify their pressure. Finland has clearly been assigned a special place in Russia's present plans for Europe, and its continued struggle for independence will therefore be watched by the West, not only with sympathy, but also with a quickened interest.

Newspaper Copyright

Upwards of four years have elapsed since there was a considerable discussion on the right of property in inventions. . . . Again, this question of a right of property in the visible exhibitions or expressions of thought has come before the public under a new phasis, and now it more immediately affects our class. It is proposed to confer on newspapers a copyright to last 24 hours in all the original articles published in them. To our class this is deeply interesting—to us, personally, it is unimportant. . . . They who have written year after year about Free Trade cannot now have to learn that the gain of another is not necessarily their loss, and may be their advantage. They may believe, therefore, that the purpose for which they obtain the news is fully answered when they can publish it before their contemporaries; and that preventing others from appropriating it, though an injury to those others, would not ensure the sale of a single additional copy of their own journal. It is a fact that the journal from which most articles of intelligence are copied, which is most quoted, thrives the most; and the journals have therefore more to hope than to fear from appropriations. The public are not now satisfied with seeing mere quotations: they are never sure that something is not omitted; and will, in the long run, be attracted by quotations, where access is possible, to the original journal. . . . Every day booksellers inform the public that they publish the "author's edition" of a work, because they know that the public like authenticity, and like a guarantee for completeness and excellence as well as cheapness. The public will act on this principle in regard to journals as well as books. Papers that merely appropriate without acknowledgment will soon be found out and discarded. . . . The journals which are most diligent, most careful, and the best informed, now get the largest circulation; and no copyright will ever give success to their less diligent and less well-informed competitors.

The Economist

April 28, 1855

The Election of 1955

For the next few weeks comment upon the course of the election campaign, based partly upon despatches from correspondents in the constituencies, will be presented in this special section of *The Economist*.

Of Swings, Seats and Candidates

INTO the glorious uncertainty of election campaigns there has emerged in recent years—as a sort of programme seller rather than as a prophet—the figure of the electoral statistician. He carries with him, as a main tool of his trade, the kind of table that is set down at the bottom of the next page. It analyses the results in the general election of 1951; and, although the general election of 1955 will be fought out within a slightly different pattern of both constituency boundaries and candidates, this table serves as the best available sketch map of the battleground for May 26th. It is a sketch map that will be the more eagerly studied as a result of the latest *News Chronicle* Gallup poll. For this poll, which suggested a three or four point lead for the Conservatives, just before the election date was announced, now suggests that the lead has been whittled away. It may be that the large swing it reports in the past week is due to a sampling error in either the previous poll or the latest one. But the safest assumption for anybody to make about the election is that it is going to be an affair of desperately level pegging. The battle will depend on the outcome in the marginal seats.

★

The first piece of information to be drawn from the table is that each of the main parties at present holds an approximately equal number of marginal seats. The table shows that 146 of the 321 seats won by the Conservatives in 1951, and 141 of the 295 seats won by Labour, were rock-solidly safe; they could change hands only if more than 10 per cent of the electorate changed allegiance from one main party to the other. In addition, there were 99 other Conservative seats, and 79 other Labour seats, that could be regarded as reasonably safe; they would change hands only if more than 4 per cent of the electorate changed its allegiance. A swing of this size would be quite small by the standards of prewar elections, but it would be about 1 per cent bigger than that which occurred in the fairly controversial years between 1945 and 1950; rightly or wrongly, not many people expect it to be exceeded between 1951 and 1955.

It is around the remaining 76 Conservative seats and 75 Labour seats (as modified slightly by boundary changes) that the main battle on May 26th is likely to rage. If the Conservatives had won all of these seats in 1951, they would have had a majority over Labour of 176 in the House of Commons; if Labour had won all of them they would have had a majority over the Conservatives of 126. These may be regarded as the rough upper limits to majorities in the new House, unless there is an unexpected landslide either way. But there are quite comfortable majorities to be won from much smaller changes of allegiance. For example, a 2 per cent swing to the Conservatives in 1951 would have given them a majority of 94, and a 2 per cent swing to Labour would have given it a majority of 40.

A second lesson from the table is that the present electoral system, or rather the present geographical distribution of population in relation to that system, carries a fairly substantial bias against Labour. The reason for this is that about one third of the really safe

Labour seats that would have been lost in 1951 by a swing of 2 per cent or less to the Conservatives are: Ealing North, Hornchurch, Watford, Faversham, Rochester and Chatham, Rugby, Southampton (Test), Nottingham Central, Nottingham East, Nottingham South, Lowestoft, Malden, Norfolk North, Stalybridge and Hyde, Liverpool (Kirkdale), Chorley, Preston South, Halifax, Sunderland South, Edinburgh (Leith), Walthamstow East, Wandsworth Central, Wandsworth (Clapham), Willesden East, Uxbridge, Reading South, Falmouth and Camborne, Plymouth (Devonport), Leek, Droylsden, Huyton, Rossendale, Sowerby, Glasgow (Camlachie).

Conservative seats that would have been lost in 1951 by a swing of 2 per cent or less to Labour are: Battersea South, Camberwell (Dulwich), Bedfordshire, Buckingham, Spelthorne, Chislehurst, Plymouth (Sutton), Burton, Norfolk South-West, Peterborough, Doncaster, Bolton East, Rochdale, York, Darlington, Conway, Rutherglen, Glasgow (Govan), Glasgow (Scotstoun), Bexley, Brentford and Chiswick, Woolwich West, Wycombe, Portsmouth West, Stroud and Hornbury, Kings Lynn, Yarmouth, Liverpool (West Derby), Bury and Radcliffe, Preston North, Shipley, Barry, Romford.

Labour seats are too safe to be profitable; there are nearly fifty Labour strongholds—especially in the mining areas—where Labour votes are regularly "wasted" in piling up huge majorities of over 20,000, while there are only ten or eleven Conservative strongholds with majorities of this size. This waste of Labour votes explains why, as the table shows, Labour won 26 fewer seats than the Conservatives in the general election of 1951 although it actually had a lead of 0.8 percentage points in total votes cast. An even more intriguing lesson of the table is that Labour would have needed a lead of more than 2 percentage points in the total poll before it would have been able to form a government in 1951.

It is against this part of the table that the results of this week's *News Chronicle* Gallup poll may be read off by those who either hope or fear that they can have faith in them. The poll suggested a ½ per cent lead for the Conservatives if the tentative preferences of the "Don't knows" are excluded from the reckoning; a 1 per cent lead for Labour if those preferences are included; and a 1½ per cent lead for Labour if one relies on the question (which proved a remarkably accurate indicator in 1951) "Which party do you consider is best for people like yourself?" It will be seen from the table that if the actual vote in 1951 had fallen within these ranges—of a ½ per cent lead to the Conservatives and a 1½ per cent to Labour—then the Tories would still have been the majority party in the House (with a majority over Labour of anything between just over 50 and and just over 10). The Tories can also draw comfort from the fact that between 5 and 7½ per cent of the people who answered the pollsters' questions this week said that they would prefer to vote Liberal; between half and three quarters of these are unlikely to get a chance to do so, and some of them may come over to the Tories' side. But it is the reported movement of opinion, rather than the present state of it, which is likely to worry the Conservatives most. In the previous poll, published a week ago, the *News Chronicle* had shown a 3 or 4 per cent lead for the Conservatives, according to which treatment of the preferences of the "Don't knows" one prefers to use.

★

The discussion so far has been carried on in the assumption that the lines of battle in 1951 are a fair guide to the struggle of 1955. How far are the prospects altered by the changes in candidates and constituencies in between? The answer is that these changes will probably have surprisingly little effect on the election's result. Some more news about candidates has become available this week. The Liberals have published a first list of over 80 seats for which they have candidates already in the field. They hope to add some forty or fifty other names to it between now and nomination day. The main interest in their list had centred on the fact that seventeen of the twenty-one seats that the Conservatives had gained from Labour in 1951 had been seats where Liberals had withdrawn from candidature between 1950 and 1951, and there was eager speculation about in how many of these they would reappear.

The answer is that, so far and from this first list, they have reappeared in only one; it is the London borough of Battersea South, which the Tories may now have considerable difficulty in holding. Of the other Liberal candidates now announced just under fifty are in seats that Liberals contested last time; these candidates, of course, make no difference to the figures in the table. More than thirty are in seats that the Liberals last contested in 1950 but that did not change hands as between the major parties in 1951. Since not many people expect the Liberals to pick up more votes than in 1950, it might normally be concluded that these reappearances should not affect the results. Unfortunately for the Conservatives, however, some six or seven of these reappearances are in seats which the Tories held by only a narrow majority in 1950, and which Labour could now win by a fairly small swing to the left; while four or five are in seats that Labour held by only a narrow majority in 1951, so that it will now be more difficult for the Tories to capture them if there is a small swing to the right. Moreover, two of the Liberal reappearances in marginal Conservative seats strike an area where boundaries have been revised since 1950 in Labour's favour; even without a swing to the left it is possible that this will mean a Tory loss in Stroud and the unseating of Miss Hornsby-Smith in Chislehurst.

On the other hand the Liberal list has one more cheering feature for the Tories. There were fourteen Labour seats that were won on a split vote in 1951; in eight of these there is so far no Liberal candidate, while in one other (Merioneth) no Tory has yet appeared. The Liberals may, of course, appear in some of these seats, and in other inconvenient places for the Tories, later. But, taking the announced rough with the still changeable smooth, the Conservative Central Office has no reason to feel desperately disturbed with this first indication of Liberal intentions. It has other things to feel disturbed about just now.

★

What, now, of the changes in constituency boundaries? At one time it was believed that these changes would be of substantial benefit to the Conservatives, and this should still be true as regards the entirely new seats and the entirely abolished ones. Of the eleven entirely new constituencies, the Conservatives should gain seven (Chigwell, South-East Essex, Rye, East Herts, Surbiton, Eastleigh and Nantwich), Labour should gain three, and the eleventh seems to be very marginal. Of the six abolished seats Labour will lose an MP in Leeds, Sheffield, Fulham and Droylsden; while the Conservatives will probably lose a seat in both Blackburn and Reading. This possible tally of seven Conservative gains against two Conservative losses, and three Labour gains against four Labour losses, with one seat very doubtful, suggests a net Conservative gain of between five and seven in the House from new or abolished seats alone.

In addition, however, there will be major boundary changes in 177 existing constituencies and minor changes in 43. There will be some swopping of seats between the parties as a result of these. Contrary to earlier impressions (which suggested some net Conservative gains in these existing constituencies), the present indications are that the swopping may just about cancel out. Indeed, it is possible that the net effect will be to whittle away some of the small advantage that the Tories should secure from the creation of the new seats.

All in all, however, these changes in candidates and constituencies should leave the general terrain—although not all the individual features—of the battle ground in much the same shape as 1951. The broad picture drawn by the table on page 366 should still hold good. Interest in the next four weeks should be particularly concentrated on the 75 or so seats that each party could lose as a result of a 4 per cent swing, and perhaps especially in the 30 to 35 that each could lose as a result of a 2 per cent swing. The names of these "2 per cent marginal" seats are set down in the box on page 365. They provide a fair guide to the areas where the noise of battle is likely to be most fierce.

EFFECTS OF A SWING

	Swing from 1951 %	Proportions of Poll %			Con. Gain in Seats	Composition of New Parliament

Pink Hopes and Red Letters

THE swing of the *News Chronicle* Gallup poll in their favour has made Labour suddenly but unmistakably cock-a-hoop. For the first time for many months a majority of Labour MPs honestly believe that they are going to win this election. They may be reading too much into the poll, but the turn of the tide in their morale has come at an important psychological moment; for if they have been gaining support they have done so during a week when the headlines had suggested that they were losing possible and promising issues. To set against the careful stage-management of Lady Megan Lloyd George's accession to Labour, the Tories have gained a much more surprising collection of allies; in the last week Mr Chou En-lai, Marshal Bulganin, Mr Dulles and Mr Albert Hallworth of the engine drivers' union have been doing all the things that the Tory Central Office wanted them to do.

Of these factors, Mr Chou En-lai's peace talk at Bandoeng has been by far the most important. The Tories had lived under constant fear that the Chinese might invade Quemoy or Matsu while the election was in full swing; if there was an invasion, the issue of a hydrogen bomb war would dominate behaviour at the polls, and almost certainly sway it in Labour's favour. It now looks as if it is going to be much more difficult for any Labour speakers to make this campaign an irresponsible campaign against Mr Dulles; the news from Bandoeng, Moscow and Washington have all combined to suggest to the electorate that Sir Anthony Eden's foreign policy is paying off. The long-expected red letter has arrived, and Tory candidates are saying that it is a letter in support of their side.

The electoral effect of the threat of a railway strike is much more dubious. But for some reason the Conservatives are blithely confident, and Labour is obviously fearful, that a strike would cause a definite swing to the right. The theory is that the public is utterly weary of strike threats in general, and of railway strike threats in particular; and that if dislocation, and possibly some unemployment, spread from the engine-drivers' "selfishness" there would be a reaction in favour of a stronger hand on the tiller. The politicians believe that the public thinks that in the next few years the right hand would be slightly stronger than the left. They may be right in this assumption. But the suggestion of the latest Gallup Poll is surely that the main impulse which moves the public may be a quite illogical habit of blaming all ills on the government of the day; it is a moot point whether this impulse would turn round in its tracks if mainly-imagined ills were to be changed into temporarily very real ones. The only sensible attitude to strike about the state of public opinion this week-end is one of complete perplexity.

"Forward with Labour"

By a last-minute leap-frogging operation Labour released its election manifesto for publication on Friday morning; it will be discussed more fully in *The Economist* next week, when it can be compared with the Conservative manifesto, which was due to be published on Friday afternoon. At first reading, however, "Forward with Labour" contains several expensive additions to the programme adumbrated in "Challenge to Britain"—and some quite meaningless ones. Among the latter, the announcement that "Britain should propose the immediate cessation of H-bomb tests" holds pride of place; proposal and other people's disposal are two worlds apart.

In economic affairs, there are now flat statements that Labour will "bring sections of the chemical and machine tools industries into public ownership," and that local authorities will be asked "to submit schemes for gradually taking over and modernising rent-controlled private property, subject to fair compensation"; the nationalisation of water, together with the renationalisation of steel and road transport, is thrown in to fill this mixed bag. Among the specific bribes proffered Mr Gaitskell is now pledged to repeal Mr Gaitskell's charges on teeth, spectacles and prescriptions; Labour will "abolish the tax on sport and the living theatre"; and the repayment of postwar credits will be speeded up.

The section on the cost of living contains the promise to reimpose price controls on essential goods where necessary" which the party's economists must have striven so desperately to avoid. It plays into the hands of those who have said that if the price system is not to be allowed to work, then rationing will have to be re-imposed; but the manifesto tries to bluster its way out of this trap of its own devising by saying that the rationing scare is "a deliberate Tory lie." At the end the manifesto wisely scents one of the main fears that its inconsistencies may arouse. "The powers we ask for will be used in the interests of the whole nation and they will respect the rights of human personality. For our aim is to make men more truly free."

The Press Lines Up

As soon as it reappeared, the national press began groping for election issues. The first story grew from Mr Maudling's remark in the budget debate that import controls, the only alternative to the Government's monetary policy to deal with the balance of payments, would necessitate consumer rationing. The Conservative popular press quickly sought to saddle the Labour party with rationing as part of its policy, at least by implication: "Points. Ration books. Utility goods. Queues. Under the counter. Heaven preserve us from a return to these bad, drab ideas," said the *Daily Mail*. The *Daily Sketch* put the threat of the ration book into pictures, in clear imitation of the *Daily Mirror's* fatal play with Mr Churchill's revolver in 1951. The *Daily Express* asked who was most likely to avoid rationing—Butler or Gaitskell.

The *Daily Herald* inevitably stigmatised all this as the first big Tory lie. So did the *Daily Mirror*, which, however, has not yet fully committed itself to either side. Its circulation is needed by Labour to equalise the otherwise great preponderance of the Tory press. Presumably it will ultimately range itself with Labour; it certainly has some compulsion to range itself against the *Daily Sketch*. It gave prominence to Mr Gaitskell's attack on the "rich man's budget" and Vicky, its cartoonist, celebrated the demise of "Mr Butskell." But editorially the *Mirror* has so far only taken the line that it will impartially expose the lies of both sides. Perhaps as an earnest of its independence—or of its fears—it took Mr Bevan to task for his "farmyard insults" to the other side (or to the marginal voter); similarly the *Daily Express* showed anxiety over Mr Butler's treatment of Lancashire and urged him to think again—irrespective, apparently, of the fact that the textile trade between Britain and India is Empire trade.

So far comment has centred on the budget, which the *Daily Telegraph* called the first plank of the election. The cost of living issue is already finding prominence on the left. The *Daily Express's* brainchild in the last election, "Mr Rising Price," seems unlikely to sprawl across its pages this time, even though he could be overshadowed by "Mr Rising Earnings." Nor are there any invigorating slogans yet. "Peace and pantry," from the *Daily Express*, smells of the lamp. The *Daily Mail* tried out Mr Eden's phrase "the Opportunity State," but that smells of undue loyalty.

The Air is Neutral

The BBC has made known its strict adherence to protocol for the three weeks of the campaign; it is making provision for party political broadcasts to puncture the neutrality of the air in accordance with precedent. The Conservative and Labour parties are to have four radio and three television broadcasts each, the Liberals one period on the air and one on the screen. If any other party could put up 50 candidates it would also get one—which has produced the usual frustrated complaint from the Communists.

Meanwhile, programmes like "Any Questions?" will disappear from the air; the funny men will be doubtless solemnly warned to keep off the one subject on which the public might well enjoy some light relief; and lest it should be accused of taking any risks with unscripted programmes, arrangements to broadcast an Oxford Union debate "that the methods of science are destructive of the myths of religion" have been cancelled. As making points out of order is a pastime in the House of Commons itself, the occasion might have proved too great a temptation; and in any case the possibility of a Left *versus* Right line-up on such a motion are all too obvious. As usual, the purity of intention behind the BBC's rules must be applauded with politeness rather than enthusiasm; these slightly ludicrous pre-election arrangements are inevitable so long as the monopoly in broadcasting remains.

Notes of the Week

Strike in the Balance

The public has become used to the threat of railway strikes—and to last-minute compromises that avert them—that there was, therefore, a general tendency on Thursday to assume that there must still be an even chance that the engine drivers' stoppage at midnight on Sunday will not really come off. At the time of writing, however, all parties are standing pat. The Minister of Labour says he cannot intervene or call a court of inquiry; he evidently has scruples about knocking the industry's arbitration machinery for six a second time. But he has twice called the two sides together at the Ministry, and one meeting was in progress as *The Economist* went to press. The Transport Commission takes its stand on the latest decision of the Tribunal—whose awards it always accepts even when, as in November, it finds them embarrassing. The Associated Society of Locomotive Engineers and Firemen is still demanding the differentials produced by the November award. The best hope of compromise seems to lie in the possibility that the union might call off the strike on the understanding that there should be immediate talks about differentials; the Trades Union Congress, which believes that a strike would be as bad for Labour's election prospects as it would be for the country as a whole, is strongly urging it to take this course.

If the worst happens, the Transport Commission hopes to be able to keep essential services going, with priority for milk, perishable foods and some coal. About a quarter of the locomotive men belong to the NUR, whose executive does not support the strike. But whether in practice many of them will be prepared to man trains normally worked by ASLEF men, unperturbed by the strikers' calls of "blackleg," seems doubtful. Industry's coal stocks are said to be sufficient to last three weeks. The most serious problem will be the distribution of finished output; the coal mines themselves can only stock about one week's supply at pithead, and many of them would have to close down after that. A prolonged strike would therefore inevitably put a large number of people out of work; as a rough rule of thumb, the best forecast is that one week of strike would cause serious inconvenience, a second week serious dislocation, and a third week widespread tragedy.

Diplomacy on the Escalator

Conferences and meetings of foreign ministers are now pressing so close upon each other's heels in Europe that some of the participants have the nervous feeling of a man whose clothes have got caught in a fast-moving machine. That seems an unnecessarily alarming image. But in the past week diplomacy has certainly found itself on an escalator which is not merely moving remorselessly onwards, but accelerating. To the western talks which began on Wednesday, the Franco-German talks this weekend, the depositing of ratifications of the Paris agreements next Thursday, the subsequent meeting of Mr Macmillan, Mr Dulles and M. Pinay, and the Atlantic Council session on May 9th, there must also be added the imminent negotiations for an Austrian settlement. The speed-up has been dramatic. Some things that only a few days ago looked like obstructing the onward rush seem to have been whisked away by invisible scene-shifters. M. Pinay is now confident that the outstanding Saar issues will not stand in the way of next week's proceedings; the Russians, having made their propaganda point, now accept the commonsense of the western view that an Austrian text must be prepared by ambassadors before foreign ministers are called together to sign it. The conjunction of the Austrian developments, the approach of the Nato meeting, and the final approval of the Paris agreements have crowded the headlines together, and a whole new phase of diplomacy has begun before the loose ends of the old one could be tidied up.

It is not surprising that excitement is in the air. But in Britain, at least, there is clearly a tendency to over-excitement, which can be traced without difficulty to electoral origins. At the beginning of this week a mere nod from Marshal Bulganin revived febrile speculation about "talks at the highest level." It is one thing to press forward with plans for the exploration of every specific possibility that a new international situation may now open up; it is quite another to encourage a public belief that a confrontation with the Russians could result in an instant and universal relaxation. As long as the great international problems remain—and among them the problems of disarmament and of German reunion in freedom, which will certainly not be solved overnight—any such encouragement of delusions must be treated as grossly irresponsible.

Stirrings Among the Six

M. Monnet is still in Luxemburg, despite his well publicised decision to retire as president of the High Authority of the coal-steel community when his term of office expired in February, in order to have a freer hand to work for European union. The French suggestion, made while M. Mendès-France was still prime minister, that M. Monnet be succeeded by M. Ramadier was greeted with considerable coolness by "good Europeans." With the fall of the Mendès-France government the appointment of a

successor became one piece of unfinished business which M. Faure has been in no hurry to settle, and the "Europeans" have been making good use of the breathing space, with the result that M. Monnet's determination on an early departure seems by no means as unshakable as it once was. And the last few days have shown that the foreign ministers of the Six do not wish to answer the interrelated questions of who is to head the High Authority and where "little Europe" is to go next until the Nato and WEU meetings have been held and Germany has taken its place in the western alliance.

Meanwhile, the initiative appears to have passed to the Benelux countries. Last Saturday, M. Spaak and M. Beyen called for a meeting of the six foreign ministers at the end of May, not only to decide whether M. Monnet is to be succeeded by himself, or another, but also to consider a programme for further European integration. Specific proposals have not yet been made public, but the Dutch are known to believe that something like the "Beyen plan," proposed in 1952, which calls for a full customs union, is ultimately necessary, and to be sceptical about further experiments in the sector-by-sector approach.

The experience of the coal-steel community supports the Dutch doubts about the sector approach. The anomalies of dealing with coal and steel as though no national boundaries existed while all other economic sectors remain oriented to national ends have daily become clearer. A sensible policy for modernising the community's coal mines cannot be evolved independently of the plans being made for other sources of power. Ruhr coal competes with oil as directly as with coal from Lorraine. Why, it is asked, should one set of rules apply to those who sell coal and another to their principal competitors? Thus the very reasons that have led many to conclude that the establishment of separate authorities for additional economic sectors is both the hard way, and an economically unsound way, of achieving "integration," will be used by the Dutch, and by some others, to argue for an extension of the powers of the coal-steel community into related fields such as other sources of energy and transport.

Sir Anthony in the Saddle

SIR ANTHONY EDEN'S election last week as leader of the Tory party completed the transfer of power from Sir Winston Churchill, although the reshaping of the party hierarchy will not be completed until after the election. Lord Woolton is then expected to leave the Central Office, thereby allowing Sir Anthony to appoint a younger man to the party chairmanship. At the same time, if the Tories are returned to power, Mr Butler will presumably become Deputy Prime Minister *de jure* as well as *de facto*.

As usual, the election of the new Tory leader was a pure formality; no other candidates were in the field, and the occasion was devoted to graceful speeches of farewell to Sir Winston and greeting to his successor. But the powers that it placed in Sir Anthony's hands are far more than formal. He can now remain Tory leader for as long as he likes; he will not have to seek re-election. He alone is technically responsible for formulating party policy, and he alone appoints all the senior officials of the Central Office, the party's civil service. As Mr Robert Mackenzie wrote in his recent book about the parties, "If one takes the Conservative leader's position and powers at their face value, he appears to have greater authority over his followers and to be less subject to their restraint and control than the leader of any other political organisation calling itself democratic."

One of the main Tory criticisms of Sir Winston Churchill was that he did take the leader's powers at their face value. It is much too early to pronounce on Sir Anthony either as Prime Minister or as party leader, but so far as rank-and-file Tory MPs are concerned, he has not yet put a foot wrong. He has made the right new appointments, he has got the business of the Commons moving smoothly, he has personally been in regular and interested attendance on the front bench, he has made encouraging and helpful speeches at party gatherings and sent useful messages to the appropriate party organs. These can all be dismissed as mere matters of detail, the trimmings of the job, and certainly the serious policy tests are still to come. But it was Sir Winston's very spasmodic attention to just such details that led to most of the domestic embarrassments which afflicted his government. What is more, Sir Anthony also seems to be paying attention to the wider problem of keeping the Government in closer touch, not only with its own followers, but with the public at large.

Finance Bill in a Hurry

THE proceedings on the Finance Bill have proved as brief as the Bill itself. On Tuesday the committee stage was completed in one sitting of four and a half hours, compared with the usual struggle through anything up to ten days, with three or four all-night sittings thrown in. The reason for truncating debate was ostensibly the shortage of time; but presumably Mr Butler also had in mind the considerations that guided Sir Winston Churchill when he was Chancellor just before the summer election of 1929, when the same proceedure was used. Explaining why the vital clause for the general amendment of taxation law would be omitted from the Finance Bill, Sir Winston said, "It will, therefore, not be open to honourable members to move a long series of new clauses setting forth electioneering lures and wiles until after the election has taken place. It will not be possible, for instance, to bring forward new clauses of a vote-catching character for greatly improving the universe and then forcing the supporters of any responsible government to vote against them."

How wise was the similar precaution this year became apparent from the beginning of the Budget debates. With the election date already announced, every speech was made from an invisible husting—with some of the normally moderate Labour members, led by Mr Gaitskell himself, most eager to throw moderation to the winds. Under such circumstances the drastic shortening of debate was a merciful shortening of what was already becoming a tedious repetition of electioneering arguments. Labour rang every change possible on the theme of a "rich man's Budget," and the Tories produced every available statistic to show

The POWER behind PROGRESS

It is significant that every civilisation which has so far existed has progressed in relation to its power to reshape the earth to its special requirements. This is the part that Priestmans play, for wherever there is earth to be moved or bulk materials to be handled, there Priestmans excel.

Building dams, making roads, clearing jungle, dredging rivers;—in every part of the world, Priestman equipment plays its part by bringing greater speed and efficiency to the digging which must precede all building.

PRIESTMAN

Manufacturers of earth-moving equipment for seventy-five years.

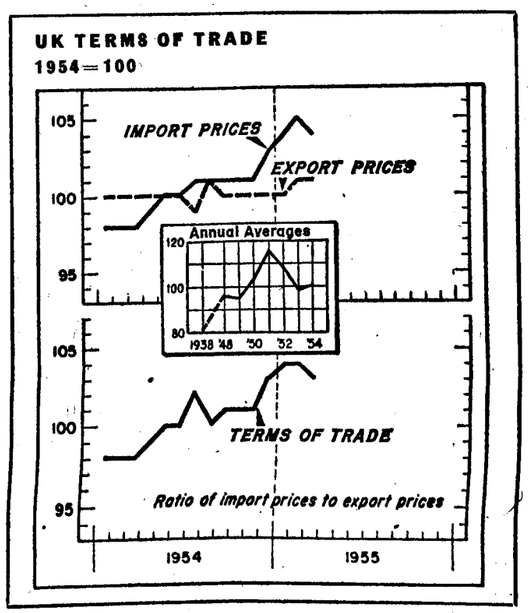
MAXIMUM PRICES:— Bottles 35/-, ½-Bottles 18/3, ¼-Bottles 9/6, Miniature Bottles 3/8, as fixed by the Scotch Whisky Association.

how widespread will be the benefits of Mr Butler's tax cuts. The only amendments Labour was able to move in committee were none the less designed to spread the benefits even wider. Their main proposals were to restore to £100 the band of taxable income charged at the lowest reduced rate ; and to cut all the reduced rates by the full 6d. being taken off the standard rate. On neither point was discussion heated, but the amendments enabled Labour to elaborate its argument that Mr Butler was being mean to the smaller taxpayers. This, of course, was the sole intention behind them.

Germans Vote for Stability



THE *Land* elections in Lower Saxony seem to present a contradiction. If the Germans are as opposed to Dr Adenauer's western policy as evidence suggests, why do they not vote against his party when they have the chance ? The results in Lower Saxony last Sunday showed no landslide away from the Christian Democrats (CDU). That is the outstanding deduction that can be made from the voting, which is otherwise hard to interpret owing to changes that have been made since the last *Land* election. If the results are compared with the Federal elections of 1953, which marked the peak of Dr Adenauer's popularity, they show that the Social-Democratic Party (SPD) increased its percentage of the votes from 30.1 to 35.2 per cent, while the CDU fell from 35.2 to 26.6 per cent. But against the *Land* elections of 1951, the picture is not so discouraging for Dr Adenauer. The Socialists had 33.7 per cent of the votes in that contest, while the CDU, then allied to the right-wing *Deutsche Partei* (DP), had only 23.8 per cent, or less than Dr Adenauer's party alone gained in last Sunday's elections, and much less than the 39 per cent which the CDU and the DP polled on separate lists. The result of the change since 1951 is that the Socialists, although still the largest party, cannot form a government as hitherto with the Refugee Party (BHE).

It is not possible to say exactly how much more popular Dr Adenauer's party is than it was in 1951, or how much less than in 1953, because several small parties have been eliminated in the meantime. It is thought that the right-wing anti-Socialists shifted their support to the *Deutsche Partei* rather than to the CDU, because Dr Adenauer's party has too strong a Catholic bias for the liking of Lower Saxon Protestants or former Nazis. The Refugee Party (BHE) lost support for two reasons. Large numbers of refugees have been moved from Lower Saxony, and the rest are increasingly losing their identity as a special body. Moreover, the party is now seriously split on the issue of Germany's western alliance.

Elections do not fully reflect the feeling against the Paris treaties because Germans have split mentalities on the subject of reunion. They want stability in their lives and fear that any alteration, either in the government or by reunification, would upset their hard-earned march to prosperity and security. Germans do not vote against a long-established government for the sake of a change. On the contrary, they might again desert parliamentary democracy altogether if party strife became too sharp. Success succeeds in Germany even more than elsewhere, and Dr Adenauer's victory in the *Bundestag* ratification debate rallied some waverers back to his side. But another part of most Germans' minds makes them demand reunification above all. Whatever they think privately and however they vote, they publicly proclaim their patriotic wish for an end to partition, and the more they suspect the western powers are preventing it the more assertive the demand becomes. When they go to the polls, however, the urge for a quiet life becomes the strongest factor—hence the support which the present coalition is still given at the ballot box.

"Third Force" Talk in Bonn

A LANDMARK in the political campaign against the Nato alliance was passed in Bonn this week, when the Social Democrat leader, Herr Wehner, announced a programme which is, on the face of it, very close indeed to Mr Molotov's. Herr Wehner is his party's "foreign minister" and head of the *Bundestag* committee on all-German affairs. His proposal, which the Socialists want to lay before the preparatory conference of the western governments in London, takes the following shape. European security and German reunification must be treated as one matter in negotiations with the Russians ; discussions must deal with free, internationally supervised, elections as well as with the military status of reunited Germany. This presupposes that the West and East as well as the Federal Republic should agree on the principles of an all-European security agreement in the framework of the United Nations. The negotiations should not be made more difficult by trying to achieve reunification and a peace treaty at one shot. Herr Wehner believes that this proposal would be approved by the Russians and would lead to general disarmament. Foreign troops would, he

thinks, have to stay in Germany until the peace treaty, and Germany would have an army of its own, but the strength of all five forces would be limited.

According to the *Frankfurter Rundschau*, the Free Democratic Party is also conferring on a solution which would lead to a European security grouping outside the Atlantic alliance, which might include Communist states. And Dr von Merkatz, leader of the parliamentary *Deutsche Partei* (another member of Dr Adenauer's coalition), has now joined the ranks of advocates of a " third force " which would include East European states and would lie somewhere between America and the Soviet Union. It appears, therefore, that when Dr Adenauer last week declared firmly that any solution must be based on the alliance with America, he may have been speaking for most of his party, but no longer for its coalition partners.

Looking Ahead in Tunisia

At last the remaining points of discord between France and Tunisia have been tackled in a spirit of compromise, and statesmanship has averted last week's danger —that seven months of work would collapse on the issue of how many Frenchmen were to sit on a handful of municipal councils. Both prime ministers, M. Faure and M. Ben Ammar, deserve credit for the perseverance that carried matters home. But the agreement that their delegations reached is only a semi-final, not a final round. In France, M. Faure has still to put it to parliament ; in Tunisia, M. Ben Ammar has to rally the many shades of opinion within the Néo-Destour party. After Ramadan, the month of fasting which has just begun, the negotiators have to meet again to sign texts in final form. After that, both have to show that they can execute in spirit what they have signed in letter. The way ahead has been opened, but is not yet clear of obstacles.

The obstacles in Tunisia look less formidable than those in France. The task of smoothing differences in outlook between Tunisian factions has been greatly facilitated by a final gesture of statesmanship on the part of M. Faure. He saw fit, in the last sticky stages of the negotiations, to consult and gain the support of the father of the Néo-Destour, M. Habib Bourguiba, who is still for most Tunisians *le suprême combattant*, and whom long years of exile have not deprived of great influence within the territory. It is at the French end that the immediate snags look menacing. When parliament threw out M. Mendès-France, it did so on the North African issue, and though some deputies were palpably rejecting the man and not the policy, many were against both. Last week, an intransigent delegation of Frenchmen from Tunis was imploring M. Faure not to give way, and its supporters are working furiously to rally a parliamentary majority to their view. Should they succeed, France's whole position in its North African dependencies will become tenable only by force, as opposed to consent.

Were this to happen, France's partners within Nato need to think what would be their attitude. What would they feel about an ally forever unable to do its bit in Europe because it had one hand tied down in Africa ? Maybe the British cannot preach while they have the Cyprus problem on their hands, but, as their ambassador said in Algiers last week, they think the policy of agreement with the Tunisians and Moroccans " in keeping with the spirit of the times " ; the Americans would certainly not relish retaining their Moroccan bases on terms so out of keeping with their conception of democracy.

A Trump from Sir David

The Opposition was rash to choose education as the subject of the supply debate on Tuesday. This issue was certainly a Tory liability a year ago, but a combination of greater ministerial bonhomie and less financial stringency has turned it into a Government selling point. It might have been foreseen that Sir David Eccles would use the chance to play the good fairy again, for there were two or three questions on which an announcement was due.

This time Sir David's gift was a promise of bigger state grants to university students and to teachers in training. The grants for undergraduate board and lodging are to be increased by 10 per cent next autumn ; and the value of any prizes won by state scholars, up to the value of £100, will not be deducted from the grant paid. Of great importance to professional people and others is the assurance that the means test for state scholarships, which has borne so hardly on them, is to be relaxed. Sir David did not give details, but the parental income ceiling, above which no grant other than the honorarium of £30 a year is paid, is to be raised above the present figure (which is £2,200 without allowances). The allowances, or " disregards " as they are called, for other children being educated are also to be increased. The Minister will ask local authorities to bring their awards into line with state scholarships, and hopes in the process to eliminate the local variations in grant which at present cause unfairness as between one area and another. He also wants to see uniformity in grants to teachers in training, and has accepted the recommendation of a working party that these should all be brought up to the level of the highest—which would mean doubling the average grant now paid. Nothing is settled, however, about maintenance allowances for children who stay at school beyond the age of fifteen. So much generosity would presumably have been too much for the Treasury.

There was enough generosity, anyway, to leave poor polemics for the Opposition, especially as its policy of comprehensive schools has proved something of a boomerang. Labour members now hasten to deny that they would destroy the grammar schools, and their election manifesto merely says discreetly that they would " encourage " comprehensive schooling. They also, however, say that " local authorities will be asked to submit schemes for abolishing the [eleven-plus] examination." It would be nice to know what sort of schemes they have in mind.

General Templer's Task

The appointment of General Sir Gerald Templer as Chief of the Imperial General Staff comes at a time when the army is debating the changes of organisation and structure which are demanded by the development of nuclear tactical weapons. These changes were foreshadowed in the Defence White Paper last February, but of course in general terms ; the exact details of a division equipped both to defend itself against atomic attack and to follow up an atomic attack on an enemy are far from settled. It is easy to talk of power to disperse and concentrate quickly—a very different matter to create formations capable of doing these things and of delivering an effective attack. It is not likely that the problem will be finally solved by the time General Templer takes up his appointment in November. But there can be little doubt that he will bring to it an acute and original intellect as well as immense drive and singleness of purpose. In another respect his recent appointments fit him to solve problems of military organisation that have no precedent. Besides being trained for nuclear warfare, the army still has its duties in colonial campaigns and limited wars ; in Malaya General Templer had every opportunity to see what is required in formation and equipment, and therefore how such a requirement can be fitted into tactical training.

Whether the problem is the regimental or divisional structure, the equipment to be provided, the use of aircraft for mobility or transport, or the allocation of available strength to the three or four major theatres of operations, the task of the CIGS is an anxious one. Though the adjective " Imperial " in his title is only of historical interest, yet his vision must be world-wide. Through annual conferences he is in touch with the Commonwealth Commanders-in-Chief ; he must closely work with Nato ; and he speaks for the army at the weekly or bi-weekly meetings of the Chiefs of Staff. His purposefulness and grasp of detail together have an immense effect on the morale of his service. This latter aspect of his function is likely to carry particular weight with General Templer, whose deep concern to raise the standards of training and leadership of officers is well known.

Poland's Long Memory

The tenth anniversary of the Polish-Soviet alliance has been celebrated with a tremendous orgy of mutual back-slapping and eulogistic oratory. The honours were evenly divided between the two capitals. The Polish premier, Mr Cyrankiewicz, led the Polish delegation at the anniversary celebrations in Moscow. His colleague, Mr Bierut, the chief party boss in Poland, stayed behind in Warsaw to welcome his Russian opposite number, Mr Khrushchev, and Marshal Koniev. Both Mr Cyrankiewicz and Mr Khrushchev probably provided a clue to the scale of these celebrations when they spoke of the need for Poland, Russia and all other " peace-loving countries " to safeguard themselves against the provocative plans of the warmongers and to unite their armed forces under a joint command. Mr Khrushchev said that to do otherwise would mean " displaying impermissible carelessness." For months past the Russians have indeed been parading their intention of tightening and dressing-up the military links that already exist between themselves and their East European satellites when the Paris agreements come into force. But their decision to bring an East German army into close military co-operation with Polish and Czech forces will undoubtedly be a bitter pill for both of these. That is perhaps why the occasion of the Polish-Soviet celebrations has been used to butter up the Poles as much as possible.

Time and familiarity have evidently not yet reconciled the Poles to having their armed forces virtually under Soviet command. Otherwise it is hard to understand why Marshal Rokossovsky, the Polish defence minister and commander in chief, should this week have chosen to discuss with a French correspondent the disastrous Warsaw rising in 1944. Marshal Rokossovsky, who at that time was the Soviet officer in charge of the Russian forces outside Warsaw, was at pains to explain his failure to aid the insurgent Poles, and claimed that he had warned them that the rising would be premature—a claim which General Bor-Komorowski has promptly denied. If these bitter memories had been dormant, Marshal Rokossovsky would hardly have revived them ; nor would he be likely to make excuses and explanations now, if he did not wish to lighten the weight of Polish resentment against the conduct of the Red Army ten years ago.

The Italian Presidency

As *The Economist* goes to press, the two houses of the Italian parliament, plus ten regional delegates, are meeting in joint session to elect a successor to President Einaudi, whose seven-year term of office expires on May 11th. During the past few weeks the debates and manœuvres among Italian politicians and parties over a suitable candidate have thrown up a variety of names, but no firm favourite ; each party has been chary of nailing its colours to any particular mast. The Italian Republic has been exceptionally fortunate in its first elected President, and there is, unfortunately, a grave dearth of elder statesmen, able to stand above party and untainted by fascism, who could adequately fill his place. Both his great age—he is 81—and a natural reluctance to institute a second-term precedent for the presidency, tell against President Einaudi's re-election ; but if he feels willing and able, he might yet find himself his own successor.

Whoever is elected to the presidency, it is to be hoped that it will be someone who will not add to the present instability of Italian politics, even if he can do little to improve their stability—in other words, someone whom the greatest number of parties, and especially of the centre coalition parties, will not quarrel about. Apart from Signor Einaudi, the man most likely to fill this bill seems to be Signor Merzagora, the president of the Senate, who was returned to parliament on the Christian Democrat list although he is in fact an Independent. Signor Scelba, the Prime Minister, appeared to pave the way for such a candidate early this week, when he appealed to his own party not to put forward a Christian Democrat candidate ; he also, perhaps, wanted to exclude one of the leading candidates, Signor Gronchi, the president of the Chamber, who is a left-wing Christian Democrat favouring close links with the Nenni Socialists.

The Prime Minister will no doubt hand in his resignation

to the new President, even though he is not constitutionally bound to do so. But although his four-party coalition has been coming apart at the seams for months, and his own Christian Democrat party is deeply divided, Signor Scelba will probably be asked to carry on ; neither political arithmetic nor party allegiances seem to favour much change in the present complexion of the Italian government.

A Fillip to Town Development

THE Minister of Housing, Mr Sandys, announced this week that he is taking two steps to assist dispersal from congested cities. In future smaller towns that can take the surplus population of some big city will get a 50 per cent grant from the Government towards the cost of water and sewerage ; this will be in place of the much smaller and variable grants now in force. The big city will be expected to help with the cost of housing for ten years, after which the Exchequer will, if necessary, step into the breach. Secondly, the Minister is urging that an effective green belt should be created around other big cities besides London.

These measures point in the right direction and will put new life into a number of wilting schemes prepared under the Town Development Act. But they plainly will not work unless the Government, and the Board of Trade in particular, does more to steer employment away from the big cities and into the expanding towns. A green belt is a dubious asset if it forces a choice between more overcrowding in the city itself and longer journeys to work from beyond the green belt. Mr Sandys should start by getting his colleagues to locate some of their more routine office work away from the big cities.

Families in Difficulties

THE widespread feeling that there are too many separate organisations concerned with the welfare of children, especially with those who are neglected or ill-treated, was voiced this week by Sir Basil Henriques, a London juvenile court magistrate. In an address to the Royal Society of Arts, he said that "the weakest part of child welfare work in England is its preventive side—the side which is by far the most important," a weakness which he attributed mainly to lack of co-ordination between the manifold statutory and voluntary organisations. As a result, there is a failure to focus attention on the family as a group, in spite of the fact that it is usually useless to help or treat a child in isolation from his family. Furthermore, if action is needed the present cumbrous and confused arrangements only too often result in a passing of the buck between agencies, none of whom is able or willing to take responsibility for swift and decisive action at an early stage.

With the magistrate's detailed suggestions for administrative improvements locally there will be considerable agreement. He proposed the establishment of a neighbourhood Child Welfare Office, under the direction of the Children's Officer, which would house in one central building all the agencies dealing with the family, whether statutory or voluntary. To this office would come all those who were concerned in any way with the problems of children. From this office would work a team of highly trained family case workers, one of whose functions would be to act as a liaison between home and school, a need which Sir Basil feels is now very inadequately met.

There will be much less agreement with his suggestions for departmental changes at the centre. With a view to eliminating the present overlapping of the four Government Departments now concerned with various aspects of child welfare, he proposed that a Ministry of Juvenile Welfare should be set up, for whom a new minister of Cabinet rank should be responsible. Admittedly the New South Wales experiment in such a unified service has been successful, but it is doubtful whether such a solution would work in this country. At least, however, Sir Basil's address has underlined the grave drawbacks of the present system and the need for a committee of inquiry into the whole relation of the social services to the family.

In Lenin's Shade

LAST week the celebration of Lenin's birthday was given pride of place in Russia. Though the actual date was April 22nd, the Soviet press had already been filled for weeks with eulogies and reminiscences. Last year's modest celebrations of the 75th anniversary of Stalin's birth paled by comparison. In Stalin's lifetime the cult of Lenin was merely fostered as part of the ritual for the Georgian demigod ; now it seems to be encouraged for entirely opposite reasons. Extracts and recollections are no longer carefully chosen so as to show Stalin always at Lenin's side. On the contrary, in those quoted recently almost no mention is made of Stalin. Indeed, one has the impression that, while the iconoclasts have no easy task after years of Stalinist idolatry, the Leninist revival is being used as a transition, a road of escape from the Byzantine cult of Stalin.

The occasion is also being used for practical political ends. Lenin's words are chosen so as to make the dead leader give a posthumous blessing to Malenkov's deposition and the reversal of economic policy. At the commemorative meeting held in Moscow, Mr Shepilov, the editor of *Pravda*, quite justifiably insisted on Lenin's consistent emphasis on heavy industry. But, pushing opportunism ridiculously far, he went on to cite a letter in which Lenin had mentioned the virtues of maize. Maize cultivation is Mr Khrushchev's latest panacea for Russia's agricultural woes.

The echoes of the speeches celebrating Lenin have now become mingled with slogans issued in advance for May Day. These, too, have their practical aspects, and a special place has been found for Mr Khrushchev's maize. As a sign of the times a slogan is also included bearing greetings to the previously neglected Austrian people. On the whole, however, the pattern and content of the May Day formulæ

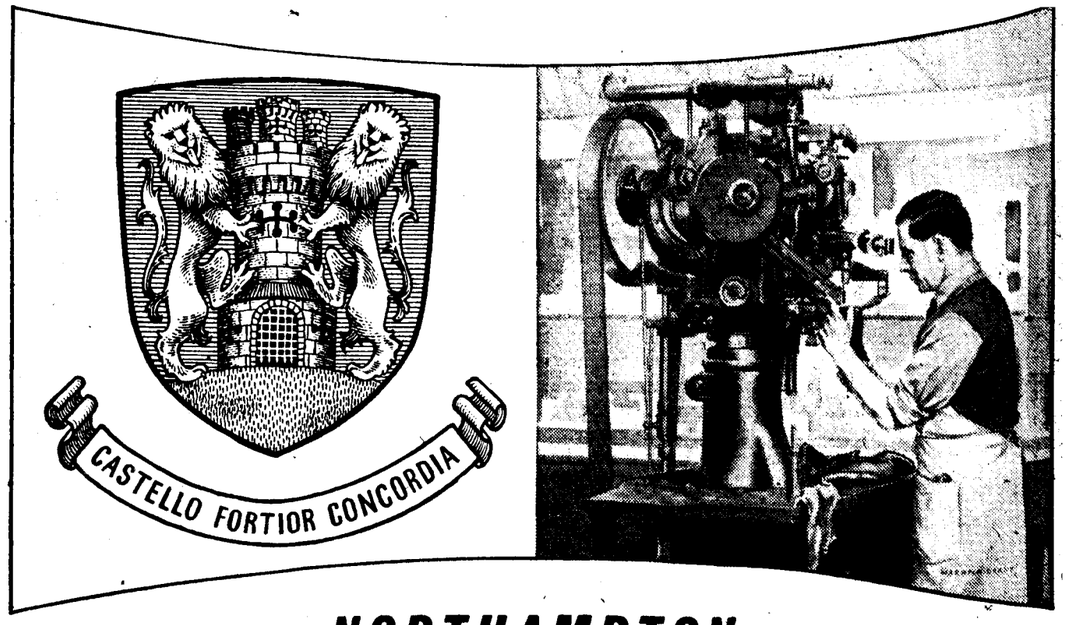
AIR TROOPING

THE PATTERN OF DEFENCE now being shaped by the western powers has as one of its essential elements the speedy movement of troops by air to trouble spots and strategic outposts. For Great Britain, in particular, the need to move reinforcements quickly—perhaps a battalion at a time—to such widely scattered places as Malta, Gibraltar, Bermuda, the Caribbean, West Africa, Cyprus, Aden, Singapore, Hong Kong and elsewhere has made the use of aircraft obligatory. Air trooping has been steadily increasing the part it plays in such movement and is the method now used for nearly 50 per cent of the total Army trooping to and from theatres other than Germany.

The speed of the trooping aircraft, as against travel by sea, is self-evident. Sea transport moreover has the disadvantage that in carrying a much larger number of men per unit it is keeping them inactive in the "pipeline" for a comparatively long period. In effect this delay means that an increased number of men must be kept ready under arms; whereas by air, troops need not be out of action in transit for more than about twenty-four hours. By the proper use of the air, therefore, fewer men are needed to guard the widely dispersed outpost defences of the democracies. The manpower saving on the Far East route alone is estimated by the War Office to be one-seventh, so that out of every 10,000 moved in a year, there are 1,400 or 1,500 more men effective in the field.

Another feature of air trooping which has directly influenced the three Service Departments in their decision to expand its volume, is the net saving of air travel over most sea routes. From the United Kingdom to Egypt, for instance, in 1952/3 the average fare per head by sea was officially stated to have been £30, compared with £22 using charter aircraft. This is considerably less than even tourist fares on the scheduled airlines, since on troop charter work every available seat can be filled.

In 1950, the Government decided that the British independent operators should provide the bulk of the extra capacity needed to develop the air trooping scheme. In this way, a measure of stability would be given to these operators enabling them to invest in modern equipment and so provide an important strategic reserve of aircraft to supplement Transport Command when required.



The aircraft at present operated are mainly suited to the medium haul routes such as those to the Mediterranean, and there has been a shortage of large, long-distance airliners. The three Bristol Britannias recently ordered by the Government for trooping operations will be capable of doing the work of six of the smaller capacity machines now used.

The maintenance of British Commonwealth and Colonial communications has always taken into account the possibility of the hostile seizure of large areas normally open to air passage, and the denial of intermediate landing facilities calls for aircraft able to fly large loads rapidly and non-stop over long distances. This is the special characteristic of the Bristol Britannia. For example, in its Long Range version it would be able to fly from England to Singapore with one stop at Aden. Its trooping capacity on a shorter route is indicated by the fact that thirty 100-seat Britannias would be capable between them of moving 20,000 troops of Britain's future Home Strategic reserve to, say, the Middle East in a week.

The World is their Market

NORTHAMPTON

Although there has been a great deal of development recently in Northampton in the engineering and electronic fields, the city's main industry is still shoes — shoes of the finest English leathers, styled and made with superb English craftsmanship.

Wherever shoes are worn at all, Northampton shoes are worn with comfort and with pride. But in the city of Northampton they know that shoes themselves — even the finest shoes in the world — cannot fill order books.

It's the same in any business. *Making* products for the world is only half the job. You've got to show them, sell them — and *sell them hard* — wherever a market for them exists. Many manufacturers are doing this very successfully through TIME, The Weekly Newsmagazine.

REACHING THE WORLD'S BEST CUSTOMERS

TIME'S net paid audited circulation exceeds two-and-a-quarter million copies. More than 93% of the readers of TIME hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

There are five separate editions of TIME* with the same editorial content. One circulates only in the United States. The other four — the International Editions — are published simultaneously in English and read by important people in over 100 countries outside the U.S.A. You can buy advertising space in just the editions you want, covering the world markets which interest you most.

are roughly the same as last year. But Marshal Zhukov's order of the day before the usual military parade in Red Square may well provide more information about the Soviet military counter to West German rearmament, which as yet remains portentous but imprecise.

Retreat from Singapore

THE attempt to found a Chinese university in Singapore has already run into serious trouble. This university, called the Nanyang, was privately endowed by a group of wealthy Malayan Chinese in response to the demand of a section of their community for teaching in Chinese and emphasis on Chinese culture—ends not served by the University of Singapore, whose teaching language is English. The first Chancellor of the university was the well-known writer Lin Yu-tang, who has been living recently in America ; from this country Dr S. J. Hsiung, who before the war achieved a remarkable success on the London stage with "Lady Precious Stream," went out to become Dean of Arts. The British authorities, however, regarded the venture with disfavour as tending to accentuate Chinese separateness and obstruct the birth of a single Malayan nation ; the Malays were likewise hostile. The attitude of the Communists was more complex. Such an institution, if brought under their control, could be a valuable means of influence over the Overseas Chinese ; but if it remained independent, it would be a serious challenge to the monopoly of intellectual life which the Communists have established in China itself and are seeking to extend to Chinese abroad.

It was to be anticipated, therefore, that the Communists of Malaya would use every means to capture or wreck the Nanyang university, and this is what appears to have happened. After a few months of bitter experience Lin Yu-tang has resigned and left Singapore, saying that Communist pressure on the sponsors of the university made it impossible for him to carry on. There are indeed poor prospects in Malaya for such an institution as Nanyang was intended to be. The Chinese community seems likely to become more and more deeply corroded by Communist pressures as British authority in Malaya is relaxed. The inevitable impression is that the British are on their way out, but nobody knows who will get the power they abandon ; meanwhile, it is prudent for ordinary people to reinsure with the Communists.

Low Incomes and Contributions

THE National Insurance Act of 1946 allows people with small incomes to be exempt from liability to pay contributions as self-employed or non-employed persons, though there is nothing to prevent them from voluntarily doing so and thereby earning a right to an old-age pension. At present, the income limit for exemption is £104 a year, and about 200,000 persons (three-quarters of them women) have claimed exemption rights. The national insurance advisory committee has now recommended (Cmd. 9432) that the rise in the cost of living and the rise in the amount of contribution justify the raising of the exemption limit to £156.

An employed person with low wages is treated differently. At present, if he does not earn more than 30s. a week, he pays a reduced rate of contribution and his employer a correspondingly higher rate, so that the total contribution paid in respect of him is the same as for all employed persons. The advisory committee now recommends that the weekly limit of earnings should be raised to 60s. It does not, however, go into the question of resident employment, which means—very largely—the problem of "living-in" domestic helps. Before adopting the recommendation, the Minister of National Insurance ought to consider whether an employer who provides board and lodging and pays £3 a week should have his share of the contribution raised from just under half to nearly 70 per cent of the total.

Farm Rents at Whose Expense?

THE Country Landowners' Association has seen the light —the green light for higher farm rents. At its recent course on estate management, Colonel R. B. Verdin roundly told the squirearchy that they should cease to regard landownership as a hobby, in which pressure on the tenant ranks as bad form ; they should treat it as a business requiring rents that are adequate for the maintenance and replacement of fixed equipment. Their change of attitude will need to be drastic if they are to live up to this prescription. Rents and interest today take a mere 7¼ per cent of total farm expenses compared with 17¼ per cent in the "depressed" and less mechanised conditions of 1938 ; indeed it is a fair computation that the cost of new equipment alone—leaving aside the generally greater value of the land itself—calls for rents of at least three times the present level.

Unfortunately, there are two barriers in the way of an economic solution to this problem. The first is that those landlords who do try to raise rents, and who go to arbitration, suffer, according to Colonel Verdin, from obsolete techniques of valuation. The appearance of the farm, its fertility and amenities are weighed up, field by field, by traditional rote, but the rent is not related to the cost or upkeep of the field equipment—although the Agriculture Act requires the owner to provide proper equipment and, strangely enough, purports to guarantee him an adequate return upon his investment.

The second obstacle is that Colonel Verdin, speaking for the squirearchy, blithely assumes that the cost of higher rents would be passed on to the taxpayer. To bring rents back even to their prewar equivalents would add perhaps £70 million to farm expenses. But rent is not just another expense ; it is, or should be, both the product and the yardstick of farming profitability. Rents should be increased because most farmers can afford to pay them, and badly need the repairs and improvements which cannot otherwise materialise. The economic object of higher rents would be to provide a necessary stick for certain farmers beside all those carrots ; it would not be to provide another rod for the taxpayer's back.

Letters to the Editor

Revolt in Ashanti

SIR—For some time now I have not taken your articles on Nigeria very seriously because you have left me under the impression that you are not well-informed, since you appear to rely on hearsay evidence.

I have in mind articles which appeared in *The Economist* in the last three years, concerning the activities of the National Council of Nigeria and the Cameroons. They were written mainly from prejudiced sources by those who are out of focus with the National Council of Nigeria and the Cameroons.

In your article of February 19th, I do not agree with the view that, if tribal separatism triumphs in the Gold Coast, then it will be widely taken by critics of British colonial policy as a sign that Africans south of the Sahara are not yet ready for full responsibility to run their own affairs. The most important reason for my stand is the fact that the idea of federation is usually based on separatism of some sort. It may be tribal, racial, cultural, linguistic, etc. If you bear in mind the factors which led to the establishment of the Swiss Confederation and the continued co-existence of German, French, Italian and Romansch-speaking Swiss nationals, under one federal authority, you will appreciate my point.

There is a federal system of government in Canada, in spite of the fact that English and French-speaking Canadians do not always agree. Linguistic and cultural differences did not prevent the creation of a Canadian federation, which has been a success. The fact that there are twenty-five multi-lingual Cantons in the Swiss Confederation and twelve Provinces in the Canadian federation cannot be used as an argument to deny Swiss and Canadians the right to run their own affairs.

Without necessarily supporting either the Ashanti National Liberation Movement or the Convention People's Party, I am of the opinion that, if the Gold Coast ultimately becomes a federation of four regions, there is nothing politically wrong in that. With an area of 91,843 square miles and a population of 4,200,000, that country compares favourably with Switzerland, which has an area of 15,950 square miles with a population of 4,780,000.

Thus, it is fallacious for any person to reason that a separatist tendency which may lead to a federal system of government in Africa is necessarily an evidence of political incapacity, when it affects Africans, and not the case, when it affects non-Africans. Any person who thinks that, because the idea of federalism is gaining ground in tropical Africa therefore, it is a sign that Africans are not yet ready to run their own affairs, is neither objective nor scientific in his approach to such a political problem. I submit that, other things being equal, the tendency towards separatism is natural and not necessarily a disqualification for self-government.—Yours faithfully,

NNAMDI AZIKIWE
Premier of the Eastern Region
Enugu, Nigeria

Modified Raptures

SIR—An aspect of the Budget which has not been sufficiently stressed is that the changes in income tax fall into two separate and independent parts. On the one hand, we have the increases in the single, married and children's allowances, costing the Exchequer some £40 million. Everybody paying income tax gains, they exempt some 2½ million people and clearly no one will quarrel with them.

On the other hand, however, and as an entirely separate issue in no way related to the increases in the allowances, we have the changes in the rates, costing some £100 million. These are completely regressive, and the vast majority of those who will still pay tax would have been better off if there had been no changes in the rates. Mr Butler has achieved the astonishing result of distributing £100 million in such a way that all bachelors earning between £275 and £1,000 a year, all married men with no children earning between £400 and £1,100, all married men with one child earning between £600 and £1,200 and all married men with two children earning between £700 and £1,400 would have been slightly better off had the £100 million never been distributed at all!

Apart from the blatant injustice of such a procedure, the incentive argument is torpedoed. Over the above range of incomes rather more tax will have to be paid on overtime than if the rates had remained unchanged.—Yours faithfully,

SPENCER SOPER
(Labour Candidate for Epsom)

*

SIR—The edition of April 11th of the US magazine *Newsweek* contained a table, compiled by the US Internal Revenue Services, showing the rates of income tax paid in the USA by earners of incomes between $7,000 and $100,000 (£2,500 and about £35,000).

US incomes of £2,500 to £3,500 pay only 10-11 per cent of gross income in tax. Even the highest income group of about £35,000 does not pay more than 38.7 per cent.

It has always been a sort of consolation to the income tax payer in this country to believe that income tax rates in the USA are by and large the same as here. Yet the truth is, that in Britain middle-class incomes pay four times the American rate and lower ones six or eight times as much, while for the highest income groups the difference is astronomical.—Yours faithfully,

London, W.1 FREDERICK JELLINEK

[It should, however, be noted that, in most states, state income tax is payable as well as federal income tax.—EDITOR.]

No Newspapers for Lent

SIR—May it not be that the loss of respect which your correspondents feel has been suffered by the national press is due to the fact that these great organisations appear to have made no effort to fulfil the first duty of a journalist, which is to get the paper out, and if a full edition is impossible, then at least something. The NPA seem to have accepted the view that what Hitler's bombers failed to do could be achieved by a handful of strikers. Did all the editors get together to protest against this feeble attitude? If not, why not?—Yours faithfully,

London, S.W.1 STEPHEN KING-HALL

Progress at Lake Copais

SIR—An article was published in your issue of November 29, 1952, about the future of the Copais Plain, after the delivery of the entire project to the Greek State. Rather pessimistic predictions were expressed in this article, to which the Ministry of Agriculture avoided making a reply pending the results of last year's full cultivation period. I am now pleased to be able to inform you that the project did not deteriorate after the English company withdrew, but on the contrary has exhibited notable progress.

Wheat cultivation, carried out entirely by the Greek Copais Organisation on behalf of tenants, who have not been established because of lack of time, has produced 2,300 Kgs per hectare against 2,070 Kgs in 1951, 2,060 Kgs in 1952 and 2,240 Kgs in 1953, the last year of operations under the English company. It should be noted, however, that 1953 was an exceptionally favourable year throughout Greece for the production of wheat. Cotton cultivation was also carried out on behalf of the tenants. Selected local seed was planted on an area of 7,400 hectares and yields of over 1,500 Kgs per hectare were obtained. This production greatly exceeds the maximum average yield secured by the English company, which never exceeded 1,150 Kgs per hectare.

Moreover, during the past production year the total area under cultivation was increased by 1,500 hectares and the Greek Copais Organisation has been able to carry out a complete programme of agricultural research as well as to develop irrigation and drainage works and rural roads.—Yours faithfully,

Athens P. X. LEVANDIS,
Minister of Agriculture

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

The Future of Foreign Aid

Washington, D.C.

IN his latest proposals for continuing foreign aid and for administering it differently, by a semi-autonomous unit in the State Department instead of by the independent Foreign Operations Administration, President Eisenhower is attempting to build another permanent new feature into American overseas policy. There is a parallel in this with what he is trying to do for foreign trade by liberalising legislation and by bringing the United States into a new Organisation for Trade Co-operation. In each instance the assent of Congress is required, and in each instance Congress is evidently reluctant.

The lifting of the foreign trade issue out of partisan politics to a more secure position as an accepted and established national policy requires, first of all, a reformation of historical Republican attitudes and only secondarily the curbing of a new and surprising Democratic aberration toward protectionism. The President can make his change in the organisation of foreign aid by executive decision, but it means nothing without money from Congress. In his attempt to make aid to other countries for economic and military purposes into a permanent commitment, the President must expect to encounter strong opposition in both parties. The opponents will include respected and influential Democratic conservatives who can usually be counted on his side; furthermore, they will be inspired by that special vigour which comes when purse-strings are being protected. The two tests are of first importance in the President's effort to exorcise the dead influence of old guard Republicanism from national policy.

★

The latest request for about $3.5 billion of new money to be authorised for future spending on mutual security undertakings frankly lays first emphasis on Asia; this in itself raises some Democratic hackles. The superficial figures can also be construed as stressing military assistance at the expense of economic development, a distribution of effort which again runs contrary to Democratic avowals. Both these characteristics look like bids for the support of the Republican right, where the militant Asia-firsters are principally found. As the details of the programme are unfolded before Congress in the near future, however, the superficial judgments may have to be revised.

The total amount asked for the 1956 fiscal year, beginning next July, is just about the same as was requested for the current year, and four-fifths of a billion more than Congress ultimately granted. The sum recommended for purely military items is actually far below last year's request for that purpose and even lower than Congress provided; the new figure, about $1.7 billion, compares with $2.5 billion asked last year and just under $2 billion voted. The defence support item has indeed been just about doubled, to nearly $1 billion, but the arithmetic cannot be interpreted as meaning a doubling of intent. The reasons for the change lie in the mysteries of government book-keeping and the intricacies of allocating spending power between the military departments and the economic aid agency. For example, the Department of Defence last year picked up the bill for direct forces support in Korea, an item including such things as petrol, medicines and rations, which soldiers use but do not shoot; this year that obligation is covered in the mutual security budget.

There is other evidence, still largely in the background, that Mars is not the sole beneficiary of the new programme. The amount requested for technical assistance—the old Point Four programme for undeveloped areas—has been increased, as has the amount covering such special needs as resettling escapees and refugees, contributions to specialised agencies of the United Nations, and aid for West Berlin. An entirely new item of $200 million is proposed, to be called the President's Fund for Asian Economic Development, and another innovation is a contingency fund of $100 million usable anywhere in the world.

Considering how well the emphasis appears to be divided between the plodding and obscure purposes of economic advancement and the exciting and spectacular purposes of military reinforcement, it is worth noting that actual spending under the new programme during the coming fiscal year, much of it from past authorisations, is also expected to be up. Again, although country-by-country and even regional figures are being reserved for disclosure first to Congress, it is estimated that perhaps two-thirds of the new programme is intended for Asia.

Senator George, who has received so many plaudits from the Administration recently for leading the Democrats to support its foreign policy, seems disinclined even to get started on the new foreign aid measure in the Foreign Relations Committee, which he heads. In both branches of Congress it is predicted that the Senate will make deep cuts. There are objections to beginning any new large programme for Asia, and voices are heard recommending elimination of all economic aid except a reasonable amount of Point Four. It is very plain that the announcement of

a British tax cut is going to work against the President's proposals in Congress.

The plan as the President has submitted it represents an adjustment between what once seemed two fiercely incompatible points of view in the government, the large visions of Mr Harold Stassen, who has been administering the programme, and the budget-balancing preoccupations of Mr George Humphrey, the Secretary of the Treasury. Mr Stassen would argue that the total request for funds comes very close to what he wanted. There are elements of economic philosophy in the new programme, however, which indicate that Mr Humphrey really had things more his way. Among them are a sturdy faith in the self-reliance of poor and backward nations in Asia and an admitted emphasis on loans rather than grants. According to the President:

> The major responsibility must necessarily lie with the countries themselves. At best, foreign capital as well as foreign aid can only launch or stimulate the process of creating dynamic economies.

The idea that it is the primary responsibility of recipients to help themselves is carried over from Europe without, however, considering how well it may work in Asia ; yet the vast efforts at capital formation which characterised the early Marshall Plan in Europe do not seem to enter into the Asian scheme. Mr Humphrey obviously has made his point that Europe, which had an economic system, wrecked though it may have been, is different from Asia, which must create one ; right though he may be, the point does not seem to have been consistently applied. "Wisdom and economy . . . cannot be achieved through speed" is the new maxim. The President's $200 million Asian Economic Development Fund is to be dealt out in driblets over several years. Two hypothetical examples show how: to increase trade between Japan and India the President might advance funds to one or the other temporarily short of credits ; or he might spend some to bring out more private investment, in an activity like that of the Indian industrial bank.

★

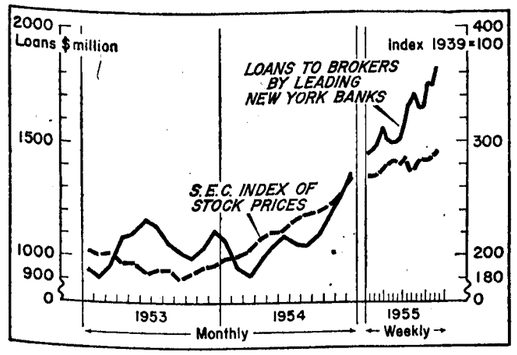
The striking thing about the President's plan to move the operating end of foreign aid into the State Department is his declaration that this reflects public recognition that foreign aid is a continuing and integral part of American international relations. Congress ordered the independent Foreign Operations Administration to go out of business by June 30th. While the President wishes to make its function permanent, the agency will necessarily lose status in its new position. It will no longer have special representation in the Cabinet and the National Security Council. The director, yet to be chosen, of the new International Co-operation Administration, must by presidential specification be a man of stature and operational experience, but he will report to the Secretary of State, not to the President, although his autonomy may perhaps be enhanced by the accident of Mr Dulles's freely admitted dislike of administrative burdens. The change re-establishes around the programme the "aura of authority" for the State Department which was sought by an earlier reorganisation under the Democrats ; the concept was consciously adapted from the relation of the British Foreign Office to operating arms of government in its field. Ih administrative efficiency, and policy, the change promises little difference.

A President's Sixth Sense

PRESIDENT EISENHOWER has put a final polish on his Secretary of State's bright new approach to Communist China. The President made it crystal clear that this is not just a diplomatic move but a national policy, and that it will be sustained against pressure from the Chinese in Formosa and from their Republican friends in the United States. The essence of the new approach is the American willingness to discuss a cease-fire in the Formosan straits and, later, other broader questions directly with the Communists without the presence of Nationalist representatives. The only condition is that nothing which affects the disposal of territory in the area or the claims of the Nationalist allies of the United States will be debated behind their backs.

Senator Knowland has, of course, already rushed, with cries of "Munich," to save General Chiang Kai-shek from being downgraded. But many other Republicans agree with the Democratic view that advantage must be taken of Chou En-lai's readiness to negotiate, provided that it turns out to be sincere and that he is prepared to renounce the use of force. It was Senator George of Georgia, the Democratic chairman of the Foreign Relations Committee, who once again pushed the Republican Administration along a positive road. He made it certain that Mr Dulles, on his return from his holiday, would repudiate the stiff and fumbling statement which was the first official reaction to the heartening news from the Afro-Asian conference.

This reaction was all the more disappointing since some encouragement of this sort was what Washington had already been hoping for as a result of the conference. In the more optimistic atmosphere that has recently prevailed, the visit to Formosa of Admiral Radford and the Assistant Secretary of State for the Far East was being interpreted as evidence not that hostilities were about to break out in the straits but that General Chiang Kai-shek was being induced to accept a truce and probably to evacuate the offshore islands.



As Mr Eisenhower pointed out at his press conference, the Chinese contribution to the relief of tension in the Far East and the Russian contribution—the Austrian treaty—to a similar relief in Europe have to be set off against the tense situation in Southern Vietnam. General Collins has just been giving Washington a first-hand report on this. But nevertheless the President, guided not by hard calculations but by his "sixth sense," believes that the outlook for peace is now better than it has been for a long time. His faith in his sixth sense is widely shared.

Less Margin for Error

DESPITE warning lights flashed by the Federal Reserve Board, the New York stock market has climbed to new heights. Last January, after fourteen booming months, the board had increased by 10 per cent, to 60 per cent, the minimum margin that the purchaser of shares is required to put down in cash. But after a brief setback, the market resumed its rise and on April 22nd one of the most significant indices of share prices reached the highest point since October 16, 1929. Loans by New York banks to brokers and dealers to finance purchases of non-government securities also reached the highest level ever recorded and buying of shares on credit has continued to increase. In view of these developments, it was not surprising that the Federal Reserve Board again increased margin requirements by 10 per cent ; a buyer will now have to cover 70 per cent of his purchase in cash.

It would be wrong to see in this second successive flash of the amber light a symptom of fear, or an admission that present statistical resemblances to 1929 are ominous under today's different conditions. The general business outlook is reassuring. Companies such as General Electric, United States Rubber, Union Carbide and General Motors—all of them national "pace-setters"—have announced record earnings for the first quarter of this year and high expectations for the future.

Nevertheless, there are indications that certain factors, such as credit—particularly for housing and construction—and the continued speculative tone of the stock exchange, need watching. This coincides with the principal findings of the Senate Banking Committee, whose chairman, Mr

Fulbright, stated only last week that Wall Street was again indulging in excessive speculation. The highway code—enforced by the Securities and Exchange Commission—is sound, but the cars are large and tend to accelerate too rapidly. Whether the caution of a slightly higher margin requirement will slow them down is doubtful. Prices in the last few days suggest that traffic is still gaining speed.

Round One to the Railways

New York

WHAT is clearly the most controversial in the series of Cabinet Committee reports prepared for—but not yet endorsed by—the President recommends some daring changes in United States transport regulations. Originally heralded as a comprehensive review of the entire field of transport policy, including federal government regulations for railways, road haulage, shipping and airlines, and federal aid for the construction of highways, waterways and airports, the report has been whittled down until it is now concerned almost exclusively with the conditions under which the railways should compete with other forms of transport. The morasses of highway finance and civil aviation subsidies have been sidestepped, and the committee, having already stubbed its toe on almost every government department, has also abandoned several of its most unpopular first thoughts on the assistance that should be provided for the railways. But in the shadow that remains there is still enough substance to delight the railway managements and provoke the most venomous opposition from the road haulage and shipping industries.

The committee's statement of general principles is a model of economic reasoning. The growth of "pervasive" road and air competition, it feels, has made an anachronism of detailed regulations imposed at a time when the railways had a virtual monopoly of both freight and passenger transport in the United States. Instead, there should be an "increased reliance on the competitive forces of rate-making" and federal regulation of transport should be reduced to the "minimum consistent with the public interest. . . ." The Interstate Commerce Commission, which has acted as a board of directors superimposed on railway managements, should be relegated to the more humble position of referee. Since, of all forms of transport, the railways have been the most closely regulated, it follows logically that in any general easing of federal controls they should benefit the most. The wrath of the trucking and shipping interests has been aroused not only because, in their view, the powers left to the referee would be inadequate to protect them against discriminatory practices by the railways, but also because the new freedom for the railways is to be accompanied by additional restrictions on road and water haulage.

★

The growth of competition in transport, which forms the basis for the committee's recommendations, can be clearly demonstrated. Calculations of the exact statistical changes differ but, according to one source, the railways' share of freight traffic has dropped from 63 per cent in 1939 to 51 per cent in 1954. By contrast, the share of the road transport industry has increased from 10 per cent to 19 per cent during the same period. And although air freight, which has also been expanding rapidly, still carried last year only a minute fraction of the total volume of traffic, the airlines, like the lorries, get the cream of the high yielding freight, leaving the low yielding bulk traffic to the railways, barges and ships.

In passenger travel the greatest impact of all has been made by the private automobile. But passenger travel by public transport has doubled since 1939, and the shift away from the railways has been even greater in passenger traffic than in freight, owing to the growing popularity of air travel. The railways, which had 68 per cent of the total passenger-miles (one passenger carried one mile) in 1939, now have only 46 per cent ; buses, by holding down fares, have just kept pace with the growth in total traffic ; and the airlines, which in 1939 carried only 2 per cent of the passenger traffic, are now responsible rof 25 per cent of the total. For the first time, in 1954, the airlines, who surpassed rail Pullman (first class) traffic in 1951, also surpassed rail coach (the equivalent of third class) traffic, which

is two and a half times as important as Pullman. What particularly depresses the railways is that the popularity of the aeroplane is greatest for the long journeys that contribute most to rail profits.

While conceding that part of the new pattern is a natural evolution of faster and more flexible forms of transport, the railways have always claimed that close government controls over rail rates, imposed when the railways had a monopoly but maintained after that monopoly has ceased to exist, give an unfair advantage to less closely regulated and to unregulated forms of transport. They also claim, as they did in England, that while the railways must earn enough to cover all fixed costs, including right of way, the road haulage industry pays far less in petrol taxes and other taxes than its share of the cost of the highways ; that the barges are subsidised by government maintenance of the inland waterways ; and that the airlines are helped both by mail subsidies and by federal aid in constructing airports. In rebuttal, opponents argue that the decline of the railways is the result, not of unfair treatment, but of inefficiency.

It is against this background that the Cabinet Committee's detailed recommendations must be judged. Frankly favouring the railways, the report cites as justification the defence needs of the nation. With their reserve capacity for expanding service without additional investment, the railways, the committee feels, are more valuable to the country in wartime than large fleets of privately owned lorries. The railway companies should, therefore, be strengthened by various means, but mainly by allowing them greater flexibility in setting competitive rates. Flexibility would be achieved by reducing the time-lag in government approval of new rates, and curtailing the ICC's powers to suspend new rates on the complaint of a competing carrier ; by giving up the practice of fixing, in effect, specific rates for the railways, and confining the ICC's role to the setting of reasonable maximum and minimum charges ; by abandoning the requirement that rail rates for long distances must not be less than the sum of the intermediate rates ; and by permitting the railways to offer incentive rates for large volume shipments when a lower charge is justified by savings in cost.

*

Road hauliers take little comfort from the fact that the railways would still be forbidden to engage in road transport or from the injunction to the ICC to guard against " unjust discrimination or undue preference " in prescribing " just and reasonable " minimum and maximum rates. The committee defines unreasonably low rates as " rates that fail to cover the direct ascertainable cost " of the service. But the crucial point is the contribution to be made towards fixed costs. For, in allowing low rates where necessary to meet competition, the ICC has already abandoned its former requirement that fixed costs must in all cases be covered. Further relaxation of this rule, it is charged, would give the railways a " hunting licence " for selective rate-cutting to eliminate their smaller competitors. Water carriers, especially the ships that ply between the Pacific and the Atlantic coasts, are harder hit by the long and short haul provision. Transcontinental rail rates now permitted by the ICC are already low enough to divert to rail much of the prewar seaborne traffic ; complete freedom to cut transcontinental rail rates further (while keeping up intermediate rates where there is no seaborne competition) would leave the intercoastal shipping trades little chance of survival.

The next step is for the President to decide what recommendations, if any, he will send to Congress, which must then decide whether to act on them as a package or, as has invariably been done in the past, by piecemeal legislation ; in any case nothing is likely to be done this year. Meanwhile the road haulage and shipping lobbies are reputedly mobilising " half the lawyers in Washington " in order to ensure that the committee's report meets the same fate as have many similar proposals in the past. The burial of a report advocating hard competition rather than soft would be cause for regret. But even the staunchest economic liberal must deplore that the committee has failed to come to grips with the need for a fully integrated transport policy, and for the consolidation of the administrative responsibilities at present distributed between half a dozen different government agencies.

Immigration Politics

THE brusque dismissal of Mr Edward Corsi, who had come to Washington at Mr Dulles's request to serve as special adviser on immigration problems, has unleashed a political storm. It was set off by the inherent contradictions and personal feuds that bedevil American immigration policies and by the political struggle between the Democrats and the Republicans for control of the key state of New York. In 1953, the Administration obtained from Congress approval of the Refugee Relief Act under whose terms the United States was, by 1956, to admit 209,000 refugees, escapees and orphans in addition to the regular immigration quotas. Unfortunately, this measure was hamstrung with all the " security " features of the notorious McCarran-Walter Immigration Act and was placed under the authority of Mr Scott McLeod, a State Department official known for his restrictive views. By December, 1954, less than 70 genuine refugees had been admitted under the new programme. In the face of mounting criticism, Mr Dulles invited Mr Corsi to speed up the process.

From the start, Mr Corsi conflicted with Mr McLeod—many of whose staff have a distinguished background in police work—and with Representative Walter who had no desire to see more than a trickle of new immigrants. After ninety frustrating days, Mr Corsi was dismissed. But unlike other public servants who have suffered a similar fate, he fought back and testified angrily before a hastily summoned subcommittee on refugee problems of the Senate Judiciary Committee. His testimony revealed that, although the time allotted for the admission of the non-quota immigrants is half over, and although $7 million has been spent, only 30,000 visas have so far been issued and of those less than 1,500 apply to *bona-fide* refugees. The latter, he argued, are being " investigated to death." Mr McLeod, on the other hand, pointed out with considerable justification that his hands were tied by existing regulations and that the Refugee Relief Act conflicted with immigration laws. President Eisenhower has indicated that he will support Congressional efforts to improve the Act and that he is dissatisfied with its present working.

Our specialist service in

NICKEL AND NICKEL ALLOYS

FURNACE ELEMENTS	Nickel alloys for longest life at high temperatures; for certain special atmospheric conditions; for furnace constructional work.
DOMESTIC APPLIANCES	" Nichrome " V for longest life at temperatures up to 1,150° C; " Nichrome " for temperatures up to 950°C; other alloys for less exacting conditions.
THERMO-COUPLES	" T1/T2 " alloys (nickel-chromium and nickel-aluminium) for temperatures up to 1,100°C are identical with the best-known wires formerly imported. Also Special " Advance " (nickel-copper) for use with copper or iron.
RADIO and TV FIELD	Cathode nickel, pure nickel and nickel-manganese, for sleeves, anodes, grids, filaments, supports, glass metal seals, and other applications.
ELECTRONICS APPLICATIONS	Nickel-containing alloys for instrumentation uses in vital scientific categories involving highly specialised and often critical requirements.
LAMP INDUSTRY	Nickel-manganese for supports, grids, and lead wires; special alloys for a variety of efficient joints between metal and glass.
SPARK PLUGS	Alloys of the correct physical properties and temper to meet manufacturing requirements in centre and side electrodes; and such as special strip for stamping out multi-point discs for aircraft plugs.
SUPER FINE WIRES	Very fine wires from 0.002 in. (0.05 mm) downwards in various alloys, such as " Nichrome " V, " Nichrome," " Karma," " Advance," and Pure Nickel, for specialised applications.

WORKERS IN THE TEAM Number 11 in a series

EVERY GOOD WORKER has a feeling for the tools and materials of his trade, whether chisel or bulldozer, wood, steel or concrete. That is how Irene Smith feels about her accounting machine. It answers to her will unerringly and at lightning speed. She handles it with an artist's pleasure.

Irene is in charge of a number of these machines and a team of operators whom she has trained. They work at head office, recording each week the wages and income tax payments of many thousands of men on contracts all over the country, and calculating all adjustments due. This centralised system, always punctual and exact, relieves the site cashiers of much arduous work and ensures that the men's accounts are in order wherever their jobs may take them.

Irene's team and their intricate machines, and the men on the sites with their heavy plant, are all parts of one organisation working for one purpose—to get construction completed efficiently and on time.

LAING

JOHN LAING AND SON LIMITED
Building and Civil Engineering Contractors
GREAT BRITAIN, CANADA
UNION OF SOUTH AFRICA, RHODESIA

In any case, Mr Corsi's dismissal has proved to be political dynamite. He is a very rare combination—a man of Italian background with a distinguished record in Republican politics in New York. His ill treatment in Washington and his account of the Administration's immigration policies are certain to anger New York's large and influential foreign-born community. In particular, this should help the Democrats to re-elect Senator Lehman, a perennial liberal who is now seeking to oust Mr McLeod and his "security gang." Paradoxically, there are hints that Mr Corsi's vigorous attitude to the immigration tangle was not unconnected with the possibility that he himself would stand against Mr Lehman in 1956. Now he has been jettisoned by his own party, and last week, with obvious glee, Governor Harriman appointed him to the re-activated New York State Committee on Refugees.

Automation in the Office

New York

GIANT computers, the electronic brains that first awed and amused American television audiences by wrongly predicting election results, are now marching inexorably into business offices. These "high velocity electronic data processing systems" have already been installed in more than forty large organisations. Best thought of as a system of as many as 25 interconnected machines, each complex has at its heart the big computer which performs numerical and logical calculations at a speed of 8,000 or more a second. Coupled to this central computer are the "input" and "output" machines which feed the brain with prior instructions and data on magnetic tape, and which receive and record its answers. The limits to a computer's capabilities—and they are critical—are set by man's ability to translate or "programme" a problem into the ultra-simplified symbolic "language" that a machine can operate with. But already there are firms that act as specialised consultants to businesses and which analyse their problems in terms capable of being electronically solved.

As the computer systems are expensive—the Univac, for example, costs $1 million to buy and $30,000 a month to rent—the user must achieve a substantial saving in clerical labour to make automation economic. The minimum saving required has been estimated at 125 to 150 "girl power displacement," or an equivalent saving in the rental of old-style punch-card machines. So far, the major achievement of computers is their capacity to save time on routine operations. But in the future it is hoped that they will aid in "management control." Rapid sales analysis and forecasting, market and operations research, and more effective control of production and inventories may be accomplished electronically in the not too distant future.

This raises a number of difficult questions, one of which is the problem of how large a business must be before it can operate a computer economically. For although special computing centres are available to those who cannot afford a full-time installation, the competitive advantage of the larger firm is certain to be increased by its readier access to comprehensive electronic intelligence. Another great bogey is that of the technological unemployment that may result among semi-skilled white collar workers. Not everyone is qualified to become an electronic expert with a degree in physics. Nor is there in existence, as yet, a computer that can beat a roulette wheel.

Purse Strings and Hustings

IN a country where politics involve the use of mass media of communication, long-distance travel and flamboyant advertisement techniques, getting elected takes an ever increasing amount of money. Ostensibly, the costs of an American election are still regulated by the Corrupt Practices Act of 1925 and the Hatch Act of 1939. Accordingly, the national committees of the two major parties are limited to spending $3 million, candidates for the Senate must not spend more than $25,000, and $5,000 is the maximum allowed for a candidate standing for the House of Representatives. Individual contributions towards the election of any single Congressman, moreover, are limited to $5,000.

In reality, these provisions have been continuously evaded both by the public and by the parties and candidates themselves. The laws are so loose that in many states only a fraction of the campaign costs have to be reported and primary campaigns—in which both parties choose their respective candidates—are not reported at all. By distributing their expenses among "citizens' committees," politicians can draw a totally distorted picture of their campaign budget. Finally, an individual wishing to give more than $5,000 can attribute his donations to various members of his family or make them in the name of friends; during the 1954 congressional elections in Delaware, for instance, fourteen persons bearing the name of du Pont contributed $51,500 to various Republican candidates and committees.

In deciding to review the entire problem of election finances, Senator Hennings, chairman of the Senate Privileges and Elections, Subcommittee, termed existing regulations "unrealistic, inadequate and antediluvian." A survey of the 1954 figures prepared by the *Congressional Quarterly* bears him out. Officially, it cost $13.7 million to elect the 84th Congress, but in fact total expenses may have been twice that amount. In the little state of Rhode Island, for example, the unsuccessful Republican contender for the Senate spent a total of $105,255, and in the contest for the lower house, in the 6th district of New York State, the defeated Republican candidate spent nearly $34,000. Unofficial estimates, moreover, suggest that the Republican and Democratic national committees spent nearly $19 million and $7 million respectively in a non-presidential—and hence less expensive—election year.

Mr Hennings is hoping to bring regulations more into line with realities. He urges reports on the costs of primary campaigns, a closer scrutiny of committees working for various candidates, and a general increase in the amount of money which a party and its candidates can spend and receive. With television networks and charter airlines warming up for the 1956 campaign, it is time for Congress to discard the aura of "false respectability" disguising the cost of a modern election.

The World Overseas

India Tackles Social Equality

FROM OUR CORRESPONDENT IN INDIA

MR DHEBAR, the president of India's ruling party, the Congress, recently denounced the spending of more than £4 10s a week as a crime against Socialism. He was not joking; he is not irresponsible; he was criticised neither by his fellow-politicians nor by the press. The reason is that in India socialism means equality, equality means economic equality, and economic equality means equality of income, not just equality of opportunity. Not many are prepared to go quite so far as Mr Dhebar; but Mr Dhebar goes virtually uncriticised, because what he said is recognized as only the logical conclusion of what nearly everybody believes. There is at the moment a committee of the Congress party considering whether a ceiling should be placed on incomes; a ceiling on salaries in private business was recommended in a recent report of the Estimates Committee of Parliament; and the Taxation Enquiry Commission (the equivalent of an English Royal Commission, and composed mainly of senior civil servants and economists) has reported in favour of a ceiling on all incomes of 30 times the average income or, in other words, £2,700 per annum after tax.

The first steps were taken in the last budget, with its steep increase in tax on higher incomes; the Finance Minister has made clear his preference for sharply progressive taxation rather than a ceiling. But he has also made it clear that there is more to come. In a country where only one out of every 500 pays income-tax, incomes which are very modest by English standards are reckoned as high. A man who earns the £10 a week of an English workman is well up in the middle class; the maximum for a government servant in the State of Travancore-Cochin is £18 a week. Once the idea of a ceiling is accepted, whether it be attained directly or through high taxes, it is unlikely to stay at the Taxation Enquiry Commission's £2,700 a year. Already the salary of government servants, for instance, is being eroded in a way which will give the highest civil servant in India's richest State, Bombay, only just over £2,000 a year; and that is all that will be given to the chief design engineer at Bhilai, which will one day produce a million tons of steel a year. The chief electrical engineer at Bhilai, or a mere secretary to the Bombay government will get a maximum of only £1,620. It is widely feared that it is figures of this order that the government will have in mind when it fixes its ceiling (or steepens its taxes).

In the countryside equality is to go further still. Ceilings are to be placed on land-holdings. States vary in their ideas; West Bengal has talked of 25 acres, the United Provinces of 30, Hyderabad of a farm giving an income of £270 per annum; the exact level varies with the pressure on land and the yield that can be got from it. But it is unlikely that once this reform is complete, many farmers except market gardeners and growers of sugar-cane, will be able to make more than, say, £10 a week.

It is against this background that one must place the Constitution (Fourth Amendment) Bill, which now awaits the President's assent after being passed by the upper house on April 20th. Its purpose is to make it possible for the State to regulate the use of property without paying any compensation at all, and to acquire property without the amount of compensation given being justiciable, as it has been hitherto. Mr Nehru has made it clear that the State has no intention of confiscating anything; and the Supreme Court would doubtless hold the payment of purely illusory compensation to be a fraud upon the Constitution. But Mr Nehru has also made it clear that, while market value will be paid for individual bits of property taken over—for a road widening for instance—the State will not and cannot pay the full price when the acquisition is part of a major measure of social reform. The cultivator will not get full value for his land above the ceiling, any more than the zemindar got full value for his rights. The bigger the man, the less the percentage of the full price he can expect to get; otherwise, Mr Nehru argues, the "haves" will remain "haves" and the "have-nots," "have-nots."

None of this is likely to touch the foreign investor. He is not a big man whose riches upset the equality of Indian society. Mr Nehru has called the Communist suggestion that he should be expropriated a "degrading idea." But it will touch the foreign resident in India. It is difficult to make exceptions for him without creating jealousy amongst Indians; yet if he is to be made equal in India, his income will clearly have to be reduced below what he can get at home. To this discouragement must be added the austerity of Indian life. The Bombay government wants prohibition for foreigners; in more and more States it is impossible to get beef; the film censorship is the world's most prudish. Obviously it is going to be more and more difficult to get foreigners to come to India unless they are very young or on very short contracts. But this does not worry Indian

(*Continued on page* 391)

(*Continued from page* 390)

opinion; most people think there are too many foreigners keeping Indians out of jobs anyway.

Whatever the foreigner may feel, amongst Indians themselves there is less resistance than anywhere else in the world to the idea of economic equality; perhaps because India provides no ideological foundation for a theory of inequality. It cannot be birth. The aristocracy, the princes and the great Rajput landowners, no longer count. It can no longer be caste. The modern educated Indians who make Indian opinion are all ashamed of caste distinctions. It cannot be class. India has never had social classes in the Western sense; caste was too important. It cannot be graciousness of living. The Brahmin tradition in which the Indian professional classes are soaked, emphasises austerity. It cannot be reward for effort. In India no great importance is attached to the rule that the thrifty, inventive and hard-working deserve to be better-off. It cannot be political conservatism; the alternative of Communism is too immediate. And it cannot be mere clinging to an accepted standard of life. Nearly everybody who matters has risen from relative poverty in the last generation or two.

The Hindu has always held that the price of power is renunciation. The work may be desired, but not the fruit thereof. Other countries have had to wait for equality until they become rich. India is to have it while it is still poor.

Boom for Soviet Spivs

SPRING has not been too bright for the Russian consumers. Though April is now well advanced the usual annual price reduction has not yet taken place and it is possible that prices of retail goods will not be cut for the first time since the rouble devaluation of 1947. This habit of slashing prices in the spring has up to now been one of the chief means of passing on to the consumer a part at least of the growing national cake. Now, however, the question is not of increasing the purchasing power of the population, but rather of applying some deflationary brakes. Increases in nominal wages, and the bigger price reductions after Stalin's death, combined with tax reliefs and higher incomes for farmers—all this has considerably strengthened the effective consumer demand, but the supply of goods has not kept pace. Output of foodstuffs has not reached its planned targets, while the post-Malenkov switch from light to heavy industry may play havoc with the pledges of the new regime.

As there are likely to be less goods on the market than was originally planned this is clearly not the moment to cut the general level of retail prices, but rather to try to mop up some surplus purchasing power. A small step was taken in this direction in last February's budget when state loans—a semi-compulsory form of saving—which had been halved after Stalin's death, were doubled again. Though Soviet gold and silver have reappeared on the London as well as on continental markets there can be no question of closing the inflationary gap through mass imports of consumer goods. Thus, for the time being, until a balance is reached through rising supplies or checks on demand, Russia is faced with shortages, queues and illicit trading.

Black marketeers thrive on a regime of controlled prices in time of scarcity and it is no accident that the Soviet press has now started a violent campaign against native *spekulanty*. During the war and immediately afterwards their activity was hindered by rationing. Now, with no ration books, it is enough to be first in the queue or to know the well-stocked shops to be able to earn a handsome profit. In the present inflationary conditions speculators, in their crude fashion, "correct" both the prices as well as the regional distribution of goods determined by the planners. Moscow—Russia's shopwindow—is, naturally enough, their paradise. Out of the 400,000 or so people who every day flock into Moscow a good percentage invade the stores of the capital buying as much as they can carry. Back home they either keep these scarce goods in the family or resell them, often at exorbitant prices.

Illegal trade, however, is not limited to Moscow. The numerous indictments now published indicate that it flourishes in the provinces as well. A witty account from Rostov-on-Don begins with a quotation from the Soviet constitution that "he who does not work does not eat," and adds that this principle is not always being applied. G. K. Nazarenko, for example, still wakes up automatically to the sound of the hooter of Rostov's car factory, but he at once relaxes after remembering that he no longer works there. On getting up he proceeds from store to store buying the most unexpected goods from ladies' blouses to boys' caps. In the shops he meets his "colleagues" who—through some sort of "professional loyalty"—exchange tips and help each other jump queues. All these Soviet spivs apparently earn a good living. The author of the article piles up an impressive list of concrete examples, including cases of people who take up jobs as drivers in order to use their official cars for profitable shopping expeditions.

No More Visions of Plenty

Cars are also sometimes used to intercept farmers coming with their wares to the "free," so-called collective, market. On the whole, however, it would seem that there is at least as much demand for industrial consumer goods as for the scarce foodstuffs. The first effects of the post-Malenkov switch to heavy industry are beginning to be felt. In Stalin's time the standard of life of the population was rising steadily, but not very rapidly. Malenkov promised a "sharp rise" and, according to official statistics, over the last two years real private incomes were raised by about a quarter through a combination of wage increases and price cuts. As a temporary measure to meet the impetus of this new demand stocks were being run down, but the real solution was to be provided through a partial revision of the production pattern, through a greater emphasis on output for the consumer. Malenkov's disgrace coincided with the shelving of these plans. There may be many more goods now on the Soviet market than, say, two years ago, but not as many as was originally envisaged and in this discrepancy between plan and fulfilment lie the origins of boom conditions for the Soviet spivs.

Visions of plenty no longer figure prominently in the Soviet press; Malenkov's ambitious programme for light industry is apparently forgotten, while heavy industry recovers its position. The switch is not limited to the domain of propaganda. An attempt is really being made to return to the traditional pattern and to fulfil the current five-year plan (1951-55) in the heavy sector ahead of schedule. The

main stress is laid on engineering and there are signs from Magnitogorsk that output of steel and alloys is to be stepped up. Nor is the fuel and power basis neglected. The gigantic Kuybyshev water-power station as well as that in Kakhovka, are to begin operations in the current year, while work has been speeded up on another vast project—the Angara station near Irkutsk in Siberia. Coal and oil expansion seem closely connected with the eastward drive. Next year oil extraction in the Tartar Republic should reach the level of the famous Baku and already the balance of Soviet oil production is slightly tilted in favour of the East. Increased resources of fuel and power should pave the way for further development of heavy industry in the eastern parts of the country and this is likely to prove the main feature of the next plan.

The spotlight is now on Khrushchev's agricultural performances. Yet the switch to heavy industry is probably the planners' chief preoccupation and the main hope of Nazarenko and his "colleagues." True, with its grip over the economic life of the country the government could stop inflationary pressures by restricting purchasing power until supplies of consumer goods become more plentiful. The problem, however, is not only one of accounting. Hopes have been raised, appetites whetted and popular pressure may still force the rulers to change their mind again and apportion a greater share to consumption. The way in which the inflationary gap is tackled—on the side of supply or that of demand—will show how far Malenkov's victors can depart from the policies of their predecessor.

Rift in Eastern Nigeria

THE constitutional dispute which has been going on for the past month in the Eastern Region of Nigeria over the use by the Governor of his reserved powers may have far-reaching implications. For it has led to chilly relations between the Premier, Dr Azikiwe, and the Governor, Sir Clement Pleass; it could lead to a High Court case; and it presages no good for the region if the latter decides that it wants independence in its own affairs in 1956.

The dispute centres on the security of expatriate members of the public service. Under the constitution worked out by all the Nigerian parties with the Colonial Secretary (then Mr Oliver Lyttelton) all appointments, including promotions, in the public service are made by Governors of Regions (or by the Governor-General for the federal service) at their discretion—though they are advised by public service commissioners. In March, certain deliberate omissions in the Appropriation Bill passed by the Eastern Legislature in connection with the 1955-56 estimates would have forced the Governor to appoint Africans to a number of posts. The bill failed to make provision for expatriation allowances for six permanent secretaries and two posts of assistant secretary in the Governor's Office, abolished the post of one Senior Resident and downgraded the pay scale of the secretary to the regional premier. Such an action seems contrary to the undertaking made by Dr Azikiwe and others at the Lagos conference that "the tried principle of promotion according to qualifications, experience, and merit, without regard to race, would be maintained."

There may be some room for argument whether the Legislature had the right to abolish the post of Senior Resident in view of the fact that at the time this was only filled in an acting capacity, so that its abolition would not prejudice an officer's position; but it was agreed at the Lagos conference and subsequently laid down in Section 64 of the constitution that a Governor could over-ride a Legislature's decision to abolish a vacant post if he considered it necessary in the interests of good government. This Sir Clement in fact did, by introducing a supplementary bill to make good the difference in the monies voted, and passing it under his reserved powers when the Legislature threw it out in the middle of April. (When he advised the Premier that he was going to bring his bill before the House, Dr Azikiwe promptly adjourned it; but it was subsequently reconvened by the Speaker.)

Expatriate Officers' Disquiet

It is obviously a serious matter for disputes over the powers of the Crown to arise so early in the working of the new constitution. But a vital principle is at stake—the morale of the expatriate officers attached to H.M. Overseas Service, whose security lies in the Governor's power to make appointments on merit. Omissions of this kind in appropriation bills are clearly aimed at them—indeed were justified by reference to the policy of bringing Nigerians into the administration to which Britain is pledged. But whether a post can at this stage be finally and definitely earmarked for Africans is a question for the Governor to answer. The bill sought to force his hand and permanently to reduce his discretionary powers—perhaps more with the object of asserting the Legislature's supremacy than of getting jobs for Africans, popular as any such political move may be. Inevitably it suggested to all Europeans serving in Nigeria that their security of tenure, to which all Nigerian leaders have pledged themselves, was in peril. Unfortunately the Governor's supplementary provision will hardly reassure them fully, since every officer will interpret Dr Azikiwe's attempt—and the denunciations which have since come from him—as an earnest of what could happen in 1956. The result may be that Dr Azikiwe will soon find he is getting more resignations from his expatriate civil servants than the number of posts he aimed at forcing the Governor to "Africanise." This is strange, for Dr Azikiwe is credited with unusual awareness of his country's need of expatriate services, and with some disquiet over events in the Sudan.

Why, then, has he done it? Perhaps because, as a man who has been bred to opposition he finds the constructive role of premiership hard to sustain, and a good row with the remaining symbol of British power makes an invigorating change. Perhaps his hand was forced. But the result will be to strengthen the doubts of people who fear that even responsible African political leaders are liable to impulsive and irrational changes of front. Since the region's best interests—and not its independence—are at stake, it may be hoped that Dr Azikiwe will take steps to remove any such impression of his own infirmity of purpose; but his reaction to the reproof of the Secretary of State, Mr Lennox Boyd, in the House of Commons on April 6th, hardly suggests that he has begun to think again. He may believe that a few honeyed reassurances at any time will keep his British servants happy and devoted. If so, he is asking a great deal of them.

Australian Labour Party Split

FROM OUR CANBERRA CORRESPONDENT

THE Labour party rebels against the Evatt regime have at last launched a passionate campaign of political destruction which, to Australians, recalls the activities of Japan's wartime "suicide pilots." In a country where politics is normally accepted by the public, and carried on by its exponents, with a fair amount of healthy cynicism, the activities of this group are something new and almost incomprehensible. But their effects are crystal clear. The breakaways, some of whom are embarked on a course leading straight to their own political suicide, will at the same time wreak great damage on the Labour party proper.

The most effective of all the political groups that are now hacking away at Dr Evatt's political career is the anti-Communist Labour party, constituted by seven federal politicians who rejected his leadership and formed their own party. What they lack in numbers they make up for in inside knowledge of the party which they are now attacking, in ability, eloquence and dedication, and in their utter abandonment of political discretion. In their first day of activity, they made political history with the most ruthless onslaught ever heard in the Federal Parliament; they mercilessly attacked Dr Evatt with an allegation that he had agreed to arrangements for a payment of £13,000 from the Communist party to Labour's campaign funds in the 1951 anti-Communist referendum.

What next? In Victoria, a similar but numerically stronger breakaway group has thrown its numbers against Mr Cain's Labour government, and has forced an election which all politicians expect to be preceded by the dirtiest campaign ever known in Australian politics. The fright created by the boiling over of Victoria's political cauldron (so far the breakaways in the Federal Parliament are all Victorians) has produced an ironic, patched-up unity in Queensland. In New South Wales, at the time of writing, it appears to be about to produce a similar result. Under this uncomfortable banner of Labour unity stand virtually two parties. One, militantly left-wing, is still fighting the battles of the early twentieth century, obsessed by the bogies of capitalism, bravely announcing its adherence to socialism (which remains in the official platform of the Labour party) and doggedly expressing a "different" foreign policy which sees the participation of a token Australian force in the local Malayan fighting as a bolster to colonialism and a threat to Asian good will. While containing its share of Roman Catholics, it sees the activities of some offshoots of the Catholic Church in Australia as a threat more real and more frightening, locally, than the threat of Communism.

The other party that still beds down politically with the left-wing traditionalists is disillusioned with socialism and is looking for a dynamic new rallying point for the Labour movement. It sees the dangers of bureaucracy, fears the consequences of Labour's past policies and administration, and wants to compete with the Liberal and Country parties by offering greater vitality, greater initiative, and greater efficiency. This section of the Labour movement is itself a conglomeration. It carries its own load of extremists who are, in their own way, more right-wing than the Liberals; they are also Roman Catholics.

The result is the most bitter sectarian dispute in Australia since the period after the dispute over conscription, which also rent the Labour party, during the first world war. The part played by Melbourne's Irish-born Archbishop Mannix in the anti-conscription campaign had much to do with the ill-feeling at that time against Roman Catholics in Australia. Oddly enough Archbishop Mannix, at the age of 89, is the principal church figure behind "The Movement," the politically active anti-Communist offshoot of the Church, which has become the chopping block in the present Labour party dispute. The result of this is that many Catholics are complaining that everywhere—at work and in the golf clubs—they are being looked at with suspicion. Dr Evatt's campaign against the Santamaria Group—Mr Bartholemew Santamaria is the somewhat mysterious Melbourne figure who runs "The Movement"—has driven many Catholic votes from the Labour party, but has also given it new Protestant supporters.

The man who opened the floodgates, Dr Evatt, now looks like leading the Labour party in the next elections. He had boldly submitted his leadership to a secret ballot in the bewildered Federal Parliamentary Labour party, and has had it confirmed by a big majority. The only serious contender was Labour's Federal deputy leader, Mr Arthur Calwell, who had already lost most of his fighting spirit and therefore much of his support. Dr Evatt caught his other real rivals unprepared and unorganised, and therefore they did not contest the leadership against him.

"The Movement" was set up to organise and support groups within the trade unions (the industrial groups) to break the power of Communist union officials. They had great successes; but there is no doubt that some of their methods of operation were dubious and that some industrial group leaders began to seek power for its own sake. Now, the effective power of the industrial groups is broken. There are already signs that the defeated Communists are starting to reorganise effectively, have regained actual ground, and could conceivably once again get a stranglehold on some of the key unions.

The ultimate outcome of the Labour party dispute is obscure. But one thing is certain: repercussions are touching the Australian nation at its foundations.

Economic Clash in Vietnam

AMONG the many sources of friction between the French and Americans in Vietnam is the changing pattern of southern Vietnamese trade now that aid from the United States is available in dollars instead of in francs. Another is implicit in the activities of the Sainteny mission in northern Vietnam, aimed at safeguarding French interests in the Viet Minh zone.

The changing trade pattern in the South began to worry French businessmen last year. In October, for instance, the imports from America came second to those from France, although the French, were still well ahead, with 66 per cent of the total of 924 million piastres (about £9,240,000). The respective figures were 609 million and 84 million piastres. Vietnamese exports to the United States (93 million piastres or 33 per cent of the total), however, already exceeded those

to France (62 million piastres). The existing tendency was given a considerable impetus by the signature on December 29th of new financial agreements between France and the former Associated States of Indo-China. The agreements enabled Vietnam, for the first time, to receive economic aid direct from the United States instead of through France—that is, in dollars instead of in the franc equivalent.

The inevitable effect of the new arrangement was to reduce the volume of imports from France and other parts of the French Union in favour of goods from the dollar area. Since January 1st, in fact, the cost of some 80 per cent of all southern Vietnamese imports has been met out of American economic aid. This clear threat to Franco-Vietnamese trade is being aggravated by a special factor—the diminishing costs of the French Expeditionary Corps in Indo-China. Last year Vietnam managed to balance its trade with France because of these expenses, which for the whole year came to between 170 and 180 milliard francs. This figure more than filled the gap between the 100 milliard francs worth of imports from France and the mere 10 milliard francs worth of Vietnamese exports to France.

Too Many Luxury Imports

The Expeditionary Corps expenses, however, are a vanishing item: they are expected to be reduced by two-thirds during this year. Vietnam would therefore be forced to reduce its imports from France even if the temptations of a dollar reserve did not make imports from other countries more attractive than those from France, many of whose products are not competitive in the international market. By mid-March about $90 million of the $240 million of American aid scheduled for Vietnam in 1955 had been made available. This made Saigon confident that it would have a surplus for imports of consumer goods after meeting all its requirements in capital goods. Indeed, the Saigon press is already complaining that imports include far too many luxury goods. The newspaper *Tieng Chuong*, for instance, observed that Vietnam was importing dollar tobacco and tinned fish, although tobacco was grown locally and Vietnamese rivers teemed with fish.

The new Franco-Vietnamese tariff agreement is a hurried attempt to restore the *status quo ante*. Under it, Vietnam grants preferences to France for the importation of 10,000 tons of milk products, 30,000 tons of flour and 30,000 tons of sugar. Reciprocal preferences cover the importation into France of 115,000 tons of rice, 5,000 tons of corn, 35,000 tons of unprocessed rubber and 2,000 cases of matches.

It will be interesting to see whether this preliminary step will do anything to dampen the persistent enthusiasm among some French commercial interests for a trade agreement with the Viet Minh. Such an agreement is one of the three aims of French economic policy in Indo-China which seemed to arise as a natural consequence of the Geneva agreements. The others are the desire to safeguard French interests in the North and to try to use the port of Haiphong as a possible economic key to the Chinese hinterland.

All three of these aims have involved the French in a clash of interest with their allies. One of the reasons for the delay in following up last year's tentative Franco-Viet Minh agreement by more concrete measures is that the Americans object to the possible implications of French moves in northern Vietnam. In the case of the French coal enterprises of the Bay of Along, for instance, the Americans were afraid that the American machinery installed by the *Charbonnages du Tonkin* might fall into Viet Minh hands. The agreement now concluded between the Viet Minh government and the company takes this objection into account: the American machinery is specifically excluded from the sale of the company's assets to the Viet Minh.

Under the agreement, these assets will be paid for in kind by decreasing annual allocations of coal, totalling one million tons and valued at approximately 5 milliard francs. Between twenty and thirty French technicians will remain behind to help the Viet Minh exploit the mines. The loss of the American machinery is a severe blow to the Viet Minh, who are aware that it enabled the mines to produce 800,000 tons of coal last year, despite wartime difficulties and a labour force of only 5,000; before the war, with 20,000 workers, the annual production did not exceed 1,400,000 tons.

The Viet Minh have now moved into the Hongay area and taken over the mines, with the assent of the international supervisory commission. The last French Union troops, however, will not move out of the port of Haiphong itself until May 16th, three days ahead of the deadline set under the Geneva agreements. In the meantime, M. Jean Sainteny, France's special envoy to northern Vietnam, who is now in Paris exchanging views with the Faure government, is anxious to reach agreement with the Viet Minh on other French enterprises in the North. Here again, however, there are difficulties. The Viet Minh were able to "buy" the assets of the *Charbonnages du Tonkin* by offering coal yet to be produced, but it is difficult to see what inducement they could offer to other enterprises, such as the *Société des Ciments Portland Artificiels*, either to part with their assets or to stay on after the evacuation of the Haiphong enclave.

Will Ho Co-operate?

American objections also apply to any large-scale resumption of French trade with northern Vietnam. The Viet Minh have been telling M. Sainteny that they would like French cloth, electric, radio and rail equipment, cars, pharmaceutical products and foodstuffs. But some of these items would probably come under the strategetic embargo.

As for the possibilities of an economic link with China, which the recent construction of the Yunnan railway to Hanoi would make practical, the French have come up against pressure from the Americans on ideological grounds, while they fear possible representations from the British because—the French argue—Hongkong's predominant position might eventually be threatened.

Despite these difficulties, there are many Frenchmen who still favour continued efforts to reach a lasting agreement with the Viet Minh. They are convinced that the chances of saving Vietnam from Communism are slender and that their long-term interests would be furthered by an accord with Ho Chi Minh. They are strengthened in this attitude by the present economic plight of the Viet Minh zone, where famine has already broken out in two areas, where unemployment is high and still rising and which seems unable to obtain either from the major Communist powers or from the satellites the technical and economic aid it needs for its rehabilitation and modernisation. The conflict of views between this group of Frenchmen and the group that remains entirely pessimistic about the chances of working with the Communists is still unresolved, and it would be hazardous to forecast what will be the outcome.

We've put out the flags for your

BIF of 1955

British industry has good reason to put out the flags. Controls have disappeared. The challenge of foreign competition is being vigorously met. There is once again a healthy home trade. The BIF of 1955 is one aspect of the new confident outlook of British industry.

Go to it . . .

Just once a year British industry goes on display. You have this one chance of doing business in ideal conditions. In an hour or two you can compare all the work of many different industries. You can see for yourself which new developments are likely to affect your business. You can discuss your needs with manufacturers who want to help you. These are the opportunities that only the BIF provides.

BRITISH INDUSTRIES FAIR

London & Birmingham 2-13 May

Open 9.30 a.m. to 6.0 p.m. daily except Sunday, 8th May. Public admitted daily after 2 p.m. (all day Saturday). Olympia only open until 9.0 p.m. Friday, 6th May and Wednesday, 11th May.

THE THINGS WE DO FOR YOU - 2

Are you aware that many concerns with whom you may never do business (perhaps we are one of them) may yet be working for you in various ways? Do you reflect, for instance, how you depend on things

made of steel? and how steel-making depends on coke ovens to supply coke for the blast furnaces and gas for the steelworks? In producing many necessities and amenities of your daily life—the structural steel of your office or factory, the car or train you travel by, the tins you buy tobacco in, the steel-shafted putter you miss short putts with—we may have done our bit in the background, for Simon-Carves have built many of Britain's coking plants and many of the washeries that clean the coal that makes the coke.

coal washeries . coke ovens . power stations . heavy chemical and gasworks plants . metallurgical plants . materials handling plants . industrial gears . flour and provender mills and many other specialities.

What shape is an idea?

In the early stages of a new product, a number of things can happen between the birth of an idea and the appearance of the finished working drawings. And one of the first thoughts that often enters the mind of the designer is—does the idea lend itself to fabrication in plastics? B.I.P. is well qualified to answer this question. Within our organisation are specialist technicians and draughtsmen who have given the whole of their working life to plastics, right from the early days. They develop and make many lines in the Plastics Industry, from moulding powders to tools and presses and the finished article. Together with our Product and Mould Design Service they constitute an organisation which is unique in the Plastics Industry. The benefit of their research is freely at your disposal. Use it! It costs you nothing and may save you a lot.

B.I.P

The most comprehensive service in plastics

BEETLE UREA & MELAMINE MOULDING POWDERS · BEETLE POLYESTER RESINS · BEETLE RESINS FOR THE PAPER, PAINT, TEXTILE, WOODWORKING & FOUNDRY INDUSTRIES · MOULDING TOOLS & PRESSES

Oil from African Coal

IT is now about five years since the South African government was asked to take over a plan to make oil from coal in the Union for which private enterprise had not been able to raise the money, and nearly three years since construction began on the site prepared at Coalbrook, on the banks of the Vaal River 50 miles from Johannesburg. The £36 million "Sasol" project is now due—already some months late—to begin trial runs on its first synthetic gasoline. This summer, as it begins to sell coal-derived motor spirit in the Witwatersrand area, it will come under the keenest of outside scrutiny—not only within South Africa, where Sasol has acquired political as well as chemical significance, but from the fuel and chemical industries of the world. This international interest is only partly technical. There is nothing remarkable in making oil out of coal, though Sasol, the first full-scale unit built since the war, uses a number of hitherto unproven techniques. What is, or would be, remarkable is to make profits out of making oil out of coal, even in special circumstances. And Sasol—*Suid-Afrikaanse Steenkool-Olie en Gaskorporasie Beperk,* to give this State-owned public company its full name—hopes to make profits.

South African circumstances are certainly special, and less artificial than those through which other countries' oil-from-coal projects have wended their uncommercial way. With great distances to cover and a weak railway system, South Africa is a motorist's country with a high demand for petroleum products. It has no oil of its own (a reluctant conclusion after many years' prospecting). Its main demand for gasoline is on the Rand, 400 miles inland, and to haul imported spirit there by rail from the ports adds no less than 7d. a gallon to the price. The motorist in Johannesburg now pays about 3s. 5d. a gallon, which seems to him a lot (it includes only 1s. tax, against 2s. 6d. out of Britain's 4s. 6d. a gallon. Against this expensive petroleum, the Union has huge reserves of coal near the surface, much of it low in quality but suitable for highly-mechanised mining at costs a fraction of those in Europe or America.

★

In these circumstances, it was obvious that making oil from coal would be considered as soon as practical ways of doing so were established. The idea was first discussed in the twenties, even before the first commercial hydrogenation plant was erected at Leuna in Germany. By the thirties, when the second major method of making oil from coal was being tried out —the Fischer-Tropsch process—more detailed studies were being made in the Union. The gold-mining company Anglo-Transvaal Consolidated, and a company set up in 1935 to distil petroleum from oil shale, Satmar, did acquire rights to this second process and actually invited tenders for a plant, but the capital could not be raised. This Fischer-Tropsch process, which is the method adopted (in two variant designs) by Sasol, involves the conversion of the raw coal first into synthesis gas, a mixture of carbon monoxide and hydrogen, and the formation of liquid petroleum products from this gas in a catalytic reaction before normal refining.

After the war Anglo-Vaal obtained a licence to make oil from coal in the Union and prepared a complete new plan. This was for a coal mine and Fischer-Tropsch plant of some 260,000 tons annual output capacity (including 76 million gallons of motor spirit), at an estimated capital cost of £13 million. Private finance was not forthcoming, and the possibility of a loan from the World Bank was complicated by the fact that Anglo-Vaal would have been a private borrower. Early in 1950 the company approached the Govern-

ment, and later that year the rights, technical knowledge and options were taken over (for £600,000, payable over a period of years): Sasol was set up in September, 1950. An official committee studied the project and the processes available, finally deciding that a new Fischer-Tropsch technique developed to the pilot plant stage by M. W. Kellogg, of New Jersey, should be employed in conjunction with a more established German version, while the synthesis gas should be made using oxygen under pressure in Lurgi gas generators.

The project financed by the Government (through the state-backed Industrial Development Corporation) was originally expected to cost £18 million, for a slightly decreased capacity (71 million gallons of products, 55 million gallons being motor spirit), on the Coalbrook site ; it was hoped that the plant might begin operations late last year. Most of the plant had to be bought overseas, much of it being ordered in Germany under escalator-clause contracts shortly before the Korean war broke out. Prices of heavy steel plate and equipment rose sharply, and estimates of the "cost to completion" went up steadily. The current estimate is £36 million, of which about £2 million is for construction of the Sigma colliery that serves the Sasol plant, and about £4 million for housing its workers and setting up a marketing subsidiary ; the remaining £30 million is for the plant itself.

Sasol, now nearly complete, is certainly an impressive industrial complex, set in the Vereeniging area almost within sight of Van der Bijl Park, the country's splendid steel strip mill, and of the massive Klip and Vaal River power stations. Its small colliery, fully mechanised with Joy power loaders and shuttle cars, will mine about 7,600 tons of coal a day from a 24-foot seam and send it along a 1½-mile conveyor belt to the coal bunker of the chemical plant ; delivering it there for less than 6s. a ton. In full operation, about 3,200 tons of this coal will be gasified daily in the Lurgi plant, along with more than 10 million lb. of steam and 720,000 cubic metres of oxygen, made on the site in one of the largest oxygen plants in the world. The total production of purified synthesis gas will be nearly 3 million cubic metres a day ; by-products of the gasification process include ammonia, tar, phenols and creosote. In the American "fluidized bed" version of the Fischer-Tropsch synthesis system, powdered iron catalyst is "boiled" with gas blown up through it in two large reactors, the products being condensed to liquid and separated out into the various oils and waxes by more or less standard refinery techniques ; the German Fischer-Tropsch unit does the same with a "fixed bed" of catalyst. A second by-product stream derives from these synthesis reactions—a range of oxygenated organic materials such as ethyl, propyl and butyl alcohols, acetone, paraffin waxes and liquid petroleum gas.

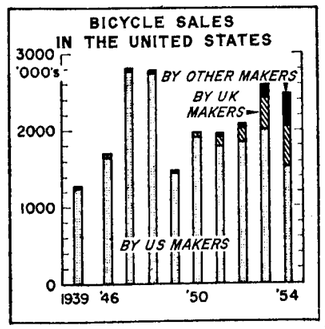
The economics of Sasol remain to be learned in practice—as do some of the techniques, such as those involved in the American synthesis plant. But on its own published assumptions, some guesses at possible revenue and cost can be made. Its managing director stated last year that its yield on motor spirit at the plant (duty, freight and distribution paid) would be 22½d. a gallon—for 55 million gallons, plus diesel and fuel oils, some £5-5½ million a year. A cut in rail freights has now brought the Rand retail price down by 3d. a gallon ; unless, as has been suggested, Sasol is to receive a remission of 3d. a gallon as indigenous alcohol producers do, that would mean 19½d. a gallon—about £700,000 a year less. Last year, too, it was hoped that a third of total revenue could be obtained from by-products. Though this implies a high average price for them—more than £50 a ton—the £2½ million a year it suggests, from the quantities and prices involved, is not out of all reason. Such estimates might give Sasol a total revenue of £7-8 million a year.

Of the £35 million of capital likely to be raised by Sasol and its subsidiaries, £25 million is in ordinary shares, and only about £10 million is likely to be in fixed charges (at about 5 per cent). This state-owned company, therefore, has not the obligation to service all its capital, regardless of current profit or loss, that British nationalised corporations bear. It could, nominally or politically, "float" without in fact paying very much return on its capital at all. A fair assessment might be to charge it a rate of return suitable to a public utility, rather than a commercial enterprise—say 6 per cent. This, with interest on its loan capital, would require about £2 million a year. Depreciation, on plant of which so much is experimental, should provide for amortisation over not much more than 10 years—say £3-3½ million a year. Coal, on Sasol's own figure of 2½d. per gallon of motor spirit, would cost just under £600,000. Capital costs and the main raw material, therefore, might require say £5½-6 million annually, leaving £2-2½ million for operating costs on the plant, or something under a shilling a gallon of motor spirit. That would be 6-7 per cent of capital costs—which accords roughly, but barely, with some "rule of thumb" estimates for operating costs on a Fischer-Tropsch plant.

All that can be inferred from such tentative orders of magnitude is this: that Sasol's solvency—which cannot fairly be judged until teething troubles are over—will depend crucially on attaining the rated throughput and selling all its products at the prices planned. Chemical and oil plants are more often underrated in capacity than overrated, and certainly Sasol should have no difficulty in disposing of all the liquid fuel it can make in this expanding market. But if and when a pipeline to the Rand from the coast comes into being, the freight on imported motor spirit might be cut further from 7d. to about 2d. a gallon—which would probably quite upset Sasol's calculations of revenue. The value it has put on its by-products, in total and in an isolated market, may not be unreasonable ; but finding customers for them in a country without much chemical industry may be hard. Some experts, indeed, argue that after selling the more conventional gasification by-products, the best return Sasol could get from its complex synthesis products might be by putting most of them back to increase the liquid fuel yield—as it is certainly equipped to do. Commercially, of course, the whole economic question can be simplified. For a project of this nature, a private chemical or oil company would probably want an annual revenue of at least 25 per cent (15 per cent return and amortisation over 10 years) on the total capital. Can Sasol be counted upon confidently to bring in £8-10 million a year, which means some £40 a ton over its whole range of products ?

It is fair to say that Sasol's contribution to the South African economy cannot be counted quite so coldbloodedly. This plant is the Union's first venture into large-scale and complex modern chemical technique. That the venture happens to have been made by the State may have meant some expensive technical perfectionism—and some risky scientific short cuts—but it is also a reflection upon private capital in the Union that has held back from such industrial pioneering. The fact of a massive and modern complex of chemical engineering, offering by-products from which a wide variety of chemical manufacture could start, and trained men with experience of projects on such a scale, may well outweigh some of the gaps that seem likely to appear in any strict book-keeping. Almost certainly the Union's next big chemical venture will be more economically planned ; and in its own field of oil from coal Sasol, too, will point some lessons from which other nations can later learn. In any country in the early stages of an industrial revolution—as South Africa undoubtedly is today—technical adventurism is perhaps less dangerous than over-caution.

More Power to the Pedal



MANUFACTURERS of British bicycles have every reason to be disturbed by the support that the second recent attempt of the American cycle industry to secure greater protection against imported makes has obtained from the Tariff Commission. The President has until May 13th to decide on the plea for a quota or a higher tariff. The British cycle industry fears that it may be sacrificed to the protection lobby by an Administration that already has its hands full in trying to negotiate an extension to the Reciprocal Trade Act through a reluctant Congress. Since the devaluation of sterling five and a half years ago British bicycles have achieved great successes in the American market. With a new type of "English" lightweight specially developed for that market, total sales have increased more than ninefold, until last year one out of every six machines made in the Midlands found a United States buyer. American manufacturers have been slow to adjust themselves to this marked preference for lightweight machines which has revived interest in cycling in their market and could, now that the large post-war crop of babies is reaching cycling age, push total sales up to 3 million or more a year from the depressed 1954 figure of 2¼ million. Most firms have stuck rigidly to their traditional, heavier balloon tyre models, which can certainly stand up to very tough handling, and only recently have they begun to incorporate 2- and 3-speed hub gears. One or two companies now make lightweights using British designs or assemblies, and some have introduced their own compromise medium weights.

Presidential support for protection would be a serious blow to the Midlands. The industry has tried to avoid becoming dependent upon one or two large overseas markets. Until recently, it has found this fairly easy to do. The British safety bicycle is eagerly sought in most parts of the world for its robustness, lightness, cheapness, and reliability. With no serious competitor, the industry doubled its prewar output by 1951 and increased its overseas business from 18 per cent of total production in 1935 to 70 per cent four years ago. But when the home market went sour in 1952 and shipments to South-East Asia and South America started to slacken, the bright prospects of the large North American market became too attractive to ignore.

The motor cycle makers, on the other hand, have never found much business in the United States, where every third person has a car and many families have two. They have managed to sell about 7,000 motor cycles a year there, only 4 per cent of their total output. Even this has been sufficient to arouse hysterical yelps from the few American manufacturers, who find that imported machines now absorb a major share of their diminishing market. Since its prewar German competitors were destroyed by the war, the British motor cycle industry has had few real rivals in the medium and heavy range. Czechoslovakia could compete effectively, but its policy of playing fast and loose with prices and its lack of adequate after-sales services have tended to alienate its customers more than upset its rivals. Last year British firms made 180,000 motor cycles—a record output nearly three times that of 1935. Exports to Australia were hard hit in 1952, but shipments are now much more evenly spread, and the latest cuts imposed by the Australian Government need give the industry little real difficulty.

The industry's biggest problem, at the moment and for the future, is the marked swing towards lightweight

machines. The postwar successes of both industries have been scored with traditional models. The pedal bicycle is a remarkably efficient and inexpensive piece of machinery ; there is little room for further improvement. In the last few years designers have smartened up their models, improving appearance, comfort of riding, and accessories. The motor cycle has been given more power for less weight, its transmission and suspension have been improved, and its appearance has been continually cleaned and tidied up. The side-valve engine has been gradually replaced by the overhead valve engine ; the next steps would appear to be new machines built around the o.h.v. engine with attempts to cut down the familiar noise. Most enthusiasts—perhaps not all—would welcome a quieter motor cycle ; in any case, a growing number of countries are introducing regulations to limit traffic din, to which their motor cycles are often full-throated contributors.
