Much of the Premier's convention address was concerned with the claim that the Eastern Region, alone in Nigeria, was a true democracy, on the basis of its universal adult suffrage. One of the changes brought about by Dr Azikiwe's government has been the introduction of English-style local government, with county, urban district and rural district councils. In the East, as in the West, these local government bodies are intended to replace the "colonial system" of administration by residents and district officers. It is ironic that one of the last acts of the Eastern Region Executive Council before the Premier left for Ibadan was to order the dissolution of two of these councils for corruption. They were the urban district councils of Onitsha and Aba, the two most important commercial centres of the region. A relevant factor in their downfall was stated to be inefficiency and incompetence amongst the administrative staff, who are all African. Many people in Nigeria will not be slow to point out to Dr Azikiwe that his concern for democracy and his strictures on civil servants might be more appropriately turned towards the "grass roots" amongst the local government bodies. It is there that real democracy will succeed or fail.

Soviet Industry Under Fire

TODAY, as in the past, it is a Soviet custom to sound the alarm from time to time on behalf of one of the branches of the economy, but the manner is no longer the same as in Stalin's day. Then the inquiry used to be held behind closed doors and appeals to workers to raise production would often take the form of pledges to Stalin, say, on the occasion of his birthday. Now, in more businesslike fashion, ministers, managers and leading technicians are called to Moscow for an industrial conference at which Bulganin and Khrushchev do not hesitate to criticise openly the shortcomings or to admit that in certain spheres Russia is lagging behind advanced Western techniques—which not long ago would have been attacked as dangerous cosmopolitanism.

Industry's turn of "self-criticism" has come much later than that of agriculture because its crisis is less acute and its achievements incomparably greater. Yet they are still not enough for a government faced with the gigantic tasks of expanding basic production and armaments without forgetting the consumer and the important Chinese ally whose demand is insatiable. Hence, at last week's conference in Moscow, one branch of industry after another came in for criticism: the timber industry—because its productivity per man rose only slightly compared with prewar, while its equipment was quadrupled; the oil industry—for costly and incompetent drilling; the steel industry—for failing to spread new methods which could produce at least 1.5 million tons of crude steel per annum; the coal industry—for not using its capacity to the full, etc. Insufficient adaptation of new techniques resulting in low all-round productivity—this criticism was the monotonous refrain of the conference.

It is extremely difficult to calculate the growth of productivity in Soviet industry. As it is computed on the basis of the inflated index of production, it naturally has an upward bias. In addition it is calculated in man-years not man-hours; therefore the change in the length of the working week from 40 to 48 hours in 1940 invalidates comparisons. Hence the official claim of a sixfold rise since the introduction of planning in 1928 cannot be taken at its face value. On the other hand, there is no doubt that tremendous progress was made over that period thanks to a real technological revolution. Its pace was most rapid during the second five-year plan (1932-37) when the fruits of the initial investment were being gathered; there was a drop during the war, but the prewar level was recovered by 1948 and productivity has continued to rise fairly rapidly since then. Not rapidly enough, however, and to carry out its production targets Soviet industry had once again to rely on the rapid growth of manpower.

The phenomenally quick swelling of the industrial labour force by immigration from the countryside has been a crucial feature of the Soviet industrial revolution. Yet, this is a process which cannot go on for ever. When the current five-year plan (1951-55) was drawn up, emphasis, at least on paper, was switched to productivity: it was to be raised by no less than 50 per cent, while the number of workers and employees was to be increased by only 15 per cent. After four years the manpower target has already been exceeded, but the productivity objective will certainly not be reached. Since the exodus from country to town must now be halted, the demand for a more rapid increase of productivity becomes imperative.

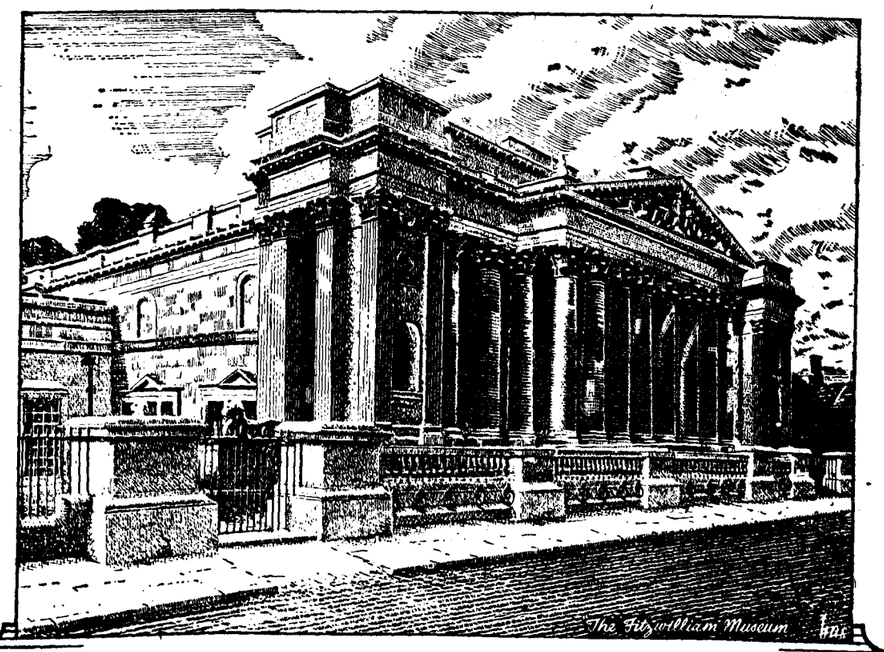
Why does not the Russian worker's productivity come up to the planners' expectations? One of the main reasons must undoubtedly be sought in the nature of the newcomers to the labour force. Its rapid growth was made possible only by the greater employment of women—who are less productive — and above all by the turning of *muzhiks* into industrial workers. A peasant finds it extremely difficult to adapt himself to the rhythm of industrial life, let alone

"Motor Business"

The June issue of this quarterly research bulletin for the motor and allied industries will include:

The domestic and export markets for commercial vehicles 1955-1960.

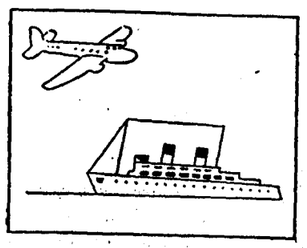
A financial and economic study of two major British motor manufacturers.



Second hand price indices of cars and vans.

The U.K.'s leading export markets for parts and accessories.

The Bulletin is fully illustrated by charts.



For full particulars of this service apply to:—

THE ECONOMIST INTELLIGENCE UNIT

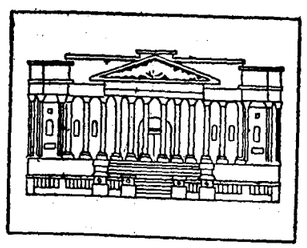
Whitehall 1511. Ext. 47

It shall not burn

At last, MINERVA, a scientific application of nuclear physics, brings to every building; store and industrial enterprise, a sure and certain means of fire prevention.



WHAT DOES IT DO?

Minerva is the only proven system which instantly detects the first trace of smoke before any heat or flame is generated—in fact the fire is given no chance.

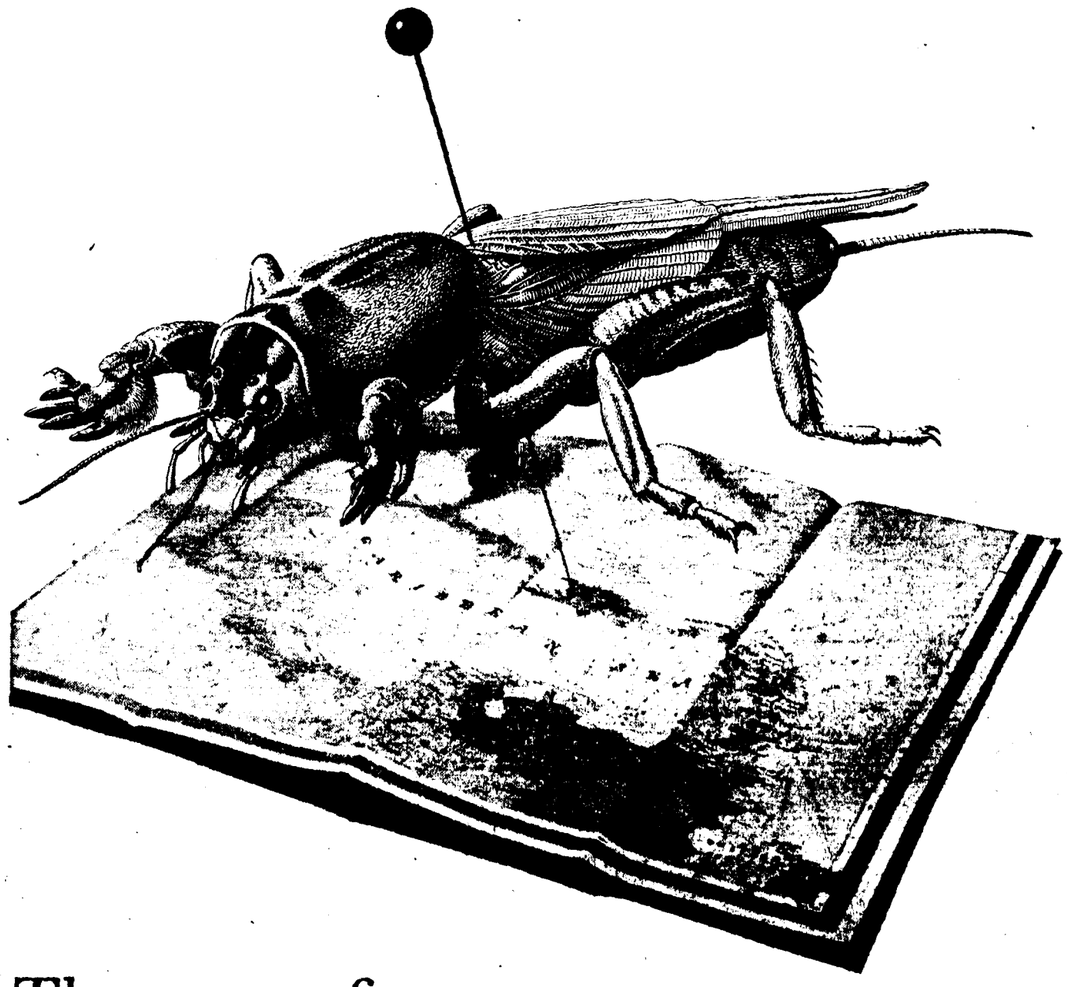
HOW DOES IT WORK?

The activating source of the detector is a particle of radio-active material with a theoretical life of more than a thousand years. The entry of smoke triggers the detector. No current is consumed while the detector is on guard.

HOW IS IT INSTALLED?

Each detector is no larger than an electric light bulb and can be fitted as simply.

Only one is required in a room or for every 1,000 sq. ft. of floor area.



NO BUILDING FITTED WITH MINERVA HAS EVER BEEN DESTROYED BY FIRE

TE CUSTOS URBIS MINERVA

MINERVA FIRE DETECTION SYSTEM

The case of *Scapteriscus vicinus* . . .

Wherever the mole cricket burrows, crops are sure to be in trouble. With grotesquely developed forelegs acting as shovel and rake for digging, and as shears for clipping roots, this armoured tunneller works its destructive way through many crops — particularly sweet potatoes and tobacco. Its presence is particularly dreaded in nurseries, where it plays havoc with seedlings.

Caribbean and Central American farmers, who have been losing thousands of dollars to mole crickets each year, now meet and destroy this pest with aldrin. This potent soil insecticide, recently developed by Shell, is the perfect answer to mole crickets and to many other pests that spend much of their lives below ground.

1 to 2 lbs. of aldrin per acre, applied to the soil before planting out, annihilates the heaviest infestations — and one dressing gives at least a year's protection.

Long-lasting, non-tainting aldrin is the most effective of all insecticides for use in the soil. Because of its great stability, it is ideal for compounding with fertilizers. Aldrin's wider range includes many pests previously difficult to 'get at' economically.

Another recently developed Shell insecticide is dieldrin, possessing exceptional persistence. On foliage, dieldrin controls a very wide range of weevils, beetles, flies and other crop-eating pests. It is also extensively used as a residual spray against disease-carrying insects.

Have you a stubborn pest problem to deal with?

to master the latest techniques. The American expert, Professor Galenson, has calculated that on the eve of the war the productivity of the average Soviet worker was roughly 40 per cent of that of his American counterpart ; now it is estimated at about 50 per cent. Here, however, the average camouflages great discrepancies, since the skilled Soviet workers employed in the most advanced establishments are as productive as the Americans.

This should dispose of the Western illusion that Soviet productivity cannot continue to increase rapidly. Even if we do not take into account Soviet capacity to venture in uncharted roads, there is plenty of scope for progress merely by bringing the most backward plants up to the technical level of the model establishments and the inefficient newcomers up to the standard and skill of the old industrial workers. This is what Khrushchev and Bulganin hope to achieve through technical education and the concentration of investment in engineering industries.

It is still too early to say what effect the various new measures announced will have on industrial production. The creation of a special State Committee for introducing new techniques is not really a new move, as such a body had existed in the early days of the Soviet regime and was actually resurrected when Malenkov was still premier. The separation of the State Planning Commission (Gosplan) into two bodies—one concerned with long-term planning, the other with watching current production—is also a return to a former pattern. Only experience can show how much these bureaucratic changes can speed up actual output. One thing is certain: that with the burdens facing it, the Soviet Union is badly in need of rapid economic progress. It relies largely on this to win the struggle of "competitive coexistence." Marshal Bulganin issued his order of the day: "To win over capitalism in economic competition we must have advanced technique, better organisation of production and higher labour productivity." Much will depend on the regime's ability to transform yesterday's *muzhiks* into skilled industrial workers.

Uneven Scales of French Justice

FROM A FRENCH CORRESPONDENT

AMID the many reforms which are always talked about in France without ever being carried out, that of the judicial system takes pride of place. Some recent trials have emphasised the need for change, but though the years of occupation and the liberation period have made the judicial machine still more squeaky, the defects of French justice are really of long standing. Many trials are held in France ; they always take a very long time and often judgments are not beyond reproach. Hence, the average Frenchman is no more satisfied with his judiciary than he is with the administration or the educational system of his country. Yet justice is the institution, if any, which should be above suspicion and outside polemics. True, during the occupation, the condemned was often a hero and the judge —the unjust. This reversal of values has left its mark. To the traditional principle that an accused is presumed innocent until his guilt has been proved a new one has been added—that any condemned man may well have been the victim of a judicial error.

This attitude has made public opinion and the press more exacting. At the same time, the trials of the occupation, followed by those of the liberation, have tended to make magistrates very sensitive to any governmental attempt to use penal legislation for political ends. Here lies one of the reasons for the numerous acquittals in proceedings relating to internal or state security, particularly in the case of Communists. The other reason for the resounding failures in cases of this nature is obviously the fact that traditional legislation did not foresee the existence of a revolutionary party whose activities would be perfectly legal. The crisis of French justice, however, is illustrated in a more striking fashion in ordinary criminal and civil cases. Often because of the slowness and high costs of proceedings the lawyers of both parties try to avoid going to court ; they have recourse instead to private arbitration, though this is contrary to their professional rules.

The judiciary is the poor parent of French administration. For the whole of France it has only ten cars at its disposal ; many courts do not own even a typewriter. The magistrates are among the worst paid officials. An ordinary judge begins at about £500 per annum ; an appeal judge earns scarcely more than £1,000. Most magistrates have no hope of ever exceeding that amount. Furthermore, coming usually from modest families, they can no longer rely, as in times gone by, on marrying a *dot*. The judge has become the impecunious defender of a society in which money is king. The moral level of the magistrates remains fairly high but their intellectual level is bound to suffer.

Prosecuting Judge

Several trials, the Dominici case for instance, have revealed two cardinal weaknesses in the administration of justice. Criticism centres on the roles of the examining magistrate (the *juge d'instruction* who carries out the pre-trial examination) and of the judge in criminal cases. In principle, the pre-trial examination is carried out by an independent judge ; in fact, it is too often done by the police controlled by a judge dependent on the executive power. In French law, the *juge d'instruction* is a judge like any other, that is to say, he is in theory completely independent and possessing perfect security of tenure. Yet in certain parts of the pre-trial examination he is subordinated to the prosecutor, in other words to the government. ("A judge placed under the authority of a counsel ; this cannot be conceived and yet it is," exclaimed the eminent lawyer M. Garçon.) The result is that the prosecuting counsel is not, as in England, placed on equal terms with the counsel for the defence, since, unlike the latter, he can influence the *juge d'instruction* preparing the *dossier* which will have such an important bearing on the case.

All this would not matter too much if the examining magistrate really conducted the examination. Too often, however, he leaves it to the police or *gendarmerie* and then tends to cover up their illegal methods (it is quite frequent, though unconstitutional, to keep suspects at the police station for over 24 hours) and their abusive interrogations. Brutal police methods can be explained by the wish to extract a confession, but for a judge the confession should not be the proof, only an element in the case. Too often also the judge relies on superficial and biased *expertises* to back the prosecution's case. The discredit surrounding police brutality and the somewhat dubious expert advice thus falls on the judiciary, though the real wrong of the

magistrates has been to rely too blindly on their auxiliaries. This is partly the result of lack of time, means and skilled staff, partly the outcome of a "confession mania." The frantic efforts to make the suspect confess are often followed by a retraction during the court proceedings.

The second weakness and cause of many scandals is connected with the role played by the presiding judge. The penal code does not say that the trial judge should not be an arbiter and only an arbiter in cross-examination as he is in the British system. Nor does it say that he must interrogate the accused. Yet, this has become a habit: the judge, following the previously established *dossier*, really becomes the prosecutor. This happened, for instance, in the Dominici trial and it shocked Anglo-Saxon correspondents. The president of the court is a judge whose function is to watch the balance and not to tilt the scales either way.

To restore the trial judge to his proper role as referee and to give back to the examining magistrate his independence—these are the two most urgent reforms. At the same time the police and the public prosecutor should be put in their place: the police should be merely an auxiliary of justice and the prosecutor a counsel like any other. It is quite possible today, as in the past, there are no more violations of personal freedom or judicial errors in France than in any other country. The trials, however, would gain in dignity and justice in esteem if these reforms were carried out.

Denmark's Progress in the Air

BY A CORRESPONDENT

ALTHOUGH there has been a marked improvement recently in the efficiency of the Danish air defences, Nato planners—and many Danes—still feel that there is much to be done. Denmark is the cork in the mouth of the Baltic bottle; Danish radar and fighters might be the first line of defence against Russian bombers heading for London from the Baltic states. A year ago a crisis developed when the Defence Minister, Hr Rasmus Hansen, temporarily grounded all jet fighters after a tragic series of crashes, and Denmark's skies were violated by a number of unchallenged and unidentified intruders. Last July, at the Danish government's request, Air Chief Marshal Sir Hugh Saunders was seconded to Denmark to advise upon the reorganisation of the air force. This appointment, which has already proved fruitful, has now been extended to the autumn.

In Copenhagen last January General Gruenther expressed his satisfaction with the improvement shown by the Danish air force. Sir Hugh Saunders is said to be pleased with the progress in reorganisation, which has helped markedly to cut the number of crashes, and young Danes have shown that they make excellent pilots. A start has been made in building up the still inadequate radar coverage. In spite of all this, however, certain radical difficulties remain.

Lack of adequate flying training in Denmark itself has been one of the principal weaknesses. It was discovered last year that nine out of every ten fatal crashes involved Texas-trained pilots; the trouble, in the view of many experts, is that training in the clear and sunny skies of Texas was no preparation for the Baltic's treacherous fogs. Pilots are now trained in Canada; there has been some talk of a scheme to dispense with this by establishing a joint Norwegian-Danish air school in Denmark, but so far progress has been achieved only on paper. Until recently the Danish air force had nowhere to practice "live" bombing, and still lacks an air-to-surface rocket range. The Danish farmer guards his land jealously, and he is well protected in law.

Hr Hansen has been the target of a good deal of criticism for his handling of these problems. Last year his difficulties were increased by the personal antipathy existing between General Foerslev, the commander-in-chief of the air force, and Colonel Birksted, formerly chief of the air staff. Whereas General Foerslev represents the "old guard" of prewar army air force regulars, many of whom lack combat experience, Birksted is a former naval pilot and served as a Wing Commander in the RAF during the war. Birksted's appointment to a senior post in Paris has now resolved the problem. An important stage in reorganisation was reached by the recent setting up of a tactical headquarters at Karup in Jutland, entirely separate from the administrative headquarters at Vedbaek near Copenhagen. This decentralisation has been described as a victory for Birksted.

Nato Bases on Danish Soil?

Danish fighter pilots have no illusions about the combat quality of their present aircraft; the Korean war showed what Mig 15s can make of Meteors and Thunderjets. Denmark has a Nato off-shore order for Hawker Hunter interceptors to the value of £3 million, but delivery is not expected before the autumn. Last year Hr Hansen turned down an offer by Canada to supply a squadron of Canadian-built Sabres. Matters have recently been coming to a head. The Danes have now only one squadron of interim "all-weather" fighters, equipped with British NF Mk 11s. The Americans have been offering Hr Hansen a squadron of modern "all-weather" fighters, it being left to the Danes to choose between Sabres, Canadian-built aircraft and British delta-wing Javelins. Danish pilots, accustomed to British radar equipment, would like the Javelins if they were available now; unfortunately they are not—but the American Sabres are.

Hr Hansen's hesitations reflect the common Danish attitude, earlier displayed over the stationing of foreign Nato personnel at Danish air bases. In 1953 the Americans offered to establish two fighter wings, with 150 aircraft, in Denmark, but the offer was rejected by the late Hr Hedtoft and the Social Democrats. The Danes have given several reasons for their reluctance to admit Nato forces. They say that trouble might arise through the difference between the American and Danish rates of pay, and that the people of Copenhagen have been offended by the behaviour of some American servicemen on leave. Probably Hr Hedtoft expressed their fears most accurately in 1953, when he said that Nato's land forces were too weak to protect Denmark's southern flank. When the Danes have the comforting presence of 12 German divisions on their flank the situation may change. It has been suggested that the Danes might consider a Canadian offer to station a Sabre wing in the country. Although there is at present no sign of a reversal of Social Democrat policy on the question, the recent change in premiership may open the way for a reassessment. Meanwhile the Conservative and Liberal opposition will continue to press for more wholehearted Danish participation in Nato.

Were those the days?

Yes, those were the days all right—for disease-bearing bacteria and unscrupulous adulterators of the people's food. But today we have a strong shield against both the infectious and the rapacious. Thanks to modern packaging and the concomitant use of brand names, our food is now protected to a degree unknown to our ancestors.

Vital indeed is the part that packaging has to play in the nation's economy. Already over half the packaging board produced in Britain is made by Thames Board Mills. And the higher our standard of living rises, the greater the demand for "Thames Board" and "Fiberite" cases. This train of events can only serve to confirm Thames Board Mills' leadership in this expanding industry.

March into the future... *No. 5*

Maybe one day...

A pretty involved bit of reckoning, that, for a kid to be playing around with . . . But maybe one day even that complicated calculation will seem child's play to him—one day when his ambition is fulfilled and he's a qualified engineer.

In the modern world engineering has so many branches, covers so many diverse and complex activities. Electronics, for example—a science that grows in scope and importance almost daily. Yes, very probably he'll specialise in electronic engineering, this lad. In so doing he will learn to serve science, industry, all mankind, in an ever-greater number of ways. And Philips, always to the fore in research and development, will be there to help him.

THE BUSINESS WORLD

Chemical Engineers Accepted

AMONG the many teams that crossed the Atlantic in the postwar years to study American industry, one group of experts from the European chemical industries set out in 1950 to examine "Chemical Apparatus in the United States." Its main conclusion*, however, was not about apparatus but about men—and it sharpened a long-standing professional controversy in Europe which only this year, and after further lengthy debate, has approached some resolution. After looking at the rapid development of the American chemical industry, which in forty years has caught up and outstripped the European in technique as well as sheer size, the team concluded:

> A large part of the success of the great American achievements in industrial chemistry is due to the efficiency of the chemical engineer. The action of the chemical engineer is decisive when a process has to be transposed from the laboratory to the industrial state.

It contrasted the "quantitative and essentially practical" training of the chemical engineering profession that has developed in the United States over the last twenty-five years with the "descriptive theoretical courses" of European chemical training, and argued that Europe would not be able to begin to compete until industry was served by greater numbers of staff trained specifically as "chemical engineers."

This view was by no means universally accepted in Europe or in this country. Many sections of the chemical industry have refused to accept "chemical engineering" as a separate profession with a distinct field of expertise, or even to agree that chemical engineers merited the title of "engineer." They asked what a chemical engineer could do which a chemist and a mechanical engineer working together could not do. The Germans, particularly, and those sections of industry in this country which had been most exposed to German influence, took this view. On the side of the new profession, it was argued that chemical engineering first developed during a period when the work of many practising engineers had become over-systematised; and that the chemical industries needed men who could tackle new problems with originality of mind and an engineering outlook rather than by the application of ready-made rules.

*

The difference in professional approach, moreover, was linked with a major shift in technique. Historically, Europe had a large and prosperous chemical industry long before the United States, and in the development of this Germany played a leading part. The industry was built up by collaboration between the chemists, who developed manufacturing processes, and the engineers who designed and built the production plants. In general, the plants they designed were scaled-up versions of the chemist's bench apparatus, and they committed the industry to batch processes, in which the addition of raw materials, the carrying out of the appropriate operations and the removal of products are a sequence of separate steps. This batch system imposed limits upon the increase of output, and generally meant that the labour content of the cost of the product was high.

Some early exceptions, however, did provide continuous processes. These included the work of Solvay in Belgium and of Mond in this country on the ammonia-soda process, the later work of Mond on gas plants and on the extraction of nickel, and of Haber and Bosch in Germany on the fixation of atmospheric nitrogen. They demonstrated the great advantages of

* In a report published by OEEC, Paris 1952. 20s.

the continuous treatment of raw materials by the appropriate operations and the continuous removal of the products under a "flow process," in which the physical conditions at any one place in the plant remain constant. The introduction of automatic control methods is obviously easier for such "steady-state" flow processes.

Progress from the batch process to the continuous process is by no means easy. It was particularly difficult for chemists who thought only in terms of the laboratory batch process, and for engineers who thought only in terms of enlarging the chemist's apparatus into plant of a suitable size and materials of construction. Continuous processes demand a knowledge of the dynamics of flow, and of the transfer of heat, matter and momentum that was largely outside the academic curriculum of the conventionally trained chemist and mechanical engineer. The idea of the flow process was most quickly adopted in the United States after the 1914-1918 war, largely to meet the requirements of the vastly expanding oil refining industry, handling a liquid raw material in great volume. From oil the continuous flow system spread to all branches of the chemical industry. As a result, the United States has become an exporter of chemical processes during the last thirty years, rather than an importer. The American process industries would not have obtained such spectacular developments without adequately trained men to work upon them; these were the products of the newly-established American schools of chemical engineering.

In Germany, too, an evolution of ideas was taking place in the training of chemists and engineers. The technical universities provided excellent courses in industrial chemistry or chemical technology, including a large portion of what are usually considered engineering subjects. At the same time, the engineering courses included adequate instruction in fluid dynamics and heat transfer processes. Between them they probably covered all the curriculum of the American chemical engineering graduate, while at the same time the chemists had a more thorough knowledge of chemistry, and the mechanical engineers of the mechanical design of plant, than had the American chemical engineers. But in the United Kingdom there was nothing to compare adequately with the great technical universities in Germany; from our own universities the chemists learn virtually nothing of engineering subjects, while the average engineer gains only a superficial knowledge of fluid mechanics and heat transfer processes. Their fields of knowledge do not overlap. It is the need to fill this gap that has necessitated the establishment of schools of chemical engineering in this country, sponsored in some cases by oil companies such as Shell.

Opinions about chemical engineering remain controversial and contradictory. There remain those who do not believe in chemical engineering at all; even the converted cannot always agree how chemical engineers should be employed, whether they should be trained by undergraduate or post-graduate courses of study, or whether they ought to undergo an apprenticeship or not. Early this year a conference sponsored by the Organisation for European Economic Co-operation was held in London to try to resolve some of the differences. Technologists such as Sir Christopher Hinton, managing director of the Industrial Group of the Atomic Energy Authority, bore witness to the value of chemical engineers in the evolution of industrial chemical projects, in process plant management and in administration. Experts from Germany, Italy, Belgium and France, as well as the United Kingdom agreed about the necessity for chemical engineering, and if they were sometimes discordant about what chemical engineers are, some of the disagreement seemed to be verbal and interlingual. When the experts came to discuss how the variously-labelled expert they had in mind should be trained, they found much more to agree upon. University courses in the United Kingdom, Germany, Austria, Belgium, Netherlands, France, Sweden and Norway all had far more similarities than differences. While not all the Germans agreed with Professor Kirschbaum of Karlsruhe when he said "In Germany the words chemical engineer and process engineer really mean the same thing," it is clear that a German *Verfahrensingenieur* (process engineer) would be perfectly at home in a chemical engineering department in this country.

★

The similarities came out, too, in discussions on research. What the Germans called "Process Engineering Research" ranged from the study of high temperature and pressure reaction kinetics to the behaviour of constructional materials. Chemical engineering research in this country covers the same range of topics. Moreover, the Germans had tackled some of the problems that were outlined for Britain four years ago in the Cremer Report on Chemical Engineering Research, which was published in 1951. This report drew attention to the lack of central facilities for carrying out or co-ordinating such research. It added that one of the first jobs of a central chemical engineering research organisation should be to distribute to potential users information that already exists or is available from different sources. Little has been done in this country towards implementing this report. The Germans, on the other hand, have organised a number of important committees to do just that — co-ordinate and distribute information in specialised fields to the chemical industry.

For many years the Institution of Chemical Engineers has endeavoured to gain general recognition for chemical engineering, along with civil, mechanical and electrical engineering, as a primary branch of technology. It may claim that this has now been achieved. Contributions from many of the most important industrial companies in Britain, including ICI, Courtaulds, and Shell, showed that these companies are satisfied that the chemical engineer is now a necessary part of a design, development and production organisation. In some cases this represented a marked change of front, and the professional institution is entitled to draw full encouragement from them. As Sir Harold Hartley has said, "The chemical engineer is no longer regarded as a misnomer or a curiosity."

The profession must still expect a considerable degree of reserve, however, about the status that some of the more enthusiastic delegates to the OEEC conference would claim for the chemical engineer. The new discipline, said one French delegate, "is a cross roads not only for technologists but for economists; it interprets, codifies, translates. It is concerned with everything without becoming superficial and deals with details without specialising." These are claims indeed; it is fair to say that they are supported by some experts in Britain, who argue that this broadly-based discipline of applied science gives to a student a judgment and facility for the art of technical co-ordination that no other field of study can. If this is justified, the demand for such paragons of training may well become immense, but it is a claim which chemical engineers have yet to prove—if they can.

Money From Green Fingers

THE frost has played havoc with the cistus and there was hardly a specimen to be seen in the whole breadth of the Chelsea Flower Show this week. The iris growers have had difficulty in bringing their plants forward sufficiently, and many of those shown were still in bud with a single flower opened here and there to hint at the glory that will perversely bloom, unseen, after the show has closed. On one side of the 3-acre tent was a splendid exhibit of tropical plants arranged at two weeks' notice by the Liverpool parks gardeners after a big nursery had cancelled its stand. There were fewer of the herbaceous perennials than are usually seen in a show that is held, by long-established tradition, in the third week of May, but the cold spring has brought more specimens of such early-flowering ornamentals as malus and prunus than Chelsea usually sees.

The Chelsea Flower Show, organised every year by the Royal Horticultural Society in the grounds of Chelsea Hospital, has become the principal shop-window of an industry that supplies flower and vegetable seeds, bedding plants and ornamental shrubs to thousands of amateur gardeners. Its turnover is difficult to estimate with any accuracy. The Census of Distribution for 1950 suggested that sales in that year were not less than £13½ million and may have been substantially higher—the doubt is caused by the difficulty, mentioned in the Census, of tracking down all the nurseries that sold direct to the public. Such a turnover is much bigger than that of any of the other trades that cater for hobbies, such as shops selling musical instruments, sports goods, art needlework and knitting wools or even toys. It is also a good deal higher than the turnover of florists, milliners or furriers.

There are probably about 10,000 growers in the country, though many of these are primarily market gardeners who bring up as a sideline some bedding plants, or shrubs that need glass. Only about 2,000 nurseries concentrate exclusively in the supply of garden seeds and plants. The Census of Distribution ran to earth more than 1,200 and credited 32 of them with turnovers exceeding £50,000. These are substantial figures judged by any standard, and they are due in part to the wide, popular support that the nurseries have enjoyed since the war. This support is not without its problems.

Before the war the nurseries had fewer customers than they have today, but their orders were far bigger. Fairly modest gardens were supplied with bulbs by the thousand and with rose bushes by the hundred. The big gardens ordered on a royal scale and were good customers for all the new and rare varieties—and, almost equally important to the nurseries, many nurserymen and market gardeners received their early basic training in big private gardens.

Now many of the big gardens have gone, and the big orders with them. Those that remain no longer order on the same lavish scale; how can they when an ordinary rhododendron is catalogued at an average price of 15s.? Instead, the nurseries find that they are supplying hundreds of small customers with a few specimens at a time. In shrubs and bedding plants, these small orders are frequently for ordinary varieties, and not for the expensive novelties. The costs of invoicing and packing these small orders are considerable; so is the time that the nurseryman spends walking from one part of his land to another to collect the handful of plants for individual orders. Yet the nurserymen have to recognise that this change is permanent, and adapt their selling methods to deal with it, if they are to remain prosperous. Until two years ago, they enjoyed a sellers' market; gardens were being re-stocked after the war and the nurseries themselves were rebuilding their depleted catalogues. But during the past two seasons conditions have become increasingly competitive; last year's bad winter seems to have discouraged many gardeners from planting and some nurseries have substantial stocks of shrubs and fruit trees on their hands.

This change in the character of the market has created a new type of demand. The big gardens still buy shrubs and ornamental trees because these need the minimum of upkeep, and industry, too, is emerging as

the new patron of landscape gardening. But the new army of amateurs has generally not the ground for more than a few strong growing specimens. They concentrate much more on seeds and bedding plants and buy in large quantities. It is said that bedding plants—with luck and hard work—can bring returns of £1,000 an acre, and that by changing to them a number of small nurserymen have escaped from bankruptcy. Market gardeners grow bedding plants in substantial quantities, and may have been quicker than the specialist nurseries to see the advantages of a crop that can be quickly grown and easily marketed either locally or through wholesalers.

★

Seedsmen long ago recognised the importance of catering for the small customer. Cuthbert's packets sell by the million across the counter at Woolworths'; Carter's coloured sixpenny packets are retailed by ironmongers and general shops across the country. Carters are selling more than twice the number of vegetable packets that they did before the war and their sales of flower seeds have gone up by a sixth. And whereas the amateur who buys plants usually sticks to the hardiest and least exotic variety, there are many amateurs, with a little glass and the challenge of the show bench to stir them, who are prepared to pay several shillings for new strains or rare types of seed and they concentrate increasingly on the half-hardy as opposed to the hardy annuals. The older and less highly selected strains do not find so ready a market in spite of being the cheaper.

Growing for seed is highly competitive, but on balance a slightly less hazardous business than growing plants or shrubs. Much of the stock is grown abroad from seed selected in this country, so that the business is not entirely at the mercy of the British weather. This is as well, particularly in a season like last when much of the flower seed grown here could not be harvested. Seed needs careful growing and storing, but it does not require much space—there are two million begonia seeds to the ounce and a packet containing a minute measure retails for 3s. Consequently, a seedsman's capital is less tied up in fixed assets, in land and plants, than that of a nurseryman's or market gardener's. One bad season can wipe out the cash reserves of a nursery; two bad seasons could put most of them out of business. Most of the growers are short of cash and cannot easily lay hands on new capital; but some start in a small way with a few thousand pounds locked up in land, stock and equipment and manage to do very well. An approachable bank manager is always useful, particularly in years of bad trade and high coal bills.

These conditions do not encourage a competitive spirit among nurserymen. They may compete for prizes at exhibitions, but not, it appears, in the prices asked in their catalogues. There is a marked similarity between the price lists of different nurseries; 4s. to 4s. 6d., for example, is the almost universal charge for a shrub rose of average quality. It is difficult to believe that costs are identical all over the country—or that all growers have any accurate idea of the cost of bringing up individual plants. The nursery trade is highly organised in its own trade association and also in associations of specialist growers—and the price lists of the one or two non-member nurseries diverge sharply from the average charged by members.

A strong sense of solidarity prevents the nurseries from undercutting each other, but that does not protect them from competition from other sources. Before the war, regular auctions were held in London and other parts of the country of surplus stock from British nurseries and of plants sent in at very low prices from the continent. These have not been resumed since the war, but now the multiple chains have begun to sell not only seeds, but plants, shrubs and fruit trees of good quality at prices far below those listed in the growers' catalogues.

★

Some of this stock is being bought from local nurseries—not necessarily because it is surplus, but because a firm contract is attractive even at a low price. But it is probable that a good proportion of it is being imported from the continent. Foreign bulbs and tubers are imported on quotas, but other plants are on open general licence, and while the foreign nurseries are afraid to send cut-price stock to this country for fear that British growers would retaliate by asking for lower bulb quotas, they may have been making contracts either direct with the multiple chains or with British growers who finish off the plants in this country on the multiples' behalf.

This competition is causing the growers concern, but they note that, while the quality of the stock is excellent, the strains are commonplace and cannot compete with highly selected specimens. Much more serious to them is the increasing competition from the nurseries run by local authorities, which sell surplus stock to the public. The trade done in this way by a big municipal nursery can run well into five figures. A strong campaign is being fought by the nurserymen to prevent any more municipalities from acquiring powers to sell plants retail because it is feared that whatever price the nurseries charge, the municipal gardeners will always and automatically undercut them. The real answer may, however, lie not in trying to shut out competition but in exploiting the special skill and experience that only nurserymen have. Most of the famous nurseries and seed businesses are family businesses built on the special skill of their founder. Where this aptitude has been passed on down the family, which is not inevitable, these businesses continue to thrive and there are plenty of examples at the present time of new reputations that have been created during the past few years. The efficient nurserymen and seedsmen survive and some prosper.

Business Notes

Blue-coloured Spectacles

THE Conservatives had won the General Election a fortnight or so ago in Throgmorton Street. On the eve of the election account the *Financial Times* ordinary share index had climbed to 189.1. On polling day nine days later, it stood at 195.9, less than one per cent below the peak of 197.5 touched on February 3rd. Bank rate had then only just been raised to 3½ per cent: it is now 4½ per cent. But in the meanwhile the standard rate of tax has been reduced, and the flow of dividends and profits has been at least as inspiring as investors anticipated at the end of last year. Confidence in a Conservative victory was the mainspring of the boomlet in a market more active than for some weeks past. But the strong advance in many of the market leaders was the product of American buying. ICI led that advance, but investors in the United States and Canada were also buying Bowater Paper (the first of the stocks to attract their attention), British Petroleum, "Emmies," Ford and Unilever. Prices in Wall Street are now at such a height that the dividend and earnings yields offered by the equities of the British giants look attractively higher than those offered by American companies of the same calibre. It needed only a few favourable comments from American brokers to touch off the demand. The transatlantic interest in British securities, which may be engendered in part by tax advantages, was given another illustration this week by a scheme inaugurated by Irving Trust, the New York commercial bank. Under this scheme American brokers will be able to place orders for their customers with British and American brokers for 34 selected British, Dutch and South African stocks. The Trust will issue depository receipts against the stocks lodged with the National Provincial Bank in London and Pierson and Company in Amsterdam; the Trust will also arrange to pay dividends to the American investors.

Sterling on Tenterhooks

AN air of brooding uncertainty has prevailed in the exchange markets this week. Operators surmised that on the outcome of the votes that were being cast on Thursday would depend whether the sterling-dollar rate dropped to the "floor" of $2.78 or whether there would be a recovery beyond the level of around $2.79⅛ at which the rate hovered during the greater part of the week. But any substantial rise beyond this figure would probably be checked by the Exchange Equalisation Account taking the opportunity to regain some of the dollars that may have been lost in the earlier part of the month in supporting the rate for transferable sterling. In the circumstances, with perhaps 1¼ cents in the rate to lose "if things went wrong" and only ¼ to ½ cent to gain "if things went right," potential buyers of sterling have naturally postponed covering operations and dealers have, on the whole, kept their sterling holdings on

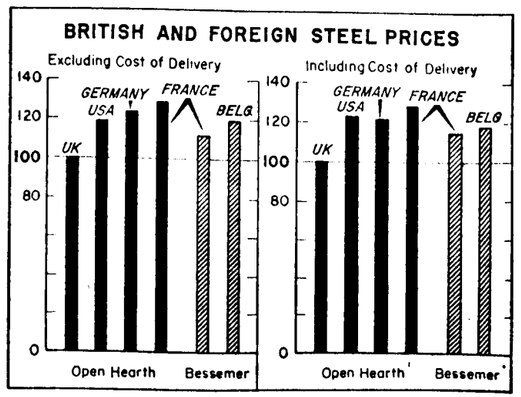
Looking at the market through blue-coloured spectacles has not been confined to equities. Now that selling by the joint stock banks has stopped, some of the industrial concerns and institutions have switched their interest from Treasury bills to the short-dated bonds, which now offer a strong element of capital appreciation over a limited period of time. That has stopped any further slide in gilt-edged prices, but at the same time some of the longer-dated and undated issues have been bought. This week's rally in sterling and some easing of the pressure in Lombard Street have contributed to this result. But the renewal of confidence in Throgmorton Street presupposes something more than a Conservative victory. It assumes some slackening of the rigours of the stringent credit policy and a continuation of the industrial boom without check or pause. That in turn assumes a more favourable balance of payments in the autumn than seemed to be likely when the Government first tightened the screws on credit or seems from present evidence to be on the cards.

the short side. In order to offset this depressing influence the authorities appear to have given the market some support, though the recovery in the rate after its fall to under $2.79 at the end of last week was attributable also to an improvement in the market's electoral confidence. Whether the month of May closes with a residual gold and dollar deficit will almost certainly depend on the experience of the three final working days next week, when the response to the election results will emerge. They promise to be exceptionally active days.

The tendency to postpone purchases of sterling has also affected the transferable rate. Over the past ten days some official support has been necessary to keep the rate above $2.77, which the authorities appear to regard as their support point. But the market in transferable sterling has been deriving some support from recent sales of Russian gold, most of it has been sold against dollars and the dollars converted into sterling in the transferable market. Zurich has also reported occasional commercial orders for transferable sterling running into substantial figures. The transferable sterling market has, therefore, been of two-way character; there have been occasions when the Exchange Equalisation Account has been a seller.

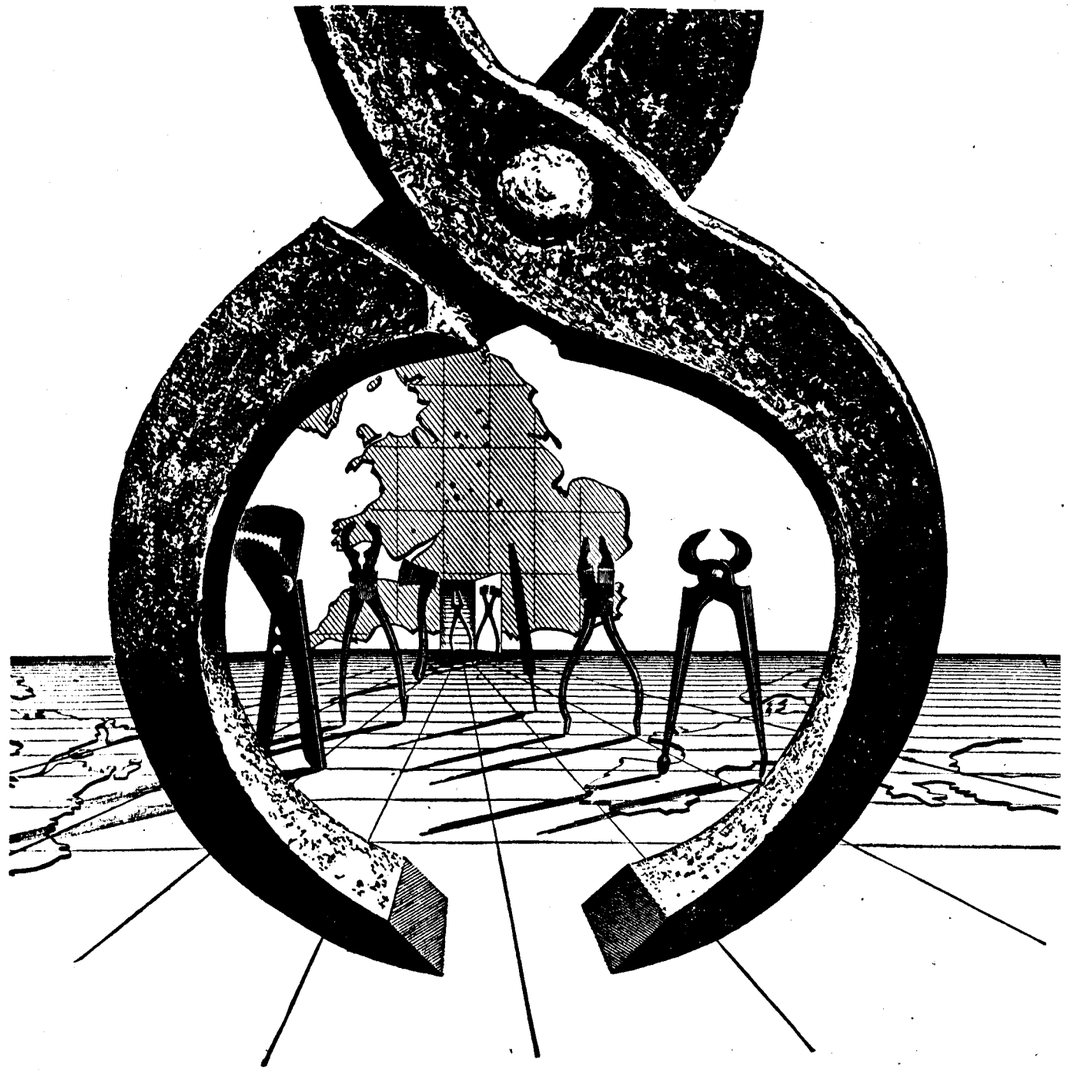
The strongest market for sterling recently has been that for security sterling, which has risen since mid-May from $2.73½ to $2.74¼. The main supporting factor in this case has been a fairly steady demand for sterling equities by American investors. Certain Wall Street quarters, unlike the foreign exchange market, have had no doubts in anticipating the election prospects bullishly, as this week's substantial buying of British equities on American account demonstrates.

Settling Steel Prices



MOST of the work that the Iron and Steel Board has begun to do since it was set up two years ago has been taken over from the Ministry of Supply or the British Iron and Steel Federation. The most important task it has carried out, however, is one that no authority in the steel industry has attempted since an earlier Steel Board (also headed by Sir Archibald Forbes) did it in 1949—a comprehensive review of the industry's price structure. In its first report, covering the 17½ months to the end of 1954, the board has outlined some of the principles of steel pricing on which it made last year's changes.

The board, which was set up under the 1953 denationalisation Act "to exercise a general supervision over the iron and steel industry with a view to promoting the efficient, economic and adequate supply under competitive conditions of iron and steel products," has no statutory duty to fix steel prices. It has to keep them under review and is permitted, if it sees fit, to "determine" maximum prices. To nobody's surprise, it did see fit, and in December, 1953, took over from the Ministry of Supply the long-established arrangements for collecting figures of costs, realised prices, and capital employed from steel producers.



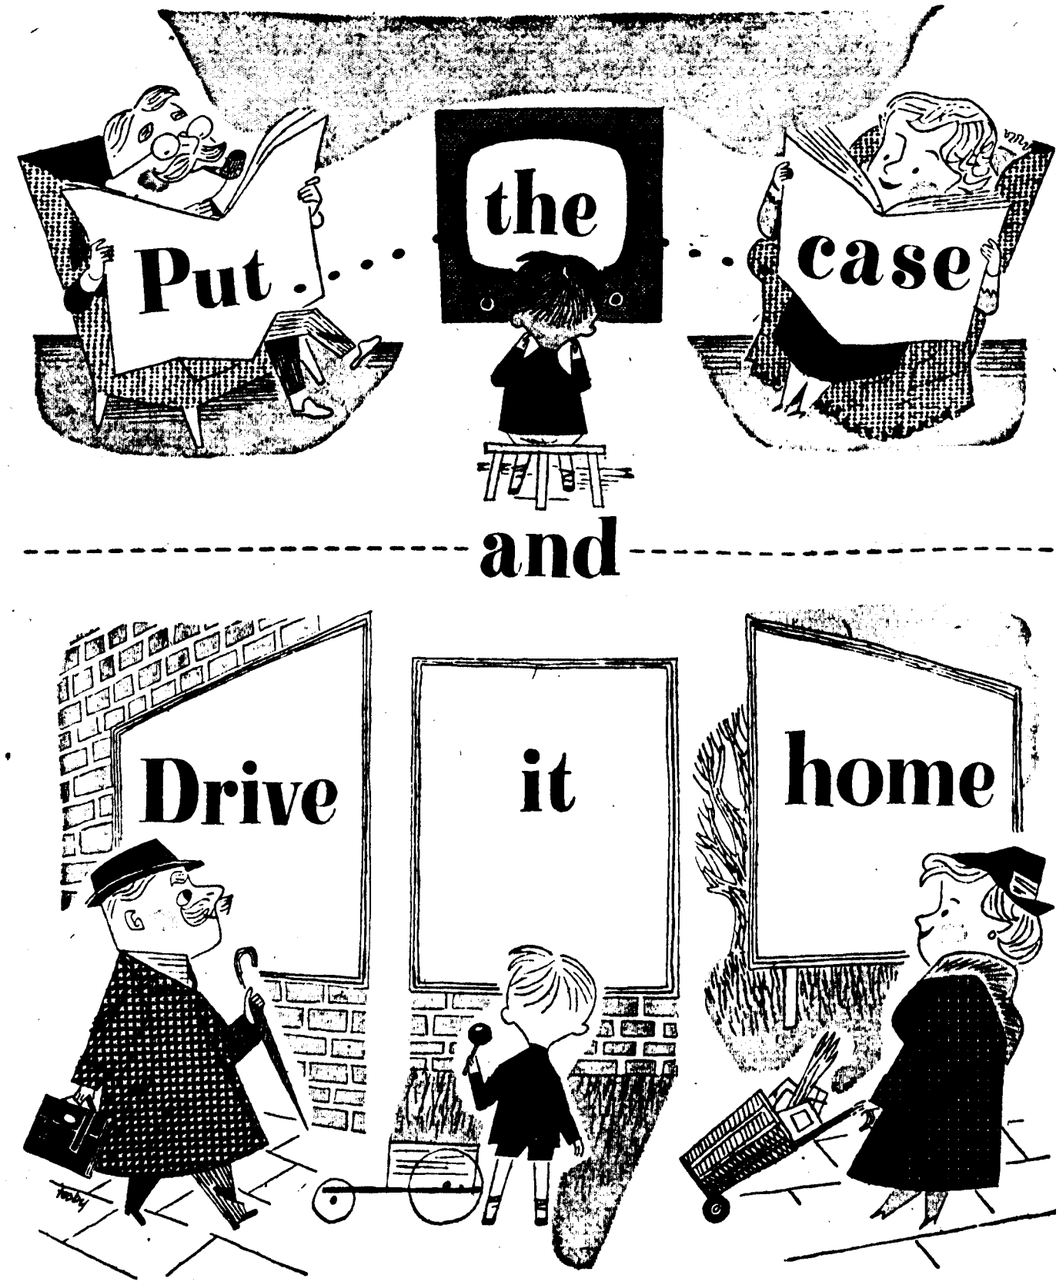
The board decided to continue the existing practice of basing prices on costs of production, including adequate depreciation, plus "a reasonable margin of profit." For operating costs it excluded a proportion of the highest-cost producers and took the average of all others (except in the case of sheet and tinplate, where the operating costs on the new continuous mills differ so radically from those of the hand mills that it has set two prices). In calculating the depreciation element, it continued to take replacement costs of equipment, adjusted mainly for the average life of assets. Depreciation thus calculated now accounts for some 6 per cent of costs, against the average of about 3 per cent that was actually being set aside by companies as recently as 1951-52, and the board last year told the steel industry it would expect the amounts now set aside for depreciation and obsolescence "would not be less than the allowance made in prices." In allowing a profit margin, the board took the written-down historical cost of fixed capital employed, plus working capital and liquid assets, and set a profit margin with regard to interest rates and the likely "normal level of working" for the industry's capacity. This is the same basis as the earlier board used in 1949, but the effect differs significantly. In 1949 a profit margin of about 8-10 per cent on historical capital offered far less on capital reckoned at replacement prices. Today, when the majority of the £352 million worth of fixed capital in the industry must represent plant bought at postwar prices, a profit margin based on historical cost comes much closer to economic reality.

Britain's Real Advantage

IN settling steel prices the Iron and Steel Board, like the authorities that did the job before it, has been concerned with stability and with "the maker of reasonable efficiency." Prices based upon the average operating costs of all but the highest-cost producers do not remove the incentive to reduce costs, though they do mean that the maker who reduces costs does not get the full benefit of his saving. This "restraint of prices and earnings in time of high demand," however, is moderated by the fact that producers are left free to enjoy all the export premiums they can earn: in certain postwar years, the average of about 15 per cent of total steel

output that was exported appears to have contributed about half as much profit again as would have been earned by selling all the steel at controlled home prices. Moreover, the board says it may on occasion "allow the producers con-

Pincer movement



Over a million pairs of pincers and pliers moved out of this country last year. With them went nearly five million files, as many assorted axes, and two thousand tons of hacksaw blades and twist drills.

These export figures for tools are a few out of many. They give some small idea of the world-wide demand for British-made steel products. Last year Britain's toolmakers alone earned £18 million for Britain.

Wherever there is steel there is British steel.

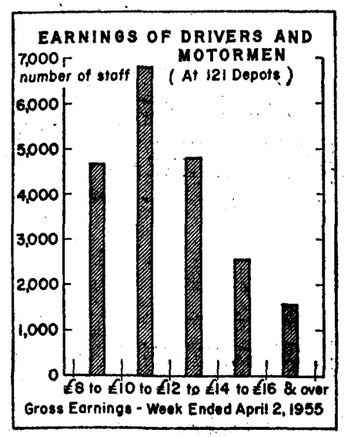
cerned to retain for a time some part of the saving in costs secured by their efforts and initiative."



The controlled prices for British steel, which as the chart shows are markedly lower than American and Continental prices, still contain certain artificial elements. The spreading of costs of imported materials, and the partial equalisation of steel-making costs from scrap and iron effected by the "Industry Fund" (about which, surprisingly, the board gives less specific information than either the British Iron and Steel Federation or the late nationalised corporation have done from time to time) does not affect this competitive price level. The control of scrap prices at a level lower than the steel-making value of scrap relative to pig iron does hold British prices down, but the board thinks that if the price of scrap did rise to its equivalent in iron, British steel prices would rise by less than 5 per cent. The steel industry, like other British consumers, also gets its coal cheaper than it could in the free market that some major consumers such as the North-Western Gas Board are now beginning to advocate. But a rough calculation here, too, suggests that a free market for coal might add less than 20 per cent to the price of coal, which itself accounts for well under 20 per cent of steel-making costs. Though correction of these artificial elements would certainly reduce the extent to which British steel is cheaper than foreign, it would not wipe out its real competitive advantage—which comes from making steel cheaper.

Pay for Footplate Staff

It is a grievous disappointment that the Associated Society of Locomotive Engineers and Firemen brought no new proposals to the wage discussions early this month, and have refused to consider the proposals that the British Transport Commission put forward twelve days ago. The Commission's ideas were open to discussion, and they may have been well short of perfection. But they had the merit of being broadly based on two principles: first, that differentials, if they are to have any meaning, must be based on some kind of classification; and secondly that the proposed allowance for mileage between 80 and 140 miles attempted to relate work done with reward for those drivers and firemen who are not enjoying the considerable benefits of the mileage allowances that express train crews doing more than 140 miles have long enjoyed.

Endless argument is possible about degrees of skill and responsibility between different types of footplate duties. The ASLEF will have none of it (save that fast train crews have their skill and responsibility recognised, whereas the others do not). There ought to be some symmetry between duties and earnings, and in fact there is—as the accompanying charts demonstrate. The Commission's proposals would have had the effect of giving more for the more important duties and of giving some encouragement towards increased productivity.

The essence of the railways' development plan is to cut out a lot of uneconomic mileage and build up new and speedier services; and the Commission's proposals could have formed the first stage in a new conception of footplate pay by matching more effective work with the extra reward that it merits. If locomotive crews reject these principles from the start, it is difficult to believe that the £1,200 million of new equipment for the railways will be well spent. And, as Sir Geoffrey Heyworth has pointed out this week to the stockholders of Unilever, "the frequent threat of strike on the part of any particular form of transport can only make industry hesitate to commit itself too much to that form."

Transport: a User's View

Transport and handling equipment, along with warehouses, account for almost 15 per cent of Unilever's total investment in manufacturing and distribution facilities: its annual spending on transport is equal to nearly half its total wage-bill; and one day's delay in the combine's world-wide movement of raw materials and finished products would tie up an extra £5 million in working capital. It is not surprising that what Sir Geoffrey Heyworth had to say about transport at Unilever's annual meeting this week contained a good deal of interest to transport users and operators in general. His remarks were objective and unbedevilled by politics; though they contained some criticism of nationalised transport in this country, Sir Geoffrey gave it some good marks too.

In the more developed countries where Unilever operates, about 21 per cent of its margarine moved from factory to distribution depots by rail, 77 per cent by road and 2 per cent by water; for soap, 48 per cent went by rail, 37 per cent by road, and 15 per cent by water. The location of the depots available, and in some cases the fixing of road and rail prices by law, make these proportions differ widely for different countries; in Britain, where the choice rests largely upon the rates and service different forms of transport can offer, Sir Geoffrey noted that rail

secures a bigger share than in the average for the group as a whole. In Britain about 52 per cent of soap—a commodity that does not deteriorate during transit, so that speed does not matter much—went by rail, 37 per cent by road, and 11 per cent by water. Margarine, on the other hand, must be delivered fresh, in frequent and fairly small consignments, and is thus basically suited to road transport; nevertheless, in Britain about half of it goes by rail. From depots to final customers, of course, most of the delivery is by road; in Britain, Unilever takes about 80 per cent in its own vehicles and 20 per cent in contract transport.

The better-than-average share that British Railways secure may mean higher efficiency in railways or lower efficiency in road haulage in this country. Sir Geoffrey commented that "it will be interesting to see whether the new railway charges scheme is effective in encouraging a greater use of rail transport." But on some questions of handling, he can only give British Railways half marks for progressiveness; for example, the railways here have encouraged the use of pallets for fork truck handling of rail consignments by returning pallets free, but have not taken the logical further step of setting up a national pallets pool, as Swiss Railways have. Sir Geoffrey complained, too, of the rigidity that tends to characterise the national organisation of transport in Britain and elsewhere: "The general lesson we have learnt from our own experience is that in transport as in industry a dynamic outlook is vital."

April Trade Winds

THE improvement in the overseas trade balance last month was not evenly spread: it resulted from a sharp fall in imports of food and beverages on the one hand, and from a sharp rise in exports of engineering products on the other. Detailed figures for April (a short month), compared with the average for the first three months of this year, show that of the fall of £17 million in imports to £318 million cif, £15 million was attributable to a fall in imports of food and beverages. Imports of tea fell by £9 million, thanks to a seasonal drop of 43 per cent in volume and a 14 per cent drop in price; coupled with smaller imports of cocoa and meat (at slightly lower prices) and of cereals and feeding stuffs, this more than offset a sharp seasonal rise in imports of fruit and vegetables and sugar. Imports of basic materials remained high, and imports of coal and petroleum rose further in April. Among manufactures, a fall in imports of chemicals and non-ferrous base metals was partly offset by the continued rise in imports of iron and steel. Reductions in prices of meat and beverages were mainly responsible for a fall of one point to 103 (1954 = 100) in the index of import prices. Prices of engineering exports and metals rose by one point in April, but the index of all export prices remained at 101. Hence the terms of trade moved a further point in Britain's favour to 102, compared with 104 in the first two months of this year.

The high level of exports in April, which were only £2 million below the first quarter's average, at £245 million fob, was entirely due to a rise of £5 million to £99 million in shipments of engineering products; all the other main categories of exports fell last month. Shipments of road vehicles and aircraft rose by £3.7 million to £32.4 million, and shipments of mechanical and electrical machinery were also higher.

The improvement in the balance of trade was unevenly spread among the main trading areas too. The fall of £12 million to £65 million in the trade deficit, compared with the average of the first quarter, was almost wholly in sterling area trade; imports from that area fell much more than exports, and the trade deficit fell by half to £10 million. But the slight fall of £2 million to £55 million in the deficit with the non-sterling world in April masked a welcome reduction in the deficit with the dollar area. The resurgence of exports to North America lowered the deficit with the dollar area by £7 million to £31 million; the deficit with the OEEC area was £1 million lower at £4 million, but with the rest of the world the deficit rose sharply by £5 million to £19 million.

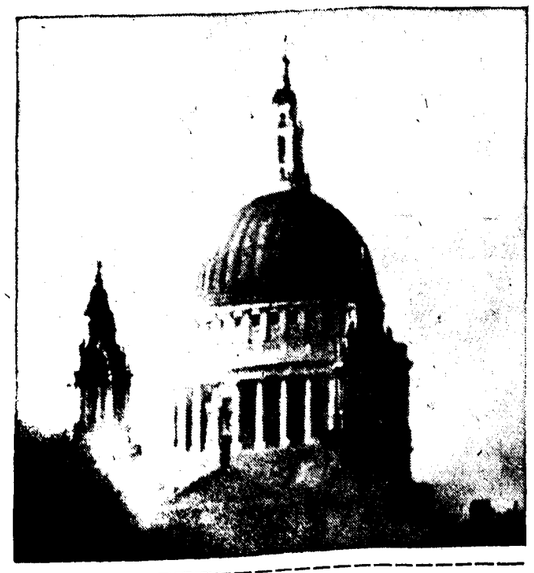
Now! Luxury Air Service TO KARACHI via Cairo in 16* HRS

P.I.A. Super Constellations Fly Fastest to the East

At last! Pakistan International Airlines have extended their domestic routes serving West and East Pakistan, India and Burma. Now you can fly to Karachi via Cairo in 15.50 hours air time*—fastest ever—*and* enjoy a trans-Atlantic standard of luxury aloft. P.I.A. Super Constellations leave London every Friday and Karachi every Tuesday. Ask your travel agent. First Class and Tourist accommodation. The First Class section is fitted with special de luxe seats to ensure perfect comfort during the day *and* night.



CAPTAIN N. HEMSWORTH
It's comforting to know that the man 'up front' is a man like Captain N. Hemsworth. Australian by birth, he brings to P.I.A's crack international air service a brilliant war record and experience of three airlines.

St. Paul's stands in need of your help

Last October we launched an Appeal for St. Paul's, the main objects of which were:—

To complete the restoration and repair of the Cathedral.
To build a new Choir School and reconstruct other ancillary structures such as the Chapter House.
To secure additional income (estimated at £20,000 per annum) needed to meet increased costs.

All these objects are of vital importance if St. Paul's is to be maintained in a manner worthy of London's Cathedral and a great national shrine. The response has been generous and we are more than half-way towards our goal. To reach it we need your help. Gifts may be sent to me—The Dean, St. Paul's Cathedral, E.C.4.

W. R. Inge

The Trustees of the Fund are the Lord Mayor of London, the Governor of the Bank of England, and Sir Noel Bowater, Bt.
An illustrated leaflet explaining the needs in detail will be sent on application to the Secretary, St. Paul's Campaign, St. Paul's Cathedral, E.C.4.

TO THE DEAN, ST. PAUL'S CATHEDRAL, LONDON, E.C.4.

This is my gift to St. Paul's Cathedral. Please acknowledge receipt to:

P & O in a New Light

In a grey, unemphatic voice, Sir William Currie, the chairman of P. & O., told stockholders at the crowded annual general meeting of the new look that would be given to the group's balance sheet. The proposed changes are impressive, for they reveal the true value of the fleet at original costs. They are not startling, for the directors have refused to put an estimate on the present day value of that fleet. And with such specific assets as a fleet of ships who can say they are wrong in their refusal? They know better than anyone the cost of building new ships and they do make adequate provision for replacing the present fleet. The proposed changes are one of the results of the survey made by the company, with the help of Lazards and Deloittes, into the organisation, financial structure and policy of the group. They are the directors' answer to the stock-

£ million

holders' association which was pressing for more information about asset values. The spokesman of that association, reserving his fire, asked for time to consider the new changes. He then heard individual stockholders supporting the policy of the board.

The board's proposals are as follows:

(1) The fleets will be shown at cost for all ships in service, less depreciation at a rate of 5 per cent per annum.

(2) Payments still to be made on ships under construction will be excluded both from fixed assets and current liabilities and will be shown in a footnote to the balance sheet.

(3) Tax savings on initial allowances and on the excess of depreciation allowances granted by the Inland Revenue above the company's rate of 5 per cent per annum will be shown in a separate reserve for future tax.

(4) Capital and revenue reserves will be increased by depreciation and reserves deducted from the cost of ships in excess of the 5 per cent rate, less the amount placed to future tax reserves. They will also be increased by reserves hitherto deducted from freehold and leasehold properties and by amounts written off investments which are no longer required.

In effect, these changes, taking the consolidated balance sheet as drawn up on September 30th last, will work out as follows:

In no sense at all do these changes alter the value of the group's assets; they merely reveal their value in a truer light. It is a conservative reform but none the less welcome for that. Equally conservative is the decision to write off the fleet over twenty years. As Sir William points out, that may be within the normal physical life of the vessels but it should provide the company with a margin of safety and room to manœuvre when replacement is considered.

The Free Scrip Issue

In the course of the survey the directors also decided that the issued capital of a number of subsidiaries was out of line with the real capital employed by those companies. Accordingly a number of proposals to capitalise part of the reserves of these subsidiaries have been submitted to the Capital Issues Committee. If that committee agrees to these proposals then a new capital reserve of about £12½ million could be set up in the parent company's balance sheet, by showing on the assets side the investments in subsidiaries at their new nominal value. But, after consultation with counsel, it was discovered that the parent company was prohibited by its charter from capitalising such a reserve—or, indeed, any other reserve arising from an unrealised capital profit. The directors have therefore decided not to set up such a reserve. But as the reserves the company already possesses are strong they have decided to capitalise £13,777,554 from existing reserves in order to make a 100 per cent free scrip issue of the deferred ordinary stock. Another proposal considered by the directors was to turn the parent company simply into a holding company, transferring its shipping assets to a new subsidiary. But the directors have been driven to the conclusion that such a change "could only be brought about at a cost of heavy additional tax burdens and that it is not financially feasible for the P. & O. to become a holding company pure and simple."

After such a frank survey, no one can complain that the directors have failed to consider what is in the best interests of the company or its stockholders. Sir William Currie admits that the return of 3.8 per cent by earnings after tax on the revised value of the group's new assets is low and so too is the return of 1.1 per cent provided by net dividends in 1954. But he argues that it is a reasonable return for a company working at all time in the full blast of international competition and faced with heavy capital commitments. If it is not enough for stockholders (who have received a bigger dividend each year since 1949), is not the solution to sell the stock?

Business in Cotton Textiles

Business in the cotton industry has improved a little in the last week or two. Home orders for some types of textiles have increased, mainly because buyers cannot hold off any longer, and partly because the abolition of purchase tax on piece goods has stimulated business in furnishing fabrics. Abroad, there has been some increase in orders from India, following the reduction in the import duty on British textiles; Pakistan should soon release import licences for the £1.85 million worth of textiles ordered from this country under the American aid programme, and there is a possibility of further orders under this programme. In other markets business remains quiet.

Order books, on the other hand, are still declining, and in general the mills are selling less than their production. Last week about 25,000 workers were on short time in 220 mills, and some finishers are also about to introduce short time. The latest statistics show that the output of all single yarn in April fell to a weekly average of 16,315,000 lb, compared with 18,665,000 lb a year ago, and that the output of cloth in March fell to a weekly average of 54.52 million linear yards, compared with 55.63 million yards in February and with 56.44 million yards a year ago.

There is undoubtedly a substantial volume of business awaiting Lancashire when the marketing policy for American cotton is settled; this question is much more to blame for the present difficulties than competition from cheap imports of grey cloth and purchase tax. Traders are less fearful now of an export subsidy on the American crop, but the belief persists that some action to move the surplus into world markets will be announced before the new crop year begins in July. In the meantime, the most serious effect of the uncertainty is the loss of full and part-time workers, and the reluctance of juveniles to enter the industry, which has long had too high a proportion of elderly workers. Recruitment of juveniles this year has been negligible; the spinning section has lost more juveniles than it has gained. In March alone the spinning, doubling and weaving mills lost 4,300 workers. The number of workers on spinners' books on May 7th was 107,130, compared with 114,550 a year ago, and the number on weavers' books on April 2nd was 138,490, compared with 142,100 a year ago. When business revives it will be difficult to get back the full-time workers, and the shortage of labour may in time lead to a lengthening of delivery dates and consequently to a loss of foreign orders.

Further Expansion for Bowater

The plans for expansion that Sir Eric Bowater now has in train for the Bowater Paper giant will shortly involve a new rights issue for Ordinary stockholders and a reorganisation of the company's capital structure. The 1,500 stockholders who travelled to the annual general meeting at Chester on Wednesday—one of the corporation's new North American stockholders made a special three-day trip from Vancouver—authorised an increase in the corporation's share capital from £12 million (of which £10 million has been issued) to £14 million to prepare the way for this rights issue. Sir Eric made it clear, however, that the greater part of the organisation's capital expenditure in Britain would still be provided out of its own resources. Expansion at the Newfoundland mills will be financed out of present and future resources; but $20 million of the $25 million needed for the third newsprint machine now to be installed at the new Tennessee centre of Bowaters will be subscribed, as before, by a consortium of American insurance companies and bankers. The other $5 million will be contributed in convertible debentures by the Bowater Company of North America, which owns all the equity capital of the Tennessee venture.

This method of financing further expansion in Tennessee—which will bring newsprint capacity there up to 275,000 tons by 1957—will accentuate the high gearing of the group's capital. Of the £65 million it now employs, only £7 million is in the form of ordinary stock, plus another £18 million in reserves.

	Reserves	Share Capital		Loan Capital	Total Capital Employed
		Ord.	Pref.		
	£ mn.	£ mn.	£ mn.	£ mn.	£ mn.
Parent company.	4·4	7·2	2·8	8·4	22·8
Subsidiaries.....	14·0	...	5·8	23·0*	42·8
	18·4	7·2	8·6	31·4	65·6

* Excludes £8·9 million new loan capital for Tennessee.

The further funding issue of ordinary stock that Sir Eric Bowater forecast last July will presumably be associated with an attempt to clear away some of these prior charges. The corporation is pushing ahead in the manufacture of the more profitable mechanical printing and packaging paper, but its total newsprint capacity will reach 1,000,000-1,200,000 tons in the next few years, against 750,000 tons at present.

New Export Duty on Rubber

The new export duty on Malayan rubber, which forms part of the Federal government's plan to encourage replanting in the rubber industry, comes into effect next Wednesday. The new duty will be less burdensome than the old when the price of rubber is below 80 cents a lb (it is now about 93 cents, or 26d. a lb). Above that price the new duty is progressively higher than the old, and when the price is above 100 cents a new "anti-inflationary cess" becomes payable. Up to about 88 cents a lb however, the new duty is still less than the total payments of producers, for the existing variable replanting cess is to be abolished; that cess is returnable to estates against expenditure incurred on replanting, and returnable to smallholders through their common replanting fund.

By imposing a higher rate of duty in the higher ranges of price the government has endorsed the view of the inde-

Material for Publication

pendent mission of enquiry, headed by Sir Francis Mudie, that there is a good case for a duty designed primarily to take away a substantial part of the excess profit made when rubber prices are exceptionally high. But the government has also given some weight to the objections of the Rubber Producers' Council, which argued that the industry depends on such profits to help it over the lean times. The yield from the anti-inflationary cess will therefore be returned to the industry when prices fall, under conditions that have

HOW THE EXPORT DUTY WORKS
(cents per lb : 100 cents = 28d.)

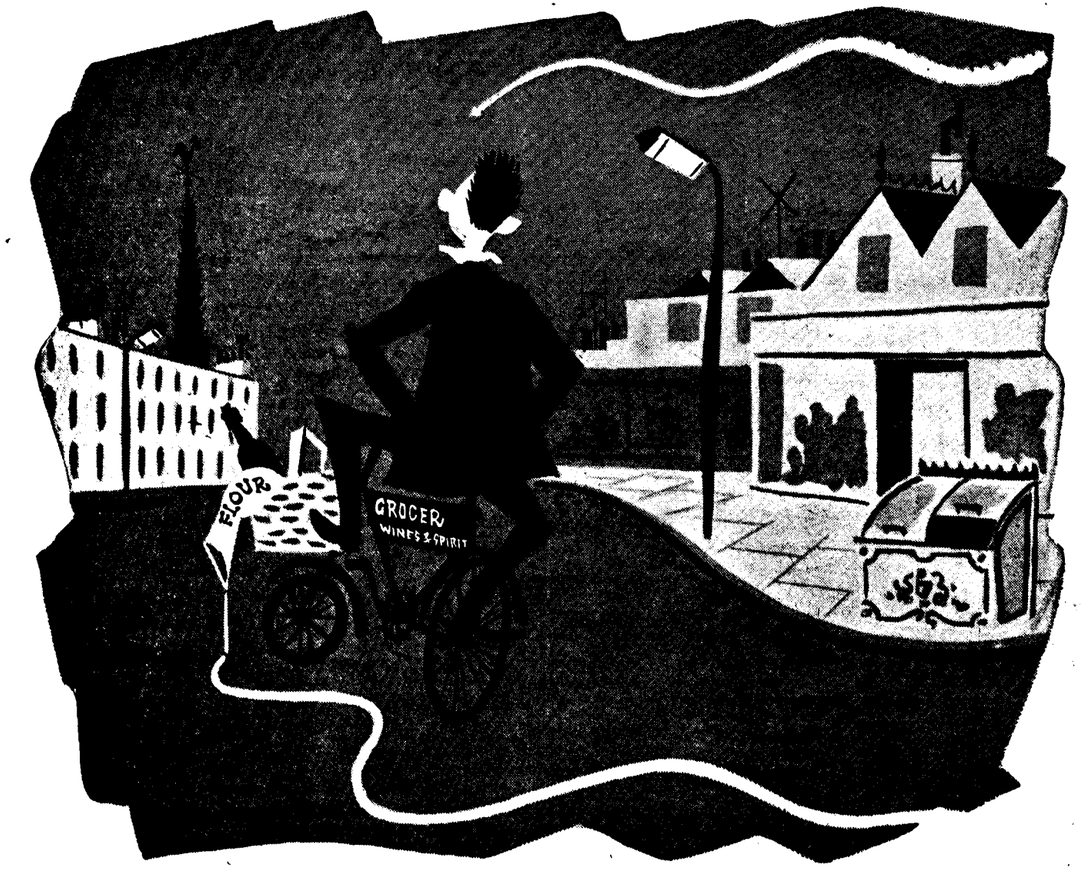
Price	Present Duty and Cess			New Duty and Cess		
	Duty	Cess	Total	Duty	Cess	Total
40	2·00	—	2·00	1·625	—	1·625
50	2·50	—	2·50	2·00	—	2·00
60	3·00	—	3·00	2·375	—	2·375
65	3·75	0·25	4·00	3·375	—	3·375
70	4·50	0·50	5·00	4·250	—	4·250
75	5·375	0·625	6·00	5·250	—	5·250
80	6·125	0·875	7·00	6·125	—	6·125
90	7·625	1·375	9·00	9·250	—	9·250
100	9·25	1·75	11·00	12·375	—	12·375
110	10·75	2·25	13·00	13·50	2·50	16·00
150	17·00	4·00	21·00	22·50	12·50	35·00

still to be settled in consultation. As the cess is levied on output, the industry will doubtless want it to be refunded in proportion to the output of the individual producer. Its usefulness as an anti-inflationary device will depend on the timing of that refunding.

Another of the loose ends in the plan is the method by which extra assistance, estimated at a maximum of $112 million (£13 million), is to be provided to smallholders. While the plan is mainly concerned with replanting, the government recognises that planting in new areas is also important and this neglected question may at last be given the consideration that it deserves. The extra money for smallholders could probably earn a much better return if it was invested in new planting rather than replanting, and if some of it was spent on improving the administrative and technical resources of the existing replanting scheme.

Competitive Cigarettes

THE days when the heavy smoker rushed feverishly from shop to shop looking for a familiar packet of cigarettes and finally, in desperation, bought an unknown and often shoddy brand have long passed. He can now take his free choice from the crammed shelves of his local tobacconist; he can, if he likes, experiment with new brands. Smoking habits are fickle, but new brands do not merely illustrate the oddities of public taste; they point to growing competition.



Imperial Tobacco broods like a benevolent big brother over the industry and, though it has recently lifted all quota restrictions on its supplies to the tobacconists, it might be embarrassed if its share of the market grew suddenly greater. The real tussle is between the smaller companies that are competing fiercely for their share in the rest of the market. Many of the really small firms have been merged into the larger groups. All of them are advertising extensively; all of them are improving the appearance of their packets, by adding, for instance, "cellophane" wrappings; and all of them must dread the thought that one of the number might decide to re-introduce cigarette cards. Gallaher is probably leading the field at the moment—relying on the sale of "Senior Service," a brand familiar to smokers for many years. Godfrey Phillips has introduced the "Red and White" cigarettes; they were first sold in London, but now they are sold all over England and Wales, and sales in Scotland and Northern Ireland will begin next month. So far the results have been reasonably encouraging.

Carreras was the first to launch a new brand, when it introduced the "Dunhill White Spot." The initial response was quite good, but more recently sales have fallen off. This week Carreras passed its interim ordinary dividend; in 1953-54 an interim of 7½ per cent was followed by a final of 10 per cent. The directors say that the volume of business has recently improved, but that they prefer to wait on the full year's results before determining the dividend payment. Any company introducing a new brand has to fight hard and spend heavily, and initial sales are not maintained without further fighting and spending. The Dunhill brand was introduced when some popular brands, including "Players," were still on quota.

Leyland Bids for Scammell

LEYLAND MOTORS is striding ahead of its rivals in the British commercial vehicle industry. Among the world's makers of buses and heavy lorries it probably ranks in size only after General Motors, Ford, and possibly International Harvester, all in the United States. Four years ago it absorbed Albion Motors; last week details were published of its recent offer for the shares of Scammell Lorries, another of the progressive smaller firms in this industry. If this offer is taken up, Leyland's share of heavy commercial vehicle output in this country would be pushed considerably above that of its nearest rival Associated Commercial Vehicles, which was formed in 1948 by the marriage of AEC, Crossley, and Maudsley Motors. Leyland already employs a third of the work force in this section of the vehicle industry.

Co-operation between Scammell, which makes the "Scarab" mechanical horse, articulated lorries and their trailers, heavy tractors, and special types of heavy cross-country and road vehicles, and Leyland, with its wide range of medium and heavy lorries and buses, would bring several advantages to both firms. Scammell makes engines only for its "Scarab" and its overseas organisation is not as strong as Leyland's. Order books for heavy vehicles are now growing much more rapidly than the present capacity of the industry can empty them—it has not yet regained the labour it had to sack three years ago when the market slumped. Leyland is spending heavily on new plant and claims to be making four vehicles now for every three a year ago. Both Leyland and ACV are also heavily engaged in the manufacture of diesel rail cars for British Railways. These are designed and sold by a new joint subsidiary

High over London, a lone jet fighter traces its path across the cloudless sky,
and men and children stop for a moment to look. From his vantage point 40,000 feet above them,
the pilot sees, through his canopy of 'Perspex', the English Channel
and the coastline of France curving away into the distance.

White trail

For many years now, transparent 'Perspex' has been used
to make windows, canopies and blisters for aircraft,
because it is light, easy to mould and unaffected by weather.

This remarkable plastic has found countless uses on the ground, too,
in the twenty-odd years since it was discovered by I.C.I. research workers. The street lamps
and signs that add colour and sparkle to our great cities are made from it.
Corrugated 'Perspex' lets daylight into dark buildings.
Surgeons and dentists use 'Perspex' instruments, and dentures and artificial eyes are made
from a different form of the same versatile material.

Thus, and in a thousand kindred ways, I.C.I.'s research and production are serving the Nation.

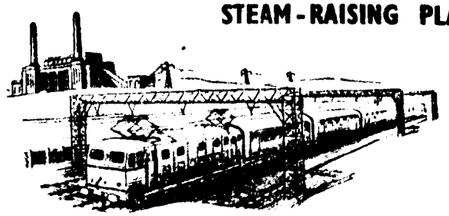
NELLIE WILL BE ELECTRIFIED



SO steam for our railways is on the way out? Don't you believe it! Electric power for the new programme of railway electrification will be generated by means of steam.

Britain's precious coal can be used much more efficiently in a power station than in a steam locomotive; and, thanks to modern steam engineering, the power station produces electricity economically from the cheaper, low-grade coals, whereas the steam locomotive eats up the high-grade coals that we badly need for other purposes.

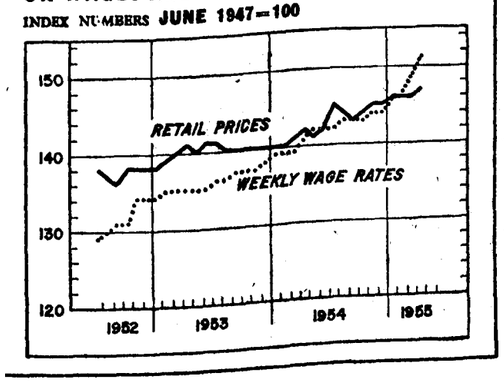
Remember that over 98% of Britain's electricity is steam-generated, using coal-fired boilers — mostly Babcock boilers.

In the 'atomic' future, electricity for railways and for industry will still be generated through the medium of steam, and Babcock & Wilcox are playing a leading part in the development and manufacture of steam-raising plant utilizing atomic energy.

BABCOCK
STEAM-RAISING PLANT

BABCOCK & WILCOX LTD, BABCOCK HOUSE, FARRINGDON ST. LONDON, E.C.4

British United Traction. Leyland may consider that Scammell, which has considerable experience as a user of heavy diesel engines, will be a useful additional outlet for the heavier power units that it is now developing.



The possibilities opened up by the Leyland-Albion merger do not appear to have been taken very far very quickly, however. Their technical research staffs now work to a joint plan; some servicing depots have been amalgamated; and two subsidiaries in South Africa have been made into one. On the production side, the few models made in direct competition with each other have been dropped and the manufacture of certain assemblies has been gradually concentrated. At the level of output that most heavy vehicle builders operate, there is not much room for the lucrative economies that flow from large-scale specialisation in the motor-car industry. But if final assembly must remain batch work, there should be a decided gain in making certain common parts in specialised plants.

Standard adds Frills

THE Standard Motor Company has bowed to popular taste and added winding windows, trimmed door panels, press-button handles and £28 6s. 8d. to its Standard Eight saloon. The original, untrimmed version that was introduced in September, 1953, goes out of production and is replaced by one with rather more finish: the price, with tax, goes up from £481 to £510. Standard attempted to offer the bare mechanical essentials of motoring stripped of all frills, but if the public wants austerity it can buy it from Ford for nearly £100 less; the Popular costs £390 with tax.

Standard had already introduced a de luxe version of the basic Standard Eight costing £538 (which remains in production) and has now accepted the fact that motorists are prepared to spend quite substantial sums for details that add nothing to a car's mechanical efficiency and little to the physical comfort of driving it. Ford first proved this with the Zodiac version of its Zephyr which costs £92 more (after tax) than the basic version of the Zephyr, for which the customer gets two colours on the body and more trim and accessories.

SHORTER NOTES

Two of the programme contractors of the Independent Television Authority signed their contracts this week, Associated-Rediffusion and Granada TV Network. The Associated Broadcasting Company signed its contract, which is identical with those of the two other companies, some weeks ago. The one contract still outstanding is that of the Kemsley-Winnick group, which had been offered the week-end time on both the Northern and Midland transmitters.

★

The Bristol Aeroplane Company's light jet engine, the Orpheus, has completed its first 150-hour type test at a power of 3,285 pounds thrust. The eventual power of the engine will be substantially higher. It is expected to have a wide market among manufacturers of light-weight fighters: the Orpheus is the only suitable engine that is under development, and it will fly in the Folland Gnat in a few weeks' time.

★

The tea trade may be getting over its bout of indigestion. At this week's auctions in London the market generally was firm, and the improvement in quality was reflected in prices. The doubt is whether this firmness will be maintained in the face of larger offerings during the next two months.

★

World smelter production of virgin copper (excluding Communist countries) fell by 11,000 tons to 2,372,000 tons in 1954, according to the British Bureau of Non-Ferrous Metal Statistics. Output in America, the leading producer, fell by 91,000 tons to 845,000 tons; in Canada and the Belgian Congo output increased by 42,000 and 10,000 tons.

★

Output of the motor industry during the first four months of the year reached 409,000 cars and commercial vehicles, 84,000 more than in the same period of 1954. Exports accounted for 144,000 cars and 56,600 commercial vehicles, half the total produced, with the majority going to Australia, New Zealand and South Africa.

★

The Bank of British West Africa, which is partly owned by Lloyds Bank, the National Provincial, the Westminster and the Standard Bank of South Africa, has made an interesting reorganisation of its capital structure. The paid-up portion of the 300,000 £10 shares has been raised from £4 to £5 by paying a bonus from reserves; the court sanction has been received for the cancellation of the remaining £5 reserve liability. The paid-up and subscribed capital is thus unified, and raised from £1,200,000 to £1,500,000; the draft of £300,000 on reserves has been made good by a transfer from contingencies, maintaining total reserves at £1,200,000. The streamlining of the bank's capital (which is now quoted in stock units of £1) has been made in anticipation of the rights issue of £1,000,000 that is expected shortly.

Company Notes

J. & P. COATS. The preliminary profit and dividend statements of the two biggest thread manufacturers in this country, J. & P. Coats and English Sewing Cotton, show how exposed they are to competition, particularly in overseas markets. But their dominance in the British market and the constant demand for their products from industry protect them to some extent against extreme fluctuations in trade and earnings.

The most surprising feature in the J. & P. Coats announcement is the effective increase in the ordinary dividend. Allowing for the 100 per cent free scrip issue the dividend has been raised from the equivalent of 7½ per cent to 8¼ per cent. The conservative policies of the company in the past had led investors to believe that there would be no change in the dividend. After the announcement of the new dividend the £1 ordinary stock units made a net gain of 1s. to 27s. 3d., to offer a yield of 6.4 per cent. The group's trading and manufacturing interests all over the world make its accounts particularly complex; its profits are more subject than most to currency restrictions and to changes in exchange rates. Last year, for instance, the loss on exchange was reduced from £4.2 million to £1.3 million; as those losses are charged before striking the trading surplus that sharp reduction is largely responsible for the jump in the trading surplus of the group from £4,503,241 to £8,638,513. The parent company's own trading surplus has risen from £3,474,351 to £5,407,837. Taxation seems to have been computed conservatively, bulking large in the accounts; British taxation is shown at £2,449,984 (against £1,746,652) and foreign taxation at £2,541,507 (against £2,173,584). Even so the group's net profit has surged forward from £583,005 to £3,647,021. But as is often the case with this company the full implications of the sharp swing in earnings cannot be gauged from the preliminary statement alone.

★

ENGLISH SEWING COTTON. Effectively both the parent company, English Sewing Cotton, and its principal subsidiary, American Thread, are paying higher dividends from smaller earnings. Compared with the results of J. & P. Coats, these earnings are not particularly satisfying. The ordinary dividend of English Sewing Cotton has been effectively raised, allowing for the 100 per cent free scrip issue, from 10 to 12½ per cent. It is in keeping with the greater liberality in dividends promised by the board.

The group's revenue before tax is shown as £1,513,813, compared with £1,412,479. But the latest surplus includes £464,577, compared with only £244,105 in 1953, representing dividends passed back by American Thread to the parent company. And that dividend, too, has been raised for a year in which the company's earnings fell; American Thread's net earnings are shown to have declined from $1,476,345 to $953,571. Competition in the American market must have been severe. Similarly, if the dividends received from American Thread are excluded, the decline in earnings (from £1,168,374 to £1,049,236) also points to strong competition in other markets. It is not surprising that in its policy of modernisation and expansion English Sewing Cotton has taken a leaf from the book of J. & P. Coats in putting more emphasis on local manufacture overseas.

★

STEEL PROFITS. Control over the greater part of the British steel industry is now back in the hands of private investors. But the Iron and Steel Realisation Agency still owns all the industry's fixed interest stocks (except in English Steel and Lancashire Steel) and the equity capital of many medium sized concerns. The Agency has published the separate accounts of the 46 companies that were still its subsidiaries at the end of last March; these accounts relate to the year ended on October 2nd.

	Year ended Oct. 3, 1953 £	Year ended Oct. 2, 1954 £
William Beardmore :—		
Gross profit	681,521	372,798
Net profit	224,327	149,512
Capital and reserves	4,140,006	4,173,979
Brown Bayley Steels :—		
Gross profit	570,052	540,743
Net profit	219,046	275,369
Capital and reserves	2,922,672	3,363,832
Consett Iron :—		
Gross profit	925,485	869,189
Net profit	460,369	554,393
Capital and reserves	10,272,797	11,941,730
John Baker and Bessemer :—		
Gross profit	320,410	442,053
Net profit	94,330	142,596
Capital and reserves	951,562	1,038,989
John Lysaght's Scunthorpe:—		
Gross profit	1,270,110	1,870,876
Net profit	339,452	785,246
Capital and reserves	1,660,061	2,480,757
Park Gate Iron and Steel:—		
Gross profit	870,290	619,918
Net profit	162,522	67,033
Capital and reserves	1,708,737	1,765,770
South Durham Steel :—		
Gross profit	2,245,103	2,588,180
Net profit	1,103,162	1,505,269
Capital and reserves	5,023,975	8,871,164

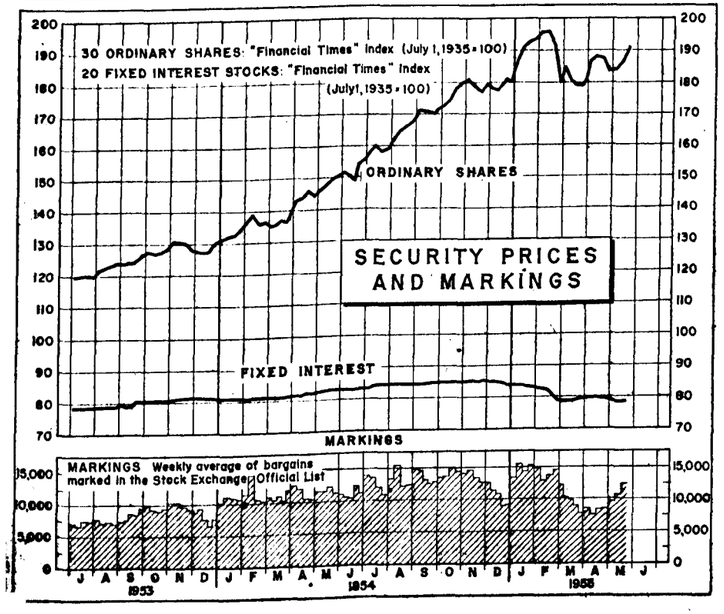
A sample of the trading results of some of the better known of these companies has been made in the accompanying table. The denationalised giants of the industry reported sturdy advances in their earnings in 1953-54, with many of them earning profits from newly installed capacity. Similarly, those smaller concerns which have development programmes under way (such as South Durham and John Lysaght's) have also reported bigger profits. Consett presumably would have been among them, but for the mechanical troubles that it suffered. Of the remaining companies in the table only John Baker and Bessemer has achieved an increase in gross earnings; as a producer of wheels, tyres and axles it presumably was kept busy by the programme to build more railway rolling stock. The other companies—William Beardmore, Brown Bayley, and Park Gate—earned lower profits in 1953-54 than in the previous year. Where these companies have bought in semi-finished steel from other producers margins may have been squeezed by the general increase in steel prices announced a year ago; those increases tilted the balance in favour of the producers of semi-finished steel. Moreover, in the year to September 30th, total net deliveries of finished steel were higher than in 1952-53, but deliveries of light rolled products (other than strip and sheet), forgings and castings were down. The tendency to replace forgings and castings by welded steel products may explain why the drop in the profits of William Beardmore is so marked.

★

BRITISH INSULATED CALLENDER'S CABLES. Last year BICC's trading profit dropped from £8,344,074 to £7,362,580. The directors were content to leave the trading dividend unchanged at 10 per cent. Sales, apparently, were not much lower but margins were finer. Three factors seem to account for the trimming of these margins. First, production was uneven; the year opened quietly but by the end of the year the factories were working a great deal of overtime. Secondly, competition in overseas markets was much fiercer. There was a substantial fall in direct exports of cables last year; BICC sold less abroad than in 1953 though it increased its share of the market. But it had to trim its margins to compete with foreign companies, which Mr W. H. McFadzean claims, "were either determined to buy themselves into certain markets and/or were being heavily subsidised." Thirdly, the price of copper was higher than in 1953.

BICC has started the year satisfactorily. But Mr McFadzean adds that selling prices are likely to remain "very competitive" and that the volume of business, can change fairly rapidly for the company has relatively short order books in some of its products. Naturally he makes a strong plea for stability in copper prices; this year, through its association with Rhodesian Selection Trust, BICC may benefit from the fixed prices introduced by RST. But Mr McFadzean looks well beyond the end of this year, and concludes that there will surely be "in the long run an expanding demand" for the products of the electrical industry. That confidence is reflected in the steady expansion in the size and activities of the group. Additions to fixed assets last year totalled nearly £2.9 million, which did not merely represent replacement. At the end of the year capital commitments were estimated at £1.3 million for the group while the parent company had an outstanding commitment in an investment of nearly £1.4 million. This expansion is not confined to the factories in this country; as last year's investment in Ndola Copper Refineries showed, BICC is putting increasing emphasis on overseas interests.

UNITED MOLASSES. Stable prices last year encouraged the demand for molasses for animal feeding stuffs and distillation and chemical purposes. But United Molasses is a shipping company, as well as the principal supplier of molasses, and its shipping interests fared less well. Largely because of lower freight rates the group's trading profit declined from £4,652,740 to £3,902,392.



The immediate outlook for shipping is not encouraging. The group has had to cut down its orders for new ships. The chairman, Mr G. W. Scott, tells shareholders that there is "a surplus of tanker tonnage over actual requirements," so that at the low tanker freight rates now prevailing "the smaller type of tanker which is absolutely essential to the company's molasses trade cannot profitably trade in oil." In this, Mr Scott reaffirms what the oil company chairmen have recently said. Hence, though the fleet was fully employed last year, there were occasions when the rates obtained by these tankers did not cover normal depreciation. The directors have therefore decided to cancel the orders placed in 1952 for two tankers, each of 13,000 tons deadweight. The group's tanker building programme will be completed by the delivery of two 10,000 tons tankers, one this year and the second in 1956. Mr Scott does not see much chance of higher tanker freight rates in the near future nor does he hope for "any major improvements in conditions" in the next year or two. But he does add that earnings in the current year are expected to be satisfactory, though possibly at a slightly lower level than those in 1954; profits should be sufficient to cover "normal dividend requirements." Last year the dividend was 22.10 per cent, compared with 21.97 per cent in 1953.

Looking further ahead, Mr Scott is a little more optimistic. He believes that elimination of old ships in the fleet and the switch from tankers to dry cargo ships will ultimately make the group's shipping interests more profitable. On the molasses business, he is keenly aware that the group must "in the not distant future expect increasing competition from synthetic alcohol." But Mr Scott is confident that a growth in the demand for cattle feed will quickly offset this anticipated decline in the consumption of molasses by the distillers.

★

ROYAL MAIL. Royal Mail will soon spend at least £10 million on four new ships, none of them designed for the South American run. Three will operate on the Caribbean route and the other in the North Pacific. Some of the ships now on the South American run will soon be due for replacement but the directors have yet to decide on the kind of ships to be built. Their hesitancy is justified. Both meat and passenger shipments to South America are severely curtailed and there must be a fear in the boardroom of Royal Mail, even though the Anglo-Argentine trade agreement offers a glimmer of hope, that Britain has lost some of its trade in the South American markets for good. Those doubts and fears find their expression in the comment of Mr Walter C. Warwick that "temporary withdrawal from these South American markets is likely to result in long term exclusion."

The loss of much of the South American trade explains why in each of the last four years the trading surplus of Royal Mail has fallen. In 1954 it declined from £1,713,104 to £1,639,736. In each of the last four years the ordinary dividend has been left unchanged at 10 per cent. The loss in traffic is not the only headache, for on all Royal Mail's shipping routes operating costs continue to rise.

LONDON STOCK EXCHANGE

Next Account begins: June 8th
Next Contango Day: June 8th
Next Settlement Day: June 14th

THE stock market staged a boomlet in prices in the week before the election. At the beginning of the election account the *Financial Times* ordinary share index stood at 189.1. On the eve of the poll it stood at 195.9 (compared with the year's peak of 197.5). Throughout this period the market was quite active. Gilt-edged stocks were also firm. The "shorts," after selling by the banks had dried up, were a little better, as some investors switched their attention away from Treasury bills to these money market bonds. The relaxing of the pressure in Lombard Street and the rally in sterling contributed to the better tone. But the longer-dated stocks and the undated issues were also firmer. In the foreign market Japanese issues were firm and German stocks went ahead on buying from the Continent.

Most of the industrial equities shared in the advance in prices. But the biggest advances were reported in those stocks being bought on American account. A favourable report from an American broker on ICI touched off the demand for its equity. But British Petroleum, Ford, Bowater, "Emmies" and Unilever also attracted American buyers. Yield comparisons between these stocks and their American counterparts favour the British securities. That buying and Sir Eric Bowater's statement at the annual general meeting carried the Bowater stock up to a new peak. Elsewhere Carreras "B" were marked down by 3d. to 3s. 9d. on the passing of the interim dividend. The strength of British Petroleum and Burmah Oil dominated the oil market, but Ultramar also came into favour.

A better trend at the tea auctions and some increased dividends sent the prices of tea shares up. Rubber shares remained quiet. Business in the Kaffir market, overshadowed by the political events in South Africa, was at a low ebb and no decided trend became apparent. F.S. Geduld moved erratically when profit takers came into the market after the good borehole result was reported.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 21st there was an "above-line" deficit (after allowing for Sinking Funds) of £16,691,000 compared with a deficit of £2,394,000 in the previous week and a deficit of £27,707,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £12,298,000, bringing the total cumulative deficit to £94,413,000 (£71,353,000 in 1954-55).

THE MONEY MARKET

The Treasury bill rate was again virtually unchanged at the tender on Friday last; the average rate of discount came out at £3 18s. 4.64d. The discount houses maintained their bid at £99 0s. 5d. per cent for the offer of £240 million (£10 million larger than that of the previous week); applications fell by a further £6.8 million to £375.6 million.

The credit stringency in Lombard Street shows no signs of abatement. On Thursday before the week-end considerable special buying just enabled the market to balance its books, but on each of the first three days of this week the market was in the Bank. The number of houses and the amounts involved were, however, small in each case. July and August bills have changed hands at 3⅞ per cent during the periods of stringency, but at the week-end there was a fair volume of dealing at 3 31/32 per cent and even at 3 15/16 per cent.

The price of gold has fluctuated in sympathy with the sharp vacillations in sterling in the past week; under the influence also of active demands, the price at the fixing rose from 250s. 9d. an ounce on Thursday before the week-end to 251s. 2½d. on Monday, but thereafter it dropped back to 250s. 11d.

The Bank return shows a pre-Whitsun outflow of notes of £16.6 million. Government securities rose by only £5.3 million, and discounts and advances fell by £4.5 million, so that bankers' deposits are down by £16.7 million to £240.5 million, a new nine year low point.

What Vulcan *say about it...*

WHY A HOT WATER CYLINDER FLEW THROUGH THIS ROOF

It was a hot water expansion cylinder 5 ft. long × 2 ft. diameter of welded ⅜" steel plate.

Dished to saucer shape, but not flanged, the ends were merely corner welded to the cylindrical shell without any plate edge preparation. This welding was very defective and the structure was highly stressed under the required working conditions.

After only a few days' service the cylinder violently exploded, took off like a rocket, and flew disastrously through the roof.

It is essential in the interests of safety that any vessel to be used under pressure should be examined by an experienced person before use.

A Vulcan Standard Boiler Policy specifically provides for prior inspection of new plant by one of Vulcan's engineer-surveyors. Such a report would not have sanctioned this cylinder's use, and the accident would have been prevented.

VULCAN INSPECTS —AND PROTECTS

FREE. For news of industrial accidents and ways to avoid them, ask us for "Vulcan"—a Quarterly Journal for Power users. Please write to Dept. 17.

NOTICES

UNIVERSITY OF RAJSHAHI
EAST PAKISTAN

Applications are invited for the posts of:
PROFESSOR OF LAW
and
PROFESSOR OF ECONOMICS

The Professor of Law will be the Head of the Department of Law. The Professor of Economics will be the Director of the School of Social Studies, consisting of Economics, Political Science, Sociology, Anthropology and Psychology. The University only undertakes teaching at post-graduate level (MA, LLB) and research, and there are no undergraduate classes.

Applicants should have:
(a) a good Honours degree of a British University or a Research degree from an American or Continental University;
(b) teaching experience and experience in guiding research of not less than five years at the post-graduate level;
(c) recognised research work to their credit.

Applicants are asked to submit lists of work and copies of their publications and the names of two Professors of standing to whom reference can be made.

Salaries are at the rate of Rs. 1,500 per month (£1,946 per annum). The cost of transport and passages for appointees and their families will be provided and suitable accommodation will also be made available.

The posts are offered on a contract basis for a period of three years, which will be renewable. (The age of retirement is 60 years.)

Applications with supporting documents should be lodged by June 30 1955, with the Registrar, University of Rajshahi, Rajshahi, East Pakistan, and one complete copy should be sent to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, by the same date.

EASTERN GAS BOARD
ASSISTANT TO THE STATISTICIAN

Applications are invited for the appointment of an Assistant to the Statistician at the Board's offices in Tottenham. Applicants should hold an Honours degree in Economics or Commerce, or be sitting for the Final Examinations in one of these subjects this year.

The work will be mainly concerned with the preparation of statistical reports for the guidance of management, and calls for attention to detail and the ability to write clearly rather than a high level of mathematical statistics.

The successful candidate may be required to pass a medical examination and, unless already subject to a pension scheme by virtue of the Gas (Pension Rights) Regulations, 1950, will be required, if eligible, to join the Board's staff pension scheme within six months from taking up the appointment.

The salary will be in accordance with grade A.P.T.7 (£650-£730) per annum of the National Salary Scales for Gas Staffs, and the initial placing within this grade will be subject to the candidate's qualifications and experience. Promotion beyond this grade would be dependent upon proved ability.

Applications, stating age and qualifications, should be addressed to the Secretary, Eastern Gas Board, 2 The Abbey Garden, Great College Street, Westminster, S.W.1, to reach him not later than Saturday, June 11, 1955.

PRIVATE SECRETARY

wanted by busy Advertising Manager. All the qualifications of a top-grade Secretary PLUS first-rate organising ability and a high degree of initiative essential. This is a progressive post for a career girl eager to accept a large measure of responsibility. Modern offices; five-day week; subsidised meals. Write or 'phone: Personnel Manager, Colgate-Palmolive Limited, 145 Charing Cross Road, W.C.2. (GER. 9080.)

LEADING CHAIN STORES AND WHOLESALE BUYERS THROUGHOUT THE WORLD

know they can trust the quality of shirts, pyjamas, blouses, children's wear and slippers supplied from Hong Kong by the Swedish-owned Elof Hansson concern. Competitive prices, supervised shipments, confidential service by expert European staff. Reference: Royal Swedish Consulate, 605 Fu House, Hong Kong.—Please airmail detailed enquiries with bank references to Elof Hansson Limited, Suite 314, Alexandra House, Hong Kong.

RAPIDLY expanding Public Company, S.W. Greater London, requires immediately General Manager to control a group of adjacent private companies, total employees 1,500, engaged in light engineering, instrument making and automatic control apparatus. This appointment may, later, carry a seat on the parent board. Applicants between 40 and 50, with an engineering and business background, who have held or are holding posts of £3,000 to £4,000 p.a. salary level, are invited to apply. Experience in heavy engineering, foundry or textiles is here of no value.

Details of age, education, qualifications and experience, with present and past emoluments, should be forwarded in confidence. The position offers exceptional opportunity to the right type of senior executive.—Box 964.

NATIONAL COAL BOARD are about to establish a residential Staff College for the Industry and invite applications for posts as Instructors, who will be required to take up duty by October 1st. The work will be largely concerned with the supervision of study-syndicates, project work, and case studies. Opportunities may be given for research into management problems in the coal industry. Experience in education, personnel relations, or industrial management and its problems is desirable. The salary for one of these posts will be within the range of £1,620 to £2,170 and the others, £1,270 to £1,620. The appointments are pensionable.—Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates), to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/987. Original testimonials should NOT be forwarded. Closing date June 13, 1955.

LEADING firm of Stockbrokers require Statistician capable of taking charge of Gilt-Edged Department. Previous experience of Gilt-Edged Statistical work essential.—Write, giving full details, to Box "V.Y." c/o J. W. Vickers & Company, Limited, 7-8 Great Winchester Street, E.C.2.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(UNIVERSITY OF LONDON)

Applications are invited for appointment in October, 1955, to Assistant Lectureships in Economics. Salary scale £600 x £50—£700 per annum, with superannuation benefits and family allowances. In assessing the starting salary due consideration will be given to age and experience. Candidates are invited to give in their applications an indication of any special interests in the field of economics.

Applications, with the names of three referees, should be received not later than June 20, 1955, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, London, W.C.2, from whom further particulars may be obtained.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(UNIVERSITY OF LONDON)

Applications are invited for appointment in October, 1955, to a Lectureship in Economics. Salary scale £700 x £50—£1,000; £1,050 x £50—£1,400 per annum, with superannuation benefits and family allowances. In assessing the starting salary due consideration will be given to age and experience. Candidates are invited to give in their applications an indication of any special interests in the field of economics.

Applications, with the names of three referees, should be received not later than June 20, 1955, by the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, London, W.C.2, from whom further particulars may be obtained.

ACCOUNTANTS
SIMON-CARVES LIMITED

have two vacancies for young Qualified Accountants. One will be engaged in handling the general commercial accounting of a busy department which builds large chemical plants both at home and overseas: for this post an interest in costing is desirable. The other will be primarily engaged in centralised financial work. Salary will depend on experience; for a recently qualified man it will be no less than £650. The posts are pensionable and both offer excellent scope. Please send brief relevant details (quoting Ref. DF 13) to Staff and Training Division, Simon-Carves Limited, Cheadle Heath, Stockport.

THE Aircraft Division of The Bristol Aeroplane Company Limited is seeking to engage within its Sales organisation gentlemen with personality between the ages of 23 and 40 years, of above average intelligence and of good appearance, who are able to express themselves concisely and clearly.

Applicants should have engineering experience, with preferably a University degree or equivalent professional qualifications. The applicant must have experience of aviation matters gained in the Services, civil aviation or in the aircraft industry.

Good salaries and working conditions, together with the pension, life assurance and welfare schemes, make employment with this Company really worthwhile.

Applications should be made in writing to the Personnel Manager, The Bristol Aeroplane Company Limited, Aircraft Division, Filton House, Bristol.

PROSPEROUS Private Company, with increasing orders, eight miles from Richmond, Surrey, 400 employees, engaged in light engineering and small component manufacture, requires a Chief Engineer. Salary £1,200 to £1,500 p.a., according to experience.

Applicants between 35 and 40 should possess first-class knowledge of non-ferrous metal machining, autos, capstans, presses, progression tools and design experience of tools for quantity component production. Experience must include at least five years in a similar capacity.

Fine future for a man with the right background.—Box 966.

A GENERAL MANAGER is required for one of the manufacturing divisions of HAMWORTHY ENGINEERING LIMITED, POOLE, DORSET. This is a responsible post for which the commencing salary will not be less than £2,000/annum, in addition to which a bonus will be paid.

The ideal person would:
(a) Possess an engineering degree or comparable professional qualification.
(b) Have had experience of either pumps, compressors or oil-burning equipment.
(c) Be now in a position of similar responsibility.
(d) Be aged between 30 and 40.

The successful candidate will be provided with a car and, if necessary, given assistance with housing. A pension scheme is in operation.

Please send written applications, marked "Private and Confidential," to the Managing Director. Each application will be treated in confidence and a reply sent.

BRITISH FILM INSTITUTE invites applications for Head of its Information Department. Qualities required are skill and experience in information or library work, a knowledge of films, good business sense and administrative ability. Professional qualifications and some knowledge of foreign languages are desirable, but not essential. The starting salary, according to the ability of the successful applicant, will be between £650 and £750 p.a.—Applications should be addressed to the Secretary of the Institute at 164 Shaftesbury Avenue, W.C.2.

NATIONAL COAL BOARD invite applications for the post of Bursar at a residential Staff College. The duties will include the keeping of accounts, responsibility for the premises and stores, and control of domestic staff. Salary £770 x £35 to £1,020. The appointment is pensionable.—Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates) to the National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/988. Original testimonials should NOT be forwarded. Closing date June 13, 1955.

COPIES of back numbers of *The Economist* for sale. July, 1920, to March, 1939, in bound volumes. Offers should be made in writing to the Librarian, Church Commissioners, 1 Millbank, London, S.W.1.

COMPANY MEETINGS

UNILEVER LIMITED

TRANSPORT AND STORAGE PROBLEMS

CONSTANT DRIVE FOR EFFICIENCY AND ECONOMY

IMPORTANCE OF FOSTERING GOOD HUMAN RELATIONS

SIR GEOFFREY HEYWORTH'S ADDRESS

The Annual General Meeting of the Members of Unilever Limited was held on May 26th at The Hall of the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided. Addressing the Meeting the Chairman said:

I shall make no apology for discussing today—Election Day—a subject which has become a bone of contention between our two main political parties. I refer to transport. It plays an important part in the success of our business and has become a topic of national interest in many countries.

Transport is involved in every facet of our operations. It includes the movement of raw materials from all parts of the world to our factories located in some 40 different countries, spread over all continents. The distances involved are enormous. For Western Europe, for example, copra has to be transported 9,000 miles from the Philippines, palm oil 8,500 miles from Indonesia, groundnuts 5,000 miles from the interior of West Africa, woodpulp (which we need for packaging) 1,000 miles from Norway—to mention only a very few of our main raw materials. Transport also includes the distribution of finished products from our factories over long and short distances right to the most isolated village shop, as well as the daily and weekly rounds of our salesmen in their vans and motor cars, and the journeyings throughout the world of our technicians and managers.

Our investment in transport, handling equipment and warehouses amounts to £18 million, or nearly 15 per cent of our total investment in manufacturing and distribution facilities. Our annual expenditure on transport is equivalent to nearly one-half of the total wage and salary bill of our 250,000 employees. Transport also affects the amount of working capital we need. The slower the movement of raw materials, intermediate products and finished products, the larger the stocks that have to be maintained and financed. A day's delay in our world-wide operations would tie up another £5 million working capital. All this shows why we take such an active interest in transport, and why efficiency of transport is as important to us as efficiency of manufacture.

A MAJOR ELEMENT OF COST

Four years ago when I discussed "Distribution," I tried to show that it is an integral part of the productive process and that its cost is a significant factor in determining the retail prices of products. Transport is a major part of the distribution process, and indeed a major element of cost. A striking illustration of this is the fact that while the labour cost of producing a ton of washing powder is 13 man-hours, the cost of delivering it 200 miles from factory to retailer may be the equivalent of 19 man-hours. It is this aspect of transport which I shall discuss today, namely, the movement of finished products from the factory to the customer, including warehousing and handling.

I have no intention of going into the theoretical, still less into the political issues of transport. I shall discuss it simply from our point of view as producers of consumer goods. Our experience in transport has of course varied greatly from country to country, and even from commodity to commodity in a single country. We have learnt many lessons in the past, often the hard way, and no doubt we shall learn many more in the future. Our products range from non-perishable goods such as soap, toilet preparations and canned foods, to perishable foods such as margarine, meat pies and sausages, and to highly perishable foods such as fish, frozen foods and ice-cream, which obviously require specialised transport services. But for purposes of illustration I shall concentrate on two: soap and margarine. Also, I shall draw on our experience from the more highly developed countries of the world and ignore those picturesque methods of transport which we have to employ in certain countries, such as reindeer in Lapland and donkeys in North Africa.

As we are engaged in large-scale production and in nation-wide selling, our problem in a country is to move our goods from a few centralised production units to the many thousands of wholesale and retail outlets. To produce economically we must maintain, as far as possible, an even flow of production. Demand for our products, however, varies from week to week. We must, therefore, have a buffer somewhere between the end of the production line and the consumer—a distribution warehouse, or depot, to equate an even production flow with a fluctuating consumer demand. For soap, for example, we have to hold nearly a month's stock. This buffer can be located either at the factory or in the area where the products are finally consumed. With few exceptions, warehousing at factory is only economic where the distances to the final consumer are relatively short.

NATIONAL SYSTEM FOR DEPOTS

Our usual pattern is to operate through a national system of depots located in the main consuming areas. Thus the first movement of the product can be made in full loads straight from the packing line to the area of consumption, where it comes to rest for the first time. This method involves the minimum of handling and the most economic use of transport. It also enables us to give a speedy delivery service in those areas where we have no production unit. Further, by this means we can combine deliveries of goods originating in different factories to the same customer and so continue bulk delivery as far as possible down the chain of distribution. In deciding our pattern of distribution, the size of the country, the density of population and the volume of sales are important factors.

The nature of our products allows us to use any form of transport—rail, road, water and, in exceptional circumstances, air. Our main concern is to see that our products reach the retail shop in the proper condition, at the right time and at a price that the housewife is willing to pay. The extent to which the various forms of transport can meet these requirements differs from product to product, from country to country and from time to time. Our choice of transport therefore depends on service (which includes protection of quality, speed, reliability and regularity) and cost. It is also influenced by the handling facilities that exist at either end. At those factories and depots which were built when railways were the main form of transport, we still rely on rail to a large extent. But our policy is to adapt them so that we can secure complete freedom of choice. In the main, having decided the degree of service we require for any particular product, we then select the form of transport which provides it at the lowest cost. Last year, in a representative group of more highly developed countries in which we operate, 21 per cent of our margarine moved from factory to depot by rail, 77 per cent by road and 2 per cent by water. These proportions differed for soap where 48 per cent went by rail, 37 per cent by road and 15 per cent by water. But such global figures tend to mask the different patterns which exist in different countries.

To illustrate this point, I shall take soap first. As the quality of soap does not deteriorate during transit, speed is not so important as it is for a perishable product such as margarine. In the United Kingdom 52 per cent of our soap was moved from factory to depot by rail last year, 37 per cent by road and 11 per cent by water. In the Netherlands, virtually none went by rail, 30 per cent by road and 70 per cent by water, whereas in Western Germany none went by rail, 80 per cent by road and 20 per cent by water. The reasons for these differences are instructive.

In the United Kingdom we have our own depots which handle not only soap, but also margarine, a wide range of other food products and toilet preparations. Those depots which are situated on the coast are served by all three forms of transport; those inland are served by road and rail. On certain routes there is at present relatively little difference between the rates and service offered by road and rail, and for these we use both forms of transport. On others the difference is more marked, and we generally choose the one which provides the better service at the lower cost. It will be interesting to see whether the new railway charges scheme is effective in encouraging a greater use of rail transport. But we must remember that the frequent threat of strike on the part of any particular form of transport can only make industry hesitate to commit itself too much to that form.

THE CONTINENT

On the Continent the selection of the method of transport for soap depends largely on the availability of depots. In the Netherlands, the geography of the country and the volume of sales of soap do not justify the establishment of our own depots. As the inland waterway companies provide a system of depots which we can utilise, we use mainly water transport. In France the railways provide this facility, and in both countries the

provision of these facilities is accompanied by attractive freight rates. In Western Germany depots are provided by the road and inland waterway companies. While water freights are the cheapest in Germany, the road rates are tied by law to rail rates so that service in this instance is the deciding factor.

For margarine, the picture is entirely different. Our main concern is to get it into the home in a fresh condition and without any loss of quality. This means speedy movement with frequent and relatively small consignments. In other words, margarine is a product basically suited to road transport. Yet in the United Kingdom about half of the movement from factory to depot is by rail, whereas in France and Western Germany, all of this movement is by road. The explanation of this is that in the United Kingdom, for margarine as for soap, there is little basic difference between the service and rates which rail and road offer, so the choice again depends on existing conditions. In France and Western Germany, on the other hand, climate plays an important role Summer temperatures are so high that for margarine we have to insist on speedy service and insulated vehicles. Road transport is quicker than rail, and ordinary box lorries can be temporarily insulated at a low cost. On rail we would have to use specially built insulated wagons which are costly and not always available. Also, the relatively small consignments of margarine from factory to depot cannot take advantage of the railways' best load rates, whereas lorries can start with a full load and speedily serve a number of depots en route. I deal later with the situation in the Netherlands.

ROAD TRANSPORT

Distribution from the depot to the customer is primarily by road transport, as for all products this final link in the chain of distribution is concerned with small quantities and frequent deliveries. But even here we have a choice—a choice between vehicles owned by us, vehicles exclusively hired by us, and vehicles operated by independent hauliers. In the United Kingdom, where approximately a million tons a year pass through our depots, we find it profitable to use both our own transport and contract transport, at present in the proportion of 80 per cent to 20 per cent. In this way we can ensure that the products, delivered as composite loads, arrive at their destination in a proper condition. In Belgium, where we have recently established composite depots, all our deliveries are made by local hauliers under an annual contract. In the Netherlands we use public road transport for delivering soap from depot to customer, mainly because there is an abundance of scheduled road services for short distances. In both France and Western Germany we employ a large number of driver salesmen for margarine who sell and deliver it at the same time. Soap, on the other hand, is delivered in both these countries by local hauliers.

As I mentioned earlier, the depot system forms the general pattern of distribution for our products, but there are some exceptions where delivery to the customer is made direct from the factory. One such case is in the Netherlands, where 75 per cent of all margarine is delivered direct from factory to customer, and the bulk of it by the railways. The distances involved are not very long, and the Netherlands has a very high density of population. The Dutch railways, which have been modernised since the war, have concentrated on providing a combined rail-road service covering the smallest hamlet, and they enter freely into contracts with large customers on special terms which differ from the published rates. The Netherlands railways have never enjoyed a monopolistic position; they have always had to compete with water and more recently with road, too. This has largely dictated their commercial policy. We have a single contract with them covering the nationwide movement of our margarine, and the arrangement whereby they accept our invoice as consignment note simplifies our own administration. Further, the speedy service of the railways ensures that margarine sent in parcel by rail at night will be delivered in a fresh condition at customer's premises the next morning or at the latest in the afternoon.

UTILISING MOST ECONOMICAL SERVICES

If we are to use the available means of transport intelligently, we must be prepared to adapt our methods to circumstances which may vary from place to place and from time to time. In Australia in recent years we have changed from coastwise shipping to rail in transporting a substantial part of our soap tonnage to depots, because coastwise shipping has become relatively dearer and the delays in ports have meant longer and uncertain transit times. In South Africa, on the other hand, we are engaged in a change-over from rail to coastwise shipping because since last September coastwise traffic has become relatively cheaper, while the congestion and delays on the railways were becoming so frequent as to interrupt the flow of goods. In the same way we switch from our own transport to public transport and *vice versa*, according to which can give us the necessary service most economically. In the Netherlands, for example, during the past twenty years we have changed from public transport to our own transport for delivering margarine to customers, and now we have returned to public transport.

But flexibility in the use of different forms of transport is not the only way of reducing cost while maintaining a high standard of service to our customers. Another way is to use efficient methods of handling, movement and storage. Handling methods have been revolutionised by the fork-lift truck and the pallet which came to us from the other side of the Atlantic after the war. This method has the advantage of moving and storing goods in unit-loads of a predetermined number of standard packages to each pallet, the number varying according to the product. It enables them to be stacked much higher without damage, and to be moved more easily both vertically and horizontally. It simplifies the administrative work in storekeeping and it greatly speeds up the turn-round of transport vehicles, both rail and road. Unfortunately many warehouses (public and privately owned) are old-fashioned and cannot be adapted to use this method effectively. But industry has been rather more progressive in this field than either the transport authorities or the public warehousing companies.

INTRODUCTION OF PALLETISATION

In the United Kingdom, after the war, when we re-examined our distribution methods in Unilever, we decided to exploit this new system of handling wherever possible, and to replace those main depots which could not be adapted to use it. The new depots have been sited at nodal points in the consuming areas where they can be served by both road and rail and in some cases by water as well. They are constructed without pillars so as to give a clear floor space and to allow a stacking height of sixteen feet. This simplified form of construction and the fact that pallets use more air space and less floor space (involving a 30 per cent saving of ground area) has meant a consequential saving of some 40 per cent in the cost of warehouse construction. At the same time the introduction of palletisation has reduced warehouse labour costs by 60 per cent. In one of our new depots it now takes only 0.44 man-hours for each ton moved, whereas under the old system it took 1.22 man-hours. Six of these new depots have already been built; a further nine are in the process of construction and sites for seven more are being sought. Their individual cost varies from £85,000 to £300,000, but the amounts invested show a good return. In one depot, which cost £200,000 to build, we have reduced our handling and storage costs by £21,000 a year—indicating an equivalent yield of over 10 per cent on the investment. These economies are typical of our experience. In our Swiss factories, for example, palletisation has saved between 50 per cent and 65 per cent of the man-hours in handling and some 25 per cent of the storage space, yielding an adequate return on the investment.

NEED FOR INCREASED SKILL

The new handling methods not only reduce the physical labour in warehouse work but also require increased skill on the part of the employees. In the older depots the main quality required of the warehouseman was physical strength. He needed little training or experience, so that his basic wage came within the labouring category. Now that all the fatiguing work of lifting and moving has been greatly reduced, we need more and more warehousemen who are intelligent and have initiative; they must acquire a skill and be capable of looking after costly equipment. The emphasis is now on the quality of labour.

The overall saving in handling costs is obviously greater where it is possible to load straight from the packing line on to pallets and then to transport them on the same pallets to depot and finally to wholesaler and retailer. In the United Kingdom the railways have already done much to take palletised loads and they now return pallets free of charge, as do certain continental railways. Although we appreciate this service provided by the railways, the sending of large numbers of empty pallets across the country clearly offers scope for further economies. In this connection we have been interested in the successful experiment launched by the Swiss Federal Railways in 1950. With the co-operation of industrial and commercial undertakings, they instituted a Pallet Pool for standard-sized pallets and recently the road hauliers have joined it. Under this system, when traders dispatch loaded pallets they receive at the same time the same number of empty ones; thus any unnecessary movement of empty pallets is eliminated.

The new methods of handling are equally effective in other sectors of our business. In one factory where output has been increasing, we have been able to halve the number of man-hours involved in handling, increase wages (because of the revaluation of jobs), and reduce handling costs from 7s. 8d. a ton to 3s. 6d. The annual saving amounts to £20,000 compared with a capital outlay on fork-lift trucks and pallets of £24,000. A different example of the value of these mechanical methods is shown at another of our factories where a large increase in production has been achieved on a very restricted site. By extending the facilities for handling without extending the site, we have been able to expand output from 149,000 tons a year to 490,000 tons. It involved a major operation of co-ordinating all three forms of transport—rail, road and water.

Another development of mechanised handling is the new $5 million warehouse which we opened last year at our Hammond factory in the United States. The products coming from the packing lines are electronically sorted by brands, automatically stacked on to pallets and delivered either to the storage area or to the shipment bay without being touched by hand. This operation was designed to economise in labour, to speed up delivery and to reduce damage to packages and products.

Palletisation and automatic warehousing are not the answers to all handling problems. There are, of course, other types of mechanised aids. But in any case such methods are only profitable if the volume of goods handled is sufficiently large and if the saving in labour costs offsets the capital outlay for the equipment. And these conditions vary from country to country. For example, in the United States a fork-lift truck pays for itself if it saves only 600 man-hours a year, whereas in the Netherlands the annual saving would have to be 3,400 man-hours.

In all this, I cannot stress too much the importance of fostering good human relations. The developments, which I have mentioned, require the full co-operation of employees at all levels. It is still only teamwork that makes these mechanical methods economically effective.

So far I have ignored the question of transport costs and location of factories, because it is of secondary consideration as far as finished products are concerned. We find that provided adequate transport facilities exist, the economies we can reap from large-scale production tend to be greater than any saving we may achieve on this aspect of transport. Thus, we tend to concentrate production in single units. In Canada, which has an area of nearly 4 million square miles but a population density of only four to the square mile, we have concentrated our four regional factories into one national factory, and now, for instance, we send edible fats 2,700 miles from Toronto to Vancouver. Much of this, incidentally, goes by road vehicles for speedier transit and they use the better United States highways for part of the journey.

RAIL, ROAD AND WATER COMPARISONS

Another problem confronting industry is that the relationships between rates for rail, road and water are constantly subject to change. Thus a manufacturer is compelled to equip himself to be able to use any one, or any combination of the forms of transport as these changing circumstances dictate. In almost every country of the world, inland transport has become a political issue for fiscal or other reasons. It is only in the exceptional case that transport rates are entirely governed by economic factors relating to transport. It is a healthy sign to see France and now the United Kingdom introducing railway charges schemes which are to some extent based on costs of operation. But on the whole, transport is too much at the whim of domestic politics. We have recently witnessed an example of this in Germany, where railways are state-owned and road hauliers forbidden by law to give special concessions even on regular loads which can be transported at low cost. Because of this, German industry has been encouraged to invest in large and often specialised fleets of long-distance vehicles—indeed Germany is the only country where we operate such a fleet to serve our depots. But the German Government has now imposed a severe tax on such transport, and thus the position for German industry has been radically changed. The consequent waste of capital could have been avoided if the Government had not substituted rigid regulations for economic pricing.

Here, surely, is scope for close consultation at all levels between industry, commerce, the transport authorities and the appropriate Government departments. They can discuss how to make the most effective use of existing investments in transportation. A small example of such fruitful co-operation occurred recently in connection with our own business in France. Under a mutually satisfactory arrangement, whereby we made use of the railway depot system, the French railways in turn were able to move a given tonnage of soap with 36 wagons a day, whereas under the old method of distribution this would have required 69 wagons a day. Close consultation can also help in the formulation of future plans and long-term developments. The British Government has recently sanctioned a £1,200 million investment plan for railways which will cover 15 years, and some £150 million for roads over the next four years. Other plans are in the making on the Continent and elsewhere. Since industry will be the chief user of both these means of transport and must bear the reflected cost of such investments, it should surely be consulted as to how the money can best be used in the national interest.

I have tried to show you how in Unilever we handle this transport problem in different countries. We have found that we must not be tied to any one form or method of transport either in thought or in fact. We must be flexible and ready to put new ideas into practice. The intelligent use of transport depends in the end on men. The transport officer no less than the factory manager must be trained to be supple in ideas and in operation. He must have imagination, brains and a comprehensive knowledge of his subject. He must be able to seize opportunities as they arise—and indeed anticipate them—and he must be able to adapt himself quickly and effectively to changing conditions. Transport men of this calibre can help not only industry but also the transport undertakings themselves. We have also found it advantageous to appoint transport advisers in London and Rotterdam, whose task is to study transport problems, to co-ordinate policy and to stimulate the consideration and application of new ideas relating to transport, in its widest sense, throughout our organisation.

It is strange that the world of transport, which should be one of mobility, is to a certain extent characterised by a rigidity of outlook and policy. In the main the origin of this rigidity is the unwillingness of the older forms of transport to accept the consequences of technological change and to meet the changing demands of industry. This tendency applies to management, labour and governments. It does not exist everywhere, and I have already given several examples of laudable awareness on the part of transport authorities. But it is, I fear, still strongly embedded in many countries. It appears not infrequently nowadays under the guise of national or international co-ordination. Insofar as this means a more efficient use of all forms of transport, we welcome it. But where it is used as a means of resisting progress by the imposition of undue restrictions, it can only be condemned. Too often, even the trade unions have resisted labour-saving methods or have applied practices that vitiate their effects, while some authorities still maintain a bureaucratic approach to the economic problems of transport. Managements are often reluctant to admit that the economic life of rolling stock, equipment or track may have come to an end long before they have become technically obsolete. The whole idea of economic obsolescence is unwelcome to them. The airway companies have already learnt the lesson of writing off aircraft costing millions of pounds after only a few years of use. It is true that the railways have suffered from fiscal restraint and legal obligations, and in certain periods of their history they have been subjected to unfair competition. But now that governments are committed to full employment in an era of expanding production, the opportunity surely exists for labour, management and officialdom to do away with all the remnants of the old defensive attitude and to adjust themselves with open minds to the requirements not only of today but of tomorrow as well. Transport undertakings who do this will, I believe, be able to give a better service to their customers, offer more attractive jobs to their staffs, reduce their operating costs, and still show an adequate return on capital invested. The general lesson we have learnt from our own experience is that in transport as in industry a dynamic outlook is vital.

The Chairman concluded by moving the adoption of the Report and Accounts for the year 1954.

Sir Herbert Davis, Vice-Chairman, seconded the resolution and it was carried unanimously.

The proposed final dividend of 9¾ per cent on the Ordinary Stock and a dividend of 6 per cent on the Deferred Stock payable on June 9, 1955, were approved, the retiring Directors were re-appointed and the remuneration of the Auditors, Messrs Cooper Brothers & Co. and Messrs Price Waterhouse & Co., who had been re-appointed under the provisions of the Companies Act, 1948, was fixed.

The proceedings terminated with a vote of thanks to the Chairman, Directors, and all employees.

UNILEVER N.V.

The Annual General Meeting of the Members of Unilever N.V. was held on May 26th at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the Annual Meeting of Unilever Limited, reported above.

The Report and Accounts for the year 1954 were adopted. The proposed final dividend of 8¾ per cent (being the equivalent of the final dividend for the same year to be paid by Unilever Limited to its Ordinary Stockholders calculated in accordance with the provisions of the Equalisation Agreement) was approved, the retiring Directors were re-appointed and the Auditors, Messrs Price Waterhouse & Co. and Messrs Cooper Brothers & Co., were re-appointed.

YORKSHIRE INSURANCE COMPANY

RECORD PREMIUM INCOME

The annual general meeting of the Yorkshire Insurance Company Limited was held on May 24th at York. Lord Middleton, MC, the chairman, in the course of his speech, said: I may summarise the year's results by saying that in the Life, Fire and Accident Accounts, premium income has reached a record level, our overall income having risen by over £2 million, an increase of no less than 10 per cent, and our General Reserves and departmental funds have increased by nearly £5 million.

The Life Department has had an excellent year, 8,457 new policies having been issued for Sums Assured totalling over £20 million, a new landmark for the Company.

Fire Account: The Fire premium income for the year—£4,261,000—shows an increase over the preceding year of approximately £92,000 and we are able to transfer £383,488 to the Profit and Loss Account.

Accident and General Account: The aggregate premium income of which rose during the year by over £539,000 to £7,932,000 and we have been able to carry £263,424 to Profit and Loss Account.

Marine Account: Our Marine premiums totalling over £1,848,000 show a small reduction on the previous year. We have transferred £150,000 to Profit and Loss Account and have left in the Fund over £3,266,000, representing 176 per cent of the current year's income. The Directors recommend the dividend be increased to 19s. 6d. per £1 of paid-up capital.

The report and accounts were adopted.

THE WHITEHEAD IRON AND STEEL COMPANY

A SATISFACTORY TRADING YEAR

PLANTS FULLY OCCUPIED—BRISK DEMAND UNABATED

REVIEW OF COMPANY'S HALF-CENTURY OF PROGRESS

MR G. H. LATHAM ON RETURN TO PRIVATE OWNERSHIP

The forty-eighth annual general meeting of The Whitehead Iron and Steel Company, Limited, was held on May 23rd at the Westgate Hotel, Newport, Mon.

Mr G. H. Latham, LLD, JP (chairman and managing director), who presided, said: When the company was absorbed into the nationalised iron and steel industry in 1951 we had approximately 1,800 shareholders. The company was returned to private ownership in February of this year. As you know, the issue of the ordinary shares was an overwhelming success and because of the enormous amount of work involved there has been insufficient time to analyse fully the new share register, but it is interesting to reveal that we now have no less than 5,800 shareholders. This can be taken as a fair measure of the present day interest in our activities.

REVIEW OF COMPANY'S HISTORY

I recollect on a previous occasion, many years ago, I gave a brief history of the company to the shareholders on our register at that time, but I think it might be appropriate to repeat some of this information for the benefit of our new shareholders.

The original private company was formed in 1903 by the late chairman, Mr L. D. Whitehead, who purchased at scrap value an old discarded mill at Tredegar.

The mill was rebuilt and made serviceable and the first products were iron bars, rolled from discarded wagon axles. As some indication of the size of the company it is interesting to note that when I joined Mr L. D. Whitehead in 1905 the total number of employees was only about a dozen.

In 1906 Mr L. D. Whitehead went to America and bought a semi-continuous rolling mill, which was a duplicate of one of the very few continuous rolling mills then operating in the USA. We found the greatest difficulty in raising money to finance the project because at that time those engaged in the industry were opposed to the new method of continuous rolling, which was frequently described as "impossible." However, the mill was started up in 1907, but our teething troubles were so great that by 1909 we had completely depleted our meagre financial resources.

TEETHING TROUBLES OVERCOME

It must be remembered, at that time, no one in the country knew anything at all of the process of continuous rolling. The company was forced to import a few skilled technicians from America to help start the plant; but the cost was more than the company was able to meet. It is the sort of thing that has happened many times before to pioneers and will doubtless happen many times in the future. The situation was saved by taking boys from school and training them from the beginning to do the various jobs in the plant. Theoretically, there was an alternative: to train existing operatives in the new methods. But in practice, men who had been performing jobs for a lifetime in the same way, were too wedded to old-fashioned methods to accept revolutionary changes. This devotion to the familiar is a human failing and one to be reckoned with in the larger sphere of general industrial re-equipment. It was only by dogged perseverance and hard work that we succeeded after three years in getting the plant going.

LONG EDUCATIONAL PROCESS

The next significant date in the development of the undertaking was 1922, when the continuous strip mill at Newport was brought into operation. The site was acquired in 1913, but construction could not be commenced until the end of 1918, after the first world war. Benefiting from previous experience we took only three months to get this mill running satisfactorily, but unfortunately, the company encountered another difficulty.

This time it was the consumers who proved conservative They had been used to taking our finished material in straight lengths as produced in all contemporary mills; whereas the production of our new mill was wholly in coils of one long continuous length. The company was in fact forced to start an intensive campaign with the object of popularising the new product and it even had to show customers how better production could be obtained on automatic machines by feeding them from a coil of one long continuous length of steel strip, instead of in straight lengths of from 10 to 20 feet.

The educational process was a long one and, meantime, the mill could not be run full time. This forced us to attempt, with some success, to turn these grave difficulties into positive advantage by constructing the finishing end of an auxiliary mill, in which the hot metal from the first half of the strip mill was turned into small round, square and flat bars, thus giving the company entry into a new market. Again with the object of helping to utilise coiled strip, it was decided in 1925 to put in the first 16 Robertson cold rolling mills.

SUCCESS OF COMPANY'S PIONEER WORK

It was pleasing to record that your company introduced continuous rolling into this country and also that the many continuous plants now erected all over the world have benefited from our pioneer work which was carried out in close collaboration with the Morgan Construction Company of America who designed the plant and with whom we have maintained the closest co-operation, on a basis which proved to be of mutual advantage when we constructed subsequent continuous bar and strip mills in our present works at Newport. From this very modest beginning your works has been developed into a very efficient plant which compares favourably with any similar plant in this country or indeed in any part of the world.

There is little wonder, therefore, that I joined my many colleagues in the steel industry in vigorously resisting nationalisation of our great industry, particularly as those in favour of nationalisation claimed that in privately owned plants there was a lack of initiative and enterprise!

CONCENTRATION OF PLANT

The first semi-continuous mill together with the merchant bar mills were operated successfully at Tredegar until 1931. These were then closed down, primarily because of the closure of the Ebbw Vale works which had been supplying the company with raw material. An immense saving in transport was achieved by the transfer of this plant from Tredegar alongside a new and more modern continuous hoop and strip mill which by this time was operating at our Newport works. This concentration of our plant proved to be even more successful than was at first contemplated and resulted in a considerable financial saving.

The company's main plant at Courtybella Works, Newport, is very favourably placed, being on the seaboard. This makes it extremely economical to receive all raw materials by rail or sea and, at the same time, enables us to make our full contribution to the export trade. Shipment to all parts of the world can be made through the port of Newport, which provides adequate deep-water accommodation for both inwards and outwards traffic.

FIFTY YEARS' PROGRESS

I think the following figures will be of interest as an indication of the progress which the company has made during the past fifty years:

	1904	1929	1954
	£	£	£
Fixed assets	1,109	371,002	1,281,463
Investment in subsidiary companies	...	17,450	1,102,688
Investment in associated company	...	...	50,000
Current assets	6,921	214,046	3,797,278
	8,030	602,498	6,231,429
Less Current liabilities	4,614	296,232	2,098,625
	3,416	306,266	4,132,804
Deduct Future taxation	...	...	439,582
Net assets	3,416	306,266	3,693,222

ACQUISITIONS AND DEVELOPMENTS

In 1925 your company acquired the wire mills, then owned by J. C. Hill & Company, Limited, Cwmbran, which incorporated a hot galvanising plant. It was at this works that the first electro-galvanising plant was developed, which proved to be an improvement on the hot dip process. In these very early days we developed electro-deposition of zinc and tin coatings, which, as you know, have been emulated by even the most modern plants and has become standard practice not only in this country, but most countries in the USA and on the Continent.

In 1933, in order to secure freehold land attached to the works established at Caerleon, we acquired the Caerleon Brick Works, which has proved to be a very valuable asset and is now producing over 300,000 quality bricks each week.

In the early 1930s the demand for highly finished cold rolled steel products for industries such as the automobile, motor and pedal cycle, furniture and others, increased rapidly; consequently, your company turned its attention to the installation of modern equipment for producing this type of material with a superior finish and a high degree of accuracy which had not been previously achieved in this country. This project was so successful that your company became, not only a well-known source of supply for hot rolled products, but also suppliers of highly finished cold rolled steel.

Since we installed the first two-high cold reduction mills, the technique of cold rolling improved, and in 1936 we installed one of the first four-high reversing mills. In the same year we were pioneers in developing an electric annealing plant, which was to act as complementary equipment to an additional number of temper mills we erected at that time.

In 1939 we supplemented our existing cold reduction plant by the installation of a four-stand tandem continuous mill, and again in 1943 we put in an additional reversing mill and a three-stand tandem mill, which had the effect of substantially increasing our output of cold-rolled material. We have since installed an additional four-high four-stand tandem mill, which has still further increased our output.

Your company also operates a modern plant for bright drawn bars with a capacity of 4/500 tons per week.

A VERY EFFICIENT UNIT

In 1938 the company acquired the engineering and foundry business of W. A. Baker & Company Limited, Westgate Works, Newport. The object was to utilise this new works for the maintenance of our substantial plant at Newport. It was a convenient source of supply for ferrous and non-ferrous castings and at the same time Bakers used a considerable tonnage of our finished products as their raw materials. The modernisation of these works was completed in 1946 and it is now a very efficient unit capable of dealing with light and medium engineering, high class castings in electric steel (high-frequency and basic-arc), cast-iron, etc. Highly alloyed steels, such as corrosion and heat-resisting steels, are a speciality.

This subsidiary company has a very pleasant association with The Black Clawson Company of America through its British company, The Black Clawson International, Limited, which provides for the manufacture of modern paper-making and paper-board machinery, absorbing the major part of the output of our very substantial engineering shops.

Fifty per cent of the share capital of Godins "The Rollers of Steel Sections" Limited was acquired in 1940 and the remaining 50 per cent in 1948. This company specialises in the production of cold-formed sections, ferrous and non-ferrous.

FEATURES OF YEAR'S TRADING

I think now might be an appropriate time for me to draw the attention of our shareholders to the salient features of our trading for the year ended October 2, 1954. The [illegible] report and statement of accounts is [illegible] your hands.

[illegible] £8.5s. £21.50 or [illegible] £5.5s. [illegible] part of the year 1954 [illegible] ns of a recession in the [illegible] output of our various plants, but this proved to be of a temporary nature and towards the end of the year the demand for our products increased very substantially so that the final turnover for the year was 12.5 per cent greater than the turnover for 1953. The increase in the trading profit of the holding company was very satisfactory as it represented an increase of 28.2 per cent over the corresponding figure for the previous year.

PROFIT AND ALLOCATIONS

The consolidated profit and loss account shows that the group trading profit for the year ended October 2, 1954, was £954,520 an increase of £182,377 (23.6 per cent) compared with the previous year.

After making full provision for taxation and depreciation the net profit of £390,943 attributable to the holding company is £56,689 more than the corresponding figure for last year. The dividends paid and recommended (less income tax) absorb £120,455 and after crediting the surplus brought forward from the year 1953/54, amounting to £76,232, the surplus available at October 2, 1954, was £346,720. Of this amount £175,000 has been allocated to general reserve and £100,000 to the reserve for increased cost of replacement of fixed assets, leaving a balance of £71,720 to be carried forward.

The latter allocation re-establishes the policy we adopted prior to nationalisation. We still feel that it is desirable and necessary to allocate a reasonable proportion of the profits to this reserve each year.

The total amount distributed in dividend, viz. £120,455, represents 30.8 per cent of the profit available to the holding company so that 69.2 per cent is retained in the business. I think shareholders will be interested in the following analyses of the trading results for the year under review.

ANALYSIS OF GROUP TRADING RESULTS FOR THE YEAR ENDED 2nd OCT., 1954

	To nearest £'000	% of total income
Purchases of raw materials	8,897	74·0
Wages and salaries	1,130	9·4
Works and administration expenses	868	7·2
Depreciation	144	1·2
Taxation	522	4·4
Distributed to shareholders (net)	120	1·0
Retained in business	338	2·8
Total income	12,019	100·0

ANALYSIS PER £1 OF INCOME

	s.	d.
Purchase of raw materials	14	10
Wages and salaries	1	10
Works and administration expenses	1	5
Depreciation		3
Taxation		11
Distributed to shareholders (net)		2
Retained in business		7
	20	0

The book value of the net assets of the holding company as at October 2, 1954, was £3,693,222, as compared with £3,415,570 for the previous year.

I would like to call your attention to the capital re-organisation of your company, which is referred to in the directors' report, on page 4 of the annual report and statement of accounts.

You will see that whereas the capital of the company when we were nationalised in 1951 was £783,835 of ordinary stock, the capital re-organisation now provides for an increased issued share capital of £1,250,000 together with loan capital of a similar amount. We felt that the remaining transitional figures given in the directors' report would also be interesting to shareholders.

THE OUTLOOK

During the year under review the whole of the company's plants have been fully occupied, and there is no reason to believe this happy state of affairs will not continue throughout the present year.

We have been fortunate in raw material supplies being adequate to enable our rolling mills to operate at full time, although supplies have been scarcely adequate to enable us to operate the plant to the fullest advantage. If we could obtain adequate supplies of semi-finished steel to meet our full requirements, we could contribute an increased output in small sections and sizes which are in such great demand today, without any increase in our labour force.

Generally speaking, the brisk demand for all our products seems to be unabated, and there is every reason to believe that the whole of our production during the next twelve months will be readily absorbed by the consuming industries.

In conclusion, I should like to pay tribute to the enthusiasm and loyalty of all our staff and employees who have contributed to the satisfactory results I am able to report.

The report and accounts were adopted, and the dividend recommendation approved.

The retiring directors, Dr Brynmor Jones and Mr G. I. Rushton, were re-elected and the other formal business duly transacted.

BRITISH ROPES

PROFITS MAINTAINED

The thirty-third annual general meeting of British Ropes Limited was held on May 25th in London.

Mr Herbert Smith, the chairman, in the course of his speech, said: The Group Trading profits follow very closely the results recorded for the two previous years, the amount of £1,904,000 for 1954 comparing with £1,830,000 for 1953, and £1,868,000 for 1952.

The total capital and revenue reserves of the Group, excluding Amounts set aside, aggregated approximately £4,216,000 at December 31, 1954, an increase of £1,064,000 as compared with the previous year, and these reserves are now in total not far short of the Issued Preference and Ordinary Capitals of £4,295,000.

During 1954 the demand for wire increased considerably and this trend continues.

Sales of Wire Rope in the Home market continue at a fairly steady level as regards total tonnage, but there have been marked changes in the demand for the different types of rope which have meant considerable changes and alterations to plant.

The demand for our various fibre products remains steady with an increasing sale of Baler Twine, and with the continual increase in the use of Baling Machines a greater quantity is likely to be used, and our sales should increase. Our twines for Agricultural purposes are sold as "Red Star" brand, and have a reputation for quality of which we are proud.

The report was adopted and a final dividend of 11 per cent on the Ordinary Stock (making 15 per cent for the year) was approved.

CADBURY BROTHERS LIMITED

GROUP SALES TOTAL £72½ MILLION

TRADITIONAL POLICY OF DOWNWARD PRICE ADJUSTMENT

EFFORTS TO STIMULATE WORLD PRODUCTION OF COCOA

MR L. J. CADBURY ON FIRST YEAR OF TRADING FREEDOM

The fifty-sixth annual general meeting of Cadbury Brothers Limited will be held on June 13, 1955, at Bournville, Birmingham.

The following is the statement by the chairman, Mr L. J. Cadbury, which has been circulated with the report and accounts:

I am sending my Chairman's statement with the firm's accounts this year. I hope that having them both together will be more convenient to shareholders than having them separated as in the past by a period of three weeks. An illustrated brochure is also being sent out, which deals particularly with our overseas interests and how our development programme is being paid for. I will therefore begin this statement by dealing with the Company's financial affairs for 1954.

It will be seen from the Cadbury Brothers Limited accounts that its sales and those of its subsidiaries at home and abroad rose from £59½ million to £70 million. If the sales of the other subsidiaries of our parent Company, the British Cocoa and Chocolate Company, are added, they total £72½ million. After allowing for depreciation, etc, and taxation, we are left with a Consolidated Profit of £3½ million. We are transferring £2 million of this to our general reserves and retaining £650,000 in our subsidiaries. The sheet enclosed with the accounts shows diagrammatically more details of these overall figures.

The increased turnover of the group and the high price of cocoa have required more money to finance the business. "Stock" is up by £10 million; "Debtors" by £1½ million. On the other side, in addition to substantial sums ploughed back, there are increases in our "Acceptance Credits" and "Balances due to Bankers." Since the date of these accounts we have been able to negotiate a £3 million Unsecured Loan as from February 1st for ten years at 4½ per cent.

FIRST COMPLETE YEAR OF TRADING FREEDOM

Looking at 1954 from a trading point of view, it is a remarkable fact that it was the first complete year of freedom from restriction that our industry has had since 1938.

Going back still further over the last forty years, we have for nineteen of them operated under the restriction of war conditions or postwar controls. If we take into account that we still had to ration our customers after the first World War for several years, nineteen becomes twenty-four.

However, it now really does look as though the fifteen years' seller's market is coming to an end and that before 1955 is out it will be the consumer who will be calling the tune. If so, we shall have to deal with such once familiar problems as more seasonability, the unpredictable vagaries of the market, the desire for multiplication of lines and packings. We have already experienced in our overseas companies the rapidity with which a seller's market can turn into a buyer's, and the long spell of comparatively easy trading our industry has enjoyed may be coming to an end during 1955.

GROWTH IN CADBURY SALES

Turning to Cadbury sales, they showed a tonnage increase of nearly 16 per cent. Bournville Cocoa, Bourn-vita and Drinking Chocolate all showed satisfactory increases. Sales of Quick-Mix Drinking Chocolate in particular were so successful that they outstripped our supplies, a situation which should be corrected by the installation of further plant in time for next winter. The heaviest section of our sales is, of course, in Moulded Chocolate. Here 1954 saw the end of "Blended," a line that fulfilled a very useful purpose during all the years when full-cream Milk Chocolate was severely cut. With the remarkable increase in supplies of home liquid milk our production of Cadbury's Dairy Milk Chocolate has been so stepped up that during the last few weeks we have been able to put it on freer sale.

Despite the increase of output mentioned above, we had nevertheless to ration all our more important lines during 1954. We could have pushed up our production a little further if we had been able to recruit more labour; but with a local unemployment rate of .5 per cent (the lowest in the country), this was not possible. Even if we had been fully staffed we could not have done much more as our buildings and plant were being used very nearly to their maximum capacity.

Under these circumstances we are very glad we decided some years ago to build a new factory in an entirely fresh area, at Moreton in the Wirral Peninsula. Here labour is more available. We have ample space and have been able to put up a plant designed from scratch to suit the most efficient production of the lines we have decided to make there. Moreton made a useful contribution to our output last year and we hope this year to be employing over 1,000 people on well-mechanised layouts. We have started to duplicate our original buildings and have plans for still further development in this new and expanding industrial community. We estimate it will cost £5! million to complete them.

At Bournville we also have some extensive building schemes in hand. They are mainly, however, for rehousing certain departments of the works and enlarging sections that have got out of balance with the general scheme. It is not our policy to make any major increase in the overall size of the factory. We believe we are a big enough single unit under the circumstances that exist in this area.

The increasing tonnage with which we have to deal has put a great strain on our distribution system. We have therefore purchased or are negotiating new sites for rail-head distribution depots at Glasgow, Leeds, Gateshead, Cambridge and Exeter, extensions are in hand at West Hampstead and Cardiff, while a completely new depot is going ahead in Belfast.

COCOA PRICES

Of our raw material supplies, cocoa has of course been our main preoccupation.

Nineteen fifty-four was a year of extremely high cocoa prices and violent fluctuations.

Various reasons have been given for these happenings, such as British African cocoa being in the hands of a single seller. Certainly the single seller has not produced that steadiness of price that some of us were led to expect, but fundamentally the trouble has been a slight fall in world production and a rise in world consumption in 1953 and 1954. Thus stocks declined, and there was no buffer to take the shock.

Prices began to increase back in March, 1953, when cocoa was £235 a ton; by December that year it was £365; in the New Year it reached £470, and panic buying in the summer caused a peak of £550. Forward sale of the 1954-55 crop thus started in July at £500.

Fortunately, the good May-June crop in Brazil and devaluation of her currency eased the situation, and in September the market was favourably impressed with the first official estimate of the new African crop, an estimate which unluckily in the event proved too optimistic. In addition America was not an active buyer of African cocoa, and it seems likely that her consumption will be reduced by 10 per cent over the year. All these factors combined made the supply position easier as the season progressed, and it finished with the price down to £300 a ton.

The average price at which we have bought is above that figure. This was inevitable. To meet our needs at home and overseas we have to buy a substantial proportion of the African crop as it is marketed by the Board to give us the cover we want for the rest of the year. We cannot, therefore, postpone our purchases to the end of the season on a gamble that we shall be buying at the bottom of a falling market.

DOWNWARD ADJUSTMENT IN PRICES

As it is, we now know the cost of our cocoa for the rest of the year, and have recently been able to make some downward adjustment in prices of Bournville chocolate and one or two other packings. This is our traditional policy. It will not be possible to decide whether any further cuts can be made until we see how the cocoa market is behaving next winter.

We are still doing all we can to stimulate world production. A buying agency has been started in the Cameroons, and a delegation went to Brazil in May and June last year. Potential cocoa-growing areas in the South Pacific have been visited, and the Malayan venture continues. It still remains that the quickest way to obtain an immediate increase is the elimination of pests and diseases in the large producing countries of West Africa. An encouraging start in spraying against Black Pod disease has taken place this season in Nigeria, and the Gold Coast's determined campaign against Capsid, long delayed as it is, if it is successful, can put an entirely new complexion on their expectations. Cutting-out remains the only method of controlling Swollen Shoot and about 40 million trees have been cut out so far.

COCOA'S IMPORTANCE IN GOLD COAST ECONOMY

By virtue of its great importance to the economy of the country, cocoa plays a very large part in Gold Coast politics. Mr Gbedemah, the Minister of Finance, in his recent Budget speech emphasised the dependence of the Government on the revenue it derived from the cocoa export duty, likely to be this year £40 million, which is of course additional to the profit retained by the Cocoa Marketing Board.

The revenue from the export duty is used for the country as a whole, but this season over half the cocoa came from the farmers in Ashanti and this has been the cause of a political agitation. A new party has thus emerged which wants less control from Accra and which may cause trouble for Dr Nkrumah; after all the Gold Coast as a political entity is little more than fifty years old. With a reduction in price and high export duties, the Government must consider whether they are not taking too much of the revenue and leaving too little for the farmer. It is in their interest as well as in that of the cocoa manufacturers to maintain every effort to increase their output, which will never be accomplished unless the farmer is satisfied that he is getting a square deal.

We made a small trading loss on our BWA agencies, but continue to believe that the presence of our organisation there has a stabilising influence that is well worth the effort it involves.

Sponsored by this firm, Messrs Longman published in March a technical book on growing cocoa by Mr Urquhart. It will be of great value to those engaged in the practical side of the business. The first edition was immediately sold out, and it is now being reprinted.

MILK IN GREATER ABUNDANCE

On April 1, 1954, as a result of the Government's general policy of decontrol, the Milk Marketing Board had returned to them from the Ministry of Food the marketing powers that were suspended soon after the outbreak of war in 1939. Following this, we began to receive milk in greater abundance and at lower cost.

Our milk intake for the year in England and Wales was up by 8 million gallons. This was due to a general increase in milk production among our farms and to the extra intake at Llangefni, the milk depot in Anglesey we bought from the Milk Marketing Board in February last year. The relative remoteness of this new area from the liquid milk market is an asset from the point of view of the manufacturer, and it should form a useful addition to our milk resources.

A better stock position as well as the improved supplies and lower price of milk in this country caused us to halve production at Rathmore, our milk factory in Southern Eire.

OVERSEAS ACTIVITIES

Overseas, our Joint Cadbury-Fry Export Department sold nearly 11,000 tons, worth £3.8 million, an increase of 37 per cent and 33 per cent respectively over 1953. These figures represent over half the country's total export of cocoa, chocolate and chocolate confectionery.

The biggest item in this increase has been the resumption of USA cocoa contracts at over £½ million; our dollar sales also include large shipments of block chocolate to the USA and of assortments and biscuits to Canada.

We have had considerable success in increasing our cocoa trade, loose and proprietary, on the Continent. In Germany, where we are faced with a severe tariff barrier, we are experimenting with having our goods made for us under contract by a local firm, to whom we supply the beans.

At our overseas factories, Australia and Canada showed substantial increases in output of 6 and 8 per cent respectively. In South Africa sales by weight have remained level, but those of New Zealand and Eire have fallen.

We have considerable building programmes overseas, particularly in Canada and Eire.

ORIENT STEAM NAVIGATION COMPANY

STEPS TO ATTRACT NEW TRAFFIC

At the fifty-fifth annual general meeting of Orient Steam Navigation Company, Limited, held in London on May 23rd, Mr A. I. Anderson, the chairman, said that the operating profit, after making a transfer to contingency reserve and provision for depreciation, amounted to £679,954. While this showed an improvement over last year—due mainly to the first half-year's working of Orsova, the exceptionally good results of the first two Pacific voyages and the effect of the fare increases introduced in February, 1954—the amount set aside for depreciation, though adequate on the basis of first cost, was a long way short of that required for replacement.

Reviewing the operation of the company's fleet, Mr Anderson said that the initial response to the new Pacific Service had been sufficient to warrant the planning of subsequent sailings at approximately two monthly intervals. He hoped that this would encourage more tourist traffic originating in North America to Australia and New Zealand; but up-to-date hotel facilities were urgently needed in these two countries if their undoubted tourist appeal was to be exploited to the full.

Traffic on both the Suez and Pacific routes followed a similar seasonal pattern and as a new experiment towards making the best possible use of the available tonnage, one outward and one homeward sailing between this country and Australia was this year being routed via the Panama Canal. Although the fares for these sailings via Panama had to be about double those via Suez, the support already received from Australian passengers was a striking illustration of the attraction of a new route.

The new cheap "Boomerang" excursion ticket for travel between Australia and this country in the off-season had proved popular and appeared to be attracting new traffic.

Mr Anderson said that the steady increase in costs experienced since the War still continued, and it had only been possible to permit charges to lag behind them by devising new means of filling passenger berths which would otherwise have been empty. He emphasised, however, that there were limits to what could be done in this direction.

The report and accounts were adopted.

BRITISH PAINTS (HOLDINGS)

SALES MORE THAN MAINTAINED

The twenty-fifth annual ordinary general meeting of British Paints (Holdings) Limited was held on May 24th at Newcastle upon Tyne, Mr J. W. Adamson (the chairman) presiding. The following is an extract from his circulated statement:

Despite the abnormally bad weather during 1954 sales have been more than maintained and after a moderate start the year improved and paint sales finished at a satisfactory level.

A substantial increase was shown in sales in our raw materials division, where we produce our own synthetic resins, pigments, dry colours and certain chemicals. The resin works had a record output and the target for this year, which has been set at a higher figure, will most likely be achieved since new and interesting materials are due to be produced there for the aircraft and plastic moulding trades by arrangement with two famous American firms whose products in these fields are first and foremost.

From our plastics division where are produced decorated wall boards and phenolic sheets, we will be manufacturing a new decorated board for housing and the furniture trades, which is most attractive and resistant to heat.

POPULARITY OF PAINT PRODUCTS

Our paint products, some of which are shown in colour in this year's statement of accounts, continue to enjoy a popular demand and specimens of our advertising showing some of our brands are also shown. Our marine division continues to paint annually millions of tons of shipping throughout the world and with the consent of the owners and builders, to whom our thanks are due, we show photographs of some of the world's newest tonnage coated with our "Torpedo" brand marine paints.

The company's order books show cause for satisfaction and unless there is a deterioration in the international situation, a serious setback in the country's economy or a recession in trade, the outlook can be considered encouraging. Most of our overseas subsidiaries have also enjoyed their share of prosperity in 1954, and some of them show record sales and profits.

PROFIT AND ALLOCATIONS

Of the profit of the group, £800,226 taxation takes £461,477. Dividend on preference and ordinary stock will absorb £122,100 and the carry forward is £829,407.

It has again been decided to allocate a further £50,000 to overseas investments reserve and general reserves receive £79,518.

Your directors have decided to pay a final dividend of 20 per cent, making 25 per cent less tax for 1954 on the ordinary stock.

The total assets of the group amount to £5,627,216 while liabilities including the balance dividend appropriation and outside shareholders' interest in subsidiaries amount to £1,828,664, share capital £1,468,997; reserves, the usual provision for income tax on the profit for the year, plus unappropriated profit totalling £2,329,555, make up the net capital of £3,798,552 employed in the group. Current assets exceed current liabilities by £2,659,751.

We have received the usual faithful and enthusiastic assistance from our staff and workpeople and they have again been rewarded with their annual share of profits bonus which amounts to approximately £56,000. The report was adopted.

CEREBOS LIMITED

A VERY SUCCESSFUL YEAR'S TRADING

RECORD HOME AND EXPORT SALES

MR W. ARNOLD INNES ON MERIT OF COMPANY'S PRODUCTS

The Fifty-first Annual General Meeting of Cerebos Limited was held on May 25, 1955, at Cerebos House, London, N.W.10.

Mr W. Arnold Innes, the Chairman, presided.

The following is his Review which has been circulated with the Report and Accounts for the year ended December 31, 1954.

I am happy to be able to report once again a very successful year's trading. This has been achieved despite the steadily rising cost of labour, fuel, raw and packing materials.

ACCOUNTS AND DIVIDEND

The Consolidated Balance Sheet with the comparative figures for the previous year clearly sets out the position of the Company and its Subsidiaries as at December 31, 1954, but a few comments thereon may be of interest to Stockholders.

The value of the Fixed Assets of the Group in the form of Land, Buildings, Plant and Equipment after making full provision for depreciation, together with the Goodwill and Trade Investments items, now amounts to £3,217,210—an increase of £128,360 on last year's figures. In the main this increase reflects the further expenditure on the Middlewich factory reconstruction and re-equipment programme during the year.

Nett Current Assets at £1,390,627 have increased by £174,183.

Reserves and Surplus, including the sum set aside out of profits in cover of Future Taxation, stand at £2,414,487—an increase of £302,718 over the previous year. It will be observed that the strong financial position of the Group has been well maintained.

Capital Commitments at approximately £269,700 are slightly higher than the corresponding figure at December 31, 1953, and reflect the expenditure contemplated for the improvement of the plant, equipment and other facilities referred to later in this review.

The Consolidated Profit and Loss Statement includes for the first time the trading results of the Scott (Midlothian) Limited Group of Companies. The accounts of these Companies have been drawn up as at December 31, 1954, and cover a period of sixteen months.

Due to the incorporation of the combined trading results of the Scott Companies the nett Profit shown in the Consolidated Profit and Loss Statement of £630,718 is not comparable with last year's figure of £480,287.

The nett Profit of the Group, with the amount brought forward from last year, makes a total of £927,336, out of which it is recommended to transfer £250,000 to General Reserve, leaving £677,336 available.

Your Directors have decided that the results achieved justify their recommending the payment of a Final Dividend of 23¾ per cent (less tax), which, with the Interim Dividend of 6¼ per cent (less tax) paid in November last, makes 30 per cent (less tax) for the year. This Dividend will absorb £330,000, leaving £347,336 to be carried forward.

HOME SALES, MARKETING AND ADVERTISING

I can again report that our 1954 sales, both in tonnage and sterling, exceeded those of any previous year.

At probably no other time has the housewife been so selective and discriminating in her purchases of household products; it is also probably true to state that at no other time has she been offered such a wide variety of foodstuffs.

Under such conditions it is gratifying that the demand for our proprietary goods continues to increase, with the result that we are adding daily to those millions of homes where Cerebos products are in daily use. In this way our fixed policy of manufacturing to the highest possible standard of quality at the most economic price has justified itself by the high opinion held by consumers throughout the country of our various brands.

This discriminating demand has helped us to consolidate our increased share of business in the total market and to improve upon it during the year under review. Incidentally, during 1954 the relatively low retail price of our proprietary products has again remained unchanged—a factor which has won favour with all distributors and the millions they serve.

Before passing on to other matters I would like to take this opportunity to express to our Trade friends our sincere thanks for the enthusiastic co-operation they have again extended to us. We hope to preserve indefinitely what is probably the happiest relationship existing between trader and manufacturer.

Our sincere thanks are also due to the numerous industrial firms who rely on us for their Bulk Salt requirements and whose support we have enjoyed for so many years. Salt is used in a considerable number of important industries and we shall continue to do our utmost to produce the most suitable grades to meet the varying demands made upon us.

EXPORT AND OVERSEAS TRADE

We have had another progressive year in the Export field, our sales for the period being once again an all time record although, in common with other exporters, we were badly hit by the serious dock strikes which occurred in the Autumn. As a result, we had a heavy carry over of orders at the end of the year.

It is not generally realised that stoppages such as we have experienced have a lasting effect upon Export Trade in that, even after work is resumed, it is a matter of some two or three months before ports return to normal and during that time supplies of our products become very scarce in many overseas markets. Consumable goods which are not available obviously cannot be absorbed so that the final result is that we lose permanently a substantial volume of trade to local manufacturers and foreign competitors who naturally seize the opportunity to get their products substituted for ours.

While it would be too optimistic to say that there is any very definite trend towards the easing of import restrictions, it is noteworthy that several countries have resumed the granting of permits for our products and this has helped considerably in building up the satisfactory annual turnover. There is, however, something about table salt which gives it an importance out of all relation to the value of the trade and causes schemes to be proposed requiring substantial capital investment merely for the purpose of refining locally a moderate quantity of prepacked table salt, which can be imported upon much more favourable terms. Many of these schemes collapse before they reach completion but others struggle on for a few years until it becomes clearly apparent that they will never become self-supporting.

As we fully realise the danger of relying to an undue extent upon any one product, we are doing all in our power to broaden the basis of our overseas business and I am happy to say that today non-salt products represent a far larger proportion of the annual turnover than was the case in the past. The progress we are making with our other proprietary lines is particularly gratifying and I am convinced that there is still plenty of scope for the further expansion of this trade.

Our Australian Company has had a successful year, reporting increased profits from which an initial dividend has been received. Plans for the erection of a well-equipped modern factory proceed apace and building operations will shortly commence upon a site about twelve miles from the centre of the city of Melbourne. Town Planning permission has been granted and there is good reason to hope that the factory will be completed and equipped by the end of the year. The new Works should enhance our prestige in Australia and will provide us with all the facilities required for our manufacturing and distributing operations for some years to come.

Before leaving the subject of Australia I would just like to say that Mr K. R. Clements, who has been associated with the Gravox business over a long period of years, has accepted the position of Deputy Chairman responsible for the executive control of the business. We regard ourselves fortunate in obtaining the benefit of Mr Clements' services and are quite sure that our interests will be well cared for.

Our Export business to Canada continues to progress but I am not satisfied that the time has arrived when we should consider any full scale programme of local production involving high capital expenditure. With its rapidly growing population and vast mineral wealth, this market appears to offer great scope to certain English manufacturers. It should be borne in mind, however, that local industry is already highly developed and that the field in which we operate is well established and well protected.

To conclude my remarks upon our overseas trade I can only say that the progress we continue to make is a testimony to the intrinsic merit of our products and the skill and enterprise shown by all connected with our organisation overseas. Unfortunately the future of the Export Trade, not only of this Company but of the country as a whole, depends very largely upon the policies of various Governments in regard to import duties and quotas. The situation in this connection fluctuates a good deal and it is impossible to predict the future course of events. Subject to this I am sure that we can look forward to further steady progress.

PRODUCTION

The work of modernising our principal Middlewich factory continues and good progress has been made. The new Vacuum Plant is now in initial production and it is expected that full, efficient output will be attained after a short testing period. Other development schemes at our various Factories are moving satisfactorily, and despite the difficulties attendant upon such major installations, the Factories have maintained the necessary production to meet the increasing demand for our products.

Our constant attention is being given to improving the efficiency of all our Factories, the objective being the economic integration of the various units of the Group. For example, a recent step taken in this direction has been in the field of chemical and industrial research, a high degree of co-ordination having been obtained.

Improvements in methods and economic management have enabled us to reduce certain costs, and these reductions, assisted by the increased volume of sales, have partially offset the impact of higher wage rates and of higher prices of raw and packing materials.

DISTRIBUTION

Our commercial fleet is now nearing the strength required for our present needs, although further expansion may have to be considered if the demand from our customers continues to increase.

During the past year a closer integration of the Group delivery system has been secured, and by operating a combined service and joint depots encouraging economies have been effected. Our long distance trunk services have continued to ensure that our depots throughout the country are always well stocked with our products.

The increased business now being handled in the London area has necessitated the enlarging of our Willesden warehouse, which will provide additional facilities necessary to maintain and improve our service to customers in Greater London.

SUBSIDIARY COMPANIES

It is with deep regret that I have to report the death in May last of Mr Roger Greene. Mr Greene was one of the original Directors of Cerebos (Ireland) Limited and played a prominent part in the formation of that Company. His wise counsel and specialised knowledge will be much missed. Mr W. Morris Hutton, who has an intimate knowledge of the grocery trade in Ireland, has been appointed to fill the vacancy.

Once again I am able to report that our operating subsidiaries continue to make progress and their successful trading is evidence of their outstanding position in their respective fields of the grocery and allied trades.

STAFF AND EMPLOYEES

In a relatively short review of this kind it is only possible to touch briefly upon the principal aspects of our activities during the year, but I trust that my comments will portray something of the steady progress of your business during the past year.

On behalf of the Board I would like to express our gratitude for the devoted efforts of our officials and staffs of all your Companies at home and overseas, without which the excellent results presented to you today could not have been achieved.

In conclusion, I wish to record my warm appreciation to all my colleagues on the Boards of Cerebos and its associated Companies for the excellent support which they continue to give me in the management of the Group as a whole.

The Report and Accounts were adopted.

Mr F. N. Patterson, the Director retiring by rotation, was re-elected.

The proceedings terminated with a vote of thanks to the Chairman.

PROJECTILE AND ENGINEERING COMPANY LIMITED

MR J. WADDELL'S STATEMENT

The fifty-third annual general meeting of the Projectile and Engineering Company Limited was held at the offices of the company on Tuesday, May 24, 1955, Mr J. Waddell (chairman) presiding. In his statement, which had been circulated with the accounts, the chairman said:

ACCOUNTS

The figures before you in the profit and loss account once again reflect a successful year's trading, and, while the accounts will require no detailed analysis in this statement, there are a few points to which I would draw your attention.

Arising from the Board's capitalisation proposals, which were carried through in 1954, the authorised and issued capital of the company now stands at £750,000, having absorbed the whole of the capital reserve and £300,000 of the general reserve. In the opinion of your Board, the new level of issued capital is more realistic than the old figure and much nearer the total of shareholders' funds employed.

It will be seen from the directors' report that your Board now recommend a further appropriation to general reserve amounting to £80,000, increasing the total of that reserve to £280,000. Following this and the other appropriations, there is a reduction in the amount carried forward on profit and loss account, but shareholders will have noticed that the "carry forward" on that account has been steadily rising over recent years.

On the asset side of the balance sheet it will be noted that the additions to fixed assets during the year have been at a rather lower level than in recent years. The additions in the main arise from the Board's normal practice of replacing with modern machinery items of plant no longer operating at the high level of efficiency called for by modern production methods. No major plant expansion scheme has operated during the year, and your Board have considered this a period of consolidating the company's position, following the investment in and the installation of a considerable amount of new plant which was spread over the previous three or four years. The good results which have flowed from that plant expansion and improvement programme have fully justified your Board's confidence in the company's progress and in the management.

The turnover for the year—spread fairly equally over all departments—was considerably higher than in the previous year, but, under the much more competitive conditions prevailing, the ratio of profit showed a slight decline.

DIVIDEND

In view of the excellent trading results for the year, your Board has pleasure in recommending the payment of a final dividend of 12½ per cent, less income tax, on the 10s. ordinary shares which, with the interim dividend already paid, makes a total equivalent to 15 per cent on the present ordinary share capital of the company.

MACHINERY DIVISION

Production and sales of the "Peco" injection moulding machines and die-casting machines have continued to increase since their introduction in 1947, and the range of new designs will be widened from time to time to meet the needs of our customers.

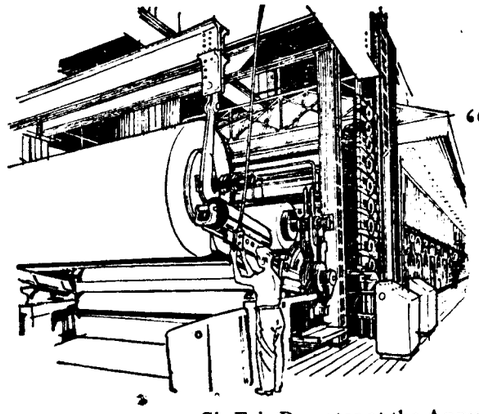
These machines, for which there is a steadily increasing demand, are now renowned throughout the world, being generally accepted as the best of their kind. Your company's policy is to continue the expansion in this field of manufacture and arrangements are well in hand to provide increased capacity by using some of the facilities now provided for the manufacture of armaments, the production of which, in future, will be on a reduced scale.

The pressure of competition in Europe is now becoming a little more acute, but "Peco" designs are subject to constant review and improvement and it is felt that all reasonable competition can be met.

MOTOR INDUSTRY

I made reference last year to the changing requirements of the motor industry and the consequent reduction in demand for the lighter types of chassis frames manufactured by your company. I am now glad to say, however, that during the year the reduced output of this section of the works has been more than compensated by increased production of commercial vehicle chassis frames, together with many other components for the industry.

THE CURRENT YEAR



I am glad to advise shareholders that the value of orders in hand still remains at a very high level and your Board looks forward to a successful year's trading. However, I feel it necessary to offer a word of caution. In general your company now faces rather keener competition than in the past, with rising cost of labour and material, and it is clear that where a rise in prime production costs occurs, especially if accompanied by the need to adhere to keen selling prices, an encroachment on profit margins must result unless offset by a corresponding fall in indirect cost. Such reduction can only be gained by yet higher production efficiency. This term, which is so often loosely used, connotes among other matters effective production planning and routing; favourable rates of stock turnover; the minimising of the rate of labour turnover, and accurate costing and management-control accounting. You may be assured that to this important section of the company's activities the closest attention will continue to be given.

RISING COSTS

In addition to rising costs your company is feeling the effects of the country's shortage of steel sheet and plate—particularly in connection with supplies for the motor industry—and this, in turn, tends to control the volume of production in that section of the business, which, at the best, is likely to be rather lower than for last year.

In conclusion, I would, on your behalf, like to thank the staff and all other employees for their efforts and co-operation during the past year.

The report and accounts were adopted.

"The strength of a free Press depends ultimately upon the paper resources of the printing presses—that is to say, upon a regular and sufficient supply of newsprint"

Sir Eric Bowater at the Annual General Meeting of The Bowater Paper Corporation Limited

Sir Eric Vansittart Bowater announced a programme for considerable expansion in the paper industry at the Annual General Meeting of The Bowater Paper Corporation Limited on 25th May, 1955. The Meeting was held at Chester in order that shareholders could visit Ellesmere Port to tour the Mersey Mills and adjoining Multiwall Sack Factory.

Sir Eric stated that the past year had been one of great achievements and great decisions. All plants, factories and mills had reached the highest production level in their history. Earnings for the 15-month period to December last exceeded £13 million, and the Directors recommended a final dividend of 15 per cent. on the Ordinary capital, which, with the interim dividend of 7½ per cent paid last October, totalled 22½ per cent for the fifteen-month period—equivalent to a rate of 18 per cent per annum, compared with 16 per cent for the previous year. All employees in the British Isles were to receive a bonus equal to three weeks' basic pay, in recognition of the enthusiasm and efficiency with which they have carried out their duties.

Sir Eric quoted a famous British humorous periodical (*Punch*) which had wittily rebuked a section of the British newspaper Press for "artless duplicity" in criticising Bowaters' profits in the light of British newsprint needs. *Punch* had shrewdly pointed out that the greater part of Bowaters' earnings came from diversified overseas interests. Sir Eric added: "Despite the increase of £2.5.0 per ton (last January) . . . the cost to publishers in the United Kingdom of the newsprint made in the home mills is still the lowest of any that they buy . . . That increase barely covered the higher prices for raw materials and the cost of manufacture and distribution that our industry had had to meet. Never have we attempted, nor shall we in future attempt, to exploit any shortages in supply, and I believe this is generally well known."

Referring to the newspaper strike Sir Eric stated: "We felt it to be our duty to continue full production in the interests of both our employees and our customers. The paper maker has a high obligation in a democracy, for the spoken word is not enough to maintain free discussion in modern times. A free Press is also essential, and the strength of a free Press depends ultimately upon the paper resources of the printing presses—that is to say, upon a regular and sufficient, might I say, abundant, supply of newsprint."

Sir Eric gave further details of the Master Plan for the expansion of the British mills and factories, and he disclosed that this development programme would cost about £25 millions. The programme should be completed in four to five years, and included two new paper machines at Mersey Mills and two at Thames Mills, thereby adding some 225,000 tons of various grades of paper to the Organisation's British output annually.

In addition, a new groundwood mill would be built at the Mersey Mills, consuming home-grown wood, whilst another building board mill would also be built in the North.

A further project related to the Corporation's recent purchase of the St. Andrew Mills, makers of "Andrex", "Camelia" and other high-quality cleansing and toilet tissues, whereby Bowaters would build a factory beside the Thames Mills to develop to the fullest possible extent the tissue market.

During the year the Bowater Steamship Company had been formed to run the Corporation's new fleet of ships, in replacement of a former fleet seriously depleted by war losses. Two new ships had been launched, and another would shortly be ordered.

Speaking of the new Bowater mills in Tennessee, U.S.A., which began production last year, Sir Eric stated that the output rate, already high, had risen in the past six weeks from 145,000 to 160,000 tons of newsprint a year, and from 60,000 to 65,000 tons of sulphate pulp. The machines had also created an all-time world record for newsprint production by operating at 2,100 feet a minute.

The demand for newsprint through the free world was extremely high, and both circulations and the sizes of newspapers continued to increase. It had therefore been decided to instal a new paper-making machine at Tennessee immediately, in addition to the two existing machines. The new machine should be in production by the autumn of 1956 and by 1957 it was hoped that the output of these machines would reach 275,000 tons a year. The additional funds needed for this development, $25,000,000, are being obtained entirely in North America on satisfactory terms.

The Corporation's Canadian mills at Corner Brook, Newfoundland, were to embark on a considerable expansion programme, to be financed entirely out of their own resources. The Corporation had formed a separate company, The Bowater Power Company Limited, to take over and operate the Deer Lake hydro-electric power station near Corner Brook, originally designed to serve the mills but now also serving many other customers in a rapidly developing area. The resulting cash received by the Corner Brook company, Bowater's Newfoundland Pulp and Paper Mills, from the sale of these assets had been applied in redeeming the whole of that company's funded debt.

It is intended that most of the cost of British developments will be provided from the Organisation's own resources, but new capital will still be required. The Corporation proposed shortly to offer Ordinary shares on favourable terms, by way of rights, to Ordinary shareholders, and a resolution for the increase of the Corporation's capital by the creation of additional Ordinary shares was passed at the Meeting. Later in the year the Directors hoped to be able to propose a reorganisation of the capital of the Corporation and its subsidiaries in the United Kingdom, in order to render the capital structure more flexible. It is also hoped that a further funding issue of Ordinary shares can then be made, as foreshadowed in July, 1954.

Bowater's development programme involves, in the United Kingdom alone, a £25,000,000 expansion plan. Four new high-speed paper machines, each costing more than £1,000,000, each longer than a football pitch, form the core of the expansion of the Organisation's mills in Kent and Cheshire.

And in the Tennessee Mills, the installation of another machine alongside the two which were brought into operation as recently as July, 1954, will soon increase the newsprint capacity of these mills, the most modern in the world, by 50 per cent.

LONDON BRICK COMPANY LIMITED

YEAR OF GREAT ACHIEVEMENT

MR A. T. WORBOYS ON A NOTABLE DEVELOPMENT

The fifty-fifth annual general meeting of London Brick Company, Limited, was held on May 24th at Kingsway Hall, Kingsway, London, W.C.2. Mr A. T. Worboys, CBE (the chairman), presided, and in the course of his speech, said: Turning to the balance sheet first, you will see that under the heading of "Capital, Reserves and Outside Shareholders," the authorised capital at £6 million and issued capital of £400,000 8 per cent Cumulative Preference Stock and £3,900,000 Ordinary Stock remain unchanged. Including £292,062 unappropriated balance of profit and loss account, revenue reserves and surplus now amount to £1,217,062. This compares with the figure of £815,261 for the previous year.

No one experienced in the running of manufacturing businesses can have any doubt of the necessity of providing adequate reserves. I think you will agree with me that our determination to pursue a sound and conservative financial policy is in the best interests of stockholders.

PROFIT AND LOSS ACCOUNT

The trading profit and sundry income for the year amounted to £2,205,996, as compared with £1,940,351 for last year. After providing £400,000 for depreciation and £1,027,566 for taxation and other charges, there remains a net profit of £778,430. To this has been added £290,261, the unappropriated profits at the beginning of the year, and £16,346 for taxation adjustment of previous years making available a balance of £1,085,037.

After deducting the transfer of £400,000 to general reserve, the net dividend for the year on the 8 per cent Cumulative Preference Stock, and the net interim dividends of 17½ per cent on the Ordinary Stock, there remains an amount of £292,062 to be carried forward. The directors do not recommend the payment of any further dividend for 1954.

The amount distributed for the year is on the increased capital and is an additional 3½ per cent, or 25 per cent increase on the dividend for the previous year which, incidentally, benefits our employees under our profit-sharing bonus scheme.

SUBSIDIARY COMPANIES

Dealing now with our two Subsidiary Companies—Stewartby Housing Association Limited is in full operation and all the houses are let and prove of great advantage to our employees.

Having regard to our increasing interest in Transformers (Watford) Limited, the manufacturing Subsidiary Company, I feel stockholders should know something of the Company's activities. The demand for the Company's transformers by the British Electricity Authority and by the Area Electricity Boards is increasing, and a reputation for a high standard of workmanship and design has been established.

Orders received during the year are again at a record level, some 50 per cent higher than the previous year, so keeping pace with the increased production facilities.

Export business has been secured in overseas territories. The upward trend in both orders and production has been carried forward into the current year, which inspires confidence in our ability to contribute to the development of the world's electrical power distribution.

PRODUCTION TARGET ACHIEVED

Returning to the parent Company, the year has been one of great achievement. At our last meeting I told you that there was every indication that we should exceed our target of 2,000 millions in bricks and brick equivalents, and it is with some pride that I now tell you that we have achieved our ambition. The production figure for the year is a record—2,050 million bricks and brick equivalents. Our delivery figures, too, are greater than in any previous year in the Company's history.

Following upon the freeing of the Building Industry from control, we have encountered a heavy demand by private enterprise for houses built for sale, in addition to a growing demand for industrial building, but we hope, arising from increased production, to shorten the waiting period for supplies. This should enable our customers to make better planning arrangements.

We take pride in the fact that our extensions and developments have resulted in our playing an important part in the national housing programme, a position which has been generously acknowledged by different Ministers.

Control has gone, but we hope to maintain contact with our appropriate Ministries and give what advice and assistance are needed.

NEW DEVELOPMENTS

Last year I detailed our approach to development and instanced the co-operation existing between our Research, Engineering and Works Departments. I also mentioned the possibilities of a new variant to the range of our facing bricks. In this direction success was achieved in the early autumn. The brick, now known as the "Golden Buff," was brought on to the market in August, and within a matter of weeks the whole output was eagerly taken up, and today the demand is such that, within twelve months of introduction, steps are being taken substantially to increase the output.

The cumulative effect of many improvements has still further raised our efficiency and, whilst the developments and improvements are too numerous to allow me to mention each individually, there is one to which I want to refer. It was introduced deliberately in an endeavour to break the circle of rising costs—followed by increased prices.

In the spring of last year we decided to modify the shape and to increase the volume of the indentation or "frog" as we brickmakers call the cavity in our pressed brick. In making this alteration as an experiment, we were encouraged by the advice given to brickmakers by the Building Research Station to reduce the weight of bricks wherever possible. Our own favourable experience of lightweight building units gained over a period of many years from selling our well-known Cellular brick, in which the cavity principle is incorporated to the fullest practicable extent, still further encouraged us to make the change. Having demonstrated during this year the economy that can be secured by reducing the weight of bricks, we have recently had to decide on a standard shape and size of frog for future production. We therefore have standardised the size of the frog in such a manner as to retain the shape for so many years associated in the building industry with the efficiency of London Brick Company Limited. For still further reductions in weight we must look to our Cellular bricks and to our hollow clay blocks.

THE PRICE OF BRICKS

I have previously expressed concern over the price of bricks and regret that it has not yet been possible to make a general reduction. I am afraid this uncomfortable position still persists. We are entitled to some credit arising from increased production and efficiency which follows from our determination to go forward with our programme of research, mechanisation and improvements and although, as I say, it has not been possible generally to reduce prices, we have been able at least since we last met to stabilise prices in spite of increased charges in various directions. These increases, which are substantial, we have been able to bear, but our hopes of maintaining this position or making any price reductions have received a setback as a result of further increases in wages, fuel and transport charges.

SATISFACTORY PROGRESS OF EXTENSIONS

Throughout last year extensions at two of our hollow clay block works proceeded satisfactorily. Trial block production was commenced at the end of December, less than nine months after the building had been raised from ground level. We now have the largest and most modern clay block works in the world, incorporating design of buildings, plant and machinery of which we can be justifiably proud, ensuring that the maximum use is made of mechanical handling in all sections. At the moment, and as part of this year's programme, extensions are proceeding at the Warboys Clay Block Works.

In reporting to you the record output achieved by our Company last year, stockholders will realise that this could not have been achieved without the full support and co-operation of all our staff and employees, and I take this opportunity of thanking them for their hard work and willing effort.

You will, I know, expect a few words on the current position. Our order and contract books predict that the whole of our output will be eagerly taken up and we shall be fully extended to meet demands made upon us. We have now almost completed five months' trading with satisfactory results and I look forward with confidence to the results that I shall place before you when we meet again next year.

The report and accounts were unanimously adopted.

PRESSED STEEL COMPANY

ANOTHER GOOD TRADING YEAR

STEEP RISE IN OUTPUT

MAJOR ALBERT PAM ON THE OUTLOOK

The twenty-eighth annual general meeting of the Pressed Steel Company, Limited, was held on May 25th at Winchester House, Old Broad Street, London, E.C., Major Albert Pam, OBE, chairman of the company, presiding.

The secretary, Mr F. E. Cairns, CA, read the notice convening the meeting and the report of the auditors.

The following is the chairman's speech, which had been circulated with the report and accounts for the year to December 31, 1954:

Ladies and gentlemen, I am glad to be able to tell you that, as the enclosed accounts show clearly, we have had another good trading year. You will see that the profit for the year, after allowing fully for taxation and for our usual reserve allocation of £250,000 for the increased cost of replacement of our plant, machinery and equipment, is £1,151,331. We therefore have to deal with an aggregate of £2,221,255; we have to deduct from this aggregate the cost of the service on our two issues of preference shares, together £38,957, and also the interim dividend paid on our ordinary stock £136,721, making a total of £175,678.

Out of the balance of £2,045,577 the directors recommend a transfer to general reserve of £500,000 and the payment of a final dividend on the ordinary stock of 15 per cent, less tax, requiring £273,442, which, enables the company to carry forward £1,272,135, against £1,069,924 brought in from last year. So we have increased our total distribution by 5 per cent and increased the carry forward by £202,211.

FACTORS AFFECTING PROFIT

I realise fully that some people are disappointed with these results and believe that we should have shown a profit of at least the amount we saved by the abolition of EPL. But competition has increased and our customers are asking us all the time to reduce our prices so that they can compete better in the export markets. One of the most important reasons for the slightly lower profit margin is that we have this year had to produce many new models, and these of course need a lot of extra labour during initial production. The ouput is slowed up and the costs rise until all the adjustments have been completed.

We have also had to import more sheet steel than we used to do; this foreign steel is much more expensive than British, and we cannot pass on to our customers all the increased cost. About 30 per cent of the steel used in motor car bodies now has to be imported, which is a heavy burden on the industry. For years now we have been trying to help the British motor car manufacturer to reduce his export prices, and we are of the opinion that we have done a great deal in this respect, much more than is generally appreciated.

INCREASING DEMAND

Our output in the number of bodies and parts, and in the £-sterling value, has risen very steeply. Our customers have been increasing their demand for our products and in most cases we have met these demands fully. There are of course cases in which we have not been able to send out all that we have been asked for—this is attributable chiefly to the number of pressings which a modern motor car body requires. We foresaw the heavy demand for pressings more than two years ago and ordered a large number of new presses to deal with it. But these new presses are only being delivered slowly by the British manufacturers—we have not bought an American-made press for many years, although at one time the United States were the only source of supply.

NEW MACHINE SHOP

In Cowley we have this year opened a new machine shop, which I am told is the best equipped in the country for work such as we do. It has all the most modern machine tools and equipment of every kind. It is in a new building and the move to this has allowed us so much more room where the old machine shop was located that we have been able to erect a number of assembly lines there, which we badly needed.

In Linwood we have asked Scottish Industrial Estates to erect for us the building which we had originally planned and then decided that we did not after all require at that time. This will enable us to construct the increased number of railway waggons for which we have received orders and also, possibly, other products for British Railways for which we are now tendering. Linwood is fully occupied with railway waggon construction, ammunition boxes, fuselages for fighter aircraft, and various equipment for Cowley.

Our Refrigeration Department has been able to maintain its previous percentual advantage over other makers in this country; this applies to the combined commercial and domestic installations. Theale has been producing the "sealed units" for our refrigerators in the number we require. This number, of course, varies according to the season of the year, but as Theale works all out for the full 12 months, we can make enough for our needs.

DECISION TO ERECT NEW FACTORY

And I now get to the most important decision to which your directors have come in the recent past, and that is to erect a new factory within easy reach of Cowley, where we can manufacture and assemble those motor car bodies for which we have no room at Cowley. You know that the number of employees in our service was limited after the war to the maximum which we had employed up to then. When the motor car trade expanded so largely in the early 1950's, we told the local authorities that we should hamper the export trade if we failed to deliver the bodies which the trade wanted, and they said that, in the circumstances, they would close their eyes to the excess number we employed.

However, we fully realised that this was only a temporary matter and that we must provide for something much more permanent. We had for years been trying to find a site, not too far from Cowley, which had available labour. We then heard there was a suitable site for industrial development at Stratton St. Margaret in the Highworth Rural District, just outside the Swindon boundary. In addition, Swindon Borough has a housing scheme which has been approved, and this would provide an adequate number of houses for those employed.

A HANDY SITE

This seemed to all of us to be just what we had been looking for and after investigations, which were favourable, we decided to go on with this scheme. In January, before I went to America, we had agreed to build a factory of 300,000 square feet on the site and to engage labour in London. I went to see the site when I came back from the United States and found that our contractors had a large quantity of earth-moving equipment on the spot and had already levelled quite a lot of land and started to sink the concrete pillars on which the buildings will stand. We very much hope that by the end of this year, we shall be able to start production in the new factory at Swindon—there is plenty of room there for very large developments, as we have bought about 138 acres. There will, we are assured, be houses available for our senior staff and management — this is a matter which we have constantly in mind, as we fully realise its importance.

I did not explain how handy the new site at Swindon is. It is less than 30 miles to Oxford and convenient for Birmingham and Coventry, with an excellent direct railway service. We are all confident that this new extension will be of the greatest use to your company. I should like to add that the officers of the Borough of Swindon and of the Highworth Rural District have been most helpful and co-operative.

THE FUTURE

As to the future, this is anybody's guess. At present there appears to be a good demand for motor cars, and while this lasts we shall prosper; if demand falls, we shall not make so much money, but we have got good diversification and do not depend altogether on motor cars, although they represent our most important business. I have just been in the United States, where generally the population can see no end to the expansion of production, although when you ask them who is going to consume all that is being produced by every industry, they say that there is no limit to what America can consume! This I cannot believe, and in a way the same question applies to our own industrial position, where production has increased enormously and is still increasing. In fact, in his Budget Speech the Chancellor of the Exchequer said that production must increase if we were to pay our way, but he did not say who was to buy all that was made.

Finally, I hope that you will allow me, on your behalf, to thank the management, the staff and all employees for their good work and the interest which they have shown in the past year—the results of the company for 1954 are the best proof of this.

The company's accounts were signed by the auditors and approved by the board before the announcement by the Chancellor of the Exchequer of a reduction of 6d. in the standard rate of income tax. This will affect the accounts submitted to you herewith, but as the accounts, as printed, are the audited accounts, we have no practical alternative to sending them out in their present form. The necessary adjustment will be made in the accounts for 1955, but the 15 per cent dividend paid to you will be subject to a tax deduction of only 8s. 6d. and not 9s.

The report and accounts were unanimously adopted; the proposed dividend was approved and the retiring directors, Mr F. E. Cairns, CA, and Mr W. E. Lambourn, were re-elected.

Brigadier Schrieber proposed a vote of thanks to the Chairman and Directors and moved a resolution increasing the Fees of the Board with effect from January 1, 1955. The resolution was seconded by Colonel Archdale and carried unanimously.

INNS AND COMPANY

RECORD TRADING RESULTS

The twentieth annual general meeting of Inns and Company, Limited, was held on May 20th in London.

Mr Walter Wallace (Joint Managing Director) presided, and in the course of his speech said: The Company has had a good year's trading, and you will be happy to know that every department of your business has had an increase in turnover during the year under review. This has resulted in a record trading profit for the year 1954, as shown by the accounts, of £540,378, and a net profit of £432,417, being increases of £107,302 and £80,144 respectively over those of the previous year.

The Fixed Assets show, under the heading "Freehold Land and Buildings," an increase of £52,469 over last year, and it is worthy of comment that the total cost to the Company thus amounts to over £1 million and, after depreciation, shows a value of £844,603, as set out in the Balance Sheet.

This is an asset, not only of great capital value, but of real trading value to your Company, and is represented by Freehold lands well situated for a convenient and economical carrying on of your Company's various businesses. This asset of Freehold Land and Buildings is entirely free from any mortgages, charges, debentures, loans or other encumbrances.

Your Directors' policy has been consistent throughout the Company's history in the maintenance of the Company's plant at a high standard of efficiency, and this policy has been pursued during the year.

Shareholders will observe from the Balance Sheet that the Company is in a strong financial position.

I again call your attention to the very heavy demands made upon your Company in respect of taxation, and the Board regret that the Chancellor has not yet taken any steps to allow relief in respect of wasting assets, as recommended by the Millard Tucker Committee.

I am happy to report that trading for the current year compares favourably with that of 1954, all departments being operating satisfactorily.

Your Company is well equipped to carry out successfully whatever demands may be made upon it in connection with any Road Programme or other National Works.

The report and accounts were unanimously adopted, and the total distribution of 30 per cent, less tax, on the ordinary shares was approved.

P & O STEAM NAVIGATION COMPANY

COMPANY'S ANNUAL GENERAL MEETING, MAY, 1955

CHAIRMAN'S SPEECH

The Chairman, Sir William Currie, GBE, began by thanking the staffs ashore, afloat and at the Agencies for loyal and efficient service. It was the Management's aim to foster the "human touch" and make those at sea feel part of one family with those ashore.

On the Accounts, the Group surplus after Taxation at £5,226,000 did not differ materially from the 1953 surplus of £4,953,000. The proportion of the surplus remaining with the P & O Company was £1,693,000 from which £311,000 had already been paid in dividend, a final dividend of £985,000 was proposed, making a total of £1,296,000 for the year, and £400,000 to be placed to Reserve. The deferred dividend, which stood in 1939 at 6½ per cent, had risen in 1949 to 12 per cent and thereafter had been increased every single year. The dividend policy had thus been neither static nor unattractive to Stockholders.

There had been good reasons for conserving the Group reserves during the ten postwar years, because there had been so many unknown factors such as type, number and cost of ships for replacement; secondly, the impossibility of estimating the scale and requirements of the trade opportunities open as a result of the war; and the increasing price levels.

A postwar pattern had emerged last year which enabled them to take stock. That seemed an appropriate moment to look at their capital structure and have a survey made by Lazards and Deloittes.

The financial structure of each of the important subsidiaries and of the P & O Company itself had been examined. Some of the subsidiaries were taking steps to increase their capital and permission had been received from the CIC to capitalise further P & O reserves and to make a new scrip issue of one for one. It should not be assumed that any larger total distribution on the Deferred Stock would necessarily follow from that issue. It was, however, the intention to reduce to some extent the disparity between the interim and final distributions.

The non-shipowning subsidiaries were not a separate interest but were all linked in different degrees with the shipowning companies of the Group. It would thus be misleading to isolate them in the Accounts.

As for the organisation of the Group, the P & O was both a trading and a holding company, but it represented historical growth and not deliberate creation. Subsidiaries were left enough freedom to keep them vital. P & O could only shed its trading interests and become purely a holding company at the cost of heavy additional tax burdens, so they had decided to follow a line of administrative devolution. The Chairmen of five of the subsidiaries had been appointed to the P & O Board.

The practice of financing capital expenditure programmes as far as possible from the business was well justified. They must take a long-term view of their policy on capital investment, but this must eventually pay for itself and earn a fair return having regard to the risks run.

The net dividends paid in 1954 represented 1:1 per cent of the net assets of the Group.

Nevertheless they were firmly convinced that investment in ships would be necessary in the future and could be made remunerative.

TELEGRAPH CONSTRUCTION & MAINTENANCE

The ninety-first annual general meeting of The Telegraph Construction & Maintenance Company, Limited, was held on May 24th in London, Mr John N. Dean, chairman, presiding.

The following is an extract from his circulated statement:

My first statement to you enables me to record another satisfactory year, despite the fact that the profit rate is becoming lower due to ever keener competition. In the early part of the year, orders came in very slowly for our cables division, particularly so far as power cables were concerned, but in the latter part there was a substantial improvement, and we ended the year with an order book, in each division, very substantially larger than in the opening period: in fact, our combined order book is nearly an all-time record. The effect of these leaner months, however, coupled with a reduced rate of profitability, has slightly reduced our balance of trading account.

The year 1954 was again a period of unprecedented activity in our engineering division, for not only has the expansion of our cables division been proceeding, and the new plastics division at Farnborough been set up on a wider basis, but the Transatlantic telephone cable project has been transformed into a first-class engineering reality.

The plastics division is very active indeed. Our research division has had a very busy and satisfactory year, and recently we have widened the scope of the division.

The report and accounts were adopted.

CROSSE & BLACKWELL (HOLDINGS)

NEW SALES RECORDS

The thirty-fifth ordinary general meeting of Crosse and Blackwell (Holdings), Limited, was held on May 25th in London, Sir Sydney Parkes, CBE (the chairman), presiding.

The following is an extract from his circulated statement:

During the year we have welcomed the disappearance of the last of the food controls, but it has not been without a steep increase in the price of many commodities. Then again we have been concerned at the rising tide of charges for freight, fuel and labour, all very important factors in our business. The answer to all these questions is a greater volume of sales.

The products of our main trading company, Crosse and Blackwell, Limited, continue to enjoy an ever-widening demand, and I am very pleased to report a healthy increase in sales.

In the overseas markets we have again achieved a new sales record, but import quotas and exchange control in some countries have hindered full development.

The trading profit in the consolidated profit and loss account amounts to £1,147,757 and, after providing for all expenses, but before taxation, the total is £988,740, compared with £1,199,177 in 1953. Taxation takes a smaller amount, estimated at £522,000, against £665,000 the previous year. The net profit for the year is £446,679, being £66,846 less than in 1953. The directors recommend a final dividend of 7½ per cent actual, less income tax, making a total of 12½ per cent. The report was adopted.

BRITISH INSULATED CALLENDER'S CABLES

GROUP TURNOVER MAINTAINED

MR W. H. McFADZEAN ON PROBLEM OF RISING COSTS

The tenth annual general meeting of British Insulated Callender's Cables Limited will be held on June 14th in London.

The following is an extract from the Statement by the Chairman and Managing Director, Mr W. H. McFadzean, CA:

Although Turnover of the Group has been maintained in total, Profit on Trading has fallen by £981,494 to £7,362,580, almost wholly due to lower profit rates. Many factors have contributed, but the two most important have been the uneven load and intensified competition.

Competition is a challenge that must be accepted, and your Group are meeting it by ever-increasing efficiency in technique in production and indeed in every field of our activity.

Following the fall in Trading Profit, one would have expected a decreased charge for Taxation. This charge is, however, little altered at the immense sum of £2,736,162, as the benefit of the decreased tax payable this year following the lower profits has, from a comparative point of view, been offset by the special credits brought into the 1953 Accounts from (a) Excess Profits Levy Refund, and (b) the release of taxation provisions made in earlier years following settlement on several major outstanding points.

Stockholders will recall that although we are providing adequate Depreciation to write off the cost of our Fixed Assets such provision is insufficient to provide for their replacement at present prices. An up-to-date assessment shows the necessity of increasing the Reserve for replacement of Fixed Assets to £3 million by the £500,000 now proposed.

Having in mind the heavy capital expenditure to which we are committed, the further strengthening of General Reserve by £500,000 is clearly desirable.

Your Directors also recommend the same distribution to Ordinary Stockholders as was made last year, namely, a Final Dividend of 7½ per cent, less income tax (making, with the interim of 2½ per cent already paid, a total of 10 per cent, less income tax), plus a Special Distribution of 2½ per cent, free of income tax, out of the "Realised Capital Profits Reserve." As this latter Reserve will then be reduced to £148,509, it will be appreciated that this is essentially a special distribution.

Total Assets now amount to almost £65 million, with Reserves of one and a half times the Issued Capital.

As one of the largest fabricators of copper in the world, the BICC Group are vitally concerned with the supply and price of that metal. The supply position in this country during 1954 was normal, but the price increased substantially over the year and there were many wide fluctuations from day to day.

The problem of introducing greater stability into the copper market is continuing to receive the active consideration of many parties. I hope in the interests of the country and the Industry an early solution will be found.

We have made a good start to 1955, and in the absence of exceptional happenings I feel we can look forward to a satisfactory year.

JOHNSON & PHILLIPS, LIMITED

MR G. LESLIE WATES'S REVIEW

The fiftieth annual general meeting of Johnson & Phillips, Limited, was held on May 19th in London.

Mr G. Leslie Wates, JP, CompIEE, chairman and joint managing director, in the course of his speech said: The early part of the year was particularly difficult and the intake of new business was at a very low rate. There was, fortunately, some revival towards the end of the year. Costs, however, on all accounts continue to rise.

I will now refer to the expenditure, exceeding £80,000, on the reconstruction of certain buildings and the contribution of £50,000 towards this from the revenue reserve. We have taken the opportunity to extend and modernise the Cable Shops and also to rebuild the Cable Test and Research Department. I think I can without risk of denial claim that our present Paper Cable Shop is one of the best in England. I reported to you last year that we had acquired a factory at New Cross and that we have called it the Elizabeth Works. This will provide more room for certain of our departments.

The balance sheet shows Current Assets at £4,721,000 and Current Liabilities, including the proposed dividend, at £1,867,000, an excess of liquid assets of £2,850,000, which is satisfactory. We have during the year issued the balance of the Cumulative Redeemable Preference Shares to assist with the purchase and alteration of the Elizabeth Works.

The directors constantly have before them the question of provision of further capital for the company, but have no recommendation in this connection to make to shareholders at the present time. We propose for the time being to rely on the Bank facilities. The report and accounts were adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LTD.

(Incorporated in Northern Rhodesia)

RECORD ZINC PRODUCTION

SIR ERNEST OPPENHEIMER'S REVIEW

The following are extracts from the Statement by the Chairman, SIR ERNEST OPPENHEIMER, which has been circulated with the Report and Accounts for 1954.

The year under review, marking as it did the jubilee of the Company's foundation, is of more than ordinary interest. Fifty years ago, when the Company began operations, it was a pioneer faced by many obstacles in a primitive, undeveloped country; to-day the thriving town and community of Broken Hill are evidence of its achievements. These achievements are the results of a policy of courage and tenacity consistently pursued despite many reverses and difficulties.

In 1954, zinc production achieved a new record and lead production was the highest since 1947. The fiftieth anniversary celebrations held on the 16th December last year thus set the seal on a half century of courageous and successful endeavour.

We can now claim that the Company has reached a stage of relative stability and has many years of fruitful activity ahead of it.

During 1954 the London Metal Exchange prices for both lead and zinc were reasonably steady, with a general trend upwards, and the profit for the year shows a welcome increase of about 18 per cent over that for 1953. True, lead production was still adversely affected by continuing difficulties in the operation of the new lead plant; but the consulting engineers are satisfied that it is inherently sound in design, although the operational problems, almost inevitable with any new plant, have been more troublesome than was anticipated.

The Directors in their report refer to changes made in the balance sheet to show the Company's capital and capital reserves more realistically in relation to expenditure on assets of a fixed nature. I should like to draw the attention of members to the significance of the figures now presented. These show that retained profits—which have been provided from earnings subject to taxation—are in excess of the total subscribed by way of share capital and share premium.

Another change will affect the future publication of metal production figures. In the past these have been issued monthly. Your Board feels that quarterly reports, by averaging output over periods of three months, will give a truer picture of activity than monthly ones, and also bring the Company's practice into line with that of other mining companies.

The current capital expenditure programme provides for the erection of 365 new houses for married Africans. During the year African conditions of employment were further improved by the institution of a non-contributory pension scheme and a paid leave scheme. These benefits are in addition to the existing long service and retirement bonus payments made to African employees. In June, 1954, twenty-eight African employees who had been with the Company for 20 years were each presented with a wrist-watch as a token of their long service.

Relations with the Northern Rhodesia Mine Workers' Union and the Mine Officials and Salaried Staff Association continue to be harmonious. Details of amendments to the bonus scheme for European employees are given in the Directors' Report.

SUMMARY OF OPERATIONS

	1954	1953
FINANCE		
Operating profit	£1,489,973	£1,277,887
Taxation	£452,000	£381,856
Dividends—total	£812,500	£650,000
Dividends—per unit of stock, net	1s. 3d.	1s.
METAL PRODUCTION		
Tons of ore treated—short tons	135,886	141,649
Average grade—percentage of lead	19·2	18·0
percentage of zinc	28·7	29·1
Production—long tons: zinc	26,550	25,130
lead	15,000	11,510
ORE RESERVES		
Proved reserves	1,463,400	1,543,500
Indicated reserves	909,100	973,700
Total extractable reserves—short tons	2,372,500	2,517,200
Average grade—percentage of lead	17·3	17·2
percentage of zinc	26·0	26·7
Allocation of reserves:		
Extractable reserves—short tons:		
Oxide ore	914,800	1,009,700
Sulphide ore	1,457,700	1,507,500
Total	2,372,500	2,517,200
Broken ore in stopes underground—short tons	159,300	140,000
Surface stockpiles—oxide ore—short tons	237,000	254,000

THE BRITISH OXYGEN COMPANY, LIMITED

GRATIFYING EXTENSION OF SALES

The sixty-ninth annual general meeting of The British Oxygen Company, Limited, was held on May 24th in London.

Mr J. S. Hutchison (the chairman), in the course of his speech, said: The Consolidated Profit at £4,736,856 after charging Depreciation of £2,189,618 shows an increase for 1954 of £411,881 which came directly from a gratifying extension of sales and improvement in earnings of our larger Overseas Associated Companies. In Britain, the growing business of the Chemicals Division made an additional profit contribution but considerably increased turnover of the Industrial and Medical Divisions no more than enabled us to meet reduction of selling prices in some spheres and to absorb increase of costs in others. There was little change in the Equipment and Electric Welding fields.

INDUSTRIAL AND MEDICAL DIVISIONS

In Britain, 1954 was a year of marked expansion in the use of Industrial gases. The increase in oxygen sales was again mainly in the larger quantity bracket and we have passed on the benefit of increased scale in price reductions and in absorption of cost increases.

Dissolved Acetylene and Propane have shown satisfactory sales increases in relation to their use as fuel gases with oxygen.

Argon maintains its rapid advance in popularity for special welding and other purposes where an inert atmosphere is of importance. Our policy of continual price reduction as use grows has helped to establish Argon in a very short time as a gas of considerable industrial importance. As expected, sales of the other rare gases again increased although the totals remain relatively small.

Sales of Medical Oxygen, Nitrous Oxide and other anaesthetic gases grow steadily and the criterion here, of course, is excellence rather than quantity.

OXYGEN SUPPLY POLICY

Our policy is to make oxygen available to each type of user on the most economic basis, supported by a very progressive technical service and with reliability of supply. Four principal methods are used. Small, intermittent or scattered demand is met most easily and cheaply by supply in high-pressure cylinders, and this is a daily supply service. Larger demand on one site is met more conveniently and more economically by the installation of liquid oxygen evaporating equipment in customers' premises, which gives great saving in transport, and in handling when the oxygen is piped to the points of use. This second method caters for quantities of from 20,000 cu ft to 2 million cu ft or more per week. In the third case of greater use again, increased convenience and balance in economics are afforded by a supply pipelined direct from a nearby oxygen producing works which may be directly matched to use by the simple opening and closing of a valve.

Lastly, where there is a really large continuous use in the chemical, steelmaking and gasification industries for example, a case arises for the special siting of an oxygen production plant in proximity to the main point of use, and we have several such projects in hand. At this end of the scale oxygen is measured in tons and when a ton of oxygen is 26,000 cu ft and a "tonnage" oxygen plant may produce 100 tons or 200 tons or more of oxygen per day seven days per week, it will be understood just how soundly the economics of such a supply must be based and the value there is in our long experience in the problems involved in such cases.

PROSPECTS

In the main Industrial Gas field in Britain costs are still moving against us. We know that we shall have a large increase in sales but this will lie mainly in the very large quantities category which is accorded the keenest price basis. These very large additional supplies, too, are drawn from costly new plants which require time to settle into their due place in the general economy of our nation-wide organisation. I do not foresee, therefore, any great change in the results of the Industrial Division during the nine months' period to the new balancing date on September 30th next.

Equipment manufacture and Electric Welding interests are governed by notable increases in costs and improvement is likely to be gradual rather than quick.

The Chemicals Division should maintain its as yet modest contribution to our profits despite the sharp continental and other competition its various products have to face.

Our Overseas Companies continue to enjoy favourable conditions. Last year, I suggested, correctly as it turns out, that there might be some improvement Overseas—this year I am sure there will be.

Overall, there are many features of encouragement and I look to a favourable result in 1955. Our whole business today is entering a phase of wide development, full of opportunity, and I have great confidence in the outcome. A development phase, however, can be an expensive phase, and I am sure it is wise to take a prudent view about the improvement in results to be expected—at first.

The report and accounts were adopted.

UNITED MOLASSES

The twenty-ninth annual general meeting of United Molasses Company Ltd. will be held on June 14th in London.

The following is an extract from the statement by the chairman and joint managing director, Mr G. W. Scott, CBE, for the year 1954:

The combined gross profits of the company and its proportion of subsidiary companies' profits amounted to £4,313,573, compared with £4,946,906 for the previous year. This reduction in gross profits bears out my forecast of twelve months ago, namely that the impact of lower shipping freights would result in some decline. In spite of this, however, the net profits show a small increase from £1,277,873 to £1,319,427 entirely due to the reduction in the charge for taxation largely occasioned by the welcome lifting of excess profits levy and the relief obtained from investment allowances.

Once again in order to supplement the return to ordinary stockholders your directors have felt justified in recommending in addition to the final dividend, that a special cash distribution of 4 per cent, not subject to income tax, be paid out of the capital profits which have been credited to the capital reserve during the year.

Molasses prices during 1954 remained relatively stable and reasonable and these conditions were largely responsible for an increase in consumption. Furthermore, the exceptional value of Molasses for animal feeding purposes is becoming more widely appreciated.

Present indications are that the gross profits for the ensuing year will be satisfactory, but possibly at a slightly lower level than those for 1954. Profits should, however, be maintained at a level sufficient to cover normal dividend requirements.

THE SEA INSURANCE COMPANY LIMITED

GROUP ASSETS EXCEED £16 MILLION

The seventy-ninth annual general meeting of The Sea Insurance Company, Limited, was held on May 24th at the Exchange Hotel, Liverpool. A statement by the chairman, Major A. Harold Bibby, DSO, DL, had been circulated with the report and accounts for the year ended December 31, 1954.

Before dealing with the accounts for 1954, Major Bibby referred to the increase in capital and said that of the authorised capital increase from 500,000 to 1 million shares, only 100,000 shares had so far been issued, the balance of 400,000 remaining under the control of the directors; he added that the new issue had been an unqualified success.

There were no changes to report in either the head office or local boards during the year, but a local board had been established in South Wales and Mr Julian S. A. Hodge and Mr Cyril R. Morgan had agreed to become the first members.

THE ACCOUNTS

Referring to the accounts, the chairman reported that the total income of the company, excluding life and capital redemption, amounted to £4,047,700, as compared with £4,130,483 in the previous year.

In connection with marine business, premiums had fallen from £1,992,678 to £1,827,407. These figures reflect the continued policy of restricting underwriting and of declining to accept business which gives no reasonable prospect of profit.

Nineteen-fifty-three marine underwriting account has been closed after charging £487,346 to meet outstanding claims and a credit balance of £132,298 has been transferred to the profit and loss account.

The premium income of the fire department amounted to £1,213,266 and a profit of £80,074 was transferred to profit and loss account.

Major Bibby reported that for the first time the accident department premium income had exceeded £1 million, although the year's results had been unprofitable and the account shows a loss of £69,440.

Turning to the Beacon Insurance Company, Limited, accounts, the chairman referred to the marked progress of the life assurance and capital redemption accounts. The life assurance fund has increased by nearly £500,000 and total new business reached a record figure of £7,028,413.

A sum of £135,000 has been reserved for United Kingdom taxation.

A final dividend of 15 per cent was approved, making 25 per cent for the year, the same as the previous year.

The total group assets now stand at £16,252,935, an increase of £504,963 over last year. The market value of investments is substantially in excess of the value shown in the balance sheet.

The Accounts were adopted and Major Bibby paid tribute to the work done during the year by the Company's agents at home and abroad. The Meeting closed with a vote of thanks to the Chairman and Directors, also officers and staff of the Company.

HIGHLANDS & LOWLANDS PARA RUBBER COMPANY, LIMITED

MR T. B. BARLOW'S REVIEW

The Forty-ninth Annual General Meeting of The Highlands & Lowlands Para Rubber Company, Limited, was held on May 24th in London.

Mr T. B. Barlow, the Chairman, in the course of his speech, said: The Accounts for 1954, after allowing £67,255 for depreciation of buildings and machinery, show a group profit of £64,337 which is within £150 of the 1953 figure. It has been possible to write back £38,000 of Taxation over-reserved in previous years and with the balance from 1953 there is a sum of £154,612 to appropriate. The Board have transferred £28,500 to Replanting Reserve, £46,500 to Taxation Reserve, and recommend a dividend of 10 per cent costing £26,995, and £52,617 is carried forward. A cash distribution of 2½ per cent costing £11,737 is also recommended and, being of a Capital nature, the 2½ per cent will not attract either income tax or surtax.

One of the financial papers in reviewing the Company's Accounts states that the estate cost of production of rubber was 10.8d. per lb, a statement which may easily be misleading because it refers only to estate expenditure and omits export duty and cess 1.54d., depreciation 3.01d., freight and selling charges .88d., London expenses .27d., and replanting 1.5d., which gives a total of 18d. per lb. All these are necessary items to the continued production of rubber, and presuppose that it is sold on c.i.f. terms. A further ½d. for landing should be added to give a cost figure comparable to the London spot price.

Your Board have for many years refrained from quoting figures of cost because they can be calculated in so many different ways. The true figures, which must of course include either replanting expenditure or obsolescence allowance.

Estates.—The chief event is that during the year 632 acres have been replanted of which 541 acres were rubber and 91 acres oil palms. The rubber figure constitutes a record for the Company and although 541 acres of old rubber have been cut out, the crop for the year increased from 3,576,762 lb to 3,750,286 lb and the crop per acre rose from 421 lb to 467 lb.

NATURAL AND SYNTHETIC RUBBER

It would be idle to ignore the very great increase in synthetic production and now that many of the American synthetic plants have been sold to private interests, which are the chief consumers, there can be no doubt that they will continue to be worked to the greatest financial advantage and there will be keen competition for the natural rubber market.

The potential outlets for rubber are so vast and are expanding so rapidly that there does not seem to be cause for undue alarm, but it is idle to overlook the fact that the producer of the synthetic product is often directly controlled by a consumer and therefore knows exactly what is required. In this way the synthetic rubber industry conforms to most modern industries which by their vertical organisation recognise and act upon the fact that distribution is a function of production.

If the plantation industry is to hold its position no time must be lost in improving the plantation product. Much work has already been done in the matter of technically classified rubber. This Company was one of the earliest to make use of the assistance offered in this matter by the RRI, but this can only be the beginning of the process of producing a natural product with the required physical and chemical characteristics.

The time is probably soon coming when it will no longer suffice to produce a commodity to be sold on its appearance. And if in the face of the growing competition of a synthetic product with uniform chemical reaction, natural rubber is marketed as a substance of varying chemical and physical reactions, the outlook will be dim.

There can be no doubt that if Malaya is to retain its advantage and main source of revenue, the industry must agree on considerably greater scientific research.

OUTLOOK

Singapore has had its local elections and returned a Labour Party to office. The Malay States are to hold their elections in July and it would seem probable that the local leaders will recognise the necessity for maintaining and attracting foreign capital, for it is only by foreign capital that Malaya has been built up during the last 60 years into one of the most prosperous territories in the world.

As to our prospects for the current year, palm oil is a quiet market at about £80 a ton and in view of the weight of current and near-future shipments from West Africa it would not be surprising if the market goes lower. The Company's estimated palm oil crop for 1955 of 1,900 tons is 150 tons more than the previous year. With just over 1,000 acres of young palms planted in 1950 and 1951 coming into bearing, the palm oil crop will continue to increase.

World production and consumption of natural rubber appear to be evenly balanced at 1,845,000 tons and 1,830,000 tons. A difference of 15,000 tons in totals of this order is obviously of very little consequence. The current price of about 27d. per lb is apparently reasonably satisfactory both to producers and consumers alike, so that the outlook for the current year—always providing nothing unforeseen occurs—would appear to be fairly good.

The Report and Accounts were adopted.

E. POLLARD AND COMPANY

The forty-third annual general meeting of E. Pollard & Company Limited was held on May 24th in London.

Mr H. Edward Pollard (chairman and managing director), who presided, said:

The profits for the year are £191,000, which is a decrease of about £3,000.

In April, 1955, a Capital Dividend of £80,000 was received from a Subsidiary Company and your directors are recommending a Capital Dividend out of this sum at the rate of 20 per cent on the Ordinary Share Capital. This dividend will be paid without deduction of Income Tax and will not be subject to Income Tax or Sur-Tax in the hands of the shareholders.

Taking the year as a whole, I feel that the results were satisfactory. We experienced, particularly in the latter half of 1954, a stronger demand for all our products.

As regards the Shopfitting section, the improvement was concentrated in the last three months of the year, and then almost for the first time since the war ended we were at full production.

There has been a very steady increase in the sales of Hammond and Champness high quality, fast silent lifts. Haskins Rolling Steel Shutters have a substantial export trade as well as a very steady home market demand.

Competition has been fairly strong in both these products, but we ended the year with a record book of contracts.

We are starting 1955 with a full order book.

The report was adopted

UNIVERSITY OF READING

The Council invites applications for an ASSISTANT LECTURESHIP IN AGRICULTURE with special reference to Farm Management and Work Husbandry. Applicants should have an honours degree in Agriculture or Agricultural Economics or possess equivalent qualifications. The salary will be within the range of £550 p.a. to £650 p.a.—Further particulars may be obtained from the Registrar, by whom applications should be received not later than June 30.

BEECHAM GROUP LIMITED have a vacancy for an Assistant Technical Controller for their Overseas Division. The successful applicant must be a Qualified Chemist or a Qualified Chemical Engineer and must have held the position of Works Manager of a factory within the Pharmaceutical or Chemical Industry and be experienced in modern production methods. The position entails co-ordinating the technical activities of Overseas factories (under the direction of the Technical Controller) in the field of both production and quality control and will necessitate visiting overseas factories when necessary. Profit Participation and Pension Schemes in operation.—Apply in writing only, giving full details of age, qualifications and experience, to Personnel Controller, Beecham Group Limited, 68 Pall Mall, London, S.W.1.

COMPANY SECRETARY AND ACCOUNTANT shortly required by leading wholesale fashion firm to take full charge of its office administration. Five-day week. Responsible and progressive position with good salary. Experience of punched cards, useful but not essential.—Write Managing Director, Dorville, 14 John Prince's Street, London, W.1.

ECONOMICS Graduate, several years' experience Market Research, seeks position as economist with manufacturing company operating or developing a market research department.—Box 947.

ULSTER FARMERS' UNION

Applications are invited for the position of

DEPUTY SECRETARY

whose duties will include work in connection with the establishment of Agricultural Marketing Schemes and the compiling of statistical and economic records relating to Northern Ireland agriculture.

Applicants who possess a University degree in law or in economics will receive prior consideration. An agricultural background is a desirable asset.

Subject to qualifications and experience, the salary will be £1,000 x £50 to £1,250 and the upper age limit will be 40. The appointment is subject to a probationary period of one year.

Applications, accompanied by copies of testimonials, to be addressed to The General Secretary, Ulster Farmers' Union, 18 Donegall Square East, Belfast, not later than Saturday, June 11, 1955.

EXCELLENT opportunity and good prospects for three technical and business managers for expanding private companies, situated 15 miles S.W. of Central London, engaged in Domestic Appliances, Refrigeration and Automatic Controls respectively. Salaries offered range between £1,000 and £1,500 p.a.—Applicants between 35 and 45 to furnish, in confidence, particulars of age, education qualifications, experience, present and required emoluments to Box 965.

VACANCY with reputable London Company for British-born man aged 35-45. Qualifications: Sales Executive on a nat... with proven record. University education preferred and German an advantage. Perfect health. Car ... Four-figure post with permanency and pro...

COMPANY employing approximately 200 ... goods and selling to electrical indust... —Box 952.

ROYAL TECHNICAL COLLEGE OF EAST AFRICA

(Principal: Major General C. Bullard, CB, CBE, B.Endg, MIMechE, MIEE.)

Applications are invited for the following posts in the Commerce Department, tenable from January, 1956:

LECTURER and ASSISTANT LECTURER in ACCOUNTANCY, to teach up to final professional standard. Candidates should have professional qualifications and, preferably, degrees; also professional and teaching experience.

LECTURER in LAW, to teach mercantile and company law to final professional level; ability to teach other legal subjects, such as elements of English law and law of real property, to lower level an advantage. Candidates should be graduates, preferably with professional and teaching experience, but accountants with experience of teaching legal subjects would be considered.

LECTURER in PUBLIC ADMINISTRATION and ECONOMICS. Qualifications: good hons. degree, experience of teaching P.A. to diploma standard, ability to assist with teaching of economics. Knowledge of organisation and methods an advantage.

ASSISTANT LECTURER in ECONOMICS and GEOGRAPHY, to lecture up to inter. standard. Qualifications: degree and, preferably, teaching experience.

The College, established under an autonomous Governing Council by the Royal Technical College of East Africa Act, 1954, is being built in Nairobi as the main instrument in British East Africa of higher technical and commercial education for students of all races and will admit first students in March, 1956.

Salary scales (including temporary c.o.l.a.): Lecturers, £1,162-£1,637 p.a.; Assistant Lecturers, £937-£1,241 p.a., or slightly lower for transferred staff wishing to retain Colonial Government pension rights. (Scales quoted are for staff who would contribute to proposed College pensions scheme or maintain existing rights under, e.g., FSSU or Ministry of Education, with College paying employer's contributions.) Starting salaries according to qualifications and experience. Partly furnished houses or flats provided, rent according to salary. Free first class passages to and from Kenya on first appointment, leave and normal retirement for persons appointed and wives; up to equivalent of one adult passage for dependent children under 21. Leave on full salary at rate of four days for each month's resident service. Tours of service 24-36 months.

Write for further information to Secretary, Advisory Committee on Colonial Colleges, 1 Gordon Square, London, W.C.1. Closing date for applications (six copies) June 20, 1955.

NEW ZEALAND MARKET

A well-established, keen and experienced importing firm with first-class trade credentials and offices in Auckland, Wellington and Christchurch desires to expand its activities. We seek exclusive agencies from manufacturers. Can we discuss the sale of your product in New Zealand? References Bank of New South Wales, London. Write direct to Mair and Co. (Importers), Ltd., P.O. Box 1477, Christchurch, N.Z

B.Sc.(ECONOMICS) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above Degree (open without residence), which is a valuable qualification for executive appointments in commerce or industry, government or municipal posts. The College founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, free from Registrar (60), Burlington House, Cambridge.

CHIEF ACCOUNTANT: Departmental stores group (5,000 employees) invites applications for this senior executive appointment at its head office in Liverpool. Candidates should be about 35 years of age, professionally qualified, and have a minimum of 10 years' experience in industry. The company seeks a man who has wide experience of the introduction and application of budgetary control; he should also be conversant with the most modern accounting and statistical methods. In addition he must have an enquiring mind accustomed to the production of control information, rather than mere figures, for management. The commencing salary will be £2,500 per annum plus pension rights under a contributory scheme. Applications, stating age, education, full details of career and salaries earned should be made to Cooper Brothers and Co., Chartered Accountants, 14 George Street, Mansion House, London, E.C.4.

CHEMIST required by large Rubber Factory situated in the London area. This post is a unique opportunity presenting unparalleled prospects for an energetic, capable and experienced man; salary minimum £1,100 per year, but according to ability and experience; non-contributory pension scheme, together with use of car. Housing accommodation would be provided if necessary.—Applications to be sent to Box 963 and will be treated in the strictest of confidence.

THINKERS' HOLIDAY ORGANIZATION.—1955 Summer School, "Democracy in the Atomic Age." Buxton, August 13-27. Speakers include H. J. Blackham, Prof. E. Devons, Prof. S. E. Finer, the Rev. G. J. G. Grieve, Wilfrid Harrison, Sir Will Lawther, Prof. H. Levy, D. A. Routh.—For details apply to The T.H.O., 8 Kenton Street, London, W.C.1. Visitors from abroad especially welcome.

"TRAINING FOR MANAGEMENT."—Pitman Home Study for all Management and Secretarial Examinations; also Hospital Administration. Personal tuition. Details of courses from Pitman Correspondence College, 54, Pitman House, Godalming, Surrey.

BEFORE YOU BUY those shares, see what the *Investors' Chronicle* has to say. It is the best-informed and widest-read financial weekly. Two issues free of charge from 30 Grocers' Hall Court, London, E.C.2.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (*periodicals excluded*).

STENOTYPING (MACHINE SHORTHAND), the modern method of taking notes, dictation and verbatim reports. For prospectus of secretarial courses including Stenotyping, call, write, or 'phone Palantype College, 229/231 High Holborn, W.C.1. Telephone: HOLborn 9162.

COLEG PRIFYSGOL CYMRU
UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

RESEARCH STUDENTSHIPS IN THE SOCIAL SCIENCES

Applications are invited from graduates of any British or Commonwealth University for two Research Studentships in the social sciences. The Studentships (of an annual value of £300-£400) will be awarded for one year in the first instance, but will normally be renewed for a second year. Applicants should state their proposed subject of research, which should be within the fields covered by Economics (including Agricultural Economics), Economic and Social History (including Welsh History), Human Geography and Anthropology, International Politics, Political Philosophy and Law.—Applications, giving the names of two referees and addressed to the Registrar, should be received not later than July 23rd.

P. J. CARROLL & COMPANY, LIMITED

TOBACCO MANUFACTURERS, DUNDALK, IRELAND

invite applications from suitable, qualified Accountants for the position of "Comptroller," which will be an interesting post with a substantial salary and excellent prospects.

Considerable importance will be attached to the personality and presence of a candidate, who must have experience in Manufacturing Industry, together with a sound knowledge of Budgetary Control, Standard Costing, Forecasting, Statistical Methods and the provision of control information for Top Management.

Candidates should address their applications, giving full details of age, experience and qualifications, and marked "Comptroller," to the Chairman, P. J. Carroll & Company, Limited, Dundalk, Ireland.

EXTRUSIONS BY MARLEY

Buyers requiring rigid and flexible tubes and sections in thermoplastic materials should ask for a quotation from Marley Extrusions Limited, Dept. 99, Lenham, Maidstone, Kent. Harrietsham 381.

KENT.—ABSOLUTE TRANQUILLITY within easy daily reach. A most outstanding old cottage, unique and beautiful situation, rare period perfection and modernisation. Four large bedrooms, two large and one small reception, built-in garage, picturesque outbuildings, exquisite half-acre garden entirely enclosed by stream and wall. R.V. £36, price much below valuation, substantial mortgage.—BM/ABE, W.C.1.

MORE BUSINESS AWAITS YOUR EXECUTIVES if they have the use of a 1955 self-drive car. Lowest possible rates. Contract hire by arrangement. No maintenance costs. Choice of over 200 cars and 12 different models. Also guaranteed repurchase scheme and Autopak self-drive package tours in GB and Europe. Ask your secretary to write for new brochure giving full details.—Autohall, Dept. 2, 302-6 King Street, Hammersmith, W.6. Riverside 2881. Cables, Autohall, London.

THE BSc ECON DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretaryship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for the three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall students have passed London BSc Econ (Final) exams. since 1925.—Prospectus from C. D. Parker, MA, LLD, Director of Studies, Dept. P17 WOLSEY HALL, OXFORD.

ECONOMICS GRADUATE (female) required by Large Motor Manufacturing Organisation. Analytical mind and good knowledge current economic developments in major countries essential. Duties will cover study of changing conditions and relationship with export trade of UK. Apply, stating full qualifications, experience and age.—Box 950

ANGLO-GERMAN ASSOCIATION: A discussion between Mr Peter Tennant, Overseas Director of the F.B.I., and Miss Alison Outhwaite, of *The Economist*, with Lord Pakenham as Chairman, on "Germany between East and West." The present trend of German political thinking in the light of the Koenigswinter Conference. At the British Council Cinema, 6 Hanover Street, W.1, on Wednesday, June 1st, at 6.30 p.m. Tickets 2s. 6d. each (Members free).

EXPERT POSTAL TUITION

For Examinations—BSc Econ, LLB and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education etc. Also many non-examination courses in business subjects. —Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2)

FLUORINE CHEMICALS

This drying kiln is but one process in the C.Z.C. Fluorine chemicals division at Avonmouth. As ever increasing research in the magnificent laboratories yields more potentialities of this new group of chemicals, so is production adapted and enlarged to meet the commercial demand. Fluorines have a great future and Consolidated Zinc Corporation who are pioneers in this field, are ready to meet it.

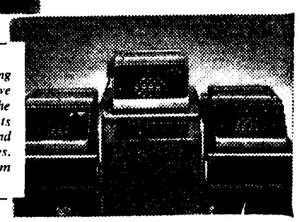
HARTLEY ELECTROMOTIVES PRESENT

The first complete range of office dictating equipment

A TIRELESS, supremely efficient secretary always at your elbow! That's the service you get from these machines. And at astonishingly little cost. See for yourself how much precious time you and your staff can save. It will cost you nothing to find out, and involve no obligation on your part at all.



FREE!

- ★ An expert to survey your needs and give advice.
- ★ Two weeks' trial of the equipment he recommends.
- ★ The services of an installation clerk to train your staff.
- ★ Our leaflet and full details. ‡ Write now!

NEW BAIRD STENOCORD — *completely portable dictating and recording machine. Weighs only 7¾ lbs. Gives 12 minutes recording time on each magnetic belt. The belt can be used again and again, and can be mailed at printed-matter postage rates. Available at a really competitive price.*

NEW TAPE-RITER DICTATING EXCHANGE — *full dictating facilities for all executives. You have a battery of three Tape-Riters in the typing pool and dictating points (equipped with the Tape-Riter Hand Microphone) in up to twelve offices. Reduces typing staff to a minimum and increases efficiency.*

See the whole range on **STAND No. 96**

BUSINESS EFFICIENCY EXHIBITION

OLYMPIA • JUNE 6th — 16th

‡ Write to Dept. T.R.2.

HARTLEY ELECTROMOTIVES LTD.

(A DIVISION OF THE HARTLEY-BAIRD GROUP)

37-39 THURLOE STREET, LONDON, S.W.7

Telephone: KNightsbridge 5211-5.

- *Humber and Hillman chauffeur driven or self-drive limousines or saloons.*
- *Clients met at dock or airport.*
- *British and Continental tours arranged.*

"I can see further!" says Timothy Brown

BECAUSE WHEN TIM'S PARENTS WERE CHILDREN, Ford, by making motoring possible for the millions, opened up the roads of the world, widened horizons, shortened distances .... Today, Ford cars, Thames commercial vehicles and Fordson tractors are everywhere. Ford has become part of the pattern of life for us all. Behind this achievement lay tremendous problems—of organisation, of economics, of transport—which Ford solved with characteristic energy and imagination. The revolutionary idea of 'flow production' for high quality motor vehicles at low cost—that comes from Ford. So today the great factory at Dagenham is unique in that it produces its own gas and electricity, makes its own iron, uses the economical water-borne transport provided by the Thames and controls production from raw material to finished vehicle. *All these facts mean fundamental and considerable savings in manufacturing costs.* What do those savings mean to *you?* Better and cheaper motoring. Better living. Always, progress.

"Into the Future" say FORD *of Dagenham*

Fratricide on the Railways

THE most significant feature of the railway strike is that the public is becoming very angry about it. The most important point for a newspaper to emphasise is that the public is quite right to do so. The cause of the present national emergency, the cause for which thousands may be thrown out of work, is nothing more inspiring than a quarrel between two unions. In this quarrel, public sympathy originally lay with the leaders of the Associated Society of Locomotive Engineers and Firemen, who have been demanding extra rewards for skill and responsibility. They have now forfeited this sympathy by pursuing their reasonable demand with unreasonable rigidity and stubborn indifference to the public interest. They have refused to modify in the smallest degree the claim that was rejected by the railways tribunal and by the Transport Commission. They will not discuss the commission's counter proposals, which would have given their more responsible members even more than they asked. Worst of all, they have refused to meet the National Union of Railwaymen in order to seek agreement on the differentials between the locomotive men and other railwaymen. One has the impression that they would rather have less pay in the absolute, provided only that the guards and signalmen continue to have less still.

The obstinacy is all on the unions' side. The Transport Commission has shown that it is prepared to pay more to the more responsible locomotive men, and there is no reason to suppose that it would not be prepared to make corresponding adjustments in the pay of the top-grade signalmen and others, provided that were the end of the matter. What it cannot do indefinitely (and has been doing for too long already) is to stand by while the unions play leap-frog with their basic rates; and it must break the habit of regular capitulation to the threat of strikes. There can be only one way out of the impasse. The two unions must first agree among themselves on the kind of wage structure that they want, and must then jointly approach the Transport Commission. After that, the commission must ensure that any settlement which it offers will aid, instead of hinder, the very necessary redeployment of the labour force on the railways.

Neither of these steps is going to be easy. To call for inter-union negotiations is to ask the craft union to walk into the parlour of the industrial union, which would like to devour it and with which it has been carrying on a feud for nearly half a century. To say that the Transport Commission must keep its eye on the long-term consequences of any settlement is to say that it should adhere to its proposals for paying more to those who drive trains than to those who merely shunt them; and the objection to such classification of trains and duties is at present the one common ground between the two unions.

But the unions should recognise the situation in which their long bickering has now embroiled them. There is no way of banning strikes in a democratic country, but there are many ways of gradually loading the scales against strikers. There are traditions about strike-breaking

that can be altered and privileges that can be withdrawn from unions who reject arbitration. The only circumstance in which a Government—and especially a Conservative Government—would be tempted to start to move along this road would be if public opinion moved first, and moved a long way ahead of it. There could be no greater incentive to public opinion to move than the present futile, irresponsible and wildly unpopular stoppage. Do the leaders of the two railway unions—neither of whom is a hothead nor an agitator, and both of whom have for so long used the weapon of strike threats without actually implementing them—really want to set these forces in motion? If not, let them come together, discuss the wages structure and avert further hardship to their members — as well as disaster to the railways and the nation.

Nettles To Grasp

EVERY general election has its surprises, and last week's chief surprise was that the much-calculated "swing" never materialised. It is impossible to establish by figures that any electors who voted Labour in 1951 swung over to the Conservatives this time. Both parties lost votes; and though, in the country as a whole Labour lost many more than the Conservatives, they held their strength relatively well where their marginal seats were in danger. The result is that the margin of 67 seats in the House of Commons between the two major parties is less than could have been expected, on the basis of past experience, from the margin of 900,000 in the total vote.

Except perhaps to the party managers, this is not a matter for regret. Indeed, to have a majority of about 60 over all comers is just about the best position for a Government to be in. It has enough votes to be sure of its control of the House, but not so many that it does not feel impelled to work for victory next time by a positive programme. On the other hand, the result of the election gives some hope to Labour for next time, together with a clear warning that irresponsibility will not be rewarded by the electors. It is the right mixture of the carrot and the stick for both parties.

From the public's point of view, the essential thing—and the great gain—is that at last the long deadlock is broken. For the first time for ten years, the country has a government securely in office with at least two years before it will feel the shadow of another election falling across it. When the Conservative government took office in 1951 (in, admittedly, much more difficult circumstances than the present) it was quick off the mark in some acts of administration (notably in monetary policy), but painfully slow in others, while in its parliamentary programme it let many opportunities pass. This time there should not be any hesitation, and Ministers, if they are wise, will already be thinking of three Queen's Speeches; not only of one to open a short "tidying up" session of the new Parliament from now until the summer recess, but of another, which should be much fuller of meat, to open the new session in October, and yet another for October, 1956. It is by the work of the two full sessions, 1955-56 and 1956-57, that the Eden Government will make, or fail to make, its mark on history.

To ease the difficulties of distributing this week's issue of The Economist, *we have had to reduce its size. Normal issues will be resumed after the railway strike is settled.*

It would be absurd to try to forecast in any detail the contents of this two-year programme. But it may be useful to list some of the things that will have to be done in those two years or not at all. This is not to incite Ministers to fly in the face of public opinion. No democratic government ought (at least in theory) ever to do things of which the public will not approve. But there are at all times certain necessary things that will never get done unless there is time for them to show their merits before the vote is taken. And there are also certain other necessary things that excite momentary protest and are then promptly forgotten. It is in the early sessions of a parliament that the golden opportunities for constructive statesmanship occur.

Three Tasks Abroad

The forefront of foreign affairs is filled with the prospect of talks "at the summit" with the Russians. There is, unfortunately, more than a flavour of electioneering about the stage management, and the trouble about things that are done mainly for electoral purposes is that they do, after all, leave some commitment behind when the election is over. Sir Anthony Eden and Mr Macmillan are now committed not merely to holding the talks, but to an attempt to wring success out of them. There is, of course, nothing against this—provided that the commitment they have given to the British public's propensity for wishful thinking does not turn out to be more binding than their commitment to their own sense of realities. After the last election, Mr Macmillan found himself committed to doing something that he knew was foolish—building houses more quickly and more cheaply than was good for the economy. This time it is to be hoped that he and his party will be able to forget the clamour of the hustings enough to remember the real, long-term interest of the British people—which lies, Heaven knows, in realising a peaceful understanding with the Russians, but also in not being deceived by any false dawns. The Prime Minister too will need to remind himself daily of the need for a stiff backbone. His unequalled experience of diplomacy and his talents as a "fixer" might turn out to be disadvantages, if he allows Mr Molotov (who is equally experienced) to draw him, in eager pursuit of a settlement, out of alignment with Britain's allies. Ministers should not be afraid to go slowly and to build firmly, however many barbed supplementaries are thrown at them in the House of Commons.

★

Perhaps, by a striking change, Far Eastern issues may now be the less critical for Anglo-American unity. It has for several months been getting more apparent that the time is almost ripe for a meeting of minds between the British and American Governments. The Foreign Office and the State Department have never been nearly as far apart as, for domestic political reasons in each country, they have been compelled to pretend to be. These domestic preoccupations are now very much less, and it may be possible before long to close the gap in the alliance of the free nations. This does not mean, of course, that the British public, now that it cannot vote for another four or five years, is to be tied to the American chariot (though it will be so represented from every fellow-travelling platform). In point of fact, it is American opinion which is in the course of making the larger transition, and is coming round to something much closer to the British view, and there is still more work to be done by British negotiators in bringing the Americans to an understanding of the position of the uncommitted Asian countries. But if there is to be agreement there will have to be concessions from both sides, and the chief concession that will be required from the British will be a willingness to join (possibly under the ægis of the United Nations) in a guarantee that the present status of Formosa shall not be changed, or the right of its people eventually to decide their own government denied, by force. As this will involve defining one of the circumstances in which Britain would find itself compelled to fight the Chinese Communists, it will not be universally popular in this country (for all that Mr Attlee's announced policy for Formosa is, in its implications, very similar). It is to be hoped that Ministers will nevertheless feel emboldened to go ahead.

★

A third topic may be mentioned under the general head of foreign affairs. This is the integration of Western Europe—a subject in which Mr Macmillan has in the past shown a real personal interest. That Western European Union has at last come to birth is a matter for satisfaction. But nobody should think that it leaves the movement for European unity in a satisfactory state. The two great objectives remain—to raise the standards of living in a highly populated industrial complex; and to knit the new Germany so firmly into the fabric of a western, liberal, democratic community that it will never again have the wish, or the ability, to escape into militarism or tyranny. In rejecting the federal approach to these problems, the British Government has always professed its keen desire to help with alternative solutions. Western European Union is only the most formal of beginnings with that task; Mr Macmillan has an opportunity, and a duty, to make further progress.

Four Tasks at Home

The success of the economic policy that has been pursued since Mr Butler went to the Treasury was one of the great Tory arguments at the election. There can, therefore, be no question of any change in its main principles. The task of the next few years is to press on with the construction of the "two-decker" economy—a firm base of welfare and social justice to ensure that no citizen is deprived of his economic and social rights, with a superstructure of the greatest possible freedom for enterprise and efficiency. More of the same as before should be the main prescription—and if as much can be accomplished in each of the next five years as in each of the last three, any thought of turning backwards to the "planned" sterility of the siege economy will be out of the question.

But it is possible to identify four groups of questions in which action will be called for before the summer of 1957. The first—inevitably it stands first at the present moment—is the nexus that links prices, wages and industrial disputes. Given the facts of parliamentary democracy, of full employment and of free trade unions, it would doubtless be a counsel of perfection to urge the Government to bring the long-continued fall in the value of money to a complete stop. Certainly nobody in his senses would want inflation to be succeeded by such a deflation as would slow down the rapid rise in production of recent years. But because these things are true, it is not enough to shrug the shoulders and accept a rapid and continuous rise in prices as a necessary part of economic progress. In the last three years the cost of living has risen by 8 per cent in this country, while it has remained virtually stationary in the United States (which also has virtually full employment and free trade unions) and—what is perhaps more directly significant—it has remained stationary in Germany too. Wages have been, and are, rising more rapidly here than in either of the other two countries.

There is nothing unreasonable or impossible in the requirement that the vicious circle of rising prices and rising wages should at least be slowed down. To do it will require an imaginative combination of economic and political action. First, and most obviously, it will be right to keep a tight rein on the supply and price of credit. There should be no hasty reduction of Bank Rate. On the political side, something will have to be

done to discourage the purely factious, internecine labour dispute, of which the present strike by the engine drivers is a prime example. This is perhaps the exceptional field where even a Government that comes straight from victory at the polls—and especially a Conservative government—will be well advised not to get ahead of public opinion. But that is no reason why the public should not be given the information that it needs to form its own judgment. If irresponsibilities like the present continue, a time will come when even the British public will lose its patience and demand that some limits be put upon the present complete freedom of the trade unions to do as they like. That will be a testing time for the Government, and it will then have no chance of being allowed to distinguish between the legitimate and the illegitimate use of the strike weapon unless it begins now to help the public to tell the one from the other.

★

The second group of economic problems are those that cluster around the process by which a community increases its wealth-creating capacity; they are the problems of change and progress. Mr Butler has popularised the slogan of "investing in success"—and it is a good slogan, provided that the investment is in fact successful in producing more wealth. If the target of a doubling of the standard of living in twenty-five years is to be hit, there will have to be a more effective use of the community's savings than at present. For example, far too much of the nation's savings is still being withheld from productive use because it is pre-empted for houses—for houses which would not be needed if they were not made so artificially cheap. Ministers know perfectly well that the Rent Acts and the housing subsidies are, taken together, by far the most damaging distortion in the British economy today. Hitherto they have not felt able to admit it in public; but now they can. Not only could capital be liberated, but the housing problem would be solved, long before the next election, if the Cabinet will have the courage to face the temporary odium of letting the price of houses, new and old, rise towards their economic level. It would be the story of the food subsidies all over again, of immediate complaints and ultimate applause. It is hard to think of a more direct test of the Government's economic statesmanship.

Apart from thus increasing the volume of capital available for productive uses, the Government would be well advised to see that public investment programmes, with their first lien on the supply, do not take too much. There has long been a suspicion that electricity is taking more capital than it would need if its pricing policies were more economic, and the renewed trouble on the railways must inevitably increase doubts about the wisdom of sinking so much new capital in an industry that apparently gives itself so little chance of making it pay. The road programme, on the other hand, which had an air of improvisation, might well be speeded up; there is very little doubt that it will pay for itself many times over, if it is considered (as it should be) in relation to the yield of taxes on petrol and motor vehicles and to the earnings of the motor industry. "Paying for itself" is not perhaps the only criterion of an investment project. But it is much the most important, and it demands greater attention, particularly in relation to the plans of public bodies.

Monopoly and restriction are the enemies of rapid progress fully as much as inadequate savings or unbalanced investment. Perhaps, after decades of official encouragement of monopoly, the climate of opinion is beginning to change. Certainly it is a necessary part of the current philosophy of the Tories that it should change, as there cannot be any rapid advance without a much more flexible and competitive economy. The first test of the strength of Ministers' resolution on this point will come with the forthcoming report of the Monopolies Commission on some of the general effects of restrictive practices.

★

Taxation is the next field where early action is called for. Mr Butler will soon have the assistance of the report of the Radcliffe Commission (it is understood that the majority report has been ready for some time, but that a minority have been taking their time in dissenting). There are some large injustices, as between one class of taxpayer and another, still remaining in the system of direct taxation. But the primary need for fiscal reform is to adapt a system which has grown haphazard under the twin pressures of war and inflation to a modern industrial community, and in particular to lessen or remove the obstacles that it puts in the way of the incentives to effort, to thrift and to enterprise. When the matter is looked at from this angle, there should not be any difficulty in identifying the places where relief would do most good to the national economy. One would be relief to the higher earned incomes; the other would be some reduction in the fantastically heavy burden of taxation that is levied on the "ploughed back" earnings of companies. Surtax-payers and company reserves will not be popular recipients; but they are the cases in which it can be said with assurance (with virtual certainty in the first case) that any "sacrifice" of revenue would be quickly recouped.

Direct taxation is not the only sort that needs to be scrutinised. The Purchase Tax was from the start ill-conceived (far too much attention was paid to administrative convenience, and far too little to actual commercial effect) and an effort should be made to see whether it cannot be replaced by a simpler general excise. Nor (to return to direct taxation) should the excellent work of the second Millard Tucker Committee or pensions for the self-employed be ignored any longer.

The final group of economic questions that will have to be confronted at once is the international group. Some of these have direct industrial repercussions. The results of the election in Lancashire, though perhaps not all that Lord Woolton hoped for, should have been at least enough to convince Ministers that they were wise not to go further in offering protection as a solution to the cotton industry's troubles. Perhaps it takes more courage in Conservatives to resist suggestions for protecting particular interests than anything else they are called upon to do—and to reduce the protection of domestic agriculture is the most difficult of all. But here again the reminder that they need to keep constantly before their eyes is that they are staking their future, and the country's, on a general philosophy of expansion whose chances of success are reduced by every measure that encourages or perpetuates an uneconomic use of resources.

But the international economic problem that is nearest the centre of the stage at the moment is the much discussed and little understood one of convertibility for sterling. The Continent apparently expects an early and decisive announcement that will substantially liberate sterling from the present restrictions on its use. If so, the Continent is likely to be disappointed. This is not to say that there is likely to be any backsliding; that also would run counter to the Government's whole philosophy. But the uncertainty of domestic politics was only one of the reasons for a cautious and gradual approach, and the others still remain. So far as "non-resident current-account sterling" (that is, pounds acquired by foreigners, not as a result of capital transactions, but in current trade) is concerned, it is already almost fully convertible *de facto*. The questions at issue are, firstly, whether the *de facto* ability to convert these pounds into dollars shall become a *de jure* right with a promise that it shall not be withdrawn; and, secondly, whether the promised conversion shall also be at a promised fixed rate of exchange. These are matters too complex for adequate discussion at the end of a long article. But both of them boil down to this: are our economic affairs sufficiently well in hand that we can be quite sure of getting out of any future balance-of-payments crisis without recourse to restriction of payments or to changes in the exchange rate? That is a question that it may be possible to answer with assurance when progress has been made with the other matters that have been discussed in this article. To answer it with a bold affirmative now might show something more than the courage and decisiveness that can be expected of Ministers after an election. Events might still prove it more reckless than realistic.

Brazil in the Red

IN the Brazilian jungle powerful wildcats sometimes get tangled helplessly in the creepers and lianas. Then the ants and flies can finish them off at their cruel leisure. The same defeat of strength, paralysed and reduced piecemeal, sometimes seems to characterise Brazil itself. Larger than the United States, it is a land of great natural wealth and may be destined, towards the turn of this century, to become one of the centres of gravity of the world's population. But its political and economic structure labours under a heritage of crisis which historians date back to the 1850s; and there is little relation between Brazil's inherent wealth and its standard of living or place in world affairs. The physical realities of the country underline this paradox: ultra-modern cities on and near the Atlantic shore; but behind them the grasslands and jungles, in whose clearings Indians with large hats and small pumps refuel mail-planes.

Of the difficulties besetting Brazil, the political ones are at this time the most dramatic. Many Brazilians look to the October presidential elections, in the hope that they will resolve doubts that have perplexed the country since the overthrow of the Vargas regime. But whether these elections will produce a government capable of restoring confidence, or even take place free from interference, remains to be seen. Two contradictory tendencies underlie Brazilian politics: with its large body of partially illiterate and poor farmers and labourers, with its urgent need for centralisation and strong army tradition, Brazil would seem a classical setting for autocracy, on the military pattern, so common in Latin America. But it possesses a liberal middle class, whose views have so far been followed by the army, and the country is so intensely regional in outlook as to weaken the role of the central administration.

These conflicting tendencies are both at work in the presidential campaign now getting under way. Although the suicide of President Vargas caused only minor disorders, the image of a strong leader basing his power on the affection of the underprivileged still looms large. At least two important figures are seeking to use it in the present election. Sr Kubitschek, an ex-governor of the State of Minas Gerais, is leading the Social Democrats (SPD) in a campaign inspired by the techniques and ideas of the Vargas regime. The same is true in an even more radical degree of Sr Goulart, who served as Minister of Labour under Vargas and inspired the famous doubling of minimum wages that brought on the final crisis of the Vargas system.

Several other candidates are also in the field. A dissident faction of the SPD, supported by President Café Filho, has nominated Sr Lins, ex-governor of the State of Pernambuco. More important is the newly announced candidacy of General Tavora, formerly the

head of the presidential military household and a man respected for his integrity. But the attitude of the army remains the factor of uncertainty. Leading military figures have let it be known that a regime including Sr Goulart would not be acceptable, and this has aroused speculation as to whether the army might impose the re-election of the present government and disband Congress, creating a constitutional dictatorship somewhat on the model of Venezuela. If, on the other hand, it looked as if General Tavora could win a fair election, the army might choose to let matters take their course.

★

Although political uncertainties momentarily overshadow Brazil, the country's fundamental illness is economic. A mixture of inflation, under-production and lack of flexibility in export, has poisoned Brazil's monetary system, which is now dangerously near the edge of collapse. The rate of inflation continues with a monthly increase of nearly 1,000 million cruzeiros in the note issue, the cost of living is rising incessantly and has doubled since 1948, and Brazil's balance of payments situation is progressing from serious to desperate.

The collapse of Brazil's coffee market is the most widely known symptom of the general crisis. At the turn of the century, Brazil's annual export averaged 12.5 million bags out of a world total of 16.5 million ; at present it supplies only 11 million out of a total of 33. If the decline is to be blamed on any one thing it is on the policy of alternating between restriction of exports in the interest of high prices and sudden dumpings on a hostile market. The Coffee Institute has suspended purchases at the official minimum price for the remainder of the 1954-55 season. Such a step forces exporters to find their own price-level and discourages growers. But it is politically dangerous and the government has already promised that support buying will be resumed in the 1955-6 season. One line of solution involves the kind of international coffee price stabilisation agreement already concluded with Colombia, but the only long-term answer is a recognition by Brazil that it must look to other exports to achieve prosperity.

At the root of Brazil's difficulties are the fantastic commercial arrears that threaten its foreign trade with extinction. At the end of 1954, Brazil owed some $2 billion and only the intervention of the Export-Import Bank and the International Monetary Fund enabled it to meet urgent interest payments. The gold and dollar reserves of the Bank of Brazil, which still amounted to $322.4 million at the end of 1953, fell to $104.2 million in 1954 and what little increase there has since been in gold holdings is entirely absorbed as security for the five-year $200 million emergency loan granted by American banks in November. Brazil's commercial debt towards Britain, Germany, France and Japan has risen constantly and in the first case has virtually halted trade. Even Germany, which has always been willing to give Brazil the benefit of numerous doubts in exchange for long-range political and commercial advantages, found itself saddled with a bad debt of $34 million at the end of March.

Instead of facing the cold truth that it will have to restrict imports and step up production and exports, Brazil has preferred to live in a carnival of inflation and emergency dollar loans given by the United States for obvious strategic reasons. Imports have been rising continually under the pressure of speculative buying.

Many complex monetary schemes—including the entire system of exchange certificate auctions and government-regulated premiums on foreign currencies—have been devised to meet the balance of payments crisis. The new Minister of Finance is known to oppose the export bonus system and is thought to favour a return to freer exchange rates. The result might bring some improvement to the free cruzeiro rate. But the main obstacle is the lack of an exchange reserve with which this free rate could be supported. As long as Brazil imports much and exports little, monetary weapons can bring only a temporary improvement in the cycle of inflation.

The crucial question, therefore, is—how can Brazil increase its industrial production? Here, there are definite signs of hope, if only because the continual inflow of capital and capital goods has expanded plant and machinery. Industrial production in 1954 averaged 7 per cent above 1953, and the increase in cement, iron and steel was particularly encouraging. But the greatest —if the most long-range—hope lies in the exploitation of Brazil's oil deposits. An important strike has been made at Nova Olinda in Amazonia, and it is calculated that under full production this region could satisfy one half of Brazil's domestic consumption by 1960. But if Brazil's oil deposits, as well as the iron ore thought to be in Amazonia, are to be exploited, foreign participation, both financial and technical, will be essential. If the legal structure of Petrobras, the national oil monopoly, is any example, however, Brazil appears to be better equipped to receive *ad hoc* loans than to welcome creative investment when it comes to the exploitation of natural wealth.

Foreign confidence in Brazil still exists. This is demonstrated by the great development plans initiated by the Schneider-Creusot group for heavy industry, by the participation of Japanese interests in Brazilian cotton mills, by the recent agreements with Metropolitan-Vickers, and by the joint action by American and Brazilian companies in the rubber and automobile industries. The Germans, moreover, seem willing once again to invest heavily in Brazil's future. But if this confidence is to survive the recurrent monetary crises, it will have to be met by a change of attitude on Brazil's part, by a realisation that a country should honour its obligations and pay its way abroad. Increasing imports and printing money to pay for them may lead to short-term political success, but they lead far more surely to long-range economic disaster.

The Election of 1955

The results of the election are analysed in detail in the concluding issue of this special section of *The Economist*.

Why the Conservatives Won

IT was not the swung, but the stay-at-homes, who decided this election. The total poll was 76.8 per cent compared with 82.6 per cent in 1951. Within these totals:

(1) Labour polled 12.4 million votes compared with 13.9 million in 1951. One-and-a-half million people—or more than one out of every ten of those who voted Labour last time—did not this time feel excited enough to turn out.

(2) The Conservatives polled 13.3 million votes, compared with 13.7 million in 1951. As they piled up some 165,000 votes in four Ulster constituencies where they were *unopposed* last time, it seems that over half a million people who voted Tory last time did not vote this time.

(3) The Liberals polled 722,000 votes, about 8,000 less than in 1951. In the constituencies with unchanged boundaries in which they fought in both 1951 and 1955, however, their votes went up by an average of about 450 per constituency. More than the whole of their increase in the share of the votes in these constituencies was at the expense of Labour.

Differential Abstentions

Theoretically, the proportion of votes cast for each party (49.7 per cent Conservatives, 46.4 per cent Labour, 3.9 per cent Liberals and others) showed a drop of 2.4 per cent in Labour's share of the poll: of this just over 1.7 per cent went to the Conservatives and just under 0.7 per cent to Liberals and others. When one subtracts the four Ulster constituencies that were not fought over last time and the Speaker's seat, the direct swing to the Conservatives was about 1½ per cent.

It seems clear, however, that this election is best described in terms, not of swings, but of differential abstentions. The average drop in Labour's turn-out in the constituencies that it contested was just over 2,400 ; the average drop in Tory turn-out was just over 900. Spread evenly across the country this should have given to the Tories each of the twenty-one unchanged Labour seats held by majorities of less than 1,500 last time, plus nearly a dozen others affected by boundary changes ; after allowing for certain Tory losses due to redistribution, it would have caused a Conservative majority over Labour of about 85, in place of the majority of 68 (including the Speaker) which has in fact been achieved. But:

(1) In marginal Labour constituencies, the drop in the Labour turn-out was below the average drop elsewhere. This cannot have been solely due to the excitement of the contest: in marginal Conservative constituencies just as many former Labour voters abstained as they did in the rest of the country, while Tory abstentions cannot be made to follow any sensible pattern at all. There seem to be two lessons from this: (*a*) it is possible to mobilise the Labour loyal to save "our member, Mr X," but it is not so easy to whip up Labour enthusiasm with the battle cry that "we can turn that Tory rascal, Mr Y, out." (*b*) Labour party organisations are often much more efficient in seats that have a sitting member than in seats that have not. The tenacity of the last few hundred Labour votes in marginal Labour seats is not a new phenomenon ; there were already signs of it in 1951, although not on the national scale that has been evident this time.

(2) The biggest drops in Labour turn-out—and drops which rather misleadingly put up the national average—occurred in safe, or fairly safe, Labour seats of a mixed residential and industrial type. In some of these—and in particular in what might be called the prosperous engineering constituencies in the Midlands—there was also an increase in Tory votes. In other words, in these areas there seems to have been a sizable old-fashioned swing to the Conservatives (witness Coventry 5.3 per cent swing, Birmingham 2.8 per cent swing, and surprisingly good Tory turn-outs in redistributed Walsall and Wolverhampton).

(3) The drop in the turn-out was generally smaller in the agricultural than in the urban areas. There was also hardly any swing to the Conservatives in them ; in Norfolk there was actually a small swing to Labour.

(4) The increase in the Tories' share of the poll in the Lancashire cotton area (1½ per cent) was almost the same as the national average. It does not seem that cotton was an issue for either side in this election.

(6) Compared with 1951, the Labour share of the vote fell in every one of the twenty-five districts shown in the accompanying table except the Eastern Counties (and even here it gained less than the Conservatives from the redistribution of absent Liberals' votes). The Conservatives' share increased in every area except South West England and Northern Home Counties (where there were more Liberal candidates) and the rest of Wales (where there were fewer Conservative candidates). In most suburban constituencies where there had been a particularly sharp influx of council house tenants Tory majorities obstinately refused to go down.

It may be worth examining the effect of Liberal interventions and departures in more detail.

(1) In the thirty-six seats with unchanged boundaries where Liberal candidates re-appeared after being absent in 1951, the Liberal share of the vote was just over 12¼ per cent ; in these constituencies the Conservatives' share of the vote fell by just over 5 per cent, while Labour's share fell by as much as 7¼ per cent. The Liberals seemed to get fewer votes in these constituencies whenever there was a danger that Labour might win.

(2) In the thirty seats with unchanged boundaries where Liberal candidates fell out compared with 1951, the Liberal share of the vote to be redistributed was 9½ per cent ; the Conservatives seem to have got just under 7 per cent of it and Labour just over 2½ per cent. The turn-out in these constituencies did not drop by more than the national average ; very few former Liberal voters can have abstained or deliberately spoiled their votes.

In the first group of constituencies the swing to the Conservatives (so far as anybody can talk about a swing in this election) was slightly below the national average, and in the second slightly above it ; nevertheless the implication seems to be that although the Liberals can help the Tories moderately by dropping out of particular constituencies, they do not help Labour much by re-appearing in them. This is not as quixotic as it may appear ; in present circumstances, it is quite possible that a Liberal vote should often be regarded as a sort of half-way house, where radicals who are fed up with Labour pause to draw breath before taking the plunge and voting Tory.

The Seats that Changed Hands

In all, Labour (including one Irish Labour) lost twenty seats, all to the Conservatives ; while the Conservatives lost four seats, all to Labour. There were no changes among the minor parties, except that Sinn Fein inherited the two Irish Nationalist seats in Ulster, though with decimated

* Gain from Irish Labour.

majorities. It may be worth looking at these gains and losses with reference to the table of sensitive indicators published in *The Economist* of May 21st.

(1) Labour lost all eight of the seats that had been marked as "Expected Labour Losses" assuming no swing compared with 1951 ; these were the seats where it had been fatally wounded by boundary changes or by the disappearance of a Liberal candidate. Its other twelve losses were divided as follows : Seven of the seventeen seats we had marked as vulnerable to a one per cent swing ; two of the eleven we had marked as vulnerable to a two per cent swing ; two of the twenty-one marked as vulnerable to a three per cent swing ; and Carlisle, which fell to a four per cent swing and a surprisingly heavy re-alignment of ex-Liberal votes in the Tories' favour.

(2) The Conservatives lost only three of the ten seats that we had marked as "Expected Conservative Losses" on the assumption of no swing compared with 1951. In one of the seven "expected losses" that it held we had obviously misread the effect of boundary changes ; all the other six were held by narrow majorities, and it seems probable that the Tories achieved in these the swing—or differential turn-out—in their favour that was typical of all the non-agricultural marginal seats in which they had a sitting member. The Tories' fourth loss was the unchanged agricultural seat of Norfolk South West, where Labour marked up a one per cent swing in its favour.

(3) The new or renamed seats went in Labour's favour by only 18 to 17, compared with the 21 to 14 which it had seemed reasonable to forecast on the basis of no swing compared with 1951. Two of the three new seats that went the "wrong way" from Labour's point of view were Birmingham (Selly Oak) and Walsall South. They seem to have been the victims of the "Midlands swing" already referred to.

Candidates and Issues

Some people have argued that the lack of a uniform "swing" in this election has shown that local issues and personalities matter in politics after all. Unfortunately, the remarkably even distribution of changes in the share of the poll between areas—as distinct from between different constituencies—simply does not bear out any such contention about local issues (apart, possibly, from agriculture). The record of failures and successes in the marginal seats also does not bear out extreme emphasis on the importance of the quality of challengers. But there seem to be three exceptions :

(1) The advantage of being known as a sitting member is clearly considerable in a demure election. It is notable that seven of the twenty seats that Labour lost were not being contested by the previous sitting member.

(2) A second exception concerns the Bevanites. It is not necessarily true to say that Bevanite sitting members did badly in this election. Mr and Mrs Bevan, the Coventry duet, and Mrs Barbara Castle, did do rather badly ; but they were in the sort of areas where the general trend was towards a low Labour turn-out. On the other hand, Mr Mikardo, Mr Greenwood, Mr Harold Wilson and Mr Harold Davies all did rather well. But what does seem quite clear from this election is that when a local Labour party imports a Bevanite candidate to an area that has not had one before, the Labour vote is liable to drop like a plummet, and the indignant local Tory vote is liable to rise. Definition of the term "Bevanite" is always difficult, and information about the proclivities of Labour candidates hard to come by ; but in the only six cases of this sort where a check has been made, the swing against Labour was quite remarkably greater than the regional average. The achievement of Mr Zilliacus in very nearly losing the rock-solid Labour seat of Manchester Gorton (Labour majority down from 7,948 to 269) was one of the most striking in this election.

(3) A final striking result was the cut in Mr Palmer's majority in the unchanged Labour seat of Cleveland, from 5,481 to 181 ; the workers in this constituency are largely employed by Imperial Chemical Industries, which Labour had promised to nationalise.

Votes and Seats of the Parties

In the table below the country has been divided for the purposes of comparison into twenty-five regions, based on social and economic homogeneity, although widely different in size and population.

THE COMPOSITION OF THE REGIONS is generally clear but some details of the boundaries are as follows : *Greater London* includes all boroughs adjacent to County of London. *Northern Home Counties* extends as far as Berks (excluding Abingdon and Newbury), S. Bedford and, in Essex, to Epping, Chelmsford and Southend. *Mid-Southern England* includes the rest of Berks and all Dorset except West Dorset. *South-West England* includes Bristol and S. Gloucester. *Eastern Counties* includes the rest of Bedford, Peterboro', Huntingdon and Isle of Ely. *Black Country* includes Birmingham, Wolverhampton, Coventry and adjacent boros. also Cannock, Solihull, Sutton Coldfield and Nuneaton. *N.W. Midlands* includes Salop, rest of Stafford and Cheshire up to Chester, Runcorn, Knutsford and Macclesfield. *Manchester and District* includes Eccles, Middleton and Prestwich, Oldham, Stalybridge and Hyde, Cheadle, Altrincham and all boros. contained within these. *Merseyside* includes Crosby, Huyton, St. Helens, Widnes and all Wirral constituencies. *Rest of Lancashire* excludes Barrow and Morecambe and Lonsdale. *Yorks Woollen District* includes Sowerby, Keighley, Leeds, Wakefield, Colne Valley and boros. contained within these. *Yorks Coal and Steel District* includes everything in W. Riding south of Penistone, Hemsworth, Normanton, Barnsley and Don Valley. *Dlrham and Teesside* includes Middlesbrough and Cleveland. *Tyneside* includes all constituencies on the River Tyne as far as Consett on one bank and Newcastle on the other. *Glamorgan and Monmouth* includes Llanelly. *Clydeside* includes Glasgow, Greenock, Dumbarton and all Lanarkshire except Lanark. *Southern Scotland* includes everything else south of Stirling and Fife.

THE PARTIES HAVE BEEN DIVIDED as follows : *Conservative* includes Cons. and Lib., Cons. and Lib-Nat. Unionist, and Lib-Nat. *Labour* includes Labour and Co-op. but not Lab.-Ind. or ILP. Under *Others* are grouped all candidates who would not accept or would not be accorded the whip of any of the three main parties if returned to Westminster.

Two Conservative unopposed seats in Northern Ireland in 1950 and four in 1951 are excluded.

* Majority over Liberal in a three-cornered contest with a Labour poll of 6,891.

Notes of the Week

Back to Trouble

THE rail strike has dislocated the time table at Westminster almost as much as at Waterloo ; and the opening days of the new Parliament will be very different from normal. The leisurely business of electing a Speaker and swearing in the other 629 members is to be compressed into two days instead of four ; and the official opening, originally scheduled for June 14th, has been advanced to June 9th. This is not just to enable MPs to start talking about the strike a little earlier. On the day that they assemble, next Tuesday, the Government will have to table the twenty-five Emergency Regulations published this week, and both Houses must approve these within seven days. The Commons will have to take the regulations almost at once, either postponing or drastically shortening the Address in Reply to the Queen's Speech—the traditional "grand inquest on the state of the nation," which normally runs for a week.

This is not the atmosphere in which Sir Anthony would for preference reshuffle his Government, nor is there much need. There have been three reshuffles in the last ten months ; and most senior Ministers are either new in the job or else, like Mr Butler and Sir Walter Monckton, old in it but irreplaceable. Lord Woolton is expected to glide from the scene, but with the party assured of four or five years in office there is no hurry. Mr Stuart may in due course leave the Scottish Office, but to single him out for removal would be a slur on both the Stuarts and the Scots. Mr Crookshank is also said to be earmarked for retirement ; Sir Anthony probably wants to become Leader of the Commons himself. But, at the moment, and until he has been to "the summit," he may well feel that he has enough on his hands.

Labour's Choice

As soon as the new Parliament meets, Labour MPs will have to pick themselves a leader, deputy leader, Chief Whip and twelve other people to complete the Shadow Cabinet. There can be no doubt that, as Mr Attlee apparently still wants the thankless job of leader, he can have it for the asking. Apart from any other consideration, the party could not conceivably agree on a successor other than some innocuous personality like Mr Griffiths—and a defeated Labour party is not in the mood for Mr. Griffiths's bromides. But the voting for the other party offices promises to be more open. Although Mr Morrison will presumably be confirmed as deputy leader again, there is a movement afoot to get rid of some of the rest of the "Old Guard" who were so strongly entrenched in the Shadow Cabinet and the Whips' Office in the last Parliament.

If it succeeds, where will the new men come from ? The election results have deflated Bevanite hopes of getting nearer control of the party. The basic Left Wing vote in the last Parliament was 57—a figure polled twice—and from this there have been four nimble-tongued casualties. They are Mr Driberg and Mr Freeman, who did not stand again ; Mr Foot and Mr Bing, who were defeated. By way of compensation, four or five of the seventeen new Labour MPs may prove to be Bevanite sympathisers. They will include that doubtful asset Mr Zilliacus. But even if the Bevanite vote creeps back above 57 again, it will still be in a four to one minority.

The Right, too, has had its losses. Sir Frank Soskice, to Labour's great shame, could not even get a seat and will have to be replaced on the Shadow Cabinet. Neither Mr Wyatt nor Mr Crosland succeeded in pulling off what were always forlorn hopes, and among the other Labour casualties the Right, as well as the Left, has lost some obscure but reliable supporters. The one section of the party that has emerged almost unscathed is the smaller "Keep Calm" group, which has always tried so hard to provide a corn plaster for a wound that needed cauterising. If the Opposition front bench is to be revitalised on non-Bevanite lines, it will probably be decided to include one or two of these "left of centre progressives." The prospect does not look very exciting. Labour's first priority is to get some of its intelligent younger men into positions where they can help Mr Gaitskell to produce a modern policy for the party that he may well be destined to lead before the next election. The Stracheyites hardly seem the ideal people to help him in that task.

Satellite Eyes on Belgrade

MR KHRUSHCHEV has nobody but himself to blame if his visit to Belgrade got off to a bad start. No sooner had he stepped off his plane than he started to say a number of things that could hardly fail to put Marshal Tito's back up. He launched into an emphatic and pointed appeal for a full-scale rapprochement between the Soviet and Jugoslav Communist parties. He humbly apologised for the Jugoslavs' past treatment, put all the blame on Beria and his associates, and after acknowledging in passing Jugoslavia's desire to develop relations with the West as well as the East, made a strong and repeated appeal for "the re-establishment of mutual trust" between the two Communist parties.

Much of this must have made the Jugoslavs very angry—

and not merely because it might undermine all their careful efforts to reassure the West about their good intentions. Even if Mr Khrushchev hardly expected his hosts to swallow his tale about Beria's guilt, it was a gross insult to their intelligence to behave as if they would. Moreover, Marshal Tito and his colleagues see nothing to be ashamed of in their relations with Russia since 1948. They are the last people to be gratified by any attempt to wipe the slate clean and to pretend that the Jugoslav comrades have always been good comrades because they never really committed the sins for which they were expelled from the Cominform. The Russian Communists, however, evidently see things differently. For them, to forgive a heretic is intolerable and if expediency dictates that he must, nevertheless, be forgiven, then the only thing to do is to pretend that he never really deviated.

Possibly Mr Khrushchev is too unsophisticated a traveller to foresee the effect of his remarks on the Jugoslavs ; but he must have known that they would cause much hard thinking in Eastern Europe. The final communiqué on the talks has not, at the time of writing, been issued, but it looks as if the satellites have occupied an important place in them. It is, however, by no means clear to what purpose they have been discussed, nor to what extent Soviet and Jugoslav policies towards the satellites are really out of step. The Jugoslavs are reported to be pressing the Russians to extend to the satellites the more flexible attitude that they have now adopted towards Belgrade. But there are also signs that the Russians are toying with a change of policy towards Eastern Europe. Was Mr Khrushchev's careful emphasis on a return to Marxist-Leninist teaching (leaving out Stalin) addressed to a wider audience than his Jugoslav hosts ? On present evidence, his visit to Belgrade looks like a fresh approach towards Moscow's cherished project of an " all-European security " system with a neutralised Germany at its centre and Russia as its dominating member.

Food on Khrushchev's Mind

MR KHRUSHCHEV'S small-talk repertoire, it is reported from Belgrade, is limited to virtually one subject: maize. And well it might be, for probably his reputation, if not his head, depends on the success of the present urgent drive for coarse grain. Before he left Moscow, Mr Khrushchev had given a bullish progress report on the drive begun in 1953 to cultivate virgin land. Some 20 million tons of additional grain are expected to be harvested in the " new " lands this year, the best prospects being reported in the warmer south and less good ones—as foreign experts expected—in the Baltic and the north-west regions. But even with this bonus the total yield will probably fall far short of the ambitious target of 180 million tons: the last yield reported, in 1953, was 130 million—and that was the inflated " biological yield " figure. Russian farmers, who do not always share Mr Khrushchev's enthusiasms, are being offered premiums as an incentive to greater output of maize. But with the present switch back to heavy industry and the need for maximum food output to combat the emerging inflationary pressure, Mr Khrushchev's reliance on shock tactics has to prove its value in severely testing circumstances.

Soviet sugar production, moreover, has suffered badly owing to drought in the Ukraine. Some 500,000 tons of sugar have already been imported this year by the Soviet Union, mostly from Cuba. This has helped to reduce the threat of a glut and has enabled the World Sugar Council—which classifies the Russians as a regular exporter—to restore the 20 per cent cut in the sugar exporters' quotas imposed last year. In this instance, the ill wind has blown in an unexpected direction: to Formosa, the second largest sugar exporter in the world. It is a long time since Chiang Kai-shek last received Soviet aid.

Mediation and Frustration

A SERIES of abortive meetings led up to the rail strike called at midnight last Saturday. On the Friday the Ministry of Labour's chief industrial commissioner, Sir Wilfred Neden, suggested the establishment, under an act of 1896, of a board of conciliation, consisting of representatives from both sides of the industry and an independent chairman. The Associated Society of Locomotive Engineers and Firemen refused point blank. On the Saturday Sir Wilfred tried to discover the minimum that the locomotive men would accept. Would they, for instance, accept 4s. for all engine drivers, 1s. for second and third year firemen, and nothing for cleaners—and what in that case would the NUR claim in consequence ? The locomotive men's leaders were plainly impressed by this idea, and no wonder ; but the NUR ensured that nothing came of it by saying that the repercussions in terms of further pay claims for its members would certainly be substantial. In any case the Transport Commission would not have accepted this purposeless surrender, and would have been wrong to have done so. It knew nothing about the suggestion beforehand. Since the strike began, the task of conciliation has fallen on the TUC's General Purposes committee, which at last, on Wednesday afternoon, got representatives of the ASLEF to call.

The TUC has also been busy with the dock strike. The executive committee of the National Amalgamated Stevedores and Dockers, contemplating the failure of their strike to spread to dockers of the Transport and General Workers' Union, want to call it off. But their members insist on staying out, and no face-saving formula is forthcoming from the TUC, which continues to tell the NASD to return its poached members first and put in its claim for representation on local committees afterwards. The NASD is in an awkward position. The dock strike was already an embarrassment to it when the rail strike, by making it more difficult to move goods away from the docks, turned the whole demonstration temporarily into a farce.

State of Emergency

IT is an irony of the present situation that while the action of the footplatemen is operating as a severe restriction of individual freedom of movement, the provisions of the State of Emergency proclaimed on Tuesday actually take existing restrictions off. The most important regulations free motor transport to use the roads to their maximum capacity and with the greatest possible flexibility as regards type of load ; they bring on to the roads vehicles that normally do not provide road transport ; they cause certain licences and controls (some of which shelter the railways from competition) to go by the board. Statutory duties to provide gas or electricity are waived, and so are the Transport Commission's obligations to provide trains—or, more particularly, to observe any existing obligations in the use of such trains as are left to it. Everyone responsible for transport or the movement of essential supplies, in short, is given discretion to put first the one thing that now matters —extracting the utmost possible productivity from the nation's remaining stock of transport equipment. So far, however, this has not extended to abrogation of the agreement with the Transport Unions about standing passengers on buses. The principal new controls introduced are those granted to the Ministries of Agriculture and Fuel and Power to regulate distribution. This will not immediately mean rationing, but it might involve some temporary rationing schemes if the strike went on long enough. That would be a strange sequel to the general election campaign —and would hold innumerable morals for both political parties.

Most of the other new powers merely ensure that the authorities will be free to safeguard movement of essential supplies without interference ; and in particular to use the Services to do so. So far the use of the Services has been confined to 250 Army trucks for postal delivery. This is not the most that the Army could do if called upon, but there is, as yet, no parallel in prospect with the situation in 1948 and 1949, when the Labour government used troops and Army transport to unload ships during the dock strikes. Few people in the Services could drive trains safely, and they would hardly be called in to do so unless the NUR joined the strike first ; and the additional road transport which the Army could provide (it is already taking care of routine service movements) might not greatly exceed a thousand trucks or so. " State of Emergency," in fact, is a rather awe-inspiring entitlement for the powers actually taken, or indeed for any further powers that might be taken, if the strike is prolonged ; but the term itself may be of some use in making clear to the strikers that the whole weight of the nation's resources will be used to defeat their attempt to enforce its capitulation by near-strangulation.

Mr Strydom and the Optimists

THE South African government is obviously in a hurry to get the Senate Bill on the statute book as soon as possible. After a 30-hour debate the Bill was given a second reading last Friday. Mr Strydom is quite unmoved by the widespread opposition to the Bill, which extends even to members of the Nationalist party itself.

In the bitter debate in parliament all the opposition parties and groups stood solidly together. Even the Conservative party, which had been formed by dissident elements of the United party who favoured compromise with the government on the Coloured franchise issue, refused to be associated with the Nationalists' plans. In the country, feeling is running deep ; but it is doubtful whether the reported " remobilisation " of the Torch Commando, which has fallen somewhat into disrepute, is in the best interests of the opponents of the government. In the present circumstances, only the United party, for all its shortcomings, is capable of giving an effective lead. But it will have to show itself more resolute than hitherto.

In some quarters the charitable interpretation has been put on the government's intentions that, as soon as the Coloured franchise problem is out of the way, the Senate will be restored to its orginal size and shape. This is supremely improbable, since it is the unconcealed ambition of the Nationalist party to secure the perpetual domination of South Africa by the Afrikaner *Volk* under its own leadership. For this purpose a " packed " Senate is far too useful a tool to be discarded once it has been shaped ; and the present Bill is, indeed, no more than a logical preliminary to other and more far-reaching measures.

Red Light in Berlin

THE fracas in Berlin this week was an alarm signal. Nothing on the scale of this battle between organised Communists and the West Berlin police had been seen before. Several thousand roughs, presumably members of the " Free German Youth," crossed the sector boundary to demonstrate against a gathering of the former members of a Panzer division. There were a considerable number of casualties among the police, and it will not be surprising if the West Berlin authorities soon ask the Allied commandants for the right to reinforce their men. Already, the attempt has been made to give revolvers to customs police, after a recent incident with the Berlin Communists. The danger of serious affrays in this precarious centre has grown.

It is possible that the attack against the ex-soldiers' meeting is the first of a new campaign of force. At the Warsaw military conference last month the East German premier, Herr Grotewohl, announced that henceforth his government would have a free hand to deal as it liked with the West Germans. Its actions—allegedly in the interests of reunification—would be supported by the Soviet government. In other speeches, Herr Grotewohl has threatened action in a way which could mean anything from organising a *coup d'état* in Bonn to throwing stones in Berlin. No doubt, the East German leaders intend to bring more pressure to bear on German businessmen, as they did when they suddenly raised the tolls on the *Autobahn* into Berlin. But violence, blackmail and subversion are also certainly on the Communist programme for Bonn as well as Berlin. The battle on the sector boundary will do little to further reunification, except by raising the spectre of a civil war in German minds ; but Herr Ulbricht and his colleagues can have no interest in any form of reunion except one which extends their rule. The possibility must be envisaged that they will concentrate their new powers on achieving an outright victory, using the stock-in-trade of both Communist and Nazi revolutionaries.

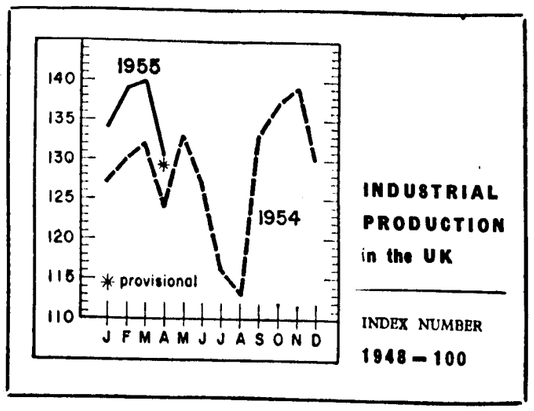
The Communist Case for Bases

THE withdrawal of Russian troops from Port Arthur, which was completed on Tuesday, has been going on by stages throughout May, accompanied by the presentation of bouquets, the raising of a memorial and profuse expressions of gratitude from the Peking government. The newspaper *Kwangming Jih Pao* said that China would "never forget the vital role played by Soviet armed forces in the defence of peace and security in the Far East"; and a local party official, Kuo Shu-shen, declared that "the heroic Soviet forces have contributed immensely to China's security." This contrasts strangely with what the Russians had to say about bases on foreign soil in their much publicised statements on disarmament of May 10th. They then said flatly that the establishment of such bases "increases the threat to the security of the states on whose territories they are being set up." The Chinese government now states exactly the opposite view, and thus implicitly sides with the Atlantic allies in their claim that Nato bases are genuinely defensive and vital to defence.

The Finns, who had the Soviet base at Porkkala, under whose guns lies Helsinki itself, imposed on them at the end of the war, would indeed feel a good deal more secure if the Russians dismantled their fortifications and marched away. But it is unlikely that the Russians will be consistent enough to do this; the concession announced in Helsinki this week amounts to little more than a lifting of the "blackout" formerly imposed by the Russians on Finnish trains passing through the base. The Port Arthur incident shows that the propaganda for the abolition of bases is meant for consumption outside the Iron Curtain only. It would be more realistic for the Russians to admit that, in the West as anywhere else, small countries depend for their security on the military assistance of their bigger allies; but that sort of realism would strike at the foundations of their foreign policy.

Results on the Screen

WHATEVER may be said of the use to which television was put as an electioneering instrument, there can be no doubt about the efficiency with which it was used as a medium for recording and commenting on the election results as they came in on Thursday night and Friday. Television was not only considerably ahead of sound broadcasting with the results, but its human brains were far quicker than sound radio's electronic brain in giving a general picture of the situation. And, although nowadays the scenes at the declaration of the poll are hardly those of Eatanswill, the cameras managed to convey the sense of excitement, and quite a lot of incidental comedy, outside and inside town halls in various constituencies. The tantalising postponements of the announcement of the key Watford result were an accident, but one that felicitously heightened the drama for the viewer; and there were several entertaining unrehearsed interludes—in one of which Cheltenham's defeated Socialist candidate replied to his Tory victor's platitudes about a "good clean fight" in terms which may have shocked Cheltenham, but which came to the ordinary viewer as a delight.



Immediately after the announcement of the first results, the commentators in the studio were forecasting a Conservative victory; shortly afterwards they had to explain to indignant telephone callers that when there was a swing to the Conservatives, and they said it was a swing to the Conservatives, they were not being unimpartial towards Labour. There was a certain slowness in spotting that peculiar things were happening in the marginal constituencies, and that the Conservatives had already failed to capture on the roundabouts some of the seats they were supposed to capture on the swing; but this was an easier point for the psephological mind to grasp in repose than it can have been in the remarkably quick-talking act in front of the cameras. Unfortunately, the commentary on parliamentary personalities was well below the intellectual level of the rest of the performance. But the BBC can be pleased at the discovery that election night is a subject perfectly suited to the combination of studio set-piece and outside telecasting. Side-by-side with the outside broadcast on the Coronation, this was the television service's most notable achievement to date.

The Stigma of Insanity

THE Royal Commission on the lunacy and mental deficiency laws has periodically been taking evidence without much publicity, and so far as mental illness is concerned, a main problem that may have to be decided is becoming clear. Since 1930, people suffering from mental illness have been encouraged to seek treatment by being allowed to enter mental hospitals as voluntary patients. They do not thereby have to undergo the stigma of certification, which involves them in a judicial process, subjects them to restraint and deprives them of some of their civil rights.

The voluntary patient formula has certainly enabled much mental illness to be treated at an early stage with correspondingly better chances of success. But there are still many people who refuse treatment, even though they are assured that they will not be certified, because they want to avoid the stigma of entering a mental hospital at all and thereby being labelled as "mental." Much of the evidence before the Royal Commission has, therefore, turned on the best way of avoiding this stigma, and the solutions proposed have tended to take two opposing forms. One is that the treatment of all mental illness should be focused on the mental hospital, which should be regarded as a specialist hospital, be upgraded to the status of one by the recruitment of far more staff, and which should reduce its custodial aspect to the minimum. It is through familiarity with the mental hospital as an active centre of treatment, where patients can come and go with as little formality as in a general hospital, that, in this view, the mental hospital barrier can best be broken down. The opposite point of view is that, wherever possible, mental illness should be treated in general hospitals or in special units attached to them. People suffering from neurosis, in particular, it has been argued by some witnesses, will not seek treatment because they are afraid of having to go into a mental hospital, associate with the "really mad," and be similarly stigmatised.

It will be interesting to see if the Royal Commission comes down on one side or the other. The first view can perhaps be regarded as rather idealistic, especially when most mental hospital buildings prevent the complete segregation of distressing cases from the milder ones. On the other hand, the opposing view would involve the withdrawal of skilled staff and of the milder cases to the general hospitals, and therefore the downgrading of mental hospitals, which would nevertheless still have to look after the majority of the mentally ill. Is there not a danger that people will then still be afraid to seek treatment, lest they be considered bad enough for admission to places that can be little more than care and protection institutions for the chronically insane?

Forecast for North Africa

PERSISTENT heavy weather over French North Africa has been broken by one bright interval. The Franco-Tunisian conventions have been signed. Provided that they are ratified by both the Bey and the French parliament, Tunisia will have home rule, its French residents will enjoy certain municipal, cultural and economic rights and Paris will look after its defence and foreign affairs.

An article on page 862 suggests that there is little doubt about ratification by the Bey; it is at the French end that the prospect is less sure. The French residents who oppose the conventions are said to have collected large sums with which to fight their passage through parliament, a campaign that has more hope of succeeding in the Council of the Republic than in the National Assembly, where few right-wing deputies see any advantage in causing M. Faure to fall. The conventions cannot be debated for a month; this is unfortunate for M. Faure, who is well aware that France's whole future relation with North Africa hangs on getting them through quickly.

Were he to wait longer, deputies might be swayed in some unpredictable direction by the course that events are taking elsewhere in North Africa. For Morocco and Algeria are both torn by faction and unrest. In Morocco, it is difficult for the Faure cabinet to take positive action till the Tunisian agreements are fully sealed and delivered. Yet M. July, its Minister for Tunisian and Moroccan Affairs, has now openly admitted to fellow parliamentarians that its present Sultan is devoid of any authority and a virtual prisoner in his palace. When he made this admission to the Foreign Affairs Committee of the National Assembly, he added that whereas to restore the old Sultan was impossible, to establish a Council of Regency was difficult on religious grounds. In a word, he seemed to be relying on his voices to tell him what to do next.

The scene in Algeria is little brighter. The so-called outlaws have extended the range of their raids and the news that Paris has set up a permanent "Committee of Action" to handle the twin problems of North African security and economics has brought little comfort to uneasy rural *colons*. The arrival of an entire division of the French army, released after due notification to Nato, has done more to allay their fears, but it has exacerbated the emotions of the Moslem inhabitants. Nor was the step welcome to General Gruenther—for Nato can hardly view with equanimity this warning that its military strength may be continually drained as a result of French policy in North Africa.

Prohibition for Britain?

Many men complain, and with considerable justice, of the displays of mercers and drapers, which too often are the means of luring young females from the paths of virtue. Misery then ensues quite as great and protracted as arises from the sale of intoxicating drinks. Is, also, the sale of silk mercery and fine drapery to be prohibited? The gentlemen mean no such thing—the ladies, we are sure, do not; but the rigid morality, the stiff intolerant puritanism, which would put a stop to the sale of intoxicating drinks, must in consistency put down all mercers' and all jewellers' shops. There is another luxury at present largely indulged in by the people, and a considerable nuisance both here and in the United States. Tobacco is smoked, snuffed and chawed, to the manifest injury of health, waste of property, and begetting of very offensive social habits. If the sale of alcohol be prohibited, can the sale of tobacco be legally permitted? . . . Not far from Exeter Hall stand Drury Lane and Covent Garden; and there, patronised and encouraged by Royalty and the highest nobles of the land, the soft and lascivious airs of a Southern people charm and possibly delude many a young person. Theatres have been denounced like intoxicating drinks. Like them, they are capable of great perversion, and like them they waste the national resources, and frequently tend to increase crime, to corrupt the social habits and to destroy the lives of the people. At least, these effects are continually laid to their charge. . . .
That sobriety of manners, as of mind, is of great advantage to individuals and to communities, no man denies. Nor can any reasonable being deny that the extinction of drunkenness would be a prodigious moral advantage.
About the means of accomplishing it only can there be any difference of opinion. Perhaps the gentlemen who would make laws to prohibit the sale of intoxicating liquors are not aware that their fathers or grandfathers were habitual drunkards—that a century ago to get frequently drunk was a gentlemanly accomplishment, and that at present the race of six-bottle or even of three-bottle men is utterly extinct. "The cup that cheers without inebriating" has taken the place of the wine cup. Men follow the fashion, but resist restraint.

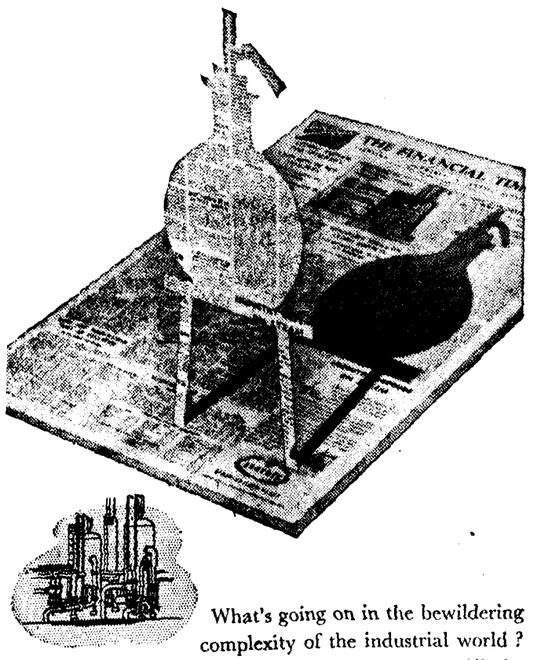
An Omen from Victoria

BOTH Mr Menzies and Dr Evatt have cause for satisfaction in the result of the Victorian state elections, in which not only the dissident anti-Evatt Labour members have been defeated, but also four Liberal rebels, headed by the former premier (they objected to boundary reforms which have reduced the weight of the rural vote). Mr Menzies has made new party capital out of the schism that has rent the Labour party and has now made it possible to form a shaky Liberal-Country party coalition in Victoria, based on an increased Liberal representation in the state house and the opportunism of the dwindling Country party. But Dr Evatt has most reason to rejoice, for he is confirmed in his grip on the leadership of the federal Labour party, and the power of the federal party executive in the states has been amply demonstrated.

Early this year Dr Evatt initiated the purge of the Victorian state executive of its anti-Communist, and anti-Evatt, Catholic Action members; the result in Victoria, as in the federal parliament, was the creation of a dissident group of Labour members, disowning Dr Evatt and their newly elected executive. Their defeat at the polls confirms the new, purged state party executive in power, makes almost certain the success of moves similarly to purge the New South Wales executive, and suggests that the rebel right-wing Labour MPs at Canberra cannot expect to survive the next general election—which Mr Menzies may now feel he can safely arrange next year. But Dr Evatt has not met the challenge to his leadership by uniting his party on a policy which both wings can accept; he has done it by driving heretics out of the fold—together with an unknown quantity of electoral support. Left-wing counsels are in the ascendant. Much of the blame must be laid at the door of Catholic Action, which overreached itself in moving from the industrial arena to politics and there giving Dr Evatt the chance to beat the drum of anti-sectarianism. The final result, however, may be to reinstate Communist influences in the trade unions, which the disbanded "industrial groups" had so largely eradicated.

Odyssey for Sea Lawyers

THE experts in international law who are trying to evolve a code of the sea probably feel that a voyage with only one Scylla and Charybdis must have been child's play for Odysseus. The present meeting of the International Law Commission, at Geneva, has managed to reach agreement during the past fortnight on a number of the less controversial items in the draft articles it hopes to lay before the United Nations, and has prudently given itself until July 8th to tackle the rest. But on the two main issues, territorial waters and the regulation of high seas fishery, the Commission still has to find a way between the rival claims of the internationalists, who want to give as much authority as possible to a UN organ, and the nationalists, who want to preserve the influence of the coastal states. And even if the Commission can report back unanimously to the General Assembly, its proposals will still have to pass under the scrutiny of Chile and Peru, who are not members of the Commission but who have recently shown themselves to be avaricious snappers-up of sea space. Their refusal this week to submit their case to the International Court shows that they are as intransigent as ever.



Britain has been playing the role of Odysseus, who found himself forced to steer unpleasantly close to Scylla's clutches in order to get the majority of his crew through safely. Instead of entrusting the regulation of all fisheries outside territorial waters to a UN authority, the British are willing to allow the coastal states wider regulating powers than they have at present within a limited distance of the shore. It is felt that states which are given this right will be less tempted to mark off huge expanses of sea as "territorial" waters. As to the width of territorial waters, Britain stands firmly on the principle of the three-mile limit, and is willing to admit only the kind of minor local variation sanctioned by the International Court in the Anglo-Norwegian case. The Commission also has to decide whether special extensions of territorial waters should be approved by a UN authority or settled by agreement between the coastal state and other interested parties. Another point in dispute is whether the right of innocent passage of ships through territorial waters should be qualified to protect what the Commission's draft vaguely calls the "public policy" of the coastal state. By the time the members of the Commission have argued their way through all these matters they will probably feel that they have qualified for a spell in Lotus-land.

Justice in Djakarta

INDONESIA has taken a regrettable decision in refusing an entry visa to the eminent British lawyer briefed by the Netherlands government to take over the defence of Dutch nationals charged by the Indonesians with engaging in subversive activities. The case has dragged on now for eighteen months, during which time Mr Jungschlaeger and his fellow prisoners have had these serious and as yet unproved charges hanging over their heads. Charges of impropriety towards witnesses had been levelled by the Indonesians against the Dutch lawyer conducting the defence and, while firmly rejecting these accusations, the Dutch government decided to ask Mr Curtis-Bennett, QC, to take over the case.

It is not clear from the long and involved statement put out last week by the Indonesian embassy in London, precisely on what grounds his entry visa has been refused. Indeed, the statement quotes the presiding judge as saying that "there is no regulation whatever allowing or forbidding the engagement of a foreign lawyer." This makes it all the more difficult to understand why there should have been qualms in Djakarta that the law of the land would be broken. This decision is sure to exacerbate still further relations between the Dutch and the Indonesians, and it is surprising that in these circumstances, and with Indonesia's reputation in the world as a free and fair-minded nation at stake, it should have been based on a narrow, not to say shaky, legal point. There is time yet for a change of mind in Djakarta.

Bubble, bubble, toil and trouble...

What's going on in the bewildering complexity of the industrial world? What simple formula can give you all the facts and figures of industry. The answer, of course, is THE FINANCIAL TIMES.

This newspaper supplies a wealth of vital information—carefully summarised and concisely reported—together with absorbing articles and measured comment on countless industrial subjects. As you read, facts take shape and form, puzzling situations become clear. Thoughtful trade forecasts help you to plan ahead.

Be well informed. Try reading THE FINANCIAL TIMES every day for a week—at the end of that time we believe you will wonder how you ever managed without it.

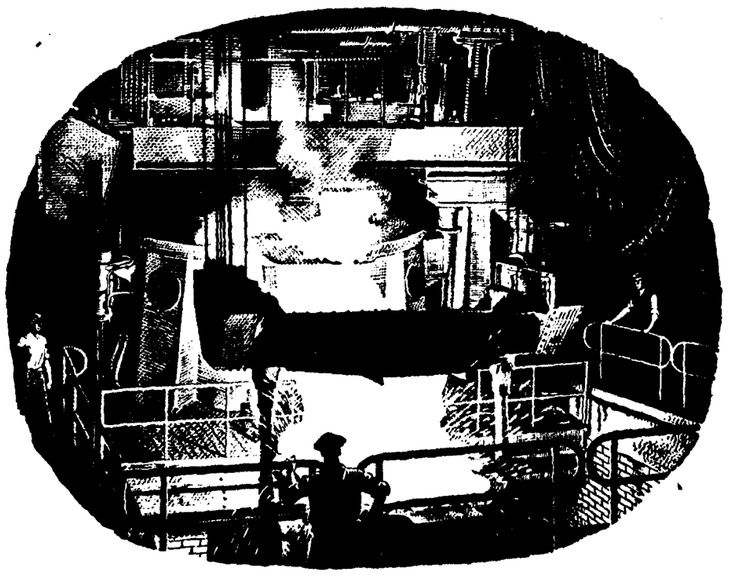
JUNE

THE OLD CHERRY-PICKER



The ripe cherries of June remind us of our absolutely favourite person in English and Irish history. Katherine Fitzgerald, Countess of Desmond, was born 1464 and died 1604. (There are spoil-sports who dispute that date of birth, and say the old Countess was a mere 104 when she died. We are less niggardly, and insist on 140.) But it is not her great age alone that puts the Countess at the top of our list of favourites. The fact is that, at the age of 90, she broke her leg falling out of a cherry-tree. We have never found record of anybody else falling out of a cherry-tree at the age of 90. We are sorry for Katherine Fitzgerald. It must have been painful. But what was she *doing* up a cherry-tree at the age of 90? History does not in fact relate. Perhaps she had gone up to fix a hammock, so that she could snoozle in the sun. She may have been trying to rescue a stranded and yiauling kitten. But we prefer to think that she was picking, or trying to pick, some particularly juicy-looking cluster from a tree when her grumpy young (say about 75) gardener wasn't looking.

We cannot protect you from the hazards of cherry-picking, but we can help you to safeguard the future of those who depend on you. Ask at any Midland Bank branch for details.

The Prime Minister

SIR ANTHONY EDEN.
By Lewis Broad.
Hutchinson. 256 pages. 15s.

SIR ANTHONY EDEN.
By Alan Campbell-Johnson.
Hale. 272 pages. 18s.

THIS is obviously a good moment commercially to publish books about Sir Anthony Eden, but, as both his new biographers admit, it is difficult to write an adequate account of a public figure in mid-career. Even during the first few weeks of his premiership Sir Anthony has added a significant new chapter. In one sense, of course, his public life provides an exceptionally continuous story. Not only has he been in and out of the Foreign Office for nearly a quarter of a century, but throughout that time he has worked consistently, and on the whole realistically, in the cause of collective security. Even this part of the story, however, is far from complete. In 1955 the Geneva settlement over Indo-China is still being hailed as a triumph, but in ten years' time it may have to be assessed very differently.

In any case, a fully rounded account of the new Prime Minister should contain a good deal more than the long list of his negotiations. These are faithfully catalogued by both his biographers, but where Mr Campbell-Johnson never moves from the level of superficial reporting, Mr Broad delves deeper. For too long the public has been presented with a one-dimensional picture of an agreeable young man with a happy knack for getting on with foreigners. Mr Broad manages to suggest the more steely qualities without which Sir Anthony's present eminence would be not only inexplicable, but impossible. It is tough at the top in Westminster, and only the cleverest politicians get there. Greatly to the Tories' advantage Labour has consistently under-estimated what Mr Butler has called Sir Anthony's political "flair." But now his calculating politician's mind has been revealed in its considerable capacity. In his timing of the election, in his strategy for the Tory campaign, and in his early handling of the rail strike, Sir Anthony has displayed a political touch not seen in 10, Downing Street since the days of Baldwin.

Both writers note the influence of Baldwin on the young Eden at his most politically impressionable age, and there is a distinctly familiar flavour about Sir Anthony's stress on national unity, his almost physical distaste for class bitterness, and his instinctive desire to bridge rather than divide the House of Commons. It is fortunate that Sir Anthony's record at the Foreign Office can effectively dispel any fear that Baldwin's languor might now afflict the Government's conduct of foreign affairs. Nor is there much similarity of temperament. Mr Broad has been intrigued by the Eden family inheritance of violent temper and artistic sensitivity, and it is a fact that while Sir Anthony's first nights may be calm and assured, the dress rehearsals can be torrid. But in public he has always practised to keep a tight rein on temper. The price he has had to pay is a certain deadening of personality, but if this has prevented him from firing the blood like a Churchill, he may have already acquired a wider popularity than Churchill both among MPs and with the general public.

As a guide to what Sir Anthony may achieve as Prime Minister Mr Broad's analysis is inevitably inconclusive. But the picture he creates of an intelligent, sensitive politician, refreshingly free from dogma, is both intriguing and hopeful.

Revolutionary Memoirs

THE RUSSIAN REVOLUTION 1917.
By N. N. Sukhanov. Translated and edited by Joel Carmichael.
Oxford University Press. 728 pages. 42s.

THIS abridged translation of Sukhanov's *Zapiski* is a welcome addition to the short list of memoirs available in English by active participants in the Russian Revolution. N. N. Sukhanov, as member of the original Executive Committee of the Petrograd Soviet, was one of those responsible for installing the Provisional Government in office in March, 1918; for the next eight months his influence was steadily exerted to prevent that Government acquiring effective power, and his rationalised preoccupation with the danger of counter-revolution made him consistently oppose any serious attempt to check the Bolsheviks. Lenin's description of him—"one of the best representatives of the petty bourgeoisie"—may be taken in either sense.

He was not untypical of the revolutionary intellectual of his age. A Socialist Revolutionary in 1905, a Menshevik Internationalist in 1917, he remained, above all, an eager theoretician. "My mood," he says, "and perhaps my nature as well, were such that I had too little desire at that time for spade work. . . . All my efforts and thoughts were concentrated on the sphere of high policy." Intensely civilian, he refers (when it was clear that force would be the final criterion) to "that depression of spirit I felt whenever military matters were raised." Trotsky describes him as "semi-Narodnik, semi-Marxist, a conscientious observer rather than a statesman, a journalist rather than a revolutionist, a rationaliser rather than a journalist." But Trotsky's frequent mention and quotation in his own history of the Revolution are a tribute to Sukhanov's importance as a chronicler. Subjective as these memoirs are, they remain an essential source; the skill and sincerity—if at times rather muddled sincerity—of the rapportage afford a vivid picture of the atmospheres and personalities, the alarms and the excursions of the period; and they make clear why it was, given the leadership of the various groups, that the ultimate victory of Lenin and Trotsky was inevitable.

In his original foreword—unfortunately not translated here—Sukhanov explains that he started on his *Zapiski* because he had nothing else to do; the Bolsheviks had clamped down both on his political activity and his journalism. Volume I was completed between July and November, 1918; then there was a pause, and the six further volumes were written between April, 1919, and June, 1921. There was good evidence by then of the vigour of Bolshevik repression, and it says much for Sukhanov's courage that he not only included his famous reference to Stalin ("a grey blur, looming up now and then dimly"), but frankly accused Lenin of vacillation and cowardice in the crisis of July, 1917. During the twenties Sukhanov became sufficiently reconciled to the regime to work for it as an official. This lasted all through the New Economic Policy; but in 1931 he was overtaken by the inevitable fate of Left Wing idealists who believe they have struck a bargain with the Communist autocracy.

This English abridgement is devised to give a continuous narrative. The translation is fluent. The editor's introduction makes some excellent points. There is a good index. The notes are the right length and useful, though not in every case accurate (the big SR Trial was in 1922, not 1920). The serious student will, of course, want to have the complete text; and it would be helpful if subsequent editions had a note to say precisely what has been cut. But, as it is, we have good reason to be grateful to Mr Carmichael and his publishers.

Poet of Talent

THOMAS GRAY: *A Biography.*
By R. W. Ketton-Cremer.
Cambridge University Press. 323 pages. 25s.

MATTHEW ARNOLD contended that Gray was unfortunate in being born into an age of prose, when "a sort of spiritual east wind was blowing," but it is arguable that had he lived in a vigorously poetic age, his gifts might have been quite obscured. A man can scarcely be ranked as a great poet on

the strength of one lyric, no matter how fine; and apart from the *Elegy*, Gray's poetry shows talent, not genius. Yet because there were so few men of poetic sensibility writing in the middle years of the eighteenth century, he enjoyed a very considerable reputation in his own day and he has a secure place in the history of English literature.

Dr Johnson distrusted the innovating tendencies which he perceived in Gray's work—the experimental metres and the latent romanticism—and he dismissed him with the very unfair comment: "Sir, he was dull in company, dull in his closet, dull everywhere. He was dull in a new way, and that made many people think him *great*." Had this really been his character, he could not conceivably have held the friendship of Horace Walpole. Indeed, Walpole showed much more perspicacity than Johnson when he remarked that "Gray never wrote anything easily but things of humour; humour was his natural and original turn." His letters, always lively, sometimes playful, often brilliantly amusing, certainly bear out this thesis; and Mr Ketton-Cremer suggests that if Mason, his friend and first biographer, had been less discreet, posterity might have enjoyed several more lampoons and satires on political personages and events—perhaps in the rumbustious vein of the lines on Lord Sandwich, perhaps in the ironic mood of his attack on Lord Holland.

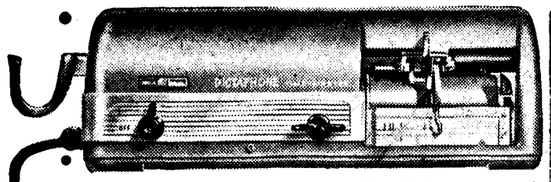
Mr Ketton-Cremer does not attempt a critical study of Gray's poetry, but as pure biography this book is admirable. It is a work of scholarship, in which considerable use is made of hitherto unpublished material, but it is also a pleasure to read. The picture of Gray that emerges from these pages is an authentic portrait built up from the man's own writings, and from the remarks of his contemporaries, by a discriminating and sympathetic biographer who is very well acquainted with the period. Gray was not a simple person; he had many of the tiresome characteristics of the "remote and ineffectual don," together with extreme sensitivity. Without intrusive comment or pretentious explanation, Mr Ketton-Cremer has presented him as a man who reconciled a difficult temperament with a truly civilised mode of life.

Analyst of Infamy

A TRAIN OF POWDER.
By Rebecca West.
Macmillan. 339 pages. 21s.

MISS REBECCA WEST is a sentinel in Purgatory, but the souls over whom she keeps tireless watch have in them no seed of grace. She brings to bear on minor infamy, on the lecherous and sordid perimeters of evil, her marvellous style, her capacity for minute research and her towering rectitude. When Miss West applies herself to the lesser cases—the murder of Mr Stanley Setty, the William Marshall espionage inquiry—the result is unconvincing because her essays are like vast cyclones in a small and slightly muddied swimming pool. When, on the contrary, she addresses herself to the great crimes—the Nuremberg trials—the result is depressingly inadequate. It is simply no good trying to reduce Lucifer and the nine circles of Hell to an exercise in disgust or fastidious rejection. The great tragedy of Nuremberg was not the particular gesture of Dr Schacht or the poor ventilation in the Palace of Justice, but the fact that the Nazi gang was being denounced for mass torture and deportations by a Soviet judge and by the very men who would soon be begging Germany to rearm.

It is only in purgatorial evil, in a middle region where crimes are large enough to be exemplary but not cataclysmic or mainly political, that Miss West is fully at home. Consequently, her present volume contains only one entirely satisfying achievement, "Opera in Greenville," a study of the trial in Greenville, South Carolina, of thirty-one taxi drivers implicated in the lynching of a Negro on the morning of February 17, 1947. The whole town, melodramatic, heat-ridden and vaguely sinister, stands naked before Miss West's inquiry. The attorneys gesticulate in a way curiously reminiscent of Kafka; one of them is so good a lawyer "that the imperfections of the case must have vexed him to his soul." The climax of the trial, an acquittal, brazen in the face of the obvious, is beautifully contrived. Miss West flays the crime as "a hideousness that begets hideousness," and yet recognises that the South is on its way to better things.



When one puts down this book it is with a sense of exasperation that so much skill should be expended on so much sordid triviality. Over the past few years, Miss West appears to have lost that sustaining instinct for nobility and laughter which informed her earlier writings. But above all, she has lost the essential distinction between mere pity—with which her last two books are filled—and compassion, which means "suffering with those who suffer" and discerning the truer harmony beyond.

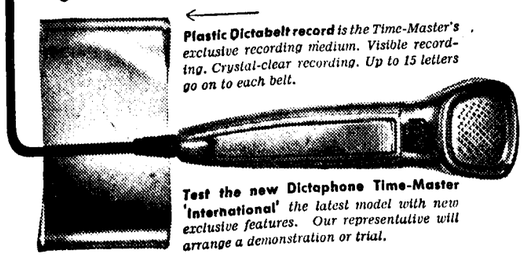
The new Dictaphone Time-Master 'International'

Why is the Dictaphone TIME-MASTER Britain's highest-priced dictating machine?



THE reason is plain. Even plainer after you have used a Time-Master for a day or two.
The great practical advantages of the Time-Master cost money to produce. To design. To manufacture.

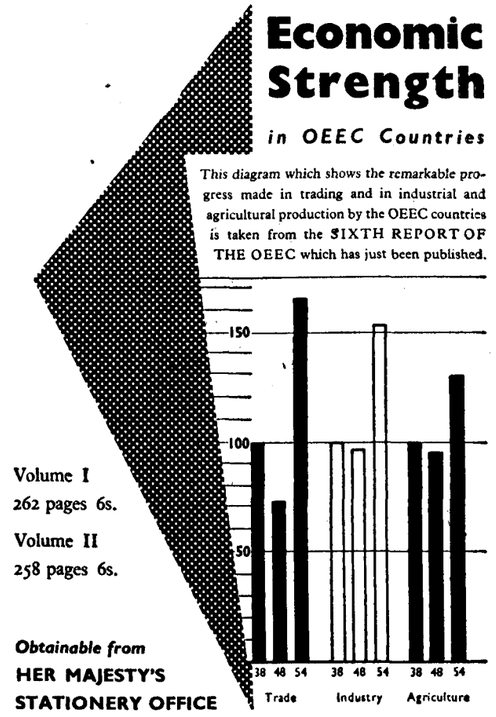
The Time-Master is built to endure. Styled to enhance. But above all, it is a machine to take the difficulties *out* of office dictation. You will find it as simple to use as your telephone.

Companies who have equipped their offices with Time-Masters report that, in practice, the Time-Master proves the *least* expensive dictating machine. It brings such astonishing increases in executive accomplishment that it quickly pays for itself, frequently within the first year. That is why the Time-Master is also the world's best-selling dictating machine.

Our representative would be glad to prove these facts to you.

Visit Stand 104 Business Efficiency Exhibition Olympia June 6th - 16th

Plastic Dictabelt record *is the Time-Master's exclusive recording medium. Visible recording. Crystal-clear recording. Up to 15 letters go on to each belt.*



Test the new Dictaphone Time-Master 'International' *the latest model with new exclusive features. Our representative will arrange a demonstration or trial.*

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Military Cross Currents

Washington, D.C.

SELDOM have the interdependence of foreign and strategic policy and the effect of domestic politics upon both been more clearly illustrated than by two developments in Washington during the past three weeks. For largely parochial reasons, the House of Representatives rejected the Administration's military reserve plan. At the same time the Pentagon "discovered" that Russia was flying formations of advanced types of long and medium range bombers. The action of the House may well have an effect upon the timing of the forthcoming Big Four "parley at the summit," and the announcement from the Defence Department may influence the whole attitude of both Congress and the American public to negotiations with the Soviet Union.

The outbreak of war in Korea five years ago necessitated partial mobilisation and exposed the weakness and obsolescence of the American reserve organisation. Ever since, there has been a general feeling that some better system must be devised. Last January the Administration laid before Congress what was, in effect, a "packaged deal." It proposed a reduction in the strength of the armed forces, principally the Army, from 3,200,000 men at the beginning of 1955 to 2,850,000 by mid-1956 and a consequent reduction in the military budget and in the number of young men called up each month; this was to be counterbalanced by an improved and strengthened reserve system.

On paper the United States has a "ready reserve" of some three million men, mostly veterans of the second world war. But of these only 700,000 are in active reserve units such as the Air or Army National Guard. The latter are roughly the equivalent of the British Territorial Army or the RAFVR, except that they are more local in organisation since the National Guard—for reasons reaching far back into American history—is under the administrative control of the state governors in time of peace. The Korean war proved that the reserve units other than the National Guard were useless as reservoirs of trained or skilled men. Since there are no enforced penalties for failing to attend drills or camps, it is estimated that 95 per cent of those on the paper strength of the units are regularly absent.

The Administration proposed a new system which, in view of the fundamental anti-militarism of the American public, was bold in conception. It envisaged the merging of the reserve and National Guard units into a new Active Reserve force, and the imposition of penalties for those who did not attend 48 annual weekly drills and a two weeks' summer training camp. What counted even more over the short term was the provision allowing a minimum of 100,000, and a maximum of 250,000, young men between seventeen and nineteen to volunteer for six months' basic training in the regular Army, followed by nine and a half years in the Active Reserve. The Administration asked for compulsory powers if enough volunteers did not come forward.

★

The Bill which embodied this programme sank below the surface of public attention for many weeks and emerged on April 27th from the House Armed Services Committee, shorn by an overwhelming vote of 31 to 5 of most of the compulsory provisions which made the new system an advance on the old one. The amendments were rather weakly accepted by the Administration. When the Bill came before the whole House of Representatives three weeks later, it was clear that the exigencies of the cold war had made only a superficial impression on the deep-seated dislike of Congress for any system of compulsory military service, a dislike which has been fanned by the active opposition of many religious and educational groups.

After several days of acrimonious debate on the floor of the House, opposition to the programme polarised around two amendments. One of them would have debarred the six-month trainees from serving abroad in countries where they would be liable to the jurisdiction of foreign courts. The other, moved by the theatrical Negro Congressman from New York, Mr Adam Clayton Powell, and backed by northern liberals, would have forbidden the assignment of reservists to units that practised racial segregation. This is an extremely thorny subject in the South because of state control of the National Guard. The active forces under the President's goading have made better progress in eliminating racial discrimination than almost any other sector of the community, but Mr Powell feels that much of this progress would be undone if reservists were assigned to segregated units after their basic training.

By May 19th there was nothing the House leaders could do but to take the Reserve Bill out of circulation for the time being. The Senate will not act unless the House does, and the Administration is faced with the alternative of either re-fighting the whole battle this summer or of seeing its proposals shelved, not merely for this year, but probably until 1957, since a measure as intrinsically unpopular with the American mother would receive no serious attention in an election year. But on the other hand the House has

passed with pious speed the Administration's military budget, calling for a 25 per cent reduction in the Army.

In part, the action of the House in shelving the Reserve Bill was the expression of deep-rooted prejudices and political calculation, but in part it may have been due, as Mr Walter Lippmann suggests, to the sense of complacency and relaxation which the indications of greater Soviet flexibility and reasonableness have induced even in Washington. Although the Administration is now re-examining the statute book to see if the present reserve system cannot be improved and tightened under existing legislation, its sense of the real urgency of getting the Reserve Bill through Congress this year has contributed to the President's unwillingness to be away from Washington during the closing weeks of this session, that is during late July and early August. It is in part for this reason that the western powers are proposing that the Big Four meeting be held in mid-July, which means a more hurried preparation than the professional diplomats approve of, or else that it be postponed until late summer.

★

But if action on the Reserve Bill provided evidence that the United States might be tending to let its guard down and put domestic political considerations foremost at the first hint of a thaw in the cold war, the disquiet of the Senate Armed Services Committee about the relative air strengths of Russia and the United States exemplified the reverse tendency. The Senate has been much more critical of the decision to reduce the size of the Army than the House. Two weeks after the May Day air parade in Moscow the Pentagon put out a statement to the effect that the formations of T37 and T39 bombers seen there "established a new basis for our estimate of Soviet production of the heavy jet bomber." This announcement was timed to support the Administration's decision to spend the bulk of next year's defence funds on the expansion of the Air Force. But in fact it had the opposite effect, causing many of the younger Democratic Senators, led by Senator Stuart Symington of Missouri, an ex-Secretary of the Air Force, to demand why the Administration has assumed so complacently that development of American long range bombers was far ahead of the Russians.

There are some politics in this, but in fact the evidence of recent Soviet strides in bomber design and production, though not as new as the Pentagon tried to assert, has really alarmed those officials and members of Congress who have had access to the facts; in particular they are concerned at Russia's apparent ability to move from prototype to production without going through the elaborate testing and modification before tooling up for full output which is necessary under a system of commercial contracts. Conclusive proof of this sense of alarm came last Thursday when the Air Force announced that it had ordered an acceleration of 35 per cent in the production rate of the B52, the intercontinental bomber which was due to come into service at an otherwise leisurely pace over the next two years.

Which cross current proves the stronger, complacency or alarm, depends very largely on the lucidity with which the President can provide the public with a balanced estimate of the strategic and international situation over the next few months. As every American politician would agree, no one else's words and views on these subjects count for anything like as much with the public.

Desegregation By Degrees

SLIGHTLY more than a year after its famous decision that racial segregation in publicly financed schools was unconstitutional, the Supreme Court has taken its first step towards changing this legal principle into a practical reality. It has now ordered the lower courts to require local school boards to "make a prompt and reasonable start toward full compliance" with desegregation. In this formula, the Supreme Court found a compromise, along lines suggested by the Department of Justice, between those Negro lawyers who had demanded a specific date for the end of segregation, and those southern states who had asked for indefinite time in which to comply. The Supreme Court action initially arose out of five cases appealed from lower courts in Kansas, Delaware, the District of Columbia, Virginia and South Carolina. In the latter two states, as in most of the rest of the South, no attempt to integrate school systems has so far been made. Under the present ruling, local authorities in all states "must yield" and set up non-segregated schools "with all deliberate speed."

These words, "deliberate speed," can be widely interpreted and it appears as if the Supreme Court is trying to give the South as much opportunity as possible to comply in its own reluctant way. The reason is that the pressure of a specific date could provoke grave troubles in the social and governmental fabric of the region. South Carolina, Georgia and Mississippi have plans for dissolving their publicly financed schools and reconstituting them as private schools entitled to exclude Negroes. Hotheads in Georgia and Alabama have threatened to defy federal law altogether and have asserted that local law-enforcement agencies would be on their side. Other southern spokesmen point out that district-by-district litigation can be prolonged over many years. No one really knows what will happen in the last resort and it is arguable that the Supreme Court has postponed the time of crisis rather than avoided it.

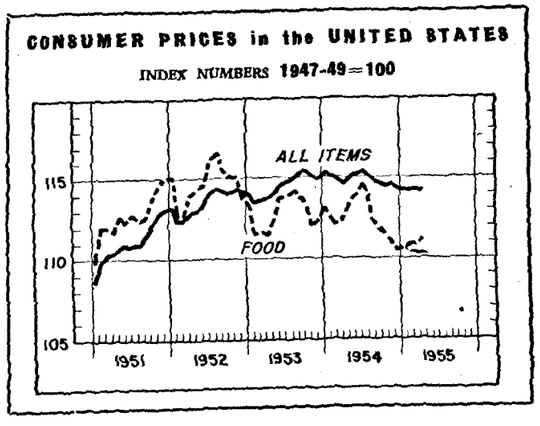
Ford's Package

THE Ford Company's "prosperity partnership package," thrown into its negotiations with the automobile workers' union a week before the current labour contract expired, woke up the dilatory proceedings with a bang. On wages, pensions, holidays and other benefits, the company's offer came near to meeting the union's requirements. But the answer to the union's basic demand, for a guaranteed annual wage, was an imaginative counter proposal. The violence with which union leaders rejected it demonstrated the strength of its probable appeal for the average Ford employee.

Later this year the company's stock is to be sold on the open market for the first time and it is proposed that Ford workers should be enabled to invest up to 10 per cent of their annual earnings in these shares, with the company putting up half the cost. Furthermore, the company offered an "employment stabilisation plan," under which laid-off workers would be able to borrow, without paying interest, against their future earnings while unemployed; men laid off permanently would be entitled to a separation allowance. The union leaders condemned this as failing to provide genuine protection, which the employers also agree is desirable, against insecurity of employment, and therefore as no substitute for the guaranteed annual wage. Mr Henry Ford is anxious that the rank and file of the union should express an opinion on the new proposal before it is finally turned down by the union leaders. Nevertheless, rather surprisingly, the company has shown no enthusiasm for the union's offer of a secret ballot of its members, to be conducted by an independent organisation.

Meanwhile, from the little information being published about the continuing negotiations, it appears that both sides have made concessions on points of detail. The union has even gone so far as to declare its willingness to modify the guaranteed annual wage scheme so that it will cost no more than the company's plan—estimated to amount to 12 cents an hour for each worker. All this means that the bargaining is now centred on a question of principle, on which both sides are apparently determined not to give way. On the other hand, neither side wants to break the automobile industry's present wave of prosperity. However, the prospect for next Monday, the latest deadline for the Ford strike, is not promising.

Chains of Command



WASHINGTON'S prophets and military pundits were as surprised as was the rest of the Navy when President Eisenhower selected Rear Admiral Arleigh Burke to replace Admiral Carney, whose term as Chief of Naval Operations expires in August. Admiral Burke, who is only 53, was promoted over ninety-two admirals of the line. Ever since Admiral Carney spoke somewhat too loosely about an expected Chinese assault on the off-shore islands in April, it had been thought that President Eisenhower might not renew his appointment. But the choice of Rear Admiral Burke is extremely surprising; although he has distinguished himself as a destroyer commander, his main notoriety derives from his role in "the Admirals' Rebellion" in 1949. That was the unsavoury episode in which a group of senior naval men used all the resources of advertisement to combat the Air Force's request for intercontinental bombers and to press their own claims for super-carriers. Admiral Radford, Chairman of the Joint Chiefs of Staff, was involved in the same episode and it may be to that association that Rear Admiral Burke owes his spectacular advancement.

Despite his own involvement in recent debates over American foreign policy, Admiral Radford—who has stood for a "tough line" in the Far East—has been reappointed as Chairman of the JCS for a second two-year term. By that time General Gruenther, whose presence in Europe is considered indispensable during the difficult beginnings of German rearmament, may be available. Also reappointed to the JCS is General Twining, chief of the Air Force, a man distinguished for the fact that he has not been involved in any Washington fracas. This is equally one of the principal qualities of General Taylor, who was recently chosen to replace General Ridgway as the Army's representative on what will, it is hoped, be a more harmonious military team.

Highway Collision

LAST week's head-on collision between the President and the Senate arose on a matter not of conviction but of method. Everyone is agreed that the United States needs more and better highways urgently. The President, however, wants to finance them, without putting a strain on either his budget or the national debt, already extended to the utmost, by means of bonds issued by an independent highway corporation. But to the opposition, and particularly to its conservative fiscal expert, Senator Byrd, this attempt to build roads painlessly is an irresponsible fraud. When the question came to a vote in the Senate, the Democratic majority, acting with a rare unanimity and with the help of a number of Republicans, rejected the President's proposals and substituted its own bill for them. This follows the solid old-fashioned custom of finding the federal government's share of highway funds by direct congressional appropriation. It has the added attraction of offering increased sums for farm-to-market and other local roads, beloved of Congressmen who want to do something for their friends back home. The President's plan not only lacked this particular political appeal, but would also have left Congress with little control over where highway funds in general were to be spent.

Both schemes, however, concentrate on bringing up to modern standards the transcontinental network of interstate highways linking major cities, and both accept that this must now become in the main a responsibility of the federal government. This year 40 per cent of the $300 million being spent on the interstate system is coming from state governments and they are required to match the federal contribution of $700 million a year for building other types of roads. The President wants $39 billion to be spent during the next ten years; just over $7 billion of this altogether would come from the states, but they would contribute only

$1 billion of the $26 billion allotted to the interstate highways. Senator Gore's Bill provides for an expenditure of $18 billion during the five years beginning in July, 1956. This would double the present rate of outlay. The states would supply over $5 billion of the total, so that their liability would be greater than under the President's scheme, but they would be responsible for only 10 per cent of the $8.6 billion to be spent on the interstate system. The federal contribution would be over $12 billion during the five years; this would make it impossible for the President to reach his goal of a balanced budget coupled with reduced taxation. For this reason he is hoping that the House of Representatives can be persuaded to salvage the wreckage of his new model highway programme.

Bulls and Bears in Congress

MEMBERS of Congress disagree about whether or not the present boom in Wall Street is unhealthy as much as do ordinary speculators. This was demonstrated last week by the release of contradictory reports from the Senate Banking and Currency Committee, which has been investigating the state of the stock market. The majority opinion, signed by the chairman of the committee, Senator Fulbright, seven of his Democratic colleagues and three Republicans, found that there was evidence of "an increase in unhealthy speculative developments" which might prove a "threat to the stability of the economy." The minority report, inspired by Senator Capehart—a garrulous critic of Mr Fulbright—and signed by three other conservative Republicans, denounced the entire investigation as "political in nature and intended to weaken the confidence of the people in the Administration of President Eisenhower."

The majority report embodied a series of recommendations, one of which Senator Fulbright is putting forward in a Bill. It requires companies whose shares are traded over the counter to meet the same standards with regard to the filing of financial statements and the declaration of voting rights as companies whose securities are listed on the exchange. This is the only point on which both the majority and minority reports are in agreement. The majority further finds that the Securities and Exchange Commission should curb abuses incident on the issue of "penny" stocks, such as those uranium stocks of low nominal value being speculated on rather wildly in Toronto and outside the New York market. Among other aspects of the market which the majority report wishes to see investigated are buying on credit, a possible separation between the functions of brokers and dealers, institutional purchases and their influence on prices, and whether "investment advisers" should be required to register.

Wall Street itself appears quite unruffled by congressional disagreements about its health. Trading last week continued bullish and the outcome of the British elections set off a new spurt. There is no doubt that Senator Capehart is right when he says that the present boom is closely connected with the general economic strength of the country and with its particular confidence in Mr Eisenhower's policies.

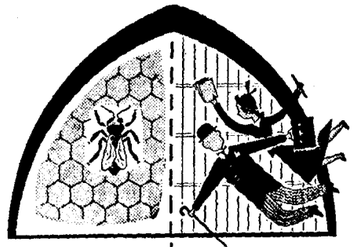
Aluminium—Feast or Famine?

New York

THE upward surge in the demand for fabricated aluminium products, especially in the building industry, and the present inability of the producers of primary aluminium to provide fabricators with all the metal they need, has posed difficult questions for the government. Should it assist yet another round of expansion of aluminium capacity, and bring new producers into the industry? Should yet more aluminium be diverted from deliveries scheduled for the strategic reserve? How should the distribution of the supplies thus freed for industrial use be controlled so that the 20,000 odd independent fabricators, who have no ingot producing capacity of their own, receive a fair share?

Primary capacity has already been doubled, from 719,000 tons in 1950 to 1,461,000 tons in 1954, by the expansion begun during the Korean war. Both Alcoa, the largest of the three present producers, and Reynolds have plans for further expansion, and part of the output of the huge Canadian Kitimat project will be available for the American market. A new domestic producer of the primary metal, the Anaconda Aluminium Company, expects to complete its first plant this summer. If the Pittsburgh Consolidation Coal Company and the St Joseph Lead Company carry out their present plans to build a large coal-powered plant, the country may have five producers of aluminium by 1957. To offset the immediate shortage, before this new capacity comes into operation, the government has already agreed that 25,000 tons of aluminium, scheduled for delivery to the strategic stockpile during the first half of 1955, should go to private industry.

When it comes to the related problem of the fair distribution of the scarce primary metal, the main complaint, a familiar one in the aluminium industry, is that the three integrated producers favour their own fabricating facilities at the expense of the non-integrated "independents." The independents are now being placated by the allotment of the entire 25,000 tons saved from the stockpile. If, as the producers argue, the present shortage is a temporary one, the government may prefer to use its strategic buffer stock again, rather than embark on a third round of government-aided expansion of capacity.



SHORTER NOTES

President Eisenhower has asked Congress to make a number of procedural changes in the much-criticised Refugee Relief Act, which should make it easier for the legislation to achieve its purpose of bringing 209,000 special immigrants, mainly from Iron Curtain countries into the United States by the end of 1956. While the President's proposals have wide support in Congress, they are considered to be unnecessary by the chairman of the House subcommittee on immigration; unfortunately his influential position makes it easy for him to block this legislation.

★

As expected, the Senate sustained the President's veto of the postal pay Bill and is now proceeding to pass a compromise Bill, believed to be acceptable to the Administration, giving postmen an average increase of 8 per cent.

THAT'S SHELL THAT WAS

The big problem in producing a modern bomber in quantity is 'tooling-up'. For the Avro Vulcan this meant more than 40,000 special jigs and tools which themselves had to have their own production programme. In essence the skill and experience with which the tooling programme is planned determines the ability of a company to meet a specific rate of production.
But Avro are 'old hands' at all this. And even with such a revolutionary design as the Vulcan, the basic principles of successful quantity production are still the same. The traditional technique which enabled over 7,000 Lancasters to be built during World War II was used to speed the Vulcan into production.
From the very beginning, the Avro Vulcan was designed for smooth quantity production. At each successive stage of its passage from design to prototype the 'know how' of Avro Production Experts was fully utilised by the Avro design team.
Today the famous Avro tradition of co-operative planning and genius for large-scale production can once more be seen successfully at work in the swiftly growing production of the vital Avro Vulcan—world's first four-jet Delta wing bomber.

Above: *one of the jigs essential in large-scale production. Over 40,000 jigs and tools were designed and installed for the quantity production of the Vulcan.*
Below: *a section of the vast Avro production line which during World War II produced nearly half the total of 7,366 four-engined Lancaster Bombers besides thousands of Ansons.*

What Kind of Wehrmacht?

GENERAL GRUENTHER has constantly declared that with the twelve divisions, the 1,300 aircraft and the light naval forces which Federal Germany is to contribute to Nato, the Russians can be prevented from overrunning Western Europe. The implication is that Marshal Zhukov could drive to the Atlantic at any time he wished during the next three or four years, if the Soviet leaders liked to court atom bombs on their own strategic centres. General Gruenther may be underestimating the time it will take to set up the full German contingents. According to estimates in Bonn, it will be at least four years before much is seen of the highly-mechanised German defence forces. In fact, eight years will be needed, according to Colonel von Bonin, the former head of the planning department of the "Blank Office" (the embryo Ministry of Defence). The Colonel had a strategic plan of his own which he and his supporters think much better than Nato's and he was dismissed for spreading it round political and military circles outside the Blank Office. His views are accepted by some German politicians who argue that there are still a few years in which to come to an agreement with the Russians on German reunification.

This is the background against which to judge the significance of the news that the first military bill has been passed by the Federal German cabinet and sent to the Upper House in Bonn. The Social-Democrat opposition has been pressing for all measures to be suspended until Russian offers are examined at the next four-power meeting, but last week the *Bundestag* voted against their proposal by a large majority, and action has gone forward. The bill is a stop-gap, which will allow the first volunteer cadres to be formed before the whole corpus of laws is passed. The first of the 150,000 men who will train the army will themselves soon start training with American assistance. But a great deal has still to be done. Federal Germany has to start from scratch in the defence field. About twenty laws will have to be steered through the committees in two houses in the coming months. They will decide vital questions, such as parliamentary control of the new forces, the means by which the instructors and higher ranks will be screened, the period of service, pay and other conditions, and the economic powers of the new defence minister.

Somewhat surprisingly, a semi-official article in Bonn has just declared that it has not yet been decided whether the Federal Republic will have a volunteer or a conscript army. The question is a basic one, and the officers in the Blank Office, who have planned themselves stale in the last four years have not left it unsolved for want of time or thought. If it is really not settled, the reason is to be found in the widespread opposition to an army of any kind which has been fostered by the government's political antagonists. They are largely responsible for the fact that it will appear to be patriotic for Germans to shirk military service, as the reason can always be given that rearmament hinders reunion. To change the attitude of the young men, the government sorely needs the support of the Socialists and the Trade Union Federation. Without it, Socialists boast, a new German conscript army would have such poor morale that it would be worth little to Nato. To rouse its fighting spirit, say the champions of "reunion first," it would be necessary to indoctrinate it with hatred of fellow Germans in the Soviet Zone—a task which its instructors will not undertake. This problem of morale is real, and the government will certainly go slow before introducing conscription, in the hope that the Socialists and trade unionists can be persuaded to join the Ministry of Defence and the selection board. There they could also do valuable work in keeping army leaders of the future from developing the power complex of a General von Seeckt or his predecessors.

In the meantime, the Socialists are faced with the fact that the kind of army which is first to be set up—the selected body of 150,000 volunteers—is the type which they most fear. The Socialists by tradition prefer the mass army to an organisation on the Reichswehr model, which tends to become an instrument of internal politics in the hands of its chiefs. If the party's left wing were not so strong, this thought might lead it to follow the moderates who would be ready to set up a democratic force in collaboration with Dr Adenauer and the present reformists in the Ministry of Defence.

The controversies over the German army, which will rage afresh as each of the twenty bills come up for debate, revolve round its internal role. There are good reasons for this obsession—Germany's present division, together with memories of the abortive revolution of 1918, the Kapp *Putsch*, the "Black Reichswehr," and the Hitlerite interregnum. Fear of internal troubles in the future make German politicians dispute the question who is to be the commander-in-chief of the new army—the President, the Chancellor, or the Minister of Defence, and how far can any of them be subject to parliament? The powers of the Nato supreme commander in Europe are barely mentioned, while the figure of Hindenburg still looms large in German politicians' minds. Though it is realised that times have

changed, and the President, for instance, has much less, and the Chancellor much more, power than in the past, Germans are justified in feeling that unstable conditions are bound to recur.

Japan on the Brink

FROM OUR TOKYO CORRESPONDENT

SINCE the strong, if intolerant, authority of Mr Yoshida has been removed, the Japanese Diet, as was expected, has become a bedlam of conspiracy, in which a temporary advantage by one party clique today serves only to precipitate another party counterplot tomorrow. The conservatives—Democrats and Liberals—are groping desperately for some form of unity, but personalities, expedience and revenge still darken and stultify the "negotiations"—if such a dignified term may be used for such cynical bargaining.

The Hatoyama Democrats realise that they cannot continue in office, and they have now made the most humble overtures to the Liberals, who in turn know that they would suffer further reverses at another election but are still smouldering over their reverse at the last election. Mr Nobosuke Kishi, the ambitious secretary-general of the Democratic party, is apparently prepared to make a deal with the Liberals which would allow Mr Taketora Ogata, Mr Yoshida's successor, to become the figurehead leader of a superficially united conservative party. But Mr Yoshida, embittered equally against Mr Ogata and the Democrats, and still commanding great prestige in the Liberal party, is doggedly pulling strings to circumvent this plan. And even Mr Ogata—an unimpressive leader, who has been acidly described as "an admirable principal for a girls' high school"—has his own strong doubts about the merger.

The brooding and mystical Mr Bukichi Miki, who is executive chairman of the Democrats, and who does not go along with Mr Kishi, has added another touch of caprice to this fantasia by suddenly making signs of affection and sincerity to Mr Yoshida, for whose downfall he was largely responsible. To add further confusion, the Prime Minister Mr Hatoyama, ancient, affable and ailing, continues to proclaim one day that he is waiting to resign as soon as the interests of Dai Nippon require, and the next day to insist that he was misquoted or misunderstood, and that he intends to remain in office at least until relations with Soviet Russia and Communist China have been "normalised." A party deputation has waited on him with the pathetic request that he abstain from these and other statements "calculated to lower party morale."

Fortunately for the West, the Socialists, both right- and left-wing, are still failing to grasp this opportunity. They are continually threatening to merge, holding regular *banzai* unity meetings, but making not the slightest real progress towards agreement. It is probable that an uneasy Socialist merger would force the conservatives to compromise and take corresponding action. But the Socialists seem even less likely to get together than the conservatives.

The only bright relief to this sombre and confusing picture is the accumulating evidence that the United States has at last fashioned a realistic long-range policy—flexible but consistent—for Japan. This achievement, for which the American Ambassador, Mr Allison, deserves much of the credit—means that the impatient but futile open pressure for greater Japanese speed and effort in rearmament will be eased. Washington has now wisely decided to make haste slowly. There will be discreet encouragement for the more reasonable elements in the floundering conservative side until the Japanese people—still suspicious of the most simple and elementary self-defence measures—recover their lost instinct of self-reliance and self-preservation. It has, in fact, been recognised at last that, if the Socialists, gaining slowly but steadily as separate factions at every election, achieve power, the stage will be set for such wildly irresponsible Japanese overtures to Russia and Communist China as will make Mr Hatoyama's slapdash vagaries appear prudent and well-considered by comparison.

Meanwhile, the dangerous and popular trend in Japan is expressed most articulately by Colonel Masanobu Tsuji, one of the former conquerors of Hongkong and Singapore and now a member of the Diet; although he would gladly shoot down Japanese Communists in the streets, he is now advocating a policy that must delight Moscow and Peking; "The Japanese must defend Japanese neutrality with their own hands." Colonel Tsuji demands complete Japanese aloofness from either the United States or Communism and the immediate withdrawal of all American security troops from Japan. He hints—like a good member of the Japanese Communist party, which he in fact abominates—that the Americans are seeking to train Japanese ground troops to fight for the United States in Asia, and insists that the Japanese should have nothing to do with any defence scheme which does not bolster Japanese air strength and heavy industry, and does involve any "Wall-street strings" or the extensive call-up of infantry.

The new American policy for Japan will be an effective counter to this popular Japanese delusion. It is a great pity that Whitehall is not, like Washington, thinking along positive lines. It seems here that Britain has no policy for Japan—except such obstructionist attitudes as blind and doomed opposition to Japanese membership of Gatt. Japan, bewildered and distrustful, is teetering on the edge of decisive changes. A hand of encouragement now in the right quarter would be a wise investment.

Home Thoughts for Tunisians

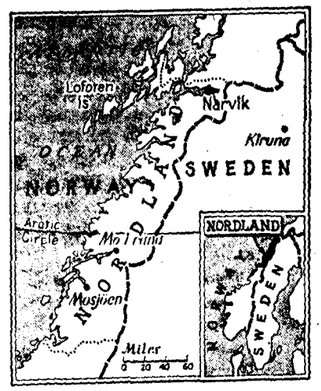
ON Wednesday there set out from all the beaches round the Gulf of Tunis an array of small boats crammed with excited passengers. Both on the calm waters of their historic bay and massed in happy ranks along their quays and streets, the Tunisians staged a delirious welcome for their national hero, and *supreme combattant*, M. Habib Bourguiba, back at last from long years of exile. In the last months of this enforced absence, M. Bourguiba has played an interesting part in the Franco-Tunisian negotiations—at first, in the wings, but lately, also openly. Once an extreme nationalist, he has become a moderate by the standards of the young firebrands who now fill the role he played in the nineteen-thirties. In the speech he made in Paris on Tuesday, after being carried shoulder-high into the Gare de Lyon, he turned phrase after happy phrase about "cohabitation in a traditionally hospitable land," "guarantees for the continuity of French enterprise" and "Franco-North African solidarity." Is it within his capacity to fulfil the comfortable words he utters so fluently?

For soon after he gets home, he is bound to find himself beset with complications on the domestic front. Hitherto, the thoughts of almost all Tunisian politicians have been beamed on their relationship with France, and on whether the home-rule agreements are desirable in themselves or merely as a stepping stone to full independence. But the moment the conventions are ratified, questions of a different kind will surge to the fore, and the first to arise will be the form of constitution that the Neo-Destour (meaning "New-Constitution") party will wish the Bey to adopt.

Amongst educated Tunisians, a majority seems to favour a constitutional monarchy on the British or Scandinavian model, but there is also a republican group that would like to tuck M. Bourguiba into the presidential chair, and leave the premiership and the ministries free for younger *combattants* with more recent and direct experience of the home scene. Again, tradition runs strong in Beylical circles, and is reinforced by religious practice and the exercise of Moslem law; how can it be dovetailed with the ambitions of a younger generation that has had a more modern and westernised education than most members of the palace entourage?

M. Bourguiba, despite two long periods of exile in the last decade, still holds more sway than any of his fellow-politicians over the hearts of his party and the people of the desert as well as the town. Upon him, therefore, more than on anyone else whose head has yet appeared above the bobbing sea of the nationalists, depends the future pattern of government. His countrymen will be in his debt if he is able to switch from the role of *combattant* to that of administrator, conciliator and constitution-maker.

He is bound to be exposed to one fatal temptation, that of diverting attention from domestic difficulties by directing it into differences with the French residents and with France. His stature as a statesman, which is as yet unmeasured, will be reckoned by the extent to which he avoids this pitfall.



Norway Takes to Steel

BY A NORWEGIAN CORRESPONDENT

IN the industrial progress of Norway the opening of the £25 million steel plant at Mo i Rana, a few miles south of the Arctic Circle, is an important landmark. Norway uses about half a million tons of steel a year, and up to now almost all of this has had to be imported. At the same time, Norway has considerable iron ore deposits and large water power resources for generating cheap electricity, and the marriage of these two factors in a national steel industry has long been a Norwegian aim. The scarcity of steel during and after the last war emphasised how undesirable it is to be dependent almost exclusively on foreign supplies, and it was a unanimous Parliament that in 1946 agreed to proposals for building a steel plant at Mo i Rana.

Unfortunately, the plant took longer to build than was originally estimated, and the cost of construction also greatly exceeded the first optimistic calculations. The supplementary appropriations which Parliament has been asked to vote have somewhat soured the opposition parties, so that recently the Labour majority has been practically alone in support of the project. As the steel plant is built, run and owned by a government company, it has inevitably become a political issue. The Conservative and other opposition parties do not deny the value of a steel industry, but they have increasingly questioned the timing of the project. Certainly the plant will be handicapped from the start by extremely heavy construction costs, while established steel plants abroad have been able to write off much of their capital charges in recent halcyon years. On the other hand, it can be argued that only in boom conditions can a nation muster sufficient capital and confidence to embark on such a big industrial venture.

The Mo i Rana plant has now at last started trial production, and, with political reputations at stake, news of the technical and commercial success of the undertaking is awaited with much interest. As now equipped, the plant has a maximum annual capacity of 170,000 tons of rolled steel products. It is hoped fairly soon to instal a fourth electric smelter which will increase the capacity to 230,000 tons. The aim is eventually to expand to half a million tons a year, and that is the optimum output on which the design of the plant has been based and which should give the lowest production cost per ton of steel.

As it is, output at first will be comparatively small—though large by Norwegian standards—and will be spread over a rather wide range of rolled products. Scope for specialisation will be limited, and it may well be difficult to compete in price with foreign plants. One of the determining factors, however, is power, and in this respect the Norwegian plant enjoys the advantage of relatively cheap hydro-electricity from the new Rössaga power station nearby. The ore to be electrically smelted comes from mines at a considerable distance from Mo i Rana, but later it is planned to develop new mines only a few miles away.

The plant fits in nicely with the Norwegian government's plans for developing the economy of North Norway. It gives direct employment to more than 1,000 men and indirect employment to many more. Mo i Rana, a traditionally depressed place, has become a healthy, prosperous town and a good market for neighbouring farmers and fishermen. At Mosjöen, in the same county, Nordland, another big industrial scheme is expected to be realised soon: this is the building of an aluminium plant to be financed jointly by Norwegian and Swiss capital. Aluminium production in Norway has more than doubled since the war, and two large new plants are now in operation. The prospect for further industrial advance in Nordland

and in Norway generally is good in view of the country's large water power resources. Norwegian hydro-electric power production has more than doubled since the war, and is now much the highest per head of population of any country in the world. In the electro-chemical and electro-metallurgical fields, the scope for expansion is considerable, for in these fields the competitive advantage of cheap and plentiful hydro-electric power is greatest.

Water power is still being developed at a record rate. More than half a million kilowatts of additional generating capacity will be installed this year alone. In what way the further expansion of power and industry will be affected by recent measures for curbing investments is not clear, but there are indications that Norway's exceptionally high investment rate is not yet being significantly reduced. Imports, too, are still running extremely high. In the context of the general economic situation, the completion of the steel plant is significant, both because it means the easing of investment pressure in one sector at least, and because it should help to reduce and eventually to eliminate one of Norway's principal import commitments.

Scripts and Politics in Asia

BY A CORRESPONDENT

THE Chinese People's Republic is now experimenting with the use of a simplified form of the Chinese script. Throughout the East, reformers in a hurry to modernise their countries have been attracted by similar ideas. A simple script is a basis for universal education and the liquidation of illiteracy. And the break with the past produced by discarding the traditional script sets up the youngest generation with a new literacy which their elders find hard to acquire, and obstructs access to the literature of the past. There is, too, greater facility for learning one of the major Western languages if its script has already been acquired. On the other hand to adopt a Western script is to run up against the pride in national culture that goes with nationalism and the desire for maximum independence from foreign influence.

Adoption of a Western script—Roman or Cyrillic—has occurred in two regions of Asia: in the zone of the Turkish languages and in certain countries of South-East Asia. The various Turkish languages, including the Turkish of Turkey itself and the cognate tongues of Russian and Chinese Central Asia, were formerly written in the Arabic script introduced with conversion to Islam. The changes of script in Turkish-speaking countries have been closely connected with revolutionary modernising attacks on Islam and its clergy and with nationalist emphasis on pre-Moslem Turkish origins. Reforming nationalists saw in the adoption of the Roman script a way of both modernising the Turkish peoples and enhancing their national self-consciousness.

The first adoption of Roman script took place in Azerbaijan as a result of the Russian Revolution and the cultural autonomy initially allowed by the Soviet regime. Kemal Ataturk's Turkey soon followed, the language reform there being closely connected with the abolition of the Caliphate and the Sheri law, and the disestablishment of Islam. The Roman script was also adopted by the Turkish-speaking Soviet Republics of Central Asia; only the Turkis of Sinkiang or Chinese Turkestan continued to use Arabic writing. In the 'thirties, however, Moscow realised that the Roman script tended to link the Soviet Turkish peoples with Turkey, and thus indirectly with Western Europe, instead of with Russia, and they were made to adopt the Cyrillic script used in Russia.

In South-East Asia, also, the Roman script has spread at the expense of the Arabic, but in this case largely at the instance of a colonial power, for the Dutch encouraged its use for the writing of Indonesian. In Malaya the British authorities never tried to promote it, but today the younger Malays use it, while the older generation still writes in Arabic. In Vietnam under French rule the influence of Catholic missions brought about a romanisation which has survived in both south and north, the Chinese script formerly employed by the *literati* having fallen into disuse.

Thus in Asia today Cyrillic prevails in the Soviet Turkish lands, while Turkey, Indonesia, Malaya, the Philippines and Vietnam have turned to Roman. There is no immediate prospect, however, of other parts of Asia following their example. The non-Turkish Moslem countries are holding fast to Arabic script, while India retains its many variants of the alphabet which, though ultimately of West Asian derivation, was given its characteristic form on Indian soil. Burma and Siam continue to use alphabets of Indian origin.

Case for a Radical Change

Finally, there is the Far East, consisting of China, Korea and Japan, which uses the Chinese so-called ideographs, the sole survivor in the modern world of the numerous non-alphabetic modes of writing which preceded the invention of the alphabet. It might seem at first sight that here more than anywhere else there is a case for a radical change, and in fact there have long been ardent advocates of romanisation. In Japan, an association, the *Romaji Kai*, publishes books in romanised Japanese, and in China the Communists at one time favoured a peculiar alphabet which mixed Roman and Cyrillic. In neither country, however, has there been up to now a general or official discarding of the traditional script. The Chinese language and the Chinese element in Japanese contain numerous homonyms, distinguished by different characters in the existing script, but easily confused if written alphabetically. There are, however, deeper reasons for the retention of the old Chinese writing. Its abandonment would be a much more serious matter than the substitution of one alphabet for another, and patriotic feeling both in China and Japan has run strongly against it. Japan got rid of illiteracy and became a great power without altering its script (which mixes Chinese characters with a Japanese-invented syllabary) and since then the Japanese have felt that to romanise would be a national humiliation.

The Chinese have been even more reluctant to relinquish a script which is entirely of their own making and has four millennia of continuous development behind it. The ideographs are apparently to be retained by the new China; the Communists seem to have lost their early enthusiasm for Western alphabets since they made themselves the champions of militant Chinese nationalism. The written language, however, is to be made easier by simplifying some of the more complex characters, and it is this modified "spelling" that is now being adopted under official direction by the Chinese press.

FOCUSING ON NEXT YEAR'S AIRLINER, MR. ARNOLD?

Mr. Arnold (busy news photographer) is himself a very tricky person to get in focus. No sooner here . . . he's got to be somewhere else . . . and fast. Of course he always gets there — by air; and he invariably flies British. *Which is where next year's airliner comes in.* For Mr. Arnold's fares are helping to put yet another British world-beater on the stocks. Helping to pay the men who design and build her; and helping BEA to send air line technicians to advise on the operational aspects. Mr. Arnold was one of nearly 2 million people who flew BEA last year. That's why British Civil Aviation is on top. And passengers who fly British this year — and next — are making sure we stay there.

Right first time!

That's the best of Twinlock VETRO Mobil Suspension Filing — you can *see* exactly where the file you want is. Index-tabs, in six distinctive key colours, are angled for snap-vision reference and sheathed in anti-glare celluloid to prevent eye-strain and fatigue. No "lifting" or "pushing" is necessary when removing papers because file folders are suspended within the drawer and glide smoothly on steel runners *at the finger's touch.* These strong manila folders always remain upright and straight, and never slip under one another, never become dog-eared or frayed. No wonder documents are so crisp and clean whenever you want to refer to them. VETRO Mobil does the job as no other filing system can. Remember, it's "right *first time*" every time with Twinlock VETRO Mobil Suspension Filing.

Get your Secretary to snip out coupon below and send for our brochure "20th Century Filing". The address of your nearest Stationer or Equipment Dealer will also be given.

More than 100,000 customers have appointed Lloyds Bank as their executor

If you would like details of this service, please ask for a booklet at any branch of Lloyds Bank.

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

Please ask for our new booklet—"Capital for Business and Where to Find it".

THE BUSINESS WORLD

Foreign Money in London

IT is, perhaps, a mark of the still gradual relearning of old lessons that the difficult questions about the movement of foreign funds into London come from visitors (particularly from Canada and the United States) rather than from observers in this country. A flexible monetary policy is still something new here, and it takes a little longer than three months to brush up on Bank rate, and on the consequences of the movement of foreign funds that has been attracted towards London since the end of February. That movement has been substantial, and a major part of it has come in to take advantage of the hardening of interest rates in the money market. Since February, London has been offering higher rates for money (and charging higher rates for accommodation) than any of the major international money markets. The difference can be measured by the margin between the three months' British Treasury bill rate and the comparable rate in New York; since February the spread has averaged about 2 per cent, and it is now about 2½ per cent.

The questions that visitors from across the Atlantic are asking are plainly of the greatest relevance to the success achieved by the monetary measures in securing a lasting improvement in Britain's external balance. They ask, first, how much money has been attracted by London's higher interest rates. Secondly, they want to know how far this incoming money has taken the strain off sterling and helped the dollar reserves. Thirdly, they ask how far such a contribution has been a temporary factor, to be reversed in coming months. As it happens, there are no ready-made answers to any of these questions. Even in the highest places and the most authoritative quarters, there is a marked disinclination to talk in anything but the vaguest indications of orders of magnitude. But the experience of the banks and money market firms, when culled and compared, does suggest that perhaps £50 million of short-term money may have been attracted from overseas centres to London. There are some visitors, however, who claim that their own operations would represent a considerable slice of this guess-work total, and they fall to wondering whether it is big enough, or whether their compatriots have been a lot slower in moving funds here.

*

It may help in the consideration of this complex problem to follow a typical operation. A Canadian bank, say, holds maturing US Treasury bills, and finds that it would get a more advantageous return on these same short-term funds if they were moved to London. Instead of renewing the US Treasury bills, the bank buys spot sterling and pays for it from the dollars released by the repayment of the bills. This sterling it invests in British Treasury bills on which it obtains a higher return. But this is essentially a short-term movement of short-term funds, and the bank needs to be certain of getting back its dollars without loss when it takes the money home. So concurrently it sells sterling for delivery three months forward (when the British Treasury bills will be repaid) against dollars. As a result of this series of transactions, it will secure a somewhat larger return on its three-months operation. It will earn up to 3⅞ per cent on its British Treasury bills, instead of about 1½ per cent on US Treasuries. But it will have to pay a premium to secure its dollars at the end of the three months' tenor of the bills; this forward swap will cost the Canadian bank 1¼ cents for three months for every pound exchanged against dollars, which is equal to about 1 15/16 per cent per annum. Thus after deducting the cost of its dollar cover, the bank will earn

roughly 2 per cent net on its investment in London ; at the end of the three months it will once again be in possession of its dollars, and will have improved the yield on its short-term funds without running the slightest exchange risk.

★

Such operations have been carried out by American and Canadian banks, and on an even larger scale by Continental banks which have switched short-term assets from New York to London. In a perfect market, the transfers would go on until the cost of covering the exchange risk (that is, the premium that has to be paid to secure dollars for three months delivery) exactly offsets the advantage of the difference in interest rates in the two centres. But there are few perfect markets, and the forward exchange market is not one of them ; so considerable scope still obtains. Under the classical gold standard, interest arbitrage was the most immediate of the ways in which a divergence from parity tended to be corrected. An increase in interest rates in one of the larger international money centres immediately attracted funds from other centres, and these movements of funds in turn had a direct impact on the rate of exchange and on movements of gold.

But today the impact of movements of short-term funds is much more complicated and less direct. If the guessed £50 million of foreign funds that may have come in during the last three months had had no side effects, they would have produced a smart rise in the dollar reserves—though it would be a fleeting one if all the money returned home after three months. But in fact interest arbitrage operations nowadays have the essential collateral ingredient of forward exchange cover, and this neutralises the apparent initial gain in the reserves. This assumes, of course, that the London bank that buys the dollars from the foreign bank that is investing in Treasury bills covers its commitment to produce dollars in three months by a spot purchase of dollars in New York, as it normally will. The impact of interest arbitrage on the sterling-dollar rate and on the dollar reserves will thus be self-cancelling.

But this takes the effect of interest arbitrage in isolation ; it ignores the secondary effects of the impact on the forward exchange. It has been seen that transfers of short-term money to London tends to widen the discount on forward sterling. This widening discount will in its turn encourage forward buying of sterling by importers in dollar and other foreign countries, as they prepare to pay for purchases of sterling commodities. Such long-term covering purchases may not be an exact match for a three months' forward sale of sterling ; but they may form part of an account in which commitments on each side are balanced.

Thus the forward exchange market is considerable and immensely complex ; it is fruitless to try to identify its individual components, and there is no way of measuring, through movements in the forward exchanges, the volume of interest arbitrage transactions that have lately been taking place. It may be, indeed, that some forward sales of sterling remain for a time unmatched by countervailing sales of dollars and that certain members of the international market in pounds and dollars are prepared to remain at risk by running an open position—having bought sterling forward without covering themselves. Only if that had happened on any wide scale would the inflow of money to London have helped spot sterling and the dollar reserves, and as soon as the open position was covered this help would be neutralised. It is unlikely, in fact, that any such open position exists. It is possible that at a particular time some London banks may be " at risk " in some of their dollar swaps, but unlikely that their open position will be large.

The sterling area's dollar reserves are in fact much more powerfully affected by repayments of short-term borrowing in London and by movements of funds induced by major changes of sentiment that shift the whole timing of payments between the sterling and non-sterling world than by the movements of funds for interest arbitrage.

Such a swing occurred twelve months ago, when anyone with a conceivable sterling commitment covered it and held sterling on the confident assumption that the pound was about to float into convertibility at an appreciated rate against the dollar. In the autumn, the pendulum began to swing in the other direction. Convertibility had become unlikely ; sterling bought in anticipation of needs was used to make payments ; the balance of trade had deteriorated ; and a general election had become probable. All these factors pushed the pendulum to the opposite end of its arc. On the eve of the election, it is probable that sterling was underbought, and not overbought, and a mere restoration of a normal equilibrium should now bring relief to the reserve.

★

The immediate effect of the election results was a world-wide demand for sterling, which would probably have carried the rate higher had the movement not been checked by the strike situation. These swings in the timing of international payments—the " leads and lags " in the exchange situation as they are sometimes called—are a much more potent factor on the reserve position than any interest arbitrage.

To sum up: the movement of foreign money to London immediately causes a demand for spot sterling and therefore tends to help the reserve. The corresponding forward selling of sterling may in its turn be covered by a purchase of spot dollars, in which event the impact on the rate and on the reserve will cancel out. In any case the forward selling of sterling will tend to widen the discount on forward sterling and this will encourage forward buying of sterling by importers in the non sterling world who have future need of sterling. In that event the immediate beneficial effect of the inflowing funds on the reserve will be more perceptible, though it will still be of relatively short duration.

The Devaluation of Skill

FROM the time of Henry V to the beginning of the first world war, it has been estimated, a craftsman in the British building industry could usually earn about half as much again as his labourer. His " differential " —the extra reward of his skill—had remained proportionately about the same for 500 years. But today a building craftsman earns only about 14 per cent more than an unskilled labourer.

Because the industrial revolution passed building by, the length of its history of stable rewards for skill is exceptional. The steep decline in those rewards since 1914, however, is not. The available evidence suggests that, even in industries where technique was revolutionised, the skill differentials had become fairly stable for some decades before 1914: the extra margin for skill—in industries where that qualification required the definite investment of effort, time, and liberty in an apprenticeship lasting several years—had settled down at about a half to two-thirds as much again as unskilled labourers earned.

Since 1914, in many industries, that margin has been narrowing, without much interruption. The table summarises this record—stability before 1914, continued narrowing since—for four major industrial groupings. This shows skilled wage rates as a percentage of unskilled ; though separate figures of actual earnings are not generally available, it seems that the skill differential in earnings has narrowed in much the same way.

The comparison for the railways in the table shows the engine-driver's basic wage as a percentage of the porter's. This is the differential upon which the Associated Society of Locomotive Engineers and Firemen has now, as so often before, dug its heels in. The table shows this comparison in April, 1954. In November, a railway arbitration award raised the lowest engine-driver's rate to 132 per cent of the porter's, a recovery of the skill differential that gathered some general approval outside the industry. In April, following the successful threat of a strike by the National Union of Railwaymen, a subsequent award reduced the engine-driver's margin to 129 per cent. (The difference between maximum rates for the two jobs, rose in November to about 47 per cent, but was narrowed to about 43 per cent by the later NUR rise.). ASLEF still demands the wider margins it was awarded in November ; it has spurned the Transport Commission's offer of wider differentials between drivers doing different jobs, though less than the November margin for engine-drivers in general.

Over the centuries, the builder's differential for skill appears to have narrowed in times of inflation, but recovered again to 50 per cent as inflation passed. The 40 years since 1914, spanning two world wars, have certainly included the inflation. Indeed, the general rise of money and real wages since then has partly disguised the narrowing of differentials ; in money, margins have often remained the same or risen, but proportionately they have been reduced by a much faster rise in unskilled wage rates. In the deflation after 1920 skill differentials widened, and again in the 'thirties there was some recovery of margins for skill as unemployment swelled the competition for jobs at the bottom of the scale. But these changes did not widen the margins to anything approaching the 1914 levels. Some built-in stabilizers, or rather ratchets, had been introduced into the economy—primarily, the much stronger " industrial " trades unions.

The strengthening of the trades unions, for the most part, seems to have reduced the advantage of the skilled worker. The great industrial unions have grown by success in demanding " flat rate " increases—which disturb nobody in particular but erode everybody's advantage. The workers they had to woo were the lower-paid, less skilled people ; the craftsmen were unionised already. So the general increases have been more often sought as flat sums of money, not as percentage increases.

SKILL DIFFERENTIALS IN FOUR INDUSTRIES
(Time Wage-Rate of Skilled Worker as % of Unskilled)

Year	Building	Ship-building	Engin-eering	Railways
1885	157	185	167	198
1900	150	192	172	N.A.
1914	150	181	171	184
1919	120	133	130	135
1922	134	134	140	140
1930	134	146	140	140
1939	131	136	132	163
1946	125	122	119	133
1950	119	122	118	129
1954 (April)	114	118	116	128

Based on: "Differences between the Wages of Skilled and Unskilled Workers, 1880-1950", K. G. J. C. Knowles and D. J. Robertson, Bulletin of the Oxford Institute of Statistics, April 1951.

Certain smaller, entrenched unions have stood out, with varying success, against this devaluation of skill. The coalface worker, the cotton spinner, the steel melter still command differentials of about two-thirds or more, partly since they have a closed shop and partly, it has been suggested, because they recruit exclusively from the next lower grades in their industries. The craft unions, which demand a lengthy apprenticeship, do not accept " dilution " by ambitious men from lower grades ; whether or not for that reason, they have been less successful in defending their differentials. ASLEF, a small craft union entrenched in an industry dominated by the huge NUR—which, however, competes for loco-

motive members, and cannot press levelling demands too far—has a rather special position, and so far it has held or managed to recover its margin for skill rather better than have some other craft unions.

★

As a price that the economy offers for a particular skill, a wage differential theoretically provides the incentive for as many people as are needed to undertake the training required to qualify in that particular skill. Does the steady erosion of the incentive British society offers to equip oneself with skill—at least with manual skill—suggest that the economy is tending over the years to require less of this formal training for industrial trades and crafts?

Twenty years ago, plenty of theorists, echoing Karl Marx many years before, were ready to say "Yes" to that question, with the growth of the semi-skilled labour force in mass production. Today—even with the automatic factories that their latest heirs declare are just round the corner—the only honest answer must be "Not proven." Technological change has largely retired some hand skills, but it has immensely widened the range of skills that its attendants require; and today, in addition, its demands upon many of them, such as electricians, are deepening the skill needed into a much more complex qualification than the same job required twenty years ago.

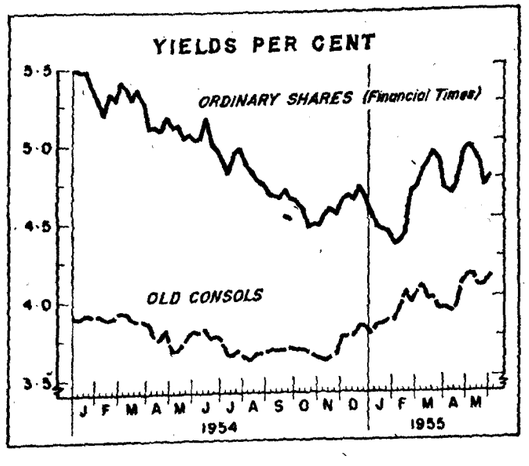
Evidence is certainly insufficient to establish the hypothesis of any absolute decline in modern industry's demand for skill; on the whole, the indications tend the other way. But will enough people acquire skill if the price for doing so continues to fall? It would be as well not to answer that question too confidently, either, at any rate in the short run; social patterns of emulation play as large a part in the choice of occupation in British society as they do in elaborating that cobwebbed and rickety tangle, almost without rhyme or reason, that constitutes Britain's wage and salary structure. But in the long run, if the extra reward of taking extra trouble to acquire extra skill thins down towards nothing, fewer people are likely to take the trouble.

The margin for skill is not yet down to nothing; are there any signs that it may widen again? A slump, certainly, might have its traditional effect, though this might be moderated as it was between the wars. Nobody, however, is proposing so cathartic a remedy: the problem is more often posed for continued conditions of full employment on the postwar scale. In the United States, where differentials, though also narrowed, remain wider than in Britain, there has recently been some union pressure to restore these margins. In a few British industries, such as coal, some "reform of the wage structure" by an agreed re-classification of jobs and levels of wages, is taking place. On the railways, finally, Mr Baty defends his little midden of privilege; hopelessly outclassed in bargaining weight by the NUR, venting his frustration upon the nation as a whole, but epitomising one of the grittiest problems of industrial relations to which this Government or this generation has to seek an answer.

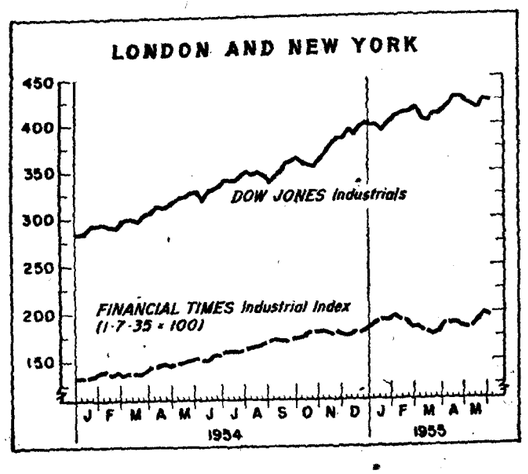
Business Notes

Stocks Against the Strike

IN this first short working week of a railway strike British industry in general has managed to avoid any serious interruption of output; fairly soon, however, some cuts so far made in overtime work may develop into "shut-downs" and "lay-offs." Most firms carry at least one to two weeks' supply of the raw materials that they usually receive by rail, and can lay their hands upon a certain amount of emergency storage space for such finished goods as they are unable to clear by road. Indications of the size of industry's stocks of materials are fragmentary and seldom published, though the sample census that the Board of Trade has been carrying out for some time must be helping the Government to assess priorities in transport. Although the size of stocks varies widely from firm to firm, in general industry has been keeping a tighter control on the working capital tied up in this way; in the last two years regular deliveries of materials had become more dependable. Buyers are traditionally prone to hoard materials that are, or may become, short, but three years' of expanding production coupled with the recent rise in interest rates has tended to keep stocks down.



Coal is by far the greatest load carried by the railways—last year it accounted for three-fifths of the 283 million tons of revenue-earning freight traffic. As an average, gas and electricity plants now carry at least 3 weeks' stock of coal, coke ovens about 2 weeks' supply, and other industrial users



3-4 weeks. So far the pile up of coal at pitheads has had no noticeable impact upon coal production; most pits were on holiday on Tuesday and many have space available to dump several days' output. Steel plants will be the first major casualties in heavy industry, through lack of raw materials and over-abundance of finished products; their problem at present is mainly finding storage space where separate orders can be kept separate. The steel industry has in hand about 2-3 weeks' supply of coal, scrap, and crude steel, slightly more iron ore, and a little less pig iron; but a number of plants have much less, particularly those using imported coal or iron ore, and one or two expect to close down this weekend.

These bulky materials do not lend themselves in any quantity to transport by road though much flat steel, for example, can be moved by road. And not all industrial users carry the estimated average stocks of 2½-3 months' supply of steel and 3 weeks' supply of coal. The bigger firms sited some distance away from the coal and steel areas will probably be the first to suffer. Apart from some shipbuilders, motor car manufacturers, and parts of the building industry, there should be no serious trouble in the rest of industry for perhaps a fortnight, provided enough warehouse and other storage space is located. But after one week of half speed at the docks most warehouses were more than normally filled with frustrated exports.

Markets after the Election

APPROPRIATELY, the colour of the pencils that jobbers use to mark prices up on their boards is blue. Those pencils were kept busy a week ago as the election results spelt out a Conservative majority. All prices went ahead, with the steel issues naturally enough, in the lead. At the end of last week, following the poll, the *Financial Times* ordinary share index broke through its previous peak of 197.4 to reach 199.4, an increase of 3½ points on the day. But even that excitement paled in camparison with the boom in the equity prices on Thursday. The railway strike forced the jobbers in a narrow market, with many brokers marooned in outer London, to mark prices down as soon as the market opened after the Whitsun holiday. But if there were any bears in Throgmorton Street they were only faint-hearted ones. Once it was clear that there were no heavy selling orders prices rallied quickly and sturdily. And when the market broadened on Thursday the fire kindled just after the election burst into flame. On that day the *Financial Times* ordinary share index gained 5.8 points to reach 204.4, despite the strike and despite a Bank rate of 4½ per cent. Gilt-edged prices might be left waiting on the next Government issue—and there must presumably be one from the nationalised industries soon—to give them a lead, but equity prices required no such lead.

On the Right Track?

SOME of those who draw charts to make their fortunes saw in the new peak in the share index a fresh bull point. Nor did the strike deter Thomas Tilling among other industrial borrowers from making its new preference share issue. The fresh boom in Throgmorton Street has not been generated solely by confidence that a Conservative administration will provide the best of all possible worlds for the City. Industrial earnings are still high and the American buying of British stocks must suggest to many that equity prices in London, in comparison with those in New York, have not yet fully caught up with the increases in all other prices recorded over the last decade. Or is it that New York is getting too high?

Inflation always brings ordinary stocks into favour. And who can say in view of the wage claims and the industrial disputes that it is still not present in the British economy? And if in the autumn the balance of payments in reality turns out to be less alarming than was feared at the beginning of this year, may it not then be said that dearer money has done its work? The arguments are not conclusive and they beg some important questions about economic policy. But at the moment more investors see a clearer road ahead for equities than three months ago, and are expecting firm though not exciting markets.

Reserves Unchanged

THE gold and dollar accounts of the sterling area in May came out exactly evens: the reserves remain at $2,686 million. At first sight that is a disappointing result, for the reserves benefited last month from the receipt of $31 million from the European Payments Union in settlement of the large April surplus. Further, American aid brought in $19 million. That means that the balance of all other accounts was a deficit of $50 million—a disturbing reversal of the improving trend of the two previous months shown in the accompanying table. But it is in fact doubtful whether this deterioration is a significant pointer to the trend of the

TREND OF DOLLAR BALANCE

* E.P.U. settlements *depend on balance* with Union in previous month. † After payments totalling $99 million to E.P.U. creditors in initial settlement of part of UK's overdraft with Union. ‡ After payment of $112 million to IMF for "repurchase" of sterling. § After payments totalling $189 million on United States and Canadian loans. ‖ After paying $8 million in quarterly instalment on Canadian wartime loan.

current balance. The uncertainties of the election induced an unusually large building up of speculative positions against sterling by exchange dealers and traders, and the subsequent disturbance of the rail strike meant that the move back into sterling was delayed On Friday last the London spot dollar rate rose on balance by only ¼ cent, to $2.79⅞, and on the opening after the holiday it fell back to $2.79¼, despite some official support. On the following day the rate recovered well to $2.79½; but as this was the first day of June the gains from the offerings of dollars would not be reflected in the May gold figures. An encouraging feature in the May accounts is the achievement of yet another good surplus with the European Payments Union—of £7 million. As usual this will be settled 50-50 in gold and credit in the middle of this month

Omens for Output

INDUSTRIAL output in the first quarter of this year was about 7 per cent higher than a year before, and the first indications of output in April suggest that this may have been nearly 6 per cent higher than in April, 1954. The record of these months already contains most of the material for guesswork that will become available until the late autumn, since the months after May are blurred by the effects of holidays. Moreover, Mr Butler's advisers can draw some confidence from the fact that in most

QUARTERLY RECORD OF INDUSTRIAL OUTPUT SINCE 1950 (1948 = 100)

	1950	1951	1952	1953	1954	1955
First quarter	114	118	120	121	129	138
Second quarter	113	120	113	119	127	...
Third quarter	108	112	105	114	121	...
Fourth quarter	119	119	118	128	140	...
Annual average	114	117	114	120	129	...

postwar years production in the first quarter has offered a good pointer towards the eventual average for the year. From this point of view, the first quarter of 1955 appears to support Mr Butler's hopes about total output this year; the effects of tightening in credit and restrictions on hire purchase—to say nothing of a railway strike—have, however, yet to come.

One-sided Money Squeeze

THE pressure of dear money on the banks is being sustained; but their response continues to be heavily one-sided. The latest statement of the clearing banks shows that in the four weeks to May 18th holdings of investments fell by very nearly £76 million—whilst advances were up by a further £36 million. The principal source of the squeeze on the banks continues to be the withdrawal of deposits by the public for investment in Treasury bills, at rates up to 3⅛ per cent; deposit accounts—which earn 2½ per cent—fell by £27 million in May, and total net deposits by £42 million.

Given the continued expansion in advances, therefore, even the major unloading of investments did no more than maintain the average liquidity ratio at 30.5 per cent—to which, it may be recalled, it recovered in April from the March low point of 29.9 per cent. Of the "Big Seven" only the Midland now records a liquidity ratio of under 30 per cent; this bank is indeed the only one to have maintained its investment portfolio intact since mid-January, notwithstanding the rise in its advances and the erosion of its deposits. Its liquidity ratio has accordingly been reduced month by month, from 35.4 per cent to 29.1 per cent. The investment portfolio of the eleven clearing banks together has, however, now been reduced by no less than £139 million in the two months from mid-March alone. The weakness of gilt-edged must have owed still more to the banks than has been apparent in the market.

The credit squeeze is thus succeeding well in exerting pressure in the markets; and, as the banks run down their portfolios of the shorter stocks, that pressure will permeate more fully throughout the breadth of maturities. But it is nevertheless disconcerting that the banks' lendings continue to rise. Bankers are plainly having difficulty in cutting down on existing advances according to the classical canons; in these days of sustained full employment few good risks turn to bad or indifferent merely because Bank rate is raised by 1½ per cent. There is slightly more scope

of course in the more critical scrutiny of applications for wholly new projects; though many banks are still reluctant to turn away good business in the advances field. But now that they have made such substantial reductions in their investment portfolios the pressure to do so may have become irresistible.

News about Oil

THE first of the promised quarterly profits statements from the Royal Dutch-Shell group coincided with the chairmen's statements in London and Amsterdam this week. The statement has been helpfully arranged to conform with the annual figures and it shows a further remarkable advance in sales, compared with the first quarter of 1954, with a satisfactory but restrained increase in net income after charging higher operating expenses and depreciation:

ROYAL DUTCH-SHELL GROUP
(£ million)

	Year, 1954	Jan.-Mar., 1954	Jan.-Mar., 1955
Sales proceeds, etc.	1,851·0	429·5	473·7
Operating expenses	1,044·2	246·2	272·3
Sales taxes	405·9	83·6	94·7
Depreciation	155·4	38·2	41·7
	245·5	61·5	65·0
Investment income	13·9	2·7	1·7
	259·4	**64·2**	**66·7**
Interest	5·8	1·4	1·5
Estimated taxation	101·7	24·8	26·3
Minority interests	17·4	4·6	4·7
Net income	134·5	33·4	34·2

Sir Frederick Godber pointed out at the "Shell" Transport and Trading meeting that it was too early to regard these figures as a pattern for the year's trading, but the group's business this year had "come up to expectations" and the results were "not unsatisfactory." Sir Frederick also referred to the roles of petroleum and atomic energy in meeting future demands for power. All Shell's studies had led to the conclusion that the two would be complementary rather than competitive.

Esso's sales last year in the home and export markets were a record; the throughput at Fawley hit a new peak of 6,861,000 tons, compared with 6,072,000 tons in 1953. Yet trading receipts were a bare 1 per cent higher at £188.6 million because of lower prices for the major products. A similar story of reduced profit margins is told in the Burmah Oil report; after charging exploration costs, Burmah's trading profit is down—£5,131,211 against £5,330,987—but the fall is handsomely made good by the increase of £646,093 in dividend income.

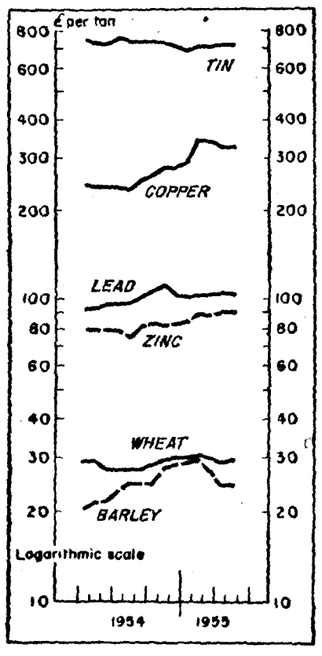
World Bank's Stake in Italy

THE World Bank approved this week a loan in various currencies to the equivalent of $70 million to the Cassa per il Mezzogiorno, an Italian governmental agency charged with the administration of the ambitious Vanoni plan for the development of southern Italy and Sicily. The loan is the largest to have been granted by the World Bank to any European country; and the fact that it has been made to a country that is in part highly industrialised makes it something of a new departure in the bank's operations. The specific projects to which the bank's loan has of necessity been keyed—they include schemes for the development of irrigation and electric power and complementary industrial projects—will be undertaken and supplied to a large part by Italian concerns in the north; the direct foreign exchange cost will be only a fraction of the $70 million.

The bank's loan will in practice take the form of a general purpose advance: it will make a contribution to the foreign exchange cost of the Vanoni plan as a whole. It has been estimated by the Italian Government that the twelve-year plan will require a total inflow of foreign capital to the value of $120 million every year. The bank's advance thus satisfies the needs of a mere seven months. But it is regarded as a vital marginal contribution; and it is understood that the bank is unlikely to turn down a further approach in the near future. It is well satisfied with the results of its earlier loans to the Cassa, totalling $20 million, and it regards Italy as a highly promising field for investment. The development projects have been chosen with a special eye to their contribution to the balance of payments, through either reduced imports or increased exports; the cultivation and processing of citrus fruits in particular ranks high in the schemes backed by the World Bank. Moreover, it is expected that the extra materials and equipment imported for the new projects themselves will come mainly from Europe. The new loan to Italy is accordingly expected to be taken up mainly in sterling, Swiss francs, guilders and deutschmarks rather than in dollars.

Another notable feature of the loan is that $5 million is to be taken up by a private institution, the Bank of America. As this bank has not insisted on the guarantee of the World Bank, the usual 1 per cent commission charge will not apply to this portion of the loan, which will accordingly carry interest at 3¼ per cent, against 4¾ per cent on the remaining $65 million. The loan as a whole is guaranteed by the Italian government and is repayable over twenty years.

Between Seasons in Wheat



IN several ways the 1954/55 wheat season is ending in better shape than it began. Prices are a little higher—No. 1 Northern Manitoba, for instance, which opened the season last August at 171¼ cents a bushel, is now 176 cents—and in no immediate danger; all the major exporters except Canada have sold much more wheat this season than last; and stocks in some exporting countries have been reduced. The improvement is the result of poor harvests in exporting and importing countries, and the need to replace stocks that were consumed in the previous season. World shipments of wheat from August 1, 1954, to May 21st this year are estimated to have risen by 68.9 million bushels to 618.8 million bushels, compared with the same period of last year. Shipments by the United States have caught up with those of Canada, owing largely to the special sales made to foreign countries under the various schemes for disposing of surplus American wheat. Those sales have naturally drawn criticism from other countries, particularly Canada, but it was not to be expected that America would be content to sit on its surplus. This season has also seen France emerging as a major exporter; up to May 21st France had contracted to export 89.8 million bushels, nearly three times as much as in the same period last year.

But despite the improvement in trade, the world carry-over of wheat into the new season on August 1st will be scarcely less massive than a year ago. A sharp fall in the carry-over in Canada will be partly offset by a rise of about 100 million bushels in the American carry-over to a new record of nearly 1,000 million bushels. With the equivalent of an entire crop already in hand, the further reduction in the 1955/56 American crop is merely a step in the right direction, not a major relief. In other countries the harvest will almost certainly be larger than last season's, and next season demand will not be inflated by the need to replace stocks. Hence the pressure on world prices may increase. Once more, the prospect turns mainly on the policy of the United States. While other exporters so far have had little

Course of Commodities

THE industrial materials have fared best among commodities this year. The sharp decline in *The Economist* commodity price indicator from the peak of 103.6 (1952=100) in January to 91.4 this week is attributable more to the fall in prices of cocoa, coffee and tea than to the weakening in rubber, coarse grains, copper and cotton. The three beverages have probably passed the worst of their setback, but are still sickly; sugar, for long an invalid, has made a spectacular recovery. Tin, lead and zinc are riding a buoyant industrial demand, backed by official support policies, and copper remains short. Maize and barley are not too plentiful, and the American government is still a firm holder of the only burdensome surplus of wheat. Rubber and wool are soundly based, and the only major threat to cotton prices is the unlikely one of drastic action to move the American surplus into world markets. The lesser industrial commodities, such as jute, sisal and copra, are rather wan.

Assembly work in progress at Marconi's Chelmsford factory. (Left) Mr. John Mabey, the Burroughs man called in by Marconi, with one of the Burroughs machines which have speeded up their accounting.

This man helped Marconi gear their accounting to rising production

HE IS ONE of Burroughs' world-wide team of mechanized accounting consultants. This is the story:

Marconi's Wireless Telegraph Company Limited export radio, electronic and heavy television equipment to the world. The demand for Marconi products increases every month.

At their Chelmsford factory, they needed to expand their accounting procedures in order to cope with the mass of extra work.

Marconi's decided to call in the Burroughs man, an experienced consultant on *all* accounting and record-keeping systems. Mr. John Mabey is the specialist sent by Burroughs.

A FULL ANALYSIS

Working closely with the Deputy Chief Accountant at Chelmsford, Mr. Mabey applied his experience to the problem. After a full analysis of the existing system they evolved a new plan, based on the speed and versatility of Burroughs Sensimatic Accounting Machines.

The plan was adopted. Now all Marconi's accounting is in line with their increased production. And Works Payroll is completed in *less than a day;* the same machines take Salaried Staff Payroll in their stride. Costing is now done on a single 15" card which shows eight running totals—hours, labour, overheads, purchased materials, manufactured materials, processes, aggregate balance and net balance.

So well has the new system worked at Chelmsford that Marconi have followed the same plan at their newly-opened factory at Basildon.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve it. He will make a full analysis and suggest the most economical and *workable* solution. If he thinks no change is advisable he will frankly say so. But if he does recommend a change he will plan the new routine in detail, and see that you always get the full benefit from any Burroughs machine you install. Call in the Burroughs man—you're committed to nothing and his advice is free.

Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

For specialist advice on mechanized accounting methods call in the **Burroughs** *man*

real cause for complaint with that policy, they remain understandably anxious lest Congress should push the American government towards more disruptive methods for getting rid of wheat.

Prospects for de Havilland

NEW knowledge is often acquired only with pain. The cost of the new knowledge now possessed by the world about metal fatigue in aircraft has to be measured first in the loss of life in the Comet catastrophe. Only then can the financial tally be made. That financial cost is heavy and it has had to be borne largely by the de Havilland Aircraft Company. Nearly £4¼ million has had to be written off out of profits to cover expenditure on the development and production of the Comet which cannot now be recovered. Thus in spite of profitable trading from the production of other aircraft and components the full accounts for the year to September 30th show a net loss of £663,415; much of that loss has been covered by the writing back of tax provisions no longer required.

That, in essence, is the sober report that Mr W. E. Nixon in his first year of office as chairman has presented to stockholders. But, equally soberly, he expresses confidence in the company's ability to recover from the setback in the not too distant future. There are many reasons for that confidence. Firm orders, subject to the granting of a certificate of airworthiness, have been placed for a number of Comet 2's; BOAC has ordered an initial fleet of twenty Comet 4's; the company's overseas subsidiaries are "more than self-supporting"; and, aside from the Comet, the production of aircraft, engines, guided missiles and components sets the business on a broad basis. But now that the peak of the rearmament orders is past Mr Nixon believes that the emphasis will be switched back from production to development. Hence the future prospects for de Havilland will turn on the success that the Comet, the D.H.110, the jet and rocket engines and the guided weapons can attain. De Havilland's accumulated experience places it amongst the first of the aircraft industry. But it would be wrong anywhere in that industry to minimise the risks that attend new developments.

Newspapers Fit to Sell

IN two characteristically rumbustious speeches last week, Mr Cecil King, chairman and managing director of the *Daily Mirror* and *Sunday Pictorial*, had a good deal to say about postwar expansion of newspaper sales. By the second half of 1950, he said, the eight national daily newspapers had a combined sale of 16.8 million and eleven national Sunday papers had a combined sale of 30.7 million. In May, 1951, prices were increased and this caused a recession in sales. Recovery had been steady but slow: by the second half of 1954 the daily sales had reached 16.2 million and the Sunday sales 30.4 million. Mr King was entitled to add that in the second half of 1954 the *Daily Mirror* and the *Sunday Pictorial* had both passed their level of sales in the peak half-year before that recession.

The expansion of television and the continuance of the larger newspapers that have been published since the newspaper strike made Mr King reflect that "it would not be surprising if the tide (of sales) receded again." Competition was intensifying and would probably make the strong newspapers stronger and the weak ones weaker. Mr King feels that some reduction in the numbers of the long established Sunday newspapers would do no harm, but he hopes the "weak sisters among the dailies" can survive. The *Daily Mirror* decided not to enter the commercial television field because the Act "had shown far more concern to placate some old blimps in the House of Lords than to produce a workable scheme." Nevertheless, Mr King emphasised the likely effects of television both upon the advertising revenue and on the content of newspapers. "Though some newspapers do not yet seem aware of the effect, the advent of radio altered the character of newspapers from that of purveyors of news towards that of daily magazines. The impact of television will be greater than that of radio. . . ."

Expansion of the *Daily Mirror* group, of course, has exploited that trend towards magazine presentation. *Reveille*, which Mr King classes as a weekly family newspaper, has been used to "take up the slack in this market," and the group has introduced a children's newspaper and more recently a women's Sunday paper. Mr King contributes his usual vigorous attack upon

> the idea that all sorts of matters of interest and importance should only be discussed in the narrow circle mostly of self-important, self-appointed busybodies and that newspapers only exist to report the speeches of such people and their friends.

But can one detect a slight similar tinge of what he would probably call "do-gooding" in his promise to continue to give through the *Daily Mirror* and its robust associates "the news that interests and the news that ought to interest our readers"?

Plastics Under Pressure

THE plastics industry expects to make 300,000 tons of plastics materials this year, against some 250,000 tons in 1954 and about 180,000 tons in 1953; but the volume of orders is still more than certain sections of the industry can cope with. Both exhibitions previously staged by the industry have been held when its firms have been pulling out of sharp recessions, but the third biennial exhibition, which opened this week at Olympia, is taking place during a period of very rapid expansion indeed, many times greater than that now being enjoyed by industry as a whole. Current output is about twice that of 1948 and nearly ten times greater than in 1938. This much higher level of production, plus improvements in plant efficiency and in manufacturing technique, have enabled the industry to absorb rising costs; in general, prices of plastics materials have been slowly falling over the last three years.

The pace of advance is hottest in the thermoplastics group, particularly in polyvinyl chloride, polystyrene, and polythene. ICI, British Geon, and Bakelite make "p.v.c.," and between them expect to have in production this year twice their 1953 capacity; but sizeable imports of vinyl resins will still be needed to meet the big Coal Board contract for the replacement of rubber conveyor belting with non-inflammable belting. The capacity of polystyrene plants has also doubled in the last two years, and polythene production has trebled. By 1957 ICI expects to make 55,000 tons of polythene against 35,000 tons this year, but its patent expires next February and it may soon be facing competition from low-pressure polythene plants now under consideration by certain petroleum chemical firms.

Expenditure upon research and development is high for the plastics industry. A recent estimate puts it at about £5 million a year, perhaps 7 per cent of its turnover, although this is an industry containing a large number of small firms. Plant for the industry is now the field of specialist firms, and many raw materials that were formerly imported are now made in Britain. But the industry still suspects that its market is fickle. Overseas business—last year a good 30 per cent of total production of plastics materials, plus a large but unknown quantity of finished products—is liable to be cut overnight by import restrictions, and some forward estimates for the home consumer market can be upset by changes in hire purchase policy. However, in the field of electricity, electronics, radio and television, in building supplies, car and aircraft accessories, and in packaging, the industry has large and growing markets. And by the adoption of standard specifications of quality and performance and by the wider use of certification marks, it can in time overcome the last memories of the inferior and shoddy plastics goods that flooded the domestic market shortly after the war.

Shipping for Steel

THE 13 new ore-carrying ships that the British steel industry ordered last week bring the total fleet of these specialised carriers so far delivered or on order to nearly 40, totalling about 425,000 tons deadweight. So far none of the 22,000-tonners that the industry has been considering have been ordered. Five specially-built ore carriers of 8,500 tons dw each are at present bringing ore in; these were built by private owners and are on time charter to the industry. The shift towards controlling its own tonnage and using specialised ships has been made by the industry after the great postwar increase in its imports of iron ore had on several occasions left it short of tonnage and caused it to pay very high freights. It imported more than 12 million tons of ore last year, and hopes to bring in about half a million tons more this year; but by 1958, upon the basis of the development plans recently reviewed by the Iron and Steel Board, the industry may need to bring in about 17 million tons a year of iron and manganese ore.

The arguments for a sizeable ore fleet—owned by the industry or built as large tankers are specially for time charter—are already being reinforced by the trend of coal imports. During the spring the steel industry found some difficulty in keeping up to its ore import programme because the heavy traffic in coal across the Atlantic was bringing about a marked shortage of tonnage. It would be most optimistic to assume that any less coal from overseas will be required next winter; the chances are that the National Coal Board will make yet heavier demands on shipping to bring in the coal it is failing to mine.

Troubles in Jute

THE East Pakistan government has not renewed the licences of a number of exporters of raw jute. No specific reason—other than "irregular" activities—has been given, but it can no doubt be partly explained by the government's apparent desire to restrict the operations of Indian firms, and by its apprehensions that shipments of raw jute to India are providing the cover for movements of capital to that country. The action, which follows the cancellation of some export licences last November, was widely expected in London, and its repercussions should be small. London importing firms, which handle the bulk of Pakistan jute shipped to European markets, tended to avoid entering into contracts for shipments just before or after the new licensing year begins on July 1st. Moreover, when representatives of the London trade visited Pakistan early this year they were assured by the government that if licences were cancelled, exporters would be allowed to fulfil existing contracts that were registered with the State bank; as jute prices have dropped, there should be little reason to fear that contracts will not be fulfilled.

Prices have in fact fallen by about 25 per cent from the peak of last February. Jute firsts from the old crop are now about £83 a ton cif Continent, compared with £112 in February, and new crop firsts are being offered at or just above the official minimum export price of £80 a ton; prices of other new crop grades are also bumping their minimum prices. The crop promises to be substantially higher than last season's harvest of about 4 million bales. Though the acreage was formally restricted to an area that should produce about 5.5 million bales, actual plantings are as usual much higher. The question now is whether the government can maintain the present minimum prices.

Skirmish in Softwood

THE seasonal lull in British imports of softwood has been unusually marked this year; in the last two months importers have practically withdrawn from the market. This inactivity seems to be no more than a natural consequence of the exceptionally heavy orders placed early in the season; by the end of January importers had bought over 1.2 million standards, and since then purchases have slowly crept up to about 1.5 million standards. For what it is worth the trade's forecast of British consumption of softwood this year is about 1.7 million standards. The recent paucity of British buying has not led to any weakening of the market. Exporters are well sold forward and are confident that current prices can be maintained. Swedish producers have sold the bulk of their exportable supplies; Canadian exporters have received large orders from their major customer, the United States, and with American building and construction still racing ahead demand there is unlikely to slacken.

Although British importers have bought heavily they are not entirely happy about the prospects for home consumption. Purchases this season have cost, on the average, about 9 per cent more than last season's, freight rates are still rising, and Bank rate has been increased. As in many other trades, the inflation of raw material prices has not been matched by a rise in the importers' financial reserves, and most firms have to rely on bank loans for much of their working capital. Yet consumers are resisting higher prices. The builders, in particular, claim that present prices of softwood are encouraging the use of substitute materials wherever possible. Thus, on the one hand, importers are under pressure to keep prices down and increase the volume of turnover; on the other hand, they face the need to bring prices into line with replacement costs. By the end of the year it will be clear which side of the trade has had the better of the argument.

SHORTER NOTE

Undeterred by the railway strike, Thomas Tilling, the industrial finance company, has come to the market with a new preference share issue. Stockholders in the company are offered 2,200,000 £1 5½ per cent cumulative preference shares at par, with 5s. payable on application. Subscription to the issue, which will "provide funds for further expansion," has been guaranteed by Helbert Wagg and Company.

Company Notes

GUEST KEEN AND NETTLEFOLDS. In 1954 the gross book value of the fixed assets belonging to the 78 companies in the Guest Keen and Nettlefolds group rose by £16.5 million to £52.3 million. Just over £10 million of that sum represented the consolidation of the assets of Guest Keen Iron and Steel. That company was purchased last year from the Iron and Steel Realisation Agency for £8,268,759; the price was met by the sale of gilt-edged securities. These assets have been consolidated into the accounts as at their current value on October 4, 1953.

The remaining £6.3 million represented fresh capital expenditure. Of that total £2.1 million was spent by the steel companies, £2.5 million by other British subsidiaries and £1.7 million by overseas subsidiaries. At the beginning of this year the directors had sanctioned the following capital expenditure:

Steel companies	£4,600,000
Other home companies	£4,950,000
Overseas companies	£2,750,000
Total	£12,300,000

Since then the board has authorised the spending of a further £3 million. About £3½ million of this programme will be spent to keep production in line with the expansion schemes of the motor industry; it will be used to expand the capacity of Joseph Sankey in wheels, panels and frames, of Garringtons in forgings and of Guest Keen and Nettlefolds (Midlands) in bolts, nuts, screws and valve forgings. The multiplier effect of the motor companies' investment plans could have no better example.

In all the Guest Keen group will spend about £15 million on fixed capital in the next two or three years. If profits continue to run at their present level—in 1954 profits after depreciation advanced from £7,460,883 to £12,404,901—the directors do not anticipate any trouble in financing these commitments from ploughed back profits. But there is a sting in the tail. The directors are not likely to break with their conservative policy on dividends. Last year the ordinary dividend was raised from 15 to 20 per cent; but the 100 per cent free scrip issue does not, the directors point out, imply any intention to increase the sum distributed to ordinary stockholders. And the dividend yield of 4¾ per cent at the current price of 85s. 7½d. is not over-high.

Profits should continue to run at a high level, for order books are full for six months ahead and the "principal limiting factors to output will be supplies of raw material and labour." But costs are also rising and though some of these increases have been absorbed, bringing the ratio of profit to turnover down to a low level, the company in due course will have to raise some of its selling prices.

★

GALLAHER and GODFREY PHILLIPS. Imperial Tobacco reigns supreme and unruffled over most of the market for cigarettes in this country. It can look with some detachment, though not with indifference, on the competitive struggle between the smaller tobacco companies. That struggle is fierce, now that all quotas on supplies to the tobacconists have been removed. As Sir Edward de Stein, the chairman of Gallaher, points out, it means higher selling and advertising costs. An example of this trend comes from Godfrey Phillips, which, having introduced recently the "Red and White" brand, has charged £97,673 of "exceptional advertising expenditure" to a development and contingencies reserve. Other costs are going up as well. Wages are higher and Sir Edward says there are indications that the cost of leaf tobacco may rise again this year. The two increases in Bank rate also add to the costs of the tobacco companies that rely on bank overdrafts to finance their tobacco stocks.

Of all the smaller companies, Gallaher is perhaps the most happily placed. Its sales, particularly of "Senior Service" and "Park Drive" cigarettes, were higher last year and its profits improved from £2,010,816 to £2,510,784. In establishing a bigger market for its cigarettes it was helped by an improved allocation of dollars. As a result its stocks by the end of the year had risen from £15,487,324 to £19,004,933. Even so, these stocks when related to the current rate of sales were less adequate than the end-1953 stocks. If, as the manufacturers hope, more American leaf tobacco can be purchased this year, Gallaher will have to increase its stocks still more. That will mean a bigger bank overdraft than the sum of £3,674,015 outstanding at the end of last year.

	Years to Dec. 31, 1954	1955
Earnings:—	£	£
Gallaher:		
Profit, before tax.....	2,010,816	2,510,784
Taxation	1,097,434	1,408,209
Net profit	906,532	1,095,912
Ordinary dividends....	543,125	632,617
Ordinary dividends (per cent).....	20	22½
Godfrey Phillips:		
Profit, before tax.....	677,232	316,922
Taxation	345,420	186,069
Net profit	331,812	130,853
Ordinary dividends	83,379	86,222
Ordinary dividends (per cent).....	10	10

The reverse side of Gallaher's success last year is the sharp decline in Godfrey Phillips's profits from £677,232 to £316,922. The drive to sell "Red and White" cigarettes was not then under way. A recovery in this company's earnings seems to turn on its ability to create and to hold a market for a new brand of cigarettes. That is no easy task, as Carreras's experience with the "Dunhill" brand shows. That is why the £1 ordinary stock units in Godfrey Phillips on the maintained dividend of 10 per cent and at the current price of 20s. 6d. offer a yield of 9¾ per cent. It compares with the yield of 5.9 per cent offered by the Gallaher 10s. units at the current price of 38s. xd. on the increased dividend of 22½ per cent.

★

COURAGE AND BARCLAY PERKINS. The proposed merger of Courage and Barclay Perkins, two of the biggest brewers in London and the

Home Counties, has been carried another step forward. A report from the chartered accountants, Peat, Marwick, Mitchell and Company, is being considered by the two breweries and a formal offer to stockholders will be issued "as soon as possible." Bare details of the exchange of stock of the two brewers into a new holding company have been published. They are as follows:

	Existing stock	*New holding company stock*
COURAGE:		
£100 5% cum. pref.		£107 10s. 5% cum. pref.
£100 5% 2nd cum. pref.		£105 5% cum. pref.
£3 ordinary (in £1 units)		£7 ordinary (in £1 units)
BARCLAY PERKINS:		
£100 10% cum. pref.		£215 5% cum. pref.
£1 ordinary		£1 ordinary

It would be easier to assess the merits of this exchange if some estimate of the earnings and dividends likely to be paid by the new holding company had been published. But that presumably must wait on the formal offer to stockholders. Meanwhile, however, it is possible to make a rough calculation of the worth of the equity. For 1954, Courage paid an ordinary dividend of 22½ per cent. The equivalent dividend of the new holding company can hardly be less than that. Hence, on the basis of the seven for three exchange, it would be approximately 9.6 per cent—say 10 per cent. The average yield on brewing equities is about 6½ per cent, so that on the twin assumptions about the dividend and yield the price of the new ordinary shares would be about 30s. At that price the existing stock units of Courage, allowing for the terms of the exchange, would be worth about 70s. That was the sort of calculation the jobbers had to make when the preliminary details of the scheme were published. The conclusion at which they arrived was to mark the £1 units in Barclay Perkins down by 3s. 6d. to 29s. 6d. and to mark the £1 units in Courage up by 5s. 3d. to 68s. 9d. But at this stage the arithmetic is very rough and it can make no allowance for any economies that may emerge from the amalgamation of the two companies—and economies there surely must be if the merger is to have any point at all.

*

CONSOLIDATED ZINC. Lead and zinc production is the heart of Consolidated Zinc, for these metals provide most of its current profit. But it is playing an important and growing role in the exploitation of Australia's mineral wealth. In Australia it has interests not merely in lead, zinc and silver, but also in sulphuric acid, fertilisers, cement, timber, rutile, zircon, natural gas, oil and uranium. Some of the ventures are still in the primary stages of exploration and development, but that is inevitable in a list that looks forward to new horizons.

Lead and zinc earn the means for such new developments. Last year the consolidated trading surplus jumped from £2,896,272 to £5,089,924; ordinary stockholders received a dividend of 3s. 9d. on each £1 unit, compared with 3s. in 1953. The final dividend of 2s. 6d. is payable on the new shares offered at par in the ratio of one for three last November, though the funds from that issue came too late to make any contribution to the year's profit. The increase in profits reflects the higher prices realised from the sale of lead and zinc. In Australia more lead, zinc and silver were mined, while in this country the Imperial Smelting Corporation was busier than ever. That company also sold more sulphuric acid than before. Throughout the organisation, in fact, the year's operations led, Mr John R. Govett remarks, to "increased output and improved efficiencies in all the major branches of activities." There is a growing number of substitutes for lead and zinc and, hence, it is not surprising that Mr Govett, casting an anxious glance over his shoulder at purchases for the American stockpile, insists upon the need for stable prices and regular supplies to industry of its basic raw materials.

LONDON STOCK EXCHANGE

Next Account begins June 8th
Next Contango Day: June 8th
Next Settlement Day: June 14th

AT the end of last week the Conservative victory at the polls set equity prices ablaze. The *Financial Times* ordinary share index gained 3.5 points in one day to touch 199.4, well above the previous peak of 197.5 touched at the beginning of February. When the excitement died the market had to take account of the railway strike and when it opened after the Whitsun holiday prices were marked down. On Tuesday the ordinary share index fell back to 197.0. But prices rallied very quickly and went ahead very strongly on Thursday. In the gilt-edged market there was a further improvement in prices just before the week-end. But the funds, too, were marked down on Tuesday; little selling pressure, however, was encountered and, indeed, some investment support was given. Prices began to rally later in the week. Renewed Continental support for the German issues was the feature of the foreign market. Japanese issues, notably the dollar stocks, were also very firm.

All the equity issues in the industrial market shared in the boom immediately following the election results. But steel issues were the most prominent, as were high grade issues giving large earnings yields. There was still some American buying of such stocks as Bowater Paper. Prices were then lowered on the railway strike. But hardly any selling orders came into the market and the rally soon began. On Thursday sharp gains were made by the "blue-chips." Oil shares followed the lead set elsewhere in the market, taking their pace from British Petroleum and Burmah Oil.

Rubber and tea shares remained quiet, with prices showing no decisive tendency. Tea shares failed to react to the halving of the Indian export duty. Business in the Kaffir market was at a low ebb. Loraine was weak in front of the first monthly return but some speculative interest was taken in F. S. Geduld. Copper shares were strong on buying from the Continent.

(1) From August, 1953, the index has been revised to show a more representative wheat price. (2) Figures up to July, 1953, relate to delivered prices and subsequently to ex-warehouse prices of H.C. electrolytic copper. (3) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (4) Annual figures are based on unit values and are influenced by changes in the composition of trade as well as price movements. (5) Surveys made twice a year: annual figures relate to October survey. (6) Revised series based on Liverpool spot market prices, as from July 1 1954.

Financial Statistics

EXCHEQUER RETURNS

For the week ended May 28th there was an above-line " surplus (after allowing for Sinking funds) of £666,000 compared with a deficit of £16,691,000 in the previous week and a surplus of £4,132,000 in the corresponding period of last year. Net expenditure " below-line " last week reached £8,879,000, bringing the total cumulative deficit to £102,626,000 (£68,136,000 in 1954-55).

THE MONEY MARKET

At the Treasury bill tender on Friday last the discount houses bid at £99 0s. 5d. per cent for the fourth week in succession; and the average rate of discount was again virtually unchanged at £3 18s. 4.37d. per cent. The offer was up by £10 million to £250 million, so that despite an increase of £14.3 million in applications, to £389.9 million, the market's allotment dropped only from 50 to 48 per cent.

Credit was again generally short in the week to Wednesday last. Before the week-end the Bank of England gave a fair amount of special aid, but on Friday two or three houses were nevertheless obliged to take small seven-day loans at 4½ per cent. Conditions continued stringent after the holiday; on Wednesday the market received no special aid and was accordingly again forced into the Bank for a small amount.

Dealings in gold in the London market have been considerable this week; the price has moved in sympathy with the fluctuations in sterling (reported in a note on page 872).

The Bank return shows a further outflow of notes of £13.1 million, an unusually large amount for the week ending after Whitsun. The outflow has, in fact, gone largely to stock up the banks' tills against the uncertainties of distribution during the rail strike. Accordingly, there is little significance in the renewed fall in bankers' deposits at the Bank of England to £239.5 million, a new eight-year low point.

COMPANY MEETINGS

THE UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

SERIOUS EFFECTS OF CONTINUED RISE IN OPERATING COSTS

DISPARITY BETWEEN LOW LEVEL OF FREIGHT RATES AND VOYAGE EXPENDITURE

SHIPBUILDING: URGENT NEED FOR SOME FORM OF FIXED PRICE QUOTATION

COMPANY'S NOTABLE ROLE IN SOUTH AFRICAN TRADE

SIR GEORGE P. CHRISTOPHER ON FORTHCOMING FREIGHT AGREEMENT NEGOTIATIONS

The annual general meeting of The Union-Castle Mail Steamship Company, Limited, was held on June 2nd at Winchester House, Old Broad Street, London, E.C., Sir George P. Christopher (chairman and managing director) presiding.

Mr W. Guy Densem, of Messrs Deloitte, Plender, Griffiths and Company, having read the report of the auditors,

The Chairman said:

ACCOUNTS

The Accounts have been in your hands for over three weeks. May I, as usual, assume that it will be your pleasure to take them as read?

The drop of £1,054,286 in the gross Profit of the Parent Company is entirely accounted for by increases in running costs, despite some improvement in gross earnings, as I shall explain later in this speech. This fall was, in part, offset by somewhat higher income from investments, by a slightly lower figure for depreciation and by the reduction in income tax on the smaller profits. The final result is a net profit of £631,576, or £482,570 less than the figure for the previous year.

Depreciation on the actual total cost of the Company's ships on the usual basis of 5 per cent per annum absorbed £1,392,173. If, instead, depreciation had been calculated upon replacement cost, the required figure would have been something upwards of £4 million. It is a disturbing thought that, on such a basis and on similar earnings, the Accounts would have shown a heavy deficit. Such a position is yet a long way off, but as new tonnage comes to be built to replace older units of the Fleet, on the hypothesis that building costs remain at their present levels, that position will gradually be reached, unless net earnings can be substantially increased to provide normal depreciation on the much higher actual cost of the new ships. It is not my object to sound a note of alarm, but I nevertheless feel it to be the duty of the Chairman of this Company to emphasise two things. They are, first, that whatever the amount by which depreciation provisions fall short of the cost of ultimate replacement, that shortfall must be made good out of accumulated reserves; and secondly, that when such reserves as we now command are used up for new ships further resources can only be provided or serviced out of future earnings. It is, therefore, axiomatic that in the long run Industry must provide the means in the freights it pays, if its transport is to be kept abreast of the requirements of the times.

If freight structures are framed and adjusted with these considerations in view there will be no need for perturbation as to the future. But there can be no escaping from the need of a broad-minded outlook on the part of the vast interests which expect shipping companies not to fall short of the unceasing demands being made upon them for up-to-date and ever more efficient ships. It must be borne in mind that these are most expensive things nowadays.

DIVIDEND

I now come to the manner in which we propose to deal with the balance of our Profit and Loss Account amounting, with the carry forward from the previous year, to £1,791,083. We have transferred £500,000 to Fleet Replacement Account, which, with the net book surplus on the sale of *Llangibby Castle*, brings that Account to £4,611,443, by no means an extravagant provision, indeed a modest one, having regard to the height to which the cost of shipbuilding has soared. Preference Dividends absorb £160,800 gross, or £88,440 net after allowing for Income Tax. We propose to pay the same dividend of 7½ per cent on the Ordinary Stock as last year, absorbing £411,000 gross, or £236,325 net after payment of Income Tax. The carry-forward will thus be £966,318.

We are, of course, aware of the insistence of the demands which have of late been made for increased dividend payments and revisions of the capital structure of public companies, with the ostensible object of protecting the general interests of shareholders. Your Directors are mindful not only of these things but also of their own responsibilities to you who entrust the Company's affairs to their hands. I sometimes think it is not so generally known as it might be that neither the Companies Act nor Articles of Association make any provision for these responsibilities to be undertaken or even so much as shared by any other persons or bodies than Boards of Directors. Without your complete confidence in our judgment and in our knowledge of matters which can only be acquired by intimate association with the many intricacies of the Company's affairs, I for one would find it quite impossible to continue to act. Therefore, I would ask you to be assured of the sense of duty with which we propose these allocations of the available resources and of our belief that they are in the best interests of the Stockholders.

BALANCE SHEET

The Union-Castle Balance Sheet calls for no special comment. It is based on unchanged lines, drawn up in such a way as to give a clear portrayal of the figures, and shows a sound current position. It is my hope that our trading potentialities in the times ahead of us will make it possible for this position to be maintained.

CONSOLIDATED ACCOUNTS

These are likewise drawn up on lines familiar to you. The King Line, which is our principal subsidiary Company, has met with the usual vicissitudes in the open freight markets during the year, but has well maintained its profits and has repeated the previous year's dividend. This Company is engaged in general world trading and is not directly concerned in the African routes but has behind it a wide and long experience in what are known as the "tramp" trades.

I am sorry to say that Bullard, King and Company, our other ship-owning subsidiary, which is engaged in the South African trade, made a trading loss in 1954. This, however, is fully covered by its own reserves.

FREIGHTS AND COSTS

Inherent in the figures with which I have been dealing are two factors of great potency, the first having a unique bearing on the affairs of the Union-Castle Company, the other being of more general application, although having a very definite effect upon us, in common with all industrial concerns. The first is the fact that, in the liner trades between South Africa and the United Kingdom and Europe, rates of freight and terms of carriage are subject to agreement with the South African Government. This has been said before, but being, so far as I am aware, a phenomenon applicable to no other shipping conference in anything like the same degree, it is easily lost sight of. Rates of freight to and from South Africa have not been fundamentally changed since the middle of 1951, despite the fact that

general increases have since then been made more than once in most other conference trades. In consequence, South African rates are now not only far below the levels of those on any other comparable liner route, but have become increasingly out of parity with the costs of running, maintaining and rebuilding fleets.

The second factor is the ceaseless spiral of costs, which is really another facet of the same state of things, forming a two-ply thread running through our economic existence; namely, gross and net earning power.

In August of last year, the South African Shipping Conference took part in a searching discussion with combined representatives of the South African Perishable Products Export Control Board and the South African Shipping Board, in the course of considering a request made by the Conference for a revision of rates of freight on the carriage of fruit from the Union. I use the word "searching" unequivocally, because the Union-Castle Company was subjected by the Shipping Board to an examination of the financial results of our voyages and our whole financial set-up of such a nature as to make any other term undescriptive. We hoped thereby that a frank disclosure of our case would convince the Shipping Board of the need for remedial action. We did not succeed. Our interlocutors seemed unconvinced by our case, and expressed themselves assured that costs of running and building ships would very shortly fall, basing on this hypothesis their refusal to accede to our request.

Facts are, however, proverbially much harder things than theory. Since that time there have, on the contrary, been further increases. No amount of theory can obliterate the fact that this Company's seven fully refrigerated ships, especially built for the conveyance of South African fruit, made a substantial trading loss in 1954. Nor is there any getting away from the following percentage increases in the main items of our voyage expenditure in the past year as compared with 1953:

	Were approximately per cent up
Passenger and Cargo Expenses ..	10
Crew Wages and Victualling	6
Repairs and Renewals.....	29
Port Charges.....	8

The only item which was lower in cost in 1954 than in 1953 was oil fuel, but increases in the price of this commodity for application in 1955 will wipe out even the comparatively small benefit under this heading.

In 1954 the actual increase in total expenditure by this Company, entirely exclusive of capital expenditure, was over two-and-a-half times the amount of the increase in cargo and passenger revenue. This is the outstanding reason for the reduction in the profits to which I have referred, accentuated, as it has been, by strikes.

It is impossible for those in control of industry to be blind to the tendencies which are making themselves evident in this matter of operating costs. Section after section of industrial labour, including seafarers, have, in quite recent times, secured considerably increased pay, the indicated additions of which to ultimate costs are tremendous in their aggregate totals.

I make no attempt to assess the considerations behind these increases, over most of which in any event we have no control. I would only comment that when it is remembered that shipping is vitally connected with practically every feature of industrial life, it will be seen that whatever happens to the general level of wages and whatever affects the cost of living and of maintenance, is reflected in full measure in the running and upkeep of ships, together with the additional wear and tear of the sea. It is, therefore, incumbent upon shipping managers to take a realistic view of cost increases.

FORTHCOMING NEGOTIATIONS

Further Freight Agreement negotiations are to take place between the South African Government and the Conference Lines in Pretoria in August, as well as discussions with this Company in regard to the Mail Contract, at which these considerations will be stated afresh. In view of this, it is disquieting to note that the Union Government recently introduced a legislative measure designed to produce greater control over shipping to and from their shores. The Bill has since been postponed until early next year. This is not the time nor the place to comment upon the detailed provisions of that measure. This much, however, must be said. From a perusal of its terms, in the language in which they are phrased, one can hardly fail to form an impression of unfriendliness towards shipping lines in place of the mutual good-will which is necessary for the continuity of the services rendered by them. I cannot believe this really speaks for the spirit in which the South African Government envisages these matters because it seems to be contrary to an encouragement of future facilities of the kind which have been available to them for so long, and which presumably they still desire.

What, in effect, we seek in the forthcoming talks is something much more important to South Africa, as well as to ourselves, than the mere enabling of shipping lines to exist. It is literally the wherewithal from which alone can come a continuance of shipping support second to none enjoyed by any other country in the world, by ships specially equipped for the carriage to her shores of the goods she needs and from them of the increasing output of her own agricultural, industrial and mineral production. To say the least, the measure to which I have referred is bound to be a severe discouragement to a future progressive shipping policy. May I add that such a measure, if it is persisted in, would result in an inevitable deterioration of the shipping resources available to South Africa, owing to the sheer inability of the Lines to face the costs or the consequences either of running or of replacing ships. It is for this reason that I hesitate to think it is the real intention of the South African Government to bring this about, and I therefore hope they will not proceed with their legislative proposals.

The Union-Castle Company has performed a very notable part in the trade of South Africa for a great many years. One in my position is perhaps peculiarly able to make an impartial assessment of matters which had their birth long before I was appointed to this chairmanship just over two years ago. In the careful study I have made since then of the past build-up of its traditions and commitments, I have been immensely impressed by the many evidences of the way in which my predecessors bent their efforts and formulated their policy in the determination to serve South Africa. Therefore, it would be more than a little odd if it were implied that we have been doing too well out of the remuneration we have received through the years. Had we not accumulated something more than just sufficient to give a modest reward to our shareholders on their venture in holding our stock, it would not have been possible for the fleet to have been renewed and equipped as it has so constantly been to meet the needs of the trade, thus conferring benefits on South Africa without any sort of anxiety on her part.

A point which needs emphasising is that the exorbitant costs now current are altogether disproportionate to the present levels of earning power of ships capable of effectively serving the South African trade. In the long run that great land, like every other country, can only receive the oversea transport for which it is ready to pay. In the days of our childhood our grandfathers used to admonish us that pennies did not grow on gooseberry bushes. Neither do ships, and there is no bottomless purse upon which a shipping company like this can draw for the building of tonnage. Except by the issue of fresh capital, which would need increased revenue to provide for its remuneration, it is only in the measure of the money which can be ploughed back out of the earnings of the ships that it will be possible to replenish the fleet as existing units become too old or too uneconomical to be retained. There must be sufficient inherent vitality left to us to enable the processes of reproduction to work. And, let me add, it must not be expected that we will be able to go on committing ourselves on terms which can only result in trading losses to this company.

NEW SHIP

These considerations apply with great urgency in the case of this company's older ships. The cost of replacing these at to-day's prices will call for some four and a-half times the figures of their original cost on which, incidentally, they have contributed to their own depreciation. This brings me to a practical illustration about which stockholders will rightly expect me to give some information. A public announcement was made in March last of the order placed by the company with Harland and Wolff for the construction of a new mail passenger steamer. This new ship will cost well over double that of *Pretoria Castle* or *Edinburgh Castle*, the last mail ships delivered in 1948, although she will be of the same dimensions and engine power and will embody nothing intrinsically more luxurious. Apart from additional Ministry of Transport requirements for sub-division and fire precaution, costly and far reaching in themselves in comparison with the standards called for when her immediate predecessors were built, the startling increase I have mentioned represents the rise in wages and materials in the intervening period. It may well be asked what justification there can be for embarking upon such an expenditure without any guarantee of countervailing improvement in freight rates. The answer is that *Arundel Castle*, which this new ship is designed to replace, is now 34 years old and will be 37 by the time her intended successor is ready. But for the war, the re-engining of such ships, and their reconditioning after war service, and the rising costs of rebuilding, together with the hope of those costs being stemmed, her replacement would have been accomplished long ago. Unfortunately, the hopes of prices coming down entertained when the position was reviewed two years ago have been completely disappointed. Having very carefully considered all the facts, including the heavily growing cost of *Arundel Castle's* upkeep and her inability to produce economic results, we came to the decision that no further delay should be faced. South Africa can regard this as an act of faith on our part in their future and their government's fairmindedness.

SHIPBUILDING COSTS

Those chiefly concerned with shipbuilding in the United Kingdom must be anxious lest their costs become so unproductive as to curtail orders. I would be so bold as to suggest to shipbuilders and their many sub-contractors the most penetrating joint consideration of the vexed question of finding some form of fixed price quotation. One of the most unfortunate legacies of war economics is what is known as the "price variation clause," the only reliable point about which is the certainty that the clause will apply. It is my belief that shipbuilders will find it more and more difficult to obtain orders unless they

place themselves in a position to quote either fixed prices or fixed "variations."

I would also say of the British shiprepairing section of the industry that, judging by their bills, one is driven to the conclusion that upkeep has become almost as expensive as shipbuilding. It seems to me that shipbuilders, shiprepairers and trades unions in this country should give earnest consideration to this problem from their respective points of view, in their own interests as well as those of shipowners. In both shipbuilding and shiprepairing, there is no doubt that the injurious effect of demarcation practices is a resultant cause of swollen costs.

FUTURE PROSPECTS

Those best able to judge hold the future of South, Central and East Africa in the highest degree of confidence. This is a matter for rejoicing to all concerned and the Union-Castle Company shares very fully in this feeling. May I express the hope that we will be permitted our just share in that prosperity which is the promise of the future.

The Federation of the Rhodesias and Nyasaland has started auspiciously and this augurs well for the future of these important territories. The new rail link with the port of Lourenco Marques will provide a valuable additional route for the inward and outward traffic of the Federation. As is known, we opened an office in Salisbury in 1953. So far as East Africa is concerned, considerable development work is proceeding at the ports of Mombasa and Dar-es-Salaam to facilitate the flow of traffic arising from the economic expansion of this large area. We have decided to open our own office at Dar-es-Salaam, which is an important centre.

DIRECTORATE

I would here wish to pay my tribute and that of their fellow Directors to the past services of Mr Arthur Henry Milbourne and Mr James Gray, before and during their periods on the Board. There are many who could speak with much longer experience of these two gentlemen than I can, but from my own personal association with them I can say without hesitation that the Company has had from them both long years of willing, loyal and devoted work.

In their places we are happy to have the assistance of Lord Maclay and Mr Reginald March Turnbull. The former bears a name highly respected in shipping circles, not only for the memory of his father, who was Shipping Controller in the first World War, but also for his own steadiness of purpose in the Admiralty and Ministry of Transport in the second World War, as well as for his services as President of the Chamber of Shipping of the United Kingdom in 1946. Mr Turnbull likewise comes of an old and famous shipowning family and he has himself won his own laurels both therein and in service in the Ministry of Transport during the late war. I am personally delighted to have both these well-tried friends with me on the Board to share in the problems and responsibilities ahead of us.

STAFF

To the Staff ashore and afloat, in this country and in Africa, administrative, executive, technical, seafaring and clerical alike, I would pay a well-merited testimony for work willingly and tirelessly performed and convey to them all a personal message of gratitude from one who has watched with pride their response to all the calls made upon their energies, as well as their abilities.

The report and accounts were adopted and the retiring Directors were re-elected.

The proceedings terminated with a vote of thanks to the Chairman and Directors.

KEMSLEY NEWSPAPERS LIMITED

VISCOUNT KEMSLEY'S ANNUAL REVIEW

The thirty-first Annual General Meeting of Kemsley Newspapers Limited was held on June 2, 1955, at Kemsley House, London. The following is an extract from the Statement of the Chairman, the Viscount Kemsley, submitted with the Report and Accounts for the year ended December 31, 1954, at the Meeting:

This statement occurs on the morrow of the greatest crisis through which the newspaper industry has had to pass since the general strike in 1926. These recent events overshadow the trading results for 1954 which in themselves were not unsatisfactory, as you will see from the accounts.

PENSION SCHEME

The most important event to be noticed in the accounts is one which is primarily for the benefit of the employees of the group. I refer to the inauguration on December 1, 1954, of the Kemsley Newspapers Employees' Pension Scheme. On many occasions in the past I have mentioned that it was our intention to initiate such a scheme and I have given some indication of the difficulties involved and the preparatory work and negotiations that had to be carried out. The bringing of the scheme to fruition has been a source of satisfaction to my colleagues and myself but especially to me; indeed, I am proud to say that its achievement has realised one of my cherished ambitions.

TRADING PROFITS

Turning now to the results of the year's operations you will see from the consolidated profit and loss acount that the trading profits and sundry income of the group amounted to £1,564,000 in 1954 as compared with £1,335,000 in 1953, an increase of £229,000.

After providing for taxation and deducting the share of profits (£6,000) attributable to minority interests there remains a balance of £685,000 which is the net profit of the group for the year attributable to our company.

As I said at the outset, the trading results of 1954 are overshadowed by the consequences of the recent strike. Although, as you will have seen, our combined efforts on your behalf in that year have been rewarded by an improvement in earnings, this encouraging trend has been reversed in 1955 by the substantial losses sustained during the four weeks of the strike, in addition to the very substantial increases in wages in London and Manchester, which operated from November 1, 1954, and of newsprint which was raised by 35s. a ton in January.

Against this background your directors have had to make their decision as to the final dividend which they should recommend on the ordinary stock. After very careful consideration we have decided to recommend the same distribution as last year, that is 5 per cent, making 10 per cent for the year.

SOLID PROGRESS

During 1954 the total circulation of newspapers in general tended to become stabilised and the sharp and often sensational movements of circulation which characterised the postwar years seem to have come to an end as, two years ago, I indicated would probably be the case. Nevertheless, the overall picture of our own publications is one of solid and steady progress. Although for some years we have published audited and certified figures of circulation, this year we associated ourselves with the Audit Bureau of Circulation, and to quote the headline in the *World's Press News* of January 21, 1955, "Kemsley's first ABC figures show large gains"—having risen from an average of 7,892,831 copies per issue in the last six months of 1953 to a figure of 8,137,703 copies per issue in the corresponding period of 1954. The figures are even more impressive when I say that this means we were selling over 22 million copies of the group papers a week, which represented an increase of more than 700,000 as compared with the same period in the previous year.

THE "SUNDAY TIMES"

It gives me great pleasure again to record a substantial increase in the circulation of the *Sunday Times*. Last year I was able to say that during 1953 the circulation of the *Sunday Times* increased by nearly 50,000. The net sale of the *Sunday Times* as certified by the Audit Bureau of Circulation shows an increase in the period July-December, 1954, of 49,220 copies per issue over the corresponding period of 1953 and reached a record average sale during the period of 600,266 per issue. You will be interested to learn that there has been a marked increase in the readership amongst the younger age groups.

WELSH ENTERPRISE

We found it possible to produce special Welsh and West Country editions of the *Empire News* when, on October 3rd, we inaugurated the printing and publishing of this newspaper at our plant in Cardiff (as well as in Manchester). It was thus able to serve a new and populous area with later news, to the great benefit both of our readers and of the circulation of the newspaper. The newspaper has now the highest circulation in the Group, selling more than 2 million copies every week.

COMMERCIAL TV

A new phase in advertising development has come into prospect with the introduction of Independent Television. It may be that Commercial Television will open a new and important field of advertising, but it would be a bold man who would make any firm prophecies. As you may have read, the opportunity was afforded to us to interest ourselves in this new development, and negotiations with the Independent Television Authority are proceeding at the present time.

THE FUTURE

This is an unusually difficult year for me to look into the future. I have told you of the losses we have sustained which must be borne in the accounts of the current year. I cannot yet estimate the extent to which we may be able to recover some of these losses by increased revenue. We are, moreover, aware that already new and heavy demands are to be made upon us for increased salaries and wages. You will understand, therefore, that I cannot at this moment be expected to make any firm forecast of the current year's working, but your directors can be relied upon to do all in their power to secure a favourable result for 1955.

THE BURMAH OIL COMPANY, LIMITED

FURTHER INCREASE IN VOLUME OF SALES

EFFECT OF HIGH TAXATION ON MOTOR SPIRIT

FURTHER DRILLING SHOWS LARGER GAS RESERVES

SIR KENNETH B. HARPER'S STATEMENT

The fifty-third annual general meeting of The Burmah Oil Company Limited will be held on Friday, June 24, 1955, in the Merchants Hall, 30, George Square, Glasgow.

The following statement by the chairman, Sir Kenneth B. Harper, has been circulated with the directors' report and accounts for the year ended December 31, 1954:

Since our last Annual General Meeting two of your Directors have been signally honoured by Her Majesty. At the New Year a Barony was conferred on Sir William Fraser and Lord Bilsland has recently been appointed a Knight of the Thistle. In the last New Year's Honours List also Mr M. J. Condon, who manages your interests in West Pakistan, was made a Commander of the Order of the British Empire. To all three we offer our warmest congratulations.

As was recently announced in the press, Mr W. E. V. Abraham has asked to be relieved of the duties of Managing Director and retired from the Company's service on April 30, 1955. He will remain on the Board so that his advice and the experience of 35 years of notable service with the Company may continue to be available to us.

We are fortunate in having as his successor Mr W. E. Eadie, who by experience and ability is particularly well fitted to assume the responsibilities of Managing Director

Mr R. P. Smith has been appointed a Director. Mr Smith served Burmah-Shell in India for 24 years before joining your Company's London staff and the Board expects to receive valuable assistance from his knowledge and judgment.

Mr E. Colman, after 21 years as Secretary to the Company, has decided to retire and will hand over his office to Mr D. Andrew on July 1st. We wish Mr Colman the long and happy retirement to which his loyal, valuable and efficient service so well entitles him.

ACCOUNTS

Last year, when comparing the 1953 results with those for 1952, I drew attention to a small increase in the volume of our Group sales and also to a slight reduction in profit margins. This year I am able to report a further increase in the volume of sales in each sphere of activity, although again this is accompanied by somewhat lower profit margins. After charging the cost of a comprehensive programme of exploration and including our interest in the trading of The Burma Oil Company (1954) Limited, the Group's trading profit for the year was £5,131,211, compared with £5,330,987 in 1953.

The deduction for depreciation amounts to £1,276,163, which corresponds closely to the charge in 1953.

Income from dividends and interest this year at £4,228,005 is £646,093 higher than last year, due mainly to increased dividends from The British Petroleum Company Limited and certain trade investments and to the receipt of dividends for the years 1952 and 1953 from The Tinplate Company of India, Limited.

Full provision has been made for UK and overseas taxation which absorbed £4,354,184 against £4,424,792 in 1953. Together with the balance of unappropriated profit of £596,411 brought forward from 1953 the total available for disposal becomes £4,325,280.

Your Board have allocated £1,100,000 of this amount to General Reserve and have set aside £1,599,445 for a final dividend of 13¼ per cent, which they recommend should be paid on the Ordinary Stock. After providing for this final dividend and the interim dividend of 7½ per cent paid on November 19, 1954, together with the dividends on the Preference Stocks, the balance of unappropriated profit carried forward is £610,888.

I draw your attention to that part of the Directors' Report which sets out our proposals for revaluing our direct and indirect investment in The British Petroleum Company Limited and, subject to the agreement of the Capital Issues Committee, for the *pro rata* distribution of shares to stockholders. There is nothing I need add here to what is contained in the Directors' Report.

The Burma Oil Company (1954) Limited started to operate in Burma as from January 1, 1954, and this involves a change in the Parent Company's Balance Sheet. The cost of our investment in the new Company is now included in Shares in Subsidiary Companies with a consequent adjustment of Advances. The reduction of Stocks of Stores and Materials, and consequently of the finance tied up in them, is also reflected in the reduction of Advances by the Parent Company.

The ordinary share capital of The Burma Oil Company (1954) Limited is the equivalent of £15 million. Your Company holds slightly over 55 per cent of this equity and the Union Government 33⅓ per cent. The balance is held by Indo-Burma Petroleum Company Limited and The British Burmah Petroleum Company Limited. A first payment of £2,500,000, of which your Company's share is £2,066,813, has been received from the Union Government in respect of the shares they have acquired. The balance is due to be paid by instalments or in one lump sum at the Government's option and your Company's share of this balance is shown in the Balance Sheet as a Loan to the Government of the Union of Burma. £51,670 of this loan has since been received.

The increase in Trade Investments results from your Company's share of the further capital required by Burmah-Shell Refineries Limited and from an investment of just over £1 million in the Sui Gas Transmission Company Limited.

During the year we received free issues of £21,371,940 British Petroleum Company Limited Ordinary Stock and £404,800 Shell Transport and Trading Company Limited Ordinary Stock.

TRADING

Our Group's share of the total trade in all petroleum products (excluding wax and candles) in Burma, India and Pakistan, was 4.5 per cent higher in volume than the corresponding figure for 1953, but there was, as I have already noted, a slight reduction in profit margins.

Assam Oil Company's production of wax during the year was the highest in its history and Burma started to produce wax again for the first time since 1952. Expanding demand in world markets enabled us to sell all our increased production and at somewhat better prices than in the previous year.

Burma. Indigenous and Imported Oil shared the trade in Burma about half and half. Total sales were some 11 per cent higher than in 1953, a small part of this increase being attributable to an improvement in security conditions.

Pakistan. Pakistan is at present a small motor spirit market, an average kerosine market, by Eastern standards, and a substantial user of fuel oils. The Group's sales of kerosine showed a small increase over the previous year, which would have been larger but for restrictions on the importation of tinplates involving foreign exchange. Some offtake of fuel oils was lost through the Eastern Bengal Railway converting a further number of their locomotives back to coal, but there are other developments in East Pakistan which should materially increase the demand for these oils.

India. There were substantial increases in the Group's trade in all products in the Assam Oil Company's sphere, while in the rest of India the increases were mainly in kerosine and fuel oils.

World trade of motor spirit increases steadily year by year and in the last three years, outside the Iron Curtain, the progressive increases have been 5 per cent, 6 per cent and 4 per cent. One would normally expect that in an underdeveloped country like India, working to a deliberate programme of industrial expansion, consumption of motor spirit would increase by more than the world average, but that has not in fact been the case. Offtake has stood still during 1953 and 1954, and in both years has been slightly lower than in 1952. This is ascribed to a combination of factors—sales taxes on motor spirit by States (or Provinces as they used to be called) on top of substantial Central import duties, States' taxation of motor vehicles, vehicle licensing policies and the threat to nationalise motor transport. There has also been an increasing use of diesel vehicles, especially by state transport organisations, resulting in some transfer of motor spirit trade to automotive diesel fuel.

I have commented in previous statements on the damaging effect of high taxation on the development of motor transport. In India import duty on motor spirit has stayed at 15 annas 9 pies (or about 1s. 6d.) per gallon since 1951. That is a Central duty. States have the power to impose sales taxes on the same product and are using it to an extent varying in different States from 2 annas to 6 annas per gallon.

One can understand the attraction to Governments of taxation on motor spirit; it brings in substantial revenue and costs so little to collect. But whatever advantages Governments may get out of taxing motor spirit, there comes a time when they can be obtained only at the expense of the development of motor transport and of the important part it plays in the development of the country as a whole. That point seems to have been reached in India, and this in spite of the increasing mileage of new roads and the improvement of road surfaces, as evidenced by sales of bitumen, which for the last three years have been 102,000, 125,600 and 168,700 tons. The figures suggest that the use of motor transport is not responding to the increase in motorable roads. It is to be hoped that the Central and States Governments will review their motor spirit and vehicle taxation policies in the light of the effect of these policies on their development plans.

PROSPECTING, OILFIELD DEVELOPMENT AND REFINING OPERATIONS

Burma. There appears to be some possibility that improvement in security conditions may permit resumption of a geophysical survey of the Irrawaddy Delta area and this is now under investigation. Stockholders are aware that no exploration work has been feasible in Burma since the war.

The Burma Oil Company (1954) Limited is now producing and refining crude oil from the concessions formerly held by the three participating Oil Companies and the products are sold through the agencies of our Burma Trading Company and Indo-Burma Petroleum Company Limited.

The "1954" Company has begun to rebuild at Syriam, near Rangoon, refining facilities which, combined with the existing facilities at Chauk, will make Burma self-sufficient in main petroleum products.

The Union Government have undertaken that their nationalised Inland Water Transport organisation will provide sufficient tug and barge capacity to transport crude oil from Chauk to Syriam.

I can still report no more progress in the matter of our "denial" claims against the Union Government than a slight advance in the preparatory steps towards the hearing of the preliminary legal issue of that Government's liability under the Defence of Burma Act, 1940.

India. As is a not uncommon experience, drilling results at Nahorkatiya have shown that the structure is geologically very complicated and further drilling will have to be done before the extent of the oil pools and the probable oil reserves can be reliably estimated, but I can say that results to date continue to be encouraging. In the meantime some crude oil is being piped to Digboi, where the refinery throughput has been increased by 50 per cent.

As a result of evidence obtained from geophysical surveys in the Upper Assam Valley, Assam Oil Company, Limited, has applied for prospecting rights over a number of further areas.

The new two-million-ton refinery built at Trombay Island at Bombay by Burmah-Shell Refineries Limited came on stream in January, 1955, and is expected to be in full operation by about the middle of the current year.

Pakistan. Pakistan Petroleum Limited, in which your Company has a 70 per cent interest, is continuing to explore vigorously in both West and East Pakistan. Following a seismic survey of the Uch area in West Pakistan, about 35 miles from the Sui Gas field, a test well was spudded in in February, 1955, and high pressure gas has been encountered. The first indications are that Uch will produce a substantial supplement to the supplies of gas from Sui. Drilling is being continued in the hope of striking oil at a deeper level.

Further drilling by Pakistan Petroleum Limited on the Sui Field has shown the gas reserves to be even larger than originally estimated and a fresh appraisement is being made. The laying of the Sui Gas Transmission Company's main pipe line was completed in April, 1955. The line is now being tested and deliveries to consumers are expected to begin in August.

Three related structures in this part of Baluchistan have now been drilled—namely, at Sui, Zin and Uch. Gas has been found in all three, though at too low a pressure in Zin to be a commercial proposition. Other structures in this region remain to be tested. The Pakistan Government are as anxious as we are to find oil in one or more of them, as imports of oil are a heavy burden on their foreign exchange.

After a seismic survey of the structure near the town of Sylhet in East Pakistan, a test well was started in January this year.

In East Pakistan good progress was made at Chittagong with the new Ocean Installation, which should be in full operation in a few months time.

PRIVATE ENTERPRISE IN INDIA

It is becoming increasingly difficult to be sure just how welcome private enterprise is in the India of today. The Prime Minister, Mr Nehru, has proclaimed that India's aim is a socialist economy in which there is to be a planned expansion of industry; that in this socialist plan there is to be a public sector and a private sector; that the former will predominate, but there will still be room for private enterprise because the policy will be to promote new state industries and, except in special circumstances, not to "nibble into the private sector"; to do the latter would be wasting the available resources because it would not add to the total development. Other responsible Ministers have declared that foreign capital will not only be admissible, but will be necessary to the progress of industrial development.

All that being so, one would expect that foreign capital would be positively encouraged to continue to enter India, but, instead, recent legislation gives a contrary impression. An amendment to Indian Company Law, at present on its way through Parliament, while not directly affecting our interests, indicates a disturbing trend in economic thought. An Act amending the Constitution does have a direct and adverse bearing on us, at least potentially, because it removes the right which the Constitution formerly gave to anyone whose property was acquired by the State to challenge the adequacy of the compensation in the Courts. The amount of compensation is now to be decided by the Legislature.

In the latter Amendment "searching for or winning Mineral Oils" is specified as one of the matters over which the State should be able to take full "control" by means of "the extinguishment or modification of any rights accruing by virtue of any agreement, lease or licence" which Government may have granted for that purpose.

The powers taken are permissive, and we are assured that the present Government of India have no intention of using them to expropriate foreign capital and so damage their international relations and credit in the world. I must state in all fairness that in our past experience they have always been as good as their word, but Governments change, and this wide power and the removal of the protection of the Courts are now written into the Constitution. For those like ourselves, who are already established in India, the proof of the pudding must be in the eating.

TANKERS

The Fleet has operated satisfactorily and without accident during the year. Our three new vessels have fully realised expectations and have been able to meet all demands made upon them. On two voyages no less than seven different grades of bulk oil as well as packed cargo were carried.

For the first time since they were built, the Special Surveys of ss *Badarpur* and *my Yenangyaung* were carried out in UK instead of in India, when the opportunity was taken to increase the capacity of the latter to the size of our new ships. Both vessels returned to the East in March, 1954, and continue to give excellent service.

LABOUR

In the field of industrial relations I am glad to say that there was no serious interruption of the Group's operations in any area.

Our relations with Trades Unions have been satisfactory. Too often, however, the opinion is expressed in Trade Union and other quarters that an Oil Company has an unlimited "capacity to pay." This is far from true and our mounting costs in clerical and labour salaries and wages are a source of some anxiety. Coupled with this is the desire of Governments, understandably in the light of national under-employment, to press for employment of the greatest possible numbers, a policy which can only militate against the ability to pay more in return for a higher overall output per man.

PERSONNEL

It is once more a pleasure to record the Board's appreciation of the loyal and efficient services throughout the past year of the Group's personnel, both at home and overseas.

ASSOCIATED FISHERIES

At the Annual General Meeting the Chairman, Mr W. A. Bennett, said that an increased demand for fish, due to improved quality, shorter trips and beneficial weather conditions as well as the progressive modernisation of the fishing fleet and careful management yielded improved trading results for the year to September 30, 1954.

The price of Distant Water Fish had only increased by 6 per cent since 1951, while other food prices had risen by 18 per cent since 1952 and 34 per cent in the three preceding years. The revised price structure of meat and bacon brought about by decontrol had materially assisted as for years the fish trade had faced an uneven struggle with these two heavily subsidised food products. Last year food subsidies cost the country £334 million—fish caught by the Distant Water fleet cost the country nothing.

Group sales of fish for the year increased by £1 million to over £7 million, but the profit remaining out of every £1 of income received was 1s 0¼d., of which taxation absorbed 6¼d., dividends a further 3¼d., leaving 2¼d. retained to assist in meeting increased replacement cost of assets.

British shipbuilders and employees must consider methods of meeting growing competition from Germany, with whom the company has reluctantly placed contracts for two modern trawlers at fixed price with 13 months' delivery against three years' delivery at a higher price plus wage increases (since materialised) in Britain.

The company believes that public demand for fish will be maintained so long as the right quality is made available at the right price. Fish is still the cheapest food money can buy.

KILLINGHALL TIN

A DIVIDEND OF 20 PER CENT

The annual general meeting of Killinghall Tin Limited was held in London on May 26th, Mr Jack Addinsell, the Chairman, presiding.

The following is an extract from his circulated statement:

The results for the financial year show a satisfactory improvement on those for the previous year, the output from the dredge being 595 tons of tin ore compared with 286 tons. After crediting interest and sundry receipts and charging head office expenses, depreciation, etc., the profit before tax amounted to £97,277.

Since the resumption of trading after the war the most conservative basis has been adopted in estimating tax liabilities arising upon the company's profits and War Damage Compensation. A more favourable settlement has been agreed with the Inland Revenue and in consequence the substantial sum of £60,836 has been released from the tax provision. Of this sum, £18,620 has been applied in writing off the balance of the expenditure on Rehabilitation and Reconstruction.

After bringing in the balance from the previous year, and the over-provision of tax, and charging £59,400 for tax on the year's profits, there remains a balance of £101,742. Your directors recommend a dividend of 20 per cent, requiring £17,250 net, and we have transferred to General Reserve £55,000, leaving £29,492 to be carried forward to the current financial year.

The dredge continues to operate in ground of variable tin ore content, but test bores in the remaining area within the present sub-leases indicate the occurrence, in places, of payable values of tin ore below the present maximum digging depth of the dredge, and we are now investigating possible methods of recovery, which may entail some modification to the dredge. This factor, together with the General Managers' constantly reiterated warnings that the ore recovery from this mine will always be of a most uneven nature, has made prudent the substantial appropriation to General Reserve.

A further area of the rubber estate is now being prospected and, provided closer boring confirms the values indicated by initial bores, may provide additional employment for the dredge in due course.

For the first six months of the current financial year the output of tin ore, which has varied considerably from month to month, totalled 233 tons and you will note that the General Managers anticipate a satisfactory overall rate of production, although considerable variations in outputs are to be expected.

The report was adopted

TAYLOR WOODROW LIMITED

ANOTHER YEAR OF STEADY PROGRESS

The annual general meeting of Taylor Woodrow Limited was held on May 27th in London, Mr Francis Taylor (chairman and managing director) presiding.

The following is an extract from his circulated review:

I am pleased to be able to report that our company continues to make steady progress.

You will notice on the profit and loss account the outside shareholders' interest amounts to £35,868 which leaves a net figure of £130,349 for Taylor Woodrow Limited.

An interim dividend of 4½d. per share, less tax, has already been declared and paid on the ordinary share capital and a final 7½d. per share, less tax, is recommended, making 1s. per share, less tax, for the year.

At an extraordinary general meeting, a resolution will be submitted dealing with the capitalisation of reserves, in which the directors recommend the issue to shareholders of one ordinary share for every share held.

It is unwise to prophesy, but the directors will endeavour to maintain the same total dividend as that which will be distributed in respect of the financial year ended December 31, 1954, which on the doubled issued ordinary capital would represent a dividend of 6d. per share (less tax) in the current year.

AT HOME

Notable progress has been maintained by our construction company, despite a year of unfavourable weather and increasingly competitive conditions.

Our road surfacing subsidiary has expanded its activities in keen anticipation of the part which it hopes to play in the impending road construction and improvement programme.

Our woodworking company continues to make good progress.

Housing.—During the year our house building company has made another major contribution to the country's housing programme by the execution of contracts for local authorities, and by sales to owner occupiers.

The relaxation of licensing in this latter market is a great encouragement for the free enterprise methods which I have for so long advocated, and we hope thereby to increase our sales considerably during the current year.

The virtues of owner occupation of houses, its advantage to the individual and the State, have long been advocated in the highest circles; we are happy to think that we are playing no mean part in making a valuable contribution to the welfare of our fellow men.

Building Exports.—Substantial expenditure on research, design, experimental prototypes, and a world marketing organisation, has enabled us to retain a leading position for Arcon structures at home and abroad. We anticipate continued good business during 1955.

Ballast Pits.—Our ballast company is extending its activities. The quality of its product is first class and enjoys a wide acceptance.

The Chairman then reviewed the company's widespread overseas interests and the statement continues:

I cannot speak too highly of the loyal support and service given by the executive directors, officers, and staff, in whatever part of the globe they are playing their part.

The report was adopted and the board's capitalisation and scrip issue proposals were sanctioned.

PROVINCIAL INSURANCE COMPANY LIMITED

STATEMENT BY THE CHAIRMAN

The Annual General Meeting of the Provincial Insurance Company Limited will be held at the Head Office in Kendal on June 8, 1955, at noon.

The following are extracts from the Chairman's statement.

Before speaking of the actual underwriting profits, I think it is worthy of note that the net premium income of the Company has passed the £5 million mark. The underwriting results of the year in point of actual profit are the second best in the history of the Company.

Once again the Fire department showed up well with a commendable increase in income and a very satisfactory profit of £146,435. The results in the home field in particular are a cause for congratulation. The Accident account is largely dominated by the Motor figures, and the usual complaint still remains that adequate rates for Employers Liability business seem very little nearer realisation. In the Marine account a slight increase in premium income was due, not to any relaxation of the policy of deliberate restraint to which I have referred on previous occasions, but to certain changes in our reinsurance arrangements. In spite of the very guarded view we must take of underwriting profits in the future, the composition of our Marine reserve has justified us in transferring £50,000 from profits earned prior to 1951.

There are a number of points in the Profit and Loss account on which I should like to make brief comment. After careful thought we have decided to show the taxation charge as a total figure. It will be noted that the gross interest, dividends and rents have increased by the remarkable figure of £110,000.

On the receipts side, a transfer of £200,000 has been made from undisclosed reserves no longer considered necessary, to be used for capital purposes referred to later. The increased dividend of 2s. 6d. per share, against 2s. last year, is a reflection of the fuller investment policy pursued and the rise in interest and dividend income.

Finally there is a transfer of £500,000 to a special Capital reserve. Within the next few months, with the consent already received of the Capital Issues Committee, it is proposed to hold General Meetings at which the shareholders will be asked to approve the increase of the Ordinary capital by £500,000 by the capitalisation of the special Capital reserve referred to above and the issue to the Ordinary shareholders of 2 million shares of 5s. each, credited as fully paid. The strength of the Company is in no way impaired, and as capital is non-distributable, it has even greater security for the policyholders. The actual amount of dividend distributed to the equity holder is not affected and can only increase with the growth in invested earnings of the Company.

CONSOLIDATED BALANCE SHEET

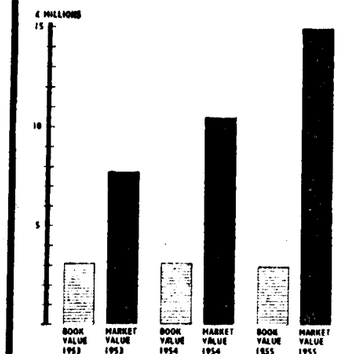
I come now to the Consolidated Balance Sheet. Under "Investments," the rise in the book value of our investments reflects the fuller investment policy to which I have alluded previously. The reserve allocation of £500,000 has already been dealt with and I do not think there are any items which call for comment, other than the passing of yet another landmark, the attainment of a total assets figure of £10 million.

STRONG FINANCIAL POSITION OF THE DAILY MIRROR COMPANY

The Thirty-Fifth Annual General Meeting of The Daily Mirror Newspapers Ltd. was held on May 27, at Brettenham House, Lancaster Place, London, W.C.2. Mr. Cecil H. King, Chairman and Managing Director, said:—

Cecil H. King discusses newspapers, television, advertising, newsprint

In the year which ended on February 28th, the trading profit of your company decreased, while the dividend income increased. The taxation provisions were smaller, and the net profit showed an increase of £168,687.



The drop in the trading profit was caused mainly by higher wage costs and by higher freight charges. The price of newsprint moved up in January, and together these factors made the level of trading profit considerably lower at the end of the year than it was at the beginning.

INCREASED VALUE OF INVESTMENTS

The balance sheet indicates, even more than usual, a strong position. In particular it is significant that your company's quoted investments and interest in the subsidiary company, having a book value of £2,925,236, increased in stock market value from £10,443,203 to £14,946,037. The latter figure was equivalent to 26/8d. per unit of your company's equity.

The capital reserve in respect of excess profits tax post-war refund was applied in writing down the book value of the unquoted trade investments. The value of machinery and plant increased due to completion of the installations at our Stamford Street establishment. Under the heading of current assets, paper stocks stood this year at a lower figure than last, but debtors stood at a higher figure due in part to payments on account of newsprint to be delivered.

£14,946,037 MARKET VALUE OF INVESTMENTS

This diagram compares the book value and the stock market value of the Daily Mirror company's quoted trade investments and quoted interest in the Anglo-Canadian Pulp and Paper Mills subsidiary. At the end of the last financial year, the total book value amounted to £2,925,236 and the total stock market value was five times larger at £14,946,037. The latter figure was equivalent to 26/8d. per unit of the company's equity.

CONTINUED EXPANSION OF SALES

The sales of the Daily Mirror continued to climb. The average sale for the second half of 1954 was 4,753,415. This represented an increase of 145,000 in a year, for the third year running a larger gain than that of any other national daily newspaper. The Daily Mirror's circulation lead over its nearest competitor, the Daily Express, increased from 358,000 in the second half of 1952 to 656,000 in the second half of 1954.

During the past year Mr. Hugh Cudlipp, the Editorial Director of the group, was appointed a member of your board. We unfortunately lost the services of Mr. G. S. Bull, our Production Director, whose health caused him to retire. His place as a Director was taken by Mr. E. M. Gray.

TREND OF TOTAL SALES

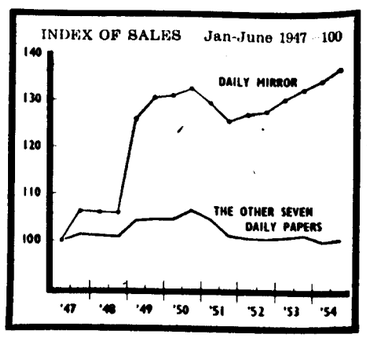
This may be thought an opportune time to survey the recent situation of the national newspapers which, since 1939, have enjoyed an unprecedented expansion in sales. The expansion reached its peak in the second half of 1950, when eight national daily newspapers had a combined sale of 16.8 million, and eleven national Sunday newspapers had a combined sale of 30.7 million. Price increases in May 1951 pushed the sales back, but that recession was followed by a slow recovery, so that in the second half of 1954 the daily sales reached 16.2 million and the Sunday sales 30.4 million.

By comparison with the peak half-year before the recession, Daily Mirror sales for July-December 1954 increased by 134,000 while the combined sales of the other seven dailies decreased by 712,000, and Sunday Pictorial sales increased by 379,000 while the combined sales of the other ten Sunday papers decreased by 655,000. In fact, both the Daily Mirror and Sunday Pictorial put the effects of the recession behind them, while most other national newspapers failed to do so.

This year there has been the strike which stopped publication for 26 days, and subsequently newspapers have been able to have more pages because newsprint was accumulated during the stoppage. Although these factors have caused some slight diminution of sales, their long-term effect cannot yet be judged. But with the expansion of television and continuance of larger newspapers, it would not be surprising if the tide receded again.

NEED FOR DIVERSIFIED NATIONAL PRESS

It is likely that in the months to come competition will intensify, and it is likely that the result of this competition will be to make the strong newspapers stronger and the weak ones weaker. Not all the long-established Sunday newspapers may survive, but some reduction in their numbers would do no harm. There are also some weak sisters among the dailies, but a reduction of the number of London dailies below the present figure would in my opinion be regrettable on all grounds—a vigorous and diversified press is a necessary part of a democratic state and, if the number of national daily newspapers were to fall, the survivors might well become too powerful to remain unmolested.



Since 1920 the number of national morning papers has fallen by two, the number of national Sunday papers by two, and the number of London evening papers by three. There have also been many casualties among the provincial newspapers. As I have said, not all the Sundays may survive, but any further reductions in the number of national daily newspapers should be resisted by all concerned.

INFLUENCE OF TELEVISION ON PRESS

The growth of television will certainly affect to some extent the character of the contents of newspapers. Though some newspapers do not yet seem aware of the fact, the advent of radio altered the character of newspapers from that of purveyors of news towards that of daily magazines. The impact of television will be greater than that of radio and may well have an important influence on the newspaper of the future.

We had hoped to take part in the development of commercial television in this country, but the Television Act seemed to us impossibly restrictive and

INDEX OF SALES Jan-June 1947 100

probably unworkable. The Act had in any case been evolved by people who had apparently not given this complicated subject any serious study, and had shown far more concern to placate some old blimps in the House of Lords than to produce a workable scheme. However, our interest remains and only time will show whether we missed the boat or whether a more favourable opportunity for participation may come in the future.

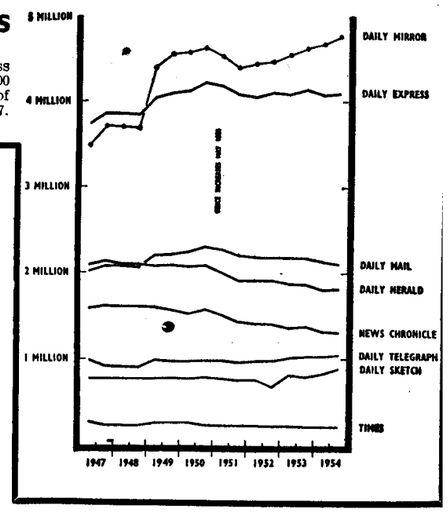
EXPENDITURE ON DISPLAY ADVERTISING

The two main sources of newspaper revenue are sales and advertising. Expenditure on display advertising regained its pre-war level in 1949, and has since doubled. Its distribution is rather different owing to the big development in national magazines, particularly the women's ones. Before the war, magazine advertising was supplementary to newspaper advertising, but this is no longer entirely so. It is said in some quarters that the rise of the magazines has been due to the fact that newspapers have their newsprint rationed while magazine paper is uncontrolled. No doubt this has had some bearing on the situation, but experience in America suggested for a number of years that there was great scope for well-printed magazines for women.

With more newsprint becoming available, newspapers can accommodate more of the advertising offered to them, and this will tend to hit the weaker magazines and the weaker newspapers. Commercial television will operate in the same direction, and here again it is likely that the strong will become stronger and the weak weaker.

EFFECT OF HIGHER WAGES ON PROFITS

An important factor affecting the finances of all newspapers is that of wages. Workers in the newspaper industry are, I am proud to say, among the most highly paid in this country. The new wage offers made earlier this year, which were the basis of resumed working after the strike pending further negotiations, seriously affected the profitability of all national newspapers. It is right that newspaper workers, whose hours are long and mostly at night, should be generously paid, but in these days wages must have some relation to productivity, or some of the geese that lay the golden eggs will be squeezed out of existence.



THE FREEDOM OF THE PRESS

In the last year we have seen some feeble and quite misguided efforts to restrict the Freedom of the Press. Someone wants to restrict the publication of wills: someone else wants newspapers to be prevented from enquiring about medical cases of general public interest: others again want secrecy for the meetings of public authorities. I suppose this is all harmless nonsense—we are bound to have with us, until human nature changes, the idea that all sorts of matters of interest and importance should only be discussed in a narrow circle mostly of self-important, self-appointed busybodies and that newspapers only exist to report the speeches of such people and their friends. However, we shall continue to give the news that interests and the news that ought to interest our readers, in spite of all efforts at suppression from whatever quarter they may come.

Daily Mirror increases its lead over the Daily Express

The Daily Mirror's circulation lead over the Daily Express increased from 358,000 in the second half of 1952 to 656,000 in the second half of 1954. This graph shows the trend of six-monthly average sales of daily newspapers since 1947.

AVERAGE DAILY SALES PER SIX MONTHS

RESTRICTED SUPPLIES OF NEWSPRINT

The essential raw material of the newspaper is newsprint, and one of the difficulties of our industry has been to secure an adequate supply. At one time the supplies for Fleet Street came mainly from Scandinavia and from British mills whose pulp was drawn from Scandinavia. But this pattern has changed. Production of pulp and paper in Norway and Sweden is limited to some extent by the annual re-growths of their forests. Finland is enlarging her output but may not wish to become over-dependent on the British market. And the only other major source of supply is Canada. In the year before the war, Britain consumed 1,195,000 tons of newsprint, of which 750,000 tons came from home mills, 120,000 tons from Scandinavia and 325,000 tons from Canada. This year we expect to have 936,000 tons, including 480,000 tons from home mills, 150,000 tons from Scandinavia and 300,000 tons from Canada. But if we ever could get back to our pre-war consumption, the additional paper or pulp would have to come mainly from Canada.

It is well known that an increasing standard of living involves a greatly increased consumption of paper of all kinds, and it is unfortunate that paper and pulp are to be had in large additional quantities only from dollar sources. Last year, due to newsprint rationing, UK newsprint consumption was about two-thirds of pre-war, while consumption of other types of paper normally used for printing exceeded pre-war.

Our relations with the Canadian manufacturers have always been of the happiest, but as long as the difficulties of the 'dollar gap' remain, so long will uncertainty hang over the supply of our vital raw material. I am not suggesting that there is really anything we can do about it; it is merely an awkward fact that must be borne in mind.

IMPORTANT INTERESTS IN PAPER INDUSTRY

Your company, as you know, has important interests in the paper industry, which is prospering. In Quebec the Anglo-Canadian Pulp and Paper Mills Ltd. had a consolidated net profit after taxation of $4,668,000 for the year to December 1954. That was the second year in succession when the net profit increased by more than $1,000,000. The Anglo-Canadian company's recently acquired subsidiary, the Dryden Paper company in Ontario, increased its output, and last December sold $14,000,000 worth of debentures to redeem outstanding bonds and debentures and to finance part of a proposed $11,600,000 expansion programme. The right to use an additional 3,800 square miles of timber land was acquired in preparation for this expansion.

At home, the Albert E. Reed company, in which your company has an important interest, has announced that it will be paying what amounts to an increased dividend on its recently enlarged capital.

INCURSIONS INTO NEW PUBLISHING FIELDS

Your company's other investments are mainly publishing ones, notably that in the Sunday Pictorial company which has announced satisfactory results. There have been vigorous incursions into new publishing fields by companies in which both your company and the Sunday Pictorial company share interests. Reveille's additional mid-week edition has become an established success. Junior Mirror has gained a foothold in its very competitive field. Woman's Sunday Mirror, launched in January, brought an entirely fresh and original element into the Sunday newspaper market, where, despite the interruption of the strike, it has made a promising start.

Sales of the Argus daily newspaper in Victoria have been showing a lively improvement. The Australian commercial radio stations in which you are interested have been increasingly successful, and your company has a small indirect interest in two of the first four companies to be granted commercial television licences in Australia. In West Africa all five of the newspapers which concern you have been going ahead well.

PROSPECTS OF THE CURRENT YEAR

The current financial year of your company started with the set-back of the strike, the influence of which on this year's trading profit will be considerable. Higher wages affected only part of last year's trading; they affect the whole of this year's. The future is not without uncertainties, but your company, which has flourishing investments and considerable reserves, is very strongly placed to meet whatever the future holds.

Before I close, I would like to pay well-deserved tribute to the staffs, both at home and abroad, whose work was the foundation of an eventful year.

The report and accounts were adopted.

THE BUTTERLEY COMPANY, LIMITED

CAUSES OF REDUCTION IN GROUP'S INCOME

MR E. FITZWALTER WRIGHT'S SPEECH

The sixty-eighth Annual General Meeting of The Butterley Company, Limited, was held at the Registered Office of the Company, Butterley Hall, Ripley, near Derby, on Friday, May 27, 1955.

Mr E. Fitzwalter Wright (Chairman of the Board of Directors) presided.

The Secretary (Mr P. Elliott) read the notice convening the Meeting, and the report of the Auditors.

The Chairman said: Ladies and Gentlemen,—I have to record with deep regret the death of Mr A. P. Coote, which occurred in October, 1954. Mr Coote had been ill for many months, and for him death must have been a welcome release. He had given thirty-two years of loyal service to the Company in a variety of posts, and joined the Board in 1938 We shall all miss him much

Since our last meeting Mr R. W. F Wilberforce, a partner in the firm of Messrs Travers Smith, Braithwaite & Company, has accepted an invitation to join the Board and you will be asked to confirm his appointment. I am sure his advice and experience will prove of great value to us

SALE OF KELVIN CONSTRUCTION HOLDING

In comparing the results of the Group in 1953 and 1954 as set out in the Accounts, the most important point to bear in mind is that the figures are not strictly comparable. This is because the 1953 figures include the results of the Kelvin Construction Company, at that time one of our Subsidiaries, whereas the 1954 figures do not, as our holding in the Kelvin Construction Company was sold in September, 1954. An announcement of the sale was made in the press at the time.

Our interest in the Kelvin Construction Company was acquired in 1947. Since that time its record has been one of rapid expansion and increase in profitability. An opportunity arose of disposing of our interest at a price which secured for us a very substantial capital profit, and your Board felt it prudent to take advantage of it. The capital profit of just over £200,000 has been placed to Capital Reserve. As a result of the sale, the Group's trading profit is deprived of the contribution which the Kelvin Construction Company would have made, a contribution which amounted to about £100,000 before taxation in 1953.

END OF COAL NATIONALISATION PAYMENTS

A further reason for the reduction in the Group's income is the ending of interim income payments under the Coal Industry Nationalisation Act now that we have received the whole of the compensation due to us for our collieries, etc.

These two items then, the sale of the Kelvin Construction Company and the cessation of interim income payments, just about account for the drop in the Group's income from £556,704 to £400,884. It must be our task to see that the cash now freed from investment in the Kelvin Construction Company is put to other fruitful uses so that the reduction in income may be made up. I see no reason why we should not perform this task successfully.

Other changes in the Accounts before you to which I should make reference are:

(1) The reduction in the issued ordinary capital to £225,000 as a result of the repayment to shareholders in May last year of 7s. 6d. per share.

(2) The appearance of a figure of £110,540 in our Capital Reserve. This represents assets found to be in excess of liabilities when the affairs of our Colliery Workmen's Compensation Trust were wound up. We are advised that this is a capital receipt not liable to tax.

PROFIT AND ALLOCATIONS

Turning to the consolidated profit and loss account, I have already referred to the reduction in income from £556,704 to £400,884. However, after making provision for tax and other charges and adding in the balance brought forward from the previous Accounts, the amount available for appropriation is only reduced from £288,868 to £263,462.

Your Directors have decided not to recommend a final dividend, but instead to make a capital distribution of 8d. per share, absorbing £60,000, from our Capital Reserves. This is approximately the same net amount as the final dividend last year, and is not of course subject to income tax or surtax. Shareholders therefore who have not attained to the surtax bracket are left with the same net income from their investment as before, while shareholders who are surtax payers enjoy a welcome relief. At the same time the Board recommends that a total of £60,000 should be transferred to General Reserve in the Group's Accounts. As at present advised, it will be our policy to make capital distributions of this nature year by year until the Capital Reserve is exhausted, at the same time making transfers of equal amounts from our trading profits to General Reserve. In assessing the amount of the capital distribution to be recommended each year, your Directors will have regard to the trading profits of the year in question, and although it is impossible to prophesy with certainty, I see no reason to expect that the total net distributions from the Company in the immediate future will be any less than they have been in the recent past.

A DIFFICULT ENGINEERING YEAR

To the ordinary person the year 1954 may not in retrospect have very much to distinguish it from other years. To those engaged in the Civil Engineering and General Contracting industry, to whom the weather is just as important as to the farmer, it will long be remembered as the worst in living memory. In the months of May to August inclusive the rainfall in the Midlands was over 3½ inches more than in the previous year, and was higher than in the average winter period. As a result, although we started the year with considerably more work on hand than in the previous year, the actual work done in 1954 was about 20 per cent less than in 1953. Small wonder, therefore, that profits in this Department were less than half what they were in 1953. It is to my mind a considerable achievement to have made any profit at all. We can reasonably expect, I think, that this year's weather will be better than last year's, and with over £3 million worth of work on hand we may hope for very much better results from this Department.

IRONWORKS' RECORD SALES

The Ironworks Departments had a very good year indeed, considerably better than in 1953. In the Foundry, although the rate of profit was down, turnover continued to rise, as it did in all the other Ironworks Departments except the Forge. In the Wagonworks particularly, sales reached a new high record of well over a million pounds, a remarkable achievement from a works where only a few years ago sales were less than half that figure. In the Constructional Department we have decided to build a new erection bay for overhead electric cranes. We are particularly gratified that our customers continue to favour our cranes, which are built to a most exacting specification, and are therefore by no means always the cheapest offered. We are very busy indeed in the Oxygen Division. Shareholders will no doubt remember that we were successful in the Autumn in gaining an order from Messrs Stewarts & Lloyds Limited for a 250-ton-a-day plant for their Works at Corby. Progress on this project has been good, and we hope to start erection of the main compressor house this summer. Negotiations with other customers for even bigger plants are in progress, but naturally for plants of this size negotiations must of necessity be protracted Orders for the smaller plants continue to come in, and we have altogether now nearly £700,000 worth of orders for oxygen plant of all sorts on the books. This I think is most encouraging and worthy of congratulation to those who have built up this entirely new Department in so comparatively short a time.

BRICKWORKS EXCEPTIONALLY BUSY

Our Brickworks have remained exceptionally busy, and our output in 1954 of 44 million bricks is a record for our Company, and some 2 million bricks more than the target set for us by the Ministry of Works. More than 75 per cent of our output consists of high quality facing bricks, for which we are assured a keen demand will continue for many years to come. We have decided to put down a new kiln at Boughton, close to our Ollerton Works. Experiments on the brickearth there show that it will produce facing bricks very similar to and just as good as the bricks we are now producing at Blaby. We hope to be in production there in about March of next year.

SUBSIDIARY COMPANIES

Shareholders will have noted two new names in the list of Subsidiaries—T. Darnell & Sons, Limited, and First Inter-Town Properties Limited. T. Darnell & Sons, Limited, are a small firm of light constructional engineers situated in Nottingham, which has been acquired as an adjunct to our Civil Engineering Department. We believe it will prove a useful addition. First Inter-Town Properties Limited is a firm which held the remainder of a long lease of No. 9 Upper Belgrave Street, which we have converted into our London Office. We have been quite inadequately housed in London ever since our original offices in the city were destroyed by enemy action. The remainder of the lease we acquired from the purchase of First Inter-Town Properties Limited has been surrendered to the landlords, Grosvenor Estates Limited, and a new lease of 83 years has been negotiated with them. We now have a London Office of which I think we may well be proud, and with room for the expansion I am confident we shall need.

TRIBUTE TO EMPLOYEES

Taking it by and large I think we have come through a difficult year in 1954 with commendable steadiness. The hard work and loyalty of our employees in all grades made it possible for this to be done, and I offer them our best thanks on your behalf.

I now have pleasure in moving that the Directors' Report and Balance Sheet which carries with it the following recommendations of the Directors:

(a) that the sum of £10,940, Capital surplus from investment, be transferred to Capital Reserve;

(b) that the sum of £30,000 be transferred to General Reserve;

(c) that a capital distribution be made to the Ordinary Shareholders at the rate of 8d. per share, absorbing £60,000, out of the capital profit realised on the sale of a Subsidiary;

(d) that the balance on profit and loss account of £331,593 be carried forward, be received, approved and adopted. After it has been seconded, any Shareholder can ask any questions before the motion is put.

The Report and Accounts were adopted; the retiring Directors, Mr M. F. M. Wright, Mr P. N. Wright, and Mr R. W. F. Wilberforce, were re-elected; the Auditors, Messrs Price, Waterhouse & Company, were reappointed, and the proceedings terminated with a vote of thanks to the Chairman.

THE BURY FELT MANUFACTURING COMPANY

INCREASED TURNOVER

EFFORT TO MEET PROGRESSIVE RISE IN COSTS

LT. COL. A. BUCKLEY ON HIGHLY COMPETITIVE SELLING PRICES

The fiftieth annual general meeting of The Bury Felt Manufacturing Company Limited was held on June 2nd in Manchester, Lieutenant Colonel A. Buckley, CBE, DSO, JP (the chairman), presiding.

The following is his circulated statement:

Shareholders will observe from the accompanying notice of the Annual General Meeting that the accounts now laid before them are in respect of the fiftieth year of the Company's trading.

The group trading profit for the year ended December 31, 1954, is £296,547. After crediting investment income and charging Directors' and Auditors' remuneration and providing for depreciation and development and taxation, the net profit is £126,802 compared with £116,623 for 1953.

Adding the profit on realisation of investments £7,955 and the net profit to the balance brought forward from last year, there is an available figure of £300,029. Your Directors recommend that £50,000 be again transferred to General Reserve, the profit on investments be carried to the appropriate reserve account (which now shows an aggregate surplus of £22,066) and that a dividend of 1s. 9d. per share, together with a bonus of 3d. per share, less income tax at 8s. 6d. in the £, be paid on the Ordinary Shares in respect of the year ended December 31, 1954, against 1s. 9d. per share for the preceding year. After these appropriations and deduction of the Preference dividends which have already been paid, £182,512 remains to carry forward to next year.

REVENUE RESERVES AND SURPLUS

Revenue Reserves and surplus on Profit and Loss Account now amount to £727,078 apart from the provision for future taxation of £115,084. Investments, Tax Reserve Certificates and Cash total £675,075.

During 1954 the subsidiary companies have continued on a profitable basis and a dividend has been received from one of them equivalent to last year's payment. The manufacturing subsidiary continues to be efficiently managed and its buildings and productive capacity have been increased.

The present time may be opportune to refer to the value of the Company's fixed assets which appear in the consolidated Balance Sheet at £286,603 against which there now exists a depreciation and development reserve of £140,000. To arrive at an accurate present-day value of these assets is a difficult problem but it may be mentioned that for fire insurance purposes the buildings, plant and machinery of the group have recently been valued on a depreciated basis at a figure well in excess of £1 million and on a replacement basis at a much higher figure.

CONTINUED ADVANCE OF MANUFACTURING COSTS

Turnover during the year, both in value and volume, has increased satisfactorily. Profits have not proportionately increased owing to the continued advance in manufacturing costs to which reference has been made in previous reports. Selling prices in both the home and overseas markets have continued to be highly competitive and the full recovery of rising costs under such circumstances has been impracticable. Unless the progressive increase in costs in Britain can be arrested the outlook for industry generally must give cause for concern. In an effort to meet this situation, your Directors are in course of transferring and redeploying a substantial portion of the plant and machinery of the parent company into new buildings, some erected during recent years with this object in view and others now under construction. No benefit can be expected during 1955 from this operation but it is anticipated that it will be possible to carry out the alterations without undue interference with normal production. The total cost of the project is envisaged as being well within the amount of the Depreciation and Development reserve of £140,000, some of which may be utilised towards this development.

DIRECTORATE

During the current year Mr Clifford Snape and Mr Graham Buckley have been co-opted to the Board. Mr Snape has been with the Company for almost twenty-two years and Secretary since June, 1948. Mr Buckley is responsible for the engineering and maintenance departments.

Your Directors again take this opportunity of placing on record their appreciation of the services of the staff and employees of your Company during the year.

The report and accounts were adopted.

POWER SECURITIES CORPORATION, LIMITED

WELCOME INCREASE IN PROFITS

The thirty-second annual general meeting of Power Securities Corporation, Limited, will be held on June 22nd in London.

The following are extracts from the circulated statement by the chairman and managing director, Sir Andrew M. MacTaggart:

The accounts under review show a welcome increase in profits which I trust you will regard as satisfactory. The consolidated net profit at £270,524 shows an increase of £120,854 over that of the previous year.

Balfour, Beatty and Company, Limited, is our chief subsidiary and continues to maintain an ever-increasing volume of work, both at home and abroad. Progress on the Staythorpe and Carmarthen Bay Power Stations which we are constructing for the Central Electricity Authority continues satisfactorily. During the year we erected a total of approximately 800 miles of high tension transmission lines, and we still have in hand the erection of some 2,000 miles of transmission lines for that Authority and the North of Scotland Hydro-Electric Board. In addition we have carried through a considerable number of other contracts, including tunnelling for railway, sewerage and water undertakings, together with a substantial amount of miscellaneous works. Overseas we continue to handle a large volume of work.

Tersons Limited, our building subsidiary, had a successful year, and continues to expand. The organisation is efficient and well equipped to carry out all types of building contracts. During 1954 a block of flats built by Tersons for the London County Council was awarded the gold medal presented annually by the Royal Institute of British Architects for the best building of the year.

Stent Precast Concrete Limited.—During the year a considerable amount of development work was carried out for special products, and there is plenty of business in hand. The company, however, is operating in a highly competitive market.

Metropolitan Construction Company Limited had a satisfactory year and has an increased volume of work in hand. This company is also equipped for, and is carrying out, a substantial amount of demolition work, and recently successfully completed an intricate under-water demolition contract at Tilbury Docks.

In Canada, *Balfour, Beatty and Company (Canada) Limited* have completed their first year of operation, which has been chiefly devoted to investigating various projects with a view to collaborating with our Canadian associates in future developments. A certain amount of work was carried out successfully during the year, but it is too early to venture any further opinion than the one that I expressed last year of confidence in the future.

During the past three years we have been living more or less hopefully and striving with others to help shape things towards a more stable future, and the results achieved, I think, can be considered satisfactory. Now we have a newly elected Government with an avowed policy of expansion and liberation of effort we look forward to the future with confidence.

Your Board of Directors, after viewing the position of the various companies in which this Corporation is interested, have again felt justified in recommending an increase in the dividend on the Ordinary Share Capital of 1 per cent, making 9 per cent for the year.

Sunday Pictorial company's year of enterprise and expansion

The Thirty-Fifth Annual General Meeting of Sunday Pictorial Newspapers (1920) Ltd. was held on May 27, at Brettenham House, Lancaster Place, London, W.C.2. Mr. Cecil H. King, Chairman and Managing Director, said :—

The year which ended on 28 February was in many ways a good one, but your company did not escape the effect of economic factors which influenced the trading of all national newspapers—in particular increased wages from November onwards, and higher freight charges. The higher wage costs considerably reduced the margin of trading profit, and this effect was only partially offset by a small increase in the Sunday Pictorial's advertisement rate in January.

The trading profit, which was arrived at after charging a pension fund contribution of £56,682, decreased by £145,106. This was largely counter-balanced by an increase of £122,546 in the dividend income, which at £467,773 accounted for over half of your company's total profit of £867,457. The net profit after taxation, no provision for excess profits levy being required this year, showed an increase of £44,863 to £436,467.

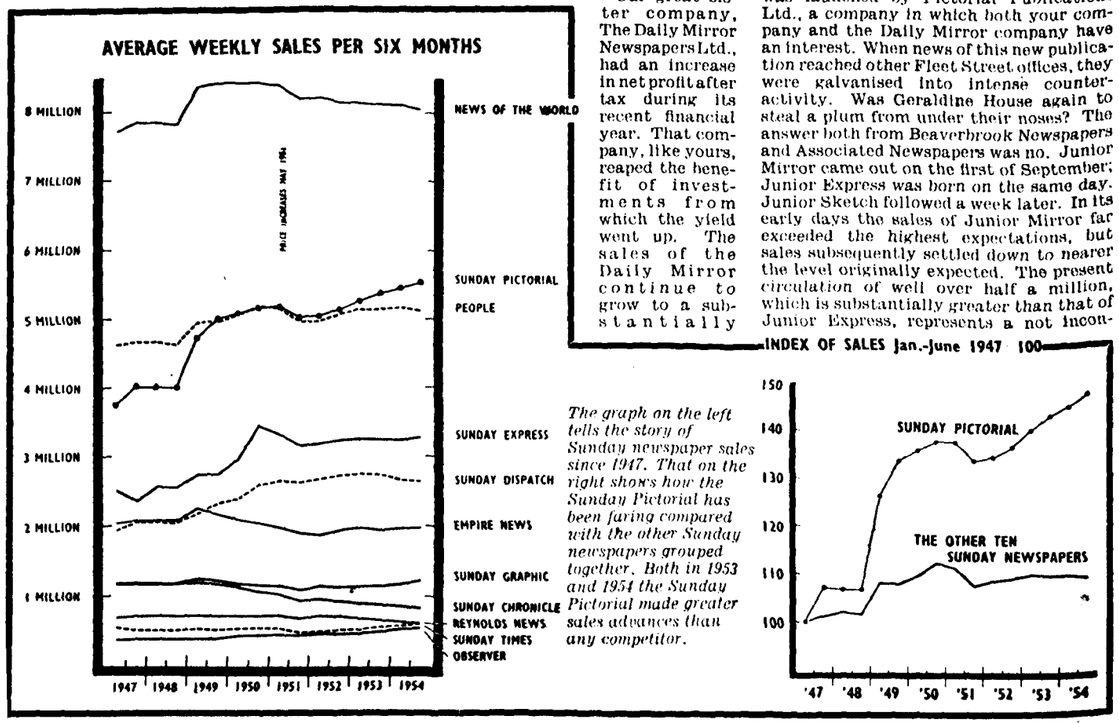
The increase in dividend income reflects the health and breadth of your company's investments. Those quoted had a book value of £2,838,618 and a stock market value of £8,750,154, equivalent to 29 2d. per unit of your company's ordinary stock.

Of the capital reserves, the whole of the reserve of £65,469 in respect of excess profits tax post-war refund, and £134,530 of the reserve of £238,082 in respect of surplus on sale of investments, were applied to write down certain trade investments that have no stock market quotation. The balance of £103,552 in respect of surplus on sale of investments was transferred to the investment reserve.

SUNDAY PICTORIAL OUTSTRIPS COMPETITORS

The sales of the Sunday Pictorial continued to expand, and for the latter half of 1954 exceeded five and a half million copies weekly. Compared with the sale for the latter half of the preceding year, the Sunday Pictorial had an increase of 171,000 —three of its competitors in the popular Sunday newspaper field also had increases, the largest of which amounted to 66,000—and its other five competitors suffered some decline in sale. This was the second year in succession in which the Sunday Pictorial made much greater progress than any of its competitors. During the two years the Sunday Pictorial increased its lead over the People by about 375,000, and narrowed the gap between its and the News of the World's sale by about 500,000.

Our great sister company, The Daily Mirror Newspapers Ltd., had an increase in net profit after tax during its recent financial year. That company, like yours, reaped the benefit of investments from which the yield went up. The sales of the Daily Mirror continue to grow to a substantially greater extent than those of any other daily newspaper.



THREE NEW NEWSPAPERS IN TWELVE MONTHS

There have been notable developments in the affairs of various other companies in which your company has interests. Three new newspapers were launched in Britain within a period of twelve months, each in the face of severe competition.

First there was Midweek Reveille, started in February 1954 as a companion to Weekend Reveille. At that time the market for weekly family newspapers, which had expanded hugely since 1947 when the Reveille company entered the field, was still not fully satisfied, and Weekend Mail, a somewhat belated imitator, was making progress. Midweek Reveille succeeded effectively in taking up the slack in the market, and indeed, as anticipated, caused the sales of both Weekend Reveille and Weekend Mail to decline temporarily to some extent. Recently Weekend Reveille's sale was about 3,200,000 and Midweek Reveille's sale was about 1,600,000, the latter being somewhat less than that of Weekend Mail. Midweek Reveille proved a profitable venture from the outset, and it has enhanced the value of your company's investment in the Reveille company.

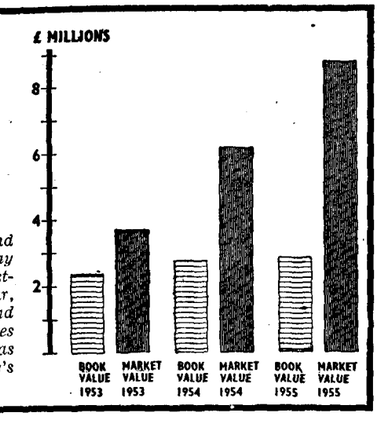
COMPETITIVE FIELD FOR JUNIOR MIRROR

Then, in September last, Junior Mirror was launched by Pictorial Publications Ltd., a company in which both your company and the Daily Mirror company have an interest. When news of this new publication reached other Fleet Street offices, they were galvanised into intense counter-activity. Was Geraldine House again to steal a plum from under their noses? The answer both from Beaverbrook Newspapers and Associated Newspapers was no. Junior Mirror came out on the first of September; Junior Express was born on the same day. Junior Sketch followed a week later. In its early days the sales of Junior Mirror far exceeded the highest expectations, but sales subsequently settled down to nearer the level originally expected. The present circulation of well over half a million, which is substantially greater than that of Junior Express, represents a not inconsiderable share of the comparatively small total market.

The graph on the left tells the story of Sunday newspaper sales since 1947. That on the right shows how the Sunday Pictorial has been faring compared with the other Sunday newspapers grouped together. Both in 1953 and 1954 the Sunday Pictorial made greater sales advances than any competitor.

SUNDAY NEWSPAPER EXCLUSIVELY FOR WOMEN

The third new newspaper in which your company has an interest is Woman's Sunday Mirror, of which the first issue appeared at the end of January. This was the most momentous of the new ventures, and may well turn out to be the most successful. It was, I believe, over 30 years since a new national Sunday newspaper had been launched in London, and the first time in history that a Sunday newspaper had been designed exclusively for women. In this case the launching was beset not by imitators but by distributional difficulties which temporarily starved some areas of copies, and later by the stoppage in the newspaper industry. In spite of these difficulties the reception of the paper, both by women and by advertisers, has been most encouraging, and the circulation exceeds the anticipated level of one million. It will be no surprise to you that the advent of Woman's Sunday Mirror spurred other publishers of Sunday newspapers into violent—and expensive—measures to retain their readers. How the pattern of Sunday sales will settle down has yet to be seen. Meanwhile, it may suffice if I tell you that the sales of your own company's newspaper, the Sunday Pictorial, continued to flourish.



INVESTMENTS IN PAPER-MAKING COMPANIES

Your company has, as you know, an important stake in Albert E. Reed & Co. Ltd., the parent company of the well-known Reed Paper Group, and news has been released at regular intervals of substantial developments in that company's activities. Last June it enlarged its paper-making resources by acquiring the shares of the Sun Paper Mill company. In July it acquired an interest in Colthrop Board and Paper Mills, thus widening its packaging interests and becoming associated with the building of a new board mill. In October came a one-third interest in Cellucotton Products, with plans for a new cellulose wadding converting factory. This was followed by the announcement of a £1,500,000 investment in Tasman Pulp and Paper, the big New Zealand newsprint undertaking. The Albert E. Reed company has increased its capital by a 50% free scrip issue, and the proposed final dividend of 12½% on the increased capital means that your company will receive a handsomely increased return from its investment.

Our second major paper-making interest is in the Anglo-Canadian Pulp and Paper Mills of Quebec. There the mills have continued to work to capacity and profits have increased.

Some 1,000 miles farther west in Central Ontario is the Dryden Paper company, of which the Anglo-Canadian company bought the shares about a year and a half ago. At Dryden the first stage of a development programme has been completed and a further $11,600,000 expansion scheme is proposed, all of which should result in Dryden's annual rate of production being more than doubled. The prospects as regards your company's Canadian investment look more than satisfactory.

Cecil H. King reviews world-wide interests

This diagram compares the book value and the stock market value of the Sunday Pictorial company's quoted trade investments. At the end of the last financial year, the book value amounted to £2,838,618 and the stock market value was three times larger at £8,750,154. The latter figure was equivalent to 29/2d. per unit of the company's ordinary stock.

INCREASED SALES OF MELBOURNE ARGUS

I will now turn to the affairs which interest you in Australia and West Africa. The news of your company's Australian publishing investment is considerably better than it has been in past years, although the position is not yet satisfactory. The main property, the Argus daily newspaper, is gaining ever wider public recognition as the most alert source of information and comment. Sales of the Argus have been well above the level of last year, when, on the basis of six-monthly average figures, the Argus had a larger percentage increase since 1949 than any other Australian metropolitan daily newspaper. Advertisers have noted the growing vitality of the newspaper, and advertisement space has been in good demand. The weekly magazine, Australasian Post, has made rapid strides forward and recently had a sale some three times greater than it did in 1949. The Argus company's three country radio stations, at which a rebuilding programme has been completed, are doing very well.

Last year Mr. R. F. Sanderson retired as Chairman of the Argus and Australasian Ltd., after guiding the company with great skill through a difficult period. He was succeeded by Mr. J. D. Patience, formerly Deputy Chairman, with whom we look forward confidently to continued improvement in that company's well-being.

RADIO INTERESTS IN AUSTRALIA

We have also, as you know, an indirect interest through our associated company Broadcasting Associates Pty. Ltd. in several commercial radio stations in Australia, most of them in New South Wales. The prosperity of these radio stations continued to increase. The most important of them, 2GB in Sydney, has for each of the last three years had a higher overall popularity rating than any of the other seven stations serving the city. Fifteen of the twenty-five most popular programmes in Australia were recently being broadcast by the Macquarie network, of which 2GB is the key station.

Commercial television is being introduced in Australia, and in April it was announced that, among the first four licences to be granted, there would be one for Amalgamated Television Services Pty. Ltd. in Sydney and one for General Television Corporation Pty. Ltd. in Melbourne. The extent of overseas investment in Australian television is, as anticipated, limited by the terms of the licences. But both of the companies I have mentioned are ones in which your company has a small indirect interest.

THRIVING NEWSPAPERS IN WEST AFRICA

Let us now look at West Africa, where your company and the Daily Mirror company share interests that are comparatively small in terms of capital, but which have been developing fast against a background of expanding trade and improving education. There are now four vigorous and prosperous newspapers—a daily and a Sunday newspaper in both Nigeria and the Gold Coast. In the last quarter of 1954, their net daily and weekly sales reached a combined average of 182,000, an increase of 44,000 over the previous year.

In Sierra Leone the up-and-coming Daily Mail has also been making steady progress, and its sale recently reached the 10,000 mark. New buildings are going up in Lagos and Accra. A branch office has been opened in Togoland, which now for the first time gets its daily newspaper on the day of publication. Process engraving plant has been installed in Sierra Leone, which can consequently for the first time enjoy the immediate publication of news pictures. The profitability of the Nigerian and Gold Coast undertakings has increased, and when recent developments in Sierra Leone bear fruit we expect there also to see a good return on our investment. While commercially the future of these West African undertakings seems assured, the political risks in such a rapidly changing part of the world are necessarily appreciable.

PROGRESS AT HOME AND OVERSEAS

I have given you a broad picture of the way your company's interests have been progressing both at home and overseas. The year was one of enterprise and expansion in many spheres. Trading profits of the current year will be affected both by non-production during the newspaper strike and by higher wages effective throughout the year. Nevertheless, the scene is one at which you may look with a fair measure of satisfaction and confidence in the future. It now remains only for me to express the company's appreciation and thanks to all the staffs at home and overseas whose services contributed towards the progress that was made.

The report and accounts were adopted.

HARLAND AND WOLFF, LIMITED

LAUNCHINGS AGAIN EXCEED 100,000 GROSS TONS

SERIOUS COMPETITION FROM CONTINENTAL YARDS

SIR FREDERICK E. REBBECK ON NEED FOR PERIOD OF WAGE STABILITY

The seventieth Annual General Meeting of Harland and Wolff, Limited was held on May 25th at the registered office of the Company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, Chairman and Managing Director, presided.

The Secretary, Mr F. V. Spark, CBE, ACA, read the Notice convening the meeting and the Report of the Auditors.

The Chairman said:

As the Statement of Accounts and the Directors' Report have already been in your hands for some time, I propose with your permission to take them as read. (Agreed.)

It will be seen from the Accounts that after charging £513,256 for Depreciation the Gross Profit of the group before taxation is £2,168,390, and notwithstanding the reduction in the standard rate of Income Tax to 8s. 6d. in the £ the Government takes approximately 50 per cent of the gross profits, as the sum of £1,068,824 is required for Income Tax and Profits Tax on dividends paid and profits retained in the business.

The consolidated net trading profit after depreciation and taxation is £1,099,566. During the year considerable progress has been made in finalising as far as possible our taxation liabilities over recent years and it became clear that our reserve for taxation raised over the past ten or twelve years was more than was required. We have, therefore, been able to transfer a sum of £88,200 back to Profit and Loss Account.

In addition the accounts are credited with a further sum of £12,000 arising on settlement of claims under War Damage Act Part II, and a transfer from Future Income Tax re Initial Allowances of £15,934.

These make the total amount available £1,215,700 out of which the Directors propose the same rate of dividend payment on the Ordinary Stock as for a number of years, together with a Special Bonus on the Ordinary Stock of 3 per cent as last year, both less Income Tax at 8s. 6d. in the £, and to add to the reserves and carry forward on Profit and Loss Account a sum of £829,084 in the accounts of the parent company and £50,170 in the accounts of the subsidiaries.

The consolidated total of reserves and undistributed profits now amounts to £6,418,782, which is very necessary for keeping up to date the equipment and financing the business of the Company.

LAUNCHINGS AND WORK IN HAND

For the fifteenth successive year the vessels launched from the Company's yards have exceeded 100,000 gross tons, the total for 1954 being over 154,000. During the year twenty-one vessels were delivered, the most notable being the Light Fleet Carrier *Bulwark* for Her Majesty's Navy and the Passenger Liner *Iberia* for the Peninsular & Oriental Steam Navigation Company. This is the second year in succession that we have delivered a Light Fleet Carrier.

At the present time the Company has 58 vessels under construction, or on order, including the Light Fleet Carrier *Bonaventure* for the Royal Canadian Navy and other Naval work consisting of Frigates and Coastal Minesweepers.

Merchant work includes two large Passenger Liners, the *Reina Del Mar* for the Pacific Steam Navigation Company and a Passenger Vessel for the Mail Service of the Union-Castle Mail Steamship Company, three cross-channel passenger vessels, several cargo and passenger/cargo vessels, large tankers for British and foreign owners, including two for The Texas Company, and a number of smaller tankers and other craft.

Her Majesty The Queen honoured the Shaw Savill & Albion Company Limited and ourselves by visiting the Company's Belfast Works in August and naming and launching the *Southern Cross*, which was delivered to her owners early in 1955 and is now on her maiden voyage.

DIVISIONAL OPERATIONS

The Marine Engineering Division has been fully employed throughout the year in the manufacture of Diesel and Steam machinery for ships building by the company and for a number of vessels being constructed by other Shipbuilders. Several sets of our new turbo-charged Diesel propelling engine have been ordered and will soon be in service.

The Land Engine Division is engaged in the manufacture of our standard 2-stroke and 4-stroke Diesel Engines, most of which are now pressure-charged, also Compressors driven by gas engines, Diesel engines and electric motors. Recent contracts include an important order for large Diesel engines for a Middle East pipe line project.

The Steel Construction Division has been fully employed and has secured some further large contracts which will keep it well occupied for some time to come.

The Electrical Division has also been well employed during the year on electrical systems on board ships, both Naval and Merchant, and in the manufacture of alternators, direct current dynamos, motors, and other electrical work for both the home and foreign markets.

The Repair Works at London, Liverpool and Southampton were well employed during the year and important repair contracts have also been carried out at Belfast. British Shiprepairers continue to feel the keen competition from the Continent, and they are at a considerable disadvantage due largely to the fact that the Continental repairers are comparatively free from demarcation rules and are able to work a three shift system and so carry out work in less time than in the United Kingdom.

Scotstoun Works, in association with The English Electric Company Limited, have been engaged throughout the year on the manufacture of turbo-alternators for hydro-electric installations at home and abroad. They have also been employed on gun mountings for the Admiralty, and on general engineering work.

FOREIGN COMPETITION

Towards the end of last year there was some revival in the placing of orders with British Shipyards, principally for dry cargo vessels of various types, and this has continued in the opening months of the present year. Most of these orders have come from British Shipowners, and your Company has been successful in obtaining a number of such contracts. The vessels we now have under construction and on order should keep the Works well occupied until early 1957; but it cannot be too strongly stressed that if regular and full employment is to be maintained in the future it is essential that there should be a steady inflow of new work. It is to be regretted that some publicity has been given to the idea that the competition from Germany and elsewhere is now slackening. Those of us who are in the Industry see nothing of this. Our problem is to maintain the present level of employment against the competition not only of Germany but of Holland and the Scandinavian countries, all of whom have developed their shipbuilding capacity, and most of whom have very willing labour to carry out the work.

Orders from foreign clients—principally in Norway—have been lost to Continental Builders, who are still ready to quote Fixed Prices; but if British Shipbuilders could be assured of a reasonable period of wage stability in their own industry and in the steel, coal, and transport industries, on which they so much depend, it would go some way towards enabling them to meet this serious competition from Continental yards.

The Company's property and plant have been well maintained.

In conclusion, I must thank all the members of our staff, both at home and abroad, for the excellent work they have done throughout the year.

The Report and Accounts were adopted; the proposed dividend and special bonus were approved; the retiring Directors, namely, Sir John Craig, Mr W. Strachan Jr, Mr H. C. MacEwan and Mr W. H. Park were re-elected. Messrs Price Waterhouse & Company were reappointed Auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the Chair.

NEW BROKEN HILL CONSOLIDATED

A HIGHLY SATISFACTORY RESULT

The nineteenth annual general meeting of New Broken Hill Consolidated Limited will be held on June 22nd in London.

The following is an extract from the circulated statement of the Chairman, Mr John R. Govett:

The profit for the year 1954, before providing taxation, amounted to £1,141,234, compared with £677,922. This result, which I think may be regarded as most satisfactory, is due partly to the substantial increase in production and partly to the higher prices realised for lead and zinc. The tonnage of ore milled reached a total of 483,461 tons, compared with 403,662 tons for 1953.

Depreciation has been provided, amounting to £307,000, compared with £277,400 for 1953. The charge for taxation amounts to £543,960. This leaves a net profit for the year of £597,274 compared with £413,262 for 1953.

Two hundred thousand pounds has been transferred to General Reserve and the Board recommend a final dividend of 1s. 9d. per share, making a total distribution for the year of 3s. per share, which compares with 1s. 6d. per share for 1953.

Capital expenditure during 1954 amounted to £650,061.

The total production for 1954 was 482,058 tons (lead averaging 9.4 per cent, silver 2.1 oz, and zinc 14.4 per cent) as compared with a total for 1953 of 405,629 tons (lead 8.8 per cent, silver 2.0 oz and zinc 13.7 per cent).

The ore reserves fully outlined and developed ready for stoping, or in process of being stoped, show a further satisfactory increase, and at December 31, 1954, were 2,800,000 tons assaying 11.1 per cent lead, 2.7 oz silver and 11.9 per cent zinc, as compared with 2,500,000 tons assaying 10.9 per cent lead, 2.7 oz silver and 11.4 per cent zinc.

After reviewing the year's operations the statement continued:

I know shareholders will again wish to join me in a tribute to our management at Broken Hill and the staff and employees there for the further substantial progress made in 1954 towards our present goal of 540,000 tons of ore per annum. This rate of production should be fully achieved so soon as the underground crusher station and extension of the mill are completed before the end of the current year.

Our financial resources place us in a strong position to meet possible vagaries in the metal markets and the demand likely to arise for future mine development, including any development of the low grade orebodies within our leases which we consider will ultimately prove a substantial additional asset. I have every reason to expect that our results for this year will be no less favourable than those I have been able to put before you today.

SCHWEPPES LIMITED

RECORD OF PAST SEVEN YEARS

THE HON R. HANNING PHILIPPS ON RECENT ACQUISITIONS

The fifty-eighth annual general meeting of Schweppes Limited was held on May 27th in London, The Honourable R. Hanning Philipps, MBE (the chairman), presiding.

The following is an extract from his circulated statement:

Owing to the very poor summer the 1954 trading season proved unexpectedly difficult. Nevertheless, with the exception of July and August, normally the period of peak sales, every month showed an increase over 1953, and the final home trade sales for the year exceeded those for the previous year by 4 per cent. Home trading profits rose from £1,018,067 to £1,108,207, after absorbing substantially increased wages and increased transport, advertising and miscellaneous costs.

The growth of our business over the past seven years can be seen by comparing 1948 figures with those of 1954.

In 1948, shareholders' capital and reserves totalled £2,405,000 as against the 1954 figure of £4,653,000, the increase being represented by a further £1,450,000 of new share capital subscribed and £798,000 ploughed back into the business out of undistributed profits.

Profit, after charging depreciation, but before taxation, was £246,000 in 1948 (10 per cent on the capital plus reserves) as against £940,000 (over 20 per cent) for 1954.

Taxation absorbed only £134,000 as against £469,000, which figure would have been substantially higher but for the removal of excess profits levy (which the previous year had cost the company £75,000). In addition, last year we benefited from substantial tax allowances in respect of our new fixed asset investments which were purchased during the year at a cost of £591,000.

Having considered the position of our large body of shareholders who have ventured their capital in our enterprise, it might interest you to know how our workpeople have fared over the same period.

I have told you on a previous occasion of the advantages they have earned from the prosperity of our company in the form of extended pension benefits and health schemes. What of their cash earnings? Since 1948, the average wage has risen by 75 per cent and in addition, the annual bonus which reflects the profits of the company has increased by 200 per cent, and this year amounted to £70,000. Out of the profits for 1954, after setting aside what is needed for payment of staff bonus, your board have appropriated £100,000 to write down the company's investments in subsidiaries. They believe this to be a prudent course in view of the heavy development expenditure being incurred by two of our companies, namely, Pepsi-Cola Bottling Company (London) and Schweppes (USA) Limited, in introducing their products on to their respective markets.

Your board further recommend a transfer to general reserve of £150,000 and the payment of an increased dividend on the ordinary stock of 15 per cent as compared with 12½ per cent in the previous year.

After allowing for the £200,000 recently capitalised under the scheme for reorganising the company's preference capital, and after the allocation to reserve now proposed, the general reserve will stand at £1,425,000.

TRADING ACTIVITIES

Last summer's poor trading weather adversely affected sales of Pepsi-Cola, which fell well below the figure we had budgeted for, though still showing a small increase over the previous year. As this is a product peculiarly susceptible to weather conditions, we do not feel that the results were a fair indication of sales potential. We are pressing on with our plans to achieve national distribution and during 1955 Birmingham and Manchester areas will be opened up.

After reviewing the progress of the overseas companies, the statement continued:

Franchises. — During 1954, Belgium, France, Malta, Gibraltar and Switzerland have all traded successfully. During 1955 Franchise bottling will start in Ceylon, India and Norway.

In the USA the results have again been encouraging. The Canadian market is also showing encouraging results but, as in the United States, further development costs will have to be borne before we can show a profit.

The substantial development programme that we have initiated overseas now requires a period of a year or two to consolidate the position both in terms of providing trained manpower and of profit earning, having in mind that our overseas development was definitely planned as a means of spreading our risks and as a safeguard for the future security of both our workpeople and shareholders.

Recent Acquisitions.—Early this year we completed long drawn out negotiations for the acquisition of the whole of the capital of the English company known as Apollinaris Company Limited. We have also acquired the whole of the share capital of Jewsbury & Brown Limited, of Manchester.

FUTURE OUTLOOK

Once again we have started the year with an increase in our home sales for the first three months. While it is difficult to forecast the future under the present uncertain political and economic conditions, given a reasonable summer the parent company's trading profit at the end of this year should at least equal that for 1954.

The report and accounts were adopted.

THE CONSOLIDATED ZINC CORPORATION

RESULTS SHOW A SATISFACTORY INCREASE

INCREASED OUTPUT AND IMPROVED EFFICIENCY

The sixth annual general meeting of The Consolidated Zinc Corporation Limited will be held on June 22nd at 37, Dover Street London, W.

The following is an extract from the circulated statement of the Chairman, Mr John R. Govett:

The results for 1954 show a satisfactory increase over the previous year and reflect the higher prices realised from sales of lead and zinc, the profit before taxation amounting to £4,696,142, compared with £2,516,562 for 1953, an increase of £2,179,580. This result is arrived at after charging depreciation of £942,673, compared with £837,471 for 1953. Taxation absorbs £2,229,409, compared with £1,043,799 for 1953.

The net profit for 1954 amounts to £2,383,378, compared with £1,393,022 for 1953. Provisions set aside in previous years and now no longer required, amounting to £141,490, have been credited to the Consolidated Appropriation Account. Transfers to general reserves have been made of £1,500,000, which compares with total transfers in 1953 of £1,130,000.

An interim dividend of 1s. 3d. per share, compared with 1s. per share for 1953, was paid on January 1, 1955, and a final dividend of 2s. 6d. per share is being recommended, payable on the Capital increased by the rights issue in December, 1954. The balance on the Consolidated Appropriation Account carried forward at December 31, 1954, amounts to £905,445, an increase of £61,475 over the balance at December 31, 1953.

Capital expenditure during the year on buildings, plant, machinery and equipment amounted to £1,049,116 (compared with £1,470,053 for 1953), of which £484,235 related to the plant extensions of Sulphide Corporation Pty Limited at Cockle Creek, New South Wales, and £338,165 to smelting and other plant of Imperial Smelting Corporation Limited in the United Kingdom.

To make provision for the present programme of capital and exploration expenditure up to the end of 1956 and towards future projects and contingencies, an issue was made in December last, of 2,182,649 Ordinary shares of £1 each.

An important step in the integration of the Group was taken in January, 1955, when an offer was made to holders of Imperial Smelting Corporation Limited 6½ per cent Preference shares to exchange their shares for 4½ per cent Preference shares in the parent company, and this offer has been accepted by holders of 99 per cent of the shares.

The market value of the quoted investments is nearly £2 million in excess of their book value. The Directors are satisfied that the value of the unquoted investments, which include our interests in the Broken Hill Associated Smelters Pty Limited and British Titan Products Company Limited, is considerably in excess of their book value.

The summary of activities published with the report and accounts shows that the year's operations have achieved increased output and improved efficiencies in all major branches of our activities.

Given freedom from any major disturbance in world affairs we can, I feel, look forward to the future with confidence.

UNIVERSAL PRINTERS LIMITED

(Controlling Bemrose and Sons Limited, Derby, Alf Cooke Limited, Leeds, and Norbury Printers Limited, Manchester)

RECORD SALES

The thirty-fourth annual general meeting of Universal Printers Limited was held on June 2nd at Derby, Mr Max Bemrose, chairman, presided.

The following is an extract from his circulated *statement*: *Group Sales* have passed £3 million, which constitutes a record. This has only been achieved by greater efforts on *the part of Sales Staff, Management* and other workers.

As a consequence of most departments of all factories being busy, trading profit shows a very satisfactory increase.

Taxation absorbs the greater proportion of the increased profit, leaving approximately one-third only for net profit, which is available for development and dividends.

The enormous contribution that industry is making to the upkeep of the Welfare State is often not fully appreciated. *In our case,* £290,000 out of a total profit of £450,000 goes to the State.

If we, and many thousands of firms like us, did not do so well, taxation in other directions would have to be considerably increased.

But *heavy taxation of business profits* makes it increasingly difficult for companies to finance replacements of machinery, new buildings and developments.

Income Tax, Surtax and Estate Duty also handicap British Industry through penalising those who bear the brunt of responsibility. It is wrong that progressive policy cannot benefit those who have the courage and wisdom to make decisions which lead to the successful expansion of a business. Taxation on the reward for middle management, too, prevents some from taking responsibility.

The reduction given in the recent Budget is a step in the right direction. Nevertheless, taxation in this country is still higher than in America, Germany or any other country.

You will recollect that the interim dividend was increased by 1½ per cent to 6½ per cent. Your Directors recommend the payment of a Final Dividend on the Ordinary Shares of 12½ per cent, which is also an increase of 1½ per cent, making a total of 18½ per cent for the year, as compared with 16½ per cent for 1953. The net amount of the Preference and Ordinary dividends provided in the *Accounts represents 4.71 per cent of the* Shareholders' Funds employed in the business at December 31, 1954, *i.e.*, the total of *the Capital and Reserves* £1,271,387.

EMPLOYEES' WELFARE

Great stress is laid at all factories on providing better working conditions, such as good canteen facilities, better lighting and welfare services.

In addition, there is a Contributory Staff Superannuation Scheme and a Non-Contributory Pension Scheme for Works Employees.

During this period of buoyant trade, considerable improvements have been made to buildings at all factories. At *Manchester* a new warehouse has been completed, at Leeds increased capacity for Finishing and other departments has been provided.

The Photogravure Department at Derby has again been enlarged and, in addition, a new factory of 26,000 square feet has been *built six miles from the town.* Six months after placing the contract with Taylor Woodrow Construction Limited for an "Arcon" structure the building was being used for the production of advertising calendars.

This factory is of the latest form of structure, with large spans and good lighting. The canteen and office blocks are of the "Derwent" structure, devised primarily for school *buildings.* These have a large expanse of window, they are well insulated, and are completely modern in decoration.

The new factory was opened on April 29th by The Right Honourable Reginald Maudling, PC, MP, Minister of Supply.

Your Company has also created a record in *the purchase* of machinery. Part of this is replacement, and part new equipment for *further* development in the wrappings *section.*

Commitments at December 31, 1954, for buildings, plant and machinery at £138,323 are higher than in previous years. As a consequence of this heavy expenditure, however, *cash balances are likely to be further* reduced.

THE FUTURE

Whilst business in the first three months of the year has been well maintained, there are signs of growing competition and, in addition, negotiations are in hand for a new wage structure. It is to be hoped that a sound agreement will be made for the benefit of the industry as a whole. Subject to general prosperity, your Company is in a strong position.

The report was adopted.

At a subsequent extraordinary general meeting the proposed capitalisation of reserves and scrip issue of one new Ordinary share for every three held was approved, and the increase of the authorised capital from £800,000 to £1 million was sanctioned.

GUARDIAN ASSURANCE COMPANY LIMITED

ANNUAL GENERAL MEETING — 1st JUNE, 1955

Chairman—The Rt. Hon. Lord Blackford, D.S.O., D.L., J.P.

Extract from the Directors' Report.

For the first time since 1938 the figures of the Albingia Insurance Company of Hamburg, practically the whole of the capital of which we acquired 20 years ago, have been included in the Accounts.

LIFE DEPARTMENT

Net new sums assured were a new record at £10,565,503, an increase of £1,904,191 compared with the previous year. *Immediate Annuities securing £27,492 p.a. and Deferred Annuities* securing £351,512 p.a. were issued.

The net rate of interest earned on the Fund was £4 7*s.* 1*d.* per cent. and the Fund increased during the year to £26,055,272.

The end of 1954 was the end of a quinquennial period and the usual actuarial valuation was made as at the 31st December. The surplus disclosed was highly satisfactory and enabled *a reversionary bonus of 50s.* per cent. per annum calculated on the sum assured to be declared on *With-Profit Policies of the new series which was opened on the 1st January, 1950.* With-Profit Policies of the old series which closed on the 31st December, 1949 received bonuses *at least at the same rate of 50s.* per cent. per annum calculated on the sum assured *and* bonuses. Interim bonuses will be paid on claims at the same rate until further notice.

REDEMPTION ASSURANCE ACCOUNT

A valuation at the end of the year revealed a surplus of £31,390 of which £20,000 has been transferred to Profit and Loss. The fund at the end of the year after the transfer was £4,980,509.

FIRE DEPARTMENT

The net premium income increased during the year by £657,544, of which £418,000 applied to the "Albingia", to £5,144,498. The loss ratio was 42.7% and after providing for unexpired risks on the usual 50% basis the surplus transferred to Profit and Loss was £681,990.

ACCIDENT AND GENERAL DEPARTMENTS

The net premium income increased during the year by £3,290,752, £2,777,000 of which came from the "Albingia", to £8,517,924. The loss ratio was 54.9% against 50.6% in 1954 and after providing for unexpired risks on the usual 45% basis the surplus transferred to Profit and Loss was £599,089.

MARINE DEPARTMENT

The net premiums amounted to £1,808,140 against £1,411,756 in the previous year, £380,000 representing the Marine income of the "Albingia". After a transfer of £301,536 to Profit and Loss the Marine Fund was £2,268,917 representing 125.5% of the premium income.

PROFIT AND LOSS

After making full provision for taxation, *including that on the* Profit for the year and after transferring £475,000 to General Reserve and providing for the increased final dividend recommended by the Directors of 4*s. 6d.* less *income* tax (3*s. 6d.* in 1954) *on each ordinary* share and meeting the cost of the Preference dividend for the year, the balance carried forward was £414,884.

BALANCE SHEET

The total assets of the Company and its subsidiaries increased during the year by £12,000,000 to £60,000,000 of which approximately £5,400,000 is due to the inclusion of the figures of the "Albingia".

During the year the Company acquired a holding of 80% of the shares of the *Cambrian* Insurance Co. Ltd. by the issue of 30,270 shares of £1 each at a *premium of £7 15s. 0d. to the* shareholders of that Company.

ALL THE PRINCIPAL CLASSES OF INSURANCE TRANSACTED.

The Company undertakes the office of Trustee, Executor and Administrator.

Head Office: 68, KING WILLIAM STREET, LONDON, E.C.4.

THE CUNARD STEAM-SHIP COMPANY LIMITED

FIVE PER CENT CUMULATIVE PREFERENCE STOCK
SIX PER CENT SECOND CUMULATIVE PREFERENCE STOCK

NOTICE IS HEREBY GIVEN that the Transfer Books in respect of the above Stocks will be closed from June 8 to 10, 1955, both *dates inclusive*, for the purpose of preparing Warrants in respect of Dividends for the *half-year ending* June 30, 1955, to be paid on and after July 1, 1955.

Offices: Cunard Building, Liverpool.
June 2, 1955.

By Order of the Board,
J. C. TOMLINSON,
Secretary.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT
ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN that the seventy-seventh ORDINARY *GENERAL MEETING* of the Shareholders will be held at the Company's Offices, 61 Avenue Fouad 1er, Alexandria, on Friday, June 24, 1955, at half past five in the afternoon, for the transaction of the ordinary business of the Company, pursuant to Act of Parliament and for the purpose of considering and, if thought *fit, passing* the subjoined resolution as a special resolution:

"To elect Mr Mohamed el Sayed Marzouk, manager of the Company, as a director of the Company and, *for that* purpose, to declare Article 106 (a) of the Articles of Association suspended *in his favour.*"

Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before June 10, 1955, or in Alexandria before June 21, 1955, until after the Meeting, at the National Bank of Egypt, 6 King William Street, London, E.C.4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

A Member of the Company is entitled to appoint a proxy to attend and vote at the Meeting in *his* stead and any proxy so appointed need not be a Member of the Company.

Dated, Alexandria, Egypt, May 26, 1955.

By Order of the Board,
ALEX. L. BENACHI,
Chairman and Administrateur Délégué.

THE WEST AFRICAN EXAMINATIONS COUNCIL

There are vacancies for posts of Assistant Registrar in the offices of the Council in Accra and Lagos. Candidates must hold an honours degree of a British University and have experience in teaching or educational administration.

Salary scale £1,000 x £40 to £1,280, plus overseas pay in the range £275 to £350, where applicable.

The posts are pensionable but contract terms at higher salaries can be arranged. Quarters with heavy furniture are provided at a rental of £75 to £120, according to salary.

Further details and forms of application may be obtained from The Registrar, West African Examinations Council, C/o Box 969.

Completed application *forms* must be returned not later than June 25, 1955.

CAN THE TORIES FIND ECONOMIC STABILITY ? The leading article in the JUNE issue of THE BANKER poses the challenge of the rail crisis in its wider context. Another key question discussed in this issue is the extent to which sterling and the gold reserves are being bolstered by the inflow of foreign money. The careful analysis of the technicalities of the exchange market explodes some popular fallacies.

SHOULD THE BANKS participate more directly in industrial finance ? The controversy set off last month in high banking quarters is among other topics discussed in the June issue of THE BANKER. Further articles include: Can Output Maintain Its Rise?; Monetary Policy and Australia's Deficit; Sweden Takes the Plunge; and What Reserves do Building Societies Need? Price 2s. 6d. (or 30s. a year) from bookstalls or 72 Coleman Street, E.C.2.

KEEN YOUNG ACCOUNTANTS who can write fluently, and consider that a career in financial journalism, with an *excellent* starting salary, has attractions are invited to write to Box S. 707, c/o Streets, 110 Old Broad Street, E.C.2.

ASSISTANT COMMISSIONERS, NATIONAL SAVINGS COMMITTEE. The Civil Service Commissioners invite applications for about 15 pensionable posts. Age at least 21 on *March 1, 1955.* University education and knowledge of economics desirable. Final year university students may apply. Experience of public speaking, supervision of office procedure, *organisation of* work with the public an advantage.

Starting salary for men (including extra duty allowance, where payable), according to age, e.g. at 21 £434; at 25 or over on entry £559. *Maximum £1,112. Somewhat* lower for women (above age 21) and for provincial posts. *Prospects of promotion.*

Particulars and application form from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 154/55; application *forms* to be returned by June 16, 1955.

A YOUNG Chartered Accountant is required to train for a responsible position with a well-known manufacturing company. The appointment requires experience of management accounting and costing, and provides excellent opportunities for rapid advancement. A good commencing salary is offered. Applications will be considered from accountants about 30 years of age.—Particulars of qualifications and experience should be sent to Box 968.

EXCELLENT opportunity and good prospects for three technical and business managers for expanding private *companies,* situated 15 miles S.W. of Central London, engaged in Domestic Appliances, *Refrigeration* and Automatic Controls respectively. Salaries *offered range* between £1,000 and £1,500 p.a.—Applicants between 35 and 45 to furnish, in confidence, particulars of age, education qualifications, experience, present and required *emoluments to* Box 965.

BEFORE YOU BUY those shares, see what the *Investors' Chronicle* has to say. It is the best-informed and widest-read financial weekly. Two issues free of charge from 30 Grocers' Hall Court, *London*, E.C.2.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ENGINEERING
POST-GRADUATE COURSE IN STRUCTURES AND MATERIALS

A *post-graduate course* in Theory of Structures and Strength of Materials, extending *over one* year (October to June), will begin at the Department of Engineering, Cambridge University, on October 5, 1955.

The latest advances made in the understanding of the behaviour of metallic *structures* under static, repeated or fatigue loading will be the principal subject of the course, with particular emphasis on welding as a method of fabrication. No attempt will be made to teach conventional methods of design, but present-day practice and possible future developments will form the subject of critical study.

The object of the course is not to train research workers, but to help engineers to apply the latest advances in knowledge. The course will include lectures, colloquia and laboratory work, and each student will be encouraged to make a detailed study of some problem of particular interest to him.

The course is open to university graduates with industrial experience, and to others with suitable equivalent qualifications.

Applications for admission should be sent by July 1st to The Secretary, Cambridge University Engineering Laboratory, Trumpington Street, Cambridge, from whom further particulars may be obtained.

NORTHAMPTON COUNTY BOROUGH EDUCATION COMMITTEE

NORTHAMPTON COLLEGE OF TECHNOLOGY
Principal: E. Jewitt, BSc(Eng), MIEE
LECTURER IN MANAGEMENT STUDIES

Applications are invited for appointment to the post of full-time Lecturer in Management Studies as from September next.

The successful candidate will be required to develop contacts with local industry and to assist in the development and organisation of courses in management subjects. He should be well *qualified* by experience and *training* to teach a number of subjects up to the level of the Diploma in *Management Studies.*

Salary in accordance with the 1954 Burnham Technical Scale for Lecturers (£965 x £25 to £1,065).

Form of application and further details of the post may be obtained from the undersigned.

"Springfield,"
Cliftonville, Northampton.

H. A. SKERRETT,
Chief Education Officer.

BANKERS' NOTICE TO THE PUBLIC

The Committee of *London* Clearing Bankers gives notice that as a result of the Railway Strike delays may occur in the collection of cheques and other items. Bankers cannot, therefore, undertake that the clearing of such items will take place within the normal period.

M. P. GREENWOOD,
Assistant Secretary.

The Committee of London Clearing Bankers,
Post Office Court,
10 Lombard Street, London, E.C.3.
May 31, 1955.

RAPIDLY *expanding* Public Company, S.W. Greater London, requires *immediately* General Manager to control a group of adjacent private companies, total employees 1,500, engaged in light engineering, instrument making and automatic control apparatus. This appointment may, later, carry a seat on the *parent* board. Applicants between 40 and 50, with an engineering and business background, who have held or are holding posts of £3,000 to £4,000 p.a. salary level, are invited to apply. Experience in heavy engineering, foundry or textiles is here of no value.

Details of age, education, qualifications and *experience, with* present and past *emoluments*, should be forwarded in confidence. The position offers exceptional opportunity to the right type of senior executive.—Box 964.

BEECHAM GROUP LIMITED have a vacancy for an Assistant Technical Controller for their Overseas Division. The successful applicant must be a Qualified Chemist or a Qualified *Chemical* Engineer and must have held the position of Works Manager of a factory within the Pharmaceutical or Chemical Industry and be experienced in modern production methods. The position entails co-ordinating the technical activities of Overseas factories (under the direction of the Technical Controller) in the field of both production and quality control and will necessitate visiting overseas factories when necessary. Profit Participation and Pension Schemes in operation.—Apply in writing only, giving full details of age, qualifications and experience, to Personnel Controller, Beecham Group Limited, 68 Pall Mall, London, S.W.1.

PROSPEROUS *Private* Company, with increasing orders, eight miles from Richmond, Surrey, 400 employees, engaged in light engineering and small component *manufacture*, requires a Chief Engineer. Salary £1,200 to £1,500 p.a., according to *experience.*

Applicants between 35 and 40 should possess first-class knowledge of non-ferrous *metal* machining, autos, capstans, presses, progression tools and design experience of tools for quantity component production. Experience must include at least five years in a similar capacity. Fine future for a man with the right background.—Box 966.

M.A. (Oxon), 27, Economics, commercial experience, at present P.A., seeks post (sales, administration), preferably not London. Hard working enough to expect reasonable remuneration.—Box 972.

EXPERIENCED SALES MANAGER required by company with branches dealing in electrical accessories and with substantial turnover. Pension scheme in operation.—Box 953.

EXPERT POSTAL TUITION

For Examinations—BScEcon, LLB and other external London University *Degrees;* Law Society; Bar; Accountancy; *Banking;* Secretarial; Civil Service; *Commercial;* General Certificate of *Education* etc. Also many non-examination courses in business subjects. —Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2)

world-wide facilities for building

Paper Mills Using Native Fibres

This is Parsons & Whittemore's Private Point 4 Program to develop Pulp and Paper Mills throughout Free World

1. Conduct a preliminary survey and prepare an appraisal report.
2. Engineer the complete project in cooperation with the world's leading consulting engineers.
3. Produce and deliver all the pulp and paper machinery and other necessary equipment that cannot be produced in the country where the mill is to be built.
4. Supply the necessary trained personnel to assure proper operation of the project until local workers can take over.
5. Assist the local group to obtain financing within the currencies available in the particular country, such as dollars, sterling, francs, D-Marks, Finn-Marks, etc.
6. Assist the local group to obtain the necessary raw materials and chemicals to operate the mill after it is built, as well as sell the output through Parsons & Whittemore's own offices.

Nothing so dense in the whole U.S.A.

IN THE WHOLE of the U.S.A., home of mammoth-circulation magazines, there is no publication with a circulation-density to compare with that of the Radio Times in Britain. What is "circulation-density"? It is the circulation of a publication compared with the population of the area in which it circulates. In Britain the Radio Times sells 163 copies for every 1,000 people. In the United States, Life sells 36 copies and the Reader's Digest 67 copies for every 1,000 people. In fact, no publication in the world beats the Radio Times figure.

What is the significance of this fact? It means that British business men have an absolutely unique advertising medium to help them sell their goods or services—and the uniqueness of the Radio Times doesn't end with its circulation density.

Pound for pound, the Radio Times will put an advertiser's message before more total readers and more readers in the higher income groups for a longer period of time than any other publication or group of publications.

These are big claims but readership surveys, with which this country is unusually well supplied, substantiate their validity with statistical emphasis. With a circulation of well over 8,000,000 copies a week,* the Radio Times is bought by more people than any other publication. It goes into almost eight homes out of fourteen. It is read by every other man and woman in the country. Its pages are consulted any number of times a day for nine whole days after publication. Even this period of nine days is not the end of its active life as those who 'key' their advertising know. Coupons from advertisements continue to be returned by readers in significant numbers over many months—a considerable 'bonus' to advertisers.

PUBLICATION	CIRCULATION	DENSITY PER 1,000 POPULATION
RADIO TIMES	8,223,612*	163
READER'S DIGEST (U.S.A.)	10,500,000	67
LIFE (U.S.A.)	5,615,000	36

What is more difficult to weigh, but nevertheless a critical element in an advertising medium's worth, is the authority of the editorial context in which the advertisement appears. It is like trying to evaluate the benefit of a good address, or estimating the bonus in sales derived from transferring a shop to a street of high reputation. Some of the BBC's own authority, universally envied, carries over to the pages of its major publication to the benefit of any product advertised there.

Unfortunately, newsprint shortages continue to make the Radio Times a 'hard-to-get' publication. But the time will come when this unique magazine can be the backbone of *every* national campaign.

*Average Weekly Net Sales (A.B.C.) Jan.—Dec., 1954, 8,223,612.

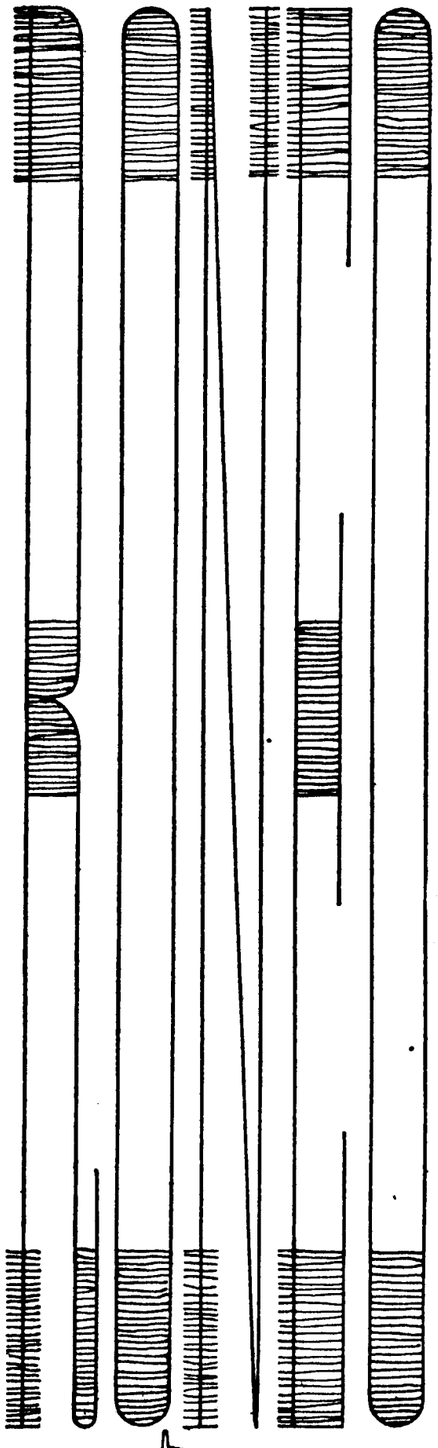
1,200 EUCLIDS on 3 JOBS!

World's largest road building programme

EUCLIDS outnumber competitors by more than 4 to 1 on the Ohio Turnpike—a 261-mile road from the Pennsylvania border to the Indiana line—where 438 EUCLIDS are hard at work.

On the New York Thruway, more than 500 EUCLIDS are combating swamps, rock, sand and heavy clay to drive this new 427-mile road.

When it comes to rock jobs—deep cuttings and fills through mountains—the West Virginia Turnpike is really tough! But 260 EUCLID Rear-Dump Wagons are, in a matter of months, removing mountains that took nature centuries to build.



Whatever the job, EUCLIDS move *more* loads in *less* time at *less* cost.

EUCLIDS are available for sterling. They are distributed and serviced by:

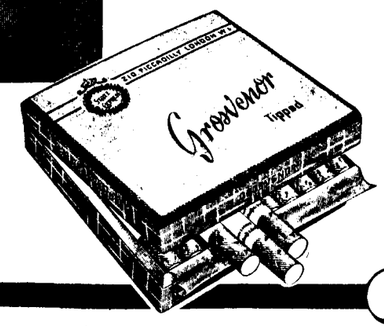
LATERAL FILING

Compresses a lot into a little space

Bulk filing can occupy a great deal of valuable space as many business houses know only too well. RONEO LATERAL FILING is designed to compress a mass of documents into the compass of relatively little floor space. It can be installed very economically in existing shelving and cupboards; also in "awkward" spaces (corridors, landings and odd recesses) which are not normally used to advantage. If desired Steel Units, with open or protected fronts, are available. *RONEO LATERAL FILING saves staff time by giving speedy reference and ease of access.*



LOOK AT IT  *FROM HERE—THEN WRITE FOR FULL PARTICULARS TO RONEO LTD.*

a BM business machine

Why not try your hand at calculating . . . on a Facit ten-key calculator.
Nothing could be simpler. With only ten-figure keys to use, any member of your staff can become a proficient operator *after a few minutes' instruction.*
Think what this means—all the routine multiplication, division, addition and subtraction in every part of your business, can be handled by any clerk.
Essential figures can be computed at a moment's notice. Tedious, time-wasting figuring becomes high-speed, machine-perfect calculating . . . without special departments, trained staff or reorganisation.
You can also use FACIT for on-the-spot calculating and figure checks.
Your Director can use FACIT on his desk for rapid reckoning.
Your Accountant can use FACIT to speed the routine of his department.
Your Secretary can use FACIT on the figures in Company control.
Anyone can use FACIT to save time and labour, wherever there is more than a half hour's figure work a day.
There is a complete range of FACIT hand and electric models . . . each one a precision-built item of equipment for the modern office. Let us send you a FACIT to use on your own work for a day or two . . . or write first for full details to: **Block & Anderson Limited,**
58-60 Kensington Church Street, London, W.8. Tel: WEStern 2531.

IN TEXTILES

The WHOLESALER helps the MANUFACTURER

By selling his goods through the Wholesaler, the Manufacturer gains many advantages. He receives bulk orders in advance of the seasons and thus ensures an even flow of work throughout the year.

He saves the expense and worries of a large sales and distribution organisation, of credit control and increased office work. He avoids the problem of finding storage space for mounting stocks awaiting delivery.

The Wholesaler orders early, takes delivery for stock and pays quickly, thus enabling the Manufacturer to buy further raw materials. In textiles, the distribution channel of *Manufacturer—Wholesaler—Retailer* has consistently proved economically sound.

This is the SECOND of a series of four announcements describing how the Textile Wholesaler helps the Manufacturer, the Retailer and the Nation.

Issued by
The WHOLESALE TEXTILE ASSOCIATION, 75 Cannon St., London, E.C.4

Can YOU look forward to plain sailing too?

They're vigorous, vital, and keen to get on and after eight years of marriage, they're looking forward to plain sailing with quite a bit of confidence. They're starting to buy a lot of the things they've been longing for, too. Some of them quite expensive. Are they choosing your products? Do they plan to? Today? Tomorrow, perhaps?

By facing the problems of our time realistically and presenting the news in a vigorous, modern style, the Daily Mirror appeals outstandingly to young readers. In fact, the majority of the 4,753,415 people who buy it every day belong to the all important younger generation. With long buying years ahead of them they're forming brand preferences now which may last them all their lives. If they take a fancy to your products you can look forward to plain sailing too.

With the biggest daily sale on earth, the Daily Mirror offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate. Moreover, its readers are *young* readers. Your customers today—next month—next year.

This sturdy robot works 24 hours a day . . . draws no wages . . . never takes a holiday. Consider, for a moment, its advantages in cost alone as compared with police control. Effective all-day traffic control at a busy intersection requires the full time services of at least two police officers; total cost, £1374 every year. An "Electro-matic" installation, at an initial cost of £1750 with £175 per year covering depreciation, running and maintenance, will in two years effect an economy of £300 and incidentally provide a 24 hour service.

It is obvious that the only economic form of traffic control at busy intersections is with

ABOUT NEWS LETTERS

News letters are the oldest form of journalism. Hand-written news letters were in wide circulation during the reign of Elizabeth I, and, indeed were important factors in politics long before that.

Modern news letters are in wide use amongst advanced students of world affairs, large business houses, in Government and diplomatic circles, and at military colleges and Universities.

Britain's leading news letters are subscribed to by over 40 official agencies of the U.S. Government alone. Official agencies of every leading Government subscribe to them.

The news letter is based on a special form of reporting. It is outspoken *in its presentation*. It publishes all the facts, theories, and trends behind international policy. Privately circulated, neither accepting advertisements nor bothered by news-stall circulation problems, the 20th century news letter is a private communication to its subscribers. Britain's top circulation news letters are prepared and published by

The Kenneth de Courcy Group

BUILDING WITHIN A BUDGET

The most successful building operations today are the fruits of collaboration—the closest possible partnership of owner, architect and a widely experienced firm of builders and contractors. Wates are such a firm.

Wates believe in pre-planning, the scrupulous examination of all possible means of achieving the client's aims with maximum economy and at maximum speed. And the final drawings are those which crystallize optimum solutions to every aspect of the building problem. The Wates method invests the owner with complete control of costs : he gets his building at a price within his budget, and he gets it on time.

Wates building operations are economical because they make full use of the latest mechanical equipment, because they employ resources of men, materials, machines and architectural talent to maximum advantage.

These services are offered either on a fixed fee basis or at a fixed inclusive price. Consult Wates or put them on your tender list—it pays.

WATES BUILD

The World is their Market

BELFAST

Linen manufacture in the city of Belfast was developed into a flourishing industry by Huguenot refugees during the eighteenth century. In Belfast today they will tell you they make the finest linen in the world. And so they do. But they'll also tell you that *quality manufacture alone* is not enough if their products are to hold their own in the international market. Competition from the linen industries of other countries is increasing—and increasing fast.

It's the same whatever the industry, whatever the business. Making products for the world is only half the job. You've got to show them, sell them—and *sell them hard*—wherever a market for them exists. Many manufacturers are doing this with remarkable success through the pages of TIME, The Weekly Newsmagazine.

WORLD SALES FORCE

TIME's net paid audited circulation exceeds two-and-a-quarter million copies weekly (ABC). There are five separate editions of TIME* with the same editorial content. One circulates only in the United States—the other four, the *International Editions*, are published simultaneously in English and read by important people in more than 100 countries outside the U.S.A.

Ninety-three of every 100 readers of TIME's International Editions hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

You can buy advertising space directed to those markets which interest you most—through one edition, any combination of *two*, *three* or *four*, or in all *five* of the world-ranging editions of TIME.

Advertising in TIME sells around the world!

...DELIVERIES OF FINISHED STEEL
INCREASED BY 18% SINCE 1949...
OUTPUT NOW ENOUGH TO BUILD
5 FORTH BRIDGES A WEEK!

...it's part of Britain's progress, to which

'ENGLISH ELECTRIC'

contributes, at home

and abroad

New factories, increased activity, more goods in our shops, are proof of Britain's progress.

Since 1949, Britain's industrial output has risen by 20% and the value of British exports has gone up by 42%.

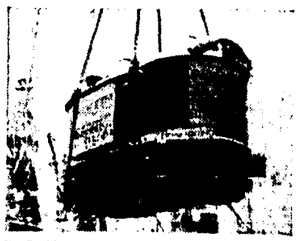
More goods at home, more of the exports the country depends on . . . mean *better living for Britain.* In both ways ENGLISH ELECTRIC is playing a vital part.

Production needs power. 50 power stations have been brought into commission by the Central Electricity Authority since April 1948; output of current has risen by 60%. Much of the equipment for these power stations has been provided by ENGLISH ELECTRIC.

And ENGLISH ELECTRIC makes the motors and other electrical gear by which industries *use* power for production.

Export success

Moreover, ENGLISH ELECTRIC is a vigorous exporter of equipment—and of engineering skill. *Approximately half its business is overseas.* All over the world, ENGLISH ELECTRIC is earning foreign currencies for Britain—and a reputation that helps all British exports.



This Company encounters diverse problems; solving them adds to the store of *experience* through which its resources are combined in making their contribution—at home and overseas—to Britain's progress.

POWER FOR INDUSTRY. *This* ENGLISH ELECTRIC *60,000-h.p. steam turbo-alternator in Thornhill Power Station helps to provide power for industrial Yorkshire.*

POWER IN INDUSTRY. *The power for this 60-ton electric melting furnace at Stocksbridge is supplied through an* ENGLISH ELECTRIC *switchboard and transformer.*

EARNING DOLLARS. *One of two 125-MVA three-phase transformers, built by* ENGLISH ELECTRIC *for the city of Seattle in the United States, being loaded at Liverpool.*

DEVELOPING MARKETS OVERSEAS. *One of five* ENGLISH ELECTRIC *straight-flow valves, the world's largest, for the Castelo do Bode and Cabril Power Stations in Portugal.*

For This Relief . . .

LAST Tuesday, after four and a half years of hard work, the Royal Commission on the taxation of profits and income produced its final report. It would be impertinent to offer firm conclusions on the report in a mere four and a half days; it is destined in its scope, in its breadth of discussion and in its free expression of dissenting views, to be the formative document on income tax of this generation. Together with the Commission's two interim reports (on the taxation of overseas earnings and the taxation of personal incomes) and flanked by the two Tucker Committee reports (on the assessment of taxable profits and the taxation of pension schemes) this final report completes the most comprehensive grand inquest that has ever been held on direct taxation in this country. The first duty of all good taxpayers must be to thank Lord Radcliffe and his colleagues for their patient labours, for their care for the Queen's English, and for the scrupulous quality of their argument.

To many, this will nevertheless seem a disappointing report. It is well endowed with reservations, and it contains a formidably argued memorandum of dissent signed by the two trade union members and Mr Nicholas Kaldor. The majority report, plus the unfinished business carried over from the two interim reports, will keep any Conservative Chancellor fully employed for the next five years. The minority report must cheer up any prospective Labour Chancellor during his enforced period of opposition. Yet it would be an exaggeration to think of the two reports as rigidly opposed tracts from the Right and the Left. The minority argue for subjecting capital gains to income tax (though not to surtax); but the ordinary man who disagrees with them will concede that they argue their case no less well than the majority who find against such a tax. It is the minority's dissenting memorandum that cuts through the objections to a single-tier corporation profits tax (the majority reject this by a narrow margin of argument) and indeed suggests that it should be levied at the rate of 33⅓ per cent; the majority would improve the present system but evidently expect companies to pay about 50 per cent. And it is the minority who come out clearly for giving earned income relief to all incomes, no matter how large, that are assessed under Schedule E rules. Thus the Royal Commissioners have not spoken with one voice, and the dissenters have produced some good arguments—as they did in the second interim report—capable of appealing to many people who have never voted Labour.

Simplicity, intelligibility and fairness are cardinal virtues in any tax system. The British system does not lack these virtues, even though equity soon gets in the way of simplicity, and the sheer weight of taxation often magnifies the defects into serious grievances. These are conditions outside the Royal Commission's terms of reference and beyond its power to remedy. It has been forced, moreover, to make one broad assumption that will cause raised eyebrows; the assumption is that there will be no marked change in the value of money.

"If we could not take it as our premise that stability of purchasing power is the normal thing to be expected . . . our review would be beating the air. . . . Indeed, if we had thought that we were obliged to assume a persistent decline in the purchasing power of money, even if only a slow one, our examination of the problems of dealing with the inflationary elements in profits . . . would have started on a different basis and might have reached a different conclusion." This is a large assumption, and it seems to come close to imperilling the Royal Commission's conclusions on the proper scale of relief that the tax system should allow for the depreciation of productive assets. The report comes down solidly in favour of the "historical cost" school, and rejects the arguments of most economists and some accountants that depreciation should be allowed on the "replacement costs" of the fixed assets that are being used up in production. It is true that the impact of rising prices on capital replacement now seems much less severe than it was in 1951 when the Royal Commission and its witnesses started their work. It seems equally true that the more dire forecasts of the erosion of industrial capital through the inadequacies of depreciation allowances in a period of inflation have somehow not come to pass. But if the premise of no further inflation should turn out to be wrong, then the endorsement of depreciation based on historical cost would turn out to be fallible, too.

There is a sharp contrast, indeed, between the Royal Commission's conventional conclusions about the depreciation of fixed assets by reference to historical cost and its forward-looking findings on the valuation of stocks in computing profits. The majority are prepared (subject to one rather formal reservation) to admit the "last in first out" principle in the valuation of stocks. These questions abound in technical jargon, but the upshot is this: whereas the Royal Commissioners are not in favour of taking the inflationary element out of profits to the extent that it arises from insufficient provision for fixed assets, they are prepared to take the inflationary element out of profits to the extent that it arises from increases in the price levels of stocks. Despite the contradiction, here is an important gain of principle; it would mean a great relief to industry in a period of galloping prices, and a correspondingly heavy reduction of taxable income in those circumstances.

★

Something, at any rate, of the heat has been taken out of these controversies by the comparatively moderate behaviour of prices in the last two years. Industry has gone ahead, profits have risen, and even the biggest companies have managed to survive. The report offers the hope of an important, if still partial, measure of reform in the computation of profits by its endorsement of LIFO. And while the majority are not prepared to go to the logical limits, proposed by Mr Kaldor and his associates, of a straight corporation profits tax, they unhesitatingly reject the conception of a differential profits tax, as introduced by Dr Dalton in 1947. They find that the economic arguments in favour of a heavy tax on distributed profits are dubious; they emphasise the uncertainty and weight of the potential tax liability that companies bear if they should in future years make payments that can be construed as distributions for profits tax purposes. The differential rates of profits tax should be brought to an end and replaced by a single rate which, it is suggested, "would be a good deal nearer to the lower rate of 2½ per cent than the higher rate of 22½ per cent."

This proposal is welcome, despite its limitations. The majority reject, for reasons that are a compound of technical and philosophical objections, any notion of a single-tier corporate profits tax. Company profits, they say in effect, ought to be subject to their own tax régime—a régime that goes beyond the old conceptions of the Colwyn Report of 1920 that companies should be regarded largely as mere agents, collecting in advance the personal income tax due by their members. In tax law and practice, these conceptions have long been discarded; but it is one of the important merits of the Radcliffe Report that it sets out an acceptable philosophy of the taxation of company profits as a distinct class of incomes. It is a matter for regret that the Commissioners were unable to accept the final logic of a separate tax for them.

★

Most of the Royal Commission's work comes under the heading of useful improvement, rather than major reform. One does not fell an oak tree to change its shape; the tax tree has grown over a century and a half, and the Inland Revenue, which has the responsibility for collecting the acorns, can be forgiven, up to a point, for tendering cautious advice when drastic reforms are proposed. To some, the balance of the majority report may seem to err too far on the side of caution. But this does not arise from any merely complacent acceptance of the tax system as it is. The report might have gone further, perhaps, in considering the highly favoured position of the small incorporated business under British tax laws. But many of the detailed proposals are on the side of equity and reason, and the British tax system, for all its complications, has been built on the foundation of these two principles. The modification that the majority propose to the present narrow and strict rule governing the expenses that can be deducted from wage and salary incomes is a good case in point. Because of the different treatment of expenses, it has been said that Schedule D incomes (from profits or professional earnings), and Schedule E incomes (from employment) are in essence taxed under two separate systems—not two Schedules so much as two distinct taxes. Whether the more liberal form of words proposed for Schedule E expenses is the best that can be devised remains to be seen; but the spirit of the proposal, to hold justice more evenly between the two main classes of tax-paying persons, is welcome.

There are other suggestions, undramatic in form but excellent in intention, such as the averaging of widely fluctuating incomes, the acceptance of the "current year" basis of assessment for companies, and the new proposals for taxing compensation for loss of office. The Royal Commission has spared the time to consider the tax advantages of "playboy ploughboys," and would stiffen the rules against those whose farming activities (in their admirable phrase) "can be seen clearly to lack commercial inspiration." But when these items have been listed, they merely pick the eyes out of the Radcliffe Report. There is vast material here for more considered discussion in later issues of *The Economist*. From a quick first reading of the report, and from his fuller acquaintance with the two interim reports, the British taxpayer ought to be grateful for many proposals that will ease his burdens, particularly if he is in the middle income group, and set right many injustices. Given the limiting terms of reference and the composition of the Royal Commission, this is still a great achievement. Now it is the Chancellor's turn.

Tito's Tug-of-War

IN Moscow and the satellite capitals the declaration issued after the Soviet-Jugoslav talks has been received with enthusiastic approval. It could hardly be otherwise. But it is doubtful whether the Russian leaders really feel such unalloyed satisfaction over the results of their journey to Belgrade as their leader writers and radio commentators are in duty bound to feel. It would be wrong to talk about their mission in terms of failure; but it is inconceivable that they would have embarked on such an enterprise unless they expected great things from it and, in some important respects, Marshal Tito has certainly been a great disappointment to them.

The Russian delegates may have left Belgrade with a document in their briefcases that endorses—so far as it goes—the main lines of Soviet foreign policy, but any plans they may have had for staging a triumphant and magnanimous (on their part) reconciliation between the Soviet and Jugoslav Communist parties were firmly knocked on the head at the outset. On the contrary, in the final communiqué, any mention of either Communist party was conspicuous by its absence; the "inter-state" character of the talks was underlined—at Jugoslav insistence—by having the document signed, not by the official leader of the Soviet delegation, Mr Khrushchev, but by Marshal Bulganin, who may, in Belgrade, have played second fiddle to the party boss, but is Prime Minister of the Soviet Union; and, finally, the Russians accepted an astonishing and unparalleled declaration that "different forms of Socialist development are solely the concern of the individual countries." In other words, the "mutual understanding" between the two Communist parties for which Mr Khrushchev pleaded in his famous speech at Belgrade airport is to consist, in effect, of an agreement to disagree.

Moreover, if the leader of the Soviet Communist party imagined that the Jugoslav leaders had smouldering regrets for their estrangement from the rest of the "Socialist camp" which he would be able to fan into vigorous flame, he proved to be very much mistaken. Mr Khrushchev may have managed to live down some of the tactlessness with which he celebrated the first moments of his first venture outside the borders of the Sino-Soviet world; but he went on behaving very much as if he lived in a Communist world of his own, and his continued ineptness only served to confirm the Jugoslavs in their belief that they have nothing to learn from their former masters, and are better off as they are.

Obviously, the Russians will squeeze the last drop of propaganda and bargaining value out of the declaration on improving international relations in general that was signed in Belgrade. This has rather more stuffing to it than the blamelessly innocuous five-point declaration of Mr Nehru and Chou En-lai. But it is still couched in very vague terms; and in no case have the Russians succeeded in persuading Marshal Tito to accept something that he would not have been perfectly ready to accept without a personal visit from Mr Khrushchev and Marshal Bulganin. The declaration gives the impression of a well-fought-over battlefield, from which both combatants have withdrawn with no advantage ceded without a compensating gain and with the battle honours even.

Marshal Tito agrees to condemn "military blocs" (which he has in any case been doing for some time), but there is nothing to suggest any breath of criticism of the Balkan Alliance, which has always been regarded by the Russians with the most categoric and vituperative disapproval. He agrees that there should be a system of general security which would include special arrangements for Europe, and that there should be an agreed settlement of the German question "on a democratic basis in conformity both with the wishes and interests of the German people and in the interest of general security"; but there is not a word to suggest that he specifically subscribes to Mr Molotov's long-cherished European security plan or that he is prepared to fall in with Russian ideas of the form that a German settlement should take. He implicitly supports the repeated Russian demand for the abolition of the western embargo on the export of strategic goods to the Communist bloc; but in return he gets the Russians, who have always denounced all western aid as a form of "enslavement," to approve of economic assistance

through the United Nations " or in other forms which are in accordance with " United Nations principles.

High-sounding and unexceptionable declarations between members of the Communist bloc and uncommitted countries outside are becoming increasingly fashionable. But although these may lead to a more relaxed atmosphere and generate a certain amount of ingenuous good will towards the Communist bloc, they do nothing to paper over the real and deep rifts that divide it from the rest of the world. If the Jugoslavs ever had any doubts about this, they are unlikely to have them now. Indeed, all through the Russian visit their press was emphasising that Soviet-Jugoslav differences could not be settled at the drop of a hat. And an article in the semi-official *Borba* towards the end of the talks, stating categorically that it was quite wrong to believe that the progress of the world depended on the expansion of one or other ideological bloc, suggests that on the most fundamental and long-term issue of all, the Jugoslavs very definitely did not agree with their Russian guests. There must have been a good many raised eyebrows in Belgrade when Mr Khrushchev, after accepting a declaration that extols " peaceful co-existence . . . regardless of ideological differences " and condemns military blocs, proceeded to beat all the old war-drums in the Victory Square in Bucharest, and to assure his audience that the Soviet-Jugoslav agreement was part of the Soviet-led struggle " against reaction and imperialism " and that Soviet Russia was not weakening in the struggle.

★

It is easy to understand why Mr Khrushchev felt it necessary to go home by way of Sofia and Bucharest, even though we can only guess at what he said to the satellite party bosses who gathered to confer with him. The visit to Belgrade, the attempt to blame Beria for the Tito-Cominform quarrel (a tale which has not actually been suppressed in the satellites although, understandably, it has been given the minimum of publicity and attention), the startling admission that Titoism is after all a respectable form of " Socialist development "—all this must have left the satellite leaders wondering whether they were coming or going. Most of them have climbed to power over the bodies of men accused of " Titoism " and " nationalist deviations," and however strong may be the popular longing for a change, the men in power are unlikely to relish any radical alteration in the *status quo*. In fact, however, on present evidence, any such change does not seem very probable.

It is true that the strongest reverberations of the Russian visit to Belgrade may well be felt in Eastern Europe, but it is too early yet to estimate either their strength or their exact nature. There is no reason to suppose that the Russians are at present considering any dramatic reversal of policy in Eastern Europe, or that they would ever be willing to do so unless the *quid pro quo* were something equally dramatic. It must be remembered that if the satellite leaders are told that they can strike out on their own a little, they are most likely to want to do so in the economic field, where obedience to Moscow's demands has involved them in a wealth of popular disapproval and a multitude of difficulties ; but that it is precisely in this field that Moscow, with its scheme for the inauguration of co-ordinated five-year plans throughout the bloc in 1956, is demanding even closer conformity with its own policies. It is quite possible that the Cominform may be openly or tacitly abandoned and another organisation with a new and more fashionable look set up in its place. But although the Russians may have decided to shift or camouflage their grip on Eastern Europe, there is no sign as yet that they have made up their minds genuinely to loosen it.

★

Marshal Tito, however, seems to hope that he may now have forged for himself a weapon with which eventually to prise open Moscow's hold on the satellites. The Russians have agreed to the reciprocal establishment of information services, and have promised to assist the " exchange of socialist experiences and a free exchange of opinions." It appears also that together with whatever other assurances and explanations Mr Khrushchev saw fit to give the satellite leaders, he told them that they too will be expected to join in the general swapping of ideas and experiences. In other words, if the agreements are put into effect, there is now to be a grand war of words for the soul of the satellites. Already the Jugoslavs have pointed out that it is not they themselves who stand to benefit most from the declaration on different forms of Socialism, but those Socialist countries which have not yet been able to develop according to their own peculiar needs. In Khrushchev's eyes, of course, it is a war for the soul of the Jugoslav Communist party, whose real feelings, he no doubt hopes, are not adequately represented by its present leaders. Marshal Tito, for his part, must realise that the game on which he has embarked is not without its risks, but he may well believe that the Russians suffer from grand illusions about the powers of attraction of their own brand of Communism and reckon that they are courting far greater risks.

For the Russians, this pull-devil-pull-baker ideological struggle—if it really materialises—is probably an unexpected outcome to their Belgrade visit. The mystery of what exactly they did hope to get out of it has not been made any less cloudy by Marshal Tito's firm refusal to tag along behind them. Through his own resolution and the backing of the western powers he has been able to negotiate with the Russians from a position of strength, and he seems to have resisted their blandishments as stoutly as once, in Jugoslavia's time of weakness and isolation, he resisted their worst threats.

Siam, "Land of the Free"

UNDER the guidance of Field-Marshal Pibul Songgram, now in Britain on an official visit, the Siamese have taken sides in the cold war, firmly and unequivocally. Theirs was the first nation to ratify the South East Asia Collective Defence Treaty (Seato); their armed forces are being trained and equipped by the Americans, and the organisation of their para-military police owes much to British methods ; they are collaborating with the Malayan authorities in the search for Communist terrorists along the southern border of Siam. They are, moreover, the only directly threatened nation in the region which has dared to join Seato—although southern Vietnam, for one, would doubtless have done likewise if freed from a restrictive clause of the Geneva agreement. One need not share Marshal Pibul's apparent fatalism to understand the anxiety that inspired his recent prediction that a third world war was inevitable. Nor should one try to discover a deeper symbolical meaning in his name, which he assumed as a rising officer more than twenty years ago, and which means " great war."

To be swimming vigorously against the tide in a sea of neutralism is a test of any swimmer's capacity ; there has, however, been no sign of flagging on the part of the Siamese. Marshal Pibul's anti-Communist policy has been as audaciously implemented on the international front as it has been strongly executed on the internal front by his able lieutenant, police General Phao Sriyanondh, another recent visitor to London. Abroad, Siam is a member of an anti-Communist alliance ; at home, it seeks to raise a standard of living that is already one of the highest in Asia in a commendable effort to create a climate of resistance to subversion. That these exertions, whether economic or military, would be largely inadequate without American backing, is irrelevant ; the point is that they are being made, that the will to undertake them is present.

In its entirety, the problem of security that confronts the Siamese is immense. If it has seemed at times that they have tended to exaggerate the peril from outside and to underrate the enemy within, the reason may have been a desire to put Siam's case for military aid in the strongest possible light, while emphasising its ability to keep its own house in order—always an encouragement to investors and military planners. Yet it cannot be denied that the danger, whether inside the country or on its periphery, is considerable. Internally, neither Marshal Pibul not General Phao has been willing to concede that there were more than fifteen hundred active Communists, with a further ten thousand sympathisers—all among the Chinese minority of three millions. These are almost infinitesimal figures in a country of more than nineteen million inhabitants. Siamese spokesmen have insisted on the immunity of their Buddhist and royalist nationals to the threats or promises of Communism. But a similar insistence on the part of the neighbouring Cambodians and Laotians did not prevent the development of strong Communist movements ostensibly acting in support of local nationalist bands. It may be retorted that Siam, which alone of the South East Asian countries escaped the tide of colonialism, offers soil insufficiently fertile for the growth of " crypto-nationalism." But it would be wrong to over-estimate the resistance to subversion of say, the Lao people in its north-eastern provinces.

Subversion, from without, remains indeed the main problem. " Crypto-nationalism " may not be a danger in the strictly Siamese context ; but it certainly is in the wider sense of Thai nationalism. One ambitious movement, and two smaller ones, are the self-appointed instruments of this sentiment. The ambitious one, that of the Free Thais, is an old Communist gambit, which nourishes itself on dreams of a Thai Federation that would include the ethnically similar populations of Yunnan, the Thai country of Tonking, Laos, Siam and part of Burma. The " autonomous " Thai territories in Yunnan and the Thai-Meo autonomous region recently set up by the Viet Minh in the Dien Bien Phu area

are examples of the kind of unit that would belong to the wider federation if it were ever realised. For some years, the idea had been dormant. It was given a fresh impulse in 1953 with the first Viet Minh invasion of Laos, which resulted in the establishment of the "state" of Pathet Lao; and a further impetus was provided by the highly publicised appearance of the former prime minister of Siam, Nai Pridi Phanomyong, in Peking nearly a year ago. Last September, Marshal Pibul's spokesman in Bangkok announced that the Siamese government feared "imminent" aggression by Pridi's Free Thai army. The Siamese claim that Pridi now has twenty thousand men under arms, but it may be doubted that the lethal properties of these arms meet modern requirements. At the same time, Pridi, once a resistance hero high in Britain's esteem, seems to have alienated much of his presumed following in Siam by his open association with Peking. The most potent instrument of subversion might eventually turn out to be the Pan-Lao group, the second—and at present much the less effective—of the smaller movements associated with the Free Thais. There is, in any case, no doubt that the Pan-Lao movement, which originated among the Laos of Siam, is now, like the Pathet Lao movement, taking its orders from Ho Chi Minh.

It is understandable, in these circumstances, that Field-Marshal Pibul and General Phao should have been tempted to deploy so much of the 100,000-strong army and of the 43,000 police along the northern and eastern borders of Siam; that the Siamese should have agreed to give advanced military training to officers of the Royal Laotian army; and that they should have made such persistent efforts to secure the deportation of the 50,000 Vietnamese who, since the time of the Japanese occupation of their country, have been living on the western side of the Mekong, constituting a potential breeding ground for disaffection.

This preoccupation with the northern and eastern borders, however, has sometimes led to a feeling in Kuala Lumpur that the Siamese were paying insufficient attention to the problem of security along the Malayan frontier. It is true that the police forces of the Malayan Federation and of Siam have closely collaborated for several years; but the Siamese have shown themselves reluctant to accept British intelligence reports—now confirmed—that the leader of the Malayan Communists, Chin Peng, had set up his headquarters in Siam. On the other hand, General Phao showed himself aware of the extent of the problem of jungle operations when he brought Siamese army, navy and air force officers with him on his most recent visit to Lieutenant-General Sir Geoffrey Bourne, the Federation's director of operations. And there is now a hope that combined operations on both sides of the border may begin to yield results beyond the frustrating discovery of deserted terrorists' camps.

The willingness of the Siamese to co-operate with the British and Malayan forces is a proof of the statesmanship of Siam's present rulers; for it is clear that the threat in Siam's southern border region points away from Siam. But if all Indo-China eventually falls to the Viet Minh and its subsidiaries, the existence of a Communist base in Siam would present an obvious threat to Siam itself as well as to the British end of the Malayan peninsula and to the rest of South East Asia. It is to be hoped that the "home guard" of 120,000 men now being raised in Siam with American help will enable the Siamese to release more of their regulars for service in the South.

It is clear from the existence of these threats along three borders that the Siamese will have to continue to fight hard if they are to preserve their immemorial name of "Muang-Thai," or "land of the free." Marshal Pibul has always insisted on the name of "Thailand"; but Siam and Siamese have the merit of clarity, which "Thai" lacks, since it applies to so many non-Siamese. It is equally clear that geography and political realities make Siam the real linchpin of Seato. And Siam's determined adherence to the Western side has conferred upon it the right to demand all possible help from the West.

Formidable Opponent

Just before the Whitsuntide recess Mr Gladstone delivered a speech of singular force, earnest eloquence, and acute ability, in which he impugned in no measured terms the wisdom and justice of continuing the war. We heard that speech. We listened to the orator for two hours with unflagging interest and admiration, and we are bound to say that we never heard arguments so skilfully marshalled or so brilliantly expressed, statements so lucid, declamation so impassioned yet so chastened and restrained. . . . And if one thing was made clearer than another to our minds as we listened, it was the deep self-conviction of the speaker, and the solemn sense of responsibility under which he addressed his audience. Yet ever since it was delivered that speech has been the object of the most unmeasured invective and the most shameless and perverse misrepresentation . . . it was described in one leading article as "something between the rant of the fanatic and the trick of the stage-actor"; . . . while several have not even disdained to descend to the usual vulgar, self-refuting, and self-accusing insinuation that the loss of office is the key to the whole matter, and that Mr Gladstone's doctrines are solely the consequence of the special bench on which he sits. It seems strange that it should devolve upon us to take up the cudgels on behalf of a political antagonist; but in truth it is not Mr Gladstone that we are anxious to stand up for:—it is the cause of fair weapons and honest warfare—of that candour without which discussion is valueless—of that decent justice which alone can prevent antagonism from degenerating into scurrility. On the special subject of the speech in question we differ from Mr Gladstone *toto cælo*; . . . Yet it devolves upon us, the advocates of war, to protest against the pitiful unfairness shown to the advocate of peace; and we should despise ourselves were we unable to do justice to the character, or to appreciate the reasoning, of a formidable opponent.

The Economist

Notes of the Week

Spanner or Olive Branch?

THE Trades Union Congress has worked indefatigably to find a basis for settling the rail strike. It is not so certain that it has worked wisely as well. It is unfortunate that its "five-point plan," though it asked everyone to make concessions, demanded least of those who are doing such damage to the nation. The Associated Society of Locomotive Engineers and Firemen has readily agreed to a scheme whereby its men might get an immediate increase, smaller than they claim, on the understanding that there would be more to come after talks on differentials; and it has been content to modify its insistence that differentials should be discussed without reference to the National Union of Railwaymen, provided that the NUR comes in only at the end—or at what seems to be the end. This last provision, however, is quite a large pill for the NUR to swallow. It leaves it holding the baby, for to persist in its "reservations" would mean that it, and not the ASLEF, was now blocking the path to negotiation—as also, in the later discussions on differentials, it might incur the odium of blocking a settlement.

The Transport Commission was given a more difficult decision still. It has always been a matter of tactics (and of definition) whether it should refuse to go back on its own—and the Prime Minister's—declaration that there can be no negotiations while the strike is still in progress. But it is a matter of substance that it should refuse to offer any better terms than it would in peacetime just because the pistol is still kept at its head. In particular, it should certainly refuse to agree to an interim and flat-rate increase for every driver, regardless of his responsibility; the most it should offer is some improvement on its last proposals, which would have increased differentials within ASLEF, and not merely between ASLEF and other people.

Talks between Sir Brian Robertson and Mr Raty were to be resumed on Friday afternoon, and any comment set down before they are concluded is liable to be overtaken by events. But nobody should forget that peacemaking has its dangers no less than war; and that it is the Transport Commission—not the engine drivers' union—which is now on the side of genuine differentials. If the intervention of the TUC leads to a settlement on the lines of the Transport Commission's original proposals, it will have been a great achievement. If it leads to settlement on any other lines, it will have been a great tragedy. And if this flurry of diplomacy breaks down—after having encouraged the strikers to think that they have only to hold fast a little longer to gain their whole case—it may have been the greatest tragedy of all.

Unappetising Diet

THE Queen's Speech on Thursday adumbrated a large and rather stodgy programme of legislation; and the Government has decided that the first session of the new Parliament should last for a full year. This is a pity. Once the emergency of the rail strike is out of the way, Ministers should spend the summer in thinking out what new and unpopular steps they can take, in order to put the country more firmly on its feet and to make themselves more popular in five years' time. If they had to draw up a new Queen's Speech in October, they might have more incentive to do this. It remains to be seen whether they can recover from this initial mistake.

A large part of the programme—and the part which is to be taken first—consists of minor measures that were axed by the early end of the last Parliament, or that the Ministers or pressure groups concerned were known to have jostled to near the top of the queue. It will be a pity if the Government assumes that all of these essentially technical measures are therefore uncontroversial. The old Copyright Bill (which made the mistake of seeking to give the BBC and ITA a too rigid form of copyright), the Road Traffic Bill (one feature of which is discussed in a later note), and the County Courts Bill should certainly not be re-introduced and passed without amendment; while the proposed smoky fog Bill and the proposed legislation to protect agricultural and forestry workers are examples of the type of "popular" sanitary measure which the last Parliament handled very badly indeed. And the Government will hardly need to be reminded that the same danger of mishandling will hang over its revised measure for teachers' pensions. One other political headache of the last Parliament is to undergo examination in preparation, presumably, for treatment in some later session; as promised in the Conservative election manifesto, there is to be an inquiry into the practice and procedure of administrative and quasi-judicial tribunals

The Main Courses

THESE, however, are relatively small fry. There are four main headings under which the Government's other—and more important—domestic tasks may be grouped. In the first place, it is now generally assumed that it will want to make—in the words of the Queen's Speech—a "further advance towards a free flow of international trade and payments." Unfortunately, the only legislative proposal in th

Speech about trade points in precisely the opposite direction; a bill is to be introduced "to permit the imposition of countervailing and anti-dumping duties on imported goods." This may be a necessary protection of the flanks of the main advance; but it will need to be very carefully watched. In particular, it is to be hoped that it does not mean that new barriers are to be imposed against the limited classes of cotton goods that can come freely into this country already.

A second heading covers local government reform, which is to go forward in this session and which will merge by the middle of next year with the new rating valuations. Finance has always been the key to local government reform; and it will be a great pity if, as it turns its mind to this problem, the Government simultaneously shuts its eyes to the whole question of housing subsidies.

A third heading is that over monopolies. Here the Government promises "such action as may be required"; exactly what will be required should be shown in the forthcoming report of the Monopolies Commission on general restrictive practices. The final, most general and most important heading of all covers the whole question of inflation, fair shares and fair opportunities. Inevitably these are questions that will affect the shape of the next budget, and the answers to them cannot be anticipated in a Queen's Speech—especially one launched in the middle of a period of industrial disputes. But one minor—and welcome—step towards fairer opportunities is to be taken at once; a bill is to be introduced to extend the period during which family allowances are payable for children who remain at school.

Red Carpet for Dr Adenauer

ONE by one, the Soviet government is playing the cards that have so long lain face downwards on its side of the table. Its invitation to Dr Adenauer was anything but a surprise; it was a logical sequel to the Austrian Chancellor's visit to Moscow, and ever since Herr Raab's joyous return to Vienna in April a theme of Communist propaganda has been that Germany's best hope of securing reunion and the withdrawal of the Red Army lay in taking the road to Russia alone. Muscovite diplomacy sees nothing strange about issuing a polite, indeed pressing, invitation to a man whom Communist propaganda has long depicted as a bloodthirsty tyrant; nor, after Belgrade, should anybody in the free world be astonished at this new instance of skill in the somersault. Only among the East German Communists are there signs of shock, which are doubtless genuine enough. They have lately had several reassurances from the Russians, and it is a little cruel of Moscow to revive all their feelings of insecurity by a statement which simultaneously claims that they have always been treated "on a firm basis of equality and non-interference."

However, Herr Ulbricht and his followers will probably regain their composure quickly, for any examination of the Soviet invitation to Dr Adenauer soon shows that it is doubly not what it seems. Superficially an amicable offer to enter into diplomatic and commercial relations with the Federal Republic, its very text contains, buried among the glowing images of increased trade and the sombre recollections of war, clear intimations that if Dr Adenauer comes to Moscow he will have to discuss "connected questions," and in particular the "plans of aggressive circles" that obstruct "mutual trust and peaceful collaboration" between Russians and Germans. In plain English, he will be pressed to strip the Federal Republic of its protecting alliances and to rely on Moscow's assurances that the "new order" for Europe which it has in mind will not be dominated by Russia. Moreover, the Soviet rulers know very well that the Chancellor himself will fall for no such gambits, and their real aim thus emerges clearly: it is, as before, to make his domestic position and that of his government as difficult as possible, to isolate him by playing on the Germans' fears and their hopes of a quick and cheap accommodation with Moscow. But the Russians may have misunderstood the German mentality as fully as the Jugoslav. Among the Germans, the first general reaction has been to see the new move as a tribute to the Chancellor's sound judgment and steadfastness. Ironically, the Communists, whose cry only a few weeks ago was "The West German people must replace Adenauer," are now adding to his laurels.

On the Upper Slopes

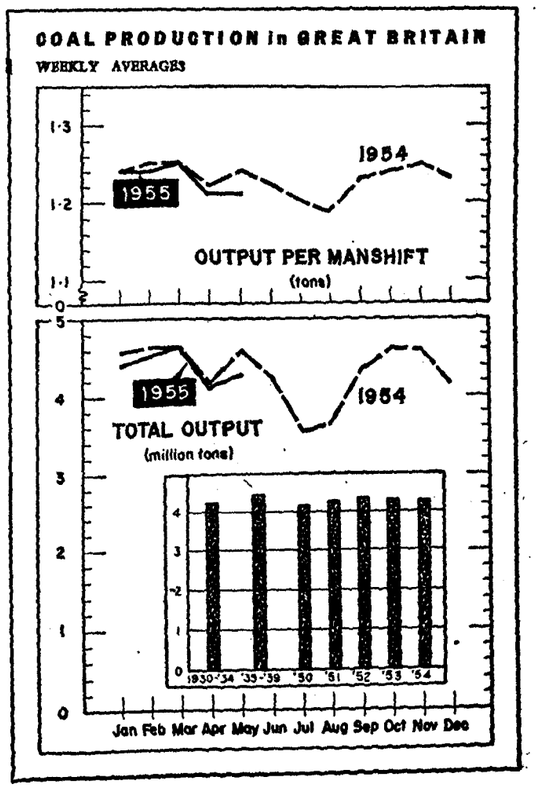
THE "summit" seems at last to be clearly in sight. The western governments can see no good reason why the Russians should now reject the proposal, formally made on Monday, that the meeting of heads of government should begin in Geneva on July 18th. Moscow may continue to make some play with its propaganda point in favour of a longer meeting between the President and the three Prime Ministers. The outside world, however, will be the less impressed by this after the revelation at Belgrade that Marshal Bulganin, like Chou En-lai, is a subordinate, not a supreme, figure. The fact that Communist states can afford to be lavish with the time of their "prime ministers" is no argument for the democracies, where the doctrine is still current that detailed negotiation is a task for foreign ministers and diplomats.

Yet, if the ascent to the "summit" is not now to be a long one in time, it will be a tiresomely circuitous one in terms of space, passing through preliminary western discussions in Washington and New York, and pitching Camp Three at San Francisco during the commemoration there of the signing of the United Nations Charter ten years ago, before returning to within sight of Mont Blanc. And the western governments have also to cover a formidable amount of ground in a more figurative sense. If they are to arrive at Geneva in mid-July with a negotiating position that is not only firmly agreed between them but also positive enough to prevent the Russians from stealing the show, they will have to put in some very hard work on a whole range of issues, from Germany to general disarmament. Nor can they count on being allowed to get on with the task in peace. The Russian approach to Western Germany on Tuesday will hardly have been Moscow's last diplomatic manœuvre before July 18th. On the upper slopes of their arduous climb, the western mountaineers can expect to encounter quite a few abominable snowmen wearing Mr Molotov's boots.

Operation Greybeard

LABOUR'S exercise in plucking at its greybeards started this week amid remarkable *bonhomie* from the greybeards themselves. Mr Dalton and Mr Shinwell forestalled the tumbril by announcing that they will not seek re-election to the Shadow Cabinet; one, or possibly two, more of the Old Guard are expected to follow them. Allowing for the enforced absence of Sir Frank Soskice, this would leave four or five vacancies in the Shadow Cabinet. One of them may be filled by the familiar figure of Mr Bevan; if he is willing to end his self-imposed exile, his long-suffering party is apparently ready to restore him to its higher councils. The rest will probably be filled by younger men; as the *News Chronicle* so cruelly put it this week, the addition of "inexperience to incoherence" is Labour's favourite nostrum just now.

Before the rejuvenation of the Shadow Cabinet takes place, however, the party must choose a leader, deputy-leader, and chief whip for the new session. Mr Attlee is to be elected unanimously to the first office, and Mr Morrison will almost certainly be given a clear run for the second. But Mr Whiteley, who is 72, has been told very firmly that he is too old to remain as chief whip, and will now retire gracefully from the scene. Mr Attlee, who is also 72, is believed to have told his colleagues that he is willing to retire towards the end of the present elongated session if the party so desires; but the party is not sure that it does. For the succession is still doubtful. Mr Morrison, who has been the Crown Prince for so long, will be 71 or 72 by the next election; and that would be very late for a man to become Prime Minister for the first time. The alternative, of course, is Mr Gaitskell; and this is why Mr Bevan is now the loudest proponent of the view that Mr Attlee must stay.



Patience Not on Strike

IF there is ever to be any "reform" of the present system of industrial relations, any Parliamentary attempt to make strikes less frequent, public opinion will have to move a long way in advance of the Government; and, for this reason, one of the most interesting questions raised by the railway strike has been whether the stricken public would become really angry at last. So far the public seems to have wriggled rather than turned. The popular newspapers of all parties—representing in this the feelings of the man in the long bus queue—have certainly been angrier with the railwaymen's leaders than in any previous dispute, and have sometimes carried attacks upon personalities beyond justified limits. But although they have deprecated the strike, they have also given the impression that they would welcome surrender to it. The lesson that would-be strikers will probably draw from public and press reactions so far is that stoppages are unpopular, but that standing up to stoppages is unpopular too.

In the more expensive newspapers—those that are addressed primarily to the man in the motor car—there have been more frequent warnings about the dangers of surrender. It was upon this class of commentator and reader that the moral of the disastrous Cameron court of inquiry last January had its main impact. But beastliness towards those who attack the country is still plainly against the ethos of the administrative class. One responsible Sunday newspaper went so far last week as to say that "any attempts . . . to work up public anger against the strikers will impede a settlement by hardening tempers all round." As an essay in the art of durable peacemaking, this is just not true; the long term problem of the railways will not be more easily settled if striking railwaymen feel that a suffering public will never become angry with them, instead of feeling that a molten lava of wrath will erupt on any striker's head. But as a summary of the way in which the public would like peace to be patched up, the newspaper was probably near to the mark. In the end, Britain will get the sort of system of industrial bargaining that it demands. After two weeks of remarkably easily assimilated chaos it does not—at the moment—seem to be demanding any very great change. Whether this is cause for congratulation upon our national steadiness of temper, or a sign of the urgent need for a little more rabble-rousing in the right place, is a matter upon which two opinions can be held.

Re-launching "Europe"

LAST week's meeting at Messina demonstrated once again both the durability of the European idea and the fact that the conviction and sense of urgency required to "make

Europe" are still largely missing. The ministers of the six Schuman Plan countries slammed no doors, but they compromised and temporised both on the appointment of a new president of the High Authority and on how to make a new start in Europe. M. René Mayer, a "good European" but one without a programme, will succeed M. Monnet, a man whose uncompromising determination to give Europe a new form proved too heady for his compatriots.

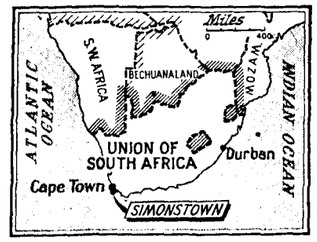
The ministers agreed in principle that the time had come for a "new stage" on the road to European unity and that the next moves should be economic. They agreed that some kind of joint action was required in the development of transport (rail, water, road and air), the use and development of gas and electric power, and, most specifically, the development of atomic energy. They also cautiously endorsed the ultimate objective of a common market free from internal tariffs and quantitative restrictions, but the terms in which they did so will make it easy to lose sight of the objective by concentrating on technical difficulties. A committee assisted by experts will try to work out in detail what specifically might be done in each of these fields, and the ministers will review progress before October. Where a basis for action is found to exist, the work of reducing plans to treaties will then be undertaken by special conferences.

★

No decisions have been taken which make eventual action inescapable. On the contrary, it will be hard to resist the tempting resting places that line the way. The difficult questions have all been sidestepped, and the key job of pacesetter and taskmaster has yet to be filled. The ministers agreed that a "political personality" should be put in charge of the preparatory work, but the prevailing reluctance to be pushed has apparently ruled M. Monnet out of the running.

The communiqué is pointedly silent on the controversial issue of supra-nationality, and skirts the related question of which European countries should participate in any new attempts at further integration. Some feel that Switzerland and Austria are almost indispensable partners of the Six if much is to be done in transport and electric energy. The basic Benelux memorandum, which the Messina meeting took as a point of departure, proposed that both the British and the OEEC, as an organisation, should be asked to participate in the next stage of the discussions, and this was agreed. With the Monnet concept of a "supra-national community" in at least temporary eclipse there is much to be said for more broadly based discussions. All the subjects mentioned in the communiqué are ones which the OEEC has on its docket. With the inevitable tapering off in the OEEC's preoccupation with trade and payments which will come with the eventual re-establishment of a world trading system, the dimensions of regional co-operation need re-examination. But the compelling reason for broadening the discussions is that the most urgent new field for European action is the development of atomic energy for peaceful purposes. At this early stage in the discussion, few Continental countries will be prepared to count themselves out of a common approach, and on both economic and strategic grounds the United Kingdom would be very foolhardy to do so.

Messina settled nothing but the first steps of a procedure which may lead anywhere or nowhere. It is a misfortune that the gritty backwash of the wave that broke before the EDC could be launched is still hampering the efforts of the man who has always seen clearly, if at times too boldly for his contemporaries, how a new Europe might be built. But resilience as well as the courage of his convictions have made M. Monnet a hero to some and a thorn in the flesh to others. It will be surprising, and disappointing, if he finds anything but a new opportunity in the ambiguous decisions of the Messina conference.



Fogging the Formosa Strait

THERE is cause for a certain satisfaction about the Formosa situation, but no room for complacency. By the beginning of this week, the tacit truce in the strait, marred by one burst of fire from mainland guns, had held for long enought to justify Mr Dulles in drawing public attention to it. Peking is still emitting periodic reminders of its determination to "liberate" Formosa, but the war-drums which it was beating so loudly before the Bandoeng conference have now remained half muffled for some weeks. The Nationalists have likewise reduced their output of inflammatory, and in their case ludicrous, statements. Indeed, when their ambassador in Washington publicly concedes that cessation of Communist attacks implies that the Nationalists hold their fire, too, there seems some hope that they at last understand how much their infantile sabre-rattling has tried the patience of the Americans, as well as of other governments.

Yet it is still mistaken to suppose that the Peking government has agreed to negotiate a cease-fire. When it last spoke clearly it showed that the talks it had in mind would deal rather with an American abandonment of Formosa to its fate. Chou En-lai has since delivered himself of some lengthy and scarcely limpid observations to Mr Krishna Menon and to Mr Trevelyan, the retiring British *chargé d'affaires* in Peking, and these have been passed on to London and Washington, which do not feel much wiser for hearing of them. For once, however, there may be a case for not trying to find out too exactly what Mr Chou has in mind. If the assumption is that Peking can no more renounce its demands on Formosa than the United States can abandon an allied government, there is much to be said for Mr Dulles's remark on Tuesday that some matters are best handled by not doing anything about them. In naval terms, the most helpful order in the present situation may be to "make smoke."

The Fate of Simonstown

TALKS are to be held next week in London between the South African Minister of Defence, Mr Erasmus, who is accompanied by his Service chiefs, and their British counterparts. The talks will cover a wide range of topics, but high on the agenda will be the question of the future of Simonstown, the Royal Navy's base near Capetown and headquarters of the South Atlantic squadron. Changing circumstances have altered the strategic importance of the base, which is in any case small and in no sense comparable with such large naval centres as Singapore. The advent of nuclear weapons and long-range aircraft and submarines has reduced the value of the Cape route as an alternative, in time of war, to the Mediterranean; but it still retains considerable importance for inter-Commonwealth communications.

Of greater immediate significance, however, are the changes, both those that have already taken place and those likely to occur in the future, in South Africa's relationships with Britain and the Commonwealth. A South Africa hostile to Britain could, obviously, make Simonstown untenable; but this is not likely to arise. Indeed, reports from South Africa indicate that Mr Erasmus will be as much concerned to offer Britain assurances regarding the availability of Union ports in the event of war as he will be to demand the immediate giving up of Simonstown. This new attitude is explained perhaps by a sudden realisation in South Africa that the country is in danger of finding itself on a lonely doorstep. Admiralty planners, who are aware of the inadequacies of Simonstown as a base, will probably favour the proposal. But everything depends on the price South Africa is asking. A political deal involving, say, the transfer of sovereignty over the Protectorates, stands no chance of acceptance.

Newspaper Dispute Again?

THE negotiations following the end of the newspaper dispute do not promise too well for the long run, and the public has a right to be kept informed about them. It will be remembered that the main recommendation of the court of inquiry last April was that "the fourteen unions . . . should co-operate to establish an appropriate central body which should in future negotiate with the Newspaper Proprietors' Association on . . . rates of pay, conditions of service and the wage differentials applicable to the various grades of workers." The jealousies of the various craft unions, and their liking for the opportunities for endless leap-frogging which separate negotiations with the employers offered, have already made it clear that in this recommendation the court was beating the empty air.

The one hopeful development is that, at the preliminary meeting with the employers after the stoppage, representatives of the two former striking unions, the Amalgamated Engineering Union and the Electrical Trades Union, were present along with the leaders of the craft unions comprising the loose alliance known as the Printing and Kindred Trades Federation. If they continue to negotiate alongside the PKTF peace may be preserved. The PKTF at least understands the industry; although it sometimes negotiates to breaking-point, it has hitherto always managed to avoid a breakdown. It may keep the electricians and maintenance men in check, though the determination of these to secure an increase for their members was clearly shown in the bitter remarks of Mr Haxell, the ETU general secretary, at the union's recent conference.

Meanwhile the compositors' union, the London Typographical Society, will have nothing to do with the rest, and is negotiating entirely on its own—indeed it has not yet terminated the previous round of negotiations or accepted the money due to its members from them. The prospect for the employers is therefore discouraging. The upshot is almost certain to be wage demands which in total will be more than the industry can afford, rather than an agreement on the right division of whatever money is available. This is not necessarily a situation in which a strike will recur; but it is clearly one in which it could.

Peace at the Ports?

THE TUC's unwillingness to make moral judgments about the union differences on the railways is not matched by a similar detachment at the docks. Its inflexible attitude towards the National Amalgamated Stevedores and Dockers has now produced results. Mr Newman of that union has crawled abjectly under another yoke. He has agreed unreservedly to accept whatever judgment the TUC's disputes committee may pass on the NASD's dispute with the Transport and General Workers' Union; and he has accepted two of the TUC's prior conditions before that committee can be set to work. He agrees that no more recruiting should be carried out, and no more contributions received from the members "poached" from the big union; but he asks to be allowed to pursue representation on the local committees by peaceful means. He says, with some truth, that the men cannot be handed back as if they were cattle. Mr Newman himself, indeed, is finding them very far from docile, for they are more enthusiastic than their own leaders, who have tried to call off the strike. For those who know the stevedores' record it would go against the grain that they should keep members whom they recruited by promising that they could enjoy all the benefits which had been negotiated by the Transport Union, without standing by the agreements to which those benefits were tied. But it would take more than a letter from Mr Newman or a frown from Sir Vincent Tewson to prevent people holding meetings if they want to. The TUC has, therefore, wisely accepted Mr Newman's offer; and there now seems no reason why the docks should not get fully back to work.

Fortunately, the other piece of trouble at the docks—the strike of liner crews which began at Liverpool at the end of last week, and which rapidly spread to Southampton—also seemed to be breaking up by Thursday. The crew of the *Queen Elizabeth*, which docked at Southampton on Tuesday, were not infected by the strikers who are holding up the *Mauretania*, and the liner sailed to time. The aim of this strike was a protest against hours of work and living conditions, about which dissatisfaction had been brewing since men walked off the liner *Georgic* a month ago. It is reported, however, that the dissatisfaction is confined largely

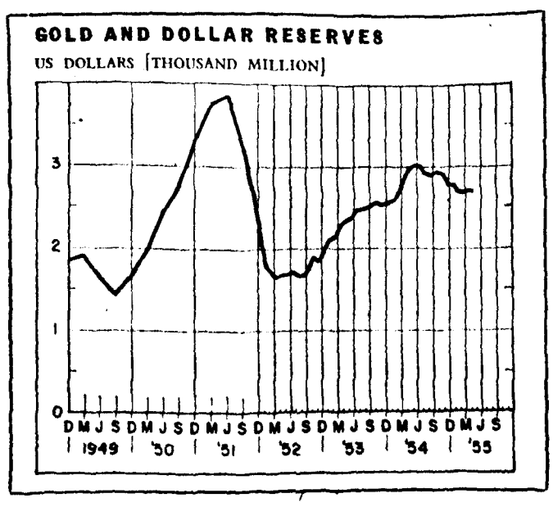
to the younger men, who do not know how much conditions have improved. Their action imposed iniquitous hardship on stranded passengers, many of whom are dollar tourists who certainly will not be coming back next year.

Guessing Game

IN April and May of this year seventy-one leading economists in the universities and in business were asked by the study section of the Royal Statistical Society how they thought the British economy would fare in 1955. With remarkable near-unanimity, they replied that it should fare in much the same way as in 1954. They expected retail prices to rise by about 3 per cent during the year, and unemployment to remain stable at only 1.3 per cent of the insured labour force. The average of their predictions about production, demand and exports—translated into real terms—is shown in the accompanying table. It will be noted that, if their guesses about exports and imports prove right, Britain's balance of payments position would deteriorate this year by only some £5 million more than the extent to which it is hit by the deterioration in the terms of trade; as Britain had a surplus of £110 million last year (excluding defence aid), and as the terms of trade are currently only 2 per cent worse than the 1954 average, this means that they hardly expect any payments deficit at all. But it should also be noted that the economists put on their spectacles before the railway and dock strikes burst over the nation.

GUESSES AT THE OUTTURN
(£ million at 1953 factor cost)

	Actual	Average guess
	1954 compared with 1953	1955 compared with 1954
Changes in Demand:		
Consumers' Expenditure	+390	+390
Public Authorities' current expenditure including defence..	− 40	+ 10
Gross Fixed Investment.....	+125	+150
Exports of Goods and Services..	+240	+150
Total	+715	+700
Investment in Stocks and Work in Progress.....	+ 50	+ 15
Total Change in Demand..	+765	+715
Changes in Supplies:		
Gross Domestic Product	+625	+560
Imports of Goods and Services..	+140	+155
Total Change in Supplies...	+765	+715



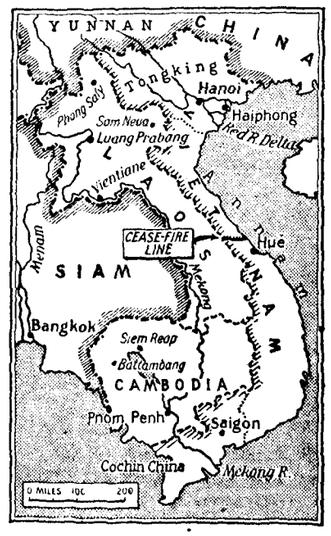
Same Again in Holland

THE Dutch cabinet crisis has been quickly solved. After an interval of only ten days Dr Drees's government has returned intact to finish the job it started. This happy solution was made possible by the efforts of Dr Burger, leader of the Labour prime minister's own party in the lower house, to find a middle way acceptable to both of the two main coalition partners. Both sides gave way a little. The Socialists agreed to the principle of a rent increase, but they gained a point from the Catholics by getting a flat increase of 5 per cent on the rent of all properties instead of the differential increases originally proposed by the government. But the Socialists were obliged to forgo, for the time being, their proposal that part of the rent increase should be earmarked as a special fund for house building and repair. To placate those who argued that the proposed tax reductions which the government had coupled with the rent increases would distort the pattern of income distribution in Holland, further tax concessions of about 70 million guilders, all on the sales turnover tax, have been agreed.

This unwanted crisis has not solved the real underlying problems between the coalition partners. Yet, with only twelve months to go before the next general election, and with little observable shift in the relative strength of the parties in the country, another coalition based on the same political groupings as the present one seems the only likely prospect. Renewed efforts to find common ground on social and economic questions will have to be made by the two main parties.

Little Landslide in Sicily

IN last Sunday's Sicilian elections the Christian Democrats achieved what some local newspapers called "a little landslide." They increased their representation in the 90-member regional parliament from 30 to 37. This success must have owed a good deal to the Christian Democrats' reasonably successful record in office of social development and land reform. Moreover the announcement a few days before the poll that the World Bank had made a $70 million loan to Sicily and southern Italy, must have added an impressive feather to their cap.



But the Christian Democrats' success was not great enough to allow them to dispense with their embarrassing coalition partners—the right-wing Monarchists and the Liberals; and the reverses suffered by the small centre parties do not offer the Christian Democrats any suitable alternative partners. The Communists, the principal rivals of the Christian Democrats, hung on to their twenty seats but lost votes—presumably to their allies, the Nenni Socialists—and failed to substantiate their claim that, whatever their difficulties in northern Italy, they were maintaining and even extending their hold in the south. The Nenni Socialists, who chose this time to campaign on a separate list, can congratulate themselves on polling more votes than in the 1953 general elections, but gained no more seats than in the last regional elections in 1951; thus the combined strength of the extreme left—thirty seats—remains exactly what it was before.

In Rome, the Sicilian elections have for months past been regarded as a kind of milestone. Until it was reached it was permissible to attempt nothing drastic to solve the present political stalemate. But once it was past, it was generally agreed that something decisive would have to be done either to stick the present coalition firmly together again, or to give it the final *coup de grâce* and try something new. If behind this argument lay the hope that the Sicilian elections would somehow point the way to a solution of Italy's political problems, the hope now seems a slender one. The Christian Democrats' success will, it is true, strengthen the position of Signor Scelba, who is himself a Sicilian and led his party's campaign on the island; it may even help to bring together some of the warring elements among the Christian Democrats. But since they achieved their victories largely at the expense of the smaller lay centre parties the election results will hardly improve the already strained relations between Signor Scelba and his coalition partners. And Signor Nenni's very modest success will hardly do much to strengthen his advocacy of an "opening to the Left."

Polling Dates Along the Mekong

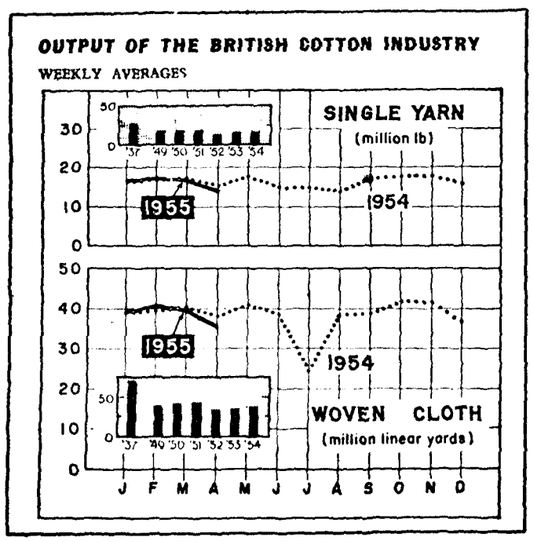
WHILE violence and anarchy have taken their spectacular toll in southern Vietnam, developments in the smaller Indo-Chinese states have gone almost unnoticed. After long and frustrating negotiations, the Cambodians last month signed a military aid agreement under which the Americans will supply arms and equipment on a scale comparable with the amount previously supplied by the French. Although the Cambodians intend nearly to double their army of 30,000 men, the new agreement does not, as the Viet Minh radio is vociferously claiming, automatically commit them to the western camp; nor will the presence of thirty American military advisers constitute a United States base on Cambodian soil. What the agreement will help to ensure is reasonable security and freedom in the forthcoming general elections, now scheduled for September 11th, having been postponed from April 17th because of King Norodom Sihanouk's abdication. The ex-king's sense of drama should be well served at the polls, when all eyes will be fixed on the "Popular Socialist Community" which he has founded since abandoning the throne. On paper, it ought to sweep the country, since the old Democrat party, hitherto the dominant political force, has dissolved itself so that its 4,000 adherents may join the Community. Again on paper, it looks as though Prince Sihanouk has stolen the thunder of his bitter rival, the ex-rebel Son Ngoc Thanh; but it is not clear how far Thanh's men in the Democratic party are going to infiltrate the ex-king's party.

In Laos, fighting continues on a small scale between troops of the Royal Laotian army and irregulars of the Communist-supported "Pathet Lao" rebels. All attempts to reach agreement with the Pathet Lao seem to have failed and the government is apparently pushing ahead with plans to hold general elections on August 28th. It would be foolish, however, to take as sanguine a view of the prospect in Laos as in Cambodia, since neither the Laotian government, the international supervisory commission, nor the honeyed Viet Minh statement at Bandoeng, has altered the basic fact that the Pathet Lao still controls the two provinces of Phong Saly and Sam Neua in the north.

Queueing for the Test

A WEEK when the nation is more on the road, and at the driving wheel, than ever before was clearly well chosen by the Society of Civil Servants to protest at the steadily-lengthening queue of people waiting for driving tests, and also to announce that it was claiming an increase in the pay of driving and traffic examiners. This is one pay claim that every economist should back to the hilt. Last January the Ministry of Transport announced that it was seeking to recruit 170 new examiners; the Society states that it has failed to get them on existing rates of pay, which start at £9 11s. 6d. a week and rise to £11 9s. in London (less in the provinces). Whatever the details of this recruiting "failure," it is quite clear that the supply of examiners falls far short of the demand. There are now 125,000 people in the queue for tests even before the summer rush starts, and the situation has become intolerable.

The reason why the pay of examiners is kept so low—and why the waiting list is packed by some frivolous applicants—is that the fee for the test is pegged at 10s.; at this rate, as the Minister of Transport admitted in the Commons last autumn, the cost of testing exceeds receipts from examinees by £90,000 a year. At the moment, statutory permission is required before the fee can be raised;



and it is expected that the Government will take advantage of the new Road Traffic Bill to obtain this. But Parliament will be making a silly mistake if it merely authorises a flat rate increase. There can never have been a clearer case where variation of a fee should be made subject merely to ministerial order ; and, to help relieve the congestion which the Ministry has allowed to pile up, the first variation now should probably be to quadruple the fee at once. Later, it could be lowered again if pressure of demand is reduced (as it was lowered, from 7s. 6d. to 5s., in 1937).

Uganda in the Melting Pot

A CRITICAL phase has been reached in the negotiations about the future of Uganda. Three delegations from that country are now in Britain. One is drafting in legal terms the amended constitutional proposals for Buganda, after the changes made in the original Hancock scheme by the Lukiko committee. Another is here to press for the return of the Kabaka even before the scheme for the constitutional monarchy comes into operation, on the grounds that only the Kabaka can inaugurate it. The third—and least important—is here to justify expectations raised in extremist circles in Buganda by recent Congress agitation ; it is demanding " immediate independence."

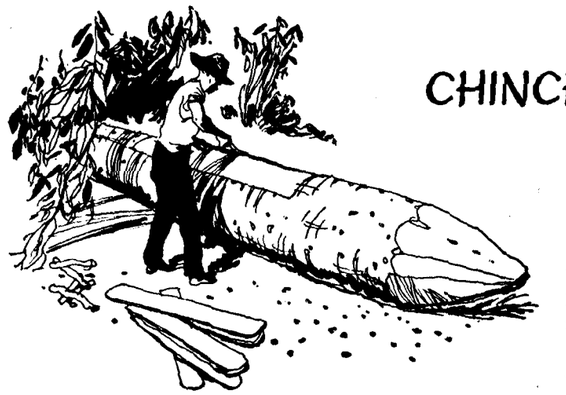
It is now clear that two issues stand out as the main dangers to a final settlement of a problem that has dragged on for eighteen months. One is the African demand that the Kabaka should return at once, before the new constitution is operating. If he did go back in virtually the same position as he left the country—as absolute ruler, even if as an absolute ruler under promise to inaugurate a constitutional monarchy—the whole point of the protracted discussions, and the creation of a " new situation " under which his return became possible at all, would be lost. But there is no reason to suppose that, once the scheme is accepted—and all the delays have been on the Lukiko's side—his return would not quickly follow.

More difficult is the objection that prominent Baganda now take to the presence of an Asian as a minister in the reorganised Legislative Council, on the ground that it detracts from Uganda's status as a " primarily African country." Asians have already served in the Executive Council and it is not proposed that they should cease to sit in the Legislature. As ministers are selected by the Governor, what is sought amounts to a restriction on the Governor's choice of ministers. It ignores the claim of an able and important minority to have some say in policy. It is another sign of the growth in Uganda, as in Kenya, of an emotional and xenophobic African nationalism—which has, indeed, even begun to affect Zanzibar and Tanganyika.

Doctors and Heroin

MANY protests were made at the annual meeting of the British Medical Association against the decision to ban the manufacture and export of heroin after the end of this year. Six divisions had submitted motions to the meeting deploring the ban, and the association's council was instructed to seek direct access to the Government to get the decision reversed.

The decision itself was taken for international, not domestic, reasons. Drug addiction is not a serious problem in this country ; the number of addicts to manufactured drugs is only 317 (compared with 5,000 in Canada) ; and for over 60 per cent of these morphine is the drug of addiction. Only about 15 per cent are addicted to heroin, and it is significant that an equal proportion is addicted to pethidine, one of the synthetic drugs which are used to relieve pain. In other countries heroin addiction is more common, and the international bodies concerned regard the drug as particularly dangerous both because people become more easily addicted to it than to anything else and because of its very damaging effects on the addict. The United Kingdom is the largest producer of heroin, and the Government doubtless felt that the international goodwill to be obtained by reducing the sources from which the illicit traffic can be supplied would far outweigh the loss of its use at home for licit purposes.



But the Government did not reckon with the individualism of the doctors. The basis of the protests that are being made is twofold: first, many doctors are convinced that there is no adequate substitute for heroin in certain cases ; and, secondly, it is held that the Government ought not to have taken its decision without consulting the medical profession through its representative bodies. The Central Health Services Council was consulted and agreed to the ban ; but no attempt was made to ascertain the views of individual doctors, on whom the responsibility for the licit use of heroin has rested. The heroin protests are one more instance of the doctors' insistence on their right to prescribe what they consider best for their patients. It is a particular facet of their determination to preserve their professional independence, which was expressed at their annual meeting in a more general way—in their reaffirmed opposition to the introduction of a fulltime state medical service.

CHINCHONA

The Countess of Chinchón, wife of the Viceroy of Peru, was cured of a fever in 1639 by taking a potion prepared from the bark of a tree which, a century later, was named Chinchona by the botanist Linnaeus. The indigenous name of the bark in Peru is quina-quina; it has saved countless lives for it is the natural source of quinine, once man's only weapon against malaria.

The Chinchona is an evergreen tree which is native to the well-watered eastern slopes of the Andes near the equator. Although it has been successfully grown in other parts of the world, it is still exported from Peru and neighbouring Republics.

In almost all the important commercial centres of these countries and throughout South and Central America, branches of the Bank of London and South America serve the needs of traders. Reports on local produce markets, trading conditions, exchange regulations and economic affairs in general are sent by the branches to the Bank's Head Office; the contents of these reports are published in our Fortnightly Review, which is distributed to our customers and correspondents.

Acid test for enterprise . . .

Where the Gulf Stream sweeps deep-sea currents, rich in bromine (a vital ingredient in "anti-knock" petrol), against the shores of Amlwch, in the Isle of Anglesey, Wales, the Associated Ethyl Company Limited has erected a Bromine Extraction Plant.

Sea-water gives up its pure bromine only after complex chemical treatments which set free many acid gases. Corrosion by these gases and by the sea-water itself had to be taken into account in designing the many vessels, pipes and other metal and concrete structures which could be attacked. Dunlop prepared special rubber compounds to withstand all the corrosive attacks and undertook the lining of the huge plant. In one sea-water processing unit alone, 75,000 square feet of rubber sheeting was needed to protect the walls and floors; for another single chamber 30 tons of rubber was used for lining; numerous fan-units and four miles of steel girders were covered with hard rubber.

Now, protected by its six acres of Dunlop rubber linings, the Amlwch plant is in full production: an example of two major British industries collaborating to fill an urgent need for this mechanised age.

Letters to the Editor

Why the Conservatives Won

SIR—In your issue of June 4th you write: "The achievement of Mr Zilliacus in very nearly losing the rock-solid Labour seat of Manchester Gorton (Labour majority down from 7,948 to 269) was one of the most striking in this election." This example was adduced to illustrate your contention that the Left in the Labour party had done even worse in the General Election than the Right.

Are you really ignorant of the fact that redistribution took away two of Gorton's four wards (including the biggest and most solidly Labour ward, Openshaw) and added two new wards, one mixed and the other mostly Tory, thus making a new constituency, which as it happens is not nearly so good from a Labour point of view as the old Gorton? Or did you ignore this fact because it spoils the point of your contention?—Yours faithfully,

London, W9 K. ZILLIACUS

[The two wards withdrawn from Manchester Gorton were Withington (described in the *Manchester Guardian* of May 11th as "predominantly Conservative") and Openshaw ("solid Labour") The two urban districts added to it—Audenshaw and Denton—were "both, to judge from their councils, safely Labour." It is interesting to learn that Mr Zilliacus did not expect a majority of more than 269 from a constituency which had been changed in this way. —EDITOR.]

★

SIR—I was reading your election analysis with the open-mouthed awe that I reserve for the psephologists, when I arrived at your notes on the Coventry result. If henceforward I regard statistical interpretations, even when supplemented by a general political knowledge, with some doubt, it is because I saw illustrated by your assessment of the Coventry elections how local "invisibles"—invisible, that is to say, to an electronic machine fed with inadequate data and to the back-room numerologists with inadequate local knowledge—can lead to false conclusions.

My Coventry colleagues (who, by the way, are the Coventry [Bevanite] Duet that you speak of?) will answer for themselves. As far as Coventry North is concerned, our electorate had fallen between 1951 and 1955 by approximately two thousand, known Labour voters for the most part, who had been rehoused in Council estates elsewhere. A large industrial hostel had been closed, and its residents dispersed. Indeed, the *Birmingham Post* wrote the day before the Election, "the electorate in the North has fallen by more than two thousand . . . and in this exodus may be reflected the removal of Mr Edelman from the House of Commons."

When you take into account these figures, the North Coventry vote gets closer to the national average without much need to introduce in explanation factors such as local squabbles between the Press and the Labour Council, which engendered high feelings, or the somewhat colourless personality of the candidate. May I suggest that the diviners now pause till the entrails stop steaming?—Yours faithfully,

MAURICE EDELMAN

House of Commons, S.W.1

Television in the Election

SIR—The suggestion contained in your issue of May 28th that there may be some future support among the parties for "a smaller ration of television time at the next General Election" is not, in my view, correct as regards the Conservative party. We believe in as wide a propagation as possible of the principles of Conservatism and the maximum publicity for the achievements of a Conservative Government, and there will certainly be no electronic Luddism as far as the Tories are concerned. We are encouraged by the fact that in the recent General Election our three television broadcasts had the highest ratings in the Gallup Poll of viewers, and we are quite prepared to risk an assault on this position at the next General Election.—Yours faithfully,

M. CHAPMAN-WALKER,
Chief Publicity Officer

Conservative and Unionist Central Office

Nettles to Grasp

SIR—In your article of June 4 you have provided me with a nettle which, despite my instinct to side with *The Economist*, I feel obliged firmly to grasp.

You observe "it would doubtless be a counsel of perfection to urge the Government to bring the long-continued fall in the value of money to a complete stop." The thesis that the welfare state cannot have real money in the sense of money that keeps its purchasing power must, I suggest, be firmly repudiated. Otherwise would we not have to acquiesce in the following unwelcome or inadmissible propositions?

1. That there is no particular point in saving in order to incur certain losses. (What becomes of the national savings movement?)

2. That only simpletons or trustees circumscribed by time-worn settlements would hold fixed interest securities, including what are called gilt-edged.

3. That contracts for time cannot avoid being vitiated by monetary erosion.

4. That gross injustice between those on elastic and inelastic money incomes are to be a permanent feature of our society.

5. That progressively rising costs, even at a modest tempo, can continue without causing periodical crises to our exports, employment, balance of payments and confidence in the currency.

This catalogue could be extended more or less indefinitely.—Yours faithfully,

CECIL KISCH

London, SW1

Foreign Investment

SIR—It seems to be the common view today that there are only three channels for foreign investment:

1. Directly by the government of the capital exporting country (Marshall Plan, Fourth Point, etc.);

2. Directly by a large private concern (an oil company sets up a refinery);

3. By the flotation of a *new* issue on the stock exchange of the capital exporting country; or its private placing with the World Bank.

But there is a fourth very important possibility: the foreign purchase of the existing securities of well-established firms (or of the national debt). It seems to me that greater returns would be offered by exploring this channel than by pressing further along those better trod. Thus many an American institution might well consider adding British blue chips to its portfolio as yield sweeteners, or to spread the risk into an area less subject to purely American trade recessions, etc.

Is it true that the sole obstacle to the quotation of many British equities on Wall Street is the companies' refusal to publish quarterly reports? If this is so, an amendment to the Companies Act, compelling large firms to do so, would surely contribute more to our balance of payments than any export drive, exchange restriction or Bank rate increase; and is the first and easiest duty of the newly elected Government. Do our commercial representatives push our securities with half the energies with which they push our woollens? Has the government a Wall Street broker?

The peculiar virtue of such a move would be to set free native capital to undertake the risks at home and in the Commonwealth for which, by long tradition, intimacy and proximity it is better qualified than American private risk capital. Also, since it is to the latter and not the US government that this move would appeal, it would be more likely than any other to increase the total flow of US capital abroad; and less likely to lay us open to the very real dangers of interferenoe by that government in our internal affairs. —Yours faithfully,

New College, Oxford P. J. D. WILES

Books & Publications

Labour's Struggle in Australia

THE AUSTRALIAN FEDERAL LABOUR PARTY, 1901-1951.
By L. F. Crisp.
Longmans. 360 pages. 25s.

POLICIES FOR PROGRESS.
Edited for the Victorian Fabian Society by Alan Davies and Geoffrey Serle.
F. W. Cheshire. Distributed in Great Britain by *Angus and Robertson.* 187 pages. 15s.

THE present state of civil war in the Australian Labour party may well fill moderate British Labour politicians with some forebodings. After a long period of reforming activity, which brought the Australian welfare state into being, the party is falling apart. Little remains on which its left and right wings can agree; and the former, led by Dr Evatt, is now purging the right wing amid recrimination and abuse which seem to have disgusted even the case-hardened Australian electorate. Is this the shape of British Labour's destiny?

Special circumstances, in fact, produce frustrations for the Australian Labour party, which give rise all too easily to feuds and party splits. The most important of these—probably more important than the tug-of-war between militant Catholicism and militant Communism in Australia—is the federal system itself, the main theme of Professor Crisp's scholarly and detailed analysis. Notwithstanding the reserve powers vested in the federal executive, which Dr Evatt has lately used to coerce the state parties, Australian Labour is not one party but seven; and "in general the hand of the Federal party and its constitution and rules ordinarily lie lightly on the state branches." The state parties in their turn have a vested interest in the federal system, which is infinitely more restrictive than the British House of Lords in its heyday.

Yet the basic "Objective" of the party, first formulated in the nineties, is the nationalisation "of all sources of wealth and all means of producing and distributing wealth." The "Objective" has been whittled down in successive party conferences, and lately Dr Evatt even declared socialisation as a policy to be dead as the dodo; but the fact remains that almost everything short of socialism has been achieved, while the federal system solidly blocks an advance even to the most moderate use of governmental power. As one of the essayists in the other volume under review observes, it is not even possible for an Australian Labour government to use budgetary policy effectively to secure full employment—"where responsibility for public expenditure on current services and public works is divided between seven governments and numerous other public authorities, the task of stabilising total spending is very nearly hopeless." Admittedly the Fabian ambition is a considerable one—"full employment without inflation, interpreted as implying continuous slight excess demand for labour." Australia has had, in fact, inflation.

A large part of Professor Crisp's history, and the Fabians' formulation of a new policy to unite the party, are taken up with the struggle between Australian Labour and the federal constitution, a struggle all the more hopeless because party and constitution are inextricably intertwined. The party, of course, stands for the full sovereignty of the federal parliament, but almost every attempt to assert it, or to get the people to agree to its extension by means of referenda, have failed ignominiously. By comparison, Mr Strydom's task in South Africa is simplicity itself. So strong is the federalism enshrined by six states created by separate British Acts of Parliament that the Australian Labour party's central conception of democratic majority rule goes down before it, and the states have an equal voice on the federal executive and conference, Tasmania with New South Wales. Yet the federal cabinet is strictly elective, and the Prime Minister's powers are (at least in theory) limited to that of the chairman of a committee.

In fifty years of power the Labour party has achieved much; yet it has never been within striking distance of the freedom of action given to the British Labour party by the 1945 electoral landslide—let alone the power to nationalise steel on a majority of six. Australian industry may be grateful—and take correspondingly less care about its tendency to monopoly—but the results can be bad in other ways. Baulked of power and responsibility in so many basic domestic issues, Australian Labour may yet be tempted to an extreme and sentimental, but distinctive, "left wing foreign policy." This is a danger not to be disregarded. But the party's complex difficulties and motives should be understood; to them Professor Crisp's survey from the beginnings to the significant date 1951—when the frayed unity of the party finally dissolved upon the death of J. B. Chifley—provides a master-key.

The Growth of Whitehall

A HISTORY OF RED TAPE.
By John Craig.
Macdonald and Evans. 220 pages. 18s.

SIR JOHN CRAIG, who before becoming Deputy Master of the Mint was one of the Treasury experts on establishments, has written what he describes as an account of the origin and development of the civil service. It is only that in part—inevitably so, since he starts at the Conquest, and it was centuries before the term began to have an exact meaning. Most of the book, therefore, is an account of the development of the different offices of state. Sir John Craig concentrates as far as he can on the junior staff, their recruitment, numbers and pay; but the thread of continuity is the geological deposition of office on office. The story is well told, and there is a strange sameness about it: until the nineteenth century almost nothing is abolished; function after function runs its life from unofficial arrangement to official dominance, and thence to a long decay of formality and sinecure.

The true account of the development of the civil service starts about the end of the eighteenth century. Sir John Craig does not minimise "the Gothic extravagances which time had made of old offices," but he is kind to the unreformed service, and points out that there were always modestly paid and hard-working officials; even the sinecures were often given as a reward for doing something else without pay, or in lieu of a pension.

When he comes to the age of reforms, the author's emotions begin to show. He can find no good word to say for Northcote and Trevelyan, though he does not wholly condemn what sprang from their work. Chadwick and Morant fill him with a mixture of admiration and repulsion. He deals briefly, and with evident distaste, with the Leviathan which has grown up since the world wars.

Sir John Craig's book can be warmly commended as an introduction to the development of the tools of British Government; on the origins of the modern civil service he is too brief, and a little too spirited, to be very useful. A few slips of small importance can be detected, of which the most surprising is the creation of a Ministry of National Assistance, and the most intriguing the statement that the Post Office used wireless telegraphy five years before Hertz demonstrated the existence of the necessary waves.

Fiscal Essays

ESSAYS IN PUBLIC FINANCE AND FISCAL POLICY.
By Gerhard Colm.
Oxford University Press. 392 pages. 38s.

DR COLM has been writing on economic subjects, mainly public finance, for thirty years. The present collection of eighteen essays (all but one of which have been previously published, although not all in English) is presumably intended as a representative sample of his output. It is arranged under four headings: The Theory of Public Expenditure and Taxation; Fiscal Policy; Government budgets and National Income; and Economic Planning and Stabilisation. Within each section the articles are arranged chronologically; but between the sections the reader has to take a leap back to the middle thirties, which presents certain difficulties as Dr Colm has changed his views substantially over the period.

Dr Colm received his training in public finance in Germany, and throughout his career has retained a special reverence for the work of Adolf Wagner. He does not appear to have more than a superficial acquaintance with English writing. Since 1934 he has had a busy and successful career in the United States, including a spell with the Council of Economic Advisers. This has no doubt left him scant time for original thought or even reading. The essays are all popular in character, and it is evident that Dr Colm has been markedly successful in explaining fiscal matters to businessmen. It should be noted, however, that his own understanding of the problems with which he deals is by no means impeccable. As an illustration may be cited the passage on page 230, where he unequivocally condemns the "factor cost" computation of the national income, because it distorts the total of money incomes in a way that the "market price" computation is said not to do. It appears that Dr Colm has here lost sight of the significance of the national income as a collection of real goods and services.

The Epic of the Valley

ROSSANO.
By Gordon Lett, with a foreword by Freya Stark.
Hodder and Stoughton. 223 pages. 12s. 6d.

"THIS was one of the trickiest situations that I had ever had to deal with in my life as a partisan, and it was some consolation to know that I was not facing it alone. King's Regulations, the soldier's Bible, had not done much to prepare one for this kind of thing. . . ."

The situation was a mountain somewhere behind La Spezia reached by Major Gordon Lett early in 1944 with a handful of his faithful partisans, pursued hotly by the Germans who had descended upon Italy in force. But the mountain situation was, contrary to expectation, desperate. The other partisans who should have been there had gone to earth, and Major Lett has to do likewise, with the ultimate aim of working back through the undergrowth to Rossano Valley.

The valley is a cordial place, which has taken this escaped English prisoner of war firmly to its heart, and every encounter we have with its poor peasant inhabitants is a heartening encounter. It is fashionable today to scold Italy for not being a welfare state, as though a welfare state were the highest achievement of humanity. Major Lett's very well-told story is told from a soldier's point of view, which might easily have become the occasion for just as violent scoldings as those administered by welfare state enthusiasts, for Italy finds military and social discipline distasteful and often undesirable. But here in Rossano valley, in one of the poorest mountain places, nearly 500 escaped Allied prisoners received help and comforts from the villagers during those hard months when there was no central government, only the hated German occupier trying to establish his positions against harrying partisan activities. The individual bravery and kindness and sacrifices of these people is continually noticed by Major Lett. He hates the Germans and he hates all politicians, but he has to watch the partisans splitting into political groups. Finally he himself has to come to grips with political questions when he becomes the AMG officer in the chief city near his familiar valley. This makes an exciting end to the whole adventure. Years later, to his deep regret he finds thousands of "partisans" celebrating liberation day, who could have been but small children at the time when Italy's partisan war took place.

> Now I understood why my old companions in arms do not like to be referred to as "partisans." We have been forgotten, and our places taken by the rank and file of the Communist Party who are making political profit out of our good name. There is not much we can do about it.

This book does quite a lot about it, and there would be no excuse now for those who try to palm off the Communist partisans as the heirs of Italy's war of liberation. The modern partisan is trained to lay down arms if Soviet troops arrive and to sabotage industry if they are delayed. But there is reason to believe that Italy still has many Rossanos, which would fight again if Togliatti's and Nenni's "welfare state" were to be forced down their throats.

America Looks at Aid

APPROACHES TO ECONOMIC DEVELOPMENT.
By Norman S. Buchanan and Howard S. Ellis.
New York: *The Twentieth Century Fund.* 508 pages. $5.00.

THIS book is of interest as indicating the direction of American thought over the past ten years on the problems of under-developed territories. Bearing the imprint of the Twentieth Century Fund, it confounds the scoffers who claim that Americans appreciate only size and speed. The authors make two important points in non-technical language and with persistence, if perhaps at undue length. The first is that the misapplication of Keynesian economic policies is not helpful in the economic development of a poor country which suffers from a dearth of productive resources, not from their temporary disuse; it will probably result only in inflation, the great enemy of investment and of habits of thrift. The second point is that foreign loans, grants or technical assistance should be regarded only as "marginal contributions of a strategic character"; they can be effective only in an economy where the considered and informed choice of the disciplines entailed by economic progress has been made. The authors do well to remind us that external aid has no magical character and that free will, and good will, are of pre-eminent importance in the richer and poorer countries alike.

Although we cannot force another to be free, even from want, we can do much to create the conditions in which choice can effectively be made. Thus the authors draw the conclusion that the major responsibility of the United States is to play neither the role of Dutch uncle nor of benign headmaster, but to place its economic weight firmly in the scale of free, multilateral and stable conditions of world trade. As opposed to economic autarky as to political authoritarianism, the authors are forthrightly sceptical of grandiose projects of industrialisation, despite their psychological attraction. The vital importance of improvements in agricultural techniques and in transport and communications is well stressed, and it follows from the emphasis on the need to change the typical *Weltan-*

The Economic Development of Nigeria

The Report of a Mission organized by the International Bank for Reconstruction and Development

This report contains the most complete and up-to-date description available of economic conditions in Nigeria. It appraises the territory's prospects for economic development and recommends measures for realizing them. 60*s. net*
(Published for The Johns Hopkins Press).

The Inter-War Years and Other Papers

A selection from the Writings of Hubert Douglas Henderson (1890-1952)
EDITED BY THE LATE SIR HENRY CLAY

"It is a contemporary's account of important events and many of the papers, which were written while in Government service, have not been published before. The publication could scarcely be more timely."
—*The Spectator* 42*s. net*

OXFORD UNIVERSITY PRESS

schauung of the peoples of the poorer countries that the authors would prefer scattered small-scale industries, as an effective method of widespread education through practice and demonstration, to a few large urban concentrations; in short, they prefer a slow advance in depth to the *chimera of* "a rapid advance on all fronts." A drawback of the book is the proliferation of quotations of opinion from sources of widely differing value. The intelligent layman, whom the book will interest most, might well have been spared many of these.

Mésentente Cordiale

MAJOR THOMPSON LIVES IN FRANCE.
By Pierre Daninos.
Cape. 192 pages. 9s. 6d.

THE see-ourselves-as-others-see-us vein is a very rich one for those who know how to work it. M. Daninos struck it very rich indeed in France, where his Major's bewildered reactions to the local *mores* have enchanted a six-figure public. The English reader expecting another Colonel Bramble is, however, likely to be disappointed, for this is a book about the French, not about the English. Major Thompson is no more than a ventriloquist's dummy, uttering M. Daninos's observations with a rather unconvincing English accent; and an oddly anachronistic dummy at that. Born, so his biographer tells us, in 1902, he is of the post-World War I vintage of military men; yet he belongs even further back than Colonel Blimp himself and has more in common with Captain Gadsby of Kipling's Simla. His first wife, the archetypally horsy product of a girl's public school ruled over, obviously, by Miss Beale or Miss Buss, is perhaps only one generation out, but she is getting very scarce even in the depths of Barsetshire. The mirror-image of "Major Thompson Lives in France" would show contemporary English quirks, foibles and flavours through the reactions of a Frenchman with a conical topper, peg-top trousers, and pomaded moustaches, as illustrated in a *Punch* cartoon of about 1900.

Yet this anachronism does not really hurt M. Daninos's delectably funny book. What is important is not that the Major should be accurately a mid-twentieth-century Englishman, typical or exceptional, but that he should be a thorough non-Frenchman, perennially astonished at French habits and attitudes; at *fonctionnaires* and handshakes, gastronomy, gossip and the *Tour de France*, pottering, gallantry, apartment-house lifts, Sunday clothes and public conveniences—astonished, baffled, and unwillingly captivated. In this rôle he is an outstanding success. No prospective—or recent—visitor to France should miss him. As for Mr Walter Goetz's drawings, they are a pure joy, *le mot juste* in black-and-white, the essence of affectionate exasperation. See, in particular, pages 57 and 152-53.

Oceanic Abundance

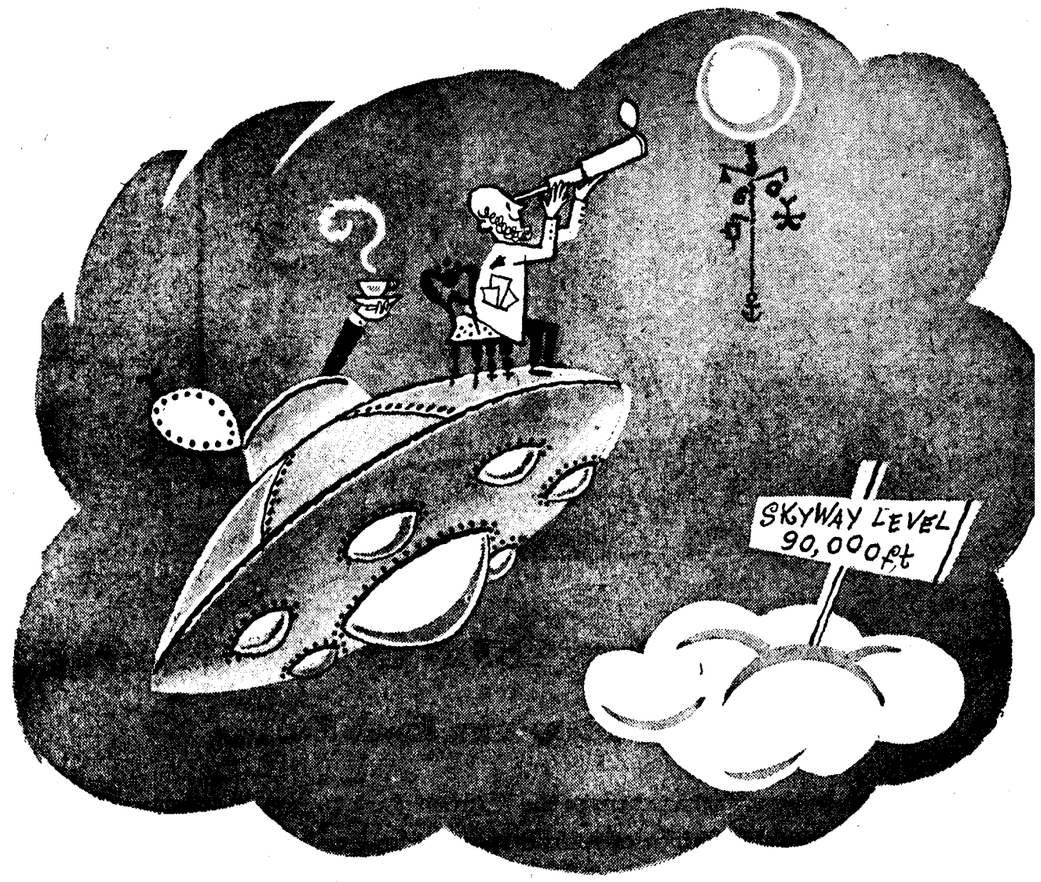
THE INEXHAUSTIBLE SEA.
By Hawthorne Daniel and Francis Minot.
Macdonald. 239 pages. 16s.

THIS book is a useful popular account of modern knowledge of the oceans and their inhabitants. It is unified by a single theme: that if an ever-growing world population is to be fed, mankind will have to rely increasingly upon the foodstuffs to be won from the sea. As yet man is still a mere food gatherer on the face of the waters; and there are only a few areas where fisheries have been developed to anything like their full potential. Sea-birds still probably take more fish than does the entire human race.

Though the oldest fisheries, those round north-west Europe for instance, are probably "over fished," a problem which the authors do not discuss, there are many areas in the Pacific and Indian Oceans, and in particular in the waters of the Humbold Current off South America, where new fisheries could be immensely productive. Moreover, present methods are sometimes extremely wasteful. In the 1950-51 season 45,000 whales were killed, weighing round two million tons. Forty to fifty per cent of this could be used for human consumption. But the whaling industry is only geared to produce oil, and is not equipped to handle, preserve, and market the millions of pounds of whale meat that pass through its hands in the course of a season.

The yield of a fishery depends ultimately upon the amount of nutrient salts in the water; for these limit the growth of plankton, the drifting mass of small or microscopic plants and creatures upon which, either directly or indirectly, all other sea animals depend for food. Thus slight changes in the amount of phosphates in the waters of the English Channel have of late years led to the herring deserting the south coastal waters where it was abundant in the 1920s. As the authors say, there are possibilities of "farming" suitable areas of the sea by adding fertilisers. Curiously they do not mention the successful British experiments in fertilising the waters of certain Scottish lochs, which showed that, in the right places, the crop of fish can be greatly increased.

There is bound to be wastage at every link in a food chain. Thus an acre of land can support more people if they themselves eat the plants they grow, instead of feeding them first to domestic animals. In the same way, to get the maximum benefit from the sea, ways should be found of utilising the plankton, which is the first link in the food chain of the oceans. It is plankton that supports herrings in shoals too numerous to count, and feeding on it alone the blue whale—the largest animal the world has ever seen—grows to a length of 100 feet and a weight of 140 tons or more. According to the authors, Kansas farm land in a good year may produce perhaps six or seven hundred tons of wheat to the square mile; the waters of the English Channel produce annually about four thousand tons of plankton per square mile. And the Channel is by no means the richest plankton producing region in the world.



Thus, this book, besides containing a fascinating collection of general information about wind and waves, fish, fisheries and the history of marine science, provides much useful ammunition for those who refuse to accept the mood of cosmic gloom which sometimes emanates from the authorities on population and food supply. The oceans are a new world unconquered, undomesticated and almost unexplored. The era of the domestication of the seas is yet to come, but when it does, who knows what population the world might then support in plenty?

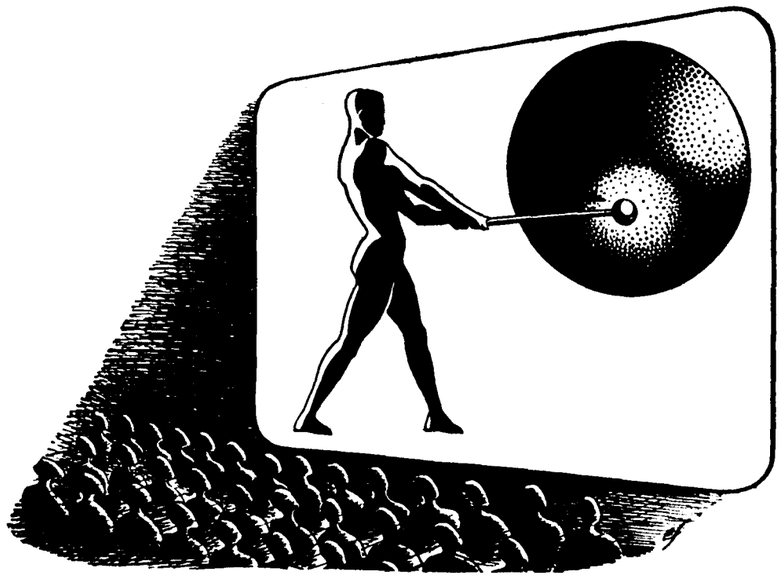
Illyrian Journey

THE IRON GATE OF ILLYRIA.
By Torgny Sommelius.
Hart-Davis. 205 pages. 18s.

MR SOMMELIUS is a Swede with "an itch to find new angles on the world." While on his way to India he stopped off in Jugoslavia and somehow became stuck there for several months. He fell in love with the country and the people and explored both as thoroughly as he could. He wandered down the Dalmatian coast and lingered in Split, Dubrovnik and other places less well known—like Cavtat, near the submerged city of Epidaurus ("somewhere in the sea a Roman city lay sleeping with water in its lungs"). He sailed down the Danube, through and beyond the famous Iron Gate. He visited Cardinal Stepinac, secluded in his native village of Krasić. And he toiled up into the Bosnian mountains to Sarajevo, "to listen to the echo of a shot." He discussed painting with artists in Belgrade, "where they have revolutions only to achieve reactionary results." And he enjoyed the hazards of motoring in Montenegro in a five-seater 1925 model with no brakes, ten passengers and innumerable fleas.

In the middle of recounting all this and much else Mr Sommelius pauses to explain that he is not trying to write a handbook on Jugoslavia, but "more of a groundbook"—a highly individual, subjective summary of what he himself believed to be important. This is fair enough in theory, but in practice it gives rise to conflicting feelings. Sometimes one is delighted by a striking and apt description of a person, place or incident; sometimes put off by too much cleverness, too much whimsicality, too much straining after effect. Sometimes one feels that the author has barely escaped from falling between several stools, sometimes that he has brought off a fine *tour de force*. At any rate, one is not asked seriously to consider the political situation—and that in a modern book about Jugoslavia is an agreeable change.

When scientists of Bristol University decided
to extend their atomic research into the stratosphere, they faced many difficulties.
They needed a balloon to lift their instruments to a height of 18 miles.



Up and up - to 90,000 ft!

The envelope had to be made of material
no thicker than a hair, yet able to withstand
the ultra-violet rays that would strike it, and temperatures
that would reach as low as 108°F. below freezing.

What they sought they found — in 'Alkathene', I.C.I.'s brand of polythene.
The same material is being increasingly used — to come down to earth —
as a packaging material for foodstuffs and other commodities in daily use.
'Alkathene' is also used to insulate the new transatlantic telephone cables,
to make cold water pipes, and all manner of fancy goods
from lampshades to washing-up bowls.

Thus, and in a thousand kindred ways, I.C.I.'s research and production are serving the Nation.

The Man-with-the-Gong is a Symbol...

... of every aim and every achievement of the J. Arthur Rank Organisation. It means that we welcome the opportunity which exists in Britain to adventure into commerce — with a target whose attainment must be good for the country and good for all whose interests or whose work is with the Organisation

The man-with-the-gong symbolises our plans to offer the finest in screen entertainment; to promote British pictures to match the best that other countries have to offer; to give to millions of people overseas the opportunity to see our films and so learn something of British living, British thought, British character — and British goods.

To accomplish this two-fold purpose we have built up a British film enterprise which produces, distributes and exhibits a major programme of first feature films every year: a film enterprise which operates world-wide, helping to draw the free nations nearer to Britain and strengthening the ties between Britain and the Commonwealth.

The man-with-the-gong is a symbol of our determination to keep abreast of the times — both in thought and in technical developments.

We are proud to have been pioneers in many fields of production, distribution, exhibition and the manufacture of components (from cinema seats to electronic equipment for cinema television) designed to serve the needs of the British Film Industry.

The man-with-the-gong is a guarantee of first-class entertainment. He represents progress in the British Film Industry. He symbolises our confidence in the present and our faith in the future.

The J. Arthur Rank Organisation Ltd. includes:

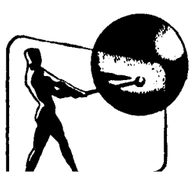
Some 550 Odeon and Gaumont cinemas.

Pinewood Studios . . . *producing an annual programme of 15 British feature films.*

Denham Laboratories . . . *processing 700 miles of film a week.*

General Film Distributors . . . *with an unrivalled service to domestic exhibitors and thus to cinemagoers.*

J. Arthur Rank Overseas Film Distributors . . . *taking British films to the cinemagoers of the world.*



J. Arthur Rank Screen Services . . . *covers screen advertising, documentary films, television advertising and television programmes.*

Gaumont-British and Universal Newsreels . . . *bringing up-to-the-minute screen reports on current events to filmgoers at home and abroad.*

British Optical & Precision Engineers . . . *manufacturing a key range of cinematograph equipment and allied products.*

Cinema-Television . . . *producing television equipment, scientific and industrial electronic equipment and vacuum devices.*

Bush Radio . . . *making the renowned Bush radio and television sets.*

THE J. ARTHUR RANK ORGANISATION LIMITED

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

A Guaranteed Wage

Washington, D.C.

THE agreement reached on Monday between the Ford Motor Company and the United Automobile Workers, in which the company accepted the principle that it has a responsibility for the welfare of its workers when they are unemployed, must have given a severe headache to the editorial writers of *Pravda*. For without a strike, and with the federal government deliberately refusing to intervene, one of the largest manufacturers in the United States has taken a long step toward establishing a welfare economy within the framework of a capitalist society.

This latest triumph, in his capacity as president and chief negotiator for the automobile workers' union, establishes Mr Walter Reuther even more firmly as the pioneer of new industrial relationships between American labour and management than did his 1948 contract with the automobile manufacturers, which correlated wages to productivity and the cost of living, or his five-year contract in 1950, which established the principle of company pensions. Both these principles were considered revolutionary in their day.

Even before negotiations with the Ford and General Motors Companies for the renewal of labour contracts got under way eight weeks ago, it was clear that among all the questions of wages, hours and benefits to be discussed, the principle of the guaranteed annual wage would be the central problem. This idea is not new in American industrial relations and schemes which embody it have been operated by several companies in different industries for some time. It is based on the concept that the obligation of an employer toward an established employee does not cease when the latter has to be laid off temporarily, and that it is the duty of management to calculate its labour costs upon an annual basis, as it does most other costs, rather than on a weekly basis. This concept has been called into being by circumstances that are more or less peculiar to the United States; unemployment insurance is a state and not a federal responsibility and, since most state legislatures are dominated by conservative majorities, benefits are usually barely up to subsistence level and last only twenty-six weeks. The average level of unemployment compensation is $25 a week, while an employed Ford worker averages $84 a week. This gap is felt particularly keenly by automobile workers because, until recently at least, employment in the industry was subject to wide seasonal variations as companies concentrated the bulk of their output in the first half of the year and virtually closed down production for retooling in the late summer.

The demand for a guaranteed annual wage, as put forward by the UAW to Ford, proposed that employees with two years of seniority should be guaranteed by the company the difference between their state unemployment insurance compensation and 80 per cent of their gross weekly earnings for up to fifty-two weeks a year. To finance this, the union proposed that the company should create a special fund equal to 20 per cent of its payroll costs; in the case of Ford this would have cost $130 million over three years. There was never much doubt that Ford would accept some form of guaranteed annual wage, though not on the scale proposed by the union. Although Mr Reuther's interest in establishing the principle of a guaranteed annual wage is far greater than that of the rank and file of his union, he commands immense loyalty. The fact that he had built up a strike fund of $25 million convinced automobile manufacturers that he would call a strike if he did not get what he wanted. With the automobile market booming even beyond expectation, and with sales of Ford cars having just outstripped, by a hair's breadth, those of Chevrolets, their great rival, a strike was the last thing the Ford management desired.

*

Two weeks ago, however, it did attempt to divert pressure for the guaranteed wage by producing its own "employment stabilisation" plan. This consisted of a scheme—unparalleled in the history of collective bargaining—whereby the company's employees would be able to purchase Ford stock at half price when it is offered to the public later this year; this was accompanied by a proposal for long-term loans for those laid off. The defect of the scheme was that it was too imaginative: in recognising the capitalist instincts of the American worker it underemphasised his continuing interest in tangible benefits. It was rejected angrily by the union as a "smoke screen." When, at the beginning of last week, the strike deadline was postponed from June 1st to June 7th and it became known that Ford had proposed an unemployment fund of $55 million, it was clear that the company had accepted the inevitability of the guaranteed wage plan and was now arguing on means and not ends.

Early on Monday morning, as sporadic walkouts were starting in Ford plants all over the country, a haggard but jubilant Mr Reuther emerged from the negotiating chamber to announce that he had secured a three-year contract with Ford; this included a scheme by which the employee would get 65 per cent of his net weekly wages for the first four

weeks of unemployment and 60 per cent for the next twenty-two. The company had come near the union's demand in terms of actual benefits but had refused to be liable for more than half a year. The new contract also provides for a rise of 6 cents an hour in basic pay and increased pension and insurance benefits. But the rash of short unofficial strikes which followed the announcement of the contract, though partly inspired by Mr Reuther's enemies in local branches of the union, illustrates the fact that the rank and file of automobile workers remain more interested in straight pay increases than in less immediately intelligible provisions for their welfare.

At the time of going to press, the outcome of the union's negotiation with General Motors is still uncertain; the strike deadline has been postponed until next Sunday. General Motors is no more anxious than Ford for a strike, particularly as it has just established a new production record, but the union has committed itself publicly to getting a better contract than it got from Ford. Most people expect that the two will be very similar.

★

The first reaction of the American business world, as registered by the New York Stock Exchange, to the announcement of the Ford contract was one of intense relief that the strike had been averted. The automobile industry is in a real sense the mainspring of the economy, and any prolonged shut-down would have had wide repercussions. Conservative newspapers, though referring to the contract as a "premium on idleness," have talked little of that "creeping socialism" which they often associate with the name of Mr Reuther. Moreover, although the president of the National Association of Manufacturers expressed himself on Monday as "much disappointed" with the contract, a closer look at it by businessmen shows that Ford has not sold the pass to the extent originally thought. By preserving the principle of fixed contributions by the employer, in this case 5 cents an hour per worker, it has limited its liability to its employees by the size of the fund it has agreed to create. The fears of small businessmen that wealthy companies might accept a much higher level of liability are, for the moment, assuaged.

The prevailing good temper is largely attributable to the fact that businessmen can argue that this is not a guaranteed annual wage, since it is neither guaranteed nor annual, while Mr Reuther can argue that it is both in principle. But whatever it may be, it is certain that its equivalent will figure in other labour negotiations this year. The steel unions cannot re-negotiate their whole contracts with the steel industry, but they will begin doing so with the aluminium companies in July; there are new contracts to be worked out with the aircraft industry this summer; and most important of all, Mr Reuther will face the Chrysler, Packard and Studebaker companies in August. Though it is reported that he is anxious not to undermine the position of the remaining independent automobile manufacturers, there is grave doubt whether they can afford the 10 per cent increase in labour costs which the Ford plan envisages.

Moreover, there are immense complications in fitting the guaranteed wage into state laws, for in twenty-six states a worker loses his unemployment pay if he receives additional compensation from an employer, and in another twenty the rate would be automatically reduced. Possibly the most far-reaching effect of this week's contract may be to begin reconciling an eighteenth-century political system with a twentieth-century economy. In other words, business men, particularly small business men, may decide that it is better to accept a higher level of local taxation, to finance adequate unemployment insurance schemes, than to accept direct responsibility for the welfare of the unemployed.

Liberalism in Practice

THE thaw in the cold war is not only affecting America's foreign policy but also its attitude towards dissent and the risks of subversion at home. Last week, a Senate subcommittee voted unanimously to recommend the appointment of a non-partisan group of twelve citizens to survey the entire system of security in the Civil Service and to report on it by the end of next year. The Senate as a whole will probably force this idea on a reluctant Administration.

In part, this development has resulted from the activities of Mr Harry Cain, who started out as a right-wing Republican Senator from the State of Washington and who is today the most effective critic of the Administration's entire security programme. Over the past months, Mr Cain has been using his position on the Subversive Activities Control Board to bring into the open what he considers to be flagrant abuses of personal freedom and violations of the due process of law. His major targets have been the Attorney General's list of 275 allegedly subversive organisations and the dismissal of civil servants who have been given neither a fair confrontation with their accusers nor a chance of judicial review. Mr Cain has called for a series of reforms, including the provision of free legal advice for accused government employees and the right for them to retain their jobs while their status is being decided.

★

Although the fundamental improvements in principle will have to come from Congress, the courts have been showing liberalism in practice in individual cases. After a delay of two years, Dr Otto Nathan, executor of Albert Einstein's estate, has received a passport. This was achieved when the Court of Appeals took an unprecedented action and ordered the State Department either to grant Dr Nathan's application or to confront him at once with the charges that allegedly made his presence abroad undesirable. At the same time, Professor Owen Lattimore has been allowed to lecture abroad although his case is still *sub judice*, and there is increasing evidence that the Court of Appeals may dismiss the government's remaining charges against him on the ground of vagueness.

The same trend towards a more severe scrutiny of the government's security system was exemplified by the decision of the Supreme Court in the case of Dr John Peters, Professor of Medicine at Yale. Dr Peters had appealed against his dismissal from government service in 1953 on the ground that he was not faced with hostile witnesses and hence was denied due process of law. The government argued that dismissal from its service was an executive prerogative and that the identification of informers would imperil security. The Court upheld Dr Peters on procedural grounds and ordered the Civil Service Commission to expunge its previous ruling from his record. But it did not enter into the vital question of whether an accused civil servant has the right to know and cross-examine his accusers.

Green Light for Foreign Aid

IT is not surprising that this year's foreign aid legislation is having a comparatively easy run through Congress, for the Democrats would be ill-advised to obstruct a programme which has been so closely associated with their party for so long. Indeed, the most dangerous proposal in the Senate, which has just passed the authorisation Bill, came from the Republican leader, Senator Knowland. He wanted at least 50 per cent of all economic aid to be in the form of loans, not grants. While the Administration is gradually moving in this direction, such a drastic and peremptory shift would have made it difficult to direct dollars to some of the places that need them most.

The Democratic majority repulsed this threat, but made two changes in the President's proposals. A few innocuous restrictions were put on the use of his new $200 million emergency fund, designed mainly to encourage regional economic development in Asia. Secondly, the higher grade employees of the old Foreign Operations Administration are not to be liable to dismissal, regardless of their civil service standing, when it becomes the new International Co-operation Administration. To the Democrats, the suggestion that they should be looked more like an attempt to make vacancies for Republican supporters than to organise the new agency more efficiently.

That it will in any case be organised efficiently seems certain, for it is to be headed by Mr John Hollister, a lawyer well known to be an able administrator. But his suitability for the job is doubted on other grounds; he is thought to share the conservative, isolationist opinions of the late Senator Taft, with whom he was closely associated. President Eisenhower has confessed that he appointed Mr Hollister without knowing his views on the foreign aid programme. If this is to become an effective long-term project, centred on Asia, then sympathy and imagination will be needed as well as efficiency.

Mr Hollister has recently been executive director of the Hoover Commission on the reorganisation of the government, and there is a suspicion that his appointment, to replace Mr Harold Stassen, was the price paid by the Administration to persuade the commission to tone down its report on foreign aid operations, due to be published as the debate on this year's Bill was at its height. Certainly the report was less critical than had been expected. As passed by the Senate the Bill authorises the full $3.5 billion asked by the President for the year beginning next month; two-thirds of this is for Asia, including $915 million for various kinds of economic assistance. The House of Representatives is expected to be equally generous with its authorisation but, when it comes to appropriating the cash, things will probably not go so easily.

Merry Month of June

AT degree-taking time, flocks of fiancées, famous personages and "talent scouts" descend on America's colleges and universities. The young women are there to press caps and gowns, the famous men come to make speeches about the "high destiny of youth going into this difficult world," and the talent scouts have been dispatched by industrial and commercial concerns eager to put the new graduates on their payrolls. For a young man or woman taking a B.Sc. or B.A. this June, destiny does look very high and the world does not seem terribly difficult. The reason is simple: a sustained economic boom, a technological revolution in numerous industries and a steady call for trained men by the armed forces have combined to create a buyer's market in graduates.

Some 325,000 men will be graduating this year and a large number of them will be going either into national service or into more specialised study. Those who are entering gainful employment have, during their last year of college, been wooed by literally hundreds of firms whose representatives have vied with one another in offering brilliant prospects. For every available engineer, physicist, chemist or other technologically qualified graduate, there have been three to five offers of employment. Science graduates are starting at salaries ranging between $375 and $525 a month. To make employment more attractive, engineering and chemical companies are offering their young recruits free housing, lavish expenses and introductions to local golf clubs. Next in order of demand come men trained in business and management—they will be offered up to $400 a month—and lawyers, particularly if they are willing to practise outside cities such as New York, Washington or Boston.

What is most striking this year is the fact that students who have graduated in the humanities and who possess no special skills are also being sought for. Slowly, the conviction has spread among American business men that a knowledge of literature or philosophy may not disqualify a man entirely from a useful role in ordinary life. In fact, banks and insurance companies are appealing to "those who like culture" and offering them up to $300 a month. And as the new graduate's girl hands him his mortar-board, she too may be smiling, for if she has a college degree and some secretarial training, jobs ranging up to $4,200 a year will be waiting for her choice.

Who Buys Houses?

THE mysterious factor in the housing boom is its illogical failure to be damped down by the decline in "family formations," supposedly the decisive influence in the demand for new homes. It is now some years since the number of young people reaching what the statisticians consider the marriageable age of 20 to 24 began to decline as a result of the low birth-rate of the nineteen-thirties. And the number of families now living "doubled up" (sharing dwellings) is, at 1½ million, proportionately lower than ever before; the absolute housing deficiency of the depression and war years has obviously been met. A study in the Department of Commerce's latest *Survey of Current*

Business, however, suggests several reasons why people are still buying as many houses as ever.

The birthrate has not declined with the decline in the marriage rate and the prosperous young couples who were delighted to find a two-roomed bungalow in 1947 want more, and better-built, space today for their three or four children, their washing machine and their second car. At the other end of the population increase, now running at 2½ million additional people a year, savings made during a long period of full employment, supplemented by today's pension schemes, are enabling a growing number of retired old people to maintain their own households. Single persons, especially women, are also more likely to live alone than they used to be.

These general factors underlying the strong demand for homes are supplemented, in particular places, by the steady migration to cities, suburbs and the sun. Farm houses are being deserted as people leave agriculture for industry; they are usually too dilapidated or too inconveniently situated to be realistically regarded as contributions to the supply of vacant dwellings. In the towns people are moving from the centre to the suburbs, and from flats to separate houses; the number of dwelling units in towns increased by one-fifth from 1940 to 1950, but in the outskirts of metropolitan areas the number was nearly doubled. Finally—and the visitor does not need to be an expert to notice this—the rate at which houses are being built in the warm coastal states of Florida and California far exceeds the national average.

All of this suggests that the demand for new homes may be sustained until the baby boom of the nineteen-forties becomes the marriage boom of the nineteen-sixties. The essential condition is, of course, that today's prosperity and optimism, accompanied by high earnings, stable prospects, and a good supply of mortgage credit, should continue.

Harnessing the Sun

New York

THE recent announcement of a grant of a quarter of a million dollars by the Rockefeller Foundation to the University of Wisconsin for research in solar energy is a reminder that, although nuclear power claims the lion's share of publicity and investment, the solar scientists are not without hope of an equally dramatic future. Research, which is now being carried out simultaneously at half a dozen centres in the United States, is concentrated on two broad objectives. One is the invention and economic production of low-powered solar devices to cook food, to heat and illumine houses, and to operate irrigation pumps and communications systems. More ambitious programmes of fundamental research are concerned with the conversion of solar light into chemical energy.

The simplest, if most cumbersome, solar devices are concave reflecting mirrors, designed to focus heat on a boiler, and flat plate collectors, consisting of a number of panes of glass arranged over a black surface that absorbs heat. Several current research programmes are directed towards the production of cheaper and more efficient devices of this nature, for use as cookers or irrigation pumps in tropical countries where conventional fuels are scarce. American industry is not blind to a potential market in India, for example, for 100 million simple solar cookers which might be sold at $5 or less. In the United States large-scale flat plate collectors have already been employed successfully to heat a few houses and distil sea water. In all these devices the limiting factor is the surface area required to generate more than token amounts of power.

Among the more ingenious low-powered devices is the Bell Company's solar battery. This simple-looking apparatus, consisting, in essence, of thin wafers of silicon, specially treated to be extremely sensitive to light, can convert sunlight directly into electricity at a rate of 100 watts for each square yard of surface—a conversion efficiency which is allegedly more than 20 times better than that of any other available photovoltaic device. Although the cost is still very high, experimental models of the battery will be used this summer in amplifier stations on rural telephone lines.

Photosynthesis, the natural process by which plants absorb water, carbon dioxide and sunlight to produce both food and fuel, is, contrary to general belief, a most inefficient converter of sunlight into energy. Advances can therefore be made both by improving the efficiency of the natural process from its present 1 per cent up to a theoretically possible 30 per cent or more, and by attempting to imitate the entire process outside the living cell. In these ways, photochemistry may ultimately revolutionise the industry and food supplies of man. But at present, the production of competitive solar power on a large scale for industrial use is still a mid-summer day's dream.

Perennial Drought

FROM A CORRESPONDENT IN COLORADO

THE great droughts in the American prairies have their origins in the physical structure of the continent. Mountain ranges running north and south absorb the moisture in the winds from the Pacific. Since the prevailing winds are from the west, the great plains are in the dry lee of the Rocky Mountains. The way is open for rain storms from the Gulf of Mexico to come up the wide mid-continental trough, but such storms are normally diverted eastward by the prevailing winds. Thus the western plains, deprived of rainfall on two sides, are relatively ill-watered. While agronomists say that 20 inches yearly, and at the right time, are necessary if crops are to be raised without irrigation, annual precipitation on the plains moves erratically above or below this figure. Over much of this area, and of the enormous plateau-regions between the mountains, it averages no more than 10 to 15 inches a year.

The entire experience of early American settlers lay in the moist east and most of them came from well-watered western Europe. So the history of settlement in the plains consists, mainly, of a series of attempts to flog nature in this semi-arid country into perennial fruitfulness. As early as 1875, there were warnings against attempts to grow crops in the plains without using irrigation.

The weather-cycles certainly helped to deceive and betray

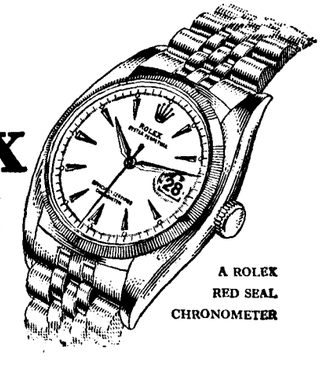
Men who guide the destinies of the world wear Rolex watches

THERE IS a small group of men whose names will live on. Their faces and voices are overwhelmingly familiar. In the newspapers, on television, on the radio, the impact of their personalities is inescapable. So is the impact of their words and actions on our lives.

It would not be fitting to mention their names, for they include royalty, the heads of states, great service chiefs and statesmen. But next time you see them or their pictures, look at something you might normally overlook—the watch on their wrists. That watch will most likely have been made by Rolex of Geneva.

We are proud that Rolex watches serve so many eminent men. Accustomed though they are to the very best, they often express amazement at the accuracy and dependability of Rolex. We are pleased that they soon take it for granted.

Every Rolex Oyster Perpetual Datejust is a chronometer. *This means that it has been submitted to a Swiss Government Testing Station to undergo strict accuracy tests, and has been awarded an Official Timing Certificate. And every Datejust gains the coveted distinction "Especially good results." The watch is powered by the new Rolex Perpetual "rotor" self-winding mechanism that keeps the tension on the mainspring constant, making for constant accuracy. The date is shown on the dial, changing automatically each night at midnight, and magnified by a "Cyclops" lens for easy reading. The mechanism is protected, permanently, from all harmful elements by the famous 100% waterproof Rolex Oyster case.*



A ROLEX RED SEAL CHRONOMETER

Thirty-five years of watchmaking progress are contained in the Rolex Oyster Perpetual. In 1910 Rolex produced their first Officially Certified Chronometer. *Now they have produced 250,000 chronometers—three times as many as the rest of the Swiss watch industry. The first truly waterproof case in the world, the famous Oyster, was invented by Rolex in 1926. And in 1931 Rolex invented the first "rotor" self-winding mechanism. A new refinement of this Perpetual "rotor" powers the Oyster Perpetual, silently and automatically, actuated by every slightest movement of the wrist.*

ROLEX

A landmark in the history of Time measurement

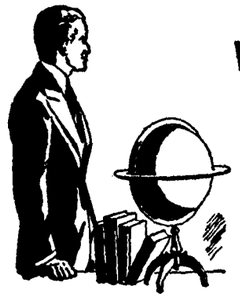
AT NO EXTRA COST

Fly to Bermuda

ON YOUR TRIP TO NEW YORK



At no extra cost you can fly to Bermuda, via any international airline, on your first class fare to New York.

So when business is over in New York, enjoy a holiday in Bermuda. You can travel light—buy clothes, even rent or buy sports equipment in Bermuda. Remember, you'll be in the sterling area. Bermuda is only three hours from New York, and there are frequent daily flights. Bermuda's sunny days, sandy beaches for loafing, sports and pleasant social life will do wonders for you.

settlers. For six to twelve years at a time, the prairie may receive relatively abundant rainfall in the growing season. Eager-eyed homesteaders, coming into what seemed an agricultural paradise, began to farm exactly as they had in lush Ohio or Illinois. They tore up the tough prairie grass to plant wheat and corn. For a few years nature would co-operate. Then the rain-bearing winds would bend away, the dust would begin to blow, and the tragedy of failure would be repeated once again. Flying above the plains today, one can see the rectangles of differing vegetation where farms were abandoned long ago.

The worst of the droughts, at least until the present, came in the nineteen-thirties, aggravated by the general economic depression, when thousands of farmers fled from the parched plains. This brought home even to the unwariest the possibility that man might be creating a new Sahara. The country took alarm, and the New Deal Administration bought up millions of acres of the worst-hit land, establishing huge preserves to be sown with grass, and grazed over only with care; these still exist today. Conservation authorities, established under state law, had power to enforce rigid rules of soil use. Millions of privately owned acres went back to grass and new cultivating tools were devised to stir up the soil without overturning it; thus the "trash was kept on top" and the earth anchored against the wind. It seemed that the people of the plains had learned their lesson.

Then the weather-cycle changed, the prairie again blazed with verdure and the war brought huge demands for more wheat, the plains' best crop. The "suitcase farmers" also came back; traditionally they live out of a suitcase in the nearest hotel, while gambling on getting rich in one season. Conservation rules crumbled and great gang-ploughs, drawn by mighty tractors, ripped up millions of acres of sod to plant wheat. In 1948, wheat millionaires were reputed to own more Cadillac cars per head in two Eastern Colorado counties than anywhere else in the United States.

By 1952, the weather-cycle had come full-turn again, and the resulting "dust bowl" has reached, for the first time, right to the very doors of cities like Denver and Pueblo. In a succession of dry storms, the worst of which began in February last year, the top soil has again blown off millions of acres and the drought has once more cut deep into the prosperity of the plains. Early last month, a sea of dust covered an area of approximately 20,000 square miles, and other areas of similar size were threatened with the same disaster.

The federal government's aid this time has been cautious and restricted. In 1954, $15 million were appropriated by Congress for feed to keep livestock farmers going, for aid to farmers who would chisel the soil deeply to throw up ridges which resist the wind, and for subsidising lowered freight-charges on feed and other farm supplies. As the 1955 drought deepened and spread, the cries for help became more compelling and the President set aside $7.5 million for more emergency relief. Drought disaster loans were made available, but much of their benefit to farmers was lessened when the Department of Agriculture, without publicity, increased the interest-rate to be paid by borrowers from three to five per cent.

The Secretary of Agriculture, Mr Benson, reared in the Mormon tradition of hard self-sufficiency, has been openly and acidly of the opinion that the blame for the new "dust bowl" rests, first, upon the Democratic Administrations for keeping wheat prices high and, secondly, upon individuals who cultivate the prairies wastefully, acting as if drought conditions were abnormal. Mr Benson believes that 80 per cent of the plains area can still be farmed if thrifty and prudent means are employed. Meanwhile, however, demands are growing louder for something bold of the New Deal order—government purchase of millions of acres to be converted into grass and, if ever sold again, to be sold only under covenants that will forbid the plough. These demands have little appeal for the deficit-conscious Administration; but the issue is one sure to be debated in 1956. Meanwhile good, though late, rains have, to some extent, eased the immediate tensions and demands of prairie dwellers.

SHORTER NOTES

Next week a practice civil defence operation is taking all essential government departments out of Washington for three days. Some of them will go as far as 300 miles away from the capital and they will be well separated from each other, so that not more than one agency can be wiped out by a single bomb. While in most cases military camps or university buildings will be used, conditions and communications in some places will, it is said, be austere.

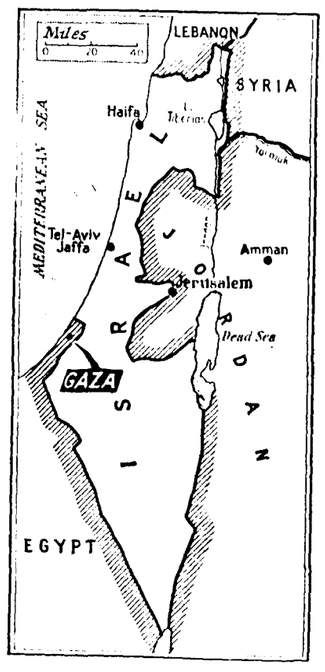
*

The Senate last week, by a rider attached to another Bill, changed hardboard from the paper to the lumber category in the tariff schedules; this would have the effect of doubling the duty on imports of this commodity. Since the House passed a similar Bill last year, there is danger that it may approve the Senate's action. The beneficiary would be one company, almost the only producer of hardboard in the United States, which has never felt sufficiently threatened by imports to appeal to the Tariff Commission for relief. That commission has just ruled that imports of a related product, hardwood plywood, are not damaging the domestic industry, which has expanded greatly in recent years.

*

The latest report on awards of defence contracts shows that from July, 1953, to the end of 1954, firms manufacturing aircraft and guided missiles held the first eleven places by value of contracts awarded during this period.

The World Overseas



The Danger at Gaza

THERE can be few men in the world who would exchange their job for that of a United Nations truce supervisor in the Gaza area. For the latter, as he jolts in his white jeep across the barren undulations of the truce line, is beset with gnawing frustrations. At Egypt's request, the number of his colleagues has lately been increased, but numbers are valueless if the will to settle for their proposals is lacking. What can he do when Israel is in the middle of an election campaign which most parties prefer to fight in an atmosphere of crisis, and when someone objects to every conceivable proposal? All ingenuity is valueless while Mr Sharrett thunders from Israel that "Egypt has forfeited its right to hold Gaza," while Colonel Nasser replies from Cairo that any attack on its position there will entail "total war." This week's plea for moderation sent out from New York by Mr Hammarskjöld sounds, to anyone at Gaza, like the thin piping of some distant bird.

The outlook is the blacker because, only five months ago, it looked quite bright. Incidents diminished so substantially in the last months of 1954 that the Israelis who favour a "diplomatic" or "non-activist" approach were in the ascendant. But in January, the Security Council revealed fresh powerlessness to secure the passage of Israeli ships through the Suez Canal, and Israeli opinion was roused by the execution of two Jews on a spy charge in Cairo. In February, Israel's sense of isolation was increased by the Turco-Iraqi pact, while the search by western statesmen for Arab allies and the consequent proferring of arms and pacts was filling Jews with a fear that their present military advantage was a diminishing asset. Finally, in March, intruders from Gaza raided a military post, stole maps and murdered a cyclist right in the heartland of Israel, only fifteen kilometres from Tel Aviv. Mr Sharrett's stock slumped, and so, to keep abreast of his public, he sought a boost from the activists. He asked Mr Ben Gurion to take the Defence Ministry and acquiesced when a majority of his colleagues pressed for a retaliatory raid. There followed the Israel army attack of February 28th on Gaza—a point at which there are advantages in pressing because it is, as it were, an outpost and not a parcel of soil that is native to the troops who are holding it.

To a majority inside Israel, the activist arguments are potent, and the Gaza raid was a triumph. Some who counted the cost (which was a revulsion of western feeling) reckoned that this was worth paying because the tactical loss was only temporary. What sanction could the West apply, they asked, that Israel could not afford to meet while the revulsion lasted? Since then trouble has been continuous. From the Gaza side, it has taken the form not only of incursions by Arab marauders, but of some minelaying by refugee irregulars which the Israelis are sure that Egyptian soldiers condone. The Israel retort has been great in quality though not in quantity—a few well-organised military reprisals.

Hurrying to and fro between the antagonists, the UN Truce Supervisor, the Canadian General Burns, has done everything possible to check rising tempers. It says much for his demeanour and acumen that, while doing so, he has succeeded in retaining the respect of both sides; this he holds in a higher degree than any predecessor. He has now produced four proposals for lessening tension: first, joint patrols, ranging on both sides of the line, by a mixed team of UN, Israeli and Egyptian officers; second, the erection of a barbed wire fence to check marauders; third, an undertaking to use only regular soldiers in front line areas; and fourth, an agreement on communication across the line by local commanders to report and discuss incidents. All four have been accepted by the Egyptians, subject to two reservations—that the barbed wire shall not sanctify the permanence of the truce line, but can run on their side of it in the parts where danger lies, and that no direct connection between local commanders shall be made without the presence of a UN third party. (Surely telephone lines relayed through UN switchboards would be feasible.)

The Israelis have accepted the last three proposals, but they refuse joint patrols on security grounds. Admittedly, they own valuable installations much nearer to the truce line than does Egypt. They also dub the Egyptian reservations as objectionable, and as amounting to proof of their intention that raiders shall be able to dodge through gaps in the barbed wire. They are ready to talk, but only at a level high enough to entertain permanent peace proposals, whereas the Egyptians do not want to be engineered into meetings at which they might have to discuss these without their Arab allies at their elbow, and therefore wish to limit talk to the immediate issues at Gaza. Colonel Nasser has shown some will to make progress by suggesting the creation of a neutral zone, to be formed by means of a one kilometre withdrawal by both parties. The Israelis have not yet replied, but seem likely to refuse on the grounds that the move will cure neither Egyptian bad faith nor bad management, one of which, they say, must exist or minelaying could never have taken place. To the outsider, they seem little inclined to give anything a trial, yet none of their objections seem insurmountable, and in so relatively empty a quarter, a neutral zone seems practicable. General Burns publicly remarked at one point that they were not being co-operative, and it is impossible to avoid the impression that Mr Sharett cannot just now afford to agree to experiments in settlement.

The Israeli parliamentary elections take place on July 26th. Between now and then, candidates need to attract the votes of the uneasy sleepers in frontier settlements, the new voters fresh from hazards in lands in which Jews are not secure, and the army fire-eaters who would like to fight while they hold the best guns. Meanwhile, the Egyptian junta, whose position at home is none too strong, is thundering, for Egyptian home consumption, threats that, requoted in Israel, merely feed the "activist" campaign.

Further, inside Israel, a few statesmen who make time to take a longer view, look beyond their own elections to next year's American Presidential election. Last time, the Jewish vote was cast for Eisenhower. If he wants to catch it again will he not have to check the arms-giving to Arabs that has marked the middle years of Mr Dulles's term of office? Might he not even proffer the bilateral treaty that would help to equalise Israel's arms-race with the Arab states? But if he is to be swayed in this direction, must not an issue such as that of Gaza remain in the public eye? The prospects of a full-scale attempt to oust the Egyptians and confront the world with a *fait accompli* may not be grave, but those of keeping blood on the boil are serious. They will certainly last until July 26th, and might do so until the American poll in November of next year.

France's "European" Feud

FROM OUR SPECIAL CORRESPONDENT

BENEATH the apparent quiet of the parliamentary recess Paris is full of political activity. Parties are already in an electoral mood, thinking not so much of this month's voting for the Senate (or Council of the Republic) as of next year's elections to the National Assembly. M. Mendès-France began the campaign with his spectacular seizure of the Radical party's machine; the Christian Democrats (MRP) went on with it at their congress; now committees are being set up and programmes prepared with an eye on possible electoral alignments. Yet, though to Left, Right and Centre there is so much talk of regroupings, coalitions, alliances, there is no sign that the forces which have kept Gaul so divided are no longer at work. Indeed, even seemingly outworn issues continue to obstruct the process of political crystallisation.

One interesting illustration of this is provided by the problem of European integration. It might be thought that the European quarrel would die down once the question of German rearmament were settled. Yet, even now, after the ratification of the Paris Agreements, it is still very much alive. The government itself is deeply divided over the speed at which France should travel the road of European integration. As in the governments preceding that of M. Mendès-France, the MRP ministers are champions of the "European" idea and their ex-Gaullist colleagues its chief opponents. M. Faure, the Prime Minister, must keep the "ultras" constantly in check if he wants to keep the Gaullists in the cabinet.

The struggle has degenerated somewhat from issues to personalities. The MRP, aware that so soon after the defeat of EDC it could not advance bold "supranational" proposals, decided, at least for the moment, to put safe men in the key positions. Even these suggestions, however, were blocked by their partners in the cabinet. The refusal to reappoint M. Monnet to the Coal and Steel Community was only the most resounding of their failures. The case of M. Alphand, one of the draftsmen of the defunct EDC treaty, is almost as typical. This ally of the MRP was nominated ambassador to Tokio by M. Mendès-France in January, but never left for the Far East. As soon as M. Mendès-France was overthrown, the MRP demanded a reward for M. Alphand: they asked that he should be appointed ambassador to Bonn in succession to M. Francois-Poncet. Under pressure from both sides M. Faure havered. Last week a decision had to be taken when the replacement of General Ely in Saigon made necessary a complete reshuffle. M. Alphand was finally nominated French delegate to the United Nations. The MRP did not give in without a struggle and M. Robert Schuman apparently threatened to resign.

Search for a Compromise

There is no doubt about the part the Gaullists played in this struggle. In a speech last weekend, their parliamentary leader, M. Schmittlein, did not mince his words. He declared that they could not stay in the government if "that uncrowned king of Europe, candidate of MM. Adenauer, Hallstein and lesser gentlemen . . ." were kept at the head of the Coal and Steel Community or "if a French official were sent to Bonn whose character would not seem sufficiently firm to resist the song of sirens and other Lorelei." Without infringing the libel laws he could hardly have been more outspoken and explicit.

Still, however bitter the struggle, it is unlikely to bring about the government's collapse. M. Monnet was finally succeeded by M. René Mayer, a milder and less committed "European." At the time of writing the choice for Bonn has not yet been settled, but once again the parties will certainly seek a compromise. The reason is simple and it is one which may insure a fairly long life for M. Faure's government: the partners in the coalition would not benefit from his fall. In particular, if the MRP walked out, thus

paving the way for an openly right-wing government headed by, say, M. Pinay, it would be playing straight into the hands of its arch-enemy, M. Mendès-France, since it would thus facilitate a regrouping on the Left.

With nearly a year to go and the electoral system still undecided, it would be presumptuous to forecast the shape of alliances to come. At the same time, it seems certain that the European quarrel will be an important factor in their composition. It did not die with the EDC, it survived the ratification of the Paris Agreements and it is now added to the long list of issues that complicate the pattern of French politics. The "Europeans" may now be fairly cautious and have little hope of advancing their schemes in the present Assembly; but they will seek each other out before the next one is elected and bring about some strange alignments at next year's polls.

Indian Socialism and the State

FROM OUR CORRESPONDENT IN INDIA

INDIA is a society of small property-owners heading rapidly towards an equality where there will be fewer and fewer of either the rich or the totally propertyless. That is why in India the initiative of planning is left to the State with so little resistance; the State is the engine of change, and nobody except a few businessmen sees any alternative. The State may act directly, by building a new steel mill, or indirectly, by starting an agricultural extension service; but act the State must, for the small owner cannot. He has neither the education, nor the knowledge of the world, nor the resources.

Because State initiative in India derives from the inability of the little man to innovate for himself, it takes a quite different form from that customary in Western countries. The only real parallel is Meiji Japan. The Indian government has very little of the interest in controls and rationing for their own sake which distinguishes the British Labour party. Rationing has gone completely. Price control remains only on steel and cement, where the government is itself the main supplier, and on coal, where industry demands it. There are few cartels, no restrictions on entry into any line of business, no real monopolies. Indian agriculture and commerce, and much of Indian industry, are indeed one of the last examples of classical free competition; an Indian *mandi* is still Marshall's "market." Controls are confined to foreign trade and to the expansion of industry; these are, significantly, precisely the two areas where the private sector impinges on the government's role as the initiator of change. The government wishes to be sure that its plans are not interfered with by the private industrialist building factories which do not fit, or importing so many consumer goods that the government has no foreign exchange left for its bulldozers and its generators.

Nor, at this moment, is the government eager for any wide general socialisation, however much vague talk there may occasionally be. After all the arguments about the public sector which have gone on over the last few months, all that has been actually decided is that the government will build three new steel plants (assuming that there will be one in collaboration with the British in addition to those already decided on with the Germans and the Russians), that the Korba coalfield in Madhya Pradesh will be developed by the government, and that it will build a £15 million heavy electrical equipment factory; and even of these, Indian private enterprise could not have found the money for the steel, and the government itself buys most of the heavy electrical equipment. It is likely that in the second five-year plan well over half the expenditure will be in the public sector; but most of it will be in fields which in India have always been largely governmental—irrigation, power, railways, communications; and the plan for the private sector is likely to be about two-thirds bigger than it was in the present plan.

The government's first function in India, indeed, is to provide the external economies without which economic development is not possible. The private individual has enough capital to build a factory or terrace his land for rice; but the railways, the hydro-electric dams, the irrigation canals, the roads, the higher education, the DDT campaigns against malaria, must be done by the government or they would not be done at all. Nobody else has the money, or the knowledge, or, quite often, the power to get the foreign assistance which may be needed.

The government not only has to provide the small man with his external economies. It has also to do his adapting to the modern world for him. That the small owner enjoys his independence, and will not sacrifice it without the severest struggle is, in India as in France, a fact of great political importance. But if he is not nevertheless to lose it to the blind economic forces of the modern world, he must be shown how to widen his horizon from the village to the world. His production and his marketing must be made efficient, or, as is already happening with the handloom weavers, the preservation of his independence will be another burden on a society already poor.

A Touch of Fussiness

Therefore, the government must see that the schools have an agricultural bias, must provide doctors and the culverts for the village roads, must do the agricultural research and run the seed-farms, make the sulphate of ammonia and see to its distribution. The government must introduce the Japanese method of rice-growing and teach the villager how to run a co-operative brick-kiln; it must show the handloom weaver new designs and invent a better press for the oil-presser. Above all, the government must, through the co-operative movement, provide warehouses if the peasant is not to be compelled to sell his produce at the low prices of harvest-time, and credit, if he is to be able to borrow at rates low enough to allow agricultural improvement to be profitable. And a government which has to assist so universally inevitably becomes a little fussy, a little unwilling to give the economy the freedom to make mistakes which it needs if it is to develop.

The modern capitalist in India, caught between the small man and the State, is thus in a quite different position from his opposite number in the West. In the West he is the main motive-force of social advance. In India he is almost unimportant; modern industry provides only one-fifteenth of the national income; the whole modern capitalist sector perhaps a sixth. As the economy expands, he will expand with it, provided he conforms to five-year plans and does

This 5-storey reinforced concrete structure has been built by Cubitts for the National Employers Mutual General Insurance Association at Port-of-Spain, Trinidad.
All floors are designed on the 'drop-panel' system, which entirely eliminates ceiling beams, and movable vertical aluminium louvres, to exclude the sun's direct rays, have been set in the front elevation.
Long experience of building at home enables Cubitts to execute successfully important projects overseas—'invisible' exports which contribute materially to Britain's prosperity.

Now, as in the past

CUBITTS *build for the future*

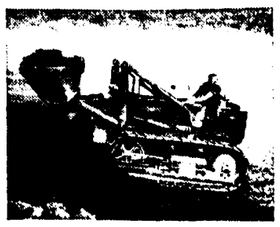
ONE QUEEN ANNE'S GATE · WESTMINSTER · S.W.1 · ENGLAND · SCOTLAND · OVERSEAS

THE WORLD'S FINEST FRONT-END LOADERS

DROTT Skid-Shovels

4 MODELS
6-K3 (Tractor BTD-6) ¾ yd. 3000 lb. lift
9-K3 (Tractor TD-9) 1½ yds. 4000 lb. lift
14-K3 (Tractor TD-14A) 2 yds. 6000 lb. lift
18-K3 (Tractor TD-18A) 3 yds. 9000 lb. lift

HERE'S HOW THEY MOVE MORE MATERIAL FASTER!



1

Drotts dig straight into the heap or down to 14" below ground line with the full weight of the tractor behind the bucket.

2

Drotts 'break-out' with a force greater, pound for pound, than the tractor's maximum drawbar pull.

3

Drotts get a heaped bucket every time, transport it on skid-shoes, keep it level during lifting.

4

Drotts lift to a great height, reach well forward, dump quickly and cleanly. They will clear the highest trucks and rail wagons, place material farther on the bank.

You can dig and load a wider variety of materials faster and more economically with Drott Skid-Shovels than with any other front-end loaders.
In the first place because Drotts are specifically designed to work with Internationals, the world's most versatile, efficient and dependable crawler tractors. Second, because over 30 years of planning, testing, proving, have resulted in many revolutionary output-boosting and wear-saving features that no other loaders possess. And, third, because Drotts are engineered to stand the most severe strains, the most brutal shocks, for many more hundreds of working hours.

not tread on too many artisan toes; and the State makes as sure as it can that he will make a profit. But he will have to be good; and he will never be important.

Free Trade Unionists in Vienna

THE *Konzerthaus* in Vienna seems to be a favourite meeting place for international trade unionists. In October, 1953, the Communist-controlled World Federation of Trade Unions held its last congress there in a room draped in scarlet and hung from roof to floor with red banners. The same room, now more soberly garnished, was the scene at the end of last month of the fourth world congress of the rival International Confederation of Free Trade Unions (ICFTU). Despite the comparative restraint of the décor—a symbolic torch, and a cluster of national flags on the platform—the free trade unionists presented an air of considerable self-confidence. The general secretary, Mr J. H. Oldenbroek of Holland, reported that the organisation had expanded considerably in the non-Communist world during the past two years at the expense of the Communist body, 90 per cent of whose affiliated membership is now within the Iron Curtain. The Confederation also managed this time to settle its disagreements behind the scenes.

The main achievement of the congress, and the issue over which opinions were divided most sharply, lay in the decision taken by the executive board to foster the ICFTU's regional activities, with the aim of helping the growth of non-Communist unions in underdeveloped areas. For this purpose a special contribution of one American cent per member was approved in principle, and it is expected that this will add about $330,000 a year to the Confederation's resources. But a battle developed within the executive board about who was to administer these regional activities. The American groups—the Congress of Industrial Organisations (CIO) and the American Federation of Labour (AFL)—wanted to pass a constitutional amendment putting M. Omer Bécu, the Confederation's Belgian president, in charge of this side of the ICFTU's work, thus by-passing the general secretary, Mr Oldenbroek, who, in the American view, is not outspoken enough in his anti-Communism; Mr Irving Brown, the European representative of the AFL, said sternly that Mr Oldenbroek was "no guide in a drifting world." Most of the European delegations, including the British, opposed this as a slight to Mr Oldenbroek, and as a compromise the executive board decided to create a special post of Director of Organisation to look after the development of unions in backward areas.

This will involve some renunciation by the AFL, who have hitherto carried on their own regional activities in various parts of the world on much the same lines as are proposed for the new agency. It has been felt for some time, by their fellow-Americans in the CIO and by many Europeans, that such activities should properly be under ICFTU control. The success of the new agency will depend largely on how far it manages to avoid one of the biggest pitfalls facing those who set out to encourage trade unionism in backward areas—the proliferation of tiny unions which fall too easily under the influence of demagogues. It has been estimated, for example, that in British colonial territories at the end of 1954 there were over 1,200 registered unions with a membership of less than a million.

The same division—between militantly anti-Communist American unions and less militant ones elsewhere—emerged again when a Cuban resolution on rearmament was considered. This resolution used phrases like "the basis on which the world is to be organised after the defeat of Communism" and urged the congress to resolve to "fight in the most active and dynamic fashion to ensure that the victory over Russia brings about the transformation of the world on Socialist bases." The vigour of the anti-Russian sentiments met with the approval of Mr Irving Brown, who is connected with what is known as the "New York group" inside the AFL—a group which exists to foster a trenchantly anti-Communist line in foreign affairs. But like the resolution on regional activities, this motion never reached the floor of the congress. It became known that, if it did, it would be opposed by the German delegation, apart from giving heart failure to some of the other Europeans. Instead, a compromise addition was made to a Japanese motion on disarmament.

Apart from a refusal to approve the admission of Jugoslav unions to affiliate bodies of the ICFTU, the other most noticeable feature of the congress was the number of resolutions on colonial subjects. Three of these concerned Britain—a motion to investigate allegations of forced labour in Kenya, another urging self-determination for Cyprus and a third calling for equality in social welfare between Malta and Britain. The British delegation accepted these with a stiff upper lip, not by way of a barter deal with the Americans on the other points at issue—there was no direct bargaining of this kind—but in the hope of preserving the unanimity and decorum of the congress. It may well be that opposition would have aroused even fiercer anti-colonial demons in some delegates' bosoms.

South Africa's "Historic Mistake"

FROM A CORRESPONDENT IN DURBAN

THE South African government has recently withdrawn its offer made last December to discuss with India and Pakistan the problem of Indians living in the Union. It has done so on the rather inadequate grounds that a recent speech of Mr Nehru's, which admittedly contained some pretty brutal knocks, showed that the proposed round table conference was foredoomed to failure. The Pakistanis, however, were studiously absolved from any blame. This long-standing issue has every year been the subject of acrimonious and sterile debate in the United Nations, and it has bedevilled diplomatic relations between the three countries. It is more the pity, therefore, that the opportunity of direct contact between the parties has been frittered away.

Of all South Africa's many race and colour problems that which concerns the 350,000 people of Indian origin is certainly the most complicated. No aspect of the Indian problem causes the white population more alarm than the

prolific fertility of the Indians in their midst. Recently the residents of Durban were dismayed to read that the Indian population of their city was already larger than the European; that the number of Indian girls under the age of 15 were three times the number of white girls in this age group; and that the multiplication rate of the Indians in South Africa was the highest in the world. More than 85 per cent of the Indians, the majority of whom are Hindus, live in Natal, and no less than 150,000 live in Durban. This heavy concentration is in part the result of provincial barriers forbidding their movement. The result is that the Indian problem is essentially a Natal problem, and in Natal, a Durban problem.

The Indians are not a homogeneous community. Within the group there exist all the antipathies which the Indians are seeking to erase from their relations with the other sections of the community. The communal quarrels that led to partition in India are mirrored in Natal; Hindus and Moslems vie with each other in seeking exclusiveness to the detriment of their unity. The first comers, mostly Hindus, arrived in South Africa as indentured labourers in the 1850's. Hard upon their heels came the free Indians, mostly Moslems, who went into trade. Both continued to come, to thrive and to multiply, the traders capturing a large proportion of the wholesale and retail trade, especially among the Africans; the Hindus advancing to become industrial workers, small farmers, and professional men.

The success of the Indians as traders, their rapidly mounting numbers and their racial incompatibility are the three main factors in the so-called Indian problem, which, in 1946, drew from General Smuts the observation "we are the victims of an historic mistake." The mistake was that after encouraging Indian "coolies" to come they were not, like the Chinese, compelled to go back. In Natal they were (and still are) welcomed as workers, frowned upon as traders, and heartily disliked as neighbours. In the Transvaal they were as early as 1895 segregated on account of their "insanitary mode of life."

The varied treatment meted out by the four territories to their Indians presented an astonishing muddle at the time of Union in 1910. The first attempt to bring about some uniformity was made by General Smuts during the war when he extended to Natal what were known as the Pegging Acts of the Transvaal and included certain economic restrictions. As compensation, he offered the Indians indirect representation in Parliament, through Indian-elected white representatives. The Indians refused the offer, though some leaders of the South African Indian Congress were ready to accept it. The result was a rift in the Congress; the younger professional and Trade Union discontents captured the leadership on a no-compromise platform. Later a new political body, the South African Indian Organisation, was set up by the moderate group. Indians now have two political bodies and speak with two voices. Congress, largely Hindu, draws its support from the workers and is led by professional men with Leftist leanings. The Organisation, largely Moslem, is representative of vested interests. It is willing to make concessions and to accept compromise, while Congress openly refuses co-operation with the government. Whereas Congress leaders still look to the United Nations and especially to Mr Nehru for help in their difficulties, the Organisation believes that Mr Nehru's continued intervention in Africa only injures the Indian cause by antagonising Europeans still further.

Indians and Africans

Something of the same conflict can be seen in Indian-African relations. Congress has an alliance with the African National Congress in their common struggle against the Europeans. The Organisation opposes any such alliance and seeks African friendship in other ways. How far these alliances and gestures touch the real differences between Indians and Africans is impossible to estimate. Superficially, however, relations between them at the present level are amicable. But it must be recognised that the vast majority of Africans as well as Indians are completely remote from the political struggle and show little interest in what the politicians are doing. The Africans certainly view the Indians' economic status with jealousy and suspicion. In Durban, Indians own fixed property to the value of £16 million, as against £90 million in white ownership. The Africans are forbidden such freehold property. The Indians—or rather some Indians, for wealth is most unevenly distributed—appear rich in African eyes, and this fact alone explains the tensions which give rise to such incidents as the ugly anti-Indian riots of 1949.

Indian disabilities in South Africa are real, and many of them could be remedied without harm to European interests. All the same it is a fact that few Indians can be persuaded to leave Mr Strydom's oppressions for Mr Nehru's freedoms. Indeed, despite the offer of financial inducements to return to India, only a trickle of Indians go, and many on the other hand try to get into the Union by legal or illegal means. The problem of fitting the Indians into the Union's multi-racial society is pressing and fraught with danger. *Apartheid* with its simple and ruthless logic is no solution, since the Indians have no reserves in which they can be penned off. Nor is there any possibility of uprooting this large part of the population, most of whom know no other home than South Africa, and shipping them off to alien and unwilling hosts in India and Pakistan. It is a problem for patience, wisdom and statesmanship—qualities, which, unfortunately, are rare in the ruling classes of South Africa today.

THE BUSINESS WORLD

How the Bill Tender Works

ONE welcome and probably enduring consequence of the vigorous monetary policy that has been pursued since January is that it has consolidated and extended the progress made in the previous three years in restoring a genuine flexibility to the monetary apparatus. Many of the rigidities and artificial arrangements that were built up during the nineteen-year span of cheap money—when Bank rate, except for its brief flutter at the outbreak of war, was held inert and ineffective at 2 per cent, and market rates became almost invariable at much below that level—have now either disappeared or been noticeably loosened.

Some of these special arrangements do, however, still persist, and perhaps the most notable among them is the system of concerted tendering for Treasury bills that is followed by the discount market. The discount houses—numbering twelve since the war—each week agree upon a uniform price, at which they will severally tender for the offering of Treasury bills, and then regulate the amounts of their applications within defined limits, by a scale based upon their capital resources. A system of this character has been in operation for the past twenty years, but before the war it embraced a few "outside" banking houses as well as the then larger number of discount houses.

To form any fair judgment of these arrangements it is necessary to glance first at their origins, and especially at the associated practices of the clearing banks. The world slump of the early 'thirties, and the barter agreements that beset world trade when it began to revive, deprived the discount market of most of its traditional business in commercial bills ; and at the same time the Treasury seized the opportunity presented by cheap money to fund Treasury bills. These conditions would have oppressed the discount market in any case, but a further circumstance aggravated them to the point at which all save the few big houses faced a threat to their very existence. This circumstance was the refusal of the clearing banks to allow full flexibility to their charges for short loans to the market. Apparently in response to the wishes of the authorities in the difficult phase after World War I, the banks had adhered to the wartime practice of fixing a minimum rate for these loans. In the very different conditions of the early thirties they insisted on keeping the minimum at 1 per cent (i.e., 1 per cent below Bank rate), while simultaneously joining in the scramble for bills that eventually forced the Treasury bill rate down to 3/16 per cent, and thus confronted the discount market with heavy losses—which only the bigger houses could reasonably reckon to make good by dealings in short bonds.

At this juncture all parties agreed that, although some contraction of the discount market might be desirable (by consolidation of the smaller houses), it was imperative that an efficient market should be kept in being—not merely in the hope that its commercial functions would revive, but because its traditional services in the money mechanism as such were (and are) of vital concern alike to the Treasury as borrower, to the Bank of England as credit regulator, and to the commercial banks. One solution might have been to complete the freeing of the money mechanism, but the banks were opposed to this and preferred merely to reduce their money minimum (for loans against bills, while retaining the 1 per cent rate for the new category of "bond" money). Hence it was still necessary to ensure that the bill rate did not drop below the money minimum, and this was achieved by two further artificial expedients, devised with official blessing.

The first of these was an agreement among the banks that they would abstain from tendering for Treasury bills and from buying any bills in the market at rates

below the ½ per cent money minimum. This forced bill rates up, and immediately provoked a great spate of demand at the tenders, including many mere "stagging" applications. The second expedient, devised to meet this threat to the whole plan, was the discount market's quota system for tenders. The discount houses agreed not to join in the rush, and to keep their aggregate applications roughly in line with (actually somewhat below) the amount of bills on offer. And both banks and market later agreed not to purchase Treasury bills from "outside" houses unless at least one week of their life had elapsed—so that the scope for "stagging" applications was greatly narrowed.

★

During the abnormal circumstances of the 'thirties even the most ardent advocate of flexibility recognised that these arbitrary arrangements were necessary and desirable—as the very means, indeed, of preserving the apparatus of flexibility. The whole series of expedients has persisted, with relatively little change, ever since; yet since 1951 the conditions that gave rise to them have wholly disappeared. As soon as Bank rate itself became variable again, a margin opened up between the bill rate and the standard money rate, to provide the discount houses with a premium against the risk of a sudden rise in rates generally; more recently, rates for a substantial part of the money supply have themselves become flexible, and official policy has forced the bill rate close up to the Bank rate, making it fully effective.

In these circumstances it may seem not only that the reason for these artificial devices has disappeared, but that their continuance is obstructing the flexibility of the monetary apparatus as a whole. A doctrinaire approach to the problem of freeing the money system, which finds much justification in the experience of the recent evolution, would certainly require them to be swept away. No such demand has yet been voiced, however, from any of the several interests, including the authorities, most closely concerned—except that one of the big banks became momentarily restive at the abstention from tendering. If such restiveness were to grow, some radical changes might follow.

Something more than mere inertia and habit may explain the apparent absence of desire for change. It is possible that these arrangements have acquired a genuine function that has taken the place of the original limited purpose. Though the mechanics of the concerted tender are still much the same as before the war, the discount houses would claim that a major change of principle occurred in the early days of the war, because they have since regarded themselves as having a collective responsibility—even on obligation—to ensure that their aggregate applications approximately cover the whole amount offered each week. The discount houses at all times stand ready to take any shocks caused by variations in the demand for bills, whether at the tenders or in the market. This relieves the Treasury of worries or uncertainties in the placing of its bills, and minimises the risk that the needs of the Treasury may conflict with the aims of monetary policy.

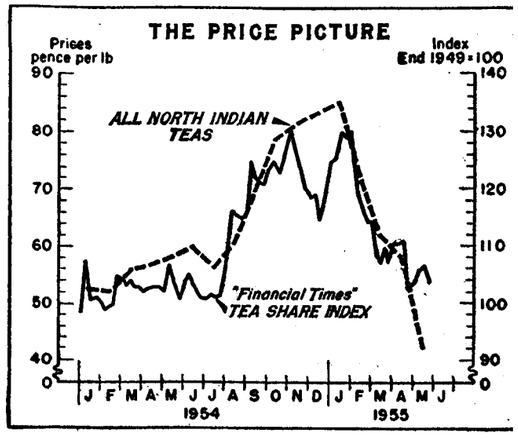
There could be no such assurance, it is argued, if the clearing banks constantly competed with the market at the tenders, or if the discount houses did not concert their applications. And this assurance is particularly valuable now that Bank rate is variable. Without it whenever a rise in that rate was feared, the outside and overseas demand for bills would fall away, and the banks and market would reduce their applications or even abstain altogether. Hence the Treasury would run the risk of having to finance itself temporarily by Ways and Means advances from the Bank, and of thus causing credit inflation at the very moment when firmness in monetary policy was most needed. At the very least, the money apparatus would be liable to violent jolts.

Dangers of this kind did in fact arise in acute form after World War I, when the Treasury bill issue was very large; after the severe fundings that followed, they recurred only occasionally. But in the years before 1931, the last phase of flexible money, the volume of tender bills was equivalent to only 27-30 per cent. of net bank deposits, whereas now it is about 52 per cent. Again, since 1929 the true capital resources of the discount market have certainly doubled and may have trebled—but the weekly offering of Treasury bills has been multiplied six or seven times. This suggests that if the concerted tender was abandoned now, the authorities would be likely to find that an effective policy of flexible money might require a substantial reduction in the volume of Treasury bills—yet the present supply does not seem to be more than adequate for the normal needs of the banking system.

Though arguments of this kind are common in the market, and even among the banks, there is no evidence that they have actually been voiced by the authorities themselves. But if it is true that the concerted tender system is performing this new service (and if there are good reasons for maintaining so large a bill issue), the question still arises whether a price is being paid in terms of loss of market flexibility and perhaps of increased interest costs to the Treasury. To this question there can be no categorical answer.

From time to time Labour politicians have attacked the system on the ground that it raises interest costs. Certainly it is true that in at least part of the prewar period from early 1935 Treasury bill rates were higher than they would have been if the whole rate system had been free; but the rate-maintaining force, which kept rates from falling to the minute fractions reached in some other countries, was really the banks' minimum rather than the tender arrangements as such. And the Treasury, in effect, agreed that the price was worth while. Moreover, while the plan then saved the market from making an outright gross loss on its bill dealings, non-market competition at the tenders kept the rate at only an infinitesimal fraction above the money rate at which the bills were financed.

There can be no such objective demonstration of the workings of the market tender system today. But the competition the market has to meet—both from the "inside" tenders submitted by the Bank of England for itself and its customers and from "outside" quarters—is very strong. It has lately been eating into the market allotments, notably because the credit squeeze has kept the market from increasing its application price (and, indeed, has forced a progressive reduction). Moreover, there are frequent differences of view among the discount houses themselves, so that the agreed policy is a compromise between the conflicting objectives of the best rate and the best allotment. If during the past year the market's margin has at times been higher than it might have been without the concerted tender, at least part of the cause has been the relative inflexibility of the banks' money rates. These, however, have lately become much more flexible; and in any case the market's margins have never been wide by the standards of former periods of orthodox money. The special tender arrangements have almost certainly kept the range of Treasury bill rate fluctuations narrower, but it is not certain that they have kept the average perceptibly higher, than it would have been in a fully free market. On a long view, a more volatile rate might produce a wider average margin.



These considerations do not suggest that there is any *prima facie* reason—except the doctrinaire one—for getting rid of these devices, anomalous though they look in the new phase of growing flexibility. But the advantages of the system, if such they are, probably do not require the retention of all the defensive adjuncts that were added to it before the war. The market and the banks would do well to look afresh at the details. The system could be made more free, without making it less useful.

Recipe for Tea Shares

THE tea share dividend season has produced a strong brew. Profits and dividends spring this year from the booming tea prices of 1954, a year in which common tea opened at 4s. per lb. in Mincing Lane and finished little short of 7s. Most companies' accounts cover the calendar year, and North Indian companies had sold the bulk of their crop before the break in prices last February. Companies are paying the highest dividends and showing the highest profits in living memory: some must be hard put to know what to do with the money. Consolidated Tea and Lands, with a profit before tax of £2½ million, compared with £1.3 million for 1953 and with only £98,000 in 1951, is no more than typical of the trend, and its dividend of 30 per cent, tax free, against 10 per cent tax free in those circumstances is conservative.

But the boom in tea prices is over, and the active market in tea shares has vanished with it. Fine profits and dividends are falling on a share market that is as flat as only the tea share market can be. The *Financial Times* index of tea share prices, which reached a peak of 130.1 on February 2nd, is now 104.7, and the fall understates the true stagnation of the market. There is no "market," and the impatient sale of only a few hundred shares can send prices tumbling further. At the present level of prices it is not difficult to obtain dividend yields from sound shares of 30 per cent backed by earnings of twice that figure.

It is always so with tea shares. The market in London is narrow and suitable only for those who understand the business, and the Calcutta share market is no better. The three London jobbers who try with limited resources to keep a market going in the shares of an industry made up of innumerable small companies find themselves negotiators rather than jobbers, and they can hardly be blamed if they sometimes reject the risk of dealing unless they can see both a buyer and a seller. The limitations of the London jobbing system and the capital structure of the tea-growing companies—many

of whose shares are tightly controlled by family groups or agency houses—are equally to blame. The market is either all buyers or all sellers, and the change-round is as sudden as the change from prosperity to depression in the tea industry itself.

In the depression of 1952 more than 60 companies

in India and Pakistan made serious losses. In the boom of 1954 nearly all companies made the best profits of a generation. Yet today for many companies prices barely cover costs of production, plus export duty. The investor who bought tea shares last year because he could see that magnificent dividends would be due in May, 1955, has the satisfaction of knowing that he was right. He has little other cause for satisfaction. Share prices have fallen so far below their peak as to almost wipe out the gain he made in 1954, and if he were to try now to sell any quantity of shares he would not realise even those reduced prices.

So it is strange that the share bidders who were so active in the last months of 1954 have all vanished. Indian buyers were then haunting the London offices of stockbrokers and agency houses in their search for companies whose control could be bought through the market. It was demonstrable that the break-up value of the companies was well above the market value of the shares, and many were also palpably well endowed with liquid assets. A few sales were made, and several purchases were attempted. The Assam Company had a narrow escape, and many companies—Assam, Jorehaut, and the whole Walter Duncan & Goodriche group—have taken evasive action to make any bidder secure overwhelming rather than a bare-controlling interest.

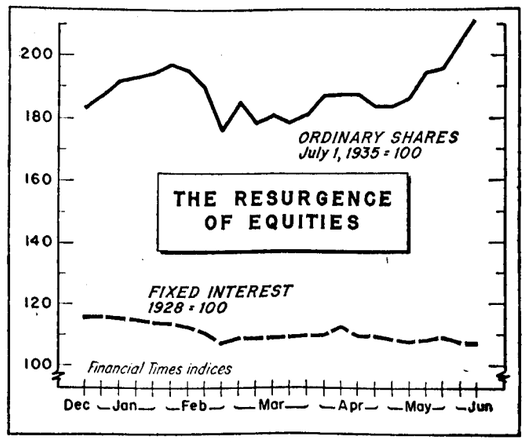
Company	Net Profit 1953	Net Profit 1954	Dividend Rate 1953	Dividend Rate 1954	Current Price	Yield Per cent
	£'000	£'000	%	%		
Ceylon						
Ceylon Tea Plants	119	321	27½	50	48s.	20¾
Demodera	35	101	17	53	30s.	35½
Lunuva	82	354	15	25	27s. 3d.	18½
Nuwara Eliya	77	220	12½	22½	31s.	14½
Galaha	49	119	25	50	9s.	22½
Standard Tea	87	177	27½	50	45s.	22½
Pundaloya	16	57	17½	40	28s.	28½
India, Pakistan, etc.						
Consolidated Tea & Lands	825	1,149	10†	30†	34s. 6d.	30½
Amalgamated	224	356	5†	11½†	21s. 6d.	18½
Sylhet	22	44	15	50	27s. 6d.	36½
Dekhari	32	128	20	17½†*b*	20s. 6d.*	29½
Chandpore	39	96	25*a*	30†	8s.	27½
Kanan Devan Hills	234	642	10†	27½†	41s.	23½
Darjeeling Consolidated	42	80	10	20	19s.	21

All £1 shares except Galaha 4/- and Chandpore 5/-. All for years ended December 31st; except Pundaloya December 1st, Consolidated Tea, Amalgamated, and Kanan Devan November 30th. (*a*) 5 per cent less tax, 20 per cent free of tax. (*b*) Dividend adjusted to 100 per cent free scrip issue of April, 1955. * Ex-dividend. † Tax free.

What accounts for this disappearance of the bidders almost overnight? The cost per acre of good bearing tea gardens in a favoured Indian district is still about £250 to £300 an acre, and must remain related to the cost of planting such land and bringing it to maturity. And thanks to the sharp fall in prices, tea shares now appear to be an even more attractive proposition for a take-over. Can the disappearance of bids be due solely to the stiffer attitude of the Indian exchange control? It is known that the Indian Finance Minister has expressed doubts about the wisdom of Indian buying of tea companies through London, and that at least one prospective sale in South India has been abandoned. Yet that cannot be the whole story.

Take-over bids seldom flourish in a falling market. They might if the bidder were a man of great wealth, seeking only to buy an estate cheaply, plough his own money in and run it as it is now run—for the long view. But normally it is the glitter of the company's present liquid wealth, its current profits and its accumulated cash that catches the bidder's eye. That cash may now be committed to relieving a lean time. The bidders can afford to wait.

Many companies are this year not only paying higher dividend rates, but also paying on a larger capital, for free shares were issued widely in the especially profitable conditions of 1954. That policy is still within the conservative traditions of the English and Scottish agency houses. They are also ploughing much larger sums of money into the gardens to build for the future. If another lean period is in store for tea, most companies will face it with unusual financial strength. How lean that period may be depends mainly on the producers. World consumption of tea remains high—and will almost certainly increase further over the years—but there is too much tea on the market at present.



The investor must frame his policy not only against that background and the peculiarities of the share market; he must also make the allowance he thinks appropriate for the political and other factors that are steadily restricting the companies' operations in India, Ceylon and Pakistan, the three main producing countries in which British investors have a stake. The remittance of earnings from Pakistan is practically impossible, and difficult from Ceylon. In India, the rupee companies now face the likelihood of the gradual elimination of the managing agency system, essential though that system is for the efficient operation of the estates. All three countries impose restrictions of varying severity on the employment of Europeans in the tea industry. All these factors will help to keep tea shares on a relatively high-yield basis and to make it difficult to raise capital by any means except retained profits.

Above all, investors must realise that with tea shares they cannot hope to swim with the stream. It is costly to buy when all are buying, and fatal to sell when all are selling. Hence, it is already too late to get out of tea shares. This may be a time when shrewd professional investors start thinking about getting in again. Those who contemplate investing a fair amount are now making small beginnings, with no certainty that tea shares will not suffer a further fall, but with the hope that their purchases as a whole—spread over a period—will average out well. On the long view, it might also be right now to choose the companies managed by agents that traditionally treat shareholders with something less than generosity, for those companies should have substantial retained resources and a relatively easy passage through what may be a difficult time.

Business Notes

Effervescent Markets

DESPITE the worries and inconveniences of this second week of the rail stoppage—not to mention the continuing dock strikes and the new hold-ups of transatlantic liners—the stock markets have been quite unable to restrain the effervescent optimism that has been gaining strength ever since investors made up their minds that the Conservative government would gain a second term. Although the market was rather patchy at the close on Thursday, optimism has bubbled every time there seemed any excuse for believing that the rail strike might be quickly settled. Last Friday, after the spectacular leap in the *Financial Times* ordinary share index, by 5.8 points to 204.4, profit-taking carried it back to 202.9, but since then there has been a further extraordinary advance—slight on Monday, but amounting to over 8 points in the two following days. By Wednesday's close, it had reached the dizzy peak of 211.3, or no less than 35 points above the low point of mid-March, and the average yield on the blue-chip stocks included in the index has been forced down to only a small fraction above that on long-term gilt-edged.

The immediate future of the gilt-edged market, however, is by no means assured. This week it has only just succeeded in holding its own—after renewed weakness on Monday. Although many people believe that the market has just about touched bottom, it certainly cannot be taken for granted that no new pressure will be put upon it from the credit squeeze—even though the banks at the moment do not seem to be showing any anxiety to sell. Some further sales are believed to have taken place in the past week, but only in response to a clear demand for a particular stock. The rail strike has made it the more necessary to ensure that monetary policy really does restrain the pressure upon the economy, and if that policy is kept firm, the best hope for the gilt-edged market is that it will henceforth operate mainly by squeezing bank advances. It is unwise to assume, as many people are assuming, that an electricity issue ought to ease the pressure on gilt-edged. The banks plead for such an issue because they regard it as unfair that their liquidity should be so heavily burdened by electricity advances; but if the liquidity ratio is eased by a funding operation, the cutting edge of the money weapon will be blunted—and, if it is to do the necessary cutting of real demand, it will then have to be sharpened again by official sales of gilt-edged. And this kind of pressure will have to be the more determined if the Electricity Loan were to be placed on such terms as left any large proportion with the "departments."

Meanwhile, lesser borrowers are being put first in the queue. On Monday a £10 million cash and conversion issue was announced by New Zealand, to provide for the £11,984,000 of 3 per cent 1952-55 stock that finally matures on July 1. The new stock, 4¼ per cent, 1970-73, at 97½, compared favourably with existing New Zealand issues, which fell sharply on the announcement; but it clearly has not made any notable appeal. The cash lists remained open throughout Thursday.

Steel Thrust

BY one of the ironies of political forecasting, the steel equities that did not attract full subscription because of the threat of renationalisation are now in the van of the stock market boom. They are not being bought simply because a Conservative victory gives the steel industry a clear road for at least a spell of years. Nor are they being bought simply because the earnings cover on the ordinary dividends is high. Both those facts have weight, as the doubling of the price of the Stewarts and Lloyds stock illustrates. Earnings on that stock are very high but, then, the issue price was very low because Sir John Morison had to make a success of that issue to clear the path for those that followed. The argument for buying now, however, is rather more sophisticated. It is recognised that the steel companies will need to plough back profits to finance the development programmes still under way and that hence any statistical calculation will show a high ratio of earnings to dividends. But it is also recognised that the development programmes so far completed and those to be completed in the future have brought and will bring in increments to

profits. It is from those additional earnings that the bigger dividends are expected to come.

But why have steel equities leaped ahead in the middle of a strike that threatens production in that industry more than in most? The answer can be found in this week's announcements from Colvilles and John Summers. Both those announcements indicated that trading results in the current year will be much better than the cautious forecasts made in the offers for sale. In the Colvilles prospectus the directors spoke of a profit after depreciation but before tax of £4.5 million as a reasonable figure on which to base

Ordinary Shares (£1)	Issue Price	High 1955	Low 1955	Approximate earnings % †	Dividend per cent.	Current Price	Yield per cent.
							£ s. d.
United Steel	25/-	44/4½	29/-	57	10	44/7½	4 9 8
Lancs. Steel	22/6	35/-	24/9	37	9	36/6*	4 18 8
Stewarts & L	35/-	73/-	42/6	109	12½	73/9	3 7 9
J. Summers	24/6	43/-	27/6	32	9⅝	43/9	4 9 10
Dorman Long	22/6	34/4½	23/3	40	8	35/6	4 10 1
Colvilles ...	26/-	36/4½	27/3	87	9	37/4½*	4 16 4
Whitehead..	55/-	69/-	57/3	67	17½	67/9	5 3 4
Firth Brown	25/-	30/-	25/3	76	8	31/9	5 0 9

† Relating to last financial year (end-September, 1954); Stewarts & Lloyds have since declared an interim dividend of 5 per cent., John Summers of 4 per cent., and Colvilles of 3 per cent. * Ex-dividend.

their dividend policy. The directors now show in an interim report (accompanying the 3 per cent interim dividend) that in the first half of the current financial year the group has already earned a profit after depreciation but before tax of nearly £3.7 million. Small wonder then that the optimists began to calculate that equity earnings would be twice as high as the prospectus estimate of £1,960,000. And to encourage their hopes comes the decision from John Summers to raise its interim ordinary dividend from 3 to 4 per cent.

Coal Now and Next Winter

WHILE the miners can keep output up, as so far they are doing, the rail strike will not have much effect upon the total amount of coal Britain has in stock; what it will affect is where those stocks are held. Consumers are making up their reduced current deliveries by drawing coal from their own "distributed" stocks: the coal they do not get is piling up in colliery yards and opencast stocking grounds. At the beginning of the strike consumers had about 11½ million tons of coal in stock and the industry about 1¼ million tons. Last week about 3.3 million tons were produced, which was for this year of low coal output not an unusually bad Whit week. Roughly two-thirds of this coal was distributed, perhaps as much as half by road, and a third put into the industry's stocks. Export shipments are now hardly likely to be exceeding imports; so distributed stocks might have been expected to fall by 1-1½ million tons last week and the industry's stocks to rise by more than a million tons. The daily output figures that the National Coal Board is now issuing suggest that this week has been continuing at a normal level for 1955, and that a rather larger proportion of coal may have been moved from the pits this week than last.

The limits on colliery stocks in times of normal trade are reputed to derive from the miner's psychology: daddy does go down the mine when there is plenty of coal in the yard, but he may not send as much up. Today, there are no fears about coal demand. The miners are keeping output steady: and even the resolutions in South Wales appear to have been worded so as to sound as militant as possible while in fact hampering coal movement there as little as will save red faces. The physical limits on stocking at pithead are taking longer to master than most people guessed: it is inconvenient and costly to handle coal twice, but so far most pits have no shortage of room to put it.

But in full working weeks from now on, even in the summer, the economy as a whole may have to draw upon its distributed stocks by half a million tons or more a week while the strike lasts. Industry is getting whatever coal is moved, and the cutting of hours worked may somewhat moderate its fuel needs. But it is running already on fairly narrow margins at best, and hand to mouth in many cases; and specialised requirements, such as coking coals for some areas, present the worst problem of all. Until mining output is interrupted, the significance of the strike for coal stocks this winter is primarily in piling up a big autumn task for coal transport. It is keeping current output moving to industry now that matters.

Output Without Transport

BEFORE industry's coal stocks run out, it is beginning to be argued, other supplies may dry up as a result of the rail strike, such as bought-out components and sub-assemblies. Only one freight train out of five is running normally; the dockers are at full strength on only one ship in three; and five passenger liners are still crewless; but the week has passed by with remarkably little interruption to output. Some 7,000 persons were actually laid off last week (plus an unknown number under notice), and the number has not been much greater this week. This was the second week of the railway strike and the third week since the stevedores came out. Business has been more than enough for road hauliers, canal barges and Thames water-buses.

The steel industry, which was the most vulnerable to a railway stoppage, is now working at about 75-80 per cent of normal, with some plants doing better than others. Special coal trains at weekends should help to keep coke ovens and furnaces going for some time, but the industry expects to continue running slowly downhill.

By living off stocks and by reducing working hours as a precautionary measure, most steel users have kept going without interruption. The greatest danger to the motor-car industry, which, with the cycle and aircraft firms was receiving 29,000 tons of the 260,000 tons of finished steel delivered weekly earlier this year, lies in its long chain of suppliers. No trouble has happened here yet, and none so far appears imminent. The building and construction industries had been taking 27,000 tons a week; the rate of factory construction this year may thus be less than had been expected. Even with the 10 per cent increase in

"There are people whose business it is to know about these things"

You may never have seen a refractory. "The technical side!" you may say. "There are people whose business it is to know these things." How right you are! Refractories are technically very complex, and financially very important. Their selection really is a specialists' job. Morgans are such specialists. They are the manufacturers of some of the finest refractories in the world. They designed, and they operate, the most up-to-date refractories plant in Europe. They know, if anyone does, the care with which long-life refractories must be made.

Morgans' advice—which involves no obligation—is completely authoritative.

Refractories are the materials from which furnaces are built. They may well be in your balance sheet—unseen. Think of their effect on labour and fuel costs, overheads, furnace productivity; and their importance at once becomes clear. As well that there are people who know about these things!

7 days in the life of a busy man

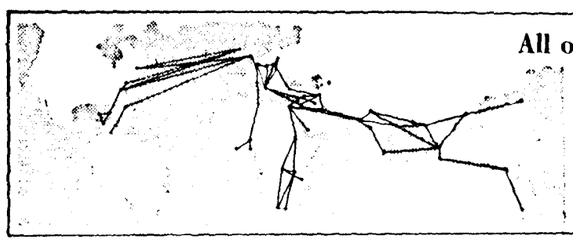
New York, Tuesday evening. Flew over from London by B.O.A.C. for conference. Now by B.O.A.C. again for tour of world plants. Back across the Atlantic by "Monarch" de luxe *Stratocruiser* service . . . air travel at its superlative best.

London, Wednesday morning. What a wonderful way to travel . . . got in fresh as a daisy for a day of concentrated business at head office, then . . .

Cairo, Thursday morning. Reached Egypt in the comfort of a B.O.A.C. *Argonaut* for a quick look at new installations, business dinner and overnight stop.

Calcutta, Saturday morning. Another restful flight, then a two-day stop for discussion of local problems with Indian agents. Satisfactorily solved.

Tokyo, Tuesday evening. Across the world — with stops — in only seven days! A wonderful way to complete a week's heavy programme, then . . . back home again by B.O.A.C., of course!



Whether your itinerary demands rush or leisure, B.O.A.C. offers you frequent services — at First or Tourist Class fares — to 51 countries of the world.

Delicious free meals and courteous, personal service. No tips or extras.

FIRST CLASS "Monarch" *Stratocruiser* services to U.S.A., Canada, Caribbean. "Majestic" *Constellation* services to Middle East, Far East, Australia, and South Africa.

TOURIST CLASS "Coronet" *Stratocruiser* services to U.S.A. and Canada. "Coronet" *Argonaut* services to Middle East, Africa, Pakistan, India, Far East. *Constellations* to Australia.

Consult your local B.O.A.C. Appointed Agent or any B.O.A.C. office, and ask about the Ticket Instalment Plan.

All over the world

B·O·A·C

BRITISH OVERSEAS AIRWAYS CORPORATION WITH QANTAS, S.A.A. & TEA

supplies—including extra imports—that was thought likely earlier this year, steel would still have been short. The position will now be worse. No further orders are being taken at present, and by the autumn steel prices will probably have been raised.

The dock strike is now of only academic interest for many export packing departments. Warehouses were beginning to get full before the rail strike, but the whole rail pipeline is itself now nearly dead. British Railways cleared a month's back-log of shipments in remarkably quick time after last October's dock strike. This time, however, the railways will have much more work to do, and the present system of priorities will have to be continued for some time. A small loss of steel output and the breaking of export delivery promises will be the major results of the two strikes if work is resumed before next week-end. If the footplatemen or the stevedores stay out longer, then the pile-up of finished goods and the interruption of supplies of materials and components will bring a more serious situation.

The Price of Coal

SOME of the coal merchants who are using lorries to collect coal from the pits—particularly in the Midlands—have been allowed to make temporary increases in the price of the coal to consumers. The altered transport involves these merchants in buying the coal at pithead price and paying for it to be carted to their own depots, instead of buying it at a "zone-delivered" price and receiving it by rail. The delivered price normally averages out transport costs to merchants throughout certain areas from the variety of pits that may supply coal to these areas. The shift to pithead prices and road transport means that merchants have to pay the actual cost of transport from particular pits to their own particular location, which may be somewhat more—or somewhat less. This week local fuel overseers were given permission by the Minister of Fuel and Power to allow their merchants to adjust their prices—and therefore their margins—to cover these exceptional costs. The increases have been allowed only to individual merchants who can demonstrate the extra costs they are having to pay: nevertheless, the actual size of the increases allowed—some were as low as 2s. 6d., but others have approached £1 a ton—have surprised a number of people even in the coal trade.

The increase of 7½ per cent granted some weeks ago in coal prices to cover the higher transport costs has meanwhile come into effect this week, and the National Coal Board can hardly postpone much longer a further price increase to cover the higher wage costs that have already arisen from revision of its wage structure. Speaking in London this week, Mr D. P. Wellman, chairman of the North-Western Gas Board, forecast that this increase might be 8s. a ton. Some observers think the average increase might be rather higher, but the incidence upon particular grades of coal remains to be seen. The National Coal Board relies partly upon "scientific grading" of coal, partly upon actual costs of production, and partly upon "commercial considerations" in fixing its prices (which have to be approved, under a gentleman's agreement, by the Minister of Fuel and Power). Commercial considerations in the trade, at least, suggest that certain grades of screened industrial coals are at present rather cheap in comparison with domestic grades.

Bargaining for Comet IVs

CANADIAN PACIFIC AIRLINES has openly announced its willingness to buy four Comet IVs from de Havilland but on conditions that are so stringent that talks during this week or next will decide whether or not de Havilland can meet them. Delivery must not be later than mid-1959 if the order is to be signed, and the engines of the aircraft must be equipped with reverse thrust. While de Havilland could easily meet the first condition alone, the second depends on how rapidly Rolls-Royce, who provide the engines, can develop reverse thrust mechanisms. When jet airliners land they must rely on wheel brakes, whereas piston or turbo-prop airliners can apply braking power through the propellers, and so are less vulnerable to conditions on the runway surface. Canadian Pacific, using icy Canadian runways, is insisting on a modification known to be technically possible but difficult to design—that means are provided for changing the direction of the engines' jet stream so that instead of pushing the aircraft, they brake its progress, producing the same effect as the reverse pitch propeller. Rolls-Royce will begin bench-testing such engines in August, and expects to be able to deliver them in time to meet the Canadian Pacific deadline, but it will obviously call for a concentrated effort to do so.

Power Behind the Atom

PROMOTION of the fantastic possibilities that lie in nuclear physics is gaining momentum at a rate that hardly seemed possible a year ago, when the Atomic Energy Authority was formed. Some of the incentive comes, certainly, from the need to prepare for the conference on atomic energy that is being organised in Geneva by the United Nations during August. This promises to be even more of an atomic trade fair than a scientific conference, with the main developing countries, Britain, Russia and the United States putting their wares on show. First appearances suggest that the Russians are prepared to be more forthcoming than the Americans, and American ideas on security may be sharply revised in the process of learning how far other countries have gone by their own unaided

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXIV (January to March, 1955) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1.

efforts and how many nominally secret ideas are considered in Europe to be popular currency.

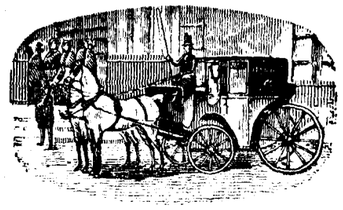
So far in Britain four groups have been formed by manufacturers concerned in the design and development of plant and buildings for atomic installations, each group having sufficient co-operative know-how to undertake commissions to build atomic power stations. It is possible that other groups may be formed ; the big aero-engine manufacturers are likely to look for partners with atomic experience. All are able to draw on the experience of the Atomic Energy Authority whose own plans for new and improved reactor design have been materialising rapidly. The speed of progress has given a curiously old-fashioned air to the American "Atoms for Peace" exhibition that has reached the South Bank after touring Europe for a year. A disproportionate amount of space seems to be given over to the use of radio-active materials which are only a small though useful sideline to the business of atomic engineering, while nuclear power prospects are handled in a broad and vague manner that looks incongruous in a country that has already digested the Government's White Paper on atomic energy and is committed to an ambitious programme of atomic power stations. The matters of interest today are not atomic energy in the abstract, but individual atomic power plants, their different designs, powers and efficiencies. The prospects are enticing enough to have fired the imagination of the somewhat formal professional Institutions of engineers. Five of them, including the Institute of Physics, are co-operating in a British Nuclear Energy Conference, the purpose of which is to see that information on nuclear techniques is spread through all interested branches of engineering. Lack of effective channels of communication (which the Conference will now provide) between the scientists at Harwell, who initiate atomic research, and the men in industry who translate their findings into commercial ventures has up till now been the biggest danger to atomic development.

Hard Selling in Wool Textiles

In the wool industry, unlike the cotton industry, there is confidence in prices of the raw material ; that helps business, but nevertheless it is not easy to obtain orders. In most sections of the trade, particularly on the worsted side, competition is increasing and selling margins are being trimmed. Though activity is still high the best days are past and the trend appears to be towards the prewar conditions of trade. In the home market sales of wool goods, as of other textiles, are struggling to compete with consumer durables for the public's eye, and the emphasis is accordingly on price. Hence the preference for the fine and medium qualities of crossbred wools as substitutes for the more expensive merinos in the worsted trade. The turn of fashion's wheel too, favours woollens rather than worsteds in women's wear and therefore favours crossbreds. Fashion will change in time, and the change may be hastened now that the difference in prices of merino and crossbred wools seems to have narrowed to the point at which merinos are becoming more attractive to buyers.

Compared with the home trade, export business is brisk, though here again competition is keen—in some markets it is described as "devastating." In the first four months of this year exports of tops reached a postwar record of 25.8 million lb and were 10 per cent higher than in the same period of last year ; exports of woollen and worsted cloths, at 34.4 million square yards, were the highest for several years and 12 per cent higher than in 1954.

The relative scarcity of business in the worsted section is beginning to be reflected in the activity of the industry as a whole. The statistics of the Wool Industry Bureau show that in April the rate of wool consumption fell slightly for the first time this year, though it was still seven per cent higher than a year ago. The rate of consumption in topmaking was a little lower than in March and five per cent higher than a year ago, whereas in the woollen section consumption was slightly higher than in March and 12 per cent higher than a year ago. And the bulk of the decline of 543 in the industry's labour force was again in the worsted section, which lost 413 workers in April.



MG Up to Date

For more than twenty years MG (originally the pioneer Morris Garages, of Oxford) has produced small open two-seater sports cars which have changed only gradually. It has commanded an enthusiastic market, chiefly among the younger members of the fancy, by a combination of sporting appearance, low price and a performance which has been exhilarating rather than ultra-rapid. The company had the honourable record, until this year the Volkswagen surpassed its best figure, of the largest volume of sales in the US market, of any imported car. But these American sales, which in 1952 took about 7,500, probably half the MGs made, fell off in 1953, and showed a sharp fall last year to under 3,500. And last year, rising sales in America of the Austin-Healey and the Triumph TR2, showed that there was still a handsome market for an up-to-date version of the MG—and not only in the USA.

The prototypes which are to race this week-end at Le Mans show the shape of MGs to come. The bodies are gracefully streamlined, bearing some resemblance to the open Jaguars, and paying less tribute to the traditional ideas of what an open sports car should look like than the Triumph TR2. The dry weight is said to be 14¼ cwt, corresponding to a kerb weight of perhaps 15½ cwt, against the 17½ cwt of the present MG Midget or the 18¼ cwt of the Triumph—a notable reduction.

The design of the new frame should give a really rigid structure, which is even more important for a high performance car than for a saloon car ; and the designer has secured that rigidity by using for the structure much more of the depth of the car than is customarily employed, except in cars where the body is an important part of the load-carrying framework. Just as the rigidity of a beam is as the cube of its depth, so this design is likely to give great rigidity in proportion to its weight—and may influence American car designers, who have always been apt to rely entirely on a frame, of considerable weight rather than depth, to carry the main structural loads of an automobile.

The engine is based on a BMC engine of 1500 cc, very considerably developed from the volume-produced

St. Paul's stands in need of your help

Last October we launched an Appeal for St. Paul's, the main objects of which were:—

To complete the restoration and repair of the Cathedral.
To build a new Choir School and reconstruct other ancillary structures such as the Chapter House.
To secure additional income (estimated at £20,000 per annum) needed to meet increased costs.

All these objects are of vital importance if St. Paul's is to be maintained in a manner worthy of London's Cathedral and a great national shrine. The response has been generous and we are more than half-way towards our goal. To reach it we need your help. Gifts may be sent to me—The Dean, St. Paul's Cathedral, E.C.4.

W. R. Inge

The Trustees of the Fund are the Lord Mayor of London, the Governor of the Bank of England, and Sir Noel Bowater, Bt.
An illustrated leaflet explaining the needs in detail will be sent on application to the Secretary, St. Paul's Campaign, St. Paul's Cathedral, E.C.4.

TO THE DEAN, ST. PAUL'S CATHEDRAL, LONDON, E.C.4.

This is my gift to St. Paul's Cathedral. Please acknowledge receipt to:

The Evening News
GLASGOW
is Britain's fastest-growing paper

The astonishing growth in circulation of the Evening News, Glasgow, is made doubly important in view of the fact that its area of coverage—Glasgow and the West of Scotland—is Britain's fastest-growing market.

The sensational month-by-month growth of the GLASGOW EVENING NEWS is shown by the following table of audited, certified average net sales per issue.

July, 1954	131,917	November	164,415
August	147,465	December	156,964
September	151,263	January, '55	163,954
October	161,377	February	173,403
	March 177,562		

The people the paper reaches are living and working and earning high wages in the midst of unparalleled Scottish industrial development. Combined output of Scottish shipbuilding and marine engineering firms in 1954 was the best for nearly a quarter of a century. And this is only one of the many fields of industry in which Scotland is forging ahead.

The 'Personal to You' theme sells the 'News'. Over the last nine months, the GLASGOW EVENING NEWS has developed an entirely new appeal whereby its readers become its friends. From many sources comes evidence of an ever-increasing 'reader trust'. Every day the men and women of Glasgow and the West of Scotland read what the journalists in the 'News' have to say to them *personally*.

The 'Personal to You' theme can sell your goods if you advertise in the

What you should know about Brandy

V·S·O·P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. *All* Remy Martin Cognac is made from grapes grown *exclusively* in these two areas. That is why people ask for Remy Martin and are never disappointed.

V·S·O·P

REMY MARTIN
Pride of Cognac

versions of that engine, with major modifications in the cylinder head. Power output is reported to be 82 bhp, with prospects of further development. It is unlikely that in the production MG to follow this prototype, the engine output will equal that of the 2,000 cc engine of the Triumph, which gives 90 bhp. But the power weight ratio of the car and driver may well be better, and with a body whose aerodynamic resistance at speed is likely to be lower, the performance may exceed that of the Triumph.

Russia in the Rubber Market

PRICES of natural rubber have recovered strongly in recent weeks. Spot rubber has risen sharply, touching 31½d. a lb this week, and prices for forward shipment are also higher: July shipment is now about 29d. a lb, compared with 26¾d. a month ago. Labour troubles in Britain and Singapore, and speculative operations have contributed to the recovery, but the main influence has been the re-entry of Russia to the market after an absence of 2½ years. Russia has been buying spot and nearby supplies of the top grades of rubber at a time when these are relatively scarce, and stocks—as usual—are low. Poland has also been buying again. The Russians have bought mainly in London but also in Amsterdam; their policy seems to be flexible for they have not followed the rise in prices this week.

Their demand for the top grades and their refusal to accept damp and mouldy bales at the appropriate discount could imply that these purchases are for Russia's strategic stock, and possibly that old rubber is being released for consumption. On the other hand, the Russians have always wanted the best grades, and a more reasonable explanation may be that the switch back to the expansion of heavy industry in Russia has led to an increased consumption of rubber. Whatever the reason, if Russian buying is maintained for any length of time, the small surplus of 15,000 tons of rubber forecast for this year by the Rubber Study Group could disappear. Hence the market could remain narrow and vulnerable to any dislocation of supplies, with little likelihood of a radical decline. Rubber growers might view that prospect with mixed feelings. The more buoyant the price of natural rubber, the more the American industry will be encouraged to expand production of synthetic rubber.

Fats to Feed the World

AT their congress in Baden-Baden this week the International Association of Seed Crushers could look back on a year of expanding trade and to further expansion in 1955. That is as it should be. To meet the relentless growth in population the world needs an extra 300,000 tons of oils and fats each year, and trade policies that enable these supplies to flow where they are wanted. Both conditions were satisfied last year. In his customary address to the congress, Mr J. C. A. Faure, of Unilever, estimated that world production of oils and fats last year rose by nearly 1.2 million tons to 25.6 million tons. Geographically, the largest absolute increases were of 420,000 tons in Western Europe and of 240,000 tons in India and Pakistan, though the increase of 115,000 tons in the Philippines was relatively very high. By commodities, the largest increase was in liquid edible oils (680,000 tons), followed by coconut, palm and palm kernel oil (230,000 tons), and animal fats, including butter (180,000 tons). World exports rose sharply by 750,000 tons to a new peak of 6.3 million tons, thanks largely to shipments of cottonseed oil and linseed oil from accumulated stocks in the United States and Argentina. Of world consumption the estimates are necessarily rough: Mr Faure believes that consumption rose by about 800,000 tons, of which Western Europe accounted for 200,000 tons and the United States and India for 100,000 tons each.

This year the growth in world production should again keep pace with world needs. Production is expected to rise by about 370,000 tons, a higher output of soya beans, coconut oil, butter and lard more than offsetting the fall in cottonseed oil and olive oil. As a large part of the accumulated stocks in exporting countries have now been liquidated, supplies available for export are not expected to rise by more than 100,000 tons, but they should be enough to meet world import requirements. The United States may be an even bigger exporter of cottonseed oil this year, in contrast to its failure to dispose of its surplus of butter. The willingness of the American government to offer its surplus of liquid oils competitively in world markets, and the relaxation of restrictions in importing countries, have washed away the arbitrary postwar division between the dollar and non-dollar markets. This freedom of trade, as Mr Faure points out, has brought about a much better balance in world supplies of oils and fats and should help to stabilise world prices.

Boom Statistics

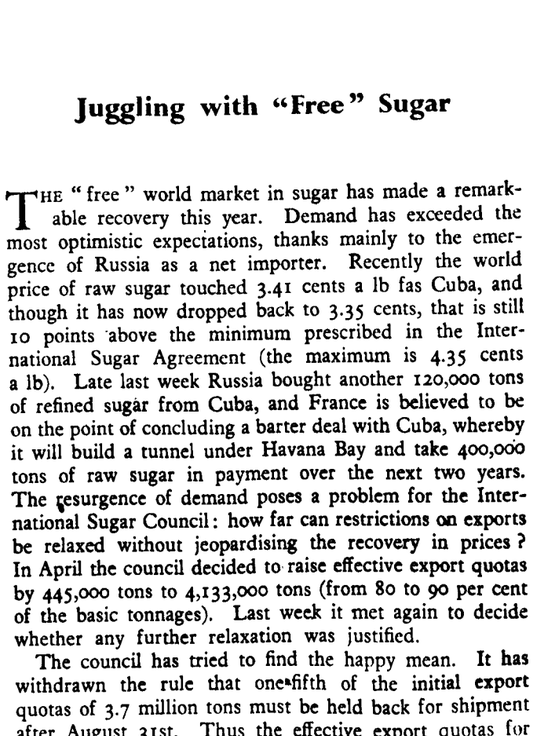
THE Stock Exchange Council closes its year at the end of March. It was the most active of all the postwar years for Throgmorton Street, where 3,218,749 bargains (compared with 2,190,257 in 1953-54 and 2,816,356 in 1946-47) were marked. That is only one of the figures published in the latest annual round-up of stock market statistics. They cover the year in which the *Financial Times* ordinary share index climbed from 138.9 to 181.9 but in which the fixed interest index declined from 112.58 to 109.89. Taking all the securities quoted in Throgmorton Street together, while their nominal value over the year went up from £26,653 million to £27,749 million their market value rose much more sharply, from £30,503 million to £33,796 million.

The Funds and British Government guaranteed stocks make up nearly half of this total. The market value of these securities fell in the year by £486 million to £15,533 million. That downward trend in fixed interest stocks is reflected in the separate analysis of the securities of the public companies (which is reproduced on page 970 in this issue). Both in loan stocks and preference shares the market

value has risen less than their nominal value. Thus while the nominal value of loan stocks has risen by £88 million to £1,080 million the market value has risen by £81 million to £931 million. Similarly while the net nominal addition to preference issues is £70 million (bringing the total up to £1,555 million) their market value is only £35 million higher at £1,530 million. In both cases market values are lower than par values. Equity stocks tell a completely different story—as they must after the boom. The nominal value of ordinary stocks owned by companies has risen by £695 million to £4,170 million—an increase that perhaps owes more to free scrip than to cash issues—but their market value has risen by the amazing sum of £3,550 million to £12,792 million. And since those statistics were compiled the market value of the leading equities has gone up by another 16 per cent.

Currency and the Strike

DURING the past few weeks the active note circulation has been increasing unusually fast. The outflow, which this week made necessary an increase of £50 million in the fiduciary issue to the new record level of £1,825 million, totalled £43.1 million in the three weeks to Wednesday last, against an outflow of £27.4 million in the corresponding weeks of 1954. But this does not in fact appear to reflect increased spending, or even higher holding of notes, on the part of the public. It is primarily a by-product of the rail strike: part at least of the extra notes have remained in the tills of the commercial banks, which have felt obliged to increase their holdings of notes against the uncertainties of distribution during the strike. These precautions provided the principal explanation of the unusually large running down of bankers' deposits at the Bank of England—to under £240 million a week ago, the lowest level since 1946. The banks were holding a larger part of their cash reserve in notes distributed amongst their branches and a smaller part in balances at the Bank.



The trend of the active note circulation over recent months gives no evidence of any tendency towards currency inflation. Since the post-Christmas low point (which was reached this year only in mid-February, three weeks later than usual) the net outflow has reached £122.3 million; this is £20 million more than in 1954, but more than three-quarters of this excess is attributable to the past three weeks. For the first four months of 1955, the actual note circulation with the public (that is excluding the holdings of the banks) show that the proportionate increase was slightly below the increase a year before.

Nor can signs of excessive spending be found in the figures of small savings, for what these are worth. In the first nine weeks of the financial year net savings through savings certificates, defence bonds and the savings banks reached £13.6 million (before adding accrued interest), against only £2.3 million last year and a shortfall of £15.8 million in 1953. It is encouraging to note that a large part of the improvement is attributable to a reduction in net withdrawals from the Post Office, which has until recently lagged markedly behind in the savings revival.

Juggling with "Free" Sugar

THE "free" world market in sugar has made a remarkable recovery this year. Demand has exceeded the most optimistic expectations, thanks mainly to the emergence of Russia as a net importer. Recently the world price of raw sugar touched 3.41 cents a lb fas Cuba, and though it has now dropped back to 3.35 cents, that is still 10 points above the minimum prescribed in the International Sugar Agreement (the maximum is 4.35 cents a lb). Late last week Russia bought another 120,000 tons of refined sugar from Cuba, and France is believed to be on the point of concluding a barter deal with Cuba, whereby it will build a tunnel under Havana Bay and take 400,000 tons of raw sugar in payment over the next two years. The resurgence of demand poses a problem for the International Sugar Council: how far can restrictions on exports be relaxed without jeopardising the recovery in prices? In April the council decided to raise effective export quotas by 445,000 tons to 4,133,000 tons (from 80 to 90 per cent of the basic tonnages). Last week it met again to decide whether any further relaxation was justified.

The council has tried to find the happy mean. It has withdrawn the rule that one-fifth of the initial export quotas of 3.7 million tons must be held back for shipment after August 31st. Thus the effective export quotas for 1955 remain the same, but an extra 740,000 tons could in theory become available to the market now. The more cane sugar that can be sold in the next few months, the less will be on hand to compete with sales of European

sugar in the autumn. The council has also juggled with the consequences of the defection of one exporter, Brazil, and of the fact that some exporters, notably Russia and Holland, will not be able to fill their quotas this year. It had become apparent that Brazil would not, after all, ratify the agreement; in an effort to relieve its acute shortage of foreign exchange Brazil has already sold about 450,000 tons of sugar, nearly three times its effective quota, at rather less than the world price.

The council has taken these changes into account in re-allocating export quotas to a total of 372,000 tons. It is impossible to assess the real effect of its action. The quantity re-allocated may prove to be no more than the actual shortfall, ignoring the defection of Brazil, and several exporters may be unable to take advantage of the withdrawal of restrictions on shipments before August 31st. With six months of the year still to run, the council cannot hope to strike more than a rough balance between supply and demand. The prospects of success will turn largely on the size of the European beet crop, and on whether any further extraordinary demands are made on the market.

Rio Tinto Pays Out

JUST under a year ago Rio Tinto arranged to sell two-thirds of its Spanish assets for £8 million. A straightforward capital distribution from those proceeds was ruled out because in France, where some of Rio Tinto's large stockholders live, such distributions are subject to income tax and surtax. It was also clear that the directors, with the support of many stockholders, were anxious to re-invest these proceeds in new and promising ventures. Indeed, Rio Tinto has already begun to re-deploy its resources. In addition to its investment in Algom, the Canadian uranium producer, it has more recently taken a shareholding in Brunswick Mining and Smelting, whose interests in pyrites in Canada provide a natural outlet for Rio Tinto's funds. The company is also actively engaged in mineral exploration and development in Africa and Australia. All these interests are in addition to its investments in copper and its minority interest in Spain.

But the directors were also anxious to pass out something more to stockholders than the mere dividends which would accrue from these ventures. They have now done so by capitalising £3,187,500 from reserves. Ordinary stockholders will receive 425,000 new £5 ordinary shares in the ratio of one for one and 212,500 second £5 preference shares in the ratio of one for two. The 50 per cent free scrip issue of preference shares is a true bonus. Stockholders can either wait to receive the 5 per cent dividends or they can sell the preference shares immediately to N. M. Rothschild and Sons at £5 each. Effectively the cash offer means that a distribution of £1,062,500 has been made to stockholders. The 100 per cent free scrip issue of ordinary shares, which is accompanied by a splitting of the £5 units into 10s. units, is not a bonus in itself. It merely tidies up the capital structure. But stockholders, who have seen the price of their shares double since the sale of the Spanish assets, will hope that this implies higher dividends in the future. And that hope must have been stimulated by the decision to raise the tax-free ordinary dividend from 20 to 30 per cent on the old capital.

SHORTER NOTES

Britain's working population rose by nearly 40,000 in April to 23,836,000, which was 228,000 more than a year before. Since the beginning of the year the net increase has been about 20,000, all in civic employment; however, the manufacturing industries have continued to gain some labour from other industries, and their labour force has risen by 39,000.

★

At the end of this month, Philips will leave the Electric Lamp Manufacturers' Association. Three years ago the Monopolies Commission called for the end of ELMA's collective enforcement of lamp prices, which has since been done, but did not recommend that the practice of fixing prices in common should cease. Philips will now be free to vary its prices as it wishes as other makers outside ELMA do; but the bulk of lamps are still made by ELMA members.

★

The annual award by *The Accountant* on the form and content of reports and accounts published by public companies in 1954 has been given jointly to Ford Motor and Unilever. These are two of the giants of industry but the accounts of the smaller, less well-known, companies stand an equal chance of gaining the award. In future years it is intended to earmark quite specifically one of the awards for a "comparatively smaller company producing a simpler set of accounts."

★

The whole of the loan and share capital of Brown Bayley Steels has been sold at par, involving £1,950,000, to Brown Bayley's Steel Works by the Iron and Steel Realisation Agency. That sale is to be followed by the placing of £750,000 of the 4½ per cent debenture (1967-82); the price is expected to be 98. Half the ordinary stock of Brown Bayley Steels will be offered to ordinary stockholders in Brown Bayley's Steel Works by rights in the ratio of four for one; the price is expected to be 10s. 9d. for each 10s. share.

From

'Bedevilled Copper'

to Jet-age metal

'Kupfer-nickel'—or bedevilled copper—was the name given by disappointed Saxony miners to a seemingly useless metal extracted from ore which promised copper. When in 1751 Cronstedt isolated from this ore a new element, he simply called it Nickel. Its merits once realised, this metal was destined to play a vital part in industry, and intensive researches led to many important uses. Today Nickel and Nickel-containing materials are used for countless applications from bicycles to jet engines, and are continually opening up new developments throughout industry.

Our technical service is freely available to advise on any use of Nickel.

Following on the absorption of the Siemens ordinary stock by Associated Electrical Industries, that company has now made an offer for the £550,000 of 10 per cent cumulative preference stock of Siemens. For each of these stocks holders are offered two AEI 4½ per cent "B" preference shares of £1 each together with a cash payment of 5s. AEI has also announced an acceptance of over 98 per cent for its recent one-for-four rights issue of ordinary shares at £2 each; the remaining shares are being allotted to employees.

★

Negotiatons to repatriate the remaining 500,000 shares of the 2,000,000 shares in Distillers Ltd. formerly owned by National Distillers of America have been completed. Like the 1,500,000 shares repatriated last September the ordinary shares have been placed with institutions and the market.

★

The Ceylon government has reduced the export duty on tea from 100 to 50 cents (9d) a lb, and has abandoned the payment of subsidies to producers.

Company Notes

ANGLO AMERICAN CORPORATION. The 1954 report of the Anglo American Corporation is rich in detail. But there are so many trees to attract the stockholder's attention and to see the wood one must concentrate on a few salient facts. Those facts should be sufficient to strengthen the stockholder's confidence in his stake in the largest of all the South African finance houses. Currently the 10s. ordinary shares yield £4 7s. per cent at a price of 8 1/6.

To see where his dividend of 7s. a share, compared with 6s. in 1953, came from, the stockholder will turn to three entries in the consolidated profit and loss account:

	1953 £	1954 £
Income from interest, rent, etc.	2,359,923	2,641,045
Income from investments	2,311,379	2,593,552
Profits on share transactions	514,024	966,991

Probing a little deeper into the gold interests of the group he will find that the Transvaal mines earned a working profit on gold mining of £6,060,970 (against £6,735,221) and of £2,793,536 (against £891,636) on uranium and sulphuric acid production. In the Orange Free State the gold mines earned a working profit of £1,902,408 (against £269,010). That, together with the uranium profits, more than made good the decline in the earnings of the older gold mines. In all the total income of the mines both in the Rand and the OFS from gold, uranium and sulphuric acid amounted to £10,756,914, compared with £7,895,867. Only the Transvaal producers passed back any of these profits in dividends to the finance house. The latest half yearly dividends from these producers are not particularly encouraging but it is the growth in profits from uranium and from the OFS mines that is the really significant pointer to the future.

It was a good year in the stock markets for the finance houses, as the jump in share dealing profits shows. It is also shown in the improvement in the market value of the investments that Anglo American owns. The book value of the Corporation's quoted investments went up from £22,762,000 to £23,981,000 while their market value jumped from £36,561,000 to £60,822,000. At the same time about £3,272,000 more of unquoted investments and interests in subsidiary companies were introduced into the balance sheet, bringing the total up to about £10,337,000. That increase was due, in the main to the acquisition of the entire shareholding in South African Mines Selection and in Anglo American (Rhodesian Services). Such figures reveal the size of the Corporation's interests but say nothing of their scope. Copper, diamonds, coal and several industrial companies make a contribution nearly as telling as gold and uranium.

★

J. AND P. COATS. No stockholder in J. & P. Coats, which trades and manufactures in almost every country in the world, can find the company's accounts easy to understand. The consolidated account lumps together all the profits earned in the year whether those profits have been remitted to this country or not. The parent company's account, on the other hand, lumps together in one sum profits made in countries supplied with goods from Britain and the income derived from dividends remitted from abroad; those dividends are remitted after the period in which the profits were earned. An item specifically showing the sum of these dividend remittances might help the perplexed stockholder. This year, however, he has received a little more help than in the past for the chairman, Mr Robert Laidlaw, has adopted the modern practice of circulating his statement with the accounts themselves.

His statement reveals that the group enjoyed a rather better trading year than the chairman anticipated a year ago. Only in Canada, Latin America and parts of the Far East did the group fail to prosper. The consolidated profit is £8,472,853 (after charging £1,300,000 for exchange losses, arising principally in Brazil and Mexico); in 1953 the profit was £4,175,745, after charging exchange losses of £4,200,000. The parent company's profit is entered at £5,398,874, compared with £3,221,257, and the ordinary dividend has been raised effectively from 7½ to 8¼ per cent and at the current price of 27s. 6d. the £1 stock units yield 6⅛ per cent. Stocks have again been reduced, this time from £37,052,609 to £36,012,305, but the improvement in liquid resources can be traced much more directly to the large sums (including the £707,000 released from excess profits tax provisions no longer required) retained in reserves.

Mr Laidlaw is habitually cautious in assessing future trends and this year he confines his predictions to saying that it would be reasonable to hope that sales this year should be on much the same levels of 1954 but that there is "no justification for assuming that they will be noticeably better." But that statement does not necessarily rule out bigger profits, for re-equipment and modernisation (which last year raised the gross value of fixed assets from £30,717,008 to £35,323,741) has proceeded and is still proceeding apace.

★

J. LYONS. The "A" ordinary shareholders in J. Lyons, who own £2,555,342 of the issued equity capital of £3,680,342, have no votes. However parsimonious they may consider the directors' dividend policy to be they have no way of expressing their exasperation. And there is reason for exasperation. Since 1946 the ordinary dividend has been left unchanged at 22½ per cent on a highly geared capital. Throughout that period the modernisation and development programme has kept the group's restaurants and other assets in good shape, continually adding to their value in the consolidated balance sheet. Throughout that period profits have been improving. In 1947-48 the trading profit was about £2.4 million; in the latest year to March 31st last it was nearly £4.6 million, over £250,000 higher than the 1953-54 profit. The latest net ordinary dividends take £402,998 from a net profit, after paying the preference dividends, of £648,274. There is quite fair room for a bigger payment.

The directors can, if they wish, enumerate several reasons for caution this year. They can point to the decline in net profits from £932,667 to £921,891 and to the much more significant entry in the accounts of a provision of £500,000 "for adjustment of tea prices." They can then turn to the consolidated balance sheet to show that a further growth in fixed assets (which before depreciation rose in value from £26.7 million to £28.4 million) and in working capital commitments demands the support of ploughed back profits. The increase in stocks from £12,375,706 to £16,405,307—partly reflecting no doubt the increase in tea prices—adds weight to their argument, as does the rise in bank overdrafts from £356,508 to £1,843,239 and the borrowing of £1,750,000 on acceptance credits. But however strong those particular arguments may appear in the boardroom, the general postulate that shareholders should get a bite at the fruit of expansion is still valid. The responsibility of the directors to make sure that they do becomes perhaps even greater when those shareholders have no voting rights.

★

CANADIAN EAGLE. This company is essentially an oil marketing and shipping concern. Some of its income is at the mercy of the vagaries of exchange controls and currency devaluations in Latin America. The sudden increase in its income from investments (from £548,415 to £2,486,318) is largely due, for instance, to a substantial dividend from Shell-Eagle South America; that dividend represented in part profits earned in earlier years but which were not allowed through the barriers of exchange control until last year. Last year also witnessed a rise in trading profits from £7,786,697 to £8,372,226. In commenting on that increase the directors point to an increase in sales through its marketing associates in the United Kingdom and in Central and South America. They add that both crude and product prices were in general higher than those ruling in 1953 but that "trading profits in South America were to some extent offset by the further depreciation in the Brazilian cruzeiro and the Chilean peso." Moreover, the profits earned by Canadian Eagle's tanker fleet were lower, thanks to the fall in tanker freight rates.

That fleet, which at the end of 1954 was made up of 22 tankers of 292,918 tons dw, was fully employed last year. No deliveries of tankers were made to Canadian Eagle last year but one was delivered in April and there are still six on order. The directors do not expect any marked improvement in tanker freight rates this year but they are confident that the new tankers due for delivery in 1956 and 1957 will "greatly enhance the operating efficiency of the fleet." But that statement does not aid stockholders very much in deciding what are the implications of the 25 per cent free scrip issue. But as net earnings are high they can hope, though they cannot be certain, that the 1954 dividend of 1s. 9d. a share (of which 35/100ths is tax free) will be maintained on the new capital.

LONDON STOCK EXCHANGE

Next Account begins: June 22nd
Next Contango Day: June 22nd
Next Settlement Day: June 14th

Hopes that the railway strike would be settled set equity prices ablaze again this week. By the end of the election account the *Financial Times* ordinary share index had climbed to 207.6, compared with 189.1 at the beginning of that long account. On the first day of the new account the boom continued, bringing the index up to 211.3. Steel shares led the way, but the advance in prices took place throughout the list. The buyers were very active—15,397 bargains were marked on the first day of the new account—and profit taking was easily absorbed. Stock was still in short supply. The capital goods equities were most prominent but textile, store and hire purchase issues were not far behind in the advance. Dollar stocks were higher in line with Wall Street. Trading was particularly active in oil shares; at one time British Petroleum led the way and then at another time Shell, and on the first day of the new account dealings took place long after market hours. On Thursday, after a firm opening, some prices reacted and the market was patchy at the close.

Gilt-edged stocks began the week rather uneasily and though the market closed above the worst on Monday there were net losses on the day. Prices, however, recovered a little later in the week, helped by the improvement in sterling. But the market was quiet and there was only a limited rally in prices. What interest there was was largely concentrated upon the medium-dated issues. In the foreign market German issues went ahead again at the end of the old account on continued Continental buying but they eased a little when the new account opened.

Rubber shares went ahead on the firmness in the commodity and on the flow of higher dividends. Ceylon Tea issues were marked up on the cut in the export duty. The Kaffir market was quiet and prices moved rather uncertainly though a slightly better tone was reported on Thursday. Copper shares made a strong advance.

[1] Petroleum production in Canada in 1938 includes natural gasoline. 1938 figure of electricity production in Australia is for 12 months ended June 30th; figures for New Zealand represent about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for Pakistan is based on 12 months ended March, 1949, as 100; for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. Annual figures for Australia are for year ended June 30th. [5] Including foreign investments. [6] Figures for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 4th there was an "above-line" deficit (after allowing for Sinking Funds) of £24,392,000 compared with a surplus of £666,000 in the previous week and a deficit of £32,802,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £20,014,000, bringing the total cumulative deficit to £147,032,000 (£114,771,000 in 1954-55).

THE MONEY MARKET

The Treasury bill rate rose at the tender on Friday last, after a month of stability. The discount market cut its bid by 2d. to £99 0s. 3d. per cent, and the average rate of discount on all bills rose by 6½d. to £3 18s. 11.08d. per cent, or over 3⅛ per cent. The rate for three months' bank bills was raised correspondingly by ⅛ per cent to 3⅜ per cent. Applications for the Treasury bill offer of £250 million fell by nearly £20 million to £370.5 million, and the market increased its allotment from 48 to 52 per cent.

Credit was consistently short in Lombard Street in the week to Wednesday last. The market was in the Bank for small amounts on Thursday of last week and again on Tuesday and Wednesday; and on every day of the week except Tuesday the Bank has supplemented market funds by special purchases.

Sterling has fluctuated around $2.79⅜ during the week. Turnover in the gold market has been moderate; the price at the fixing rose from 250s. 10d. a fine ounce on Thursday last to 251s. on Tuesday, but subsequently it fell back to 250s. 10½d.

The Bank return shows an outflow of notes of £13.4 million, and the fiduciary issue has been raised by £50 million to the new peak of £1,825 million. Discounts and advances are up by £9.3 million, reflecting in part the week's frequent borrowing at the Bank.

BANKUNION

THE LONDON OMNIBUS

A VEHICLE OF INFORMATION

WHEN Shillibeer's omnibus first clattered its way through the city streets in 1829 the citizens of London realized that here indeed was a public service worth knowing and using.

Likewise, the London Assurance offer the public another kind of useful service by journeying into print with selections from their own omnibus collection of insurance policies.

Better Terms

When school fees come in, some fathers find themselves wrestling with sums. Others have discovered, however, that the right answer to this particular problem is to take out an Education Policy with us well before schooling begins. It's just a matter of good arithmetic.

"How to be Well Assured"

The many different kinds of Life Assurance we provide deserve a volume to themselves—and they have one. Our booklet "How to be Well Assured" has helped many people to find the Life Policy that suits them exactly. Would it help you?

Valuables Advice

"Rings on her fingers and bells on her toes, she shall have cover wherever she goes" if her jewellery, furs and other valuables are safeguarded by our All-Risks Policy.

There's more to be said . . .

If you would know more about any of the policies outlined here, if we can provide any information about any other particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1 King William Street, Department X6, London, E.C.4.

A Great Elizabethan . . .

The founder of London's Royal Exchange was the famous Sir Thomas Gresham whose sign of the Grasshopper, so well known in London, is combined with the emblem of Liverpool in the Coat of Arms of Martins Bank Limited.

The Exchange or Bourse established by Gresham was used for the business of the Goldsmiths who were the bankers of the sixteenth century.

Martins Bank Limited, with its agents and correspondents throughout the world, provides an efficient and complete banking service for its customers.

A YEAR OF CONSOLIDATION AND PROGRESS

IMPROVED PROFIT EARNING CAPACITY AND FINANCIAL STRENGTH

NEED FOR INSPIRED POLITICAL LEADERSHIP IN BRITISH GUIANA

MR J. M. CAMPBELL ON MAJOR DEVELOPMENT PROGRAMME

The fifty-fifth Annual General Meeting of Booker Brothers, McConnell & Company, Limited, will be held in the Library of the West India Committee at 40 Norfolk Street, London, W.C.2, on Wednesday, June 29th, at 12 noon.

The Accounts were posted to Shareholders on June 6th and the following is the Statement of the Chairman, Mr J. M. Campbell, circulated with the Report and Accounts:

For Bookers, 1954 was a year of good progress. The Accounts for the year show further gain in the profit-earning capacity and in the financial strength of the Group.

From the Directors' Report you can see that the Net Trading Profit of the Group after Tax was £580,743, compared with £505,701 in 1953; and that, in addition, there were Capital Profits of £286,003. The Capital and Reserves of the Group, representing the interests of Bookers' Shareholders, have increased by more than £1,300,000 to £8,614,057. Net Current Assets have increased by over £1,100,000; with a drop in Current Liabilities. Despite new investment and higher turnover, we had over £750,000 in the Bank at December 31st. We do not mean to hold large idle cash balances; because we want to put the money to profitable use in furthering our policy of buying new businesses for our Operating Groups. Moreover, we hope that our present Trading Companies can again increase their turnover and earn more profits.

Your Directors are recommending the payment of a final Ordinary Dividend of 1s. 2d. per share, free of Income Tax, bringing the distribution for the year to 1s. 6d. per share —the same rate as for the last two years. In addition, they are recommending a cash distribution of 3d. per share from Distributable Capital Profits not subject to United Kingdom Income Tax. In the words of the Directors' Report, "Provided that future results justify the continuance of the present annual rate of Ordinary Dividend, your Directors intend that the interim Ordinary Dividend payable on January 1, 1956, shall be the equivalent of 6d. per Ordinary Share, free of Income Tax, on the present Issued Ordinary Capital—thus achieving a better balance between the interim and final Dividends. Your Directors also hope to be able to recommend small annual distributions out of Distributable Capital Profits so long as this Revenue Reserve lasts."

The Directors' Report also deals fully with the proposal to increase the Authorised Capital of the Company from £2 million to £5 million; and to double the Issued Ordinary Capital by capitalising £1,272,025 of Reserves, thereafter issuing to Shareholders one new 10s. Ordinary Share for every one existing 10s. Ordinary Share held on May 20, 1955. This capitalisation and issue of "plough-shares" is a first step towards bringing the Issued Capital of the Company more into line with the total investment of over £5 million in Subsidiary Companies; and with the total Fixed Assets of the Group at over £5,500,000. It carries with it no implications about the level of future dividends which must depend upon the success or failure of future trading, and it leaves Shareholders no richer, and no poorer, than they were before.

REVIEW OF OPERATIONS

The Review of Operations tells how the Operating Companies in the Group fared in 1954. Sugar output was down owing to bad weather and the aftermath of 1953 strikes. Prices were down, too, and production costs were higher. In the face of great difficulties Management and Labour worked wonders to achieve results which were, in the light of all the circumstances, much better than might have been expected. The improvement of housing and the development of Social Services and amenities continue vigorously. For the Sugar Factories we have planned a major programme of improvement and consolidation over the next five years, involving capital expenditure of some £2 million and the elimination of two existing factories. It is expected that this money will be found by the Group without recourse to outside borrowing. Great progress is being made in our agricultural techniques and practices. We are establishing a pilot scheme to investigate the possibility of Tenant Farmers producing some of the sugar cane for our factories. All these plans should enable our Sugar Estates to continue to progress in the face of great natural difficulties. I hope you will have time to look at the Supplement to these Accounts which tells and illustrates the story of Bookers Sugar.

Our Shopkeeping, Agency and Export Companies in the Campbell Booker Group made a bigger contribution to profits than in 1953, but profits did not increase commensurately with record turnover. Our Shipowning interests did well, taking into account their valuable service to the Group. United Rum Merchants' sales in the United Kingdom, including Lemon Hart and Lamb's Navy Rum, kept pace with the previous year; and in Canada increased beyond expectations. Our group of small miscellaneous Companies, Carpet wholesaling and Produce dealing in the United Kingdom, Drug manufacture, Balata production, Printing and Produce dealing in British Guiana, had, on the whole, a good year in 1954 and promise well for 1955. These trading and financial results once more pay clear tribute to Managers, Staff and Labour throughout the Booker Group. I know that Shareholders will feel a renewed sense of appreciation and of personal gratitude to each and all the men and women —Producers and Traders, and no less Administrative, Accounting and Secretarial Staffs—upon whose successful endeavours the Group depends.

Wages, Salaries and Other Employment Costs increased by more than £1 million during 1954 to over £4,500,000. £700,000 is attributable to new Subsidiaries; leaving a well-earned increase of £300,000 in previously existing Subsidiary Companies. It is important to Shareholders, Management, and Labour to realise that during 1954 the Trading Profits of the Group, after Tax, were under £600,000; Dividends distributed under £250,000; Tax paid over £850,000; and Wages, Salaries and Other Employment Costs over £4,500,000. Thus Wages, Salaries and Other Employment Costs were nearly eight times the Trading Profits after Tax; and the *increase* therein attributable to existing Subsidiary Companies more than the *total* dividends paid.

POLITICAL SITUATION IN BRITISH GUIANA

The political situation in British Guiana can best be described as quiescent. The people are living their lives and going about their daily work more or less normally. The Report of the Constitution Commission under the Chairmanship of Sir James Robertson upheld the suspension of the Constitution, roundly condemned those ignoble politicians of the People's Progressive Party who had brought it about, lucidly analysed the social, economic and political problems of the country and recommended a period of Constitutional "marking time" with a wholly nominated Interim Government. With this Interim Government, with some emergency regulations still in force preventing open subversion and indiscriminate agitation, and with British troops in the country, there is little fear, at present, of serious disorder. But this is a very unsatisfactory state of affairs and the country cannot exist for long—and certainly not progress—in a political vacuum. Some sound and sensible politicians of ability and goodwill are now striving to establish a responsible, progressive Party; but there is little evidence yet that, if elections were held again in the near future, they would be able to attract the majority of voters from the quite unattainable material promises, the misrepresentations and the intimidation of the past and present leaders of the People's Progressive Party. British Guiana will not prosper until she can produce a leader of the calibre of those other British Caribbean leaders who have held ministerial office with high distinction; a Guianese who can form a clear vision of the good Guiana, strive for it, convey it to the public imagination and, when he has gained election, lead government and people, constructively and progressively towards their goal—with a true sense of responsibility and in terms of the possible.

FUTURE CLOUDED AND UNCERTAIN

It now looks as though Federation of the British West Indies may become a reality within two years. The earlier policy of British Guiana had been to stay out of Federation. Now, however, much informed opinion in British Guiana, but not all, favours a new move towards entering a Federation on terms which properly recognise the contribution which her people, land

and resources would make to the Federation. Despite her potential, British Guiana would have a long and hard struggle to achieve economic viability on her own, nor could she alone attain the Dominion status to which her people naturally aspire. We believe that she has the choice either of ploughing her own difficult furrow alone; or joining the rest of the British Caribbean in *their forward march of social, economic and* political progress.

So the future of British Guiana remains clouded and uncertain. Last year I said to Shareholders: "Our policy must be, so long as politics do not make it economically unjustifiable and downright imprudent, to maintain our businesses in British Guiana as efficiently and profitably as we possibly can. All our Staff will wish to know that Shareholders wholeheartedly support this policy as long as it remains feasible. However this may be, your Board are keenly aware of the need that the Group should continue to build up, in the form of profitable interests elsewhere, 'hedges' against catastrophe in British Guiana should the worst come to the worst. . . . We do not believe that this will happen, but we must guard against it happening." Your Directors continue to carry out that policy to the best of their ability.

HUMAN AND PUBLIC RELATIONS OF FIRST IMPORTANCE

In British Guiana, vital factors are understanding, confidence and a sense of identity between the people of the country and Bookers. All your Directors and Executives regard better human and public relations as being of the first importance. To help our endeavours to this end, during last year we appointed an experienced Director of Public Relations for the Booker Group of Companies in British Guiana in the person of Mr Antony Tasker, and an experienced Chief Personnel Officer for Bookers Sugar Estates in the person of Mr A. J. Wells.

The acquisition late last year of the entire equity Capital of the Motor Car Supply Company of Canada Limited, was a decisive step towards building up the profit-earning capacity of the Group outside British Guiana. Canada, perhaps particularly Western Canada—despite the recent check to the expansion of their economy—seems to offer glowing prospects for the future. We are now looking into further possibilities there.

A PARADOX ANSWERED

Shareholders who have studied the Review of Operations may find it paradoxical in the light of this declared policy that we should, during 1954 have increased our investment in the Sugar Industry of British Guiana by buying control of Port Mourant Limited—a Sugar Estate and factory producing about 20,000 tons of Sugar a year; and sold 49 per cent of the Capital of United Rum Merchants, who trade preponderantly in the United Kingdom and in Canada. The explanation of the former transaction is that Bookers already held 49 per cent of the Capital of Port Mourant and have for many years managed the Estate. When for death-duty reasons the family owning control wished to sell their shares, it was inevitable, and in our interest, that we should buy them. As to the latter, the circumstances of the Rum Trade in the United Kingdom and Canada dictated that we should broaden our common interests with the Hiram Walker-Corby Group, thus gaining a powerful partner by selling to them a 49 per cent interest in the Share Capital of United Rum Merchants.

It is, after all, a change, in emphasis of policy, and in timing, which events have impelled, rather than a change in fundamental policy. For many years the Booker Group have been developing investments outside British Guiana—in Central Africa and in the United Kingdom. Now we have been forced to accelerate this process in order to underwrite the political hazards of British Guiana. Your Board are confident that you would not wish them, by applying this change of emphasis too rigidly, to lose profitable opportunities of purchase or partnership which suit and will strengthen the Booker Group.

CLOSER ASSOCIATION WITH DAVSONS

This brings me to the subject of the following Press announcement issued in British Guiana, with a shorter version in the United Kingdom:

"Closer association is being planned between the Booker Group of Companies and Davsons. This was announced yesterday by Mr J. M. Campbell, Chairman of Booker Brothers, McConnell & Company, Limited, and Lieutenant-Colonel H. M. Davson, CMG, DSO, Chairman of S. Davson and Company, Limited, who said that the closer association would be based largely on an exchange of shares and that the details were being worked out by the Boards of the two Companies. The text of the joint statement is as follows:

"We are glad to announce the planning of closer association, including the co-ordination of management, between the Booker Group and Davsons. The boards of the two companies are now engaged in working out the details of this alliance, which will be based largely on an exchange of shares between Bookers Sugar Estates Limited, and Davsons.

"The name of Davson is as much a part of the history of British Guiana as is that of Booker. Simon Davson arrived in the country in 1814, a year earlier than Josias Booker, and in 1816 founded the firm of S. Davson and Company in New Amsterdam. Today Davsons own Blairmont, producing some 20,000 tons of sugar annually, together with a cattle ranch, a lime grove and a foundry, as well as a general trading business holding valuable agencies. Throughout the years Davsons has remained a private company—a family business in the strictest sense. We need not emphasise the special problems that face such a business today beyond stating that the current level of death duties in the United Kingdom, combined with the difficulties of financing modern industrial developments, have convinced Davsons' directors that it would be in the best interests of the shareholders and employees and indeed of British Guiana for the company to ally itself more closely with a larger group of companies having concurrent but more widely spread interests. Not only are Bookers such a group but there has been close community of interest between our two companies for nearly a century and a half. Our friendly relationship has, in fact, greatly contributed to that spirit of practical co-operation between the three largest producers which is demonstrated daily in the successful working of the Sugar Producers' Association.

"Finally, and of the greatest importance, we wish to emphasise that consideration of the interests of all employees of Davsons has been and will remain an essential factor in all stages of our planning for this closer association."

I can only add that this is a case where, after the fullest discussion and consideration, your board feel that not only should Bookers' shareholders benefit by this alliance with Davsons, but that their interests might well have been imperilled by refusing the opportunity.

As to the future; it has been raining torrents in British Guiana at quite the wrong time of the year, which is bound again to affect sugar output, yields and costs. Barring political upheaval, there is no reason to expect that the rest of our businesses will not do as well in 1955 as in 1954.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

OIL AND ATOMIC ENERGY

SIR FREDERICK GODBER'S STATEMENT

The annual general meeting of this company was held on June 1st in London.

Sir Frederick Godber, chairman, in the course of his speech, said: In my statement I said that the figures of results of the Royal Dutch/Shell Group for the first quarter of 1955 would be available within a few weeks. I am able to tell you that they are now ready, and are being given to the Press today. They disclose a net Group profit of £34.1 million, after the deduction of estimated taxation for the period based on our normal method of accounting. This compares with £33.4 million for the same period in 1954.

It is still early to see in these results a pattern for this year's trading as a whole, but I think I can say that the Group's business has come up to expectations so far, and the results are not unsatisfactory. You will appreciate that no part of this income has yet been distributed to parent companies—your company and Royal Dutch Petroleum Company.

I would like to take this opportunity to say a few words about the important question of atomic power, which is the subject of so much discussion today. While atomic power plants may displace a certain amount of heavy fuel, low-cost electricity spells increased productivity, which in turn will create greater demands for petroleum products. All our studies on this subject have, in fact, led us to the conclusion that in the foreseeable future atomic power will be complementary to, rather than competitive with, energy derived from oil.

EFFECT OF HIGH TAXATION

Low-cost energy will be a vital factor in the raising of our future standard of living, and it is with this in mind that I have made comments in my statement, both of this and previous years, about the ill effects on the economy of the country of excessively high taxation on petrol and diesel fuel used for vehicles. It is therefore encouraging to note that the leaders of the political parties have recently given recognition to the problems created by these taxes; and I sincerely hope that, now the election is over, remedial action in this sphere will be taken at the first opportunity.

Of the large revenue raised from taxes on vehicles and their fuel only a small fraction is devoted to maintenance and improvement of roads. The result is that the roads are quite inadequate to bear the traffic of today in this country, where its density is the highest in the world.

Road development has fallen badly behind the general industrial development of the country. This lag must be made good, and future development should keep pace with future industrial expansion. Only by pursuing this objective will the nation avoid imposing upon itself a grave and unnecessary handicap to its economic welfare; for unless our roads can satisfy the demands made on them by industry and commerce, our economic arteries will be choked, the movement of exports to our sea ports slowed down, and severe loss will be sustained—not only by motorists, but by the whole community, for everyone profits from the lower costs of living which increased transport efficiency will bring.

The report and accounts were adopted.

THE UNITED SUA BETONG RUBBER ESTATES LIMITED

TAXATION AND REPLANTING

GOVERNMENT'S WHITE PAPER CRITICISED

SIR JOHN HAY ON THE ESSENTIAL NEEDS OF THE INDUSTRY

The forty-sixth Annual General Meeting of The United Sua Betong Rubber Estates Limited was held on June 8th at 19 Fenchurch Street, London, E.C.3.

The following is the statement by the Chairman, Sir John Hay:

In a recent statement relating to the affairs of an associated company, I have had occasion to refer to the lawlessness and disorder still existing in many parts of Malaya. In the directors' report of this company we are able to record an improvement in the district in which a considerable part of our property lies, with a consequent relief on two estates from restrictive regulations. In Johore, however, there has been no improvement. Despite the exertions of the Military and the Police, the terrorists are not even confined to the adjoining forests, but roam over estates seemingly at will, intimidating labour into giving food, money and information, doing destruction and murder. At the time of writing our report we were able to record the absence of human casualty. Since then we have been informed that a woman tapper was stabbed to death on Yong Peng Estate. Commenting on this brutal incident, our Agents observe that it is another unpleasant reminder that terrorists are present in large numbers in the district "and are able to strike to a great extent as and when they please." We have two estates in Johore, Melville (2,356 acres) and Yong Peng (8,604 acres). For seven years now those resident there have never been free from danger. The measures enforced by Government, involving restrictions over personal movement, and the consumption of food, and the imposition of curfews, continued now for years, become increasingly irksome, and since the security which it was hoped would follow is not forthcoming labour tends to regard such restrictions as an unjustifiable interference with personal liberty and, as such, to be resented. Police and Military action must be supported by firm and just State administration if disorder and crime are to be effectively checked. The cumulative effect of the dangers and threats inherent in a condition of lawlessness stretching over a long period of years takes a heavy toll of the physical and nervous energies of our staff, obliged not only to perform their normal tasks, but to accept a considerable degree of responsibility for the safety of person and property and to impose upon their labour Government measures which, however well designed, cannot from their very nature be regarded with favour. Nonetheless, our managers and their assistants continue loyally to co-operate with Government in the carrying out of all the orders deemed necessary for security and are ever ready to subordinate other considerations to that end. In that spirit they are fully supported by their Board. That they have been able to keep productive operations going is a creditable performance. On Yong Peng, the more disturbed of our two Johore properties, we have had for some years to suspend all replanting. That we propose to undertake a modest acreage this year is, unhappily, no admission of improvement in conditions. It is rather in the nature of a trial on an estate which perforce had to be left out of our replacement programme and in consequence is in arrears with replanting, which must soon be dealt with if this property is to be preserved as an economic proposition.

REPLANTING

The table on page 4 of the directors' report shows that of the company's total rubber acreage over 70 per cent consists of high-yielding stock. Nearly half of it is immature postwar replantings, a considerable part of which comes into tapping this current year and with each subsequent year further areas will reach maturity. From this strong position we are able to engage ourselves to replace this year over 1,200 acres of old seedling rubber.

Since official attention is now being focused on replanting, albeit somewhat belatedly, it would seem appropriate that I should state briefly what has been the record of this company in that matter. We started planting or replanting with high yielding stock 30 years ago and from that point carried on progressively until the interruption of the war years. Immediately on regaining possession of our estates we resumed these operations and in the postwar period have replanted, in round figures, 10,000 acres. We have further commitments up to the end of 1956 to replace 3,500 acres and our total postwar expenditure in respect of all these areas will amount to nearly $10 million. Other companies in this Group have followed a similar course and the Group as a whole, including this company, has since 1947 replanted or committed itself to replant nearly 50,000 acres, involving a total expenditure of about $40 million. This policy is not based on any position of special advantage or privilege. We share in common with others in the fortunes and misfortunes of the industry. The cost of such operations has been met out of our own resources, provision being made by means of an annual charge against revenue. But whatever may have been our achievements up to this point, we recognise there can be no halt. Replanting is a continuing and never ending process. The stock used in our first replants is now outmoded and in a few years will be ripe for replacement, but from the figures I have given you will understand that we have still a considerable area of old seedling rubber to be dealt with before we can advance to the stage of replanting to the second generation. Our estates on the whole have been well maintained, although it should be appreciated from what I have already written that it has not been practicable in all respects to enforce on our Johore properties the high standards at which we aim.

PROFITS

The main factor in our substantially increased profits was the higher price obtained for our larger outputs. The greater part of our rubber was processed and sold in the form of concentrated latex which again realised a significant premium over the more conventional forms. This was supplemented by other specialised rubbers for which, however, there is only a limited demand. There was a slight reduction in estate cost per pound. But this saving is not likely to be repeated. At the higher level of price now prevailing, labour by agreement is receiving an increase in wages. We are glad that those who work for us should thus participate in the better fortunes of the industry.

TEA

Although from rubber we derived much the greater part of our profits, tea made on this occasion a valuable contribution. We, of course, have no control over the price of tea. We send our product to the open market to be sold at whatever price may prevail. Our experience in production and sale of tea is not dissimilar from that gained in the course of dealing with other products of tropical agriculture. After enemy occupation we had to incur heavy expenditure in rehabilitating our tea areas with little or no revenue coming in. By 1952, when our work of recovery was complete and we were back to full production, the price of tea had declined so steeply that in that year we suffered a loss of nearly £40,000. Such are the vicissitudes of enterprises in tropical agriculture. No assessment of its profitability or otherwise can be made by reference to one particular year.

DISTRIBUTION OF PROFITS

The table that follows shows the distribution of profits earned by this company over the four years 1951/54:

	Profits £	Percentage
Taxation—including Export Duty and Malayan and UK Taxes.....	2,777,420	65·89
Ploughed back into business	794,738	18·85
Cash to Stockholders....	643,500	15·26
	4,215,658	100·00

A fuller appreciation of the significance of these figures may be gained if I put it another way. Out of every £1 of profits, the Governments of Malaya and the United Kingdom appropriate in taxes 13s., for the improvement of the business we plough back nearly 4s., and the shareholder receives 3s. Over this period of four years the average return to the stockholder after deduction of income tax was no more than 4.92 per cent on the capital employed in the business. Those who indulge in pronouncements on profits and their distribution might perhaps with advantage acquaint themselves with the facts as set out here.

GOVERNMENT PROPOSALS ON TAXATION AND REPLANTING

I had occasion last autumn to issue a statement reviewing the Mudie Report. The Government of the Federation of Malaya has now issued a White Paper, under date of April 20th last, in the course of which it examines that report and announces its own findings, which are shortly to be made the subject of new legislation. The title of the White Paper, "Taxation and Replanting in the Rubber Industry," implies, quite rightly, that the two subjects are closely interrelated. Complaints against high taxation are wide-

spread and it is quite human to suppose that the industry in which one is engaged is a special victim, but making every allowance for that tendency it is difficult to dispute the contention that the rubber plantation industry operating in Malaya is harshly treated. Those producers domiciled here, and they represent the major part of estate rubber production, have to bear all the taxes levied on industry in this country, namely, income tax (calculated on profits from which no adequate deduction is allowed for the high cost of replacement of buildings and equipment), profits tax and distribution tax. But in addition they have to suffer a levy on out-turn in the form of an export duty. This is a tax which is easy of collection and there is no time lag. It is free from all the special administrative difficulties and complexities of assessing and collecting income tax in an eastern territory. It is consequently a constant temptation to governments hard pressed for revenue to resort to the easy method of screwing up export duty. But the pursuance of such a policy is not only inequitable ; it is also shortsighted. Malaya has no monopoly in rubber. It has to compete not only against the production of other countries but also to meet the formidable competition of synthetics which in the United States have hitherto enjoyed complete freedom from all taxation and, under private enterprise, will certainly not have to carry the burden of taxation to which producers of natural rubber in Malaya are now subjected. Rubber is a world commodity sold in world markets. Producers cannot pass on export duty to their buyers ; it ranks as a charge on cost and to that extent impairs Malaya's competitive power.

INCREASED EXPORT DUTY

Prior to 1951 export duty was for the most part levied at rates varying from 2½ per cent to 5 per cent, and as this was calculated *ad valorem* Government profited from any increase in price. It was never accepted as a good form of taxation, but it was tolerated as being well within the administrative capacity of the Government machine as it then existed in Malaya and in the belief, encouraged from official quarters, that when income tax was imposed and enforced export duty, if not abolished, would at least be reduced. But in 1951 Government adopted a course sadly defeating all such expectations and introduced a system of export duty, scaled according to price, beginning at 5 per cent and rising as high as nearly 13 per cent. Against that action the industry protested, maintaining that such a scale was intolerably burdensome, calculated to discourage replanting and other improvement works, and a serious hindrance to competition against a growing and favoured synthetic industry.

GOVERNMENT PROPOSALS

Government's proposals as now published are to reduce the existing scale of duty to a fractional extent up to a price of 75 cents per lb. (21 pence), at 80 cents to maintain the existing rate, at 90 cents—which happens to be below the current price—to increase the rate by over 21 per cent, and to step it up still further at prices above that level. Government will also undertake to pay $400 per acre (i.e., half the average cost) towards the cost of replanting up to 21 per cent of an estate's planted acreage, provided replanting is done within seven years from the date when this provision becomes effective, which is expected to be July 1st next.

COST TO GOVERNMENT

After providing for assistance to smallholders, calculated on a different basis, it is stated that the maximum cost of this replanting scheme is $280 million. This figure, however, is the product of an arithmetical calculation which omits to take into account other offsetting factors. The $112 million set aside for smallholders is most unlikely to be spent within the stipulated period, nor is it at all likely that all estate owners will apply and qualify for grants whilst those who do will be subject to income tax on any such payments as they may receive except in the sad event of trading at no profit. These proposed grants have been wrongly described on occasions as "subsidies" or "free gifts." They are in fact recoverable. Recovery, it is true, is contingent on price, a contingency that cannot now be dismissed as remote since the present price is at the point of substantial recovery with a distinct prospect of its continuance for some time. On its crop as estimated for this year and at the present price of rubber, this company will be called upon to pay additional export duty amounting to $380,000. A gift horse possessing such a nasty bite may well be looked in the mouth. No one could claim to make any reliable prediction regarding the probable price of rubber over the next eleven years, the full period of the scheme, but if the history of price over the last eight years should repeat itself, Government would recover over the next eight years even more than their unrealistically calculated maximum outlay.

THE SCHEME'S INEQUITIES

Although grants are to be made to estates at the uniform rate of $400 per acre there is to be no corresponding uniformity in repayment. Recovery is to be based on output with no adjustment as between one estate and another. The effect of this must be that estates which have a high rate of output consequent on earlier replanting will pay back three or even four times as much per acre as estates which have done little or no replanting. The teaching of the parable of the talents is thus put into reverse. From him who has used his talents profitably much is to be taken away and the reward is to go to him who has wrapped his talents in the napkin of obsolete seedling rubber.

ITS ECONOMIC CONSEQUENCES

The scheme is specially designed to assist those producers who have hitherto done little or no replanting. There can be little expectation that that class, in so far as they replant at all, will do other than confine their activities to the limits of the scheme—21 per cent of their areas. The probable result will be that by the distant 1970's such producers will have reached the stage of having only one-fifth to one-quarter of their areas producing from modern stock, by which time the greater part of such estates will have reached an advanced stage of deterioration. This attempt to fix the existing pattern of estates and to check the trend to more consolidated economic units seems singularly ill-judged. The White Paper states that the "industry faces a crisis without precedent in its own chequered history." The treatment prescribed would seem to belie this serious diagnosis. Government's proposals are no doubt well intentioned but economic ills cannot be cured by discarding sound principles in favour of political expediency. Internal law and order and an equitable system of taxation are the essential needs of the industry. Only in so far as these are met will confidence be renewed and the energies of the industry set free to deal effectively with its problems.

STAFF

From what I have written earlier in this statement stockholders will appreciate how greatly indebted they are to the company's staff and all who serve under them, especially those in dangerous places.

THE CHLORIDE ELECTRICAL STORAGE

EXPANDING MARKET FOR PRODUCTS

The sixty-fourth ordinary general meeting of The Chloride Electrical Storage Company Limited was held on June 8th at Clifton Junction, Nr. Manchester, Mr A. W. Browne, OBE, MIEE (the chairman), presiding.

The following is an extract from his circulated statement: Probably the most important development during the year was the repatriation of a block of £1,573,688 "A" Ordinary Stock which in September was purchased by Lazard Brothers & Company Limited from The Electric Storage Battery Company of Philadelphia and offered to the public, with preferential consideration to existing Stockholders. As a direct result of this successful operation, the number of our Stockholders rose from 2,500 to approximately 4,800 and the market for our "A" Ordinary Stock has been broadened considerably. The increasing interest and confidence in your Company is reflected by the amount of stock held in small units. The number of members at this date holding stock of £300 or less is approximately 2,600.

The main business of our Group is the manufacture and sale of storage batteries for all purposes under various trade names, the best known of which are Exide, Drydex, Pertrix, Tudor, Chloride, Exide-Ironclad, Dagenite, Kathanode, Silver-Exide, Nife and Alklum. In addition, we are interested in plastics, pneumatic equipment, precision tools, various products in the sanitary industry and a range of barrier creams for protection against dermatitis.

Our activity overseas includes manufacture and assembly of storage batteries in Australia, Belgium, Canada, Denmark, India, New Zealand, Pakistan and South Africa, with representation in nearly every other country in the world.

SATISFACTORY RESULTS

Turning to the year's accounts, it will be seen that the Group has again achieved satisfactory results. Although the cost of lead, our principal raw material, rose towards the end of the year, the average cost over the year was not much greater than during the previous year. Increased costs were experienced, however, in labour, materials and charges such as fuel and transport. As a result of continuous efforts to increase efficiency by judicious capital expenditure and improvements in methods of manufacture and distribution, it has been possible to absorb these increased costs without any general increase in prices.

Your Directors declared a dividend of 12½ per cent on the "A" and "B" Ordinary Stock, which, together with the 5 per cent paid last October, makes 17½ per cent for the year, against 12½ per cent paid last year on present capital.

Throughout the year competition has continued to increase and we have maintained our policy of improving production technique wherever practicable for the purpose of increasing production at lower cost. At the same time the work on general research and development has gone forward, as no economy can be accepted unless the policy of producing only the highest quality products can be fully maintained.

It is difficult to foresee more than the immediate future, particularly as our affairs are so much bound up with the economic life of this and other countries. I can conclude, however, with some confidence, based on an expanding market for our products and increasing efficiency in our organisation.

The report was adopted.

UNION CORPORATION LIMITED

LORD BRACKEN'S TRIBUTE TO THE LATE MR P. M. ANDERSON

GOLD MINING INDUSTRY AND OTHER INTERESTS REVIEWED

The annual general meeting was held in Johannesburg on May 24, 1955, Viscount Bracken presiding. The chairman, in moving the adoption of the report and accounts for the past financial year, said:

Gentlemen,—Before dealing with the formal business which we meet to transact, I should like to say something, however inadequate, about the eminent services rendered to this corporation by the late Mr P. M. Anderson. Much of our present prosperity is due to the wisdom, knowledge and steadfastness which he showed as chief executive director of this corporation.

He well knew that enterprise and boldness are among the first qualities required of a large mining group. He also knew that these essential qualities must be tempered by persevering prudence in matters of finance.

Rare are the men who can successfully combine the qualities of daring and caution: Peter Anderson was one of them.

We have indeed every reason to be grateful for all that Mr Anderson did for this corporation. Outstanding among his later achievements was the care he took in providing for his successor. It was a happy day for this corporation when he brought our new managing director into its service. We wish Mr T. P. Stratten all good fortune in fulfilling the heavy responsibilities that now rest upon his shoulders.

If Mr Anderson was a most wise and careful steward of our affairs, he was also one of the most public spirited men of his generation. No one can overestimate the work he did for the University of the Witwatersrand during the many years he served as chairman of its council. During his long period of office the University became widely known at home and abroad as a place of liberal and humane learning and of sound teaching.

Mr Anderson, who was the most modest of men, would be the last to claim credit for this, but the many distinguished people who worked under his chairmanship would stake that claim for him.

YEAR'S RESULTS

I now have to submit the accounts of the corporation for the year 1954 together with the directors' report.

The gross profit for the year was £1,749,000.

After providing £502,000 as against £433,000 in 1953 for taxation, the net profit was £1,081,000.

In 1953 your directors deemed it desirable—in view of the corporation's heavy exploration programme—to increase substantially the exploration reserve account and they therefore appropriated £600,000 out of the profits of that year. Your directors consider this level of the exploration reserve account, namely about £970,000, to be reasonably sufficient for our present needs and accordingly last year they only appropriated £275,000 out of the current profits to maintain the reserve at about the same level.

The board are of opinion that the staff pension funds in London and Johannesburg are hardly adequate and so they have allotted £81,000 from this year's profits to pension fund account. I feel that shareholders will approve the appropriation.

You will see from the directors' report that we believe that our custom of declaring dividends "free-of-tax" has caused some confusion in the calculation of yields. The board therefore decided, commencing with the final dividend declared in respect of last year, to declare dividends gross but subject to deduction of United Kingdom income tax at the standard rate. As a result of this change of policy, the benefit of the recent reduction in the standard rate of UK income tax by sixpence in the £ will accrue direct to shareholders and not be retained in the business—as would have been the case if the dividend had been declared on a "free-of-tax" basis.

The dividends declared for the year were equivalent to 2s. 8.909d. gross per share as compared with 2s. 5.091d. for the previous year calculated on a similar basis. They absorb £701,000 and leave £382,000 to be carried forward to new account against £358,000 brought forward.

GOLD MINING INDUSTRY

Before reviewing the affairs of the companies under our administration I should like to review briefly the position of the South African gold mining industry as a whole, in which we continue to be chiefly interested.

While the average price received by the industry for its gold in 1954 was slightly higher than the official price for the previous year, the virtual disappearance of the premium on gold sold for artistic and industrial purposes resulted in a slight overall decline in the average price received by the industry for its output.

A satisfactory feature of the past year was the continued improvement in the supply of Native labour. As a result of this, as well as the substantial increase in production by the new mines in the Orange Free State and Far West Rand, the tonnage milled by the industry in 1954 increased by over 6 per cent to 62,354,500 tons.

The overall yield increased from 3.893 dwt to 4.068 dwt per ton so that the total gold output rose by 1,241,498 ounces fine to 12,682,328 ounces fine.

Thus, notwithstanding the lower price received for gold, the working revenue, excluding that from uranium reached £158,643,786, which is some £14,500,000 higher than the previous year and is the highest figure on record. Working costs absorbed £120,435,001, so that the working profit was £38,208,785, or approximately £1,400,000 more than for the previous year.

To the working profit must be added the estimated profits from uranium production totalling just over £8,100,000, or nearly four and a half times that for 1953. The total working profits for the industry therefore, including uranium, amounted in round figures to £46,300,000, or £7,700,000 more than in 1953.

From this profit nearly £13 million was appropriated for capital expenditure, loan redemption and other items.

Provision for taxation and Government's share of profits is estimated at £14,275,000, being an increase of nearly £2 million. Net dividends distributed to shareholders increased by just under £920,000 to £19,127,166.

Working costs for the whole industry in 1954 rose by 2s. 2d. per ton milled and averaged 38s. 8d. per ton milled. In part this increase results from the tonnage contributed by the new producers, whose average working costs are at present much above that for the whole industry. But working costs were also inflated by increases in the earnings of European and Native employees and by further increases in the cost of commodities and stores, the latter resulting largely from the higher railage rates introduced in recent years.

However, in spite of the consequent increase in the pay limit, the development footage accomplished by the industry in 1954 enabled the 1953 level of ore reserves to be increased fractionally to 168,280,265 tons. This is the first increase in the industry's total ore reserves since the devaluation of sterling in 1949. In conformity with the higher pay limit the average grade of ore reserves was 0.28 dwt higher at 5.40 dwt.

In reviewing the results of the gold mining industry for 1954 it is gratifying to note the increasing contribution to the industry's output and profits of the new producers of the Orange Free State and Far West Rand, that is to say, those mines which have reached production since 1951. Last year the eight new producers in the Orange Free State and the four on the Far West Rand between them produced just under 2,200,000 fine ounces of gold, equivalent to 17.3 per cent of the whole industry's output and accounted for nearly one-quarter of the industry's working profits from gold.

As the scale of operations of the newer and higher grade mines expands, and with the expected further expansion of uranium production, the industry's already substantial contribution to the balance of payments of the Union of South Africa will increase materially.

It is pleasing to note that the improvement in the supply of Native labour, which I mentioned last year, has continued into this year, though one cannot predict what further improvement may take place or for how long the present increase in the labour force will continue, as many factors influence the flow of Native labourers to the mines.

Unfortunately the shortage of European underground personnel has so far prevented the mines from benefiting fully from the improved Native labour supply.

This problem remains a serious one and much depends on the results of the present recruiting campaigns being carried out both in the Union and in Europe by the industry.

GROUP INTERESTS

I should now like to turn to the results of operations of the gold mining companies under our administration and of some of the other companies in which we are interested.

GOLD

East Geduld Mines, Limited.—The tonnage milled in 1954 was 1,663,000 tons and the net profit was £1,771,529. Dividends totalling 3s. 9d. per unit of stock were declared and the balance carried forward was £608,645.

Geduld Proprietary Mines, Limited.—The ore milled was 1,122,000 tons and the working profit was £386,389. Income from investments comprising principally holdings in East Geduld Mines and The Grootvlei Proprietary Mines amounted to £661,036 and the total profit for the year was £935,167. Dividends totalling 12s. 3d. per share were declared and £366,853 was carried forward.

The Grootvlei Proprietary Mines, Limited.—The ore milled was 2,185,000 tons and the net profit was £1,274,287. Dividends totalling 2s. 1d. per unit of stock were declared, and £646,391 was carried forward.

Marievale Consolidated Mines, Limited.—The tonnage milled increased to the record figure of 800,000 tons and the net profit was £487,148. Dividends declared totalled 2s. per share and the balance unappropriated was £488,763.

St. Helena Gold Mines, Limited.—The tonnage milled increased to 1,041,000 tons and the working profit was substantially higher at £757,917. A new vertical shaft is being sunk to open up the north-eastern portion of the property and the capacity of the reduction plant is being extended. The cost of the new shaft and extensions to the reduction plant will be financed out of profits which the mine should be able comfortably to provide over the period.

Van Dyk Consolidated Mines, Limited.—The tonnage milled was 940,000 tons and the net profit was £22,653. Development work was continued in the No. 5 shaft area, disclosing a small amount of further payable ore.

OTHER INTERESTS

San Francisco Mines of Mexico, Limited.—During the company's financial year ended September 30, 1954, the mill treated a record tonnage of 738,800 tons of ore. The accounts of the year's operations have not yet been published.

Bay Hall Trust, Limited declared a dividend of 15 per cent less tax in respect of the year 1954 compared with 13.64 per cent for the previous year. At the end of 1954 the appreciation of its holdings over book cost amounted to £922,042.

British Enka, Limited.—After providing £274,000 for depreciation and £303,000 for United Kingdom taxation, the consolidated net profit of this company and its subsidiaries for the year ended December 31, 1954, was £306,000, compared with £351,000 for the previous year. After crediting £82,000 taxation adjustment relating to previous years, transferring £275,000 to general reserve and debiting £108,000 in respect of a dividend of 10 per cent recommended by the directors, the carry forward was increased by £5,000 to £189,000.

South African Pulp and Paper Industries, Limited.—Initial paper production at the Tugela mill started in July, 1954, and paper of acceptable quality was being produced regularly by the year-end. Operations at both the Enstra and Tugela mills resulted in a trading profit of £730,791, the net profit being £324,557. An interim dividend of 1s. per share was declared.

Owing to the deterioration of trading conditions in this unprotected industry and the need therefore for strengthening the cash position the directors did not feel justified in distributing a further dividend.

EXPLORATION

You will have seen from the directors' report that drilling operations by Capital Mining Areas, Limited, during 1954 have indicated that the area underlain by payable Kimberley Reef is larger than we visualised this time last year. Drilling operations are still in progress but I am pleased to be able to say that the company hopes shortly to apply to the Government for a mining lease over part of the area.

Some values in the Kimberley Reef sufficiently encouraging to warrant further work have been obtained in boreholes drilled by one of the corporation's subsidiary exploratory companies operating adjacent to Capital Mining Areas. None of the other subsidiary companies in the Bethal and adjoining districts has so far encountered anything of economic interest. Options over large areas have been abandoned.

Mineral prospecting is a most difficult undertaking and as work proceeds tentative interpretations of the geology are accepted and frequently later amended or discarded, resulting often in option areas being taken up and later abandoned. For these reasons it has been our custom not to publish the results of our prospecting work or that of our subsidiaries until a project is considered suitable for presentation to the public.

Your directors are satisfied that this policy is in the best interests of shareholders.

In concluding my review of the past year, I should like to take the opportunity of expressing our thanks to the staff of the corporation both in South Africa and London and to the managers, staff and employees of the companies under our administration for their loyal and efficient services during the year.

In reply to a member's question the chairman said that he could not at this stage add anything more to what had already been said in his address about the developments in the Bethal area.

The report and accounts were adopted and the retiring directors re-elected.

ALBRIGHT & WILSON LIMITED

(Manufacturers of Industrial Chemicals)

SATISFACTORY TRADING YEAR

MR KENNETH WILSON'S STATEMENT

The sixty-third Annual General Meeting of Albright & Wilson Limited was held on June 2nd at the Registered Office of the Company, Oldbury, Birmingham. Mr Kenneth H. Wilson, OBE, JP, presided. The following is the Chairman's statement:

The year 1954 was a satisfactory trading year throughout our Group of companies. Turnover increased in each of the countries in which we operate, and three new manufacturing units of much importance to us were completed during the year and are now operating.

THE ACCOUNTS

The expansion in gross profit during 1954 has partially been offset by the substantial depreciation charges which have risen by £606,000 to a total of £1,276,000. This is due to the heavy capital outlays we have made, not only in this country but also very notably in the USA and Canada. Even so, the net profit, after deducting tax and the minority interest in subsidiary companies, has increased by £153,000 over the previous year's total of £710,000.

The total Ordinary Dividends for the year 1954 amount to 22½ per cent as against 17½ per cent for 1953. The distribution remains at somewhat less than one third of the net earnings after providing for the Preference Dividend, and corresponds to approximately 6 per cent (before tax) on the net worth of the Group as attributable to the Ordinary Share Capital.

The figure at which the investments in Subsidiaries have stood in the books of the parent company is substantially lower than even the most conservative estimate of their true value. It is felt that at least some of the growth of our overseas investment should be recognised and accordingly it has been decided to adjust the value of the principal companies in the Albright & Wilson balance sheet to accord with their nominal capital. This results in a net increase of £1,119,206 in the book value of shares in subsidiary companies.

It will be seen that the increase has been put to a reserve entitled "Surplus on Revaluation of Shares in Subsidiaries" and your directors recently announced that Treasury approval had been received to the capitalisation of the major part of this reserve by the issue of one new Ordinary Share for every two Ordinary Stock Units held. The appropriate resolutions to carry this issue into effect will be put to an Extraordinary General Meeting to be held immediately after the close of the ordinary business of this meeting.

REVIEW OF COMPANY AFFAIRS—UNITED KINGDOM

Albright & Wilson Limited.—The most important development of the year was the completion of our new factories at Portishead and Kirkby. The output of phosphorus from Portishead and of sodium tripolyphosphate from Kirkby gradually increased during the second half of 1954 so that supplies of both products are now ample for present requirements and to cover market forecasts for several years ahead.

We are pleased to announce that a new company has been formed in which the Bradford Dyers' Association Limited and Albright & Wilson Limited are equal partners. Its purpose is the development and promotion of processes by which certain textiles may be made fire-retardant.

Midland Silicones Limited.—In the course of the past year a new agreement has been made between Dow Corning Corporation and ourselves, and as a result the plant at Barry in South Wales has been transferred from our ownership to that of Midland Silicones Limited, which company now manufactures as well as distributes silicones. The shares of the reorganised Midland Silicones Limited are held as to 60 per cent by Albright & Wilson Limited and 40 per cent by Dow Corning Corporation.

OVERSEAS COMPANIES

Oldbury Electric-Chemical Company (USA).—The development of the Oldbury Electro-Chemical Company's new site at Colombus, Mississippi, is proceeding. Sodium chlorate manufacture began there in July, 1954, and a plant for the manufacture of phosphorus pentasulphide has now been completed at the Colombus site to supply the requirements of the Southern and South-Western States for this chemical.

Electric Reduction Company of Canada Limited.—The growth of the Canadian markets for phosphates and chlorates, although not so rapid as was generally predicted several years ago, has supported a satisfactory increase in the turnover of this company. The installation of the new phosphorus plant at Varennes has been completed.

Albright & Wilson (Australia) Proprietary Limited.—This company is jointly owned by Imperial Chemical Industries of Australia and New Zealand Limited and ourselves. Ever since its establishment fifteen years ago, the products of the joint company have been sold through the extensive sales organisation of ICIANZ. This arrangement has been of great importance to the young company and has certainly speeded its growth. In the course of the year, it was agreed by ICIANZ and ourselves that the scale of operation of Albright & Wilson (Australia) is now sufficient to warrant a separate sales organisation and this was accordingly established in October, 1954.

The Report and Accounts were adopted and the retiring directors re-elected. At a subsequent Extraordinary General Meeting resolutions were passed effecting the bonus issue of one Ordinary Share of 5s. for every two Ordinary Stock Units of 5s. held.

GROWING CONTINENTAL COMPETITION

MR J. C. MATHER ON PROBLEMS CONFRONTING THE SHIPBUILDING INDUSTRY

The ninety-first annual general meeting of Cammell Laird & Company Limited was held on June 7th at Birkenhead, Mr J. C. Mather, JP (the Chairman), presiding.

The following is the Chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1954:

On January 1, 1954, the shipbuilding, engineering and ship-repairing activities of the Company at Birkenhead were transferred to a wholly-owned subsidiary, Cammell Laird & Company (Shipbuilders and Engineers) Limited. Your Board is satisfied that this has resulted in more efficient management and operation of those activities.

On June 21, 1954, the Company reacquired an interest of 25 per cent in the equity capital of English Steel Corporation Limited, approximately the same interest as was held before nationalisation of the Steel Industry.

On January 1, 1955, Mr P. Sydie, Assistant Managing Director of the Subsidiary Company, was appointed to the Board and will come before you for re-election.

ACCOUNTS

In consequence of the formation of Cammell Laird & Company (Shipbuilders & Engineers) Limited, the Accounts now include a Consolidated Balance Sheet and Consolidated Profit and Loss Account.

The Parent Company's Balance Sheet reflects the exchange of the Shipyard's net assets for shares in the Subsidiary Company; the Scrip Bonus Issue made by the Metropolitan-Cammell Carriage and Wagon Company, Limited; and the transfer of part of the quoted securities into the investment in English Steel Corporation. Quoted securities have also been reduced by the payment of the Capital Dividend approved at the last Annual General Meeting. The increase of £75,896 in Debtors represents mainly additional dividends due from Associated Companies. On the liability side of the Balance Sheet, the 50 per cent increase in the Issued Capital gives effect to the Scrip Bonus Issue approved last year; the Reserves position is explained in the Notes on the Accounts and is dealt with later in this Statement.

CONSOLIDATED BALANCE SHEET

Dealing first with those Assets which have not been mentioned in the previous paragraph, you will note that Fixed Assets, after depreciation, have been increased by £82,406. Stock-in-Trade and Work in Progress again show a considerable increase, amounting to £4,814,882, but Instalments received show an even greater increase, and the net figure is reduced by £641,245. Liquid resources represented by Cash, Bills Receivable and Funds at Short Notice are increased by £770,773.

Reserves. Total Reserves amount to £7,169,352, of which £1,567,160 is retained in Revenue Reserves to meet specific and general contingencies, £240,554 in the Debenture Stock Sinking Fund and £5,361,638 in Capital Reserves. This latter figure represents approximately the book value of the Company's quoted securities and the estimated sum required to meet the commitments which your board has under consideration for the development and expansion of the Company's interests. These include the construction by the subsidiary of a new drydock at Birkenhead to which I referred last year. The cost of this will be considerable, but without it the larger ships now being built cannot be docked for maintenance and repair and this work will go elsewhere. Further plans for the modernisation of the yard at Birkenhead include the extension and improvement of existing shops, the construction of new drawing and general offices to replace the inadequate and unsuitable accommodation at present available, and the possibility of having to provide for the gas freeing of oil tankers. Your board is convinced that these and other plans now under active consideration are essential to maintain the earning capacity of the Company.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Trading profit, after again taking into account a proportion of profit on work-in-progress, is reduced by £105,756, due to fewer vessels being actually completed and delivered during the year. The increase of £53,860 in dividends and interest reflects the investment in English Steel Corporation and a small increase in the dividend received from Metro-Cammell. Charges are £46,854 higher, due to an increase in depreciation and expenses in connection with the increase in share capital and formation of the subsidiary, but taxation is £94,200 lower, leaving the net profit available only slightly less than last year. There are no profits from previous years to be brought in, but a provision of £90,000 is no longer required and has been brought into account. The net profit available to the shareholders of Cammell Laird & Company, Limited, after retention of £295,970 by the subsidiary company, is £448,746. Your board recommends a final dividend of 10% per cent, making the total distribution for the year £424,225, leaving £24,521 to be added to the carry forward.

CAMMELL LAIRD & COMPANY (SHIPBUILDERS & ENGINEERS) LIMITED

Ship Construction.—During the year eight ships were launched totalling 72,080 gross tons which, compared with the previous year's tonnage of 61,750, shows an increase of 10,330 gross tons. I am pleased to report this improvement which reflects the benefit we are getting from our new welding bay which came into production at the end of 1953 and to which I referred in my report last year. The eight ships launched were as follows:—ss *Hubert*, cargo-passenger liner for The Booth Steamship Company, Limited; ss *Hemiglypta*, tanker for the Shell Tankers, Limited; ss *Esso Cambridge*, tanker for the Esso Petroleum Company, Limited; ss *Stanvac India*, tanker for the Standard-Vacuum Transportation Company, Limited; HMS *Whitby*, Anti-Submarine Frigate for the Royal Navy; mv *Doris*, cargo ship for Doris Compania Naviera SA; ss *Manchester Mariner*, cargo liner for Manchester Liners, Limited; and the mv *Cheshire Coast*, cargo vessel for Coast Lines Limited. Seven ships, including four of those launched, have been fitted out and delivered to their Owners. It is matter for satisfaction that the aircraft-carrier *Ark Royal* completed her contractors' trials satisfactorily in September last year and was subsequently commissioned and handed over on February 26th this year.

MARINE ENGINEERING

During the year seven sets of steam double-reduction geared turbine machinery, totalling 79,125 SHP were built and tested in our main Engine Shop. Work is also going ahead on the construction of 14 diesel engines for the Royal Navy whilst our Boiler Shop, in addition to executing a great deal of fabrication work for the Engine Shop, produced 14 boilers of different types giving a total evaporation of 743,000 lb of steam per hour.

SHIP REPAIRING

Our Shiprepairing Department has carried out repairs to 173 ships during the period under review, including several refit jobs for the Royal Navy.

THE OUTLOOK

As far as the future is concerned, we have orders on hand which will keep us busy until the end of 1957. During the year a number of orders have been lost due to our extended delivery position, but, in spite of this, I am pleased to report that we have been successful in obtaining contracts for the construction of four ships. Although inquiries for new tonnage were not very numerous there was a general tendency towards the end of the year for shipowners to place orders, and quite a number of these orders, as well as some shiprepairing contracts, found their way to Continental yards. The reason for losing this business was due to the quicker delivery, with the resultant saving in cost, quoted by Continental yards, which have the advantage of an adequate labour force to draw from and no demarcation problems such as we are experiencing in this country.

If we are to improve our position and maintain full employment in our industry we must be critical of our own shortcomings and do our utmost to put them right. I will refer briefly to some of them. We have a 44-hour working week and whilst many of our employees observe this condition conscien-

tiously there are many who do not. We also experience a high percentage of absenteeism, and much of this is not justifiable. Production is also affected by inter-union disputes over the demarcation of jobs, and we consider that this matter should be tackled by the trade unions at a national level. Bans on overtime are now prevalent in our industry and these have a serious and crippling effect on production. If these problems could be overcome our industry would be in a much stronger position to attract the additional business necessary to ensure the prosperity of the industry and all engaged in it.

THE METROPOLITAN-CAMMELL CARRIAGE AND WAGON COMPANY, LIMITED

The Metropolitan-Cammell Carriage and Wagon Company, Limited, attained a new record value of output of railway rolling stock last year. Deliveries of passenger coaches for overseas included a number of light-weight vehicles of aluminium alloy construction specially designed by the company for the East African Railways, and steel coaches for South Africa, Nigeria and Egypt. Large numbers of wagons also were shipped to Rhodesia, East and West Africa, India, Pakistan, Egypt, and the Sudan. For British Railways the company continued deliveries of standard steel coaches and completed nearly 4,600 wagons.

Valuable new export contracts included 200 coaches, and parts for 100 more, for the electrified services of the Central Railway of Brazil, 94 mechanical structures for diesel electric locomotives for Coras Iompair Eireann, and a 3-million dollar contract placed under the USA Foreign Aid Programme for 2,000 wagons for the Indian Government Railways. An order received for 72 diesel railcars was the first for vehicles of this type to be placed with a private contractor by British Railways under their new diesel programme.

These and other overseas and home orders included in the company's production programme for the present year were secured under severe competitive conditions. There is no doubt that such conditions will continue and that efforts to reduce costs and increase productivity must be intensified. With this object in view, extensive re-equipment and improved layout of some of the company's workshops was sanctioned and partly carried out last year.

A decrease in the demand for new public transport vehicles, due to the completion of the postwar renewal programmes of many of the larger operators in the United Kingdom, resulted in a reduced output from the Company's 'bus body building factory. Orders for smaller numbers of vehicles were taken against keen competition, but towards the end of the year some larger orders were received, including a number of 'buses of the Company's lightweight design which provide substantial savings in operating costs. Further "Olympic" integral 'buses also were ordered by overseas customers, and efforts are continuing to secure more export business.

THE ENGLISH STEEL CORPORATION LIMITED

In June, 1954, Cammell Laird & Company, Limited, resumed its interest in English Steel Corporation, Limited, when it acquired from the Iron and Steel Holding and Realisation Agency 25 per cent of the Equity share capital. The remainder of the Ordinary Shares are held by Vickers, Limited, with whom the Company became associated in 1929 when the steel interests of the two companies were merged in English Steel Corporation Limited

Despite a falling off in demand in the early part of the year, English Steel Corporation had a very successful year and the results were in excess of expectations at the time of the purchase. In the latter part of the year there was a large increase in the volume of orders for all of the Company's products and the year 1955 commenced with a very satisfactory order book.

All departments maintained a high level of production during the year and there was a record output of 567,000 tons of special steels. Taylor Brothers & Company, Limited—which is a wholly-owned subsidiary—celebrated the centenary of its foundation with a record year in production of railway wheels and axles and tyres, of which 45 per cent was for direct or indirect export.

Firth-Vickers Stainless Steels Limited—in which English Steel Corporation has a 50 per cent interest—has had a successful year and the demand for its products is far greater than the capacity to produce.

During their visit to Sheffield in October, Her Majesty the Queen and HRH the Duke of Edinburgh visited the Works and witnessed production in several departments.

STAFF

In conclusion I am sure that all shareholders will wish me to thank the management, staff and workpeople in our Subsidiary and Associated Companies for all they have done to produce the year's results

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Mr P. Sydie, Mr P J. D. Toosey, Mr J. H Bromfield and Mr P. B. Hunter, were re-elected; the remuneration of the Auditors, Messrs Cooper Brothers & Company, having been fixed, the proceedings terminated

EXPERT TOOL AND CASE HARDENING COMPANY

FACTORS AFFECTING RESULTS

The thirty-fourth ordinary general meeting was held on June 8th in London, Mr A. H. Redfern (the Chairman) presiding.

The following is an extract from his circulated statement: I must say at the outset that the results are disappointing, but the reduction in profits was caused to a large extent through unforeseen circumstances of a non-recurring nature. Firstly, extensive structural repairs had to be carried out at the Factory of one of your Subsidiary Companies. This meant that there was no effective production for the best part of the year, resulting in a net loss. Secondly, the reorganisation of two of your Factories to increase output has taken very much longer than was anticipated.

The net profit before taxation amounts to £67,506, compared with £127,261 for the previous year. Taxation absorbs £41,204, leaving a net balance of £26,302.

The new selling organisation, Adams Ashmore and Company Limited, which commenced operations at 205/207, Great Portland Street, London, W.1, on March 1, 1954, has more than justified your Board's expectations. During the year a Branch was opened at 20, Princess Street, Manchester, 1, which also shows healthy signs of expansion.

With regard to the current year, the position has started to improve as regards both sales and profits, and the Directors feel that the effort put in during 1954 is bearing fruit.

The report was adopted and a total dividend of 17½ per cent was approved.

PHILLIPS RUBBER SOLES LTD.

The 28th Annual General Meeting was held in London on 9th June, 1955, the Chairman—Mr. Peter Pettit, D.S.O., presiding.

THE ACCOUNTS for the year ended 28th February 1955, showed:

PROFIT for the year	£218,606
(compared with £183,492 for the previous year).	
APPROPRIATIONS:	
Income Tax and Profits Tax	£120,000
Transfers and Reserves	40,000
Dividends (Net)	50,962
Added to amount carried forward	7,644
	£218,606

The following is a summary of the Chairman's Review which was circulated with the Annual Accounts:—

- The Company's liquid position at 28th February was good and Current Assets were over 3½ times Current Liabilities.
- Sales of PHILLIPS Soles and Heels again reached a new high record, and the highest standards of quality were maintained in accordance with PHILLIPS long-established policy.
- Prices to the Trade had not been increased during the year, despite a further increase in wage rates and a substantial rise in the price of raw rubber
- Exports had gone up by over 10% to a new record total, despite quotas and exchange restrictions
- Plans were going ahead for the extension of the main Works in Manchester, and since the end of the year under review the 75-year-old business of Kempner & Brandon Ltd., makers of nursery and children's shoes, had been purchased.

The Report was adopted and the dividend (15%—making 20% for the year) was approved.

NATIONAL BANK OF NEW ZEALAND

SATISFACTORY EXPANSION OF BUSINESS

MR ARTHUR H. ENSOR ON TRADING AND INDUSTRIAL CONDITIONS

The annual general meeting of The National Bank of New Zealand Limited will be held on July 7th in London.

The following are extracts from the circulated statement of the Chairman, Mr Arthur H. Ensor:

Turning to the accounts for the year ended March 31, 1955, Deposit and Current Accounts at £60,024,000 show an increase of £5,452,000. There is little change in the item Bills Payable and Other Liabilities. On the Assets side of the Balance Sheet the principal change is shown in our Advances which stand at £39,786,000, showing an increase of £10,371,000 over last year. Part of this increase is accounted for by the return to private enterprise of the financing of meat exports. Other factors, however, affecting the demand for bank credit have been operating in New Zealand to which I will refer later.

The net profit brought in after providing for taxation is £265,430, which is an increase of £52,000 over the figure for last year and reflects the higher average level of our profit-earning assets. The results are particularly satisfactory when viewed against the background of the continued increase in our running expenses.

From the net profit we have allocated £100,000 to Contingency Account and in January last we paid an interim dividend of 4 per cent actual, less United Kingdom Income Tax at 9s. in the £. The Directors now recommend a final dividend of 6 per cent actual, less United Kingdom Income Tax at 8s. 6d. in the £, making a total distribution of 10 per cent for the year. This leaves a balance to be carried forward to the current year of £188,050.

SHARE CAPITAL

It may not have been generally realised that under the National Bank of New Zealand Limited Act, 1873, incorporating the Company in New Zealand, each share carried a reserve liability of £7 10s in addition to the uncalled amount of each share.

This position has long been recognised as unrealistic, and I am very pleased to say that the New Zealand Government have fully appreciated that the relative clause in the Act was not in accord with present-day practice and the necessary amending legislation has now been passed removing the reserve requirement.

The Directors have had under consideration the question of improving the capital structure and recommend for your approval the capitalisation of £400,000 from General Reserve to be applied in paying up 10s. of the uncalled liability on each of the 800,000 issued shares of £7 10s. each, making them £3 paid.

It is further recommended that each of these shares should then be sub-divided into three shares of £2 10s. each, £1 paid.

In connection with this recommendation the Directors have transferred £400,000 from Contingency Account to General Reserve.

BUSINESS DEVELOPMENT

It is satisfactory to record that the number of our customers continues to show a steady increase. We have opened new branches at Mount Roskill (Auckland) and at Huntly, and our agency at Colombo Street (Christchurch) has been converted into a full branch. We are now in occupation of our new premises at Upper Hutt, Otorohanga, Putaruru and Colombo Street (Christchurch); a new building is in course of erection at Tokoroa, and major extension and reconstruction work is being carried out at Nelson and Te Awamutu. A site for a new branch has been purchased at Feilding and it is hoped to build there shortly. We have a total of 136 branches and agencies throughout New Zealand, and although this gives us a good network of branches in the more important districts we are always mindful of the necessity of extending our representation in other developing areas.

PRIMARY PRODUCTION

The season has, in general, been dry, although rains fell in most parts of the country in time to save the farming industry from the worst effects of drought conditions. Production has been maintained surprisingly well and the volume of output of all primary products must be regarded as satisfactory.

The quantity of butter and cheese purchased for export for the eight months to March, 1955, was 226,000 tons, an increase of 9,000 tons on the same period last year. The depressed market for milk powder has, however, resulted in a fall in milk powder production. Export killings of meat from October to March totalled 269,000 tons as against 234,000 tons for the same period last year. The heavy killings of the early part of the season have been well maintained and output for the full season will be high.

The bulk purchase contract with the United Kingdom for butter and cheese was cancelled as from August 1st last and the contract for meat as from October 1st. These products have now to be sold in the United Kingdom on the open market in competition with the produce from other countries and remaining Ministry of Food stocks. In the months since the bulk purchase contracts were ended inevitable difficulties have arisen caused by the transition from a long period of Government control to a free market. Amongst these may be mentioned the carry-over of a considerable stock of cheese belonging to the Ministry of Food. There have also been changes in consumer preferences which have adversely affected, for example, the demand for frozen beef. Disposal of the Ministry of Food's stocks of meat has, during this transition period, caused some embarrassment to the market, particularly at a time when production in the United Kingdom of home-killed meat has been higher than expected. On the whole, however, apart perhaps from some descriptions of frozen beef, the free market has not so far been unsatisfactory.

The season for wool production has been a very good one and the volume of wool sold is expected to be about 2 per cent up on last season. Prices declined from the opening of the season until December, but since then there has been a rising tendency. Prices until the end of January were lower by 2½ per cent than for the same period the previous year, but the firmer market since then will bring the season's average price up to approximately last season's level. The outstanding feature in the wool market this year has been the relatively favourable price movement of crossbred wools—which make up the bulk of the New Zealand output—compared with the finer merino types. The demand from the United Kingdom and the Continent of Europe has so far been strong, with Germany buying more than in previous years.

GENERAL TRADING AND INDUSTRIAL CONDITIONS

During the year the Government introduced several measures designed to give greater economic freedom. The system of exchange allocation for imports which was imposed as a special measure in 1952 to curb the excessive rate of imports, was terminated as from January 1st last. There has been, in addition, a progressive liberalisation of import controls, whilst a large number of goods has been removed from price control.

At the end of March the Dominion's net overseas assets totalled £94 million compared with £129 million a year earlier. The total reached a peak of £139 million in June last but thereafter commenced to fall as a result of heavy importations which arrived in late 1954 and early 1955. There has not this year been the seasonal growth in the balances which we have been accustomed to expect from December onwards and this is to some extent accounted for by the change to the free marketing of meat and dairy produce. Payment is not now received until these products have arrived in the United Kingdom and have been sold through trade channels, whereas under the bulk buying contracts payment was received when the produce was put on board the overseas ships in New Zealand ports.

Retail trade has been buoyant; turnover has been higher and stocks have been in adequate supply. There were no major strikes or labour troubles during the year. There are strong indications—although figures are not available to support this—that a factor contributing to the growth of demand for consumer goods has been the increase in the use of hire purchase finance, and there can be little doubt that a further growth in the total of hire purchase loans would at this stage be harmful to the economy.

Secondary industries continue to expand under the stimulus of a high demand for almost all types of goods. The general picture is one of prosperity but is cannot be too often emphasised that with its high volume of overseas trade and its high and rigid internal cost structure, New Zealand is very vulnerable to changes in the value of its exports upon which the standard of living depends. The Reserve Bank has recently emphasised that the Dominion must concentrate increasingly on improving its competitive position, which entails research into new methods of efficient production, more attention to quality, packaging and advertising, adaptability in production to meet any changes in market conditions and consumers' preferences; but it is also vital that the country's competitive position should not be undermined by inflation. Unfortunately, signs of inflation are still present, one indication of an overloaded economy being the continued shortage of labour, to which my predecessor referred last year. Moreover, retail prices have continued to rise in the absence of any rise in the price index for imported goods, and the pressure on the Dominion's overseas reserves is considerable.

CREDIT RESTRAINT

The Reserve Bank has used the monetary weapon under its control in order to prevent undue expansion of bank credit and the reserve ratio applicable to the trading banks has been adjusted from time to time in order

to keep their free cash at a low level. In addition, the Reserve Bank's discount rate was increased on November 26th last from 3½ per cent to 4 per cent, and although there is no organised discount market through which this rate can make itself felt, the banks now have to pay the higher rate should they borrow temporarily from the Reserve Bank.

These measures necessitate the banks following a cautious and conservative lending policy but will not reduce the pressure from the public for bank advances. For a policy of credit restraint to be properly effective throughout the economy it is necessary for it to be brought home firmly to the borrowing public and this is best achieved by an appropriate increase in the cost of borrowing. The present level of bank interest rates is, however, unlikely to act as a deterrent to the borrower and seems out of line with the general pattern of interest rates in other sectors of the economy.

In existing circumstances it is important that development plans should not be forced ahead too rapidly, that the strain on domestic savings should be relieved in appropriate cases by external borrowing, and that a realistic interest rate structure be maintained.

The Capital Issues Committee dealt with an increased number of applications this year from companies desiring either to increase their capital or borrow on mortgage. Applications for the year ended March 31, 1955, amounting to £41 million were approved, an increase of £17 million over the previous year, and the pressure which this has put on available funds has tended to tighten conditions in the capital market.

Local bodies have had difficulty in obtaining their loan requirements, but this appears to have been caused by an increase in the demands of this sector rather than by a reduction in the amount of money being invested in this type of loan. The Government loan of £30 million which was placed on the market in June last was oversubscribed. In addition to that loan two Government loans totalling just over £20 million were offered in September to the public for conversion of maturing issues. About 80 per cent of the amount was successfully converted and the balance redeemed in cash. A £10 million loan with a 30 year term and interest at 3½ per cent was also successfully floated in London at an issue price of £98.

IMPORTANT PROJECTS

Further substantial progress has been made in the utilisation of the Dominion's resources of exotic forests. The large new Kraft pulp and paper mill of New Zealand Forest Products Limited, has been in production for the full year and 42,500 tons of pulp and 17,500 tons of paper have been produced. The Company has also produced during the same period an immense quantity of timber and timber products including 55 million board feet of sawn timber and 65 million square feet of wall board. The new construction programme of Whakatane Board Mills Limited is proceeding well. Remarkable progress has also been made with the erection of the large newsprint and pulp mill at Kawerau for the Tasman Pulp and Paper Company, Limited, and with the building of the new town to house the staff and workers of the mill. This reflects great credit on the State Departments responsible for the various associated works and upon the contractors who have carried out the construction work with energy and efficiency. The plant is expected to be in operation shortly. The announcement that the Commonwealth Development Finance Company Limited has acquired a share interest and has provided £2,500,000 of debenture capital underlines the importance of the project to the economy both of New Zealand and the Commonwealth.

BRITISH TIMKEN LIMITED

MR JOHN PASCOE'S SPEECH

Mr John Pascoe, Chairman and Managing Director, at the Annual General Meeting of British Timken Limited in Birmingham, after dealing with the published accounts, said: In the balance sheet of British Timken Limited the value of freehold properties shows an increase of £976,443, mainly accounted for by the amount expended at the Daventry factory during the year of approximately £340,000, and the purchase of the freehold of the Duston factory site involving the transfer of £498,000.

The Group's capital commitments at the date of the balance sheet amounted to £823,000. This large figure is an indication of your Board's determination to maintain our manufacturing facilities at the highest level of efficiency and to press on with the development of our new factory at Daventry.

Group turnover showed a satisfactory increase over the previous year, all our factories having been fully employed on a two-shift basis. As manufacturers of anti-friction bearings, our products reach all branches of industry, consequently our fortunes are bound up with those of industry as a whole, and not with any particular section. The sources from which we receive our orders are world-wide in geographical distribution as well as diverse in type.

EXPORTS

The Group's total direct exports have now risen to 23½ per cent of our sales, and in addition we estimate that well over 50 per cent of the balance of our home sales finds its way to export markets.

In the field of transport, British Timken Limited has not only continued to be suppliers on a large scale to British Railways but has also secured large orders from territories as far apart as Europe, Australia, India, South Africa and Canada. Orders received both direct from Canada and for equipment destined for that country constitute a very pleasant feature of this business.

Moving from one of the oldest to one of the newest forms of transport, we are proud that the "Viscount," of world renown, has its Rotol propellers mounted on Timken tapered roller bearings, has Timken-equipped landing wheelers, and ball and roller bearings manufactured by Fischer Bearings Company Limited in the Rolls-Royce "Dart" turbine engines.

During 1954 we received large orders for mill bearings of the heaviest types for home and Continental steel mill builders. For many years British Timken Limited has been recognised as one of the world's leading manufacturers of the largest types of tapered roller bearings, and in the past year we have seen a very considerable increase in our output of this type of bearing.

It is for manufacture of these large bearings that the factory at Daventry is being built, and it has already begun to contribute to our output. With these increased production facilities, we shall have greater competitive power in the field of large bearings.

It is only by maintenance of our profits that we can have the means to avail ourselves of the almost incredibly rapid development not only in machine tools, but in what is known in America as "automation," which can be described as the automatic control of industrial process and movement.

In an undertaking such as ours it is difficult to compare one year's output with another, and still more difficult to compare today's output with that of some years ago. Clearly, money values are not an accurate indication, nor, owing to the diversity of sizes, is the number of bearings, but by calculation embodying all the factors, we estimate that our physical output today at British Timken Limited is five times as large as it was in 1938 with a labour force just three times as great.

Such increase in productivity throughout industry, made possible by the development of machine tools and manufacturing techniques enabling the operator to produce more work in the same time with no extra effort, has made possible the rapid increase in the standard of living.

As well as participating in the continual advances of mechanical techniques on the factory floor, we are also using more scientific management tools, such as statistical methods, to control everyday manufacturing functions of quality, inventory and time study.

These mechanical and scientifical advances, which are, no doubt, leading us into the second industrial revolution with all its social and economic implications, will not only change the duties of the factory worker, but also, with the extension of the use of digital and analogous computers to assist in the solutions of these problems of industrial design and general administration, will revolutionise the daily routine of the office worker.

RESEARCH AND DEVELOPMENT

To meet this great challenge, we have found it necessary substantially to increase our effort in research and development, as we mean by the rapid adoption of new techniques to play our part in the effort which industry must, and undoubtedly will, make to fulfil the Chancellor's prophecy of a doubled standard of living within twenty-five years.

In a time of full employment it is a problem to increase one's labour strength. We must, and indeed do, work at least two shifts in every shop, and we suffer somewhat from other firms advertising day work only. We cannot remain competitive either in our group or even in the country, if modern machine tools are only operated for some forty-four hours per week.

Our raw material, all purchased from British sources, has been adequate in quality and quantity in the past to meet our demands, although in certain directions there are signs that we are entering a more difficult period.

These difficulties have not reached large proportions, but they exist in all our factories.

As to the future, sales for the year to date for the Group show a considerable increase over those of the previous year, and there is every prospect of our factories—and, indeed, of the increased facilities which will come into operation—being fully occupied at least for all of 1955.

At the moment we view the future with confidence and look to expanding sales, but it must be borne in mind that competition, especially for exports, is particularly keen from other great manufacturing countries of the world. However, with full order books, modernised and expanding facilities and with the efficiency and skill of our staff of employees, large numbers of whom, I am happy to say, have been with us a great number of years, we face the future with the determination to maintain our position in the forefront of anti-friction bearing manufacturers of the world.

The Report was adopted.

ASSOCIATED NEWSPAPERS LIMITED

LORD ROTHERMERE'S STATEMENT

The Fiftieth Annual General Meeting of Associated Newspapers Limited will be held on Thursday, June 30, 1955, in the Memorial Hall, Farringdon Street, London, E.C.4. The following is from the statement by the Chairman:

This year's Balance Sheet and Accounts mark the 50th anniversary of the formation of the Company. Associated Newspapers Limited was formed in the year 1905, just nine years after the first issue of the *Daily Mail* had appeared on May 4, 1896. Our fortunes have greatly improved and the Company has expanded since those days. The first Report published in 1906 gives a profit figure, after depreciation, of £158,000; this compares with over £2,500,000 shown in the current Accounts. Our wage bill in that year amounted to £160,000; in 1954-5 for the Group it amounted to a sum in excess of £11 million. As a matter of interest the Directors in their first Report referred to the completion of successful negotiations with the Newfoundland Government under which the Company acquired 2,300 square miles of richly wooded area in the upper valley of the Exploits River. This was the beginning and still forms the backbone of our huge Canadian subsidiary, Anglo-Newfoundland Development Company.

Turning to the year that has passed, I am glad to be able to report again a satisfactory year's trading. The consolidated trading profit, after charging depreciation and Loan Stock Interest, amounts to £2,240,923. Although this profit has been earned as a result of entirely normal trading, the year has been one of tremendous activity for your Company, the implications and results of which are only just beginning to be felt.

During recent months all newspapers who are members of the Newspaper Proprietors Association experienced the only serious strike, apart from the General Strike, in the history of the Industry, and the country was without London national Morning, Evening and Sunday newspapers for 26 days. The strike has now been settled and all the newspapers affected are again in production. The accounts that are before you allow for losses sustained during the first seven days of the strike amounting to £150,000, and the Industry is calculated to have lost altogether more than £3 million. The real damage, however, cannot yet be assessed.

As a direct result of the strike it has been necessary for all London Evening papers to increase their selling price to 2d., an event which has had a serious effect on circulations. Although the position is still fluid, the overall average loss in sales of the three Evening newspapers affected is calculated to be in excess of 12 per cent. Similarly, the sale of all the other newspapers, the Dailies and the Sundays, show a marked decline since the strike. This may be due to some extent, to the fact that all newspapers are now using reserves of newsprint, accumulated during the stoppage, in the production of larger papers. It is my opinion, however, that the principal reason for the contraction in overall sales is that during the 26 days of the strike many readers lost or were beginning to lose the newspaper reading habit.

It would be stupid to suggest that a strike in any industry does not damage the shareholders—of course it does, but it is my duty to say that I know of no industry where a prolonged stoppage could do more damage, more quickly and more permanently to the employees than our own, and I sincerely hope that, as long as it is my privilege to be Chairman of this Company, any difficulties which may arise in the future between employer and employed, will be resolved by the modern methods of arbitration and negotiation.

ACCOUNTS

You will see from the Profit and Loss Account that the total profits of the Group are larger than last year. This improvement is in part due to the inclusion for the first time of the profits of the News Holdings Group, the Companies which became full subsidiaries at the beginning of the financial year.

The tax charge this year benefits from two factors; firstly, the unlamented disappearance of the Excess Profits Levy and secondly, the welcome reduction in the standard rate of Income Tax from 9s. to 8s. 6d. Both will have a healthy effect on industry as a whole and will provide an incentive to managements to earn profits by careful housekeeping.

When I spoke last year our stocks of newsprint were much lower than normal and it was expected that this situation would be temporary. However, the value and tonnage of newsprint held at the end of this financial year was practically unchanged. As a result and in the hope that this position will improve considerable cash resources are being held available in easily realisable securities.

The consolidated Balance Sheet indicates the great strength and resources of our Group; this strength can be the more appreciated by realising that the investment of £1,358,977 in Anglo-Newfoundland Development Company Limited is represented by Canadian assets of $23,500,000 and is therefore worth on book values alone some £8,400,000—or 10s. per Deferred share. These factors allow your Company to strike out into new ventures in the knowledge that its main activity of newspaper production will not in any way be weakened financially and will continue to provide a large proportion of your Company's revenue.

COMMERCIAL TELEVISION

During the year the Independent Television Authority granted Associated-Rediffusion Limited, the company in which we have a 50 per cent holding, the licence to run the London Television Station from Monday to Friday. In addition, we are taking a minority holding in commercial television operations in both Sydney and Melbourne. Since the London operation is a new industry and the Sydney and Melbourne stations have yet to be founded, we cannot be certain of our financial commitments until we have had some operating experience.

THE DAILY MAIL

The influence and strength of the *Daily Mail* has been more than maintained in the past year. This newspaper bows to none in the authority with which it speaks in its leading articles. On many occasions it has been the first newspaper to indicate to its readers the importance of major events in the national and international field and it can rightly claim great credit for the balance with which it has highlighted their significance. For instance, the *Daily Mail* was the only newspaper to underline the importance of the statement by the Chancellor of the Exchequer that the standard of living of our people could be doubled in the next 25 years; it was the only newspaper to tell the first full story of the recent dramatic changes in the Kremlin; it was the first newspaper to forecast that Britain would make the Hydrogen Bomb, which forecast it followed up with articles explaining the significance of the American Strategic Air Force in this age of power politics.

THE EVENING NEWS

Although the sales of all London Evening newspapers have fallen *The Evening News* has continued to maintain its very substantial lead over its nearest competitor. Its slogan, "First With The News," continues to be upheld by the paper's reputation for news, pictures, features and sport. Its high standard of journalism, combined with its accuracy and speed, have all played their part in obtaining this result.

SUNDAY DISPATCH

Competition in the Sunday field has continued unabated and although the sale of the *Sunday Dispatch* shows a decline for the first time for 17 years, its reputation for exclusive news, complete sports coverage and topical articles by leading writers, stands as high as ever; its City Notes make the paper greatly sought after by investors.

DAILY SKETCH

I am happy to tell you that the *Daily Sketch* has continued to make considerable headway both in the matter of sales and in the improvement of its finances. In the 28 months since we acquired this newspaper it has gained nearly 400,000 new readers. During the month of April the sale passed the million mark. This is a considerable performance, especially when it is borne in mind that the price has remained at 2d.

WEEKEND MAIL

During the year colour printing was introduced on the front page of the *Weekend Mail* and the size of the paper has been increased to 24 pages. A sister paper to the *Weekend Mail* is now being published in Australia and in a little over six months it has become the second largest national newspaper on that Continent. Your Company has a half-share in this venture.

PROVINCIAL NEWSPAPERS

Once again I am able to record a successful year's trading by our provincial newspapers. In every centre where they operate alone, circulations have increased, and this factor is a most encouraging sign of the success with which each newspaper operates in fostering local loyalties, interests and functions.

STAFF

It is my custom and practice each year to give your thanks and those of the Board to all members of the staffs of our Companies. In doing so this year I would like to express my earnest regret to many faithful and old servants to whom, owing to the strike, we were reluctantly obliged to give notice. I thank them again this year and at the same time express the hope that never again will the Industry allow itself to experience such a tragic occurrence.

THE ORION INSURANCE COMPANY, LIMITED

POLICY OF DEVELOPMENT AND EXPANSION

SIR STRATI RALLI'S STATEMENT

The twenty-fifth annual general meeting of The Orion Insurance Company, Limited, will be held on June 23rd in London.

The following is an extract from the circulated statement of the chairman, Sir Strati Ralli, Bart, MC:

The year under review has seen two important changes in the constitution of your Company.

Firstly, the Issued and Paid-up Capital of the Company was increased in August last up to the full amount of the present Authorised Capital, namely £500,000.

Secondly, in December, 1954, an official quotation for, and permission to deal in, the whole of the Issued Share Capital of the Company was granted by the London Stock Exchange.

Whilst continuing the policy of consolidation and development in the Marine and Aviation Departments, your Board is endeavouring to build up an equally strong position in the Fire and Accident Department in order that, both geographically and by classes, the business of the Company will rest on a broader basis.

It is well to bear in mind, however, that the development of an Insurance Company is very much a matter of patient long-term planning and controlled expansion. The heavy establishment expenses and the necessity of building up Underwriting Reserves are very material factors in the early operational years of any new development. In consequence, the results of new endeavours may not become apparent for some time.

The serious Insurance losses caused by the three windstorms on the Eastern Seaboard of the United States and Canada in the latter part of last year were naturally felt in all Departments of the Company, but I am glad to say that as a result of the various measures adopted by us during the past few years our aggregate net loss from these occurrences has been relatively light.

MARINE DEPARTMENT

In the Marine Department the net Premium Income for 1954 amounted to £1,047,744 compared with £1,008,355 for 1953.

The ratio of total Claims paid in respect of all Underwriting Accounts was 78 per cent compared with 94 per cent in 1953. Expenses of Management amounted to 6.3 per cent compared with 7 per cent last year.

Conditions in the Marine Market have become very unsatisfactory, particularly in the case of Cargo business for which competition has become intense and many rates have fallen to what may eventually prove to be uneconomic levels. With regard to Hull business, however, there is some indication that the very long run-off we have experienced on this business over a number of years is becoming slightly less protracted.

The 1952 Underwriting Account has closed with a satisfactory Profit out of which the sum of £100,000 has been transferred to Profit and Loss Account. The result reflects credit on our Underwriter who has had to deal with a constantly deteriorating background.

The Marine Fund now stands at £1,408,679 (134 per cent) compared with £1,342,704 (133 per cent) at the end of 1953.

The 1953 Underwriting Account, to date, compares favourably with the 1952 Account at a similar stage.

Although the broad trends so far revealed by the 1954 figures are not quite so satisfactory, it is still too early to forecast what the ultimate result of this Account will be.

With regard to our Aviation business, the figures for which are included in the Marine Account, the underwriting results, owing to the skill and judgment of our Aviation Underwriter, have also been good.

FIRE, ACCIDENT AND MISCELLANEOUS DEPARTMENT

The Net Premium Income in this Account amounted to £809,872 compared with £891,858 for 1953.

The fall in Premium Income is attributable to our policy of reducing certain sections of business in order to achieve a better overall balance.

Our Direct Fire and Accident business from Home and Overseas has steadily increased and, for the first time, constitutes the major proportion of this Account. The Fire Premium Income, which is included in the total figures, has increased by £25,460 to £178,251 and this section has produced a Profit of 6½ per cent.

The total figures of all Classes combined show Claims Incurred 71 per cent on Earned Premiums, and Commission and Expenses 23 per cent, thus enabling us to transfer the sum of £48,335, equivalent to 6 per cent, to Profit and Loss Account.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

After bringing in Gross Interest and Dividends of £145,618 (£153,048) and the Transfer from Revenue Accounts of £148,335 (£64,450), and deducting Directors' Fees £3,000 (£2,871), Other Expenses and Outgoings £34,529 (£38,817), and provision for United Kingdom Taxation £190,000 (£110,000), the Net Balance for the year amounts to £66,424 (£65,810). To this has been added the sum of £142,542 brought forward from 1953 making a total of £208,966 available for appropriation.

Your Directors have decided, this year, to augment the General Reserve by £25,000 using for this purpose the £16,810 available from Excess Profits Tax Post-War Refund and transferring £8,190 out of Profit and Loss Account. In addition a further transfer of £2,000 has been made to Provision for Staff Contingencies.

Your Directors recommend the payment of a Dividend of 12½ per cent (less Income Tax) for the Year 1954, being an increase of 2½ per cent over the Dividend paid for the Year 1953. This requires a net sum of £35,938 leaving a balance of £162,838 to be carried forward to the next Account.

Total Assets continue their steady growth and now amount to £5,229,708. The Market Value, or, where there is no quotation, the estimated value, of our Investments at December 31, 1954, was in excess of the Balance Sheet figure.

THE ANGLO-EGYPTIAN OILFIELDS LIMITED

AGREEMENT WITH GOVERNMENT

The Annual General Meeting of The Anglo-Egyptian Oilfields Limited was held on June 2nd in Cairo.

Mr H. M. Jones, the Chairman, in the course of his statement said: At the last Annual General Meeting I sounded a note of high optimism in the conviction that the signature of the Price Agreement in June, 1954, would resolve all the outstanding problems between the Government and the Company as regards prices and related subjects, and in the belief that it would not be long before the unexpected difficulties which had arisen over the terms of the exploration licences—and which at the time of our Annual General Meeting had been reduced to one point—would be resolved. At that time I ventured to contrast the prevailing atmosphere of confidence with the conditions of uncertainty and insecurity that had hitherto disturbed the Company's operations.

As evidence of this confidence the Company has so far planned Capital Expenditure of approximately £6 million during the years 1955-1957. This expenditure is to be directed to two main objectives—firstly, the extension and modernisation of the Suez Refinery (including a "platformer" to improve the quality of the motor benzine costing approximately £1.6 million) and, secondly, exploration work on the areas authorised by Law 205 for allocation to Socony-Vacuum Oil Company of Egypt and Anglo-Egyptian Oilfields and, where exploration is successful, the development of these areas. The work on the Refinery has begun and I am pleased to state that as a result of negotiations between the Government and the Company an understanding regarding a 50-50 Agreement has been reached.

EXTENSION OF ACTIVITIES

This, I hope, will lead to a final Agreement which will enable the Government to issue the sixty-one licences to Anglo-Egyptian Oilfields and Socony-Vacuum Oil Company of Egypt as authorised by Law No. 205-54. Some formalities remain to be settled and it is confidently hoped that the signature will take place within the next few days. It is hoped that the short fall between the production of indigenous crude and our Suez Refinery's capacity will be made good from the extra production which—and this is subject to all the limitations of what, after all, can only be regarded as a risk venture—may result from the new exploration if the latter is successful. By applying in February of this year for a further 160 exploration licences—138 in the Delta area and 22 in the Gulf of Suez, your Company further confirmed its intention to maintain and to extend its activities, both in its own interests and in the interests of Egypt.

As was stated in the preliminary announcement, differences of interpretation of the 1954 Price Agreement had arisen between the Department of Fuel and the Company. The amount of money involved was substantial. However, I am pleased to announce that an understanding has been reached with the Government on the main outstanding problem which involves the largest sum of money. Negotiations are continuing.

The net revenue for the year 1954, after providing £422,000 for Egyptian Taxation was £1,800,000 as against £2,269,000 for 1953. The increase in expenditure is largely accounted for by the necessity for purchasing and importing crude oil to the value of £206,000.

The report and accounts were adopted.

WORTHINGTON-SIMPSON LIMITED

A SATISFACTORY REPORT

The sixty-fourth annual general meeting of Worthington-Simpson Limited was held on June 9th in London, Sir Samuel R. Beale, KBE, chairman of the company, presiding.

The following is an extract from his circulated statement for 1954:

I am very pleased to be able to submit to you again a most satisfactory report and statement of accounts. Our trade pump business has kept up very well during the year and is increasing at a steady rate. New developments augmenting our existing lines are well under way and should, over the next few years, contribute to a greater turnover.

The trading profit at £652,202 compares with £642,689 for the previous year.

After making full provision for all charges, including taxation, a net profit on the year of £296,112 is shown, against £224,996.

Our order book still stands at about the same level as last year, and incoming business for the first quarter of this year again is higher than the corresponding period last year.

In the opinion of the directors, the financial position of the company is so stable that the time has arrived when the issued capital of the company should again be adjusted so as to reflect more accurately the actual amount of money invested in the business. It is accordingly proposed that a free issue of fully paid shares shall be made to the company's ordinary shareholders in the proportion of one new 10s. ordinary share for every two ordinary shares held.

The report was adopted and the proposed final dividend of 10 per cent, making 20 per cent for the year, was approved.

At a subsequent extraordinary general meeting, resolutions were passed, approving the board's proposal of a free issue of fully paid shares to ordinary shareholders.

LISBON ELECTRIC TRAMWAYS

The Annual General Meeting of Lisbon Electric Tramways Limited will be held on June 29th in London.

The following is an extract from the circulated statement of the chairman, The Right Honourable The Lord Rathcavan:

The figures for passengers carried, and mileage run, are as follows:

Passengers 344,176,597, an increase of 8,135,315 or 2.4 per cent; mileage 27,363,906, an increase of 1,119,671 or 4.3 per cent.

Thirteen open tram cars were substituted during the year by our latest type of closed car and trailer. Eight new double-deck buses were put into service during 1954, bringing our total bus fleet to 129 single-deck and 56 double-deck vehicles.

Although the additional passengers carried have produced more revenue, the cost of operation has increased so that the net result is more or less the same as last year.

The sum contributed to the state revenue of Portugal and the Lisbon municipal revenue amounted to £365,948. If the estimated cost of free travel for uniformed officials is added this figure increases by £100,000.

After providing for all charges, the net profit for the year is £79,190. The Preference dividend and Ordinary dividend of 6½ per cent net for the year absorb £75,861, leaving £68,054 to carry forward.

POSITION IN PORTUGAL

In 1954 we took 57 per cent of our current requirements from the hydro-electric grid. When hydro-electric power was not available we were able to co-operate with the authorities by running our thermal power station at full load and making the excess production available for general use in Lisbon.

New wages agreements, which operated from January 1, 1955, improve working conditions both regarding hours of work and monetary benefits and the estimated cost to the company will be £45,000 per annum.

The total cost to the company of all social services, including pension fund and unemployment fund contributions, was in the region of £380,000.

LIMMER & TRINIDAD LAKE ASPHALT

EXCELLENT TRADING RESULTS

The eighty-third annual general meeting of The Limmer & Trinidad Lake Asphalt Company, Limited, will be held on June 30th in London.

The following is an extract from the circulated statement by the Chairman, Sir John Hathorn Hall, GCMG, DSO, MC:

The principal aim of The Limmer & Trinidad Group is to foster by every practicable means the provision for the public of safe, sound, durable, traffic-worthy roads as economically as possible. My visits to the various Branches of your Company throughout the country since I assumed the office of Chairman have satisfied me that everywhere they are pursuing this aim with outstanding success and ever higher reputation.

The recent public announcement of road policy, however, shows that the Government have at long last decided to embark upon a reasonably comprehensive programme to improve and extend the road system in this country. It is important that when this programme materialises Limmer & Trinidad should play its full part.

During 1954 your Company's business made excellent progress. With the income from Trade Investments and Government Securities the Trading Profit for the Group, including the Subsidiary acquired during the year, was £649,235, an increase of nearly £100,000 over the previous year. Thus, for the third successive year, the Trading Profit creates a new record. Interim Dividends of 4½ per cent and 10½ per cent were paid in October 1954, and April, 1955, making a total distribution of 15 per cent for the year; paid once again on a capital increased during the year by further capitalisation of reserves.

W. T. HENLEY'S TELEGRAPH WORKS COMPANY LIMITED

RECORD ORDER BOOK

The seventy-sixth annual general meeting of W. T. Henley's Telegraph Works Company, Limited, was held on June 3rd, in London.

Sir John Dalton, AMIEE, FCIS, chairman, referred to the recent death of Mr W. F. Bishop, CBE, the retirement of Sir Montague Hughman and the appointment of Mr Daniel Meinertzhagen to the board and in the course of his speech, said: Profit from trading was £905,649, a decrease to some three-quarters of the 1953 figure. The main cause lay in a number of factors which, fortunately, do not appear to be repeating themselves in this current year. We started the year 1954 with a depleted order book; in addition, the early part of the year was marked by smaller volume of sales, due mainly to the continued tendency to restricted buying by our largest customers—a feature which was evident throughout the previous year.

The returns from our very large business in rubber cables were seriously affected by price increases of our raw materials. Also difficulties have been met on our export trade. The position today is that our export division is now dealing with an all-time record of enquiries for export business.

In the opinion of your board, we should not get dismayed by these temporary adversities. Indeed, during 1954 we employed more capital in stocks and in other directions, and our order book to date for the home market as well as for the export market for this current year discloses a record of orders greater than at any time in the history of the company.

The net profit amounted to £491,000. We have transferred £100,000 to general reserve, and recommend the same rate of final dividend, making 10½ per cent again for the year on the ordinary stock. In addition, it is proposed that a distribution out of capital profits should be made of 2 per cent on the ordinary stock. This distribution is not subject to income tax. The balance sheet again shows that the company has a sound economy.

The improvement reported to you last year in the position of Henley's Tyre and Rubber Company, Limited, has been maintained.

RECENT PROGRESS

There has been a considerable improvement in demand during the latter part of 1954 and for the current year. Indeed, in 1954 we obtained many important contracts for power cables from the area boards and divisions of the British Electricity Authority. We were also successful in obtaining substantial orders from the Admiralty and from the British Post Office. Orders for considerable quantities of ships' cables were received from the principal shipbuilders and shipwiring contractors for the wiring of vessels of all types, both for the Royal Navy and the Mercantile Marine.

We received noteworthy cable and overhead installation contracts which kept our home contract department fully employed during the year. Many valuable installation contracts were obtained from overseas customers during 1954.

Now I wish to comment briefly upon future prospects. Industrial activity generally continues at a very high tempo, with full employment at home. This activity is likely to be further stimulated by the schemes of railway modernisation announced by the British Transport Commission and the further increases in capital investment expected this year, as compared with last year in coalmining, gas, railway and air transport and the Post Office services.

I think, therefore, that the current trading outlook justifies the belief that we can look forward with confidence to the future prospects of our company.

The report was adopted.

UNITED BRITISH OILFIELDS OF TRINIDAD

The forty-second annual general meeting was held on June 7th in London, Sir Frederick Godber (the chairman) presiding.

The following is an extract from his circulated statement for 1954:

The profit after taxation for the year 1954 was £963,800 against £374,800 for 1953, this improvement being brought about largely by higher production and sales and by decreased operating expenditure.

During the year our crude production increased by some 500,000 barrels and our sales of refined products were also considerably greater. While purchases of Crude and Refined Oils were larger by £529,393 than those made in 1953, Oil Sales Proceeds rose by £935,816 to £10,736,209.

OPERATING EXPENSES

In a general decrease in direct operating expenses, the most marked was that on Intangible Drilling. This was brought about by a reduction in the drilling programme together with the successful introduction of improved techniques which showed economy in footage costs. This intangible drilling expenditure of £899,718, together with Production, Pipeline, Refinery, Administration and General Expenses, totalled £2,835,688 against £3,520,476 in 1953, a difference of £684,788. After taking from this saving the £284,000 charged in 1953 in respect of Ortoire expenditure incurred in 1952 there is still a reduction of some £400,000 in our 1954 operating expenses under these heads.

As a result of the Company's increased profits taxation thereon is considerably heavier, amounting to £703,000 in 1954 compared with £390,000 in 1953. Turning now to the Balance Sheet, capital additions and replacements to wells, plant and equipment, etc., absorbed £1,350,000 as compared with £1,115,000 in 1953. Most of this increase of £235,000 resulted from the continued development of Ortoire as a producing area, in particular £159,000 spent on the pipeline from Balata to Penal.

Recourse had to be made to short-term loan arrangements but taking the year as a whole, the cash generated was adequate to cover the Company's outlays. Cash and investment balances in fact improved by £181,730 to £543,433 at December 31, 1954, but this sum is indeed modest in the light of our continuing substantial requirements.

ADDITIONAL RESERVE

Some slight progress has been made in our efforts to develop additional reserves, particularly in Ortoire but the attendant expenditure is unavoidably heavy and we are clearly still a long way from being able to regard Ortoire as a profitable investment.

Considerable efforts are being made to dispose of natural gas production. Maximum use is made of this commodity for fuel and other purposes in the refinery and fields and, apart from sales already made to the Trinidad and Tobago Electricity Commission, a contract was recently concluded with Trinidad Cement Limited to supply their newly constructed cement plant.

Progress has been made by Trinidad Northern Areas Limited, of which we are one-third partners and marine operators, on its under-water concessions. Production is now being obtained from wells deviated from the shore at Point Fortin. The drilling of TNA's high-seas well was completed early this year, and we have now embarked upon a comprehensive testing programme.

The report and accounts were adopted.

BRITISH ENKA LIMITED

CONSIDERABLE EXPENDITURE ON RESEARCH

The thirtieth annual general meeting of British Enka Limited was held on June 1st in London, Mr A. D. Carmichael, CBE (the chairman) presiding.

The following is an extract from his circulated statement: The Group Working Profit for 1954 is £929,943. After taking into account £9,676 for interest received, £181 loss on sale of Fixed Assets, £12,945 loss on sale of plant stores from Breda Visada Limited, £274,086 for depreciation of plant and machinery, £22,417 for Directors' fees and emoluments, £5,745 and £15,000 contributions to the Staff and Works Pension Schemes respectively, the operating profit is £609,245.

Provision for taxation requires £303,468, leaving a net profit for the year of £305,777.

After adding the balance brought forward from last year, £184,119, and adjustments of taxation relating to previous years, £82,386, the available balance is £572,282. The Directors have appropriated £275,000 for General Reserve. Substantial appropriations to Reserves are necessary in view of existing and likely future capital commitments. Our total Reserves now stand at £1,486,639. The Directors recommend the payment of a dividend of 10 per cent less income tax, which will absorb £107,813, leaving a balance to be carried forward of £189,469.

Research.—Attention was drawn in my report last year to the great value of continuous research in the Rayon Industry. I am pleased to tell you that the special new laboratories and offices are now completed and in use. They were built and installed with the most modern equipment at a cost of approximately £250,000, and will provide fitting accommodation for a highly skilled technical staff, constantly employed on research and development. This will help us to take the fullest advantage of our valuable Research, Technical Aid and Patent agreements with our parent Company, AKU, and with NV Research of Arnhem.

GENERAL

The Company produces Viscose Rayon Yarn in substantial quantities for Industrial purposes for the Tyre and Belting Trades, and for a variety of sections of the Textile Trade. The demand during the year was very variable. In certain sections there was constant pressure, and in others an irregular demand. Our total sales were slightly less than those of the preceding year, and were adversely affected, in particular towards the end of the year, by the depression in Lancashire.

Over a number of years the Rayon Producers in this country have maintained stable selling prices in the Home market, and the last basic advance was in 1951. This policy has been followed with the object of stimulating the sales of yarn, but if the tendency of rising costs continues, it is obvious that price levels will need revision.

With the other members of the AKU group of Companies, this Company is constantly and actively engaged in research to discover still better ways of making and using Viscose Rayon Yarns. Considerable sums are being spent in changing and improving methods of spinning, to produce a still stronger and longer-wearing High Tenacity Yarn for Industrial purposes; and in the Textile field, the Company is investigating new types, including High Tenacity and other specialities. We hope in these ways still further to improve the usefulness of our yarns. The report was adopted.

THE CAPE ASBESTOS COMPANY LIMITED

IMPROVED GROUP RESULTS

MR ROBERT WALKER ON EVER-GROWING ACTIVITIES

The sixty-second annual general meeting of The Cape Asbestos Company Limited was held on June 7th in London, Mr Robert Walker, MBE (the Chairman), presiding.

The following is an extract from the Chairman's statement which had been circulated with the report and accounts:

It is with pleasure that I present to you the Accounts and Balance Sheet of your Company for the year ended December 31, 1954. Not only does the Parent Company's net profit show an increase over the previous year, but there is also a gratifying rise in the profit of the Group.

The Group trading profit for the year amounted to £1,256,015, compared with £1,038,963 in 1953. This improvement is mainly attributable to the mining and milling difficulties in South Africa having to a very considerable extent been surmounted. From this profit, £453,717 is set aside for Depreciation, against £371,597 last year, and after various other deductions and provision for outside Shareholders' interests, there is left the sum of £790,946 as the net profit attributable to the Company, compared with £668,611 in 1953, to which has been added £15,085, being an amount withdrawn from the Stock Reserve of a Subsidiary.

Taking the Accounts of the Parent Company, the net profit is £588,813, compared with £551,960 in 1953. Conditions have been highly competitive during the year, and the increase in profit, though small, has been hard-won. To this figure of £588,813 must be added the amount brought forward from last year, £140,052, making £728,865 available for disposal. From this, £237,500 is set aside for taxation, and it is recommended that a final dividend of 10 per cent be declared on the Ordinary Share Capital, as increased by the capitalisation of reserves and the new issue for cash, making with the interim a total of 12½ per cent. It is proposed that £100,000 shall be placed to General Reserve and £50,000 to Development Reserve, leaving £139,687 to be carried forward.

Turning to the Consolidated Balance Sheet the Issued Capital now appears at £3 million, while reserves and surplus exceed this figure at £3,617,288. Fixed Assets, after accumulated depreciation, amount to £3,461,760, while Current Assets at £4,916,270 compare with Current liabilities, including taxation, current and future, of £1,760,742.

I think it may be said that this Balance Sheet discloses an extremely sound position and provides a firm basis for future expansion.

FACTORIES

The factories at home have again maintained their profitability in spite of a continued rise in cost of services and labour, and keen competition. Although we succeeded in completing 1954 without raising the prices of our manufactured goods, a sharp increase in wages towards the end of the year made an increase inevitable in the early months of this year. Whilst we were reluctant to take this step, both in the public interest and because of the competition which we have to face, particularly in Export markets, some rise in prices became imperative, if we were to continue to show a return on the capital employed commensurate with the highly specialised nature of our products.

SUBSIDIARIES

Your Board's main preoccupation during 1954 has been with the conduct of the Company's mining and milling operations in South Africa. I am very glad to be able to report a considerable improvement in the situation there, which is reflected in the improved profit on the year's working.

At the Blue mines the full operation of the new mill and other improvements have enabled us to secure much more favourable results than in the previous year. On the Amosite fields, the necessity to maintain a slower rate of output from the treatment plant, in order to ensure the highest quality, confronts the Management with some difficulty in maintaining a margin of profit adequate to the scope of the operation—difficulties which they are taking active steps to overcome.

I indicated last year that as a result of the persistent demand for the relatively rare types of asbestos which are produced by your Company, the emphasis at the mines had inevitably fallen on volume of production, and that consequently other essential features in the successful operation of a mining undertaking had tended to suffer. During 1954, not only have the mines been operated more profitably, but notable progress has been made in other ways. Essential steps have been taken in planning in mine development, in mechanisation, and in the preparation of as clean a grade of fibre as the market desires. I am happy to say that a notable improvement in the quality of our fibres has been obtained during 1954, and our leading customers have expressed satisfaction at the quality of the deliveries which they have received.

A large proportion of the additional capital which you subscribed last year will be devoted to extending the operations, at both mines and mills to provide a greater output; and while the amortisation of the sums so spent will inevitably cause some rise in costs, we believe that the increased volume and still higher quality obtained will enable such income to be obtained as will offset this and show a better margin of profit.

The statement concluded with a review of the other subsidiary companies at home and overseas.

The report was adopted.

CENTRAL PROVINCES MANGANESE ORE

GOOD DEMAND AT LOWER PRICES

KEEN INTEREST IN LABOUR WELFARE

MR H. R. HOLMES ON CURRENT PROSPECTS

The forty-seventh annual general meeting of The Central Provinces Manganese Ore Company, Limited, was held on June 8th at Winchester House, Old Broad Street, London, E.C.2, Mr H. R. Holmes (chairman and managing director) presiding.

Mr A. Linton, MC (Director and Secretary), read the notice convening the meeting and the report of the auditors.

The chairman said: Gentlemen, The Report and Accounts for the year ended December 31, 1954, have been in your hands for some time, and I propose, with your permission, to take them as read. (Agreed.)

Before asking for your approval of the Accounts I would like to make a few comments on the figures which appear in the Balance Sheet and Profit and Loss Account, as well as some remarks on the conditions ruling in the Manganese Ore business during the period under review.

From the Profit and Loss Account you will see that the Balance on Trading was £2,234,297, as compared with £3,011,226 for 1953 after excluding the exceptional item of £270,376 arising that year from the increased value of lower grade stocks. For some time prior to 1954 there was a very heavy demand for Manganese Ore from all consuming countries, and prices rose to unprecedented levels. During 1954, however, the trend was reversed, buyers in some countries found that they had accumulated large stocks, demand for ore fell off seriously and prices consequently were affected. Owing to the good relations that we have built up over a long period with the principal consumers of manganese ore in the world, we did not suffer as much as might otherwise have been the case. Nevertheless, we had to accept lower prices in the second half of the year, and this, in addition to railing difficulties which prevented us from fully implementing our contracts, resulted in our profits being considerably reduced.

THE CURRENT YEAR

As mentioned in the Directors' Report, there is at present a good demand for our ore, but at prices lower than those obtainable in 1952 and 1953, when market conditions were exceptionally advantageous. Another factor which has to be taken into account, when one considers the future, is the opening up of other manganese areas in various parts of the world, which will no doubt compete in course of time with ore supplies from existing sources. But on the other hand it has to be borne in mind that the steel production in the world is continually expanding. So far as I can see at the moment, and provided that nothing unforeseen arises, I think that the prospects for the current year's trading are not unsatisfactory.

Of the balance on Trading Account taxation takes £1,265,000, and of this Indian Taxes amount to £1,259,000. In addition we paid considerable sums in India on account of Royalty and of Export Duty. Furthermore, we give employment to many thousands of Indians, whose wages and bonuses, and the many amenities provided for them, amount to a very large sum annually. As you are probably aware, the Export Duty was abolished last August.

On the Debit Side of the Profit and Loss Account, Depreciation of Fixed Assets at £97,251 is much higher than the previous year's figure of £69,537. This is owing to the substantial expenditure we have made in recent years on Plant, Machinery and Buildings, on which we have to provide for depreciation. I think it probable that the expenditure under these heads will continue for some years yet, because as the mines get deeper with the attendant technical problems, it is essential to spend money on equipment, particularly in those cases where it is necessary to change the method of working from opencast to underground mining.

PROPOSED APPROPRIATIONS

The net profit for the year, after providing for Taxation and Depreciation, is £899,284 as against £1,057,651 for the previous year, and out of this your Directors recommend that the sum of £150,000 be transferred to the General Reserve which will increase it to £350,000.

Your Directors also recommend that the following appropriations should be made:

To Staff Benefit Fund	£30,000
To Workers' Welfare Fund	£20,000
To Contingencies Reserve	£75,000

With regard to the Staff Benefit Fund, as I have said on previous occasions, it is essential that this fund be built up in order to provide something for our staff when the time comes for them to retire. As you no doubt well know, with taxation both in India and the United Kingdom at its present level, it is difficult for anyone to save sufficiently for retirement, and I feel sure that this allocation will have your approval.

As regards the Workers' Welfare Fund, you are probably aware that the Government of India attach very high importance to the welfare of all workpeople employed in industry. You will see from the Balance Sheet, we spent £17,117 during the year on this welfare work, and the £20,000 which we propose to appropriate to this fund is to replace this expenditure. We have always taken the keenest interest in the welfare of our labour, and have in the past done much to improve the conditions under which they work and live. We hope that, with the co-operation of the Government and the Trade Union, labour relations will remain on the same satisfactory footing as they have been in past years.

An Interim Dividend of 1s. 2d. per unit free of tax was paid (on the capital as increased last year) on October 1st last, and your Directors now recommend that a Final Dividend of 1s. 8d. per unit, plus a bonus of 1s. 4d. per unit both free of tax should be paid, altogether absorbing £625,000. This will leave £228,790 to be carried forward, as compared with £232,294 brought in.

BALANCE SHEET FEATURES

Turning to the Balance Sheet, you will notice on the Assets side, that the value of the manganese ore stocks has risen from £659,547 to £835,681. This increase is due principally to the fact that we were unable to ship all the ore required to implement our contracts in full, owing to the railing difficulties in the first six months, and to scarcity of sea space towards the end of the year.

British and Indian Government Securities were £1,319,117 as compared with £1,570,953, while Cash at Bank and in hand was £303,063 against £1,280,337, the reduction being due to payment of Income Tax and the financing of additional ore stocks.

On the Liabilities side of the Balance Sheet, the issued Capital is £1,500,000 as compared with £1 million in the previous Accounts, the difference of course being the £500,000 capitalised from Reserve last year.

OVERSEAS VISITS

In June of last year, two of your Directors, Mr Hardy and myself, visited the United States of America to keep in touch with our very important customers there and to discuss with them several business matters. They are the largest producers of ferro-manganese in the world, and I am glad to say that we have had very cordial relations with them for many years now. I would not like this

opportunity to pass without expressing our appreciation of their understanding of our problems.

In January of this year Mr Hardy also visited the mines in India, and submitted very full and informative reports to the Board. There is no doubt that these periodic visits to the mines by members of the Board are of the utmost value to the Company. He also took the opportunity of calling on certain Central Government officials in Delhi and also State Government Ministers and officials in Nagpur. I am glad to say that our relations with these different authorities continue on a satisfactory basis.

Last year I referred to the Heavy Media Separation Plant at our Dongri Buzurg Mine which was installed to extract ore from the old dumps at that Mine. I am sorry to say that we have had considerable teething troubles with this plant, and it has also been affected by shortage of water. I hope that these difficulties will shortly be overcome and that I shall be able to give you a satisfactory report on it at our next meeting.

Our Diamond Drilling programme is proceeding. The plant is now drilling at Dongri Buzurg Mine and the bed has been proved to a depth of 485 feet below plain level. At this depth one of the holes has proved the bed to have a true thickness of 110 feet.

TRIBUTE TO MANAGEMENT AND STAFF

I wish to pay a tribute to the management and staff for their able and untiring efforts on the Company's behalf during what has been a difficult and arduous year, and also to the work of our shipping Agents in India, Messrs James Finlay & Co. Ltd., who have been most efficient and helpful. I am sure that they will appreciate the thanks of the Stockholders which, with your approval, I propose to convey to them.

I now beg to move: "That the report of the Directors and Statement of Accounts as at December 31, 1954, be and are hereby approved and adopted, and that the profits be appropriated as recommended by the Directors." I will ask Major Herring to second the motion, and before putting it to the Meeting I shall be glad to deal with any questions which Stockholders may wish to ask.

Major A. C. Herring, VC, ACA, seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 1s. 8d. per unit, free of tax and a bonus of 1s. 4d. per unit, free of tax, was also approved.

The retiring director, Major A. C. Herring, VC, ACA, was re-elected and the remuneration of the auditors, Messrs W. A. Browne & Company, having been fixed, the proceedings terminated with a vote of thanks to the chairman, directors and staff, both at home and abroad.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA EGYPT
ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN that the seventy-seventh ORDINARY GENERAL MEETING of the Shareholders will be held at the Company's Offices, 61 Avenue Fouad Ier, Alexandria, on Friday, June 24, 1955, at half past five in the afternoon, for the transaction of the ordinary business of the Company, pursuant to Act of Parliament and for the purpose of considering and, if thought fit, passing the subjoined resolution as a special resolution.

"To elect Mr Mohamed el Sayed Marzouk, manager of the Company, as a director of the Company and, for that purpose, to declare Article 106 (a) of the Articles of Association suspended in his favour."

Holders of share warrants to bearer desiring to attend or to be represented at the Meeting must deposit their share warrants in London before June 10, 1955, or in Alexandria before June 21, 1955, until after the Meeting, at the National Bank of Egypt, 6 King William Street, London, E.C.4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

A Member of the Company is entitled to appoint a proxy to attend and vote at the Meeting in his stead and any proxy so appointed need not be a Member of the Company.

Dated, Alexandria, Egypt, May 26, 1955.

By Order of the Board,
ALEX. L. BENACHI,
Chairman and Administrateur Délégué.

OTTOMAN BANK

(Incorporated in Turkey with Limited Liability)

NOTICE is hereby given that, in accordance with Article 29 of the Statutes, the Annual General Meeting of Shareholders will be held on Wednesday, June 29, 1955, at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m., to receive a Report from the Committee with the Accounts for the year ending December 31, 1954; to propose a Dividend; and to elect Members of the General Committee.

By the 27th Article of the Statutes the General Meeting is composed of Shareholders possessing at least thirty shares, who, to be entitled to form part of the Meeting, must deposit their shares at the chief office of the Company, Istanbul, or at any of the several branches or agencies abroad (in London at 20-22 Abchurch Lane, E.C.4, and in Paris at 7 rue Meyerbeer 9me) ten days at least before the day fixed for the Meeting.

J. VASSALL ADAMS,
Secretary to the Committee.

June 7, 1955.

EXPORT SALES EXECUTIVE

A very old-established leading company of fabric and light clothing manufacturers of world-wide repute requires an Export Sales Executive about 40 years of age, preferably with a knowledge of textiles and certainly with experience of overseas marketing of high-class merchandise. Outstanding prospects are offered, together with excellent terms of service, including a contributory pension scheme and a salary at commencement of £2,000 to £2,500 per annum, according to age and experience. Financial assistance provided, if necessary, when rehousing. Applicants may write, giving full particulars of experience, in complete confidence, as the vacancy is known to all members of our staff.—Please address replies to Box 984.

SENIOR ADMINISTRATIVE OFFICER required by the Scottish Council (Development and Industry) to assist and be directly responsible to the Secretary to the Council in Edinburgh. Duties will include assistance (1) to established industry; (2) in attracting plant investment; (3) in overcoming local problems of individual areas, and relevant committee administration. Good academic qualifications desirable. Salary according to qualifications, but probably within the range of £1,000 to £1,500 per annum. The post will be covered by the Council's superannuation scheme.—Applications, stating age, background and experience and quoting three responsible persons to whom reference can be made, to The Secretary, The Scottish Council (Development and Industry), 1, Castle Street, Edinburgh, 2.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 14 New Bridge Street, E.C.4.

Agreement, £1,130-£1,320 excluding London weighting.—Apply, quoting vacancy number 55/408, on form obtainable from Divisional Secretary, Central Electricity Authority, London Division, P.O. Box 136, Generation House, Great Portland Street, W.1, not later than June 25, 1955.

AUTOHALL SELF DRIVE CARS offer their new fleet of over 200 1955 cars to promote your business. Competitive rates, special commercial and long term offers and discounts. Re-purchase scheme and self-drive package tours. All arrangements made for continental touring. Write for full particulars and colour brochures, Autohall, Dept. 2, 302/6 King Street, Hammersmith, W.6. Riverside 2881. Cables: Autohall, London.

OPENING in September—Battisborough House School. Beautiful position on South Devon Coast: boys 8-18, entry 8-14. Individual attention. Resident doctor. Home atmosphere, varied activities. Full charge during holidays. Full particulars from Headmaster, Battisborough House, Holbeton, Devon.

A SALES PROMOTION MANAGER is required to handle the merchandising of a dairy product in England and Wales. Marketing experience is essential and some knowledge of the grocery trade would be an advantage. A good educational background is desirable, and the successful applicant must reside in the London area, but be prepared to travel.

All applications will be treated in strictest confidence.—Please write to Box 981.

BEFORE YOU BUY those shares, see what the Investor's Chronicle has to say. It is the best-informed and widest-read financial weekly. Two issues free of charge from 30 Grocers' Hall Court, London, E.C.2.

AN Economist, a former university lecturer, with good academic qualifications, in economics and statistics and first-rate experience in charge of research, advisory, and administrative work in official agencies in this country and abroad, will shortly be available in England for a post with a bias towards research.—Box 977.

MANAGEMENT.—Executive, aged 36, having held substantial positions, seeks permanent career. Experienced marketing, sales, advertising, sales promotion, product development, budgeting, finance, general management. London or Home Counties.—Box 976.

RHODES-LIVINGSTONE INSTITUTE

The Board of Trustees of the Rhodes-Livingstone Institute invites applications for the following post:—

DIRECTOR of the Rhodes-Livingstone Institute, Northern Rhodesia.

Salary: £1,600 to £1,800 per annum according to experience and qualifications.

The Institute was founded for the purpose of academic research and is at present carrying out a programme of tribal studies, social surveys, studies of family economics and social organisation throughout the Federation of Rhodesia and Nyasaland.

The duties of the Director are primarily the administration and direction, under the authority of the Board of Trustees, of the work of the Institute, and the technical and administrative experience and academic training in and experience of Anthropology.

Duration of Contract: 3 years in the first instance with possibility of renewal for further period.

The Director will receive for himself, and his wife if he be married, a B3 or C1 class free boat passage and first class rail fare from Capetown to Lusaka in Northern Rhodesia, and similar entitlements on the successful completion of his contract. The Board will provide the Director with partially furnished quarters at a rental of £108 per annum. The position is not at present pensionable, but consideration is being given to the institution of a superannuation scheme for the Institute. In the meantime the Board will contribute an insurance allowance of one hundred pounds a year (which can be drawn in cash if so desired).

The Director will be eligible for leave at the rate of five days on full pay for each completed calendar month of employment. Leave may be accumulated until the end of the contract or taken after short tours of service of from 15 to 18 months, in which case the Director would be expected to travel by air. He will also be entitled to local leave of fourteen days a year.

Applicants should state age, marital status, administrative and academic qualifications and experience in research, and should submit a medical certificate stating physical fitness for service in the tropics.

Applications should be forwarded not later than July 31, 1955, in three copies to:—

(1) The Secretary, Colonial Social Science Research Council, Colonial Office (Research Department), Sanctuary Buildings, Great Smith Street, London, S.W.1 (2 copies).

(2) The Administrative Secretary, Rhodes-Livingstone Institute, P.O. Box 900, Lusaka, Northern Rhodesia (1 copy).

UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for appointment to the research staff of the Institute of Social and Economic Research from persons with a good honours degree in economics and some experience in research. Appointments may be made in any part of the British West Indian territories. The appointment will be in one of the following grades according to qualifications and experience of the successful candidate.

Junior Research Fellow: £600 x £50—£700 p.a.
Research Fellow: £750 x £50—£900 x £50—£1,100 p.a.
Senior Research Fellow: £1,000 x £50—£1,500 p.a.

Child allowance £80 p.a. for each child under full-time education (maximum £240 p.a.). USSU. Unfurnished accommodation at rental of 5 per cent of basic salary. Duties to be assumed as early as possible. Appointment for three years in first instance.

Applications (six copies), detailing qualifications and experience and naming three referees, to be received by June 30, 1955, by Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF THE GOLD COAST

DEPARTMENT OF EXTRA-MURAL STUDIES

Applications are invited from honours graduates for

(1) Two Resident Tutorships to specialise in either Economics, History or Government (including Central and Local);

(2) Two Resident Tutorships in Trade Union Studies and Industrial Relations. Previous experience in trade union, co-operative and/or organisation essential.

Salary on scale £950 x £50 to £1,600 p.a., according to qualifications and experience. Family allowance £100 p.a. per child (maximum £500 p.a.). Outfit allowance £60 on first appointment. FSSU Passages paid for member of staff, wife and maximum of five children on appointment, overseas leave and termination. Part furnished accommodation at rent not exceeding 7.5 per cent of salary.—Applications (10 copies), naming three referees and stating full qualifications and experience, to be received by June 18, 1955, by Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W.C.1, from whom further information may be obtained.

BSc(ECONOMICS) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above Degree (open without residence), which is a valuable qualification for executive appointments in commerce or industry, government or municipal posts. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas free from Registrar (60), Burlington House, Cambridge.

NATIONAL COAL BOARD invite applications for a superannuable appointment in the Organisation and Methods Branch at London Headquarters. The work involves the conduct of O. and M. studies at Headquarters and in the provinces, concerned with the organisation of work and staffing and office methods.

Applicants should have a minimum of two years' specialised experience relating to the work of this post and, preferably, a recognised professional qualification or University degree and experience in a position of responsibility in a large organisation. Salary within the range £1,070-£1,470.

Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates), to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1 marking envelope T/T/996. Original testimonials should not be forwarded. Closing date June 27, 1955.

A PROGRESSIVE modern manufacturing company in a pleasant rural part of the Midlands requires the services of a male Statistician for their established Statistical Department. This is a permanent position, and applicants should have an honours degree in mathematics, statistics or in mathematics with a recognised qualification in statistics and should be under 30 years of age.

A four-figure salary will be paid and the successful applicant will participate in the company's non-contributory pension scheme.—Applications, giving details of education and experience, to the Personnel Officer, Box 982.

A CHARTERED ACCOUNTANT is required, age 30 to 35 years, with experience of Costing in a manufacturing concern and competent to work without day-to-day supervision by Directors. The immediate salary is exceptional and the prospects good.—Applicants are requested to reply in confidence to Box 980.

PRODUCE OFFICER required by the NIGERIAN FEDERAL GOVERNMENT for the Federal Produce Inspection Service for one tour of fifteen/twenty-four months in first instance. Commencing salary according to experience in scale (including expatriation pay) either £750 rising to £1,480 a year with prospect of permanency, or £807 rising to £1,631 a year on temporary contract with gratuity of £100-£150 a year. Outfit allowance £30-£60. Free passages for officer and wife. Assistance towards cost of children's passages or grant up to £150 annually for their maintenance in UK. Liberal leave on full salary. Candidates must hold a University Degree in Commerce, Economics or Agriculture, and possess administrative ability. Experience in the inspection and grading of agricultural produce an advantage.—Write to Crown Agents, 4 Millbank, London, S.W.1. State age, name in block letters, full qualifications and experience, and quote M1B/35123/EN.

RAPIDLY expanding group of pharmaceutical companies requires highly qualified scientist with laboratory experience to take charge of Research and Technical Departments. Substantial remuneration with generous superannuation terms.—Apply, in confidence, to Box 985.

SHIPPING COMPANY requires experienced woman supervisor for female staff ashore and afloat.—Write, giving full particulars education and experience, to Box 983.

EXECUTIVE trainee required by retail association to develop new division. Duties to include promotion of conferences, writing of articles and memoranda. Prospects for person with drive and enthusiasm.—Apply Box 979.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (periodicals excluded).

ENTERPRISING AND QUALIFIED MEN required for responsible posts in Management. Show initiative by working now for a professional qualification, by means of a Pitman Home Study Course.—Write for details to 41 Pitman House, Godalming, Surrey.

UNIVERSITY OF CAMBRIDGE

ASSISTANT IN STATISTICAL RESEARCH IN ECONOMICS

The Faculty Board of Economics and Politics will shortly proceed to the appointment of an Assistant in Statistical Research. The appointment will be open equally to men and women. The initial tenure will be for a period of two or three years. Re-appointments may be made for periods not exceeding five years at a time. The duties of the person appointed will be to assist the teaching staff of the Faculty with their statistical work. Applicants should possess EITHER an Honours degree in economics with some training in statistics OR appropriate statistical experience in a Government office or other organisation. The salary scale is £500 a year rising by annual increments of £25 to £700. The starting point in the scale will depend on age and experience. The post carries with it membership of the USSU. Five copies of applications, including references or copies of testimonials, should reach the Secretary of the Faculty Board of Economics and Politics, The Marshall Library, Downing Street, Cambridge, by June 28, 1955. Further particulars of the post can also be obtained from him.

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF ENGINEERING

POST-GRADUATE COURSE IN CONTROL ENGINEERING

To meet the need of certain sections of industry for men trained to a high standard in the theoretical principles and practical application of automatic control and to afford opportunity for study of advanced techniques and modern development in the general field of Control Engineering, a post-graduate course in Control Engineering is being established at Cambridge University to start in October, 1955. The course will be of approximately one year's duration; it will begin on October 5, 1955, and end on August 14, 1956. The number of students will be limited and applications should reach the Secretary of the Department not later than July 31, 1955. Candidates should hold a degree in Engineering or satisfactory alternative qualifications and have had some practical training and experience. They will be required to attend in Cambridge for interview on some weekday during July.

Further details and forms of application for admission may be obtained from the Secretary, the Engineering Department, Trumpington Street, Cambridge.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the full-time posts of RESEARCH ASSISTANT in the Faculty of Economic and Social Studies. The successful candidates will be expected to pursue research in ECONOMICS, ECONOMIC STATISTICS, GOVERNMENT, SOCIAL ADMINISTRATION OR SOCIAL ANTHROPOLOGY, and should be graduates in any of these subjects or in Modern History or Economic History. There are two grades: Grade II—salary £550 to £650 per annum; Grade III—salary £450-£500 per annum.—Applications should be sent not later than July 2, 1955, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF BELFAST

Applications are invited from graduates in economic history, economics or history for a Research Assistantship tenable for one year in the first instance by the Queen's University of Belfast in association with the Public Record Office of Northern Ireland. The research assistant's duties will begin on October 1, 1955, and will be concerned with the compiling of a register of business and other economic records to be found in Belfast and the surrounding area. The salary will be at least £300, higher rates depending on qualifications and experience—Applications, including the names of not more than three referees, should be made by June 20, 1955, to the Secretary.

EXTRUSIONS BY MARLEY

Buyers requiring rigid and flexible tubes and sections in thermoplastic materials should ask for a quotation from Marley Extrusions Limited, Dept. 99, Lenham, Maidstone, Kent. Harrietsham 381.

ADDITIONAL CONSULTANT required to complete small group acting in advisory capacity to directors of large organisation on Merseyside.

The field of operations ranges from medium-light engineering to very large-scale clerical procedures.

The work involves a review of organisation, administration, and methods, throughout the group, and the introduction of work study, planning, financial control and all the tools of modern management.

A good general education; a degree or other professional qualification in engineering, and at least two years' experience in work study, preferably in conjunction with industrial consultants, are desirable.

This post offers exceptional opportunities to a relatively young man of ambition and proved ability, and the initial salary will be in accordance with the experience of the successful applicant.—Box 970.

GOVERNMENT ACTUARY'S DEPARTMENT: PROFESSIONAL APPOINTMENTS. The Civil Service Commissioners invite applications for four pensionable posts; (a) one ACTUARY; (b) two ASSISTANT ACTUARIES; (c) one ACTUARIAL ASSISTANT.

For posts (a) and (b) candidates should preferably be under thirty-five, but well-qualified candidates above thirty-five may be admitted. For post (c) candidates must be under thirty on July 1, 1955. Extension for regular Forces service.

For posts (a) and (b) candidates must be Fellows of the Institute of Actuaries, or the Faculty of Actuaries in Scotland. For post (c) candidates must be honours graduates and have passed at least Part I of the Institute of Faculty examination.

Salary scales for forty-four-hour week (men): Post (a) £1,359-£1,575; post (b) £1,118-£1,328. Starting salary depends on qualifications and experience. For post (c) unqualified entrants receive starting salary according to age up to £522 at age twenty-five or over, on attaining Associateship of the Institute of Actuaries (or equivalent in the Faculty of Actuaries) they receive a special increase of £60. On attaining Fellowship salary is £850-£1,081. Women's salaries somewhat lower at present.

Particulars, including promotion prospects, and application forms from Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 4465/55. Completed applications must be returned by June 23, 1955.

THE BSc(ECON) DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretaryship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) provides postal tuition of a high order for three (in some cases two) examinations, at reasonable fees. More than 1,000 Wolsey Hall Students have passed London BSc(Econ) (Final) exams. since 1925.—Prospectus from C. D. Parker, MA, LLD, Director of Studies, Dept. P17 WOLSEY HALL, OXFORD.

CAN THE TORIES FIND ECONOMIC STABILITY? The leading article in the JUNE issue of THE BANKER poses the challenge of the rail crisis in its wider context. Another key question discussed in this issue is the extent to which sterling and the gold reserves are being bolstered by the inflow of foreign money. The careful analysis of the technicalities of the exchange market explodes some popular fallacies.

SHOULD THE BANKS participate more directly in industrial finance? The controversy set off last month in high banking quarters is among other topics discussed in the JUNE issue of THE BANKER. Further articles include: Can output Maintain its Rise?; Montagu Policy and Australia's Deficit; Sweden Takes the Plunge; and What Reserves Do Building Societies Need? Price 2s. 6d. (or 30s. a year) from bookstalls or 72 Coleman Street, E.C.2.

TECHNICAL REPRESENTATIVE, aged 34 years, seeks Sales Management appointment. Is Electrical Engineer with mining and mechanical engineering experience, have handled large contracts in bulk handling equipment for the mining, electricity, cement and other industries. Sound organiser.—Box 986.

LADY business executive (29), excellent record, success selling, buying, management, seeks suitable position.—Box 987.

EXPERT POSTAL TUITION

For Examinations—BSc(Econ) LLB and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

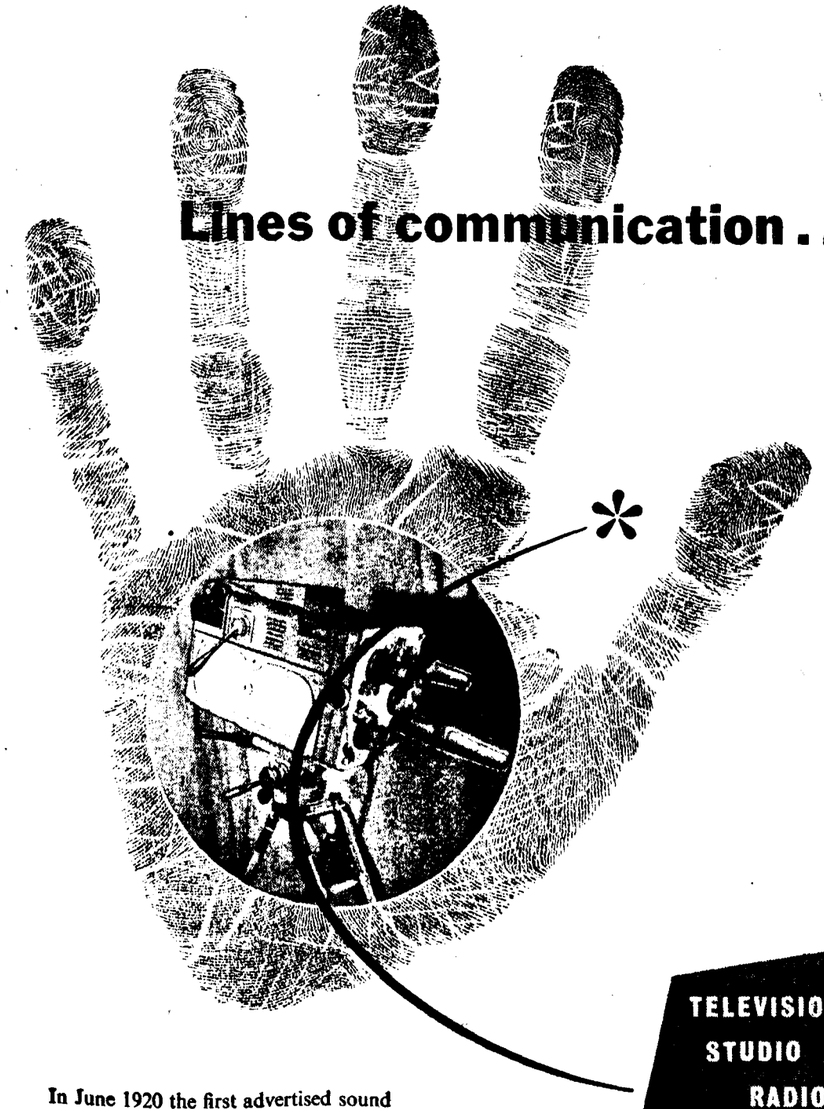
A clean soft dry towel for every pair of hands

How does the Towelmaster work?
A pull. Here's a length of laundry-fresh towel, enough and to spare for a really good dry. And as you pull, the used portion automatically winds into a separate compartment of the gleaming white Towelmaster cabinet. Nothing more efficient. Nothing more hygienic.

How much does the Towelmaster cost?
5/- per roll of towelling. Minimum usage only one roll per cabinet per week. Installation is free. Maintenance is free (two or more cabinets). No replacement charges. In fact there are no other charges whatsoever.

How much is the Towelmaster worth?
Those few shillings give 180 pairs of hands an honest-to-goodness dry. Benefit staff and visitors alike. Give you 45 yards of *goodwill*. And what an infinitesimal price to pay for a clean bill of health!



What are your particular needs? We'll be glad to discuss them—without obligation.

ADVANCE

Towelmaster

QUESTIONS THE MOTORIST IS ASKING

"Are these new Tubeless tyres a success?"

"Absolutely, sir! These tyres have more than stood up to the claim made by Dunlop when they introduced Tubeless to this country a couple of years back."

"Can you supply them?"

"Yes, sir. In the majority of sizes supplies are readily available."

"Will Dunlop Tubeless fit my wheels?"

"All wheels of 16" diameter and under, sir—except wire spoked wheels. They're quick and easy to fit and you don't need a set all at once—buy them one at a time if you wish. You can get them remoulded, too."

"What's all this about no punctures?"

"Pick up a nail in the tread, sir, and it's practically certain the tyre will stay up. Carry on, and call in here when convenient. It's repaired in a minute or two, without deflating or taking the tyre from the rim. Another great thing is that Tubeless need far less frequent 'topping up' with air."

"Will my new car be fitted with Tubeless?"

"Possibly—car manufacturers who fit Dunlop as standard equipment are fitting Tubeless on more and more of their new cars, but at the moment supplies are not sufficient to make a complete change-over. I think that by the end of the year most new cars will have them fitted, but at present it's just the luck of the draw."

New partner for the farmer

162640

Sir James Scott Watson

Editor introduces

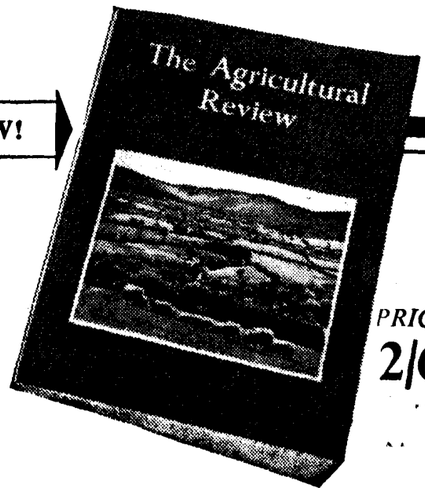
The Agricultural Review

Within a lifetime farmers must be prepared to feed and help clothe a world population double its present size, states Sir James Scott Watson, Editor of the Agricultural Review, in his first leading article.

To meet the challenge

Sir James, formerly Chief Scientific Adviser to the Ministry of Agriculture, introduces the new monthly farming journal as a partner to the farmer in meeting this challenge.
The Review, he says, will give farmers the information they need to keep abreast of achievements in the three all-important fields of scientific research, economic conditions and farm management. Sir James points out that the present dispersal of this knowledge in many reports and other publications—often couched in highly technical language—makes it difficult for the farmer to get at it.

Sharing Experience



"Those whom we hope to serve," the Editor writes, "are the farmers of Western Europe and those working in broadly similar environments... North America and Australia and New Zealand have much to teach Europe about economy of manpower, while the Netherlands or Denmark can provide many an object-lesson in the intensive use of land."

Sir James, who set out on his remarkable agricultural career from his father's farm in Scotland, welcomes his new editorial duties as "something of an adventure." He asks for the support of readers with contributions, criticisms and suggestions.

FIRST ISSUE DATED JUNE 1955

The editorship of Sir James Scott Watson and the outstanding qualifications of his advisory editorial team assure a steadily high standard of contents. There will be an important contribution each month by the Economist Intelligence Unit, as well as abstracts of research publications and book reviews.
In the first issue, authorities in their field will write on new findings in chemical weed control, current work in sugar beet improvement, baled silage, farming as a business, hybrid poultry and additives in silage making.
All progressive farmers and those concerned with farming progress will find this new journal rewarding reading.

Assembly work in progress at Marconi's Chelmsford factory. (Left) Mr. John Mabey, the Burroughs man called in by Marconi, with one of the Burroughs machines which have speeded up their accounting.

This man helped Marconi gear their accounting to rising production

HE IS ONE of Burroughs' world-wide team of mechanized accounting consultants. This is the story:

Marconi's Wireless Telegraph Company Limited export radio, electronic and heavy television equipment to the world. The demand for Marconi products increases every month.

At their Chelmsford factory, they needed to expand their accounting procedures in order to cope with the mass of extra work.

Marconi's decided to call in the Burroughs man, an experienced consultant on *all* accounting and record-keeping systems. Mr. John Mabey is the specialist sent by Burroughs.

A FULL ANALYSIS

Working closely with the Deputy Chief Accountant at Chelmsford, Mr. Mabey applied his experience to the problem. After a full analysis of the existing system they evolved a new plan, based on the speed and versatility of Burroughs Sensimatic Accounting Machines.

The plan was adopted. Now all Marconi's accounting is in line with their increased production. And Works Payroll is completed in *less than a day;* the same machines take Salaried Staff Payroll in their stride. Costing is now done on a single 15″ card which shows eight running totals—hours, labour, overheads, purchased materials, manufactured materials, processes, aggregate balance and net balance.

So well has the new system worked at Chelmsford that Marconi have followed the same plan at their newly-opened factory at Basildon.

Whatever your business, large or small —if you have an accounting problem, the Burroughs man can help you solve it. He will make a full analysis and suggest the most economical and *workable* solution. If he thinks no change is advisable he will frankly say so. But if he does recommend a change he will plan the new routine in detail, and see that you always get the full benefit from any Burroughs machine you install. Call in the Burroughs man—you're committed to nothing and his advice is free.

Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

For specialist advice on mechanized accounting methods call in the **Burroughs** *man*

Still working at top pressure, Mr. Holbrook?

So many of our industries must be able to rely on regular and plentiful supplies of steam or hot water. But even the most efficient boiler installation can be brought, by costly degrees, to a more costly halt by the scale which forms when incorrectly treated waters are used. Yet, this need not be so. For, increasingly over the past years, the treatment of boiler feed waters–under the guidance of the Technical Service Department of Albright & Wilson–has, by preventing scale formation and corrosion, led to much greater efficiency.

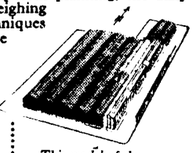
A GUARANTEE has been given by Beecham Buildings Ltd. to complete a new factory of 200,000 sq. ft. and considerable intricate ancillary work for an Industrial organisation in the Midlands — within a year. This is the sixth advertisement telling the story.



The goal is in sight!

Speed and efficiency, always inseparable from substantial progress, have brought this Beecham contract three parts of the way to successful completion. With 4½ spans erected, the job is racing ahead of schedule—thanks to scrupulous planning, the daily production of concrete components sometimes weighing 6 or 7 tons and the employment of advanced techniques that simplify fabrication. Future prospects of fine weather increase the possibility of finishing the project well within the guaranteed time.

Further advertisements will conclude the story of this contract—proving the worth of Beecham methods and a Beecham guarantee.

May we advise you on the construction of permanent and competitive Industrial Buildings.

This model of the complete factory will pin-point progress in the advertisements which follow. Progress to date includes 150,000 cubic yards of excavation; perimeter roads, North extension, foundations and floors complete and 4½ spans erected.

Better detergents —are they a pipedream?

Monsanto have always been confident of the answer. That's why they have consistently increased quality and output of ALKYL BENZENE!

Since the early days of detergent manufacture, we have played our part in the continuous search for improvement. For to make better detergents, you need enterprising ideas and better raw materials. Alkyl Benzene is the basis of most modern detergents; Monsanto are the sole producers in Britain. Monsanto Alkyl Benzene is high quality tetra propylene benzene. Quicker processing . . . a finished product that is whiter . . . a finished product with less tendency to stick . . . are thus assured to the detergent manufacturer.

And something more. For behind Monsanto's production is a considerable investment in plant and research. When more Alkyl Benzene is needed, Monsanto will produce it; when better detergents are made, Monsanto will provide the raw material.

If you are interested in the manufacture o detergents on a commercial scale, consult Monsant about Alkyl Benzene. Deliveries can be ma at short notice to all parts of the wor

Rules for Strikes?

THE settlement of the railway strike is an unexpectedly satisfactory one. The Transport Commission has managed to maintain the essential principle that differentials should depend on the type of job that a man is doing, and not merely on the union to which he happens to belong. The two railway unions have been brought into a single negotiation and their extravagant game of leap-frog seems to have been halted. And Mr Baty and his men must know in their hearts that the terms that they accepted on Tuesday are little different from the terms that they could have won without seventeen days of chaos and sacrifice. The moral that both strikers and the country should draw from this settlement is that senseless demonstrations of this kind must in future be held in check by every means that is possible.

Is there any way in which the law can be changed to help in that process? The most significant point about this question is that it is being asked, and the wryest point is that it is being asked as a result of a railway strike. Railway strikes hold a portentous place in British trade union history. It was after a railway strike in Taff Vale in 1900 that a court first ruled that strikers could be held responsible at civil law for the damage that they cause to the community; it was in revulsion from this judgment that the Act of 1906 was passed under which, although everybody else must still pay for any damage that stems from his actions, the striker alone is free. In both thought and law, Britain has been living in a post-Taff Vale atmosphere ever since. It is possible that the railway strike of 1955 will mark the furthest point of this conception of trade union rights and the public interest. Already, and not merely from the right, people are putting forward a variety of proposals to impose restraints upon strikers and to give some protection to the stricken.

Anybody who joins in these discussions should recognise one point from the outset. There is no prospect of any changes being put into effect if they are regarded by either their proponents or by their opponents as a crusade against the trade unions. Instead, those who want to bring a little order into the present anarchy of trade union law—and any government, Conservative or Labour, would dearly like to do so—will have to think out the problem in stages. The first stage is to recognise, and firmly to jettison, any proposals that would be regarded by all trade unionists as an attack upon their inalienable rights. The next is to formulate a set of rules for strikes—a set of distinctions between what is legitimate and what is not—which, after lengthy discussion and much education, would both enjoy positive support from non-union opinion and would also be accepted, with nothing worse than grumbling, by the trade unions themselves. The third stage is to examine how the rules could be enforced; not only on the trade union leaders (which is fairly easy), but on any of their members who chose to flout them (which raises all the very difficult problems of the unofficial strike).

This is a very tall order. The first stage, the stage of throwing out impossible or unacceptable proposals, is necessarily the easiest. One idea that needs to be consigned firmly to the scrapheap from the start is the proposal that strikes as a whole should be declared illegal, and that all trade unions should be constrained by law to accept impartial arbitration upon their disputes. This proposal is unfair, undesirable and impracticable. It is unfair because the threat of a strike is a trade union's last weapon for securing an increase in wages to which it feels that its members are entitled; and, in an imperfect world, arbitration in a country where strikes were theoretically debarred would always be less favourable to the workers than arbitration in a country where strikes are still legal. The proposal is undesirable because the pressure towards higher wages exerted by trade unions is a dynamic as well as an inflationary force in any economy: it helps to draw resources into the trades that are most profitable, and it forces employers into the most labour-saving, and therefore the most forward-looking, forms of production. Last, but not least, the proposal is impracticable because the trade unions simply would not wear it, and would always find ways to flout any such dictatorial decree; if 70,000 engine drivers decided that they all felt too ill to work on a certain day, no government could put all 70,000 of them into prison.

★

A second proposal that has been put forward is that a legal ban on strikes should apply only to certain industries; sometimes the idea is that the ban should apply only to nationalised industries, and sometimes to "essential" or "basic" industries. This proposal is open to all the objections of the previous one, and it would also introduce a very undesirable distinction between the sectors of the economy that some bureaucrat or politician considers to be "essential" and those that he does not put into that category. It would be an excellent thing if railwaymen and some other people in jobs where strikes hurt the public most would voluntarily renounce the weapon, as doctors and civil servants have done; but the best way to persuade them to do so will not be to thrust contentious and discriminatory legislation down their throats.

Once these proposals for outright bans on strikes or certain types of strikes are rejected, a whole family of similar proposals—for compulsory arbitration in one form or another—should be rejected too. And once the principle of avoiding unnecessary embitterment is accepted, then it should also be accepted that the Government should steer clear of any legislation about side issues—such as the closed shop—which would merely make the main advance more difficult. Instead, in the most trouble-free atmosphere that is possible, the Government should set to work to try to secure tacit acceptance from the unions and the public of the only two proposals that seem to have a dog's chance of enactment in the next decade.

These two possible enactments can be briefly summarised. The two things that the public can reasonably ask from any sensible system of industrial bargaining are: an assurance that strikes do not start until every other possible means of settlement has been exhausted, and an assurance that any strike that is called is desired by a majority of the strikers themselves. These requirements are easy to set down. They will not, however, be so easy to enact; and they could in fact be enacted in a clumsy manner that would do more harm than good to both the trade union movement and the country.

The Limits of the Possible

The first requirement implies, of course, that it should become illegal to call a strike until negotiations have plodded through all the "usual channels" of voluntary conciliation and arbitration. Only after these channels have been utilised, and only if the maximum offer that emerges at the end of them is unacceptable to a majority of the members of the union concerned, should it be legal to send out strike notices. The difficulties raised by this desirable reform are obvious. For one thing, not all industries have the same "usual channels"; a great deal of work would have to be done to bring the standard of these channels in the worst-organised industries up to those in the best. For another—and this is a very serious point—employers might take advantage of this system by refusing ever to offer reasonable wage increases until the end of each process of negotiation; they might be able to save six or twelve months' payment of the higher wages by doing so. The ideal way of discouraging these tactics would presumably be if the final courts of arbitration could adopt a system of not merely backdating any wage increases, but of adding some sort of penal interest charge to any claims that it considered had been unreasonably lengthily resisted; but nobody should assume that it would be easy to set up any case law of this kind, and it might even create new bones of discontent for half-satisfied unions to worry.

★

The second suggested requirement—that a strike should be legal only if it has been approved by the majority of strikers concerned—implies that every union should be required to organise a secret ballot among its members before resorting to direct action. One of the objections commonly raised to this proposal is that, even in the present state of the law, any strike call that is unanimously obeyed by union members must, *ipso facto*, be approved by them. But human nature is not so logical. Once war is declared, every patriot rallies to the flag; but there have been many wars in history that would not have been started if the matter had been subjected first to referendum by the aggressors' electorate.

Nevertheless, there are real difficulties in the way of a proposal for secret ballots in trade unions. The chief of them is that this is a proposal that would hurt union leaders rather than union members. In the last ten years, for better or for worse, successive governments have relied upon the good sense of union leaders to prevent dissatisfaction in their ranks from burgeoning into strike action—a Martha's task in all conscience. Now, it is suggested, they should be asked to accept a further obligation, a proposal that their conduct of business should be controlled by the rank and file in a way that no managing director—for example—would ever consent to be controlled by his shareholders. There are further difficulties about the form in which the ballot should be organised. Some secret ballots for union offices are frankly fiddled at the moment; the most undesirable characters are elected as general secretaries in a 20 or 30 per cent vote. Probably the ballot would have to be held under the auspices of the state, with a whole new machinery of election, returning officers and so forth; it might even be desirable to make voting compulsory. The only reasonable conclusion to draw about this proposal is that enactment of it certainly could not be hurried. It is a measure towards which the Government and the public should travel hopefully; nothing would be clumsier than to label it as a law for enactment this session.

The Problem of Enforcement

If agreement could ever be reached with the trade unions for carrying these two proposals, in some form or other, into law, would there be any prospect that the law could be enforced? And, if so, how? It is at this stage that one needs to sit back and consider the system that such laws would bring into effect. The system would be one in which three sorts of strike—and three sorts only—would be adjudged to contravene the law. The first sort would be those that had been called by a union before the due processes of negotiation and arbitration had been exhausted; these would presumably be cases—like the National Union of Railwaymen's threat of strike action last winter—when the union felt sure that arbitration would go against it, and thought that it had better deafen everybody with the sound of its big gun before further publicity showed the public just how bad its case was. The second sort would be strikes called by union leaders in deliberate defiance of the new rules about strike ballots; these would be strikes—like some of the guerrilla strikes called by the Communist Electrical Trades Union a year ago—that did not seem likely to be supported by a majority of the men concerned, but that the union leaders wanted for some reason of their own. The public presumably would not feel very dismayed if strikes of either of these first two sorts were adjudged to be contrary to the law; and neither would the majority of honest trade unionists.

The third sort of strike that would run foul of the law, however, would be the "lightning" or "unofficial" strike. The word "unofficial" when attached to a strike has somehow become a dirty word; and the Labour party, in particular, seems to be devising a new doctrine that "unofficial" strikes should be treated differently from "official" strikes even in the present state of the law. The doctrine is tied up with a mistaken glorification of the trade union official. It is, in fact, precisely in its treatment of these sorts of strikes that any new system would have to tread very carefully if it was not to offend against democracy. It would be a real derogation from freedom if all lightning strikes—against a particular foreman or local shop schedules—suddenly became punishable at law; and in any case it would be silly to suggest that the steamroller of court action could have been run over each of the 1,400 or so one or two-day strikes that occurred last year in the coal industry alone, or that all the 140,000 miners concerned should have been sent to prison.

★

But this example suggests a means by which any new rules about strike action might be enforced. The aim, surely, should not be to go back on the Act of 1875, by making the newly "illegal" type of strike subject to criminal liability; it should be to go back, in very small part, on the Act of 1906—the post-Taff Vale Act—by making those who incited workers into this newly illegal type of strike subject to civil suits for damages. In conditions of full employment and competition for labour it is certain that employers would not lightly start these suits; it is noteworthy that between the Taff Vale judgment and the Act of 1906 no English employers took advantage of the Taff Vale decision (although some Welsh employers did do so). But the weapon would be there, and it could be used against serious or repeated agitations—although only against those that broke the new and precisely defined rules. To be frank: partial amendment of the 1906 Act would be a weapon that would be likely to catch on the hop the Communists, the union leaders who seek to feather their own nests at the expense of other unions, and very few others.

This article has sought merely to throw out certain suggestions for discussion. If the suggestions have appeared to take the form of a concrete "plan" rather than of the usual woolly generalisations, there is no necessary harm in that. The harm will only be done if anybody assumes that the "plan" should be pushed through, as a sort of crusade for freedom, in the teeth of union opposition. The real need is not to start a crusade, but to search for the highest common denominator of agreement between potential strikers and the perpetually stricken. It would be interesting to know which group finds the compromises suggested here to be most acceptable, and which finds them to be most annoying.

Missing Atomic Tricks

PRESIDENT EISENHOWER'S offer of American assistance to other countries in developing their access to the peaceful uses of atomic energy is an act of generosity in direct descent from the Marshall Plan. The President proposes to ask Congress to offer to other free countries half the cost of setting up their own nuclear reactors for research purposes, together with supplies of the necessary fissile material, and the assistance of American technical experts in building full-scale power reactors. The reaction of the outer world to American schemes of aid has, through repetition, become steadily more passive. These acts of generosity are becoming familiar—and more remote. It has come to be taken for granted that America should act like that. And it has become unthinkable that anybody else should do likewise. The offer, said one London newspaper on this occasion, "could have come only from America."

This is dangerous complacency. If the offer could have come only from America, the clear inference is that, in the nuclear age, the United States will occupy a position of privilege and mastery to which no other nations can attain. Even if that were unavoidable it would still be regrettable—and would be regretted by none more than by thoughtful Americans. But it is not in the least unavoidable. Though others may not be able to challenge the sheer bulk and volume of American achievements in nuclear technology, there are others who should make up their minds that they will stand on a qualitative parity. The papers which the Russians have put in for the forthcoming international conference at Geneva on the peaceful uses of atomic energy—and which are reported to have astonished all those who have seen them—show that they are well aware of the race that is now beginning, and mean to run it hard. Britain should do no less.

In so far as the competition that is developing is one of scientific accomplishment, the main incentive is the desire to excel in the service of mankind. But it would be exceedingly naïve to suppose that this is all that is at stake. The benefits that will come to mankind through the exploitation for peaceful ends of the immense power of nuclear energy will come to fruition (as have the benefits of all Man's other advances in technology) through the processes of industry and trade, and those human beings can expect to benefit most who engage in that industry and trade most actively. There is no reason at all to doubt the altruistic inspiration of the President's initiative. But the more practical side of the matter can be seen reflected in the spate of speeches and statements by American industrialists, of which the echoes reach this side of the Atlantic almost daily. In short, a great new export industry is being born. And a country that makes its living by exporting the products of technology must either keep up with the others or be left out. If the American offer of assistance stands alone, the peoples of the earth will come to believe that the only country that can supply nuclear reactors, atomic fuel or technical know-how is the United States—or Soviet Russia.

If we can believe what we are told, this is not so. Britain is said to be ahead in some aspects of the peaceful application of atomic energy, and not far behind in others. But nobody will ever believe it unless we prepare to put our cards on the table and our goods in the shop window—with the same "Marked Down to Half Price" label on them as will soon appear in the competitor's shop. The layman has no means of knowing whether, before the President made his offer, the British Government had an opportunity of turning it into a joint offer—perhaps through the agency of the World Bank and its new International Finance Corporation. Equally it is difficult for the outsider to judge whether any chance remains of joint action—which would be infinitely preferable, if it could be attained. If these possibilities have not been actively explored, they should be, at once, before the President's proposal takes detailed shape before Congress. But if it is too late to prevent purely national action, then there should be a British initiative, and a British offer, to lay alongside the American. It is true that we cannot afford to rush into an undefined and unlimited commitment. But even less can we afford to be left at the post.

★

There has been much talk since the war, especially (but not exclusively) in Socialist circles, of the part that Britain could and should play in helping to develop backward countries. Here is a specific and imaginative means of turning this talk into action. Minds in this country naturally turn to the undeveloped areas of the Commonwealth, and perhaps particularly to the countries embraced within the Colombo Plan. This is obviously one of the primary fields in which British atomic knowledge and enterprise could be put to work. There is, of course, no suggestion that these parts of the world should be marked out as a British atomic preserve. If the Americans (and the Russians) have something to offer these countries in atomic assistance it will be eagerly accepted. The danger against which we must be on our guard is not the intrusion of the Americans so much as the exclusion of the British—unless we get off the mark with equal speed.

Africa and Asia, however, are not the only areas where Britain should enter the competition in atomic well-doing. There is also Europe. At their recent meeting in Messina, the Foreign Ministers of the countries participating in the European Coal and Steel Community passed a resolution looking towards plans for

further integration in a number of industries, and the first of these was peaceful atomic energy. The impression exists that the Messina resolution was an expression of good intentions rather than of firm resolve. So, in general, it may turn out to have been. But there are a number of reasons why atomic energy might prove to be the exception, in which prompt and fruitful action could be taken. On the positive side, there is a practical incentive for the "integration" of the efforts of the Western European nations (over and above the general economies of avoiding duplication of effort, which apply to many other developing industries). This arises from the position of Germany. Dr Adenauer has disavowed any intention of exploiting the military uses of nuclear energy or of making atomic weapons. But it is fantasy to suppose that Western Germany, with its record in scientific research and development and with its eager and resourceful industry, can be kept at arm's length from the whole new field of human knowledge that is opening up. Germany will have to play a part in developing the peaceful uses of atomic energy, and the only way by which that can be made possible without awakening all the ancestral fears and jealousies of Germany's neighbours is by an integrated scheme in which all can share the work, all can use the results—and all can know what each is up to. This is the special positive case for European integration of work on peaceful atomic energy. And there is also the negative absence of a familiar obstacle; there are in this instance no established interests, such as require such painful reconciliation and adjustment in existing industries.

To these two arguments for a West European atomic plan, it might be possible to add a third and decisive one. Britain ought to see a special interest of its own in bringing about such a community. Here again, it is not a question of excluding others, but rather of drawing, promptly and willingly, the logical consequences from a real community of interests that already exists, if only it could be recognised. Whatever may or may not be true of nuclear weapons (which are not here under discussion), Britain could hardly help but gain from active participation in a communal European programme. There could be a division of labour in experiment, a sharing of benefits in development, a diffusion of prosperity in building up a gigantic new industry. Just as atomic energy may present itself as a special case to the Europeans, whose present mood may otherwise be rather sceptical towards "Communities," should it not also present itself as an exception to the British Government? Instead of waiting until others have defined their plans, and then offering a somewhat ambiguous "association," would it not be the course of wisdom and imagination in this instance to take the initiative and offer active British assistance from the start in bringing such an Atomic Community into existence? The exact shape that it should take would be a matter for the experts. But as a starting point for discussion it might be suggested that whatever actions the Western European governments propose to take in the field of peaceful atomic energy (such as the financing of research establishments or the letting of development contracts to private firms), they should agree to do in common. The nature and degree of British participation and assistance—possibly falling short of full participation but going far beyond mere external "association"—should be defined in advance.

Whether it be in Europe or in the outer world, the tempo of atomic affairs is speeding up. The game is usually won or lost in the early trials, and unless the British Government looks upon Mr Eisenhower's proposal as a challenge to go and do likewise, we shall be missing tricks that we should be taking.

United Nations Birthday

TEN years ago the Charter of the United Nations was signed at San Francisco. This weekend, statesmen from all over the world are assembling there again to mark the end of the first decade of a great experiment. Of the original *dramatis personae* Mr Molotov will be the only star player billed in the same role at this revival; and to grasp the speed at which changes have taken place since 1945, one need only recall that the Charter was then brought away from San Francisco in triumph by the admired figure of Mr Alger Hiss.

During these ten years, as the fogs have rolled in over San Francisco's bay, the United Nations, too, has been repeatedly blanketed by confusion and chilly foreboding. Its complete extinction has been often forecast. Communists deride it as "an American rubber stamp"; free nations, seeing that they cannot yet obtain security through it, have set up other machinery alongside it. Yet in recent months the United Nations has seemed to move back nearer to the centre of the world stage. Not only has its San Francisco commemoration become by an accident of timing a staging post on the route to the "summit"; the international concern with the peaceful power of the atom, the loosening of the logjam over disarmament, and the confrontations at Bandoeng and Belgrade, where free Asians and Jugoslavs alike showed how much importance they attached to the Charter, have directed attention back to the United Nations. Quite apart from the calendar, there are good reasons why the organisation should now be judged anew on the basis of its first decade of life.

From the League of Nations, Uno inherited the Wilsonian idea that the member nations ought to observe certain standards of international decency; and,

as before, the result was an awkward and sometimes hypocritical blending of morality and politics. The United Nations also took over the concept, which had budded rather late in the League's life, of the importance of economic and social welfare activities on the international plane ; its chain of specialised agencies was from the start more ambitious than anything the League had attempted in this field. But the negotiators at San Francisco were most particularly concerned to give Uno what the League had so conspicuously lacked — "teeth." Unprecedented provision was made for international forces to be available to the Security Council for resisting any further aggression. However, the granting to the Council of authority to order these forces into action confirmed the great powers in their insistence on retaining the right of veto, despite the sharp criticism this drew from the smaller nations at San Francisco. The veto represented a compromise between the Metternichian idea, now beloved of Mr Molotov, that the world is best run by a small group of great powers, and the more democratic demands of the other, and especially the "younger," nations.

★

What has happened to these conceptions since fifty nations solemnly acknowledged them ten years ago ? From the beginning, it proved impossible for the great powers to provide united leadership. The chasm between free societies and Communist ones soon reduced the Security Council to a faintly ludicrous forum for recrimination. Under the glazed eyes of New York schoolchildren, its members exchange harangues and vetoes in several languages. The attempt to combine in the structure of the United Nations a parliament of peoples and an alliance of great powers forged by the temporary compulsions of war has failed. This failure was grotesquely dramatised by the Korean war, in which UN forces fought an aggressor whose arms had been furnished by a member of the Security Council.

The conception of an international club whose members should observe certain rules of decorum has also been discredited. It soon became clear that no amount of indignation in the halls of the United Nations would persuade Russia to free its slave labourers, or South Africa to revise its racial policies, or compel a dozen Latin American republics to govern themselves more democratically. And yet this idea of the "club" is still powerfully alive ; it is invoked by those who would keep Communist China out of Uno indefinitely because of the nature of its regime and because no one should be allowed to "shoot their way" into membership. It would be a more compelling doctrine if some members of the club kept their own houses in better order or were less ready shots.

The conception of the United Nations as an economic and technological centre has, however, withstood the test of ten years' experience. Some of the activities of the UN agencies are admittedly fatuous and wasteful ; occasionally, they even resemble the mad projects of the Laputan academy, and provide a luxurious ivory tower for otherwise unemployable intellectuals (this is particularly true of some of the more rarified branches of Unesco). Yet a great deal of quiet achievement has been recorded. Sometimes the result is a dramatic improvement in the health of an Asian or Central American state ; sometimes only a modest protocol on "customs formalities for the temporary importation of private road motor vehicles and tourism." Nevertheless, much miscellaneous good has been done under UN auspices, especially in underdeveloped areas.

Any attempt at drawing up a balance sheet, however imperfect, invites the question whether the United Nations is worth further investments in hope, money and energy. Have we reached the point—as certain cynics are suggesting—at which we should be preparing to sell the magnificent New York headquarters to some great detergent company ? Is the United Nations already on its way to an end as sterile as that of the League ? Surely the answer is no. The United Nations has already achieved something which the League never did : it has stopped wars. If there is peace today, however uneasy, in Kashmir and along the frontier between Israel and the Arab states, that is largely due to the United Nations and to the complex and ungrateful labours of its observers on the spot. But the United Nations has done something even more important : it has waged a police-action war in the name of its principles and in response to the kind of appeal for help which the League left unanswered when Mussolini struck Abyssinia. It is irrelevant to argue that President Rhee was not worth succouring or that the UN was able to act solely because the United States wanted it to and Russia was absent from the Security Council at the time. The facts are clear : the United Nations fought a war in Korea and stopped aggression. It carried out its defensive task and concluded an armistice. That armistice may not be ideal, but it is infinitely preferable to a continuation of war or to the subjugation of one land by another. Because the United States played so preponderant a role in the Korean war, one tends to forget its unique, international character. UN intervention may be effective only in the event of a small war which does not immediately involve the great powers ; but the very existence of an international organisation ready to stop or localise conflicts is of immense importance.

Those who hoped to find in the United Nations a substitute for diplomacy between sovereign powers may consider its first ten years a failure. Traditional diplomacy has recaptured its prerogatives, and if the mood in San Francisco next week will be one of cautious warmth, it is precisely because the diplomats have been at work. But Big Four conferences or negotiations on the Geneva model are not the only approach to international relations. In fact, their context is the rather limited one of the cold war. Of perhaps greater significance is the new prominence in world affairs of the

nations of Asia, of Latin America, and, ultimately, of Africa. If these peoples are not to brood over their heritage of frustration away from the centre of affairs, they must be enabled to play their due part in a forum such as the United Nations. This forum has its defects, but its failure would signify the permanent acceptance of a world of mutually hostile camps and non-communication.

In the autumn, the General Assembly will decide whether a special session is to be held in 1956 to revise the Charter. But Uno's failures arise not from the imperfections of its Charter, but from the bleak realities of postwar politics. To criticise the United Nations for not imposing its ideals is to criticise the nations of the earth for not yet having accepted the idea of world government. To believe that revisions of the Charter would lead to international harmony is to be either naïve or insincere. Neither the United States, nor Russia, nor, for that matter, Britain, is ready for really drastic revisions on essentials, such as the veto. A perfectly just and theoretically "effective" Uno would, as things stand, be a Uno from which the great powers had resigned.

The future of the United Nations lies in a clear recognition of what it can do and what it cannot do. It is the broadest medium so far conceived for the discussion of international problems and for the creation of world opinion. It is, potentially, a great force for the dissemination of technical knowledge and assistance ; and, rather than revise its Charter, it might be better occupied in re-organising its non-political agencies along more modest but efficient lines. Finally, it has shown that it is capable, in certain conditions, of keeping the peace along disturbed frontiers. Indeed, the most peaceloving of men may secretly hope for some small and remote war in which American and Russian troops might have a chance of serving side-by-side under a United Nations flag. But even now, there is every reason to wish the United Nations a happy tenth birthday.

Adam Smith in East Africa

WHEN Sir Philip Mitchell, then Governor of Kenya, asked for a Royal Commission into the "complex and recalcitrant" problems of East Africa three and a half years ago, racial tension and African grievances had not come to a head in the Mau Mau revolt. But before the commission could be appointed the pot had boiled over, and it was grimly clear that time in East Africa was far shorter than had been supposed. Between the commission's appointment, under the chairmanship of Sir Hugh Dow, and the publication of its report last week, there have been momentous changes in political developments in East Africa, in the temper and outlook of every race. More could hardly have happened to impress East Africa's problems on the public, or to convince it of the urgency of finding basic solutions and applying them, however drastic they may seem.

It is for such basic solutions that the Royal Commission has sought. And it begins with a bold denial of a favourite colonial catchphrase about the problems that have to be solved. Its own terms of reference took for granted that East Africa's real trouble was that a rapid increase in population was pressing on very limited resources of fertile land ; the commission on the contrary reports that the increase is not unmanageable, and has sought rather for the reasons why it is not being readily absorbed by an expanding economy. The basic problem in East Africa is not land needs, but land use. The principal obstacles which the commission found to land being economically allotted and cultivated were tribal organisation and the restrictions of land use based on it. The core of its recommendations, which are many and detailed, is that such restrictions should be finally swept away ; that individual profit, enterprise and ambition should set the pace of change ; that in an expanding economy based on market values there would be room—and, in fact, need—for all races in East Africa at any foreseeable rate of population growth ; and that if this were seen to be so, race hatreds nourished on insecurity would disappear.

Since the advent of the Europeans, East Africa has been in the process of conversion from a subsistence economy to an exchange economy based on money and the market ; the commission's belief is not that the process has gone so fast that it is producing strains, but that it is not going fast enough to prevent them. In average productivity per head (though an average hardly reflects the diversity of the region) East Africa lags far behind most of Africa. The reason why Africans pour into the congested towns for wages that will not support a family, and that are barely enough to support a single man above subsistence level in intolerable squalor, is simply that real income in the villages is still lower, the hardship and squalor still worse. Therefore "the key to a permanent raising of the supply price of African labour is to foster an increase in the incomes of the peasants, whether they produce for their own subsistence or for the market."

The commission has no doubt that this can be done, given the right economic policies ; that the high and rising living standards of a few pockets of African production—some of the Baganda cotton growers, Nyanza farmers and Chagga coffee producers and others—can be generalised ; but "it is this visible opportunity for a new way of life that static tribalism frustrates." It frames detailed proposals for speeding up, by surveys,

adjudication and registration, the process of converting tribal land into individual freehold tenures. Its object is not only that methods of husbandry and land use should be freed from customary practice, but that land should be negotiable and a security for loans and credit raised for capital improvement. It would sweep away barriers between reserves, and throw open the land of the Masai and the White Highlands alike to the operation of the market. It accepts no inconsistency between subsistence and cash crop production: make the latter profitable and the output of both will go up, together solving the only "recalcitrant" East African problem —the vicious circle of poverty, inability to save and lack of capital.

To speed the development of the market, the commission would have the East African governments invest development funds most heavily in communications by rail and road; and it criticises the emphasis on other forms of investment in the past. Better communications would develop the market; rising real incomes would in turn attract the immigrant with capital and make it possible to raise the external loans that are vital to East Africa, where known sources of mineral wealth are too small to attract massive foreign capital and where technical skills are so immature.

Putting economics before politics or anthropology offers a means, the commission believes, of cutting through racial complexes. Why should Africans resent large European farms, when it is open to any African to add acre to acre himself? Why should Europeans wish to reserve tracts to themselves when land is normally sold simply on price, and price is a matter of capital improvement? Why should Africans or Europeans fear Indians, if the economy is expanding so fast that Indians cannot do all the trade, and it is clear that what trade they do adds to everyone else's income? If towns are divided into self-governing areas reserved only for houses of various types and capital cost, why should any one feel segregated except by the length of his purse? If everyone with skill can be employed, why should Africans feel that the skills of Europeans or Indians do anything but promote the interests of Africans in turn? Everywhere, the commission believes, insecurity and fear could and should be banished by the growing opportunities created by an expanding economy and a free market.

★

It is an attractive hypothesis: Adam Smith applied to colonial conditions. Necessarily, in this modern age, Adam has to have his fig leaves; and the commission suggests some which would involve important departures from the main principle of a *laisser faire* economy. Apart from a considerable degree of central direction of land use and investment, it concedes that, in a region where incomes are so unequal, there is a problem in protecting the weak against the strong in the market: "a free market in land . . . might . . . fail to evoke a proper response from its more enterprising members who, because of the social and economic inhibitions in which they had hitherto lived, would lack the means to purchase . . . there is some danger that large areas of land would pass into the hands of a few people who happened to possess the means of purchase. . . ." The shadow of the Indian money-lender looms, and the commission would give Africans no power to sell land to non-Africans, and only to lease it under safeguards. This qualification, however necessary, raises a real difficulty. It would lower the value of land as security for improvement loans, even with the institution of land banks such as the commission recommends; and it also leaves a loophole for White Highlanders to argue that their tribe also should not sell, or even lease, land outside the tribe.

Again, although the commission would free crop prices from controls, and abolish forced savings through marketing boards, it concedes that sudden drops in prices discourage inexperienced Africans too much, and would have the government then support the market. Though the commission thinks that the rate for the job should rule the labour market, it recognises that Africans lack the educational advantages of the other races, and concedes that they need special help. It recognises, too, that individual tenure alone may not ensure improved land use; there must be instruction and planning, and there must be prohibition of subdivision of holdings below the economic minimum as well as a ceiling on size.

★

There is a second group of questions about the proposed transplantation of a free market economy in this tribal soil, which the commission may be inclined to overlook. Would the more rapid introduction of individual land tenures really act as a flywheel to the agricultural economy? Would it create a sufficient momentum to dissipate fears arising from insecurity? If progress was slow, might not the old fears persist alongside the new improvements? The Baganda are relatively rich, and have developed individual ownership, yet the commission agrees that they are obsessed by fears of land alienation and oppose industrialisation lest it bring in too many whites. Again, will better wages and better-planned towns, whatever the cost, necessarily create a contented urban, property-owning proletariat? The commission would not restrict entry to towns, but would moderate it by narrowing the gap between rural and urban incomes. But the towns, with improved communications, would pull immigrants from the poorer areas—even from outside British territory. Would they not create congestion faster than even the commission's proposals can relieve it, continuing to build up frustration, race hatred and crime? Finally, since the nub of the plan is to inject a new dynamism into the economy, a vital part is the attraction of overseas capital. But if an agricultural community can accumulate capital at no higher rate than 5 per cent a year (for all East Africa it may be less, especially if crop levies are abandoned), will enough external capital be forthcoming?

It is right that these questions should be raised; but it will be a tragedy if they are raised so high as to be intimidating. For the time has come for some fundamental thinking about colonial policy. And the broad conclusion that must be drawn by anybody with any sense of history is that none of these doubts is a reason for shelving the commission's proposals or evading its challenge. The report will be criticised for being theoretical and remote from everyday realities; already it is being suggested that the Africans "will not play." In fact, they are playing; they are increasingly thinking the thoughts of the trader and less the thoughts of the tribesman. There are cross-currents and complexities —which are reflected in the commission's detailed proposals—but it may be predicted that in proportion as the East African governments find it possible to implement the basic proposition of the report they will drain the static poverty that slows their pace everywhere; in proportion as they put the brakes on, in deference to the fears and suspicions which arise out of a decaying tribalism, black and white, they will reanimate them with fresh and malevolent power.

Every community, at every time, has to face the conflict between progress, which can only be secured through disturbing change, and security for its existing patterns of life. It is not a conflict that can ever be solved by the doctrinaire assertion of either principle against the other; the right balance between them differs from time to time and from place to place. What, in essence, the Royal Commission is asserting is that in East Africa (and the assertion could be made almost equally well of British colonial policy as a whole) the balance has been tilted much too far away from economic change and progress, and that it needs to be corrected. On this fundamental issue—whatever may be the final verdict on the details of the modalities the commission proposes—there cannot be any doubt that it is abundantly right.

Notes of the Week

The Rail Settlement

THE railway settlement was fortunately not the sort to make strikes popular among strikers. The Transport Commission has made only one concession. It has agreed to withdraw its scheme for the classification of trains into two grades with two rates of allowances, and instead to examine basic rates for drivers, "particularly for" (which, it hopes, means "only for") drivers and motormen with more than two years' service. A re-examination of the basic rates will no doubt result in some increase even for drivers engaged only on shunting, to whom the offer in May would have given nothing. But the commission will certainly try to persuade Lord Justice Morris, who is acting as referee on the question, that any increase should not cost it more than the 5s. 6d. and 2s. 6d. that it had offered to drivers of the proposed first and second class trains respectively. Drivers who have been on strike are unlikely to think that it was worth forgoing two weeks' pay. Still less will the firemen, even if those at the top rate get a little more; the commission does not think that they should, but it will leave this to Lord Justice Morris. What the cleaners will say does not bear thinking of; although they have been on strike with the rest, even the union agrees that they will get nothing.

The union, indeed, has given away a great deal. First, it has agreed to the arbitration that it had hitherto refused, although in the novel form of a single referee, to whom both sides will talk "separately and privately." What is more, it has agreed to the principle, so repugnant as a rule to trade unionists, that this arbitration shall be binding. It has withdrawn its demand that there should be a cash offer under duress. It has accepted an extension of the mileage payments as part of the settlement. Above all, it has agreed that there shall be no more "leapfrogging." If some of the grades represented by the National Union of Railwaymen get an increase as a result of an award to the footplate men, the ASLEF will not on that account put in another claim. A stand has been made, and has succeeded, on the spiral. The triumph for commonsense would be complete if Lord Justice Morris were to pitch his award in favour of the more skilled men, and in favour of some more scientific system of job evaluation on the railways.

Technique of Opposition

LABOUR has not found much scope for criticising the Queen's Speech. It is difficult to complain about a government's policy when the electors have only just made it clear that this is the policy that they want, at least in

preference to Labour's ideas. The only official Labour amendment on the Queen's Speech takes up well-worn themes about full employment, prices, peace in industry, the balance of payments and a "more equitable distribution of wealth." The motion was due to be debated on Thursday, but it is hard to see how Labour can do more during the debate than go on repeating arguments that the electors have just rejected. There has not yet been time for the "agonising reappraisal" of policy that Labour so badly needs.

But there has been time for a reappraisal of the technique of Opposition, and Labour has not yet taken advantage of it. For example, one post-election gambit of Labour spokesmen has been to run through the Tory election manifesto, pick out the items with which they agree, and then complain bitterly if any of these have been left out of the Queen's Speech. In pursuit of this policy, the Opposition has made much of the fact that there is no promise of a Bill to implement the Gowers Report on working conditions in factories and shops. The Government's retort is the obvious one that an election manifesto sets out a programme for a four or five-year Parliament, and that it is ridiculous to expect every item to be put into the Queen's Speech for the first year. If the Government has proposed sufficient legislation in the Queen's Speech to keep Parliament fully occupied for a year—and if the legislation is to be properly digested, it probably has—then Labour's complaints about omissions can only be made to carry weight by carrying an obvious addendum with them: by saying which of the Bills now proposed ought to be dropped. There are several Bills on the programme that would not be missed, but it may be best to take the most obvious and direct example. There may well be a case for giving the office and shop workers priority over the farm workers, if only because the improvement of their conditions will probably take longer to put into effect. Which Labour MP is prepared to suggest it?

Banner With a New Device

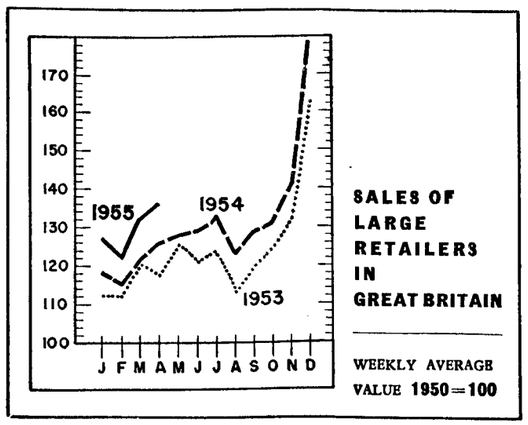
THE Prime Minister undoubtedly takes very seriously his reference in Parliament last week to the desirability of "the workers having, in some form, an increasing share, direct or indirect, in the industry in which they work. Call it profit-sharing, co-partnership, whatever you like." The election result in the ICI-dominated constituency of Cleveland, where the Labour majority was cut from 5,481 to 181 after the local Tory had claimed that nationalisation would rob the workers of the benefits of their profit-sharing scheme, was one that appeals to Sir Anthony's turn of mind. The Government hopes that the growth of industrial profit-sharing schemes in the next half-decade will be as great as the growth of industrial pensions schemes in the last one; then, by 1960, all constituencies may feel about nationalisation as Cleveland clearly does already.

To help the good work along, the Government is likely to collect and publish more information about the types of profit-sharing schemes that are already in being; and the Minister of Labour may be asked to pour honeyed words into the ears of every industrialist he meets, suggesting that his company should adopt one or other of them. In addition, Mr Butler will be helpful about profit-sharers' tax problems. One thing that may help the movement forward is that profit-sharing schemes often seem to be financed initially at the expense of ordinary shareholders, for whose fortunes both politicians and boards of directors are apt to show scant regard. In the long run, however, there is no real reason why a "profit-sharing" scheme should hurt the shareholder more than any other form of wage increase.

But there are two barriers in the way of real success for this movement. One is that the ratio of "shared profits" to total wages can never be very high; after all, before-tax ordinary dividends amounted last year to only about 5 per cent of personal incomes, and it is not proposed to sequestrate all of them. The other is that workers in profitable industries have always enjoyed higher earnings than workers in unprofitable ones; the "profit-sharing" movement is simply an attempt to give a new name, and greater formality, to a system that is in operation in all capitalist countries already. This is one reason why politicians should not get too excited about it. But there may be advantages in the new name; and even the grandiloquent term "co-partnership," as applied to some of these schemes, is no more a euphemism than is the term "public control" when applied to nationalised industries.

Mr Nehru Looks at Russia

MR NEHRU will leave a mark on the people of Russia, if not on their rulers. He has secured them the striking sight of Marshal Bulganin riding through surging crowds in an open car, slightly perturbed by the throwing of bouquets at short range; he has walked out through the gates of his embassy to talk to astonished Muscovites gathered in the street. On arriving, the Indian Prime Minister, speaking gently in Hindi and thereby foxing the Soviet interpreters, who had expected English, said that he had come "as a traveller" to get to know the Russian government and people. For the first few days it was the government of which he saw most; and in a speech on his third evening in Moscow, after carefully sharing the credit for international relaxation between his hosts and "others," Mr Nehru added rather tartly that sometimes those who spoke most of peace seemed least interested in it.



The Soviet leaders, however, are clearly determined neither to take offence nor to give any. Like Chou En-lai at Bandoeng, they are struggling to evade all controversial issues and to focus attention wholly on agreed matters. Mr Khrushchev declared last week that "no point" could separate Russia from India—a mild reaction indeed to the strictures on the Warsaw pact and the Cominform that Mr Nehru had delivered a few days earlier. A fifteenth-century Russian has been opportunely unveiled (in monumental stone) as "the first European to visit India," *pace* Alexander the Great. *Pravda* and Moscow radio have reminded Indians that they knew no poverty before the British came, that the building of their towns ceased at that point, and that the Soviet Union was the true champion of Indian independence. Its branding of Mahatma Gandhi as a British imperialist agent is now an "unfact"; so is, presumably, the description of Mr Nehru in the Soviet

Diplomatic Dictionary as having dragged India into the "Anglo-American bloc" and as "chief initiator" of Asian resistance to "the democratic and national-liberating movement in China." Only two jarring notes have been struck in public: *Pravda's* firm ruling that Russians must reject Mr Nehru's account of the Communists' role in the Indian struggle for independence, and the mutterings in the Indian press about the way Tass had handpicked individual journalists to accompany the Prime Minister on his tour.

Herr Ulbricht in the Wings

MOSCOW'S hospitality has not been restricted to Mr Nehru this week; a party of West German journalists has been receiving VIP treatment in the Soviet capital, obtaining lengthy discussion with officials of the foreign ministry and virtual freedom from censorship. The Russians have assured their guests that they will set no time limit on their invitation to Dr Adenauer. This apparent readiness to fall in with the Chancellor's own cautious response to the invitation may well be explained, however, by the Russians' confidence that opposition politicians in Bonn will continue to demand that he pack his bags for Moscow at once. The Social Democrats are, indeed, insisting that Dr Adenauer ought to meet Marshal Bulganin before the "summit" talks on July 18th. They and other West German critics seem blind to the obvious fact that to rush to Moscow means getting the worst possible terms. President Tito has just demonstrated how much can be obtained from the present Soviet government if only firm conditions are laid down in advance; that is the most relevant lesson to be learned from the Jugoslavs, who, incidentally, have now issued the flat judgment that "Germany as such cannot be neutral."

Moscow officials admitted to the German journalists last week that a demand that the Federal Republic should recognise the Ulbricht regime as an equal might come up during Russo-German talks. Herr Ulbricht himself openly takes it for granted that "normalisation" of Russo-German relations means full recognition for his government, and has even, with doubtful tact, offered Bonn his advice and the benefit of his experience in negotiating with Russians. Some measure of the confusion that has reigned in Eastern Germany in the past few days may be seen in the fact that while Herr Ulbricht was propounding "co-existence between East and West Germany" as the new formula for progress, Herr Nuschke, on the wrong foot once more, was declaring that such "co-existence" could never be. Neither of them, however, can have been altogether surprised when Dr Adenauer's new foreign minister, Herr von Brentano, said at his first press conference in that capacity that recognition of the Pankow regime could not be made a precondition for normal relations with Russia. At the beginning of June the East German leaders tacitly admitted how bitterly most Germans feel towards them when they omitted recognition of their regime from the list of ten demands on which they hope to base an all-German "people's movement" against the Federal government.

Scrabble for Europe

MR MACMILLAN gave warning, in the Commons debate on foreign affairs on Wednesday, against greeting the new Soviet moves with either emotional relief or cynicism. These two warnings, if unexciting, were well justified; but the Foreign Secretary might have added a third, a warning against losing touch with reality. At a time like this there is a natural tendency, and not least among journalists, to scrabble about impatiently for original-sounding formulae on which a new international settlement could be based, without pausing to reflect at any length on the practibility of what is proposed.

Thus, in the past week alone, the British public has been offered from thoroughly responsible sources the following strange concepts. A "neutral, truly free and independent Germany with limited but adequate forces" has been suggested as a goal, without any explanation how either the limitation or the neutrality could be imposed on a truly free and independent state. Elsewhere, the hope is expressed that if the West secures its objective of a "unified sovereign Germany, free to make its own alliances," the demilitarising of eastern Germany might then meet "Russian fears"; since this implies the disbanding of Herr Ulbricht's army along with his government, while leaving a rearmed and reunited Germany free to remain in Nato, it is hard to see the Russians eagerly greeting it as the answer to all their anxieties.

A third argument now put forward favours the granting of portfolios to East German rulers in a provisional all-German government, in order to save Communist "face"; the French and Italians, it is pointed out, have had Communist ministers in their governments and survived. The Czechs and other East Europeans, however, did not; and it is asking a good deal of the West Germans to expect them to sit round a cabinet table with men who for the better part of a decade have held down their fellow-countrymen with notorious brutality. All these suggestions bear the marks of over-haste, and at a time when extremely delicate negotiations are imminent it seems a pity that a little more thought should not take precedence over the natural urge to be first in the field with new ideas.

Labour's Finances

PEERING over the corpse of Labour's election hopes the morticians have found one diagnosis on which they can all agree—death was due to organisational atrophy. The party has less than half as many full-time agents as the Tories ; and it pays them so poorly that some are of pretty poor quality. But Mr Gaitskell had to point out this week that "a full-time agency service throughout the country would cost, even at present salary rates, between £300,000 and £350,000 a year." And this is twice the sum that comes into Transport House in the normal year between elections.

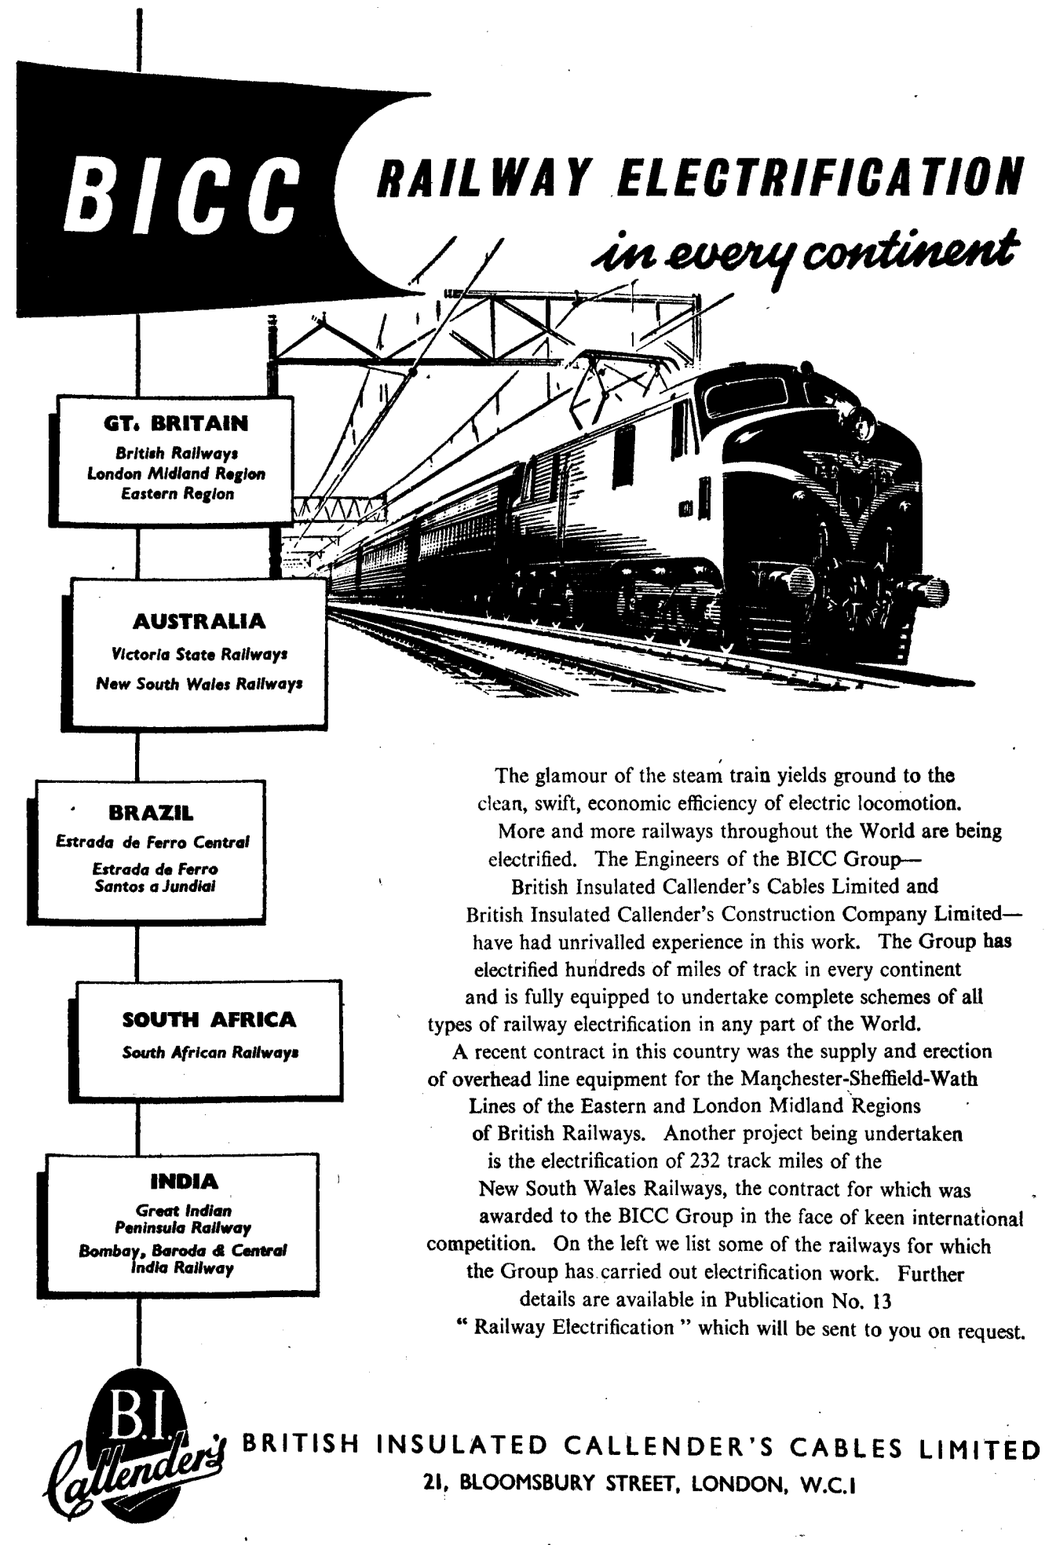
Mr Gaitskell's trouble is that he is the Treasurer of a loose federation ; and the component states—the unions, the constituencies and the Co-ops—like to keep the bulk of their money in their own coffers. The trade unions have in recent years paid the Labour party around £126,000 a year in affiliation fees ; as some of them raised their affiliated memberships last year, this figure will now rise a little, but the unions will still retain in their political funds anything up to £250,000 a year. The constituencies send £27,000 a year to Transport House, but this represents only 6d. out of the 6s. a year subscription paid by every individual party member ; allowing for a good deal of broken membership, the local parties probably keep back between £150,000 and £200,000 a year to spend chiefly at ward and constituency levels.

Mr Gaitskell's aim is to replace the present patchwork agency system with a national agents' service that will pay particular attention to marginal seats. He is going to confer about this plan with affiliated unions in September. He is likely to try to persuade the unions and the constituencies to raise their basic subscriptions if possible, and if not either to funnel more of their money to Transport House or else to disburse it in a less haphazard way. There is, of course, an element of empire-building in this. If Mr Gaitskell can recreate Labour's fighting machine, a lot of cogs in that machine are going to be deathlessly grateful to him. But there is a breath of humour in the present situation: when Mr Bevan opposed Mr Gaitskell for the Treasurership last year, his main talking point was that a Labour Treasurer need have little to do with money.

Strikers Who Won't Lie Down

WHILE the rail strike has ended sooner than might have been expected, the two strikes at the docks have unhappily dragged on longer than seemed likely last weekend. The Queen Mary was prevented from sailing by a strike of catering staff on Thursday, to the great delight of the youthful agitators on the dockside, who had previously seemed cowed by last week's failure to stop the Queen Elizabeth. As many members of the catering staff undoubtedly are working very long hours, this is one of the few cases where a court of inquiry might actually be helpful ; the more is the pity that it is also one of the many cases where the Minister of Labour's hands appear to be tied by the artificial distinction he has drawn between what he can do in an "unofficial," compared with an "official," strike.

The other strike is the one in which the National Amalgamated Stevedores and Dockers had previously been ready to recommend members to go back to work. But reactions from the northern ports have convinced the executive that it needs something to show the men for the three weeks' wages that they have forgone, someone to say that their claim for representation on local committees in the northern ports will be favourably considered. The TUC failed to give them that assurance at the beginning of this week ; and the employers merely reiterated their view that representation on the local committees is a matter for the unions to decide. As a last resort therefore the NASD have gone to the Ministry of Labour in the hope that it may put pressure on the employers to say something comforting. Presumably somebody will soon offer the union the face-saving gesture that is all it needs to satisfy its embarrassed local leaders, who are the only people who want the strike to go on. The London executive of the union was holding another meeting to consider the situation on Thursday.



Meanwhile, perishable cargoes are rotting in the holds, imports from other countries are being returned to them unloaded, and British ports are losing favour with foreign shipping. On the NASD's side, some discontented strikers are drifting back to work, and its leaders know that a prolonged fiasco might spell the disintegration of the little union which bandit tactics have so successfully built up.

Eight Shillings to Stay at School

THE decision to bring all children who are receiving full-time education into the family allowances system is a welcome gesture. But it is no sort of answer to the report on early leaving that was published last December, and Sir David Eccles knows it. In the first place, it does not meet the needs of the eldest child, for whom no family allowances are paid (although, admittedly, the eight shillings a week will now be drawn for the second child so long as the eldest is at school, and not, as now, only until he or she is sixteen). In the second place, although the "indiscriminate" nature of the relief is tempered by the fact that family allowances are subject to income tax and surtax, the concession will not be enough to meet the needs of poorer children. Such children, it is true, may draw maintenance allowances from the local authorities, but these are paid on a varying and usually inadequate scale.

Originally the Minister of Education thought of dealing with the financial causes of early leaving by a single and more radical measure: by recommending a more generous scale of maintenance allowances. But the Treasury found his proposals, on top of his demands for higher scholarship grants and allowances to teachers in training, too costly ; and the whole question was therefore shelved just before the election. But meanwhile the Conservatives felt that they had to promise something, and the proposal about family allowances at least showed willingness.

Higher maintenance allowances will still have to come (with, it is to be hoped, the biggest plums for poorer children who stay at school until they are seventeen or eighteen). But even that will not be enough to halt the exodus of bright

The glamour of the steam train yields ground to the clean, swift, economic efficiency of electric locomotion.

More and more railways throughout the World are being electrified. The Engineers of the BICC Group—British Insulated Callender's Cables Limited and British Insulated Callender's Construction Company Limited—have had unrivalled experience in this work. The Group has electrified hundreds of miles of track in every continent and is fully equipped to undertake complete schemes of all types of railway electrification in any part of the World.

A recent contract in this country was the supply and erection of overhead line equipment for the Manchester-Sheffield-Wath Lines of the Eastern and London Midland Regions of British Railways. Another project being undertaken is the electrification of 232 track miles of the New South Wales Railways, the contract for which was awarded to the BICC Group in the face of keen international competition. On the left we list some of the railways for which the Group has carried out electrification work. Further details are available in Publication No. 13 "Railway Electrification" which will be sent to you on request.

children from the grammar schools before they have finished the course. The Central Advisory Council found that an unfavourable home background was far more important than shortage of money as a cause of early leaving; and the most obvious remedial measures, such as keeping schools open in the evenings to provide somewhere quiet to work, have still to be taken.

Which Pattern for North Africa?

FRENCH North Africa today presents a contrast that French die-hards prefer not to admit. Tunisia is quiet; Algeria and Morocco are turbulent. Tunisia, with which France signed a home rule agreement last month, is the only one of the three territories in which a traveller can move everywhere in complete security.

In Algeria, almost the whole eastern province is prey to a nationalist uprising, each French farm there is a minor arsenal, a lengthening casualty list includes both Frenchmen and Moslem servants of France, and the settlers are pressing the governor-general, M. Soustelle, for official permission to execute reprisals. In Morocco, Frenchmen have gone further and taken the law into their own hands. There it is the towns that are ridden with fear and violence, and this week insecurity has reached a new peak with the murder by self-appointed French "counter-terrorists" of a leading apostle of moderation, M. Jacques Lemaigre-Dubreuil.

Two months ago, this dynamic man, who had big business interests in Africa, acquired a majority shareholding in Morocco's one liberal French newspaper, *Maroc-Presse*, and threw open its columns to discussion by both Frenchmen and Moslems of the way to heal the breach in Franco-Moroccan relations. He is not the first martyr in this cause, but far more sinister than the list of victims is the fact that no French gunman has yet been brought to book. Justice tarries either because informers dare not speak for fear of a bullet, or because members of the police, and even some higher French officials, connive at counter-terrorism, or because of influence exercised in Paris on the ground that the arrest of Frenchmen would upset the present French cabinet. Perhaps for all three reasons, hopeless indecision prevails among those in authority.

The present contrast with Tunisia is the sharper because the argument of the die-hards is that, if the Moslem inhabitants gain in power or authority, France's large stake in Morocco and Algeria is bound to become insecure. Yet last week the Tunisians, during their celebrations of M. Bourguiba's return from exile, exercised a control of extremism that astonished all observers. By maintaining this degree of orderliness, the Tunisian nationalist leaders have it in their hands to prove the French die-hards wrong; and, correspondingly, to strengthen the case of the many moderate Frenchmen who think as M. Lemaigre-Dubreuil thought. Matters for decision in Paris today are whether or not the epoch of armed containment of African nationalism is dead and gone, and whether or not French opinion is going indefinitely to condone in North Africa murders of a kind that it would not brook in France. The outward sign of an end to uncertainty will be the arrest of a French counter-terrorist.

Arrests in Singapore

MR MARSHALL, Singapore's Chief Minister, has returned to the tough line with those who are baiting him in the hope of bringing down the Labour Front government and probably the new constitution with it. He has branded the attempt to organise a general strike for what it is—"a direct form of political coercion endangering the immediate welfare and security of the people." He has accordingly ordered the arrest of six of the trouble-makers (who, under the re-enacted emergency regulations, can be held indefinitely without trial). The result has been more strikes, and the ever-present threat of violence. Nor are the six the entire junta of trouble-makers. But the others have been served notice that the government intends to govern; this may have some effect on Mr Chin Lim Siong, who was named for his part in the riots a month ago, and who proposed a one-day general strike in sympathy with the 1,300 clerks at odds with the Harbour Board.

These events ought to convince Mr Marshall's government that it is useless to try to appease those nourished on revolutionary textbooks. It would clearly have been better to have so planned matters that the instruction to school management committees to eject the disturbing elements among the students could have been enforced, and the students disciplined. The consequence of the climb-down, and the ludicrous spectacle of the schoolchildren winning a "strike," were shown ten days ago, when, at a meeting on the future of Chinese education, respected and moderate leaders of the Chinese community were howled down and resolutions were passed which, if the government accepted them, would put Chinese schools, with increased finances, finally in Communist hands. As it is, the Communists have unmasked their batteries; they have shown the Chinese community (not noted for its robust powers to go against threats) their strength, and their ability to organise a sort of student-mob rule for the colony.

Much will depend therefore on Mr Marshall's staying power. A born opposition leader, he expected to be now flaying authority in the interests of the underdog from the opposition benches. The interests of the underdog, the oppressed and the law-abiding now require him to protect them in the name of authority. As Mr Hopkinson told the House of Commons on Wednesday; "Upon the maintenance of law and order depend alike the economic stability of this great centre of trade and the success of the bold constitutional advance which it has just made."

No Popular Front in Finland

A RUSH of entries during the last few days has completed the field for the Finnish presidential election, which will be held early next year to choose a successor to the 84-year-old President Paasikivi. Six candidates have now been selected, one for each party. Particularly interesting was the failure of the Communist attempt to keep the number down to five by having a "popular front" candidate jointly supported by themselves and the Social Democrats. The Communists have appealed repeatedly for a "joint stand by the two labour parties" in order to "confuse the

calculations of the reactionaries," and have even offered, in effect, to let the Social Democrats name their man. As the two parties hold between them almost half the seats in parliament, a joint candidate's prospects would have been good. But it was tactless of the Communists, in view of the Finns' sensitivity about non-involvement, to emphasise "the importance of the presidential election to the country's foreign policy," and in the event their offers have met with the coldest of receptions: their newspaper, *Vapaa Sana*, says plaintively that the Social Democrats have "not even consulted" with them.

The candidate eventually chosen by the Social Democrats at their congress this month will scarcely please the Communists. He is Mr K. A. Fagerholm, the present Speaker of the Diet and the man who, in 1948, led the government which broke up the secret police formed by the Communists while they were in office. The election will probably be fought out between him and the Agrarian candidate, Dr Kekkonen, and the battle between the two parties will give a shaking to their already rickety coalition government. Their electoral strength being evenly matched, the issue will depend on which candidate can win more support from voters of the centre ; and although the Agrarians are a more middle-class party than the Social Democrats, there is evidence that Mr Fagerholm is personally more acceptable than Dr Kekkonen, who has a reputation for risky opportunism. Meanwhile, the Communists, their overtures having been ignored, have selected as their candidate Mr Kilpi, who is now almost the only fellow-traveller left in alliance with them. Since 1948, when their underground activities were discovered, they have been left out in the cold by the other parties. The failure of their latest move will certainly prolong their vigil.

New Union Boss

It is good news that Mr Jock Tiffin has been elected to succeed the late Mr Arthur Deakin as General Secretary of the Transport and General Workers' Union—although there was never much doubt that he would be. He has been acting General Secretary since Mr Deakin died on May Day, and was Assistant General Secretary for seven years before that. He was therefore clearly the favourite in the ballot of union members that has been going on for the last ten weeks.

Mr Tiffin's appointment will be a disappointment to the Communists. They had placed their hopes on Mr Charles Brandon, who in the event polled 146,000 votes to Mr Tiffin's 267,000. Mr Brandon is not a Communist nor anything like one ; but he had the advantage, from the party's point of view, that he is opposed to the rule that was introduced on Mr Deakin's initiative in 1950 forbidding any Communist to hold union office. To rescind that rule is an essential preliminary to the Communist plan to get control of the largest union in the country. Mr Tiffin, on the other hand, is as hostile to the Communists as his former boss—although possibly less inclined to take a bludgeon to them. His activities since he became acting General Secretary, and in particular some very sensible letters he has written to the press, augur well for his term of office. An army officer in the first world war, who became a bus driver after it, Mr Tiffin now succeeds Ernest Bevin and Arthur Deakin in one of the most important and difficult jobs in Britain. One of his first tasks should be to improve the union's public relations, both within its ranks and with the outside world.

Crime and Punishment

London's police force is still some 4,000 men below establishment, but there was less crime last year than in 1938. The number of indictable offences in the Metropolitan Police District, according to the Commissioner's annual report (Cmd 9471), was 93,937, compared with an annual average of about 127,000 in the immediate postwar years and with 95,280 in 1938. Compared with 1953, offences against the person, "breakings" and larcenies—the three main groups of crime—all showed a decline. Compared with 1938, offences against the person increased by nearly 66 per cent, and "breakings" also were higher ; but larcenies, which account for about 80 per cent of all indictable offences, fell by over 5 per cent compared with both 1945 and 1938.

The Police Commissioner refers to the fact that the amount of crime "cleared up" last year was, with the exception of one war year, greater than had ever before been recorded. But the proportion was nevertheless only 32.7 per cent, which compares with about 47 per cent for the whole of England and Wales. It says much for the efforts to improve the efficiency of an undermanned police force that the proportion of offences cleared up today is higher than before the war, when it fluctuated between 22 and 28 per cent ; and it would doubtless be higher still were it not for the diversion of the force's energy to controlling London's traffic. But what would be the state of the prisons if the police could catch even half of all London's burglars, instead of only a quarter of them ? (The proportion of "breakings" cleared up last year was 24.3 per cent.) In this connection, it is worth noting the Howard League's suggestion of a departmental inquiry into alternatives to imprisonment for certain offenders. If civil prisoners and certain groups of first offenders, who receive short sentences, were otherwise dealt with, the prisons could cope more effectively with those for whom a long term of imprisonment is the only course.

CGT Disunion

The Communist-dominated group of French trade unions have offered this week the unusual spectacle of open controversy. The congress of the *Confederation Générale du Travail* had already been preceded by lengthy polemics in the union press, in which the old quarrel between revolutionaries and reformers was revived once again. The argument centred at first on the Thorez thesis of the "absolute pauperisation" of the French working class. Some of the non-Communist leaders in the CGT quarrelled with the assertion that the conditions of the French worker were not improving and could never be improved within the present regime. Since France is not on the eve of a revolution, the dispute was really one about tactics for the present period.

At this week's conference it quickly shifted to the problem of a programme. M. Le Brun, backed by some other non-Communists, deplored the fact that the CGT is now abandoning a constructive economic programme dealing with production, nationalisation and investment. The secretary-general, M. Frachon, replied that this tended to foster the "dangerous myth" that progress could be achieved within the capitalist society and, amid general applause, advocated the substitution of a "plan of action," a negative programme of working-class demands.

The heart of the dispute really was whether the workers have a stake in the quicker development of the French economy as long as it remains capitalist. This dispute has been simmering for some time, and the Mendès-France interlude has brought it to the boil by raising hopes even in certain quarters within the CGT. M. Frachon has obviously won this week's battle, and the Communists have no intention of playing into the hands of M. Mendès-France. Indeed, although a wide variety of "Left" labels has now become fashionable, the real choice for French trade unionists may soon prove to be simply between "progressive capitalism" (as advocated by M. Mendès-France) and a *front populaire* including the Communists.

Neutralising Strategic Controls

Not much notice has been taken in the West of the small and superficially guileless clause (article 29) which the Russians inserted in the Austrian treaty pledging the Austrian government to "non-discrimination" in its economic relations with United Nations countries. Equally little attention was paid to a similarly worded declaration, which was tucked away in the Belgrade communiqué issued after Marshal Tito's talks with his Russian guests. Yet it is obvious that these provisions did not simply slip in by accident. The explanation is evidently that the Russians, in pushing their new policy of neutralisation, plan also to neutralise the West's controls on the export of strategic materials to the Communist bloc.

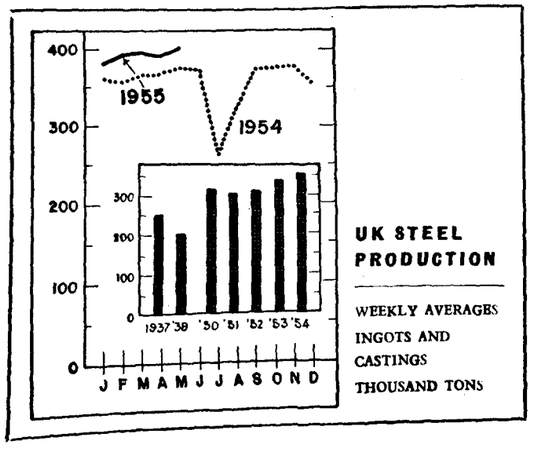
The Communists have always denied that the controls hurt them, but, whether because of injured pride or because of need, they have never spared any efforts to break the embargo. Now a new and more subtle manœuvre is being tried. The Austrians, who never belonged to Cocom (the committee in Paris that co-ordinates the controls), have never formally banned strategic exports to the Communist bloc ; but up to now the Western occupation authorities were always on the spot to keep an eye on things. Moreover, it was a simple matter to prevent the transhipment via Austria of goods on the prohibited lists by controlling the inward flow of exports from third countries. Now, however, the Austrians are committed to non-discrimination in their trade with their Communist neighbours, and to cut off exports to Austria of goods labelled strategic because they might be transhipped to the Soviet bloc would certainly be regarded an an unfriendly act on the part of the West and a godsend to Moscow's propagandists. And the Russians will doubtless also put the Austrian government on the spot by demanding repayment for the properties they are now giving up in the form of strategic goods.

Jugoslavia, like Austria, is not a Cocom country ; but until recently there was no question of its exporting strategic goods to the Cominform states, as they themselves had imposed a total embargo on all trade with it. Another possible loophole has thus now been opened. Should the Jugoslavs permit any heavy traffic of strategic supplies to the Soviet bloc (there is no indication that they will) the Americans might find themselves forced to apply the Battle Act, under which all forms of United States aid have to be terminated if a country knowingly supplies banned strategic materials to Iron Curtain nations. This would be a grave and difficult decision.

Ebbing Tide of Treasures

A pointed message to the new Parliament was delivered by Professor Lionel Robbins—who, besides being one of Britain's leading economists, is chairman of the trustees of the National Gallery—in a recent speech to supporters of the National Art Collections Fund. Professor Robbins expressed concern about the rate at which this country is being denuded of its works of art since their export ceased to be restricted by the Board of Trade. The old system worked unfairly, and was replaced in 1953 by a new arrangement whereby the export of a work of art could be forbidden only if one of the national or municipal collections was prepared to buy it at a fair price. But the resources of these collections are nothing like sufficient to buy all the works that should be saved for this country as they come on to the market. Moreover they become less and less adequate as prices in the international art market are forced upwards by growing demand for works of art abroad (especially in the United States), by steadily increasing purchasing power to make that demand effective, by the tendency to buy old masters as a hedge against inflation, and by the ordinary processes of inflation itself.

But there is no need, Professor Robbins pointed out, to wring one's hands helplessly as the tide flows out. The gross market value of all the important works of art, created more than one hundred years ago, which remain in private hands in this country is—he estimated—only about £15 million. But he did not for a moment suggest that the state should go out and buy them. All that he asked was that the annual grants to art galleries should be enough to enable them to buy all the minor works of art that come on to the market—the major ones being bought, as now, with special grants. This, he estimated, could be achieved for an extra expenditure of only £250,000 a year. It is an expenditure that would be well worth while.



More Trouble for the ILO

Once again the annual conference of the International Labour Organisation has been disturbed by dissension over the status of employer delegates from the Soviet bloc. The non-Communist employer delegates voted down all

nominations of the latter to the various technical committees on the grounds that they are merely additional mouthpieces of their governments. The compromise adopted at the ILO's European regional conference earlier this year—that Communist employer delegates should sit on the committees as deputy members without the right to vote—was then adopted again by the full conference against the opposition of the employers. Almost all the latter, however, eventually made up their minds to make the best of a bad job for the time being ; only the American and Greek employer delegates decided to boycott the committees.

It is a great pity that the ILO should once more become a cold war battlefield—and, what is more, on the initiative of representatives of the free world. It is not as if the employers' previous stand on this issue had gone unheeded ; a committee has been appointed to investigate the whole problem of the freedom of employers' and workers' organisations from government control, and it is hard to understand why the employers could not contain themselves until this committee had reported. It was apparently because the matter is thus in a sense *sub judice* that the trade union delegates, who have every reason to take exception to the credentials of the Communist workers' delegates, have accepted their presence on the committees as full members. The employers, on the other hand, have alienated sympathy from what is recognised to be in itself a reasonable case, by creating the impression that they are determined to force the Communists out of the ILO even if this means wrecking the organisation. The Communists, for their part, show every intention of hanging on. They cannot be expected to acquiesce indefinitely in an arrangement whereby the employers' delegates are separated into sheep and goats with themselves always among the goats ; on the other hand, if they returned to the ILO with the intention, as many suspect, of causing trouble, they are doing very nicely—thanks largely to their opponents.

It looks as if the ILO will soon have to sacrifice either its universality or its much-prized tripartite organisation of workers, employers, governments. The problem posed by the Soviet bloc delegates is in reality a much wider one, as the committee of inquiry's report will no doubt show. It would perhaps be both wise and prudent to preserve the ILO's universality even at the cost of changing and enlarging its organisation. In that way all could play their part, but none could sail under false colours.

Siren Songs for Refugees

URGENT appeals to refugees to return home have accompanied the present Soviet campaign for "relaxation." The drive is not entirely new. The westward flow of refugees has always been a difficulty for Soviet and satellite propaganda and efforts have been made from time to time to coax some exiles back to their fatherland, but only last spring did this campaign assume serious proportions. The Russians then set up a special committee in East Berlin whose main purpose seems to be to reassure the refugees that they will not be sent to a concentration camp on their return. The Hungarians followed suit after proclaiming an amnesty, and now it is the turn of the Czechs. The recent Czech amnesty was accompanied by a direct appeal not only to those who escaped but also to "sportsmen and trade representatives . . . who have remained abroad."

The intensification of this wooing campaign has created quite a stir in refugee circles. Some counter-propaganda, however, seems too much concerned with finding loopholes in the various amnesty decrees. Does it really matter whether the documents have been loosely worded so as to enable the Czech or Hungarian governments to arrest any returning refugee they choose ? Communist governments have never been greatly bothered by legal niceties, and whether the "prodigals" are arrested or not on their return will depend on general policy, not on the wording of any document that is now being brandished.

It is still too early to judge what success these new appeals may find amid the mass of East European refugees. They may well find an echo among a few, discontented with the often depressing conditions in some camp in Germany or Austria. Yet the relaxation of the police grip in Eastern Europe will have to be vastly more complete and visible for the bulk of the exiles to be induced to go back to the homelands from which they had to escape. For the time being the satellite siren songs are not likely to have much effect ; and the flow of refugees from Eastern Germany, whence it is relatively easy to escape, has recently again increased.

Bleak Outlook on Hungary's Farms

THE Hungarian Communist party has announced that it intends to do all it can to develop sound and cordial relations between Hungary and Jugoslavia. If this should ever lead to an exchange of "socialist experience" and if the Hungarian and Jugoslav leaders should ever put their heads together over agricultural problems, they will find plenty to talk about ; for whereas the Jugoslavs have long realised that relentless collectivisation is a mistake, the Hungarian Communists have apparently come to the conclusion that it is the answer to all their agricultural troubles. Last week their central committee passed a resolution which showed that the recent cautious retreat to the left in the countryside is developing into something like a stampede.

According to their own admissions, they face falling agricultural production, the need to import "considerable quantities" of grain, the non-fulfilment of even the reduced

compulsory deliveries, and "rampant indiscipline" in the local councils and on some of the farms. For this unhappy state of affairs the blame is placed fairly and squarely on the right-wing deviations of the unfortunate Comrade Nagy. A more correct diagnosis would probably show that these alleged right-wing deviations had not been pressed with sufficient vigour. The peasants were conciliated, but their suspicions of the regime's long-term aims were not removed; thus they continued to dissociate their interests from those of the party bosses and merely felt, apparently, that they could flout them with more impunity.

Ever since the fall of Mr Nagy last March, Mr Rakosi and his supporters have been trying to ginger up the party organisations in the villages and have been stressing the impossibility of any further delay in the "socialist transformation" of the countryside. But it was not until last week that they set themselves a definite goal ; by 1960, the "socialist sector" of agriculture, which now covers about one-third of the arable land, is to cover over half. Moreover, special emphasis is to be placed on the most advanced type of collective, and discontented collective farmers can no longer, as in Mr Nagy's day, walk out when they wish. It is true that the collectivisation goal is still fairly modest and that there is still to be no open compulsion. But the outlook for the private farmer is bleak. He is still being courted by the regime with fair words and promises of material aid ; but it is made abundantly clear that the reason for this is simply that he and his fellows farm 70 per cent of Hungary's arable land and the regime must have more food. If the drive for more collectives is successful, the private farmer will become an ever less important member of the community ; he will find that his treatment by the regime will deteriorate to the same degree.

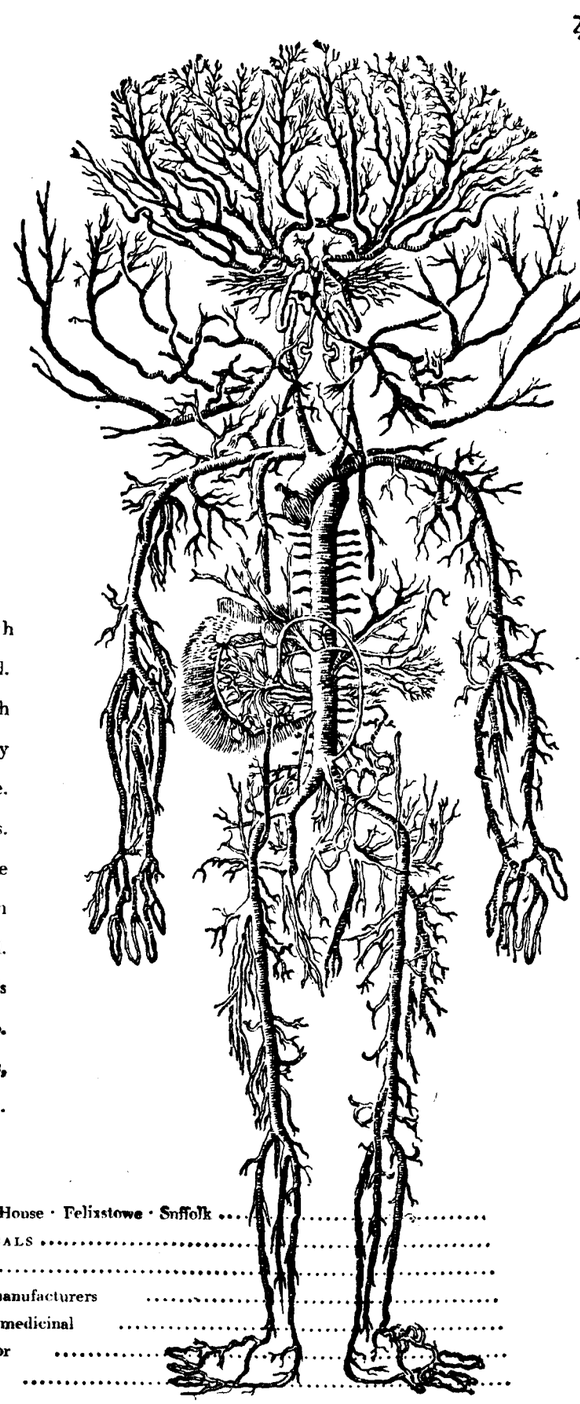
Bradshaw's New Dress

THE railway strike has postponed, among other things, a railway event. The new edition of "Bradshaw's Railway Guide," containing the timetables of the summer services that should have started on Monday, appears in a new format ; but copies have been marooned in Manchester. The change has been a long time in preparation. One by one the timetables of the different regions of British Railways (which are, in effect, sections of "Bradshaw") have been appearing in a new page-size (with nearly twice the type area of the old) and handsome sans-serif type. This time the change is complete and "Bradshaw" itself makes the transition.

The disappearance of the traditional square volume will bring much regret to railway enthusiasts and timetable fans, who are as sentimental as they are numerous. But in truth it was long overdue. The old type was so small, so badly worn and (at times) so erratically printed that to look up a train had become an ordeal to all but the youngest of eyes and the most resolute of column-chasers. When the fog of emotion has dispersed, British Railways and Messrs Blacklock, the proprietors of "Bradshaw," will be congratulated on a great improvement.

Now that they have dealt with the typography, perhaps they would turn their attention to the actual arrangement of the timetables, which is not at all sensible. Most of them seem to have been drawn up on the assumption that as much information should be crowded into a single table as possible, and that the ideal timetable would be one which showed, within a single frame, every train running on British Railways. Thus the table headed "London to the South Coast" shows on one page trains going to places as far apart as Hastings and the Isle of Wight, and by a number of different routes out of London ; it takes 72 pages to accommodate the whole monstrous table. But no passenger is interested in all this information at once ; to divide it up would make it much easier of reference, and if that involved a certain amount of repetition, what harm would be done ? On the other hand, a traveller who wants to trace out as simple a journey as from Waterloo to Andover (66 miles down the main line) has to piece it together from three separate tables before he can be sure that he does not have to change. The whole series of tables should be looked at afresh from the passenger's point of view.

There is another defect in the new "Bradshaw." Though it is now a large volume, ten shillings is an indefensible price for the only official source of essential public information.



War Aims

The final and formal closing of the Vienna Conferences and the rapid progress of our arms before Sebastopol and in the Sea of Azoff have wonderfully cleared our ideas and made plain the path of our policy before us. The character of the war enlarges in scope and dignity as its unavoidableness becomes more obvious, as it becomes clear that it must be ended by the sword and not the pen, and as its real, grand and sanctifying OBJECTS shake themselves free from the misty subtleties and wretched trivialities in which diplomacy has so long shrouded their actual majesty and worth. We are beginning to take in the conception that we are engaged in a contest which admits of no compromise ; in which anything short of signal triumph would be virtual defeat ; whose aim—if it have any worthy aim, whose justification—if it have any adequate justification, is the deliverance of Europe from a great peril, and the complete emancipation, once and for ever, of the cause of freedom, civilisation, and progress from their most irreconcilable and mightiest foe. . . . There are those who, looking back to the precedents of history, do not scruple to predict that as soon as the capture of Sebastopol has redeemed our prestige and restored our good humour, we shall accept proposals for peace, treat on the bases of the terms demanded at Vienna, play the generous, forget the just, raise a memorial column at Inkerman, sell the railway and the submarine telegraph to our vanquished foe at half price, and come home, as of yore, with an idiotic smile of self-complacency upon our scarred but radiant visage,—and full of a peace that passeth understanding! It may be so. The treachery of Bolingbroke in 1713, and the weakness and selfishness (if nothing worse) of Bute in 1763, and the folly and incompetence of Castlereagh in 1815, are suspicious cases in point. But the people are both more awake, more enlightened, and more powerful than in those days ; and it might prove dangerous to be guided by such precedents, as it would assuredly prove futile to appeal to them in justification of similar enormities. There might be difficulty in arranging what should be done with the Crimea:—as to what should *not* be done with it, there could be no difficulty whatever.

man and tree

If nature is kind, a man may live in health to a hundred years, a tree to a *thousand*. Man's knowledge of the chemistry of health is increasing. Through science man is gradually making nature kinder and more predictable. Fisons are in the business of chemicals. Their main manufacture over the last hundred years has been chemical fertilizers to enrich the soil. But they make chemicals for medicine and industry, too. Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED · Harvest House · Felixstowe · Suffolk
FERTILIZERS · HEAVY CHEMICALS
Fisons are also among the largest manufacturers in Great Britain of pharmaceuticals, medicinal food preparations and fine chemicals for Industry. Many of Fisons products in these fields are household names

it's all in FISONS field

Letters to the Editor

Why the Conservatives Won

SIR—I am afraid the *Manchester Guardian* was just plain wrong about Gorton: the wards we lost were Openshaw (the biggest, and well-nigh 100 per cent Labour); Levenshulme (which went into the neighbouring division of Willington (small), about 60 per cent Conservative to 40 per cent Labour). That left the pretty solidly Labour Gorton North and Gorton South (mostly Labour but with a Conservative enclave). The two new wards added unto us were Denton (12 Labour, six Conservative councillors; over-all vote about 55 per cent Labour, 45 per cent Conservative) and Audenshaw (12 Conservative, three Labour councillors; over-all vote about 70 per cent Conservative, 30 per cent Labour).

My Conservative opponent's calculation, based on the 1951 voting figures for these four wards, was that the Labour majority in the "redistributed" constituency was 1,000, and that a swing-over of 600 votes would give him the seat. Our own estimate, also based on 1951, was a 2,000 majority for Labour. In point of fact, the voting in Gorton was just under 77 per cent as compared with 82 per cent in 1951 and 72 per cent in the Manchester region taken as a whole.

My Conservative opponent, incidentally, while differing from my view that Labour abstentions (Gorton North and South still had the "safe seat" complacency) accounted for the smallness of the Labour majority (he claimed we had polled our full strength), agreed with me that the personality of the candidate had little or nothing to do with the result. After all, I was selected only on May 1st, endorsed on May 4th, arrived in Manchester May 5th and got on the job May 6th. In 20 days only a fraction of the 54,000 electors living in 30,000 houses ever saw or heard me!—Yours faithfully,

K. ZILLIACUS

House of Commons

★

SIR—It hardly requires detailed local knowledge of Coventry North to see that a reduction of 2,000 in an electorate is a rather inadequate explanation of the 6,000 fall in Mr Edelman's majority. I do not possess an electronic brain, but hope that Mr Edelman will not find any mistakes in my figures.

In 1951 Mr Edelman received 59.6 per cent of the votes cast; in 1955 he received 53.5 per cent. Swing, 6.1 per cent. But the electorate had fallen by 2,112 between the two elections. Mr Edelman argues that most of these were his supporters, and should not be counted in assessing the swing. Let us therefore try to eliminate them from the 1951 result. We cannot, of course, assume that all of them would have voted. There was an 86.4 per cent poll in Coventry North that year; we can only take the same percentage for those 2,112. It is likely to be an overestimate; a hostel suggests a transient population; many of whom would depart between registration day and polling day. But speculation about local conditions had better be avoided; perhaps Coventry North Labour party was exceptional and had the postal vote well organised.

Assuming that 86.4 per cent—i.e., 1,825—voted, how did they vote? Without possessing local knowledge, one may still assert that there was in 1951 hardly a constituency in the country, outside the mining areas and the East End of London, where Labour polled over 70 per cent of the vote. If, therefore, we allocate these 1,825 in the proportions of 75 per cent to Mr Edelman and 25 per cent to his Conservative opponent, we are unlikely to be underestimating Mr Edelman's support among them. So we deduct 1,369 from Mr Edelman's 1951 figures and 456 from his opponent's. That would have left him with 59.0 per cent of the votes in 1951, instead of the 59.6 that he actually got. He would still have a swing of 5.5 per cent to account for, compared with a national swing of under 2.1 per cent, or even one in his immediate neighbourhood of under 3.1 per cent. Mr Edelman may laugh at "the backroom numerologists," but numbers are what matter at elections.—Yours faithfully,

EDWIN CHAPMAN

London, S.E.26

How the Bill Tender Works

SIR—In your issue of June 11th you turn on the Lombard Street cartel a considerably kinder eye than that you usually reserve for restraints upon competition. The virtue you find in it is that the discount houses apparently consider themselves under an obligation to stand ready at all times to absorb, if necessary, the entire weekly bill offering, thus exorcising from the Treasury Chambers the spectre of an inadequate response to the tender which rattled such an effective chain in the twenties.

It is difficult to attach much weight to this kind of argument; certainly it is impossible to make a comparison between the late twenties and the present time. In the former period the commercial bill supply in London exceeded the tender bill supply, so that a complete abstention by the market from the tender would have involved the idleness or redirection of a relatively small part of its total resources; now that the commercial bill supply is 10 per cent or less of the total, however, the eventuality is scarcely conceivable. More important, the real danger in the twenties was not that of an inadequate allotment as such, but that short-term funds would be leaving London and draining the gold reserves. If the money market abstained from tendering today, as you appear to believe is possible, this major danger would not arise. Nor would there be anything inflationary, as you suggest, in a resort to Ways and Means in such circumstances; the authorities would simply be creating the idle cash corresponding to the hoarding inclinations of a self-denying market.

You are right, however, in suggesting that the whole bill system requires reconsideration in the light of modern circumstances. At the beginning of the century, when the total bill issue at the end of the financial year amounted to about 12 per cent of annual government expenditure, there was still some sense in regarding the Treasury bill as a device for meeting short-run divergences between government revenue and expenditure. To maintain this fiction today is absurd. Quite apart from the enormous tap issue, tender bills amount to some 75 per cent of total government expenditure; in the last financial year their volume varied by only £300 million or so, but at no time fell below £3,000 million. There may well be merit in maintaining the continuous turnover four times a year of what is in fact an enormous permanent debt. But we do not really get much further forward by talking about the money market in terms of a public-spirited body combining to reduce its charges to an impecunious government forced to rely on its generosity. Let us be objective about it: there is quite a big boot on the other foot.—Yours faithfully,

EDWARD NEVIN

University College of Wales, Aberystwyth

Nettles to Grasp

SIR—You compared cost of living changes in this country and in the United States during the past three years and stated that the latter also has "virtually full employment." In US Statistics on page 804 of *The Economist* unemployment for April, 1955, is given as 4.6 per cent of the civil labour force. This percentage applied to this country would give an unemployment figure exceeding one million. Would any of the political parties be prepared to describe such a figure as "virtually full employment"?

I suggest that if inflationary measures to promote full employment in this country had been administered less vigorously during the past three years the cost of living here would have been as stable as America's.—Your faithfully,

Southsea JAMES C. W. DRABBLE

The Intelligent Wildcat's Spots

CONFLICT WITHOUT MALICE.
By Emanuel Shinwell.
Odhams. 252 pages. 21s.

THE story of the Labour Party's years of transition, from a form of street corner agitation to the responsible Government of the land, will one day be written as a lurid best-seller. When that day comes, it will have to be recognised—however rude this may sound—that it triumphed in spite of, rather than because of, the early records of some of its leaders. As the working class recognised its democratic power, Labour swept forward on a popular tide; the tide carried some odd pieces of flotsam and jetsam with it; and, once they reached shore, those pieces were transformed into surprisingly successful servants of the state. Among the most notable of these transformations was that of Emanuel Shinwell, whose autobiography is a strange mixture of self-pity and self-justification for his unpleasant years and shrewd commonsense about his years of triumph.

Mr Shinwell graduated through street corner oratory to the Glasgow Trades Council, and he was sent by that council as a professional agitator to keep the Seamen's Union strike of 1911 on the boil. Within a short time he was running what the TUC "most unfairly" regarded as a breakaway union, and was running it in an unorthodox way. There was, for example, an anti-war meeting in 1917, into which an anti-German faction tried to gain admission:

> I went to the top of the landing and saw that Jamieson had managed to force the door sufficiently to get his head through, so I ran down and punched him between the eyes. The door was closed and I returned to the platform, where I made a short introductory speech in favour of peace by negotiation.

More seriously, there was a "skirmish" on the dockside, in which an official of the older union fired a revolver at Mr Shinwell, and killed a man at his side. It may be a significant commentary on the nature of the "skirmish" that this official "got off on the grounds of self-defence." Mr Shinwell says that Glasgow policemen at this time were "most brutal," and came mostly from the Highlands "with a heritage of class war against the Lowlands." The first time that they mistook Mr Shinwell for a Lowlander was when, out of no feeling of disrespect, he tried to march with a protest meeting "into the Cathedral, where morning service was being held." A second time was after the Glasgow riot of 1919, when Mr Shinwell was sent to prison for five months. Less than three years after his release he was returned as Member of Parliament for West Lothian. As he rides south to Westminster, he does not carry the reader's vote.

And then, at this watershed of his career, the whole character of the man changes. Within a very short period the national press is noting with "surprise" that he is fitting far more easily into the "conventions of parliamentary debate" than any of the other red rebels of Clydeside; he is tucked securely under Ramsay MacDonald's wing; and he has become Minister of Mines. Moreover—except where, as in the coal mine amalgamations of 1930 and the fuel crisis of 1947, his post demands some knowledge of economics—he fulfils his successive departmental duties extraordinarily well. The reason is not far to seek. Although his self-pity for his early years is almost nauseatingly exaggerated—his father, after being "victimised" from job to job for his defence of workers' rights, was somehow victimised, in Mr Shinwell's early teens, into the job of manager of a clothing factory—the young Emanuel did have one unfair cross to bear; he was snatched away from school far earlier than a boy of his intelligence ever should have been. The result was that, at Westminster and in Whitehall he came into contact for the first time with men of his own intellectual level; not surprisingly, he immediately fell in love with them, whether they were on the Labour or the Tory benches, in the higher civil service or among the generals at the War Office.

It was not a blind love. Foolishness and pomposity still met the flail of his tongue, and on one notable occasion on the floor of Parliament most regrettably also of his fists; this verbal flail is kept in motion throughout his autobiography, and it whips out strictures upon certain of his own colleagues that will not make him more beloved. But the object lesson of Emanuel Shinwell, the wildcat who changed his spots, remains. Under the modern educational system he would have drifted, through grammar school and university, into the better-paid ranks of industry—which he very nearly joined, even at the expense of turning his back on Labour politics, in 1931. And this would have robbed the Labour movement of thirty-five years of the sort of service with which it can ill afford to dispense. Where will Labour get its working class agitators of the future? Only from those who fail the eleven-plus examination?

Historical Criticism

BYZANTINE STUDIES AND OTHER ESSAYS.
By Norman H. Baynes.
Athlone Press. 392 pages. 35s.

"OF my name," said Professor Baynes in his valedictory address to University College, London, in 1942, printed in this volume, "the world still remains in an ignorance which could not well be more complete." The modesty and humorous overstatement are equally characteristic. To the world of historical scholarship, international and national, our chief authority on late Roman and Byzantine studies is *vir summus*. He is successor and biographer to J. B. Bury, as Bury was successor to Freeman: a unique line of intellectual descent, springing not from a master-pupil relationship but from vocation alone. He ranges in judicial eyre from the Hellenistic period far down to the Ottoman capture of Constantinople, and during the war he turned to investigate National Socialism and made a splendid edition of Hitler's speeches. His erudition has been mainly exercised in learned journals; this volume of essays and reviews, whose scholarship compares with the reprinted pieces of some other historians like cognac with orangeade, is ("Hitler's Speeches" apart) his longest book. It has been selected and edited with admirable care by Professors Humphreys and Momigliano.

Professor Baynes's historical criticism is traditionalist, not innovatory. Perhaps his most influential single work (not included here) has reinterpreted Constantine's adopting Christianity as a religious conversion and not a political stroke; and the controversial pieces in this volume are usually concerned to restore the significance of a source or to clarify the reputation of an individual. His use of sources is constantly vivified by a Collingwoodian imagination of human motives—of the passionate adherence to tradition of cultivated pagans like Symmachus, who could not know that their cause was lost; of the divided feelings of Roman converts to Christianity like Lactantius, as they foresaw the dissolution of the Empire; of Athanasius putting his luggage on board and ordering it off again as he hesitated whether to obey the emperor's summons to the capital; of Ambrose, another unlovable saint, skating in his funeral orations with diplomatic smoothness over the suspicious manner in which superfluous members of the imperial family have disappeared.

Much here is of political interest. A study of the struggle between the patriarchates of Alexandria and Constantinople shows how, in a world state, power politics continue below the surface, with all the accompaniments of modern diplomacy; and there are fine essays on the political theory of Byzantium and of St. Augustine. But while Bury concentrated on the Byzantine state, Baynes's interest has lain in Byzantine social life and thought. It is a world both authentically Greek, so that

when an eleventh century emperor appeared with his Caucasian mistress a courtier quoted the verse from Homer about Helen walking on the walls of Troy and everyone knew the allusion, and profoundly Christian, so that beyond all political and military skill it reposed its confidence in supernatural defenders. The learning concentrated in this book on special points diffuses a wide and gentle radiance, in which we recapture the pride and beauty, the piety and fears, the stability and endurance, of a civilisation that stands at the opposite pole from our own.

Economics of Government Action

THE THEORY OF FISCAL ECONOMICS.
By Earl R. Rolph.
University of California Press. (London: *Cambridge University Press.*) 324 pages 34s.

IN the fiscal field, more than in any other, economics should serve as a guide to conduct. Only a Harriet Martineau could expect individuals in their private capacity to be influenced towards wise behaviour by the study of abstract economic principles; with governments, the case is different. Professor Rolph writes for fellow professionals, not for Chancellors, concerning himself neither with administrative nor with political practicabilities and manfully eschewing value judgments; but his aim, which is the clarification of the effects of government actions, implies that Chancellors should act in the light of theoretically sound reasoning.

Theoretical soundness demands separate consideration for the effects of purely monetary transfers initiated by the government—inflows and outflows on account of capital and interest transactions, subsidies, taxes themselves—and the diversion to government ends of real products. Thus the inquiry diverges on the one hand into monetary theory and on the other into market theory, with remarkable results. Dealing with the incidence or "burden" of different types of tax (excise, import duty, income taxes variously determined) Mr Rolph concludes that no burden ever rests on consumers, owners of resources being the ultimate bearers in every case; that it is impossible, whatever assumptions are made about elasticity, to "tax the foreigner"; that income tax has no effect on the supply of human energy and, if losses are fully offset, actually stimulates risk-bearing. Opinions to the contrary, he asserts, and, within his assumptions, satisfactorily demonstrates, rest on confusion either with the effects of government spending on real resources or with those of monetary change. In the monetary field he rejects Keynesian analysis outright on the grounds that it violates Whitehead's principle that causes cannot be contemporaneous with their effects—a principle which evidently rules out the determination of current consumption by current income and leaves the latter to be settled by the volume of pre-existing assets.

The conclusion that income is irrelevant to consumption is paradoxical enough to give any reader pause. Considering the paradox, one discovers what is wrong with Professor Rolph and, indeed, with the more arrogant model-builders of all schools, including the Keynesian. It is the substitution of a direct causal relationship between economic data for a relationship between human decisions based on those data. Only when human decision is left out of the picture is the Keynesian argument vulnerable to Mr Rolph's strictures; for decision is as capable of using contemporaneous events for data as any others. The more thoroughly the element of human decision is omitted, moreover, the easier it is to represent as effective, through round after round of causal sequence, the repercussions of events which in real life are absorbed, blocked off and swamped in the mass of determinants impinging on human choice.

Among that mass of determinants—rational or emotional, legal, conventional, merely habitual—the economic analyst must necessarily pick and choose. Some selections are better than others (as that of Keynes was better than that of the classics). Mr Rolph's deserves considerable respect, and the use he makes of it could hardly be bettered. But the price of selection is an unreality cumulatively increasing the further each set of causal sequences is traced. Much internal evidence suggests that Mr Rolph is as capable of applying horse sense to real life as of dissecting logical sequences in a vacuum. But his book runs the risk, common to all "rigorous thought," of inspiring less sensible persons to preach quite inappropriate practical applications. In the field of fiscal economics in particular the more watertight the logic, the more impressive the argument, the more excellent the finished work, the more desirable is a warning label: Not to be Taken Neat.

Admirable Snowman

MAN OF EVEREST: *The Autobiography of Tenzing.*
Told to James Ramsey Ullman.
Harrap. 320 pages. 18s.

HIGH mountains sometimes bring out the best in men's personal qualities and the worst in their national characteristics. This has been demonstrated by the German assault on Nanga Parbat, with its toll of lives and crazy individual triumph, by the insufficient teamwork and dread suffering of the French on Annapurna, and by the flare-up of nationalistic stupidity that marred the Everest triumph. It would be useless to go into the merits of the case once again, and Tenzing's account, told to the American enthusiast Mr James Ramsey Ullman, is outstandingly fair and modest. But one important general point does emerge: in their treatment of the Sherpas, the Swiss and the Americans have far excelled other nationalities and it is with Raymond Lambert—perhaps the greatest of living mountaineers—that Tenzing would have wanted to reach the summit of Everest. The behaviour of the First Secretary of the British Embassy in Kathmandu when Tenzing asked for a night's lodging during the Swiss expedition makes bitter reading. It explains amply why the great Tiger did not choose to attend the reception there after the final victory.

As a whole, this autobiography is enchanting. It is a chronicle of the long years of heroism, training and discipline that have led in the last years to the swift conquest of Annapurna, Everest, Nanga Parbat, K2, Makalu and now Kangchenjunga. It also contains a fascinating account of the voyage through Tibet by Tenzing and Professor Tucci. The illustrations are outstanding and Tenzing's own voice comes through Mr. Ullman's transcription.

New Judgment on Donne

DONNE'S POETRY.
By Clay Hunt.
Yale University Press (London: *Geoffrey Cumberlege*). 269 pages. 30s.

SO much of contemporary criticism and poetry has been wrought in the image of John Donne that a lucid study of his art will interest not merely the scholar and the specialist. Ideally, such a study must combine the disciplines of modern criticism—the unswervingly close and subtle reading of the poem—with a classical sense of degree and limitation, in order to assign Donne's gnarled genius its true place and to correct the stimulating exaggerations of Mr Eliot and his many followers. Mr Hunt has performed this difficult task. His book is probably the finest example for the general reader of how modern criticism and scholarship can illuminate complex poetry and in its final chapter there is a portrait of Donne which it will be difficult to surpass for insight and fairness.

It is perhaps with this concluding chapter, that the general reader should begin. In it Mr Hunt compares Donne with neighbouring stars in the great constellation of Elizabethan and seventeenth-century literature. The qualities of Donne's excellence—his clean analytic mind, his sense of personal drama, his tough sensuality, his formidable drive—are distinguished from the wider genius of Marlowe, Spenser, Shakespeare, Jonson and Milton. But those qualities are significant in their own right, and significant for today:

> With a poetic sensibility as narrowly intellectualised as Auden's, and a poetic eccentricity as strong as Dylan Thomas's, Donne had an energy and definiteness of mind which drove those limitations and eccentricities to produce some of the most impressive and boldly original poetry in English. His poetry is in the literal sense of the phrase, a *tour de force.* I am reminded of an aesthetic pronouncement of Virgil Thomson's:

"In art anything is all right as long as it's enough so."

Mr Hunt has a refreshing capacity to see a much-surveyed poet in a new light.

The earlier chapters consist of analytic readings of seven poems. Mr Hunt modestly relegates to notes in the back of the book his massive familiarity with baroque theology, physiology, and poetic practice. He misses very little in the poems (but does not the final line of "Love's Alchemy" derive from the belief that mummies lose their souls through their mouths?) and he rescues much from false admiration. But above all he brings to life the setting of Donne's art—a world full of passionate intensity and doubt, of adventure and ancient fears.

Lexicography

DICTIONARIES BRITISH AND AMERICAN.
By J. R. Hulbert.
Deutsch. 107 pages. 9s. 6d.

PROFESSOR HULBERT, formerly of the University of Chicago and a co-editor of the "Dictionary of American English," has written a brief and popular account of how English dictionaries are made and how they should be used. He writes with charm, humour and frank joy in his subject, and he enlivens his book with thumbnail pictures of the great lexicographers of his lifetime. In spite of the title, the book is written almost wholly from an American standpoint. The history of dictionaries is given sketchily till the great name of Webster appears; from then on their development is taken in more detail, but whereas Funk and Wagnall gets a page, the trusted Chambers only gets a fleeting mention. The Oxford Dictionary, of course, is given the space it deserves.

To the amateur, the most interesting part of the book is Professor Hulbert's treatment of the technical process of dictionary-making, the limits imposed by costs, and the dependence of each dictionary on its predecessor. He gives one interesting warning: the name of Merriam-Webster is protected, and denotes the true succession of the patriarchs from Noah; but the name of Webster by itself is in the public domain, and its appearance on the title-page of a dictionary means nothing at all.

The only complaint that one can make of this book is that it is a little too short and too popular. Rather more may be expected of those who are ready to read anything at all on such a subject, and the book would have gained if the historical part had been fuller, if there had been something in it about dictionaries in other countries, and if the author had added a bibliography.

Lexicographers must expect their slips to be pounced on: at least in a book published in Great Britain, so careful a user of words should not have described Ogilvie, one of the long and distinguished line of his Scottish colleagues, as an Englishman.

The Cautious Cecil

MR SECRETARY CECIL AND QUEEN ELIZABETH.
By Conyers Read.
Cape. 510 pages. 40s.

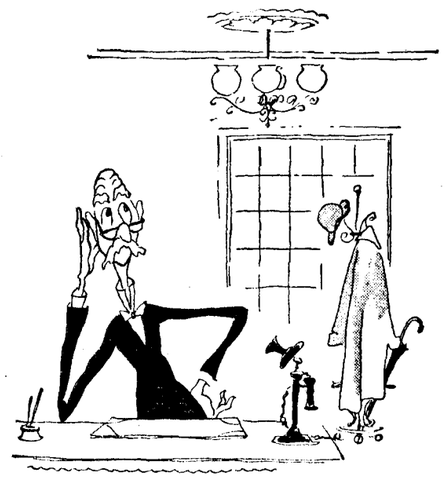
IT is not surprising that fifty years have passed since a biography of William Cecil was published. The vast and varied collection of papers that remains as a monument to Cecil's industry intimidate the historian by their bulk and range; and Cecil's long tenure of office, first as Principal Secretary and then as Lord Treasurer under Elizabeth I, makes it difficult to prevent his biography from becoming a history of the reign. Moreover, Cecil's personality remains shadowy and even unattractive. Despite the mass of evidence, few of his own letters survive and few of his speeches were recorded, while there is no adequate record of how he came to win and hold the confidence of the Queen.

Nevertheless, Dr Conyers Read, who published an authoritative life of Walsingham thirty years ago, has now given us the first volume of an equally thorough and scrupulous life of Cecil, taking his narrative to the end of the first decade of the reign. This volume closes with the collapse of the northern rebellion. By then Cecil's many services had confirmed the wisdom of Elizabeth's choice of minister, while his adroitness had made his position relatively secure against the intrigues of Leicester and the jealousy of the older aristocratic families. What were the qualities that had enabled Cecil to survive in the reigns of Edward VI and Mary and to triumph in that of Elizabeth? Macaulay explained Cecil's survival by the fact that "he never deserted his friends till it was very inconvenient to stand by them," and his greatness by the fact that Cecil was what Elizabeth needed, "a moderate, cautious, flexible minister, skilled in the details of business, competent to advise, but not aspiring to command." Although Dr Conyers Read is concerned to emphasise Cecil's integrity and patriotism, his account confirms the justice of Macaulay's judgments. In this volume he throws more light on Cecil's skill as a politician and negotiator than on his administrative capacity; indeed he will not allow Cecil's authorship of some of the economic measures ordinarily attributed to him.

"I am," Cecil once wrote, "and always have been circumspect to do nothing to make offence." Dr Conyers Read has to admit that, in the reigns of Edward VI and Mary, Cecil trod the shifting sands of politics too circumspectly to avoid suspicions of time-serving. Although Secretary under Edward VI and closely connected by education and marriage with Protestant circles, Cecil not only remained safely in England under Mary but was sent to Brussels to escort Cardinal Pole to England. And Pole testified his regard for Cecil by bequeathing a silver inkwell to him. Dr Conyers Read explains this with the sophistical formula that Cecil was "more a product of the Renaissance than of the Reformation"; but it is unnecessary to refine on Macaulay's comment: "We do not blame Cecil for not choosing to be burned." Office under Elizabeth brought Cecil wealth, but he had an irritating trick of referring to the great houses he built as "poor cottages." His prosiness, too, is a major difficulty for his biographer. Dr Conyers points out that "his written memoranda are often tedious"; and he has to say of Cecil's mission to Scotland in 1560, which he regards as presenting the fullest picture of Cecil in action, that "its very tedium reveals the perennial tax upon his patience which he regarded as one of his chief assets."

Yet if Cecil's personality was tedious, the issues of the first decade of Elizabeth's reign were dramatic and Cecil's part in resolving them was of the first importance. He was the outstandingly efficient staff officer, temperamentally disposed to foresee difficulties and both lucid and careful in devising and analysing possible courses of action, leaving the ultimate decision to the Queen. Cecil's numerous memoranda, which Dr Conyers Read quotes, make it possible to appreciate the quality and caution of his mind. But the rigorously chronological method here adopted means that the issues are not clearly detached and discussed. Experts will appreciate Dr Conyers Read's thorough scholarship, though they will be disturbed by odd slips in nomenclature and titles; those with a general interest in the period will need all Cecil's own patience and indifference to distinction of style.

Books Received



THE PELICAN HISTORY OF ENGLAND: *Volume I, Roman Britain.*
By L. A. Richmond. *Penguin Books.* 240 pages. 2s. 6d.

THE ANNUAL REGISTER OF WORLD EVENTS: *a review of the year* 1954. *Longmans.* 521 pages. 105s.

THE MULTI-RACIAL COMMONWEALTH: *proceedings of the Fifth Unofficial Commonwealth Relations Conference held at Lahore, Pakistan, March* 17-27, 1954. A report by Nicholas Mansergh. *Oxford University Press* for the *Royal Institute of International Affairs.* 187 pages. 21s.

POLITICAL HANDBOOK OF THE WORLD 1955: *Parliaments, Parties and Press as of January* 1, 1955. Edited by Walter H. Mallory. New York: *Harper and Brothers* for the *Council on Foreign Relations.* London: *Royal Institute of International Affairs.* 230 pages. 30s.

THE BUDGETARY PROCESS IN THE UNITED STATES: *A Research Study for the Committee for Economic Development.*
By Arthur Smithies. *McGraw-Hill.* 507 pages. $6.50. 49s.
This is a full and critical account of the complications of the American Budget, of how it is drawn up, of what Congress does to it, and of its economic impact. Professor Smithies is particularly concerned at the failure of the system to improve with the enormous growth in the amount of money involved during the last twenty-five years.

Does your office bear looking at?

The effects of time on everyday faces and places are seldom seen clearly. Our children grow up, our friends grow old, our offices grow shabby and we hardly notice the difference.

Any business man who detects a need for improvement when he tries to see his own office as outsiders see it, is invited to get in touch with Catesbys Contracts.

Catesbys have a team of expert decorators, designers and furnishers who will co-operate intelligently with you to give your office a comfortable atmosphere that befits and inspires a good business man. You'll find that Catesbys Contracts are organised to get on with the job fast and efficiently and that they never seek to push you into more expense than you want.

They'll do the whole thing, from first plan to last fitting, then leave the place spick and span for you.
Ring Museum 7777 and have an executive round to see you.

LET CATESBYS PUT A NEW FACE ON THE PLACE

this celebrated standard work has now been completely rewritten—forming virtually a new book

BENHAM'S ECONOMICS

Fifth Edition. Since it was first published in 1938, this standard work has retained the place it has won as an indispensable volume for all who are entering upon a serious study of economics. It has become famous as a complete introduction to the science of economics—giving a realistic account of how the economic system works today in a country such as ours. Now, Dr. Benham has made extensive changes, and the new fifth edition forms virtually a new book. The general pattern remains the same as before, but the greater part of the book has been completely rewritten in order to discuss the various problems in their post-war setting. Although written mainly for first year university students it will also be useful to the general reader and to those taking Civil Service and other professional examinations. 18/- net.

The World Overseas

South Africa's Turning Point

FROM OUR CORRESPONDENT IN SOUTH AFRICA

WITH the passing of the Senate Bill last week, many people in South Africa, of all shades of opinion, fear that a turning point in the fight for democracy has been reached. Even Nationalists have been distressed; thirteen of them, teachers at the University of Pretoria, have been bold enough to record their protest publicly, and countless others, no doubt, have private misgivings. Except for the extremists, government supporters show little or no enthusiasm for the Bill. Almost without exception they are on the defensive about it, and *Die Burger*, which used to mirror Dr Malan's views with absolute accuracy, but which is less enthusiastic about Mr Strydom, has gone as far as to say that as soon as the enlarged Senate has served its purpose it must be reconstituted—presumably on a democratic basis—and the 41 additional Senators retrenched.

There has been no suggestion that Mr Strydom shares this view, but even his own devotees are saying that the Bill is an unpleasant necessity "forced" on the Government by a recalcitrant opposition. They deny, vigorously, the opposition charge that the measure is designed primarily to entrench the Government in power, and that it will alter the character of Parliament so radically as to change its democratic nature almost beyond redemption. Nationalist apologists profess to be at a loss to explain opposition vehemence about the Bill, and they ridicule suggestions that the passing of the measure heralds something akin to the deathknell of parliamentary democracy. All that the Government is doing, they say, is to "restore" the position which existed prior to the 1952 judgment of the Appeal Court in the coloured vote case—a position which, they maintain, was accepted without demur for fifteen years.

This simple-minded explanation does not, however, square with Mr Strydom's oft-repeated claim that the sovereignty of parliament is at stake. Nor is it borne out by the assertion of a Nationalist newspaper that, unless it is unambiguously laid down that the courts have no jurisdiction to interfere with Parliament, the Government might experience endless litigation in its "further implementation of apartheid." This ominous warning, which drew surprisingly little comment in the Union, suggests a far more drastic invasion of the common law rights of the citizens of South Africa than has been the case up to the present. But there is no doubt that the fear of "interference" from the judiciary is drawing Mr Strydom relentlessly along the disastrous path on which he is now set. Furthermore, he knows that, once the entrenched clauses have been abrogated, there will be no legislative obstacle to the declaration of a republic—no two-thirds majority hurdle in Parliament to overcome. There seems no doubt that the Nationalist leadership fears that, when the day comes for it to declare a republic, it might find itself hamstrung by the courts. This Mr Strydom is determined to avoid at any cost.

There are other aspects of the crisis brought about by the Senate Bill which have alarmed public opinion. The first is the Nationalist party's ruthlessness and cynicism when it believes it is being thwarted in its implementation of the "volkswil," which it equates with the Nationalist will. The second is its complete unconcern for the spirit of parliamentary democracy and the rights of minorities. And the third is its intolerance of, and sensitivity to, opposition, both from outside and even more, within its own ranks. The present crisis, coming on top of the enlargement of the Appeal Court, has been a severe test of Nationalist party loyalty and discipline. Politics have always been a way of life to the hard core of Nationalists: now this doctrine seems to have spread to the rank and file. The reason is not far to seek: the insistence on conformity has been so clamorous and the fear of the consequences of dissent so great that unquestioning obedience has been the result. The savage fury which greeted the protest of the thirteen Pretoria professors was such that it silenced other potential waverers. And the air has been so full of threats and intimidation that some Nationalists are even too frightened to express a dissenting view in private.

There is little doubt that under Mr Strydom the Nationalist oligarchy has, consciously or otherwise, set its feet on the road to authoritarianism. At best this will be a dictatorship of White over Black; at worst of some White over Black and some Whites. However much the Nationalist leadership denies it, this must be the result of their legislation. Unless the party's own supporters call a halt to this process—and there is no sign of this at present—the single-minded fervour and fanaticism of men like Dr Verwoerd, Mr Swart and Mr de Klerk, not to mention the Prime Minister himself, can have disastrous consequences for a country in which democracy is in any event very shallowly rooted, and in which it is so easy to rally white voters by a parade of colour bogies. It is true that the anti-Nationalist forces have been roused as seldom before, and the Cabinet is not being left in any doubt about the damage it has done to White race relations by this latest act. But it remains to be seen whether the public protests

which have been a feature of the agitation against the Bill can be sustained long enough and vigorously enough to make an impact on the Nationalist leadership.

It is the tragedy of South Africa today that the forces of determination and vigour seem to be mostly on one side, and that, on fundamentals, the forces defending such democracy as there is, are more timid, hesitant and unsure of themselves than they should be. This lends an air of unreality to a struggle on which the future of democracy in South Africa depends.

OEEC Meeting—I

Cushioning Convertibility

THE empirical approach and artistry in compromise have once again rescued a ministerial meeting of the Organisation for European Economic Co-operation which, until the last minute, seemed headed for deadlock. Last week, the year-long argument between the British, on the one hand, and most of the continental governments, on the other, about what should happen to the European Payments Union once sterling or other major currencies become convertible was, if not completely settled, at least brought a long step nearer resolution. About a year ago, the OEEC set up a special ministerial group to examine the problems which would arise in the trade and payments field when any of the large trading countries in the OEEC made its currency freely convertible with the dollar. By the beginning of this year agreement had been reached on the need for a European Fund to extend short-term credit to European countries in temporary balance-of-payments difficulties and on the indispensability of OEEC trade rules for the transitional period which would begin when a major currency became convertible and would run at least until the revised Gatt rules on quantitative restrictions were fully in effect.

But fresh and seemingly intractable difficulties arose when the Managing Board of the EPU came to reduce the broad agreement in principle to a firm plan for the liquidation of the EPU and establishment of a European Fund. Two opposing views developed which, it soon became clear, no group short of the Council meeting at the ministerial level could resolve. The nub of the argument was whether, with convertibility, the EPU should be "terminated" and its capital assets formally made over to a new institution, the European Fund, which would have no functions except to grant short-term credits (i.e., for two years or less) to member countries who were in temporary balance-of-payments difficulties, or whether the EPU should be "transformed," rather than terminated. In the latter case the EPU would not only assume the short-term lending functions envisaged for the Fund, but would retain its present function of multilateral compensation, but on a hundred per cent gold payments basis. In other words, with convertibility there would, on this alternative plan, continue to be a clearing mechanism but no automatic credit facilities as at present, except the interim credits which develop within a particular accounting period.

The British delegates who argued the first case, felt that with convertibility there would be no room for a European clearing system and that there were psychological advantages (and presumably some tangible financial ones for the Bank of England) in a clean break with a system which was identified with the post-war transitional period. The majority of the continental countries argued that the psychological advantages were all on the side of not jettisoning a proven instrument of European co-operation and that in the uncertain period when some, but presumably not all, European currencies were convertible, a multilateral compensation mechanism, even on a 100 per cent gold payment basis, would be of positive help in making it possible to resist the temptation to reimpose restrictions.

Directly connected with this controversy was the question of the system of exchange rates to be adopted with convertibility. The British were determined to protect their reserves with a flexible exchange rate; the continentals, who were in any case scared that Britain was planning a premature plunge into dangerous waters, feared the repercussions if sterling were free to float too far and too soon. On both these basic questions the opposing schools were well dug in, and until one or the other could be moved, not only was post-convertibility planning stalemated but agreement on an extension of the EPU held up as well.

The compromise which was reached last week breaks the log jam. But it is constructed of so many interlocking and carefully counterbalanced undertakings that the whole structure could come tumbling down in the middle of July if the technicians cannot work out the details of the agreements that have been reached in principle. Happily, this seems unlikely and with luck the ministers can escape another bout with this problem until the over-heralded convertibility is really upon them.

Eleventh Hour Compromises

Briefly, what has emerged from the eleventh-hour compromises in Paris is this. The EPU will be extended for another year, as from July 1st. For the month of July settlements will be on a 50 per cent gold, 50 per cent credit basis, as at present. After that, the system will be "hardened" and 75 per cent payment in gold will be required of both debtors and creditors. The EPU will be "terminated" (or "transformed") and the post-convertibility arrangements will come into effect when a group of countries whose trade accounts for at least 50 per cent of the total trade of the group decides to become convertible. But this decision is made subject to the establishment by the OEEC not only of a European Fund but of "a multilateral system which will facilitate settlements between member countries."

The agreed sections of the managing board's report on the nature of the European Fund are to be put into final shape and submitted to the Council before July 15th. At the same time the managing board is to submit to the Council a report on a system for multilateral settlements, taking as a basis the so-called Dutch compromise. The essential elements in the Dutch scheme are, first, that Britain and any other countries with flexible exchange rates should indicate at the beginning of each accounting period the margins within which they would allow their exchange rates to fluctuate, and second, that countries should deposit gold in advance to cover any deficits they expected to incur in the clearing. In addition, it has been agreed that, at any rate initially, the new scheme will be for a limited period only.

The cynic will be quick to say that the British representatives have gained the substance of their position and yielded, to good advantage, on the form. But such a judgment ignores the strength of the psychological arguments, which have from the start been the most stubborn. The continent has obtained agreement on a settlement mechanism which, even if it is not used to any great extent, could be easily modified if the need for a new system of intra-European credit arose; it has received reassurance from Britain that the exchange rate would be permitted to float only within defined limits; and perhaps of most importance, it has heard from Mr Butler's own lips that the time is not ripe for convertibility. Furthermore, true to the best OEEC traditions, the council also agreed that a new high-level committee (Sir Leslie Rowan has been mentioned as the British member) will be created to discuss on a regular basis the problems that convertibility will bring in its train and, in particular, the effect of exchange rate policies on trade.

The trade rules which have been evolved during the lifetime of the EPU will be continued "for an unspecified period" after the adoption of convertibility, with relatively minor amendments. The possibility of an eventual conflict with the Gatt has been awkwardly side-stepped for the present, although again July 15th is the awful date by which more precision has to be given to the agreed principles.

(To be Concluded)

The Voice of the Soviet Army

THE Soviet army, silent in Stalin's day, is increasingly finding its voice. Recently, it openly staked a claim for more and better publicity as well as for the recognition of its wartime achievements. The occasion was provided by a special conference of novelists and other writers dealing with military subjects. The army itself may sometimes speak with several voices, but this time all the speakers were clamouring for less censorship, more accurate reporting and also for better "write-ups" of prominent army leaders.

In one respect the revision of history now demanded by the army will tend to vindicate its own role in the war. The Stalinist version of events was purposely idealised; it played down the initial defeats and ascribed ultimate victory to the masterly strategy of the "Leader of Genius." The retreats of the early part of the war were subsequently described as Kutusov-like manoeuvres destined to trap the enemy, as part of a conscious policy of "active defence." At the conference pains were taken to destroy this legend; "Writers are trying," said one speaker, "in contradiction to real facts, to show that this active defence was planned in advance and calculated by our command . . . which creates the impression that these are possible and recommended tactics."

By pricking the Stalinist myth the soldiers can underline their share of fame and, since the general picture is a glorious one, they do not mind revealing the shades. Indeed, at the conference, they explicitly asked for the shades to be put in and attacked the censor—that "man with leaden eyes"—on whom often the fate of a book depends. The delegates went further than ever before, since even at the height of the liberal phase in literature critics were told to keep off the army. Now, these taboos are openly mocked. One of the speakers described how the censor struck out a passage from a novel because it showed a woman-doctor frightened of travelling in a boat on a stormy sea; the woman was an officer and—argued the censor—officers know no fear. Apparently the army no longer wants to be protected and glorified in such a crude fashion.

Army spokesmen carried their campaign against primitive propaganda methods one stage further still. They asked writers not to present the enemy always as a foolish villain and argued that much, in fact, could be learnt from him. Western methods and ideas should not be simply dismissed; on the contrary western books should be translated and studied. "Why can we not afford to publish them now—asked one delegate—if after the revolution we dared to print the memoirs of a Denikin (White Russian general)? Here the conference began treading on really dangerous ground. It advocated the publication, on the Western model, of reminiscences or memoirs by Soviet generals and commanders of lower ranks, of documents old and new. This suggestion, if followed faithfully, would necessarily lead to the complete revision not only of the military but of the political history of the Soviet Union as well. The rehabilitation of Tukhachevsky and other marshals executed in the 'thirties would be merely the first step towards the denunciation of the Moscow trials and the restoration of the opposition exterminated by Stalin to its proper place in Soviet history. It is doubtful whether the conference was really aiming so high.

Soldiers in the Limelight

It should not be thought, however, that the whole conference was merely a modest exercise in self-debunking. Having criticised the crude methods and the primitive cult fostered by Stalin, the soldiers went on to claim a bigger share of publicity. The literary publication *Znamya*, for example, is now to become a military magazine. More important still, an appeal was made for the publication of full-scale biographies of marshals Zhukov and Konev, Bagramyan and Rokossovsky. Stalin kept his lieutenants so much in the background that their lives are not really known to the general public and no attempt has been made as yet to build up his successors. Now we are told that a Soviet Plutarch should turn his pen not to the biographies of a Khrushchev or Bulganin but to the illustrious lives of the Soviet marshals.

This was probably the most significant feature of the conference. It is impossible to say whether the whole performance was the army's own work or whether it was partly prompted by the Party. There are signs, in fact, of divisions and struggles within the army itself. The absence of Marshal Vassilevsky, the first deputy minister of defence, from the projected portrait gallery may be an interesting pointer in this direction. There are also indications that the old rivalry between Zhukov and Konev is being revived by Stalin's heirs. Most striking, however, is the army's political come-back. Stalin, always very sensitive to the Bonapartist threat, pushed the soldiers into the background as soon as they had finished their wartime job. They flocked back to the centre after his death and advanced onto the political arena after the falls of Beria and Malenkov. Now they are apparently claiming their share of the limelight.

AIR TROOPING

THE PATTERN OF DEFENCE now being shaped by the western powers has as one of its essential elements the speedy movement of troops by air to trouble spots and strategic outposts. For Great Britain, in particular, the need to move reinforcements quickly—perhaps a battalion at a time—to such widely scattered places as Malta, Gibraltar, Bermuda, the Caribbean, West Africa, Cyprus, Aden, Singapore, Hong Kong and elsewhere has made the use of aircraft obligatory. Air trooping has been steadily increasing the part it plays in such movement and is the method now used for nearly 50 per cent of the total Army trooping to and from theatres other than Germany.

The speed of the trooping aircraft, as against travel by sea, is self-evident. Sea transport moreover has the disadvantage that in carrying a much larger number of men per unit it is keeping them inactive in the "pipeline" for a comparatively long period. In effect this delay means that an increased number of men must be kept ready under arms; whereas by air, troops need not be out of action in transit for more than about twenty-four hours. By the proper use of the air, therefore, fewer men are needed to guard the widely dispersed outpost defences of the democracies. The manpower saving on the Far East route alone is estimated by the War Office to be one-seventh, so that out of every 10,000 moved in a year, there are 1,400 or 1,500 more men effective in the field.

Another feature of air trooping which has directly influenced the three Service Departments in their decision to expand its volume, is the net saving of air travel over most sea routes. From the United Kingdom to Egypt, for instance, in 1952/3 the average fare per head by sea was officially stated to have been £30, compared with £22 using charter aircraft. This is considerably less than even tourist fares on the scheduled airlines, since on troop charter work every available seat can be filled.

In 1950, the Government decided that the British independent operators should provide the bulk of the extra capacity needed to develop the air trooping scheme. In this way, a measure of stability would be given to these operators enabling them to invest in modern equipment and so provide an important strategic reserve of aircraft to supplement Transport Command when required.

The aircraft at present operated are mainly suited to the medium haul routes such as those to the Mediterranean, and there has been a shortage of large, long-distance airliners. The three Bristol Britannias recently ordered by the Government for trooping operations will be capable of doing the work of six of the smaller capacity machines now used.

The maintenance of British Commonwealth and Colonial communications has always taken into account the possibility of the hostile seizure of large areas normally open to air passage, and the denial of intermediate landing facilities calls for aircraft able to fly large loads rapidly and non-stop over long distances. This is the special characteristic of the Bristol Britannia. For example, in its Long Range version it would be able to fly from England to Singapore with one stop at Aden. Its trooping capacity on a shorter route is indicated by the fact that thirty 100-seat Britannias would be capable between them of moving 20,000 troops of Britain's future Home Strategic reserve to, say, the Middle East in a week.

Burma's Economic Monsoon

FROM A CORRESPONDENT LATELY IN BURMA

THE people of Burma, whose Prime Minister, U Nu, is in London this week, have experienced a succession of crises since gaining their independence. But the next crisis, if it comes, will follow a new pattern. Burma still has a big internal security problem, and only in the larger towns is the writ of the government accepted without question. But rebellion is now reduced to banditry, sabotage and blackmail. The insurgents cannot hope to challenge the expanded and reorganised Burma army in the field ; indeed, all the time the army is driving the remaining rebels into ever more remote hide-outs.

Burma is now faced with something much less dramatic but no less dangerous: a balance-of-payments crisis. Despite the rebellion, with its destruction of capital assets (notably the railways), restriction of economic activities and the fading away of the national revenues, the Government has hitherto managed to keep the machinery of administration turning over and has even begun to lay the foundations of a welfare state. This has been achieved almost entirely from the profits obtained from one staple commodity, rice. The export of rice is a state monopoly ; it is bought from the cultivator and sold overseas through the State Agricultural Marketing Board. Thanks to a world scarcity and the Korean War, prices rose from £40 per ton in 1949 to £60-70 per ton in mid-1953. The price to the cultivator remained constant at £22 per ton: the government took the difference. Between 1948 and mid-1953, Burma's foreign exchange reserves were trebled, until they stood at some £97 million.

As world rice prices weakened after June 1953, Burma, with its state-trading, tried to stand against the tide. But negotiations with other governments met with increasing resistance and at length Burma had to bring down prices. Because of this delay, less than half the 1953-54 crop was exported ; 1½ million tons remained in store. During recent months, the Government has been obliged again to lower its prices—even those laid down in long-term agreements. Thus, in February, Ceylon pressed for and obtained a reduction from the agreed price of £48 to £42 per ton for the current year. The disposal of the rice carried over from 1953—and even from 1952— has been difficult: some has gone at £15 per ton as animal feeding stuffs. The Government now has to dispose of an estimated 1¾ million tons from the recent harvest and there is a frenzied search for new buyers.

It is hoped that promising new markets may be found in China and Japan. Last November, a barter deal was signed with China, and in March a further exchange, rice for cotton and silk goods, to the value of £6 million was announced. Japan has been buying increasing quantities of rice for about five years. Both countries stand to gain from the relationship: Burma wishes to draw heavily on Japan for manufactures and for "services"—the employment of Japanese experts in the rehabilitation of Burma. Japan needs to replace the rice it used to get from Manchuria: this year it is buying 220,000 tons of Burma rice. Burma would have liked to send more, but in the past Japan has not been too pleased with the quality received.

Meanwhile, Burma is in the middle of the first stage of a national investment programme ; factories, power plant, diversification of agriculture, better communications, hospitals, schools, an expanded university. Some of these projects originated before independence, but virtually all capital investment came to a halt between 1948 and 1952. In the latter year, the *Pyidawtha* conference and the two thousand page report of a group of American engineers and economists (usually termed the KTA Report) opened up a wide vista of economic and social development. After the relatively inexpensive planning phase, Burma has now entered the expensive building phase. The construction of new schools and hospitals is ahead of the new factories and power stations. A great deal of money is required, and for several years—an optimist might say four or five—this huge expenditure will show no dividend in the shape of new or increased economic output. Already Burma's reserves have fallen to one-third of the 1953 total, and the KTA plan which was based on a calculation that the price of rice would not fall below £55 per ton, provided for an investment programme of some £600 million by 1960. Clearly, something must be done.

Help from Abroad?

The Government can institute drastic cuts in its development programme. This possibility is already being explored. The civil servants in charge of such key departments as finance, national planning, trade development and industry are continually in conference at the Prime Minister's residence, scrutinising all projects that make heavy demands on foreign imports or require the aid of many foreign experts. But a half-built steel mill or pharmaceutical factory cannot just be abandoned. Much of the programme must be carried on, although, no doubt, at a reduced tempo.

An attempt to expand and improve rice production, which is still little above one-third of its prewar level, is unlikely. The organisation of the State Agricultural Marketing Board is barely competent to handle the existing quantities of rice, while the rigid price-system would make the cultivator laugh at any suggestion of improving his crop. The Marketing Board and the Dock Labour Board are riddled with corruption and inefficiency which lead to delay, thefts, rotten packaging, inferior quality and hazy bookkeeping. Moreover, at the International Rice Conference held last November in Rangoon, U Kyaw Nyein, the Minister for Industries, came out flatly against further efforts to increase rice productivity.

There remains the possibility of obtaining outside assistance. An application last year for a loan from the World Bank has not yet met with a definite response. American aid, cancelled by Burma in a moment of anger in March 1953, is not at present available. Colombo Plan assistance is useful, but is not the answer to the present pressing problems. In these circumstances, Burma's success last September in concluding a reparations agreement with Japan, is of some importance. Japan is to pay $200 million in the form of capital goods and services. In addition, it will invest $50 million in Burma in "joint enterprises"—co-operative industrial and commercial activities. The annual Japanese contribution will represent one-quarter to one-third of the public capital formation of Burma for a period of ten years, and it is possible that Burma's trade, hitherto thickly woven into the sterling area, will have assumed a very different pattern at the end of the coming decade.

Notes from New Zealand

(These Notes are Contributed by Our Correspondent in Wellington)

Embarrassing Surplus

NEW ZEALAND'S new Finance Minister, Mr J. T. Watts, will be under considerable pressure to make substantial reductions in taxation when he presents his first budget after the House of Representatives resumes in mid-July. The public accounts for last year, recently released, showed a surplus of £9.9 million, but transfers to various other accounts made the actual surplus over £20 million. There were two major causes for the surplus: considerably increased tax returns from all sources and an under-expenditure of £7 million on works, which was chiefly due to shortages of labour and materials. Although the present Government has made modest, but steady, tax reductions in successive budgets, tax returns have continued to increase. For instance, despite last year's concessions in this field, income tax returns last year are now shown to have been £7 million above the estimates.

The Government can point out that it has a very large works programme ahead of it, including the essential development of further sources of hydro-electric power. It can also point out that its defence commitments must increase with the assumption of new responsibilities in South East Asia. Nevertheless there will be very strong pressure upon it to reduce the burden of taxation. Mr Watts may find it politic to concede the point because, in spite of the present level of prosperity, the Government has suffered some loss of popularity which it cannot afford to ignore. After the general election last November, it was returned to power with a sharply reduced—though still adequate—majority and with a more vigorous opposition to contend with. Since then it has been subject to strong criticism on several politically important domestic issues, notably shortages of electric power and cement, its administration of the police force and continuing difficulties with housing.

* * *

Cement in the Works

CEMENT, or the lack of it, has for some time grated in the works of the New Zealand building industry and matters came to a head early this month, when the Government convened a meeting of representatives of the cement manufacturers and importers with its own representatives and announced that imports during the next two months would be doubled. It also announced that storage plants would be built as soon as possible at several North Island ports. One such plant has already been built at Wellington but is not yet fully operating. At the conference, representatives of the Master Builders' Federation, incensed by repeated shortages, and dismayed by the prospect of laying-off men, told the Government that their patience was exhausted and that the New Zealand cement makers had fallen down on the job.

New Zealand, which is at present one of the largest users of cement in the world (532 lb of cement per head of the population last year) has only three cement works—one in the north, with headquarters in Auckland, one in the centre with headquarters in Wellington and one in the south with headquarters in Dunedin. These three companies do not compete against each other, but divide the country into three zones. Plans are well advanced for the establishment of two more smaller cement companies.

Under an arrangement made in 1949 by the Labour government, the three existing companies also control all imports of cement through an ancillary, non-profit making company which has the task of balancing home production and imports with demand. It collects a levy on cement made in New Zealand—at present five shillings a ton—to cover the cost of imports and the equalisation of prices; the latter are fixed by the Government which, through its various works agencies, is the major user of cement.

Recurring shortages have led to charges that, through the exercise of a virtual monopoly, the New Zealand cement manufacturers have kept supplies too tightly screwed down, and have lagged behind in providing storage space for imports. But the three companies have in fact nearly quadrupled their fixed assets in land, buildings and plant since 1949 and, in doing so, have increased their production considerably. There is now strong agitation for more freedom to import cement and some criticism of an agreement made by New Zealand to take the bulk of its overseas supplies of cement from the United Kingdom, on the grounds that the British Cement Federation itself tightly controls prices and supplies.

* * *

Prescription by Commission

FROM April 28th until May 25th, when proceedings were adjourned for a fortnight for recovery of breath, New Zealand listened—or did not listen—to a Royal Commission on Monetary Affairs taking evidence on a wide variety of subjects related to the banking and general financial system of the country. What the commission is likely to achieve, how long it will take to conclude its discussions and present its report and whether the Government will take any notice of it when it does, are anybody's guesses. The attitude of most New Zealanders is that this is just another commission and that they have had too many of them already.

The commission was established largely at the instance of the Prime Minister and (then) Minister of Finance, Mr Holland, after the general election last November when the National Party had its majority of 20 cut down to 10, and the New Zealand Social Credit League polled 112,000 votes or over 11 per cent of the total, to the astonishment and chagrin of both established parties. Mr Holland, in a mood for soul searching after the election, decided to find out what was wrong; and one means of investigation is apparently to be the monetary commission which is intended, among other things, to bring social credit theories impartially under examination and, presumably, to show them to be impracticable. That, of course, is not on the commission's order of reference but, in the judgment of most bystanders, it is one of its purposes. In fact the commission, so far, has been chiefly occupied with a rather unrewarding effort to ascertain the respective spheres of influence of the Reserve Bank, the Treasury and the Government in the evolution and administration of banking and credit policy.

The commission consists of six members with the Judge of the Court of Arbitration, Mr Justice Tyndall, as chairman. The other five members are a barrister, a public accountant, a managing director of a farmers' co-operative trading company, a general manager of a large furniture and hardware retailing firm, and the managing editor of a provincial newspaper. In an effort to establish the impartiality of the commission, the Government announced that it would not invite anyone to join it who had written or spoken extensively on banking and economic subjects. This provision may well vitiate the usefulness of the tribunal a good deal. It is also difficult to reconcile with the fact that the chairman of the commission has made many pronouncements on monetary and allied matters in their bearing on wage demands before the arbitration court. Moreover the outspoken president of the New Zealand Federation of Labour, Mr F. J. Walsh, who has devoted a lot of time to economic criticism, was also invited to join the commission but refused. He is now appearing before it as a forthright critic of Government, Reserve Bank and Treasury policy. The fortuitous arrival in New Zealand of the distinguished Oxford economist, Mr Colin Clark, has added spice to the proceedings. Mr Clark, ever an outspoken critic, offered the commission some blunt views on New Zealand inflation which he asserted was largely of its own making. Of the country's housing shortage, he characterised the government's policy as "trying to bale out a boat with a sieve." And when asked to comment on Social Credit theories Mr Clark said "they had well-intentioned features but mistakenly interpreted facts." The Government, which is beset with many difficulties, both political and commercial, may find this constant public examination of its financial machinery decidedly embarrassing.

* * *

The Case of Mr Compton

ONE of the most contentious domestic issues encountered by the present New Zealand Government has been the administration and state of mind of the New Zealand Police Force. Some of the dissatisfaction within the force goes back a number of years and follows the familiar pattern of pay and conditions and recruitment difficulties. But in December, 1952, the Government appointed a comparatively junior sub-inspector, Mr E. H. Compton, then aged 51, over the heads of 33 other officers, first to the position of Assistant Commissioner and then, on the sudden death of the then Commissioner, to the senior position. This sudden preferment of Mr Compton was not well received.

Shortly after Mr Compton took office as Commissioner, allegations were made by a national weekly newspaper that he had tapped the telephones of bookmakers while he was head of the anti-gaming squad in Wellington. It was also alleged that after he became Commissioner he had improperly used police materials and workmen to carry out certain work at his private residence. Although these charges were at first denied, the Government later agreed to hold an enquiry to be conducted by a retired Judge of the Supreme Court, Sir Robert Kennedy. The scope of the enquiry included charges that certain police officers had accepted "hush" money from bookmakers, that the police had been lax in their administration of the liquor licensing laws, and that there were officers serving in the police force who had criminal convictions.

The two interim and one final report presented by Sir Robert Kennedy found that Mr Compton had tapped bookmakers' telephones on two widely separated occasions—which he admitted—but that it was then legal to do this. He also found that Mr Compton had had certain work improperly done at his residence. On all other counts the police were exonerated. Sir Robert did, however, comment upon the difficulty of obtaining evidence from witnesses who might incriminate themselves.

* * *

Explosive Police Debate

Soon after the tabling of the third Kennedy report, the Prime Minister, Mr Holland, announced that the police force was to be temporarily controlled by a commission of three senior officers, all with equal powers and with Mr Compton as its chairman. This was followed by an announcement in April that the Government had accepted the voluntary resignation of Mr Compton. It proposed to compensate him for loss of office by a cash, tax-free payment of £6,000, to make him a superannuation allowance of £812 a year and to pay him approximately £1,400 in lieu of accumulated leave.

This announcement precipitated a thoroughly explosive debate in the House of Representatives when Mr Holland introduced a bill to validate the proposed compensation and to replace the commission by a civilian Controller-General, Mr S. T. Barnett. The Opposition fought the bill through a non-stop session of 36 hours including 18 divisions, but without persuading the Government to agree to any substantial amendment. There was strong condemnation of the compensation to be paid to Mr Compton, even stronger condemnation of the Government for its handling of police matters, and some adverse comment on the policy of bringing in an outsider to control the police force.

The debate aroused widespread interest throughout the country and by no means along party lines. The solution that Mr Holland forced through the House, has in the main, been accepted. But the affair has left its marks on the Government. Mr Holland is obviously staking a good deal upon the ability of Mr Barnett to reorganise the police force, remedy its grievances and improve its efficiency during the next two years. If the new Controller-General can do this before the next election, Mr Holland will be able to claim that the highly controversial settlement with Mr Compton has turned out to be for the public benefit.

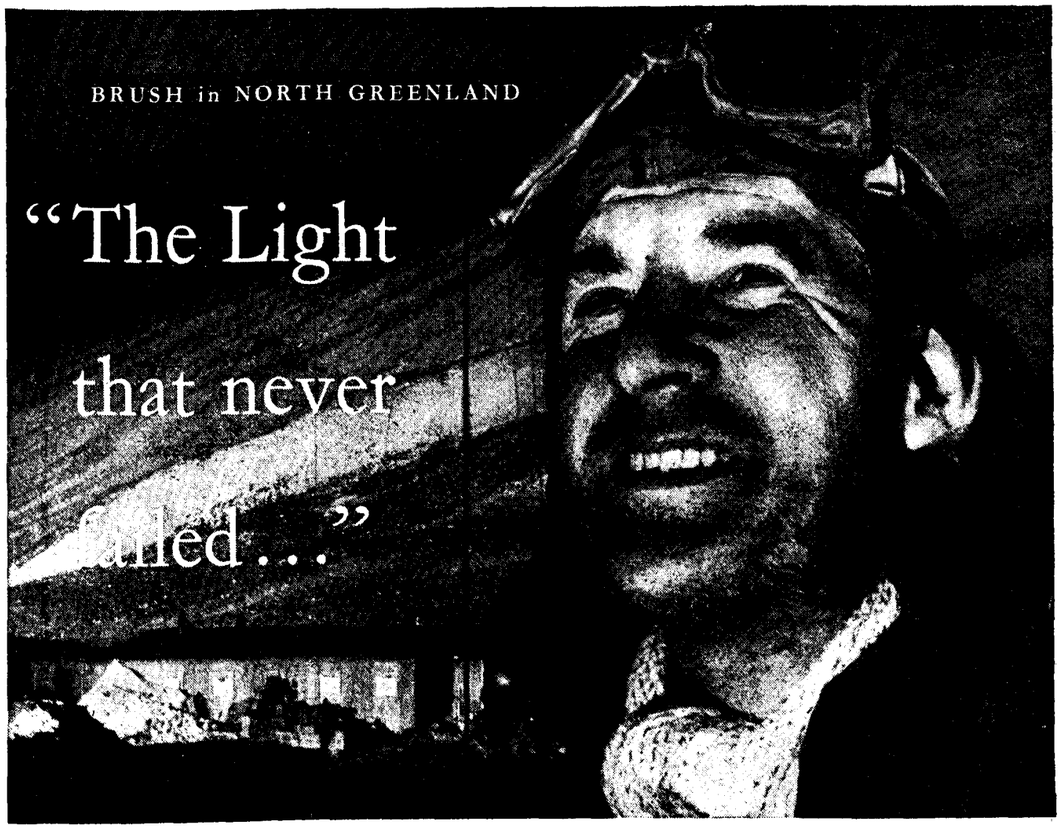
Candidates for 1956

Washington, D.C.

A COMBINATION of various events and disclosures has now produced a clearer picture than is usually obtainable so early of who will be the contestants in the next presidential election, in November, 1956. The way seems to have been almost completely freed for Mr Adlai Stevenson to have another try as the Democratic candidate, and those close to the President are now becoming convinced that Mr Eisenhower will agree to run for another term. There have been vast fluctuations of opinion on both these points and recent visitors to Washington from the hinterland were surprised to find some even-money wagering going on that the President would not face another campaign. Now all this is changed, and he is regarded as a candidate.

Two important developments have produced that same view about Mr Stevenson. When he returned from his recent trip to Africa, he talked with several of his closest friends and supporters, and the newspapers were suddenly flooded with reports that he had made up his mind to run again. Capping this series was a story sent to the *New York Times* from Chicago saying flatly that he would accept the Democratic presidential nomination in 1956. Mr Stevenson was not quoted directly, but it was perfectly evident to those familiar with American political techniques that the reporter had talked either with Mr Stevenson or with someone having the knowledge and authority to speak in his stead. In other words, the story was accepted as having the full weight of an "announcement," while leaving Mr Stevenson still technically uncommitted. There are both legal and tactical reasons for deferring a formal statement, and there is a strong possibility that it may be many months before Mr Stevenson himself announces his candidacy.

At about the same time, other men who were regarded as being competitors seemed to remove themselves from consideration. These included Senator Stuart Symington, of Missouri, Senator Estes Kefauver, of Tennessee, Senator Richard B. Russell, of Georgia, and Senator Robert Kerr, of Oklahoma. However, Mr Kefauver maintained a claim on the right to enter the contest by saying that he might change his mind about not being a candidate. The two most challenging figures left in the field with Mr Stevenson are Governor Averell Harriman, of New York, and Governor Mennen Williams, of Michigan. They have both said they will defer to Mr Stevenson if he wants the nomination again, but they have also made it plain that if he does not want it, they will try hard for it. This is for the present an entirely amicable arrangement, but that it may not be strong enough to withstand the pressures of politics and presidential ambition is the one cloud on the Stevenson horizon.



Mr Stevenson and Governor Harriman came to a personal understanding in a week-end of face-to-face conversations at Mr Harriman's official residence earlier this year. However, Mr Harriman, as the head of government in the great State of New York, is a tremendously influential figure in Democratic politics. He is ambitious, he likes the large affairs of the world, and he is of an age, nearly 64, which means that, if he does not try for the Presidency in 1956, his last opportunity is almost certainly lost. While he and Mr Stevenson deal with one another with the best of manners, they exchange no deep personal devotion.

Even if Mr Harriman successfully controls his own ambitions, there are other powerful men, ambitious in his behalf, who might try to make him the nominee anyway. In this category are the political leaders of New York City, especially Mr Carmine De Sapio, head of the Democratic organisation there. They have no love for Mr Stevenson and owe him nothing, and must naturally be fascinated by the prospective rewards of placing their own man, Mr Harriman, in the White House. Similarly, the labour leaders of industrial Michigan might be stirred to efforts on behalf of the young Governor Williams, who has had a spectacular Democratic success in what was a Republican state until he came along.

★

It is quite clear that Mr Stevenson is prepared to make a real fight for the Democratic nomination, if necessary, and a much more militant struggle for the Presidency than he did in 1952. He was not spurred, that year, by any real feeling that the election of Mr Eisenhower would be bad for the country. Now, Mr Stevenson and the Democratic intellectuals who surround him are genuinely disenchanted with the Republican rule, and will fight vigorously to bring it to an end.

Mr Stevenson has dropped the self-consciously statesmanlike approach to political conflict. He has criticised the Administration's policy in the Far East extremely sharply. In a recent speech in New York, he hit hard at the Administration's handling of the anti-polio immunisation programme and at what he asserted was its neglect of

41° BELOW ZERO. In North Greenland, 800 miles beyond the Arctic Circle, lie endless wastes of ice over 10,000 ft. thick. This is the Arctic where breath freezes with a hiss. It is also a 'weather factory' for more temperate regions. That is why 25 scientists and officers of the British North Greenland Expedition are spending two years there to study meteorological conditions. To provide power for lighting and radio communication at their Britannia Lake Base Camp the expedition chose a Brush Group Diesel Generating set. During midwinter, when North Greenland is totally dark for two months on end, this generating set runs for twenty hours a day. Last winter, operating at an outside temperature of −41°F, this Brush equipment never, at any time, gave trouble in starting, running or maintenance. From laboratory prototype to production unit all Brush manufactured equipment is subjected to a rigorous testing process. It is the strict system of tests and controls at all stages which results in the outstanding performance of Brush units under the toughest operating conditions all over the world. Today, the up-to-date production facilities and skilled engineers of the Brush Group organisation are joined to a vigorous development policy and a thorough grasp of world requirements. That is why Power Engineers all over the world increasingly look to Brush to provide them with the reliable job-tested type of Power Equipment they need.

THE GROUP APPROACH. As rationalisation progresses in Britain's major industries, there is a growing trend for complementary companies to combine together into larger, more effective units. The Brush Group is an outstandingly successful example of this grouping of old-established companies into an homogeneous production and selling organisation. The Brush Group is the world's biggest exporter of diesel engines. Last year Group companies manufactured and sold over £20,000,000 worth of electrical and diesel equipment. The immense and mounting resources of this remarkable consortium of men, machines and enterprise is playing an ever-increasing part in building the economic future of Britain.

research in public health. There was a clear implication of a coming attempt to picture Republicans as being people so essentially cold-blooded that they do not care whether Americans are well or not. The Democratic party is not fully agreed on how to deal with President Eisenhower, but Mr Stevenson has shown that he, at any rate, intends to attack directly, no matter how popular the adversary may be.

The new and firmer belief that Mr Eisenhower will run again is supported by the greater pleasure that he is now taking in his office. At a recent press conference, he delivered a homely little talk on the subject. He said he still did not like politics, in the derogatory sense of that word, but he went on to describe in most glowing terms the "fascinating" experience of having "thousands of unique opportunities" to meet leaders from all over the world, and of possessing the authority and the influence to work toward the establishment of peace.

At the same time, the President spoke of the utter necessity of an identity of views between a President and his Vice President. He went so far as to say that if a vice-presidential nominee were not acceptable to the presidential nominee, then the presidential nominee should immediately step aside. The political analysts immediately took this to be an endorsement of Vice President Nixon and an indirect criticism of Senator William Knowland, the Republican leader in the Senate, who has differed with the President on very important matters of policy, and who probably has vice-presidential ambitions himself.

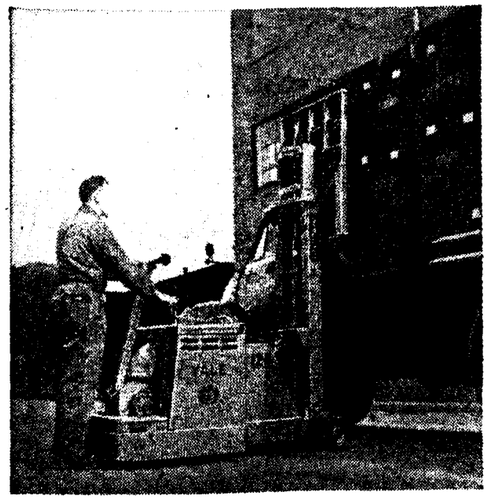
Senator Knowland, a natural rival of his fellow Californian, the Vice President, would certainly cry for the presidential nomination if Mr Eisenhower did not want it, and the possibility exists that Mr Knowland is considering an open break with the President. The Senator has repeatedly implied that the course of presidential action which is generally described as disengagement and negotiation is flirting with appeasement. The time bomb in this situation is the destiny of Quemoy and Matsu. If they passed to Communist China, then Senator Knowland, who sincerely believes that matters of the gravest principle are involved, would almost certainly make that the breaking point between him and the President. Few observers believe that there is any large or strong body of opinion in the United States on Mr Knowland's side, but he could still create an extremely difficult political situation within the Republican party. It is the sort of thing President Eisenhower has always liked to avoid, but he now seems to have made up his mind that there is going to be no appeasement of Senator Knowland.

Exploring Avenues

HURRYING from embassies on Massachusetts Avenue to presidential offices on Pennsylvania Avenue, officials have been gathering their diplomatic baggage for the coming expedition into the jungle of negotiations with the Soviet Union. The route is well-mapped—from western foreign ministers in New York this week through foreign ministers of all kinds in San Francisco next week to heads of government in Geneva in a month's time—and the dangers and frustrations are well-known. But this time there is genuine hope, if not all over Washington, at least in the White House, that the explorers may come back carrying an armistice in the cold war. President Eisenhower has warned Americans that this would be only a beginning, that it may take a generation of constant vigilance to reach a lasting and just peace. But he believes that a significant change is taking place in relations between the East and the West. In stressing this, he is as usual interpreting the mood of his countrymen more sympathetically than is his Secretary of State. Meanwhile, Mr Dulles, answering all questions with damping diplomatic caution, is being accused by Mr Stevenson of lacking the flexibility to compromise.

Even Mr Dulles, however, admits that encouragement is to be found in the signing of the Austrian treaty and in the Russian approach to Jugoslavia. In his opinion these moves suggest that the Soviet might now possibly be persuaded to go a little way toward honouring the Yalta and Potsdam pledges and allowing the satellite countries—Czechoslovakia, Hungary and Poland—more freedom. This is naturally one of the main topics which Mr Dulles wants to discuss at Geneva. One he does not want to discuss is the situation in the Formosa straits; he feels that any attempt to put the informal cease-fire there on a more permanent footing would be likely to lead only to a new outbreak of hostilities. Mr Krishna Menon has not been very warmly received in Washington partly because he is stirring up this sleeping dog in his attempt to foster a general settlement in the Far East. But another reason why he is suspect is because he represents a neutral power. By contrast Dr Adenauer, already a Washington hero, has justified the enthusiastic confidence placed in him by his firm agreement that "the concept of neutrality is in no way applicable" to his country, even should the Russians make it the price of reunification between Western and Eastern Germany.

Wages for Tomorrow



AT dawn on Monday the General Motors Corporation and the United Automobile Workers signed a momentous contract, after more than sixty days of negotiation and under the immediate pressure of unauthorised strikes in some twenty plants. Like the contract agreed to a week earlier by the Ford Motor Company, the new pact commits the world's largest manufacturer of automobiles to the principle of supplemental unemployment benefits, based on a trust fund of $150 million to be set up by the corporation. The General Motors contract differs from the Ford agreement in several important respects; but it joins Ford in the essential recognition that employees who are laid off are to receive substantial benefits—varying between 60 and 65 per cent of take-home pay—for as long as twenty-six weeks. To call such an arrangement a "Guaranteed Annual Wage" is to be inaccurate, but there can be no doubt that it represents a tremendous victory for organised labour and will deeply affect the national wage picture.

Already, there are dire prophecies that smaller industries and businesses will be forced to merge or disappear because they cannot afford the enormous reserve funds required to

finance the new wage plan. Economists are pointing out, moreover, that the Ford and General Motors agreements pre-suppose sustained prosperity. Others argue, however, that once the fund is established, it will act as a brake on deflation and will stabilise consumption. In fact, the impact of GAW on the rest of American industry will not be immediate or universal. In 1956, it will become a basic issue in the steel industry—where the idea was first conceived—and "some kind of similar plan" will be asked for by the electrical workers' union in September. But few unions wish to risk driving their employers out of business; later on drawbacks in the whole scheme may be discovered.

Not the least of these will be the legal problems attached to reconciling GAW with present state unemployment benefit laws. In most states, an employee is not eligible for state unemployment compensation if he is being paid by an employer, but GAW is based on the idea that corporations will not pay benefits except as a supplement to those given by the state. The Ford contract specifies that unless state laws are adjusted before June 1, 1957, the GAW plan will terminate. In such states as Michigan and Ohio—where a great percentage of automobile workers is concentrated—quick action is likely, but the same may not be true elsewhere.

Up to the President

THE new trade agreements Bill, giving the Administration power to negotiate tariff reductions of 5 per cent a year for three years in exchange for concessions from other countries, has been finally approved this week, after a month's delay. This was caused by the reluctance of members of the House of Representatives to agree to the protectionist amendments added by the Senate; since the Administration had accepted these amendments, the struggle against them was in fact almost pointless.

One small concession was, however, obtained: in the clause providing that, for a higher duty to be recommended by the Tariff Commission, an industry need only prove that it was being injured "materially" by imports, the operative word became "substantially." In the old Act imports had to be the sole cause of an industry's difficulties for it to become eligible for relief. The Senate also made it possible for an industry to claim relief if only one section of its output is being harmed by competition from imports, even though in its operations as a whole it is still doing well. These and other amendments will undoubtedly add both to the number of appeals to the Tariff Commission and to the pressure on the President to allow a higher duty when this is recommended by the commission. But at least the final decision is still up to him and there is no reason to suppose that he will be any more ready to allow tariff increases in the future than he has been in the past.

Almost the only example, but a notorious one, of such an increase being allowed was the rise in duty on Swiss watches a year ago; it was excused on the grounds of the importance of the domestic industry to the national defence, something which the new Bill specifically instructs the President to consider. The psychological impact of this increase has just been slightly mitigated by compensatory reductions in other tariffs, although the amount of trade involved is too small to make up to the Swiss for the full effects on their chief export to the United States. The new agreement with Japan, also just negotiated under the old foreign trade Act, may not, however, lead to so many claims of injury as had been forecast. The Senate saw to it that Japan should not be eligible for the additional concessions obtainable under the new Bill. Furthermore, no tariff reductions have been granted on higher grade cotton piece goods, which means that the threat to American textile manufacturers is not so serious as they expected. Their fear of Japanese competition has given Senator George a chance to try to enlist their support for an easing of restrictions on east-west trade. Such a relaxation would enable the Japanese to find markets in Communist China and lessen their dependence on exporting to the United States.

Competing in the Sky

New York

AS Capital Airlines prepared to bring into service the British Vickers Viscount, the first turboprop airliner to be certified for commercial operation in the United States, and as Continental Airlines was hinting that it may follow Capital's example and buy Viscounts, two developments have made it clear that the American aircraft industry intends to dispute the British lead in both turboprop and pure jet civil airliners. As its first American competitor the Viscount will have the Lockheed Electra, 35 of which have just been ordered by American Airlines at a cost of about $1.8 million each. The Electra, a four-engined turboprop with a cruising speed of over 400 miles an hour, is said to be 100 miles an hour faster than the Viscount, with a range of 2,000 miles compared with the Viscount's 1,650 and seats for 64 passengers compared with the Viscount's 44. But as the Electra exists only on paper, its claims are still unsubstantiated. The first aircraft is optimistically due for delivery towards the end of 1958, with all 35 to be in America's hands by mid-1959.

It is significant that, although the Lockheed design provides for the installation of General Motors' turboprop engines, the 3,750 hp Allison 501 recently certified for commercial operation, the selection of this engine has not been confirmed, and the aircraft will be designed to use, with little modification, engines developing up to 5,000 hp. The field is still open, therefore, to a British turboprop engine, and American Airlines is reported to be well disposed at present towards the Rolls-Royce RB 109 turboprop, if the exacting standards of performance and delivery dates can both be met. Now that American Airlines has taken the plunge, Eastern Airlines, which has similar requirements for a medium-distance aircraft, is expected to follow suit with a larger order.

Meanwhile, in the Douglas Aircraft Company's Californian factories, a competitor to the de Havilland Comet is taking shape. Last week, in what appeared to be an attempt to beat the Lockheed gun, Douglas announced that it had decided to build, without government backing, its DC-8 pure jet commercial airliner and to have it ready for flight testing by the end of 1957, and for initial airline delivery in 1959. The DC-8, to be powered initially by four Pratt and Whitney J-57 jet engines, is to be capable of cruising at 550 miles an hour, carrying 80 to 125 passengers, and completing a non-stop New York to Paris flight in 6½ hours.

No order from an airline for this aircraft has yet been announced and the prospect of early commercial certification is still bleak. But Douglas has begun an intensive sales campaign, looking to United Airlines, known to favour the pure jet for trans-continental flights, as a most likely first customer. Both American and Eastern are expected to round out their fleets, with jets for trans-continental flights supplementing the turboprops on the middle distance hauls. Nevertheless, the large backlog of orders for the latest versions of the Douglas DC-7 and the Lockheed Super Constellation shows that, although the piston engine has at last begun to give ground to the turboprop in America, the transition is certain to be slow.

Verdict on the Vaccine

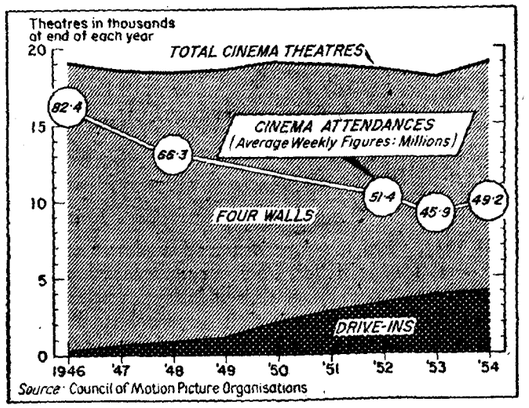
LAST Friday the Public Health Service at last issued its report on what went wrong with the Salk poliomyelitis vaccine, which was approved with so much publicity two months ago, only to be withdrawn when a number of children developed infantile paralysis after being inoculated. The blame is pinned to the mass output which had been organised in order that all children of the most vulnerable ages might be immunised before the present polio season opened. The fault apparently lies not so much with the methods used for this large-scale production as with the unexpected fact that Dr Salk's process was not so safe as he had originally supposed. A certain proportion of the vaccine was found to contain live virus which the established tests were not strict enough to detect.

Now the official requirements have been made much more stringent and the government has set up a new Division of Biologics Standards. This is designed not only to keep a better check on future supplies of the vaccine but also to ensure that similar disasters do not occur when other virus vaccines are developed. Probably the most important aspect of Dr Salk's work is the prospect it has opened up of vaccines against other hitherto intractable diseases, influenza, for example, and even the common cold. That new standards and a new agency are considered necessary is an admission of error by the government. And there still remain many questions to be answered, regarding in particular the timing of the inoculations and their after-effects in certain cases.

Nevertheless, the basic trouble undoubtedly arose from the sensational leap out of last year's trial inoculations into this year's nation-wide programme of immunisation. If a further experimental scheme, even a very large-scale one, were all that had been attempted this year and if the public had been warned that there were still risks attached to the vaccine, then the terrible disappointment of recent weeks would have been avoided. But it must be remembered that the National Foundation for Infantile Paralysis, the independent charitable organisation on which the main responsibility rests, would not have had the money to finance the development of the vaccine and the free inoculations if it had not for years been employing all the arts of the publicists to raise funds. Even now practically no one suggests that the Salk vaccine is not an extremely valuable weapon against the polio menace.

Box Office Recovery

New York



IN 1953, when the American motion picture exhibitors were seeking relief from entertainments tax, they gave a dismal account of their industry. Weekly attendances had been almost halved, from an average of 82 million in 1946 to 46 million in 1953, and of the 19,000 indoor cinemas operating in 1946 over a quarter had closed their doors by the end of 1953. A year later, attendances, although still well below their postwar peak, had begun to rise, and nearly a thousand of the closed theatres had reopened. Exhibitors can now view the future with less apprehension, though not all of the new trends are to their liking, and some ominous clouds can be seen rising on the television horizon.

The reversal of the long decline was caused by the happy coincidence of three factors: the success of the exhibitors' well organised campaign for tax relief; the welcome discovery that in city after city the inroads of television into receipts at cinema box offices had reached at least a temporary saturation point; and the adoption of the new wide screen techniques and the increasing use of colour. But although the film industry's share of the entertainment cake has stopped shrinking, the exhibitors are still dissatisfied with their portion, and claim that the producers and distributors have stolen most of the icing. Film rentals, paid by the exhibitors to the distributors, have risen sharply from the traditional 30 to 40 per cent of box office takings to a more frequent 50 per cent, and in special cases run as high as 70 per cent.

The cause of these higher rentals, according to the exhibitors, is a shortage of films. The Hollywood studios, which turned out well over 400 pictures in each of the early postwar years, made only 303 feature-length films in 1954. This, the exhibitors allege, was the result of a deliberate policy of restricting production to force up film rentals. These allegations are, of course, denied by the producers who claim that higher rentals merely reflect higher production costs. Shortages are caused by the difficulties of meeting the demands of a more discriminating public for films of a consistently high quality.

What the public is demanding are spectacles based on the Bible, on best-selling novels or the most successful stage plays and musical comedies, starring the most renowned actors, and produced in colour on one of the new wide screens. Today's lavish productions take longer to shoot and cost more to make than previous films. In some studios, output was also retarded last year by the technical problems of conversion to the new widescreen techniques. Of the feature films produced by Hollywood in 1954 over one-half—for the first time—were filmed in colour, and

nearly a quarter were filmed in Twentieth Century Fox's "Cinemascope," Paramount's "Visa-Vision" or similar processes. Other producers are free to use both Cinemascope and Vista-Vision (although they are charged a fee of $25,000 a film for Cinemascope and required to shoot

in colour), but some held up production until it was quite clear from the reaction of audiences which way the cat had jumped.

Technological changes in the studios have their counterpart in the cinemas, which must be adapted, often at considerable cost, to show the films made with new processes. Few cinemas can match the 70 by 28 foot Cinemascope projection on New York's Radio City screen or provide such a full range of stereophonic sound effects, but over 13,000 of the country's 15,000 indoor theatres have now been converted at a cost varying from $5,000 to $30,000 each to show some form of Cinemascope. Cinerama, for which installation costs run to $150,000, has had a more limited impact so far. But a new process, known as "Todd-AO," which makes its debut in the film version of "Oklahoma," is being watched with interest.

★

As fewer films are available, the single-feature attraction is replacing the double programme. This trend seems to be approved by a "television-conditioned" public. Many theatres that once changed programmes twice or three times a week can now change only once. Simultaneously, exhibitors have had to adjust to a marked seasonal change in attendances. Ten years ago, before television opened its umbrella and when "drive-in" theatres were almost unknown, cinema attendances were fairly constant throughout the year, with a slight dip in the summer months. Now theatres remain half empty in winter, and there is a pronounced peak attendance in summer. This is due partly to the concentration of the best television shows in the winter months, and partly to the spread of air-conditioning, which boosts summer attendances in indoor theatres (and is even advertised, on occasion, more prominently than the film).

But the main reason for the summer peak in attendances is the striking growth of drive-in theatres. These are little more than outdoor car parks, equipped with a giant screen and hundreds of individual loudspeakers. The customers drive in, park facing the screen, hook up to a loudspeaker, and remain in their car throughout the programme. To Americans accustomed to living—and courting—on wheels, this form of entertainment has great attractions; not the least of these is its convenient solution of the baby-sitting problem—the child asleep on the back seat. As land costs on the outskirts of cities are not prohibitively high, a drive-in theatre can be built at half the price of a "four-wall" or indoor cinema.

But the popular drive-in, ill-suited for showing films in Cinemascope, is not the complete solution to the television age. To compete with television the cinema must offer the kind of superior spectacle provided by the widescreen techniques, coupled with the use of colour. And the difficulty of outbidding the attractions of television could be increased by the development of cheap colour television. What disturbs the cinema owners even more is the possibility that subscription television, a system in which the viewer pays for each programme received, may be widely adopted. This would offer to the film producers a home box office big enough to encourage them to release first-run films to television. But the film producers, who are already spending $80 million a year producing films specially for television, will undoubtedly attempt to maintain profitable outlets in the cinema as well.

Send the Gun-Boats

THOSE members of the Foreign Office charged with writing "very strong protests" to the American government have not had much practice since the Alabama case during the Civil War. But last week, with the arrest of Mr Ronald Cook, the British consul in Norfolk, Virginia, Whitehall had a splendid opportunity for indignation. Mr Cook was briefly detained for contempt of court on two counts. Acting in accord with instructions from London and with consular protocol, he had refused to testify in a suit for damages brought by a Pakistani seaman against the Weir Shipping and Trading Company of London. Moreover, it was alleged—at third hand—that Mr Cook had stated that "all American lawyers are crooks." Judge Walter Hoffman took the view that "British consuls cannot go out and slander lawyers." Is the implication that lesser men can? Mr Cook denied having made the statement in the first place and was released on bail.

It is odd that this storm in a tea-bag cup should have taken place in Virginia, a state that calls itself "the old dominion" and which has the unique tradition of flying British colours on the state house at Williamsburg. But then, it is from Virginia too that sprang most of the leading spirits of 1776. So far, nothing has been heard from the State Department which has been asked to obtain an apology from the judge. The suspicion that the arrival of the British note caused Mr Dulles and his colleagues to evacuate Washington on a three-day civil defence exercise is thought to be unfounded. One thing is certain: if the exchange of sharp messages can be protracted for a bit, leader-writers in *Pravda* may have some explaining to do about the "49th state."

MORE POWER AT LOWER COST

What the roc did for Sinbad, Napier will do for the air passengers of the near future. Napier engines will give helicopters their vertical lift and then, once airborne, their forward power. ***Eland*** *turbo-props will be fitted in the Fairey Rotodyne, and the* ***Oryx*** *turbo-gas-generator in a new Percival helicopter.*

Both these engines are variations on the general Napier theme: more power at lower cost.

March into the future... No. 6

Maybe one day...

That microscope is one of her most treasured possessions. For Mary likes facts — and she likes to see for herself.

Maybe one day that interest will lead her to a career in the X-ray department of a great hospital. There she will find Philips X-ray apparatus for diagnosis and therapy. And there, also, close and continued watch on processes hitherto hidden from the human eye will be made possible by Philips X-ray image intensifiers and radio-active isotopes — brilliant scientific achievements in comparison with which her old microscope will seem a plaything indeed.

Taxation of Profits and Income—I

A Philosophy of Corporate Taxation

IN the vast field for debate opened by the final report* of the Royal Commission on the taxation of profits and income, the consideration of the proper basis for the taxation of corporations must have a primary place. It is not the easiest starting point because much of the ground is unfamiliar; different aspects of company taxation have often been reviewed, but only now have they been brought together for the first time, and it is an advantage to all but the Chancellor that opposing viewpoints are deployed. If they can be satisfactorily resolved a fundamental advance in the development of fiscal principles will have been made.

Companies have been subject to separate taxation of their profits for more than a century and a half (is the Royal Commission's reference to "Addington's" Income Tax Act of 1803 his first official recognition?). But until quite recently companies were thought of as large partnerships paying tax on behalf of their shareholders and recouping themselves by deducting tax from the dividends they paid. They retained a comparatively modest amount of profits, and on these retentions tax at the standard rate seemed a reasonable substitute for the average tax rate that shareholders would have paid on them if they had been distributed. Even as late as 1920, when the Colwyn Committee reported, no specific conceptions covering the taxation of company profits were thought necessary.

Since then the distinction between corporations and their owners has been sharpened, not least because large retentions of profits have become a feature of company practice. The Commission finds no theoretical justice in taxing undistributed profits at the standard rate; nowadays that is a mere rung in a ladder stretching from the lowest reduced rate of 2s. 3d. in the £ to the highest combined rate of income tax and surtax of 18s. 6d. in the £. In 1954-55, the yield of direct taxation on the undistributed profits of companies reached £848 million—two-fifths of the total yield from all sources of income tax, profits tax and surtax combined. If personal taxation is largely governed by relative capacity to pay, what concept is valid for taxing the undistributed profits of companies? The majority propound five governing conditions:

(1) Undistributed corporate profits should not escape taxation.

(2) It would be wrong to tax those profits without recognising that they represent, though in a special form, income belonging ultimately to individuals.

(3) Because of its special form that income is *sui generis*.

(4) The special features which distinguish it are that generally speaking an individual shareholder has no direct ownership of, or control over, his "share" in those profits or the assets by which they are represented.

(5) Income represented by a right of this kind has a lower taxable capacity than ordinary income by any method of comparison that treats each as part of the total income of some individual.

This analysis will be generally accepted, but as the report admits it yields no principle to relate the burden of corporate taxation and the burden of personal taxation. The conclusion is pragmatic:

> Any corporate taxation that is not merely a method of taxation at source has to be measured according to its effect upon the undistributed profits upon which its burden will fall and . . . we must expect that the rate will be determined primarily by the current need for revenue and by the economic objects that it may be hoped to achieve by changes in the impact of taxation.

* Cmd. 9474. The subject of corporate profits is discussed *passim*, and especially at pp. 13-18, 24, 155-166, 180, 240-244, 345-347 and 382-390.

The final severance of the nexus between corporate profits and personal incomes undermines any remnant of authority that the standard rate of income tax should apply to company profits. It is small enough already since the standard rate has for years been augmented by the separate charge to profits tax, which is limited to corporate profits. Is this two-tier structure justified? Mr Crick thinks not: "The resulting tax system is an unrecognisable hybrid, complex in its application, fruitful of misunderstanding and unidentifiable with clear fiscal principles." He would substitute a single corporation tax (in place of the existing income tax plus profits tax) which would be flexible and variable to meet the requirements of economic policy and would be independent of the tax on personal incomes. His colleagues who signed the main report examine the possibilities of amalgamation sympathetically, as do the minority (though their related proposals for a capital gains tax and the separate taxation of dividends break the continuity of their argument); but they run into difficulties —administrative, rather than of principle—when they consider how credit can be given for a corporation tax paid by the company when dividends paid enter into the personal incomes of their shareholders. Their final rather disappointing conclusion is that the attractions of a single-tier corporation tax, considerable as they are, do not outweigh its disadvantages, especially as there seems little likelihood of a "negative" rate of profits tax—that is, a corporation tax at a rate below the standard rate of income tax.

★

In the view of the majority, therefore, profits tax must remain to supplement the standard rate of income tax. The way is then clear for the question: what form of profits tax? Here, to everyone's relief, there is unanimity (shadowed only by the minority's insistence that the change should be coincident with a capital gains tax). The differential rates for retained (2½ per cent) and distributed profits (22½ per cent) must go. The fiscal objections to the additional charge now levied on distributed profits are notorious. The burden of the tax on preference dividends falls on the equity shareholders. The capital structure of companies is being distorted. Above all, the provisions governing the withdrawal of non-distribution relief are unfair in themselves and lead to the accumulation of a heavy potential charge which cannot be ascertained until a distribution takes place. Distribution charges were levied on £37 million over three recent years, but no estimate of the huge quantum of potential charges is given.

On the economics of company savings the report is equally forthright. The majority have doubts whether productive investment is necessarily encouraged through the means of undistributed profits. The differential rate

> does not encourage companies to plough back profits so much as to retain them. . . . The mere retention of profits cannot be rated as an economic advantage: on the contrary it would better serve the public interest that a company should be encouraged to distribute those profits which it cannot put to fruitful use, in order that there may be a chance that they may be invested effectively elsewhere. Nor is it advantageous for the economy that the level of dividends should be kept down.

And the minority, who see in the rise in share prices (which would follow increased dividends) additional fuel for their capital gains proposals, are sceptical of the anti-inflationary virtues of dividend restraint:

> The doubling of all dividend payments—which would do no more than restore the pre-war relationship between dividends and earnings—would only add something of the order of 2 per cent to total consumers' expenditure . . . the spending of the proceeds of higher dividends is not likely to make a great difference to inflationary pressure.

So the additional charge on distributed profits is found to be indefensible on fiscal and economic considerations. Indeed, any discrimination should logically be against undistributed profits (a step recently introduced in South Africa), since these are the profits which escape the rigours of individual surtax. The differential profits tax has no friends, and should be brought to an end.

★

To make good the loss of revenue would require an increase in the new flat rate of profits tax over the existing minimum of 2½ per cent. The majority say that the appropriate rate would be "a good deal nearer" to the minimum than to the 22½ per cent maximum, and estimates given by the minority suggest that 7½ per cent would be a round guess, making the total charge on company profits 10s. in the £. Ordinary shareholders of a company having a substantial preference issue would still be at some disadvantage, but far less than before. A change of this kind would be of greater advantage to companies which have been making large distributions, such as mining and property concerns, than to cautious dividend payers who would suffer. Both majority and minority agree that the existing provisions relating to the exemptions and abatement of profits tax should be abolished.

The report rejects the suggestion that bonus issues of shares created by capitalisation of reserves give rise to any taxable capacity that did not exist before: the shareholders possess two pieces of paper, instead of one, leaving their real interest unaffected. But a bonus issue in the form of debentures, says the report, creates an entirely new right, and it proposes that the law should be altered to the taxpayer's disadvantage by making such a distribution chargeable to surtax. It is true that the company has become the shareholder's debtor; but equally his real interest in the company as a shareholder has been correspondingly affected. The most surprising discovery in the whole discussion of the taxation of corporate profits is the majority's closely reasoned argument for charging dividends paid out of realised capital profits to surtax. Such capital dividends have long been regarded as free from any charge in the shareholders' hands. It has, indeed, been a sore point that they are regarded as "distributions" for profits tax purposes.

To what extent does the report, and in particular the majority view, establish a measure of equity between the taxation of corporate profits and of individual incomes? Debate on this point will long continue and cannot be decided to the full satisfaction of either side. It would be a misfortune if it were conducted on party lines: despite the prejudices, based partly on confusion with a capital levy, that are aroused by any suggestion of a capital gains tax (which must be left to a subsequent article) the issue is not one between Right and Left. Granted the need for a revenue of given size, the issue is how much should be contributed from the profits of corporations and how much from the incomes of individuals. To the extent that one side gains, the other will suffer.

Thus the question turns on the taxation of corporate savings, and the majority put it explicitly: "The saving of other taxpayers . . . must be found out of income after taxation. A company, on the other hand, can set aside out of profits, without any question of surtax arising, whatever amounts are necessary or advisable for the maintenance and development of its business." A sole trader with an annual profit of £15,000 is left with £4,500, after tax; a company with the same profit, and assuming a combined income tax and profits tax rate of 10s. in the £ would have £7,500. Companies have increasingly relied on the profits that they generate to supply their capital needs and one need not quarrel with the minority's figure of 28 per cent. as the proportion of net earnings which are being distributed. Between 1938 and 1953 corporate savings, after taxation, increased eight and a half times, from £95 million to £811 million, although gross profits had increased only four times and dividends were up by less than one half. Surtax-free saving on this scale is no doubt convenient to the companies concerned—the chairmen of the biggest companies insist that the capital markets of the world are incapable of supplying their needs. And although retained profits are not automatically reflected in the market value of the companies' shares they tend nowadays to be acknowledged rather more quickly than the majority and minority suggests—as witness the recent buying of shares showing high earnings yields.

There will be some who have an old-fashioned preference that companies, after full provision for capital replacement, should distribute the rest of the profits to their shareholders, leaving to them the decision whether to reinvest or to invest the money elsewhere. However this may be, it remains to decide whether the standard rate of income tax together with a flat rate of profits tax, making, say, a combined charge of 10s. in the £, is necessarily right. Much can be made of the surtax free advantages of corporate savings. But the incidence of tax on the total flow of savings, personal and corporate, is infinitely variable. The small saver does not pay surtax; the employee with a large income who subscribes to a pension scheme pays neither tax nor surtax in respect of his contributions. Individuals who have to look for their savings to the residue of incomes subject to the higher rates of surtax may think that companies get off lightly—though some of them could enjoy the same advantages if they changed their status. After all, accountants practise as companies in Germany and Switzerland and solicitors can be incorporated in Thailand. The Royal Commission has not given a final answer to this problem of taxes and savings, nor has it spoken in unison. It is impossible to prove that 50 per cent is the right rate for Corporations, and at least conceivable that it ought to be lower.

Spring-cleaning in Adelphi

BY the Government's decision to transfer responsibility for most of the metals and engineering industries to the Board of Trade, the Ministry of Supply becomes what some of its critics have demanded—a government department devoted largely though not exclusively to aircraft production. The Prime Minister described the change (which was planned as long as two years ago) as one that would free the Ministry from matters not directly concerned with "its prime task of supplying the armed forces." The way in which the Ministry has been performing this task has come in for growing criticism during the past year first from the services who were not getting their equipment on schedule; later from the public, which found the Ministry's apologia—the White Paper on Aircraft Production published early this year—somewhat complacent. Since then, there have been more signs of reappraisal inside the Ministry. It is now exclusively concerned with the supply of military equipment and the most important suppliers to the armament industries, such as light metals and electronics; some discussion is continuing about the possibility of further relieving it of responsibility for these sub-contracting industries. The Ministry continues to buy and supervise the production of all equipment used by the Army and Air Force, and all aircraft and clothing required by the Navy which otherwise buys its own equipment.

The most important armaments for which the Ministry is responsible are aircraft and atomic weapons. They are the backbone of the country's defence, consume the lion's share of the arms budget and make the heaviest demands on scientific ingenuity and productive

technique. Both are so complex that a small fault in design may be disastrous and a wrong choice of design catastrophic. The Ministry of Supply appears to have had remarkable good fortune in the development of atomic weapons, from what the layman can judge. Its record on aircraft delivery, by contrast, is chequered—so much so as to raise doubts both about the methods of co-ordination used so far and the internal administrative changes that now appear to have been made. These changes affect the method of placing development contracts, the arrangements for testing, the review of progress and the direction of pure research in advance of design. More are promised. But there seems some risk that these may treat the symptoms only—not the cause of the disease.

★

The record of aircraft development over the past ten years leaves no margin for complacency. In less than ten years, the Ministry has paid out nearly £300 million to the aircraft industry for research and development. For this sum it has received a magnificent series of aircraft engines of all types and powers that remain unbeaten anywhere in the world. It has also sponsored some good aircraft, the original Meteors and Vampires (the latter still in production) and the Canberras, the Viscounts and the big bombers. But there is also a long list of aircraft, some of which have grown old in development, others whose bones are discarded in forgotten corners: Tudor and Brabazon; Apollo and Marathon; the paralysed Princesses; the Swift and the Wyvern and a forgotten flock of little research machines beginning with the Miles supersonic project abandoned in the forties and continued year after year in big and small factories.

The ultimate responsibility for this mixed record lies at the door of the Ministry of Supply. Serious mistakes have been made at the factories. The Services for their part have contributed to delays by chopping and changing specifications. But such changes should be a direct concern of the Ministry of Supply; it should not be a mere pillar-box through which the requirements, much less the whims, of the service ministries are posted to the manufacturers. If a supply department is necessary, then its function is two-fold:

(1) The service ministries frame their requirements in the light of what they believe to be technically possible in Russia; that is, in the light of the threat they expect to meet. The first positive contribution that a supply ministry has to make is to examine those requirements and use its knowledge of industry to advise the Services on whether they can be reasonably met.

(2) The Ministry's second function is to supervise and assist industry in producing the arms. Here its relations are difficult and delicate. As the sole buyer of military aircraft, and the arbiter of much civil design, the Ministry has virtual powers of life and death over individual manufacturers. It provides them with much of their working capital as well as with their orders. In particular, under such a system the initiative to abandon work on a project must come from the Ministry; in the past it has been reluctant to exercise this power.

The Ministry needs to tackle with real energy the two basic reasons for delay: over-exacting demands from the Services, and failure by industry to meet requirements. Much of its attention so far has been concentrated on their secondary manifestations: the delays that affect flight testing and development after the aircraft has been built. The White Paper on Aircraft Production showed signs of a fresh and less rosy outlook about designers' abilities to work miracles. Never again, it promised, would the aircraft industry be asked to miss out a generation of aircraft and leap ahead to the next (though the industry is at this moment being asked to take just such a leap on the grounds that the intermediate stage is difficult and unnecessary). There is reason to believe that both the services and the Ministry are coming round to the view that if one set of requirements must be pitched as far ahead as the experts think they can see across the iron curtain, then a second, less advanced set is necessary as insurance lest the ultra-ambitious projects should fail. Such an "insurance" policy is more expensive than deliberately pitching Service requirements in a lower key, but it is the only compromise that the Supply Ministry can advise. It prevents a disastrous gap appearing in the air defences should one of two designs fail to live up to its promise.

In the past, the Ministry has not always had full value for the money it has lavished on research and development inside the aircraft industry. It is small wonder that sectors of the industry have come to assume that whatever they offer will be ordered, whether or not it fulfils the performance for which the Services had asked. Companies are at last being given to understand that they must take more active responsibility for the progress of work at their factories, and serious consideration is being given inside the Ministry to ways of writing a penalty clause into future development contracts—so that some positive sanctions can be applied to companies that fail to meet specifications.

★

Arrangements are also being made for the ministers concerned to review the rate of progress of development and production more frequently. This last change tacitly admits the basic weakness of the present system, its excessive dependence on the advice of technical experts. These experts are indispensable, but they suffer the common failing of overwhelming optimism; they never willingly admit defeat on projects that too often develop into pets. This optimism can give a company work that is more advanced and difficult than it can handle. It takes more than a good idea to build and deliver an aircraft. A designer, however inspired, must be backed by a design team at least as good as himself. Critical development contracts have been placed, even very recently, with companies about whose ability to handle the work there might fairly be some doubt.

However high the level at which progress is reviewed, the ministers who will review it have still to be advised by experts—as things stand now, mainly by the same experts who were originally responsible for drawing up specifications and for placing orders. Technical advice is invaluable if it is unprejudiced, but even when it is not it cannot easily be overridden. It should not be beyond the wit of ministers to devise some advisory counterweight to the over-enthusiastic expert: a "devil's advocate" department of comparable stature has been suggested. But there seems to be only one way of getting to the heart of the difficulty. This would be to postpone the placing of development contracts until a company has something tangible for which it can seek support.

At present, the industry has had some interest in its discussions with the Ministry in making the most of the cost of development of a project in its early stages. But development costs, even for aircraft, are not inherently beyond the means of companies of reasonable and even modest resources. If orders were placed after the Ministry had a palpable project to buy instead of financing a gleam in the designer's eye, it would become easier to judge between competing designs and to assess the probable rate of their progress in production. It would not be unreasonable for the Ministry to ask manufacturers to demonstrate confidence in their designs by backing them financially in their early stages; a number of companies have already done so when they failed to win official support. Such a policy would not be immediately popular, but it would remove many of the anomalies and inconsistencies of which the industry at present complains and go a long way towards putting competition between manufacturers on a more normal footing. In the United States, where aircraft development is sponsored in much the same way as in this country, development troubles have been just as severe and the record of achievement as chequered. Some British observers find this a source of comfort, but it suggests very strongly that if the same system works unevenly and not very well in two separate countries both with aircraft industries of high standing, something is radically wrong with the system, and that administrative tinkering alone cannot put it right.

Business Notes

Industrial Shares Ride Ahead

ORDINARY share prices this week have gone from strength to strength; fixed interest securities have barely held their own. That is the story of the security markets shown by the indices. The *Financial Times* index of government securities stood at 95.48 on Wednesday, and at 95.15 on Thursday compared with 95.50 on Wednesday of last week. The ordinary share index in the same period reached the record figure of 213.7, compared with 211.3 a week earlier. But the bald picture needs qualification. Although the ordinary share index rose on Wednesday (by 1.1) following the railway settlement, the buying movement did not really gather momentum on the news; indeed it seemed to have lost a little of its force, and on Thursday profit-taking spread further and though it was fairly well absorbed the industrial index fell to 212.2. That is logical; it is in anticipation of good news that investors usually buy; on its achievements profits are often taken. But in the industrial market investors seem still to be on the feed. All the profit-taking has been well absorbed and buying of selected industrials has found the market narrow, so that price movements have been big.

Almost the opposite conditions prevail in the gilt-edged market and in other types of fixed interest securities. The institutions that make much of the running there are not on the feed for the funds and are hesitant even about the best debentures until the interest basis is firmly established and it seems unlikely that the Chancellor's cautious speech in the Economic debate will change that view. Dealings in gilt-edged are narrower than usual, and the turn, when it comes, may for that technical reason be sharp. But two considerations must be holding investors back. First the rail strike (and the dock strike not less) must have caused damage to the British economy that will take time to make good, and during that time it will be as important as ever to keep the money reins tight. Secondly, a heavy programme of borrowing, with the British Electricity Authority probably high on the list, remains to be done, and new issues would check any premature market recovery. The lists for conversion applications for exchanging the maturing New Zealand 3 per cent stock 1952-55 into the new 4¼ per cent stock 1970-73 remain open until Monday; its outcome will be of particular market interest.

Railway Strike Tally

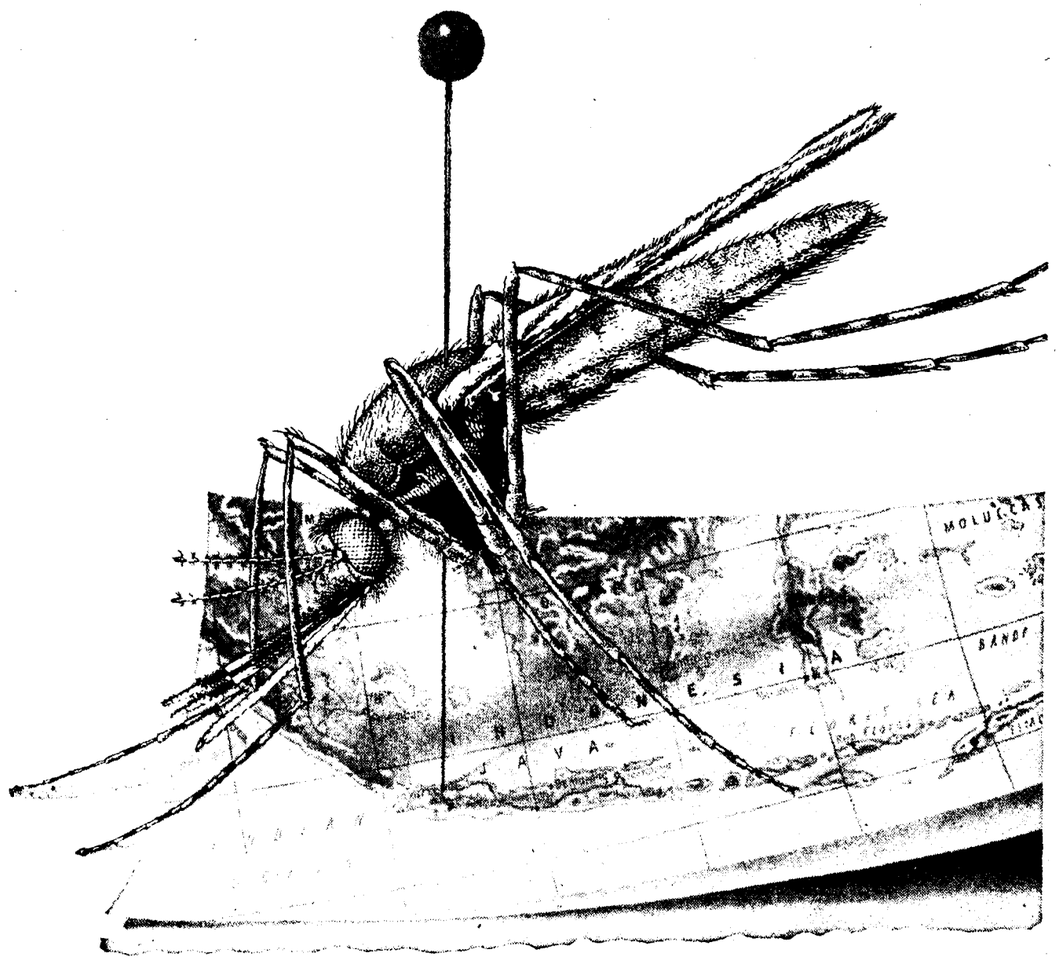
IT is too early to arrive at any reasonable calculation of the cost of the railway strike. The loss of revenue by British Railways, the forfeiture of a little coal and steel output are roughly measurable: the disruption in the rest

of industry is not. Physically, it has certainly been small and much less than most people expected ; but it may have been costly. Moreover, the dock strike still goes on ; only a third of the 400-odd ships at the six ports affected are fully manned.

With only a sixth of the footplate staff on duty (there were far fewer firemen than drivers at most depots) the Transport Commission managed to carry over a quarter of the normal number of passengers in a sixth of the usual number of trains, and perhaps a third of the normal freight traffic in a fifth of the normal number of trains. This was achieved, of course, by squashing passengers and partly by concentrating on the essential supplies that have to go by rail, such as mail, coal and minerals. These, not surprisingly, are the loads for which trains are used efficiently: good wagon loadings are possible and profit margins, incidentally, are higher. The railways may have learnt some lessons of permanent value from this experience. Without the 17-day strike the railways could have expected to earn rather more than £20 million worth of passenger and freight business. Between £12 and £15 million of this may have been lost with a very much smaller saving in train operating costs—but much of the traffic is still there to be carried and freight rates jumped by 7½ per cent on June 5th (15 per cent for consignments under 1 ton).

The turn-out of footplate staff was fortunately highest in the midlands, north-east, and in Scotland, where the bulk of coal and steel is produced, and the dock strike did not reach ports in Scotland and the north-east. With an intensive use of road haulage and no slackening in the pits the loss of coal and steel output may have been under 150,000 tons of each, which seems insignificant against the year's output hopes of 215 million and 19½ million tons. But a big task faces coal transport in shifting the 1¼ million tons or so of colliery stocks that special coal trains and lorries could not clear away, and certain steel products appear to have fared worse than others.

The clearing of this backlog and that of industry's general merchandise will take a little time, but it can be spread over the general haul. Clearance may, unhappily, benefit from the lack of demand for transport to take goods to the ports. Another week or two would have seen progressively worse trouble than this, with far more than 7,000 persons unemployed or taking premature summer holidays. But many engine drivers must be privately asking themselves whether their journeys are really as necessary as they had thought.



AEA Expands

THE Atomic Energy Authority is about to build six additional atomic piles for the production of plutonium ; it has already two in full production at Sellafield, and another two of similar capacity are under construction at Calder Hall on the same site. The new plants, which are almost exact replicas of those now going up at Calder Hall, will therefore provide for a very large increase in plutonium supplies and since, again like Calder Hall, they will have electricity generators attached to them, they will add token but useful supplies of electricity to the grid. This expansion by the Atomic Energy Authority, which is already streamlining its metal and chemical processing plants to deal with the increased flow of materials through them, is for military needs. The civil programme of 12 atomic power stations, which was announced by the Government in February, will be built and owned not by the AEA but by the Central Electricity Authority which is also expected to produce some plutonium in them that it will sell to the atomic authorities.

The additional plutonium is needed mainly to meet the demands of the services for atomic weapons. But another big development put in hand by the AEA this week is connected with the chemical side of atomic physics. A new branch at Harwell has been created to develop the use of what are now fission waste products—the split fragments of uranium atoms left after fission. These give two intensely powerful and long-lived sources of radiation. Irradiation—treatment with this radiation—can bring about certain chemical changes that are at present achieved by a combination of heat and pressure—including polymerisation, vulcanisation of difficult materials like silicones or the vulcanising of rubber without using sulphur ; it can overcome some of the limitations of transistors ; it can sterilise food, at any rate for short periods, and be used in oil refining techniques. Enough preliminary research has been done to show that the main difficulty may not be to develop uses of these fission materials but to give industry assurance of sufficient supplies. It is possible that these violent, unpleasant and unusual products, of which "caesium 137" is likely to be the first to be developed, may eventually alter techniques throughout industry more than the larger amounts of cheap energy promised by the atomic power stations in which they will be produced.

Automation Down to Earth

THE very word "automation," like the conference on the subject organised by the Institution of Production Engineers this week, has been part of what might be called the creative vulgarisation of automatic control in industry that is now in spate. Few things embarrass the technical purist more than, for example, talk about "factories without workers" in terms couched just this side of science fiction ; but on balance this ferment of discussion at variously-informed levels will probably widen the use of his recondite methods inside industry in general. This process of vulgarisation of complex techniques, at one level, is what allows an electrician whose electrical theory derives largely from how water flows through a pipe to repair a television set ; at another, it enables a managing director, occasionally but how triumphantly, to seize on an essential technical improvement in a project his technical director is trying to sell him. As such, the popularising process has often a valuable part to play in making innovation acceptable. Automatic control technique is not developing at the rate of applied nuclear engineering, where fantasy has trouble keeping ahead of the apparently firm claims of the physicists. At best, the potential pace is slower. But whether that potential pace will in fact be achieved—whether automatic control systems are adopted in industry

The case of *Anopheles sundaicus* . . .

In the Republic of Indonesia, as in many other lands where malaria is highly endemic, energetic measures are being taken to bring under full control the mosquitoes that carry the disease.

The low-lying coastal area around the capital, Jakarta, offers ideal breeding conditions for many malarial species. Here, the Indonesian Malaria Control Board is relying largely on dieldrin for mosquito destruction. Dieldrin, an insecticide recently developed by Shell, not only gives longer-lasting protection, but is also very effective against *A. sundaicus*, a locally prevalent species which has previously proved difficult to control. By the end of December 1954 approximately 28,800 dwellings were treated and some 200,000 of the population were protected.

In Indonesia one spraying a year of dieldrin, at 50 milligrams per sq. ft., gives full control over all mosquitoes and brings better health to millions of people.

Dieldrin's range of control is unique : all mosquitoes and all other major disease-carrying insects. More powerful, exceptionally persistent, giving surer kill at lower dosages, dieldrin is the outstanding insecticide developed in recent years for the protection of health against insect attack.

Another recent Shell development is aldrin, fast becoming recognised as the most widely effective and most economical of all insecticides for use in the soil.

Have you an urgent pest problem in your area ?

dieldrin

dieldrin and aldrin are SHELL insecticides for world-wide use

as widely and as fast as profitably they might be—depends partly upon the success of publicity and conferences such as this week's in opening industry's mind.

Most of the papers presented to the production engineers' conference were well designed to do just that—to promote fruitful discussion among the 850 people attending the conference, most of whom knew a good deal about industry but little about automatic control. To expect them to break new ground in control technique or theory would have been to miss the point of the conference ; and if, with one or two exceptions, they did not achieve much in the way of a general conspectus of the whole field, that is perhaps to be explained by the diversity and in some respects the lopsidedness of control development. In this general field, few of the papers rivalled the quality and clarity of thinking (Marxist jargon once removed) of one or two Russian papers that have recently become available in Britain ; and there were perhaps too few of the detailed case studies, showing a factory problem and how automation was used to solve it, with costs and savings, that some American companies have been able to produce in recent years. But both those shortcomings arise from the fact that automation has been, perhaps, more intensively applied here and there in Russia and certainly has been far more widely applied in the United States. This week's conference is a part of Britain's attempt to pull itself up by its own bootstraps to catch these two technical rivals.

Trade Deficit Cut Again

THE improvement in British overseas trade in April was carried further in May: exports remained high and imports again fell sharply. Monetary policy can surely claim some credit for that result ; it seems improbable that the partial strike of dockers that began on May 23rd could have had much effect on the May clearances. But the effects of the dock and rail strikes will certainly be apparent in the June trade figures, and the damage to Britain's export trade of these strikes—coming not long after the complete dock strike last year—will be increased by the frustration of

April–May*...	304·2	247·1	8·4	48·7

* Provisional.

some seasonal exports and the diversion of current orders to other countries. May was a short working month (though it had 25 days, one more than April). Exports rose by £4.6 million to £249.4 million fob ; the April-May average of £247.1 million was the same as for the first quarter and 9 per cent higher than in the same two months of last year.

The big change was in imports, which fell by £27.7 million to £290.3 million cif ; the April-May average of £304.2 million was £30.9 million—9 per cent—below the first quarter's average and only 8 per cent higher than in the same months of the last year. Another measure of the recent contraction in imports is that their average value in the first five months was 16 per cent higher than in the same period of last year, whereas the first four months' average was 20 per cent higher, and the first quarter's average 23 per cent higher than in the same periods of last year. With re-exports unchanged at £8.4 million, the gross visible trade deficit fell by half to £32.5 million, easily the smallest deficit for seven months, and the average deficit of £48.7 million in April and May was £28.4 million below that of the first quarter.

Exports to North America rose sharply by £2.1 million to £28.3 million, thanks to what must have been a largely seasonal jump of £3.6 million to £15 million in shipments to Canada. The average rate of shipments to North America in April and May, at £27.2 million, was 15 per cent higher than in the first quarter and 8 per cent higher than in the same two months of 1954.

Coal Stock and the Market

THIS week's issue of compensation stock for the nationalised coal mines has a wider significance than the issue itself suggests. It is a small allotment ; compensation for the mines proper in Yorkshire, South Wales and South Staffordshire has been completed and some payments on account of ancillary assets in other areas have been made. Compensation amounting to about £10½ million is being satisfied by the issue of Treasury 3½ per cent Stock 1977/80 taken at £88 7/16 (Wednesday's market price). These half-yearly payments on account of the mines nationalised at the beginning of 1947 are now shrinking. Towards the compensation of the coal mines proper valued at £164,660,000 over £160 million has been paid and all districts except Lancashire and North Wales have been paid in full. Towards the cost of the whole industry including its ancillaries estimated most roughly at £300 million, £284 million has been paid. There is not now much more compensation to come.

What is significant about this week's issue is its handling in the market. As with earlier allotments, the government broker found himself obliged to stand behind the market and buy where necessary at the issue price. As most of the colliery companies are now liquidating, most of the stock is being sold and much of it had to come the government broker's way. This was the first occasion since the tighter money policy was put into full force that the government broker has been a buyer ; but for good measure on this special holiday he was prepared to help the market a little further. If the jobbers preferred to keep the coal stock and offer him something else on the gilt-edged list instead—he tried to oblige them, provided naturally that he bought the right amount of stock.

These arrangements, it will be clear, involve no breach in monetary policy, though they take a slight edge off its

austerities. The government broker is now on occasion prepared to do switches with the market—to buy one stock from them and sell them another in exchange. Until recently he was only willing to do the selling half of a switch: he would not buy even when the purchase could be matched by a sale of the same value.

Stocks in the Balance

BETWEEN the point of import or production and the point of sale, Britain at any one time holds stocks of goods worth about half as much as its total output of goods and services during the year. For most economic purposes, the absolute value of these stocks and work in progress—they are said by the Treasury to have totalled some £7,500 million at the end of 1954—matters much less than how that value changes during any given period. Their magnitude, certainly, implies that any general change of mind among businessmen about how long a stock of materials or goods they should hold—or about how much money they can afford to tie up on the ground, such as may have been induced by this spring's increases in the cost of borrowing—can have a very significant effect upon demand in the economy and hence on production. Businessmen are always other businessmen's customers: the effects of stocking policy on demand are always illustrated, for example, when rumours of a steel shortage get around.

THE VALUE OF STOCKS AND WORK IN PROGRESS, END-1952
(£ mn.)

Manufacturing:		3.366
of which—

Total industry		**3,599**
Agriculture		635
Retail trade		598
Central Government		580
Other		1.788
Total stocks and work in progress		**7,200**

When changes in the value of stocks are so significant to the economy, considerable importance attaches to the degree of error in their measurement. Here the Government statisticians, since the war, have not been lucky: the revisions upward and downward in estimates of changes in stocks used in national income figures have been endemic. Various statistics are collected of stocks, and the coverage is uneven; figures for stocks of raw and intermediate materials are fairly good (though there have been difficulties, for example, with the census of merchants' and consumers' steel stocks), and the Government should be able to measure its own and the nationalised industries' holdings fairly quickly and accurately. Its information about stocks held in industry and commerce varies widely in comprehensiveness and certainty. Preliminary data from the census of production for any year is ready before the middle of the next, and for some time the Board of Trade has been collecting information more frequently about stocks in manufacturing industry on a sample basis.

The Rise in Advances

THE most striking feature of the current monetary stringency has been the reluctance of the banks to check the expansion in their advances, notwithstanding the losses through liquidations of investments that this has involved. The quarterly analysis published by the British Bankers' Association now provides an accurate measure of the amount of the increase in advances since mid-February (one week before the increase in Bank rate to 4½ per cent) and of the sources to which the money has gone.

The picture that emerges shows clearly the extent to which the banks have been under pressure from the nationalised utilities; but equally it demonstrates that the greater part of the increase in advances has been attributable to the demands of private industry and trade—and of hire purchase too. Total advances rose in the quarter by £95 million, to the new peak of £2,190 million. That did mark some slackening from the extraordinary pace of the expansion (of £142 million) in the previous three months; but it was still just about double the size of the increase twelve months before. Just over two-fifths of this year's expansion went to the utilities, actually carrying their total bank indebtedness to more than £200 million, a new peak both absolutely and in proportion to the banks' total advances. Plainly a public issue to fund these borrowings cannot long be postponed—acute as may be the problem of the authorities of floating such an issue without taking the sting from the money squeeze.

More bank finance has been secured by most groups of private borrowers. The largest proportionate gain is actually recorded by the hire-purchase finance companies, whose borrowings now amount to £42 million (compared with £31 million in February and a mere £12 million in May of last year). The banks were officially requested in February to grant no additional credit lines to these companies; so that the increase evidently reflects drafts upon "unavailed" margins. Appreciable increases in advances were also secured by the food, drink and tobacco groups, agriculture and fishing, retail trade, builders and contractors and cotton, and by the personal and professional group. The expansion in every group save retail trade was proportionately larger than a year ago. Reductions in outstanding advances were registered by five groups. Loans to local authorities fell by £19 million (£11 million more than last year). Further repayments, of £5½ million, by the iron and steel group reduced these advances to £27½ million (against the high point of £61 million reached in August, 1953). Loans to stockbrokers fell by £4½ million (reversing the increase in the previous three months); and small decreases were shown by the "other financial" and wool groups.

British Shipyards Too Busy

WHY does it cost more to have a ship built in a British shipyard than abroad? Mainly, it is fair to assume, because the British yards are busier. They cannot lay the keel for a considerable time, and wages and materials costs are likely to have risen by then; from then until completion costs are likely to rise more; the margin of uncertainty rises as one's orderbook grows longer, and the British shipbuilder suggests cost plus a whacking escalator clause, or—very infrequently—a fixed price pushed up to the roof to cover all his risks of further inflation.

If that were all the explanation—and if it has been impossible to increase capacity more than the British yards have done since the war—it would be a matter for regret when Blue Star and now Shaw Savill go to Germany for faster deliveries and lower prices than they can get in Britain, but not for reproach. The industry can say "Nobody buys much elsewhere until British yards are full for years." It is not easy to be satisfied that that is all. British yards get their steel markedly cheaper than German yards, and for many of the bought out assemblies and fabrications British engineering ought to be competitive. Labour costs make up a large proportion of what the yards do in constructing and assembling a ship, but it remains to be proved that British wages are very significantly higher than German wages plus fringe benefits; though it is certainly fair to say that wages in British shipyards have been rising faster than in German and shipbuilders here can reasonably expect only that they will go on rising faster. Germany certainly has more unemployed; there are enough men to work shifts and use yard capacity more efficiently. In Britain, whether or not there is the will, there simply may not be enough men. Not many reliable data exist about comparable building periods, but it is hard for any visitor to avoid the impression that wherever jobs are man-paced German labourers simply work harder. And though there have been certain increases in output in British yards recently without a commensurate increase in the labour force, there are few signs that productivity here is increasing enough to offset this extra manual effort abroad. When British yards are next able to compete for orders on equal terms, with berths to spare, will they be able to match foreign prices?

America Buys British

FOR the buoyant market in British ordinary shares since the election American investors are partly responsible. American investment in this country in recent years has been important, but it has taken the form mainly of direct investment by manufacturing concerns in their British subsidiary and allied undertakings; portfolio investment—the buying of stocks and shares in British companies for income or appreciation—has had little appeal. This latest wave of portfolio investment—it may have approached £20 million in the last month—is something new.

American trust companies and individual investors have taken a fancy to a limited group of leading British ordinary shares. ICI easily heads the list. At least 500,000 shares—possibly as many as 700,000—have been bought on American account. Others that have been bought include Ford Motor, Courtaulds, Rolls-Royce, and British Petroleum, and to a smaller extent Burmah Oil and British Motor Corporation together with modest purchases of steel stocks. In the early stages of the operation there was substantial buying of Bowaters and of English China Clay but demand for those stocks seems now to have dried up. Though American brokers with London offices were largely responsible for starting the buying movement it has subsequently been more widespread, with the merchant banks becoming involved. The plan of the Irving Trust Company for issuing depository receipts against the shares of 34 British companies may also have helped. These receipts are more acceptable to American investors and simpler from the double tax angle, but the list of companies chosen suffers from having been drawn up some time in advance of the present buying wave.

The appeal to the American investor of British ordinary shares hangs on the high earnings and asset cover that the London "blue chips" offer. On dividend yield the London market offers the American investor no marked advantage over Wall Street. But on earnings cover, thanks no doubt to the restraint of the British profits tax, London does offer a clear advantage, even though that advantage is not quite so great as some market letters imply. American earnings yields are free of all tax. British profits tax needs to be recalculated on the assumption of full distribution to reach a fair comparison.

Switch sterling is being used for the American purchases. Therefore it is not in the fullest sense new net investment. The proceeds, for example, of the recent repatriation of 500,000 Distillers ordinary units and perhaps of some sales of British fixed interest stocks are the probable sources of this sterling. At $2.77¼ to $2.77¾, it stands only at about one per cent discount below the official quotation. American investors thus obtain a modest price advantage, though the narrowness of the discount shows that the floating supply of switch sterling is no longer large.

Japan on Gatt's Threshold

THE final stage in the protracted negotiations for making Japan a full contracting party of the General Agreement on Tariffs and Trade has now been reached. Tariff negotiations between Japan and seventeen other countries

"Motor Business"

The current issue of this quarterly research bulletin for the motor and allied industries includes:

The domestic and export markets for commercial vehicles 1955-1960.

A financial and economic study of two major British motor manufacturers.

Second hand price indices of cars and vans.

The U.K.'s leading export markets for parts and accessories.

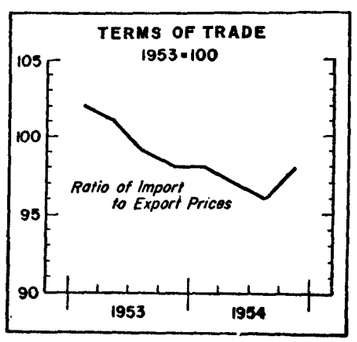
The Bulletin is fully illustrated by charts.

For full particulars of this service apply to:—

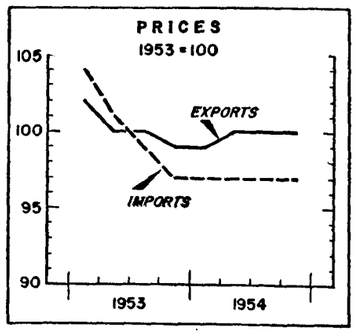
THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1
Whitehall 1511. Ext. 47

which began in Geneva on February 21st have been concluded. The most important of these negotiations were with the United States and in the course of them sizeable concessions have been made to Japan. To enable Japan to accede to the agreement two legal instruments have now been drawn up: first, a protocol of terms of accession which is open for signature at Geneva; and secondly a decision agreeing to the accession of Japan which must be approved by two-thirds of the members if Japan is to be accepted as a full member. The decision of the contracting parties must be given by August 11th.

Among the countries that refused to negotiate on tariffs with Japan were the United Kingdom, France and the Benelux countries, Australia and India. The British Government's attitude towards the accession of Japan remains unchanged. It is one of sympathy in the most general terms towards Japan's aspirations to be a contracting party of Gatt but unwillingness at the moment to enter into any hard and fast commitments on this issue. For the time being Great Britain prefers a bilateral approach in its commercial and financial relations with Japan.

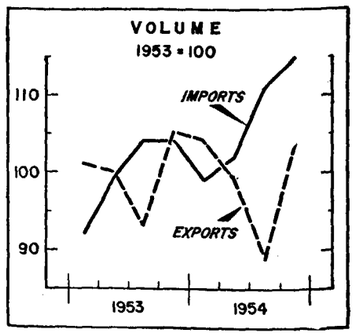


The payments agreement between the two countries expires at the end of this month, and discussions for its renewal will probably take place in Tokyo. As usual the extension of the payments agreement will be made the occasion for a general review of the balance of payments between Japan and the sterling area. In recent months Japan has been gaining sterling at a rapid rate, in marked contrast to the situation a year ago, when Japan was still scraping the bottom of its sterling barrel. By the end of 1954 its sterling balances had grown to about £50 million and the present figure must be well above this. In the coming discussions between the two governments, Japan will no doubt be reminded of the previous understanding that each side to the payments agreement will use its best endeavours to keep the balance of payments between them in approximate equilibrium. Japan will therefore be encouraged to step up its purchases from the sterling countries or alternatively confronted with the possibility of further restrictions on its exports to the sterling area.



Agreement in Coffee?

SINCE the coffee boom was pricked last year by the refusal of consumers to pay extravagant prices the market has languished. Brazil, the largest producer, has been chiefly to blame; it has tried every trick of marketing except allowing the market to work freely. Buyers have therefore had no confidence in prices and have bought only their immediate needs, leaving producers to carry stocks that would normally be held in consuming countries. The



Terms of Trade of the Sterling Area

THE terms of trade of the sterling area with non-sterling countries improved again last year. The Board of Trade's indices show that the ratio of import to export prices fell from 98 (1953=100) in the first quarter to 96 in the third, and reverted to 98 in the fourth; the average was 3 per cent better than in 1953. As is often the case, that movement masked dissimilar gains in Britain's terms of trade with non-sterling countries, and those of the rest of the sterling area. British export prices were 1 per cent lower than in 1953, but prices of the rest of the sterling area's exports were 1 per cent higher, despite the fall in the price of its major export, raw wool; prices of British imports were 3 per cent lower, while prices of imports into the rest of the sterling area were 4 per cent lower. Britain's terms of trade therefore improved by only 1 per cent, while those of the rest of the sterling area were 4 per cent better than in 1953. As Britain and the rest of the sterling area each transact roughly the same amount of trade with non-sterling countries, the terms of trade of the sterling area as a whole changed to a smaller extent.

Changes in the volume of trade that Britain and the rest of the sterling area each transacted with non-sterling countries were also dissimilar. While the volume of British exports rose by 2 per cent compared with the 1953 average, the volume of exports from the rest of the sterling area fell by 4 per cent; the volume of imports into Britain rose by 5 per cent, while imports into the rest of the area rose by 10 per cent.

By the fourth quarter, however, the cost of larger imports into Britain was accentuated by a rise in prices which continued into 1955, and the deterioration in the balance of trade led to a stiffening in monetary policy. In the rest of the sterling area the rise in the volume of imports was tempered by the improvement in the terms of trade, but the strain was too much for Australia, which had to tighten its restrictions on imports from non-sterling and sterling countries as well. Since then the British balance of trade with non-sterling countries has taken a small turn for the better, but the terms of trade of the rest of the sterling area have probably suffered from the fall in prices of beverages and other commodities. In that sense, the other sterling countries' losses are Britain's gain.

ONE

carry-over in Brazil at the end of this month will be over 6 million bags (of 132 lb), nearly twice as large as a year ago, and the Brazilian government itself owns over 3 million bags. Refusing to learn from experience, Brazil, Colombia and other Western producers have apparently decided that the road to stability lies not in free markets, but in an international attempt to restrict exports. After negotiations in New York these countries have drawn up a provisional scheme which they hope their governments will approve in time for it to be introduced when the new crop year starts on July 1st.

It is proposed that Brazil should have an export quota in 1955-56 of 15,350,000 bags, Colombia 5,650,000 bags, and the other countries 5,250,000 bags. The total of 26,250,000 bags is certainly generous, and it compares with an estimate for their exportable production of 29,400,000 bags. The surplus would be held in reserve by the producers under the ægis of the proposed International Coffee Bureau, and Brazil and Colombia would have priority in meeting any increase in demand. The African and Asian producers would be invited to join the scheme. No range of prices has been mentioned: the aim is evidently to maintain prices at about the present level—now 54 cents a lb fob for Santos 4's—which the Brazilian representative has gone so far as to say is "fair" to producers and consumers.

It may seem a pity, when lower prices are beginning to encourage consumption, that the producers should pin their hopes of stability to a restrictive scheme, backed though it may be by an expanded promotional campaign. If the scheme is approved it will severely test the loyalty of the member countries, especially if the "outside" producers do not join but try to increase their exports at the expense of the member countries. And will buyers, having seen Latin-American policies change overnight, be convinced that the surplus stocks are in safe hands?

Viscounts for America

THE American Civil Aeronautics Administrator, Mr Fred Lees, this week made a special journey to hand over "type approval certificates" for the Viscount, its engines and propellers. These certificates give blanket approval to the Viscount design and automatically clear the way for the issue of certificates of airworthiness for the sixty Viscounts ordered by Capital Airlines and now in process of delivery. Hitherto individual aircraft imported into the United States —such as the de Havilland Dove—had to be separately approved. Negotiations between the British Air Registration Board and the Americans that preceded the certification of the Viscount have been long and detailed but the American authorities have been fair and courageous in establishing what both sides recognise to be an important precedent for the treatment of British aircraft in the United States.

An order for nine Viscounts has been placed by KLM, the Dutch airline. KLM has always bought new aircraft after they had been proved by other airlines, and it has shown considerable shrewdness of judgment. This and other small orders brings the Viscount's tally up to 214: the last four, ordered by United States Steel and by Standard Oil of California, are for use as "executive aircraft." This is a tempting new field for the Viscount, though it is much bigger and faster than most of the "management's own" aircraft used in the United States. The one cloud on Vickers's horizon is the announcement that Lockheed plans to build a direct competitor with the Viscount, the turbo-prop Electra. American Airlines has ordered 35 of these but observers note that Lockheed have not finally decided about the engines to be used in the Electra.

A Chocolate Boycott

DURING July 1,800 chocolate and sugar confectionery wholesalers intend to go on strike against one of their biggest chocolate suppliers; they will neither buy nor sell any goods made by Cadbury Brothers for one month. This was agreed by the members of the British Federation of Wholesale Confectioners after a heated debate at their annual conference this week because none of their pleas for bigger margins have been granted. Trouble about margins in this trade has been brewing for some time. But as sweet sales have now more or less stopped rising after a fifty per cent increase in the last two years and fierce competition has broken out, no chocolate or sweet maker will be willing to see shop prices rise or let his own profit margin fall.

Distributors' margins on sweets and chocolate have fallen by about half since 1938. Wholesalers then got about 8 per cent on the supplies they handled and retailers about 33⅓ per cent. These margins are now about 7-8 per cent and 14 per cent respectively. But trade turnover is many times higher with slightly more consumption and very much higher prices; chocolate turnover, for instance, has risen from £34 million in 1938 to £138 million last year. The manufacturers claim that this increase has more than offset higher costs and say that the higher sweet consumption in this country justifies the smaller margins they offer to home distributors.

The boycott seems destined to fail. Even if all 1,800 wholesalers in the Federation abide by the resolution, there are another 2,000 wholesalers who are not parties to it—though they handle much less tonnage. And the retailers have not joined in, though both have participated in representations to the manufacturers. The boycott may well speed up the shift away from wholesale trade to direct dealings with retailers that has occurred since sweets rationing was abolished. Wholesalers now handle only about half total sweet supplies against two-thirds or so three years ago—and their proportion of Cadbury's trade is even lower. Moreover, the wholesalers have chosen the time of the year when sales are at their lowest and stocks in the shops are abnormally high.

Equity's Share

SHAREHOLDERS are receiving a much smaller slice of company profits than they did before the war. That doleful platitude has been current in the City for years. Now it has been given new life by two economists, Professor

F. W. Paish and Mr Nicholas Kaldor. Professor Paish has published his findings in an article, "Company Profits and their Distribution since the War," in the District Bank Review, while Mr Kaldor recently presented his in a paper read before the Manchester Statistical Society on "The Economic Effects of Company Taxation."

In both papers the discussion ranges beyond dividend distributions, but using similar material, notably the researches of Mr Phillip Redfern on "Net Investment in Fixed Assets in the United Kingdom," both economists reach similar conclusions on matters of statistical fact. Today, they agree, profit margins are not much higher in those industries that were prosperous before the war but they are notably higher in those that were then depressed and working below capacity. But, as the accompanying table shows, the Government now takes a much bigger proportion of those profits in tax; the share of profits distributed in dividends has been sharply reduced but the proportion saved by the companies and carried to their

HOW PROFITS WERE SPLIT

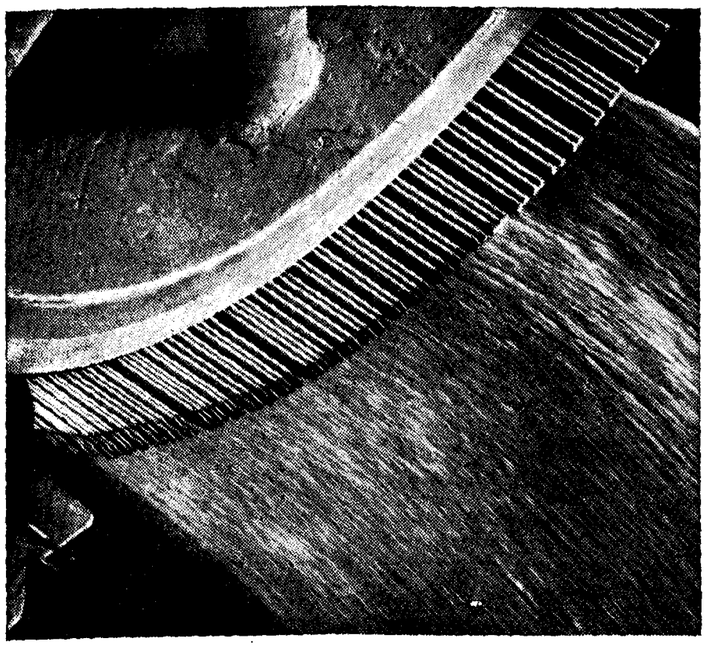
	1938	1952	1953	1954
	%	%	%	%
Taxation	31	58	53	49
Tax reserves	−1	1	1	5
Net preference dividends	10	2½	2½	2½
Net ordinary dividends	37	11	12½	13½
Dividend reserves	1	1	1	1
Companies' reserves	22	26½	30	29
Total: *profit before tax*	100	100	100	100

Source: Professor Paish's estimates.

reserves has not been cut. Voluntary dividend restraint and the distributed profits tax, at a penal rate, seem to have done their work well enough.

Both economists carry their statistical reasoning a stage further. Professor Paish estimates that (at constant 1938 prices and after allowing for changes in stock values) companies saved £150 million net in 1938 and £218 million net in 1954, but that their net fixed capital formation (again at constant 1938 prices, after allowing for depreciation at replacement cost) was only £64 million in 1954, compared with £73 million in 1938. Hence investment by companies in their own fixed capital at home has lagged behind the savings they have made, leaving a surplus to be invested abroad or lent to other sectors of the British economy. This may be true for the whole of the corporate sector, but it does not follow that individual concerns have not been hampered by a lack of funds. Substantial additions to fixed capital, notably in plant and machinery, have of course been made, and they have had the effect of raising the yield of earnings on employed capital. At the same time restricted dividend payments have kept down the dividend yields on employed capital, widening the gap between those and earnings yields. As investors tend to regard dividends as the yardstick for the valuation of shares, dividend restraint (whether it has been voluntarily accepted by directors or forced upon them by profits tax) has thus meant that the market value of securities is often less than the value of the business as a going concern, or even the break-up value of its assets. The steady rise in Throgmorton Street has gone some way to correcting this state of affairs.

Profits from Rayon



THE inevitable comparison between the earnings of Britain's two leading rayon producers, Courtaulds and British Celanese, was made again in Throgmorton Street this week. The comparison came down in favour of Courtaulds. Both companies have effectively raised their ordinary dividends: Courtaulds from 8 to 10 per cent and British Celanese from 9 to 10 per cent. But Courtaulds ordinary stock, which has attracted some American buying, was marked up while the British Celanese stock was marked down. The profit figures explain the contrast. Courtauld's profits before tax have risen handsomely from just under £19 million to over £20 million, and its net profits even more handsomely from £7½ million to £11 million. But British Celanese profits before tax have declined from £4 million to £3.3 million and its net profits have remained unchanged at £1¾ million. Another reason for the strength of the Courtauld ordinary stock was that the report from British Nylon Spinners (in which Courtaulds and ICI have each a 50 per cent interest) showed an increase in ordinary dividend payments from £880,000 to £1,100,000 (or from 20 to 25 per cent) and this increase was more than matched by an advance in net profits from £2.1 million to £3.5 million. The directors report that the weight of sales in 1954 was almost 50 per cent higher than in 1953 and production will be increased still further this year by the use of new capacity at Pontypool and Doncaster. In the future nylon should make a growing contribution to the Courtaulds profit.

EARNINGS AND DIVIDENDS
(£'000)

Current price	49/6		31/0	
Current yield	£4·0·10		£6·9·0	

* 53 weeks. † Equivalent dividends on present capital.

Courtaulds manufactures both vicose and acetate rayon while Celanese concentrates on the more expensive acetate. From the preliminary figures it seems that Courtaulds was able to increase production last year as might indeed have been expected, since the group is a big producer of the cheapest of textile raw materials—vicose rayon staple, and the directors, having reported that trading was "satisfactory in most sections of the company's business," are also able to say that "exports have been increased in spite of highly competitive conditions." Competition both at home and abroad seems to explain why the British Celanese profits have fallen—and investors will note that the directors of Courtaulds refer to the effect that "difficult conditions in the textile industry" have upon some sections of the business.

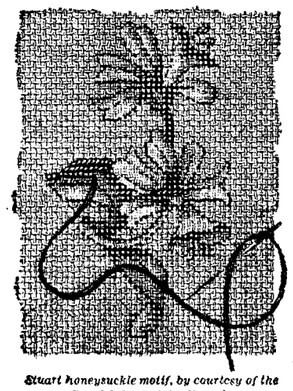
Sharp as a needle

AT THE LOW PRICES that housewives pay for needles, the quality of modern needles is something to wonder at: the finely formed and highly finished eye, the high polish over all, and the point, which has become a byword for sharpness. To produce such quality at such prices, needle makers use some ingenious manufacturing methods.



Our illustration shows how needles are sharpened. They are fed from a hopper to a guide-wheel which rolls them across the concave face of a grinding wheel. At the beginning of their journey across the grinding wheel their ends show the circular cross-section of the wire they are made from. At the end of the journey they are as sharp as . . . a needle. Sharpened needles come from this machine at the rate of 13 every second—380,000 in a normal working day.

Grinding wheels for needle sharpening are among the many specially formed wheels that CARBORUNDUM make for special purposes. Most of these special wheels do work that *could* be done by other means—but do it better, or more economically, or more quickly. Some of them show all three of these advantages, as the needle-sharpening wheel does.

CARBORUNDUM are continually invited to co-operate in the development of special wheels for new uses. We are always glad to have opportunities of that kind for extending still further the usefulness of our products to industry.

ACCOUNTANTS WANTED

for the ARMY EMERGENCY RESERVE

to spend

FIFTEEN DAYS IN CAMP

earning full pay and allowances plus a total of

£9

IN TAX FREE BOUNTY & EFFICIENCY GRANT

You can spend fifteen days with your friends, earning full Regular Army pay and allowances. As a member of the Army Emergency Reserve (Cat. IIA) *you have no other duties during the year.* If a grave national emergency should arise, you may be called up for service in the United Kingdom. *You can be called out for overseas service only by Proclamation.* Volunteers are accepted from 18 years of age and engagement is for two, three, or four years. If you have served before in a non-commissioned rank there is every possibility of your filling an existing vacancy or of being promoted as soon as a vacancy occurs.

Lend your skill to Britain, doing the job you know best

Send this coupon now for details of how to join to:

O.C. HEADQUARTERS, ARMY EMERGENCY RESERVE R.A.P.C.

District Pay Office, Aldershot District, Hospital Hill, Aldershot.

easily the best

Latest developments in automation are brilliantly reflected in the Monroe range of adding-calculators. Now available, too, is the world's most advanced machine — the Monroe Duplex 66N. Here's the fully automatic calculator that does even more than you ask of it! Because not only does this years-ahead Monroe Duplex produce almost instantly the *immediate* figures you require, it also, at the same time, stores up and shows in a separate set of accumulating dials *intermediate* figures and results you will need later for final answers. These totals appear automatically with no extra effort on the part of the operator. They can also be held during other figuring operations until needed. Truly this is automation brought to business figuring of every kind. It's *unique* in the new Monroe Duplex Model 66N.

So pink-and-white-dolly,
You'd never believe her square roots were so good!
The true explanation's
A simple equation . . .
A Miss plus a Monroe's no Babe in the

Futures in Egyptian Cotton

BUYERS of long-staple cotton, both merchants and spinners, have naturally welcomed the Egyptian government's decision to allow the Alexandria futures market to be reopened in September, after an interval of nearly three years; December will be the first delivery month. The lack of facilities for covering the risk of price changes in Egyptian-type cotton has been keenly felt, but the Liverpool Cotton Association has sensibly been reluctant to introduce a long-staple contract while the Alexandria market was closed. The Egyptian government has long been pressed to restore the market, and its decision has no doubt been influenced by the need to stimulate exports.

The usefulness of a futures market in Alexandria will depend on the Egyptian government's success in striking a balance between giving the market the necessary freedom of action and preventing the repetition of past abuses, and it will require a radical revision of the present system of state trading in cotton. Happily the government seems to be anxious to co-operate with the Liverpool market, and to introduce a similar contract and system of control. These questions are shortly to be discussed with the Liverpool Cotton Association by representatives of the Egyptian government and exporters. The difficulties are weighty, but if they can be overcome it is likely that futures trading in long-staple cotton will start simultaneously in Liverpool and Alexandria.

Pointers in Consumption

MR BUTLER'S advisors should by now be receiving sufficient indications of the trend in personal buying since February to judge whether his tightening of hire purchase regulations and appeals for voluntary restraint have been effective, or whether something more is needed. Published information is subject to a certain time-lag but preliminary estimates of personal consumption up to March and retail sales in April both came out this week. Taken together, the two sets of information confirm that the new restrictions have imposed at the beginning only a minor check on the pace of advance.

Up to March personal spending was running nearly 10 per cent higher than last year; about half this increase was accounted for by higher prices. When full figures are available, the total for the three months may turn out to be not far short of £2,900 million, which has been exceeded only three times before. Food expenditure rose to £972 million, an increase of more than 13 per cent, or 4½ per cent in volume. Purchases of household goods jumped 12½ per cent to £233 million; prices fell slightly, so the increase in real terms was rather more. This figure was much closer to clothing sales than has been customary for the time of the year; these at £254 million were 5½ per cent up in value and half as much in volume.

Allowing for the earlier Easter buying season this year, the April retail returns show no general slackening in the growth of personal buying. The pace was even faster in clothing sales and about the same in food purchases. Sales of household goods were still appreciably higher than last year, but the rate of advance was a little less rapid. The Board of Trade admits to being unhappy with its sample of multiple stores, which reported a decline of 10 per cent in furniture sales in March and a drop of 23 per cent in April: inference from this sample could be misleading. But co-operatives, the department stores, and independent retailers were still increasing their business in furniture and radio and electrical goods at a pace that appears to have been dampened only very slightly.

Cocoa's Stable Front

AFTER falling more or less steadily for nine months, cocoa prices seem to have found stability. In recent weeks the price of Accra cocoa for prompt shipment has moved within a narrow range of 280s. to 295s. a cwt cif, and new crop cocoa has commanded a premium. This week prices have moved up to about 315s. a cwt for prompt shipment, and the market may be more delicately poised than its stable front suggests. The size of the temporao crop in Brazil can still only be guessed; it could be substantially above or below 1 million bags (of 132 lb). The crop is certainly late, and some sellers appear to be short. Hence Brazilian prices, which are already at a premium over West African, may be squeezed higher. On the other hand, if the Brazilian government devalues the exchange rate for exports of cocoa and the temporao crop is large, prices could fall quite sharply. The best hope for producers is that prices will not rise much above the present level. The period of extremely high prices was countered by a fall in consumption and an increased use of substitutes; it will take time to make up that lost ground.

Tighter Reins on HP?

THE latest statistics from HP Information appear against a background of rumours that controls on hire purchase are to be tightened—or at least that the Chancellor will be asked to consider such a suggestion. These figures of the number of contracts recorded in May cover only a limited field. They do not, for example, relate to furniture, where the controls have had a dampening effect. But they again show that the motor trade (which never did "no deposit" business and usually took a larger deposit than the mini-

NUMBER OF HP CONTRACTS

	May, 1954	March, 1955	April, 1955	May, 1955
Cars	27,268	38,308	41,433	41,588
Commercial vehicles	4,913	7,258	6,783	6,449
Motor cycles, etc.	18,017	19,715	24,760	24,977
Caravans	1,441	1,428	1,344	1,443
Tractors	831	1,433	1,094	849
Farm equipment	576	630	696	712

Source: HP Information.

mum now required by law) has not been affected. Not only were the number of contracts recorded by HP Information about 42 per cent higher than those in May, 1954, but also they run very close to the record number reported in April this year.

The evidence is so scanty that a conclusive judgment on the effect of the hire purchase controls might better be left until more complete statistics are published—a move that the Board of Trade is actively considering. But it has been sufficient to set suggestions flying in the City that a further directive to the banks, urging them to tighten the screws on the credit they give to the hire purchase finance houses, may be needed. Those rumours found no confirmation in the Chancellor's general undertaking in the economic debate on Thursday to "watch the effect of tighter credit on hire purchase."

Pyrene Expands

BRASS is used to make fire-fighting apparatus, and there is brass to be obtained from making it. Last year Pyrene, the biggest and best-known firm in this field, made altogether over half-a-million pounds before tax. This was the first full year for the company since control passed from the American Pyrene company into British hands. A year ago Pyrene paid another £240,000 to its former parent company for the Canadian business of the group; and Pyrene have now made an offer of twice that sum for the ordinary shares of Minimax, another of the fire-fighting equipment firms in this country, but one that has been having a bad time.

Pyrene sells a complete range of extinguishing agents (vaporising liquids, foam, dry chemicals, and carbon-dioxide) and apparatus, from the small scarlet hand-pump to 10-ton crash tenders for airfields, and has developed fire and smoke detectors. It will presumably use the Canadian plant and the Minimax production facilities to push further ahead in export business (outside the United States which has been left to American Pyrene). The company also makes one-third of the car and lorry bumpers manufactured in Britain, and markets anti-corrosion chemicals and metal finishing processes. There are several other more specialist manufacturers of fire-fighting apparatus here, such as Nu-Swift, Merryweather, and National Foam. Between them they must be selling several million worth of equipment and agents a year. Last year, the direct loss from fires exceeded £26 million, without counting loss of production.

SHORTER NOTE

An extensive list of further references to the Monopolies Commission was announced on Thursday. There is to be a general reference on the question of "level tendering" and specific references on: steel frames for buildings, tea, chemical fertilisers, and electric batteries.

Company Notes

METAL BOX. A spectacular rise of 19s. 3d. to 112s. 6d. in the Metal Box ordinary stock is evidence both of a well kept secret and of the brilliance of the group's latest results. The packaging industry has been doing extremely well but even so no one had expected quite such handsome news from Metal Box. Sales have risen by over 20 per cent, from £43.6 million to £52.6 million. Trading profits have advanced by 27½ per cent, from £3,838,000 to £4,893,000. Net profits have risen even more sharply, by 37½ per cent, from £1,617,000 to £2,227,000. To round off those increases, the ordinary dividend has been raised from 15 to 20 per cent. The latest dividend, absorbing £611,000, is covered more than three times by earnings.

	Years to March 31, 1954	1955
Consolidated earnings:—	£	£
Sales and investment income	43,580,000	52,603,000
Trading profit at home	2,837,000	3,587,000
Trading profit abroad	*1,001,000*	*1,306,000*
Total trading profit	*3,838,000*	*4,893,000*
Taxation	2,107,000	2,300,000
Net profit	*1,541,000*	*2,227,000*
Ordinary dividends	393,000	611,000
Ordinary dividends (per cent)	15	20
Retained profits	1,052,000	1,542,000

£1 ordinary stock at 111s. yields £3 12s. per cent.

There is thus room for a further increase—and the current yield of 3.6 per cent suggests that it is already being discounted. To encourage these hopes comes the announcement of a 100 per cent free scrip issue, which, even if it does not imply an increase in the amount to be distributed, will at least make the market price of the stock units less heavy. The company also intends to make an issue of 2,400,000 £1 ordinary shares for cash. About 350,000 of these shares are to be offered to employees at the same price as the rights issue of the remainder to ordinary stockholders, and the terms of the issue are likely to be favourable. But this week's jump in the market price of the existing shares will help the directors to raise a substantial sum and still offer the new shares on attractive terms.

★

ROLLS-ROYCE. This company is a pioneer in other fields than engine design. Long ago in 1920 it introduced a scheme as a result of which £145,000 of workers' stock is now held by employees. The directors believe that scheme needs refurbishing, as the issued ordinary capital has grown and workers' stock now represents less than 2½ of the equity. They therefore propose that the existing workers' stock should be converted into ordinary stock; that conversion will give the employees a substantial capital gain if they choose to sell. But the directors are convinced that many of them will continue to hold on to their investments.

The directors also propose to create £600,000 of workers' stock in 10s. units, re-establishing the ratio of one for ten between the workers' stock and the ordinary stock. The new workers' stock will be issued at par. It will rank *pari passu* with the ordinary units for dividends, voting, rights issues and in liquidation. On any future capitalisation of reserves the holders of the new stock will receive a parallel free scrip issue in workers' stock; under the old scheme the free scrip issues were made in ordinary stock units. The right to transfer the new shares will be restricted; the units can only be sold back to the trustees and then only at par. Hence the employee cannot realise the real capital value of his investment but he secures the same percentage dividend as an ordinary stockholder and naturally a higher yield on his investment since be buys at par.

No investor could buy for income on better terms. And there is no reason why the dividend of 17½ per cent should not be higher in the future. Last year Rolls-Royce achieved new records in turnover (including direct exports of £13 million), in profits and in royalties. The ordinary dividend absorbed £596,250 but it was paid out of a net profit of £1,968,818. The group added to its fixed and working capital and still further expansion is planned but, thanks to the successful debenture issue, it has ample liquid resources. Profits should again be buoyant this year and the current yield of 3.2 per cent on the £1 ordinary stock units at a market price of 113s. 1½d. shows the market's confidence that yet another increase in the dividend is expected.

MARKS AND SPENCER. Sales of the Marks and Spencer stores have now topped the £100 million mark. At £107 million in the year to March 31st last they were £13 million more than the previous year's figure and £22 million more than sales two years ago. Profits and dividends have expanded with turnover. That, as the chairman, Sir Simon Marks, points out in his address, is the fruit of the company's policy of expansion.

The building, modernisation and development of the company's stores was held up by building controls and restrictions. Nevertheless in the ten years to March 31st over £18 million, all of which has been found from earnings, has been spent on shop properties. Of that sum £15½ million represents the cost of re-equipment and development and the remaining £2½ million has been spent either on the purchase of new sites or on the conversion of a number of important leaseholds into freeholds. Development is by no means finished. A further £3 million will be spent in the current year upon about thirty stores. For most of them this will mean the complete transformation of the original store in size, appearance, and amenities for customers and staff. The directors plan to "continue this policy systematically." To do so will require substantial funds. Most of these will come from retained profits but "additional funds will be needed." Sir Simon's reference to the recently increased borrowing powers of the company under the debenture trust deed, to say nothing of the recent revaluation of the properties, is a pointer to the way in which the new money will be raised.

★

DUNLOP RUBBER. Riding two horses is a delicate exercise especially when one is fresh and the other already getting its second wind. But Lord Baillieu, chairman of the Dunlop Rubber Company, showed great adroitness when he tried the exercise at the shareholders' meeting on Monday. "Natural" and "Synthetic" are his pair and he pinned his faith to both of them impartially. Dunlop is considering — indeed discussing —a serious entry into the synthetic field. Lord Baillieu emphasised yet again that the small synthetic factory at Fort Dunlop is to be confined to new rubbers for special purposes and will not make general purpose synthetics on a commercial scale. But the company is also discussing with the oil and chemical industries the production of styrene and butadiene the basic raw materials of synthetic rubber "to determine if and when it will be practicable and economic, and in what form to undertake further development." In the meantime he believes that the company will be permitted to import "reasonable quantities of general purposes synthetic rubber which we hope will be sufficient for our requirements for some time to come."

Clearly Lord Baillieu, who is disturbed by rapid fluctuations in the price of natural rubber, is determined to enter the synthetic field. He is equally determined to ensure larger supplies of natural rubber. The group has decided to establish new rubber plantations in Nigeria; negotiations with the Nigerian government are proceeding most satisfactorily and it is hoped to start clearing several thousand acres of jungle this year. Lord Baillieu believes that these estates can in time become as efficient as the company's Malayan estates. He believes too that a consistent demand for the natural product will continue.

LONDON STOCK EXCHANGE

Next Account begins: June 22nd
Next Contango Day: June 22nd
Next Settlement Day: June 28th

ANOTHER advance in industrials was the feature of the stock markets this week. Gilt-edged securities were quiet, for the market was overshadowed by expectations of an issue of an electricity stock. In the foreign market renewed investment support in a thin market sent the price of Japanese stocks up; but later in the week profit-taking clipped some of the earlier gains and the market became much quieter. German issues, apart from a momentary rally in Konversionkasse, were generally weaker. Insurance shares were firmer and banking issues were strong.

The industrial market began the week with a bout of profit-taking, and though there were a few bright spots on Monday, notably among the steel equities, the Financial Times ordinary share index fell back to 210.0. But with the ending of the rail strike the Financial Times ordinary index had reached a new peak of 213.7 by the close on Wednesday despite substantial profit-taking on that day. The biggest advance in prices took place on Tuesday. Steel issues were prominent in this advance, but lost some of their gains on Wednesday. The market, however, boiled over on Thursday morning when losses were reported throughout. The losses were most marked in those sectors that had made strong advances earlier in the week.

Many rubber shares touched new high points for the year at the beginning of this week, following on the rise in the price of the commodity. Profit-taking was absorbed at first, but the market turned dull on Wednesday. Further good dividend statements from the tea companies led to some improvement in the prices of tea shares. Kaffirs opened the week quite strongly, with Buffels and Hartebeest leading the way on Cape support. But the rally soon died away and some losses were reported on Wednesday. Copper shares were firm.

(1) Relates only to prices in capital cities for Austria, France, Greece and Turkey. *Cost of living in Paris based on 1949=100, and wholesale prices in Western Germany on July-December, 1948=100.* (2) Index numbers of unit value which compare the current average value of trade with its value in 1948; they are influenced by changes in the composition of trade as well as price movements. Index numbers for Germany based on 1950. (3) Notes only for France and Austria. (4) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (5) Beginning May, 1954, a new drachma equal to 1,000 old drachmas was introduced. (6) 1937. (7) New series, original base 1953=100. (8) Average for fourth quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 11th there was an "above-line" deficit (after allowing for Sinking Funds) of £34,864,000 compared with a deficit of £24,392,000 in the previous week and a deficit of £35,162,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £2,783,000 bringing the total cumulative deficit to £184,679,000 (£147,895,000 in 1954-55).

THE MONEY MARKET

At the Treasury bill tender on Friday last the discount houses again reduced their bid by 2d., to £99 0s. 1d. per cent—raising the rate to within 1/64 per cent of 4 per cent. The average rate on all bills allotted rose correspondingly, by nearly 8d. to £3 19s. 7.53d. per cent. Total applications were up by £8 million, to £378.6 million, but as the offer was raised by £10 million to £260 million, the market's allotment rose slightly from 52 to 53 per cent. After the tender, the rate for three months' fine bank bills was adjusted to 4 per cent.

Credit became easier before the week-end, but early this week stringency returned. The Bank made special purchases on each of the first three days. But two or three houses still found themselves "in" the Bank on Monday and again on Wednesday (though only for very small amounts). August and September bills changed hands at 3 11/32 per cent; at the week-end dealings took place at down to 3 11/32 per cent.

Sterling has weakened slightly on balance in the past week. The spot dollar rate fell from $2.79 1/8 on Thursday of last week to $2.79 7/16 at Wednesday's close; and the premium on the three months' forward dollar widened slightly, to 1 1/2 cents. Turnover in the gold market has been only moderate; the price has fluctuated in sympathy with sterling.

The Bank return shows an outflow of notes of £8.8 million in the week to Wednesday last, compared with an outflow of £3.5 million in the corresponding week of 1954.

CAN THE INDUSTRIAL DEVELOPMENT BANK HELP YOU IN CANADA?

Businessmen who are considering establishing or expanding a manufacturing or processing business in Canada and have a project that meets practical requirements for success, but have not been able to finance it by standard methods, might find it worthwhile to know more about Industrial Development Bank (a subsidiary of Bank of Canada) and its wide experience with unusual problems. Industrial Development Bank's credit officers and technical specialists examine proposals before the Bank provides financing. If a term loan is granted, it may make for a more efficient and profitable operation. On the other hand, it may uncover factors which make regular commercial financing feasible.

For further information we suggest you communicate with:

INDUSTRIAL DEVELOPMENT BANK
Office of the General Manager
901 Victoria Sq., MONTREAL, CANADA.

MARKS AND SPENCER LIMITED

SALES EXCEED £107 MILLION

99 PER CENT GOODS MADE IN BRITAIN

REVALUATION OF PROPERTIES

EXTENSIVE PROGRAMME OF STORE DEVELOPMENT

The twenty-ninth Annual General Meeting of Marks and Spencer Limited was held on June 9th at 82 Baker Street, London, W.1.

Sir Simon Marks, DSc (Chairman and Joint Managing Director) who presided said: Ladies and Gentlemen:

May I take it that in accordance with our usual practice the Directors' Report and Accounts may be taken as read?

PROFIT AND LOSS ACCOUNT

Our profit, after tax, amounts to £4,468,000 —an increase of £1,451,000 over last year. Provision for taxation after making allowances for Budget changes requires £4,800,000 against £4,850,000. With £2,561,000 brought forward there is £7,029,000 available for distribution.

The Directors recommend a Final Dividend of 30 per cent on the Ordinary and "A" Ordinary Shares which, together with the Interim Dividend of 15 per cent, makes a total of 45 per cent for the year. Last year's dividend was equivalent to 32½ per cent on the present Ordinary and "A" Ordinary Capital. After the transfer of £2 million to General Reserve, the payments of dividends and other appropriations set out in the Directors' Report, the balance to be carried forward is £2,515,000.

REVALUATION OF PROPERTIES

In my speeches since the war I have referred more than once to the considerable reserve represented by our properties, the great majority of which were acquired and built before the war.

At the end of July last year the Board instructed Messrs Healey and Baker and Messrs Hillier, Parker, May and Rowden to prepare a joint valuation of the Company's Freehold and Leasehold Properties. This "monumental task," to quote their Report, was completed recently and their certificate is now available. The figure set upon the value of the properties at March 31, 1955, is £35,297,191, as against our book value of £12,563,333 at the same date, and an original cost of nearly £16 million.

In their Report to the Board the Joint Valuers emphasise that our stores are situated almost without exception in premier positions in the principal shopping centres of the main towns and cities throughout the country.

They point out that a very large percentage of the stores at present operating have been completely or substantially reconstructed within the last twenty-five years. They draw particular attention to the high standard of the staff amenities and other accommodation not normally seen by the public, including the food storage and preparation rooms, "... where every effort has been made to ensure the most hygienic conditions."

They conclude their Report with the following statement:

> "We are of the opinion that the group of operational properties, which has taken many years to build up, forms a most valuable and outstanding retail chain which under present conditions would, for all practical purposes, be virtually impossible to repeat."

It is gratifying to have this independent judgment of the success of the policy we have pursued so consistently since the formation of the Company. I am grateful to the Partners of Messrs Healey and Baker and Messrs Hillier, Parker, May and Rowden for their Report.

We have incorporated the new value of our properties in the Accounts for the year 1954-55. The surplus revealed by the valuation, amounting to £22,733,858 has been credited to our Reserve Accounts. The sum of £3,410,643—the amount by which the cost of our properties had been written down—is now brought back and added to the General Reserve; the balance of £19,323,215 has been credited to Capital Reserve.

Certain installations which had previously been accounted for under the head of Fixtures and Equipment were included in the valuation as an integral part of the building. These items, which include heating, lighting and ventilating installations, have now been allocated to the Properties Account.

We have reviewed the rates of Depreciation applied to the Company's Fixed Assets and have decided that lower rates are adequate.

We spend a great deal of money maintaining these assets—which include our properties, fixtures and equipment—in first-class condition. If I may quote once more from the Valuers' Report, they say:

> "... from our inspections we are able to record that the properties in the occupation of the Company appear generally to be in excellent order, the decorative condition of the retail stores and principal offices being exceptionally good. In our view the high standard at which these properties are maintained merits special comment."

POST-WAR STORE DEVELOPMENT

During the war we lost a number of our stores through bombing, many were damaged, and all of them suffered years of enforced neglect. In quite a number of these cases the main fabric of the building was affected; roofs and floors were in a bad state, and the general condition was much below our standards. The most urgent need, therefore, was to rebuild and restore these properties.

Building controls and restrictions continued to be applied for some years to our class of property with almost wartime severity. The amount of work which we could do in this first phase was, therefore, limited. But as building restrictions were eased we put in hand a developing programme of structural and decorative work.

It was not until 1951, six years after the end of the war, that we were at last able to begin the rebuilding of our bombed stores. Whilst the carrying out of this task became a priority, the work of modernisation and improvement continued over the whole system. I am glad to say that fourteen of the bombed stores have been rebuilt and are trading, and that the rebuilding of the last one is under way. With its completion, the scars which war inflicted upon us will have been healed.

These stores have been rebuilt to high standards of construction. They are more spacious, they accommodate more customers in greater comfort and enable them to see and handle the wider range of merchandise we now offer. Modern systems of heating, lighting and ventilation have been installed and the amenities for the staff—Dining Rooms, Rest-Rooms and the like—have been planned on the most up-to-date lines. Following a tradition established many years ago, the frontages have been designed to fit in with the character of the cities in which they stand. We believe them to be imposing landmarks in the shopping centres of those cities.

With the complete removal of building controls in November, 1954, a new phase began. At long last we were free to draw up a more systematic plan of development, and we accordingly set in motion a considerable programme of work. The emphasis of this programme, which involves an investment during the current year of about £3 million, is upon the extension of some thirty important stores. The process of extension in the majority of cases means a massive reconstruction, a complete transformation of the original store as to size, appearance and amenities for customers and staff. Many of the schemes are well advanced —some will be in operation before the end of the calendar year and will then become revenue-producing.

The costs of building, restoring and developing our stores have been heavy. In the ten years up to March 31st last the expenditure amounted to some £18 million, all of which has been found from earnings. £15,500,000 represents the cost of development and re-equipment, and the remaining £2,500,000 has been invested in the purchase

of new sites and additional land, and in the conversion of a number of important leaseholds into freeholds.

The fruits of this policy of expansion can be seen in the volume of business and the profits we now report. We plan to continue this policy systematically. Many of our stores are ripe for development. The investment required will be large. A considerable part will be found, as in the past, from retained profits. But in order to ensure that our development goes forward at the pace we consider desirable additional funds will be needed.

As a result of the revaluation of Properties, the Company's borrowing powers under the existing Debenture Trust Deed have been greatly increased and facilitate the acquisition of such further funds as may be required for the development of the business.

GENERAL SURVEY

I am pleased to report that our sales again increased substantially during the year. Our turnover exceeded £107 million—over £13 million more than the previous year and £22 million more than two years ago.

It has been a year of continuing national prosperity. With full employment, higher wages, and rising productivity, the purchasing power of the community is steadily increasing. The standard of life of the great majority of our people has risen appreciably. Goods, materials and foodstuffs are now available to the public in great profusion and variety. The nation has indeed come a long way since the period of shortages and rationing, less than three years ago.

The fertilisation of industry by science and technology is surely one of the main causes of this remarkable change in our economy. Vast opportunities, rich in promise for the future, are open to the active partnership of industrialists and men of science. This partnership has already resulted in the establishment of entirely new industries, and has given new life to many of the older industries. Great factories have been built throughout the land, involving much capital investment, to develop and exploit the fruits of research, invention and discovery.

An interesting feature of this development is its widespread character. Every area of the country is benefiting from the up-surge of industrial activity. This, naturally, is having an important impact also on the shopping centres of our cities and towns. Our own programme of store expansion has been planned to cope with this actual and potential increase of business.

I have already spoken of the way in which we have rebuilt, expanded and transformed our stores, and of the large investment we have made in that side of our development. Our work in building up a system of fine stores is matched by an unceasing search for better goods and improved values, always bearing in mind the prices which the public can afford to pay.

This work of up-grading the wide variety of goods we sell is a collective effort. Our executives and the members of the buying departments work in close collaboration with our technical and specialist staffs, to whose contribution we attach much importance. Their activities are having a considerable effect on the character and quality of our goods, upon which our reputation depends.

It is gratifying to state that 99 per cent of the goods we sell are made in Britain. Last year British mills supplied some 90 million yards of woven cloth and approximately 30 million pounds weight of hosiery yarns for our garments.

Our food division is benefiting by the fact that raw materials are now in free supply. We are therefore able to specify the best ingredients for particular products which are in great demand. Our policy of developing a selected range of high quality foodstuffs from the foremost producers in the country is meeting with success.

As you are aware, we demand the highest standards of hygiene and cleanliness in the production or handling of foodstuffs, and we enjoy the co-operation of our suppliers and of our staff in this policy. Our efforts in this connection have brought us praise both from our customers and from the public health authorities.

POPULARITY OF "ST. MICHAEL" TRADE MARK

Our customers, who are very discerning and selective, are quick to respond to our improved values. Our brand name "St. Michael" is accepted as a hall-mark of quality and taste. It is one of the best known and most popular trade marks and our goods are appealing to an ever-increasing number of customers.

We concentrate much effort in creating these values and services which have won the confidence of our public. We shall strive to maintain their goodwill—an asset which we cherish most highly.

TRIBUTE TO MANUFACTURERS

It is always a pleasant duty to pay tribute to our manufacturers and suppliers, and to thank them for their co-operation. The production of the large quantities of goods and materials we require, and the high standards we set have faced them with many problems. They have adopted new techniques, installed new machinery, increased their factory space, and given special training to their staff. Many are investing large sums of money in order to expand still further their business with us. This is evidence of their confidence in our future progress together.

We give much thought to the ways in which we can help to iron out seasonal fluctuations in production. We try to estimate our requirements well in advance, and in consultation with our suppliers arrange a steady rhythm of production and delivery. This system brings about substantial economies in costs, the benefit of which we pass on to our customers, on whose approval and support both we and our suppliers are dependent.

STAFF AND WELFARE

It has been my privilege for many years, on behalf of the Board, to thank the members of our staff of all grades for their devoted service, which means so much to the success of the business and the high reputation which our Company enjoys with the public.

The well-being of our staff is of deep concern to the Board, and we encourage every activity of our Personnel and Welfare Departments directed to that end. We regard welfare work as an important and, indeed, inseparable part of staff management. Our welfare activities are many and varied, and our 30,000 staff are distributed throughout the country. But I am happy to say that those who are responsible for this work maintain that personal touch without which their efforts would lose much of their value.

In the planning of our stores, our Dining-Rooms, Rest-Rooms and other amenities are specially designed for the comfort and convenience of our staff. Every day we provide meals at a very modest charge for all our staff—a service which alone employs 1,200 persons.

I have to report with much regret the death of Mr J. Levi, our Dental Superintendent. It was thanks to his initiative that we were able to inaugurate our dental services as long ago as 1935. In his last Annual Report, for 1954, he stated: "A study of the Reports sent in by our 202 inspecting dentists shows that a very high proportion of the Company's employees continues to make good use of the free services offered under our Inspection Scheme, and that, as a result, their dental health has been maintained at a very high level."

Our welfare and health services are, of course, only one element in the happy atmosphere throughout the business. The extensive provision which we make for training and education is much appreciated by our staff, who know that an expanding business is one with great opportunities for personal development and promotion.

The report and accounts were unanimously adopted.

SHAREHOLDERS' THANKS

Mr Leslie Brown: Ladies and gentlemen, the chairman has expressed thanks to the staff for their loyal and excellent work during the year and he has paid tribute to the suppliers and manufacturers for their co-operation, tributes which we as shareholders most heartily endorse. But this meeting would not be complete without a tribute also being paid to our chairman and his colleagues on the board.

No company can prosper without an efficient and loyal staff, particularly, as in the case of this company, when personal service and efficiency are of such vital importance. Such service would not be obtained unless we had a contented staff and I am sure we shall all applaud the policy, to which the chairman has referred, of close and continuous attention to the well-being of the staff and the conditions under which they work.

The company's reputation has never been higher for the quality of the goods which it supplies and again we support the board's policy of close and friendly co-operation with the manufacturers to develop their skill and technique to the present point where the value for money given in our stores is unequalled by any other store.

My company, the Prudential, has been closely associated with Marks and Spencers for nearly 30 years now, since it became a public company in 1926 when we were privileged to provide finance to inaugurate the programme of expansion and development which has brought this company to the forefront. Sir Simon has frequently told me of those early days when he and my predecessor, Sir George May, later Lord May, planned this development, when they talked and dreamed of the future and its glories. Yet I am confident that the most fanciful of their dreams has been surpassed many times, with great benefit to us shareholders and greatly to the benefit of many customers and to the community as a whole.

For any business there is never an end to progress. You go on or go back. The chairman has told us of the present programme for systematic development and modernisation and I have no doubt that long before that programme is completed the next step will have been investigated and planned with the thoroughness which characterises all the operations of this organisation.

My company have been very happy with their close association with the development, prosperity and phenomenal progress to date and we have every intention of remaining interested in the future progress. We have every confidence that, in the hands of your directors, that progress will be soundly conceived and efficiently executed and that in their hands the resultant prosperity is inevitable. A business like this does not just evolve

out of nothing nor does it keep going of its own momentum. The inspiration and foresight, the guidance and the drive, have been supplied by our chairman, Sir Simon, Mr Sieff, and their colleagues on the board and I count it a great privilege to propose a very hearty vote of thanks to them, together with the whole of the staff throughout the country, for their work during the past year. I call on Mr Seebohm to second that.

Mr Seebohm: May I, on behalf of your shareholders—perhaps I should say your smaller shareholders—offer our congratulations and second the vote of thanks.

In reply, the chairman said: Mr Brown, Mr Seebohm, I am personally very much touched by your presence here today, and particularly by those references to a "bygone age" 26-30 years ago. I am very happy indeed that you, Mr Brown, are carrying on that tradition which was laid down by Lord May (previously Sir George May) who was the fount of much inspiration to me and my colleagues.

Men come and go and I am delighted that we have now in that very important position our own friend, Mr Brown. I have learned to know him during the last few months, although the roles have been reversed. I am older and he is younger. Sir George was older and I was younger but the fact is that it is an association of which my colleagues and I are extremely proud.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

MR S. G. MENELL'S REVIEW OF OPERATIONS

The Twenty-Second Annual General Meeting of Middle Witwatersrand (Western Areas) Limited will be held in Anglovaal House, Johannesburg, on June 28th. The following is an extract from the Statement by the Chairman, Mr S. G. Menell, which was circulated with the Report and Accounts for the year ended December 31, 1954:

The attached accounts reveal a consolidated group profit of £702,905 less £79,786 thereof which is attributable to minority interests. The profit shown in the parent company's accounts amounts to £480,340, arising mainly from the sale of certain investments at a profit of £493,260. Pending the promulgation of the new Income Tax Act and the clarification of certain points, no provision has been made in the attached accounts for any liability which may arise for Undistributed Profits Tax in respect of the 1955 fiscal year.

As indicated in the Directors' Report your Company will be entitled to a substantial participation in the mining company which will be formed to take over the Saaiplaas Lease Area.

No further prospecting was done in the joint area, known as the Van den Heeversrust Area in the Odendaalsrus District, which forms the subject of an agreement between your Company and General Exploration Orange Free State Limited. The Consulting Engineers of General Mining and Finance Corporation Limited are considering the estimates and proposals submitted by our Consulting Engineers for the demarcation of the first mining area.

Details of progress achieved by other companies, in all of which your Company has considerable shareholdings, are as follows:

VIRGINIA MINE

At the Virginia Mine, trial milling operations which were commenced in November, 1953, were continued until September 22, 1954, when the production of gold was officially commenced. During the first three months of production up till December 31, 1954, 148,000 tons were milled at a recovery grade of 3.875 dwts per ton, resulting in a working profit for this period, including sundry revenue, of £24,321, averaging 3s. 3d. per ton milled. Since the commencement of operations and up till March 31, 1955, a total of 96,178 feet of development was accomplished, of which 43,707 feet were on reef. Of 42,805 feet sampled, 22,100 feet, equal to 51.6 per cent, were payable, having an average value of 9.14 dwts over a channel width of 31.6 inches, equivalent to 289 inch-dwts. As at December 31, 1954, the available Ore Reserve on Basal and Leader Basal Reefs was estimated to be 584,000 tons [illegible] value of 5.44 dwts over a stoping width of 45 inches. In addition, 166,000 tons of payable ore, blocked out at No. 3 Shaft and in the No. 1 Shaft pillar at an average value of 5.16 dwts over a stoping width of 51 inches, are not immediately available for mining. The sulphuric acid plant was brought into production during January, 1955, using pyrite purchased from other mines pending the completion of the pyrite recovery plant which is incorporated in the uranium plant. Work on the uranium and pyrite recovery plants is proceeding and it is anticipated that these plants will be commissioned during the third quarter of this year. The application for authority to increase the capacity of the uranium and pyrite recovery plants has been approved by the Atomic Energy Board of South Africa. In terms of the arrangements made the Company will also accept for treatment uranium and pyrite-bearing concentrates produced by Merriespruit (Orange Free State) Gold Mining Company Limited. The Company will obtain an additional loan through the Atomic Energy Board to cover the cost of the extensions to the uranium treatment and pyrite recovery plants and such loan will be repayable on the same basis as that applicable to the original loan. During the quarter ended March 31, 1955, 146,000 tons were milled at a recovery grade of 4.065 dwts per ton, resulting in a working profit, including sundry revenue, of £37,090, averaging 5s. 1d. per ton milled. In addition, acid production during the quarter resulted in a profit of £12,097, making a total profit for this period of £49,187.

MERRIESPRUIT MINE

At the Merriespruit Mine, No. 1 Shaft was deepened to its revised final depth of 3,779 feet. The sinking of No. 2 Shaft was resumed towards the end of April, 1954, and at the end of March, 1955, the shaft had reached a depth of 2,886 feet. It is estimated that Basal Reef will be intersected in this shaft at a depth of approximately 3,210 feet. Since the commencement of development operations and up till March 31, 1955, a total of 28,986 feet had been advanced, of which 13,409 feet were on reef. Of 13,230 feet sampled, 9,015 feet, equal to 68.1 per cent, were payable, having an average value of 11.13 dwts over a channel width of 34.4 inches, equivalent to 383 inch-dwts. Included in these results are 120 feet sampled on Leader Reef, of which 85 feet, equal to 70.8 per cent, were payable, having an average value of 4.47 dwts over a channel width of 64.9 inches, equivalent to 290 inch-dwts. Work is proceeding on the erection of the reduction plant which is designed for an initial capacity of 75,000 tons per month. Arrangements have been made with the Atomic Energy Board of South Africa whereby the Company will erect a flotation plant to produce uranium and pyrite-bearing concentrates from the residue slimes of its gold reduction plant. These concentrates will be pumped to the uranium treatment and pyrite recovery plants at Virginia Orange Free State Gold Mining Company, Limited, where the uranium and pyrite will be recovered on this Company's behalf. The Company will obtain a loan, to be repaid over a period of ten years, through the Atomic Energy Board to cover the capital cost of the flotation plant, pumping facilities and ancillary requirements.

HARTEBEESTFONTEIN MINE

At the Hartebeestfontein Mine, No. 1 Shaft was sunk to its final depth of 3,041 feet and No. 2 Shaft to its present necessary depth of 3,297 feet. Vaal Reef was intersected in No. 1 Shaft at a depth of 2,861 feet and a full exposure of the reef was completed at a depth of 2,864 feet. The reef was sampled at 5 feet intervals around the periphery of the shaft and 15 sections sampled gave an average value of 45.12 dwts over a channel width of 4.1 inches, equivalent to 185 inch-dwts. Based on the available borehole information, it is now estimated that Vaal Reef in the vicinity of No. 2 Shaft lies at a depth of approximately 6,000 feet below surface. It is not, however, intended to sink to this depth at the present time, and the shaft was stopped at a depth to permit of the statutory connection being made on the Transfer Level between No. 1 and No. 2 Shafts at the shallower depth of workings at No. 1 Shaft. This connection was made during March, 1955, thereby removing the single-entry restrictions imposed by the Mining Regulations. Development operations were commenced at No. 1 Shaft in August, 1954, and at No. 2 Shaft in September, 1954. Up till the end of March, 1955, a total of 38,579 feet had been accomplished, of which 32,491 feet were at No. 1 Shaft and 6,088 feet, all in country rock, were at No. 2 Shaft. 9,866 feet at No. 1 Shaft were on Vaal Reef and 9,765 feet were sampled, showing 9,610 feet, equal to 98.4 per cent, as payable, having an average value of 46.08 dwts over a channel width of 12.0 inches, equivalent to 553 inch-dwts. Work was commenced during August, 1954, on the erection of the reduction plant which will have an initial capacity of 50,000 tons per month. It is now anticipated that work on the plant will be sufficiently advanced to permit of trial milling operations being commenced during the second quarter of 1955.

PROGRESS OF BUFFELSFONTEIN AND STILFONTEIN GOLD MINING COMPANIES

Recent published reports have given details of the good progress achieved at the Buffelsfontein Gold Mining Company Limited, where the sinking of two vertical shafts and the erection of housing, mine buildings and plant are in progress. The profits earned from gold and uranium production by Stilfontein Gold Mining Company Limited have been on a progressively increasing scale and the Company recently paid a maiden dividend.

NEW KLERKSDORP GOLD ESTATES

At New Klerksdorp Gold Estates Limited, the tonnage crushed for the year ended December 31, 1954, was 132,600 tons resulting in a working loss from gold production of £13,049, equal to 1s. 11.6d. per ton crushed. Trial runs of the pumping stations and pipelines, and metallurgical tests on the extended uranium treatment plant at Stilfontein Gold Mining Company Limited were commenced towards the end of September, 1954. The official contract period for the production of uranium commenced on January 1, 1955. Operations for the quarter ended March 31, 1955, resulted in an estimated profit of £3,609. Included in this amount is a profit from uranium production estimated at £7,693, which does not take into account the quarterly instalment of £1,875 payable on loans obtained in this connection. The Company has been granted permission to mine and mill the ore obtained from the two adjoining portions of the farm Klerksdorp Townlands No. 44 held under prospecting permit, on payment to the Government of a royalty of 3d. per ton mined.

SABI MINING AND EXPLORATION COMPANY

The Sabi Mining and Exploration Company Limited is actively engaged in prospecting operations in the Reservation in the Fort Victoria District of Southern Rhodesia granted to that Company in October, 1953. Initially prospecting was limited to investigation of one of the coal deposits within the area, but operations have since been extended to embrace the examination of limestone strata in the north-eastern portion of the Reservation. Work will be commenced in the near future on the prospecting of further coal deposits and iron ore deposits.

In conclusion I desire to place on record your Board's appreciation of the services rendered by Anglo-Transvaal Consolidated Investment Company Limited, our Secretaries and Technical Advisers, both at the Head and London Offices and by the Managers and staffs of our subsidiary companies.

J. LYONS & COMPANY LIMITED

CONTINUED DEMAND FOR PRODUCTS AND SERVICES

PROBLEM OF RISING COSTS

MR GLUCKSTEIN'S REVIEW

The Annual General Meeting of J. Lyons & Company, Limited will be held on July 5th at The Trocadero Restaurant, Piccadilly Circus, London, W.1.

The following is the statement by the Chairman, Mr M. Gluckstein, which has been circulated with the Report and Accounts for the year ended March 31, 1955:

The net profit for the year is £728,336 which compares with £686,914 for the previous year. There has been paid or provided in dividends on the Preference and Preferred stocks the net sum of £273,617. This year the additional "A" Ordinary stock (£629,069) issued in October, 1953, ranks for a full year's dividend in contrast to the proportional amount of 1s. 6d. per £1 unit paid last year. The interim dividends paid in December last at the same rates as in previous years, but on the equity capital thus increased, have absorbed the net sum of £86,498 which is £17,298 more than last year. We propose the payment of final dividends on the Ordinary, the "A" Ordinary and the Proportional Profit capital at the same rates as last year absorbing the net sum of £316,500 which is £48,360 more than last year.

The balance of net profit for the year is £51,721; to this has to be added £387,014 brought forward from the previous year and £57,702 in respect of tax adjustments for earlier years, making a total of £496,437. Out of this £350,000 has been transferred to "Provisions" so that the amount carried forward in the Profit and Loss Account is £146,437.

BALANCE SHEET FEATURES

You will have noticed in the Balance Sheet that "Stock in Trade" at March 31, 1955, was £11,604,758, an increase over last year of £2,511,225. This increase is accounted for mainly by increased prices. Stockholders will no doubt all be aware that in recent months tea has been, to say the least of it, a difficult commodity to deal with. We have, of course, to buy at world market prices and over these we have no control. At first, prices rose steadily and substantially and in due time (though there is always a lag) this inevitably caused progressive increases in retail prices. Then market prices began to fall. The position at the end of the year remained very uncertain and, as we wished to be able to reduce prices to our customers at the earliest possible moment, we felt it prudent to make the special transfer to "Provisions" of the sum of £350,000 which I have mentioned above. You will also have seen from the Consolidated Profit and Loss Account that the total sum transferred for the Group is £500,000, the additional amount of £150,000 being in respect of two of our subsidiaries also engaged in the tea business.

DIRECTORATE

During the year, Mr Anthony Salmon, a General Manager of the Company, was appointed an Ordinary Director. The eldest son of the late Mr Julius Salmon, he has had a long and thorough training in the business. His initiative, ability and experience have proved him to be a welcome addition to the Board. In accordance with the Company's Articles of Association he holds office until the forthcoming Annual General Meeting and will then be eligible for re-election.

Mr H. H. G. Bennett, who had held the office of Secretary for nearly 30 years, relinquished it in December last on taking over other administrative duties with the Company; he of course continues to be an Employé Director. The new Secretaries are Messrs H. E. Barlow and H. E. Lofthouse, both of whom had been Assistant Secretaries of the Company for nearly 30 years.

RISING COSTS

During the year we were forced to make increases in the prices of some of our products and in some of the charges in our catering establishments. It has always been our policy to resist such increases as long as possible and we continue to do so; but many of our costs have again risen and indeed are continuing to rise and there seems little prospect at present of any reversal of that tendency. To give but one example, the costs of transport have again increased. Quick and widespread distribution is a vital part of our business. We have some 2,400 vehicles on the roads and the waste arising from traffic congestion is very heavy. With better roads we could make economies in manpower, fuel and other costs. We welcome the Government's proposals for road improvements, though we could wish that they showed a greater sense of the urgency of this difficult problem and that they were wider in scope.

The demand for our products and catering services generally continues to be satisfactory. Consumers are becoming accustomed to use their newly restored freedom to purchase where and what they will, and to appreciate value. It is healthy that they should do so, and we shall continue to seek a full share of their demands by giving them the quality they want at prices which represent the best value. Our export trade is also well maintained. The sales of our teas all over the world showed a further increase.

At the Corner Houses we have been making some changes introducing speciality services. By limiting a particular room to a menu of very few items we can provide the best cooking, the speediest service and outstanding value. There are "The Bacon & Egg" and "The Wimpy" at the Coventry Street Corner House and "The Grill and Cheese" at the Oxford Street Corner House. The catering side of our Teashops was converted to self-service early in the war. We are now experimenting with self-service for the sale of those goods which are taken away by the customer. Our experience so far seems to indicate that the public welcomes the change and the better opportunities for display that it brings with it.

LYONS' ELECTRONIC OFFICE

I have referred before to LEO, the Lyons Electronic Office, and the kind of service it provides, but it may be of interest to give another example. On Budget Days as soon as the Chancellor has made his proposals in respect of Income Tax, it is of extreme urgency, if the PAYE tables are affected, that the new tables be worked out and sent to the Government Printers. LEO stood by in 1954 but there were no changes. This year it was again asked to stand by. There were changes in the personal allowances, in the rates of tax and in the minimum to which the lowest rate of tax was to be applied. No information could, of course, be given to us until after the Chancellor had spoken; but LEO then got to work and before 10 p.m. that evening the first sets of tables had been sent to the printers. By 7.45 next morning the whole had been completed; work that would have taken many clerks many weeks.

Finally, I wish once more to express to all our employees of all ranks our sincere appreciation of their loyal and efficient service. This expression of thanks has become an annual occurrence, but it is as merited today as it has been in the past. In believing that their loyalty and efforts will continue undiminished lies much of our confidence in the future.

DUNLOP RUBBER COMPANY, LIMITED

THE GROUP'S GOOD YEAR

LORD BAILLIEU'S SPEECH

The Fifty-sixth Annual General Meeting of the Dunlop Rubber Company, Limited, was held on June 13th in London.

The Right Honourable Lord Baillieu, KBE, CMG, the Chairman, in the course of his speech, said: In my speech last year I referred to the fact that trading during 1953 had in general been on a steadier basis than in the previous year with demand at a much more normal level. This pattern continued during 1954. The maintenance of full employment and the high level of business activity in the United Kingdom resulted in a substantial increase in demand in most branches of our business. Overseas demands also increased with the result that the turnover of the Group, including inter-company sales, showed an increase from £243 million in 1953 to £262 million. During the year, however, the prices of many products were on a lower level, so that this comparison of turnover values does not give a true picture of the increased activities of the Group. It is difficult to express our varying range of products in terms of a common unit, but we estimate that, overall, the volume of the Group increased by about 15 per cent. This was achieved in the face of intense competition, not only in the United Kingdom, but in every country in which we manufacture or to which we export.

PRICE OF RUBBER

For the last two years I have made reference to the fall in the price of rubber which is, of course, our principal raw material. Just to refresh your memories I would remind you that at the end of 1951 the price was 41d. per lb, whilst a year later—in December, 1952—it was 27d. per lb, and by December, 1953, it had fallen still further to 17d. per lb. In 1954, however, this downward movement was reversed, with the price rising gradually in the early part of the year, more rapidly towards the end, and finishing at 30d. per lb. Thus during the year we had an increase of 13d. per lb, and so far in the current year the price has kept more stable at around 26d. to 27d.

I make no apology for restating these movements in the price of rubber, as I think it is only right that you should appreciate the very great difficulties your Board and Senior Executives have in controlling costs and selling prices when the principal raw material, and consequently the major portion of cost, fluctuates to this extent. Fortunately, during 1954 we did not suffer the heavy inventory adjustments of the two previous years. On the other hand, as the selling prices of our products reflect no more than our increased costs as they occur, we do not derive any benefit from inventory gains. I think this is an important point to mention, as there appears to be an impression in some quarters that when the price of rubber rises the Dunlop Group must make substantial profits on inventories.

What I have just said is amply confirmed when reference is made to our profit margin which during 1954 was 6.2 per cent (before tax), compared with 6 per cent in the previous year, and our unit profit during the year was somewhat lower than in 1953. You will see, therefore, that as our volume has increased we have operated on a lower margin of profit and have thus passed over to the consumer most of the benefit which has resulted.

TAXATION BURDEN

I have on previous occasions emphasised the grevious burden which the current level of taxation imposes upon the life and industry of this country. Probably no man is better aware of this than the Chancellor of the Exchequer. We welcome, therefore, the reduction in taxation announced in the recent Budget and the relief it will afford to individuals and to industry. We must recognise, however, that this reduction is very modest and that the tax burden which industry still directly bears reduces its competitive power in the export markets of the world. This constitutes a real challenge to our political and industrial statesmanship. We cannot hope to maintain our present high level of employment, or increase our standard of living, unless our costs and prices are fully competitive.

To this end Government and industry must each play their full role in a great partnership; the Government by rigorous control of all expenditure and by exploring every avenue for lessening the tax burden on industry; industry by doing all in its power to increase efficiency and maintain and increase production.

IMPORTANCE OF EXPORTS

Only thus can we increase our exports; only thus can we meet the needs of a growing population, maintain employment and raise further the general standard of living in this country.

For despite all the changes that have occurred in this country and in the world generally during and since the war, the fundamental fact remains that if our exports fall, then our standard of living must also fall. I am afraid that this simple statement of fact, because of its very simplicity, is too often overlooked nowadays.

It cannot be restated too often. It is their realisation of this truth which makes the leaders of both sides of industry so concerned at the menace to our future resulting from the recent series of nation-wide strikes, sometimes irresponsible and indifferent to the wider public interest. These strikes directly threaten our production, our competitive power and so the level of employment and our standard of living. One day, probably sooner rather than later, the account will be presented and the nation will have to pay. If they continue then the gains of the last few years so hardly won, and the position which we hold in the world, would be in jeopardy.

I am confident that the traditional common sense and the underlying moral unity of our race will curb these current excesses and ensure that industry is permitted to operate under conditions of reasonable stability.

OVERSEAS BUSINESS

I have made reference already to our considerable volume of business overseas, and I can tell you that our exports from the United Kingdom and our trading activities in the countries where we operate have together contributed over 60 per cent of the profits of the Group. A considerable revenue accrues to the Parent Company in the form of payment by our Subsidiaries overseas for the research work and technical aid which the Parent Company provides. This is a good example of a form of invisible export from the United Kingdom where know-how, as distinct from actual goods, is sent abroad. We are continually expanding the scope of this know-how as new products are developed.

Much the greater part of our revenue from overseas, of course, comes from our exports from the United Kingdom and from dividends paid to us by our Subsidiary Companies. We are constantly giving consideration to the possibility of developing new local Dunlop manufacture abroad wherever conditions appear suitable, and where it is not normally possible or economic to export from the United Kingdom. One such scheme which is being negotiated is the establishment of a Dunlop factory in Spain in conjunction with Spanish industrial and financial interests, a reference to which you may have noticed in the press. We have been unable to export to Spain for some 20 years.

JOINT CONSULTATION

Due to the expansion of our activities, the total number of employees in the Group now exceeds 90,000; in the United Kingdom the number increased in 1954 to over 46,000, which was 3,000 more than in 1953 and 91 per cent above the 1945 total. The joint consultative arrangements, of which Dunlop has been one of the pioneers, have made an important contribution to the good relations which we have maintained throughout the year with our employees. Joint consultation is working smoothly at all our factories and continues to provide valuable assistance in the improvement of working conditions, welfare and productivity.

SYNTHETIC ELASTOMERS

During the past year the Company has continued to take an active interest in the development and application of synthetic elastomers which are being increasingly used in the rubber industry. These materials are products of the chemical industry and new varieties are constantly appearing for study and assessment. You will recall that last year we announced that work had started on a new synthetic rubber plant at Fort Dunlop.

The various training courses for groups of employees have continued throughout the year, as has also the practice of affording temporary employment to University students in their summer vacations. Over one hundred students were employed during 1954 in this way.

From what I have said today and from the Directors' Report you will conclude that 1954 has been a good year for the Group. We are confident of our trading position in all the countries in which we operate, our factories are working efficiently, and in most cases to full capacity, and our financial position is sound with substantial reserves. All in all, therefore, I feel we can look forward to the future with confidence and that we can expect Dunlop to continue its steady growth and expansion, meeting the increasing demand from all our customers.

To this end the Company proudly relies on the proven skill and energy of all its employees here and abroad. They have striven constantly to further the interest of the Company, to increase production and sales, to lower costs and to maintain and improve the quality of our products throughout the whole vast field in which we operate.

I am sure you would wish me to send a message of warm thanks to all concerned for their contribution to the year's results.

The report and accounts were adopted.

BOOTS PURE DRUG COMPANY, LIMITED

£60 MILLION SALES IN A RECORD YEAR

ALL ROUND PROGRESS AND CONFIDENCE IN THE FUTURE

MR J. P. SAVAGE ON THE IMPORTANCE OF RESEARCH

The sixty-seventh Annual General Meeting of Boots Pure Drug Company, Limited, will be held at Nottingham on July 14th. The following is the statement by the Chairman, Mr J. P. Savage, which has been circulated with the Report and Accounts for the year ended March 31, 1955:

This has been a magnificent year. Our sales have reached the £60 million mark for the first time. This is almost double what it was seven years ago, and four to five times the prewar figure. I am confident we can maintain the present rate of progress. We are pushing ahead with the modernisation and improvement of our shops and we have the manufacturing facilities to back up this expansion.

Our profit has gone up from £3,116,451 to £4,214,758. This is a big increase and we are proud of it. It is the direct result of selling more and selling more efficiently. The increase in profit has not been achieved at the expense of our customers. We are giving better value than ever both in terms of price and service

After making provision for tax at the lower rates provided in the Budget the net profit of the Group is £1,912,142 compared with £1,176,296 last year.

Profits retained by the Subsidiaries amount to £276,298 against £179,646 last year. The net profit of Boots Pure Drug Company, Limited, is thus £1,635,844 compared with £996,650.

The amount brought forward from last year was £331,315 and in addition we have to bring in £325,104 tax provision from previous year which is no longer required This makes a total of £2,292,263.

DIVIDEND

Last year we paid a final dividend of 12½ per cent, making 22½ per cent for the year. With the increase in our profits, your Directors propose a final dividend of 17½ per cent, making 27½ per cent for the year.

Your Directors recommend that £1 million should be placed to General Reserve. This money is available for financing the expansion of the business. We also propose that the tax relief in respect of Investment Allowances, amounting to £44,800 for the Parent Company, should be put to Capital Reserve. A similar policy has been followed for the Subsidiaries. Depreciation of freehold properties takes £125,000. After deducting dividends paid and proposed this leaves £272,450 to be carried forward to next year

CAPITALISATION OF RESERVES

Over a long period of years we have re-invested a large proportion of our profits in the business. The total reserves, revenue and capital, now amount to more than £13 million for the Group. This compares with our issued ordinary capital of £5,120,000. The reserves largely represent money which is permanently employed in the business and we propose recognising this position by capitalising £5,120,000 of these reserves and issuing one new fully paid ordinary share for every existing ordinary share held.

A Resolution to increase the Authorised Capital to £15 million will be moved at an Extraordinary General Meeting held immediately following the Annual General Meeting.

CAPITAL EXPENDITURE

Good progress has also been made with the extension of our warehouses and the construction of new premises for our Research Division. Once again we have been able to finance this out of the funds currently available in the business.

The increase in our stocks from £12,624,762 to £14,289,132 is due to increased sales and to the development of new and promising products. The stock position is a healthy one: it means that we are using more capital in our business and we think you will agree from the results that we are using it effectively.

BOOTS FOR VALUE

One of the most encouraging aspects of last year's business has been the increase in the sales of our own manufactured products. There is no doubt that the shopping public has increasing confidence in Boots high quality standards as well as our competitive prices.

Last year our shops served more than 340 million customers—an increase of 17 million over the previous year. The increase in the size and efficiency of our business has enabled us to make no fewer than 2,700 price reductions. In several cases—for instance, Halibut Liver Oil Capsules, now one of our biggest selling lines—our prices are below prewar level.

RESEARCH

The election of Dr Hobday, our Research Director, to the Board, recognises not only the confidence we place in his personally, but also the importance we attach to Research. Many of the achievements of a Research Division are unspectacular, but they make a real contribution both to the efficiency of a business and to the progress of the country at large. This year we have another new product to add to the list, namely, Safersan, our remedy for round worm in pigs.

Safersan has been found to be the most effective remedy that has ever been used, and although this product was only put on the market in November of last year, we have already sold enough to treat two and a half million pigs.

WHOLESALE AND EXPORT

The Home Wholesale business has increased by 25 per cent compared with last year, and this has been achieved despite some very keen and healthy competition in the Home market. To meet this our position has been considerably strengthened by the increased production efficiency resulting in lower manufacturing costs. We feel quite certain we can maintain this progress.

The Export division also shows an increase in sales of over 25 per cent.

We have, as I promised last year, made a complete overhaul of the business carried on through our Overseas Subsidiaries. I am glad to report that there has been a big increase in their sales and a marked improvement in the profit position. We have for the first time received dividends from our Companies in Australia, New Zealand, Fiji and Pakistan. This is an important step forward.

We have in partnership with the Imperial Cold Storage and Supply Company Limited of South Africa, formed a new Company, Biochemico (1954) (Pty.) Ltd. to produce medical products of interest to both Companies. Biochemico is already producing the first insulin ever made in South Africa—and also Diosgenin, the basic material from which we are making cortisone and hydrocortisone.

STAFF

At Christmas we gave all our Retail staff with more than two years' service a bonus equal to a week's pay. We have also in the course of the year made very substantial improvements in the rates of pay for our staff.

In 1952 we made big improvements in our Pharmacists' Pension Fund, but the General Pension Fund which covers over 29,000 of our staff has remained substantially unaltered since it was introduced in 1935. We have always wanted to improve this Fund, and I am glad to say we have now been able to do so. The improvements include a Death Benefit which will safeguard the widow and children of members of the staff dying in service.

Finally, when it became apparent that the results of the year would be a record, your Directors decided to pay a special "Prosperity" Bonus of one week's wages or salary to all employees in Great Britain and the Channel Islands who joined the Company before October 1, 1954.

In a full year the increases in salaries, the Christmas Bonus and the "Prosperity" Bonus now to be paid will cost the Company approximately £1 million. The improvements in the Pension Fund will mean that the Company's aggregate contributions, which this year amounted to £496,000 will go up to £628,000. This is the share we have been able to give our staff in our increased prosperity, and we are glad to be able to do it.

It is not always realised what a variety of opportunities this firm can offer to young men. In addition to the opportunities on the technical side of our business, there are attractive careers in selling—retail, wholesale and export—and in such fields as Publicity, Buying and general business administration.

FUTURE PROSPECTS

We have made a good start in the new financial year and retail sales in particular are showing a buoyancy which augurs well for the future

At the same time I must emphasise that the unavoidable but steady increase in overheads is bound to have some effect on the rate of progress on the trading profits.

UNITED DRAPERY STORES

Ten Years' Progress

The following are extracts from the statement by Sir Brian E. S. Mountain, Bart. (the Chairman), circulated with the Report and Accounts for the year ended 29th January, 1955:

The past year has been one of remarkable expansion.

Prices Trust Company Ltd. (*Trading as John Collier*): Our Consolidated Accounts include the last twelve months' profits, and the profits of the previous seven months to 30th January, 1954, are not included.

Alexandre Ltd.: In November, 1954, we made an offer to acquire the Ordinary Share Capital of Alexandre Ltd. by the exchange of 5 Ordinary or "A" Ordinary shares of Alexandre Ltd. for 4 new Ordinary shares of 5/- each in our Company, and this offer has been accepted.

The business is trading very satisfactorily and I have no doubt it will add substantially to the progress and expansion of our Group.

Consolidated Accounts

The Group Profit, before Taxation, amounts to £4,038,379, an increase of £1,436,795 over the previous year. Of this sum £863,100 has been earned by the new Prices businesses in the twelve months under review and the remaining £573,695 is attributable to the old businesses within the Group, which show a profit increase of 22% above last year.

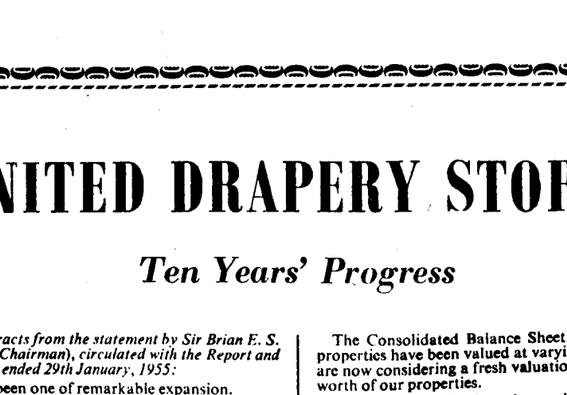
The net profit of the Group after taxation amounts to £1,843,157, an increase of £993,118 over the previous year.

We have declared a dividend of 50% this year on the capital as doubled by the free scrip Issue last year, and the amounts placed to reserve have risen this year from £440,419 to £981,705.

The Group now trades from over 700 branches ranging in size from large department stores, warehouses and depositories to retail shops. In addition we own 12 factories with a working floor space exceeding 1 million square feet, which alone employ nearly 10,000 work people.

The Consolidated Balance Sheet shows that the Group's properties have been valued at varying dates, and your Board are now considering a fresh valuation to ascertain the present worth of our properties.

The Ten Year Review shows the considerable progress made in the time that we have been fortunate in having Mr. Joseph Collier as our Managing Director, whose great energy and foresight has contributed so much to the success of your company.



In each year the turnover and profits have substantially increased and this year's record profits are more than seventeen times those of ten years ago. In the same period substantial sums have been added to reserve each year, and it has been possible for you to participate in the increased prosperity of your business by way of increased dividends.

The growth of the Assets employed in the business has kept pace with the increase in profits. The Issued Share Capital of the Parent and Reserves of the Group after deducting Goodwill have risen practically eight-fold from £1,058,394 to £8,457,942.

Future Prospects

Turnover since February, after making proper adjustment for new acquisitions, shows a satisfactory increase over last year. In addition we shall have in the current year the benefit of a full year's trading profits of our new subsidiary, Alexandre Ltd.

As a result of the developments of the past few years, our interests are now more widely spread and in the coming year we look forward to opening new branches and rebuilding and modernising a number of others. I believe we are well placed to meet competition in the retail trade and in the absence of any material worsening in the economic condition of the nation, I look forward next year to placing before you another satisfactory report on our current year's trading.

THE PRINCIPAL BUSINESSES OF U·D·S

JOHN COLLIER ✻ 400 retail Branches *ALEXANDRE ✻ Over 130 retail Branches*

SPILLERS LIMITED

(Flour Millers and Animal Feeding Stuffs Manufacturers)

OVERALL RESULTS SATISFACTORY

IMPROVEMENT IN EARNINGS

MR WILFRED D. VERNON'S STATEMENT

The sixty-eighth annual general meeting of Spillers Limited was held on June 15th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, London, E.C., Mr Wilfred D. Vernon, chairman of the company, presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended January 31, 1955:

In accordance with usual practice the more detailed comments on the Accounts are contained in the Directors' Report.

I am glad to report that the overall results of our operations during the year have been satisfactory. The profit before taxation is £3,414,000, as compared with last year's £3,096,000, and the net balance available after providing for taxes is £1,488,000, as against £916,000. This improvement in the earnings has enabled the Board to recommend that the total distribution for the year on the Ordinary Stock should be 11 per cent, as against the equivalent of 8½ per cent for the previous year. This, together with the dividends on Preference Stock and to minority interests, absorbs £615,000, leaving retained earnings of £873,000.

CONTINUED PROGRESS IN ANIMAL FOOD TRADE

Continued progress has been made in the scale of our animal foods trade and to meet the growing demand for these products the new animal foods plant at Hull is now being brought into operation, while major extensions to our manufacturing capacity at London and Birkenhead are under construction.

On the flour milling side there has been a further falling off in volume of business, due in part to some further decrease in total consumption, but in part to other causes. The demand for "white" or short extraction flour continues to be very low. Last year I pointed out that the bread subsidy was only given to bakers in respect of bread baked from long extraction flour and that it would be helpful to the public, and to the trading interests concerned, if there were a clear statement of the evidence upon which this policy was based. It is therefore gratifying to note the announcement recently made in Parliament that it has been decided to appoint an independent panel representative of scientific and medical opinion to determine the differences in composition and nutritive value between National flour and flours of shorter extraction, with and without added nutrients, and to advise whether any such differences are significant from the point of view of the health of the population. An independent and authoritative assessment of this problem is much welcomed by the Milling Industry.

EXTENDED INTEREST IN BAKERY INDUSTRY

During the year the Board gave close consideration to the question of extending our financial interest in the baking industry (which has hitherto been quite minor) with the dual object of effecting some insulation against fluctuations in flour trade deriving from circumstances outside our control and enabling us to have a closer connection with the consuming public. It was decided that in the prevailing circumstances it would be wise to do so. This decision was assisted by the fact that a substantial proportion of the baking industry is composed of family businesses, some of whom, by reason of the effect of taxation and in particular of estate duty, are anxious about the continuity of operations in their present form. We have therefore both before and since January 31, 1955, extended our investment in baking, and the results will in due course be reflected in the overall earnings of the group. It is right to say that this in large measure represents a change in policy on our part, but I consider that it is in the best long-term interests of the Company.

In dealing last year with the general financial position of the Company I referred to the fact that we had been able for many years to meet all the considerable capital requirements for modernisation and expansion from our own resources. I also said that on the basis of the conditions then existing I foresaw no need for the raising of further capital except in the event of some exceptional change in circumstances. In fact, there have been two exceptional changes during the past year. In the first place, it has been necessary to maintain considerably increased quantities of raw materials in stock at the mills. This arose in the main from the difficulty of keeping shipments in phase with our normal requirements as a result of the demand for freight occasioned by abnormal movements of commodities and particularly the import of coal into this country. I hope that it may be possible, ultimately, to effect some reduction in our working stocks but I wish to direct special attention to the serious effect of coal imports on the availability of shipping and on the freight market. In the second place there is the increase in our investment in the baking industry. So far the capital to meet both these requirements in addition to the normal capital outlay on new equipment has been found from our own accruing resources. The question of the need to raise additional capital will depend on the extent of further expansion, but it would seem that any requirement in the immediate future could, if it arose, be adequately met by temporary borrowing.

WHEAT MARKETS

I now turn to the wheat markets. So far as imported wheat is concerned there was on the whole little change in the f.o.b. price during the year. The carry-over in North America from the 1954 harvest seems likely to show little variation from the previous year—a significant reduction in Canada being offset by an increase in the USA. The special arrangements for the marketing of wheat in these and other exporting countries, to which I referred last year, have continued until now to prevent the pressure of supply from exercising its full influence on prices. It remains to be seen whether the large stocks now existing will enable the present price level to be held indefinitely. The c.i.f. price for imported wheat to this country has been subject to some fluctuation on account of the marked variations in the cost of freight for the reasons already mentioned.

As regards home-grown wheat, I explained last year that the 1954 crop was to be dealt with by each grower selling his wheat in the open market in the ordinary way and receiving, in addition to the market price, so obtained, a deficiency payment representing the difference between the average realised price on the part of the growers and a standard price (with seasonal variations) determined by the Government. This method was designed to secure a reasonable return to the grower while retaining some premium for individual efficiency and at the same time to afford the buyer the necessary flexibility of operating in a free market. The system has in general worked well and the Milling Industry has willingly taken up large quantities of home-grown wheat. The quantity available was not so large as expected because of the unfortunate effect of the adverse weather conditions at the time of last year's harvest which resulted in some of the wheat being so damaged that it was not suitable for flour milling.

HONOUR FOR MANAGING DIRECTOR

During the year the London Corn Trade Association honoured one of our Joint Managing Directors, Mr Laurence Hosegood, by electing him President, and I am sure that Mr Hosegood's knowledge of the grain trade will be of great value.

In company with Mr Hosegood I paid a visit to the Argentine in order to study the situation there in regard to supplies of wheat and grain. At the same time we took the opportunity of visiting important milling units in that country and also in Portugal and Brazil.

It is too early to make any firm prediction in relation to the current year. But, as hitherto, all our major factories continue to be maintained in the highest state of operational efficiency and I should hope that the outcome of this year will be not unsatisfactory.

TRIBUTE TO MANAGEMENTS, STAFF AND WORKPEOPLE

We are indebted to the managements, staff and workpeople of all the companies in the group for their continued loyal and efficient service. I extend a welcome to those of the new companies who have joined our organisation during the year and hope that they will enjoy their association with us throughout the future.

The report and accounts were unanimously adopted; and the proposed dividend was approved.

The retiring directors, Sir Archibald F. Forbes and Mr R. A. Twomey, were re-elected, and the remuneration of the auditors, Messrs Impey, Cudworth & Company and Messrs Deloitte, Plender Griffiths & Company, having been fixed, the proceedings terminated with a vote of thanks to the Chairman, Directors and Staff.

ATLAS ELECTRIC AND GENERAL TRUST

INCREASED INCOME

The forty-seventh annual general meeting of Atlas Electric and General Trust, Limited, was held on June 15th in London, The Right Honourable Lord Remnant, MBE, the chairman, presiding.

The chairman, in the course of his speech, said: Any comparison of the results of the year under review is affected by the changes which have occurred in the Trust's Capital Account.

The gross investment income of £849,535 shows an increase of £133,144 or 18½ per cent. Commissions, Rents and Management fees show a reduction of £3,970 and we can expect this source of income to diminish further in the course of the next few years. New issue activity during the year was considerable and commissions on "free" underwriting commitments, amounting to £6,422 show an increase of £3,338. Our total gross income from all sources, at £860,486, increased by £132,557 or 18 per cent.

Interest on Debenture Stock this time absorbs £70,260 as compared with £37,500, due to the issue during the year of £1,250,000 new 4 per cent Stock. Ordinary office expenses and Directors' Emoluments show only a small increase, despite the greatly increased volume of work entailed by the investment of new moneys and participation in the greater activity of stock markets generally. Income Tax and Profits Tax together absorbed £357,718, the increase of £40,342 being attributed to the larger gross income.

DIVIDEND RECORD

The balance of Net Revenue for the year is £395,936, a satisfactory increase of £56,933 over the previous year. The directors recommend the payment of a dividend of 6½ per cent on the £4,200,000 Ordinary Stock. It is worth noting that the record of the Trust, since the payment of dividends on the Ordinary Stock was resumed in 1948, is as follows: 1948, 2 per cent; 1949, 2½ per cent; 1950, 3 per cent; 1951, 4 per cent; 1952, 5 per cent; 1953, 6 per cent; 1954, 7 per cent; 1955, 9.1 per cent or 6½ per cent on the enlarged Ordinary Capital.

The gross income of £849,535 on investments valued at £15,636,962 is equivalent to an average return of 5.43 per cent. It should be noted, however, that the Trust did not have the full benefit of the investment of the additional money raised during the year.

The investments, which stand in the balance sheet at £10,794,196, are valued at £15,636,962, showing an appreciation of 45 per cent. The percentage of appreciation last year was 41 per cent, but since then a sum of £1,175,000, part of the net surplus on realisations, has been transferred to Capital Reserve and subsequently capitalised.

The break-up value of the Ordinary Stock is 44s. 6d. per £1 unit, which compares with 48s. 4d. the previous year. It must be remembered, however, that the Ordinary Stockholders have received a free capital issue during the year of 40 per cent of their existing holdings, but for which the break-up value would have been 62s. 4d. per unit.

The income for the first two months of the year shows a satisfactory increase over the previous year, and this present month of June will probably be equally satisfactory. I anticipate that this improvement will be maintained throughout the first half of the year, but the results thereafter will be influenced by the extent to which the Government can overcome grave difficulties which beset our path as a nation.

The report and accounts were adopted.

BARRY & STAINES LINOLEUM

INCREASED PRODUCTION

The annual general meeting of Barry & Staines Linoleum, Limited, will be held on July 7th in London.

The following is an extract from the circulated statement of the chairman, Mr T. J. Cavanagh:

The past year was one of considerable expansion of business in the home and export markets. The cost of raw materials was generally lower, and in particular, that of linseed oil showed a substantial reduction compared with the previous year. Selling prices were reduced in February, 1954, in anticipation of these raw material costs, and have since remained stable. These factors, together with increased volume of production, increased operating efficiency, and last but most important of all the team work of management and employees, have combined to yield a satisfactory increase in trading profits.

The Board is glad to recommend payment of a final dividend and bonus which increases the total distribution to 12½ per cent for the year.

The Board is of opinion that the time has come to bring the issued capital of the company more into line with the value of the present assets. Accordingly a separate letter to Stockholders accompanies the Accounts explaining the Board's proposal to apply £875,000 of the consolidated reserves in paying up in full 875,000 Ordinary Shares of £1 each, to be allotted in the proportion of one share for every £2 of Ordinary Stock already held.

HALL TELEPHONE ACCESSORIES

INCREASED ORDER BOOK

The twenty-seventh annual general meeting of Hall Telephone Accessories, Limited, was held on June 10th, in London, Major the Honourable Oscar M. Guest, chairman and managing director, presiding.

The following is an extract from his circulated statement:

For the year ended December, 1954, the net profit amounts to £47,351. Our Admiralty contracts have increased in scope, and now form a considerable proportion of our business. Your directors recommend a dividend of 10 per cent (less tax).

Our contracts for the Admiralty are for high grade instrument work, and we have been complimented by the Ministry on the results so far obtained. The growth of this side of our business has necessitated the setting up of a special department to deal with it.

Besides the bottle vending machines which we continue to manufacture for the Coca-Cola Corporation, we have developed new types of vending machines for a large range of commodities.

We are continuing to receive further orders from the British Post Office and overseas administrations for the telephone coin collectors and stamp vending machines which we make for them. Our office machinery section continues active, with a good demand.

We opened the present year with a considerably increased order book which, with expansion in manufacturing space, should lead to a growing trade turnover.

The report was adopted.

WILMOT-BREEDEN (HOLDINGS)

LARGE PROGRAMME OF EXPANSION

The sixth annual general meeting of Wilmot-Breeden (Holdings) Limited was held on June 15th in Birmingham, Mr D. L. Breeden (chairman and joint managing director) presiding.

The following is an extract from his circulated statement:

The motor industry has continued its record-breaking career. We have kept pace with this in terms of both sales turnover and physical output.

Outside the motor industry, there was an increase in our sales of components for domestic appliances, in particular refrigerators and washing machines; and here again the present size of our plant has been the only limitation to output. It seems probable that the requirements of the motor industry and the domestic appliance industry will continue at higher levels than we have known in the past, and for this reason we decided at the beginning of the year to embark on a large programme of expansion. This is estimated to be in line with the capital investment plans of our main customers which have received publicity during the last few months.

Sales to the aircraft industry were a post-war record. In this field our object has been to take on work which requires the development of new production methods. Some components for gas turbine engines provide scope for this type of development.

We were pleased to welcome Sir Harold Roxbee Cox to the Board. He is undertaking a special assignment to build up our facilities and personnel for research and development. Immediately prior to joining us, he was Chief Scientist to the Ministry of Fuel and Power.

FUTURE PROSPECTS

The present state of the Company's order book, which is 50 per cent higher than a year ago, may give some indication of prospects for the future. However, costs are likely to rise because of the National wage increase for the engineering industry which became effective in March, 1955. Also, prices of raw materials are rising and supplies are becoming more difficult.

For those engaged on production this has been an exceptionally difficult year. It has been necessary to meet unprecedented demands while at the same time implementing our expansion programme, with the movements of plant which that entails.

I would like to make a particular point of expressing our appreciation of the efforts of every member of our organisation.

The Consolidated Profit and Loss Account shows a net income from all sources of £801,734 (against £730,397 for the previous year).

After taxation of £455,310 the amount available for distribution is £346,424 (against £212,806 for the previous year).

The Directors recommend a final dividend of 11 per cent (less income tax at 8s. 6d. in the £) on the ordinary shares as further increased by the rights issue of 840,000 shares of 5s. each made in November, 1954. This will absorb £66,413 and make a total distribution for the year of 17 per cent on the ordinary shares which were in being prior to the rights issue.

The Consolidated Balance Sheet shows that current assets of £3,142,125 exceed current liabilities by £2,038,209, which is an improvement of £345,656 during the year.

The report was adopted.

GOPENG CONSOLIDATED

MR DONALD W. THOMAS'S REVIEW

The Forty-second Ordinary General Meeting of Gopeng Consolidated, Limited, was held on June 6th at the Registered Office, Redruth.

Mr Donald W. Thomas (Chairman) presided.

The Reports and Accounts for the year ended September 30, 1954, having been circulated for the prescribed time, were taken as read, as was also the Chairman's Statement, circulated with the Accounts, which was as follows:

The Accounts for the financial year ended September 30, 1954, show a profit of £65,211 after payment to the Malayan Government of £43,771 for royalty on ore sales and provision of £79,336 for United Kingdom and Malayan taxation.

Five dividends, each of 1s. per £1 Stock, paid in respect of the year under review absorbed £54,418, and the sum of £10,193 has been written off Capital Expenditure. After provisions for these commitments, the balance unappropriated at September 30, 1954, was £53,969, an increase of £600 over the corresponding figure of the previous year.

The average price of tin during the period under review was £690 per ton (metal), which compares with £800 per ton (metal) in the previous year.

The attention of Stockholders is drawn to the report of our General Managers, Messrs Osborne and Chappel, circulated with the Report and Accounts, where the comparative figures of ground treated, tin-ore recovered, etc., are clearly set out. The volume of ground treated was over 400,000 cubic yards more than during the previous year, but the tonnage of tin-ore recovered was slightly less It is pleasing to note that the working costs were reduced from 17.04 pence per cubic yard for 1952-53 to 12.60 pence per cubic yard for 1953-54.

Both the Sanglop and Moynalpy Rubber Estates again showed losses, but a refund of Replanting Gess of £3,630 offset these losses and left a credit of £1,053.

IMPROVED SECURITY POSITION

I am glad to be able to report that the security position has improved, although the precautions which are still necessary entail continued strain on those responsible for the management of our property.

It is pleasing to place on record in these Annual Statements our appreciation of the services of our General Managers, the Resident Manager, and the staff at the mine and the estates. The manner in which the deviation of the Kampar Water Supply Line, to which I drew attention last year, was accomplished—with the minimum interruption in the winning of tin-ore—reflects great credit on all concerned in this major engineering achievement.

Stockholders have been advised as follows of the production of tin-ore during the first six months of the current financial year:

October/December, 1954 ...
2,996 piculs = 178¼ tons.
January/March, 1955 .....
3,275 piculs = 195 tons.

Stockholders will be interested to know that the International Tin Agreement has received the required number of Member Governments' signatures, but it still requires ratification by some of the Governments concerned before it can be brought into operation.

I am not prepared to venture an opinion as to what the result will be, or its effect on the mine, but, under present conditions, it is reported by the General Managers that the present improved rate of output should be maintained during the current year.

In conclusion, I am happy to advise Stockholders that extensive boring operations completed during this year have confirmed scout bores in a large volume of the Company's reserve mining land carrying medium values at Moynalpy section of the property.

The Statement of Accounts and Balance Sheet, together with the Directors' Report, were received and adopted.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—DIVIDEND NOTICE.—PREFERENCE STOCK.—At a meeting of the Board of Directors held today a dividend of Two per cent on the Preference Stock was declared in respect of the year 1955 payable on August 2, 1955, to stockholders of record at 3.30 p.m. on June 30, 1955.—By order of the Board. FREDERICK BRAMLEY, Secretary. Montreal, June 13, 1955.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held today, a dividend of seventy-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1955 payable in Canadian funds on August 1, 1955, to shareholders of record at 3.30 p.m. on June 23, 1955.—By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 13, 1955.

UNIVERSITY OF BIRMINGHAM
FACULTY OF COMMERCE AND SOCIAL SCIENCE
The University of Birmingham invites applications for a Research Fellowship or Associateship, tenable in the Faculty of Commerce and Social Science. Fellowships and Associateships are renewable annually and are generally held for a period of three years. Candidates are invited to submit with their applications an outline of the investigation which they propose to undertake. The Faculty would be interested in any project falling within the general range of the social sciences and in sociology, particularly in collaborative research on sociological aspects of population movement, into, out of and within the City of Birmingham, including coloured immigration and changes due to the redevelopment of the inner housing areas. Candidates may be awarded a Research Associateship (salary not less than £500 per annum), or if they have a doctoral degree or equivalent research experience, a Research Fellowship (salary not less than £550 per annum).
Applications should be made not later than June 30, 1955, to the Registrar, University of Birmingham, and should include the names of two referees.
The University, Birmingham, 15. G. L. BARNES, Secretary.
June, 1955.

EXTRUSIONS BY MARLEY
Buyers requiring rigid and flexible tubes and sections in thermoplastic materials should ask for a quotation from Marley Extrusions Limited. Dept. 99, Lenham, Maidstone, Kent. Harrietsham 381.

CHARTERED ACCOUNTANT, aged 35-40 years, required for leading British International Organisation marketing well-known proprietary products. Initial appointment in West London Head Office with a view to subsequent permanent administrative appointment with major North American operating group. Previous experience in Senior Accountancy position essential. Commencing salary not less than £1,750 per annum. Pension and profit-sharing schemes in operation.—Write, giving full details of age, experience and qualifications, to Box 978.

INTELLIGENT young lady required as Secretary in Patents Department at Cambridge. Must be competent shorthand-typist. Some knowledge of German or French great advantage. Lodging accommodation available. Write (Quoting No. 1078) stating age, fullest particulars and salary required to Personnel Manager, Fisons Pest Control Ltd., Bourn, Cambridge.

THE NATIONAL ASSOCIATION OF PORT EMPLOYERS invites applications for the post of General Manager at its headquarters in London. The Association is the central organisation of employers of dock labour and as such is responsible for industrial relations in the Docks Industry, including national negotiations on wages and similar subjects with Trade Unions and Government Departments. The post is one of high responsibility and will carry a commensurate salary. A superannuation Scheme is in operation. The appointment will take effect as soon as possible but not later than September 1st. Applications, which will be treated in confidence, should be sent, in writing, to: The Secretary, The National Association of Port Employers, 3 St. James's Square, S.W.1, not later than June 30, 1955.

INDEPENDENT MARKET RESEARCH organisation wants Research Officer.—State qualifications and salary required to Box 991

BEFORE YOU BUY those shares, see what the *Investors' Chronicle* has to say. It is the best-informed and widest-read financial weekly. Two issues free of charge from 30 Grocers' Hall Court, London, E.C.2.

SHIPPING COMPANY requires experienced woman supervisor for female staff ashore and afloat.—Write, giving full particulars education and experience, to Box 983

LANGUAGES Graduate, early thirties, with secretarial qualifications and administrative experience, seeks progressive post where abilities can be put to employer's advantage. Perhaps Export Department. Also interested in Canada.—Box 988.

THE UNIVERSITY OF MANCHESTER
Applications are invited for the full-time posts of RESEARCH ASSISTANT in the Faculty of Economic and Social Studies. The successful candidates will be expected to pursue research in ECONOMICS, ECONOMIC STATISTICS, GOVERNMENT, SOCIAL ADMINISTRATION OR SOCIAL ANTHROPOLOGY and should be graduates in any of these subjects or in Modern History or Economic History. There are two grades: Grade II—salary £350 to £650 per annum; Grade III—salary £450-£500 per annum.—Applications should be sent not later than July 2, 1955, to the Registrar, the University, Manchester, 13, from whom further particulars and forms of application may be obtained.

THE COLLEGE OF COMMERCE, BRISTOL
SCHOOL OF MANAGEMENT STUDIES provide a full-time course, from September 26, 1955-July 20, 1956, which includes a period of industrial experience. Comprehensive fee £20. Detailed prospectus from Registrar.

IRON AND STEEL BOARD
The Board require a Senior Economist. Some experience of the steel industry or statistical administration an advantage but not essential. Salary according to qualifications and experience. Contributory superannuation scheme.
Applications should be sent to The Secretary, Iron and Steel Board, Norfolk House, St. James's Square, London, S.W.1.

MANUFACTURERS REPRESENTATION
Well connected engineering company undertakes negotiation and marketing assignments. Agency facilities extended suitable items for radio and electrical industry and distribution.—Box 993.

EXECUTIVE APPOINTMENT REQUIRED
Young Executive, 34, with wide experience in industry and commerce, sales management, marketing, administration; background in light engineering; commercial and technical qualifications; seeks responsible position. British, fluent French and German, travelled and well connected.—Box 989.

THE HOME OFFICE invite applications from men between the ages of 40 and 60 for temporary posts of Regional Civil Defence Officer at Newcastle-upon-Tyne, Leeds, Nottingham, Cambridge, Reading, Bristol, Birmingham, Manchester and Tunbridge Wells; also a Civil Defence Officer for Wales at Cardiff. Successful candidates will be the senior regional representatives of the Civil Defence Department of the Home Office. Duties will cover the co-ordination of all civil defence activities within Regions, including the planning of training exercises; liaison with Army Commands and the planning of combined exercises between units of the Armed Forces and local divisions of the Civil Defence Corps. Salary £2,000 per annum (London rate, subject to provincial deduction according to location).
Applications, stating age, qualifications and experience, to the Establishment Officer, Home Office, Whitehall, S.W.1, by not later than June 30, 1955. No testimonials should be sent and only candidates selected for interview will be notified.

NATIONAL COAL BOARD are about to establish a residential Staff College for the industry, and invite applications for the post of Director of Studies, who will be deputy to the Principal. Responsibilities will include the organisation and running of senior management courses. Experience of industrial management and of modern methods of management training is desirable.
The salary will be within the range £2,000—£2,500; the post is pensionable. The successful applicant will be required to take up duty by October 1st.
Write, giving particulars of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope SS/5. Original testimonials should NOT be forwarded. Closing date July 6, 1955.

ECONOMIST, 30, 1st Class Hons. 5 yrs. commercial/industrial experience. Proven ability to reduce industrial costs. Wishes to undertake reduction of manufacturing/administrative costs in medium sized firm. Position of direct responsibility to Managing Director required.—Box 975.

EXPERT POSTAL TUITION
For Examinations—BSc(Econ) LLB and other external London University Degrees; Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

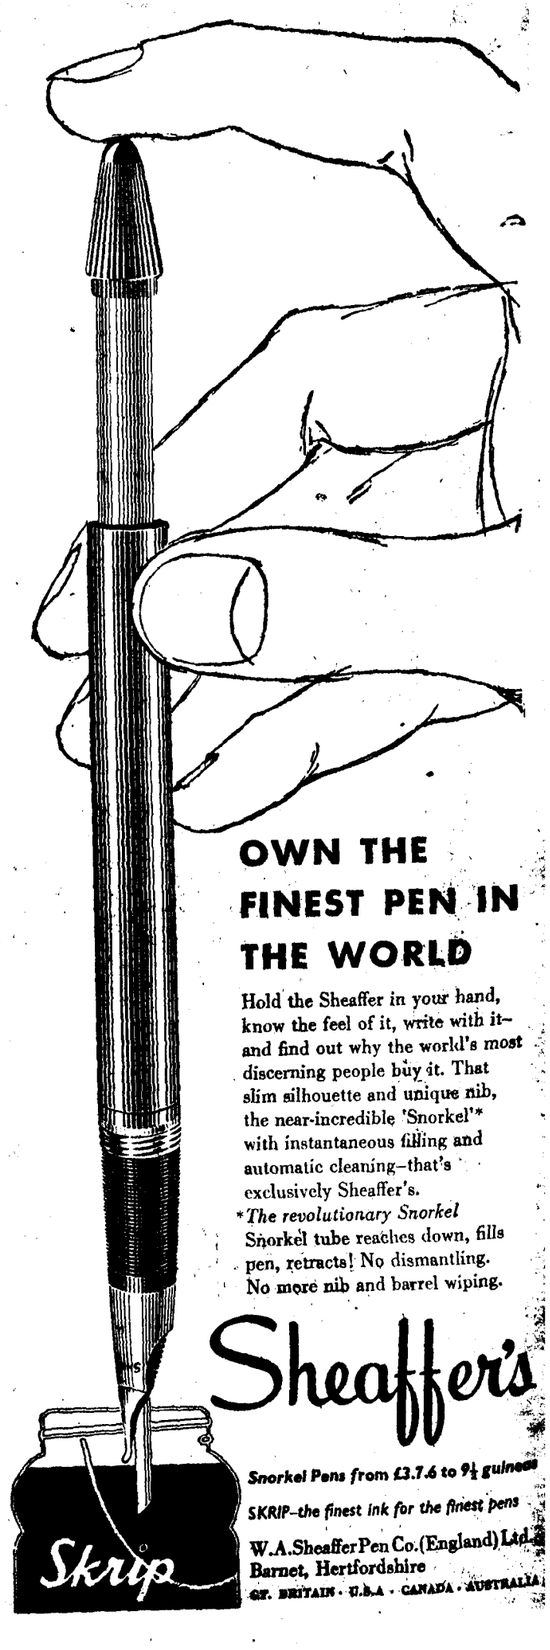
ALL WORK and no pay!

This sturdy robot works 24 hours a day . . . draws no wages . . . never takes a holiday. Consider, for a moment, its advantages in cost alone as compared with police control. Effective all-day traffic control at a busy intersection requires the full time services of at least two police officers; total cost, £1374 every year. An "Electro-matic" installation, at an initial cost of £1750 with £175 per year covering depreciation, running and maintenance, will in two years effect an economy of £300 and incidentally provide a 24 hour service.



It is obvious that the only economic form of traffic control at busy intersections is with

Troubled Waters

FACTS ON THE ICELANDIC FISHING DISPUTE

This map tells at a glance the reason for the current and regrettable fishing dispute between Britain and Iceland. In March, 1952, the Icelandic Government, on the grounds of fishery conservation, published new Regulations, cutting off vast areas of international waters from British trawlers, and substituting for the traditional three mile limits, new limit lines within which trawlermen could not fish. These new penal limits were introduced arbitrarily and without consultation, and were put into effect in May 1952, hitting British, Dutch, Belgian, French and German trawlermen very hard and causing a great deal of anger and resentment.

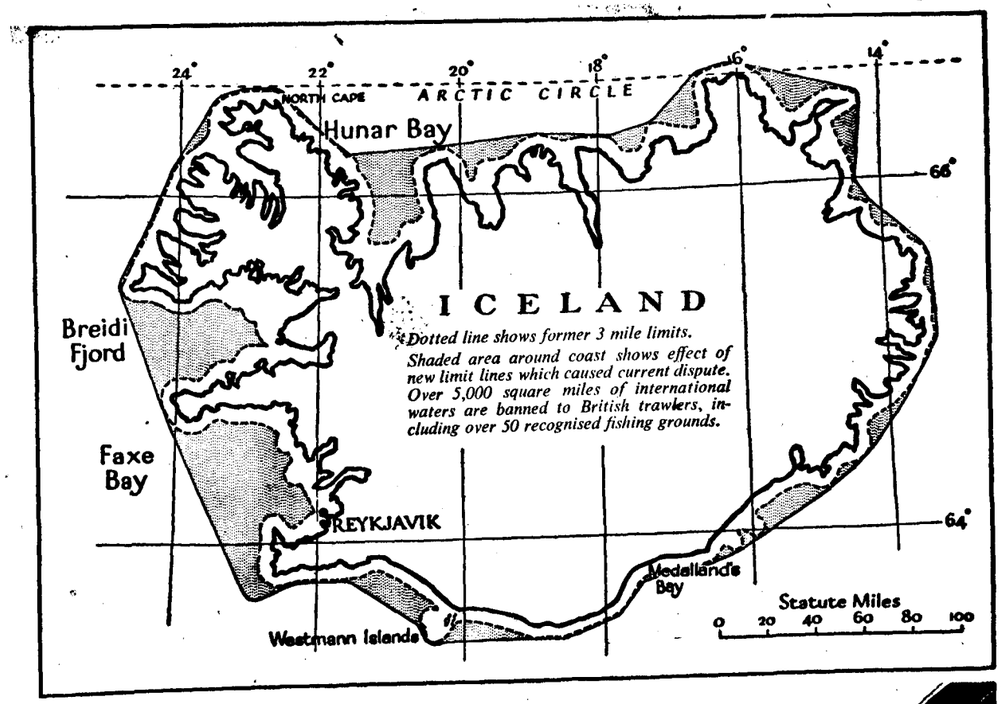
The British Fishing Industry recognises the need for conservation and agrees that certain breeding areas should be closed. But the new so-called 4 mile limit does not close only the breeding areas but is so drawn from headland to headland as to ban our trawlers from working prolific fishing grounds, notably in the huge Breidi, Faxe and Hunar bays. From the map it may be seen that in these heavy fishing areas the new limit lines are not 4 miles from the coast, but in some cases 27 miles; indeed, out of sight of land.

The fishing grounds about Iceland were pioneered by British trawlers. Small wonder then that British skippers, mates and crews resented this high-handed grab of their traditional area. The resentment became more acute when it was clear that these grounds may be, and are, fished by Icelandic line-fishing boats, but are forbidden to British vessels.

In retaliation, British skippers threatened to strike if Icelandic trawlers landed their catches at Hull, Grimsby or Fleetwood. Their action was supported by British fish merchants and by all British trawler companies. Since that time there has been a ban on Icelandic landings of fresh fish at our ports although Icelanders still land salt and frozen fish.

Whilst this dispute has been going on, a similar situation arose in the important fishing grounds around the Faroe Islands. Contrary to the Icelandic attitude, a new British agreement was negotiated with Denmark and the Faroese Government which has satisfied all parties and will come into effect on 1st July, 1955.

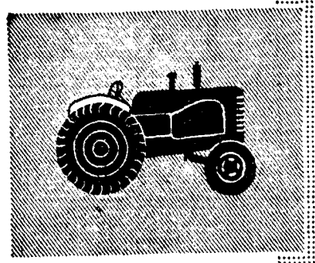
The Icelanders are our long-time friends. British capital has helped finance and build the Icelandic trawler fleet. Britain has always been the prime market for Icelandic vessels. Before the dispute, Icelandic landings made up about 5% of total British supplies. By dint of hard work, this shortfall has now more than been made up by British, German and other foreign trawlers. More and more fish is being landed in British ports and prices are being kept very stable. In fact, more stable than any other food, so that fish continues to be the cheapest first-class protein food that the British housewife can buy.



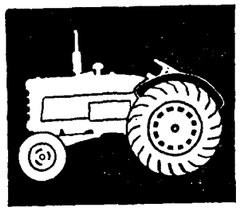
The whole British Fishing Industry regrets the Icelandic dispute. The Government has published a memorandum which has been submitted to the Council of Europe, carefully detailing the British case. Over and over again the Industry has offered to negotiate with the Icelanders, but all efforts at negotiation have been refused. The deadlock continues.

In the meantime, in addition to refusing all efforts towards negotiation, the Icelanders are continually arresting British trawlers for what can at best be termed fractional violations of the disputed new limit lines. Since May, 1952, no less than 15 British trawlers have been fined a total of £50,000 by Icelandic courts. In the case of the Hull vessel, Lord Cunningham, she was fined for alleged fishing in coastal waters, 17½ miles from shore ! Some of these incidents are very explosive in character. One British skipper, Lieut./Cdr. Jenks, R.N.R., of Fleetwood, told an Icelandic gunboat which tried to arrest him on the high seas that he wouldn't stop " so long as his ship remained afloat ". He did not stop and the gunboat backed away.

Perhaps one of the worst features of the new Icelandic limits is that British trawlers, even in storm, are not permitted to cross them unless all their fish and fishing gear is stowed. Rather than risk arrest, the almost certain £3,000 fine and confiscation of equipment, almost all British skippers prefer to take their chances by riding out a storm and hoping it will pass over without disaster. Sometimes they are unlucky. British trawlermen want the facility of running for any port in a storm with or without their gear being stowed.



In spite of provocation, British trawlermen are always ready to negotiate a settlement on conservation with the Icelanders. So far, Iceland will not negotiate. She now claims huge stretches of ocean as her " sovereign rights ".



Let us hope that this truculent mood of our friends will soon pass over and that they will be prepared to sit down with us and work out an equitable solution. We say, the sooner the better, because this dispute only hurts two long-time friends and gives aid and comfort to our mutual enemies.

SENSIBLE SUMMER COMFORT FOR EVERY MA

Sounds, Shillings and Pence

IF SMELLS were the biggest curse of the nineteenth century, most certainly noises have taken their place as the greatest nuisance of the twentieth. In industry, noise nuisance is the unseen enemy employers have to face, contributing to inaccuracy, lack of concentration, careless mistakes and unwitting distraction from the job in hand.

Whilst the employees' need for adequate light, temperature and ventilation usually receive sufficient attention, is it not strange that so little regard is paid to the requirements of the ear? Heavy factory machinery is not the only source of noise in industry. The problem is becoming acute in offices where typewriters, adding and duplicating machines, and teleprinters are also making their own noisy contributions to unpleasant working conditions.

What can be done about this unwanted noise which so systematically lowers working efficiency? Nowadays the requirements of our hearing can be scientifically assessed so that the amount of noise reducing insulation can be accurately calculated. In many cases reduction of noise can be effected without structural alteration and without interruption to working arrangements of the factory or office.

It is worth a little thought to consider what contributions the elimination of undesired noise could make to the working efficiency of your factory and office. Newalls experience in this field as manufacturers and contractors is at your disposal on any aspect of sound insulation. *Preliminary investigation and consultation are gladly offered and will cost you nothing.*

How much does an Oil Company Earn?

TOO MUCH? OR TOO LITTLE?

Judge for yourself from the facts* about one company rather than the hearsay about many.

ESSO PETROLEUM COMPANY, LIMITED transports by sea and refines crude oil and markets a wide variety of petroleum products throughout the British Isles. In 1954 the Company's total trading receipts amounted to **£188,559,000.** Of this sum **£70,874,000** was the amount collected and paid to the Government for Customs Duties and Taxes. The remainder was spent as follows :—

	£
Purchase and Transportation of Crude Oil and Products	86,525,000
Wages, Salaries and Benefits for Employees	9,679,000
Refining, Marketing and Other Costs	17,410,000

This left us with a **NET PROFIT** after tax of **£4,071,000,** of which : **£2,322,000** was ploughed back into the business ; **£1,749,000** was paid as net dividend to shareholders. So, in fact it came down to this : that, out of the £188.5 million which the Company received, the net profit represented 2.2 per cent of turnover, the dividend represented 3.6 per cent of the shareholders' funds employed in the business.

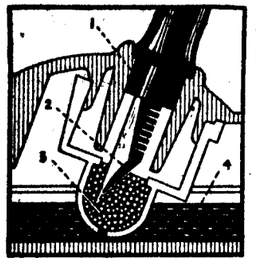
Petroleum Prices. The prices of five principal Esso products at the end of the year compared with the 1953 Government controlled levels were :—

Esso Regular Grade Petrol	down 2½d. per gallon
Esso Autodiesel *(for public transport)*	down 1d. per gallon
Esso Blue Paraffin	down ½d. per gallon
Esso Green Tractor Fuel	down ½d. per gallon
Esso Fuel Oil	down ¾d. per gallon

This Company hauls the crude oil 6,000 miles from the Middle East in tankers costing up to £2 million each to build; it refines the crude at Britain's largest refinery which has cost *£40 million to erect and equip; it markets* the finished products through a sales organisation employing over 7,000 people and distributes them through dealers to the public in accurately measured quantities. And in the end the average wholesale price of all petroleum products manufactured and sold by the Company, excluding the duty, works out at *three-halfpence a pint or three-halfpence a pound.*

TOO MUCH? OR TOO LITTLE?

ESSO



* *These are some of the facts given in the Company's 1954 Annual Review, just published.*

The pen that fills itself

Esterbrook **447** Writing Set

This is the graceful pen you see on the desks of so many busy people. It is, in effect, a fountain pen—with the ink in the base instead of in the barrel. The pen refills itself immediately it is returned to the socket and is always ready to write a full page without redipping. There are no less than 30 personal writing points to choose from so that you can be sure of a pen that is exactly suited to your handwriting. In Black, Grey or Ivory, 33/3d. and 36/9d. from all leading stationers: also a two-pen model in Black (model 487) at 66/6d. and 73/6d.

1 Pen closes spill-proof base, prevents evaporation.
2 Combined ink-feed and writing point (30 to choose from).
3 Exclusive filling device also cushions point against damage.
4 Reservoir holds 40 times more ink than a fountain pen.

Esterbrook **447**

By Appointment to the late King George VI
Manufacturers of Land-Rovers
The Rover Co. Ltd.

It's revealing to drive a ROVER . . .

You'll be astonished at the way the car takes rough surfaces smoothly in its stride. Ruts and potholes seem almost non-existent as the car glides over them.

The Rover co-ordinated suspension system allows plenty of vertical road wheel movement, while spring tensions and shock absorber settings ensure a smooth ride. The central bearing to the propeller shaft checks 'whip' and vibration.

You'll enjoy having both pace *and quiet* at your command. Even at high speeds, engine and transmission noise has been reduced almost to vanishing point.

The special cylinder head design of Rover engines sets the Rover pace, whilst the extensive use of rubber pads and mountings, spraying with sound-absorbing material and heavy carpeting make the naturally quiet engine almost inaudible.

You'll appreciate the infinite care and thought that have been paid to the comfort of driver and passengers.

All passengers sit well within the wheelbase, with front seat adjustable for height and rake and wide centre arm rests front and rear. Heating, de-misting, ventilating and draught-proofing are exceptionally efficient.

You'll feel confident even in the thickest and trickiest traffic, because a Rover is such a well-bred, obedient car to handle.

Direct central gear change with synchromesh on 2nd, 3rd and top, controlled free wheel for clutchless changes and well-planned dashboard layout make clumsy handling of a Rover practically impossible.

ROVER

Sixty · Seventy-Five · Ninety

Body and chassis are identical throughout the Rover range. However, three different engine sizes give motorists a made-to-measure service in which design and workmanship are uniformly high. New features common to all 1955 models include re-shaped luggage boot, larger rear window and flashing type direction indicators.

What Moscow Wants

IT is odd how many question marks seem to be held necessary by commentators on current Soviet policy. Nearly every discussion of this topic begins with a question; few end with an answer. Even Mr Macmillan, in last week's foreign affairs debate, maintained that the latest Soviet moves could be interpreted either as "reassuring signs of a new policy" or as "sinister warnings of a more subtle but just as deadly a threat." The Foreign Secretary added: "One can speculate on all that for ever. . . . What we have to do is to act."

At the "summit" next month, and in the whole period of negotiation that is now opening up, it is to be hoped that the western governments will not seriously adopt the view that Soviet policy is too enigmatic to be analysed, and that leaps must therefore be made into the dark. For, in fact, the range for speculation is far smaller than Mr Macmillan seemed to suggest. The Russians are approaching the imminent negotiations with a clear and consistent policy, and they have themselves provided an ample outline of it. Surely that outline must be the starting point for western policy-making in this new phase.

The five main elements in present Soviet tactics may be listed as: conciliatory gestures; an accompaniment of conditional threats; explicit and far-reaching demands; stubborn evasions on vital points; and multiple variations on the theme of neutralism. The first three, taken together, amount to a demand that the free nations must now make a choice—a choice between a *détente* on terms that would cripple both their defence and their bargaining power, and a new competition in strength which, Moscow claims, will destroy them. Western eyes, fascinated by the one conciliatory side of this diplomatic pentagon, have still to be fully opened to the other four. Mr Molotov may have taken to a ten-gallon hat, but it is hardly surprising that he finds it too small; the Kremlin still commands plenty of brains.

The Russians are not themselves in doubt about the disruptive purpose of their recent gestures. As one Moscow radio commentator put it last week, western statesmen who thought that the new Soviet attitudes towards Austria, Jugoslavia, disarmament, Western Germany and Japan were the result of the "bankrupt policy of positions of strength" (the Atlantic alliance) were quite wrong; all the Soviet moves had, in fact, successfully "checkmated" this western policy, which *Pravda* describes as "in the throes of a profound crisis" brought about by the new Russian diplomacy.

Moscow is insisting as strongly as ever on its monopoly of peaceful intent, and demanding that the western governments must match its recent "concessions." It is evidently important for its policy that western leadership should seem baffled and angered by the Russian moves. The tranquil reaction of Mr Eisenhower and Mr Dulles to the invitation to Dr Adenauer proved impossible to fit into this picture; it was therefore firmly passed over, and Moscow has been pouring out stories about "consternation in Washington" instead. Great pains are also being taken to distort the American suggestion that the "summit"

conference might discuss the promises of free elections that were given to East European countries after the war. *Pravda* and its satellite echoes transform this into a demand to restore "the regime of capitalists, landlords and gendarmes." For their part, the Communists say that at Geneva they will "emphasise everything that might make for agreement."

★

Unfortunately, they are simultaneously making it clear that they will do nothing of the kind. Quite some time before Mr Molotov's speech at San Francisco, they had already semi-officially issued their list of "urgent problems, ripe for solution," and it contains seven far-reaching demands. In proposing the removal of all armed forces from Germany, they give no encouragement to anyone in the West who thinks they would be content if the Americans fell back to the Ems or even across the Channel; *Pravda* makes it plain that they must return to Kansas, while the Russians retreat no further than Königsberg. Nor does this apply to Germany alone; a second demand (on which the latest Russian disarmament terms are made to depend) is for the abolition of all military bases on foreign soil—leaving Germany a military vacuum, with the French army facing the Soviet and satellite forces across the north European plain almost alone and without even American air support from British or North African bases. M. Pinay pointed out earlier this month that the West's true security is its common defence organisation "including the presence of allied forces in Europe, which is the real guarantee of it." Moscow evidently makes the same diagnosis; and it seeks to destroy that security at the root.

These first two Russian demands are obviously unacceptable to the West, but others are piled on top of them. Communist China's right to a veto-wielding position in Uno is pressed as part of a general Far Eastern settlement based on "sovereignty," implying the abandonment of Formosa and doubtless of south Vietnam, too. The "cold war" must be halted; this unelaborated demand embraces the ending of western broadcasts to Eastern Europe and of support for refugee organisations, but not any corresponding slackening of Communist propaganda and activity in free countries, for that, Moscow insists, is nothing to do with Russia and must not even be discussed at Geneva. The western governments must wind up their controls on the export of strategic commodities and equipment to Communist countries, whose own governments would, however, retain their total control over all foreign trade and their power to use it as a political weapon; the Soviet bloc's six-year boycott of Jugoslavia, and Russia's abrupt action against Australia when the Petrov inquiry began, are instructive examples.

A sixth and a seventh item, both of them familiar enough, were later named as "really urgent problems" for discussion at the "summit"; European collective security, and disarmament. Here one reaches the evasive side of the pentagon. When the Russians speak of "European collective security," they are referring to a specific plan, long canvassed by Mr Molotov, under which all European countries would rely for protection on pledges given by all other European countries. This plan, which evokes the ludicrous idea of, say, Hungary falling upon Russia's flank in the event of a Soviet attack on Finland, would be laughed out of existence in a matter of weeks if it were seriously proposed in any country where free discussion is possible. The Russians are, not surprisingly, unwilling to answer any searching questions about it, but it is constantly flown, like a gaudy if somewhat fragile kite, too high for close inspection.

No explanation is offered why a European collective security system should be preferred to the world-wide system which Uno ought to provide, and whose development Moscow has persistently blocked; nor do the Soviet leaders admit any inconsistency between this preference for the part rather than the whole and the Litvinov maxim that "peace is indivisible." "European" security suits the Russians because it edges the United States out while leaving them dominant throughout the continent—their propaganda now dwells on the theme that the Soviet Union is a European power, while Americans are strangers—but it is presented in quite other terms. Disarmament, likewise, is a field for evasive tactics. The Soviet terms offered on May 10th, although at first sight far more realistic than anything previously offered, still contain blurs and gaps at vital points; and Mr Molotov's claim at San Francisco that Russia had "accepted in full" the western plan for conventional arms was a bland lie.

★

Turning to the most openly unfriendly part of the new Soviet policy, the western analyst notes a certain confusion. For months before the ratification of the Paris agreements, Soviet diplomats at cocktail parties were muttering "This time we are serious" (a remark to whose revealing implications they seemed blind). After ratification, the Russians solemnly interred their treaties with France and Britain; and almost at once Mr Molotov was in Paris beaming at the very men who carried the agreements through. The melodramatic Warsaw conference gave birth to a mouse, and since then the threatening rumbles have become fainter. The Warsaw fiasco doubtless reflected rising Soviet hopes that the West Germans could yet be weaned away from the western alliance, and that the painful business of baring an East German army to the eyes of Poles and Czechs could be avoided. But it would surely have been better not to have made the big bow-wow noises in the first place. Mr Molotov at least should know by now that they yield diminishing returns as surely as cries of "wolf."

The fine hand that signed with Ribbentrop the pact which carved up Poland is more evident in the last sector of the "new look" policy. Never has the ancient strategy of "divide and subjugate" been more skilfully executed. Mr Molotov's warehouse now stocks shades and grades of neutrality, non-involvement, freedom from alliances, active coexistence, zones of peace, toothless Titoism, and non-playing Nato membership, to suit all the possible clients who can be detached, or semi-detached, from the alliances of the free nations. He has tried on the "neutral belt" idea, found it cramping and slipped into something looser, his comfortable old "European security" habit. And at this point the pentagon is completed. For the most notable thing about the conciliatory gestures that form one side of it, and in themselves are meant to create a general mood of euphoria, is that, apart from disarmament, the most important of them have been made not to the West or the free world as a whole, but to selected nations; first to the Japanese, then the Austrians, the Jugoslavs and the Germans. And in each case the basic appeal has been, quite simply, "see how nice we can be to you if only you shake off the deadly Anglo-American embrace."

After a tour round Moscow's new diplomacy such as has been attempted here, certain things are crystal clear. It is nonsense to deduce that the Russians are at last giving up their basic aims. As the Foreign Secretary suggested last week, they are trying to get the free nations to lay aside their protecting coat by beaming instead of blasting; but they want the coat off just the same, and they are quite open about it to all who care to listen to them. The West's new strength and unity have evidently helped to bring about their change of tactics, as have the Russians' own internal difficulties and dissensions; but that does not mean that their diplomacy is in retreat, or that there will be any lessening of subversive activity by their local Communist pawns. On the contrary, the Russians are approaching the "summit" in their familiar fashion—with a set of "maximum" demands which they would be surprised to get, but for which they will press all the harder if the West seems ready to yield.

How much less the Russians will actually settle for depends on the interplay between their own need for a settlement and western unity, patience, skill and imagination. The last is not the least important. If western statesmen can do no more in the phase of subtle diplomacy that is now beginning than adopt negative and defensive postures, the West will lose not only the confidence of "third-party" nations, but confidence in itself. The real challenge to the West is to show itself not more elastic and yielding than the Russians, but more imaginative and positive in the pursuit of peace.

Future of the Call-Up

IT may not be very long before the Government and the public will have to get to grips with the thorny problem of National Service. This may seem, at first glance, simply a matter of deciding whether the two-year period of the call-up can be reduced or not. The arguments of the optimists are familiar. Service commitments have been cut by withdrawals from Suez, Korea, Trieste and elsewhere; if international talks prosper the process could go further. At the same time the public is getting used to a concept of nuclear war which, however apocalyptic it may be if it happens, ought to be economical of manpower meanwhile. National Service was originally instituted to provide a large reserve army, which is now almost meaningless in hot war or cold. Why, then, should not such manpower savings make possible a cut in the call-up before long? A saving of 40,000 men by all three services should, theoretically, knock three months off the two-year period; a saving of 80,000 should reduce it to eighteen months.

But the problem is not so simple, or so electorally attractive. In the first place, any cut would fall entirely on the period when servicemen are "effectives" rather than "trainees." It would not reduce the immense cost and disability of training 133,000 army recruits annually; but it would more than proportionately reduce the numbers of trained men who are really useful. In the Army, generally speaking, the first year of the present call-up is mostly devoted to training and only the last six months produce the effective officers and NCOs. In the Navy and the RAF, the position is even worse.

The burden of training servicemen, moreover, falls on the experienced cadres of the regular forces; and it is at this point that the problem becomes more difficult still. All the services are suffering from the run-down of their cadres of men with more than six years' service; and part of the difficulty is directly attributable to the impact of national service itself. In the effort to attract men to long-service engagements, and to induce men to renew them subsequently, the services have been forced to offer shorter "long-service" periods. Today no man, whichever of the alternative types of "long-service" engagement he takes, binds himself to the army for more than three years at a time. The regular army is now a short-service army, and as different from the prewar professional army as can be imagined. And the danger of a short-service army is that, unlike one of old soldiers, it simply fades away.

The decision to make a career in the services is now taken, when it is taken, after sampling service life as a conscript or as a "regular" with an easy let-out

clause. The army, not the recruit, is on probation. It has not been possible to run an army of two completely different elements—the national service intake, turning over every two years, and the prewar professional element serving under various types of 12-year engagement (although, of course, a diminishing number of these still fortify the regular ranks). To put it crudely, and incompletely, the example of so many men taking their discharge at short intervals—and the continuous preoccupation in barracks and messes with civilian careers, wages and prospects—is proving too unsettling for long-service men. Before the war, their environment influenced them to renew; to-day it tends to influence them to get out. Hence it has been necessary to offer competitive short-service terms to regulars. For example, the Army now offers a three-year engagement as an alternative to national service which brings a man more pay, no subsequent reserve training, and can be started before the call-up age so that he can go out without losing much ground to his national service coevals. Alternatively, the Army offers a long-service engagement which, though described as a 22-year engagement, permits a man to opt out after three-yearly intervals. On the first type, the Army merely gains a year; for both types the real problem is to get men to renew. If they do not renew, the experienced cadres wither.

*

Unfortunately, there are signs that they may be withering disturbingly quickly. Of the recent average Army intake of 133,000 men a year, only about 33,000 have taken a three-year engagement (half of them under the 22-year scheme). Ideally a balanced army structure of age and experience requires that about one out of every six soldiers should have six years' service and over, and this requires that one in three of the men now taking a three-year engagement should renew. The Secretary of State for War has been pressed by Mr Wigg and other Labour MPs to state what the all-important percentage of renewals is. He has answered, quite justifiably, that the percentage will not be fully available until October, when it will be possible to analyse results for the first period in which the only regular engagements on offer were three-year engagements. But for an earlier period, in which some men were taking three-year engagements and some still enlisting under the old 12-year schemes (five with the colours, seven on the reserve), the figures are ominous. Only 5.6 per cent of the men signing on for three years renewed. The probable figure taking both three-year and five-year men together may be 10 to 15 per cent. This is not nearly enough. Already the proportion of men with over six years' service is only one in ten, not the desirable one in six.

The services have therefore entered a vicious circle. Desperately short of regulars with "long service" experience, they are all the more in need of the useful last six months of national service. But further, a reduction in the two-year call-up would obviously have serious repercussions on recruiting for three-year regulars. With the alternative reduced to only 18 months, it is all too likely that fewer national servicemen would take a three-year engagement. And to introduce a competitive two-and-a-half year engagement would cut the experienced cadre still more. It might necessitate giving men who take a 22-year engagement the right to opt out every 30 months. The impact on the Navy and the R.A.F. would be very similar. The services might, if the Treasury agreed, do something to offset this effect by improving the conditions for long-service personnel; certainly a new pay review is nearly due. But it is optimistic to suppose that it would solve the whole problem. The brutal fact is that, unless the present vicious circle can be broken, the generals and air-marshals will be forced to insist that the call-up must remain at two years even while service commitments are being steadily and visibly cut back. The politicians will be caught in the dilemma that while the reasons for such a demand may be compelling, they are almost impossible to explain in a way that will excite not only understanding but also agreement from the public.

Is there any way in which the circle could be broken? There is one. Although the services would be ill-served by any reduction in the period of the call-up, they might not—or soon might not—be so averse to a reduction in the number of young men who are made subject to it. They might even, when commitments allow, welcome such a reduction, for it would also reduce the time and manpower of the shrinking long-service cadres that are expended in the frustrations of training conscripts as reservists. It would then be possible to free regulars for more interesting duties, increase the strength of the regular "atmosphere" in the services, and avoid competitively cutting regular engagements. Any such logical and economical solution, however, would mean that a very awkward nettle would have to be grasped. It would mean that some form of selective call-up would have to be introduced.

*

There can be little question that public feeling would be instinctively against this proposal. Egalitarianism would be outraged by further extending, for example, the categories of occupation which are exempt—especially as the next occupations for exemption would probably be students, scientists and technologists; already a privileged elite. Other occupations (such as engineering for export) which gained exemption would increase their attractiveness; this might seem to be sound economically, but the services would not welcome a narrowing of the recruiting field that would deprive them of many of the skills they most need—and improve. An alternative method of selective service would be some form of balloting, which might be fairer,

but would not necessarily appeal to the national sporting instincts. For it would mean that if the intake were at first only slightly reduced, the winners of the prize of exemption would be an envied and suspect minority; commitments would have to fall heavily and regular renewals rise steeply before the ballot selected a minority for service and the odds turned tolerably against being called up. The fact must be faced that balloting would be far harder to organise than simple extensions of exemptions to more and more occupations—or possibly to more and more "favoured people" with bad big toes.

Yet the alternative may be to load the services with ever-increasing difficulties. As commitments were reduced "National Service" would increasingly mean not only employing the nation's manpower in a wasteful and ineffective way, but also the final destruction of hopes of rebuilding the armed services as full-time professions; and without this latter there can be no hope of ever getting back to a professional, whole-time, well-paid and efficient Army, Navy and Air Force, such as anti-conscriptionist Labour MPs often demand. It looks as if the nation will have to choose between its obsession with fair shares in square-bashing for all, and efficient and economical fighting services based on the readiness of everyone to accept the contingent liability to serve and the risk of losing some civilian money and seniority thereby. There are evils in both courses. But at least there is a chance that the latter course might in the end terminate conscription altogether. Do those who are most attached to milk-of-the-word egalitarianism really want to miss that chance?

Orphan Island

By a Special Correspondent

NIGHTLY explosions in Nicosia show that the political temperature is rising again in Cyprus, and it is clear that the Government again has trouble on its hands. One has every sympathy with the individual officials who have to deal with it. But that continuing abstraction, Her (or His) Majesty's Government, has only itself to blame. For if there is trouble in Cyprus it is because nobody in authority has ever given the island sufficient thought. Nor were there many signs, either in the debate that was devoted to Cyprus in the old House of Commons just before it was dissolved or in this week's general colonial debate, that the process of thought has yet started. Labour speakers, for the most part, simply advocated self-determination; the Government was content to stand on the old ground that the only change it would contemplate in Cyprus would be the grant of a constitution of the standard colonial type—which, indeed, the Cypriots could have just as soon as they had the sense to ask for it. But even a short stay in the island is enough to convince anyone that neither of these seemingly simple prescriptions really provides a solution.

British policy has often been described as ostrich-like. In Cyprus a better analogy would be the lobster, for it is only on the surface that it is unyielding. Whatever may be true of London, the colonial administration is certainly not uncompromising. It looks forward with eagerness to the most far-reaching compromises. How could it do otherwise? For a government, to be uncompromising needs bottomless resources — spiritual, material and financial—and the one thing with which the British people have never been willing to supply their farflung representatives is resources of any kind. A colonial administration that lives on a shoe-string inevitably feels uncomfortable when the people over whom it rules are out of sympathy with it; the only future course to which it can look forward is that of handing over responsibility to the representatives of the people—some representatives, chosen somehow. This is the whole modern tradition of the Colonial Service. And the representatives of the service in Cyprus refrain only with visible difficulty from telling the Cypriots to follow the example of the Gold Coast. If only the Archbishop would behave like Dr Nkrumah, they almost say aloud, he could have anything he wanted within a few years. The Colonial Office is so deeply committed to the idea of a constitution, on which it stakes all its hopes, that if ever an elected legislature came into existence, the Governor of the day would have to go to almost any lengths to keep it in existence. A politician who had the sense and the patience to play his cards one by one, instead of asking for all the tricks at the start, would have little difficulty in leading the Colonial Office to an acceptance of *enosis*. The administrators in Cyprus and at the Colonial Office will not admit that their policy is one of delayed *enosis*. But that is what it would amount to if the Cypriots knew how to play their hand.

*

Would this be so terrible a result? If the British face can be saved, would any essential national interest be damaged by a reunion of Cyprus with Greece? At any time between 1878, when the British occupation began, and a very few years ago, the answer would have been No. Indeed, it would have been difficult to establish that Britain had any interest at all in Cyprus—little enough interest had ever been shown. At any time in those seventy years, *enosis* might have been regarded as regrettable, but neither as impossible nor as unnatural. What, after all, did Mr Gladstone say in 1897?

That he would feel satisfaction if he could see "the population of that Hellenic island placed in organic union with their brethren of the Kingdom of Greece."

But it would not be so easy today. For one thing, it would not be so easy to save Britain's face—not merely the Prime Minister's face after the very dogmatic stand he took during his visit to Athens in September, 1953, but also the face of the British people after the stands they have *not* taken in other parts of the Middle East. In Palestine, in the Canal Zone, in the Sudan, at Abadan and elsewhere—in all these instances the British, saying they would ne'er consent, have consented to surrenders great or small. If now, having been even more dogmatic than usual, we run away from an ambitious cleric, a parcel of politicians in Athens and a handful of hooligans in Nicosia, it will be the final proof to all the wiseacres in the Near and Middle East. From Corfu to Karachi, it will be difficult ever again to convince anybody that the British are in earnest. The fruits of such a demonstration would be far more embarrassing than anything that can happen in Cyprus.

The second thing that has changed is the attitude of Turkey. From the time that theoretical Turkish sovereignty over Cyprus ended in 1920 until very recently, Ankara showed no noticeable interest in Cyprus. But now it takes a strong interest, and declares that it will fight rather than permit the sovereignty of the island to go to Greece. There are those who say that the British Government itself, by its well-known conspiratorial methods, contrived to procure this change in the Turkish attitude; but there is really no evidence for this, and it is highly unlikely. However the new Turkish interest in Cyprus arose, it is genuine enough, and there is no reason to suppose that the Turkish Government is not in full earnest.

The third thing that has changed has been the decision to build in Cyprus the main British military and air base for the Middle East. This is the last place in the whole area to which the British forces can go; if they are forced out of Cyprus, they have to go back to England. To suggest to the service chiefs that they could get all they want out of a long-term treaty with Greece after the island had become Greek, with the added advantage of a friendly population, is to excite the most violent reaction. Why, they ask, did a base in Cyprus (where geography is not very favourable) ever become necessary? Because the services had to leave Ismailia and Habbaniyah. And why was that? Because treaties made in good faith were denounced or revised. What reason is there to suppose that Greek governments will stick to their predecessors' bargains any better than Egyptian governments? And as for the friendly population, the services know from experience that "*friendliness*" can be turned on and off at the tap by any politicians who get into control. The military view is that every penny of the many millions of pounds that are being spent at Dekelia and Akrotiri is being thrown away unless the assumption of continuing British sovereignty holds good.

What, then, if *enosis* is out of the question, is the path that British policy should pursue? What seems to be the easiest course is to dig the toes in, to say that no change is contemplated, and to defy anyone who disagrees. But it only seems to be the easiest course because it involves no hard thinking. Actually, it is likely to be the most difficult of all courses. For it will mean fighting on three fronts—against growing unrest in Cyprus itself; against world-wide criticism in the United Nations and elsewhere; and against restive public opinion at home. Only for a brief period will it be possible for the British Government to go on saying *non possumus*. After that it will have to decide to do something.

*

But what? Though a brief visit to the island confers no authority to do more than make a few tentative suggestions, there is no need to be too modest, as the obvious first need is for some fresh thinking. Perhaps the essential preliminary to anything else is to stop thinking of Cyprus as a run-of-the-mill colony, or indeed as a colony at all. It is, after all, a European island, with a people of a standard of literacy and civilisation unknown in the colonial world. Together with Malta and Gibraltar, it should be removed from the purview of the Colonial Office and the Colonial Service. Whether they should go under the Home Office, as has been proposed for Malta, is more doubtful; it sounds right, but it might lead to their being looked after by the same section of the Home Office which today administers Welsh affairs, together with explosives, the betting laws and petitions to the Crown. It would probably be better to create a separate Mediterranean Office in London, and a separate Mediterranean Service. To suggest this change is not intended as disrespect to either the intentions or the devotion of the Colonial servants who today administer Cyprus. But their heart is inevitably in Africa, where so many of them served before, and where so many of their personal ambitions lie.

The second suggestion that can be made is that the fresh thinking about Cyprus should start from the cultural and economic angles rather than from the political. What could be done to improve education in Cyprus? Why should there be no institutions of higher education, so that any ambitious boys have to go to England or to Athens (and Athens is both nearer and cheaper)? How much farther can irrigation be carried? (Characteristically, it is only now that an effort is being made to find out the answer.) Could Cyprus, if equipped with a deep-water free port, serve as a commercial base for Britain in the Middle East as well as a military one? Or, as a comprehensive exercise, let someone try to say what would happen to the island if it came under the control of a really energetic colonising power. What would the Americans or the Germans do?

Development of this sort, of course, would cost money. But that leads on to another most interesting aspect. At the moment, money is being pumped into the island, for the purpose of building the base, at fully as fast a rate as its economy can stand—indeed, faster, for the boom has a distinctly inflationary look. It is the opinion of the authorities that an inflow of about £5 million a year is the most than can be absorbed without inflation. (That is, after all, the equivalent of something like £1,500 million a year for the United Kingdom.) For the next two years or so, this rate of inflow is assured by the military plans. But after that it will begin to drop, and what will happen then? Either the boom will collapse, and depression will be added to the Government's worries. Or else there will have to be an imaginative, adequate and properly phased Development Plan. Five million a year is a small price to pay for a secure base. What would the Germans do?

But in the end, thoughts will have to come back to politics. And when they do, they might go right back to first principles. What is the minimum British interest in Cyprus? In the present and foreseeable state of the world, the island is needed as a base for British power and influence in the Middle East, which we believe to be for the good of the world and which is, in any event, one of our vital national interests. That is the basis of the American claim to be in Panama, and it is our basic reason for being in Cyprus. That being so, we should define what we need for these purposes and confine ourselves to that. At a guess, the basic requirements of British policy are sovereignty (that is, the right as a last resort to cut through Gordian knots), military facilities and the maintenance of internal order. We should reserve these things to ourselves, and refuse to enter into any discussion of them.

These, however, are only part of the functions of government, and not a large part either. Agriculture, industry and commerce, taxation, education, social services, labour, co-operatives (which thrive in Cyprus)—none of these affects the vital interests of Britain. Why should there not be an invitation to the Greek and Turkish governments to confer with the British Government on the best means by which they could be associated in the administration—or in supervising the administration by the Cypriots themselves—of these matters? The Archbishop would no doubt hold out for complete Enosis or nothing. But it is doubtful whether Athens would, or whether it could go on with its agitation if it did. There are precedents in American federalism for two governments existing side by side in one territory, each with its own courts, its own legislatures, its own taxes and its own administrators. The only added complication here suggested is that one of the parallel governments should be wholly British, while the other was tri-national.

To suggest a combination of the principles of Dyarchy and Condominium (both of which are anathema in Whitehall) is admittedly audacious; but audacity is needed. Any constitution based upon them would be unique in the world. But so is Cyprus.

Notes of the Week

Less than the Packet of Cigarettes

MR BATY, the footplatemen's leader, has put a brave face on the award given by the referee, Lord Justice Morris, last Monday; and he deserves credit for it. He said, in one of his memorable phrases,

> We have fought a craftsmen's battle, and bearing in mind the opposition and the intrusion, the result is not without significance.

Not without significance it certainly is. The settlement will give 3s. to every driver with more than two years' service, but the strikers should now be doing some depressing arithmetic. On an average, and allowing for £2 a week of strike pay, each driver must have lost £25 or so in wages during the three weeks' stoppage. The 30 per cent of drivers who are on shunting duties, and who would have got nothing under the offer made by the Transport Commission before the strike began, will have to work more than three years before their 3s. rise makes up for this loss. The 60 per cent of drivers who work trains of "secondary importance," and who would have got 2s. 6d. a week from the commission's offer, will have to work nearly twenty years before the strike will have been worth their while. And the 10 per cent of drivers who work the most important trains would have got 5s. from the commission's offer, or two shillings more than they are going to get now. Finally, the firemen and cleaners get nothing at all from Lord Justice Morris's award; and drivers in their first and second year of service get only one and two shillings respectively.

Meanwhile the commission has been negotiating with both the railway unions about the mileage allowances, which it had been agreed should be part of the settlement. In May the commission offered to reduce the mileage above which an allowance (now one hour's pay for every 15 miles)

is paid, from 140 to 80 miles. The unions, obviously, would like a lower limit and higher allowances, but the need to have something in the bag at the time of their annual conferences may be a spur to a speedy settlement.

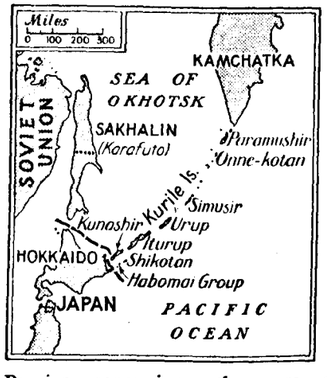
A Minister for Exports?

IT is possible that the first Conservative back-bench revolt of this Parliament will erupt over the Board of Trade. The logic of removing responsibility for steel and engineering from the Ministry of Supply has been generally accepted, but the wisdom of giving it to the Board of Trade in that department's present state is more in doubt. The Tories have for some time taken a jaundiced view of the Board's talent for export promotion.

The usual Tory practice has been to blame the Board's shortcomings on either the President or the department's organisation, but this takes a superficial view of a complex problem. The Board's organisation is not on paper particularly ill-arranged ; and Mr Thorneycroft, as is the case with any President of the Board of Trade, is obviously in the uncomfortable position of having the Treasury jogging one elbow and the Foreign Office the other. At a time when the Board's powers of compulsion are being largely exchanged for the less easily manipulated powers of persuasion, its policy is particularly susceptible to that of the Treasury.

The real trouble, however, is that the volume of work that pours through this department to the desks of the President and his Permanent Secretary is already far too large. Some Tories therefore think that the department for overseas trade should again be hived off, this time perhaps under a Minister of Cabinet rank. This might make it easier to raise the status and authority of Britain's commercial representation overseas. There is an additional reason for action at this time. The Monopoly Commission's major report on certain restrictive practices will be published next week, and the Government will then find it hard to avoid taking legislative action. This will keep the President and his Ministerial assistants enmeshed in complex legislative work all winter. Before they are lost to sight, the Government needs to make sure that there are adequate administrative arrangements for oiling the export drive. The latter should not be regarded as a spare-time occupation.

Belgrade Talks with the West



IT was the Jugoslavs who took the initiative in asking for the talks with the three western ambassadors which began in Belgrade yesterday. It was not their object to tell the western powers about the recent Russian visit to Belgrade, for they have already done that, but the two meetings are not unconnected. Although the Jugoslavs had asked for the western talks before the Soviet visit was announced, they presumably knew that it was in the offing and no doubt wished to arrange some counterbalancing contacts with the West. Their idea was that the talks should range over as wide a field as possible ; they are presumably eager to give the western powers, now toiling up the last stages of their journey to the summit, the benefit of Jugoslav ideas about what they will find when they get there.

For the western powers, the talks will provide an opportunity to reassess Belgrade's relationship to themselves. This should not cause any unpleasant surprises. The Jugoslavs have already made it clear that they were repelled and not attracted by the experience of their close contacts with their Russian guests. But although they have no intention at the moment of letting down their guard, they do believe that international tension is less and that the chances of doing business with the Russians are now better than they have been. This belief makes it easier for them to remain firmly in their favourite position—on the fence—although when they get down to particular issues, they find that on many, notably Germany, they have much more in common with the West than with the East.

It is unfortunate, however, that they still seem to feel that to maintain their independent position they must turn a blind eye to Nato's purely defensive character and condemn it as a military bloc just as responsible as the Communist bloc for the growth of international tension. Many people, and not only in the United States, may find it increasingly odd that a country with this attitude towards Nato should receive economic and military aid, without any strings attached, from Nato powers. Moreover, the Jugoslavs could play a unique role in increasing real international understanding. It is to be hoped—for everyone's sake—that they will not throw away this opportunity by unnecessarily alienating western trust.

Russo-Japanese Nerve War

IN the Russo-Japanese talks now in progress in London two wily sets of negotiators have come face to face, and connoisseurs of old-fashioned diplomacy are watching them with interest. The Russians opened with their classical gambit, the presentation of a series of impossible demands.

According to information made public in Tokyo, they are asking Japan to relinquish its claims not only to southern Sakhalin and the Kuriles, about which not even Mr Hatoyama is very optimistic, but also to Shikotan and the Habomai group of islands, which the Japanese thought would be an early Russian concession ; they are also demanding that the sea area between Japan and Korea be closed to all foreign warships except Communist ones, and that Japan should promise not to join any alliance antagonistic to Russia or China. They have rebuffed the Japanese request for the release of the 12,000-odd Japanese nationals who are thought still to be in their hands with the answer that they hold only war criminals, and that these will be released when they have completed their sentences.

Yet the fact that it was the Russians who first suggested these talks indicates that they have come to London with more in mind than just a repetition of the claims they made in 1951. Their offer will probably develop by a series of "concessions," involving the territorial questions, the prisoners and fishing rights, but leaving intact a hard core of demands based on the neutrality clause. The Japanese, however, seem equally determined to play the game in their own way. It is not often that the Russians find themselves beaten to it in "leaking" the proceedings of secret conversations to the world, and last week's disclosures have markedly stiffened Japanese opinion against the granting of far-reaching concessions. The Japanese delegate in London, Mr Matsumoto, who declares himself ready for a six-month campaign, is reported to have told the Russians that he will not discuss the restoration of diplomatic relations until Japan's claims have been dealt with. There are likely to be many more quiet strolls across the road in Kensington Palace Gardens.

German Army's Birth Pangs

IT now seems possible that the Bonn parliament may disperse on holiday before any legal basis is set up for the new German army. Dr Adenauer has been frustrated in his attempt to rush through a sketchy bill which would allow volunteer cadres to be formed with the status of "civil servants on probation" as an interim measure until the whole batch of military laws are passed. The *Bundesrat* (the upper house) has refused to consider the bill as it stands, and the *Bundestag* has postponed the first reading. A storm of criticism of Dr Adenauer and the newly-fledged Minister of Defence, Herr Blank, has broken out in political circles. The burden of their complaint is that the "blanket" bill is an affront to parliament, presented before the government has revealed the proposals it intends to make for political control of the army. The members of the Upper House also resent the way in which the rights of the federal *Länder* are being by-passed. Their wrath has been roused by the Minister of Finance, who has handed over an interim sum to the Defence Ministry while competencies are still undecided.

This zeal for maintaining their democratic rights is a healthy sign of new times in Germany. No one in Britain can object to seeing a German minister of defence castigated for refusing to answer parliamentary questions or give a press conference. Herr Blank may well have an excuse at the moment, because the government's full declarations are promised shortly, but even so it is hard to understand why, after years of paper work in Bonn, so little should still be known about the means whereby powers will be divided between the armed forces, parliament and the executive.

Recent changes inside the Ministry of Defence, including the departure of one of the leaders of the reformist group, give the impression that there is still confusion about ways of dealing with the situation. It is indeed an immensely complicated one. Germany's allies should bear in mind that the new *Wehrmacht* is starting with its traditions broken, with little or no national prestige and in an atmosphere of antagonism fostered by films, books and political speeches. It is one thing to welcome a break with the past ; but there is a danger that too little will be done to replace it. It is in Britain's interest, and that of Nato as a whole, to see that the Germans do not go from one extreme to the other—from an army of nationalist tin-gods to one treated by its own countrymen with contempt and mistrust.

Masters of their House?

THE select committee of the House of Lords set up this week to consider the attendance of peers and the powers that the House may possess in this respect is a purely fact-finding body, but the question that looms behind it is crucial: can the peers themselves limit the membership of their own House ? Any scheme of reform will have to propose a limit on the number of hereditary peers qualified to sit in the new House, and there is much doubt whether the peers can do this in existing circumstances, for each hereditary peer is summoned to Parliament by royal command.

The unofficial scheme of reform that has been in mind ever since the all-party talks of 1949 provides that the new House should contain life peers, and that the number of hereditary peers should be confined to 200, chosen from and by the whole body of over 800. Something on these lines will have to be agreed if the House of Lords is ever to be reformed ; yet when the motion to set up the select committee came before the peers this week, a wave of suspicion engulfed Lord Salisbury from some quite eminent corners of the House.

The one hopeful sign is that the need for reform is being seen with growing clarity on the Labour benches. These are becoming desperately thin in both quality and quantity, and are destined to become more so by 1960, by which time there will have been no new Labour peers created for nine years. Some of the party's elder statesmen now being bundled aside in the Commons could well grace the Opposition benches in the Lords before the end of this Parliament. Even, perhaps, a certain Lord Limehouse of Cherry Cottage ?

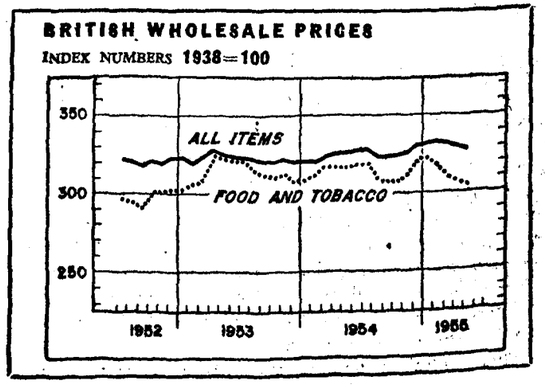
Stevedores in Confusion

THE dock strike has survived the week, but the National Amalgamated Stevedores and Dockers are now split wide open. The bitterness between London and Liverpool was intensified when Mr Barrett, the general secretary, seeing which way the wind was blowing in London, announced that he had been against the strike from the beginning ; and it rose to fury when a meeting of London stevedores on Tuesday accepted by a large majority

a recommendation of their own representatives on the executive that they should return to work on Monday if the men in the north would do so too. Even in London there are two factions. Mr Timothy, the man who ostentatiously tore up his Communist party card at the time of the last dock strike in the autumn, leads the minority who will not "betray" the men in the north. As for the men on Merseyside, they are breathing fire. Ever since the beginning of the month, when they rejected the executive's recommendation that they should return to work, there has been talk of starting a breakaway union. Now they are playing with the delightful idea of marching on London and cleaning up the traitors there first. Mr Barrett has resigned from his office, and his deputy, Mr Newman is leaving the union at the end of next week.

It is not surprising that the men in the north are in a sullen mood. They have lost four weeks' wages and gained nothing—except the re-affiliation of their union to the TUC, which they could have had at any time by making propitiatory noises. To put their trust in the verdict of the TUC's disputes committee, which is adjudicating on the "poaching" issue, is to walk straight into the spider's parlour. It is true that after the committee has given its verdict, which the NASD executive has undertaken to accept, the way would in theory be clear for the stevedores to reach an understanding with the Transport and General Workers Union about their representation on local committees. But the strike leaders know that the committee's verdict can hardly be contrary to the Bridlington agreement: the TUC is bound to say that the stevedores should give up their "poached" members. And if they accept these terms, then most of their case for representation on port committees in the north will disappear.

Striking Back



It is to be hoped that the Minister of Labour will not take the slightest notice of those who are protesting against the call up of merchant seamen who are on strike. In his answer to Labour MPs on Tuesday, Sir Walter chose to base his defence on mere procedure. It was not for his Ministry, he said, to exercise discretion in the matter. Once a seaman has ceased to be registered with the Registrar General of Shipping and Seamen, the Ministry is notified of the fact by the Merchant Navy Establishment Administration, and if the man is under 26 and has not yet done military service then the call-up is automatic. The only reason why the same action had not been taken when miners were on strike was that there was no similar procedure for notifying his Ministry, which had to make its own inquiries. But if it found that men under 26 were no longer employed as miners, the call-up again was automatic.

There is another and better defence which the Minister could have used. These men are striking against the community. Their action has been nicely timed by someone to do the maximum damage to the country's tourist trade. If ever there has been a case in which the community has been justified in striking back for once, it has been this one. How effective counter-action can be is shown by the fact that large numbers of the Atlantic crews who were on strike at Liverpool have re-registered for work—a movement aided no doubt by the Cunard Company's legal action against six of the strikers' leaders and the summonses obtained by the master of the *Queen Mary* against 49 men who refused to obey orders when on board. With the sailing of the *Queen Elizabeth* from Southampton on Thursday, it looks as if the strike should not last much longer.

Generals in Buenos Aires

THE revolt against General Perón, which had apparently been prepared over the past three years, exploded while the fight between the Roman Catholic Church and the Argentine government was at a climax. Its leaders, naval officers some of whom belong to old and anti-*Peronista* families, evidently calculated that they could associate their own coup with clerical disaffection throughout the country. The Argentine army, which is of course Catholic but not necessarily clerical in its sympathies, chose to quash the rebellion—but for its own ends; and it is not yet clear what these are. At the moment, everything suggests that the president has lost ground. The army, to whom he owes his salvation, is very much in control and the Minister for the Army, General Lucero, has emerged as a dominant figure. President Perón has not been allowed to celebrate his victory by calling out the workers; and it is the army that has issued calming proclamations to all Catholics and has assured them of its protection.

But it would be rash to consider General Perón as already expendable or to speculate about a change of regime. The army leaders cannot undo overnight the countless social and political works of *Peronismo*, nor is there any evidence that they wish to restore democracy in Argentina. As things calm down, they must almost inevitably turn back to the one man who heads a strong political apparatus, although they are unlikely to tolerate some of his most doctrinaire colleagues, such as Sr Borlenghi, the minister of the interior. Meanwhile, Argentina's recently reiterated claims on the Falkland Islands—which could hardly be pressed by a country unable to rely on its own navy—are now to be taken even less seriously than usual; and the Chileans, who have their own reasons for seeking a diversion from domestic troubles, have shown a nice sense of timing in repeating their claims to Antarctic territories over which they are at odds with Argentina as well as with Britain.

Mr Beyen Finds London Foggy

IT is difficult to understand why Mr Beyen has had to return to The Hague with little more than assurances that the British Government would soon know its own mind. Mr Beyen came to London earlier this week, not as the Netherlands foreign minister but as a representative of the Messina conference, to prepare the ground for the official invitation which will shortly be sent asking the British Government to participate, in almost any capacity it chooses, in the committee which is to study how the next steps in integrating the European economy might be taken.

The committee, which is to meet during the summer with M. Spaak in the chair, has been given no power to do anything that will bind any government in any way. After it has reported to the foreign ministers of the Six on what might be done to integrate European transport and power, including atomic power, and to bring about, in stages, a broad common market, the ministers will have to decide where they want to go and how they want to get there. At that stage, basic decisions will have to be taken and the British Government will have to determine what its relationship with any new institutions, or modified old institutions, is to be. There is much to be said for taking those decisions on the basis of the understanding which would come from working with the European countries as they develop their plans during the summer.

A logical case can of course be made out that the OEEC, with staff and facilities already available, could do most of what the new committee will be asked to do. But logic is now somewhat beside the point. The Six will meet with British participation or without it. If Mr Macmillan meant it when he said in the House of Commons last week that he was "convinced that the European idea is one by which, and perhaps by which alone the German people can be kept within the European fold," Mr Beyen should have his answer by return of post.

No Stand against Strydom?

MR STRYDOM'S Senate Amendment Bill has received the Governor-General's assent, and all that now remains is for the Nationalists to fill up the Senate with the required number of obedient party men who, at the prime minister's prompting, will vote through any further amendment of the constitution that he finds expedient—even the extinction of the upper house itself. Thus for all practical purposes South Africa has acquired not merely a unicameral legislature but the essential apparatus of a single-party dictatorship. And Mr Strydom looks like having little need to bestir himself further, for the United party, his chief antagonist, has this week taken yet another suicidal plunge.

Already splintered on the right by the defection of six of its members to form the Conservative party, the United party has now developed a crack on the left. Mr Bernard Friedman, one of its few members with the courage of his liberal convictions, has been expelled from the caucus, and has threatened to resign his seat and contest it again as an independent. But the rift goes deeper than this; all over the country there is anxiety over the party's vacillation. It was brought into the open last weekend by its leaders' feeble attitude to the question whether they would restore the Cape Coloured voters to the common electoral roll if the United party returned to power. Even on this now highly hypothetical issue they could not agree on any clear stand.

Debating the Colonies

ACCORDING to the Minister of State for Colonial Affairs, the debate on the colonies last week was the first such general debate since 1952. Many MPs must feel that there will be little to regret if the next one is postponed for another four or five years. In so far as the debate had any focus, it was upon the category of "colonies in trouble," which is in any case a diverse list, including Malaya, Kenya, British Guiana, Cyprus, and perhaps Malta and some others. Mr Lennox Boyd dealt with them in turn, and was soothing about them all. He reported fewer incidents in Kenya and Malaya; he assured the House that he was right to stick to his decision about Nyasaland's constitutional reform; he was vague about Uganda; he promised Malta, Jamaica, and other territories his careful consideration of their—very diverse—claims.

In general, however, the debate was productive of little of lasting value; the subject was too wide, the problems too miscellaneous, the knowledge of members too compartmented, and the issues too various, to make a worthwhile Parliamentary discussion. Even the attempt by some Labour MPs to define a decisive difference between their colonial policy and that of the Government—for which the occasion was well adapted—failed to come off. In future, it would be better to debate specific colonial issues or areas, of which plenty call for expert parliamentary dissection, for there is no common colonial issue to argue out. Labour spokesmen generally wanted to go faster and further than the present pace, whether in constitutional reform, the intake of colonial undergraduates, or the creation of co-operatives, irrespective of the facts on the ground. But the truth is that nearly every colony—or at least colonial region—today is a complex and integrated political and economic entity; if Parliament cannot find time to give these, one by one, the attention they deserve, it can at least deal with the more *important*. A *Cook's tour of the colonies is almost an insult* to the people whose welfare and destinies are involved.

On the Rates

THE keynote struck by the Chancellor of the Exchequer, in his speech at the conference of the Institute of Municipal Treasurers and Accountants last week, was the need for "the sternest efforts of efficiency and economy"

in local government services. Mr Butler evidently fears that the increased rating valuations that will come into effect next year will lead some local authorities to assume that they can spend more of the ratepayer's money—instead of accepting the proposition that as rating values go up rate poundages should come down in full proportion. This is a tendency that will have to be watched.

At the same conference, Mr Gilbert Sugden sketched the silent revolution that has taken place in local finance during the last fifteen years. One feature has been the narrowing—although not the closing—of the gap between the rates that have to be levied by poor authorities, compared with those with which rich ones can get away. Merthyr Tydfil's rate was once four times that of Bournemouth, and it is still precisely double; thanks, however, to the Exchequer Equalisation Grant, the great bulk of local authorities now levy a very similar rate—roughly between 21s. and 27s. in the £. Equally significant is the changed pattern of local government expenditure. In real terms current expenditure from the rates has risen by only some five per cent between 1938-39 and 1952-53, to a total of £916 million for all local authorities in England and Wales in the latter year. Out of this total, however, education now takes 38 per cent compared with 26 per cent before the war; while the share of highways has fallen from 13 to 8 per cent. Under capital expenditure (total £475 million in 1952-53), housing has jumped from 39 to 67 per cent; it has done so in part by squeezing to the bone the outlay on roads, parks, libraries, and civic amenities generally.

Increased help from the central government has brought with it increased central control, which the local authorities do not like. Sir George Schuster, in another paper to the conference, suggested one way out of their quandary. If the grant for each service was based on the costs that an efficient authority could be expected to incur for a given standard of service, there would be little need for central control. The ratepayers would then reap the rewards or penalties for the degree of efficiency of their council, as well as being free (if they wanted) to pay for higher than average standards. The difficulty would be to determine standard costs satisfactorily, but it need not be insuperable.

Signor Scelba Throws in His Hand

THE imminent fall of Signor Scelba's government has been prophesied many times almost from the day he assumed office sixteen months ago; but when he did finally give up the struggle last Wednesday, the end came almost as a surprise. It had looked as if, with the help of a cabinet reshuffle, the Prime Minister would succeed in his strenuous efforts to compose the differences within his own Christian Democrat party and to rally to his standard the three small centre parties whose support he needed to maintain a majority. But the tiny Republican party proved recalcitrant, and this was apparently seized upon by dissident Christian Democrats to stir up fresh trouble and compel the Prime Minister to throw in his hand. Thus, in the end, Signor Scelba has been forced out of office, not by the constitutional process of an adverse vote in parliament, but by a revolt within his own party.

At the time of writing the President, Signor Gronchi, has barely begun the series of consultations that precede the formation of a new government in Italy. His task is not an enviable one. Any government must be grouped round the largest party, the Christian Democrats, with their 261 seats in the Chamber. But if they are to govern with an effective majority they must have allies. The alliance with the small lay parties, which has lasted eight years, now seems to have spent itself, at least for the time being. But no attempt to join up either with the Nenni Socialists on the left or the Monarchists on the right seems very practicable, even if it were desirable, for there would be stiff opposition from one or other wing of the Christian Democrats. A minority Christian Democrat government is not a very alluring possibility; at best it would live an uncomfortable hand-to-mouth existence and at worst it would soon fall through its internal divisions—for the men who brought down Signor Scelba seem united only in their desire to get rid of him. If Italy is to have a chance of stable, effective and progressive government without recourse to fresh elections, order must be brought out of the chaos of the Christian Democrat party.

Khrushchev in Person

IN recent weeks the outside world has had its first real opportunities of sizing up the new Soviet leaders. Their journey to Belgrade and their somewhat increased accessibility at functions in Moscow in honour of Mr Nehru and other visitors have enabled journalists and diplomats alike to confirm some of the assessments which in the past had to be based on speeches, articles in the Soviet press, and circumstantial evidence. The picture of Mr Khrushchev has been filled out with particular vividness, as an expansive and somewhat primitive personality, an interminable and not very controlled talker, and, oddly enough for a Kremlin veteran, a man repeatedly and publicly in his cups. In Jugoslavia he jostled his better mannered prime minister; in Moscow he grew hot and loquacious while the guest of the abstemious Indians; and at all times he seems ready for a bearlike brush with western journalists, which may or may not lead to the granting of another visa, according, it seems, to the state of the party's head the morning after the party.

Two circumstances must not be forgotten. The apparently headstrong, garrulous, and crude Khrushchev managed to outwit and bring down the businesslike and reserved Malenkov; and if he seems primitive, so too must Stalin have seemed among the galaxy of earlier Bolshevik intellectuals. Stalin, however, knew how to keep quiet, while Khrushchev makes so many speeches (quite apart from his notorious asides) that even *Pravda* does not treat them as front-page news. Altogether, the impression that he is the first man in the Kremlin is less strong now than it was immediately after Malenkov's fall when there was a definite attempt to build up Khrushchev. On no important occasion nowadays is he allowed to lay down the law by himself. Russia is now ruled, if not collectively, at least by compromise, by checks and bargains. It is significant that Malenkov has not been kicked further downstairs, and that some major controversies—over the legal code, freedom of expression and even consumer goods—are also still alive.

Purge in Morocco?

REPREHENSIBLY late in the day, battle has been launched against French counter-terrorism in Morocco. In the Assembly on Tuesday, M. Faure made the important statement that five arrests had been made of French police officers implicated in the many recent murders and attempted murders of French and Moroccan liberals. He also announced the replacement of the resident general, M. Francis Lacoste, by M. Gilbert Grandval, until now France's ambassador in the Saar.

Certainly the documents, statements and counter-statements that have been rushed into print since last week's murder of the leading French champion of a liberal policy, M. Lemaigre Dubreuil, reveal M. Lacoste to have been ineffectual. But they also show that Paris, preoccupied with Tunisia and other matters, gave him no reason to be firm. At least since March, the Faure government has been playing down the damning evidence of French lawlessness that has been available to it both from its own scouts, such as the head of the Paris security services, and from reliable private informants, M. Lemaigre Dubreuil among them.

The whole unsavoury story shows that matters have gone far beyond the stage at which a change of representative can cure either the intransigence of certain French residents or the sullenness of the Moroccan population. Only Paris can launch the measures that will abate tempers, and bring to an end the Moroccan shopkeepers' strike that is paralysing business in the chief towns. But the Faure government is the prisoner of its own parliamentary majority. The Franco-Tunisian agreement has yet to be ratified and is promised a stiff passage in the Senate; and the pressure of events in Algeria, where Moslem unrest seems to be spreading, may also prevent the government from propounding immediate changes in Morocco.

Last but not least, with whom is it going to negotiate "reforms"? The Moroccans are surly about the present Sultan and few Frenchmen advocate the return of the old; every conceivable course leads, straight as a die, to the need for a solution of the "question of the throne" in the form of some kind of regency council. The Moroccans will be readier to co-operate in such a solution if they see some earnest of French resolve to stop the heyday which diehards, terrorists and other French extremists have been enjoying.

What is Nigerianisation?

"NIGERIANISATION" is a horrible word; but it will disappear from the political dictionary when the last member of HM Overseas Service in Nigeria hands over to a Nigerian civil servant. How quickly and successfully can this be done in the federal government and the three regional governments of Nigeria? The report of a one-man commission on this subject has now appeared, and is of importance for the future of colonial civil servants everywhere. The Commissioner, Mr L. H. Gorsuch, is in no doubt about the difficulty facing the Nigerian governments in getting Nigerians of the right quality and education, and he emphasises the danger of going too fast at a time when the whole service is overstrained. His recommendations are mainly concerned with remuneration, training and structure; his terms of reference did not require him to consider how an adequately staffed and paid service could be carried on existing revenues, but—as a result of his proposals—the salaries and wages bill might well be increased by 20 per cent. This is indeed a difficulty, and carries the danger that the richest region (the West) may outbid the others, while the regions in general may refuse to second useful Nigerians to the Federal service, which might then become a virtually white preserve—with obvious political dangers.

But while Nigerians have made "Nigerianisation" a political faith, the territory cannot get enough Europeans to meet its needs, whatever posts are given to approximately suitable Africans. Since the real recruiting officer to the service is the serving officer, and the European serving officer today cannot live on his pay, the situation is deteriorating dangerously. Nigerians, oblivious of the market value of a trained European civil servant, have enviously fixed their eyes on the expatriate allowances, taking the view that either everyone should have them, or no one. Mr Gorsuch has not only recommended that they be increased, but that they should be renamed in the hope of teaching Nigerians the realities of the market for administrators. He wishes to call them "inducement additions"—i.e. the necessary inducement to make a man undertake the higher expenses, more doubtful prospects and possibly deteriorating conditions of work involved in serving Nigeria. But the increases, even with increased child allowances, are moderate; and if the Nigerian governments get the existing type of colonial servant at these prices, they will be getting a bargain. Whether they will appreciate this is another matter.

Who is Victimised?

THE final words of the agreement that ended the rail strike were "It is agreed that there shall be no victimisation of any kind." That agreement has already been broken by some of the footplatemen who have been on strike, and who, in various ways, have been victimising their colleagues in the National Union of Railwaymen for not striking. The ASLEF members of a choir at Taunton have refused to sing with members of the NUR. At Warrington they have left a club to which NUR men also belong. At Rotherham 350 ASLEF men are not speaking to 47 men of the rival union. One ASLEF fireman cleaned just half his cabin, refusing to touch the NUR driver's side.

This sort of nonsense is becoming increasingly common in industrial disputes, and it is not always a laughing matter. For example, there was a nasty story in the Sunday newspapers last week about a boy cleaner who appears to have been victimised out of his job. Management, which is inclined to shrug off such incidents as none of its business, ought to protect its workpeople, as far as it can, from this kind of treatment; and, certainly, once somebody's job is put at stake, it should stand fast even at the risk of recur-

rence of local stoppages. "No victimisation" must be given back its rightful meaning, and not be regarded as applicable exclusively to those who have been on strike.

Sea Lawyers Draw the Line

THE International Law Commission's decision this week on the proper width of territorial waters may have a chastening effect on those countries which have been marking off huge areas of sea as their private property. After a ten-day battle and a close vote at the end, the commission in effect drew two lines: it declared that international law could not sanction an extension of territorial waters beyond a twelve-mile limit, and also that it did not oblige states to recognise a breadth exceeding three miles. The area of uncertainty reflects the vagueness of the existing law as well as the division of interest within the commission itself, but at least the formula rules out of court the claims of Chile, Peru and Ecuador to a legal 200-mile limit. In disputes involving smaller limits, such as Russia's twelve-mile claim, the commission's verdict is equivocal, as it was perhaps bound to be; but the failure of the British and other strict "three-milers" to get their way was at least balanced by the firmness with which the commission rejected the more outrageous demands.

During the discussion, the encroachers on the high seas found an odd ally in landlocked Czechoslovakia, whose representative argued in almost Peruvian language that the coastal states have the right to extend their limits in accordance with their needs. When the commission's proposal comes before next year's UN Assembly it will probably face stiff opposition from a combination of small nationalist countries and Iron Curtain troublemakers. Its chances of being approved, and after that of being enforced, are therefore slender, though the draft rules on fishery regulation which the commission adopted earlier this month, widening the power of coastal countries to control fisheries off their shore, may reduce the temptation to claim large areas as "territorial sea." But even if the Assembly shelves the problem altogether, the commission deserves credit for its attempt to introduce some law and order into the growing anarchy.

Flies in China's Ointment

IT has been left to Communists in the West to try to discredit the five American and Belgian ex-prisoners of the Korean war who have decided to come back to the West. The Chinese Red Cross, announcing their change of mind, said simply that they had had to contend with difficulties such as the marriage problem, separation from their families and an unfamiliar way of life, and that China was still a backward country—by implication, unable to keep its guests in the manner to which they had been accustomed. However, the Peking correspondent of the London *Daily Worker* has tried to explain away the embarrassing defection of the five by suggesting that they were "romantics" who wanted an easy time and found life in China too earnest for them. He calls one of the Americans a "good-time boy" and alleges that he wants to go to Japan "to live on the black market fringe of the US occupation." But he fails to conceal the contrast between the "starry-eyed enthusiasm" with which he says the prisoners went to China a year ago and their present disillusionment.

Peking's embarrassment is heightened by the attitude of the Chinese and North Korean prisoners who went to India last year, after refusing repatriation. Fifty of these, who asked to be sent to various Latin American countries, have waited in a camp near Delhi for a year while the United Nations has tried to find homes for them. Last month 43 of them accused the Indians of applying pressure on them to go home, and asked to be allowed to live in South Korea if the countries of their first choice would not accept them. It is remarkable that these men should choose the uncertainties of life under Dr Rhee's government rather than return to their homes. They have provided another in the long series of propaganda defeats suffered by the Communists over the prisoners of the Korean war.

Helping the Oppressed

England is in the worst possible odour with the suffering nationalities of Europe, as having frequently, if not habitually, encouraged their insurrections and then deserted them in the hour of need. The charge, though exaggerated into falsehood, is not wholly without foundation. It is one of the heaviest that can be brought against a powerful and honourable nation: we must see that we never again give the smallest ground or colourable pretext for its renewal. If in our present contest—not against despotism in the abstract, but against one over-weening Despot—we found ourselves baffled and defeated, and saw a necessity for calling the vast and incalculable might of "nationality" and revolution to our aid; if we once resolved to summon to our side or let loose upon our foes the enthusiasm of the oppressed Liberals of Europe; we should have incurred the solemn and irrefragable obligation never to sheathe the sword or retire from the contest till *their* objects as well as *ours* had been secured. We should have no right to listen to any peace of which their liberation was not a *sine qua non*; which did not re-establish their national existence; which did not secure them against the vengeance of those adversaries against whom we had accepted their alliance. We should have become by the claims of duty and of honour their future and perpetual protectors. We should be bound to complete and maintain the work we had begun. To rouse or even to encourage the Poles, the Italians, or the Magyars, to rise against their masters and oppressors, unless we were prepared *to go through* with the strife we had commenced,—to put arms in their hands, or even to stimulate them to insurrection by one word of excitement, or one ray of hope, or one look of promise, and then to abandon them to their fate as soon as *we* were satisfied or weary,—or to rest content with some such stipulations for their amnesty and good treatment as are readily given and always violated;—this would be an infamy with which English statesmanship must not again be soiled.

PROFILE of PROSPERITY

Prosperity is a dam
where a valley used to be.
It's a plantation carved from the jungle.
It's a housing estate sited
on what the map says is swampland.

Prosperity is **on** and **up**. But
it is dependent on the clearing,
digging, shifting, shaping, broadening
and excavating which form its foundation.

Prosperity is usually preceded by
a Priestman excavator.

PRIESTMAN

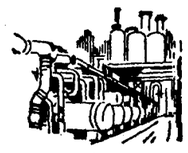
Manufacturers of earth-moving equipment for seventy-five years.

PRIESTMAN BROTHERS LIMITED, HOLDERNESS ENGINEERING WORKS, HULL

HOW MUCH MONEY ARE YOU WASTING ON FUEL?

The heat energy from at least 5 million tons of coal evades British Industry every year!

Anglo American Productivity Report on Fuel Conservation



VERY few industrial firms are run as economically as they could be with better thermal insulation. Factories all over Great Britain are eating up fuel in a way that saps both their own profits and the nation's economy. Maximum fuel saving and the economical distribution of heat energy depend largely upon first-class insulation. Indeed, improved thermal insulation can save up to nine-tenths of present heat losses.

THE DARLINGTON INSULATION CO. LTD.—a subsidiary company of The Chemical & Insulating Co. Ltd., is a contracting organisation for the supply and installation of all types of heat, cold, or sound insulation. Power Stations, Oil Refineries, Shipping and Industrial Plants are all achieving higher efficiency per ton of fuel since consulting this company. Requirements are so diverse that each problem is individually studied, to ensure an efficient, economical and lasting installation.

THE CHEMICAL AND INSULATING CO. LTD.—plays a major role in reclaiming heat energy previously dissipated through inefficient insulation. This leading organisation in the specialised field of thermal insulation maintains sales and contracting offices throughout Great Britain. It manufactures insulating materials, for sale in bulk or in prefabricated shapes, for temperatures as high as 2000° F. *The head office or your nearest branch office will be pleased to answer any enquiries.*

IPSCOL LTD., another subsidiary company, makes automatic industrial process control equipment, and S. T. TAYLOR & SONS LTD. make sheet metal and light plate structures and casings for all types of insulation.

THE CHEMICAL AND INSULATING CO. LTD.

DARLINGTON

SUBSIDIARY COMPANIES

The Darlington Insulation Co. Ltd., Newcastle upon Tyne
For all types of insulation against heat, cold and sound

S. T. Taylor & Sons Ltd., Gateshead-on-Tyne
Fabricators in sheet metal and light plate

The British Refrasil Co. Ltd., Stillington, Co. Durham
Lightweight high temperature insulation for the aircraft industry

Ipscol Ltd., Hythe, Southampton
Makers of boiler and industrial process equipment

Letters to the Editor

Adam Smith in East Africa

SIR—There seems to me nothing in the Royal Commission's Report which could not be as reasonably entitled "Alfred Marshall in East Africa—Lord Keynes in East Africa." There is not one single reference to any passage in the "Wealth of Nations"—that notable work which commends state education by town and parish, which excuses, if it does not actually praise, the Act of Navigation, which admits the case for the legal limitation of interest, and which in its extreme severity towards the East India Company for its oppression of the native population of India is just the opposite of that "Adam without his fig leaves" on which your article makes merry. But perhaps it was the chance for this jest which caused your leader writer to select this inept title.—Yours faithfully,

King's College, Cambridge C. R. FAY

Rules for Strikers?

SIR—Would you permit me to make a few observations arising out of your leading article of June 18th? So far as unofficial strikes are concerned, until it is clearly established that the unions are powerless to prevent them there would seem to be no strong case for legislation. If a union enforces its own rules no unofficial striker can remain a member. But the stage has now been reached when the unions are faced with a choice between three alternatives:—(*a*) to declare that in future the union rules will be enforced against unofficial strikers and that this will be a sufficient safeguard, or (*b*) to say what measures are still needed to make the union rules effective in this respect, or (*c*) to say whether there should be a legal restriction on unofficial strikers and the form such festriction should take. As to (*c*), I agree with your view that the remedy should be civil rather than criminal, but it is worth considering whether summary procedure like that provided under the Employers and Workmen Act, 1875, where the damages awardable are within the defendants' capacity to pay, would not be a more satisfactory and effective remedy than the ordinary civil suit for damages at large with all its attendant opportunities for delay.

Coming to official strikes, while, as your article implies, there is no logical basis for treating essential industries as such on a different footing than others in private hands, state industries appear to be distinguishable if one considers the real nature and basis of the right to strike. The value of the strike weapon as an instrument of collective bargaining lies in its power to inflict financial loss on the obdurate employer as an inducement to him to make concessions. How can this position be equated with that pertaining in a nationalised industry? Here the dispute is fought between the workers and the governing body whose members are not financially concerned and therefore suffer no financial loss. The financial loss has to be borne by the community, which is in no sense one of the negotiating parties.

Such strikes share this point in common with the General Strike. Just as the British trade unions have tacitly discarded the latter, so they might well, as a guiding principle, rule out resort to the strike weapon in state industries or, alternatively, they might reasonably be asked to give their approval in the case of such industries to the insertion in the terms of employment of a clause providing for arbitration as the final means of settling disputes.—Yours faithfully,

HARRY SAMUELS

London, E.C.4

★

SIR—Two years ago at the *Sucrerie, Distillerie, Cartonnerie* of Pithiviers, Loiret, France, of which I am a director, we had a strike, the first one since 1870. It started on a Wednesday, and the general manager rang the Labour Department, and told them that the men were entitled to their pay until Wednesday. "We propose to call them in on Saturday to pay what we owe them, but to save possible trouble or disorder we want you to be there, with a handful of policemen." On the Saturday the Government representative turned up, and everybody being present, our general manager said: "We are very sorry about this strike—a thing unheard of in our company. But we think that instead of relying on a hands-up ballot, a regular vote in favour or against the strike should be taken. Before being paid, therefore, each one of you will be asked to cast his vote in the box which I lay here in front of 'Monsieur l'Inspecteur du Travail.'"

Of course there was a huge row, and the Inspector of Labour himself wanted to go and escape the responsibility. But finally some walked in to vote and draw their pay, and then everyone followed suit. The result of the ballot proclaimed by the government's representative was 70 per cent against the strike. The manager then announced that on Monday work would restart and that those who wanted to keep out could do so. On Monday morning 100 per cent turned up.—Yours faithfully, HENRY DUVAL

La Caumine, Jersey

Why the Conservatives Won

SIR—In commenting upon the absence of "swing," you fail to take into account a factor which, I believe, may be of very critical importance. Since the last General Election, about 8 per cent of the electorate must have died and have been replaced by those who have voted for the first time in this election. It seems to me that one of the most interesting pieces of research that could be undertaken by the "vote samplers" would be to find out how those voted who voted this year for the first time. It is my belief that here will be found the reason for the Tory success.—Yours faithfully, R. C. PORTEN

Chipstead

[In the *News Chronicle* of May 24th the Gallup Poll did in fact sample the voting intentions of those who were too young to vote in 1951. 51 per cent said they were going to vote Labour and only 30 per cent favoured the Conservatives.—EDITOR.]

Send Your Gunboats

SIR—As a recent resident of Williamsburg and citizen of Virginia, I very strongly protest the implication that the British flag flies over our state Capitol. In fact, it does not and has not since 1776. The Colonial Capitol at Williamsburg does fly British colours, except from May 15th to July 4th each year, when the flag flown is that of the United Colonies, and possibly during the occasional extraordinary legislative sessions of Virginia now held there once every two years, when I presume the State flag is flown. But the Colonial Capitol at Williamsburg has not been the State Capitol since 1780; and the Capitol building of Virginia, either at Williamsburg or Richmond, has not been called the "state house." That building, sir, is in our sister state of Maryland.—Yours faithfully,

JOHN M. HEMPHILL, II

London, W.C.1

Bradshaw's New Dress

SIR—You are mistaken when you state, in your issue of June 18th, that ten shillings is an indefensible price for the only official source of essential public information. As you also say, the timetables of the different regions of British Railways are in effect the different sections of Bradshaw. The six regional timetables are also on sale at one shilling per copy, and a free list of subsequent alterations is obtainable from each region.

It is possible, therefore, to be in possession of all the latest timetable information by a payment of twelve shillings per year, for two copies of each regional book, one for summer and one for the winter service, instead of buying twelve copies of Bradshaw at ten shillings per copy.—Yours faithfully,

Cuffley, Herts B. PEVEN

In the Service of Clio

MODERN HISTORIANS AND THE STUDY OF HISTORY.
By F. M. Powicke.
Odhams. 256 pages. 16s.

HERE is an avenue of conventional *statues leading to a shrine.* The *effigies* are memorial notices of *historians*, useful for reference, but as *dull* as municipal monuments. In most cases the subject as well as the obituary tone is uninspiring: Tout and Tait, Previté-Orton and *Zachary Brooke* were fine scholars, but not great characters; H. W. C. Davis remains as colourless to *posterity* as he was admired by contemporaries; only Firth, of the English historians, acquires a posthumous personality, *with* the alert eyes *in the* drowsy meditative face. It is the foreign historians we study longest: Pirenne like a boisterous Flemish burgher painted by Rubens; the granite figure of the American Haskins; and Vinogradoff, "difficult, powerful, suffused with dusky light." But the reader who follows to the end of the avenue will be in the presence of *Sir Maurice* Powicke himself, and Sir Maurice talks with the tongue of an angel, calling us *home* (as he has said of his own Oxford) "in grave benediction, from the fugitive, the trivial, and the mean." The *collected* addresses that make the *second* part of the book are of superlative quality, and throw a tender *illumination* back upon *the* statues *themselves*. His inaugural lecture alone *makes* the book worth buying.

It might be possible from these papers to construct a composite picture of the medieval historian of the past two generations. He learned his craft in one of the *co-operative enterprises* of historical scholarship, like the Dictionary of National Biography and the Victoria County Histories. Thus he began on local history, which is sometimes talked of as if it were quite new, though its *right appreciation* had already been pointed out by Freeman and J. R. Green. Whether he leaned to *administrative*, *economic* or *religious* history, he went on to the editing and publication of texts. He became increasingly aware of the bearing upon each other of different kinds of texts, which are only different kinds of evidence. He realised the unity of historical knowledge, and his final aim was to describe an entire society, as Vinogradoff did, or to set his subject, as it might be the origins of Parliament, in the context of a complicated life moved by an incalculable variety of circumstances and motives. We find Tout remarking unexpectedly that if he had to begin the study of medieval history over again he would start with the works of St. Thomas Aquinas.

Our medievalist humbly regarded himself, like Tait, as the modest continuator of a noble succession of scholars. But a tradition has *infinite* anfractuosities, and inspiration is individual; "the best and finest work must *always be done* in solitude." At some point he collected his energies and chose a significant theme, as Haskins chose Norman institutions and medieval science. Producing a stream of articles on the criticism of sources and volumes of unedited documents, he proceeded methodically, if he was Pirenne, to a great historical work, like the "Histoire de Belgique." He knew, as A. G. Little did, that something of philosophy is indispensable to a fruitful knowledge of history. He had a constructive purpose and conscious values, a faculty of judgment and a sense of order.

It is impossible to disentangle the composite portrait from the self-portrait of Sir Maurice. Here, as in his memorable valedictory "Three Lectures," he stands gently but inflexibly opposed to all tendencies that dehumanise and dessicate historical study, to arid professionalism, absence of vision, "the generalisations which disregard the inner *significance* of human experience." Of *economic* history which does not see how *quickly* in real life the economic *motive* is transcended he says, "There is a sort of dullness so intense that it must be false." He joins issue with the prophets of a historiographical cybernetics like Sir Charles Webster, who imagine that it will become possible to pool brains and write synthetic history. An article of 1921 on a League of Nations Union scheme to internationalise history text-books remains sharply relevant when the same sticky mess is being brewed by Unesco; historical writing is not a branch of politics, and it is unwise to interfere with the natural response of intelligent teachers to their times. The recovery of the literary tradition is no less important than the criticism of texts; "the great human books clear the air and we need more of them." And such books are fertilised by the pieties, memories and intuitions of the individual scholar. Clio, he says, has no use for professional tricks.

> But patience, thoroughness, fidelity, and honest intelligence she will welcome, transforming their efforts "as fire converts to fire the thing it burns." There is then no Subjective and Objective; they disappear, with Synthesis and Analysis, Dry-as-dust and Anti-dry-as-dust and all the other idols of the market-place, like Milton's Apollo, "with hollow shriek the steep of Delphos leaving."

Abundant Make Believe

THE ROAD TO ABUNDANCE.
By Jacob Rosin and Max Eastman.
Rider. 144 pages. 12s. 6d.

THE story of the relation of population and resources continues to be written in purple ink. This book starts from the conventional belief that the growth of the first is certain to outstrip that of the second, and its theme is that there are better ways of earning our daily bread than the conventional ones that we inherited from our forebears. "Think," we are invited, "of agriculture as a gigantic food factory, and it will strike you as an industrial monstrosity," demanding prohibitive floor space, and returning very little for the effort which it demands. Consider, too, how insecure are the present sources of industrial raw materials and energy—but for all of which alternatives are potentially available. The key to the problem is cheap energy, but energy need cost nothing. That of the sun could be trapped by photochemical or optical methods, and once this has been achieved we shall be able to extract all the minerals we want from the extreme dilutions in which they are found in sea-water. The processes of photosynthesis will be unravelled; carbohydrates and fats will be synthesised; unicellular organisms such as chlorella will be harnessed economically; and we shall be able to manufacture aminoacids. And with "our freedom from the mine and the plant" we shall enter a Kingdom of Man. After that, the sky's the limit. Even certain intellectual activities will be looked after by mechanical brains and electronic computers.

All these things have not yet come about, so it is suggested, because we suffer from "a collective inferiority complex"; this makes us underestimate "the potentialities of natural science," especially chemistry, which has already provided us with synthetic dyestuffs, perfumes, rubber and textiles. The main trouble is obstinacy in not devoting to the problem the right degree of effort; for anything would be possible if it were given as much attention as went into the achievement of the atomic bomb. Where the most distinguished brains of the past have failed—say, in uncovering the steps in the process of photosynthesis—dollars and armies of workers will succeed.

Alas, in actual fact, the stuff that makes up the dreams of Messrs. Rosin and Eastman are far from the empirical realities of the present biological world, or the possibilities of chemistry as we know it today. It is, therefore, a tribute to their powers of persuasion, and a measure of the gravity with which a man like Lord Boyd-Orr regards the problem of the growth of population, that he is prepared to provide a foreword to this piece of science fiction.

Economic Third Dimension

THE ECONOMICS OF LOCATION.
By August Lösch. Translated from the second German edition (Jena, 1944) by W. H. Woglom.
Yale University Press (London: *Geoffrey Cumberlege*). 548 pages. 60s. $7.50.

THE centre of gravity of *theoretical* economics is shifting *once* more. Emphasis was laid at first *on* a price theory

> *that neglected time* and space. Then the theories of interest and business cycles introduced time. And now the third period has dawned, when space is seriously considered.

So Lösch himself says in a *footnote* (page 93), and no one has done more to bring this progress about. His book is a classic, the first—its first edition was in 1940—to bridge completely the gap between the stylised classical theory of international trade and the more earthy activities of town and business planners and revivers of depressed areas. Its first part outlines the conditions of general equilibrium for the location of firms, farms, towns, and industrial or farming belts or zones. The second, the high point of the book, shows how within these general conditions there grow up marketing networks, "economic landscapes" and economic regions, and how the formation of these is influenced by such factors as *imperfect* competition or political boundaries. A third, misleadingly headed "Trade," covers not only trade, but migration, *investment*, and the control of these things by public policy. The discussion of "price waves" in space as well as time is particularly interesting. Finally, a long section deals with practical applications—largely American, though Lösch himself had much experience of practical planning in Germany. This practical material is stimulating and remarkably up to date.

The second and last German edition of his book was date-lined "Kiel, Autumn 1943." But Lösch, like Archimedes, was not the man to let the sounds of war interrupt his work. He somehow obtained and read his Barlow, Scott, and Uthwatt reports. But this practical material is introduced by way of example. It is not a comprehensive survey of the problems of location or of any part of them, and inevitably there are slips in it. The explanation of the British depressed areas, for instance (pages 379-380), completely misses what Jones and MacDougall showed, in their memorandum to the Barlow Commission, to be the main point. There are also gaps on the theoretical side: Lösch's models are rather static, and he does not work out fully such detailed points as the question of "threshold" costs. But on that side what strikes one is not so much the gaps in the analysis as its comprehensiveness.

The service of this book, indeed, is to lay down a theory broad and comprehensive enough to bring the discussion of location right into the main stream of economic analysis, where it figures no longer as fragments or practical hints, but as a well-integrated part of the whole. Lösch himself took a modest view both of the immediate applicability of theories as general as his own, and of his own contribution towards them. But he laid an excellent foundation on which others can build after him.

Lenin's Rise to Power

THE ORIGIN OF THE COMMUNIST AUTOCRACY.
By Leonard Schapiro.
Bell, for the London School of Economics. 414 pages. 35s.

THIS book is not conceived as a history of the Bolshevik revolution. Its aim is to show why and how the non-Bolshevik socialist parties in Russia and even certain of the Bolsheviks themselves opposed and combated the system of Communist rule which Lenin established between 1917 and 1922, and how and with what consequences Lenin and his supporters overcame and silenced them. It is based on a thorough and careful survey of a great mass of material and is all the more welcome for confining itself to an aspect of the Russian revolution not adequately dealt with hitherto.

A number of important general points clearly emerge from the wealth of detail. First, Lenin never intended to share power in any real sense with the other revolutionary parties, not even with the Left Socialist Revolutionaries who were *in coalition* with the Bolsheviks from December, 1917, until March, 1918. Secondly, Lenin and his party used every means at their disposal to prevent the other revolutionary parties from operating effectively even when they did not *ban them* legally, with the result that they had ceased to exist as organised parties by the early 1920s. In this way, the Bolsheviks were able to make the Soviet state the one-party state which it has since remained. Thirdly, the Mensheviks, Socialist Revolutionaries, and Anarchists proved to be no match for the Bolsheviks in political organisation and tactics, and their continued refusal to depart from their ideals and principles contributed in no small measure to their failure and ultimate extinction. The Mensheviks in particular played straight into Bolshevik hands by trying to keep their activities within a legal and constitutional framework of Bolshevik manufacture. Fourthly, by the end of the civil war, Lenin was becoming increasingly impatient of opposition even *inside his* own party, and at the tenth *party* congress in March, 1921, he finally put the lid on it and set his followers on the road towards the monolithic party manipulated and dominated by the party apparatus. As Mr Schapiro says: "Lenin's genius lay in the technique of grasping and holding power."

But not even the Bolsheviks could escape the consequences of their willingness to follow Lenin in imposing their minority rule on the majority of the *nation*. It was not a very long step from Communist repression of socialist opponents to repression of dissidents inside the Communist party, and once repression started *inside* the party, the motives underlying it encouraged its extension. "The malignant figure of the General Secretary, Stalin," Mr Schapiro says in his conclusion, "has become only too familiar in its portrayal by disappointed oppositionists, defeated by the apparatus which he controlled. But it was Lenin, with their support, who equipped him with the weapons, and started him upon his path."

Changeless China?

THE WISE MAN FROM THE WEST.
By Vincent Cronin.
Hart-Davis. 300 pages. 18s.

A FOREIGNER who got admission to China in the sixteenth century had luck. To stay there and proselytise an alien faith he had to have character, courage and scholarship. Father Matteo Ricci, a Jesuit priest who established the first Christian mission in China, had all these, and Mr Cronin tells the story of his life in this delightful book. It is not a religious book in any sense, but a biography set against a background of the manners and morals of the Chinese official class in the declining years of the Ming dynasty. Ricci, young and zealous, was given the task of pioneering in this largest of all mission fields, and it is fortunate for us that the letters and

Rekhmire, Vizier in the reign of Tuthmosis III (*circa* 1500 B.C.) is the central character in this vivid, factual picture of everyday life in Ancient Egypt. *Fully Illustrated. Ready June 27th. From all Booksellers. 16/- net.*

EVANS

other papers which he left behind when he died have been preserved, in Rome and elsewhere, and so enabled this detailed story to be written of his travels, struggles, disappointments and ultimate success. He lived twenty-seven years in China.

The student of China will find in this book evidence of changelessness in two things: first, the methods of Chinese officials; and, second, the firm grip of the Confucian philosophy on the educated class. Only time will tell whether Communist doctrines can change either or both. Ricci, whom the Chinese rightly dubbed a "wise man," was enlightened enough to see that little of the teachings of Confucius was antipathetic to the doctrine he himself had to preach, and it is evident that much of his success derived from his acceptance of these teachings, as being complementary to the Christian beliefs. Without this apparent compromise it seems doubtful whether he would have made much progress, because religion, of any sort, has little appeal to the Chinese mind; indeed, the last chapter, which is devoted to a quick record of events since Ricci's death, shows that when Rome, later on, forbade any concession to Confucianism, the record of progress of the mission sadly declined.

It is claimed for Ricci that it was he who identified China with Cathay. When the Portuguese opened trade with China at the end of the fifteenth century, they did not realise that they had reached Cathay, the land described by Marco Polo more than two hundred years earlier. It was believed to lie to the north-west of China, and one of Ricci's original objectives was to reach it through China. He was, however, soon led to believe that the two countries were, in fact, one, and his belief was greatly strengthened when he reached the Yangtsze River and recognised how closely it conformed to Marco Polo's description of the great river which divided Cathay from east to west. His growing conviction was not shared by his brethren of the Church in India, and they decided to put the matter to the test by despatching a priest overland, to try to reach Cathay and, thereafter, join Ricci in Peking. The chapter devoted to this journey is a fascinating vignette of central Asian travel at that time.

Mr Cronin writes in a very pleasant and easily readable style, and has produced an excellent true-life story. The book contains some good illustrations and two suitable maps.

We regret

that the despatch of books to our customers has been suspended for the last three weeks, because of the railway strike.

Britain's Little Finger

WEST HIGHLAND SURVEY.
Edited by F. Fraser Darling.
Oxford University Press. 438 pages. 30s.

THIS survey was established by the Development Commissioners to study the cause of the depopulation and economic decline in the Western Highlands. The area surveyed is about a third of Scotland, containing only 2.3 per cent of its population, the number having declined to what it was in 1755 when it represented 9 per cent of the whole. The survey refers aptly to the Highland problem as Britain's "sore little finger." If a remedy is not found quickly, it will drop off and much that is fine and valuable will be wasted. Agricultural science now emphasises the importance of "trace elements." The Highlands are a valuable trace element to Great Britain as a whole, small as they may appear in economic or population statistics. The nation's debt of gratitude is more often spoken of than honoured: the numbers of soldiers, sailors, colonisers, administrators, bankers, doctors and much else that have come out of the Highlands to serve the Commonwealth has been out of all proportion to its numbers. A culture that could produce such people cannot be negligible.

As the report says, "The task has been primarily to find facts and present them and certainly not to provide a master plan of rehabilitation." The facts are presented in impressive array and further statistical material, which could not be printed, is to be made available. It would be possible to get rid of the "sore finger" by amputation; but the survey thinks it would yield to treatment. It says "Gaeldom has been and still is a living culture" and goes on to suggest that it can accept change and evolution in the "conscious poise of its own strength and its own values." Grandiose schemes are rejected since they are more likely to aggravate than solve the problem, tending to draw the population into a few centres and leaving the rest of the area still more derelict. "The land and the sea will remain the basis of any future prosperity the Highlands and Islands may enjoy. The principle is for the most part beink balked by crofters and Government alike." Crofting custom and practice must be altered to permit a system of agriculture suited to modern conditions, which would also encourage and allow the more enterprising to profit by it. There is no special organisation devoted to Highland agricultural problems. This should be remedied as the Alness report recommended in 1945, and possibly some organisation for fishing should also be set up. Something has already been done to overcome the "seeming indifference of the railways" to whether lobsters reach Billingsgate dead or alive. The two largest organisations in the area are the Forestry Commission and the Hydro-Electric Board. Both of them could and would do more if the Government would allow and encourage them to do so. As the survey sees it, what is wanted is a multitude of small measures, dispersed over the whole area and suited to local conditions, which vary much more than would be imagined. The system of land tenure is examined and on the whole approved. A large scale experiment in owner occupancy has not proved successful or progressive.

This survey, which should be a "set book" for all who have to deal with the Highlands, concludes by stating that

> effective rehabilitation will call for an organisation with executive authority, able to act in several fields, which will not neglect the scientific quality and interest of what is being done, nor omit the humane studies which could be the lubrication of the whole intricate machinery. Highland feeling is bitter and the method of procrastination practised by successive governments, of appointing committees of investigation and for giving advice without obtaining the basic data, has worn thin.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Operation Alert

New York

WHETHER by accident or by design, Mr Molotov's arrival in New York last week was heralded by the raucous wailing of air raid sirens announcing "Operation Alert, 1955," the largest civil defence exercise the country has ever had. In Washington, which was hit, in theory, by a "small" atom bomb of about the same size as that used at Hiroshima, 15,000 key civil servants fled to 30 secret hiding places from which the business of government could be continued miles away from the capital. This was the first time the government had evacuated Washington since the British sacked the city in 1812. New York, given three hours' warning of the theoretical explosion of a hydrogen bomb in the 5-megaton range (equivalent to 5 million tons of TNT) estimated that 4½ million of its citizens would have been killed—3 million outright and 1½ million by the after-effects of radiation. And in 59 other major cities throughout the United States there were also simulated explosions of various-sized atomic and hydrogen bombs.

The exercise had two objectives. One was to educate the public—and Congress—to the stark realities of nuclear warfare, and to discredit completely, if possible, the "it can't happen here" and the "if a hydrogen bomb falls there's nothing you can do about it" schools of thought; both have contributed to the almost complete lack of public support for civil defence in the United States. The second, and related, objective was to find out what the nation's civil defence system was actually worth. On both counts, the test was, at least, a qualified success.

It can indeed be argued that the simulated nuclear attack did not go far enough. Any theoretical exercise should be based on rigid calculations about the extent the enemy aircraft can penetrate, the size of the bombs dropped, the amount of direct blast damage, and especially, about the scope and duration of the radio-active fall-out. The assumption that some 60 cities would be bombed simultaneously certainly showed a harsh appraisal of the effectiveness of America's air defences. But, on the basis of information slowly and painfully pried out of the Atomic Energy Commission by scientists who have been denied access to the full facts, it is already clear that the rest of last week's assumptions were probably on the generous side as far as the unfortunate city dwellers were concerned.

In the first place, although a few of the smaller cities got no warning, for the larger cities, such as New York, three hours' grace was presumed. When the Distant Early Warning line of radar stations across northern Canada has been built, this assumption may be valid, although the possibility of subterfuge cannot be completely discounted. But the DEW system will not be completed for two years and, in the meantime, there is a big gap in the defences, which makes one hour's warning more realistic.

Secondly, it now appears that the bomb dropped at Bikini Atoll in March, 1954, was a radically new type of uranium bomb involving a triple "fission-fusion-fission" process. This seems to mean that the size of the bomb could be increased almost without limit at relatively low cost. If the Russians are also capable of producing thermonuclear weapons by this process, then it might be wise to assume—as Mr Val Peterson, the Federal Civil Defence Administrator, has done in his more sombre moments—the possibility that a bomb in the 60-megaton range might be dropped.

Thirdly, it has now become evident that the radio-active fall-out may be much greater and last much longer than the AEC admitted in its report on the Bikini test. Scientists have now suggested that it might be as long as six or nine months before an area could be called safe. Dr Willard Libby, one of the more recently appointed Atomic Energy Commissioners, has said that 100,000 square miles (an area slightly greater than the United Kingdom) could be contaminated by a 10-megaton bomb so seriously that daily dosages of radio-activity—which have a cumulative effect—would soon exceed the safety limit. The AEC's critics, presented with this new information, have strongly condemned the policy of secrecy that kept the public ignorant of the effects of the Bikini bomb for nearly a year after the explosion, and that has now led to conflicting testimony from the experts on the extent and duration of its after-effects. As this kind of information is absolutely vital for any constructive planning of civil defence, the commission is being urged to make a full disclosure.

★

The second objective, to determine the adequacy of the present civil defence arrangements, has been achieved only in the sense that one clear principle has now emerged. The alternatives of "dig or get out" no longer exist. In the light of the latest information on the extent and duration of the radio-active fall-out there is clearly only one course left—"get out or die." Deep shelters can now be considered practicable only on a very limited scale. Civil defence preparedness must accordingly be measured by a different yardstick: how much warning can be given? How

quickly can each major city be evacuated, and how can the evacuated populations be fed, housed and governed?

Apart from its demonstration that the government agencies, and particularly the Air Force, can function more or less effectively outside the capital, it is difficult to see what contribution was made by the much-publicised evacuation of Washington with "women and children last." Department heads went through the motions of dealing with awkward questions of monetary management after most of the banks had been theoretically destroyed, and with problems of food and medical supply. Mock martial law was declared, and the President was able to try out his system of inter-agency communications by closed circuit television from his tent headquarters. But on the basic question of providing for the mass evacuation of threatened cities Operation Alert fully confirmed the opinion of the Senate civil defence sub-committee that the United States is still completely unprepared to meet a nuclear attack.

With one or two exceptions, such as Milwaukee, there have been no detailed studies for evacuation made at all by city, state or federal civil defence authorities. A preliminary study by the city of New York does show, however, that even in that most densely populated area, where 15 million people live within a radius of 50 miles, the problems of mass evacuation are not quite as insuperable as they appear at first sight. The concentrated urban populations of the United States cover a much smaller portion of the total land area than in Britain, and the country is so situated geographically that at least some warning of an impending attack can be expected. There is, consequently, both time for at least a partial evacuation of cities, and room to absorb and feed their displaced populations. In the Chicago test, it was estimated that each additional minute of warning would have saved 10,000 lives.

What is now urgently needed is a detailed examination, city by city, of all possible methods of speeding up evacuation; of reducing traffic congestion on the roads; of providing some form of temporary shelter from radiation during the evacuation; and of feeding and housing the millions of evacuees for long periods. But while the city authorities in most cases consider such studies a federal responsibility, the Administration's requests to Congress for funds to carry out this work go unheeded, and co-ordination between the various federal, state and city civil defence authorities is appallingly poor. Only the continued personal intervention of the President can secure the money, the facts, the trained men, and the co-ordinating authority needed to prepare civil defence in a thermonuclear age.

Congress is Too Kind

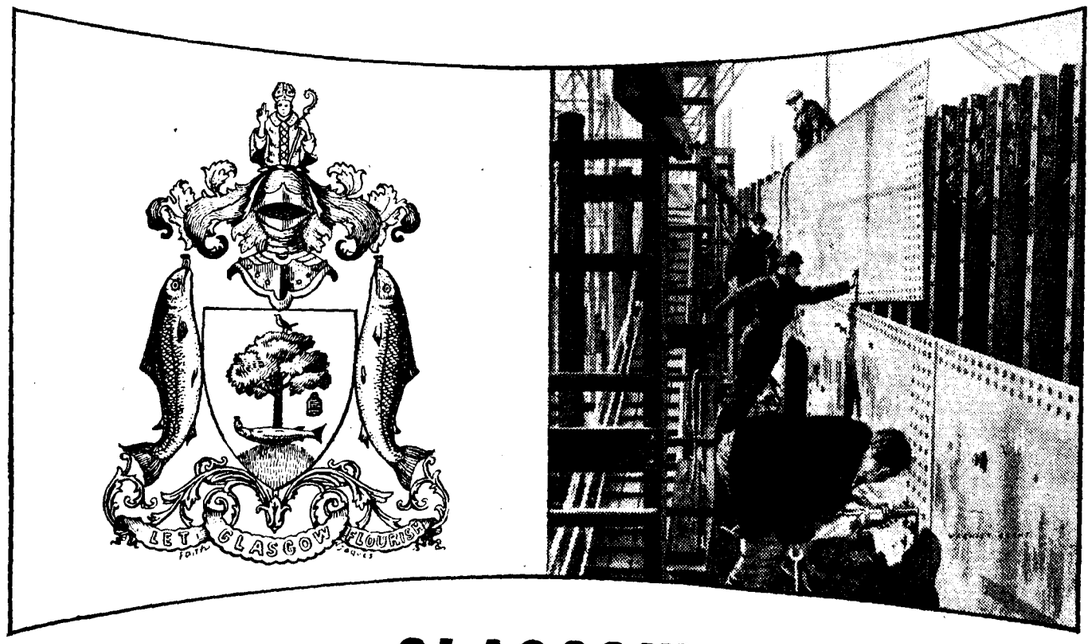
IT looks as if this Democratic Congress will not only adjourn according to plan about the end of July but will also give the Republican President a substantial slice of the heavy legislative programme for which he asked at the beginning of the session. The unusual amenability of Congress during the last six months, so frustrating for journalists, is the result of clever and firm Democratic leadership. With majorities too small for an independent programme to be pushed through against the wishes of such a popular President, whose views they often share in any case, Senator Johnson and Mr Rayburn are going along with Mr Eisenhower, but are going farther whenever they can. To build up a constructive record in this way is probably the best method of ensuring that a Democratic Congress will again be elected in 1956, but it may make difficulties for the Democratic presidential candidate.

This week Democrats in the House are working on a Bill which would give better pensions to women and disabled persons, an improvement which the Republicans had intended to leave until next year, just before the voters go to the polls. But it is in the Senate that the Democratic effort to choke the President with kindness has made most progress. It is there that his highway programme has been passed, but in a form that he did not want. It is there that the minimum wage has been increased by more than he asked. It is there that he has been given authority to build up to 200,000 units of public housing a year for four years, instead of 70,000 over two years as he requested.

The Senate's addition of $356 million to the defence appropriations approved by the House, to speed up the production of heavy jet bombers, was on the recommendation of the Defence Department. But the recommendation only came after the Democrats had drawn public attention to the disquieting Soviet progress in this particular branch of military aviation. The Senate has also provided money to keep the Marines up to their present strength, in protest against the Administration's plan for reducing the number of ground troops. But even if this increase in funds is accepted by the House, the President cannot be forced to spend the money. What he particularly asked the Senate to do was to revive his scheme, shelved by the House, for making the reserve forces effective. But the Senate was not prepared to be as kind as that.

Merry Month of May

THE queen of the May economic statistics is not the industrial production index, even though it was higher than ever before. The crown goes to the employment figures: the decline of nearly half a million in the number out of work was one of the sharpest ever shown for the month, and the total number employed, 62,703,000, was a record for May. Until now unemployment has been obstinately stable, in spite of the general prosperity. Even better, while most of the extra jobs were in seasonal occupations, agriculture and building especially, there was a contra-seasonal, and very satisfactory, rise in non-agricultural employment. While this is still not as high as it was at its 1953 peaks, it is obvious that at last manufacturers are being forced to employ more workers. The rise in industrial production which began last July had earlier been accomplished mainly by improving efficiency and increasing the number of hours worked. But May provided a warming answer to those Jeremiahs who have been arguing that the country's output is not increasing fast enough to provide work for the growing labour force.



Industrial production in May broke 1953's records even though the manufacture of durable goods for defence pur-

The World is their Market

GLASGOW

Up on the Clyde, where they built the famous 'Queens', the riveters are hammering out a tattoo that means prosperity. Keels are being laid, and hulls are taking shape, for ships that will sail under the flags of many nations.

Clydesiders know their reputation—and they're proud of it. But they also know that competition is stiffening throughout the world, and reputation alone cannot keep their shipyards bustling. Contracts must be *sought* and *won*!

It's the same in any industry. *Making* products for the world is only half the job. You've got to show them, sell them—and *sell them hard*—wherever a market for them exists. Many manufacturers are doing this very successfully through TIME, The Weekly Newsmagazine.

2,250,000 INTERNATIONAL SALESMEN

TIME'S net paid audited circulation exceeds two-and-a-quarter million copies weekly (ABC). There are five separate editions of TIME* with the same editorial content. One circulates only in the United States—the other four, the *International Editions*, are published simultaneously in English and read by important people in more than 100 countries outside the U.S.A.

Ninety-three of every 100 readers of TIME'S International Editions hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

You can buy advertising space directed to those markets which interest you most—through one edition, any combination of *two*, *three*, or *four*, or in all *five* of the world-ranging editions of TIME.

poses had fallen substantially since that year. And there are indications that the regular summer decline in industrial activity, resulting from holidays and maintenance work, may not be so deep as usual. On the other hand, output of steel and of automobiles is beginning to be cut back and there are those who believe that business in May was stimulated

by the fear of strikes and of higher prices later in the year. In that case, of course, the summer months might bring steeper drops than are now expected. Whatever happens, it is probable that unemployment will go up this month and next as university students and school leavers come into the labour market for the first time.

Finance for Exports

New York

NOW that the American Overseas Finance Corporation is about to begin business, it has become clear that it is a more formidable organisation than it appeared to be when it was first announced last November. To the original sponsor, the Chase Manhattan Bank, have been added four more of the biggest banks in the country—the Chemical Corn Exchange Bank of New York, the First National Bank of Boston, the Mellon National Bank and Trust Company of Pittsburgh, and the National Bank of Detroit. The chairman is Chase's Mr John McCloy and the directors include Mr Clarence Randall, the President's adviser on foreign trade, Mr William Batt, formerly in charge of the American economic aid programme in London, and Mr David Rockefeller, who was mainly responsible for the initiation of the new corporation.

The AOFC, which will meet the needs of American industries for medium-term credit in financing export trade, marks a major departure from habitual American banking practice. Unlike the City of London, Wall Street has no tradition of merchant bankers specialising in the financing of foreign trade. Most American exports are sold for cash, and an American exporter can rarely secure more than six months' financing from his bank. Only from the government-sponsored Export-Import bank, which liberalised its system of export credit guarantees at the end of 1954, could an exporter obtain longer term credit. This, in the view of "the people at Chase," was a field that should not be left entirely to the government.

The new corporation will have an initial capital of $10 million ordinary shares, subscribed by the five member banks, and $10 million preference shares, which are to be placed privately. It will raise its much larger operating funds by selling "senior" notes to its member banks, other banks and institutional investors. Many matters of policy still remain to be settled, but it is known that the corporation will extend credit for terms varying from six months to a maximum of five years, a limitation imposed by the Act which governs the new undertaking. Interest rates will be determined, unlike the flat rates of the Export-Import Bank, on an individual basis, according to the country concerned and the commercial risk involved. In each case a 20 per cent down payment is required from the foreign importer, and another 20 per cent of the invoice value must be borne by the exporter. Of the remaining 60 per cent risk to which AOFC is exposed, the Export-Import Bank will guarantee one third, if necessary.

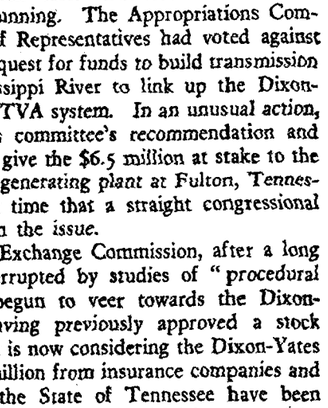
★

The AOFC is specifically designed to enable American exporters to meet competition from countries where similar credit facilities are available through government agencies. Following the example of the Export-Import Bank, the new corporation will limit its financing largely to capital goods, where longer term credit is most needed. The exporters most likely to benefit are the makers of agricultural, mining, electrical and other machinery and machine tools, and the suppliers of communications equipment, all things which will contribute to the development of the importing country and make it a better market for American exports. But the corporation does not completely rule out financing exports of consumer goods.

By European merchant banking standards both the new corporation and the Export-Import Bank are expected to remain cautious lenders. The AOFC is likely to limit its activities at first to large concerns, such as General Motors, Westinghouse, and International Harvester, with established foreign customers unlikely to default on payment. And although the Export-Import Bank has now extended "lines of credit" to the extent of over $120 million, these are in practice more in the nature of a limit than a line, and so far very little actual financing has been negotiated under them between the Bank and the exporters.

Snarled Power Lines

WADING through a tangle of emotional, economic and political issues, the Administration is making headway with its attempt to introduce an element of privately generated electricity into the great Tennessee Valley Authority's system of public power. The bone of contention has been the so-called Dixon-Yates contract under whose terms a private combine would build a steam generating plant at West Memphis, Arkansas, to provide electricity for the TVA to transmit. The added 600,000 kilowatts of energy would replace power delivered by the TVA to various atomic installations in the region. Partisans of TVA see in this scheme the Administration's first



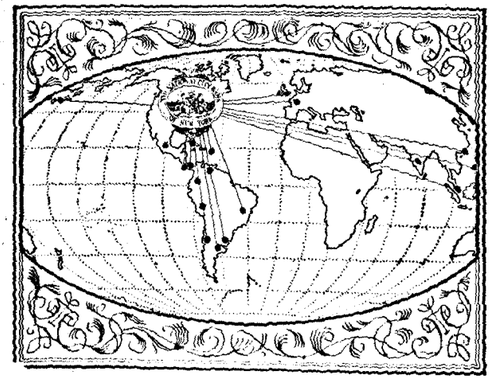
step toward destroying that great showpiece of New Deal philosophy. They argue that the right way to get more power at low rates is to build further generators for the TVA. The Administration, on the other hand, denies that it wishes to do away with the TVA, but maintains that private enterprise should also have its day.

With the victory of the Democrats in last year's congressional elections, it was thought that the Dixon-Yates interests would lose their case. But now it looks as if they are back in the running. The Appropriations Committee of the House of Representatives had voted against the Administration's request for funds to build transmission lines across the Mississippi River to link up the Dixon-Yates project with the TVA system. In an unusual action, the House rejected its committee's recommendation and defeated an attempt to give the $6.5 million at stake to the TVA for a new steam generating plant at Fulton, Tennessee. This is the first time that a straight congressional vote has been taken on the issue.

The Securities and Exchange Commission, after a long series of hearings interrupted by studies of "procedural problems," has also begun to veer towards the Dixon-Yates enterprise. Having previously approved a stock issue of $5.5 million, it is now considering the Dixon-Yates plan to borrow $120 million from insurance companies and banks. Lawyers for the State of Tennessee have been bitterly opposing this scheme, but the SEC is expected by most observers to sanction the proposed loan. Before they can really claim a victory, however, the Dixon-Yates supporters will have to win approval from the Senate and that means a major battle is in the offing.

Lufthansa Uber Alles

ONCE again, German commercial aircraft are taxi-ing down runways in a number of countries. But the attempt of the Lufthansa to cut into some of the most lucrative trade of the American airlines ran into trouble last week. The scheduled signing of an agreement that would have given German aircraft extensive routes in the western hemisphere was called off in the face of protests by domestic carriers, a congressional inquiry and a major dissension between various branches of the State Department and the Civil Aeronautics Board. This agreement would have given the Lufthansa permission to fly from Germany to New York, Philadelphia and Boston; from New York to the Caribbean and South America; to Chicago by way of Canada; and to California *via* a polar route. The German airline would not have been allowed to provide service between American cities. In exchange, United States airlines would be allowed to fly to six different points in Germany—most of which they already serve—and from there to "points beyond."



It is the lucrative routes from New York to the West Indies and Latin America which are worrying domestic carriers. With Air France already flying from New York to Mexico City and the British Overseas Airways Corporation taking American holidaymakers to Bermuda, such carriers as National Airlines, Eastern Airlines, Braniff Airways and Pan American World Airways are protesting that they will gradually be driven out of the skies even as American merchant shipping has been driven off the seas. They point out, moreover, that American air services to Central and Latin America play a vital role in hemisphere defence and that it is not so long ago that the presence of German aircraft so near the Panama Canal was considered a major threat. Finally, American airlines are urging that, at a time when they are still receiving substantial subsidies from the taxpayer, there is no reason why foreign operators should be allowed to cut the best slices off the cake.

Youth in Jeopardy

FROM A SPECIAL CORRESPONDENT

IN America today statistics for juvenile delinquency show an increase of 45 per cent between 1948 and 1953, and there are a growing number of lurid and wanton adolescent escapades in the headlines. In consequence the public conscience is deeply concerned, and popular alarm at the excesses of the younger generation has exploded into a nation-wide controversy. Many people, from their own experience, consider themselves qualified authorities on rearing children, and many deep-seated attitudes about American life in general underly the arguments about whether to punish parents or censor comic books, on how to reconcile material success with spiritual values, and over the pros and cons of sacrificing individuality to conformity. Moreover, the mother who has been told by psychologists neither to threaten nor bribe her child is often in conflict with the father who insists that to spare the rod is to spoil the child. One of the fundamental problems facing Congress and the Administration in attacking delinquency is that of channelling the enthusiastic search for scapegoats and panaceas into realistic action at the community level. Senator Kefauver, who heads the Senate sub-committee which is investigating juvenile delinquency all over the country, said recently: "The causes of delinquency are as complex as our society." And American society has become more and more complex in the last twenty-five years.

In the midst of the furore, it is easy to get the impression that all American children are living lives filled with horror and crime, but in fact 95 per cent of them are growing up in a normal and healthy way. Yet delinquency has been described as being as "infectious as the measles," and the rise in the official statistics shows the need for immediate measures for control and prevention. The number of juveniles who are currently coming to the attention of the police is estimated at about 1,250,000 a year, and the number

A bank with branches all over the world

For over forty years The First National City Bank of New York has been developing a global network of overseas branches.

There are now fifty-eight of these branches in twenty different countries throughout the world. In addition, nearly three thousand banking correspondents—reporting from every commercially important city of the globe—are in constant touch with Head Office in New York.

The First National City Bank can, therefore, offer businessmen with international interests—and particularly those engaged in the vitally important trade with dollar areas—the substantial benefits and invaluable local market knowledge of such a system.

The specially qualified staff of the London office will be glad to place at your disposal the long experience, resources and facilities of the organization.

Wherever your interests lie and whatever they may be, The First National City Bank is anxious to help.

PROGRESS IN ELECTRONICS

Many of the fantasies of science fiction writers are being brought nearer to reality by a new invention known as a transistor. This is a tiny device which has a similar function to a radio valve, but which operates on an entirely different principle.

The basis of the transistor is purified germanium, an element whose peculiar properties permit the close control of the movement of electrons within its structure. In this respect it differs from the radio valve in which electrons are controlled within a vacuum.

The transistor needs no filament and operates at very low voltages and currents. This means that its power consumption is negligible, and it is very economical to use. Another advantage is its small size—in many cases no larger than a pea—which is opening up applications hitherto impossible with the conventional valve.

Mullard transistors are already being used extensively in hearing aids where their small size and low power requirements are resulting in instruments of match-box dimensions, which will operate for about three hundred hours from one miniature 1.5 volt battery.

Transistors are also being successfully employed in the development of equipments as diverse as computing machines (electronic brains) and portable gramophones, telephone equipment and nuclear radiation counters. And this is only a beginning. Research continues, and it is still impossible to foresee the ultimate extent of transistor applications, although potentially they appear to be unlimited. Whatever the future may bring, the Mullard organisation will play its traditional part in supplying British equipment manufacturers with electronic devices of the most advanced design and the highest quality.

of children between 10 and 17 who appeared before the nation's juvenile courts increased from 300,000 in 1948 to 435,000 in 1953; only 10 per cent of this rise could be attributed to the growth in population. If the present trend continues, it is estimated that the number will reach 785,000 by 1960. Figures from the Federal Bureau of Investigation show that in 1953 "teen-agers" accounted for about half the burglaries and car thefts in the country, 16 per cent of all rapes and 4 per cent of homicides. A survey of 200 cities by the FBI shows that, whereas the crime rate for adults went up 2 per cent in 1953, among adolescents under 18 it rose 8 per cent.

The offences for which children are sent into court vary from state to state and may include, in addition to actual violations of the law, such things as disobedience to parent or guardian or smoking in a public place. "Dependency and neglect cases" also form part of the court records but, whatever the reason for their apprehension, these are children in trouble. Because of the severe shortage of facilities in most areas, dependent children and minor offenders are likely to be crowded into detention homes or committed to training schools with the incorrigibles and the murderers, thus compounding the proportions of the epidemic.

★

The war drove the delinquency rate up steeply in 1944 and 1945, but the children who are now pushing it up again, to a new high, are those who were at the impressionable ages of five to seven when their fathers were in military service and their mothers were working in war plants. The Korean War and the cold war have added to their general sense of insecurity; comic books and television have bombarded them at an early age with unevaluated sights, sounds and ideas; the universal use of the automobile has tended to disrupt family and community life; tremendous shifts in population have meant that families have found themselves cut off from familiar institutions and customs, often living among total strangers in vast housing projects. Such changes have affected all classes. Outbreaks of delinquency in well-to-do areas are becoming more frequent, and the rate in rural and non-urban communities where delinquency has always been low rose much faster than the national average between 1948 and 1952.

The most unstable communities, however, and by far the major breeding grounds of delinquency, are the big city slums. According to one source, roughly one-fifth of the child population is in families with incomes of less than $2,000 a year, and a considerable proportion of these children grow up in slum areas. Widely different racial and religious elements are crowded together, each clinging to its own attitudes of defiance, though even the most upright parent may be forced to modify his standards under the pressures of economic want or the handicap of a strange language. Many parents are delinquent themselves and transmit the techniques of lawlessness to their children, aided and abetted by the purveyors of organised crime and those who deal in narcotics and pornography.

In school, the child from this lowest economic group is likely to find himself judged by unfamiliar middle-class standards of culture and behaviour which give him a sense of inferiority. There is little chance for individual attention in classes that average sixty children. The child who falls behind, perhaps because of an inability to read, or an emotional disturbance, often finds the sense of identity which he wants in a gang. A survey of gangs in New York has shown that they are founded primarily on friendship, but that about one out of every ten gets into serious trouble. Anything from racial friction to fights over girls may cause open warfare, and the vaguely aggressive impulses of the most harmless group are sometimes twisted by a seriously unbalanced member into acts of extreme sadism. In a famous case in Brooklyn last year a boy whose childhood idol had been Hitler and who boasted of his belief in brutality and violence led a group known as the "thrill-kill" gang which tortured girls and drunks and eventually became involved in two murders.

★

There are two approaches to the prevention of juvenile delinquency: the sociological, which is mainly concerned with improving environmental conditions through schools and housing and with providing recreational activities and encouraging community enterprises; and the psychological which tries to detect and treat maladjusted children before they can get into trouble. Progress along these lines is being made through the training of special juvenile officers for the police and programmes in which "detached" welfare workers seek out potential delinquents and attempt to win the confidence of gangs. At a recent conference of psychiatrists, it was suggested that certain difficulties can be eliminated even before the birth of the child by treating the emotional problems of the mother during pregnancy and that 80 per cent of the cases of emotional disturbance in young children can be handled by social workers and teachers who have been trained in personality problems, without the assistance of a psychiatrist.

The schools and the juvenile courts are the key agencies for reaching delinquent children and for co-ordinating community facilities. The first juvenile court was established in Chicago in 1899, but the basic philosophy that these informal courts should mete out "individualised justice" in a therapeutic rather than a punitive spirit, without charging the children as criminals, was revolutionary at the time and has never been wholly accepted by the public. The courts have been accused, by the vociferous advocates of the "back-to-the-woodshed" movement, of "coddling" adolescent criminals. The Senate sub-committee emphasises that the juvenile courts have never really been given a chance and have received neither the public support nor the necessary personnel to carry out their work. While some states, notably California, have demonstrated that these courts can be successful, there often is a complete lack of co-operation between rival agencies, with welfare departments and police fighting their differences in the courts. The fact that judges are frequently elected and that jobs in the courts and in the training schools may be filled by patronage means that schemes of rehabilitation, if any, are likely to be subject to political currents and popular whims.

Both Senator Kefauver and the Administration have introduced Bills into Congress to provide for federal grants-in-aid to the states to assist in setting up control programmes and in training personnel. It is hoped by such means to encourage an all-out war on juvenile delinquency, and both the Senate sub-committee and the federal Children's Bureau feel that they are making progress in arousing the nation. Both report a tremendous growth of that public interest in, and understanding of, the problem without which the most constructive programme is bound to fail.

Raising the Wage Floor

TWO weeks ago the Senate passed a Bill raising the national minimum wage from 75 cents an hour to $1. This increase, sponsored by the Democrats, went 10 cents beyond President Eisenhower's recommendation. But the Bill disregarded the Administration's somewhat luke-warm suggestion, first put forward in the President's message on the state of the union in January, that minimum wage legislation be extended to cover some of the 38 million people protected neither by the Fair Labour Standards Act of 1938, nor by any subsequent amendments. These people, who make up more than half of the national labour force, include shop assistants, agricultural workers, civil servants, professional workers and self-employed persons. Twenty-two states, most of them in the South, have no minimum wage laws whatever and in most other states such legislation is limited to women and minors.

The new Bill will affect about 2 million of the 24 million workers now covered by minimum wage laws; it will increase the wage packets of the lowest-paid workers in the textile, lumber, confectionery, tobacco and leather industries. The $1 figure represents a compromise between the Administration's request for an increase from 75 cents to 90 cents an hour and the figure of $1.25 put forward by spokesmen for organised labour. President Eisenhower argued that a 15 cent increase corresponded to the rise in the cost of living. Union leaders, on the other hand, pointed out that 90 cents and even $1 were insufficient to maintain minimum living standards in a country where the average factory wage is $1.84 an hour. Many Democrats were in favour of the higher figure but felt that it might lead to unemployment in certain of the less prosperous industries. Opponents of the new Bill are, in fact, saying that even a $1 minimum wage will lead to further inflation and the disappearance of small businesses. These arguments will be heard loudly when the Bill goes before the House of Representatives and it is possible that some compromise between Administration and Democratic views will finally emerge.

Davy Crockett, Salesman

New York

DAVY CROCKETT, an intrepid and colourful scout in Indian wars, and a staunch supporter of the Texas movement for independence, who was finally killed by the Mexicans at the battle of the Alamo in 1836, has become since last February a hero to America's children and shopkeepers alike. In that month a Walt Disney series, the "Legend of Davy Crockett," began to provide a startling example of television's influence on the large and volatile juvenile market. Davy Crockett has already far outdistanced Hopalong Cassidy, Space Cadet, Lone Ranger and all other former favourites, and the craze shows no signs of fading. No fewer than seventeen recordings of "The Ballad of Davy Crockett," a sort of junior national anthem, have been made and these records are apparently permanently installed at the top of the "Hit Parade."

The Kings of the Wild Frontier, aged from 3 to 12, who stalk the streets of American cities, are all agreed, with the slavish conformity of children, on one point—the need for wearing, like their hero, a coonskin cap, with the tail hanging down the back, and, if possible, for toting a "b'ar killing" flintlock rifle on their trips with mother to the supermarket and other outlying territory. The resultant mania for coonskin caps, far greater than anything promoted by Senator Estes Kefauver's political efforts, has electrified the dormant market for raccoon skins. Raccoon tails, which once sold for 25 cents a pound, now change hands, if they can be found, at $5 or more a pound, and even moth-ridden old raccoon coats have developed a high resale value.

But the shrewd specialists in the promotion of children's tastes have not stopped at the caps, rifles, coats and toys more or less directly connected with the frontier hero. Hundreds of articles, some of which seem to bear no conceivable relationship to Davy Crockett—from polo shirts to bedspreads, from guitars to chocolate layer cakes, and from play tents to school lunch boxes—all, when adorned with the Crockett trademark, immediately become best sellers. Davy Crockett towels are advertised as the one sure way of encouraging reluctant youngsters to wash behind their ears. Photographs, posthumously autographed by the hero himself, are on sale. Nor have astute clothing manufacturers forgotten the Queen of the Wild Frontier. Already the value of retail sales of Crockett merchandise is estimated to be in excess of $100 million, and by the end of the year is expected to reach $300 million. So great is this boom that a posse of lawyers has shouldered flintlocks to decide which of several competing complainants has the right to use, and exact the valuable royalties from, the Davy Crockett trademark.

SHORTER NOTES

The President has often been accused of allowing his reluctance to nominate Democrats to interfere with his desire to appoint only the best men to office. But he has now nominated Mr Gordon Gray to be the Assistant Secretary of Defence who is responsible for the foreign military aid programme. Mr Gray is not only a respected Democrat but also a good and experienced man for the job.

★

The seamen's strike on the Atlantic and Gulf coasts was settled, after only a short stoppage, when the employers agreed in principle to some form of supplementary unemployment benefits similar to those which the Ford and General Motors companies have just given to automobile workers.

★

The Court of Appeals in Washington, dividing equally, has once again dismissed two counts in the Department of Justice's indictment for perjury against Mr Owen Lattimore. The department has not yet announced whether it intends to try to carry the case farther.

★

The Senate has approved the Austrian state treaty with only three right-wing Republicans dissenting.

The World Overseas

Drift in Iran

IF there is a bright side to the news from Iran, it is on the international front, not that of home affairs. The last government and the present one—that is, General Zahedi's and M. Hosein Ala's—have between them spanned a period in which suitors both from the west and from Moscow have been steadily wooing Iran, greatly to the latter's material advantage. Playing with elegant ease its historic role of buffer state, Iran has gathered in a sizable harvest.

Since Dr Mossadegh fell in August, 1953, it has scored a lucrative oil agreement, a series of loans and grants-in-aid from the United States running to some $200 million to tide it over until the oil revenue starts to flow freely, top place on the list of recipients of United Nations technical assistance, and credits from Britain, Germany and Russia designed to promote trade expansion. Last but not least, it has after years of effort at last secured fulfilment by the Soviet Union of some obligations outstanding since the war—the return of eleven tons of purloined gold, and a promise to pay a debt of about £3 million worth of goods. The convoy of Soviet lorries that delivered the gold to the frontier on June 1st symbolised the degree to which the role of buffer can be turned to account whenever the giants on either side happen to disagree.

But on the home front there is no equivalent cause for complacency. It is difficult to put a finger on any one reason for the shoulder-shrugging and downturned mouths that are everywhere to be met in educated middle-class circles. People seem to be depressed chiefly because they want a lead and see no end to indecisive, negative policies; one even hears praise for Dr Mossadegh, because he was radical: "I admit that he went too far and never knew where to stop, but at least he was a portent of a new deal." Incipient despair hangs like a miasma over more minds than is healthy, and the first months of M. Ala's ministry have done little to dissipate it.

Before chronicling them, it is best to explain that there are two bodies besides the cabinet on which future developments hang. One is the National Iranian Oil Company (NIOC), which works in harness with the foreign consortium of operating companies; on its smooth running depends the revenue that will pay for most of the public works that are being planned, and happily it works well and its relations with its foreign partner are, according to its chairman, most harmonious. The other is the Plan Organisation, responsible for receiving the oil revenue via the Treasury, and for spending it on "development." Its director, M. Ebtehaj, is a proven thruster, but has until lately been too handicapped by quarrels with General Zahedi to show his paces. Nearly all Iran's development projects, therefore, still exist only on paper. And unless cabinet, National Oil Company and Plan Organisation work well in harness, they may easily remain so. All M. Ebtehaj's talent for hustle is fruitless if Shah and premier do nothing to stop present propensities to shift men from job to job so that no one gets a chance to form an effective team.

When General Zahedi "resigned" in April, he did so with an ill grace. He felt that he had deserved well for some resolute behaviour—notably, for the decisive way in which, in August, 1953, he had saved Iran from Dr Mossadegh and the throne for the Shah, and for his active campaign against Communism. But apart from these feats, his very considerable energies seem to have been applied to the brake, not the accelerator. He spent so much time baulking M. Ebtehaj that the Shah was driven to dismiss one or the other. There were also rumours, stronger than usual, of excessive corruption during his regime. The Shah therefore replaced him by M. Ala.

This appointment of a palace official, coupled with the retention of the two really first-class men in the Zahedi cabinet—Dr Amini at the Ministry of Finance and M. Entezam as Foreign Minister—and the nomination of other disinterested and honest members of the palace circle momentarily raised hopes of change. "If only the Shah would take over . . ."; this remark, constantly to be heard, was proof that resolute action by the well-meaning young monarch would be popular if it were to occur. But hopes have since been damped.

Cries of "Down with Communism" and "Out with corruption" may be heartening, but alongside them two major events have worried thoughtful Iranians. In particular, Dr Amini has been dismissed from the Ministry of Finance on the pretext that "a strong man is needed at the Ministry of Justice to root out corruption." Given the fact that Dr Mossadegh left the Treasury owing 17,705 million rials, or nearly £195 million, and given Iran's dire need of revenue, Dr Amini's immense capacity is much more needed at the Treasury, where there is no one of his calibre to replace him and where firmness and experience are essential if the government is to extract from the rich and powerful the new direct taxation that has just been imposed. A new law offering foreigners tempting conditions for the investment of foreign capital is robbed of its glamour if the country's best financiers are to be wasted on jobs that its jurists can do.

Another example of the dissipation of energies that can ill be spared is the current campaign against the Baha'i.

This sect, founded in Iran in the nineteenth century and now worldwide, has important centres at Haifa and Chicago. In Iran, a community of perhaps 100,000 works hard for its living and has prospered greatly in the present century. Iran prides itself on religious tolerance, but extreme Moslems dislike Baha'ism, and when the Shah, on his recent visit to Chicago, met the American Baha'i community, the mullahs at home were not pleased. During Ramadan, they began to attack Baha'ism along with Communism in their sermons and broadcasts. This process, once started, has led to a form of official persecution that few Iranians relish. The dome of the handsome Baha'i temple in Teheran is being hewn down stone by stone, and the pick that struck the first blow was wielded by the Chief of Staff. This wanton waste of army time is being excused on such a variety of grounds that the excuses cancel out ; what matters is that the mullahs, given some rope, took more, and no one stopped them. The visitor is hurried past the scene of demolition by Iranian companions who prefer not to have to explain it, since they know that something of their reputation for tolerance and good manners is tumbling into the rubble along with the falling stones.

Certainly there exists in present cabinet circles a will to transform the lot of the poor. But how can the countless plans on hand produce the desired results if officials are chopped and changed, and if mistrust prevails between the several organisations that are supposed to carry out the programme ? How can public confidence be restored if the anti-corruption campaign skips the well-connected, and if the big landowner demands an unfair share of the new water flowing from the dam on the ground that the river used to be his, and challenges officials to tell him which is the old water and which the new ?

The situation would be less disquieting were the working-class in good heart, but it is not. This spring, NIOC raised its minimum wage from 40 rials a day to 67, in order to meet the rising cost of living. Other industries, less well run, are unable to follow suit ; textile factories in particular have closed because they cannot pay higher wages and match Japanese and Soviet prices. Unemployment threatens and may be aggravated if, as seems possible, rich Baha'i emigrate and withdraw their very considerable investments.

When Washington injects each fresh dose of American funds, it does so out of fear of Communism. But General Zahedi so effectively rooted out Tudeh's potential leaders that such a danger is not for the moment imminent. The phenomenon to watch is the long, slow increase of the cumulative despair that assails all educated levels below that of the ruling class. The Ala ministry can arrest this trend only if it has enough drive to be radical. The same dictum has been applicable to a long list of ineffectual predecessors.

Industrialists and German Reunion

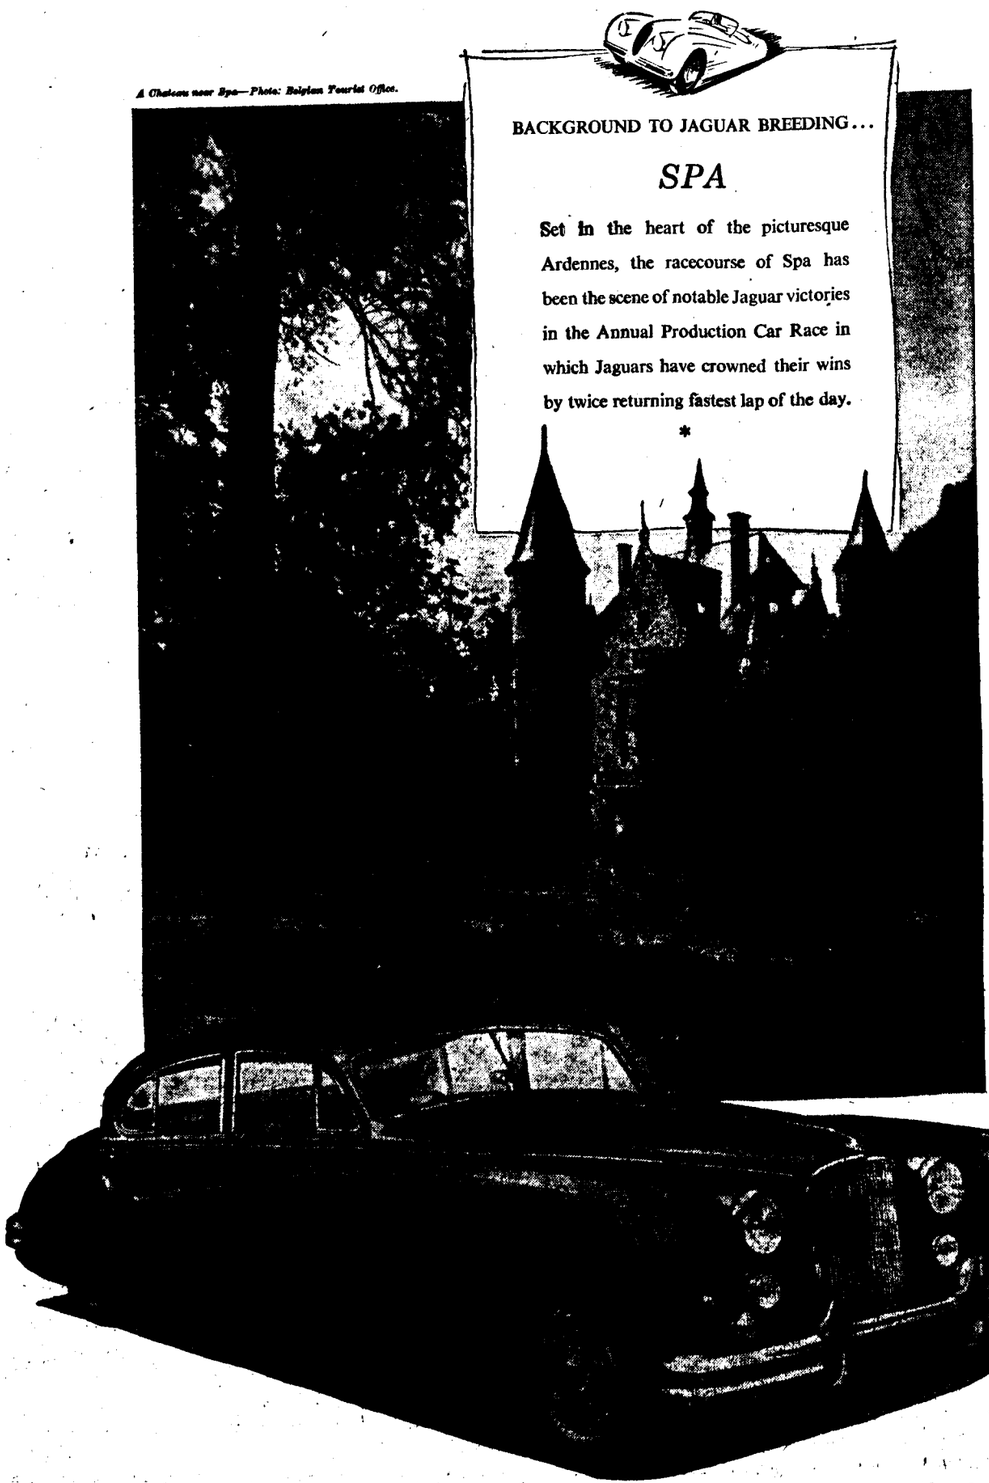
THE Soviet invitation to Dr Adenauer brought a fresh flurry on the German bourses in shares of companies with important assets in the Russian Zone. New York and other foreign stock exchanges were involved in the new wave, which ended in profit-taking. Few shares are available for speculators or individual private investors in Germany, in spite of the number of companies which have increased their capital in the last year. German firms and banks hold large packets of each other's shares in a complex system of interlocking ownership, and little is left over for the public. This phenomenon is due to the German passion for disciplined control, often termed a power complex. It is also one reason why company boards hesitate to increase their equity capital by public issues, even though most concerns have far too large a proportion of borrowed capital in their balance sheets.

The speculators overlooked the fact that Moscow's " At Home " to Dr Adenauer is not intended to be the occasion of talks on German reunification—still less of the kind of reunion that would give back nationalised firms to their " capitalist " owners. The invitation is intended to arrange co-existence between the Communist states (including Herr Ulbricht's) and the Federal Republic, for an interim period, which the Soviet leaders envisage will lead to reunion on their terms. However, German industrialists and bankers are more wary than the speculators, and even the optimists who now see reunion on the horizon are more anxious about its economic effects than they were. One leading West German bank, commenting on the latest short-lived rise in shares of the companies with central German assets, has issued a warning against overestimating their value. It gives several reasons for caution. The I. G. Farben shareholders and some others would, it is true, find that the Russians had fostered the Soviet Zone factories and some other key works which were essential for reparations. But even these would probably need modernising. And the bulk of Soviet Zone works would be problem children, requiring vast sums spent on them. Moreover, many former central German concerns have set up rival plants in the west and already find the competition of their former factories a nuisance. Central German goods are often dumped in export markets, and inferior goods are labelled with old respected trade marks to the annoyance of the emigré industrialists who, with admirable enterprise and courage, have built up a new business in the Federal Republic.

Looming over all the complicated problems of readjustment that would have to be made if Germany were to be reunited is a political question. Would the key firms in the

What's in it for you, Mrs. Broom?

What have Thames Board Mills to do with *your* housekeeping? Quite a bit, really! Think of all the goods you buy in those nice convenient containers—*cardboard* packets, *fibreboard* boxes. Without them you would be back in the bad old days of contaminated food, unreliable goods, dreariness and drudgery. Well, Thames Board Mills make over half the packaging board produced in Britain. And the higher your standard of living rises, the greater the demand for "Thames Board" and "Fiberite" cases. Vital indeed is the part that Thames Board Mills have to play in the nation's economy.



Thames Board Mills Limited

Soviet Zone be handed back to private ownership, or would they not remain nationalised? Herr Ulbricht has promised that they will never return to the "capitalists," and some of the experts who have studied the matter are privately inclined to agree. Yet the powerful western industrial leaders would certainly demand that the free enterprise system which has brought the Federal Republic back to prosperity should replace the nationalised, planned economy which has proved a failure across the interzonal border. What the outcome of this clash will be no one can foresee. But it is being more widely realised than before that rejoining central and west Germany might mean socialism in the West instead of economic freedom in the East.

Electioneering in Malaya

FROM A CORRESPONDENT IN KUALA LUMPUR

POLITICIANS and parties in the Federation of Malaya have been trying to deduce from the Singapore election results what their fortunes will be on their own election day, July 27th. It has been a sobering experience. The principal political parties are more aware than ever of the dangers of the split vote which largely helped to put the Labour Front in power in Singapore. They have also learned that general elections take much more money than Council elections.

It seems clear even at this stage that the Federation's new "Cabinet" and its 98-man Federal Legislative Council will both be largely Malay; for of the 1,128,000 people who have registered as voters, at least 90 per cent are Malays. This fact has shocked the Chinese more than they are prepared to admit, for it displayed a lack of interest, if not a lack of confidence, among the Chinese who form the majority of the 280,000-odd people who were eligible but did not register as voters. It means that the powerful and rich Malayan Chinese Association which has allied itself to the numerically strong United Malays' National Organisation will have to depend on Malay votes to get Chinese candidates elected; it will have to hope that the rural and town Malay voters will accept party discipline and not vote for the Malay opponents who will undoubtedly be set against them by their rivals, Party Negara. But the cynical are not the only ones who expect the elections to be won on communal lines despite the pious assertions of the Alliance that its members will vote on a party basis.

The elections will be a straight fight between the Alliance and Negara with a few independents thrown in; and it is confidently expected that the UMNO-MCA Alliance—now a "triple" alliance as it has been joined by the Malayan Indian Congress—will win the day unless there is a last-minute swing by Malay voters to the flag of Negara. The Alliance bases its confidence on its experience and organisation—which have gained for it 226 of the 268 seats contested in town council, municipal and state and settlement elections including 100 per cent victories in the Johore, Trengganu and Penang elections—as well as on its campaign funds which are provided almost entirely by the Chinese party. It is so full of confidence that it did not produce its election manifesto until last week.

Party Negara, on the other hand, believed in getting its election platform out early. It is a party which began at the top, as it were. It was formed by the "aristocrats" of Malaya—some Malay *Mentris-Besar* (prime ministers), senior Malay government officers, senior lawyers and important Asians in the world of commerce and industry. It is now trying to build up as much support as it can among the Malay peasantry and Asian middle class before the elections.

Negara is promising security of Malaya for the Malays by means of controlled immigration. This must also be a strong point for the UMNO; Tengku Abdul Rahman, its president, has himself declared that Malays will be outnumbered in ten years if the immigration of "foreigners" is not stopped and that before the citizenship problem can be solved satisfactorily, the question of immigration must be settled. But at the same time UMNO has to keep in mind the almost fanatical desire of its Chinese partners for a policy of *jus soli* which would give the Chinese the right of nationality from birth instead of the complicated and restrictive citizenship laws which now prevail. This is a campaigning point for Negara which keeps on hammering away at the dangers of letting in hordes of Chinese who in ten years will "swamp" the Malays.

This line does not help to improve racial relations, but as far as Dato Sir Onn bin Jaafar is concerned, everything is fair in elections. He resigned his portfolio of Member for Home Affairs in the present government in order to concentrate on his work as Secretary-General of Party Negara. It is imperative for him to regain his standing with the rural Malays which he lost, first, when he threw up the presidency of UMNO in order to form a rival political party, the Independence of Malaya Party (now absorbed into Negara), and secondly—as his close friends put it—when he accepted a knighthood. That, in the eyes of the peasants, put him in the upper "un-get-attable" class of aristocracy; he was no longer the man who had walked among them fighting for their rights. Today this 60-year-old politician rides a bicycle along the bunds of paddy fields wooing his people anew.

Call for Independence

Independence is not the promise that will win the votes. Both parties have it as a firm plank. Negara has quoted 1960, and the Alliance the mystic "self-government" during the first term of four years of the new constitution and "independence" immediately afterwards. Tengku Abdul Rahman in a recent utterance called for independence within the next four years in the belief that "bad government is better than foreign government." While the Alliance has spoken airily of the apparent simplicity of finding revenue on which the present government is not able to lay its hands—for example by raising income tax and "other taxation"—Negara has expressed its determination to appoint a planning commission to study the "material, moral and human resources" of the country, so that Malaya's prosperity can be shared equally by all.

Realising that only a miracle will put it in power at these first elections, Negara plans to make life unhappy for the Alliance in the first four years of the new legislature and simultaneously to build up its strength for the fight in the second elections in 1959 which will be the prelude to independence. How long it will be before a serious rift

breaks up what many people believe to be the unhappy partnership of the UMNO-MCA Alliance nobody can say. The recent demand by an extremist group within UMNO that all seats in the Legislative Council be farmed out among Malays only was an indication of the kind of strain that is likely to arise, although in this case Tengku Abdul Rahman's counsel of moderation prevailed. There are also, however, disagreements on such matters as citizenship, the official languages of the country, Malayan nationality and the High Commissioner's power of veto. But the Chinese will certainly stretch their endurance to the limit because they realise that if they are forced to break with UMNO they are finished politically in Malaya for a very long time.

Parties and Prospects in Burma

FROM A CORRESPONDENT LATELY IN BURMA

MODERN Burma has a genuinely democratic social structure; but no party system in the British or American tradition has so far put down roots. The Anti-Fascist People's Freedom League, which commands the support of 220 of the 250 members of the Chamber of Deputies, still reflects the hasty improvisation of its war-time origins; it is made up of a confederation of parties with widely differing functions. The most powerful body within it is the Socialist party: its adherents are probably few, but they include a forceful minority in the Cabinet. Its president is wealthy, confident, ambitious U Ba Swe, and its secretary is the Minister of Industries, U Kyaw Nyein, a more ruthless Stafford Cripps. Preaching unmodified Marxist-Leninist doctrine, the Socialists advocate carrying the "Burmese Revolution" towards its inevitable conclusion. They form a party within a party; and whereas the Prime Minister, U Nu, has forcibly asserted his authority over other sections of his Cabinet, he has to give special consideration to the Socialists.

The All Burma Peasants Organisation presided over by Thakin Tin (Socialist Party) is another semi-independent power. It predominates in the countryside, where it has great influence in the allotment of agricultural loans and in the composition of the Land Nationalisation Committees, and possesses its own "army," the Peace Guerillas. The voice of urban and industrial workers is the Trades Union Congress (Burma) whose chairman is U Ba Swe: its membership may total around 40,000. A series of communal organisations completes the constituent parts of the AFPFL. These claim to represent the Burma Muslims, the Karens, Shans and other frontier peoples.

The nation-wide organisation of the League, from the level of the township up to the Supreme Council, has a somewhat makeshift quality. Membership of the various governing bodies is acquired by self-selection rather than through any system of election. Frequently, disputes arise in district organisations which are quieted by the *ad hoc* intervention of a minister rather than by means of formal procedural machinery; and last October it was discovered that few AFPFL members ever pay their subscriptions. Many groups, notably the Communists, have quit, or been ejected from the League. But with the bulk of the dissidents underground, the legal opposition is ineffective. Some ex-Socialists have created the Burma Workers and Peasants Party, an avowedly Communist organisation; and seventeen of the thirty opposition MPs are associated in the right-wing Independent Arakanese Parliamentary Group, which stands for private enterprise and good administration. Finally there are the pre-war joliticians, like Dr Ba Maw, who still automatically contend for office.

Bands, Buses and Banners

The general elections of June to December, 1951, gave the AFPFL an unassailable position, and subsequent by-elections and local contests have confirmed its dominance. The Rangoon municipal election last February provided a pre-view of what may be expected at next year's general election. The opposition parties combined under the leadership of Dr Ba Maw, their platform being a "people's democracy." The League treated the election as a national vote of confidence, and announced that unless every seat was gained it would be a defeat. On polling day it gave an overwhelming demonstration of its resources: cars, buses, bands, gaily decorated booths, banners were everywhere. The result was: thirty-three seats to the AFPFL, one to the "United Opposition," and one to an Independent whom nobody had bothered about.

It seems unlikely that the AFPFL will fail to win the 1956 election with a large majority, provided that it stands together, and the gathering balance of payments crisis is patched up. But this does not mean that the League is universally popular. In the country districts, its leaders are, mainly, bullies and idlers to whom politics give power without responsibility, comfort without labour. The country people compare them with the underground Communists who, despite their many and obvious faults, have endured their full share of danger and hardship. Among the younger generation, a clear majority of student-leaders are pro-Communist.

U Nu has frequently challenged the Communists to throw away their guns and accept the verdict of the polls. This invitation has been ignored, although the Communists cannot hope to wrest power by fighting or sabotage. The other, legal, opposition groups cannot attempt to compete against the AFPFL with its now formidable organisation, its "influence" exerted through control over the distribution of welfare amenities and patronage throughout the land and —on a different plane—the plan for *Pyidawtha,* a welfare state, which still holds the imagination of the public. Finally there is the general popularity of the Prime Minister, who is now visiting London.

U Nu is the one leader in whom the ordinary people of Burma put their trust. They know him to be approachable, unworldly, religious and incomparably honest. He has a special position with the hill peoples and the Karens. Many Burmese public men still inwardly believe that the only true Burman is a Burmese Buddhist; but to U Nu, a Karen Christian or a Kachin Animist is every bit an equal citizen of the Union. He has only just begun to make a mark in international affairs, and although his first essays in the diplomatic art showed a certain naiveté, he is rapidly gaining stature and authority. In domestic politics, U Nu is a Socialist but not a party member. The leaders of the party, U Ba Swe and U Kyaw Nyein, impatient with the present "half-way house" of a mixed capitalist-socialist

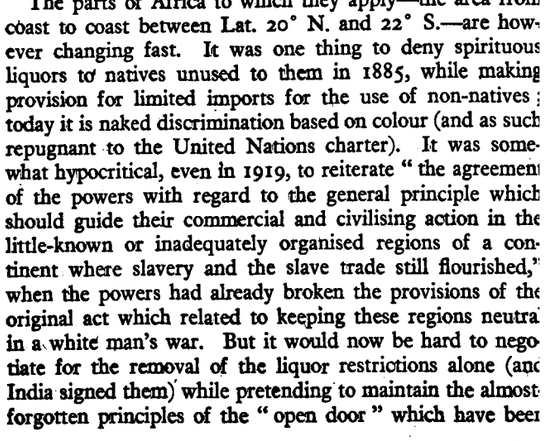
(*Continued on page* 1141)

(*Continued from page* 1140)

economy, and frustrated by the slow-down imposed by the current balance of payments problem, are believed to want to end the existing AFPFL coalition.

An immediate show-down, however, is unlikely, since the Socialists know that if they had to oppose U Nu at the next election, their cause would not prosper. By fighting the election under his leadership, the Socialist party may well emerge with a clear majority of its own in the next parliament, and there would then be pressure to "kick him upstairs," to run U Nu for President of the Union—and political retirement. Perhaps he will consent to such an arrangement: he has long stated his desire to retire from politics. But unless he is convinced that his country is on the right course, U Nu will stay at the helm.

France's Quiet Election



THE elections to the French upper chamber, or Council of the Republic, last weekend provoked little excitement. Only half the senators are re-elected every three years, and this time there are no radical changes in the composition of the Council. But this stability cannot be taken as a safe guide to the mood of the country or as a portent of calm for next year's vital elections to the National Assembly. The accompanying diagram shows how much the party pattern of the two chambers differs. The fact that they were chosen at different times is only part of the explanation. Unlike the Assembly, the Senate is elected by an indirect vote. The "grand electors" are chiefly municipal councillors and the system, though fairer than before the war, still shows a strong bias in favour of conservative rural areas. Finally, since the municipal councillors themselves were elected two years ago, their choice is, if anything, a guide to the mood of yesterday.

Allies included throughout. Conservatives include Republican and Peasant independents as well as dissident Gaullists.

However, two features of last week's voting are of interest: the continued weakening of the Gaullists, both orthodox and dissident, and the persistent Communist campaign for "unity of action" with the Socialists. Both confirm the trends shown in the recent cantonal elections. Indeed, the Gaullist tide is probably receding in the country even faster than was shown in the results. As to the Communists, they maintain their regional pressure "at the base" and their candidates continue to stand down "in the cause of working-class unity" in spite of all rebuffs from the Socialist headquarters. These two trends will certainly influence political thinking in the National Assembly, which meets again this week with next year's elections very much on its mind.

Congo Treaties in Disrepair

RECENT enactments in Uganda and the Belgian Congo designed to allow Africans to buy intoxicating beverages violate a whole nexus of solemn international engagements, if someone cared to challenge them. But they reflect the quiet decision of certain of the high contracting parties—those with colonies in the "conventional basin of the Congo"—to treat the treaties as a dead letter. The

high contracting parties have little alternative. For so certain were the draftsmen that the original Berlin Act of 1885, the Brussels Act of 1890 and the St Germain Conventions of 1919 embodied the divine law for tropical Africa, that no provision whatever was made for denouncing them. The only way to end or amend the treaties is to bring all the original signatories back to the conference table to sign a new convention; and as the treaties ban not only the sale of liquor but also the sale of arms to Africans, prohibit the imposition of imperial preference equally with the slave trade, and as the signatories include Russia, India and the United States, the difficulties are not to be minimised. Indeed the colonial powers concerned—France, Belgium, Britain and Portugal—have long accepted the fact that the treaties are permanent and unalterable.

The parts of Africa to which they apply—the area from coast to coast between Lat. 20° N. and 22° S.—are however changing fast. It was one thing to deny spirituous liquors to natives unused to them in 1885, while making provision for limited imports for the use of non-natives; today it is naked discrimination based on colour (and as such repugnant to the United Nations charter). It was somewhat hypocritical, even in 1919, to reiterate "the agreement of the powers with regard to the general principle which should guide their commercial and civilising action in the little-known or inadequately organised regions of a continent where slavery and the slave trade still flourished," when the powers had already broken the provisions of the original act which related to keeping these regions neutral in a white man's war. But it would now be hard to negotiate for the removal of the liquor restrictions alone (and India signed them) while pretending to maintain the almost forgotten principles of the "open door" which have been

violated again and again by modern exchange control regulations. Yet to try to demolish the treaties altogether would be to invite criticism that the real motive was to enable Kenya to give Lancashire cottons a tariff preference.

At the same time, it is hard to saddle the new Federation of Rhodesia and Nyasaland permanently with a dual tariff system, and with one unalterable set of rules for part of its northern provinces which may be different from those in the south. Tropical Africa, in short, has grown out of the Congo Basin treaties with the advent of motor roads, aircraft, industries, universities and a rising African middle class. It can hardly accept an indefinite contingent veto from the heirs of Czarist Russian policy. The solemn engagements first entered into in 1885 are being, and will increasingly be, quietly evaded.

OEEC Meeting—II.

Planning for Progress

HAVING dealt with trade and payments questions with pencils sharpened to points of almost invisible fineness, the OEEC ministers, who met in Paris on June 9th and 10th, took up their broadest brushes and turned to two reports which look not at the months ahead, but at the years: one on the Italian development plan, the other, a report on European co-operation in the production and distribution of power, prepared by M. Armand, the president of the French national railways.

Last January a special working group was established to meet Italian experts and to examine in detail both the ten-year outline prepared by Sr Vanoni and the more specific plans and forecasts for the first four years. The verdict of the working group, which was endorsed by the Council, was one of strong support for the broad outlines of the Italian approach and qualified approval of the details. (The ten-year plan was summarised in *The Economist* on February 26th.) After drawing attention to the biggest question mark, which is whether the necessary national enthusiasm and discipline exist for a sustained effort of the magnitude contemplated, the working group analysed three economic dangers which it felt might threaten the plan.

The first danger is the possibility that the planned public investment will not lead to the expansion in the private sectors of the type and scale required to solve the employment problem. Particularly in the South, where the expansion is most required, there are serious shortages of skilled labour, of men of proven managerial ability, and of adequate capital at rates which are attractive to small enterprises. The second danger is that the plan will prove inflationary and that the government will seek to restrain the upward spiral of prices and wages with disinflationary policies which will damp down the very expansion on which the success of the plan depends. In this connection, the working group emphasised the importance of financing new investment from savings, and implied delicately, but strongly, that more rigorous taxation policies will be needed both to draw out savings and to restrain consumption. The third danger is that as incomes go up there may be too large an increase in imports or too small an increase in exports and the resulting balance of payments problem will be met by protection of high cost industries or by measures which would run counter to the expansionary objectives of the plan. Although the working group believes that the Italians are right to look to an increase in exports rather than a reduction of imports to balance their accounts, the goal of an increase of 55 per cent is an exceedingly ambitious one, and the group apparently felt that the Italian government had not yet given enough attention to administrative devices for encouraging exports.

The report concludes that although the success of the plan depends primarily on Italian efforts, international co-operation can appreciably lighten the load. Six forms of useful co-operation are suggested: technical assistance, trade liberalisation, encouragement of private investment, financial aid, short-term credits to met temporary balance of payments difficulties, and continued help over emigration. And, buried deep in the technical reports of the EPU, there is evidence that the OEEC will soon add concrete support in the shape of a short-term credit of $50 million to the advice and encouragement already given to the Italians.

Atomic Dawn

The second report, by M. Armand, presents a strong case for international co-operation both in the immediate exploitation of conventional sources of power and in the development of atomic energy. Like the British White Paper, M. Armand sees in the development of atomic power the chance to reverse the current trend towards higher energy costs and the prospect of doing so in a future which is near enough to make immediate co-operative planning economic common sense. Furthermore, with plentiful atomic energy just over the horizon, he believes that the general power problem is changing from the technical one of how to produce more energy without exhausting limited resources, to the economic one of determining how, at various stages of technological development, adequate power can be produced most cheaply.

> The first consequence of the dawn of the atomic era must be to abolish the fear of any power shortage in the future; it will therefore be necessary to abandon the idea that power costs in Europe are linked irretrievably with the price of coal and are therefore bound to rise. . . .

For many years to come atomic energy will only account for a small proportion of total supplies and no great change in present equipment plans is therefore required; investment programmes, however, must obviously be reshaped in the light of a future which will be very different from that anticipated a few years ago. M. Armand believes that international co-operation in this revision of programmes would be "prudent"; but that it is "vitally necessary" in the development of atomic energy, particularly if Europe is to match the United States on cost of power.

The OEEC ministers had little time to do more than endorse in principle M. Armand's view that the three "vertical" committees of the OEEC which deal with technical production and distribution questions for coal, electricity and oil, should now be supplemented by a power committee competent to relate the development plans in each sector of the power industry to each other and to the changed assumptions of the atomic age. A working party will also examine co-operation in the field of nuclear power—a small step in the right direction. But firm planning for international co-operation in atomic development deserves to come first on the agenda when the ministers next meet.

THE THINGS WE DO FOR YOU - 3

You, sir, may not care a row of beans about us, but what we do for our living may nevertheless touch your own life at a good many points.

For example, you need

only think of your food

Your bread and biscuits are made of flour which was probably milled in a Simon-built flour mill (Henry Simon build most of the mills in the British Isles) and some of the wheat was very likely handled, stored, shipped and unloaded by Simon granaries and port installations on both sides of an ocean (there are Simon handling plants at every grain-receiving port in the Kingdom). Your eggs and bacon, your meat and milk, come from livestock which may be fed on the balanced rations made in some Simon-equipped provender mill. And if your wife has an electric kitchen, will you remind her that not a few of Britain's great power stations have boilers built by Simon-Carves?

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

The Corporation is ready to consider applications for capital to purchase additional buildings, plant and machinery, or to provide increased working capital to further the expansion of business. Consideration will also be given to new ventures which are soundly conceived and adequately sponsored.

THE BUSINESS WORLD

Taxation of Profits and Income—II

A Capital Gains Tax?

NO division between the majority report of the Royal Commission on Taxation and the dissenting memorandum of the minority is deeper than the gulf that separates them on the question of taxing capital gains. The majority say "No"; the minority say "Yes," and they hang their proposal for a single tax on corporate profits at a relatively moderate rate of one-third on the condition that capital gains are taxed. It is fatally easy to look across this gulf, from its left side or its right, merely with the eye of prejudice. But so long as capital gains continue—and in this age of inflation and economic expansion they are not going to stop—some people will demand that they should be taxed. In all fairness to Mr Kaldor and his dissenting colleagues, their arguments for taxing capital gains are well-ordered and put with much power of persuasion. In all fairness to themselves, investors and savers should realise what the arguments are, and not make the mistake of howling that they are being hurt without knowing what has hit them.

For this purpose, it is convenient to take the memorandum of dissent and examine the case that it makes, and to draw less directly on the majority report. The minority plunge immediately into the deep water of principle. What is "income"? The tax code offers no definition of the word, and Mr Kaldor and his associates will have nothing to do with the convenient circularity of Lord Macnaghten's proposition that income tax is a tax on income. That leaves too much to be interpreted; yet the very process of interpretation has brought within the conception of taxable income gains that would formerly have escaped income tax. The classical tax tautology—"the word income means such income as is within the Act taxable under the Act" has grown some odd shoots. It is only 35 years since an earlier Royal Commission recommended that tax should be levied on casual or non-recurring profits arising from "profit-seeking transactions"; and although this proposal was not enacted, a series of decisions in the Courts has put much of its essence into effect. For example, the sale of whisky in bond by a woodcutter produced an isolated profit, but the Court held that it was taxable, on the ground that the transaction, even though it may have involved speculation of a rare kind, carried "the badges of trade."

What, then, governs the decision whether a particular transaction (or a series of transactions) should be invested with "the badges of trade"? If the "fruit" should be taxed, but not the "tree" (except for those who deal in "trees"), how is one to delimit the "interesting borderland" (as the Board of Inland Revenue calls it) between the mere disposal of property or investments for untaxed casual gain and those transactions in property and investments "just numerous and organised enough to constitute dealing so as to make the gains liable and the losses eligible for relief"? It is one thing, say the minority, to distinguish the profits of a regular business from infrequent profits of a casual kind. But certain profits are taxable even though they are isolated or casual; how then can it be equitable that other profits should be exempted (though they may be regular) because they are deemed to lack the atmosphere of a "venture in the nature of trade"?

These are arguments of some force. One has to be something of a tax metaphysician to distinguish fruit from trees in the borderline cases; the General Commissioners and even the Courts are not entirely consistent in their nice rulings (how could they be?); and the six broad lines of guidance that the majority propose for determining whether a profit should be taxable or not

are themselves far from precise, and are subject to reservations by two of their number. It is, however, worth setting them down in summary form, to show how the majority would identify the "badges of trade" which (they hold) should continue to be the criterion :

(1) *Subject matter.* Forms of property, such as commodities and manufactures, which are normally the subject of trading, are only very exceptionally the subject of investment.

(2) *Period of Ownership.* Property meant to be dealt in is generally realised in a short time—though there are many exceptions.

(3) *Frequency of Similar Transactions.* Successive realisations of the same sort of property set up a presumption of dealing.

(4) *Supplementary work on the Property Realised.* Working up property or special exertions to find purchasers for it suggest evidence of dealing. If nothing is done, the suggestion tends the other way.

(5) *Circumstances of the Realisation.* A sudden need for cash might negative the idea that any plan of dealing prompted the original purchase.

(6) *Motive.* Motive is never irrelevant, and can be inferred from the surrounding circumstances—even if necessary in the face of the seller's own evidence.

But these, to repeat, are no more than lines of guidance ; the one concrete recommendation from the majority is that appeals on this tricky subject matter should be heard by the Special Commissioners.

★

Although many gains formerly regarded as being of a capital nature are now treated unequivocally as taxable income, the minority have no doubt about what should be done :

> The major inequities, in our view, arise from the present tax immunity of capital gains . . . the tax exemption of the so-called capital profits of various kinds represents the most serious omission in our present system of income taxation.

They do not deny that the capital gains that occur as a result of inflation may be illusory ; but they argue that property owners who make gains because of inflation are better off than the rentiers who do not. Similarly, a fall in interest rates confers capital gains on some holders of securities (though this gain too is illusory if the investor wants to maintain the same nominal income), whereas other savers (for example, those who hold savings deposits) may suffer. So in each case, some are better off than others, and this is inequitable. But the bulk of the capital gains, argue the minority, come from dealings in securities, which are associated with the expectation of rising industrial earnings and dividends :

> The value which successful businesses acquire in the form of "goodwill"—the excess of their market capitalisation over their share capital and reserves—is not an isolated windfall. . . . It is part of the normal reward of successful enterprise . . . indeed, it is the most important part of that reward, the expectation of which is a crucial factor in the supply of risk capital and business ability to new ventures.

Because these gains are not taxed, they argue, elaborate dressing up of taxable income in the form of capital appreciation is encouraged. That may indeed be true. But it is nowhere more marked than in the case of the "one-man company" or "closed corporation," which has for several years enjoyed the protection of the umbrella opened by Sir Stafford Cripps, and can plough back much of its profits without much risk of a surtax direction ; both the majority and the dissenters might have discussed this typical modern case in much more detail. Certainly, the taxing of capital gains of this nature, which have no regular market price and would involve (as the Board of Inland Revenue's memorandum makes quite plain in its own italics) a valuation of the realised assets of every such business *as at the date when the tax came into force,* would present formidable difficulties. Certainly, no system of taxing capital gains that left this class of gains untouched would be acceptable for a moment.

★

So far the minority have been concerned with their conceptions of equity and justice in the treatment of capital gains. But when they come to practical matters, expediency enters the discussion :

> We recognise the force of the argument which leads to the conclusion that it would be inexpedient to tax capital gains at the full progressive rate of income tax and surtax combined . . . the effect would [then] be that a great part of these gains would be taxed at an extremely high rate [mounting at present to 18s. 6d. in the £], which would be bound to have a destructive effect on the willingness to assume risks.

This lets at least half the cat out of the bag. One must forbear from heavy taxation, lest capitalists should be discouraged from saving and encouraged to dissipate their capital. At what rate, then ? If these gains are income, is there any principle of logic that differentiates them from other forms of income ? The majority cannot find one. The dissenters find "no principle of equity" that declares that "if something cannot be taxed at 95 per cent it should be taxed at zero per cent." Nor will the dissenters admit any inherent claim that long-term gains should have more favourable treatment than short-term gains, though they would permit realised losses to be offset against realised gains, and unabsorbed losses to be carried forward indefinitely against future gains. They also have to recognise the fact that selling to establish tax losses can be coupled with automatic repurchase of the securities sold (though this can only be done at a cost). There would be incidental cases of hardship. For example, profits from the sale of owner-occupied houses should be exempted "to the extent of one residence for each taxpayer." Here again is an expedient discrimination in favour of one type of gain and against a comparable gain realised, say, on a motor-car or on the sale of a security from the

income of which the holder might be paying rent for a house.

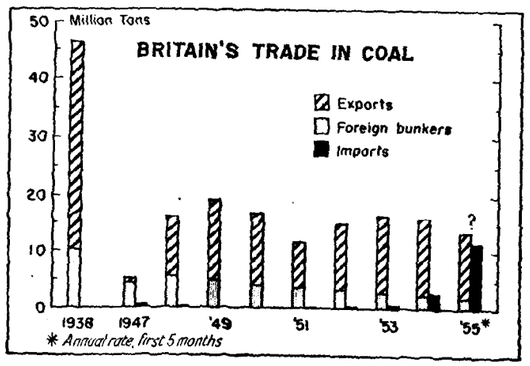
"We do not," observe the dissenters, "wish to enter into a detailed consideration of the administrative problems created by a capital gains tax, except to record our view that we do not believe that these problems would prove so formidable as is sometimes suggested." The first part of this observation is discreet ; the second is entirely *obiter.* The Board of Inland Revenue, which is likely to know more about this than anybody else, makes no bones about the volume of work that a capital gains tax would entail. The Board conceives that such a tax would be highly unpopular among those likely to be affected ; it would apprehend continued demands for modification by the public ; an elaborate system of investigation would be needed, capable of probing into millions of transactions (its guess of 2½ million Stock Exchange transactions a year seems, incidentally, to be an underestimate) ; gifts would have to be registered ; collusive arrangements would have to be frustrated ; and powers might have to be taken to obtain returns for sales of valuable articles, ranging from jewellery to greyhounds. All this would land on the doorstep of Somerset House at a time when the Inland Revenue sees some years of full employment ahead even to catch up with the back-duty work that has been hanging over it since the war.

And to what end ? The Board's guess is that a capital gains tax might average £50 million a year, but that the yield could swing between £250 million and minus £250 million (if losses were carried back). The dissenters' memorandum will have none of this. Their estimate is that "the ultimate annual yield of the tax on our calculation of the rate of appreciation of capital would be between £200 million and £350 million." The very difference in these estimates will make the average taxpayer wary. He may be pardoned for recalling that when economists get down to figures, as they have on occasion in such diverse fields as the costs of social insurance and the net earnings of railways, they have been known to miss the target completely. It needs more than a series of broad assumptions and broader extrapolations to overthrow the Inland Revenue's guess at the yield, and the figures that the minority provide are no proof that a capital gains tax would give a worthwhile yield.

In the end, the arguments of the minority cannot prevail. They have admitted that progressive taxation on capital gains would destroy the enterprise that produces part of the gains. They have not examined the effects that a flat tax on such gains might have on saving. They make little of the effect of the Death Duties as a long-run capital gains tax. They do not appear to conceive of the possibility that the apparatus of a capital gains tax, once in being, could be brought into use for a direct levy on capital—and would certainly be regarded by all who suffered from it as a threat to the entire orchard and not just a tax on the cherries. There is a good deal of logic in the minority's case for taxing capital gains, even if it is tinctured here and there with a certain amount of spite. But if the freedom of capital gains from taxation is a condition of a major ingredient of enterprise and economic progress (other taxes being as high as they are), the cost of pursuing "equity" to the bitter end could easily lead to stagnation and capital decay. A capital gains tax makes a good siren's song for the ears of the Left, but the Devil, it will be remembered, has always had too many of the good tunes.

Trading in Coal

So far this year Britain has imported nearly as much coal as it did in the previous eight years of nationalisation. About a million tons a month are being landed, and officially the implication of some 12 million tons of imports in 1955 is treated without much reserve. The National Coal Board, in the dispirited annual report that it issued this week, accepts this as one more enduring humiliation : "the country may have to continue to import coal for some time to keep pace with the expected increase in industrial activity."



No shred of official confidence now remains that coal output can be raised as fast as fuel consumption is likely to rise. Significant results from the major colliery projects begun since the war are not expected before autumn, 1957 ; nor will the board be drawn into suggesting when or whether the increases that may accrue thereafter might catch up with demand. It has had some practice since the war in answering the question: "To what do you attribute your failure ?" and by now it seems fairly well able to analyse the reasons, though largely unable to influence them purposively. It is still losing manpower, and expects this to go on while full employment continues ; it is hard put to open more new underground capacity than the mining process automatically works out each year ; and every year less of the coal that it wins from its exhausting seams is good enough to sell. From this slippery slope the mounting curve of fuel consumption may well look frightening—five million tons more of coal alone last year, and for the board's guess five million more this year.

Britain is hardly yet a net importer of coal, but it has ceased to be a significant net exporter earlier than most people expected. On occasions this year the cumulative total of coal imported has exceeded the total exported—it did on June 11th, because exports were cut during the railway strike. But the rates so far would

be consistent with an annual total of perhaps 13 million tons for export and bunkering of foreign-going ships (which pay export prices), against perhaps 12 million tons of imports : the coal trade in and out is roughly in balance.

Net imports, however, may obviously soon be required. How far the balance will have to be tipped remains to be seen. Unless each year gets successively colder (which admittedly in Britain would surprise no one), it should be some years before the net imports required from the coal trade reach, say, the order of the net exports achieved in recent years (10-15 million tons). But the total amount of coal that Britain has to buy abroad depends on how much coal it is determined to export—and this decision rests with the Minister of Fuel and Power.

The National Coal Board shares no responsibility for that decision, but it has to bear most of the implications, physical and financial. Under the nationalisation act it has the duty of supplying the coal Britain requires: it therefore acts as the principal in securing coal from abroad, though it buys largely through agents. Physically, this reversal of Britain's traditional international trade in coal has its difficulties. Although in the thirties far more coal used to pass through British ports than is handled today, it was all going outward. A railway system laid down to carry coal from pithead to wharf is not necessarily convenient for carrying coal from port to consumer. Much of the coal comes in through small ports where channels, berths and landing gear are unable to handle the large freighters used, for example, to bring coal across the Atlantic, so that this has to be transhipped in Continental ports into smaller colliers.

Physically, however, the burden and disorganisation of handling larger coal imports are marginal to the Coal Board's main task. Once settled, a steady programme of imports could be handled better commercially, for example in the charter market, than in occasional convulsive bouts of buying abroad, and might offer some flexibility in stocks. Financially, their implications are by no means marginal: even in 1955, this stump of a tail is beginning to wag the dog. For the board pays nearly £2 a ton more for these shipments of foreign coal than the British prices at which it sells them: imports of 12 million tons a year would mean a direct loss of £20-£25 million this year for imports alone. Last year, the board made enough profit on all other operations to cover its interest charges, but a loss of £5 million on imported coal put it £3.8 million into deficit ; its losses on this account since nationalisation have accounted for £14.5 million out of an accumulated deficit of £17.4 million.

On the other side of that account, of course, has to be set the £100 million that the board has earned since nationalisation by selling coal abroad at world prices, instead of the controlled British price. If export premiums are set against losses on imports, the board has had nothing to complain of—until this year. The equation is simple enough: Britain both buys and sells at the world price of coal, but the board, at any rate, loses nearly £2 a ton on the coal transported here while it makes only about £1 a ton on what it exports. As soon as imports reach much more than half the volume of exports, the board is a net loser. It would almost always (there may be exceptional prices on particular qualities) pay the board to cut exports rather than buy abroad. But even if exports were abolished, net imports will cost it dear.

In deciding how much coal Britain should export, and therefore how much it will have to import, at least ton for ton, the Minister has more to consider than balancing the Coal Board's books. There are some "consequential" exports under particular agreements with countries that supply Britain with raw materials, such as Sweden ; there may be some shipping earnings in the balance, and there are the earnings of British firms in the coal trade ; there is some general trading prestige to be lost in abandoning what was historically Britain's greatest export ; there is sometimes said to be goodwill in the coal exporting business that could be rebuilt upon some day. In the visible trade balance coal imports are costing roughly £80 million a year today and coal exports are earning about £60 million a year. Much of the imported coal has come and more may have to come from the United States, and freights are rising against the coal importer ; but by flouting the British shipowner and accepting flag discrimination, the Government can get a good deal of this American coal for sterling. It should be added that coal is not the only fuel that Britain can import ; against £6-£7 a ton for imported coal, it is probably worth bringing in as much fuel oil at current prices as consumers can use. But fuel oil, too, is becoming less abundant.

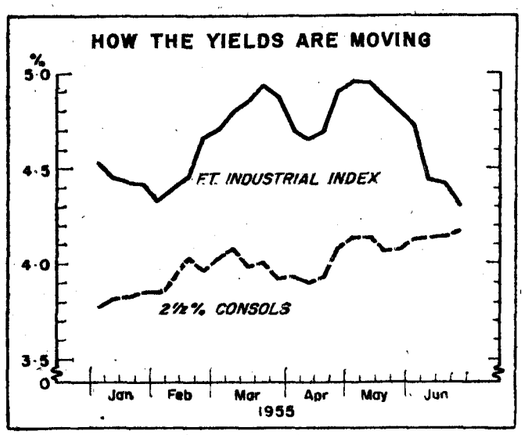
Britain is going to have to pay heavily for fuel in the next decade, however the bill is presented—in costly coal imports or exports forgone, in shifting to oil, in heavier capital programmes of nuclear power stations. Coal Board deficits rank small in the tally. But it is worth remembering that some part in encouraging the waste of coal that undoubtedly lurks in soaring consumption figures has been played since the war by holding British coal prices well below what coal would fetch abroad—or, in a free market, here—and by delaying even the rises that become inevitable in those controlled prices. Successive governments share some responsibility for the National Coal Board's failure to produce as much coal as people will buy at artificially low prices. At present the Minister is delaying his assent to a rise in price that everybody knows to be large and inevitable ; that, no doubt, is temporary, and the import-export programme will affect it. The present Minister grasped the realities of Britain's current fuel situation more quickly than any of his predecessors ; he acted flexibly to meet it, and has shown skill in educating public opinion to accept his measures. But in leading Britain towards competition in fuel it is time that he began to dust off an older gadget that also works —the price mechanism.

Business Notes

Boom in the Markets

BOOM is a word used much too often. It was rightly used about the markets in 1929, and it must be used about the industrial share market now. Investors are on the feed as they have seldom been before. Money that does not usually play the London market—from America (through the switch market) and from deposits with the building societies—is flowing in and forcing prices up. Hardly a day passes without the *Financial Times* industrial index notching a new high record. By Wednesday of this week it had reached 219.8, a rise of 6.1 on the week though there was a slight easing on Thursday. The number of recorded bargains also—inadequate though it is as a guide to the total of business done—is at near record levels. In no single day has it quite reached the record of 19,438 reached in January, 1947, but both on Tuesday and on Wednesday of this week the total exceeded 19,000 compared with a run at about 12,000 a day just before the Whitsun holiday. Moreover the total of 84,276 for five consecutive business days up to Wednesday was the highest ever. But marking is not compulsory and in times of great activity, such as the beginning of the Stock Exchange account that started this week, brokers often find they have no time to mark.

The similarity with 1929 stops there ; it would be worse than useless to try to push it further, for whatever happens now—and there are several possibilities—there cannot be a replica of what occurred in 1929. This is a boom confined to the home industrial market and indeed to the leaders of that market, based on high earnings cover and high asset values compared with current dividends and current prices. It is not an occasion when every would-be financier and every would-be inventor can come to market for money and go away fully loaded. A prosperous economy, high profits and a stable government together provide the most plausible arguments why the boom should go further. But at the peak of every boom that ever happened it has always been possible to prove that it must go on ; if that had not been so the boom could not have taken place.



One of the most logical possibilities now would be an increased flow of new issues to the market, reducing the head of steam by mopping up some of the money. Since the election and the strikes have probably held up some new issues, there should now soon be some increase in the flow. There are indeed some signs that it is coming. The most important industrial issue recently is the offer to shareholders of one new share for each three held by the Bowater Paper Corporation at £3 10s. per share compared with a market price for the existing stock of £6. It will raise £8.4 million towards the corporation's vast development plans. The issue is underwritten by the London and Yorkshire Trust which receives the general commission of 9d. per share. It is unfortunate, since Bowater is one of the shares that has been heavily bought on American account, that American holders are not allowed by their own rules to exercise their rights, though they can sell them. It is doubly unfortunate that because American shareholders are barred other shareholders have been denied the opportunity to apply for excess shares. Instead they will be made available to executive directors and senior staff. Is there any reason why these valuable excess rights (likely to be more valuable because of the American disability) should not be available to all the shareholders.

A Little Gilt-Edged Borrowing

THE gilt-edged market is the converse of the industrial market. Business is lacking and prices drag gently downwards, many of the institutions with big regular sums to invest seem to be doing less than their normal investment and the *Financial Times* index of government securities has lost a little ground. On Wednesday it was 94.99 compared with 95.48 a week earlier and on Thursday it fell more sharply. Yields from industrials, as the chart shows, are thus out of tune with gilt-edged. Indeed the two are con-

verging fast together as industrial yields shrink and gilt-edged yields edge upwards. Tighter money policy is working in the gilt-edged market; industrials it has not yet touched. Here is a disparity that must one way or the other adjust itself. Either gilt-edged stocks must recover, which would imply that the tighter money screw had been released, or the industrial boom must be checked.

It is a dilemma for the Government. A heavy list of gilt edged borrowings is waiting including issues for the Gas Council and the Electricity Authority, and to replace the 1955 Serial Funding Stock to the amount of £523 million now largely held in the money market and due to mature in November. A strong gilt-edged market would suit the programme well. Yet the Government must not defeat its own policy by buying stock (not even the Serial 1955 stock) from the market. The Bank of England is proceeding warily and with modest success with the borrowing programme. One small but urgent operation in the gilt-edged market, the New Zealand loan, has been more successful than most experts foresaw. Not only were the underwriters relieved of any obligation on the £10 million 4¼ per cent cash and conversion issue dated 1970-73, but the large cash applicants had to be scaled down to about 57 per cent of their applications.

Now the Bank has launched another urgent refunding operation. The London Electric Transport Corporation issue of £42 million of 2½ per cent stock maturing in August is being replaced. A similar amount of British Transport 4 per cent guaranteed stock 1970/72 offered both for cash and for exchange at £96½. The issue price was fixed exactly in line with the market, for British Transport 4 per cent stock is already in existence and stood at that price. Not unexpectedly cash lists remained open throughout banking hours on Thursday. The exchange operation, however (the word conversion cannot be used, for London Electric Transport Finance Corporation has ceased to exist), should prove attractive to many holders of the maturing stock. There is an overlapping interest payment for July to holders who exchange worth about 2s. per cent net. They are also exchanging a stock subject to stamp duty and guaranteed under the Trade Facilities Act for one that is free of stamp. The new stock offers a yield of a shade over £4 5s. per cent to redemption at the latest date and a guaranteed 3½ points of capital appreciation. It should be particularly attractive to grandfathers thinking of setting up educational trusts. The maturing London Electric stock is believed to be widely spread in small amounts. Conversions should be high but it will be surprising if the government departments are not required to take up some part of the £42 million, and that is just what government policy has to try to minimise.

Sterling's Unseasonable Slip

THE waning effect of the strikes has brought no relief to sterling. The rate against the dollar has been slipping almost continuously and from $2.79¼ a week ago it has fallen to around $2.78½. The demand for dollars has in part been commercial and there have been unusually early signs of substantial payments for grains. These payments also account for the weakness of Sterling against the Canadian dollar, where the rate has moved during the past week from $2.74¾ to $2.74. Part of the selling of sterling has also been due to the running down of working balances by foreign holders of sterling. These sales have been induced by the reasoning that the railway, dock and liner strikes will have an unfavourable and fairly extended impact on the balance of payments and that in consequence the outlook seems to suggest a further decline rather than a strengthening of the rate.

The strikes have certainly occurred at an unfortunate psychological moment for sterling since their repercussion from the British balance of payments will tend to fall at a moment when the seasonal pressure on sterling gathers weight. But if much of the recent selling of sterling is no more than an emotional reaction to the expected effects of the strikes the rebuilding of sterling balances later in the year may provide a useful cushion to the normal commercial demand for dollars at that time. So far as the market can tell the intervention of the authorities in the exchange market appears to have been negligible in the past week—a fact which lends a somewhat more reassuring aspect to the actual adverse movement in the rate.

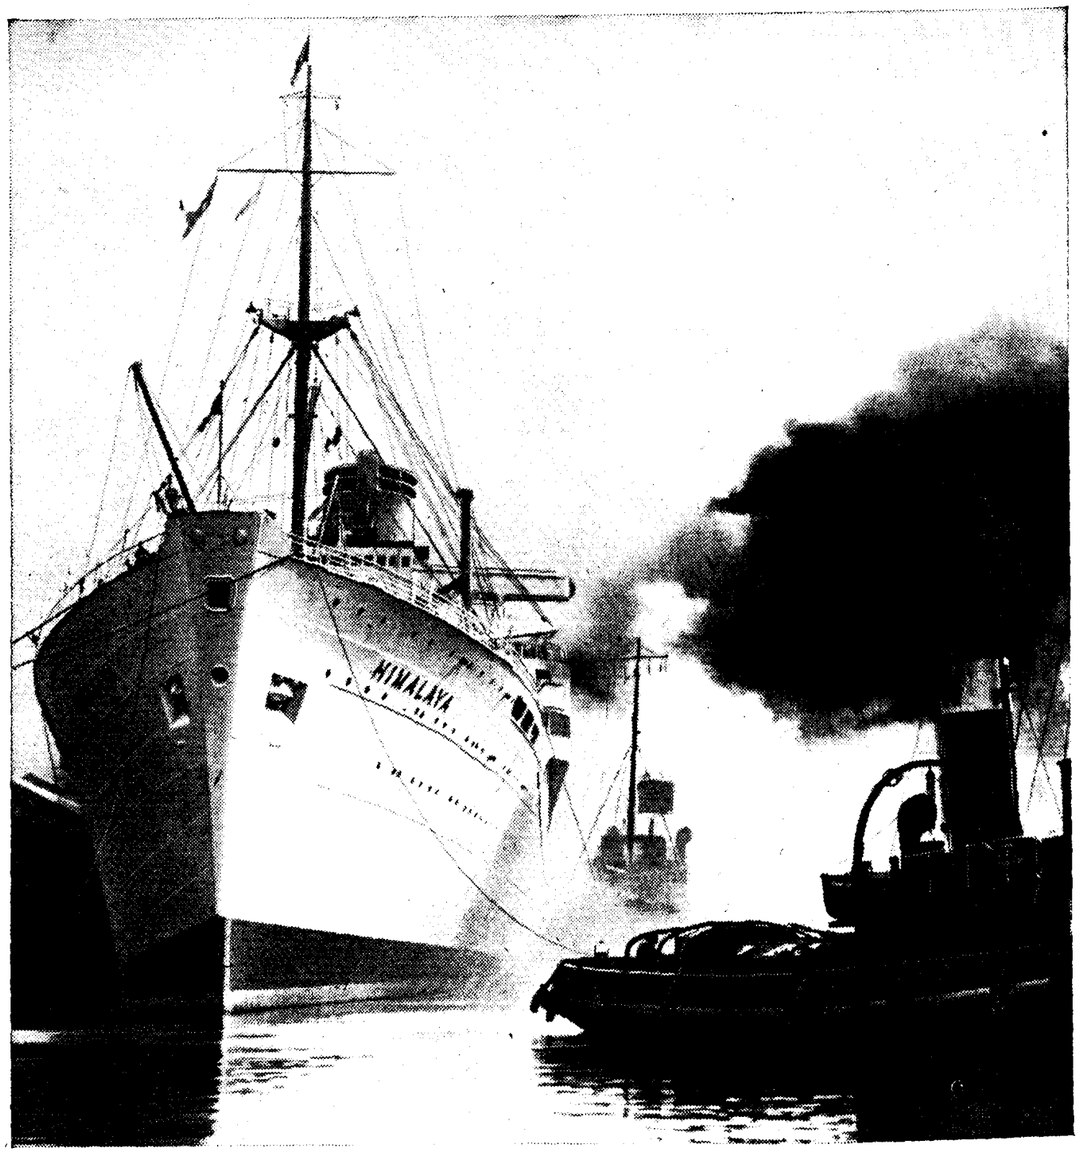
In the forward market the premium on three month dollars has remained steady at 1⅛-1¼ cents. There seems to be little evidence of a fresh influx of short term money from overseas. Such inflow of foreign capital as has come to London recently has been through the purchase of sterling securities mainly by American investors. This has affected the rate of security sterling which since the beginning of this month has moved from $2.77 to $2.78. But security sterling, helped by this unexpectedly large and persistent foreign demand for British equities, has climbed above the rate for transferable sterling. This rate has been fairly steady recently at about $2.77⅛. The market in transferable sterling has not recently required official support. Now that transferable sterling is the cheapest available way of converting dollars into sterling a fairly persistent demand for this type of sterling is reported on Middle East account. This has fully kept up with the supply of such sterling offered in the usual markets mainly in Zurich. There have even been some reports that the Exchange Equalisation Account has on occasion been a seller of transferable sterling against US dollars.

Starch
does surprising things

IN SUCH SURPRISING PLACES

Example:

STARCH IN SUGAR CONFECTIONERY



Every day, millions of young hearts are rejoiced by the sight of gay glass jars in sweet-shop windows, full of brightly-coloured 'cushions' of flavoured sugar, clear and translucent as the jars that display them.

But boiled sweets did not always shine so bright. Once (long ago, it is true) the sugar confectioners were vexed by the crystallising of the sugar in their sweets, which dulled their surfaces and spoiled their translucency. The first attempt to cure the trouble was by adding cream of tartar and so 'inverting' enough of the sugar to prevent crystallisation. That did stop the crystallising to some extent, but invert sugar is hygroscopic—it absorbs moisture from the air, and makes sweets that contain it damp and sticky. Surprisingly enough, the answer to the problem came from starch: glucose, made from starch, proved to be the ideal crystal inhibitor. Itself an energy-providing food, glucose affords a colloidal medium in which sugar crystals cannot form. Its use for this purpose in sugar confectionery is now the largest single use of glucose.

Corn Products Company Limited, the Industrial Division of Brown and Polson, produce 200,000 tons of starch products a year: more than 400 different products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learnt a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?
When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

CORN PRODUCTS COMPANY LIMITED
THE INDUSTRIAL DIVISION OF
Brown & Polson

BP SERVES THE SHIPS

AT MORE THAN 160 ports along the trade routes of the world the BP International Oil Bunkering Service provides oil power for ships; for tankers and tugs, cargo ships and passenger liners.

At Aden alone, where BP plays a major part in the fuelling of ships, over 4,500 calls are made each year.

BP products are a power behind transport on land, at sea and in the air.

The BP Shield is the symbol of the world-wide organisation of

The British Petroleum Company Limited

whose products include BP Super Motor Spirit *and* BP Special Energol 'Visco-static' Motor Oil

Money Tactics Now

THE Chancellor, in his speech during last week's debate on the Address, left no doubt of his conviction that the strikes have made it more than ever important to maintain the money squeeze and ensure that it is fully effective. There seems no reason to suppose, however, that he was already contemplating some reinforcement of this policy—although an impression to that effect did take shape briefly in consequence of his rather ambiguous references to "various other credit measures." Mr Butler had previously been speaking of the restrictions upon hire purchase, and was not prepared to give a definite estimate of their effect up to date. But he considered that, between the extremes of furniture (which has been hit "quite severely") and motor cars (sales of which are still rising rapidly) there was "considerable evidence that the upward movement . . . is being checked." The recent rumours of an impending tightening up of these restrictions were evidently ill-founded.

Although no change in present policy is envisaged, the Chancellor seems to be expecting that at least the orthodox parts of his "measures of February 24" may in the coming months exert a more evident effect upon the economy than has been discernible so far. He remarked that, "as this policy was intended to be severe, its severity is likely to be felt in the country in certain industries." Inevitably, in view of the continuing strong rise in bank advances, he confessed himself as not "yet" satisfied with their trend. He evidently accepts the explanation of the banks that the expansion that has taken place since February springs to a large extent from the utilisation of credit lines sanctioned before that date—while the total volume of advances has been swollen by the fact that new demands have not been accompanied by the customary flow of repayments, in consequence of the inactivity of the long-term capital market.

The bankers, for their part, seem during this period to have been following a somewhat stiffer policy in granting new limits, and are now facing the need to apply this stiffening more generally, because the scope for defending their liquidity ratios by sales of gilt-edged—upon which they have mainly relied in these past three months—is now much diminished. For both these reasons it seems possible that the curve of bank advances may soon show signs of flattening. But the process of extending the squeeze is causing a good deal of worry. The larger borrowers, who seem to have been those most affected so far, can without undue difficulty usually be made to understand the nature of the pressures upon the banks, but in present conditions of prevailing optimism and very full employment it is hard to make the smaller borrowers equally aware of the need for restraint.

Puzzle of High Exports

THE trend of British exports this year is both heartening and puzzling. A sharp recovery in the first quarter's rate was to be expected as shipments held up by the dock strike of last October were despatched in the New Year. It was also expected that exports in the last two months would not compare with the inflated rate of the first quarter. Yet in April and May, both short working months, the average rate was as high as in the first quarter. At some point in the last five months exports have first recovered lost ground and then surged ahead again. The change-round can be illustrated, if not pin-pointed, by comparing the average value with that of the same period a year ago (changes in export prices have not been significant):

UK EXPORTS

	Monthly Average £ million	% Change over 12 months
1954 1st quarter....	224·5	+ 7½
„ 2nd „	223·9	+ 6½
„ 3rd „	221·1	+ 4½
„ 4th „	222·0	− 3½
1955 1st „	247·3	+10
„ April/May	247·1	+ 9

The high rate of exports in the last two months can hardly have been a flash in the pan; the detailed figures for May show that, as in the first quarter, it was broadly based among engineering products, metals and chemicals. Shipments of engineering products, at £98.5 million a month in April and May, were £10½ million higher than in the same period of last year and £4½ million higher than in the first quarter of this year. Shipments of metals, at £33.5 million a month, were £4½ million higher than in the same period of last year and almost as high as in the first quarter, while shipments of chemicals, at £20 million a month, were £3 million higher than a year ago and as high as in the first quarter. It is the more unfortunate—and tantalising—that the trend during the next few months will be obscured by the effects of the recent rail and dock strikes.

The detailed trade figures also suggest that monetary policy can claim some credit for the further fall of £27.7 million to £290.3 million cif in imports last month. The fall in April had been almost wholly in foods and beverages; last month's fall was more widely—though far from evenly—spread. Imports of foods and beverages dropped by over £15 million, thanks to smaller and cheaper arrivals of tea and cocoa, and smaller arrivals of cereals and feeding stuffs and meat. Imports of basic materials dropped by £7 million; wool and timber were up, cotton, jute and rubber were down. Among manufactures, which dropped by £4 million, imports of chemicals rose further, iron and steel showed no change, but imports of non-ferrous base metals fell by £4½ million to £13 million—a decline mainly of volume, not of price. There was no change in the terms of trade last month, the index remaining at 102 (1954=100).

Atomic Interchange

THE Anglo-American agreements on the exchange of civil and military information have had a cool reception in this country, but in fairness to the American negotiators they appear to have gone as far as the amended MacMahon Act permits. The civil agreement, for example, makes it possible for the Americans to exchange data about reactor design that is still classified as secret in the United States and

although the Americans are probably behind Britain in practical atomic power development, they have considerable experience of designing and operating several basic types of reactor. Provision has been made for the transfer of materials and equipment between the two countries and the way has also been cleared for normal commercial negotiations between British and American manufacturers interested in atomic developments.

The present Act prevents the American authorities from giving either atomic weapons or practical data about them, but under the new military agreement it appears that a good deal of information is likely to be exchanged about their effects, their use and—a point stressed by the Prime Minister—the progress believed to have been made with them in other countries. Agreements of this kind can be made or marred by the manner in which they are interpreted, and in the past the American authorities have shown themselves adroit in stretching the letter of the law to its most liberal limits. The new agreements should therefore not be prejudged; if this same liberal spirit is applied to them, the two countries may gain considerably from closer co-operation. The British, on their side, operate under no such legal restrictions as the Americans and are therefore free to meet whatever the United States may offer at every stage.

When the United Nations conference on civil applications of atomic energy is held in Geneva in six weeks' time, much of the information contained in the Anglo-American agreements is going to be made public in a thousand papers being presented there. This could have a profound effect on American views about atomic security and it is a moot point whether the British negotiators might not have struck a better bargain had they waited until after the Geneva meeting, to conclude this week's agreements.

True Blue Incorruptible

It was perhaps to be expected that the Federation of British Industries might issue some statement defining its own considered views—or lack of views—about the principles involved in restrictive business practices shortly before the first general report of the Monopolies Commission on one of these practices, exclusive dealing, comes to be published (just as it was safe to bet that the Trades Union Congress would not). On the whole, it is useful that the federation has done so, and in advance (it can hardly be accused of prejudging practices it does not know about) Such a judgment must essentially be one of principles. And the federation's judgment—also hardly unexpected—is that it is unwise to generalise about restrictive practices, and that each case must be judged on its merits.

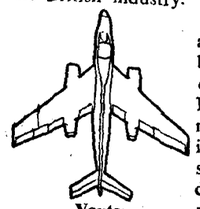
It considers, however, that "serious harm could be done to productive industry, to our national economy and therefore to the public interest if statutory action were to be based on some of the sweeping generalisations that have been made in public utterances in recent months." It has, therefore, appended to its main view a description of some of the restrictive practices concerned—price-fixing and market-sharing agreements, exclusive dealing, and resale price maintenance—and of certain considerations that lead trades and industries to employ them. It holds that:

> These practices need not and should not mean higher average prices in the long run, nor do they as a rule mean restriction of output. The degree to which they can create a closed preserve for those taking part in them is often exaggerated.

The federation admits that "undesirable results may follow in some cases of practices that limit competition: but it is wrong to assume that they necessarily do."

All propositions that begin with the word "Sometimes . . ." are hard to refute, and there is not a lot in the federation's explanations of how some of its members act that need even raise objection. There is, too, some recognition of the reasons for the slow accretion of public prejudice against these practices. What remains depressing is that the main stronghold of private industry in Britain is again declining to deviate, by so much as an inch, towards any prejudice in favour of competition. It is easy to see why. For if it once admitted that competition is, in general, a good thing, it would have to admit that any restriction of competition is, in general, a bad thing. And from there it is only one step to agreeing that the right course is for the law to pronounce a general condemnation of these restrictive practices, and to put upon particular industries the onus of proving their case before they could get exemption for the particular practices that they claim do so much good.

The Monopolies Commission's own first approach to any general restraint of competition is about to be disclosed. But it may be fair in the meantime to remind the federation that competition remains the best political argument, though it is not the only one, for private enterprise against nationalised monopoly.



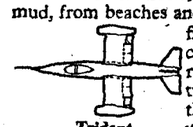
BIS—IMF Chorus

The Bank for International Settlements and the International Monetary Fund at one time seemed to American eyes to be rivals between whom coexistence would be impossible, but the two have long since become peaceable colleagues in roughly the same line of business. If there is one subject on which the voices of Basle and of Washington can be expected to speak in unison it is the march towards currency convertibility. The word "convertibility" hardly appears in the annual report of the BIS, but undoubtedly the spirit of convertibility suffuses the whole report. The past year is described in the BIS report as one of "prosperity and promise." Among its encouraging features three are marked out. They are the rapid recovery of the United States from its recent recession, the uninterrupted expansion in Europe, and the increased reliance on general financial measures to restore and maintain the economic balance. Even on the question of sound domestic policies the report is reasonably reassuring "now that reliance is increasingly being placed on monetary measures instead of on physical controls."

What then checks the further forward movement towards currency freedom? One influence, says the report, is "the false but not infrequently expressed idea that the establishment of genuine markets for foreign exchange is somehow incompatible with a continued expansion of international trade." The other is the human trait of procrastination of which the report says that while "there is no reason to dispute the advisability of proceeding by stages and with due

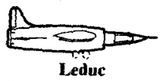
A French Aircraft Lead?

At two o'clock last Saturday afternoon a flying display began at Le Bourget that was to wind up the air show held by the French aircraft industry during the previous week. The flying went on uninterruptedly for more than five hours and when it ended most visitors, however exhausted, felt that the French had conclusively demonstrated their right to be readmitted into the exclusive circle of the world's major aircraft manufacturers. British technical observers were also prepared to concede that in some fields the French had established a lead over the British industry.



Vautour

This unpalatable admission is based on two quite different French achievements. The first is the inventive skill that produced such machines as the rocket-powered *Trident*, which has climbed at supersonic speed, and the ram-jet *Leduc*; the other the marked French success with two such conventionally designed aircraft as the *Mystère* fighter series and the *Vautour* bomber. The French claim to technical superiority is based on a narrow range of aircraft—the industry has made no attempt to develop heavy bombers and has not made much mark in the design of big transports—but its greatest successes have been scored during a period when the British aircraft industry has been having some difficulties with much the same type of aircraft.



The French aircraft industry is part nationalised, part privately owned. It employs only 60,000 people, less than a third as many as in Britain. The leading manufacturer to emerge since the war is without question Marcel Dassault. In the two latest versions of the *Mystère* series, whose main features are listed in the table below, Dassault has achieved supersonic speed in level flight with engines of lower power and less complex design than either British or American designers. How this has been done is difficult to see—the *Mystère* is essentially a conventionally built aircraft—but it has been evolved from a long series, and developed step by step rather than springing straight from the drawing board.

Neither British nor even American designers have anything to show like the rocket-powered *Trident* nor the *Leduc* aircraft, both flown for the first time in public last week. The *Leduc* represents something approaching engineering genius. A ram-jet has no moving parts, it is a pipe into which fuel is steadily pumped and ignited while the air is rammed into it by the sheer speed of the aircraft. It is a diabolically dangerous device, but the ram-jet or the rocket are the only possible motors for flight at twice the speed of sound: which means the next generation of interceptors, manned on unmanned.

Some of the other French achievements are dictated by the country's special tactical requirements. The age-old fear of invasion has evolved into a deep—and probably sensible—suspicion of too great reliance on Nato's elaborate network of runways which would be the first and most vulnerable targets in wartime. The *Baroudeur* fighter has been launched off its trolley from a foot of wet mud, from beaches and from bumpy airfields. Few air commanders would relish a squadron of two-piece fighters that left their undercarriages behind them, but they might when the time came prefer them to no fighters at all. The same logic is behind the French pressure to develop light tactical fighters, which started some time before Nato became interested in them—these aircraft have not yet flown.

Trident

It may be pertinent to speculate on how much the spurt that has been made in the French factories during the past two or three years has been affected by the manufacturers' relations with the government. The French air force budget, which finances research and development in the way that the Ministry of Supply does here, has become far more stable than it was. Orders are no longer cancelled arbitrarily and it is probable that the industry was greatly encouraged when an off-shore order was placed for *Mystère IV*'s just as it has been disappointed by the even larger off-shore orders placed for Hawker Hunters.

Leduc

But the French industry receives an added stimulus. Development contracts placed by the French air ministry contain penalty clauses for failure to deliver on time and to specification and also allow a bonus for manufacturers who beat their dates. This recoups the cost of the overtime that may be needed to meet delivery dates. The industry may be predisposed to rush a prototype into the air before it is really completed, in order to qualify for this bonus, but that is a tendency that can be watched. The other danger is the designers' tendency to lose interest in existing projects once a new idea is born. In the past this has dissipated the industry's resources and justified the taunt that the French industry was an incorrigible producer of prototypes.

Mystère

One or two instances have suggested that the French are not keen on the idea of technical collaboration with, for example, British manufacturers. But there may be much to be gained from closer discussion about design requirements between Nato countries than seems to exist at present. Neither British nor American designers can assume any longer that the balance of air leadership, so far as it rests on aircraft performance, lies in their two countries only.

LEADING FRENCH AIRCRAFT

Type	Aircraft	Performance	Engine	Delivery
Day fighters	Dassault: Mystère IV	Supersonic in dive only	1 Hispano-built Rolls-Royce Tay	15 in service; 350 ordered
	Dassault: Super-Mystère	Supersonic in level flight	1 Hispano-built Verdon (developed R-R Tay)	Late 1956; 200 ordered
Experimental fighters	SNCASE: Baroudeur	Trolly launching permits operation without airfields	1 SNECMA: Atar	5 ordered
	SNCASO: Trident	Supersonic in climb	3 SEPR rockets. 2 Armstrong Siddeley Vipers	Operational fighter prototype 1956
	Leduc: 0.21	Planned for twice speed of sound	1 Leduc Tuyere ram-jet	High-sp'd version end 1955
Light bomber.....	SNCASO: Vautour	Supersonic in dive with bomb doors open	2 SNECMA Atars.	150 ordered; delivery end 1955
Civil transports.....	SNCASE: Caravelle	70 passengers, medium ranges	2 Rolls-Royce Avons	Commercial delivery 1958
	Hurel-Dubois: H.D.32	44 passengers, short to medium range. Undeveloped airfields	2 Pratt and Whitney or 2 Wright piston engines	Commercial delivery 1956; tooling for 150.

SNCASE = Société Nationale de Constructions Aéronautiques du Sud-Est. SNCASO = Sud-Ouest. SNECMA = Société Française d'Etudes et de Construction de Moteurs d'Aviation. SEPR = pour la Propulsion à Reaction.

safeguards . . . there may be an even greater risk in failing to take advantage of the opportunities that present themselves and . . . in postponing decisions especially where a line of action is inevitable in the interest of the country concerned and of other nations as well." In this concluding sentence of its report the BIS clearly wags a finger at Great Britain and sterling.

The International Monetary Fund has no inhibitions about using the word "convertibility." In its latest annual report on Exchange Restrictions it joins the BIS in handing a bouquet to "monetary and fiscal measures as contrasted with restrictions on foreign trade and payments" as being the main ally of the cause of convertibility. In reviewing the progress towards convertibility in the past year it gives pride of place to the extension of the transferability of sterling and to the decision of the British Government to intervene officially in the market for transferable sterling. When that decision was announced it was questioned whether such intervention might not contravene the articles of the IMF agreement. Far from it; "the Fund has welcomed this action of the UK authorities as being in the direction of the Fund's objectives." The IMF report notes the different paths along which countries are progressing towards convertibility—through the removal of discrimination on payments for current transactions, the liberalisation of capital movements, and greater freedom given to non-residents. The report also notes without any indication of preference that some countries are moving towards convertibility on the basis of a single and stable rate of exchange while others have felt the need for more flexibility. It would almost seem from this dispassionate description that the IMF is willing to condone flexibility.

Workers' Shares

A YEAR ago Imperial Chemical Industries blazed a trail. The scheme then announced of setting aside part of the profits for the workers, of investing it in ordinary shares of the company, and handing those shares over to the workers, was not new in its conception of profit-sharing or of encouraging workers to become shareholders: the novelty lay in the generosity and in the absence of transfer restrictions. The idea has since spread and with the blessing of the Chancellor it will doubtless gain more momentum. ICI has also decided to add a little to its original programme. At last week's meeting the Chairman, Dr Alexander Fleck, announced that another advance on the workers' shares front is being considered. The company has already an employees' share investment scheme (apart from the profit-sharing plan). Trustees buy shares for employees at market price plus commission and allow them to pay in full in instalments over two years by deduction from their pay packets. It is now proposed that they should be able to buy limited amounts of ordinary and preference capital at a small discount below market prices. This clearly implies that newly issued shares instead of existing shares bought through the market are to be used.

Capital as well as labour got its item of good news. Dr Fleck confirmed that ICI is to join the select few British companies making half yearly reports. The interim reports will come with the interim dividend announcements in September and as he pointed out they will be unaudited and will not include the net income after tax. Since both the profits tax, and the profit-sharing bonus are geared to the year's total ordinary dividend a net taxed profit figure for the six months would clearly be impossible. Even without it the interim statement should still be a most useful guide for shareholders.

Important changes, like extending employees' investment plans and introducing interim reports, are usually announced when the tide of prosperity is flowing in. Dr Fleck left no doubt that that tide is still flowing in ICI's favour. So far this year the company has experienced a period of great activity. The general level of both home and export sales is well above that of the corresponding period of last year. Many of those sales represent the products of new plants only recently completed and competition — particularly overseas—is strong. But Dr Fleck hopes that the company will not be forced by higher costs to raise its prices. It has been successful in keeping them relatively low so far, and is trying to keep the third partner in industry—the customer—in the picture.

Mr Wolfson Bids Again

HIRE purchase restrictions may come and go but Mr Isaac Wolfson goes on adding to his empire of multiple furnishing and drapery stores. His most recent bid is for the ordinary capital of Waring and Gillow. His offer is 40s. in cash for every 12s. ordinary stock unit plus two "A" ordinary stock units of Great Universal Stores for every three ordinary stock units of Waring and Gillow (which has an issued capital of £338,643). The directors of that company point out that on the basis of prices ruling at the time of the offer the bid is equivalent to 75s. per 12s. unit. When the offer was made the Waring and Gillow ordinary stock units had a market price of 62s. 3d.; since then they have jumped to 71s. 6d. The directors are considering the offer and have advised stockholders not at present to sell.

Waring and Gillow would fit comfortably into the GUS empire. Not only has it a long established business in furniture, upholstery and interior decoration, with factories and showrooms in London, Liverpool, Manchester and Lancaster, but also it has some minor interests in other household goods and in drapery. It has itself been adding to its subsidiaries and it has been fully alive to the possibilities of deals in property, recently separating its property owning business from its trading activities.

Mines and Men

THE mining finance houses have been in the news this week. Three of them—Anglo American Corporation of South Africa, Central Mining and Investment Corporation, and Selection Trust—have all produced their chairmen's statements. In addition, the Anglo American group has announced the formation of a new development corporation. Anglo American Rhodesian Corporation, with

Now! Luxury Air Service
TO KARACHI
via Cairo in 16* HRS

P.I.A. Super Constellations
Fly Fastest to the East

At last! Pakistan International Airlines have extended their domestic routes serving West and East Pakistan, India and Burma. Now you can fly to Karachi via Cairo in 15.50 hours air time*—fastest ever—*and* enjoy a trans-Atlantic standard of luxury aloft. P.I.A. Super Constellations leave London every Friday and Karachi every Tuesday. Ask your travel agent. First Class and Tourist accommodation with Bar Service available. The First Class section is fitted with special de luxe "Siesta-seats" to ensure perfect comfort during the day *and* night.

CAPTAIN N. HEMSWORTH
It's comforting to know that the man 'up front' is a man like Captain N. Hemsworth. Australian by birth, he brings to P.I.A's crack international air service a brilliant war record and experience of three airlines.

Riley

PATHFINDER

The most exhilarating, most satisfying motoring you have ever known awaits you at the wheel of the Riley Pathfinder. From the first sight of this fine car you will thrill to its clean aerodynamic lines and low build, which combined with the unique Riley suspension gives a sureness in roadholding and cornering that is outstanding even by Riley standards. The Pathfinder is not only 'the best Riley yet' but also the most spacious and luxurious. It carries six people in deep-seated comfort. Real hide upholstery is standard. So is a very wide range of auxiliary equipment to make your motoring safer and much more enjoyable. This is a car you must inspect for yourself. Your Riley dealer will gladly give you the opportunity.

Price: £875. 0. 0d. *plus £365.14.2 P.T.*
The Riley Pathfinder is fitted with Safety Glass all round.

Service in Europe — Riley owners planning a Continental Tour are invited to see their Riley Dealer for details of a free service to save foreign currency.

BMC

REMEMBER — Quality and dependability are guaranteed by the B.M.C. Used-Car Warranty and you are certain of a good deal when you sell.

Pattern for progress

Here, at Kemsley Mills—alongside the famous No. 5 machine, largest in the world—Bowaters are installing a huge new paper-making machine. It is as long as an aircraft hangar, a factory in its own right.
Its cost: over one million pounds. Yet, under the Bowater international development programme, **five more such machines are to be installed**—two at Thames Mills, two at Mersey Mills, the other at Bowaters' Tennessee Mills, expanding even now, so soon after their acclamation last year as the greatest Anglo-American industrial venture since the war. Together these machines will produce some 370,000 tons of paper a year—a noticeable proportion of the entire world supply. They are the very heart of a master plan of expansion that includes *new power stations and pulp mills, new factories for the manufacture of building board, corrugated containers and high-grade tissues.* One of the great industrial enterprises of the century is under way.

Bowaters

THE BOWATER PAPER CORPORATION LIMITED

Great Britain United States of America Canada Australia South Africa Republic of Ireland Norway Sweden

an authorised capital of £2 million, of which Anglo American Corporation of South Africa and Rhodesian Anglo American will initially subscribe £500,000, is to canalise part of the earnings from the Northern Rhodesian copper mines into developing the natural resources of the Federation and assisting private undertakings and public works. Yet in spite of this implied warning of a possible shortage of finance, all the mining finance chairmen who have addressed their shareholders in the past week have put financial problems into the background.

Indeed Sir Ernest Oppenheimer, the chairman of Anglo American, has confirmed that the back of the problem of financing the new mines is broken. "The great effort of the last few years," he said, "has resulted in our bringing to production in the Orange Free State those mines for which we are responsible. We have also broken the back of financing the new mines in the Klerksdorp area. . . . All the finance required for the great Bancroft Mine in Northern Rhodesia has been secured. . . . Our financial requirements for the time being are of a routine nature and magnitude. We have, moreover, considerable reserves available for any new and profitable business that may arise." Neither Lord Baillieu, chairman of Central Mining, nor even Mr A. Chester Beatty, chairman of Selection Trust, spoke quite like that. But Lord Baillieu reports "a position of considerable strength", and Mr A. Chester Beatty reveals a most useful nest egg in the Selection Trust balance sheet. Quoted investments standing in the balance sheet of March 31st at £3,986,396 had a market value of £21,559,349. A year earlier quoted investments standing at £2,684,535 had a market value of £10,346,387. The change springs from the rise in American Metal common stock. Moreover, the unquoted investments standing at £658,284 include an investment in Tsumeb Corporation valued at £3 million. It is small wonder that Mr Chester Beatty has announced a one-for-twenty free scrip issue and that on the increased capital he expects next year's dividend to be not less than last year's.

On one other point two of the mining finance chairmen speak with the same voice. If the financial problem is on the way to solution, the human problem is not. Mr Chester Beatty does not discuss it; but Lord Baillieu reports a sharp improvement in native labour supplies not matched by a proportionate increase in the white labour force. Sir Ernest Oppenheimer in one of his most thoughtful speeches points out that human problems will absorb the Anglo American group's greatest efforts, that with the white people of the South Africa and the Rhodesias enjoying full employment there are grave shortages of qualified men at all levels. These shortages should be met from outside Africa. The corporation has indeed appointed a recruiting officer in England and is offering free university training. But South Africa is too small a country to afford a continuing series of constitutional crises that must diminish the confidence of the western world.

New Look at Synthetic Rubber

UNTIL recently synthetic rubber appeared to most British rubber manufacturers as an interesting substitute for the natural article, rather than as a full-blooded competitor. There were several reasons for that attitude. Synthetic rubber is not yet made in this country in commercial quantities; the industry has traditionally looked to natural rubber—and the Commonwealth—for its supplies; and there was no compelling need to undertake the laborious technical work of proving suitable synthetic compounds. There are signs that this attitude is changing. There is now a wider appreciation both of the technical acceptability for certain purposes of synthetic rubber (the quality of which has been improved) and of the possibility that supplies of natural rubber will be tight in the next few years. Natural rubber might therefore remain much dearer than synthetic, and British manufacturers would be at a disadvantage in export markets where they are directly competing with the United States. At present prices for forward shipments, natural rubber is now about 31d. a lb, almost one-third dearer than Canadian GR-S synthetic rubber at 22½d. a lb cif UK.

The change in the industry's view is reflected in its provisional estimate of its requirements of GR-S in 1956; this is for 26,000 tons, twice as much as its final estimate for 1955. Most of that rubber would be used for the manufacture of tyre covers, but this would still fill only a small part of a total rubber consumption for this purpose of about 120,000 tons a year. It cannot be assumed that licences will be granted for the industry's full requirements next year; so far, however, the effective limit has been its readiness to use GR-S and the availability of supplies. This year the final estimate was raised to 13,000 tons; that amount may not in fact be imported, because the additional quantity was requested when North American supplies were almost sold out. Normally the industry buys its butyl and GR-S synthetic rubber wholly from Canada, partly because imports from that country are duty free. But this year, as last, the Canadian Polymer Corporation could not supply enough, and the balance has had to be bought in the United States.

This is why the industry applied for, and was granted this month, the temporary suspension of the import duty of 10 per cent on American butyl and why it is now seeking suspension of the duty at the same rate on American GR-S. Demand for butyl, which is used mainly for inner tubes, is now falling owing to the introduction of the tubeless tyre, and if Canadian supplies are sufficient next year the duty will presumably be reimposed. But the industry may still have to buy a portion of its requirements of GR-S in America, and may therefore obtain suspension of that duty. As the chairman of the Dunlop Rubber Company has made clear, the industry will have to rely on North American supplies of synthetic rubber for some time to come.

Refuge Assurance Introduction

THE arrival in the market of the shares of a big insurance company, not hitherto quoted is a rarity. There will be much interest in the £1 "A" Ordinary and 10s. "B" Ordinary shares of Refuge Assurance Company when dealings start in about a week's time. Even at this late stage, though particulars of the company are already public property, details of the arrangements for the introduction have not been settled. Application has been made to the Stock Exchange Council for permission to deal in the whole of the company's capital consisting of 300,000 "A" ordinary

shares of £1 each and 600,000 "B" ordinary shares of 10s. each. The two classes rank pari passu except that the "B" capital is in ordinary circumstances non-voting. But neither the number of shares to be made available to the market, nor the likely opening price has yet been settled.

Investors must make up their minds on the basis of the published particulars. Refuge is a big and powerful company with net assets of £124.4 million. It is deeply entrenched in both ordinary and industrial life assurance and since 1953 has been concerned with general insurance (other than marine and aviation) through its subsidiary Federated Employers' Insurance Association, the whole of whose capital is held as an investment by the ordinary life branch of the Refuge. The shareholders' share of profits (and the policyholders' share too) rose in 1953 and 1954 owing to a reversal of the ultra-cautious policy that had to be adopted when markets fell in 1951. Total shareholders' profits of £323,411 in 1953 and £334,973 in 1954 are not expected to be repeated in the foreseeable future. Nevertheless the directors expect this year to be able to distribute to shareholders £188,000 net—that is a dividend of 54.49 per cent.

Refuge shares will therefore be "heavy." How heavy depends on the kind of market that develops. Dealers naturally hope that the family interests that hold the shares tightly will see the wisdom of releasing enough of both classes not only to start a market but to keep it alive. Nevertheless there is always likely to be less market in Refuge than in the other giants of the insurance world and for that reason investors may demand a slightly higher yield. While Prudential "A" yields a fraction under 4 per cent it would be reasonable to expect Refuge to yield a fraction over 4 per cent. That may price the "A" shares roughly in the region of £13 and the "B" in the region of £6 10s.

Transfer Machines

At last week's highly successful conference on automation organised by the Institution of Production Engineers at Margate, the only paper concerned directly with automatic transfer machines—machine tools that carry out a series of different operations upon a workpiece, passing it from one cutting head to the next—was given by M. Bezier, of the French motor company Rénault. Some comment was aroused by this, coupled with the fact that no representative of a British machine tool company gave a paper to the conference. The lack of a machine tool company's paper—two papers were given by research engineers on computer control of machine tools, but both were from the instrumentation side—seems to have been an inevitable accident of completing arrangements early. But the choice of a representative of Rénault to speak about transfer machines was entirely fitting. Generalisations about highly complex factories are extremely difficult to make, but the visitor's impression of Rénault's motor plant at Billaincourt on the Seine is that in certain machining operations at least this nationalised French company operates longer and more elaborate sequences of these transfer machines than most of the big British plants. It is, too, a pioneer in design, having been responsible for planning most of its machines itself from the basic machining units, which are generally interchangeable.

Nearly all British mass production motor plants employ transfer machines, and British machine tool companies are able to supply them. James Archdale of Birmingham indeed is a pioneer in their construction and design and Asquiths make them to their own design; other companies that build, wholly or using some imported units, include BSA, Sentinel, and Pollards. The demand for machines of this type is obviously limited—orders may arrive several years apart, except in a period of general expansion of the large motor companies such as has now begun—and every customer has his own special needs. The field in which the machine tool expert can contribute most is in the design of interchangeable unit heads, as Archdale's have done; it is perhaps fair to suggest that the British machine tool industry as a whole might benefit from closer co-operation on research and design with the makers of control systems and instruments.

The Fewer the Higher

The current run of rates in the tramp shipping market suggests that the fewer fixtures that are arranged on the Baltic Exchange the higher freight rates seem to go. Freight rates are not rocketing as much as Stock Exchange prices, but despite the onset of the normal summer doldrums period, and the fact that there is no sign of charterers falling over each other in any scramble for tonnage, they are creeping steadily higher. The Chamber of Shipping voyage freight rate index for May worked out at 122.6 compared with 110.2 for April. Comparable figures for last year were 77.4 and 75.8 respectively (1952 = 100), since when the index has shown an almost uninterrupted rise. This rise has been maintained despite a substantial increase in the volume of tonnage in supply.

Demand for increased shipments of coal and scrap across the Atlantic seem to have been mainly responsible. Fixtures of tonnage for these commodities have at least doubled this year, compared with the same period of last year. Meanwhile, trading in other commodities has been on much the same level, apart from a slight lapse in lumber chartering, although this has been done at much improved rates. In the time charter market, too, demand for extra ships by the liner companies has been heavy, although this has subsided somewhat in view of the falling off of shipments because of British strikes. The high demand for Transatlantic coal tonnage will be well maintained throughout the year; the demand for scrap is equally expected to continue at a high rate, although there may be a temporary quiescence. Meanwhile the demands of the Transatlantic market, at enhanced rates, have denuded other more distant markets of tonnage, so that if grain shipments are to be resumed, as forecast, at a rather higher level than last year, substantially higher freights may be needed to attract timely tonnage. Already there are reports of tankers being used for grain cargoes. More significant, however, is the considerable number of tankers now being converted into ore carriers, with a view to taking advantage of the marked increase in movement of ore that is confidently forecast for the next few years. The freight market position is, in fact, at a critical stage, and could burst into a boom before the autumn has become winter.

WORKERS IN THE TEAM *Number 10 in a series*

ANALYTICAL CHEMISTRY is Donald Brereton's job. Every material used in building and civil engineering—from cement and aggregates for concrete to tiles and paint—comes to the laboratories where he works for exact assessment of its properties. He visits sites to help solve problems and improve results, and takes part in research on new materials and techniques. His life is busy and varied, and he knows that his work is constructive.

The section of which Donald is a junior member is part of an organization within the company which is actively applying science to the selection, development and use of materials and plant. Already it has made outstanding contributions to economy, speed and quality in construction; its usefulness grows with each advance of knowledge systematically recorded. It works as part of the team whose activities at home and overseas are based on accurate study of requirements and methods.

Preserving our National Heritage

The rapid expansion of industry has left very few British streams and rivers unspoiled by obnoxious waste products.

In many cases however, the polluting effect of industrial waste on these natural waters can be reduced or even eliminated by pre-treatment with Spence Aluminoferric.

Details may be obtained on request.

ACCOUNTANTS WANTED

for the ARMY EMERGENCY RESERVE

to spend

FIFTEEN DAYS IN CAMP

earning full pay and allowances plus a total of

£9

IN TAX FREE BOUNTY & EFFICIENCY GRANT

You can spend fifteen days with your friends, earning full Regular Army pay and allowances. As a member of the Army Emergency Reserve (Cat. IIA) *you have no other duties during the year.* If a grave national emergency should arise, you may be called up for service in the United Kingdom. *You can be called out for overseas service only by Proclamation.* Volunteers are accepted from 18 years of age and engagement is for two, three, or four years. If you have served before in a non-commissioned rank there is every possibility of your filling an existing vacancy or of being promoted as soon as a vacancy occurs.

Lend your skill to Britain, doing the job you know best

Send this coupon now for details of how to join to:

Making Television Tubes

THE growth of television set sales has brought problems for the makers of cathode ray tubes. The glass industry's traditional hand methods are not suited for production counted in millions; output is at present running at 1¼-1½ million sets a year, and the high rejection rate that appears characteristic of tube manufacture means a very much higher output of glass sections. But glass of the right properties does not come easily from automatic methods, and changing screen sizes have prevented standardisation.

Nearly 80 per cent of the glass components for British tubes are now made by Pilkington Brothers and their subsidiary Chance Brothers. The rest are made by Webb Crystal Glass and by the three main tube makers, Mullard, EMI, and Edison, which make some glass parts themselves. Pilkington entered the cathode ray tube business in 1948 at the request of the Ministry of Supply. Until then most British tubes were hand blown or hand pressed, and a large number of components had to be imported.

Pilkington began manufacture on a commercial scale in 1949, making 9 in. lead glass tubes from a small pot furnace. But neither lead glass nor boro-silicate glass are suitable for continuous automatic production; it was another year before the right "frit," or mix, was found (sand, soda, potash and barium carbonate, with a little nickel and cobalt to give the glass its grey tint) and a continuous tank furnace was developed. A second such furnace has now been built, feeding molten glass into a battery of automatic pressing and spinning machines. These machines are of American design. The remarkable spinning machine, operated under licence from Corning Glass, is used to make tube cones larger than 17 in.

With four shifts in a 168-hour week, the new plant, costing nearly £1 million, can produce at least 2 million units (screens plus cones) a year, which will enable its five-year-old neighbour to be cooled and reconstructed. Pilkington supplies these components at about 5 per cent of the final tube price (including purchase tax); but the tube maker has first to seal the two parts and the tube neck, treat the inner surface, insert the anode button and the "gun," and exhaust the finished tube. The supply and manufacture of cathode tubes is now the subject of a reference to the Monopolies Commission.

SHORTER NOTES

The World Bank has sanctioned three important loans in the past fortnight—of $15.9 million to Colombia for 25 years at 4¾ per cent; $13.8 million to Pakistan, for 15 years at 4⅝ per cent; and $10 million to Austria, for 25 years at 4¾ per cent. The Pakistani loan is of special interest as £735,000 (just over $2 million) is being subscribed by six eastern exchange banks, without the World Bank's guarantee; and the whole of the loan is expected to be drawn in European currencies, chiefly sterling and deutschemarks. The greater part of the loan to Austria is expected to be made in European currencies. Both loans are to be used for the development of electric power, that to Pakistan for the construction of a thermal power station and the Austrian loan for a hydroelectric scheme. The loan to Colombia has been made to finance the extension of the Magdalena Valley Railroad, which is being built with the aid of a previous loan from the World Bank.

★

The Associated British Picture Corporation, having reported an advance in trading profits from £2,213,312 to £2,988,093 in the year to March 31st last, has raised its ordinary dividend from 20 to 30 per cent. Net profits have almost doubled, rising from £555,629 to £1,011,013.

★

Mr. J. A. Rank has announced that some two years ago he transferred his voting control in the Odeon Theatres group, through the intermediary of Odeon Cinema Holdings, Ltd. and certain private companies, to a company limited by guarantee without share capital, of which the directors are Mrs. Rank, Lord Mackintosh, Mr. John Davis, Mr. Rank, and "his professional advisers." He transferred the accompanying rights to dividends from the group to trustees—the same persons—to apply the proceeds for charitable purposes. Negotiations have recently been reported in which the American film company, Twentieth Century Fox, was considering the purchase of control of a South African cinema company that owns half the equity capital of Odeon Cinema Holdings, Ltd. Mr Rank formerly had a casting vote in Odeon Cinema Holdings; this is presumably the voting control that he now describes as "firmly established in British hands for the future."

★

Ryders Discount Company is the first of the discount houses to present annual accounts spanning both increases in Bank rate but not the reduction of May, 1954, and also covering the phase of major pressure on the short bond market. The accounts to May 31st, Ryders' first as a public company, show that investment depreciation has been provided for without any draft on disclosed reserves. Profits have fallen from £209,558 to £79,801, but the maintained dividend of 7½ per cent—"not less" than this was foreshadowed twelve months ago—is covered with £12,000 to spare.

★

The directors of Thomas De La Rue have raised the ordinary dividend from 20 to 30 per cent. The group earned

"Motor Business"

The current issue of this quarterly research bulletin for the motor and allied industries includes:

The domestic and export markets for commercial vehicles 1955-1960.

A financial and economic study of two major British motor manufacturers.

Second hand price indices of cars and vans.

The U.K.'s leading export markets for parts and accessories.

The Bulletin is fully illustrated by charts.

For full particulars of this service apply to:—

THE ECONOMIST INTELLIGENCE UNIT
22 Ryder Street, St. James's, London, S.W.1
Whitehall 1511. Ext. 47

a profit before tax of £834,526 in the year to April 2nd, compared with a gross profit of £525,658 in 1953-54.

*

The Double Taxation Agreement between Britain and Pakistan has been published as a Schedule to a draft Order in Council.

*

A loan of $4 million repayable in five years has been made by two United States banks, the Bank of America and the Manufacturers' Trust Company, to the Italian corporation Azienda Nazionale Idrogenazione Combustibili to help finance the construction of a plant manufacturing synthetic rubber and nitrogen fertilisers from natural gas available in the Po valley. The loan carries the guarantee of the Banca Nazionale del Lavoro of Rome. It will be used to purchase equipment and technical services from the United States.

*

Anglo-Japanese talks on trade and payments will open in Tokio next week, when the existing arrangements expire.

*

The Board of Trade has relieved importers of the chore of scanning a long list to see what goods can be freely imported from the sterling area. Notice to Importers No. 740 of June 22nd contains a list which now includes only those goods which cannot be imported under open general licence, and also a list showing which goods can be freely obtained from which non-sterling countries.

Company Notes

BRITISH CELANESE. The decline in the profits of *British Celanese* was due to lower sales in export markets and to a "substantial reduction" in margins in those markets. So the chairman, Mr G. H. Whigham, explains in his statement accompanying the full accounts for the year to April 2nd. Home trade was satisfactory and is likely to remain so as long as there is full employment. But Mr Whigham can see no signs of "immediate improvement" in overseas markets. The more expensive acetate rayons in which British Celanese specialises seem to be meeting more resistance in foreign markets than viscose rayon in the production of which Courtaulds, which secured an increase in exports in the year to March 31st, has such a large share.

What policy is British Celanese adopting to combat the decline in export sales? First, *the company* is looking more to local manufacture overseas. Last year, for instance, it acquired the control of a large knitting plant in South Africa and it also purchased a warp-knitting plant in New Zealand. Secondly the company is marketing new fabrics. The first samples of the new yarn "Tricel," which is a tri-acetate more versatile than the traditional "Celanese," were sent out in the 1954-55 financial year. At first fabrics made from this yarn will be a few pence a yard dearer than "Celanese" but when manufactured in bulk "it will be very little different in price and in any case will be substantially cheaper than any of the so-called miracle fibres." Given that price advantage it could compete with the new synthetics. British Celanese will be in that field too, for next month it will market "Cellon," a nylon-six polymer. The company is also building a plant capable of producing about one third of the present domestic consumption of vinyl acetate, a chemical, Mr Whigham claims, of "growing importance for the paint, adhesives and plastics industries."

*

WIGGINS TEAPE. Boom is written in large letters across the 1954 accounts of Wiggins Teape, as it is across the reports of the other paper-making companies. Last year its profits (which included eleven months' profits earned by the newly acquired subsidiary, Thomas Owen) were £5,675,404, compared with £3,873,485 in 1953. Allowing for the 66⅔ free scrip issue the ordinary dividend has been raised from 10½ to 17½ per cent. The boom still goes on. The mills are working the maximum amount of overtime wherever possible and so far this year profits show a "considerable increase" over the 1953 figures; that is due to improved results at the mills of Thomas Owen, to the increase in output at the Bridgend mill, and to a further expansion in the group's merchanting business.

Like the other paper makers Wiggins Teape has been adding to its productive capacity—as the acquisition of Thomas Owen, whose assets are consolidated into the latest balance sheet, shows. But demand still outruns capacity and, again like its fellows in the trade, the company intends to add still more to its productive capacity. New machines are being installed and the company intends to build a new pulp mill. It will use primarily home-grown hard woods to make *bleached pulp*. New capital will be needed to finance these ventures. The directors therefore propose that the authorised ordinary capital should be increased by 1,000,000 shares. They intend

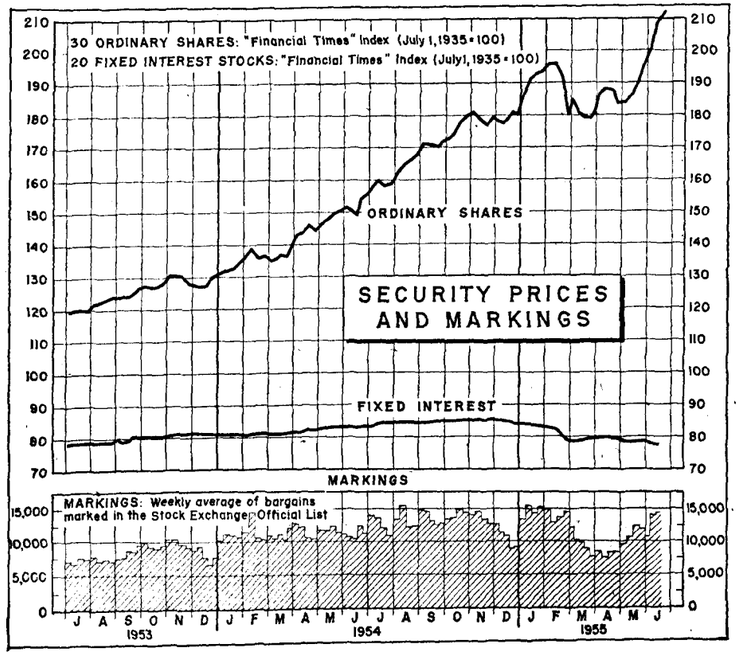
in due course to make a "rights" issue to ordinary stockholders. As the current price of the existing shares is 76s. 3d. xd., the directors have room to offer the shares on advantageous terms.

*

LAND SECURITIES INVESTMENT TRUST. Since the beginning of May when Mr Harold Samuel announced the details of the reconstruction of Land Securities Investment Trust, the property-owning company, the price of the 10s. ordinary shares has climbed from 73s. 9d. to 102s. 6d. The complete absorption of another property company—Ravensfield Investment Trust—was the prelude to the reconstruction and was one of the reasons for the jump in the price of the shares.

Even allowing for the general rise in stock markets it is clear that the speculative possibilities of Land Securities Investment Trust in its new form have caught some people's attention. Stockholders will receive a true bonus issue of stock, in that every 10s. ordinary share in the present company will be exchanged into one new £1 preference share (with a coupon not below 4½ per cent) and four 10s. ordinary shares in the new company. Moreover, the mortgages on the properties



owned by the company (which are put out at various rates of interest) will be replaced by a 4½ per cent debenture finally redeemable in 2005, but on that debenture a sinking fund (at ½ per cent per annum) begins to operate in 1961. The debenture of £20 million has been placed at par largely with the principal mortgagee, Legal and General Assurance, Norwich Union and the Church Commissioners for England. As the group, including the Ravensfield Investment Trust, has about £15 million outstanding on mortgage a balance of cash will be left for further capital development.

As the existing company will be wound up and as the new company will have to build up its reserves from nothing, the directors will not declare an ordinary dividend in the first year of its existence (ending on March 31, 1956). But, by way of compensation they intend, before the dissolution of the old company, to declare a dividend of 17½ per cent (the same rate as for the year to March 31st last) from the old company's profits. In addition shareholders in the new company will secure the interest on the preference shares. The change in the structures of the company will not alter its policy. It aims to buy freehold properties, to convert and develop them and, then, to let them largely as business premises free from rent control. While the group continues to expand, that policy means that there are always some assets in the course of conversion and usually some unlet. Income tends to expand in fits and starts as reconstructed properties are ready for letting. The consolidated net income in the year to March 31, 1954, for instance, was only £30,429, as there were several properties being converted and several unlet, but in the year to March 31, 1955, the net income was £108,408. But there is no doubt that the secular trend of the income of Land Securities is upwards.

*

METAL BOX. In a booming market this week the £1 ordinary stock units of Metal Box have gone from strength to strength. On the news of increased profits, a higher dividend and a 100 per cent free scrip issue—discussed in these columns last week—the stock units gained 19s. 3d. to 112s. 6d. Since then they have climbed up to 130s. xd (to offer a yield of 3⅛). Net earnings cover the 20 per cent dividend handsomely and the assumption in Throgmorton Street is that they will go on rising, carrying the dividend up with them.

Sir Robert Barlow's statement, accompanying the full accounts, must strengthen that hope. The springboard for the jump in profits was the extension of productive capacity. In the year to March 31st last the gross book value of fixed assets rose from £17,295,537 to £20,285,377. That capacity was fully utilised, as the increase in sales (from £43,580,000 to £52,603,000), the rise in trading profits (from £3,838,243 to £4,893,471) and the increase in stocks (from £11,136,836 to £13,549,562) all bear witness. The growth in physical capacity continues and will soon be given the support of a new issue for cash of ordinary shares to stockholders and employees. Throughout his statement Sir Robert draws attention to new capacity which is either coming into production soon or is now being installed and his references to new developments such as self-service stores or *flat top beer cans*, show plainly that he is sure that Metal Box has an expanding market for its products.

LONDON STOCK EXCHANGE

Next Account begins: July 6th
Next Contango Day: July 6th
Next Settlement Day: June 28th

THE boom in Throgmorton Street gathered pace this week. The old account closed with the *Financial Times* index at 218.1 (compared with 212.6 a week earlier). And on the first day of the new account the index climbed to another peak, 219.8. But on Thursday prices were easier in the industrial market, with the electrical equipment shares showing the biggest declines. Earlier all the leading shares, often helped by American buying, went ahead. ICI and Courtaulds were particularly strong, on American support. Other notable rises took place in Metal Box (on the free scrip and cash issues), in Waring and Gillow (on the offer from GUS) and in Burberry (on take-over possibilities). Bowater Paper, however, reacted on Wednesday on the news of the "rights" issue. Banking and insurance issues were firm, with Guardian and Prudential making strong advances.

The gilt-edged market was completely overshadowed by the boom in equities. Small losses were common. The New Zealand issue of a 4½ per cent stock (1970-73) opened at a premium of ⅛ of a point on the issue price of 97½; on Wednesday it improved to 1⅜ premium.

Oil shares were prominent in the boom in equities, both British Petroleum and Burmahs being bought on American account. Other oil shares turned a little easier. Rubber shares advanced strongly at the end of the account on the higher price for the commodity; they went ahead again when the new account opened, but profit taking was then encountered. Gains were common among tea shares until the new account opened, when the market became rather irregular. Kaffirs were subdued, though Selection Trust made a good advance on the full report and Hartebeest attracted further support. Copper shares made a good advance.

Financial Statistics

EXCHEQUER RETURNS

For the week ended June 18th there was an "above-line" deficit (after allowing for Sinking Funds) of £11,589,000 compared with a deficit of £34,864,000 in the previous week and a deficit of £21,472,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £29,955,000 bringing the total cumulative deficit to £226,223,000 (£191,438,000 in 1954-55).

THE MONEY MARKET

CREDIT conditions in Lombard Street in the past week have been less stringent than at any time since the tightening of official policy in February last. This reflects no modification in that policy; the greater ease was attributable mainly to the reflux to the banks of currency on the termination of the rail strike, and in part also to considerable official disbursements. At the week-end credit was in plentiful supply, and overnight loans were offered by outside banks at down to 2 per cent. Dealings in early September maturities took place at $3\frac{29}{32}$ per cent. On Wednesday conditions were again easy, and outside balances were offered at down to 2½ per cent.

The market raised its bid by 1d., to £99 0s. 2d. per cent, at the Treasury bill tender on Friday last—at the end of a week in which credit conditions had been quite stringent. Total applications fell by £13 million to £365.6 million, and the market succeeded in raising its allotment from 53 to 65 per cent. The average rate of discount fell by less than the market's tender rate, that is by 2¼d. to £3 19s. 5.17d. per cent.

Sterling has weakened steadily in the past week. The London spot rate on New York fell from $2.79\frac{7}{8}$ on Thursday last to $2.78\frac{15}{32}$ on Thursday of this week; and the transferable sterling rate has fallen from around $2.77\frac{1}{4}$ to $2.77. The price of gold in London has accordingly risen from 251s. 1d. a fine ounce to 251s. 7¼d.

The Bank return shows a reflux of notes of £1.9 million.

WHAT A LET DOWN FOR THE DRUM!

This deflated looking object *was* a steam-heated drying cylinder, 6 ft. diameter, 8 ft. in length. It was used for processing a hot liquid which was poured over the surface at 160°F. Copper constructed, with end-plates of ¼ in. thick mild steel, it was fitted with four equi-distantly-spaced vacuum relief valves.

It was not until after the collapse, which even forced in the stay-supported ends, that it was discovered that steam, condensing within the lightly-built cylinder, had created a vacuum. One faulty valve, and an inadequate steam supply pipe, had not helped matters either.

What **Vulcan** *say about it ...*

The possibility of the formation of a vacuum is frequently overlooked in the design of pressure vessels.

Whatever Vulcan insure, be it boiler or steam-engine, electrical apparatus, crane, lift or any other factory plant, Vulcan inspect. Inspect with an expert eye, pointing out a possible weakness, spotting the accident before it happens.

And if you want to read all about industrial accidents and ways to avoid them, why not write to us now for "Vulcan"? It is a Quarterly Journal for Power users, and it's free. Write to Dept. 17.

COMPANY MEETINGS

BRITISH CELANESE LIMITED

MR G. H. WHIGHAM'S STATEMENT

The Thirty-sixth Annual General Meeting of British Celanese Limited will be held at The Great Hall, Winchester House, 100 Old Broad Street, London, E.C.2, on Thursday, July 14th, at 12 noon.

The following statement to Stockholders by the Chairman, Mr G. H. Whigham, has been circulated with the full Report and Accounts for the year ended April 2, 1955:

The Group Net Profit for the year before taxation of £3,341,246 compares with £4,069,209 for the previous year. After deducting taxation the Net Profit is £1,710,140 as compared with £1,777,236. Alterations in the taxation allowances on capital expenditure and the reduction in the standard rate of Income Tax affect the comparisons, however, and in particular in arriving at the total taxation charge for the year credit has been taken for an amount of £230,000 in respect of Investment Allowances.

During the year we have settled outstanding matters regarding our liability to taxation consequent on the change in the Company's accounting date in March, 1953, and other sundry matters, as a result of which previous provisions for taxation amounting to £626,000 are no longer required and are now transferred to the credit of Profit and Loss Account. As a consequence of similar adjustments in the Subsidiary Companies' Accounts dividends from them of approximately £67,000 out of the balance brought forward have been brought to credit in the Parent Company's Accounts.

After transfers to Reserves of £1,493,218 and after providing for dividends as shown in the Accounts, the carry-forward of the Group is increased to £850,817.

The final dividend now recommended on the Ordinary Stock brings the total for the year to 10 per cent, which compares with an equivalent of 9 per cent for the previous year. The total dividend of 10 per cent on the Ordinary Stock is equivalent to 4.8 per cent on the Issued Ordinary Capital plus Reserves at April 2, 1955. During the year £92,721 of Debenture Stock was redeemed.

Apart from the capital required for expansion, it is essential to retain in the business sufficient of the profits remaining after tax as will provide for maintaining and modifying plants and services so that we may work at the highest efficiency and productivity. It should also be borne in mind that any replacement or modernisation of existing plant has to be carried out at a level of cost invariably higher than the original cost.

During the last ten years we have spent approximately £14,500,000 on Capital equipment for all the purposes of the business. In addition, a sum of £4 million requires to be paid out of our liquid resources over the next two or three years in respect of Capital Expenditure already sanctioned.

Further considerable sums not yet sanctioned will be required over the next few years for Plant and Equipment in connection with the development both of our established products and of our new products. I refer later to three new products, namely, "Tricel," "Cellon" and Vinyl Acetate.

CURRENT TRADING AND FUTURE OUTLOOK

Discussing the future outlook in my statement last year, I spoke of the likely continuance of a good domestic demand for textiles, although under highly competitive conditions, but I said that I did not regard the prospect for exports as very reassuring. Events have borne out this view.

Home trade has remained satisfactory, but exports, both of yarn and fabric, have proved increasingly difficult and we have experienced not only lower export turnover but also a substantial reduction in margins, and this naturally has affected the profits.

As you will be well aware, this Company has not been alone in this particular difficulty and the general decline of textile exports of the country is a serious matter to which much publicity has been given recently, and I can see no signs of immediate improvement.

Given the continuance of full employment, we can look to demand on the domestic market being such as to maintain a satisfactory total volume. But, unless there is some unexpected recovery in the country's textile exports, domestic fabric prices are likely to be under considerable pressure.

Last year, I made reference to the general tendency for countries which hitherto imported textile products to seek to manufacture these themselves. While I continue to deplore the tendency, which must inevitably depress the prospects of international trade for all nations, it is obvious that there is going to be no change of heart in the foreseeable future. We cannot, therefore, stand aside while our trade with traditional markets dwindles, and during the past twelve months we have taken two important steps to protect the Company's interests and, as far as may be possible, to ensure the continuity of our yarn exports. We have acquired the control of a large knitting plant in the Union of South Africa, where it will be our policy to expand the volume and still further enhance the reputation of "Celanese" fabrics, which have long enjoyed a ready demand in this market. We have also purchased a warp-knitting plant in New Zealand. Here, again, we aim to provide our many customers with fabric fully up to the "Celanese" standards to which they are accustomed, with all those additional advantages which local manufacture will allow us to give by way of service.

The situation as it affects our large Australian market is unfortunately much more obscure. Not only has the earlier relaxation of the control of imports of textiles been followed by a reimposition of restrictions, but the inquiry by the Australian Commonwealth Tariff Board regarding acetate yarn and cellulose acetate flake was, surprisingly, reopened within a few months of the announcement of its findings and decision. We have prepared a case and re-submitted evidence before this fresh enquiry, the result of which is as yet unknown. Nevertheless, this uncertainty and the suddenness with which policies and decisions are called in question, common though both are in international trade at present, must inevitably still further delay the crystallisation of our plans for Australia and their implementation.

In my statement last year I stated that spinning was planned to commence early in 1955 at our new Wrexham factory. This forecast has been realised and it is expected that the factory will be in full operation in another twelve months.

In the Chemicals and Plastic sections we have increased both the turnover and the variety of products, and we expect this steady progress to continue.

Costs of most services, wages and salaries continue to increase, and we are faced with additional costs in connection with effluent disposal. A preliminary agreement with Derby Corporation has been signed and work on the extensions to their Sewage Treatment Works is in progress.

NEW PRODUCTS

We have offered a number of new yarns to the market, and our Development Departments and Fabric Sections have done useful work in showing customers how best to use them. We believe that one of the best ways to improve business, particularly in the overseas markets, is in the development of new and more interesting fabric structures, and to this end we have placed before our customers a number of variants of acetate yarn. These new yarns include what are called thick and thin yarns for the reproduction of wild silk effects, spun dyed yarns, yarns with specially shaped filaments and a yarn which we have named "Soufflette" and which we believe is the forerunner of a number of important developments in what are described in the trade as "bulked yarns." These are yarns made in such a way that they are very bulky and voluminous and thus light and airy in texture, and we believe will give a new lease of life to many existing fabric constructions.

The most important thing, however, as far as we are concerned, is that during the year under review we have put out the first samples of an entirely new yarn, which we propose to market in the form of continuous filament yarn and staple fibre for which we have registered the trade name "Tricel." This new product which is the result of a number of years' research on our part, has for its base our chief primary product, cellulose acetate, but unlike our normal "Celanese" is tri-acetate. What we are aiming to do with this new fibre is to make possible the production of fabrics which, whilst not sacrificing the good properties of our traditional "Celanese" (outstanding amongst which are pleasant to handle, drapes well and comfortable to wear), will have many additional properties. They can be permanently pleated and embossed and are tough enough to stand up to the exigencies of modern life; they can be so treated that the fabrics are crease-resistant. Garments made from "Tricel" fabrics can, if necessary, be boiled without fear of shrinking; they will dry extraordinarily quickly and in many cases ironing will be unnecessary, although in cloth constructions where ironing is required they will be able to stand up to the impact of a really hot iron without damage or glazing. Undoubtedly, the increased use of the home washing machine and probably also of home drying devices, such as the modern tumbler dryer, are going to set an entirely new textile requirement and we believe that this new product of ours will provide exactly the properties required with, what is most important, reasonable price.

At first, fabrics made from this new product will probably reach the market a few pence per yard dearer than the ordinary "Celanese," but when manufactured in bulk we believe it will be very little different in price and in any case will be very substantially cheaper than any of the so-called

"miracle fibres." Development of this new product, however, will take time, but we anticipate having reasonable quantities of it on the market within a year.

You will appreciate that, although "Tricel" will open to us new outlets and new applications, it will not supplant normal "Celanese," which has established itself over so long a period. We intend, in the next month or so, to market a synthetic polymer staple under the registered trade name of "Cellon." This type of nylon-six polymer is not at present made in this country and is of great interest to spinners, both for 100 per cent spun yarns and also for blends with other fibres, such as wool, where it has been found that the inclusion of relatively small percentages of this type of fibre increases considerably the resistance to wear and tear.

On the Chemical side of our business we are erecting a plant for the production of vinyl acetate monomer. The process, which we developed ourselves, uses raw materials which we already manufacture on a large scale and we shall be the first to operate it in Europe. Vinyl acetate is a chemical of growing importance for the paint, adhesives and plastics industries. Initially our plant will be capable of producing the equivalent of approximately one-third of present domestic consumption, and it is so designed as to facilitate rapid expansion.

RESEARCH AND DEVELOPMENT

Success in research, as applied to industry, is to be measured by its fruits in terms finally capable of commercial development. Bringing new projects to the stage of commercial use naturally involves some lapse of time during which little can be said of the work in hand. Correct timing in introducing such developments to the market is always a most important consideration and we are equipped to make the necessary evaluation trials before launching new products. Resources must also be adequate for the development foreseen. The product must not be introduced without first taking all steps to ensure appreciation at the hands of the ultimate consumer. Market research must closely follow technical research and must be supported by the acquisition of adequate technical knowledge. Not only must the technique of economic production be established, but trouble-free application in secondary manufactures and final satisfaction to the user require their own technical studies. These considerations are nowhere more important than they are in the case of new yarns. I have elsewhere mentioned items of ours now in active development after a period of study, and our research will continue to help us in broadening our range of products.

The new research laboratory at Putteridge Bury is now working. I spoke last year of further strengthening our research and development. An important step in this direction has been the appointment of Professor F. E. King, FRS, as a Director; his distinguished academic career is well known. We look forward with confidence to the outcome of his work with us, which will be whole time from this autumn, when he will be in charge of the Company's Research.

PERSONNEL

The policy of the Company being that, so far as possible, positions offering opportunity for progress should be filled from within the Company, we require a regular inflow of young men who will be able to take senior appointments. With this object in view we are maintaining close contacts with the Universities, Technical Colleges and Schools.

In common with other organisations, we find that the ever-increasing demand for suitably qualified graduates in science and technology is greatly exceeding the supply. We are glad to note, therefore, that the Government has recognised this need and has made a start in providing additional facilities by grants to increase accommodation for technology at Universities, and to encourage more graduates to adopt careers as teachers. The building of more technical colleges is also a hopeful sign and should in due course help British industry to maintain and improve its position in world markets. We on our part are providing opportunities for extra-mural studies on the part of staff who are suited to take advantage of these facilities. Many large companies like ours have Scholarship Schemes and for several years past our Company has awarded scholarships tenable at various universities. Some outstanding work has been carried out by students under this Scheme.

As a further measure of self-help in this direction our established apprenticeship schemes which operate in our own shops have been extended to the fullest extent in collaboration with the Crafts concerned.

In all our factories increasing productivity must continue to be our aim so that every employee may be afforded the opportunity to make his maximum contribution to a healthy, competitive and therefore prosperous industry. Unless adequate profits are in fact made there are no resources to provide the material means for increasing productivity so necessary for competition in the world market. The prosperity of all industries in this country is a matter of prime concern to every worker, as without prosperity not only are his living standards endangered, but the whole industrial future of the country.

The expansion of the Company's interests both at home and abroad has imposed additional demands on the Company's employees, and I should like to take this opportunity of thanking them for their continued hard work and enthusiasm during the past year.

ABRIDGED PARTICULARS.

REFUGE ASSURANCE COMPANY LIMITED

(Incorporated under the Companies Act, 1862)

SHARE CAPITAL

Authorised:		*Issued and Fully Paid:*
£300,000	in 300,000 "A" Ordinary Shares of £1 each	£300,000
£300,000	in 600,000 "B" Ordinary Shares of 10s. each	£300,000
£600,000		£600,000

Neither the Company, nor its subsidiary, Federated Employers' Insurance Association Limited, has any Mortgages Debentures or Loan Capital outstanding.

Application has been made to the Council of The Stock Exchange, London, for permission to deal in and for quotation for the whole of the issued Share Capital of the Company.

THE FULL PARTICULARS SHOW (INTER ALIA) U.C. that:

1. The Company was incorporated in England in 1864 under the name Refuge Friendly Society Limited, the name being changed in 1881 to Refuge Assurance Company Limited. The principal business of the Company is that of ordinary and industrial life assurance. In 1953 the Company acquired as an investment of its Ordinary Life Branch the whole of the issued capital of Federated Employers' Insurance Association Limited. Federated carries on general insurance business (other than marine and aviation) and since 1st January, 1954, the Company has also carried on in its own name similar general insurance business, which business has been wholly reinsured with Federated on terms that leave to the Company neither profit nor loss.
2. The Company's history is one of steady expansion of income; in 1954 the premium income from Ordinary Life Assurance amounted to £7,471,598 and from Industrial Life Assurance amounted to £9,779,501 (making a total of £17,251,099) and the total income of the Company exceeded £22,000,000. At 31st December, 1954, the following life policies were in force:—
   Ordinary Life Assurance.—501,232 Life Assurance Policies assuring the sum of £143,250,226 (including reversionary bonus additions) and 1,610 Annuity Policies securing the payment of £137,058 per annum.
   Industrial Life Assurance.—8,177,425 Policies assuring the sum of £180,333,313.
3. The Company employs approximately 5,600 persons. Most of the Company's business is obtained by full-time employees who call at the homes of policyholders to collect Industrial Branch premiums and at the homes of prospective policyholders to canvas for business.
4. The Total Net Assets of the Company at 31st December, 1954, held for Policyholders and Shareholders were £124,403,918.
5. Provided unforeseen circumstances do not arise during the remainder of the year the Directors are of the opinion that the transfer to the Profit and Loss Account in respect of 1955 should enable them to recommend a distribution to Shareholders of £188,000 net, equivalent with income tax at 8s. 6d. in the £ to a gross rate per annum of 54.49 per cent.

Copies of the particulars required by the Council of The Stock Exchange, London, in connection with the application for permission to deal in and for quotation for the whole of the issued Share Capital of the Company may be obtained from:—

THE REGISTERED OFFICE: 103, Oxford Street, Manchester, 1,
and from
R. NIVISON & CO., 25, Austin Friars, London, E.C.2, and The Stock Exchange, London.

23 June, 1955.

GALLAHER LIMITED

(Incorporated in Northern Ireland)

CONSIDERABLE EXPANSION IN PRODUCTION AND SALES

INCREASED DIVIDEND

SIR EDWARD De STEIN'S STATEMENT

The fifty-ninth Annual Ordinary General Meeting of Gallaher Limited was held on June 22nd at Winchester House, Old Broad Street, London, EC, Sir Edward de Stein, chairman of the company, presiding.

The secretary (Mr George Iliff, ACA) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman which had been circulated with the report and accounts for the year ended December 31, 1954:

The year under review has shown considerable expansion in production and sales which has resulted in substantial changes in the Balance Sheet figures.

BALANCE SHEET FIGURES

The Preference Capital of the Company at December 31, 1953, was £ million in 6½ per cent Cumulative Preference Stock. This Capital has been converted into 5½ per cent Cumulative Preference Stock, and in order to compensate the holders for the lower rate of dividend payable in future they have been allotted out of Share Premium Account £1 of additional 5½ per cent Stock for each £5 of 6½ per cent Stock which they held on the date of conversion. The Issued Preference Capital has also been increased during the year by the issue for cash of 3 million 5½ per cent Cumulative Preference Shares of £1 each —since converted into Stock. As a result, the Issued Preference Capital is increased by £3,200,000 to £4,200,000.

The outstanding changes in the Group's current Assets and Liabilities are the increases in Stocks and Debtors and in Borrowings on Bank Overdrafts and Bills Negotiated.

Stocks have increased by £3,500,000 and Debtors by £4,500,000. These increases reflect the expansion in the trade of the Group compared with twelve months earlier. Stocks of duty paid and unmanufactured tobacco show increases both in quantity and value, but the increase in the stock of unmanufactured tobacco is not commensurate with the increase in turnover. I will deal with this later when I refer to our leaf supplies.

The higher value of Stocks and Debtors has been financed mainly out of the proceeds of the 3 million Preference Shares issued for cash and by the increase in Borrowings on Overdrafts and Bills Negotiated, which have advanced by £3,850,000 to £10,150,000.

In the Balance Sheet of Gallaher Limited the increases in Stocks and Debtors during the year have been higher than in the Consolidated Balance Sheet. This is due to the transfer since December 31, 1953, of part of the Stocks and Debtors of some subsidiary companies from the financial books of those companies to the books of the parent company—entirely for convenience in administration.

TRADING RESULTS

The Consolidated Trading profit for the year is up from £2,011,000 to £2,511,000 after charging Depreciation, Auditors' Fees and Expenses and Interest. Of this increase £311,000—just over 62 per cent—is taken by taxation leaving the Company with a net increase of £189,000 as compared with the previous year.

After providing for dividends—including a recommended increase in the Ordinary dividend from 20 per cent to 22½ per cent—the carry forward in the Consolidated Balance Sheet has been increased by £182,062. We have appropriated £186,383 to General Reserve, rounding off the balance in the Gallaher Balance Sheet at £1,500,000. Thus we have retained in the business this year £368,000—about one-third of our profits after taxation.

GENERAL MATTERS

The expansion of the business has been possible because of the change in the method of allocating Dollars to the industry. For many years the output of the main selling cigarette brands of the Company has been restricted by the method adopted for the allocation of Dollars for American and Canadian tobacco. This basis of allocation was changed in the middle of 1954 in order to give greater freedom of choice to the public. Your Company benefited from the change and received an improved allocation of Dollars which enabled us to go some way towards meeting the public demand for our most popular selling brands. In order, however, to cover the situation, output had to be rapidly and substantially increased under conditions which could not be maintained over a longer period. In this respect the year under review was an abnormal one. I will refer to the future later.

LEAF SUPPLIES

Dollars are normally allocated in June for the purchase of American tobacco, the auction sales of which commence each year at the end of July. Last year, as I have said, we were permitted to purchase increased supplies in America and Canada. The quantity of these types of tobacco which we had in hand at December 31, 1954, was higher than in the previous year, but due to our increased sales, these stocks, when expressed in terms of months' usage at the current rate of sales, are lower than they were at December 31, 1953.

In Sterling tobacco markets where no restrictions apply we were able to buy increased supplies in line with our estimated usage and stock requirements.

Negotiations are taking place between the Treasury and the United States Government whereby manufacturers in the United Kingdom would be permitted to purchase a quantity of Dollar tobacco for Sterling. If these arrangements are successful your Company will receive its share: this purchase, together with our annual allocation of Dollars, should enable us to restore our stocks to a more satisfactory level. Naturally, this will increase by a considerable amount our borrowings on Bank Overdrafts and Bills Negotiated.

ENGINEERING SUBSIDIARY

I am pleased to be able to tell you that our engineering subsidiary has again made a record profit, the major part of which has been ploughed back in the business.

SALES

The sales of tobacco for 1954 constitute a new record for the Group. In the hard tobacco section public demand continues to diminish, but we have maintained our share of the business. Sales of our other tobaccos increased during 1954, notably "Old Holborn" manufactured by Richard Lloyd & Sons in London.

All our major cigarette brands, and particularly "Senior Service" and "Park Drive," have done well this year. Our cigar subsidiary, J. R. Freeman & Son, Limited, has shown good results for the year, and the demand for its principal product "Manikin" remains as strong as ever.

PREMISES

The Directors have deemed it prudent since December 31, 1954, to acquire an additional factory in the Manchester area for use at present as a material store and to enable us to expand our manufacture as the occasion requires.

OUTLOOK

Now that the public are able for the first time for 15 years to buy the brand of their choice, it is obvious that we must expect increased competition. This is welcomed by your Directors, but these conditions will inevitably involve higher selling and advertising costs. Other costs are also increasing, including, in particular, the high cost of borrowing following the rises in the Bank Rate in January and February, 1955. The latter is a very material item. There are indications also that the cost of our leaf tobacco may well rise again this year and wage rates were advanced in September, 1954. These items represent a formidable addition to our working costs.

Nevertheless, because of the high quality and value for money of all our products, the public demand for our goods stands at a satisfactory level and we shall make every endeavour to continue the expansion of our trade. Your Directors see no reason why results for 1955 should not remain at a satisfactory level.

DIRECTORS

Since the last Annual General Meeting Mr J. D. Hopkins has been appointed a Director of the Company. He has been with us for twenty-five years, in the course of which he has held a number of important appointments. The experience he has gained, particularly in the buying of leaf tobacco, is invaluable to his colleagues on the Board. His appointment will come up for confirmation later.

Due to his many commitments, Mr Clarence Parker, who has been a Director of the Company since we acquired control of Cope Brothers & Company Limited, tendered his resignation a few months ago.

EMPLOYEES

The increased output of our cigarette brands necessitated considerable reorganisation in our factories and distribution depots, which was carried out smoothly but under high pressure, and the greatest credit must be given to all concerned during this period.

Indeed, the abnormal and sudden increase in production was only made possible by the wholehearted co-operation of all employees of the Group, and our thanks are particularly due to them this year for their willing co-operation. In recognition of their conscientious efforts, we have paid them a special bonus equivalent to six weeks' wages in place of the four weeks' paid for some years past.

The report and accounts were unanimously adopted.

The proposed dividend was approved and the retiring directors, Mr J. N. Hogg, Mr M. R. Norman, OBE and Mr J. D. Hopkins, were re-elected.

ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED

(Incorporated in the Union of South Africa)

YEAR OF PROGRESS AND CONSOLIDATION

PROBLEMS OF STAFF RECRUITMENT

SIR ERNEST OPPENHEIMER'S STATEMENT

The following are extracts from the statement by the Chairman, Sir Ernest Oppenheimer, which has been circulated to shareholders:

The year 1954 was a satisfactory one for the Corporation. We increased our revenue under all headings, and our profit, after taxation, was over £4 million—some three-quarters of a million more than in 1953. We were able to add further sums to the general reserve, which now stands at the substantial figure of £20 million, and at the same time to increase our dividend distribution to the ordinary shareholders from 6s. to 7s. a share. Our cash position remains strong, and our quoted investments, which stand in our books at £24 million, had a market value at the end of 1954 of £60,800,000—a considerable advance over the previous year. The year 1954 was also one in which we were able to consolidate our position in respect of many of our investments, as market conditions generally were favourable.

PROBLEMS CONFRONTING MINING INDUSTRY

In mining, as in other industries, we have to face three types of problem—financial, technical and human. In the past few years our major problem has been financial. The sums required for the establishment of the gold mines in which we are interested in the Orange Free State and the Klerksdorp area were very considerable indeed, and, in the statement I issued with the 1953 accounts, I reviewed how we had solved this problem and what we had achieved. Financial problems are, of course, always with us, but, because of the great prosperity being experienced by the diamond and copper industries and the sound basis on which our gold and coal interests have been financed, our financial requirements for the time being are of a routine nature and magnitude. We have, moreover, considerable reserves available for any new and profitable business that may arise, and we are ever on the lookout for new openings and opportunities.

In the technical field conditions are not dissimilar. The gold mining industry has met triumphantly the great challenge set by the construction of vast uranium and acid plants at the highest possible speed. The difficulties inherent in opening up any new mining field, such as the Orange Free State, are gradually being overcome and solved. In the diamond and copper fields, and particularly at the Wankie Colliery, our major programme is well advanced towards completion. Technical improvements there always will be: there do not, however, appear to be any technical problems confronting us in the next few years that we cannot face with complete confidence.

It is towards the solution of the third group of problems, the human problems, that our greatest effort will perhaps need to be directed. It is becoming more and more difficult to get enough men and women to carry on uninterruptedly the development of this great and rich country.

The local population is rising to great heights, but it is simply not big enough to face up alone to the job. The gold mines have today a better supply of Native labour than they have had for very many years, but more than half of this labour comes from outside the borders of the Union and for its continuance we are dependent upon the good will and the needs of our neighbours. The White peoples of the Union and the Federated Territories of Rhodesia are enjoying full employment: in fact, there are grave shortages of qualified men at all levels, and in nearly all industries and Government departments.

STAFF RECRUITMENT

The mining industry is making every possible effort to recruit and train men locally, and is offering training facilities even to University degree standard in its efforts to staff its enterprises. The population of South Africa is, however, clearly too small to meet the opportunity, and the Corporation has had to look further afield, and we have appointed a recruiting officer in England. To assist in recruiting, we recently brought to Southern Africa a party of some twenty educationists from Great Britain, who, it is hoped, will influence young men to join our ranks. We are offering free University training to suitable candidates. Neither are our efforts confined to Great Britain, for we have recently recruited technical officers from Scandinavia and from Australia, from Switzerland and Canada.

In the Central African Federation the European population is still very small, and both on the Copperbelt and at Wankie our European establishment must be drawn largely from outside the Rhodesias, mainly from South Africa and from Great Britain. In order to help the young men and women of Northern Rhodesia we have decided, in association with the Rhodesian Selection Trust, to set up on the Copperbelt a Foundation, which will establish a Technical College and take such other steps as its governors may judge necessary to make available the highest technical education.

The African population in the Federation must also be trained to play its part in the world of industry. African training on the mines is being constantly developed, and the recognition of the African Mineworkers' Staff Association marks a step forward in the development of the African population towards higher responsibilities and skills. Our long discussions on the subject of African advancement into a range of work that had traditionally been the preserve of the European have been greatly assisted by a statement from the European Mineworkers' Union, who are willing to co-operate in making a start with African advancement, which I welcome particularly as a genuine and valuable contribution towards this difficult problem.

Both in Rhodesia and in the Union of South Africa we are struggling with the problem of finding a way of living that provides justice and opportunity to peoples of two races—and of two levels of civilisation.

SEARCH FOR NEW ECONOMIC MINERAL DEPOSITS

I should now like to refer briefly to another branch of the Corporation's activities, which is vital to our continued existence. I refer to our prospecting activities in the search for new economic mineral deposits. A considerable programme of prospecting has been laid out for the whole of Southern Africa, not merely covering areas where concessions or exclusive prospecting rights are held; and modern methods and techniques are being applied to very considerable areas in the hope of making some useful discoveries. While it would not be appropriate, at this stage, to make any more detailed reference to the work we are doing and to the areas where we are carrying it out, I can say that we are sparing no expense in conducting extensive research under the guidance of the experienced staffs of our Geological and Engineering Departments, which have been considerably enlarged for this purpose.

May I conclude this statement on a personal note? I have recently passed my seventy-fifth birthday and have also had, for a few weeks, to detach myself from the daily round of business and to take a longer rest than I have enjoyed for many years. During this period my thoughts have gone back to the establishment of the Corporation, thirty-eight years ago, and to the men who have helped me to build it up into the great institution that it is today. I feel a great debt of gratitude to those who were by my side in the early and difficult years, and to the staff which is today so vigorously and ably carrying on our business.

It is still a young organisation, established in countries that are themselves still young in human development. It is controlled and staffed by citizens of these young countries. I know it will continue to play a great part in their material development. It is my hope that it should also help towards that unity which is so essential to these young nations, and towards which they are now struggling through many difficulties and setbacks. I hope and believe that unity and concord will be attained, and that our Corporation will make a contribution towards their achievement.

Copies of the Chairman's Statement and of the Annual Report and Accounts can be obtained from the London Office of the Corporation, 11, Old Jewry, London, E.C.2.

MILK MARKETING BOARD

FEATURES OF AN EVENTFUL YEAR

MR THOMAS PEACOCK'S REVIEW

The annual general meeting of the Milk Marketing Board was held on June 17th in London.

Mr Thomas Peacock, CBE, JP, the chairman, in the course of his speech said: The year that we are now reviewing has been very full and interesting. We have celebrated the twenty-first anniversary of the Milk Marketing Scheme, with the good wishes of the Minister of Agriculture and Food and many others who have been associated with the work of the Board since the early years. You will notice that the Report and Accounts carry our new Coat of Arms, the gift of the Board's staff at the coming of age of the organisation. It is, I feel, a symbol of the new responsibilities which the Board have this last year been called upon to undertake.

I told producers last year that the clock has not been put back to 1939, and I am sure that our experience during the past twelve months has shown to us that this can never be so. We have an industry greater than ever before; we have an organisation of milk producers whose activities are on a far broader scale than perhaps the authors of the Milk Marketing Board ever envisaged and certainly much wider in scope than any other similar organisation that I know of anywhere else in the world. The changeover last April passed smoothly and our administrative arrangements proved to be adequate to deal with the new problems that came along. We had much assistance not only from the buyers of milk, who have worked with us throughout the year, but also from the Government and from the National Farmers' Union.

DIFFICULT YEAR FOR PRODUCERS

For milk producers, however, the last year has been very difficult; indeed it is hard to recall a time when farmers have had to contend with such disastrous harvests. As a result there was a severe fall in output of milk during the winter months and our estimate is that probably 40 million gallons of milk were lost owing to the real difficulties of feeding our dairy herds adequately during the long winter. There was, however, an adequate supply throughout to meet the full demand of consumers for liquid milk.

I should like to take this opportunity of paying a tribute first to the milk producers and their workers and secondly to the transport workers and others whose task, already onerous, has been exceptionally arduous this last winter.

Last year I explained the new guaranteed price arrangements between the Government and the Board and we have explained fully in the Annual Report the results in this first year. In our estimates we anticipated that output might exceed the standard quantity by about 30 million gallons and in consequence we did not anticipate that our final payments would reach fully the guarantee determined at the Annual Review. The fall in output in the winter-time, however, brought output very near to the standard quantity and enabled the Board to pay higher prices per gallon than had been originally expected. We found it possible also to get a better realisation for manufacturing milk than had been anticipated. The financial results of these movements enabled us to adjust published prices to producers upward in the Spring months. The Board were pleased to be able to do this at a time when milk producers were facing their greatest difficulties. Another time the adjustment may go the other way, depending entirely on the course of supplies and markets.

PRICE POLICY

The Board decided last year to reduce producers' prices in the winter months and this was in accordance with the policy which I have mentioned to you on a number of occasions of moving a little away from winter output and a little nearer to summer milk. Our reason for adopting this policy is clearly that we are not anxious to manufacture large quantities of milk in the winter months, when costs are high. At mid-winter, all we need over and above the liquid market is the margin necessary to meet day to day variations in supply and requirements.

There are already some signs to show a tendency for more emphasis on summer milk. We must watch this balance of supplies most carefully and in particular we must not discourage winter milk to the extent that there is any danger of shortage in the liquid market. At the present time we only have just the minimum of surplus necessary to guarantee the liquid market through the year. And after last year's disastrous season we must be careful not to arrive hastily at conclusions about trends in milk supplies.

QUALITY

Turning from quantity to quality I refer to the fact that last September saw the end of the "Accredited" Scheme, which was begun by the Board in 1935. Since that date the names of very many producers have been written on the Accredited Roll and, as the Board had hoped, most of these producers have gone on to produce milk of higher quality from Tuberculin Tested cows. The only quality designation which now remains is Tuberculin Tested milk and I am very proud to say that at the present time 60 per cent of our milk is of this category. This is a tremendous achievement in a short span of years. It is not sufficiently appreciated perhaps that this is a very high grade of milk, because the cows have to be Attested and the milk has to reach a high standard of bacterial content. The two essential features of safety and hygiene are incorporated in it. I hope the time is not far distant when we shall have a sufficiency of this high quality of milk to satisfy the liquid market. The Joint Committee for the Control of Milk Quality has continued its good work of regulating the control of hygienic quality of milk sold off our farms.

We have, as you know, agreed with the buyers of milk that if any problem arises where we are unable after discussion to come to an understanding, then we will refer the problem to a Consultant whose decision the Board and the buyers have agreed to accept. The Consultant is Sir Edgar Sylvester, KBE, who has a long and distinguished record of commercial and public service, and the Board have every confidence that if an occasion should arise when his advice will be sought then it will be given with justice and impartiality. During the past year markets have been fairly steady and our main attention has been directed to maintain and to expand the liquid milk market.

MILK IS GOOD VALUE

Milk at today's prices is good value and this is appreciated by the housewife. It has a wide variety of uses not yet fully exploited and we hope that these will be brought increasingly to the housewife's notice. Milk and milk products form a large part of the budget of our households. We appreciate this and the industry in turn in my view offers an excellent product and good service. This is the sure and firm basis for expansion.

I have heard the opinion often expressed that the dairy industry of this country should restrict itself to the liquid market, and people often talk as if milk producers should produce no more milk than is necessary for consumers to drink. Those of us in the industry know full well that all our milk cannot be sold liquid, that we must have some milk which is surplus to liquid requirements if only to meet the day to day changes in total demands. This surplus is the basis for the manufacture of milk products in this country. We have this manufacturing market and we must look after it. Every effort has been made to place milk in the best markets and this means more milk for cream, for chocolate and for our special cheeses, which we believe can be expanded considerably.

SERVICES TO FARMERS

The board are most anxious that along with the exercise of new and varied marketing responsibilities they should continue to offer services to farmers to help them to achieve more efficient production on the farm. A reduction in costs of production is quite as important as an improvement in markets. These services have expanded during the past year. There is continuing progress in our Artificial Insemination service, and last year one half of the nation's dairy herd was artificially bred.

PRIVATE MILK RECORDS SCHEME

During the past year we have appointed a small number of Consulting Officers, one of whose tasks will be to help in the field in the difficult problem of finding good bulls for our artificial insemination stud and selecting outstanding dams to be mated to them. Last year we introduced an unofficial recording scheme specially designed to meet the needs of the commercial milk producer. This scheme, which is called Private Milk Records, has operated most successfully during the past twelve months, and already over 8,000 milk producers are using the service we have provided.

Looking back over this eventful year, we have certainly been active always with the aim of making our industry efficient and capable of giving good service to consumers. We have been encouraged on our way by many leading milk producers; they have given time and energy in helping the Board on the various committees. We have had also much co-operation and assistance from the National Farmers' Union and from the buyers of milk. Our experience in the first year with the new form of the producer price guarantee, in which the industry shares responsibility with the Government, has been satisfactory, and we have received valued help and guidance from the Ministry of Agriculture, Fisheries and Food.

The report and accounts were adopted.

GILL AND DUFFUS

PROFITS MAINTAINED DESPITE DIFFICULTIES

CAPITALISATION OF RESERVES

MR J. I. MURRAY'S STATEMENT

The Eighth Annual General meeting of Gill and Duffus Limited will be held on July 14th in London. The following is an extract from the Chairman's circulated Statement:

In my statement last year I referred to the great problems which were facing the Chocolate and Confectionery Industry at that time and what I said then has, I think, been proved to be an understatement. We had of course, the price of raw Cocoa particularly in mind.

COCOA PRICE FLUCTUATIONS

In the early part of last year this commodity rose steadily from its opening price of £365 per ton to a peak price of £560 per ton, which was reached in May. In the second half of the year the process was reversed and Cocoa fell steadily again until December, at which time the price was around £375 per ton. In other words, Cocoa values rose by £195 per ton in the first six months of the year and declined by £185 per ton in the second six months. Such convulsive movements set the whole industry, including our organisation, very difficult problems. That these have, I think, been soundly handled, is proved by the results achieved. I must, therefore, record our sincere thanks to the Managing Directors and Staff both at home and overseas on their conduct of our affairs in unprecedented conditions.

In dealing with the figures in the Profit and Loss Account and the Balance Sheet, I shall, as in the past, refer only to the consolidated figures. This year these will include the figures of Gill and Duffus (Liverpool) Limited, which became a subsidiary Company by the acquisition of 1,776 Ordinary Shares during 1954.

GROUP PROFITS AND ALLOCATIONS

The group profits last year were £907,128 as compared with £906,415. After making provision for all taxation, which absorbed £521,184, and after deducting the profits attributable to Minority Shareholders in Subsidiary Companies and the increase in amounts retained by Subsidiary Companies, the net profit available to members was £337,753. The preference dividend, and the ordinary dividend of 50 per cent of which 17½ per cent was paid in December, require in all £144,863. After bringing in the amounts brought forward from last year and a provision made in previous years now not required, and after writing off the Goodwill of £50,000, the balance to be carried forward to next year is increased from £291,237 to £439,928 of which £219,521 is attributable to the parent Company and £220,407 is retained by the Subsidiary Companies.

The policy which has been adopted in the past of prudently writing down our assets and building up reserves, has now enabled the Board to adopt a somewhat more liberal dividend policy, but it must be emphasised that although our reserves would for the moment appear to be adequate for any foreseeable contingency, we still need working capital on the basis of the current prices of commodities and of our turnover—which last year was £30 million, and reflects the extraordinary price levels obtaining during 1954. Moreover, in 1954 we spent on plant and machinery almost £200,000, and expenditure of £300,000 has been sanctioned for 1955. In the view of the Directors, keeping the plant up to date is a vital necessity. Consequently when earnings are good, as they have been recently, the policy of ploughing back a substantial part of each year's profits must continue if the Company's position is to be maintained and a proper degree of stability is to be achieved even if, as is always possible, a real decline in turnover develops.

BALANCE SHEET ITEMS

Under the heading of Current Assets, and Current Liabilities and Provisions, there is an indication of the abnormal trading conditions to which I have already referred. Stock has risen by £2,076,144 to £4,723,626. Trade and Sundry Debtors increased by £557,162 to £1,343,383 and on the other side the Bank overdraft rose by £2,365,985 to £3,170,256. In the Autumn with the object of ensuring that our Mills received the right quality of Cocoa as it became available, we made large purchases from the Marketing Boards which were shipped and paid for before the end of the year. This accounts for the exceptionally large stock shown in the Balance Sheet. The whole of this stock of raw material had been sold for forward delivery in the form of its various products, and the changes in the Balance Sheet are a reflection of the financial burden of buying and carrying the necessary stocks to enable us to fulfil our customers' contracts.

Our working capital is in excess of £2 million and in comparison with the Issued and Paid up capital, this underlines the conservative policy which has been adopted in the past. Working capital of this order was, however, inadequate for the purpose of carrying a stock of £4,700,000 and we had to seek additional accommodation from our Bankers. Since the close of the past year our overdraft has been reduced and is at present approximately £2,500,000. A further reduction is likely between the beginning of August and the end of September, when the abnormalities in the present situation should tend to disappear.

CAPITAL OF PARENT COMPANY

The capital of the parent Company at £710,000 reflects the issue under the resolution dated December 31, 1954, of 10,000 6 per cent Preference Shares of £1 each to the Preference Shareholders and 100,000 6 per cent Preference Shares of £1 each to the Ordinary Stockholders, all fully paid.

In accordance with the preliminary agreement concluded with N. V. Cacaofabriek "De Zaan," referred to in the company's circular of February 25th, Mr W. Huysman, their Chairman, has been elected to our Board and Mr Spice has joined their Board. The formal agreement has now been signed and 200,000 Ordinary Stock Units of 5s. have been exchanged for a minority interest in the capital of "De Zaan." We welcome Mr W. Huysman as a colleague and also this rationalisation of the close association which has existed between the two companies for many years.

As already announced, permission has been granted by the Capital Issues Committee and subject to the passing of the necessary resolutions at the Extraordinary General Meeting to follow this meeting the directors have decided to increase the ordinary capital by £275,000 by capitalising £233,628 standing at the credit of Capital Reserves and £41,372 being part of the balance of Profit and Loss Account and to issue free to each Ordinary Stockholder one 5s. Unit of Ordinary Stock for every two 5s. Units held. This will increase the Company's Capital to £1,035,000 and take a further step towards bringing it, as circumstances permit, more into line with the actual capital employed in the business.

THE COCOA MILL IN TAKORADI

West African Mills Limited remains on a care and maintenance basis and there is no immediate prospect of the Mills being reopened since the Gold Coast Government has informed us that it has at the moment no intention of seeking legislative approval of a reduction in the rate of local cocoa duty. When we decided to build a Cocoa Mill in Takoradi, we were given a measure of relief from the local taxes on raw Cocoa to meet the increased costs of working due to the employment of inexperienced African labour and the many other difficulties arising in a country in which industrialisation was and still is in its infancy. These reliefs were given to us during the first years of production, but were then reduced until in March, 1954, it was no longer economical for us to continue and the Mill was closed.

We have made repeated approaches on this subject to the Gold Coast Government, but none has met with any success and in Takoradi we are therefore unable to meet the competition from similar Mills operating in some other Cocoa growing countries, whose Governments are giving them not only currency concessions but a far greater measure of relief from local taxes on raw Cocoa than is at present available to us. As the pioneers of the industrialisation of raw Cocoa in the Gold Coast, we very much regret this position and the fact that the Mill which today would cost about £750,000 should be standing idle. This situation can only hinder the development of industry in a country which professes to be endeavouring to attract Capital from abroad and claims to need the establishment of local industries.

SAW MILL'S TEETHING TROUBLES

The Saw Mill is still suffering from teething troubles and from a shortage of timber due to transport difficulties in the Gold Coast. We are, however, watching the position most carefully.

Gill & Duffus Inc. and Gill & Duffus (Canada) Limited had a satisfactory year and are developing along the lines foreseen. Business in both USA and Canada would appear to offer potential scope, but development in this respect can only be slow and gradual if it is soundly based.

Finally, some reference to the prospects for 1955 will no doubt be expected. In a business such as ours it is always difficult to forecast profits even though half of the current year has already passed. The sellers market has now disappeared and trade has become very much more competitive with a resulting drop in profit margins. Subject, however, to any drastic change in the situation in the next six months, in 1955 we should be able to maintain, reasonably covered, a dividend of 33 and one-third per cent on the Ordinary Capital as increased.

THE INDUSTRIAL AND GENERAL TRUST

PROBLEMS CONFRONTING INDUSTRY AND THE NATION

GROSS REVENUE AGAIN INCREASED

The sixty-seventh annual general meeting of The Industrial and General Trust, Limited was held on June 16th in London.

Sir Edwin Savory Herbert, LLB (the chairman), who presided, said:

On the subject of the Accounts, there are a few observations I should make. The Revenue Account shows that the gross income of the Trust again reached new heights, the total of £1,321,787 exceeding last year's figure by £216,000. We collected some £11,000 less in arrears, but recoveries on account of double taxation relief rose sharply by over £83,000. The improvement in our recoveries of Double Tax Relief was due partly to an increase in our investments overseas, particularly in North America, and partly to an accelerated rate of recovery arising from a new method of dealing with claims.

The amounts we get back from the revenue authorities are not, of course, all gain, as they give rise not only to a liability for income tax, but also to an additional liability for Profits Tax. Our total liability for both income and profits tax after allowances was £570,000 and, after deducting this figure and all expenses, the net income for the year was approximately £600,000. From this we have transferred £150,000 to General Revenue Reserve against £100,000 last year bringing the total of this reserve up to £850,000. Another £5,000 has been placed to Contingencies Reserve, making £10,000 in this Account.

After these appropriations there remained £444,356 which, with the balance of £343,927 brought forward from last year, left £788,283 to be dealt with. The Interim Dividends of last November absorbed £166,000 and we now recommend the usual payment of 2½ per cent actual on the Preference Stock and a Final Dividend on the Ordinary Stock of 12½ per cent, making with the Interim Dividend of 7½ per cent, a total of 20 per cent for the year. These recommendations, if adopted, will require £274,203, leaving a balance of £348,049 to be carried forward, which is some £4,000 more than last year.

You will have noted that we have strengthened our reserves by nearly £160,000 and, at the same time, we recommend an increase in the Ordinary Dividend from 17½ per cent to 20 per cent. It has long been the policy of your Board to place substantial sums to reserve when possible and the justification for it, if indeed it needs justification, is to be found in the results we have been able to put before you each year and in the dividends we have recommended.

BALANCE SHEET

The Balance Sheet calls for no particular comment. You have been advised many times, over the years, not to pay too much heed to the market value of our investments, as shown in the Balance Sheet and I would repeat the advice. There is an improvement this year of about £4½ million as compared with the figure at March 31st last year; this represents an appreciation over the cost in books of approximately 137 per cent. This is certainly satisfactory, but any fall in markets might well cause a substantial part of the appreciation to disappear almost overnight.

ECONOMIC CONDITIONS

The results of the year reflect, as they always do, the general condition of the country's trade and commerce. The year has seen a further advance to a free economy and further steps away from the system of controls. On the whole industry appears to have responded well to this policy. Trading results have certainly been good generally and one cannot help feeling that growing freedom has released energy and initiative on a large scale. During the latter part of the year, however, less favourable signs began to appear. The value of the pound at home and abroad began to show signs of instability and the balance of payments position gave cause for renewed anxiety. The Government acted vigorously with successive rises of Bank rate and the partial restoration of limitations on hire purchase. These measures appear to have been fairly effective, but doubts must always remain about the purchasing power of the pound until people are prepared to accept and act on the hard truth that it is impossible to consume more than is produced. Inflation is a mark of self delusion as well as other things.

The latter part of the year was also overshadowed by political uncertainty. We have for some years lived under conditions that suggested that the nation was almost equally divided between two broadly opposed views of life, a state of things which led to a near deadlock in the House of Commons. Since the end of the year that deadlock appears to have been resolved for some time to come, but during the year it continued to give rise to uncertainty and uncertainty is always bad for business.

INDUSTRIAL UNREST

The year, too, experienced a period of increasing industrial unrest, which has become accentuated since the end of the year. Partly one may suspect that this unrest has not always been wholly industrial in origin. Partly it seems to reflect the turmoil of ideas in which we live. How shall we handle ourselves in a period of full employment? What should the rewards and sanctions be? Do we want equality, or equality of opportunity? Where should egalitarianism stop? All these are deep human questions which need to be answered if the conditions of confidence which business needs are to exist. I believe that answers will be found in time but they will need searching for and in that search hatred, envy and malice will be poor counsellors and those who preach them should stand self-condemned.

During the year the prospects of maintaining peace seemed to be improving and that improvement has apparently gained momentum since the end of the year.

THE CURRENT YEAR

We may say then, that while the year had its ups and downs, which led to considerable stock market fluctuation, it was a good year. The signs for the current year so far have been mainly favourable. As to the future, if we have peace and can solve the problems I have already mentioned, I see no reason why the ability, inventiveness, energy, experience and reliability of our countrymen, should not bring to our country a growing and widely diffused prosperity.

I have been speaking of our own country, but we are interested in other countries, too. Our investments become more widely spread each year, so it is important that our officers should be familiar with conditions in countries overseas. It is with pleasure, therefore, that we welcome home our Managing Director, Mr Ockford, from his recent journey across the USA and Canada. To him and to all the Staff we offer our thanks for devoted service during a year that has been full of problems.

The report and accounts were adopted.

OFFICINE VIBERTI S.P.A. TURIN, ITALY

(Motor Manufacturers)

The Annual General Meeting of Officine Viberti was held on April 28th in Turin, with Dr Angelo Viberti, sole Managing Director, in the chair. The following are details of his report:

The Company's capital totalled Lit. 750 million (£430,000) of fully paid-up shares. Production reached 6,820 units during the year, bettering the 1953 figure by 14 per cent in volume, and 16 per cent in value; sales total more than £5 million.

The output of motor buses in particular showed a spectacular rise, and was more than 50 per cent up on the previous year. This was due to the success achieved by the MONOTRAL VIBERTI, a vehicle with a bearing body which has had an excellent reception.

The Company's products meet practically every transport requirement: from passengers to goods, from airport feeder services to the carriage of fuel, from fire-engines to street sweepers for municipal services, from tipping lorries to special vehicles for the Army and Air Force. OFFICINE VIBERTI have designed suitable economical transport vehicles for all types of goods and for every need, and are prepared to meet every possible special requirement.

All the machinery and plant damaged during the war is once again in full working order and now carries a book value of £600,000.

Capital expenditure during the last three years, mainly on new plant and machinery, totalled £160,000. As a result the Company is now equipped on the most modern lines and geared to a high level of production.

The VIBERTI group includes a number of other important companies manufacturing transport vehicles. They are mainly concerned with the production of all types of trailers, and are responsible for the output of 60 per cent of all such vehicles made in Italy.

Productivity shows a steady increase both as a result of improved organisation, and owing to the interest the Company's employees now take in their work. This attitude has been reflected in the results of the recent Works Council elections when workers in the Company's plant showed to what extent they identified their interests with those of the undertaking. They realised that this was an essential condition to ensure a high standard of living for themselves.

IMPERIAL CHEMICAL INDUSTRIES LIMITED

RECORD GROUP SALES

DR ALEXANDER FLECK'S SPEECH

The twenty-eighth annual general meeting of Imperial Chemical Industries, Limited, was held on June 16th in London.

Dr Alexander Fleck, the chairman, in the course of his speech said: The consolidated sales of the Group, after deducting the value of the sales made by our new subsidiaries, have increased from £282 million to £327 million—an increase of £45 million or 16 per cent over the figure for 1953, itself at that time the highest in our history. The Company's home sales and direct exports each increased by approximately the same percentage.

I should like most specially to draw your attention to the table of price indices in which the changes in home trade prices of the Company's products are compared with other significant indices. I am sure you will agree that the comparison shows the Company's prices in a very favourable light. Since 1938 the cost of our raw materials has risen by 272 per cent and the earnings of our workers have risen by 202 per cent. For the same period the Board of Trade wholesale price index increased by 225 per cent. In comparison with these increases (each of which exceeds 200 per cent) the prices at which ICI sells its products in the home market have risen by only 91 per cent. This, I think you will also agree, shows the remarkable success which has attended the Company's policy of keeping its selling prices as low and as stable as possible. Low and stable prices encourage our customers to use more of our products, and as our products are used by many British industries, we believe that our price policy aids and supports the economy of the country as a whole.

Between 1953 and 1954 the Company's price index for home sales has moved up by one point only, and the increase in the value of our home sales during this period is therefore almost entirely due to increase in volume. The consequential increase in profit for 1954 is also attributable to increase in volume, coupled with improvements in efficiency due to Work Study and other factors.

The Company will continue this price policy and will aim not only at absorbing increased costs but, wherever practicable, at seeing that reductions in costs resulting from improved methods and greater efficiency are reflected in lower prices to its customers. Let me emphasise, however, that the price indices I have quoted are averages, and that it may not be possible in all cases to avoid an increase in price; in fact, I am sure that some readjustments upwards in some of our products will almost be inevitable. This is particularly so where raw materials, fuel and freight represent a large proportion of total costs. We are glad to play our part with others first of all in striving after methods of increasing productivity and then of passing on the results of such efforts. Contributions of this nature will, we hope, come from all branches of British industry.

EXPORTS AND OVERSEAS INTERESTS

At £67½ million the Company's exports were a record and showed an increase of 16 per cent over the previous year. This increase in the value of exports represents a still greater rise in the volume of exports.

I regard this high export figure as a particularly significant feature of the year's trading, because it has been achieved in the face of keen competition from other major chemical producing countries and in spite of the strong demand for our products from the home market. Indeed, if indirect exports were included, it would be seen that more than 40 per cent of the Company's production now goes abroad.

A number of our overseas companies are now substantial manufacturing entities, and when I tell you that the total turnover of the Company's overseas business (both local manufacture and imports from the United Kingdom) through subsidiary and associated companies is now approaching in value ICI's sales in the United Kingdom, I am sure you will appreciate how important our overseas interests are.

It is worthy of note that the net ICI Ordinary dividend, requiring just under £8 million, represents rather less than 37 per cent of the net income of the year, £21¼ million. Furthermore, this Ordinary dividend, requiring £14 million before deduction of income tax, represents a return of 4.8 per cent gross on an employed capital of £295 million, which according to the Company's balance sheet is the employed capital belonging to the Ordinary stockholders.

I referred last year to the Employees' Profit-Sharing Scheme then being introduced so as to operate from January 1, 1954. The Board regard it as a valuable development in industrial relations and one means of emphasising the essential unity and partnership of all those who are engaged in the Company's business.

CURRENT YEAR'S TRADING

As regards current trading, I am pleased to tell you that in 1955 we have so far experienced a period of great activity. The general level of both home and export sales is well above that of the corresponding period of last year. In fact, I do not think I can do better than repeat the words that I used to the stockholders last year and say that "So far this year the Company has enjoyed, in common with other industries in this country, a period of expansion, and the prospects are in general good."

This, of course, assumes that the very serious strikes which so gravely affect our national economy are not allowed to recur and that our united efforts can be successfully directed to minimising, if not eradicating, the deplorable setback which the country as a whole has suffered.

On the other side of the acount, I would tell you that the increased level of sales this year, to which I have referred, is due to some extent to production now coming forward from new plants which have recently been completed. Competition, particularly overseas, is strong, but we are confident that, provided our prices do not have to be put up because of rising costs at home, we can meet this competition and make still further progress. It is much to be hoped, therefore, that all concerned in these matters will realise the serious effect which further upward movements in wages, freight charges and in the price of fuel and other raw materials, may have upon the exports of this country as a whole.

The report and accounts were adopted.

LOBITOS OILFIELDS, LIMITED

RECORD PRODUCTION

The forty-seventh annual general meeting of Lobitos Oilfields Limited was held on June 20th in London, Mr F. C. Bowring, chairman, presiding.

The following is an extract from the Chairman's circulated statement for the year 1954:

Crude Oil production by your Peruvian subsidiary company reached the all-time record of 490,338 tons. This figure compares with 461,225 tons for the previous year, and represents an increase of 6.3 per cent over that year.

The improved production did not come from any spectacular discovery, but from a series of factors. The most important of these were the continued success of pressure maintenance and consequent lower rate of decline in the Lobitos field, the continued concentration on the improvement of drilling completion and production methods, and to the efforts of the Production Department in the field of gas-lift and displacement pumping.

FOOTAGE DRILLED

During the year under review the footage drilled totalled 206,152 ft, compared with 223,222 ft in the previous year. In all 61 wells were completed, of which 15 were exploration wells; of the latter, six were producers, and of the total 38 produced oil. Thirteen wells were suspended for deepening with a heavier rig at a later date.

Production from the "Strip" Area, the original area of Joint Development, amounted to 161,130 tons compared with 129,181 tons for the previous year. The Peruvian Company's share of this production amounted to one-half, i.e., 80,565 tons, which as usual is not included in the total production figure given earlier in this statement, and gave a satisfactory profit. Six wells were completed in this area, of which four were producers. This increased production was unexpected and was due to the excellent results obtained from two wells.

Production from the second area of Joint Development, Area "A," was 86,716 tons, compared with 16,417 tons in the previous twelve months.

The consumption of Refined Products within Peru continued to increase, resulting in your subsidiary company's contribution to the domestic market being increased from 60 per cent of their production in 1953 to 65 per cent in the year under review.

PROFIT AND DIVIDEND

The Gross Profit of the Group, before charging the Debenture Interest, at £1,268,990 shows an increase over the comparable figure for 1953 of £197,803. The Gross Profit of Lobitos Oilfields Limited before taxation is £700,895 including £269,795 received in dividends from the subsidiary companies. The net profit after taxation is £336,431 and after payment of the proposed final dividend the carry forward of the Profit and Loss Account will be increased by £83,832.

The Board now recommends a payment of the final dividend of 8 per cent (less Income Tax) which together with the interim dividend of 6 per cent represents a total distribution of 14 per cent out of the Trading Profits for the year plus a special distribution of 2 per cent (not liable to Income Tax or Surtax in the hands of the Stockholders) from the Investments Reserve out of profits realised on the sale of investments.

The report and accounts were adopted.

SUEZ CANAL COMPANY

INCREASED VOLUME OF TRAFFIC

The Annual General Meeting of the Suez Canal Company was held on June 7th in Paris.

M. Francois Charles-Roux, the President, in the course of his speech, said:

Traffic increased beyond our expectations. This improvement affected both the number of transits and the tonnage of the ships: 13,215 passages as against 12,731; 102,494,000 tons as against 92,905,000.

In step with the increase in traffic, that of receipts came up to estimates. It was even higher: nearly 32⅓ thousand million francs against less than 31. This increase justified the reduction which we informed you of a year ago and which came into force on July 15, 1954.

The results of the first five months of 1955 showed an increase in receipts of about 630 million francs compared with 1954. This is the reason why we thought it possible and advisable to extend the reduction in dues adopted last year for a period of twelve months.

The rise in receipts has almost been offset by that in expenditure which rose from 15,406,437,000 francs in 1953 to 16,861,889,000 francs in 1954.

In spite of our efforts to keep down the cost of working the Canal, we must not labour under the delusion that it is not going to be more costly as it becomes more active. The growth in traffic, if it brings in substantial profit, cannot but include some liabilities. It is obviously impossible to ensure the transit of an average of 42 vessels daily—which means on certain days a peak of 50 and sometimes 55 ships—and also to ensure within 16 hours the transit of ships of constantly increasing tonnage without having more pilots, paying more pilotage bonuses and spending more on repairs of equipment, fuel, and maintenance dredging.

We may hope, nevertheless, if the growth of traffic continues, that in 1955 the rise in expenses will be smaller than the increase in receipts.

The essence of sound and remunerative operation is to keep the Canal permanently in a fit state to give passage, in a reasonable time, to the stream of shipping arriving at both ends to pass from sea to sea.

This is the reason why we placed before your International Advisory Commission of Engineers the eighth programme of large-scale works. This scheme, on which the Commission reported favourably, is divided into two instalments, the work we have put in hand being all part of the first.

DIRECTORS' REPORT

The following are extracts from the Directors' Report:

The financial year under review today has been marked by a new and regular increase in the volume of traffic

But this rapid rise in traffic inevitably entails additional expenses, whilst the fact of approaching the end of the Concession lays on the Company new burdens of various kinds.

For the future, everything points to further expansion of traffic as a result of the increased consignments of oil from the Middle East.

Your Board has examined a programme of works and has decided on a first instalment. This includes the creation of two by-passes, one at Port Said and the other at the southern outlet of the Great Bitter Lake. The average maximum capacity of the Canal will then be increased from 40 to 48 ships per day, with the possibility of coping with peaks of 60 ships per day. The completion of this first instalment will take about three years and will entail an outlay of about £6 million.

The number of transits by vessels over 300 tons gross rose to 13,215, showing an increase of 3.8 per cent over 1953. Net tonnage, with an increase of 10.3 per cent reached 102,494,000 tons.

Among the 46 countries whose ships used the Canal in 1954, Britain retains first place with a record tonnage of 32,909,000 tons, which represents a share of 32.1 per cent of the total.

Cargo traffic, totalling 96,881,000 tons weight, shows an increase of 7.2 per cent compared to 1953.

Southbound traffic, with 22,370,000 tons, is very slightly lower.

Northbound cargo traffic, with 74,511,000 tons, shows an increase of 6,630,000 tons, or 9.8 per cent compared with the previous year.

THE ACCOUNTS

Total receipts in 1954, including receipts in respect of past financial periods, amounted to 32,455,700,791 francs, an increase of 1,602,170,277 francs over the previous year. Expenditure for the year amounted to 15,122,860,163 francs. After deducting interest on and redemption of capital, and expenditure in respect of past financial periods, the surplus comes out at 15,593,811,114 francs.

Transit receipts have improved by 5 per cent from last year. Social charges have advanced by 958,211,698 francs.

Expenses in Egypt rose from last year by just over 3 per cent, this increase being mainly due to the growth of traffic.

Charges in respect of interest on and redemption of capital show scarcely any change from one year to the other.

To the surplus of 15,593,811,114 francs is to be added 16,058,846 francs brought forward from last year, so that the total sum, on the distribution of which you will have to decide, amounts to 15,609,869,960 francs.

We propose that the following appropriations be made out of this sum to the following provision accounts: Depreciation and Renewal of Plant, 1,000 million francs, this amount being justified by the large orders already placed; 2,500 million francs to Reserve for New Works, having regard to the statement already made on the first instalment, now being carried out, of the eighth programme of improvement works; Insurance and Contingency Funds, 600 million francs; and 1,000 million francs to Extraordinary Reserve.

After these various allotments, a sum of Frs. 10,509,869,960 will remain available

The distribution proposed to you and which amounts to ... ... Frs. 10,422,535,211
would leave a balance of Frs. 87,334,749
which we again invite you to carry forward.

The proposed distribution would correspond to a gross dividend of Frs. 9,250, to which will be added, in the case of capital shares, the statutory interest for 1954, amounting to Frs. 1,429.28.

The full report, in French, will be sent on application to the Company at 6 Bishopsgate, London, E.C.2.

THE CENTRAL MINING & INVESTMENT CORPORATION

FIFTY YEARS OF PROGRESS

The fiftieth annual general meeting of The Central Mining & Investment Corporation, Limited was held on June 20th in London.

The Right Honourable Lord Baillieu, KBE, CMG (the Chairman), presided and in the course of his speech, said:

On May 9th the Corporation celebrated the Golden Jubilee of its founding in 1905 by the partners of Wernher, Beit & Co., a firm which played a very conspicuous part in the early development of both Kimberley and Johannesburg. Our hope is that as a result of our stewardship our successors in 50 years' time will be able to record further progress and expansion.

The Accounts now under review indicate that in 1954 the Corporation had a good year though the bloom has been removed to some extent by the incidence of taxation.

It is, of course, our custom to maintain a surplus of current assets over current liabilities and provisions, and to ensure the liquidity of the deposit and current accounts of our associated companies. This surplus at December 31st last was over £3.1 million or nearly £1 million more than at the end of 1953. Accordingly, we are in a position of considerable strength. The Board has allocated £550,000 to Reserve thus contributing to the expansion of the Group's net assets from £10.9 million to £12.1 million.

The year 1954 saw a steady expansion in the scale of operations of the Gold Mining Industry and the results reflect a satisfactory achievement.

MINING DEVELOPMENT

On the mining side, 1954 marked a great advance in the production of uranium. At the end of that year 13 companies were producing and profits from uranium rose from under £2 million in 1953 to over £8 million in 1954. The Orange Free State goldfield continued to open up impressively, although development results show that within the field there is a wide variation in the fortunes of the individual mines

Central Rand and Eastern Transvaal Gold Mines: Many of these famous old mines began production between the closing years of the last century and the beginning of the first World War. Hence, you will, I feel, agree that it is not surprising if, after a half-century of profitable operation, several of them are in or near the closing stages of their careers.

I would refer, however, to the young and vigorous Orange Free State Harmony mine, where production of gold began last September—four years from the start of shaft sinking—and where the production of uranium is now under way. Progress to date is encouraging and is welcome in that this new mine offsets, in some degree, the inevitable contraction in numbers of our Group mines.

The two collieries in the Group again earned reasonable profits having regard to the continued adverse effects on operations of the inadequate South African railway facilities. The principal industrial companies of the Group all experienced satisfactory trading conditions in 1954.

We continue to maintain our interest in the oil industry through our investment in Trinidad Leaseholds, Limited.

The report was adopted and a total dividend of 2s. 9d. per share was approved.

AMALGAMATED LIMESTONE CORPORATION

PROGRESS OF HOME INVESTMENTS

MR D. W. CLEAVER ON THE YEAR'S DEVELOPMENTS

The fourth annual general meeting of Amalgamated Limestone Corporation Limited was held on June 21st, Mr D. W. Cleaver, DSO (the chairman), presiding.

The following is his circulated statement :

The Directors' Report and Accounts for the year ending October 31, 1954, having been in your hands for the statutory period, it is presumed that they can be taken as read.

When, in June, 1950, shareholders of our Parent Company were invited to participate in this, its Subsidiary Company, it was emphasised that we should have a long row to hoe, and last year I referred to the probability of the incubation period being somewhat extended. As far as our Kenya interest is concerned, this still holds true, but in view of our profitable investment in Ulster and the progressively increasing profit now to be expected from our wholly owned limestone and cement undertakings in this country, we feel that a distribution based on the earnings of these home investments should not be long delayed.

THE ACCOUNTS

The extension of our small cement works at Plymouth cannot be completed much before this time next year. Meantime, due to Capital Expenditure having not yet become fully productive, an unduly high proportion of trading profit has been absorbed by Depreciation—£32,600 out of £50,600 in the year under review and £92,500 out of £166,000 since inception. Taxation has accounted for £30,000, leaving net undistributed profit carried forward of £43,765, of which £14,972 net, after tax, was contributed in the year under review.

In Ulster Limestone Corporation Limited, our investment comprises £37,000 6½ per cent Redeemable Stock out of £94,250 issued, and 47,500 1s. Shares (£2,375) out of 100,000 issued. This Company has continued to prosper exceedingly, and we anticipate in the immediate future the redemption out of profit of 30 per cent—£11,100—of our stockholding. Given continuity of trading and profit earning on the present scale, we may, I think, confidently expect the whole balance of our stockholding to be similarly redeemed within two or three years.

KENYA INTEREST

The cement works at Mombasa, Kenya Colony, which this time last year I was able to tell you had then recently commenced production, has a similar financial structure, viz., £100,000 Share Capital in 2 million 1s. Shares and £560,000 6 per cent Redeemable Stock entitled to repayment before any cash distribution on the Share Capital. It has recently issued its balance sheet and accounts made up to October 31, 1954, which disclose Capital Expenditure of £700,000. Development Expenditure prior to production of £79,500, and a small balance to the credit of the Profit and Loss Account. This current Financial Year now half spent, is already showing trading profit at a rate which should suffice not only to cover interest on the Redeemable Stock accrued to the end of October, 1955, but also to meet further Capital Expenditure of about £150,000 now being incurred partly on housing for the staff and partly on bringing the third kiln into operation in September this year. Then, having attained a capacity of at least 100,000 tons per annum, compared with a production of about 60,000 tons in this current Financial Year, we can reasonably look forward to that Company being in a position to redeem its £560,000 Stock out of profit within a couple of years. Alternatively, its Board may decide to duplicate the plant, in which event such Stock redemption would be postponed by a further couple of years, but the value of the enterprise to shareholders would be correspondingly enhanced.

Our interest in this concern, direct and indirect, is 45 per cent of its Share Capital, which, in the now not too distant future, we are confident will prove to be a very satisfactory investment.

In conclusion, I am sure you will join with me and the Board in thanking the staff for their wholehearted keenness and enthusiasm. The report was adopted.

AMALGAMATED ROADSTONE CORPORATION

BOARD'S CONFIDENCE JUSTIFIED

STRONG POSITION OF SHIPPING SUBSIDIARY

COLONEL W. H. GATTY SAUNT'S REVIEW

The nineteenth annual general meeting of Amalgamated Roadstone Limited was held on June 21st, Colonel W. H. Gatty Saunt (chairman and joint managing director) presiding.

The following is his circulated statement : The Directors' Report and Accounts for the year ended October 31, 1954, having been in your hands for the statutory period, it is presumed that you will take them as read.

The first point to which I should draw your attention is that, in pursuance of the advice of our Auditors, the accounts of our Subsidiary, The Williamstown Shipping Company Limited have this time been consolidated in the Group Accounts. Not only do we now own the whole of that Company's Preference Shares, carrying a cumulative Preference Dividend of £20,000 per annum, but we have also increased our share in the equity.

FLEET CHANGES

During the year under review, one old ship was sold and another ran ashore in a gale and became a total loss, fortunately without loss of life or accident to any member of the crew. The ship lost was, of course, fully covered by insurance. A new ship is due for delivery in June, and three more now under construction are due for delivery next summer, and they will all of them have been paid for out of ploughed-back trading profits.

The fleet, valued at the date of the Balance Sheet at just over a million, should by then be worth about a million and a half and comprise exclusively ships of postwar construction. With capital, revenue and future taxation reserves aggregating £650,000 and ships worth £300,000 more than Balance Sheet figures, this Subsidiary is in a strong position and is of great value, directly and indirectly, to our Company.

I should next like to draw your attention to the cash position disclosed in the Consolidated Balance Sheet—a Bank overdraft of £255,538 offset by cash balances of £239,081. Other Liquid Assets amounting to £1,696,666 and current liabilities to £1,320,560 show an aggregate net liquid surplus of £359,649.

INCREASED DIVIDENDS AND CARRY FORWARD

My last year's optimistic remark that "Your Directors felt justified in expressing their confidence that this year's results would be excellent," is, we think, fully borne out by the fact that we have been able not only to increase dividends by £60,000 gross—12½ per cent on the increased Ordinary Capital of £1,200,000, compared with 10 per cent on £900,000—but also to increase the amount carried forward by £80,000 net—almost equal to the net amount of Ordinary dividends. The additional tax-free distribution of 1½ per cent net—the same rate as last year but on the increased capital—is equivalent to 2½ per cent gross.

Taxation is still a heavy burden. In addition to the liability of £329,423 for Current Taxation, Reserves for Future Taxation amount to £587,873—together more than £917,000. Capital and Revenue Reserves aggregate £830,000.

We are still incurring considerable Capital Expenditure, especially in the Shipping Company and in our Limestone Subsidiary. The former I have already described above ; the latter is referred to by my colleague, Colonel Cleaver, Chairman of Amalgamated Limestone Corporation Limited, in his statement.

Incidentally, when reading what he has to say, you should bear in mind that this, the Parent Company, owns 51 per cent of the Share Capital.

POTENTIAL DEMAND FROM ROAD PROGRAMME

One perennial grievance of spokesmen of our industry has to some extent been alleviated by the Government at long last recognising the necessity of greater expenditure on roads. While this may encourage us in the long run to look forward to increasing demand for our products, it is premature to expect any benefit therefrom in the current Financial Year.

Another grievance which is almost perennial with Companies engaged in our industry is the weather. This winter has, in fact, been more than usually severe, with the result that our figures for the first half of the current Financial Year are not quite so good as last year, but, given reasonable conditions for production and delivery during the summer, we hope by the end of October to have achieved results at least equal to those of last year.

However, weather is not, unfortunately, the only contingency. At the moment of writing, both dock and railway strikes are in progress. Although, fortunately, we rely only to a minimum extent on railborne transport and on dock labour in the delivery of our products, it is obviously difficult to foresee in what way and to what extent we might be adversely affected by the general chaos which may ensue.

Having been engaged in this industry ever since the General Strike of 1926, I personally cannot recollect any strike or serious labour trouble at any of our Company's quarries or, indeed, throughout the quarrying industry. I feel, therefore, that we should now take this opportunity to express our gratitude not only to all members of our staff, but also to every workman in the service of the Company and, in these troublous times, comfort ourselves with the knowledge of their unremitting zeal and loyalty.

The report and accounts were adopted.

ALLEN WEST & COMPANY

HEALTHY ORDER BOOK

The forty-sixth annual general meeting of Allen West & Company, Limited, was held on June 21st at Brighton, Mr M. W. H. Lancaster, MC, FCA (the chairman), presiding.

The following is an extract from his circulated address: The Trading Profit for the year ended January 31, 1955, is greater than the corresponding figure for 1954 by £14,500, but through our associated French Company reducing its dividend, Dividends on Investments are lower by £3,000.

APPROPRIATIONS

The Net Profits at £425,400 compare with £338,600 last year and we recommend that they be appropriated as follows:

(1) Transfer to General Reserves £285,000. (2) Pay a dividend of 15 per cent on the Capital of the Company as increased by the capitalisation of a part of the reserves approved by you in February last, costing £144,787 net. (3) To complete the Capital reconstruction of the South African Company which I explained in my address last year, which will cost £80,000.

After these recommended appropriations there remain profits to be carried forward of £134,000 as against £218,000 last year.

BALANCE SHEET FEATURES

Turning to the Consolidated Balance Sheet you will see that during the year we had delivered to us £100,000 worth of new plant. As I have said on other occasions, our Board believes in having the finest plant procurable and we never hesitate to dispose of plant which has still many years of useful life, but which can be economically replaced by a more efficient tool.

If the Balance Sheet now before you and dated January 31, 1955, had been dated February 7, 1955 (the date when the capitalisation of reserves took place), then the Capital structure would have appeared as follows:

	£
Capital and Reserves:	
Capital issued	1,755,000
Capital Reserves arising on the acquisition of Shares in Subsidiary Companies ...	103,670
General Reserve	1,107,079
Reserve for Contingencies ...	6,000
Unappropriated Surplus ...	133,932
Total Capital Employed ...	£3,105,681

From what I have said you will have appreciated that the year under review has been a very good one and coupled with the drop in tax liability has produced a Net Profit only £3,000 less than our record year ended January 31, 1953.

EXPANDING OVERSEAS REPRESENTATION

Our order book remains healthy and our products are well received throughout the world and we continually expand our representation to cover those portions of the world which are becoming gradually more commercialised.

Mr V. Breeze, our Managing Director, has recently returned from a visit to South Africa, which had for its object an appraisement of our new factory there and of the organisation as a whole. Your Board were pleased to hear from Mr Breeze on his return that he was more than satisfied with everything he saw. It was obvious that the prestige of Allenwest S.A. (Pty.), Limited, is very high. The report was adopted.

WALTHAMSTOW BUILDING SOCIETY

The annual meeting of the Walthamstow Building Society was held on June 16th at Walthamstow, London.

Mr Reginald W. Beken, FRICS (Chairman), presided, and in moving the adoption of the report and accounts said:

We have as a metropolitan Essex society made excellent progress. For upwards of three-quarters of a century we have provided good service for both investors and borrowers. Last year's progress was particularly outstanding.

The total amount standing to the credit of investors' accounts rose by £566,586 to £2,532,905, a new record.

It is our endeavour to propagate the ideal of thrift everywhere. In 1953 we increased the rate of interest paid to shareholders from 2½ per cent to 2¾ per cent and the wisdom of paying these rates now becomes manifest.

In making advances, the board pursues a cautious policy. After allowing for redemptions, the total mortgage balance established another new record of £2,344,287 spread over nearly 3,000 accounts.

The Board considers that the amount of our financial liquidity totalling £278,063 is in every degree adequate for our needs. These resources showing a financial liquidity ratio of 10.59 of our increased assets engender the fullest confidence in the society's financial position.

The satisfactory results which I have given you reflect the quiet efficiency of the management and augur well for the society's further progress.

Mr Herbert A. Chappell, JP (President), seconded the resolution, and the report and accounts were unanimously adopted.

BARTON & SONS

The Ordinary General Meeting of Barton & Sons Limited was held on June 22nd in London, Mr A. H. Redfern (the chairman) presiding. The following is an extract from his circulated statement:

At the last Annual Meeting I had to report that trading conditions for the first few months of 1954 had not shown much improvement on 1953. I am glad to report, however, that an improvement occurred during the last six months of the year, sales increased, and this brought into production new Plant which had been installed in 1952. The profit on trading is £737,605, compared with £605,824 for the previous year, and after providing for all normal charges, including Depreciation, there remains a Profit of £594,279, from which taxation of £303,792 is deducted, leaving a Net Profit for the year of £290,487, compared with £214,947 for 1953.

Consolidated Balance Sheet: Reserves have increased from £1,067,550 in 1953 to £1,274,196—an increase of £206,646, and the excess of Current Assets over Current Liabilities has increased by £207,695.

The Trading results of our Overseas Subsidiaries are very satisfactory.

In addition to the final dividend of 10 per cent and a Bonus of 2½ per cent on the Ordinary Stock, you will be asked to pass a Resolution approving a Bonus Issue of one fully paid 5s. Ordinary share for every 30s. of Ordinary stock held.

Prospects for 1955 are good.

The report was adopted ; the total dividend for the year of 17½ per cent was approved and the Board's capitalisation and scrip issue proposals were sanctioned.

JOHN BRIGHT AND BROTHERS, LIMITED

INCREASED TRADING PROFIT

The thirty-second annual general meeting of this company was held on June 22nd in London.

Dr E. P. Andreae (the Chairman), in the course of his speech, said: Turning to the Accounts, you will see that the Gross Trading Profit at £1,033,010 compares with £1,012,418 for the previous year, an increase of £20,592. On the other hand, the net Profit is lower by £70,178. This, as mentioned in the Directors' Report, arises chiefly from Taxation adjustment, the figures last year having had the advantage of £100,000 from a Taxation Reserve no longer required.

You will agree that the Accounts in general disclose a very strong and a very liquid position with Reserves now totalling well over £2 million and with Cash and Tax certificates amounting to rather more than another £1 million.

The Directors are recommending a final dividend of 15 per cent which, with the interim dividend already paid, makes a total of 25 per cent. This is the same total percentage as for the previous year, but, being declared on the larger capital, means an additional net distribution of £31,250.

Outstanding Capital Commitments are shown at £75, 664 as against £132,528 for the previous year. Since the date of the present Accounts, fresh Capital Commitments have been entered into to the extent of some £275,000.

NEW FACTORY

You will be aware that over the last 12 months several motor car manufacturing companies have announced plans for substantially increasing their present factory capacity. It will be some time before cars and lorries flow from these new production lines, but ultimately it will mean a greater demand for tyre cord fabric. We are building a new tyre fabric factory, merging it with an existing one, and equipping it with the very latest types of handling and productive machinery. When this project is completed in 12/18 months time, we shall have a greatly increased capacity and will be able to meet any required demand made upon us.

It is now universally known that rests are recent years has almost entirely ousted is Indo- as the raw material for Cord Fabric. nent of difficult- lends itself admirably to the manufacture public the highest grades of Cord Fabric and realise ing Cotton machinery can, relatively easily will be adapted to its use, but probably the advantage to tage in price as compared with Cotton has been primarily responsible for its rapid introduction on such a large scale.

More recently Nylon and Terylene and other so-called "man-made" fibres of a more or less similar character have become widely known to the public, particularly in the fashion trades. These fibres which are chemically entirely different from Rayon are now rapidly proving themselves of great actual and potential value for industrial purposes over a very wide field. Our Research and Development Staff and our Laboratories are making a very close study of these Fibres.

You will no doubt expect me to say a few words about the future outlook for your Company. It must, I think, be obvious to you after hearing my summary of our plans for expansion, that your Directors, taking the long view, are very confident of a prosperous future. To take the shorter view, that is to say, the outlook for the current year, I feel that we may look forward with quiet confidence to another year of satisfactory trading. The report was adopted

COMPAGNIE FINANCIERE BELGE DES PETROLES "PETROFINA" BRUSSELS, BELGIUM

DIRECTORS' REPORT

The Annual General Meeting of PETROFINA was held in Brussels on May 13th, and the following are details of the report presented by the Board of Directors:

GENERAL SURVEY

For the oil industry the most outstanding event of the past year was the settlement of the Anglo-Persian problem. The development of nuclear energy foreshadowed important changes in methods of research, production and the processing of petrol.

In spite of signs of a downward trend during 1954, particularly in the United States economy, the consumption of petrol and related products showed an increase compared with the previous year:

2 per cent in the United States;

12 per cent in Western Europe;

11 per cent in Belgium.

Prospects for a further rise in consumption during 1955 are encouraging.

World production was 4 per cent up on 1953 and totalled 682 million tons.

In the United States large-scale prospecting continued. Middle Eastern production showed a further rise of 11 per cent and reached 136 million tons. In Venezuela output also increased by 6 per cent. Canadian wells produced 13 million tons, a rise of 17 per cent. Further progress was also made in Europe and in the East.

Refining capacity expanded equally throughout the world, and tanker tonnage totalled 39.5 million tons at the end of 1954.

THE YEAR'S DEVELOPMENTS

The Company continued its progress both [illegible] Belgium and elsewhere. In Belgium consumption increased by about 11.4 per cent. The French subsidiaries, PURFINA FRANCAISE, Amalgamated and associated companies, did well, June 21 advance could also be registered in [illegible] (chairman of PETROFINA PETROLEUM PRODUCTS presided). Other countries with PETROFINA subsidiaries are the Netherlands, The [illegible], Switzerland, Italy, various parts of year [illegible], Egypt, Mexico and Canada. The expansion of the Company's activities last year involved considerable funds. The capital was accordingly increased by Bfrs. 100 million towards the end of the year, by capitalising reserves. Loans were also floated in Switzerland and the Netherlands for Sfrs. 40 million and Hfls. 20 million respectively.

RESULTS

The year 1954, thirty-fourth of the Company, showed satisfactory results.

The amount available for distribution at the end of the year totalled Bfrs. 400,451,758.84, including the balance brought forward from 1953

It is proposed:

to transfer Bfrs. 100 million to the reserves; to distribute Bfrs. 207.9 million by way of a net dividend of Bfrs. 110 for each of the 1,890,000 shares constituting the Company's capital;

to carry forward a balance of Bfrs. 68,926,758.54.

The report and the accounts were adopted.

RUBBER PLANTATIONS INVESTMENT TRUST

The forty-sixth annual general meeting was held on June 22nd in London.

Sir Eric Macfadyen, the Chairman, presided and the following is an extract from his address: The year's revenue was £191,060 before taxation, giving an earnings yield of 11.05 per cent. The balance left after tax is £105,834. With £98,673 brought forward, the total of undistributed profits becomes £204,507. We are recommending a 10 per cent dividend, against 7 per cent a year ago, which will take £99,392 and leave a carry forward of £105,115.

At the close of the year, the net book cost of investments stood at £1,712,499, and their net valuation was £82,384 below that figure. Current assets exceed current liabilities, including the proposed dividend, by £318,869. Liquid funds, which under present circumstances are employed profitably in short-dated securities, are double what they were a year ago The break-up value of the stock has improved from 2s. 0½d. to 2s. 3d. per 2s. unit. Present indications are that the Trust's income should again be higher.

Many transactions individually small were carried out in our Plantation holdings, sales predominating in the case of Tea. Taking advantage of favourable market conditions, we have continued to reduce our stake in Companies in which we considered it had been on the high side. Investments in Companies operating in Indonesia still represent 15 per cent (in value) of the portfolio but are in Companies which hold outside Indonesia, more cash per share than the equivalent of the cost of the shares in our books. They give us a free option on Indonesian recovery, while paying for their keep. The report was adopted.

SIAMESE TIN SYNDICATE

IMPROVED OUTLOOK

The annual general meeting of the Siamese Tin Syndicate Limited was held on June 23rd in London, Mr Robert S. G. Scott, chairman, presiding.

The following is an extract from his circulated Review for 1954:

The production for the year was 1,998 tons of tin concentrates compared with 2,642 tons produced by the group in 1953. This drop in output is accounted for partly by reason of the Bangrin No. 1 dredge having been under repair for some four months, and partly by reduced recoveries by other dredges of the group. Besides the fall in output we have suffered a reduction in the average price obtained for our concentrates. Against these adverse factors there has been some reduction in our costs. This is attributable to some extent to a decrease in mining costs but is mainly the result of a most welcome reduction of Thai export duty which has been operative throughout the whole of 1954.

Under the circumstances, our profits have suffered. The consolidated net profit before tax is £265,731. This represents a considerable drop. The taxation provision has, however, been considerably reduced so that the net amount available is £137,837 as against last year's figure of £134,822. Our total reserves at the year end stood at approximately 126,800,000 cubic yards estimated to contain some 29,700 tons of tin ore.

Given a continuation of present conditions and tin price, I have every hope that 1955 will show an improvement over 1954. Our production to April 30th showing an increase of about 10 per cent is a welcome pointer in this direction.

The report and accounts were adopted.

GEORGE SWIFT & SONS (HOLDINGS), LIMITED

(Machinery Manufacturers)

INCREASED TRADING PROFIT

MR W. P. EASTWOOD'S REVIEW

The thirteenth annual general meeting of George Swift & Sons Limited was held on June 21st at Halifax. Mr W. P. Eastwood (Chairman) presided. The following is his circulated statement:

The group turnover for this year is up again, giving a bigger trading profit of £155,700 against approximately £130,000.

The provision for Income Tax is higher by approximately £11,000, but this year an equivalent saving is made through not having to suffer Excess Profit Levy, with a result that the final group net profit, after all charges and provision for taxation, stands at nearly £69,000 against £39,000 last year.

Another point of interest is that we have changed over from an overdraft at the Bank of approximately £17,000 to a credit at Bank and in Hand of £49,000.

In view of the foregoing position it may be asked why the Directors do not recommend a larger Dividend distribution than the proposed 22½ per cent. The answer is that in view of unforeseeable difficulties in the future and a somewhat larger capital expenditure programme to be incurred on new plant, it is deemed advisable to place something to reserve, and you will note an amount of £40,000 has been transferred to this account.

Secondly, it was considered desirable to finally wipe out of the Consolidated Balance Sheet the item "Excess Cost of Shares in subsidiary Companies over their nominal value, etc." This has been done by taking a further £12,658 from the balance on Profit and Loss Account.

The expenditure on new buildings and plant, incurred over the last few years, is beginning to bear fruit and our new Southedge Works is now operational. We have transferred from our Claremont Works to Southedge the whole of our Gear Cutting Section, and also installed a very large new Planing Machine which will enable us to tackle bigger machines than we could hitherto. A few machines have also been built in these premises, which is a help to relieve congestion in our other Works.

Our arrangements with our Associate Firms outside the group have worked very harmoniously during the past year and we have been able to offer them a full programme for the next twelve months plus.

So far as our order book is concerned, this shows no signs of diminution although conditions, particularly with regard to export, are getting increasingly difficult due to the fierce competition from abroad which is hard to meet due to the ever increasing costs of production here through wages awards and their concomitant increase in cost of materials, fuel, transport, etc.

However, as mentioned, we still have a very healthy order book and providing no major material shortages arise as a result of the recent strikes and other troubles, we may hope to maintain our position and look forward to another satisfactory year.

Once again I must pay tribute to the Management, Staff and Works for their efforts during the year, and hope we may be able to continue to find full employment despite the obvious difficulties that are going to arise as a result of the recent strikes.

The report and accounts were adopted.

UNION INSURANCE SOCIETY OF CANTON

ASSETS EXCEED £18 MILLION

The Annual Meeting of the Union Insurance Society of Canton, Limited, was held on May 26th in Hongkong, the Honourable C. Blaker, MC, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £3,412,179. After releasing £135,000 to profit and loss account the marine fund stands at £5,274,495.

Fire.—The net premiums for the year amounted to £3,629,233; £320,839 has been transferred to profit and loss account. The fire fund stands at £2,007,079.

Accident and General.—The net premiums for the year amounted to £3,090,024; £82,075 has been transferred to profit and loss account. The accident and general fund stands at £1,436,025.

Profit and Loss Account.—Interest and dividends amounted to £464,655 and transfers from underwriting accounts to £537,914. After charging outgoings not brought into account elsewhere, making provision for taxation, and allowing for the minority interests of the outside shareholders of a subsidiary company, the profit for the year appertaining to the society is £720,860.

Consolidated Balance Sheet.—Total assets amount to £18,198,132.

CHAIRMAN'S STATEMENT

The premium received in the marine department shows a fall of £79,922 from £3,492,101 to £3,412,179. This does not indicate a reduction in marine liabilities assumed; in fact, the reverse is the case and our marine account continues to expand. The lower aggregate premium results from the need to meet competition on a world-wide basis, coupled with an appreciable reduction in war risk rates for most voyages during the last quarter of the year.

The substantial marine fund, representing more than 154 per cent of the 1954 premium, is considered fully adequate to meet all outstanding losses.

The fire department continues to produce particularly good results, in spite of 1954 having been beset by a series of catastrophes in the areas in which we operate.

I have again to record substantial progress in the Accident and General business where the premium income has increased by £461,356 to £3,090,024. The underwriting of Motor insurance continues to present difficulties in certain fields and these are reflected in a higher claims ratio to premium than that for the previous year. Acquisition costs were also somewhat higher in 1954.

Our Canadian subsidiary the Beaver Insurance Co. has made satisfactory progress with a total premium increase of 20.85 per cent.

With the continued increase in our investment earnings, less such taxation as is deducted at source, your directors are able to recommend an increase of two shillings and sixpence in the final dividend, making a total payment of £2 2s. 6d. It is also proposed to increase our share capital by the issue of one new share for every nine shares now held, and you will have received notice of an Extraordinary General Meeting to be held immediately after the Ordinary Yearly Meeting to pass the necessary resolutions for this purpose. It is anticipated that the annual dividend will be maintained for the current year on the increased capital. The report and accounts were adopted.

TIMOTHY WHITES & TAYLORS LIMITED

PROFIT IMPROVEMENT MAINTAINED

The twenty-sixth ordinary general meeting of Timothy Whites & Taylors Limited was held on June 23rd in London, Mr George Ingham Rushton, MPS (Chairman and Managing Director), presiding.

The following is an extract from the circulated statement by the Chairman:

The trading profit and sundry income of the group for the year ended January 1, 1955, was £1,413,681, compared with a figure of £1,373,558 for the 53 weeks ended January 2, 1954. Equated to 52 weeks, the appropriate figure for comparison with the year ended January 1, 1955, is £1,347,642, from which it will be seen that the improvement in the profits has been maintained.

The Directors are recommending a final Dividend on the Ordinary Share Capital of 21 per cent, less tax, making 30 per cent, less tax, for the year.

The policy of expanding the business of the Group continued to a large extent during the year under review. Twenty-four additional branches have been established and a large number of branches have been enlarged and refitted.

Coupled with the extensions of the Group's activities, the policy of the Board is to close branches which have become uneconomic, and during the year thirteen of such branches have been closed.

THRELFALL'S BREWERY

STEADY PROGRESS

The annual general meeting of Threlfall's Brewery Company, Limited, was held on June 16th in London.

Mr F. Cornwall (chairman and managing director), in the course of his speech, said: Once again it is a great pleasure to me to inform you of our company's steady progress. I am able to report another good trading period, as notwithstanding the present high prices, which include such a heavy Duty, we found a sustained demand for our beers.

Your board recommend a dividend on the Ordinary Stock, which represents an increase on last year. I have no doubt you will derive satisfaction from the reasonable increase in the profit from trading especially when I remind you of the ever increasing prices for the scores of commodities we must purchase to run the business, and also our overhead costs for wages, coal, electricity, rates, and other items which still continue to rise. We have to meet these extra charges which so far have been absorbed by the larger turnover, not being in the position generally adopted of passing on increased costs to the consumer.

The profit from trading is £844,179, an increase of £27,277. The charge for taxation at £424,243 is reduced by £6,544. The net profit is £301,311 and after adjustments the profit is £366,991 out of which interim dividends have been paid amounting to £86,699.

The report was adopted and a dividend at the rate of 22 per cent per annum on the Ordinary Stock for the half-year ended March 31, 1955, making 18 per cent for the year, was approved.

The sales and dispensing figures for the current year up to the present exceed those of the corresponding period last year, and I look forward again to satisfactory results this year. The report was adopted.

BAH LIAS RUBBER ESTATES

INDONESIAN ELECTION EXPECTED THIS YEAR

The forty-fourth annual general meeting was held on June 17th in London.

Sir Eric Miller, the Chairman, who presided, said in the course of his address:

Before providing for the Indonesian Government's 66⅔ per cent Levy on remittances or for taxation, the parent company's profits is £122,977, including the Kulai dividend of £27,930 gross and other investment income. The directors recommend the payment for the fourth successive year of a dividend of 10 per cent less income tax.

The exceptionally strong financial position of the group has again led one or two important stockholders to write to the Board urging a capital repayment and it therefore seems opportune for me to recall briefly what I have said on previous occasions.

This Company was formed in 1911 for the purpose of growing rubber and other crops in Sumatra, and this it has done with success, broadening its basis during its third decade by the Kulai investment in Malaya and later absorbing the Wampoe and Bila companies, which also were shareholders in Kulai. The dividend record is not unsatisfactory and reserves have been prudently accumulated, primarily to pay for the gradual replanting of obsolescent older areas with high-yielding strains. During the war many of our buildings were destroyed and we lost about one-fifth of our pre-war planted acreage by felling, flooding and other causes; thanks to the praiseworthy efforts of our staff much of the damage has been made good, but, for reasons which I have made clear, the lost trees have not been replaced and the back-log of replanting has steadily mounted

DIRECTORS' FAITH IN NATURAL RUBBER

Your directors have faith in the future of natural rubber. The East Coast of Sumatra is, agronomically, capable of growing rubber as well as any of the territories in South East Asia, where rubber is so largely grown. People who go in for rubber-growing have to be tenacious by nature. Tenacity is required in double measure when one's interests are largely situated in a country which is undergoing such fundamental changes as is Indonesia, arising out of its recent attainment of independence, with all the resultant difficulties and upheavals. The young Republic numbers among its leaders some who realise that narrow and exclusive nationalism will not enable their country to progress and to achieve freedom from want. A pointer to the future should be provided by Indonesia's first general election, which according to the latest official pronouncement is to be held before the end of this year.

It is of paramount importance to the free world that South East Asia should not pass under Communist domination. With that in view it is the bounden duty of people like ourselves, who for half a century have done much to develop the plantation economy of that area and who, with fair treatment could speedily add to its productive capacity, not to throw up the sponge at this critical juncture. If the new Indonesian Government which follows the General Election does not show clear evidence of a determination to give reasonable encouragement to non-Indonesian entrepreneurs of goodwill, then the Board will simply have to take steps to return to stockholders the money which has been saved up over the years for the modernisation of the Company's estates in Sumatra.

The report and accounts were adopted.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS LIMITED

INCREASED DIVIDEND BENEFITS PROFIT-SHARING STAFF AND WORKPEOPLE

The Annual General Meeting of The Associated Portland Cement Manufacturers Limited was held on June 23rd in London.

The following is an extract from the circulated statement of the Chairman, Sir George Earle, CBE:

Our total capital expenditure for the year was £3,513,712; during the past nine years our Group has expended on capital account no less than £28,215,632, and this has been financed without our issuing fresh Capital. Net Current Assets are more by £3,372,789 than a year ago and include considerable liquid resources—investments in Government, Municipal and other Securities, Tax Reserve Certificates and Treasury Bills together amounting in total to £9,720,690. Moneys unexpended at December 31, 1954, on approved capital schemes amounted to £7,347,142, which included the new works at Cauldon.

The Associated Portland Cement Manufacturers Limited holds over 80 per cent of the equity of The British Portland Cement Manufacturers Limited, and 100 per cent of the Alpha Cement Limited equity, so a clearer picture of our past year's working in the United Kingdom is produced by combining the results of these three Companies than is shown in the Consolidated Accounts, which include our overseas interests.

The trading surplus increased by £1,894,000 to £11,053,000, being helped by the fact that in 1953 we had to import cement to sell at the home trade price, involving us in a loss of over £800,000. We set aside £3,578,000, which is £690,000 more than last year, for depreciation and replacement of plant and machinery, leaving £7,475,000. Provision for Taxation, which in 1953 included an amount for the Excess Profits Levy of £172,000, increased by £636,000 to £3,984,000. After deducting Directors' and Trustees' emoluments, Debenture Service, amounts due to Staff Pension Fund, a Subvention payment to a Subsidiary Company and transfers to General, Investment, Contingencies and Dividend Equalisation Reserves, amounting in all to £2,300,000 —an increase of £414,000, there is left for the Stockholders £154,000 more than last year. It is proposed that the major part of this increase be passed to them by way of a higher dividend.

Our staff and work-people will benefit also under their profit sharing schemes from the increased rate of dividend. You will be interested to know that last year the three Companies paid out under these schemes £444,000 before tax. This year it will be at least £63,500 more. The dividends to the Stockholders, after deducting the dividends paid by one Company to another, amount to £1,743,000 before tax.

During the nine years since the end of the war the total distributions under these profit-sharing schemes have amounted to £2,760,000.

I feel sure our Stockholders will be pleased that those who have produced the improved results are benefiting in this way from their good work.

There are people who are apt to find an increase in dividends a cause for complaint. However, so far I have not heard it said that it is unreasonable to expect some return on money invested.

For the additional £19 million employed in the business since 1938 the increase in the dividend works out at 4¼ per cent. It would be hard for anyone to find just cause for complaint about our dividends being too high.

The tax we pay per £ invested in the business is now 94 per cent higher than pre-war, while wages are up 173 per cent and coal 271 per cent; but the home trade price of cement is only up 130 per cent and it is still the cheapest in the world.

We have good reports from the Companies in which we are interested in Australia, Canada, Kenya, Malaya, New Zealand, South Africa, Southern Rhodesia—but the position in Mexico, owing to the effects of devaluation of the currency, is difficult. The policy of your Board remains to expand our overseas interests wherever prospects offer inducement.

OUTPUT AT HOME

During 1954 we produced record quantities of cement at home, and also of many of our other products, while other makers increased their production substantially. It was thus possible to avoid the importation of foreign cement so avoiding the loss of foreign exchange and also saving ourselves a lot of money.

This year we hope to show even better figures of production from our own works, and in addition there will be cement coming along from Widnes and Whitehaven, where new sulphuric acid plants are being erected.

With regard to the export trade, we are maintaining our share in the world markets, and our shipments so far this year reflect the steadily expanding needs of our customers.

We are constantly having to shoulder extra costs, but since March last year we have been able to avoid increasing our prices. It is questionable whether we shall be able to so absorb the increase in the price of coal which we are told is shortly to be made. Apart from its very high price, we are involved in great expense at our works owing to the varying quality of the coal we are obliged to buy. The variation in quality gets worse every year. This is a serious trouble and one which we did not have to bear in pre-nationalisation days.

Our expenditure on research on the development of improved methods of manufacture and on the quality of our products is increasing. In 1954 it amounted to £252,000.

THE METROPOLITAN RAILWAY SURPLUS LANDS COMPANY, LIMITED

The Twenty-Second Annual General Meeting of The Metropolitan Railway Surplus Lands Company Limited will be held on July 7th at Winchester House, Old Broad Street, London. The following are extracts from the circulated Statement by the Chairman, Sir Bernard Docker, KBE:

A steady increase in our revenue from rents, averaging about 10 per cent per annum since 1950, has been a noteworthy feature of the Accounts for some years. For the year to March 31, 1955, gross revenue from rents showed an increase of £26,755 to £254,913, and the net rents at £200,309 were £16,622 higher. This expansion of net rents coupled with the receipt of £68,750 from Ortem Estates, our principal subsidiary, compared with £25,750 in the previous year, produces a substantial improvement in the amount at our disposal. We recommend a dividend of 6 per cent compared with 5 per cent last year which after providing for taxation will enable us to carry forward £56,417 compared with £48,152 brought forward from last year. The Consolidated Balance Sheet shows no changes to which I need draw particular attention. The total assets at £3,112,976 are very much the same as last year.

After referring to the affairs of the subsidiary Companies and to special resolutions to be put before the meeting relating to the directors' fees and to an increase in the limit of direct investment in real estate trading the statement continues:

In the current year, expansion of revenue from all sources is unlikely to do more than enable us to maintain the new rate of dividend, possibly with some reduction in the amount which will remain to be carried forward, adequate though this balance is. Such a result would clearly be affected by unforeseen adverse conditions meanwhile, as indeed, any major recession in trade would naturally affect our future prospects further ahead. Nevertheless, taking as fair a view as I can over the next few years, I can go so far as to say that your Board is quietly optimistic about the future.

CRUSADER INSURANCE COMPANY LIMITED

PROGRESS MAINTAINED

The Annual General Meeting of the Crusader Insurance Company Limited was held on June 22nd. In the course of his Statement to Shareholders, the Chairman, Colonel Sir Gilbertson Smith, TD, DL, CA, referring to the Company's continued progress in 1954, quoted the following details:

Total net premium income exceeded £1,394,000.

Assets increased from £4,538,285 to £5,129,385.

Record new Life Assurances amounted to £4,857,717 in sums assured.

Life and Annuity Premium Income showed an increase over 1953 of £122,015 to total £675,450.

A bonus was declared on "With Profits" Whole Life and Endowment Assurance policies for the year ending December 31, 1954, at the rate of 36s. per £100 assured (1953 : 34s.)

Fire Premium Income was £97,138 and that for Sickness Accident and Miscellaneous business £556,389—both showing satisfactory increases.

Group New Business Premium Income, quite apart from the amount derived through the Company's participation in the British Motor Corporation Scheme, was the highest yet recorded. Over 500 Staff Welfare Plans installed by the Crusader are now in operation.

After announcing that, while remaining as a Director, he would be handing over the Chairmanship of the Board immediately following the Annual General Meeting to Mr Harvey Bowring, Sir Gilbertson concluded by thanking his colleagues on the Board and the Staff for the magnificent support which they had given him during his term of office, and by expressing his confidence that under the direction of Mr Harvey Bowring, the Crusader would continue to thrive by maintaining its service to policyholders, to the public, and to its agency connections at as high a standard as ever.

AUSTRALIA—UNIVERSITY OF ADELAIDE

Applications are invited for a LECTURESHIP IN ECONOMICS.
Salary scale: £A1,100 x £A50—£A1,450.
Terms: Every potential applicant is invited to seek from the undersigned* or from the Secretary of the Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, a copy of the detailed conditions of appointment which give particulars of general duties, tenure, study leave, promotion and travelling expenses.
University Film: A potential candidate in Great Britain may also borrow from the Secretary of the Association of Universities of the British Commonwealth a coloured film illustrating the University and the city and surroundings of Adelaide.
Superannuation: On F.S.S.U. basis.
Applications: Applications must include particulars of age, nationality, marital status, academic record, teaching qualifications, war service (if any) and present position; a list of publications; copies of testimonials; the names and addresses of two referees of whom enquiries may be made; a recent photograph; and a medical certificate of good health. They should be lodged in duplicate with the undersigned* not later than *July* 11, 1955.
Further information about the post or about the University will gladly be supplied on request to

*V. A. EDGELOE, Registrar,
University of Adelaide, Adelaide, South Australia.

NEW ZEALAND MARKET

A well-established, keen and experienced importing firm with first-class trade credentials and offices in Auckland, Wellington and Christchurch desires to expand its activities. We seek exclusive agencies from manufacturers. Can we discuss the sale of your product in New Zealand? References Bank of New South Wales, London. Write direct to Mair and Co. (Importers), Ltd., P.O. Box 1477, Christchurch, N.Z.

IRON AND STEEL BOARD

The Board require a Senior Economist. Some experience of the steel industry or statistical administration an advantage but not essential. Salary according to qualifications and experience. Contributory superannuation scheme.
Applications should be sent to The Secretary, Iron and Steel Board, Norfolk House, St. James's Square, London, S.W.1.

B.Sc (ECONOMICS) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE
provides postal tuition for the above Degree (open without residence), which is a valuable qualification for executive appointments in commerce or industry, government or municipal posts. The College, founded 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas free from Registrar (60), Burlington House, Cambridge.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for pensionable appointments. Applications may be accepted up to December 31, 1955, but early application is advised as an earlier closing date may be announced. Interview Boards will sit at frequent intervals. The Scientific posts cover a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects the number of vacancies is small; individual vacancies exist for candidates who have special knowledge of, or who are interested in palaeobotany, foraminifera, and recent and pleistocene mammals.
Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification; or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience.
Candidates taking their degrees in 1955 may apply before the result of their degree examination is known.
Age Limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted. For Scientific Officers between 21 and 28 during 1955 (up to 31 for permanent members of the Experimental Officer class). Salary (London) *Senior Scientific Officers*: (men) £1 010—£1,185; (women) £893—£1,077. Scientific Officers: (men) £492—£885; (women) £492—£795. Women's scales subject to improvement under equal pay sch. re. Somewhat lower rates in *the provinces*.
Further particulars from Civil Service Commission, Scientific Branch, 30, Old Burlington Street, London, W.1, quoting No. S.53/55 for Senior Scientific Officers and S.52/55 for *Scientific Officers*.

NATIONAL COAL BOARD invite applications for a superannuable appointment in the Staff Department at its Headquarters. The post will be in a Branch responsible for intelligence and advice on grade structures, rates of pay and hours of work of non-industrial staff throughout the Board's organisation, and the negotiations of such matters with Trade Unions. The successful candidate will be required to assist in this work, and in particular to advise on the economic and other aspects of salary policy, and to undertake special enquiries, using statistical and other data. Experience in similar work or knowledge of the coal industry, although useful, are not essential. The main requirement is ability to analyse complex factual material, both statistical and otherwise, and to draft clearly and concisely. Good academic qualifications, especially in Economics, would be an advantage.
Salary will be according to qualifications and experience within a range £1,070-£1,470.
Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with dates), to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope SS/13. Closing date July 20, 1955. Original testimonials should NOT be forwarded.

ATTWOOD STATISTICS LIMITED invite applications for the posts of Client Service Executives for their new Attwood Personal Panel. This service is rapidly expanding and offers excellent prospects to personnel who are prepared to join now and help to build up a service which is designed to provide fast moving market research information specifically related to the confectionery, tobacco, and similar product fields. Apply—in writing only—giving full personal details to Contact Director, Attwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

LEADING CONTRACTING COMPANY *require* the services of a man of strong and proved ability to supervise personnel engaged on sales at high level, with emphasis on executive development, management training and organisation. Experience of personnel management as such less important than wide general experience involving main management in expanding organisations. Age not less than 47. Applicants should have been earning not less than £2,500. Men having retired early from substantial positions would be considered, but the work will be exacting.—Box 992.

MARKETING MANAGER.—Genatosan, Ltd., a member of the Fison Group, *invite applications for the post of Pharmaceutical Marketing Manager. The man* selected will be responsible to the newly appointed Commercial Manager and his duties will mainly comprise the advertising and promotion of the Company's existing and future *pharmaceutical proprietaries*. At least three years' recent practical experience in marketing consumer commodities is an essential qualification. The post is well remunerated and is superannuated.—Applications, stating age, education and experience, should be addressed in confidence to The Personnel Officer, Genatosan, Ltd., Derby Road, Loughborough. Please quote Ref. M/M.

"TRAINING FOR MANAGEMENT." Pitman Home Study for all Management and Secretarial Examinations; also Hospital Administration. Personal tuition. Details of courses from Pitman Correspondence College, 54, Pitman House, *Godalming, Surrey*.

GENERAL SALES MANAGER required by an important company in the Plastics Industry in the North-West, to create a live and efficient organisation for handling a variety of products, some of which are in the early stages of market development.
Previous experience of Plastics is not essential, but applicants must be able to show a good record of successful sales management.
The position is permanent, with good prospects.
Age range, 35-45.—Give full details of qualifications and experience to Box 998.

EXECUTIVE, aged thirty-four years, Oxford Graduate and Barrister, seeks opening in progressive organisation in London area. Wide commercial and administrative experience. Three years company secretary. At present holds responsible position in well-known public company. *Moderate commencing salary.*—Box 990.

BEFORE YOU BUY those shares, see what the *Investors' Chronicle* has to say. It is the best-informed and widest-read financial weekly. Two issues free of charge from 30 Grocers' Hall Court, London, E.C.2.

THE Economists' Bookshop, 11-12 Clement's Inn Passage, London, W.C.2, invites you to submit lists of books on Economics, History and Social Services, you may wish to sell (*periodicals excluded*).

THE UNIVERSITY OF SHEFFIELD

DEPARTMENT OF EXTRA MURAL STUDIES
Applications are invited for the post of Staff Tutor, to be principally concerned with the teaching of Industrial Relations-Economics to trade union students. Applicants should have a good Honours degree in an appropriate subject; experience in adult education will be a desirable further qualification. Initial salary according to qualifications and experience on a scale beginning at £650, with F.S.S.U. provision and family allowance. Further particulars may be obtained from the Registrar to whom applications (6 copies) should be sent by July 16, 1955.

WOOLWICH POLYTECHNIC, LONDON, S.E.18

Principal: J. S. Tait, PhD., BSc. ARTC, MIEE, AMIMechE
Applications invited for:
Lecturer in Management Subjects (with particular reference to Factory Management and Organisation, Production Planning and Control and Work Study), with a degree or *equivalent, industrial management* and teaching experience.
Salary Scale £965 to £1,065 plus London Allowance.
Particulars and application form from Clerk to Governors, to be returned by July 9, 1955.

EXTRUSIONS BY MARLEY

Buyers requiring rigid and flexible tubes and sections in thermoplastic materials should ask for a quotation from Marley Extrusions Limited.
Dept. 99, Lenham, Maidstone, Kent. Harrietsham 381.

STATISTICIANS in the HOME CIVIL SERVICE.—The Civil Service Commissioners *invite applications for posts of Assistant Statistician in Government* Departments. Selection will be by interview in London early in August. Age at least 20½ and under 24 on August 1, 1955, with extension for service in HM Forces *and approved post-graduate statistical experience*. Candidates may be mathematical or economic statisticians; they must have a First or Second Class Honours Degree (II (i) where the Second Class is divided) with statistics as the principal subject or *a substantial part of the final examination*, or a post-graduate University Diploma or higher Degree in Statistics. Those so qualifying this summer will be eligible. Starting pay in London, including Extra Duty Allowance (where payable), between £531 and £696 (£615 women), according to periods of National Service and post-graduate experience, rising to £955 (men) and £858 (women). Promotion prospects to £1,570 (men) and £1,420 (women), with possibility of later increases to £2,200 (men) and £2,071 (women). Women's scales being improved under equal pay scheme. —Particulars and application forms from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 96/55. Completed application forms must reach him by July 15, 1955.

PRODUCT RESEARCH ASSISTANT required by COUNTY LABORATORIES LIMITED, Members of BEECHAM GROUP LIMITED.

The applicant should know something of, and certainly be interested in the biology and biochemistry of skin and hair. He should have some working knowledge of protein chemistry and a strong interest in the chemistry and physics of interfaces and colloidal systems. He must be well acquainted with emulsions in general and should have worked on some special types of emulsion connected with industry. Some knowledge of mechanics and simple engineering would be an advantage.

A positive interest is desirable in preparations for anointing the skin and scalp and an appreciation of the physical chemistry underlying the effects of such preparations when applied to living tissues.

A further advantage would be some knowledge of organic chemistry, especially in relation to modern emulsifiers.

It is more than desirable that the applicant has the ability to write clear concise English and be able to make complicated scientific terms and thoughts intelligible to *the layman with whom he will have to co-operate closely in his work*. The position is an important one and the salary will be commensurate with the responsibility. Profit participation and pension schemes are in operation.

Applicants should send full details of qualifications, past experience and present salary to Product Research Director, County Laboratories Limited, Stanmore, Middx.

THE BSc(ECON) DEGREE of London University is open to all without University residence. It is a valuable qualification for ambitious men and women engaged in accountancy, secretaryship, banking, finance, commerce, public services. Wolsey Hall (est. 1894) *provides postal tuition of a high order for three (in some cases two)* examinations, at reasonable fees. More than 1,000 Wolsey Hall Students have passed London BSc(Econ) (Final) exams. since 1925.—Prospectus from C. D. Parker, MA, LLD, Director of Studies, Dept. P17 WOLSEY HALL, OXFORD.

MARKET RESEARCH: Applications are invited for positions as Senior Client Service Executive. The Attwood Consumer Panel is a continuous market research service subscribed to by leading national advertisers of branded consumer goods. The position calls for the ability to interpret and present the research findings to top level management of the client companies. If you are in the age bracket 35-40 with sound experience in the field of marketing and advertising, apply—in writing only—giving full personal details to Contact Director, Attwood Statistics Limited, Chantrey House, Eccleston Street, London, S.W.1.

EXECUTIVE required by expanding company in the Electrical Engineering industry to assume control of works accounting, costing, salaries and wages.
Applicants must have been thoroughly trained in a large organisation of similar character and should be aged 35 or over.
Location is in new factory near London, and housing can be provided. Pension scheme is in operation. The post is one with real opportunity in a young enthusiastic team, and the salary will be fully in keeping with the responsibilities. Box 997.

DRIVE YOURSELF IN AN AUTOHALL CAR. *Is your business being hampered* by transport problems? Or are you coming home on leave? Then hire one of our 200 1955 self-drive cars. We offer the lowest rates, minimum formalities, special offers for long term hire and contract terms. Repurchase scheme and first in Europe self-drive packed tours.—Write for colour brochure and full details to Autohall, Dept. 2, 302-6, King Street, Hammersmith, W.6. Riverside 2881. Cables, Autohall, London.

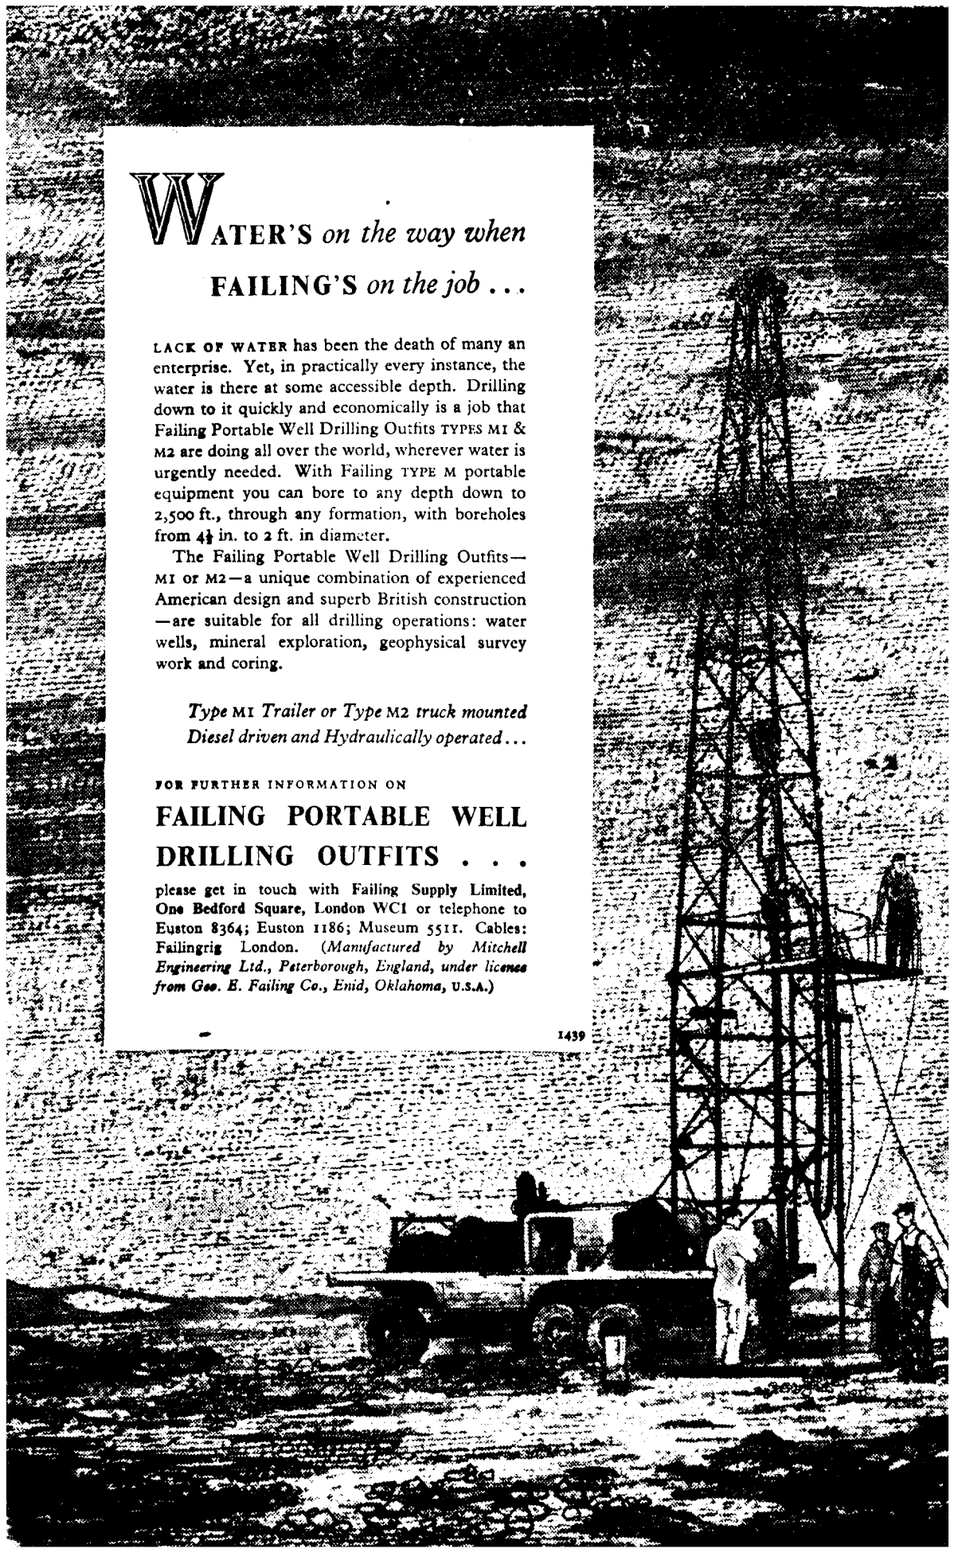
ECONOMIST, 30, 1st Class Hons. 5 yrs. commercial/industrial experience. Proven ability to reduce industrial costs. Wishes to undertake reduction of *manufacturing/* administrative costs in medium sized firm. Position of direct responsibility to Managing Director required.—Box 975.

COMMERCIAL MANAGER, 44, Chartered accountant, A.C.W.A., B.Sc., now with well-known producers of domestic products, experience home and overseas in manufacturing planning, purchasing transport, warehousing, budgetary control, sales statistics, requires appointment in South or West England. Box 995.

INTERNATIONALLY known Company (Mayfair Head Office) requires Executive for Continental Department. Negotiating and drafting ability and first-rate knowledge of French and/or German are essential qualifications. This is a progressive and most interesting position which entails the possibility of inspection trips abroad. *Non-contributory pension scheme in operation. Detailed applications will be* treated in strict confidence.—Box 994.

INTELLIGENT young lady required as Secretary in Patents Department at Cambridge. Must be competent shorthand-typist. Some knowledge of German or French great advantage. Lodging accommodation available. Write (Quoting No. 1078) stating age, fullest particulars and salary required to Personnel Manager, Fisons Pest Control Ltd., Bourn, Cambridge.

SHORTHAND-TYPING (MACHINE SHORTHAND), the modern method of taking notes, *dictation and verbatim reports. For prospectus of secretarial courses including* Stenotyping, call, write, or 'phone Palantype College, 229-231, High Holborn, W.C.1. Telephone: HOLborn 9162.



EXPERT POSTAL TUITION
For Examinations—BSc(Econ) LLB and other external London University Degrees; Law Society; Bar; *Accountancy; Banking*; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G 9/2).

METROPOLITAN COLLEGE, ST. ALBANS
or call at 40 Queen Victoria Street, London, E.C.4

SPRING BOOKS 1955

The Tale of Simpkin Marshall

A MONTH ago, at the beginning of the spring flush of books, the board of Simpkin Marshall Limited—the largest firm of book wholesalers—announced that it had been compelled to cease trading, and at a meeting of the creditors held on Monday the deficiency to unsecured creditors was put at about £475,000. It would be an exaggeration to say that this announcement has dealt a blow to the trade as severe as Simpkins itself experienced on one night in 1940, when bombs destroyed its premises and stock of six million books. Nevertheless, the decision has immediately put some publishers in an awkward position and, if resuscitative measures are not applied, may seriously affect the retail selling of books.

The recent Simpkins bomb was a delayed action one. It was last November that the board told the associations of the publishers and the booksellers in confidence that the company would have to cease trading unless it was enabled to do so on better terms than it had up to then been allowed and had itself allowed to booksellers. In the following months, members of both associations voted by large majorities in favour of the reconstruction of Simpkin Marshall, and the Publishers Association set up a special committee to negotiate a scheme for carrying on Simpkins on a co-operative basis. The committee's efforts had not been successful by the end of March, but there is still a chance that they may bear fruit in time for Simpkins to start another life. In the meantime, the receivers have announced that booksellers' orders will where possible be fulfilled from the company's very considerable stock of books.

Some booksellers, with regular customers and with a pretty good idea of what their sales of a particular book will be, order direct from publishers and rarely use the service of a wholesaler. The extent to which others do so depends largely on the size and nature of their particular orders. Suppose, for instance, that someone is moved by reading *The Observer* to ask for Sir Harold Nicolson's fancy for the week; and that someone else is persuaded to buy a different book by Mr Cyril Connolly's review in the *Sunday Times*; and that X, Y and Z are each attracted by three more books reviewed in their favourite weeklies. It is an expensive burden for the bookseller to send off several different orders to as many different publishers every day; even more laborious for each publisher to despatch and invoice single copies to booksellers all over the country; and laborious again for booksellers to open and check several different parcels. Apart from libraries' purchases and school textbooks, the book trade is almost entirely based upon the requirement of single copies, and, as a rule, each book (and each is a separate business) finds a particular customer only once. Therefore, while the bookseller cannot, for financial and physical reasons, be expected to carry a stock of anything like all the books published, he must be prepared to order large numbers of individual items. Since some 19,000 new books and reprints are published every year in Britain by some hundreds of firms of publishers, the ability to order and supply in bulk through a wholesale organisation is a great saving to bookseller and publisher and enables the customer to receive his book more promptly.

But if wholesaling is so important to the book trade and if, as is generally admitted, Simpkins provided a well-run service, why was the company unable to pay its way? The reason given by the board and by the accountants is insufficient margins for trading in the home market, from which it was making losses at the rate of about £6,000 a month—its export trading was run at a profit. As a rule the wholesaler in the book trade receives from the publishers the same discount as they offer to retailers (which varies according to the type of book and the number of copies ordered) with in addition a certain percentage (usually 10 per cent) of the selling price. In theory, the wholesaler can fix his own terms of supply to his bookseller customers; but if he departs too far from traditional discounts, they will go to another wholesaler offering them better terms or else order direct from the publishers. If he offers less favourable terms than the publishers, the booksellers will accept them only if they find the wholesaler's service advantageous in other respects.

There can be no doubt that booksellers have found Simpkin Marshall's service worth while. In fact, after the accountants had made their report, the company tried to stem its losses by reducing its terms to booksellers—and immediately secured a 20 per cent increase in orders from the country trade. But this was evidence of goodwill, not

of a genuine increase in the demand for books. Booksellers, in fact, have been so chronically overstocked in recent years that they recently had to have recourse to a National Book Sale to clear their shelves. Unless the public buys more of the present vast output of books, retailers cannot place larger orders with the wholesalers; and if the wholesaler has (like Simpkins today) no retail outlets, he cannot increase his turnover to the extent necessary to meet his increased costs, which consist largely of wages for a skilled labour force.

The increase in wages since 1939 has far outstripped the increase in the price of the average book, yet publishers are reluctant to raise their prices again. At the moment they appear instead to be exploring the possibility of setting up a co-operative organisation to take the place of Simpkins. This, modelled perhaps on the *Bestelhuis* at Amsterdam, on which the 1948 Book Trade Committee reported favourably, would concentrate all the single copy orders from booksellers in a non-profit-making concern. The *Bestelhuis* acts as a clearing house for the despatch departments of the various publishing firms. By collecting together different consignments for the same bookseller, it effects considerable savings in the cost of transporting books. It does not fulfil all the functions of a wholesaler because it does not carry stocks. Housed in the same building, however, and working in co-operation with it, is the Central Book House, in which publishers deposit a number of copies of all their publications, these remaining the publishers' property so that the Book House incurs no loss on books remaining unsold. It deducts from the publishers' accounts 9 per cent and adds 3 per cent or 4 per cent on its account to booksellers; and this income of 12 or 13 per cent of its turnover is enough to cover its costs—though it does not allow any profit.

The Book Trade Committee did not recommend the immediate adoption in this country of a co-operative wholesale organisation on the lines of the Book House (though it did not rule it out altogether), partly because of the existence of Simpkins and other wholesalers and partly because it would have to be housed in such an immense building. Thus, as things are, the publishing trade seems likely to try to achieve a co-operatively run packing and despatch organisation for single copy business. But even a co-operative concern would have to cover its costs. It is far from certain that whatever emerges from the new ruins of Simpkins will not have to be established on the basis of a higher average price for books.

Mild Revolutionaries

THE SECOND INTERNATIONAL 1889-1914.
By James Joll.
Weidenfeld and Nicolson. 213 pages. 18s.

THIS book tells the story, part noble and part ludicrous, of men who tried to bind the workers of the world into an international organisation that would throw capitalism over and build a new society in its place. Many of their sentiments seem admirable today; certainly they were less ferocious than their enemies thought at the time, and one of the International's main problems was to extricate itself from the clutches of destructive fanatics. Yet once the tussle with the anarchists was over it was hard for the International to find much common basis for action among its members. Economic development varied immensely from state to state; so did the degree of liberty available to socialists to state their views; so did the complexity of socialist party organisations. The empire of Russia, vast as it was, contained few factories, and the Russian socialists who stayed at home had to grapple with interminable divisions among themselves as well as an active and hostile police; while in highly industrialised Germany, as Mr Joll says,

> More and more the Social Democratic Party formed a world of its own, a society within the state, which absorbed the interests, energies and imagination of its members, while its leaders acquired a mythological status usually reserved, in England at least, for the royal family.

Mr Joll has not much to say about the socialist side of the International's work; this is hardly surprising, for the prospects of real power for any socialist party before the Great War were remote indeed. He touches, of course, on the incessant quarrels between moderates and extremists, and points out how Lenin and Rosa Luxemburg drew the correct lesson from the abortive Russian revolution of 1905—"not that revolution at the end of an unpopular war would fail, but simply that it must be better organised and led." His book is much more rewarding on the International's attempts to deal with the central problem of relations between great powers in its day: the problem of preventing a heavily armed peace from turning into a disastrous European war. He shows deftly how the socialist leaders, like all humanitarians, detested war; how willingly they would have diverted the vast sums spent on armies and navies into more beneficial channels; how they toyed with the project of a universal general strike, to stop any European conflict at the outset; and how, in the end, this project was abandoned, and the International collapsed in pathetic failure. National enthusiasms triumphed over humanitarian longings; the men who were to have struck in unison marched away in discord to shoot each other down, in the holocaust Engels had predicted as long ago as 1887.

This short and weighty book is best of all on the personalities of the *simpliste* and engaging orators who headed the movement. A few minor slips apart, Mr Joll has produced an attractively written model of historical compression.

Origins of Diplomacy

RENAISSANCE DIPLOMACY.
By Garrett Mattingly.
Cape. 323 pages. 25s.

SIR HAROLD NICOLSON once suggested that much of the disrepute of diplomacy is due to the fact that it reached Europe via the Italian city states. Mr Mattingly's invigorating book is a study of this formative phase, tracing the origins of modern diplomatic techniques in the Italian city states of the later Middle Ages and examining the diffusion and development of those techniques in the European states of the sixteenth and early seventeenth centuries. The first and major innovation was that of the resident embassy. Mr Mattingly's main theme is to trace the adoption of this Italian invention by the greater powers in the sixteenth century, showing that it was the essential unit of the developing and increasingly professional diplomatic services. The value and interest of this study are greatly enhanced by the skill with which Mr Mattingly relates the growth of diplomatic institutions to the changing relations between the powers, and by the good sense which prevents him from dramatising his conclusions by pressing them too far.

It was in the half-century following the French invasion of Italy that the newer diplomatic techniques were diffused and developed most rapidly. Ferdinand of Aragon deployed resident embassies against the greater military strength of France and combined a small corps of professional experts into the beginnings of an organised diplomatic service. One of Ferdinand's bishops, sent to induce Austria to make war on France, stated candidly that he placed this object "higher than the safety of my immortal soul." So enthusiastic an acceptance of the new professional loyalties was unusual, and much complicated casuistry was devoted to reconciling diplomatic practice with older standards of honour and morality. But the ideological conflicts of the later sixteenth century further corroded what remained of the older conceptions of diplomacy. Ambassadors now engaged in conspiracy, plotted with subversive movements, bribed, spied and corrupted.

Mr Mattingly analyses carefully the different aspects of professional diplomacy: embassy routine, ciphers, courier services, the conventions of diplomatic immunity and the growth of foreign office archives. At the same time he knows the sources too well to claim that development was continuous or to conceal the inefficiency and incompetence resulting from the administrative weaknesses, financial chaos and political instability of the European courts. In the early sixteenth century a knowledge of canon or civil law was considered advantageous to an ambassador, but later the arts of the courtier came to be a more important qualification. Inadequate stipends irregularly paid made the career expensive in an age of growing ostentation. Chanceries were lazy and erratic in their use of ciphers: when they did encipher dispatches they used a predominantly substitutional method, though aware of its vulnerability. Chapuys used the same cipher for twelve years, and later in the century the Spanish ambassador at Prague used the same cipher for twenty-seven years. Mr Mattingly's account of how Gondomar's dispatches, with their black record of Spanish successes in corrupting the English court, were for years systematically intercepted and deciphered by the English ambassador in Madrid makes an interesting parallel with "Operation Cicero."

Mr Mattingly's book is not merely instructive but also stimulating, for he is always seeking explanations and is suspicious of the easy ones. He does not allow the writings of Machiavelli to distort his account; and he observes with justice that "it is not certain that Erasmus and Contarini, Luis Vives and Thomas More were any less typical of their era than Ferdinand of Aragon or Niccolo Machiavelli." Again, when seeking an explanation of the weakness of diplomacy in the early seventeenth century, he places more emphasis on the failings of administration than on the dramatic shifts of policy in the hands of royal favourites. Occasionally he lapses into artificial antitheses, exaggerating the unity of medieval Christendom and over-dramatising its break-up in the sixteenth century. But these lapses are few. Mr Mattingly's attractive and lively style together with his unpretentious tone should not distract attention from his careful thought and patient research, particularly with regard to the Spanish archives of this period.

Battle of Beliefs

WHEN IRON GATES YIELD.
By Geoffrey T. Bull.
Hodder and Stoughton. 254 pages. 12s. 6d.

THIS is a much more unusual book than might be expected. Nowadays we are, sadly, becoming familiar with the harrowing tales told by men who survive Communist captivity. As the grim evidence piles up, we are coming to accept "brain-washing" and extorted "confessions" as being as commonplace as in the worst days of the Inquisition. But Mr Bull provides a more direct, and more striking, link with the days of bitter religious wars and persecutions. A lonely Protestant missionary in Tibet, he did not flee when the Chinese Communists marched in, but calmly rode to meet them, hoping against hope that he might be able to continue his mission. For the Communists, however, it was enough that he was a foreigner and a staunch Christian. He was arrested, taken to China, and spent over three years in political prisons, under repeated threat of death and enduring other torments no less frightful.

His accounts of these prisons is horrifying; recalcitrants lived in chains and

The Russian Revolution 1917

A Personal Record

by N. N. SUKHANOV. Edited, abridged and translated by Joel Carmichael from '*Zapiski o Revolutsii*'.

A unique eye-witness account of the entire Russian Revolution by a man who, while politically unaffiliated, was inside the movement that has given rise to the present Soviet regime. Long suppressed in the U.S.S.R. because of its anti-official character, it gives an account of the revolution which is the antithesis of the mythology now accepted. Illustrated.

BASIL BLACKWELL

handcuffs, hysterically harassed, day in and day out, not only by their captors but by other prisoners so broken that they adopted the attitude locally known as "hit others, elevate yourself." Each prisoner had to spy on the others; many were near to madness, and some reached it; long solitary confinements were exchanged only for overcrowded cells and the diabolical process called the "squeezing toothpaste" technique, whereby prisoners drove each other to false and futile confessions of imaginary "crimes."

Totally incommunicado, denied all news from the living world except for floods of propaganda, robbed even of his Bible and forbidden even to pray, Mr Bull yet managed, by extraordinary efforts, to keep both his sanity and his faith. His faith was, and is, as steel-hard as that of his tormentors; he has no doubt that Christ bore him through his ordeals and that the prayers of fellow Christians won him his freedom. His story is the more fascinating as a study of battle, on cruelly unequal terms, between two strict beliefs; but, although a most valuable, and a most precise and sober, account of Communist methods of destroying men's minds, it does not suggest how those methods can be resisted by free men whose faith is less absolute than Mr Bull's.

University Town

PORTRAIT OF CAMBRIDGE. *A Selection of Photographs by A. F. Kersting with text by Bryan Little.*
Batsford. 96 pages. 25s.

THIS is a beautiful picture-book. The Master of Pembroke, in his foreword, quotes the distinction that was drawn at least three hundred years ago, that while Oxford is a university in a town, Cambridge is a town in a university. The town, perhaps, is nothing very special, an ordinary Fen-country market town. But Mr Kersting's photographs show—to many people who thought they knew their *alma mater* they will show more fully than ever before—what a beautiful university it is. What is there at Oxford (the reviewer, his loyalty re-awakened to enthusiasm, is tempted to ask, meaning his question to be rhetorical)—what is there at Oxford—or, for the matter of that, anywhere—to compare with Great Court, with the fan vaulting of King's Chapel, with the river front of Clare, with the President's Lodging at Queen's, or with the superb montage of the Backs? Until Mr Kersting takes some pictures of the other place, echo will only answer where.

Mr Little's historical and architectural commentary provides an admirable accompaniment, elucidating the pictures without overbearing them. He can find a kind word for nearly all the many architects who have built in Cambridge; only Alfred Waterhouse is roundly condemned.

The End of the Affair?

THE DREYFUS CASE: *A Reassessment.*
By Guy Chapman.
Hart-Davis. 400 pages. 25s.

PROFESSOR CHAPMAN has given an admirable rendering of the most exciting incident in modern history. Nothing can make the story easy to follow: the complications of deceit, counter-deceit and simple misunderstanding, coupled with the intricacies of the changing political background, are enough to tease the wisest brain. But the tale comes out as clearly as it can, and is as enthralling as ever.

The book is called a reassessment; and so it is, compared with the work of the deeply engaged writers of the time, who saw the case as an unambiguous fight between good and evil. But passions have faded and the element of muddle and self-deception has been clearer. The story which Professor Chapman tells is the one which most people nowadays would accept, one of stupidity and strong emotions, and above all of the logarithmic growth of error when the actions of those in power are sheltered from criticism, publicity and the rule of law. Confusion multiplied until the skilled minds of the civil courts were applied to the case; and then it crumbled into dust. And from all the vast accumulation of lies, fraud and intrigue, none of the principal actors gained anything at all.

The most puzzling episode of the whole story is its start. How could any intelligence service, however badly chosen and however little under control, be so stupid? Later on, when all concerned were committed to defending their positions, one act led almost inevitably to the next. But at the start, when they believed (wrongly, as it turned out) that there was a spy in the War Office, how could they be satisfied by picking on one man and considering the case closed, without taking any steps to see whether the leak of information had been blocked? Stupidity and lack of method is one answer; but antisemitic prejudice is certainly another. Professor Chapman is at pains to show that at that stage there was no widespread antisemitism in France. This may be so, but one or two officers in the War Office were antisemites, and that was enough to fire the train. The initial blunder might never have been made if the principal actors had not, by mere chance, been Alsatians, and thus either a Jew or more inclined than most Frenchmen to antisemitism.

"Not about little things but from little things. . . ." Great changes in French political life came from the Affair, which Professor Chapman analyses briefly and clearly. But by then Dreyfus himself was fading into the background, and what the author calls the "Dreyfusian revolution" might have occurred, under another name and by different stages, but without much essential difference, if Dreyfus and Esterhazy had never existed.

From a Watchtower

HERETICS AND RENEGADES.
By Isaac Deutscher.
Hamish Hamilton. 228 pages. 15s.

IT was time we knew more about the mind of the biographer of Stalin and Trotsky, and here in these essays is at any rate the beginning of Mr Deutscher's self-revelation. Whether he is to be regarded as a heretic or a renegade, or as both, must be a matter of opinion; but he is clearly moving towards a Montaigne position, into what he calls a "watch-tower." There he can sit, snug but not smug, watching the cold war rage and smiling sadly that the warriors below have no sense of historical analogy. Perhaps he would like them to pause a moment, lean on their swords and say, "This is where we came in." Certainly he wants everyone to realise that most ex-Communists are mainly concerned with self-justification, "the most dangerous motive for any political activity." Mr Deutscher wants to range himself with Jefferson, Goethe and Shelley, who refused to choose in their time between the Holy Alliance and the Napoleonic idea.

This aspiration makes him here and there rather priggish; but there is no denying his mastery of the technique of political intelligence and diagnosis, or his ability to illuminate and stimulate. The first essay is a devastating attack on "inverted Stalinism" among ex-Communist intellectuals. The second is a moving and imaginative fable of the life of a Polrugarian Minister, people's democracy in miniature. The third is a penetrating study of the limitations of Orwell's vision of 1984, in which the historian denounces the novelist as a "simple-minded anarchist."

Here we move on to more solid but no less interesting historical fare: a critical tribute to Mr E. H. Carr's History of Soviet Russia, a comparison of the French with the Bolshevik Revolution, a study of Trotsky's indictment of Stalin and of mid-century Russia. Then come two sections showing the author as a skilful and well-documented Sovietician, standing up firmly for his thesis that Russia is now seething with the spirit of change and that we must look warily for the signs that Bonapartism may be the only answer to revolt against Stalinism.

We have had recently from historians several volumes in which articles and reviews have been casually flung together into a *macédoine* of essays. Mr Deutscher has been more careful, and this book can and should be read in his own well-contrived sequence. It reveals a powerful mind, a growing charitableness and a remarkable feeling for the subtleties of a language learnt in middle age. The Marxism is still there, but modified and developed in a manner that would not be tolerated in Russia. What we want from Mr Deutscher is a study of British political history, an assessment of the strength of the society in which he has found it possible to erect his watchtower.

ANDRÉ DEUTSCH

Badges of Class

ENGLISH SOCIAL DIFFERENCES.
By T. H. Pear.
Allen and Unwin. 318 pages. 18s.

THE *effects—tragic and comic—of* social class on raw humanity must have provided half the material of British novelists for a hundred years and nine-tenths of the material of politics for the last fifty. A vast social *bouleversement* has occurred in that period; the ideal of the classless society has been set up; yet class distinctions still impregnate everyday life. Indeed, so infinite are the gradations of class manifestations that no satisfactory definition of any one "class" can be made; nor does Professor Pear do more than criticise those that have been attempted. He is concerned to trace the ramifications of class consciousness in accent, idiom, gesture, manners, etiquette, food, games, clothes, and habits generally—the day to day realities behind the word itself.

The result is a book packed with realistic detail but curiously inconclusive. Mr Pear avoids judgments; he is after a perfect dissection of the creature. He offers, for example, T. S. Eliot's views on whether culture is possible without class, but not his own; he examines the whole question of class education in almost perfect detachment, though he ends by quoting with approval Professor Brogan's conclusion that

> England will not be a full, or anything like a full, democracy as long as one of the kindliest and most united people in the world is internally divided in a fashion that impoverishes the national life.

But the picture that emerges from Mr Pear's survey is not one of impoverishment but rather of luxuriance. English society at every level seems to make an art of class distinction, or should one say of class self-expression. The art is practised no less sedulously—if perhaps more subtly—because large income differences between social strata have been reduced. The lesson of this entertaining, if at times diffuse, book is perhaps that all the trappings of class will remain when the last vestiges of financial or even educational justification for them have vanished—which will be a bitter disappointment for the progressives who (one cannot help feeling) are secretly far more incensed by the trappings than by differences in actual income. Until they can remove the social cachet from rugby football, put yachting in the same category as bull-baiting, and standardise the calibre of trouser-legs, they will not have the classless society they wish to impose.

Professor Pear's book, however, suggests that this is not the sort of society the British are particularly anxious to have. As in so much else, they are empirical: there should be less snobbery, but no ruthless expropriation of it. In the phrase of a precisely identifiable class, a little of what you fancy does you good.

Uncommon Letters

POET AND PAINTER.
Edited by Claude Colleer Abbott and Anthony Bertram.
Oxford University Press. 295 pages. 30s.

IN 1910, when Gordon Bottomley was thirty-six, a common friend sent him a copy of one of his plays in which Paul Nash, then aged twenty, had drawn an illustration. Bottomley was impressed and sent him a letter of encouragement. This was the start of a correspondence that lasted, with some interruptions, till Nash's premature death in 1946.

The correspondence is mostly concerned with painting in general and with the two men's work—and more with Nash's work than with Bottomley's. There is a background of personal news, but rather little about other people—partly because they seldom met and lived different lives; but partly, one feels, because the two men and their wives, in their relations with each other, sufficed to themselves.

The period up to the first war, when Nash was greatly influenced by Bottomley and when the correspondence is most continuous, is the best of the book. Later, as Nash developed on his own lines, and as his busy life interrupted the correspondence, it loses continuity and one sees a smaller part of Nash; but the deep warmth of feeling between the two men lasted to the end, and they never lost their common interests. One of the best things in the book is an exchange of letters on the pre-Raphaelites (an early point of contact) in 1941.

Nash was a natural letter-writer. His thoughts and feelings poured out easily and unconventionally, without inhibition, helped by sketches (of which some are reproduced). Yet one does not see so much of him as of Bottomley. One has a vivid picture, not of the whole man, but of the particular thoughts and moods evoked by the process of sitting down to write to Bottomley. Nash's are the letters of a man who never has time enough to *do all he wants to*; Bottomley's of a man, confined by ill-health, who has time enough to think and only lacks the strength to do what he wants. His letters contain more of himself, and what emerges is heroic: a man constantly suffering who remains even-tempered, wise, cheerful and humorous; fully formed when the correspondence starts and almost unchanged throughout it. He and Nash both write about what interests Nash; and that is mostly painting, in which Bottomley had a profound interest, backed by wide knowledge and technical understanding.

The book, which is well produced and discreetly edited, is addressed to the general reader. One need not be a specialist to find it fascinating.

The Political Economy of Art

DESIGN IN BRITISH INDUSTRY: *A Mid-Century Survey.*
By Michael Farr.
Cambridge University Press. 370 pages. 60s.

ALMOST a century has elapsed since Ruskin delivered at Manchester in 1857 two lectures, *The Political Economy of Art,* containing profound reflections on industrial art.

Mr Michael Farr's survey is largely a sequel to one by Dr Nikolaus Pevsner, which appeared in 1937. This new and more comprehensive book is, as Mr Farr explains, an attempt to describe and evaluate the social, economic, material, and, in general, extra-artistic aspects of the present state of industrial art in Britain. He has tackled an important theme thoroughly. His book should be read by educated business men, especially those concerned with the manufacture of wares that come within the category of industrial art.

Even readers who have long studied this subject will learn much from Mr Farr's inquiries into the extent to which design affects various industries. He cites important foreign instances. Referring to the firm established by Georg Jensen, *facile princeps* in the field of modern domestic silver, Mr Farr tells us that it "accounts for 87 per cent of the total export of the Danish silver industry." He might firmly have drawn the moral which Jensen silver, Swedish glass, and similar successes point: that a thriving export trade in such outstanding wares can only develop from sufficient appreciation in the home market. Britain, increasingly dependent on exports for a living, must regard design as a vital factor in the economy.

Yet the general standard of industrial art remains dismally poor. There is still far too much truth in Ruskin's lament: "Your manufactures become base because no educated man set hand to them." Surveying design in different industries, primarily those producing domestic gear, Mr Farr has wisely refrained from fulminating from a pulpit. His dry strictures are examplified by this comment on wallpapers:

> Modernistic (as distinct from *modern*) patterns began to be used about 1930. Floral period designs were given up and replaced by riotous pseudo-cubistic patterns derived from German "Expressionism," but devoid of the expressive qualities which were that artistic movement's *raison d'être.*

Hard-headed readers may complain that Mr Farr has not told them what good design is. Nobody on earth could furnish them with a verbal definition of its resulting visual music, but Mr Farr writes shrewdly on what may be called its philosophy. Referring to the widespread reliance of radio designers on furniture forms, he remarks that "a high standard of design in a radio set depends, not upon its formal similarity to the products of another industry, but upon the way in which it embodies on the one hand the essential qualities of radio and on the other the spirit of the age in which it is created."

The book's ramifications are inevitably wide. Space does not permit of comment on what Mr Farr has to say about art schools or the education of manufacturer, retailer and consumer. A treatise on such a theme could hardly afford to be badly presented. The Cambridge Press has sustained its high reputation, and the many excellent illustrations constitute a pictorial encyclopædia of the subject.

From Vulture to Cigar

W.S.C. A CARTOON BIOGRAPHY.
Compiled by Fred Urquhart.
Cassell. 255 pages. 16s.

DAVID LOW tells us that he has achieved posterity in one of Sir Winston Churchill's immortal books as "a green-eyed Antipodean radical." He had been naughty, provoking the great man by a shrewish observation on the British Empire into "a passage of pleasing sound, the meaning of which was lost to me because I was otherwise engaged in looking at him."

How well Low looked will be remembered from his affectionate charcoal drawing of "Winston" which he made nearly thirty years ago and which is reproduced below—one of the choicest contributions in this garland of cartoons collected in honour of the nation's Grand Old Man. In his illuminating foreword, Sir Harold Nicolson identifies the symbols and stages of the career of "a most individual, intimate, lovable and provocative human being, whom the gods have delighted to abase and to honour and whom the caricaturists for the last fifty-five years have delighted to draw." The vulture in the veldt needs Sir Harold's note of explanation; this is the first symbol of a half-century series that processed from hats of odd shape to bricklaying, painting, the V sign and the invariable cigar.

It is a catholic collection. One can compare the similarities of the Churchill as the German propagandists saw him during the war with the Churchill that the Russians present to the readers of *Krokodil.* One can perhaps detect some failure among the cartoonists to get the real measure of the man during the later years of his public life—as if he had transcended their power to taunt. But that is the fitting close in the career of one who in earlier years earned envy, distrust and hatred and invested himself in his maturity with the affection and gratitude of a nation and of a civilisation.

Life Among the Physicists

ATOMS IN THE FAMILY.
By Laura Fermi.
Allen and Unwin. 283 pages. 18s.

ATOMIC scientists are temperamentally very different from the popular idea of a boffin. They tend to be self-assured, sociable, and, because they deal with the fundamentals of matter, often have an earthy, tweedy quality which suggests they might have made successful farmers. Laura Fermi married one of the most famous of them all, Dr Enrico Fermi, when he was a young Italian physicist helping to build the newly established school of physics in Rome. Dr Fermi became interested in the behaviour of neutrons; he and his workers used a goldfish pond in the garden of the physics building to test their theories. In 1938 he received the Nobel prize for his work, using the money to emigrate with his family to the United States. With his knowledge of neutrons' behaviour, he and other physicists persuaded Dr Einstein to warn President Roosevelt about the possibility of constructing an atomic bomb. Fermi later built the first atomic pile in the world in Chicago in 1942, and produced a chain reaction in it which demonstrated beyond all doubt that a bomb was possible. He worked at Los Alamos on the bomb project and after the war went back to Chicago to start a fresh field of work on a new unknown type of atomic particle, the mesons. There he died a few months ago.

Mrs Fermi has written a Mrs Dale's Diary of life among the physicists; but she is a civilised and witty woman, and her account of early married life leaves a sharper and more accurate impression of the psychology of the men of the new science than more learned and soberer accounts might do.

Her description of life at Los Alamos with the bomb is, however, more disappointing. The nearness of the events and personalities seems to have cautioned a curb on her lively sense of observation and reduced her narrative to a series of innocuous vignettes of life in the Mexican desert. The frustrations and tedium of living in wartime on the atomic research stations away from all normal forms of society are glossed over. Nor does she refer to the most difficult moral problem that faces the modern atomic scientists, the tension created among men dedicated to the pursuit and dissemination of truth by the continued corrosive secrecy that spreads beyond their working hours and into their family life. Mrs Fermi tells of her predicament one evening in 1942, when she gave a small party for workers in the atomic laboratories and one by one the guests congratulated her husband—for what she did not know. That was the day on which the atomic pile had run for the first time, the crowning moment of her husband's achievement.

Exhilarating Companion

HILAIRE BELLOC.
By J. B. Morton.
Hollis and Carter. 191 pages. 12s. 6d.

"NOBODY," Dr Johnson declared, "can write the life of a man, but those who have ate and drunk and lived in social intercourse with him." This, if not true, serves to remind us that there is a distinct literary kind, the memoir, the canons and prerequisites of which are not the same as those of formal biography. Mr Morton has written an admirable memoir of the mature Belloc, who was over fifty at the time of their first meeting. One cannot be confident that he would have written so good a life, had he attempted it. For the effect here is of a complex and disturbing phenomenon viewed in very short perspective. It is as if Mr Morton had tumbled in on us, breathless and excited, crying "I've had a tremendous afternoon with a staggering person; it was quite exhausting but wholly wonderful. Let me see if I can give you any sort of idea of what it was like."

And certainly the effort succeeds. We may not feel as enthusiastic as does the narrator contemplating his astonishing friend. We may suspect that a man liable to sing all through his meals (particularly "the kind of song which required roaring") or to announce "I will now compare human life to a river" and at once carry out his intention in a copious rhetoric; who insisted that the more ridiculous Oxford dons actually do walk sideways; who was invariably "not one companion but several," allowing "never a dull moment" and "whipping you up the whole time," taking you to no harbour, city or hamlet without "at once beginning to talk about what had happened there"; who could, moreover, never relax but must always be planning timetables, dispatching telegrams or scribbling rhymes: we may suspect, to our shame, that this exuberant personality would have been too much for us.

At the same time we are convinced that, measured up to, the friendship of Hilaire Belloc must indeed have been wonderful, and that all His grumbling and his gloom before the present spectacle and future prospects of western civilisation held for those who understood him nothing depressing or tedious. Indeed we can see how he spread exhilaration, not merely among his acquaintance but among a large body of readers. "A clean wind blew through his books," Mr Morton says finely, "and he made it possible to believe that a professional writer could lead a large and romantic life." It was a life the protracted close of which was much shadowed by bereavement, disappointment and the consciousness of failing powers. But Belloc remains in Mr Morton's narrative a figure of large dignity rather than of pathos—an Englishman, as indeed also a Frenchman and a European, in the great tradition of Catholic chivalry.

Poet's Self-Portrait

AUTOBIOGRAPHIES.
By W. B. Yeats.
Macmillan. 599 pages. 21s.

IN this beautifully printed book are assembled the several autobiographical studies that Yeats wrote between 1915 and 1935. The actual record of his life does not go beyond 1923, and no hitherto unpublished material is included; but it is pleasant to have in a single volume all that Yeats chose to tell the public about his life.

He was too proud and fastidious a man to write the kind of autobiography that resembles a confession. The strong fund of reserve that made him, until his latest years, a rather impersonal letter-writer inhibited him as an autobiographer. What impelled Yeats to write about his own development was not a need to unburden himself, nor a craving for approval or admiration, but a conviction that he was a poet of integrity playing a significant part in the Irish literary movement. There is neither false modesty nor arrogance in his attitude, and his method of self-portraiture is always to relate, and sometimes to subordinate, his own figure to his human environment.

People and places meant a great deal to Yeats. Few poets have made more direct use in their lyrics of their personal associations. In these memoirs his gift of retrospection is beautifully evident. Nothing is set down until it has been brooded over, seen in perspective and proportion. Not surprisingly, the most perfectly satisfying instalment of the autobiography is "Reveries over Childhood and Youth."

In spite of his reserve about his intimate concerns, Yeats spoke out frankly enough about the people he encountered, and his reminiscences of the Rhymers, of Henley, of Oscar Wilde, of Synge and Lady Gregory make "The Tragic Generation" and "Dramatis Personae" of capital importance to all who are interested in the literary scene at the turn of the last century. These pages abound in shrewd or compassionate analyses of personalities. Yeats had, too, the Irishman's flair for a good story, and George Moore in particular gave him opportunities for scathing comedy.

What these autobiographical studies especially reveal about Yeats himself is the tension that always existed in him between the dreamer and the man of action. Passionately concerned with the creation of poetry, constantly fascinated by the supernatural and the occult, he nevertheless expended an enormous amount of time and energy on organising and propaganda work. Occasionally we are allowed to overhear his own reflections on this tension, as in this extract from a diary that he kept in 1909:—

> I cry continually against my life. I have sleepless nights, thinking of the time I must take from poetry—last night I could not sleep—and yet, perhaps, I must do all these things that I may set myself into the life of action and express not the traditional poet but that forgotten thing, the normal active man.

Fantastic King

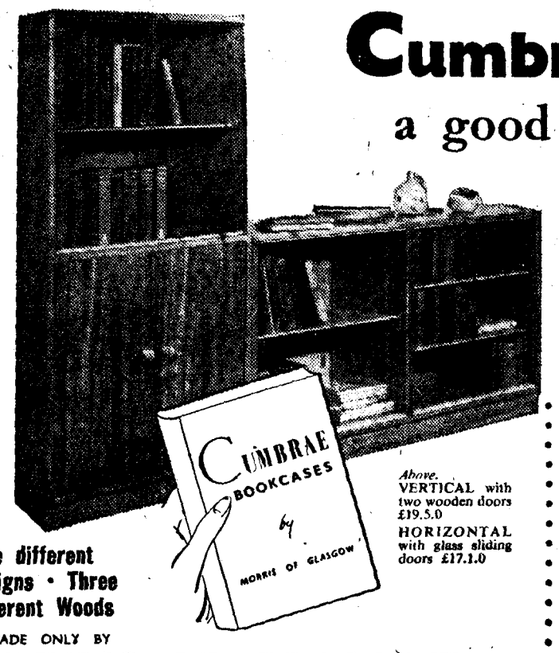
BAVARIAN FANTASY: *The story of Ludwig II.*
By Desmond Chapman-Huston.
Murray. 314 pages. 25s.

BAVARIA is the heart of old Germany—the Germany that Goethe championed against the deadly uniformity which he saw coming: the Germany of small semi-independent duchies, with their courts and palaces, their libraries and art-galleries, their parks and opera-houses. Once an outpost of the Roman Empire, then of the Catholic Church, then of the western states against the Holy Roman Empire, finally drawn through the fall of the Napoleonic Empire into the German *Reich*; yet it still epitomised in Wurzburg, Nuremberg, Ratisbon, Rothenburg, Augsburg, and above all its capital Munich, what is most lasting in the old German culture. It was a disaster for the rulers of this state when in 1806 the Elector Maximilian began, by leave of Napoleon, to call himself king; for his successors had neither the traditions of royalty nor the material forces to assert their independence in the troubled years that were coming; their real life was in their rococo palaces, their family alliances, their patronage of art and music. There was too a strain of mental instability in them, sometimes verging on insanity; and it is this which, in the person of Ludwig II (1845-86) and his brother Otto, has more than once attracted the "romantic" biographers.

Major Chapman-Huston, who had already published a number of books dealing with the history of Bavaria, did not live to complete the present work; it has been edited by Osyth Leeston. But he had already, before the second world war, spent much time in the country, and was given access to the secret archives of the Wittelsbach family, including private letters and diaries of Ludwig never before published. It may be too much to claim that "no monarch has had such a detailed and fully documented biography"; but at least these papers, particularly the "Secret Diary" of 1870 and the "scraps of paper" of 1884, provide convincing proof of the mental deterioration which began in a broken engagement and ended in murder and suicide. Ludwig, a tall attractive young man, with his grandfather's aquiline features, had a feminine strain in him ("bisexualism" his biographer calls it) which made him refuse marriage with his pretty cousin Sophie, and led to a series of passionate attachments to young men: much of the book is devoted to the silly or sentimental letters which passed between them. More creditable was Ludwig's admiration for the much older Wagner.

But there was something kinglike beneath the surface of Ludwig's schoolgirl *schwärmerei*. True, he made himself unpopular by spending the crisis of Sadowa out of the country; but afterwards he praised the bravery of his Bavarian troops, and in 1870 was full of anti-French rather than pro-Prussian patriotism. Bismarck must have known what he was saying when he wrote that "he always impressed me as a business-like, clear-headed ruler, full of the German national spirit." The pity of it was that Ludwig's romanticism, the "fantasy" of solitary mountain walks, music and moonlight, Lohengrin posturings, fairy palaces in the Bavarian Alps, morbid confessions of sin, and hysterical resolutions of amendment, gradually undermined his moments of sanity; he was forced to abdicate, put under restraint, and perished by drowning himself and his keeper in the lake at Schloss Berg.

The story of Ludwig's life makes melancholy reading; nor is the manner in which it is told free from the flamboyancy of the "Secret Diary." Yet we may agree with the verdict that "we cannot fail to believe that such prolonged and seemingly forced-drained spiritual, emotional, mental and physical agony as Ludwig the Second suffered will somehow, somewhere, be purged and assuaged. Meanwhile we dare not—will not—judge."



An Admiral Looks Back

THE SEA HERITAGE.
By Frederic Dreyer.
Museum Press. 472 pages. 30s.

THIS book is subtitled "A Study of Maritime Warfare." In the post-atomic age such a study is badly needed, but this is no such thing. It consists of the memoirs of a distinguished gunnery officer who joined the navy in 1891, retired in 1939 and played a useful part on shore in the Second World War. His hero is Jellicoe, whose flag captain he was at Jutland and who thought highly enough of him to say that to him more than to anyone else was due the gunnery efficiency of the Grand Fleet. Although enough ink to float a battleship has been spent on Jutland, Admiral Dreyer fights the battle over again and does well to draw attention to the vital night signals which were not transmitted to the commander-in-chief and which only appear in the second edition of the official history. Jellicoe's unpublished note on the errors of that battle is perhaps the most important thing in the book, though the author has some pertinent remarks about the battle of aircraft priorities in the last war.

It is a pity that a great deal of scrappy information extraneous to the author's own experiences should have been included by way of postscripts and appendices. Nor is the book's appearance improved by the author's predeliction for fancy typography: just as a midshipman's journal blossoms into parti-coloured inks when he wishes to impress, so retired admirals are apt to harangue their readers in italics and capitals. As for initial letters, it is easy to have too much of this sort of thing: "As CNAS I gave a somewhat lengthy address, and was followed by the DNAD, the DGNDP, the DAM and the ADNAD."

This is NO Book

(in the ordinary sense)

This is the famous KEESING'S—a fusion of a Book and a Periodical, ingeniously contrived to form a continuous "living" Reference Tool on Current Affairs—embodying the following characteristics :—

(1) The current Volume contains the records from 1st January 1955 to date (previous volumes are still available for the past 20 years) and to this is added every week a fresh supplement covering the latest developments all over the world—*including any reports which you may have missed due to the London Newspaper strike*

(2) Its unique, alphabetical, cumulative Index is renewed 26 times a year to afford instant access to every item in the volume.

(3) There is no slant, no prejudice, just plain documentary evidence of established FACTS in Politics, Economics, Social Questions, compiled in scholarly manner without comment or interpretation.

Many other aspects of KEESING'S will interest you. Just post the coupon below to obtain the full literature.

MACMILLAN

Wives and Writers

OLIVE SCHREINER: *Her Friends and Times*
By D. L. Hobman.
Watts. 191 pages. 15s.

THE MEASURE OF MY DAYS.
By Sarah Gertrude Millin.
Faber. 394 pages. 21s.

THESE books are about two women, outstanding in their country (South Africa) and in their generations, who, in character, have something in common: both intelligent, imaginative, agnostic and egocentric; both gifted with an intuitive awareness of political events; and both suffering from a chronic nervous disease—one from asthma and the other from insomnia. Olive Schreiner, of whom Smuts wrote: "She is a national possession, and the more one knows her, the more one reverences her" was born in 1855 and died in 1920, when the young Sarah Gertrude Millin, whom Smuts was to call his "Thucydides," was at the beginning of her career as a writer. There was thus a continuity in their evaluation of the South African scene, about which each wrote a book of distinction.

Miss Hobman's admiration for Olive Schreiner was kindled when as a young girl she read "Women and Labour," which she still considers "one of the noblest books which have ever appeared in defence of feminism." It is a pleasant surprise that the biography (which also includes competent thumb-nail sketches of Havelock Ellis and Edward Carpenter) is not distorted by hero-worship, but is an effective and balanced appraisal of a puzzling character, from which there emerges a woman of great gifts but little concentration, driven by a stubborn and erratic temperament and inhibited by physical suffering. Her "The Story of an African Farm," written when she was a young governess in a Boer family on the veldt, was a world success. She was acclaimed as a poet, prophet and pioneer, but all that she subsequently wrote, apart from "Women and Labour," were volumes of "Dreams," "Allegories" and "Stray Thoughts."

When she was almost forty she married a man eight years her junior, on the understanding that he would take her name. She found life on his lonely farm insupportable, and he, believing that it was his mission to give her genius scope, renounced his own vocation and went to live in Kimberley so that she might finish two full-length novels which were to earn her £30,000. But her asthma proved as bad in the city as on the veldt, and they moved to Johannesburg, then Cape Town, but the novels remained unfinished. Her husband was a pedantic and meticulous man, with a strict sense of duty, and he cherished her in sickness and health, bore with the superciliousness of her friends, her erratic housekeeping, her uncomfortable habit of sleeping during the day and wandering restlessly and noisily about during the night until at last they became estranged, and separated for six years, only to find that reunion was even more impossible.

It is not surprising that Olive Schreiner grew to feel "out of everything" and terribly lonely. The biography depicts the pathetic metamorphosis of an admired and eagerly welcomed friend into a perverse, unwanted and forgotten invalid. She swept like a meteor across the sky of her own generation leaving little trace behind, and yet—people still living who knew her in her brilliance and perversity are "alight when they speak of her, as though her very memory were luminous." All her world seems to have taken Olive Schreiner very seriously. It is not recorded that anybody laughed at her. Nor does Miss Hobman, which is also a pity.

There was a warmth of shared laughter in another South African household, where the wife was a distinguished and also a prolific writer, undeterred by a shattering inability to sleep more than six or seven hours a week. Sarah Gertrude Millin's biographies of Rhodes and Smuts and her brilliant study of the people of South Africa have won her world recognition; she also wrote novels which were widely read. She made an early marriage which grew into an ideal partnership, crowned with well-deserved success in public life and great happiness in shared work and mutual understanding, but clouded in later years by the threat of her husband's heart trouble, from which he suddenly died.

When one partner to a good marriage dies, the other dies too, and is born again into a bleak and frightening world in which everything must be seen through two eyes instead of four. Many people arm themselves for this struggle with gratitude for a rich memory of happiness; with courtesy in leaving the feast graciously when it is over; with pride that the one who is gone is still reflected in the added personality of the one who is left behind. Not so Mrs Millin. She is concerned to show how wrong the doctors were to keep from her the true facts of her husband's precarious hold on life; pitifully to con over the chances that contributed to his death at that particular moment and other chances which might have prevented or postponed it; with the complete emptiness and hopelessness of widowhood, "Nothing matters in the end," she says, "not parents or children—except the loss of your companion." Others who do not have a companion, would, for the sake of having one, accept with stoicism the inevitable corollary that one must go and one stay.

In an earlier book Mrs Millin wrote that one had to learn how to be middle-aged and elderly and old. One had to practise being fifty and sixty and seventy no less than being twenty and thirty and forty. In every phase of life one was inexperienced and immature, and puzzled and young. Now she is puzzled and young in bereavement—and even her fine courage is daunted by lack of sleep—and in her groping for some way out of her anguish she has, with youth's impetuosity, written a book in order to keep the memory of her husband alive. But if she had waited until she was more mature in bereavement, it could have been a better tribute to a very gifted gentleman, whose attributes included humour, stoicism and a horror of fuss.

Soldiering

GOING TO THE WARS.
By John Verney.
Collins. 255 pages. 12s. 6d.

ANY reviewer can be forgiven a sigh when presented with yet another book of the personal war experiences of a young man. And a quick glance through the contents of this book seems to promise all the usual ingredients, including—yes, of course—the escape story at the end. But this reviewer soon stopped complaining. This book does manage to be different. It is a mixture of truth and fiction and a very agreeable mixture, told with a freshness and humour which make delightful reading.

The story starts gaily in the 1930s with the author at twenty-three taking a vacation from his job as an assistant film director to do, for a reason he finds hard to explain, his first amateur soldiering as an officer with a Yeomanry regiment in Somerset. "'Have a smoke, sir?'" he says to his fierce red-necked Major with heavy cavalry moustache—an insurance agent in ordinary life. "His prominent, rather red-rimmed blue eyes stared at me in outraged astonishment. 'We never smoke during battle,' he said angrily." The tone of this book is set by the subsequent observation: "Strangely, the real thing when it came was not much more real than the make-believe."

Yet if the air of fantasy never quite leaves this story, it is only fair to report that the author soon begins to take his soldiering seriously when his Yeomanry Division goes overseas to Palestine in the early months of the war. But the stage was set for fantasy in those first idle days for cavalrymen when the jingle of their swords sounded quaintly in a war of tanks and aeroplanes. From behind the humour in the telling of those two waiting years in the Middle East, there emerges the utter frustration for these ill-equipped troops, the awful muddle of the Syrian campaign, and the impossible task of keeping up the morale of these troops. Eventually getting himself attached to a small hush-hush unit, the author is parachuted over Sardinia on a John Buchan-type project of blowing up German bombers based on airfields there. Inadvertently, the little band of men is captured. John Verney finally manages to escape, to get reunited with his wife, to contract attacks of acute malaria, and to bring his war story to a gentle close.

This is a kindly story of soldiering, not full of high-sounding words, not unduly kicking against the army system, tolerant towards fellow soldiers—or seemingly quite so—and written in an accomplished way.

"Although this autobiography is lively with the excitements and the high colour of gang warfare, corruption in public office, and the operations of the secret service, its larger value is its record of the development of police organisation during the past 25 years."
Glasgow Herald.

CLOAK WITHOUT DAGGER

THE MEMOIRS OF
SIR PERCY SILLITOE, K.B.E.,
Former Director-General of M.I.5

Foreword by the RT. HON. CLEMENT ATTLEE, P.C., O.M., C.H., M.P.

Ambitious as he had always been, Sir Percy Sillitoe had never in his wildest day-dreams visualized himself at the head of the Secret Service, but these extraordinary memoirs provide a more than adequate explanation of the rise to so exalted a position of the one-time choirboy of St. Paul's Cathedral.

The Friendly Rivals

GEORGIANA.
Edited by the Earl of Bessborough.
Murray. 317 pages. 25s.

DEAREST BESS.
By Dorothy Margaret Stuart.
Methuen. 279 pages. 21s.

THE last days of the English "Old Regime"—the age which enjoyed the scandals of the Prince of Wales's relations with Perdita Robinson and his reputed marriage with Mrs Fitzherbert—knew few domestic situations more remarkable than the one which developed at Devonshire House. There the social chief of the Whig aristocracy presided, as happily as his phlegmatic nature permitted, over a family circle consisting of Georgiana (his first Duchess), Lady Elizabeth Foster—his mistress—and his children by both of them. The party was joined later by the two Foster boys on the death of their disagreeable father, with whom "Bess" had found life insupportable some years before. Outside this happy family (the younger members of which got on well together) hovered, somewhat in the shadows, but provided with a good start in life, two other illegitimate children: the daughter whom the Duke begot before his marriage; and Georgiana's daughter by young Charles Grey, later Earl Grey of the Reform Bill, to whom she had turned for consolation.

Most of the letters comprising the first of these books, so carefully selected and wisely introduced by Lord Bessborough, were written by Georgiana and her mother, Countess Spencer; but there are enough of those between Georgiana and Bess to confirm the strength of a friendship that apparently stood the severest test imaginable. Lady Spencer's letters convey her displeasure at her daughter's hectic life, which moved with a frequency that is rather puzzling (owing to the absence of addresses on many of the letters) from Devonshire House to Chiswick, or—less frequently—Chatsworth, and back again: they might well be the letters of a Victorian mother to one of the "Bright Young Things"—though it is doubtful if many daughters in the nineteen-twenties would have answered them so repentantly. But the promised reformations were short-lived; and the Duchess's debts piled up fantastically. The Duke is said to have extricated her to the tune of a million. It is a matter of guess-work rather than arithmetic to calculate a figure from the clues in her letters; even when appealing to Mr Coutts, the banker, whose heart again and again overcame his presumably hard head, she never disclosed her real liabilities. Monsieur Calonne, who found her problem as insoluble as the bankruptcy of the French monarchy, seems to have been more cautious: he advised, but did not lend much. The Duke's patience was exhausted in 1791 when he compelled her to retire to the continent for a year; but his decision may have been strengthened by other anxieties, for during her exile Grey daughter was born, and Bess, als abroad, bore one of the Duke's childre

Lady Spencer must have watched h daughter's married life with disappointment. One senses in some of her letters a doubt whether a wise choice of husband had been made for Georgiana. Her natural qualities might have matured more healthily in the bracing air of Chatsworth than in the candle-lit card-rooms in London. But the Duke, unlike his father and his son, took little interest in Chatsworth or the country duties of his rank. There is evidence that Georgiana saw some of the possibilities afterwards exploited by Paxton; and she founded a school for poor children at Edensor. But her enthusiasms were not encouraged, and her follies may have been partly due to the frustration of a nature whose kindly generosity won and held her friends.

"Dearest Bess" might be described as sympathetic biography; it presents Lady Elizabeth Foster's life in the most favourable light—to Miss Stuart she deserves neither Lady Spencer's disapproval nor the unappeasable dislike of Georgiana's daughter Harriet. But it would be unfair to call the book "biographical fiction"; for Miss Stuart allows Bess in letters and journal to tell her own story unaided, except for an occasional word of reproach to her detractors; and, it must be added, rather a superfluous amount of textbook history—though even this provides background for the eye-witness accounts of people and events in which Bess displays her ability as a foreign correspondent. She had, indeed, a real gift for portraiture and exceptional opportunities for using it: she tells us what Napoleon looked like and what some of his chief assistants thought of him. It is especially interesting to compare her descriptions of Bourbon and Consular Society. Like Georgiana she was on terms of friendship with Marie Antoinette. This pleasure in observing and recording what she saw and heard lasted all her life, and obviously lightened her long second widowhood—the Duke died in 1811, but Bess lived on till 1824. During her short reign as Duchess (1809-11) she managed, aided by their good nature, to live on friendly terms with the Cavendishes: and the sixth Duke, though he soon discouraged frequent visits to his houses, treated her fairly.

The most difficult character to appraise in this "Comedy" is the Duke. He is described in Mr Francis Thompson's History of Chatsworth as so lethargic that he refused to get out of bed when told the house was on fire—he said "they had better put it out," and went to sleep again. Yet his letters to "Dearest Bess" are lively and not without humour. Perhaps she possessed some psychological spur which Georgiana lacked. Or perhaps Georgiana's magnetism, which held the Prince of Wales and Charles James Fox, not to mention the Westminster electors, had no attraction for the Duke.

"This Were a Popet . . ."

ENGLISH DOLLS, EFFIGIES AND PUPPETS.
By Alice K. Early.
Batsford. 226 pages. 25s.

THE author of this book is well known to doll addicts as a collector of antique dolls and puppets. The success achieved by the attractive "Dolls Through the Ages" exhibition in Park Lane in July, 1954, was evidence of the extent to which the craze for doll-collecting has crossed the Atlantic. During recent years, its American ardours have become fully apparent to officials of English museums containing dolls.

Mrs Early devotes the greater part of her amply illustrated book to dolls. In her context effigies are, primarily, wax images of British monarchs and famous people. Inevitably shapeless, but pleasantly discursive, this book will appeal to those delighting in information about the history of everyday things.

Small figures surviving from remote antiquity are often to be regarded as symbols belonging to religious cults or to superstitions, rather than as playthings. In more modern times, there is the charming tradition of fashion dolls, tiny inanimate mannequins displaying the newest modes. A notable employer of such dainty trade emissaries was Rose Bertin, Marie Antoinette's dressmaker and milliner. Queen of the doll industry—dolls for nurseries—was Madame Augusta Montanari, whose success in London during the middle of the last century was crowned by the award of a medal for her wax dolls shown at the 1851 Exhibition. She "perfected the method of inserting every hair individually in the dolls' wax heads with a hot needle as if it grew naturally." The jury reported that, while her dolls were "the most remarkable and beautiful collection of toys in the Great Exhibition. . . ." they "are adapted rather for the children of the wealthy than for general sale, since prices of the undressed dolls are from 10s. to 105s. each."

English Movable Fashion Doll (c. 1830)

Two corrections may be noted for any further edition: *coiffeur* is more than once used in the sense of *coiffure*; the Roman rag doll from Oxyrhynchus is in the British Museum, not the Victoria and Albert.

Disencumbered Johnson

SAMUEL JOHNSON.
By Michael Joyce. *Men and Books Series.*
Longmans. 183 pages. 10s. 6d.

"NO species of writing," Johnson declared, "seems more worthy of cultivation than biography, since none can be more delightful or more useful, none can more certainly enchain the heart by irresistible interest, or more widely diffuse instruction to every diversity of condition." Mr Joyce may fairly claim to write under this charter, since his book is essentially a modest and competent labour of diffusion, likely to appeal to casual readers who find Boswell bulky and bewildering, and who are unwilling to tackle such formidable subsidiary sources as the "Johnsonian Miscellanies" and the "Thraliana."

There is no doubt something to be said both for retrenchment and for a composite sketch. Boswell aimed at the largest of conversation pieces—one "exhibiting a view of literature and literary men in Great Britain, for near half a century"—and in pursuing this public design he may have failed a little to do justice to the more domestic Johnson, for glimpses of whom we must turn to Mrs Thrale or Miss Burney. Again, Boswell adopted, to a point of injudicious lavishness, that technique of incorporating epistolary correspondence within biographical narrative which had been innovated by Mason in his "Life of Gray." Mr Joyce admires the letters (it is in them, he excellently says, that Johnson most finely "merges the fruits of his own experience with the accumulated wisdom of mankind"), but he maintains that they are most agreeable when read in bulk in Dr Chapman's edition. A disencumbered portrait, in which the subject stands out boldly against a lightly indicated background, has a charm which Johnson himself superbly knew how to command in the "Lives of the Poets." Mr Joyce makes a creditable attempt upon it.

But Johnson's "Lives" are equally distinguished as literary criticism. Unfortunately Mr Joyce's lively appreciation of the personality of his sitter is not matched by much feeling for his works. It is no doubt true in a sense that Johnson "had never wished to become a professional writer." But the same thing might be said of Swift. And when we read that "he clearly knew nothing of that imperious creative force which drives the true artist to bring his masterpieces to birth" we are bound to reflect that, nevertheless, "The Vanity of Human Wishes" and "Rasselas" exist. Mr Joyce shows no awareness of the first of these as much differing from "London." And he declares the second to be "merely dull."

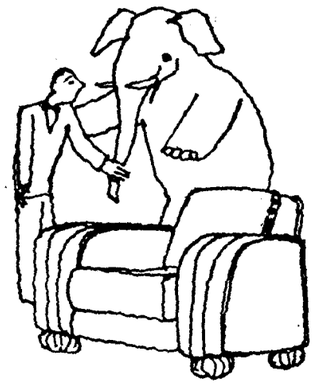
Graven Imagery

THE IMAGERY OF BRITISH CHURCHES.
By M. D. Anderson.
Murray. 230 pages and 24 plates. 25s.



ENGLAND'S parish churches are its folk museum. Ravaged only by Reformers between 1540 and 1660, the neglect of eighteenth-century rationalists and Victorian restorers, they still conserve most of what we know of the life and attitudes of our ancestors. In the imagery of their architecture and contents we trace a continuous line back to pre-Islamic Syria or Africa, to the Celtic missionaries and to the pagan Roman-Hellenistic arts. Paulinus of Nola and Apollinaris Sidonius mention wall-paintings, mosaics and other imagery which told the Christian story to illiterates. Today we know more of the symbolism, imagery and iconography which link our remaining churches to "the chaos of pre-ordination and Night of our fore-being."

Miss Anderson has put us deeper in her debt by this latest of many works. Her knowledge of crafts, liturgy, social history and literature is immense; her zeal infectious; her dispassionate probing of our ancestors' attitudes most revealing. She views churches and their wide range of contents—the latter serving both ecclesiastical and secular purposes—from many different standpoints: those of the Church itself, the local parson, the laity (rich and poor), the artists, young and old, men and women. It is possible to disagree with her: for example, can Norman (or were they Saxon?) stone-carvers have been so unskilled, even if they did copy metalworkers, when they could do work like that at Kilpeck?

It is nice to be reminded today that a marriage six or seven centuries ago legitimised previously-born children, who "knelt under the care-cloth" at their parents' wedding; that joining the hands for prayer came in late, and from the secular ceremony of homage-plighting by "a lord's man" under feudalism; and that "going to the wall" comes from the early days when the only seat for the congregation was the wall-bench for the aged or infirm. And the following passage recalls Pater's "Denys of Auxerre"; it is about the rebuilding of Bodmin church in 1469-72:

> Every inhabitant seems to have given according to his means and those who could not give money gave their free labour. Many gave both labour and gifts of produce to be sold: here a lamb and there a goose, and further on we read that Cicely Serle gave her "crokke" (or cauldron) which was sold for 20d. The vicar gave his whole year's salary and the "parish people" who lived outside the town also contributed.

There is a wealth of learning in this book; above all, about the "becoming" of much of the beauty of England still around us. Some errors should be corrected in further editions: e.g., there is no West "tower" to the Saxon church at Bradford-on-Avon. The notes, bibliography and indices are superb.

For whom was this chair made — people or elephants?

A Matter of Taste

GOOD AND BAD TASTE.
By Odd Brochmann. Translated from the Norwegian by M. A. Michael.
Eyre and Spottiswoode. 128 pages. 18s.

THIS book attempts to explain one of the great mysteries of all time—why we find some objects beautiful and others ugly, and, indeed, why we ought to do so. The appeal of an object to the eye depends on its form, its colour and texture, and Mr Brochmann takes these elements in turn and analyses the kind of reaction they produce in the beholder. Form, he says, is appreciated in three ways. The first depends on the way the eye works, on the way it perceives order and balance, and relates objects together. On this perception depends the appeal of a Georgian building, with all the emphasis on geometrical shapes and their proportion to each other. The second way in which form is appreciated is described by Mr Brochmann as organic, and his theory is that membership of the animal kingdom gives us an instinctive love of natural forms, flowing curves and so on. This sense overlaps with the first kind of appreciation, in that the proportions of the human body affect our judgment of good proportion—which explains why, for example, people would condemn the monstrous armchair in the illustration reproduced above. Thirdly, there is a strictly rational appreciation of form which depends on whether the object is considered well adapted for the purpose it is meant to serve.

A person with bad taste thus becomes by definition a person deficient in his optical, emotional and rational reactions. The fact that the majority appear to be so deficient is perhaps to be explained by the fact that their appreciation is overlaid by mental associations such as the desire to impress. It is an illuminating book and wittily illustrated.

The Art of the Party

I MARRIED THE WORLD.
By Elsa Maxwell.
Heinemann. 318 pages. 18s.

GEORGE BERNARD SHAW called Miss Elsa Maxwell the eighth wonder of the world; indeed, her career was remarkable from the start, for she was born in a theatre box during a performance of *Mignon*. Lady Bracknell would not have considered that much of a recommendation, and the young Elsa certainly had neither money nor social position, and was very far from goodlooking. The only advantage her background gave her—and that a modest one—was that through her father, an American literary journalist, she met a few visiting celebrities. Yet Elsa Maxwell became the most famous party-giver of the century.

How did she do it? The mechanics of her career give little clue; it was a triumph of sheer personality. She had a small talent for singing and playing the piano, and began as an actress in a touring company. An actress friend paid for her to go to Europe—the first of many friends who forked out fares and hotel expenses for the sake of her vibrant company. At Maxine Elliott's house in London she first found herself in the fashionable circle, and from then on she was in great demand. She was always, in short, the life and soul of the party, and many a hostess was thankful for her extraverted exuberance.

Her technique for making a party "go" was, first and foremost, to assemble interesting people. (Never, she says, work in the bores to whom you owe invitations. It is better to have them to a separate party—where you will find that they generate a sort of animation, exchanging their banalities with great vivacity.) Another rule was to provide music—and what music hers was. Anyone from Artur Rubinstein to Cole Porter might be heard at her parties. But her principal technique seems to have been to run her parties as if the guests were children. She would shake the guests out of their dignity and self-consciousness, not with plentiful alcohol, but by making them play silly games or take part in some monstrous charade. Her distinguished guests might have to hold up a sheet and blow a feather off it, or come dressed as they were at the moment of receiving the invitation. And so she kept boredom at bay from a set that was haunted by fear of it.

It is not surprising that she was so popular. Her father once told her that her plainness and plumpness could be an asset "because no woman will be jealous of you and no man will be suspicious of you." To supplement this asset she has a warm and generous personality, a simple delight in knowing interesting and famous people, but an honest scorn for those whose only claim to notice is their snob value. Her comments on people are not particularly penetrating, but they are usually good natured and always entertaining.

Adolf Galland
THE FIRST and THE LAST

The life and death of the Luftwaffe: the personal story of Adolf Galland, Germany's most famous fighter ace and wartime commander of the fighter force. Here is a document of cardinal importance in the history of the air war. It 'combines in one man's memoirs both the passion of combat and the perspective of command' (Time Magazine)

Foreword by DOUGLAS BADER
Illustrated 18s

Régine Pernoud
THE RETRIAL OF JOAN OF ARC

The evidence produced at the trial of rehabilitation of Joan, held twenty years after her death, is presented in English for the first time. 'The story has the exciting quality of all trial stories, but it also builds up in a remarkable way the atmosphere of fifteenth century France... This extremely interesting book, extracted from original material, is a serious addition to our understanding of her' (C. V. Wedgwood, *The Bookman*)

The Solitary Singer

A Critical Biography of Walt Whitman

By GAY WILSON ALLEN

"A full scale life of the singer of songs, the man, the myth and the poetic genius .... It is and probably will remain for our time the definitive biography."—N.Y. TIMES. "He has given us our most thorough and reliable Whitman biography and has told well one of the great stories behind one of our great books."—N.Y. HERALD TRIBUNE. Special price 42s.

Leonardo da Vinci

By LUDWIG HEYDENREICH

"We are indebted to Mr. Heydenreich for pulling Leonardo's scientific activities together into a valuable and consistent pattern. . . . It is a very good picture of the total man . . . the reader can learn more from this work about Leonardo than he could ever have learned before."—Alfred Frankfurter, N.Y. TIMES.
1 volume edition 100s 2 volume edition 126s.

His Very Self and Voice

The Collected Conversations of Lord Byron

Edited by ERNEST J. LOVELL, Jr.

"The success of Dr. Lovell's technique . . makes this massive 600-page volume singularly noteworthy and interesting .... Those of us who feel as strongly as did Byron's own generation the spell of his powerful and relentless genius will find Dr. Lovell's book not merely illuminating, but even indispensable, to any effort to solve the enigma of Byron's life and personality."—THE TIMES LITERARY SUPPLEMENT. Special price 42s.

Marketing of Agricultural Products

By Richard L. Kohls. An easily understandable survey of the marketing of many familiar farm products in the present economy. Realistic and concrete, it incorporates all recent findings. 37s.

The Social Economics of Agriculture

By Wilson Gee. Concise coverage of basic economics and rural sociology as they relate to agriculture and the economy as a whole. Rev. ed. 45s. 6d.

Economic Geography

By C. F. Jones and G. G. Darkenwald. Up-to-date second edition of this outstanding work analyzes the production and distribution of the principal world commodities. "A first class book in its field."—SOIL SCIENCE. Special price 35s.

Governments of Europe

By William Bennett Munro and Morley Ayearst. The fourth edition of a classic work completely revised to include all the recent changes in European politics today. 37s.

Introduction to the Study of Public Administration

By Leonard D. White. A forthright analysis of American governmental structure, personnel and control at all levels. Probably 42s.

Techniques of Magnetic Recording

By Joel Tall. Complete, practical guide to modern recording emphasizing the many new uses in education, science and the arts. Probably 52s. 6d.

Make Your Own Stereo Pictures

By Julius B. Kaiser. Easily understandable directions for making beautiful 3-dimension pictures with a minimum of equipment. Special price 31s. 6d.

Information Please Almanac 1955

Edited by Dan Golenpaul. A handy 960-page reference for home and office containing over one million facts. Hard cover edition 15s. Paper-bound edition 10s. 6d.

Beyond Despair

By G. Ray Jordan. An inspiring book that shows how to develop spiritual capacities through a closer and more meaningful relationship with God. 17s. 6d.

Modern Germany

By KOPPEL S. PINSON

"Written in simple, fluent style. It is a book many students of German affairs have been waiting for and for once, the term indispensable, so often misused by reviewers, is completely justified."—F. A. Voight, TIME AND TIDE.
"The most useful introduction to the subject at present available to English readers." — THE TIMES LITERARY SUPPLEMENT. Special price 35s.

Sounding the Alarm

BUT WE WERE BORN FREE.
By Elmer Davis.
Deutsch. 229 pages. 15s.

MR ELMER DAVIS, the eminent American radio commentator, is not very well served by the publication in Britain, without any revision, of his six essays in defence of liberty. This is the latest of a number of American books brought out here that are vigorously critical of Senator McCarthy and his imitators. In so far as this helps to dispel the fiction of a reign of terror in the United States and the myth that the friends of liberty are afraid to speak up, it is a good thing. But the first and longest of these essays is a report on the state of civil liberties at the end of 1953; Mr Davis himself, in his foreword to the English edition, recognises that it is already much out of date and that he exaggerated the invulnerability of Senator McCarthy. This blow by blow account of the now rather wearisomely familiar assault of the "primitives" upon civil liberties fails to shed very much light upon its causes and importance. In any event, a domestic call to arms is unlikely to persuade foreign readers that other accounts of the "perilous night" have been painted in too dark colours, as Mr Davis seems to hope it may.

Mr Davis is much happier in the other five shorter essays, which are all linked to the same defence of freedom of thought but do not retrace such well-worn paths. Here he is able to display his gifts as an essayist and as a cultivated and thoughtful commentator. "History in Doublethink," for example, deals very neatly and justly with the American phenomenon of the ex-Communist who has never ceased to regard himself as an inspired prophet, whether of the extreme left or extreme right. The most gifted of this little band, Mr Whittaker Chambers, is placed in his proper pigeon-hole; it is a rather smaller one than he tried to claim in his own book "Witness." There is a great deal that is interesting, too, in Mr Davis's discussion of "News and the Whole Truth," in which he describes the risks that are run when newspapers adhere too rigidly to a dogma of "objectivity." Is a paper doing its whole duty to its readers when it simply reports bald facts: when, to take a far-fetched example, it records that Senator McCarthy says that the sun revolves around the earth, without pointing out that this is incorrect? This is a problem to which Mr Davis, America's wartime information chief, has given much thought.

The most human and touching chapter of all is on the "Grandeurs and Miseries of Old Age," which probably survives the transatlantic crossing best of all. In this there may be a moral for publishers, who sometimes too hastily conclude that a common language is a passport to understanding, and do not realise that an American writer may need as much translation and adaptation as a German one if his journey is to be a success.

Georgiana's Grand-daughters

THREE HOWARD SISTERS. *Selections from the writings of Lady Caroline Lascelles, Lady Dover and Countess Gower, 1825-1833*
Edited by the late Maud, Lady Leconfield. Revised and completed by John Gore.
Murray. 309 pages. 21s.

"COMFORTABLE Girls, who like a dirty joke." This report by a middle-aged Regency lady on her nieces was, according to Lord David Cecil in his "Young Melbourne," intended to be complimentary. But it could not have been made on the Howard sisters: their letters do not lack humour; but it is not Rabelaisian. Mr Gore says that "the tongue of scandal never clacked on them. They gave it no cause." Their discretion was due not to a home discipline much less strict than that inflicted on their grandmother, Georgiana Duchess of Devonshire, but to a change of moral climate.

Mr John Gore, ably completing the editorial task of the late Lady Leconfield, provides a family tree that differentiates Caroline, Georgiana and Harriet from their relations with the same fashionable Whig names: a fertile tree —their mother had twelve children; their own score was twenty-eight.

Lady Leconfield's introduction describes their nursery days, their Castle Howard background, and the personalities of their husbands: Georgiana's Agar Ellis, intelligent, temperamental, politically ambitious, but hypochondriacal; William Lascelles, who carried Caroline into the Tory camp at Harewood, but "deviated" during the Reform Bill struggle; and George Granville, Earl Gower, whose romantic devotion to the memory of the heroic Queen of Prussia, to whose Court he had been accredited, did not prevent his proving a devoted husband to Harriet. The sisters lacked their grandmother's brilliance; but they were observant and shrewd. Their letters were substitutes for telephone conversations between friends more completely separated by time and distance than we ever are today; they convey atmosphere as well as news, gossip as well as facts. Caroline goes racing from Harewood to please her uncle, the Archbishop of York, who was a keen punter. Nor did their good nature fail them when writing about the Court. Even the moribund George IV seems a little pathetic and almost likable; William IV a good host—though disconcertingly apt to fall asleep in the middle of a conversation.

The trials from which "privilege" was not exempt: bad inns; toothache painfully prolonged by dental incompetence; the fear of cholera—these are mentioned calmly and uncomplainingly, while the regular arrival of babies is recorded with cheerful simplicity. But the sisters belonged to a ruling class at a time when the latest French Revolution was disturbing Paris and once more exporting Bourbons and their supporters across the Channel; while ricks blazed in the English countryside, streets smouldered in Bristol, and in London crowds "groaned" and threw stones at the carriages of the great. They calmly record the impressions these events made on them, and how their friends and relations, whether battling in Parliament over the Reform Bill, or calming potential peasant revolts on their estates, displayed a common sense and a gift for compromise that the continental aristocracies conspicuously lacked.

It may have been true in 1816 that (as Pamela Fitzgerald wrote to her friend Emily Eden) the vices were wonderfully prolific among the Whigs; but these letters show how invaluable were their virtues, male and female, public and domestic, sixteen years later.

Traduttore Traditore

POET OF PARIS.
By André Beucler. Translated by Geoffrey Sainsbury.
Chatto and Windus. 248 pages. 18s.

M. BEUCLER'S "Vingt Ans avec Léon-Paul Fargue" is a charming book. Fargue was in some ways a contemporary French counterpart of Dr Johnson: a writer of merit, a brilliant talker, a much-loved man, a tremendous character, as much a Frenchman as Johnson was English. M. Beucler (not without help from Fargue before his death) has written a set of sketches of life with Fargue, and brings alive with great success the flow of talk and ideas that circled round his odd and rather egocentric life. It is an intensely French book: the idiom, the fashion of speech and ideas, the surroundings and the habits of Paris are so sharply delineated as to charm the English reader not only by their substance, but also by their foreignness.

It is doubtful whether such a book can be successfully translated. What in French is natural, in English is strange; and, once it is out of its natural dress, the unfamiliar strikes the reader most, and the unpleasant takes too much emphasis. There is an unpleasant side: the intense and competitive professionalism of literary life in Paris, the rather seamy bohemianism, the lack of good manners and the spurts of bile; all those little things that go to show that French literary men are not brought up at English public schools. In the original this takes no more than its proper and minor place; but draw attention to the oddity of the foreigner, and it is what strikes one first. To translate such a book at all is to betray it to some extent, and it cannot be said that Mr Sainsbury has minimised the danger. His version reads like a literal translation, yet it is not close. The book has been fairly extensively cut (though this fact is not announced); the gaps are not always skilfully patched; and the translation is sometimes inexact. Nothing substantial has been omitted or changed, but this is not a substantial book: talk and words are what matter in it, and when they are left out or clumsily rendered, the value of the book is diminished.

UNITED NATIONS

Economic Survey of Europe in 1954

Economic upswing in western Europe and its background, trade and payments of western Europe, trade and economic development of eastern Europe and the Soviet Union, regional problems in European countries and the structure of the French economy are the subjects covered in this comprehensive survey. (1955, II, E.2.)

Are you a Psephologist?

In the last 10 years a great deal of information has been compiled about the workings of elections, and this young science has been christened Psephology from the Greek word for a pebble, which they used for voting.

In a special four-page election guide on *May 1st* The Observer will present the most up-to-date knowledge on such questions as: Which matters more—the floating vote, or the machine for getting out the vote? Are issues important in elections? Do candidates matter? How are they selected and what sort of people are they? How does the middle class vote? Do non-voters decide elections? Can television dominate the election? How accurate can election forecasts be?

The guide will be edited by two of the best known "psephologists" in Britain, Robert Mackenzie, author of "British Political Parties", and David Butler, of Nuffield College, Oxford. In the three subsequent issues of The Observer Mr. Mackenzie will continue to report the election in depth, using the methods which have been developed by students of elections, sociologists, statisticians, party managers, and constituency canvassers.

This will be the first attempt in Britain to carry out a study on scientific lines of an election *while the campaign is going on*. It will try to bring you the hindsight which always follows the poll, before the voters go to the ballot box.

BUILDING SOCIETIES AND HOUSING

Fair Wind and Fast Race

Leading Building Society Figures

Property after the Rent Act

Efficiency and the Private Builder

Over the Housing Hump

Fair Wind and Fast Race

WHEN a year comes round in which the building societies do not achieve new records in total assets and sums advanced on mortgage it will be news. The movement's growth since the early 1920s, unbroken save for the war period and still gathering momentum, suggests that it may still be far away. Reason suggests that the rate of expansion will have to slacken one day, but at the moment growth is still accelerating: the movement's total resources rose by a shade over 13½ per cent in 1954 compared with a shade over 11 per cent in 1953. With a rate of house building well exceeding 300,000 a year and with the privately built and privately financed house once again allowed its place, the societies had expansion handed to them. If they had failed to expand they would have defaulted on their job.

It would still be absurd to belittle their achievement or the service to the community that has accompanied the great expansion of the last few years. Money has poured in from investors large and small; it has poured out again on mortgage loans, a high proportion of them on newly built houses for owner occupiers. The estimated figures speak for themselves; total assets at the end of 1954 had reached £1,867 million, rising by £224 million following an increase of £165 million in 1954; the amount advanced on mortgage jumped 25 per cent to £373 million, compared with £299 million. Investors provided the societies with more than sufficient funds to make these record advances, and liquid assets—cash and investments—rose by £44 million to £278 million.

Last year official policy began to give the housing boom a deliberate tilt towards houses for sale without subsidy. The demand for mortgage loans was therefore excellent. So were the supplies of money. Despite the evidence of the preliminary National Income estimates that no increase occurred in personal savings as a whole last year, increases were recorded in most of the conventional channels of private saving, and building society rates were favourable enough to attract much of that money. The general rate paid on shares remained at 2½ per cent net and on deposits at 2 per cent net, the societies paying income tax at the "composite rate" (which was 5s. 1d. in the £ compared with 4s. 10d. in 1953). For an investor paying the standard rate of tax the share interest was equivalent to £4 10s. 11d. gross and the deposit rate £3 12s. 9d. per cent gross. These rates seemed highly attractive while the trend in Bank rate was downward and yields on quoted investments were narrowing.

One further event also enlarged the field of opportunity for the societies—the two schemes negotiated by Mr Macmillan, then the Minister of Housing, with the local authorities and the building societies. Under one scheme the societies agreed to advance 90 per cent of the price or valuation of certain small houses, and under the second 95 per cent of certain others; the Treasury, the local authorities and the societies sharing any loss on the excess over what a building society would normally advance. The arrangement was distinctly favourable to the building societies. Their normal advance was deemed to be

70 per cent under the 90 per cent scheme and 66⅔ per cent under the 95 per cent advance scheme. In fact, building societies have been accustomed to advance substantially higher proportions of the valuations of such small houses, and they were in effect relieved of part of their normal risk. The plan was designed to encourage the householder of slender means to become an unsubsidised owner-occupier instead of a subsidised council tenant; not every authority has adopted it, nor has it worked wholly without friction. Standing stiffly on the confidential nature of their surveyors' reports the societies have refused to let the local authorities see those documents even when they are sharing in the risk. Over 900 authorities—well over half the total housing authorities in the country—are working the two schemes but figures of business under them are not yet available. It is nothing more than a guess that about £30 million of mortgages a year are being done in terms of those schemes. Some of this business would presumably have been done with the aid of insurance policies if the Government scheme had not been devised.

In a year of outstanding growth many societies show remarkable individual scores. The Abbey National has joined the Halifax to make a group of two societies with assets exceeding £200 million. The Woolwich Equitable and the Co-operative Permanent, who see themselves as close rivals, have graduated into the £100 million class. The largest society, the Halifax, has grown more slowly than the rest. Its assets have reached £237 million, slightly less than 11 per cent up. The reasons are well known. The Halifax, expecting cheap money to last longer than it did, held its share interest at 2¼ per cent net when the general standard was 2½ per cent and cut its mortgage interest from the usual 4½ per cent to 4 per cent. Taken in isolation the experiment failed. The demand for mortgages was great but could not be satisfied; money found more lucrative investment in other societies; and after four months, during which borrowers had to be severely rationed and interest rates had palpably stiffened, the society was obliged to move its rates into line.

The Halifax experiment seems to prove that even a big society cannot for long march out of step. But there is one thing that it does not prove. The practice of the better societies is to work on a gross margin of 2 per cent; they pay 2½ per cent net on shares and charge 4½ per cent on mortgages. Out of the 2 per cent margin between these rates, they cover their management costs, their own tax and income tax at the composite rate paid on behalf of their shareholders and depositors. The Halifax society believed it could work on a gross margin of 1¾ per cent; the society was working on that margin for four months only, to end January, 1955, and the revenue figures for the full year show a comfortable surplus but the narrower margin probably added little towards reserves.

BUILDING SOCIETY GROWTH

(Figures for 1954 estimated)

	1952	1953	1954
	(£ million)		
Total assets	1,478	1,643	1,867
Due to shareholders	1,186	1,338	1,536
Due to depositors	197	203	221
Due on mortgage	1,263	1,396	1,574
Investments	158	184	221
Cash	44	50	57
Number of shareholders (mn.)	2·47	2·62	2·80
Number of depositors (mn.)	0·60	0·59	0·59
Number of mortgagors (mn.)	1·65	1·75	1·88
Advanced on mortgage during year	266	299	373

Great growth such as the 777 building societies in Britain experienced last year is bound to raise problems. In 1954 several difficult questions were, on the whole, squarely faced by responsible societies. First there was the problem of institutional money. In times when building societies offer favourable returns compared with what is obtainable in the gilt-edged market, they become convenient repositories for large sums such as the temporary surpluses of companies. The societies have to pay the full standard rate of income tax in respect of interest on all company money and indeed on all sums, whether from companies or individuals, greater than £5,000. Therefore they offer less favourable net terms to such investors, but even so they have been offered some sizeable institutional investments. The societies however are borrowing short from the public and lending long—sometimes too long—on mortgage, and the straddle is reasonable so long as the investors are a wide group of small shareholders and depositors. It is indeed true that some industrial companies have succeeded in placing large sums running into six figures with the building societies, but many leading societies recognise that these big blocks of money, which can be withdrawn at short notice, should be discouraged.

A second main problem arises out of the rate of growth itself. Assets can expand rapidly; reserves can only be built up gradually out of the margin between the society's borrowing rates and its lending rates—out of the surplus that an industrial company would call the profit. After the big growth of assets in 1954, reserves now represent a smaller proportion of balance sheet totals. The Building Societies Association recommends that reserves should not be allowed to fall below about 5 per cent of total assets. Very few societies reach this ideal. The societies' figures this year show that reserve ratios have been falling and that a 5 per cent ratio, even among the biggest, is the exception. A more satisfactory ratio will require a period of gentler growth during which reserves can be accumulated. But sensible investors will acknowledge that the risks of a low reserve ratio can be lessened by the societies maintaining a high liquidity ratio.

As more money has been received from investors than has been lent on mortgage, holdings of cash and gilt-edged securities have risen, to the greater security of depositors and shareholders. But the rise in the proportion of liquid assets to total assets has brought its own problems. First these liquid assets are, as a rule, less remunerative than mortgage assets. Secondly when the gilt-edged market turns downward, as it turned last November, some of them are liable to market depreciation. For that reason the liquidity ratios shown in the table opposite are based on market and not on book values, and they still show formidable strength. Some societies are now beginning to feel that the weight of liquid assets is becoming oppressive.

Hence the development of new selling points such as 35-year mortgages by the Co-operative Permanent Society and 30-year mortgages by the Woolwich Equitable, despite the recommendation of the association that mortgages should not exceed 25 years in length.

On the whole building society managements have shown a highly responsible attitude to the problems of rapid growth. They have been determined both to play their part in the housing drive and to maintain a high degree of solvency. Suggestions by Mr Hugh Gaitskell that institutional money might be more freely accepted, and that conventional solvency mattered less because no government could afford to let the societies fail, found scant support within the movement. And with one accord as their assets leaped ahead the leaders of the great societies have proclaimed half apologetically that growth was not an end in itself. In that they were speaking a profound truth—possibly more profound than they would care to admit. Persistently, year after year, the analysis of building society expenses by the Registrar of Friendly Societies shows that the lowest expense ratios are not to be found among the great societies with over £20 million assets but in the group with assets between £1 million and £5 million where the original friendly society character of the movement still survives, and institutional overheads are unknown. Many of the small societies get along very well without expensive advertising and highly-paid executives.

MANAGEMENT EXPENSES

(Per cent of mean total assets)

	1951	1952	1953
Societies with assets :—	s. d.	s. d.	s. d.

107th year of Progress

Established in 1848 the Leeds Permanent Building Society has grown from a small local institution to a National organisation with Branches and Agencies throughout the Country.

The principles of thrift and home-ownership which inspired the founders of the Society have been maintained throughout the years, and the funds provided by over 100,000 Investors are being usefully employed in promoting home-ownership.

The total Assets of the Society now exceed **£90,000,000 with reserves** of over **£4,680,000 and** these resources provide **absolute security** to the Investor. Market fluctuations do not affect the investments and withdrawals can be made at any time at full face value.

Investments in Paid-Up Shares receive 2½% interest, Income Tax paid by the Society.

Ask for booklet "Safe Investments."

Property after the Rent Act

BY A SPECIAL CORRESPONDENT

IN a White Paper "Houses—the Next Step" issued in November, 1953, the Government explained its policy on sound rent restricted houses. The bulk of these were either in a good condition already or could be put into that condition if the landlords had enough income from rent. Therefore Part II of the Housing Repairs and Rents Act, 1954, that followed the White Paper and came into force on August 30th last year allowed the landlords an annual "repairs increase" of twice the statutory rateable deduction. But because some rents are already high, a limit (known as 'the stopper') prevented the net rent from rising beyond twice the gross rating value of the house. The landlord cannot claim the repairs increase unless the house is in good repair and reasonably suitable for habitation. He must also produce satisfactory evidence that work of repair to a specified amount has recently been carried out (this is known as the 'expenditure test'). To obtain the full repairs increase the landlord is deemed responsible for all repairs, but, following the precedent of the 1920 Rent Act, if responsibility for repairs is divided between landlord and tenant the repairs increase is proportionately reduced. The tenant can question the landlord's figures but his main safeguard against an undue increase in rent is that, if he at any time considers the house not to be in good repair, he can apply to the local authority for a certificate of disrepair and withhold the rent increase (both under the 1954 Act and the 1920 Act) whilst that certificate is in force.

It is perhaps too early to see how the scheme is working out. The start has certainly been slow for a variety of reasons. The landlord has had to check his accounts in order to satisfy the expenditure test. In order to apply the 'stopper' it is also necessary to work out the net rent, which may involve a determination by a rent tribunal of the cost of contractual services. Then it is necessary, failing agreement with the tenant, to get the county court to determine the proportionate liability for repairs as between landlord and tenant. There is much more argument about proportionate liability for repairs under the 1954 Act than arose from the similar provision in the 1920 Act.

When the landlord has done all this and served a notice on the tenant in specified form he may find that the local authorities are ready to issue certificates of disrepair on such slender grounds as shared lavatory accommodation. Property owners who have taken the lead in claiming repairs increases also find that they have disturbed good relations between themselves and their tenants and created resentment with local authorities. Not a few property owners have preferred to moderate their demands to secure agreement with their tenants. These have been the teething troubles. Good landlords meanwhile are keeping their houses in good repair. The very fear that tenants may run to their local authority for certificates of disrepair which, if granted, would bring the recoverable rent down to he pre-1920 level no doubt encourages them to do so. Where houses can be put in good condition to attract the repairs increase at reasonable expense, property owners are generally ready to use reserves to do the work. Few landlords with houses in bad repair have dared to apply for repairs increases; those few have been sharply rebuffed.

In addition to the repairs increase allowable under the 1954 Act, landlords can claim rent increases to cover the rise in the cost of services between 1939 and 1954, both contractual and non-contractual. The rent tribunals are the deciding authorities where the landlord and tenant fail to agree, and with no definition of services in the Act their decisions have naturally varied. In some of their earlier rulings they seem to have come down rather heavily against the landlord, But these again may be teething troubles: the more recent decisions seem more reasonable.

The 1954 Act excludes from rent control dwelling houses converted or built after August 30, 1954. This experiment in freedom was designed to encourage the building of houses and flats to let. There is little evidence, so far, that many new dwellings, apart from those built by Housing Associations, are in fact being built for letting. The high cost of present-day building is the reason. To ensure an economic return, rents would have to be considerably higher than for similar accommodation in existing houses. And landlords making conversions have found it difficult to get agreement from tenants to allow structural alterations; the tenants naturally object to losing their security of tenure when they are offered suitable alternative accommodation in the reconstructed building. Courts giving judgment in favour of the tenant have sometimes still expressed the view that he may be behaving unreasonably, and that his objections might be met by the offer of a lease giving equivalent security of tenure.

★

In terms of investment—or the price of houses—the new legislation has made hardly any difference to controlled weekly houses. Recent auctions have shown that such properties are often still selling at less than three-years' purchase. The 1954 Act has, however, made considerable difference to the value of modern blocks of suburban residential flats where the rents hitherto have been kept far below true values and where the flats are occupied by middle-class tenants. In these flats tenants rarely apply for certificates of disrepair; the owners—usually big property companies or insurance companies—have been able to charge almost the full permitted increase. The annual income, and therefore the selling price, of these flats has been considerably raised. Where it has also been possible to get "service increases," the investment value has been much enhanced.

What is happening to the price of private houses with vacant possession is yet another story. According to the index produced by the Co-operative Permanent Building Society the decline in selling prices evident since late 1951 continued during 1954. The fall varied with the type of property and the district, but, in general, it was least on the smaller, new houses in or near towns and greatest on older, larger houses in more inaccessible rural areas. Evidently potential buyers were becoming more discriminating and carefully weighed the balance of advantage between second-hand houses and the new houses coming on to the market. The gap between the price of old houses and the cost of new building is becoming distinctly narrower.

An interesting new development is the building of freehold flats for sale. As with houses, the high cost of storied construction is deterring contracting and property firms from buying or building blocks of flats to let. The possibility of selling flats freehold is therefore receiving more and more attention. The idea is contrary to the belief of many English lawyers that a property could only be described as freehold if it was firmly attached to its own ground. For many years, however, freehold flats have been bought and sold in Scotland, on the Continent, and in the United States. The main problem lies in the shared responsibilities of the freeholders for the maintenance of the structural fabric; this has to be solved by covenants, agreements and undertakings in which the occupiers bind themselves to share in the cost of maintaining the roof, outside walls, foundations, common passages, and stairways. Various forms of arrangement exist. Usually the occupiers agree to pay a specified proportion of the cost of maintenance. Sometimes they also share the cost of central heating, lifts, cleaning, porters, etc. The question at once arises as to who shall decide on what repairs and redecorations shall be done, and how, and when. Sometimes the original vendor of the property has been responsible; sometimes an estate agent is employed to decide on all repairs in consultation with the parties; sometimes (and this is becoming more popular) the occupiers form themselves into a holding company and subscribe a fixed sum annually to a fund. The essence of any satisfactory arrangement is a carefully drafted covenant, supported by mutual trust. As yet, the building societies and insurance companies are not altogether happy about lending money on the security of freehold flats, particularly where they are of more than two storeys. But a few local authorities are more forthcoming and are ready to lend money to a purchaser of a freehold flat under the same terms as for a dwelling house.

All these developments are perhaps the symptoms of a property market distorted by rent control. What of the future of rent restriction? So long as control is necessary it seems logical that, once a uniform rating valuation of dwellings has been established, the valuation figures ought also to be used for fixing limits of rent and for the Schedule A assessment for income tax. This was recognised (so far as rent control was concerned) in the 1953 White Paper and the 1954 Act was a stop-gap measure to improve living conditions and to save rent-controlled houses from further deterioration. If the new rating valuation takes effect on April 1, 1956, it might be possible to launch a new, and firmer Rent Bill. Will it then still be necessary to control the more expensive houses—particularly the houses and flats let with services? On the higher valued houses—few though they are—there seems little reason for retaining controls. On houses and flats let with services, the valuation figures themselves will be a poor guide for no account is taken in the valuation of the services that the landlord renders, and the decisions by rent tribunals on the cost of services have been so anomalous that it is doubtful whether such matters ought still to be decided by them. The proper criterion is the rent, and where the charge for the services forms a large part of it, the property should be taken out of control and left to the free play of the market.

Efficiency and the Private Builder

DURING the last few years the purchase of newly built houses has once again begun to account for the bulk of the new business of the building societies, and with private enterprise responsible for about 91,000 of the 348,000 houses completed during the year, the societies have again become the providers of finance for a significant proportion of the work done by Britain's house building industry. This resumption of the movement's traditional role has increased its concern with the quality of that work and with the efficiency of the building industry. Both, during the long postwar interregnum of building mainly for public authorities, have been the subject of critical study by committees, technicians and laymen; throwing bricks at the building industry has become a popular sport. Nor has the industry been hard to hit on grounds of efficiency; it has come off fairly badly before the nation-wide inquisition on industrial productivity. But it is fair to note that during the last two years—the years, by no means accidentally, of progressive removal of building controls—efficiency in building clearly seems to have been on the increase.

The growth of productivity in building since the end of the war still lags behind that in most other industries, but recently the improvement seems to have gathered some momentum. Upon the basis laid down by the Girdwood Committee, productivity in housebuilding in 1947 was no more than 69 per cent of the 1939 level, and by 1949 had risen to only about 80 per cent of the prewar level. In 1951 (a year of exceptionally bad weather) it seemed to be about the same as two years before. But more recent studies suggest a rise of about 5 per cent over the next two years to 1953. That would still leave productivity about a sixth lower than in 1939; what has happened since then? The crudest statistical yardstick, total output and employment, suggests a further gain of about 6 per cent in output per head in the building and civil engineering industry as a whole between 1953 and 1954, or half as much again as the average increase in productivity achieved throughout British industry last year. For house building in particular certain further studies of man-hours, as yet provisional and unpublished, suggest an even greater increase in efficiency last year, nearer 10 per cent. This would suggest a level of building efficiency within 5 per cent of the prewar level: itself nothing to boast about. Some private indices of building efficiency, moreover, suggest that the industry as a whole is only about three-quarters as efficient as it was in 1939. But in an industry as large, diverse and sprawling as the building industry, all these global estimates can be misleading. As the Building Research Station showed six years ago, different contractors to local authorities showed an enormous range in man-hours of time spent on building similar types of houses—and the variations occurred between firms rather than between sites.

It may be that those differences have narrowed in the meantime. After initial flounderings, local authority housing has acquired a certain rhythm. But what of private building? It has been argued that the tiers of financial

supervision imposed upon local authority contracts squeeze more water out of the prices of council houses than is the case with privately built dwellings enjoying a market that still favours the seller. This is an argument that works both ways—excessive official supervision seldom reduces costs. The type of house put up by some of the speculative builders appears to have changed little since before the war; the dire shortage and high cost of land suitable for housing development is certainly a hindrance to adventurousness in design or technique. Sites that would fetch 30s. to £2 a foot before the war now command £16 to £20; and many are too small to allow any considerable use of new equipment in building there. However, the gain in efficiency is one to which all sections of the building industry have probably made some contribution.

The further shift from repair work to new construction has helped. Productivity in repair operations is perhaps 75-80 per cent of the 1939 level, compared with about 90-95 per cent for new building; it may be only in civil engineering that productivity is really up to the prewar standard. Between 1951 and 1954 annual expenditure on repairs rose by a mere £73 million to £705 million, compared with an increase of £371 million to £1,144 million on new construction. The 400,000 or so "new tradition" houses that have been put up since the war have also played a part, though their prices have not always been as favourable as expected, and they have not ushered in the wide use of prefabrication and factory-made components as had at one time been thought likely. There is still considerable room for making and assembling items in workshops on the site or even further back, but these methods call for a much greater degree of mechanisation and careful phasing of construction work than house-building, in particular, has generally managed to achieve.

★

The relaxation of controls and the considerably higher output of building materials has been an inestimable tonic to the industry. It now has the incentive and the opportunity to add to its mechanical equipment and to abandon some of its traditional methods in place of the newer ideas. There appears to be a gradual increase in the practice and accuracy of what is called "pre-planning" (why "pre" and not simply "planning"?) Complete and close co-operation between the architect, builder, sub-contractors and building owner before work begins and during the successive stages of construction is still a subject for special comment rather than common practice, but more frequent than a few years ago. Similarly, the industry is still under-mechanised, but it spent twice as much, in real terms, last year on new plant and equipment as it did in 1948. The tower crane has lost some of its reputation as a panacea; even so, there are nearly 300 in use now compared with none four years ago. Power hand tools and transporting and hoisting equipment are appearing on more building sites with the general but very slow increase in the use of electrical and mechanical power in building operations stimulated in part by the use of new building materials. There remain plenty of sites where this equipment could be used or employed more effectively; the current shortage of building labour is leading many firms to buy new machines.

For mechanisation to play its full part its use must be reckoned with at the drawing-board stage of new building, and the administrative staff of builders must learn how to make full use of it. The process of capitalisation—and education—will always be somewhat circumscribed by the nature of this industry. Compared with manufacturing, in which firms may find it profitable to invest very large sums in fixed equipment, in building it is the production line that moves on from contract to contract, not the product. Moreover, this is an industry that will inevitably consist of a large number of small and medium-sized firms without the resources to spare for much capitalisation and certainly none for research, though in new building, as against repair, the share of the larger companies may be growing. The development of plant hire firms for house builders is therefore to be encouraged. So are schemes like that of the Eastern Federation of Building Trades Employers to enable its members to lend and borrow idle plant from each other.

★

During this period of improved efficiency in the industry, costs have steadied. Prices of materials were fairly stable until just recently. There has been little slackening in the rise in wage rates, but the growth of earnings has probably been matched by the improvement in labour productivity. In 1952 total building costs were about three times as high as in 1938, and they are about the same now, or if anything a shade lower. The use of costing methods and budgetary control, which are commonplace tools of management in manufacturing industries, is still the subject of ring-side controversy in building. Certainly there are difficulties in implementing a full costing system on a building site, not the least of which is the paper work involved; but these difficulties are not insurmountable, except possibly for the really small firm or small job where the working principal of the business is likely to exercise a less scientific but equally tight rein on spending.

The last few years' improvement in efficiency, it will be seen, have not been the accompaniment or result of any very radical change within the building industry. There seems to have been some loosening of minds towards better organisation, newer methods and machinery which may generate results that may not be immediately apparent. The onus for further improvement now rests upon the industry itself; most of the external brakes have been lifted. The new building bye-laws, which have been adopted by nearly all local authorities, no longer constitute the drag upon the use of new materials and techniques that the previous regulations were before 1952. The building society movement, indeed, might well reconsider some of its own requirements and standards, to see that these in their turn do not impose restrictions upon the efficiency of the private builder. Some builders feel that it is only among the smaller and more newly fledged societies that specifications—as to constructional standards as well as to design—that take full account of the new methods and materials that have proved their merit since the thirties, when the movement was last responsible for financing new building on a really large scale. The older and richer societies, who can afford to be very selective in a period when new mortgage business is by no means short, still require standards of construction that were appropriate several decades ago. The performance implied by those standards of construction today can often be achieved by materials and specifications better suited to new techniques of building, and private building cannot take full advantage of these until the societies, too, recognise their potentialities.

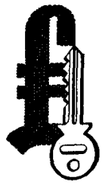
Over the Housing Hump

TO try to assess what is in store for the building societies means making a guess at how many houses will be built and who will pay for them—a hazardous undertaking even against the background of the Economic Survey and the Budget speech. The Economic Survey forecast at least as much building as in the previous year, which seemed to point again to 300,000 houses at least, even allowing for some increase in non-residential building. But if the number of new houses this year shows little change, the number privately built still ought to be higher and fewer ought to be built by the local authorities. The reduction in the housing subsidy on April 1st this year should speed that movement. The subsidy has been reduced from £35 12s. 0d. a year for 60 years (£26 14s. 0d. from the Exchequer and £8 18s. 0d. from the rates) to £29 8s. 0d. a year (£22 1s. 0d. from the Exchequer and £7 7s. 0d. from the rates) over the some period. The field of house building that the building societies can hope to finance should therefore continue to grow, though nbt at the great rate of 1954.

In all probability, the building societies have another increase in business before them, but that increase will have to be won in the face of keener competition. The local authorities are lending money, under the Small Dwellings Acquisition Acts and the Housing Acts, drawn from the Public Works Loans Board with the mere addition of ¼ per cent to the interest for their trouble. On these terms mortgages of more than 15 years life cost 4¼ per cent. Not only is the rate (despite its recent increase) lower than the building society charge of 4½ per cent; it remains fixed for the whole period of the mortgage. So the societies (which might, if money continued to harden, be obliged to revise their rates upwards), are faced with local authority competition at a charge that is both firm and below the current level of Bank rate. Competition in mortgage business from the local authorities has been growing. The only surprise is that the latest annual figure—unfortunately more than a year old—was so small. It was still less than a tenth of the advances that the societies made in the same period. More recent experience of the societies suggests that local authority business since March of last year may have increased further.

But a moderate growth in local authority mortgage business at the peak of a housing boom may not be an unmixed evil. If public competition skims off some of the peak load the growth of the societies' business may be smoother. Many of them would sincerely prefer a more gentle growth in 1955 with opportunities to build up reserves ratios as they go. Mr Butler has also made the building of reserves a little easier this year. The reduction in the standard rate of income tax will not mean an equivalent reduction in the "composite rate" that the societies pay on behalf of their members. That rate still has to be negotiated in detail, but a fall of 2d. to 3d. in the £ to a composite rate again under 5s. is a reasonable hope.

Will enough money be subscribed to finance that further expansion in building society mortgage business for which the societies look? On present form it will, though not with the consumate ease of 1954. Despite the turn towards dearer money, funds are still flowing in well from small investors, and it will be surprising if the chairman of the association cannot tell the annual conference that opens on May 16th that net investment in the first quarter of 1955 is a little up on the first quarter of 1954. But the societies have recently been facing and must continue to face increased withdrawals by some of their larger investors. Some of the company money has gone out again and with it some of the larger personal investments. As 4½ per cent Bank rate becomes fully effective, the exodus of such funds must surely increase; tighter money should mop up some of the surplus funds of business undertakings and make alternative investments relatively attractive to interest-conscious investors. With income tax at 8s. 6d. the gross yield on a building society share paying 2½ per cent net is £4 6s. 11½d. per cent and on a deposit at 2 per cent net £3 9s. 7d. per cent. By contrast the yield of Treasury bills is nearly £4 per cent, on 3½ per cent War Loan £4 2s. 9d. and on 2½ per cent Consols £3 18s. 11d. The building societies still offer a margin (though a small one) over gilt-edged whether long or short—though not over the deposit rates paid by some hire-purchase finance houses. Nor do they offer the same advantage on the institutional money on which they pay a lower rate to compensate for the fact that they have to pay full income tax on it.



There is no reason why the small investor who has found the societies a safe and handy haven for his savings should now change his mind. He has never been absorbed by problems of marginal advantage in interest rates, being content that the building societies provided a fair yield on safe and easily encashable investments. If some of the big investments are taken elsewhere the societies may well be healthier for their loss. Some of them could face such a prospect without concern.

Naturally if Bank rate were raised again the whole structure of building society rates and charges would almost certainly have to be changed. Neither the mortgage rate nor the share interest rate is directly tied to Bank rate and neither was changed after the increases in January and February. But any further increase in Bank rate would show beyond doubt that the foundation of interest rates throughout the British economy was rising, and that would be a

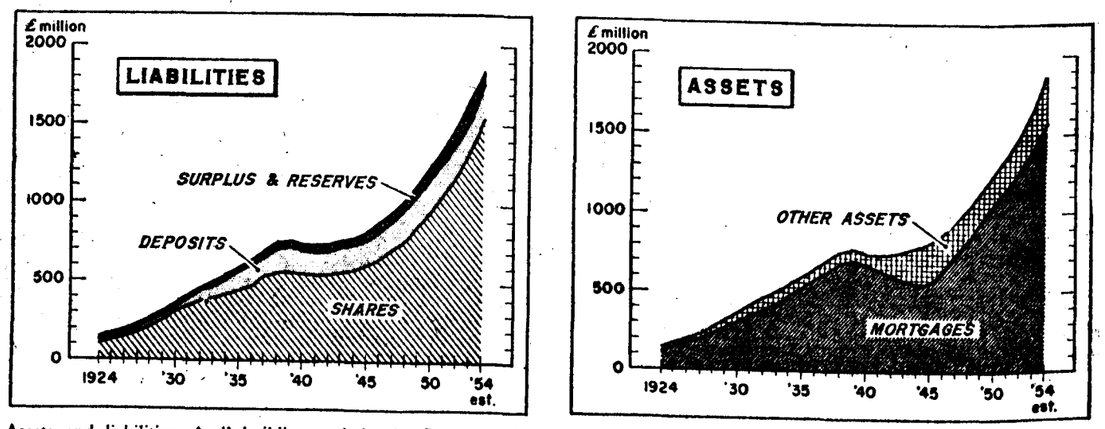
trend that the societies could hardly ignore. It is less easy to see what may happen to building society rates and charges on the alternative assumption—that the 4½ per cent rate is held for a prolonged spell and that the Bank of England actively sets to work to make that rate effective. Leading building societies would presumably hold on to the basis of 2½ per cent net paid on shares and 4½ per cent charged on mortgage as long as they could ; and at any rate there seems little prospect of a general change in rates within the next three months.

Beyond that point it is difficult to peer, but slightly dearer money spells a slightly tougher life for the societies. One symptom of that is a move by some of the smaller London societies (Chelsea is a recent example) that have found it necessary to offer shareholders ¼ per cent more than the general 2½ per cent. This increase is not a consequence of the higher Bank rate as such, but a confession of the need slightly to outbid the Halifax Building Society which recently came into line with the general 2½ per cent rate. There always was a fringe of societies that needed to offer a shade above the normal rate, and the present slight extension of the number causes no great concern.



But it raises a big question: are the powers and duties of the Building Societies' Association quite wide enough to provide the discipline that a responsible and nationwide movement serving unsophisticated savers and borrowers ought to have? The building societies are strongholds of private initiative. They do not take kindly to discipline, and the prewar attempt to establish a code of conduct temporarily split the movement. For that reason the association's powers are mainly advisory and persuasive. It has one firm rule—the 7½ per cent liquidity ratio. Failure to show that ratio results first in a warning and then in a request to resign. But most of the association's other decisions are requests. The request to maintain an approximate reserve ratio of 5 per cent is impossible to attain in a period of growth ; the request not to grant mortgages exceeding 25 years is openly defied by a few societies ; the recommended interest rates and charges are disregarded though only by a small minority.

The rugged individualists who run the societies generally run them well, but they are now facing big new problems on which slightly stronger central guidance might be justified. There were the unhappy Skipton and Dudley affairs that fortunately leave the shareholders and borrowers unscathed. There is the even more unhappy Southern Counties affair. These incidents fortunately have not shaken the general confidence of investors but they must raise in the minds of building society people the question whether the high status that investment in building societies rightly enjoys with the saving public does not deserve to be protected by some central fund. There is no sign that such a move is likely in the near future, but if it does have to come a demand for a stronger discipline will come with it.

Thirty Years' Expansion

THIRTY years ago the building societies claimed less than £200 million of assets between them. Now their resources are over nine time that amount. Only during the war, while most borrowers continued repaying mortgage debt, has the growth been reversed. The chart of assets shows how the mortgage borrowings were then reduced more steeply than were total assets. Most of the "other assets" are liquid—cash, gilt-edged securities and loans to local authorities. The societies therefore ended the war with a degree of liquidity much greater than they wished. Those extra liquid assets were subsequently absorbed by a revival of mortgage business and by inflation in house prices. The societies have, however, insisted on maintaining a reasonable degree of liquidity.

Share subscriptions have provided much the largest part of the funds that the societies receive from the public and re-lent on mortgage. There has not in recent years been any sustained growth in the amount of money received from depositors, but the popularity of the shares—largely with small investors—has been constantly growing. It is significant that although their assets and share investment have continued to expand, the number of building societies in Great Britain has been steadily falling, mainly through the process of amalgamation. The number of societies reached its peak—3,642—in 1895. At the end of 1954 the number was 777.

Bank Rate's Second Round

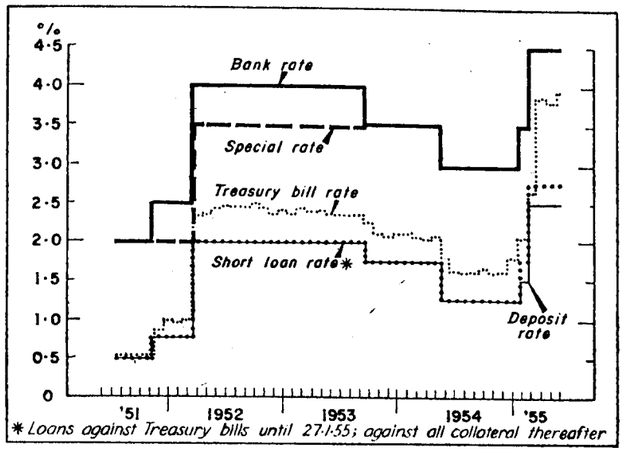
THIS past year, it is safe to prophesy, will merit a prominent place in all future studies of the evolution of Britain's monetary policy and technique—but it will not be merely the most obvious of recent monetary developments that gain it this prominence. To the general public, the most striking fact will undoubtedly be the use of the Bank rate weapon, for the second time since its unsheathing in 1951, as the means of cutting down the excess of demand that is threatening Britain's equilibrium. Some observers may add the further significant fact that the working of monetary measures during the first round of Bank rate increases had been sufficiently encouraging to induce the authorities to leave them to operate as almost the sole instruments of restraint in this second round. Their effectiveness, moreover, has already been even more clearly demonstrated than it was in 1951-52, when the working of the monetary restraints could not be readily disentangled from that of the many other influences that were operating simultaneously.

This view of the recent measures has admittedly to rest mainly upon observation of their effects within the monetary sphere. It is still too soon for it to be possible to gauge with any certainty their impact upon the "real" factors in the economy—the trends of public spending, stock-building and the balance of external payments. But the principal monetary indicator gives a very clear reading. The trend of the total volume of money, which had been rising steadily for almost two years, has been strikingly reversed since the increase in Bank rate to 4½ per cent on February 24. In the three months from mid-February net deposits of the clearing banks declined by £153 million, or 2½ per cent, to £6,104 million, the very point at which they had stood twelve months previously. This is the first time since before the war that there has been any decline at all over this period of the year. In the corresponding months of 1954 deposits rose by £94 million, and in 1953 by £45 million ; in 1952 they were just stable—but the comparable period in that year coincided with the sharpest phase of the credit squeeze in round one.

This heartening contrast, it should be observed, does not owe anything to the big build-up of the budget surplus that occurred in the last fiscal year ; the fruits of that big gain over the surplus of 1953-54 had been harvested during the phase when the trend of bank deposits was still upwards. One other consequence of past inflation has, however, continued to relieve the immediate pressure upon the domestic economy, and therefore upon the credit system, during these past three months. At the similar time last year Britain was still financing an external surplus, whereas this year its external account has almost certainly been in deficit—but this swing cannot have been sufficient to account for more than a moderate part of the difference of £247 million



between the movements of deposits during the two periods. Most of that difference has been clearly and directly attributable to the deliberate pressure of monetary policy.

This demonstration of the ability of monetary policy to bring about so striking a change within so short a period, and yet to do so without exerting any of those violent and dislocating effects upon the economy that its critics constantly regard as inseparable from its effective operation, is clearly of the utmost significance. Yet the long-term significance of this past year's experience will not rest upon this demonstration alone. Even more enlightening are the means by which the pressures have been exerted. The lessons to be learned from them are less obvious, but it is the more important that they should not be overlooked—especially by those who, even now, regard monetary policy as a clumsy bludgeon instead of the sensitive instrument that it can and should be.

The Growth of Flexibility

On a long view, the really important monetary development of the past year has been the marked improvement in the flexibility of the whole monetary mechanism. It is this greater flexibility, rather than the power inherent in any one instrument of monetary orthodoxy, whether Bank rate or "open market" action, that has made the whole apparatus so effective. And this new advance to flexibility, though it was jolted even faster forward by the two increases in Bank rate and by the manner in which the authorities supported them, was really quite a separate process. It actually began during last summer and early autumn, during the phase of easy optimism when few people in either official or unofficial circles saw that there might be trouble ahead.

During the early years of the move towards orthodoxy it was the monetary authorities themselves who made the running—with the commercial banks lagging noticeably behind and therefore limiting the pace of advance. But it has now been demonstrated that, just as control begets more control, so does some flexibility sooner or later lead to wider flexibility—provided that the first injection is sufficiently potent. This latest advance was started by the commercial banks—not, apparently, because of faith in the virtues of flexibility as such, but simply because it was eventually perceived that the relationships rigidly established between the several short money rates during the prolonged phase of rate stability were not appropriate when the whole level of rates was liable to vary. The clearing banks had clung obstinately to their habits of lending to the discount market at fixed rates (established in three tiers according to the type of collateral offered), as well as to the convention, forced upon them during the cheap money phase, of fixing the lowest of these rates at an abnormally wide margin below Bank rate and at parity with their standard rate of interest allowed on deposit accounts. The abnormalities of these arrangements, by contrast with former phases of flexible money, were fully discussed in *The Economist* on January 8th last.

The new flexibility that led the clearing banks to think again was that in the Treasury bill rate. In the conditions of risk that had been re-created for the discount market by the possibility of changes in Bank rate, this rate had settled down at a much wider margin above the banks' short loan rate than the exiguous margin that obtained when Bank rate was frozen. Throughout last summer, this was inducing the banks to try to switch from call money into bills; and although they still hesitated to open up a margin between their minimum short loan rate and the deposit rate, some of them were striving hard to find ways of lending a proportion of their money at rates above the minimum (which, for "good" money, was by convention also a maximum). Thus was flexibility extending automatically and unobtrusively even before the rise in Treasury bill rates gave further incentive to such tactics; and it was virtually certain, even then, that an overt move would be made upon the next change in Bank rate—even if it were downwards.

The really decisive step to flexibility was not, therefore, associated with the 4½ per cent Bank rate. It was taken at the moment of the ½ per cent increase, to 3½ per cent—much criticised as too timid—on January 27th. The banks thereupon abandoned their three-tier system of rates for short money, and opened up a margin between their deposit rate and the basic rate for short money by raising the former by only ¼ per cent and the latter by ½ per cent. It was also informally agreed that not more than about two-thirds of the short money would automatically command the basic rate; the remainder was to be lendable at variable higher rates if market conditions justified an increase. The essential principle of flexibility had been conceded, if with some reservations. At the same time, to minimise the risk that the margin between deposit allowances and short money rates might start a flow from deposit accounts into the money market, the notice period for deposit balances was reduced from twenty-one to seven days—the shortest period that is regarded as drawing a firm line between time and current accounts (for the banks are very fearful of pressure for a revival of interest allowances on the latter).

All this, it will be seen, was achieved without any initiative from the authorities—apart from the indication that there had been no disapproval of the preceding rise in Treasury bill rates (in the end, there had been some official encouragement). Thereafter, the Bank of England's vigorous drive to make the 3½ per cent Bank rate effective just before it gave place to 4½ per cent, and then the forthright-

ness of that move itself, had the effect of completing the conversion of the clearing banks. The new basic rates for deposits and short money kept step with Bank rate, and the new flexibility, which might have slipped back into a too conventional management of the "one-third" of variable money, extended still further. The more the authorities forced bill rates towards Bank rate by keeping money tight in the short loan market, the more the clearing banks found (and seized) opportunities to charge high rates for new money and the more ready were discount houses to accept renewals of old money at rates above the minimum. There has certainly been no systematic observance of the principle of the two-thirds/one-third division, which is all to the good.

The whole system, therefore, has become an active market mechanism in which the several rates tend towards an appropriate equilibrium. And the fact that the clearing banks' money rates have become so far variable means that, for the first time since the early thirties, the dominant influence upon the whole rate system is Bank rate and the wishes of the authorities in supporting it, rather than the arbitrarily fixed rates of the clearing banks. The one anomaly is the absolute rigidity of the clearing banks' maximum deposit allowance. But, paradoxically, this one remaining rigidity has given to the recent official exercises in flexibility a power and a speed in action that the authorities could not, in the particular circumstances, have attained otherwise unless they had been prepared to reinforce them by heavy sales of gilt-edged.

From Deposits to Bills

At this point the market mechanism has not been able to bring the rates themselves into equilibrium; the unnatural gap of 1⅛ per cent or more between what can be earned from a seven-day deposit and from a three-months' bill has provoked a big flow of funds from the one to the other, yet has been kept open from the one end by the rigidity of the banks' rate and from the other by the official pressures that have kept money short and rates for bills firm despite the increasing "outside" demand for them. The banks have lost liquid assets and deposits simultaneously, so that the screw upon their liquidity ratios has been kept tight despite the Treasury's need to borrow on bills to finance its seasonal deficit. If deposit rates had come sufficiently into line at the margins (i.e., for big deposits that are competitive with bills) to check the outflow from deposits, the squeeze on liquidity could have been sustained only if the authorities had financed part at least of their requirements by selling gilt-edged instead of bills. As it is, they have been able to squeeze the volume of liquid assets, and not merely force up rates, by operating almost wholly in the short-term market.

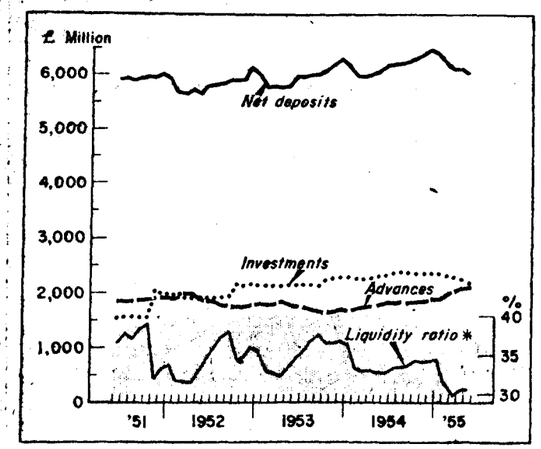
No one had foreseen the full strength of this particular influence, and the fact that it has acted so strongly has led to the suggestion that it provides an additional weapon of real value. This, however, is an exaggeration; and the suggestion itself is yet another example of the many misconceptions and frictions that have stemmed from the failure to recognise that the extent to which orthodox monetary devices achieve their full potential worth and efficiency must depend in the end upon how far they rest upon and use the principles of freely functioning markets and eschew arbitrary rules—whether of pegged deposit rates or unduly rigid liquidity ratios. Recent experience in the extension of flexibility in the short loan market suggests that it might be unwise to assume that deposit rates will indefinitely be held at an unnatural relationship to other rates. However reluctant the banks might be to abandon their maximum-rate agreement formally, it is readily conceivable that on this or some future occasion when pressure becomes strong some or all of them might circumvent it, just as they always used to do, by *ad hoc* offers of higher rates for deposits at notice for longer periods (not necessarily much longer) than the minimum period, to which the agreement alone applies. For this reason alone, this new "weapon" would be liable to break in the hands of the authorities at precisely the moment when most reliance was put upon it.

There is, however, another reason, which also stems from the normal working of market principles, for discounting the worth of this influence in future, even if all deposit allowances were again to be kept arbitrarily below other short money rates. The force of the movement from deposits into bills in these past three months derives from the fact that the margin was opened up suddenly and drastically. Some margin, as all past experience of flexible money shows, is justifiable; and there must always be some point at which even a wide margin represents a position of equilibrium—since only a small fraction of total deposit-holders either have the opportunity or would take the trouble to switch into bills. A change in the margin now would start a new flow or a reverse movement, but these changes would start from a position of equilibrium, and thus would not be comparable to the spate of recent months. Instead of providing a new "weapon," they would simply take their place in the whole series of normal market adjustments to changing conditions, even though this particular resultant flow would always be larger than would occur if deposit rates had some degree of flexibility themselves.

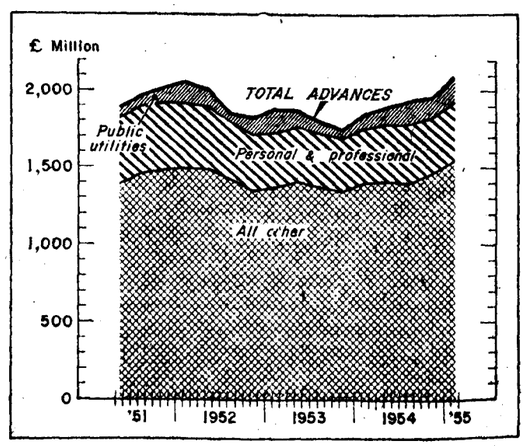
Lessons for Round Three

The immediate lesson to be drawn from this is, of course, that even in this second round of essays in flexible restraint the authorities have not had to employ their full armoury of orthodox weapons in order to achieve the desired result. Just as in the first round they were strongly aided by the shock effects of the dramatic unsheathing, so in round two they have been fortified by a transitional adjustment that is never likely to be repeated on the same scale. At each successive stage in the whole continuing evolution, the orthodox weapons have to do more of the work. It is well, indeed, that there have been these transitional aids to help the authorities after they had wisely cast aside the special arbitrary devices—such as the compulsory fundings and the "special" rate for loans against Treasury bills—they themselves enlisted for the opening phase. Because of the progress achieved by natural and special influences combined, the authorities have been encouraged to uses of the orthodox weapons from which they might otherwise have been deterred by popular prejudice and misunderstanding, given the uncertainties of their own recollections of the technique and doubts about its fitness for modern conditions.

This latest experience should hearten them for the next occasion, when once again a bigger call will be made upon the orthodox armoury if the whole policy is to progress. Who would have supposed, three months or so ago, that the banks could have unloaded investments to the extent of £157 million without causing the most acute paralysis in the gilt-edged market? The monetary mechanism in these past



three months, like the whole economy in these past three years, has been shown to have far greater resilience than almost anyone had supposed. Fears for the gilt-edged market have generated many inhibitions about the use of monetary policy in the past. Now it has been clearly shown that this is a sphere in which the weapons of monetary restraint can operate potently without fear of untoward consequences. And it is a near certainty that in round three, whenever that may come, they will need to do so.



Finally, the most important lesson of all is that, given this evidence of good and steady progress in the use of the market mechanisms, there is not one shred of justification for the frequently heard suggestions about the need to "improve" the monetary apparatus by adding to it new devices not based on market principles. On this point one immediate caveat seems necessary: some of the suggested devices, notably if they resemble those employed in other countries that believe in flexibility, are not always readily detected as inimical to the market principles. It is well to remember that even the principle of the liquidity ratio, which is a much more vital lever now than it ever was in former times, is, or should be, a principle of flexibility. The sensitiveness of the whole apparatus will be better served by leaving the desirable minimum ratio to the judgment of individual bankers rather than by seeking to impose upon them collectively a single and almost rigid minimum comparable to the cash ratio. This, however, is a wide issue that cannot be adequately discussed in this article. It is comparable in importance to the even more difficult problem of how monetary pressures exert their restraint upon bank advances when conditions of full employment tend to equalise the risks of different loans in the eyes of lenders. The "new" monetary policy has made excellent headway, but both those who manage it and those through whom it is exerted still have much to discover about the use of these classical principles in the modern world.

How Credit Restraint has Worked

From the time of the introduction of a positive monetary policy at the end of 1951, to the end of 1954, the net deposits of the clearing banks rose by 8¼ per cent. That expansion matched almost exactly the increase in the country's gross domestic product; and this has been a period in which Britain has been financing an external surplus—to a total of some £360 million in the three years. But whilst the secular credit trend of the past three-and-a-half years has been one of steady expansion, there have been two phases of contraction—this year, and early 1952. Both these phases have been marked by steep increases in Bank rate; but the nature and causes of the falls in deposits have been very different. In 1952 the major influence was the reduction of advances, attributable in part to tighter standards of lending by the banks and especially to the reduced demands resulting from the fall in the prices of stocks, the reduction in the volume of stock-holdings, and the drop in production. But in the past few months the economy and the demand for advances have boomed merrily on; and the banks have not as yet checked the expansion in their lendings. But, thanks to the flexibility in the money market that has evolved since 1951, they have had to make almost exactly compensating cuts in their other "risk" asset, investments. For the banks have recently been subject to strong pressure from withdrawals from deposits for investment in Treasury bills. This, as the preceding article explains more fully, has been the dominant influence through which the banks have suffered a liquidity squeeze, bringing their liquidity ratios down sharply to 30 per cent and below for the first time since the war.

The truest picture of the movement of advances is that given by the quarterly figures of the British Bankers' Association, which include all advances made in Great Britain. These are plotted in the right-hand chart. The most significant trend is that shown after the exclusion of the public utilities, since the utilities' cycle of piling up their bank borrowings and then reducing them at a swoop from the proceeds of public issues is a major distorting factor. Advances to all other borrowers fell in the two years from November, 1951, from £1,922 million to a low point of £1,699 million. But from the beginning of 1954 they have been rising steadily, and by February last they had broken through their earlier peak. About one-third of the fall in advances in 1952-53 was suffered by personal and professional borrowers; but this category has been responsible for less than one-seventh of the subsequent rise. That rise has been fairly evenly spread between the various industrial and commercial groups, though advances to the "financial" group of borrowers have expanded particularly fast.

Restrictions within the Sterling Area

ONE of the most familiar descriptions of the sterling area is that it comprises a very large part of the trading world within which payments are free, so that trade can flourish without having to force its way through the barriers of exchange control. As a broad generalisation, this complimentary description is justified, but closer examination shows the implied claim to be subject to more qualifications than it usually receives. It is true that under the exchange regulations of the United Kingdom current payments within the sterling area—or, in the language of the Exchange Control Act, within the "scheduled territories"—are entirely free ; to that extent trade within the sterling area can indeed proceed without impediment from exchange control. But when this claim is made it should be borne in mind that restrictions can be applied to *current* payments by import controls as well as by exchange regulations as such. No such quantitative restrictions apply to sterling imports into the United Kingdom, but many such restrictions operate upon trade flowing in the reverse direction, especially on goods moving from the United Kingdom to such dominions as Australia, New Zealand and South Africa.

Moreover, while no exchange control at all is applied by the United Kingdom to any payments to other sterling area countries—not even for the purpose of measuring the flow—no corresponding immunity is granted by those other countries to payments transactions with other sterling countries. Each sterling dominion maintains an exchange control that applies to payments to other scheduled territories as to payments to non-sterling countries. These controls operate with varying degrees of severity. Some of them scrutinise sterling payments for no other purpose than the compilation of adequate statistics. Others, though ostensibly no more constrictive of sterling payments than this, have at times been used as a "psychological" deterrent to incoming funds. For example, during the latter part of 1950 and in early 1951 when a great deal of capital was moving to Australia, speculatively bent on hopes of an appreciation in the Australian pound, of which there was then much discussion, the Australian authorities did their best to discourage the movement by reminding all concerned that when the time came to repatriate this capital the holders might find that the authorities in Australia had the right to put restrictions on such an outflow of funds. Many other sterling area controls are more exacting, and impose a number of restrictions upon current as well as capital payments to other sterling area countries. All sterling dominions except South Africa limit tourist expenditure in the rest of the sterling area. Britain imposes no such restraint, nor does it control outgoing capital funds. The only circumstance in which any reference has to be made to the authorities before making any payment within the sterling area is when the amount exceeds £50,000 and is for capital purposes that require the sanction of the Capital Issues Committee.

★

For the purpose of describing the restrictions upon payments within the area, the territories concerned can be divided into three broad groups. The first of these comprises the colonies or "dependent territories," in which there is virtual freedom for all payments to the United Kingdom or elsewhere in the sterling area. Exchange control as operated in the colonial territories is almost identical with that operated in the United Kingdom. Secondly, there are the "white" independent territories in most of which the exchange control machinery at least takes note of payments to and from the rest of the sterling area—and, in certain instances, moderately interferes with the free flow of capital. Thirdly, there are the Asian territories, and here the regulations differ very considerably from country to country. In general, residents of the particular country are subject to restrictions on current payments and to very strict control of capital remittances to the rest of the sterling area ; non-residents who reside elsewhere within the sterling area enjoy much greater freedom than the local population, but still have to submit to rigorous procedures of exchange control.

★

The conditions obtaining in the first two of these groups need only brief description. In the colonies no control at all is applied to sterling area payments. Profits and interest on capital invested from elsewhere in the area can be remitted and the capital itself can be repatriated. Current payments can be made for visible or invisible transactions without any reference to exchange control authorities.

Australia imposes no restrictions upon the inflow of sterling area capital for investment or upon the transfer of the resultant profits and interest. It gives no guarantee that capital may be repatriated, but in practice no restrictions on repatriation have been imposed. Similar conditions are applied by New Zealand, though a little more formality appears to be involved in securing permission to repatriate capital to the rest of the sterling area. The capital repatriations are expected to be "reasonable" in rate and amount, as judged by the circumstances of each case ; but in practice the control is operated moderately—there have not, apparently, been any sufficiently important instances of impediment on repatriation of capital to deserve publicity. In South Africa and in the Federation of Rhodesia and Nyasaland there is virtual freedom of payments, both outwards and inwards, for capital as well as current transactions. In Rhodesia and Nyasaland, however, all capital repatriations must be notified to the authorities, and there is power in the regulations to limit them to a reasonable level.

It is in the Asian territories that the concept of freedom of payments within the sterling area is most often and most severely violated. In each of these countries—India, Pakistan, Ceylon, as well as in Burma—there are rigid limitations on current remittances by residents to the rest of the sterling area. Travel allowances are limited, and strict control is also maintained over remittances for maintenance of students in other parts of the sterling area. There is also rigorous control, generally amounting to virtual prohibition, of exports of capital by residents of these countries to the rest of the sterling area ; without such control there would probably be a substantial exodus of capital. These arrangements for control of domestic capital vary from one country to another and are too various and detailed for

summarised description. Perhaps more important from an international standpoint are the restrictions and restraints on payments, whether for current or capital purposes, for account of residents in other parts of the sterling area.

In India, the record on this account is reasonably good. Very few difficulties are encountered in making payments for most current transactions. Nonetheless, detailed investigation and sometimes long delays have to be endured in getting permission to remit profits and dividends. In these investigations the aim of the Indian authorities is to ensure that before a remittance is sanctioned the would-be remitter has honoured or provided for all his current liabilities in India, and, in particular, that his tax liabilities have been cleared. All this takes time, and the remittance queue is sometimes long.

The export of capital from India for account of residents in the United Kingdom has been, and still ought to be, facilitated by the agreements made with the three Asian dominions soon after the end of the war whereby their sterling assets were segregated into "No. 1" and "No. 2" accounts, the first being freely available and the second immobilised. It was then provided that any resident in the United Kingdom who had in the past acquired capital in this area, and wished to repatriate it, would be given the right to do so by the authorities in the three countries concerned, and that the necessary sterling would then be made available by release from the blocked "No. 2" accounts, and so would not strain the freely available balances in the "No. 1" accounts. In general, this principle has worked fairly well in practice, but in recent years the administrative difficulties in getting sanction for the repatriation of capital have been increasing. For example, a British investment trust that sold some rupee jute shares and asked permission to remit the proceeds home would have to show first that it had complied with all its fiscal obligations in India. If the seller were a British insurance company, it would, in addition, have to give an assurance that it had sufficient assets left in India to cover its local potential liabilities. A British tea company that sold one of its tea gardens in India last year and wished to repatriate the proceeds had to wait many months for permission to do so. Many letters often pass to and from the Indian exchange control authorities before even the most trivial capital transaction can be completed. Questions may be asked about when and why the shares in question were originally bought and why they have been sold. Months may elapse without the necessary sanction, and although it usually is forthcoming in the end, there are indications that this administrative delay is in many subtle ways acting as an additional measure of exchange control.

Homeward remittances by United Kingdom personnel working in India are generally limited to £150 per month, and the amount remitted must come from earnings in the month of remittance. Full allowance must be made for taxation, and sufficient funds must be retained in India to meet all commitments. All such personnel can, however, remit their savings on leaving India to take up permanent residence in the United Kingdom.

In Pakistan there are considerably greater difficulties, which have become more pronounced as the country's sterling reserves have declined. Remittances by British personnel are limited to £100 a month, and it has become more difficult to secure permission for the remittance of profits and dividends—the "queue" of applicants for such purposes has been lengthening considerably recently, and the delay may extend to six months. As might be expected, the most severe restrictions relate to capital transactions. Pakistan has for some time imposed a strict control on the inflow of capital, and all investments in excess of £1,500 or its equivalent must receive the prior approval of the State Bank. In practice no serious difficulty is experienced in getting this approval, but a real measure of restriction is applied to the repatriation of capital. The Pakistan Government announced towards the end of last year that capital invested in Pakistan in a given range of industries after September 1, 1954—twenty-seven industries were listed initially—would rank for certain concessions for repatriation. It seems to follow from this that investments made prior to September 1, 1954, or in other industries do not enjoy unconditional facilities for repatriation. The general rule seems to be that each case is dealt with on its merits. British persons in Pakistan who have invested savings in that country may not repatriate that capital unless the person in question is leaving Pakistan permanently.

*

In Ceylon the repatriation of capital is likewise controlled by decisions made in the light of the circumstances of each case. The permission of the central bank is required before British or other foreign-owned capital can be withdrawn, and the nature of the answer to the request is usually guided by the current state of Ceylon's balance of payments and the level of its exchange reserves. British personnel working in Ceylon are allowed to remit home up to £100 a month from current earnings in order to meet current liabilities, but it is specified that such remittances are not eligible for investment in any other part of the sterling area, i.e., they must be for current and not for capital purposes.

Burma permits remittances for certain personal expenditures and also for the transfer of such current earnings as rent, profit and dividends. There is, however, a complete ban on remittances from Burma for investment, whether by Burmese or by foreign personnel working in that country. When a non-Burmese who is a resident of another country in the sterling area and who has lived in Burma and accumulated savings there leaves the country permanently for his home country, he is in theory entitled to transfer his savings with him.

Apart from these various restrictions applied by sterling area countries to payments within the rest of the sterling area generally or to the United Kingdom, there are also a number of bilateral restrictions, which operate mainly between Asian sterling countries. There are, for example, many tiresome difficulties to be overcome in effecting payments between India and Pakistan. Ceylon has used restrictions upon payments to discourage the influx of Tamils from Southern India. All three Asian dominions have for political and racial reasons imposed special restrictions on payments with South Africa.

It will thus be seen that the familiar claim made for the sterling area derives from, and rests upon, the complete freedom permitted by the regulations of the United Kingdom; but the system as a whole embraces many different kinds of restrictions. This contrast between United Kingdom and overseas regulations may become greater and the overseas restraint of remittances may grow tighter if sterling becomes an effectively convertible currency. For in that event the temptations for the exodus of capital from some of the sterling area countries, and from the Asian dominions in particular, will be heightened.

East of Suez

East of Suez! A phrase that quickens the imaginative pulse, evoking images of a strange, exciting world—the mysterious Orient, the exotic East of Stevenson, Kipling's India. Life would be dull, indeed, without fiction, and Kipling and Stevenson will always find a welcome from the armchair traveller; but for those concerned with the sterner stuff of eastern commerce, information of a more realistic nature is required. This explains why so many businessmen and traders consult the National Bank of India for accurate and dependable information on conditions in the East. Through their long-standing associations the National Bank of India have established an unrivalled knowledge of the many problems peculiar to eastern trading, and can supply up-to-date information on the prevailing conditions and trends in your particular market.

A comprehensive service is available at the Bank's branches in INDIA, PAKISTAN, CEYLON, BURMA, KENYA, ZANZIBAR, UGANDA, TANGANYIKA, SOMALILAND PROTECTORATE AND AT CAMP AND STEAMER POINT, ADEN.

South Africa and the Foreign Investor

"IF we had not kept our interest rate fairly high, less capital would have come to South Africa from abroad. Through a wise interest rate policy, we have practically righted our balance of payments," declared a Nationalist member of the House of Assembly in Cape Town early this year. He was concerned in part, presumably, with the direct influence of stable and comparatively high interest rates in South Africa—where Bank rate has stood at 4 per cent since early 1952—in attracting foreign money to the Union. A similar concern was shown by the Minister of Finance, Mr Eric Louw, when in March, following the increases in Britain's Bank rate, he raised Treasury bill rates in the Union in an attempt to check a consequent outflow of funds to London. But the more important influence upon foreign capital of the conservative financial policy pursued by this far from politically conservative Government since it took office in 1948 has been indirect—in giving the foreign investor confidence to grasp the glittering opportunities that investment in South Africa has offered.

Since the war the foreign investor—and more recently perhaps the South African repatriating money from abroad—has played a most significant part in South Africa's balance of payments. That is the striking evidence of the balance of payments accounts, which are summarised in the accompanying table. From 1946 to the end of 1954 the net inflow of private funds amounted to some £530 million, an average of about £60 million a year. That flow served to offset or significantly reduce the impact upon the Union's reserves of the large deficits on current account incurred in most years since the war. Last year, for example, South Africa had a current deficit of £30 million, but enjoyed a net inflow of £55 million of private capital and of £19 million under official loans. The Reserve Bank's holdings of gold and international exchange, therefore, rose by £44 million. But this raised the total of the reserves to only around £160 million—against the peak of £212 million reached in 1946. The rise recorded last year was the only postwar increase in the reserves with the exception of those of £17 million in 1949, when the capital inflow was probably still influenced by the last of the hot money that flowed into South Africa from the sterling area in the immediate postwar years, and the increase of £71 million in 1950. Since devaluation the inflow of private capital has been for more genuine investment purposes; it has averaged about £45 million a year.

The weakness in South Africa's trade balance since the war has been largely attributable to the fact that the price of the main export item, gold, has failed to match the steady increases in the prices of the goods the Union buys from abroad. Against this, the pace of increase in its spending on imports has been moderated since official control was imposed in 1948 and widened in 1949; there has been a steady increase in the earnings of exports other than gold; and the value of gold exports had a "once-for-all" benefit from the upward step in its sterling value produced by devaluation. Last year's current deficit, indeed, was only about half as much as that incurred in 1953.

Though Mr Louw, in his budget speech this year, showed himself prepared for some slackening in the net inflow of capital from abroad, he was confident that the rising production of gold and now of uranium would earn enough to ensure that the additional relaxations he has made in import controls do not cause an excessive drain upon the Union's exchange reserves. In considering how large a reduction in the reserves it might be safe to accept over the year, he mentioned the figure of £30 million. On May 27 the reserves stood at £125 million. This represents a fall of about £35 million since the end of 1954. This is a season during which the Union always expects to lose gold, but certainly not to this extent. It appears that, notwithstanding the counter measures taken by the South African authorities, there has been some attraction of short-term funds to London.

★

Internally, South Africa has experienced certain periods of rapid inflation since the war, but since 1951 conservative finance and disinflationary budgeting have succeeded in holding prices fairly stable. Even since 1946 the retail price index shows an increase of less than 50 per cent and the index of wholesale prices an increase of about 70 per cent. That is not an immoderate degree of price inflation for an economy expanding as fast as is that of the Union.

The real rate of expansion in the South African economy cannot be deduced on the basis of these inadequate indices of changing money values. At current market prices, however, the Union's national income is estimated to have doubled between 1946 and 1954, reaching the level of about £1,400 million in 1953-54. National accounting in a country where two-thirds of the population consists of Africans presents huge problems and degrees of error, but the rapid expansion of economic activity in the Union is unmistakable. Besides the absolute figures, it is significant to note the movements in the division of the national output and in the proportionate rate of capital formation in the economy: on both counts, some justification emerges for the claim that South Africa is today in the upsurge of an industrial revolution.

In 1938, it has been estimated, mining industry in the Union accounted for nearly 21 per cent of the national income (before the first world war it contributed about 28 per cent); today its contribution is down to about 12 per cent. Manufacturing, which accounted for only about 7 per cent of national income in South Africa before the first world war, rose to about 17.6 per cent by 1938; by 1953-54 it accounted for 34.5 per cent of national income.

These comparisons may tend to understate the continued importance of mining, since the small extent of the rise in the gold price has reduced the proportionate value of mineral output. Mining remains the Union's greatest export industry, and a considerable amount of the manufacturing activity that has developed over the years has been ancillary to it or largely supported by it. Nevertheless, the growth of manufacturing output since the thirties has been remarkable; its labour force, to use another measurement, has increased by more than half, while employment in agriculture has risen by less than 20 per cent and employment in mining by only 6 per cent.

This vast expansion of industrial output has been partly generated by an unusually high rate of capital formation; in 1947 and 1948 this reached 30 per cent of the Union's national income, and in 1953 about 23 per cent. The greater part of this capital investment, however, has been financed from outside the Union by the inflow of foreign capital. Though domestic saving does recently appear to have shown some increase, in 1953-54 it still amounted to only about 12 per cent of national income.

★

This shift in industrial structure has brought some weaknesses as well as rewards, and the young manufacturing industries of the Union are now much concerned with the threat of a setback to the easy expansion of recent years. Politicians and businessmen in South Africa have recently begun to talk confidently about an approaching end to import control; and certain of the manufacturing industries that have benefited from a sheltered market are accordingly staking out their claims for tariff protection. They have been encouraged by an official "Buy South African" campaign designed to show that domestic industries can now offer a fair range and quality in consumer goods. This is broadly true. Nevertheless, for most products the Union is still a high-cost country. Apart from the cost of imported materials or parts, this is attributable mainly to South Africa's two-tier structure of employment. White South African labour, although it is guaranteed a high standard of living and protected in the majority of works from any too direct competition from non-Europeans, is fairly efficient by British standards, as are the coloured and Asian workmen where these are employed; but African labour, in general, is uneducated and shiftless, wtih an extremely low productivity that largely offsets its cheapness.

The value of production, even so, is clearly rising more than prices are at the present time; and the volume of output is probably rising more than employment. There does accordingly seem to be some improvement in the general efficiency of South African labour; in practice, too, though not in Nationalist theory, the non-European is gradually being admitted to semi-skilled jobs in certain industries, which should reduce costs. Nor is it easy to single out particular "mushroom industries" that one would necessarily expect to wither if the warm wall of import control were, in fact, completely demolished. A very considerable share of the nation's industrial investment since the war has gone into its basic industries such as power and steel, which make use of the country's abundant low-cost reserves of raw materials. These materials are the really unshakeable foundation of South Africa's industrialisation.

★

The great extractive industry built upon the South African natural resource that was first profitably exploited, gold, has provided most of the basis for this recent development of secondary industries; but it has suffered somewhat in the postwar competition for resources. Both manufacturing and commerce have been more successful than mining in obtaining extra labour, offering rates that under its fixed prices mining cannot match. At the same time, the rise in the prices of the manufactured goods the mining industry buys, domestic and imported, has increased its costs and raised the margin at which gold production becomes profitable. In spite of their huge postwar investment outlays—in particular in the Orange Free State and the Far West Rand—the gold mines have thus found it impossible to push production beyond the levels attained during the war; though diamond output and the new by-product recovery of uranium oxide offer increases in output that are less demanding in terms of extra labour. The late Minister of Finance, Mr Havenga, said in his last Budget speech in 1954 that he counted upon the gold and uranium earnings of the Union to rise by about £100 million during the ensuing four years, that is by 1958. Mining is still the largest earner of the imports that much of its rival manufacturing industry continues to require.

The recent decline in the Union's exchange reserves, in spite of the seasonal ingredient, is raising some doubts whether the current liberalisation of imports can be sustained and extended without further adjustments in monetary policy. Last year's increased inflow of private capital is considered by some observers to have been influenced significantly by the repatriation of South African money from London for investment in the National Finance Corporation, a Government-sponsored institution set up to improve the facilities for deployment of short-term funds in the Union. Its interest rates were adjusted in the spring at the same time as the Treasury bill rate, following Britain's increases in Bank rate, but it seems probable that these adjustments have not been enough to prevent a significant outflow of capital from the Union. Certainly the rate of net inflow of capital will have been reduced markedly this year.

In the medium term, this decline can be accepted. Some slackening is expected in the current rate of investment in basic industries, such as electric power, and perhaps in manufacturing industry itself; the extremely high rate of investment achieved in the economy since the war may safely be allowed to decline somewhat. Nevertheless, in the short term, the South African balance of payments remains vulnerable, and it remains to be seen whether the conservative managers of its national finances will proceed to end all import control as soon as many businessmen in the country still profess to expect.

Facts on the
MIDDLE EAST

Address your inquiries to the Bank which has been operating in this area for nearly 70 years, and thus possesses an unrivalled knowledge of market conditions in the Middle East and India. In recent years newly acquired oil revenues have transformed the economy of many Middle Eastern states and they are now keen buyers of consumer goods and capital goods, particularly in the industrial and agricultural fields. Your inquiries will be welcomed at our Head Office.

Where the NATIONAL comes in

Australia's continued development offers undoubted scope and opportunities for the expansion of British industrial interests and activities. In the initial stages of estimating prospects, and later during the planning and operation of an enterprise, The National Bank of Australasia is in a good position to help the wheels go round much more smoothly. 'On the spot' information, gathered from over 750 branches throughout Australia, is readily obtainable from the Information Department of the Bank's London Office.

Monetary Weakness in Australia

BY A CORRESPONDENT

SECOND only to an unprecedented turnover in visiting Hollywood entertainers in Australia during the past six months has been the strong inflow of VIPs from the City of London—bankers, economists and investment advisers, to be noted almost daily pursuing their independent tours of observation in Collins Street and Martin Place. Their verdicts, unlike those of the Americans, are unspoken; and they are awaited with trepidation for the tangible form they will eventually take in the movements of capital to Australia. It has been evident that the financial visitors came, for the most part, in a constructive, indeed indulgent, spirit and that the external signs of prosperity and growth have not failed to make an impression. But they have inevitably been deeply disturbed by the glaring weakness in the Australian economy—the tendency to chronic external deficit. They have been disturbed, too, by the inadequacy of the Australian Government's methods of countering that tendency, and particularly by its apparent lack of influence over the Commonwealth's commercial banking system.

The payments problem was highlighted in the early months of this year first by the evident pressure it was placing on sterling and the central gold and dollar reserves, and later by the considerable tightening of import controls from the beginning of April. But the strain was in fact long-lived. The trade balance and the Commonwealth's external reserves had been moving adversely since the spring of 1954, and the stability in the external accounts in the twelve months or so before that was largely attributable to the effect of the stringent import restrictions imposed in the crisis of 1952. Once the relaxations made in 1953 and 1954 had taken effect the pressure of demand—and a drop in export receipts due in part to the lower level of world wool prices—swung Australia once more into the red. In the ten months from July, 1954, to April, 1955, imports reached £A690 million—£A146 million more than in the corresponding period of 1953-54. Exports, meanwhile, were falling sharply, so that the visible balance was transformed from a surplus of £A168 million to a deficit of £A51 million. The resultant strain emerged in the sharp fall in the Commonwealth's external reserves—from the high point of £A543 million reached in March, 1954, to £A376 million by the beginning of last month.

In the circumstances, Australia could not but cut down hard and directly on its swollen imports; but even when equilibrium is thereby achieved—and that is not yet—the problem of the underlying unbalance in the economy will remain. That malaise can be remedied only through measures acting on the internal economy. Australia has as yet done little to harmonise the pattern and pace of domestic expansion with the demands of the balance of payments. In particular, it has made only sparing and inconsistent use of the monetary weapon to this end. In part, that is attributable to the special difficulties of controlling an external balance as volatile as is that of Australia. But that is not the whole story. Monetary weakness is also the result of political antipathies to conforming to the discipline of monetary restraint; and to some degree too to deficiencies in the technical fabric of monetary control.

The strain on the balance of payments has undoubtedly been intensified by the undue expansion of credit; but there have, of course, been many other factors that have served to swell internal demand. Stocks have been rising particularly fast, and investment in commercial building and other forms of fixed capital investment in the private sector have been increasing. The decline in export receipts from wool has, moreover, had only muffled effects on economic activity. Incomes of graziers still remain very good, and it is their savings rather than their personal expenditures or capital outlays that have taken the brunt of the decline in the wool cheque. Another factor that may have had inflationary consequences has been the uninhibited upsurge of consumer credit business—which has doubled in the space of two years. The role of hire purchase in Australian consumer spending now approaches American proportions.

★

Given these pressures, there was naturally a strong tendency for bank credit to rise in the absence of restraint from the authorities. Between March, 1954, and March, 1955, a period in which overseas assets fell by £A135 million, the deposits of the trading banks—including those of the Commonwealth Trading Bank—rose by £36 million to £1,725 million, whilst total advances rose by very nearly £A150 million to £A957 million, that is by 18½ per cent. Part of the responsibility for this pace of increase unquestionably lies with the authorities themselves; during the autumn the Commonwealth Bank made more than the usual seasonal releases of the trading banks' "special deposits" held with it; and this spring it has made no extra calls on them as it did in 1954. The upshot is that in March the amount of the banks' funds frozen in these special accounts was, at £A295 million, smaller by £A59 million than a year before.

It is at first sight strange, therefore, to find Dr Coombs, the Governor of the Commonwealth Bank, remarking in his report for the year ended June 30th last that the year's rise of £A115 million in trading bank advances "was substantial and may well have been more than was required." That amounted to a diplomatic rebuke to the private trading banks for not having toed the line; as early as November, 1953, it is understood, the central bank had privately intimated to the general managers of the trading banks the desirability of a slackening in the rate of credit expansion. The inconsistency shown by the Commonwealth Bank between its advice and its subsequent action was due primarily to its reluctance to bear responsibility for the depressive effects of the fall in deposits caused by the increase in the external deficit. It may also have been a by-product, however, of the bank's attempts to improve its techniques of control.

The effectiveness of the weapon of the manipulation of the special accounts has always been limited by the failure of the Australian banks to maintain even reasonably constant ratios of liquid assets to deposits. In recent years, in particular, the liquidity ratio has fluctuated widely, so that

quiet, but they might yet come to an agreement if they were not subjected to political pressure on both sides. Other Saar companies work smoothly under mixed ownership, and the Völklingen works might do the same. There is provision for Franco-German economic collaboration in the agreement signed by M. Mendès-France and Dr Adenauer last October, and industrialists on both sides seem to be taking it seriously. They are working out ways and means of collaborating in arms production and for joint undertakings in French Africa. As things are, however, it may prove easier to work together in Gaboon than at Völklingen.

Rash Tactics in Rio

THE latest developments in Brazil show once again that good finance and bad politics do not mix. Dr Gudin, the Minister of Finance, and Sr Mariani, president of the Bank of Brazil, have been dismissed by the government of President Café Filho, at the very time when the country most urgently needed a steady fiscal policy. Their dismissal represents a barefaced piece of political horse-trading with a view to the presidential elections six months from now. In order to obtain from Sr Janio Quadros, the dynamic and ambitious governor of the state of Sao Paulo, a promise that he would not run for president and would support the government's candidate, Sr Café Filho had to give the ministry of finance and the presidency of the bank to men from Sao Paulo. Not even in official pronouncements has the slightest attempt been made to disguise this shoddy operation. Evidently, the government needs all the support it can muster against Sr Juscelino Kubitschek, the candidate who claims to be political heir to the late President Vargas. It is not yet clear who will be nominated by the government, but most observers believe that the choice will fall on General Tavora, the head of the president's military household.

The new Finance Minister, Sr José Maria Whitaker, who served in this office in 1930, does not face a pleasant task. Sr Gudin's dismissal brought on a major break in confidence: the cruzeiro-dollar exchange rate dropped sharply, and foreign investors who had begun to take Brazil's fight against inflation seriously received a severe shock. Sr Whitaker's only known policy is a wish to make all exchange rates free, and nothing could be less realistic in Brazil's present financial situation. In fact, his actions will be largely dictated by the continuing coffee crisis. Last week, Brazil and Colombia signed an agreement in order to stabilise coffee prices and prevent a major glut. This probably means that Brazil will withdraw five million bags from the market and Colombia two million. Continued massive support for coffee-growers by the government will make inflationary pressures more intense.

Smoothing the Ratepayer

THE Rating and Valuation Bill, which had its second reading in the House of Commons last week, is—as the Minister of Housing and Local Government unenthusiastically observed—an odds and ends measure. But one clause of the Bill is of considerable interest. It is designed to foil a howl of protest and a flood of appeals from ratepayers when, about a year from now, they find that the rateable value of their properties has been assessed substantially higher—by reminding them that, at the same time, the number of "shillings in the pound" in the local rate will become substantially lower. Under the previous procedure, ratepayers had to have prior notice of proposed changes in rateable values. One of the objects of the new Bill is to make sure that the new and higher valuations and the new and lower poundage rates will go through the ratepayers' letter boxes together. The right to launch appeals will remain, but there should be substantially fewer of them than there would otherwise have been.

The new valuation lists, which have been under preparation by the Inland Revenue for a very long time, are designed to iron out local anomalies and to bring valuations somewhat more in line with modern realities. The last lists were made as long ago as 1934, since the outbreak of war prevented the quinquennial review in 1939. But many MPs foresaw considerable trouble, and plenty of appeals, even under the new procedure. For one thing, the adjustments may tempt local authorities not to reduce their poundage rates quite to the level which maintenance of their previous revenue would permit. More important, it is clear that shopkeepers are going to pay far more than house owners, since shops are to be assessed on modern values (on the argument that there has been a free market in such property) while houses are to be valued more or less at 1939 levels (since there has been so much rent restriction). One MP suggested that whole some house owners will pay up to 20 per cent less, some traders will pay up to 60 per cent more—which, however, they can set against profits as an expense. Mr Sandys must feel very glad that this storm lies on the other side of the general election.

Proconsul for Nigeria

IN Sir James Robertson, whose appointment to succeed Sir John Macpherson was announced this week, Nigeria will have as Governor-General a first-class administrator, trained in the Sudan political service. That is important, since the country's administration needs attention if it is to carry the burdens imposed by federation and self government. But this responsibility falls more on the regional governors than the Governor-General. The real task which faces Sir James will be political and imaginative: to hold the federation together when the constitution is reviewed in 1956. After this review the regions will be given complete autonomy and independence in their own affairs, which were much broadened in scope by the Lyttelton agreement. They will come near to being allied sovereign states, but it could be disastrous for them to behave as sovereign states. The Governor-General has a short period before him in which to fan a stronger feeling of Nigerian nationhood and statehood at the centre and in the regions, in face of wide differences in tribal attitudes, religion and social development. Sir James Robertson's sympathies will surely lie all in favour of unity, since he will bring from the Sudan a strong preoccupation with the importance of developing a diversified economy and a large trading area.

March into the future... No.3

Maybe one day...

For the moment, of course, it's just a case of 'Let's pretend'—but the day is probably coming when she really *will* graduate at one of the great universities. And Philips will have helped to make her work there far easier, far more interesting, than it was for the students of yesterday. Science is her subject—so Philips electron microscopes will show her the secret ways of Nature, the myriad unseen worlds around us. A career in horticulture or agriculture is her plan. There again, Philips will help her in many ways—with ultra-violet and infra-red techniques, for instance. For Philips, in adding so much to the knowledge of today, contribute so much to the better world of tomorrow.

the effects of given changes in the special accounts have been largely unpredictable. Dr Coombs has therefore been trying for some time to persuade the banks to accept a ratio of standard size; in 1953 he requested them to maintain in liquid assets—which in Australia are taken to include government securities, but exclude the special accounts themselves—an average of 25 per cent of deposits over each year. But when the Commonwealth Bank impounded part of the seasonal increase in deposits in the spring of 1954 in special accounts the banks merely reacted by running down their liquidity ratios. In his latest annual report therefore Dr Coombs made public his endeavours to introduce an effective conventional ratio—and gave a hint that sanctions might be imposed for non-compliance in the future. He indicated, moreover, that his future ability and willingness to release special accounts would depend on the trading banks' observance of the convention.

The releases of special accounts last autumn may thus have been made partly to induce the banks to raise their liquidity ratios (which had fallen to only 16 per cent in September, 1954) to the hoped-for conventional figure. By March of this year the ratios had indeed risen to 22 per cent—but credit inflation had proceeded still further. This abortive attempt to improve the monetary weapons had involved a soft-pedalling of the one existing sanction, the calling of special accounts.

The reluctance of the trading banks to submit to tighter conventions of practice is, from the standpoint of the efficacy of monetary control in Australia, unquestionably unfortunate. But it must be conceded that the banks' recalcitrance is in part to be explained by the equivocal status of the governor of the central bank—he is also governor of a vigorously competitive trading institution, the Commonwealth Trading Bank. A piquant small example of the effects of this duality occurred recently in Sydney. A hire-purchase company that happened to be the leading exponent of no-deposit transactions with the public transferred its account from a private bank to the Commonwealth Trading Bank on the understanding that this bank's superior liquidity would permit it to offer overdraft accommodation on more liberal terms. The private bank could naturally not help but feel that Dr Coombs's own trading institution had penalised it for observing the earnest preachings of restraint by Dr Coombs, the central banker.

Responsibility for this situation is not, of course, attributable to Dr Coombs himself, whose relationships with commercial bankers are obviously happy. It was the legislation of the Labour Government in 1945 that compelled the Commonwealth Bank to change the tempo of its own trading activities from one of gentlemanly diffidence to active competitiveness. The subsequent attempt to nationalise the trading banks, abortive as it was, completed the chain of distrust and fear of the Commonwealth Bank on the part of the trading banks; and it also created a special impetus to uninhibited expansiveness. The private banks felt that at all costs they had to avoid gaining a reputation for being less liberal than the Commonwealth Trading Bank. The Trading Bank has in fact been increasing its advances at a considerably faster rate than have the private banks; the trading adjunct of the central bank may thus be held to have become an active pace-setter in the present credit expansion. If the Australian authorities are to evolve a more effective mechanism of monetary control they will have to be considerably more single-minded in their purpose than they have been in recent years.

Financing India's Development

BY A CORRESPONDENT

As the Indian economy stands poised in mid-1955 between the final phases of the first five-year plan and the opening of the second, it is natural that foreign companies and banks should pause to take stock of their future prospects in this changing and increasingly socialised country. Thus far, they have fared considerably better than might have been expected, given the dual pressures of nationalism and anti-capitalism. That has been largely the reward of their own remarkable measure of adaptation to the new conditions on the one hand and of the general good sense and sympathetic attitude displayed in practice by Indian officials on the other. But now that India is on the threshold of its second and more ambitious phase of development, the foreign concerns have renewed fears for their future—not only on account of the Government's vague and possibly half-hearted plans for more socialisation and control, but also for fear of the effects of the plan on India's economic stability, both internal and external.

The first plan was very largely a collation of agricultural policies and industrial projects that had been started during and immediately after the war. The initiative that passed to Mr Nehru's Government from the pre-independence regime has, on the whole, been turned to good account. Central and States administrations have endeavoured to create, in conjunction with their policies to encourage food production, the will amongst the agricultural population to raise its living standards; and by their Rural Extension Services and Community Projects the authorities have provided the means by which local communications, health and education services can be improved. It has been recognised that rural planning demands a substantial element of "self-help" for its success. Industrial expansion in turn has been fashioned to the Government's plans by regulation of investment, both domestic and foreign.

Yet, despite the complex and formidable network of controls that has been built up, a very fair measure of freedom for the individual has up to now been maintained. Legislation has generally tended to look more frightening than it has in fact turned out to be. The right kind of proposition has rarely failed to receive administrative approval—once, that is, the right official in Delhi or in some State capital could be found. But the extent to which the Indian economy in recent years has become an increasingly controlled economy may be seen as the inevitable prelude to the "socialised" economy that the ruling Congress Party proclaimed as its ultimate goal early this year. As a rough generalisation, it can be said that as the second five-year plan comes into sight—it is due to begin in 1956—the
