WROUGHT TITANIUM can you use it?

162858 *British Industry now has at its service
a new wrought metal—titanium.*

*Years of pioneer research and the development of
special extraction and melting techniques by I.C.I. have
heralded its debut in Britain. Now it is ready
to revolutionise progress in our aircraft industry
and in other engineering fields.*

can you afford not to use it?

Titanium is only half the weight of steel. Alloys (I.C.I. is now producing a steadily widening range) can be made which, besides being phenomenally resistant to most forms of corrosion are as strong as many high-tensile steels.

Already, I.C.I. titanium and titanium alloys are available in sheet, strip, rod, tube, wire, plate and forging stock. I.C.I. will be pleased to advise on the known and potential applications of this new and outstanding material.

The heart of the matter

The electric storage battery plays a vital part in modern life, and lead is vital to economic battery production. Batteries provide the means of storing electrical energy for motor cars and for emergency lighting in hospitals, cinemas, and wherever there is absolute dependence on continuity of electrical supply. Emergency signalling systems on railways, and standby systems for communication and alarm on ships depend on the electrical storage battery, of which the lead plates are a most important part.

Tory Thanksgiving?

N OBODY expects much that will make big headlines to escape between the rounds of applause at the Conservative annual conference at Bournemouth next week. Most of the journalists there will be looking forward to a more gossipy time at the Labour assize the week after. They have got used to this. As long ago as 1948 Lord Woolton was tactfully explaining that because Tory ranks were closed in the face of the enemy, the press might find the proceedings dull; but in 1955, when the enemy is sprawling on his back, the ranks are likely to be found as obediently solid as before victory was won. The platform will make its bow to the floor and tell it that the devotion of the rank and file pulled in the votes that carried the day last May. The floor will applaud the platform and especially the new leader. Need anybody except the journalists be disappointed about this? The answer is surely that although few people would really like these massed delegates from the Tory backwoods to rise above their proper constitutional station, yet if the platform should find the clapping a little thin here and there, it might be a good thing. It would show that the vote-collecting end of the party was not entirely complacent about the policy-making end.

The annual party conference does not make policy. Its function, as Mr R. T. McKenzie put it in his recent book, is rather like that of Bagehot's constitutional monarch. It has "the right to be consulted, the right to encourage and the right to warn"—but no right to transmit the party's instructions to its leaders. What matters is the sense of the meeting, the currents of confidence or anxiety set up when the platform meets the floor. This is not a negligible factor, even among the Tories. Certainly, if the conference shows any

Editorship of *The Economist*

Mr Geoffrey Crowther, who has been Editor of *The Economist* since October 1, 1938, has expressed the wish to retire from that position on March 31, 1956, and the Board of Directors of The Economist Newspaper Ltd. have accepted his resignation with regret. It is intended to appoint Mr Crowther a Managing Director of the company, and he will continue to devote the greater part of his time to its affairs.

With the approval of the Trustees, the Board have appointed Mr Donald Tyerman, at present a member of the editorial staff of *The Times*, to fill the vacancy. Mr Tyerman served with *The Economist* from January, 1937 to September, 1944, latterly as Deputy Editor. He will be rejoining the staff on January 1st and will take up his duties as Editor on April 1, 1956.

unexpected signs of intelligent restiveness, Sir Anthony Eden should take warning; the Tory machine is sensitive to the trend of feeling in the country, even if it is not always sensible about what should be done to meet or to forestall it.

And, if it is not restless, he should perhaps be even more on his guard for the future. Prime ministers are not infrequently slaves of the circumstances in which they won office. Sir Anthony may yet find it a misfortune that he has risen to the leadership during a period in which his party has been gathering the dividends of success: it is not only in the City that dividends are too often mistaken for the permanent return on a fixed interest security. Instead of riding the social revolution from decade to decade, as the Liberals rode reform after 1832, the Labour party has come a fearful cropper. But it would be incredibly unwise to assume that socialism is completely on the run and that Labour must virtually disappear with the retreat from nationalisation. The Labour party is a party, not a policy. It needs a policy; but it derives a lot of its strength from the failures of its opponents. Similarly, the Tories are in the ascendant partly because of Labour's follies, partly because they have purloined so many of Labour's garments. The appeal of mid-century Toryism is that it contains all that is best in socialism—but without its controls, queues and general heartbreak. It is an appeal that has temporarily managed to capture the progressive vote.

The Tories' problem, after four years of successful

absorption of the social revolution, is to keep their new faith moving forward. The floor of the conference cannot tell the platform how that is to be done; though pressure groups will put up their regular demands to edge it back a little. The fact is that a whole series of problems loom—labour relations, agriculture, defence, subsidies; all revolving round the central economic issue. The platform's main object should be to convince the floor that these issues will be systematically met, and that in meeting them the Government will give the Tory rank and file a sound case to take to the electorate—the sort of case that smashed the socialist argument about “rationing by the purse” when controls were removed.

But in providing reassurance, in making its bow to the floor, the platform should not give way to particular pressures. It need not do so. If it knows its mind, and has a policy, it can give a packaged promise of action that will carry conviction; and applause will carry the hall before people start calculating whose toes are going to be trodden on during its fulfilment. If there is one slogan that deserves to be written in letters of fire above the conference hall, it is that the Tory leaders are riding a bicycle; they must keep pressing forward or they will fall down. The worst service that the delegates could render would be to give them the impression that they are sitting on a coaster instead. Perhaps that will be easier at Bournemouth than it would have been at Margate or Blackpool.

The Council Housing Nettle

WHEN a Government looks as if it is going to try to be rather brave, it may seem a little harsh to urge it to show really white hot valour. But, as Mr Sandys braces himself to face the housing problem, nothing is more important than to remind him of the old slogan about “sheep, not lambs.” He is going to need a particularly nice sense of discrimination between these two animals if—or surely one can say when?—he broadens his promised assault upon the local authorities' housing subsidies to an assault upon the even more pernicious distortions caused by the Rent Restriction Acts. But since Mr Sandys's discussions with the local authorities are just about to begin, it will be best to confine comment this week to their problem alone. In the field of council housing the difference between lambs and sheep is quite clear.

The meek lamb of a reform will be to say that the subsidy which the central government must pay to the local authorities on each house built in the past has already been fixed, and that it would be a breach of faith to try to change it; the only room for manoeuvre, on this view, lies in the subsidies that will be paid from the central government to the local authorities for each house built in the future. It is easy to under-

stand why Mr Sandys is going to be under great—indeed probably irresistible—pressure to take this course. The subsidy on new houses is fixed every year, and it is the only part of the Exchequer subvention that could be cut without introducing what might be regarded as retroactive legislation. It is also the part that could be cut with a minimum (even if still quite a big minimum) of fuss and with a maximum of administrative convenience.

The so-called Bevan formula that is generally used for fixing subsidies on new houses is fairly widely recognised to be illogical. Under this formula the Government pays two-thirds, and local authorities themselves pay one-third, of the sum needed to bring the rent of a standard new house down to a sum equal to one-tenth of one average industrial worker's earnings. (The “average” industrial worker is a statistical abstraction rather than a tenant, and in any case at least half of the families now in council houses are believed to have more than one breadwinner.) By custom and cajolery, the impact of even a limited reform of this formula would probably—and initially—be fairly widely spread once it reached down among the tenants themselves. No local authority would be

likely to put the whole burden of a cut in subsidies for new houses on to the tenants of those new houses alone; nearly all of them would raise rents on existing houses as well, and many might accept Mr Sandys's view that the best way to do this would be by differential rent schemes, whereby the rent that each tenant paid should depend partly upon his income.

A reform of this kind would, therefore, have several good effects. But there are two reasons why the Government should not be satisfied with it. The first reason is that, if all subsidies on existing houses remain as they are, there will be no reduction in the present burden of subsidies on the taxpayer; all that will happen, if the rate for new houses alone is cut or even abolished, is that the annual growth in subsidies will be slowed down or checked. The second reason is even more important. It can never be too frequently repeated that the main object of housing reform is not merely to save the Government money; it is to try to ensure a better use of existing accommodation, and the only way to do that is to see that people who are at present paying too little money for too much accommodation are squeezed by higher rents—so that they are given the incentive to move out. The only direct incentive from a cut in the subsidy on new houses would be to slow the rate of new housebuilding, which is one of the purposes that any reform should aim at but by no means the main one. Only in areas where the rate of new building could not be or was not significantly slowed would existing tenants be obliged to pay more economic rents—and thus given the goad to make more economic use of existing accommodation. This would be widely regarded as unfair; but, even more important, it should be widely recognised as inefficient.

Is there any way in which these disadvantages could be avoided? The answer, of course, is that they could only be avoided by changing the whole basis of housing finance, for old houses as well as for new. If Mr Sandys is really going to follow a policy of “sheep, not lambs,” then he will have to cut the Exchequer subventions into an entirely new pattern, where they will themselves form the incentive, or even the complete machinery, for imposing differential rents schemes on local authorities' tenants. And to do this he will have to go back upon—or rather to codify into a new system—the promises that have been contained in, and are still being fulfilled from, four or five different Housing Acts over the past thirty-five years. The mildest new system that would make sense would be regarded by most people as a very radical change. Its essential feature should be to say that local authorities should no longer be paid a subvention from the Exchequer according to the number of houses that they own. They should be paid a subvention according to the number of needy families whom they house.

Under this system, the councils would no longer get any grant for houses occupied by tenants who could

afford to pay full economic rents, that is to say rents based either on free market prices or on the replacement value of their house. But for needy tenants, including needy new tenants, the flow of funds from the central Exchequer to the local authorities would continue, and be determined by some national criterion of assumed ability to pay. Probably the best system would be to judge need by income tax groups (and income tax coding numbers), although in this case wage-earning children, and not merely wives, should be counted with the male householder as a single income tax unit. Indeed, a good case might be made for going further: for saying that rent assistance with taxpayers' money should be taken out of the hands of local authorities altogether. Under this scheme the councils could continue to build houses and to say who should have them, but would recoup themselves by charging each tenant a full economic rent (as modified by a subsidy from the rates if councillors wished); the tenant could then draw Exchequer assistance, determined strictly according to need and not according to the size or age of his house, perhaps from the local post office like family allowances.

★

These are the radical choices. It is most unlikely that Mr Sandys will plump for either of them, but outside commentators have a clear duty to urge him on. There can be two replies to the charge that any such schemes would put the Government in flagrant breach of its predecessors' contracts under previous Housing Acts. First, if Parliament has the sovereign right—and nobody denies that it has—to nationalise a private industry, then it surely also has the right to nationalise or partly nationalise a municipal service such as rent assistance. Secondly, there is no contract between any public authority and the people living in these houses; the people living in a particular house rarely get the exact subsidy that was attached to it by whatever Housing Act was in force when it was built. There are merely contracts between the central and local authorities, that is to say between one branch of government and another.

And, in this respect, fate for once seems to have been kind in its timing. Next year the whole basis of local government finance is due to be overhauled. If the Government has any hope of cutting the subsidy bill, at any time before the current series of Housing Acts expire towards the turn of the century, then now, at the beginning of a Parliament and with this overhaul of local government finance just over the horizon, is the best opportunity it will get. If it does not take this opportunity, then the most that it can hope for is that the subsidy bill, instead of being cut, will be temporarily stopped from rising—and stopped in a way that is likely to create new strains in time. A Government of Tory Reform should consider very carefully for which sort of animal it is most willing to risk its neck.

The Algerian Dilemma

THE educated Algerian Moslem is often indistinguishable in appearance and aspect from a southern Frenchman, but, if he is a practising Moslem, he may, nevertheless, confide to a European intimate that his life is poised between two worlds. He lives on a knife edge, on one side of which lies Paris, beckoning his intellect; on the other, Islam, Cairo and Mecca, offering spiritual sustenance that he finds nowhere in Europe. The thought of making a choice between these worlds disturbs his peace of mind, and hitherto he has been content not to have to make it.

This passivity has led many Frenchmen to forget that the choice exists. They see their Algerian Moslem colleagues and compatriots in terms of equation with themselves—of equal access to a vote, the Sorbonne, the *Ecole Normale*, high rank in the army, a seat in the French Assembly. They see Algeria as the home of a million Frenchmen whose industry has endowed it with flourishing vineyards and crops, a mining industry and other benefits; they see relatively little evidence of its Islamic affiliations and of the demographic pressure that makes most of it a backward area. And so they harbour the complacent conviction that "Algeria is part of France."

This week, however, that slogan has received a blow from which it will probably never recover. On Monday, the Second College of the Algerian Assembly, which consists of the sixty Moslem members elected entirely by Moslem voters, first agreed that any minority would abide by its majority decision, and then decided by a large majority to reject the policy of integration with France that had been reiterated in a broadcast by M. Faure only the night before. Its members also decided not to take their seats in the Assembly on Tuesday, when it was due to debate the reforms which the present Governor-General, M. Soustelle, has at last brought to the boil. M. Soustelle therefore postponed the discussion, for, had he held it, not only would the session have been dominated by French *colons* who are bitter opponents of the changes, but it would also have been farcical, being representative of only one-tenth—the European tenth—of the population of Algeria. The purpose of the Faure-Soustelle policy was to create, or re-create, a pro-French Moslem group in Algeria; and for the moment the Moslems most likely to support that policy have paralysed it.

The shock they have administered to French opinion is the greater for being abrupt. Their very membership of an Assembly that Algerian nationalists have good reason to regard as rigged by the French authorities marks them as a pro-French element. Last January—that is, two months after their more extreme compatriots had started the present rebellion—46 of them made their first showing of independent action by sending a delegation to Paris to protest at disgracefully

arbitrary police methods of handling suspected rebels; but all that they then asked for was equal treatment with Frenchmen and a "loyal application" of the unfulfilled statute of 1947, by the terms of which Algeria was to remain part of France while obtaining a greater measure of management of its own affairs. As lately as July, one of the most highly "assimilated" of their number, M. Bendjelloul, in an admirable speech in the French Chamber, pointed out that there were three courses open to France in Algeria—independence, federation and integration—and added that of the three he preferred integration.

The first intimation that these assimilated Moslems were thinking otherwise came as lately as September 2nd, when four of them called on M. Faure. All four were deputies to the French Assembly; each sported the label of a French, not an Algerian party; so much was their attitude taken for granted that the Prime Minister detailed a subordinate to see them. But they had come to say, with M. Bendjelloul as their spokesman, that the Moslem members of the Algerian Assembly were no longer in favour of integration. In a word, that they were Africans.

★

What caused their change of heart? Undoubtedly the immediate reason for it was the revulsion of feeling caused by the violent methods used to repress the revolt on August 20th in the most easterly Algerian department, that of Constantine. As the cream of French newspapermen in Algeria have borne witness, many Frenchmen, too, are revolted by the mass reprisals and indiscriminate punishment of the innocent that have taken place in response to the demand of the *colons* for protection. The four Moslem deputies who paid the call on September 2nd were all members for Constantine.

But behind this immediate reaction lies a grievance of longer standing—a conviction of French bad faith. The Statute of Algeria became law in 1947. Since then, the Algerian Moslems who have tried to work the parts of it that came into force have seen the rest of it pigeonholed through the efforts of the richest and most powerful section of the French community—who want to retain their paternalistic supremacy, and therefore seek to frustrate representative government. Many of the reforms now tabled by M. Soustelle were prescribed in the statute—the promotion of local government reforms that would convert the French administrator from a dictator into an adviser, the adoption of Arabic as a language of instruction, the abandonment of French control over religious appointments and finances. Today even moderate Algerians are disillusioned because, again and again, they have witnessed

the same cycle—a Moslem rising or strike in support of these rights, a response by successive French Ministers of the Interior in the form of "new proposals," a violent reaction from the *colons* and their pressure groups in Paris, a declaration by someone in authority that the institution of reforms in response to rebellion places a premium on violence, a consequent postponement of action, and a return to the start of the cycle. As often as not, the reason for going back to the beginning is the fall of a government in Paris.

Today, this rising tide of Algerian dissatisfaction is swollen by the news from Tunisia and Morocco. To the east, Tunisians are grappling with serious economic problems, but doing so contentedly because they are working under their own steam; to the west lies an even more depressing spectacle—the sight of Moroccans fallen victim to the indecision of a French cabinet that has placed party considerations in Paris before the well-being of North Africans. It is possible for Frenchmen to argue that other influences have been at work, such as inflammatory broadcasts from Cairo and Moscow. But these have had no effect on the decisions of M. Bendjelloul and *assimilés* of his ilk; for their conversion into opponents of integration, the shortcomings of successive French governments are alone to blame.

★

It is only fair to add that over the many years of political procrastination, the French Treasury, the French investor and the hard work of the French *colon* and administrator have done a great deal to raise the level of production and wellbeing in the territory. The visitor to Algeria comes away laden with glossy and excellent literature about a volume of investment, public and private, that puts the World Bank in the shade, a decline in infant mortality that leaves Egypt far behind, a tenfold increase in the school population between 1900 and 1954, a current annual increase of 1,000 per annum in the number of state school teachers. He will also see much good work in the realm of European enterprise—vineyards brought back to prewar production, citrus orchards the yield of which has doubled between 1940 and 1952, booming cement factories and satisfactory results in the iron and phosphate mines. But against this good record must be set two factors. The first is that economic advancement under alien management never satisfies the yearnings of nationalists who are being educated to run themselves. The second, more peculiar to Algeria, is that the French success story has a seamy side because it has created fresh problems that have outrun France's strength.

Health services are producing a rise in population so rapid as to be reducing, not raising, the proportion of cultivated hectares to the number of mouths to feed, and two million Algerian children are not yet in school. A combination of French urban enterprise, of farm mechanisation, and of rural want, has vastly increased the tendency of the Moslem to flock townwards

(Algeria's urban population was 16.6 per cent in 1906, 24 per cent in 1948), and indigent town populations are notoriously more expensive to provide for, and more alive to their discontents, than indigent rural ones. Even the unlettered Algerian is fast becoming aware that his average individual income is negligible compared to that of a Frenchman; the figures are 240,000 francs per annum for a family in France and 54,000 in Algeria, the latter figure becoming 30,000 (that is, £30 per annum) for a Moslem family if the Europeans and North Africans are computed separately. It is small wonder that most of the postwar consumption industries in Algeria are flagging for lack of local purchasing power. Perhaps 75 per cent of Moslem families can afford nothing beyond their subsistence needs.

★

Only now is this aspect of the Algerian scene becoming common knowledge in France. This year, it has been painted in its sombre colours by two or three government commissions, all of which conclude that only by immense further expenditure—expenditure that falling Algerian budget receipts cannot possibly meet—can the territory keep abreast of its population problem and maintain present levels, let alone improve them. It is at once apparent that dissident nationalists, now led by dissident and fluent *assimilés*, have fertile soil in which to sow the seeds of discontent.

But another reflection emerges from the alarming statistics. France is idealistic and sincere in preaching its policy of integration; only this week the Ministry of the Interior has allotted the first of a fresh series of large grants on current account to be paid into the Algerian exchequer annually until 1962. But many Frenchmen in France are beginning to ask themselves how a territory so backward is to be "integrated" with the standard of living of the metropolitan country without ruining the metropolitan taxpayer in the process and without, in the end, placing his fate in the hands of a mounting number of African deputies in the French Assembly.

A settlement of the fate of Algeria is going to be far more difficult to achieve than one in Morocco. More Frenchmen with vested interests at stake intend to obstruct it; the much graver economic problems restrict the room for manoeuvre available to Moslems as well as to Frenchmen; the Algerians, for lack of any one leader to whom to turn as their spokesman, may well find themselves as divided on the issue as a French cabinet. British observers of the scene would do well to think what their feelings would be if there were twenty-five times as many European residents in Kenya as there now are, and if the White Highlands were only 470 miles from the white cliffs of Dover. M. Mendès-France fell on the Tunisian issue; M. Faure is wobbling on the Moroccan one. What French statesman is in a position to collect a cabinet capable of bringing to birth a federation with Algeria?

Boom in the Bard

THOSE who greeted with lamentation the birth of commercial television, who fear that its search for crude profitability may strangle the already feeble educational influence of the BBC, can take some comfort from the news that one of the most popular playwrights to produce is Shakespeare himself. The boom in the Bard is admittedly not new; it has been flourishing for many years. But it has reached a new intensity. One of the two Stratford companies, headed by Sir John Gielgud and Miss Peggy Ashcroft, has just finished a short season in London, during which the Palace Theatre has been packed. At Stratford itself, where the other company is headed by Sir Laurence Olivier and Miss Vivien Leigh, there has not been an empty seat since the season opened last April. At Regent's Park Mr Robert Atkins has at last had suitable weather for his open-air productions, and 175,000 people have attended. The Old Vic's new season recently opened with *Julius Caesar*, and looks like being as successful as the last two seasons, throughout which the house was filled to an average capacity of 85 per cent—a degree of success rarely equalled in the commercial theatre.

Is this boom one of the fruits of universal secondary education? Those who are concerned with the production of Shakespeare are inclined to take the opposite view. They complain that the way Shakespeare is "done" in the schools can put people off him for ever; that his poetry is forced upon children who are too young to understand it, and ruined for those who are old enough by the compulsory conning of grammarians' glossaries. The repellent effects of these processes can be exaggerated; most people seem to regard with affection the plays they did as "set books" at school, and Shakespeare surely owes something to the examination grind that is now so out of favour. But more glamorous influences than the schools have been at work.

★

The present popularity of Shakespeare is mainly due to the circumstance that the stars in their courses are fighting for him. Good actors and actresses always like to appear in the great Shakespearean roles because these give such scope for their art—and the British stage in recent years has been unusually rich in acting talent. Between the wars there arose a new school of Shakespearean acting, which showed his characters as human beings rather than declaiming puppets, and greatly increased his following. But this was still more increased by the war when, in the absence of new plays, actors and actresses turned to the classics. The Old Vic had been bombed, but an Old Vic company

under Sir Laurence Olivier and Sir Ralph Richardson played Shakespeare at the New Theatre from 1944 to 1950. And when more normal times returned and the Old Vic itself reopened, the stars' interest in Shakespeare did not wane.

This fidelity to Shakespeare survived in spite of pay that is rarely as high as can be earned on the ordinary commercial stage. At the Old Vic the maximum salary is £45 a week (though Edmund Kean used to draw £50 a night for playing in Shakespeare on the same boards); at Stratford it is more, but still nothing like the £150 or so a week that can be earned in the West End. But a Shakespeare season is good for an actor's prestige; and many value the security of the contract, which at the Old Vic is for a minimum of a year and at Stratford for a season. They like, too, to be able to look ahead to what they will be doing in the future; those at the Old Vic can certainly have little complaint on this score, as they plough through the first folio in five years.

The management of the Old Vic has been much criticised by some for its policy of adding a big name or two to the regular company. It is felt (rightly, surely, in *Julius Caesar*) that the addition does not always improve the performance, and also that the Waterloo Road should be a platform for young talent. To this the management's answer is that the platform is supported by the stars. The Old Vic itself has its own regular audience, which pays for perhaps a third of the run, and as far as this audience is concerned, the permanent company has its own stars; a mob of teenagers nightly lie in wait at the stage door for Mr John Neville. But outside London a big name is needed to draw the crowds. The fabulous returns of the second Old Vic company which is now touring Australia, for example, are being earned with the help of Mr Robert Helpmann and Miss Katharine Hepburn. The management has to face the reality that the public now expects to see Shakespeare finely acted and produced, and adorned with its favourite stars.

The lengths to which the public will follow the stars has been strikingly demonstrated this summer. Whether for bad Shakespeare in a good production or good Shakespeare in a bad production, virtually all seats are booked. At Stratford the entrance of Titus "dressed as a cook" with *paté maison* made of his guests' sons does not lessen the hunger to see Sir Laurence Olivier. In London a Jap at the court of King Lear has not impaired the box office appeal of Sir John Gielgud. The public, in the experience of the Old Vic, does not distinguish between good and bad Shakespeare; a play's attraction depends on whether it is familiar or unfamiliar. Thus in the season before last, *Hamlet* was played to 87 per cent of the Old Vic's capacity, compared with only

67 per cent for *King John*. The technique is to sandwich an unfamiliar play between two familiar ones, or as at Stratford to slip it into the repertory late in the eight-month season. *Titus Andronicus* will have only forty performances compared with seventy of a more popular play.

The mounting of a lavish production with so few performances is naturally very expensive, and the Shakespearean theatres' mission of presenting all the plays at some time or other can be performed only by letting some plays carry the financial burden of others. This is now being done with great success. The Stratford Memorial Theatre (though it did not start to make a profit until 1925, nearly fifty years after its foundation) is entirely self-supporting—or rather its only aid from the state is the indirect one of tax exemption. The Regent's Park season was entirely financed by private enterprise, the Arts Council having decided it could no longer gamble on the weather. The Old Vic has had its ups and downs, and after its re-opening in 1950 it had a down. But since, two seasons ago, it stopped popping Pirandellos, and so on, into the programme and stuck to Shakespearean repertory, it has done much better. It is not, however, self-supporting, as it probably could be. The Old Vic Trust (which covers all Old Vic companies, including

the Bristol Old Vic) has received a grant from the Arts Council amounting to about £20,000 a year in each of the last three years.

The reason for this deficit is that the governors seem to consider that it is their duty under their Royal Charter to offer Shakespeare at cut prices. A stall at the Old Vic costs 12s. 6d., whereas at Stratford it costs 14s. 6d.; and the difference between Old Vic prices and commercial West End prices is just about equal to £20,000 a year. The case for this policy would be stronger if the subsidy were confined to the cheaper seats. The occupants of the stalls at the Old Vic are little different from the occupants of any other theatre's stalls in their willingness and ability to pay. The Arts Council is subsidising the well-to-do.

To this it may be objected that no one should assume the continuance of a prosperity which, as far as the Old Vic is concerned, is of recent origin. The partisans of some companies are fond of pointing to the danger that rival productions by inferior companies may kill the taste for Shakespeare; and no one knows whether that taste will survive the personalities that have helped to create it. But this danger can only lie some way in the future, and perhaps it does not even lie in that. The lesson of recent years is that, as far as Shakespeare is concerned, familiarity breeds respect.

Notes of the Week

The President

THE health of any President of the United States is a matter of concern throughout the world. But the shock felt everywhere at the news of Mr Eisenhower's heart attack is a clear measure of the almost unprecedented position that he has made for himself. Wall Street was not the only place where, for a moment, the bottom seemed to be dropping out of affairs. Nor is this simply a matter of affection—though there is plenty of that for such a sunny personality. There is also a new and real respect for Eisenhower the political leader and the statesman. For the first eighteen months of his Presidency, the Republican Administration seemed, to the outside observer, to be not very much better than its opponents had said it would be. But at some time in the summer of last year, Mr Eisenhower seemed to be taking hold, and he is now in unquestioned command of his party and his policy.

It is his ability as a vote-getter, and the effect of his

illness on party chances in next year's election, that is of greatest concern to the domestic politicians (and to Wall Street). These matters are further discussed in "American Survey" on a later page. But to non-Americans the party colour of the Administration makes less difference than the policies that emerge. What they have admired in the President's recent performance is the skill with which he has brought American public opinion round from the hysteria of fifteen months ago to the comparative calm and moderation of today. The succession to the White House, now or next year, of a politician (of either party) who was less able or willing to impose common sense would be a disaster. Nor is it only at home that Mr Eisenhower has won victories for his own version of firmness and moderation. What substance there is in "the spirit of Geneva" lies largely in the impression that he made on the Russian leaders, and if there is any hope of a genuine settlement coming out of the current negotiations, it depends to a considerable extent on his being there to watch over the tender plant.

It is no mere politeness to say that the progress of his recovery will be most anxiously watched all over the world.

Brass Tacks in New York

DIPLOMACY has come down out of the clouds that veiled the "summit," and all who really want to see peace secured should be glad. The cosy fog of doubletalk that disguised the powers' failure to agree on any major issue at Geneva in July was pleasing only to those who enjoy stepping off cliffs (and those who enjoy leading them over the edge). Since the United Nations Assembly opened in New York last week, there has been plenty of plain speaking; not abuse—spokesmen for both Communist and free nations have now discovered that they can speak honestly without being abusive—but not dissembling or evasion either. Any-one who reads what the foreign ministers have said in the past few days can see for himself how remote are the prospects of their reaching quick agreement at Geneva at the end of this month. Yet, paradoxically, this sweeping away of illusions is an essential first step on the road to eventual understanding and a stable peace.

The Assembly itself got off to a businesslike start by brushing off its agenda several all too familiar items—Cyprus, Algeria, the Chinese seat. It is not necessary to go into the rights and wrongs of the cases to realise that a sixty-nation debate at this time could not promote a solution in either Cyprus or North Africa, but could easily make matters worse. This is the tenth UN Assembly, and the fact that so many delegates have now learnt to resist the natural temptation to debate every topic offered them is encouraging. It was interesting to see that even Archbishop Makarios's expedition to Bandoeng had not brought about an "anti-colonial bloc" solidarity on Cyprus; and even more striking was the fact that Mr Chou En-lai's contact at Bandoeng with the leaders of 28 Asian and African states led only three of them to support the unsuccessful Soviet demand for a debate on the Chinese seat. But it would be rash to interpret these early developments as indicating that there will be no loud echoes of Bandoeng, no vigorous marshalling of "anti-colonial" and anti-western forces at this Assembly. On the contrary, if the delegations decide to mark time on other issues while awaiting the coming Big Four meeting, a void will be created in which those echoes will resound.

Litmus Paper for Geneva Spirit

THIRTY days hath November; and although the foreign ministers seem to have agreed over a New York dinner table that their Geneva meeting on October 29 should only last for about three weeks, the two latest restatements of the Soviet position suggest that they could sit the whole month out without much profit. Both Marshal Bulganin's letter and Mr Molotov's speech to the Assembly were reasonable in tone, but both were unyielding in content. The Russian concept of "co-existence" remains as one-sided as it was before the "summit" talks; the free nations are now again told (most politely) that they can have a settlement only on terms which would condemn freedom to slow extinction.

The core of the Marshal's letter is his attempt to push aside the American offer of inspection from the air and exchange of military information without actually rejecting it. In gently chiding the President and asking what his plan "will really do to end the arms race" he is doubly disingenuous; Mr Eisenhower presented it only as a first, confidence-building, move, and Marshal Bulganin declares in his own letter that "the main problem is to look for ways which would enable us to move the disarmament problem away from dead centre." Mr Molotov, more crudely (how hard it is to shake off old ways), misquoted Mr Dulles in an effort to brand him as defeatist on disarmament, although earlier in the debate, Mr Dulles had specified that the air inspection plan should make it easier to move on to comprehensive disarmament. Mr Molotov then once again demanded that all western alliances must be scrapped and all American and British forces withdrawn from Europe and the Middle and Far East, which would then obtain "security" only from "pacts of peace." Porkkala and Port Arthur were cited in support of this thesis, but Mr Molotov made a strange Freudian slip in claiming that there will now be "no Soviet military bases on the territories of other states"; in the same speech he had rebuked those who spoke of "satellites" in Eastern Europe, and what of the Soviet forces in Hungary, Rumania, Poland and East Germany?

Mr Dulles's restrained speech contained one very necessary note of warning: that the United States and its allies could not be expected "always to be ready to enlarge their present commitments to meet Soviet concern about European security." He asked, too, whether the "Geneva spirit" was to prove genuine or spurious, lasting or merely fleeting. Mr Macmillan, when addressing the Council on Foreign Relations on Wednesday, knotted these matters together. The "Geneva spirit" would be proved real, he said, if Russia accepted the plans that the West had devised to insure it against any threat from Germany. A rejection of this offer would force the West to deduce that Eastern Germany was being held down not because of legitimate Russian fears but because the Soviet rulers wished to hold it and even to extend their grip to Western Germany. If this proved so, the free nations would face a long period of negotiation, not unlike the earlier "long haul" of defence; and they must face it with patience and hope, remembering how—in Austria, for instance—the Russians had suddenly changed an attitude in which they seemed permanently frozen. Here is, indeed, the litmus test for the "Geneva spirit."

Who Should Lead the House?

THE Government changes have not yet been announced; and the country may yet have to wait until after the Bournemouth conference before it knows whether Sir Walter Monckton really is going to leave the Ministry of Labour, and whether Mr Crookshank is to move up to the House of Lords. This latter rumour has been accompanied by a report that Sir Anthony Eden may take over the Leadership of the House of Commons himself. Before the war, of course, it was customary for a Prime Minister to assume

this duty; it was one of the few jobs that Mr Baldwin, as he "educated Labour for responsibility," did extremely well. But Sir Anthony should consider carefully whether times and the job have not changed. Although Labour may still need educating, it does not really need educating for responsibility (or, at any rate, Sir Anthony had better not try).

The trouble is not simply that Leadership of the House is an increasingly time-consuming office—although, at a time when the Prime Minister has his hands full as co-ordinator and director of policy, new burdens could cause damage. The main practical, if not constitutional, function of the Leader of the House is to stand in the firing line whenever the Opposition gets restless, and to try to calm it; although Sir Anthony would do this job as well as, or better than, anybody else in ninety nine cases out of a hundred, it would be much more serious if he, instead of Mr Crookshank, were on the hundredth and probably very minor occasion should fall down. Moreover it is an occupational hazard that the man in this office may develop a longing for a quiet life, and this could be a serious hazard for the supreme arbiter of policy: he could so easily persuade himself, for example, that it would be better not to cut rent subsidies yet awhile, if the Opposition had seemed unitedly angry about some quite separate bagatelle when he last announced the week's business of the House. Against all this, there is the respectable constitutional argument that the House, including Conservative backbenchers, may feel justly angry if the Prime Minister appears constantly to be dealing with it through a sort of Parliamentary public relations officer; but it is the duty of a good PRO to act as a two-way link with his chief on minor matters, and on major matters to bring forward the chief himself. When allowance is made for the difficulties of the Churchill era, it may be felt that Mr Crookshank has fulfilled this function, as well as the other and more majestic duties of the Leader of the House, quite reasonably well.

Labour's Lord Woolton?

THE long-awaited report on Labour party organisation, which has been compiled by Mr Harold Wilson with the intermittent aid of three colleagues, was laid before the party's national executive committee on Wednesday. So far it has not been published, and comment on this very important British political document must be confined to information based on leaks.

The most important leak has oozed from the debate about whether Labour should have a Lord Woolton; that is to say whether it should have an active politician with experience of government at the head of its organisation, instead of a paid party servant like Mr Morgan Phillips. Under a Woolton system, Mr Morgan Phillips (or his successor) would be set free to handle the more detailed problems of administration; he would become the equivalent of Sir Stephen Pierssené at the Conservative Central Office. Most students of political organisation, and of some of the personal frictions that have sprung up in the party in recent years, now seem to be convinced that this step would be in Labour's own interests; they hold

this view whether or not they welcome the fact that Labour's Lord Woolton would almost inevitably be Mr Harold Wilson.

In his report, however, Mr Wilson is believed to have plumped for a compromise. The suggestion is apparently that the new link between the national executive and Transport House should be a small but permanent liaison committee—composed of three or four members of the executive working with officials of the party, and with a member of the executive as chairman. The presumption is that Mr Wilson would be the chairman, and also the biggest noise. On paper, this looks very different from the Woolton system: the Tories concentrate control in the hands of one man and do not scatter it among a group which, in theory at least, might change its composition annually. Mr Wilson presumably knows what he is aiming at, and how large or how small a reform he can get the party to stomach at the present time; but it is not so certain that he may not be overestimating the smoothness with which a structure of this sort could be handled. There has been so much manoeuvring behind the scenes about who should sit on which stools that it will be a pity if the eventual decision is to get a committee to fall between them.

Facing the Future

THE other proposals of the Wilson committee are inevitably largely concerned with the need for more staff and more money. Labour undoubtedly suffered in the election from the fact that it has fewer whole-time agents than the Conservatives, and that their pay (and with it their quality) is generally lower. The demand for more and better agents will undoubtedly be welcomed at Margate; the conference agenda is flush with resolutions about them.

It will be a pity, however, if concentration on this point is allowed to obscure an even more important defect in

the party organisation to which the Wilson committee has drawn attention. This is the need for an overhaul of party education and research. The research work done at Transport House is often surprisingly good, so far as it goes, but Labour has not found the money to recruit a large staff, and it uses the staff that it has more for day-to-day briefing than for long-term planning. The Conservatives have a briefing staff separate from the planners, and the Tory planners are independent of the Central Office.

A rough indication of the difference between the two parties in the size and quality of their "back room" staffs can be given by comparing the number of MPs that the respective back rooms have produced since the end of the war. The Tories have produced seven: Mr Macleod, Mr Hopkinson, Mr Maudling, Mr Enoch Powell, Lord Balniel, Mr Biggs-Davison and Major Sharples. Labour has produced two: Mr Fienburgh, who was secretary of the research department proper, and Mr Healey, who was secretary of the international department. Labour, of course, has always complained that the Tories have money to burn, but it is impossible to believe that the Labour movement could not finance an adequate research department if the case were properly presented to the constituency parties and the trade unions; and it is certain that unless Labour gives itself some such equipment it will be at a permanent disadvantage. The money that Mr Gaitskell is now trying to raise should not be spent on agents alone.

A Soldier for Cyprus

THERE is an obvious logic in the transfer to Cyprus of Field-Marshal Sir John Harding. After the deplorable show of incapacity by the authorities on the island a fortnight ago, when unarmed rioters were able to do what damage they pleased in Nicosia, all remaining doubts about the urgent need for a vigorous and steady hand at the wheel were swept away. There is logic, too, in the decision to appoint a serving soldier as Governor. Not only has Cyprus's civilian police force of 1,600 proved so pitifully unable to take the brunt of terrorism and political violence that the army is already doing the greater part of the job; the Colonial Office announcement last Monday may be taken at its face value when it emphasises that, as an important "base for the discharge of Her Majesty's Government's obligation in the Eastern Mediterranean," Cyprus now requires a military Governor. There has indeed been something of tragic farce in the Government's insistence that Cyprus is a unique strongpoint, from which protection radiates both to neighbouring Nato allies and to the whole Middle East, at a time when flames from the burning British Institute Library in Nicosia were revealing its condition in a very different light.

But logic need not dictate that the appointment of a "strong man" means a petrifying of policy. On the contrary, public security in Cyprus needs to be reinforced as an essential preliminary to new political and diplomatic initiatives. From this point of view it may be questioned whether to hasten a Chief of the Imperial General Staff to Cyprus is not an over-dramatic choice. Comparisons with Malaya and Kenya are automatically being drawn, and these

are hardly likely to improve the atmosphere. It might have been wiser to find a Governor and Commander-in-Chief for the island elsewhere than among the very topmost brass.

Russian Arms for Egypt

WHILE Mr Molotov sprinkles the Geneva spirit in New York, his subordinates are sowing rather different seed in Cairo. They have offered to sell Colonel Nasser arms from Soviet bloc countries on terms which Egypt finds acceptable. Casting to the wind years of Communist denunciation of "merchants of death," they have adopted a technique long employed by western powers in their quest for Middle Eastern allies.

Colonel Nasser describes the deal as ordinary, and quite rightly points out that Egypt is as free to turn where it likes for armaments as it is to choose where it will buy food or industrial equipment. To most Egyptians, the American Under-Secretary of State's hasty journey to Cairo to argue against the policy will simply prove that neutrality is a role worth playing, since it invests the neutral with importance and with infinite opportunities for playing off rival suitors. Egypt's allies, the Saudis, and the wavering Syrians are weighing the advantages of the technique, and have pointed to Iraq as the fool of the Arab family who prematurely took sides.

Armed neutrality, however, has two obvious practical drawbacks. First, it is expensive; the country which pursues it has less to spend on development because, for lack of sure allies, it has to maintain more armaments and larger stores. The Swedes, for instance, spend more on defence than do the Danes, secure in the arms of Nato. Secondly, it raises the dreadful problem of spares. In the event of war, countries do best to sport arms supplied by a state that is likely to be an ally, or else they may find themselves running out of ammunition. Iraq, now formally linked with Turkey, Pakistan and Britain, is not without shots in its locker.

From the western angle, far the most serious angle of Egypt's decision is the upset it causes in the delicate balance on the Palestine frontier. So far, the western powers' supply of arms to Israel and the Arabs has been governed by their declaration of May, 1950, and the clause in it which binds the Middle Eastern states not to use for aggression the weapons they buy from the West; that clause now loses its value, and Anglo-American policy is being reshaped accordingly. The reshaping, however, is somewhat one-sided, for Israel has since 1948 been buying armaments wherever it can get them and from behind, as well as in front of, the Iron Curtain.

Bipartisan Talk in Bonn

THE idea that Dr Adenauer and Herr Ollenhauer might agree on a common foreign policy has been given a new lease of life in Bonn by the unanimous vote in the *Bundestag* in favour of opening diplomatic relations

with the Soviet Union. Herr Ollenhauer was mild in the debate, and did not repeat his earlier jibe that Dr Adenauer's Nato policy had proved "completely bankrupt." The optimists even find it a sign of a new conciliatory spirit that the Social-Democrats want the Federal Republic to leave Nato and Western European Union by agreement with its allies, and not unilaterally. One of the reasons given for this loyalty is that the Russians would otherwise conclude that the Germans were unreliable parties to any agreement.

The Free Democratic leaders and press have for a long time past favoured co-operation with the Socialists on foreign policy, much though they dislike their economics. The common ground is Protestantism and the two parties' attitude to Nato. Dr Dehler, the chairman of the Free Democratic Party, has, like Herr Ollenhauer, bluntly declared that the western treaties were a mistake and that Germany must be allowed to leave the alliance for the sake of reunion. What would happen if the allies refused to release Germany is not mentioned. Some Free Democrat leaders are even thinking of bringing the Socialists into a coalition government after Dr Adenauer retires, if not before. Only the Christian-Democrats point out that the *Bundestag's* unanimity hides a fundamental difference on the value or disadvantage of the western alliance. Dr Adenauer still proclaims that it will lead to his goal of European integration and believes that firm friends in the West are vital to reunion in freedom. But Herr Ollenhauer maintains that the Chancellor's "European policy" collapsed when the French rejected the EDC, and is nothing but a barrier to reunion. In the *Bundestag*, he refused to face the fact that Russia's price for giving up the Soviet zone is far higher than West Germany's renunciation of

Nato, and plainly indicated that his party would only consider a "bipartisan" foreign policy if Dr Adenauer was willing to sacrifice the alliance. The Socialists can maintain this stand because they are sure—too sure—that American and British forces will continue to protect Germany as long as necessary.

In view of this yawning difference over the western alliance, it is hard to understand why partnership with the Socialists in Bonn should be regarded in the West as either possible or desirable. Dr Adenauer's firmly pro-western policy would inevitably be watered down and there is no certainty that parliamentary democracy would be strengthened. In Germany, as elsewhere on the continent, coalitions are regarded as good in themselves, whereas the main need is for a responsible, healthy opposition in which the Social Democrats maintain a clear distinction between themselves and the Communists.

Deadpan Paper

THE White Paper on the disappearance of Burgess and Maclean has run into heavy weather from all sections of the press. Some of the popular papers are able to point out that they published some of the details of the affair long before Petrov's revelations forced the Government into making a confession. Even the serious papers want to know why Maclean and Burgess were allowed to escape

Source: A Statistical Analysis of Road Accidents, published by the Commissioner of Police of the Metropolis.

when one plain clothes watcher could have given the alarm; and there is a chorus of complaints that insufficient detail is forthcoming about what they got away with. Certainly, as one Sunday newspaper pointed out, they got away uninterrogated about other Soviet contacts in the service.

Yet, now that the White Paper has been published and official dovescotes have been fluttered, the sensible thing for outsiders to do is to let most of the matter rest. The real complaint against ministers is not that they have been deadpan, as this White Paper is; it is that, in some of their Parliamentary replies, they have been a little worse than disingenuous. On the other question raised by this affair—the efficiency of the security services—the public's verdict must be one of "not proven." The plain fact is that espionage and counter-espionage have to work in secret; and it does not follow even from the Petrov revelations that now is the time for a full "now it can be told" official story. Many interesting Maclean stories have been told—but they are mostly speculation, and it is easy to think of a dozen reasons for the authorities playing the game the way that they have, with Burgess and Maclean ending up in Moscow (where Mr Zorin failed to meet them). The other difficulty is that it would be impossible in any open inquiry to give details about the measures taken to tighten up security. Only the security services themselves know how good or bad they are, and how they compare with those on the other side. It must be presumed that in the four years that have elapsed since Burgess and Maclean took to their heels a searching inquiry into British security services has been made; and until another such case occurs it will be impossible to assert that it has been ineffective. This is an unsatisfactory situation; but more parry and thrust in Parliament about the security aspects of the affair will not make it a better one.

The Embattled Screen

THE early stages of the battle between the BBC and the independent television service have made fascinating viewing. Even before its rival appeared on the screen the BBC had plainly decided to fight for its customers at every audience level. The balance of its programmes was not disturbed; all that happened was that the mildly intellectual programmes became slightly more intellectual, the flashy programmes became flashier, and the sentimental programmes became very much more sentimental. This last tendency reached its apogee two days before the ITA's inauguration when the tear ducts were set in nauseous flood in a very public celebration of Mr Wilfred Pickles's silver wedding. The critics, who were the only people who were watching this programme through duty instead of choice, were appalled; but the millions who were watching because they like this sort of thing—and it is not really a harmful thing to like—undoubtedly enjoyed themselves more than ever. With fiendish cunning the BBC's sound services carried on the good work by killing off Mrs Grace Archer, the most dispensable heroine of their favourite soap opera, in a long death-bed scene ten minutes before the ITA was due to appear on the air. Broadcasting House was flooded by letters from people who said that they felt that they had lost a personal friend, and the jollity

at the ITA's inaugural banquet was undoubtedly made to look rather indecent.

Independent television itself got off to the sort of start that most people had expected. It has been widely criticised for slavishly copying many of its programmes from the BBC. In fact, it has copied them from successes in the great television testing ground of America; but since the BBC adopted the same policy at least three years ago, the difference is difficult to spot. There has been a certain freshness of approach in some of the independent programmes, but this has been obscured as yet by occasional amateurishness in presentation. The new programmes have also made some mistakes, of which the most obvious (in imitation of the film moguls) has been that they have recruited too many big names—and then under-employed them in roles that less experienced (but more carefully rehearsed) artists could have filled just as well and with a smaller sense of let-down. It is also quite obvious that advertisers are being allowed to place their plugs just where they want them. This does not matter so much at the moment, when the companies seem to have as many applications for advertisements in evening viewing hours as they can accommodate; but if the supply of advertisements should become harder to get, it might affect the balance of their programmes.

Newscasters at Grips

THE presentation of the news on independent television deserves a separate comment of its own. When Mr Aidan Crawley announced that his company would report crime and other "idiosyncrasies" on the screen, many people must have felt a slight sense of shudder. Up to now, however, the shudder has been unjust. The general attitude on the lighter items, thrown out of the screen "the accompaniment of a wrinkle from the newscaster's eye, has been; "It is a bit silly for intelligent people like you and me to be interested in the nuptials of a fifteen-year-old foreign princess. But it is rather absurd fun, isn't it?" On the whole this is a healthy approach, although the search for a joke even in major news items might sometimes be pushed too far. That wrinkle, in particular, may one day cause the same trouble that King Magnus's cabinet ministers professed to find in their sovereign's conduct in "The Apple Cart." To read a pompous politician's speech, or the verbatim evidence of an accused bookmaker at the Old Bailey, may seem safe enough; but what if somebody claims one day to have spotted unfairness, or even contempt, in the shadow of a doubting smile?

The BBC's initial response to this competition in news-casting was the opposite of its response to the competition in entertainment. The horn-rimmed spectacles on its announcers seemed to grow bigger, the carefully prepared news scripts were pressed closer to the nose, caution and sobriety became even more obviously the order of the day. Within a few days, however, the corporation had clearly and wisely decided that completeness rather than caution was its best answer, since completeness is a quality that the ITA's rather dilettante bulletins have conspicuously lacked. The result is that the BBC television service's bulletins now approximate to an extended and illustrated version of

master

and servant

SOMETIMES placid, often savage—heat is vital to industry. Equally vital is its control. But Asbestos does more than control: it conserves and exploits. . . . It protects men and their buildings from fire, helps warm their rooms, saves their fuel, insulates their factories, starts and stops their lorries and buses. Asbestos is Master of Heat and Friction. Let us tell you many ways in which Asbestos can be your servant.

OCTOBER

DON'T LOOK NOW

In October 877, by all accounts, the usual French cry of 'Le Roi Est Mort' was changed to 'Le Roi Chauve Est Mort'. On the 8th day of that month, died a King of France known to history as Charles the Bald. It is interesting to wonder how nicknames for kings developed currency enough to survive. Did the kings know about their nicknames? Did anybody call Ethelred 'Unready' to his face? Julius Caesar's troops used a friendly, if scandalous, two-word description of their favourite commander; and one of those two words meant 'bald'. The Duke of Wellington's troops referred to him as 'Nosey'. Who, if anyone, called King Charles of France 'The Bald' in his hearing? And was it then to laugh at him, or to distinguish him in a gathering of kings all called Charles? Neither theory sounds likely. Another question: how bald did you have to be in 877 in France in order to be given the word in your title? Egg-bald? Or was it enough to have the head gently growing through the hair on top? Poor King Charles. He probably minded being bald, and wished he could look like those storied kings who, unshaven and unshorn, resembled, in P. G. Wodehouse's noble phrase, burst horschair sofas.

The Midland Bank is in no position to comment! But if ever it achieves the affectionate accolade of a nickname, it will certainly not be 'the Unready'. For the Bank is always ready to help in financial matters of every kind.

future imperfect

Wild animals depend for their food on what they can find.

It is a hard to mouth existence. Man, having evolved the idea of agriculture, sows to reap. He cozens nature, making her amenable,

to produce his food when and where he wants it.

He asks only health and strength to work his fields,

peace to enjoy the fruits of his labour and a stable economy

to ensure that he can sell and buy and exchange.

The main product of the Fisons business has for a hundred years

been chemical fertilizers, to enrich the soils of farms and gardens.

But they make chemicals for medicine and industry too.

Fisons contribute to Britain's harvests, health and wealth.

FISONS LIMITED • HARVEST HOUSE,
FELIXSTOWE • SUFFOLK

..... Fertilizers • Heavy Chemicals

Fisons are also among the largest manufacturers in Great Britain
of pharmaceuticals, medicinal food preparations and fine chemicals
for industry. Many of Fisons products in these fields are household names.

it's all in **FISONS** field

the "Today's News" feature on the leader page of *The Times*; while the ITA's bulletins reflect what a fairly young university graduate might find to be intriguing—but not what he finds to be tasteless—in the *Daily Mirror*. This is as good a mixture as any; it is a pity that both evening bulletins come on at the same time. So far, however, the viewer has no reason to be displeased with the benefits of competition, on either screen.

How to Restore Freedom

THE downfall of General Perón is obviously much more than just another Latin American upheaval—and for that reason it is a matter of the broadest international interest. Nowhere else in the world has a dictator controlling a modern totalitarian apparatus been brought down by an internal revolt. In Europe, the Axis régimes were overthrown by invasion from outside, and while in parts of Eastern Europe one form of totalitarian government merely succeeded another, in Italy and Western Germany the rebuilding of free institutions could be carried out slowly under the wing of occupation authorities which were themselves responsible to democratic governments. The victors in Argentina, however, are Argentines, and they thus face a task without precedent. Pledged to restore freedom, they must, if they are to fulfil their pledge, recreate a whole fabric of free society in a country where press and publishing houses, schools and universities, social services and every kind of institution and organisation have been stamped into one servile form.

It is easy to scrape the names of General and Señora Perón off ships and even cities, or to leave an Italian sculptor with three years' output of heroic masonry on his hands; it is much more difficult to purge education, social security and local community life of their Peronista content, and, after a decade of all-pervading indoctrination, to revive non-political youth organisations, independent newspapers, untainted academic staffs, and trade unions that are not mere puppets of the state. Perhaps the most delicate of all such tasks is the fostering of a political opposition which, while sturdily challenging the very government which makes its existence possible, does not lapse into extremism and thus discredit democracy all over again. A good many other countries may some day face similar tasks. The progress, and the difficulties, of the new Argentine government ought therefore to command the attention of the whole free world, not merely of the connoisseurs of Latin American politics.

Ripples from the River Plate

THE more immediate international consequences of the fall of General Perón are extensive enough; they will be felt in places as far apart as Mexico and Moscow. The Argentine drama may directly affect the Brazilian elections on Monday, for Senhor Goulart, the vice-presidential candidate on what is generally regarded as the strongest ticket, has a strongly Peronista reputation. It must already

be causing much searching of hearts in those Latin American republics that had been wooed and, in very varying degrees, won by General Perón as partners in "economic union" and other loose forms of association—Chile, Paraguay, Bolivia, Ecuador and Colombia. Throughout Latin America, the Peronista labour groups, youth groups and other organisations financed and fostered from Buenos Aires during the fallen dictator's long struggle for regional hegemony are now cut off from their source of support and inspiration. Quite a few newspapers are likely to change hands, and trade union leaders allegiance in the months to come. For the Americas as a whole, the question will arise whether the role of principal challenger to the United States will pass to another republic—to Brazil, perhaps, if Monday's ballot boxes yield an answer that makes anti-Yanqui feeling a profitable political note to strike.

But General Perón's "third position" did not merely make Argentina the natural focus for resentment of the United States throughout the hemisphere (until the dictator himself belatedly began to flirt with Wall Street in hopes of salvaging his finances). Equally naturally, it caught Moscow's alert eye; and even before Stalin's death an intriguing association began to develop between the Russians and the regime which they had tried to exclude from the United Nations in 1945 because of General Perón's Axis sympathies. Communists in all countries, while sniping at Madrid, obediently stifled all criticism of the Buenos Aires government. Russian missions were feted in Argentina, and, while Soviet spokesmen dwelt on their fervent wish to help struggling Asians, Russia's first sizeable credit to a non-Communist country was extended not to India, Indonesia or Egypt, but to the fascist regime of General Perón. It is hardly surprising that the Moscow press was tongue-tied when he fell.

Striking for Jobs

THE Daimler company may not feel as tragic as some other motor companies would about the ban on overtime imposed this week by 3,000 employees at its Coventry factory. The ban is in support of 150 vehicle builders and finishers who are on strike, and these in their turn are on strike because the Daimler company has discharged as redundant 250 others. This is the second strike of this kind at the factory within a month. This time redundancy arose, according to a statement by the company's managing director, because bodies for both Daimler and Lanchester cars are in future to be made by an associate firm, Carbodies Ltd., whose plant is being extended for the purpose. As this firm is also in Coventry, it seems likely that there will be jobs on the new plant for at least some of the dismissed men. The Coventry branch of the National Union of Vehicle Builders, however, denies that it has been told anything about this, and it hopes to get its headquarters, as well as that of the Amalgamated Engineering Union, to recognise the strike as official. The NUVB, being left-wing, though no longer strongly Communist-influenced, may be tempted to do so.

The motor industry as a whole is badly placed to risk fracas of this kind, for the union leaders with whom it

deals are having a difficult time. Last weekend the motor factories' Stop Stewards' Liaison Committee, which is regarded by union leaders as a very left-wing instrument indeed, held a conference about automation; it passed a resolution declaring that labour-saving machines should not be allowed to save any labour—a resolution which was well on the Communist party line. The union leaders recognise that this sort of thing is madness, but they are very afraid of redundancy; and dismissals need handling with great care if the average worker is not to be driven into the arms of some of his well-organised comrades. Time is well spent on patient explanation and consultation, and it is not clear whether this took place at Coventry.

France's Wage Front

THE battle of wages has flared up in France after two years of relative truce. The violent outburst in the shipyards of St Nazaire a few weeks ago, which gave the signal, was soon followed by the still unfinished struggle in the Nantes engineering works, and the wave of strikes has since spread to other regions and branches of industry; building, gas, electricity, transport, coal and textiles have been affected. The workers' tactics vary from the quasi-revolutionary violence of St. Nazaire to sporadic stoppages. Nor do the employers present a united front: some have granted substantial wage increases, others are stubbornly counter-attacking through lock-outs, while certain establishments, particularly in the nationalised sector, are trying to check the tide by modest wage offers combined with other benefits. The nationalised Renault works, which have granted a three weeks' holiday and promised to swell the pay-packet in the next two years, are prominent in this "reformist" group.

The impact of the new wage increases on the cost and price structure of French industry is still hard to assess. The Commission of National Accounts has estimated that a rise of seven per cent in the total wage bill this year need not have any dangerous inflationary effects. The employers' chief argument is that for many enterprises the profit margin is so small that the present demands threaten to bring about unemployment or to wreck M. Faure's experiment of "expansion with stable prices." The apparent gains, they argue, will be swallowed up by a new bout of inflation, while in the last two years real wages had risen by about nine per cent.

The argument is somewhat one-sided, and a comparison with the prewar period yields less impressive results; indeed, it enabled the Communists, earlier this year, to launch the slogan of "absolute pauperisation" of workers under capitalism. Their calculations deliberately ignored the important changes in family allowances and other social benefits; yet objective estimates show that a worker with less than two children really earns for the same number of hours less than before the war, despite the substantial rise in production and productivity. Only through longer hours or the employment of more members of the family do the workers derive certain advantages; many are convinced that even this has been achieved exclusively through their struggle against the employers. Wage increases of up to

22 per cent now won in the heat of battle, concessions granted by employers faced with strikes or the threat of strikes, only strengthen this conviction. The Communist CGT has not created this mood, though it will certainly try to feed it and benefit from it. North Africa will not be M. Faure's only major problem when parliament reassembles.

The Dutch Stand by Nato

AT a time when some people are questioning the need to maintain the free nations' military preparedness, the emphasis in Queen Juliana's speech from the throne last week on "the essential function of Nato" should act as a much-needed corrective. The Dutch will, it appears, vigorously oppose at the coming meeting of the Atlantic Council any proposal for a reduction in the strength of Nato's forces.

Yet they are a nation who by inclination and tradition are strongly anti-militaristic. It was only grudgingly that they accepted the need for conscription in peacetime, and the taxpayer in the Netherlands is fully conscious of the cost of maintaining substantial land, air and naval forces at the disposal of Nato. But the Dutch are a hard-headed people who are only too painfully aware of the indefensibility of their eastern frontier—separated by less than 200 miles of flat "tank" country from the Soviet armies in Eastern Germany—without the aid of allies. They are not easily persuaded that the recent conciliatory gestures from Moscow represent a real change of heart and they can see no reason at present to lower Nato's guard. No doubt their Minister of Defence, Mr Staf, was able during his recent visit to reassure himself that Britain holds similar views.

What is striking about the firm words the Dutch have lately been using is that one of the smaller partners in Nato has chosen to give a lead. Critics of the Atlantic alliance who habitually talk as though it was the Americans who always dictated policy to reluctant European partners might do well to think over this clear evidence to the contrary.

Procrustean Education

AT the annual conference of the National Institute of Adult Education several speakers cast doubt on the suitability of university courses, particularly in science and technology, to the needs and capacities of the majority of students taking them. Standards and traditions set by the abilities of the first-rate academic cadres were said to have imposed on others—that is, on the bulk of the expanded university intake—strains that prevented them from "deriving anything like the benefit they should from university life"; and this complaint was echoed by warnings that the technical colleges, in pursuit of prestige and status, were inflicting similar strains by overloading the academic content of their syllabuses.

It is fairly easy to see the logical conclusion of this argu-

ment, and why the conference took it up. If the argument is right, the main aim of policy in "further education" should not be the enlargement or multiplication of universities or university colleges—let alone at the cost of lowered standards—nor their indiscriminate emulation by technical institutes. The aim should be the provision of a whole graded range of training opportunities, full-time and part-time, for that majority of moderately gifted young people for whom a university career is, realistically considered, a delusive mistake, but whose abilities are so urgently needed and so often wasted. In other words, there should be more emphasis on the sorts of further education with which many speakers at the conference are connected. But this argument immediately runs into an apparent contradiction: at the moment there are more opportunities available for many types of evening classes than their potential beneficiaries are willing to take up.

The real problem is one of prestige. The status of a university student, even for members of the "silent, unsociable, Nescafé-drinking race" of hard-pressed technical aspirants, is matter for envy. The technical colleges and institutes have a lesser prestige of their own. But evening, extension and continuation classes have no prestige at all; indeed, the judgment most likely to be passed by his peers on the young worker who takes advantage of them is that he is a poor fish who cannot get a girl to go out with him at night. Were continued education to become the generally Done Thing, the relation between the universities and technical colleges and institutes would fall into perspective, to the advantage not only of vocational training, but of the development of young technicians as human and civilised persons. Educationists should be thinking no less seriously about the problems of projection and propaganda than about those of using limited material and human resources to the best educational advantage. Perhaps a great deal could be done by a wholesale reform, not of courses, but of various institutes' names.

Punter's Paradise

THE football pools remain legal because the Royal Commission on Betting, Lotteries and Gaming concluded that a substantial element of skill was involved in making forecasts in the Six Results or Penny Points and other pools. The commission felt—as the public feels and is encouraged to feel—that "the football follower would have a much greater chance than someone entirely ignorant of the merits of the teams and the players." One distinguished witness before the commission, Mr Hubert Phillips, disagreed. Mr Phillips has now produced new calculations* designed to prove his point; and also to prove, to any punter who cares to have his private daydream punctured, that the mathematical expectation, for example, of winning £75,000 by means of a regular weekly stake of 2s. on the Treble Chance is once in 500,000 years. While in some pools there is a fixed number of possible forecasts (from 729 in the case of the six results to 4,782,969 in the case of the penny points) any competitor can choose any number of them, so that the odds against success are unpredictable—they fluctuate only around a predictable norm.

* Pools and the Punter. By Hubert Phillips. Watts and Co. 8s. 6d.

But this does not help the punter. Nor do the tipsters. Mr Phillips shows very simply that the scores obtainable from following the tipsters are no better than random guessing. He also shows that if the results of two identical pools run by competitive firms are compared, the dividends conform closely with each other—and with the pattern of chance; there is no variation which might suggest that an element of skill is distorting random distribution round the predictable norm.

Whether Mr Phillips's mathematics will interest the punting public as much as the booklets brought out by the pools to guide punters through the intricacies of perms (which Mr Phillips considers increases the chance of a prize exactly as taking two tickets in a sweepstake increases it over taking one ticket) may be doubted. Whether he has demonstrated that the pools are lotteries—and particularly unfair kinds of lottery at that—could only be settled in a court of law with both sides calling mathematicians as witnesses. But for his general conclusion that as the state and the pools organisers do so handsomely out of the sale of these pipe-dreams, they might as well be nationalised, there will be much more sympathy than proposals for nationalisation can now usually claim.

Freedom of Speech

It seems singularly difficult for foreigners—even for those who have resided long among us—to comprehend the degree of freedom and individualism which pervades the speaking and acting of nearly all classes of Englishmen. On the Continent men's thoughts and utterances are so generally under Government inspiration, or fettered by Government control, or checked by the dread of Government interference or retribution, that what is said (or at least what is published) is usually conceived to have more or less of an official character, or at all events not to be wholly devoid of official sanction or connivance. Nor is the inference there a very unjust one; for when authority so perpetually interposes its preventive arm, it may not unfairly be held unanswerable for what it does not prevent. Moreover, this ceaseless sense of supervision and restraint from powers above imparts a character of caution and design to all their political writing of which we in our free land know little; few authors (on public subjects at least) are quite without an *arrière pensée*; they seldom can give way to the *épanchement de cœur* which is as natural to us as the air we breathe. Hence when foreigners read, in any of our more popular or widely circulated English journals, articles at all remarkable for opinion or expression, they are too apt to jump to the conclusion that these articles either indicate the secret designs or tendencies of Ministers, or at all events the deliberate feelings and policy of the nation...—and what is merely the spontaneous sympathy of an individual which he is certain will be shared by thousands, they interpret as encouragement given either by the Government or the nation... We refer to this subject now, in consequence of finding that the remarks which have appeared in the leading journal and in our own columns, holding up the brutalities of the King of Naples to the execration they deserve, have been represented in some quarters and are regarded by some hasty Italians as proofs that a rising and resistance in that oppressed country would be welcomed and applauded, if not positively encouraged or aided, by Great Britain.

Letters to the Editor

Interim Report

SIR—Your editorial article states that the banks, in operating the credit squeeze, "seem to be relying principally on some weird system of hypothetical fair shares as between their different branch managers."

I agree that such a system would be a weird one, but to the best of my knowledge it exists only in the imagination of the writer. One cannot believe that any of the banks have thought of doing anything so absurd as to seek a uniform reduction in advances branch by branch, not least because supervision of all advances of any size is centralised in local or chief head offices.

So far as the smaller advances are concerned, it may not be humanly possible, with several thousand offices in question, to guarantee absolute uniformity in the treatment of customers throughout the country. Nevertheless, if there are anomalies, as you state to be the case, these arise from difficulties in the practical application of a set of principles which are clear and sensible in themselves, not from any doubt about the criteria to be applied. These are clearly implicit in the Chancellor's statement in Parliament of July 25th, when he said that for the time being our primary aim must be to reduce home demand in order to leave room for the extra exports we need, that all who can must try to spend less in order to save more, and that business firms should endeavour to slow down investment not of the greatest national urgency.—Yours faithfully,

J. HUNSWORTH
Banking Information Service, EC3

Officers and Gentlemen

SIR—It is not only your civil service correspondents who consider that a comparison of service officers with the administrative or any other grade of the civil service is invalid.

The complexity of modern war and the development of multi-national staff planning of the Nato variety has unhappily led to large numbers of officers serving at desks. It would, however, be dangerously misleading to consider this their normal employment, or to regard their skill with paper as more than just one criterion for their professional advancement and monetary reward. The basic difference between the officer and the civil servant is that the latter very rarely assumes final and inescapable responsibility; while the service officer—normally in direct charge of a situation, of men and of material in motion—has necessarily to make a decision and act on it there and then, and on the out-

come his future career and perhaps his and other lives will depend. It seems no more reasonable to class a lieutenant-colonel by his performance at a desk, although he has to sit there at times, than it would be to judge a civil servant by his performance at sea, in the air, or in the jungle. The service officer asks to be judged in his own environment doing the job for which he was selected and trained, and with due regard to the hazards, discomforts and responsibilities of his profession.—Yours faithfully,

SERVICE OFFICER

SIR—The speed with which your civil service correspondents have reacted to your leading article must surely silence unkind critics who claim that no civil servant can be expected to answer a letter in less than four weeks. No doubt gallant officers of Her Majesty's services will now point out in reply that their pay should take into consideration the risks inherent in their profession. We must not forget, in this context, the hazards to be faced by the civil servant. On any working day he may become comatose in committee; he may be poisoned by a rusty nib, choked by a cup of tea, strangled by red tape, trapped in a lift or inadvertently filed away. Imagine, too, Sir, the frustrations and annoyances to which he may be subjected. He may not be asked to the garden party; he may not get his share of the departmental allocation of gongs; he may even (though this is admittedly rare) be questioned by the Security Service. No wonder that it is difficult, at present rates of pay, to find suitable recruits for the administrative grade.—Yours faithfully,

CHAIRBORNE

SIR—My colleagues, Messrs Green and Woolf, have ably pointed out how inappropriate it is to compare officers of the armed forces and the administrative class of the civil service. The table of analogues set out in Mr Green's letter has been sanctified over many years by its inclusion in the King's Regulations (order of precedence), this point being clearly established before the Tomlin Commission of 1929-31. To Mr Green's statement that executive officers are paid less than the service officers who are equalled with them one could add some examples. A colonel's pay is £1,900, whereas a chief executive officer gets only £1,595; a lieutenant-colonel gets £1,700, a senior executive officer only £1,325. You say "since 1946 officers' pay has risen by about 35 per cent." Some comparable executive grades have received as little as 38 per cent more in pay since before the war.

Your statement that "the home civil service still gets all the recruits it needs" is inaccurate as regards all classes of the civil service. Mr Woolf has already pointed out that the Civil Service Commission has been unable to fill the vacancies in the administrative class. A similar situation is now developing in the executive class. After the October, 1954, open competition, the Civil Service Commission submitted a document to the Royal Commission which showed, not only the steadily declining margin of "surplus acceptable candidates," but an actual deficit of successful candidates. The Commission concluded that "the attractions, including the financial attractions, set out by the executive class were . . . at least adequate five years ago, but have since grown weaker to a point which must cause anxiety for the future."—Yours faithfully,

E. C. REDHEAD

The Society of Civil Servants
Westminster, S.W.1

SIR—I have noted with admiration the promptness with which office-holders of the Civil Service Clerical Association and of the Association of First Division Civil Servants have unsparingly defended their pens in the interests of their members. One must now await the remarks of the Field Officers' Guild and the Amalgamated Squadron Leaders' Society. Or do such pressure groups not exist? And if they do not, could this possibly be a contributory cause of the present inadequacy of officers' pay?—Yours faithfully,

QUARTERDECK

Black Market in Cars

SIR—Mr Seager complains that in the early summer (the peak buying season) he found waiting lists for "a new car of popular make," but was offered immediate delivery of secondhand models at above the list price. The problem here is one of shortage and not, as Mr Seager believes, of deliberate inflation by manufacturers.

The primary national need is to export, not to satisfy the home market. Production for the first seven months of the year was 515,000 cars. This is a rise, in which the industry can take pride, of no less than 16 per cent over the same period of 1954. The percentage of exports for the first four months, until the dock strike, was practically the same as last year.

All will agree, however, with Mr Seager in condemning the overcharging which any product is liable to, when there are pockets of scarcity, unless the public has the strength of will to resist. In the immediate postwar years this association effectively controlled the sales of new cars through its Covenant and Declaration schemes, as part of its unvarying policy to restrain both overcharging and undercharging. Those schemes were relinquished as supplies improved. The policy remains unaltered, and any breach of trading agreements will always be investigated. The regrettable defects discovered by

Mr Seager in his new car seem all to be covered by the manufacturer's guarantee.—Yours faithfully,

W. L. RICKETTS

The British Motor Trade Association,
W.1.

Goa Blunders

SIR—In *The Economist* of September 17th a letter from a Mr Ferreira, of Mozambique (Portuguese East Africa), stated, among other rather inconsistent things, that there is no freedom in Portugal. It seems to me that the very fact that Mr Ferreira was able to write, sign and send such a letter proves just the opposite. It at least proves that in Portugal anyone is free to write silly letters. No one could fail to reach a different conclusion if they were patient enough to read the letter to the end.

However, one point does emerge quite clearly from Mr Ferreira's letter. He states that the whole of Portugal is united in supporting the Portuguese Government's position on Goa. In this I entirely agree with him.—Yours faithfully,

MARIA DA SILVA

London W.1.

SIR—Your article of August 20th is incisive, but major elements have been omitted. Goa is a chapter in the history of European imperialism in Asia, it is also a part of a clash between white and black which extends to Kenya, Morocco and South Africa. Any account of the Goan problem which does not mention these elements seriously distorts an understanding of Indian motives. The presence of these factors in the Goanese situation, and their absence in Patna and Bombay, is of crucial importance.—Yours faithfully,

G. ISAAC

Calcutta

[It is also surely relevant that racial discrimination is markedly absent in Goa.—EDITOR.]

Two Internationals

SIR—In *The Economist* of September 10th you mentioned the inter-parliamentary potentialities of the Liberal International Conference at Lucerne and the Inter-Parliamentary Union Congress at Helsinki, but you neglected to mention another recent conference which came closer to the sort of inter-parliamentary co-operation you have in mind. In July of this year there was a meeting of members of Parliament from all the Nato countries. Earlier this year Mr James Griffiths spoke of the value of a Commonwealth Parliamentary Association. In January, Mr Menzies of Australia, addressing a meeting of pressmen in the United States, said he would welcome the inclusion of American representatives in the annual Commonwealth Ministers' Conferences. These separate proposals might, if drawn together, well develop into a parliamentary assembly of free peoples such as you favoured in your report.—Yours faithfully,

RALPH E. LOMBARDI

London, W.4.

Books & Publications

The Romans' Road

MANPOWER SHORTAGE AND THE FALL OF THE ROMAN EMPIRE IN THE WEST.

By Arthur E. R. Boak.

Michigan University Press (London: Geoffrey Cumberlege). 169 pages. \$4.50. 36s.

THIS little book contains the lectures delivered at the American Academy in Rome by the professor of ancient history at the University of Michigan. It is a model of what such lectures should be: clear, packed with information, well-knit to a theme, abundantly documented, authoritative, critical, and original. It is so sane a study of a most complex and ever-baffling problem that it is a pity its sterling price, for so small a book, makes it prohibitively costly. Professor Boak is of the realistic school begun by Hume ("The Populosity of Ancient Nations") and carried into our own times by Bury, Jones and many another. He seeks numerical grist for his mill far and wide. No cross-check is ignored. Nearly a fifth of the book contains his notes and sources for the text, and they are a joy to read, for the author's own studies of the Roman world have clearly been exhaustive. The result is a really exciting "dig" among mounds of evidence, much of it conflicting: an historical "whodunit" with a discomfitingly contemporary relevance.

Mr Boak concludes, with others, that there was no one cause of the decline and fall of the western Roman empire; that many interacting causes aggravated each other, and in sum worked a catastrophe; that a cumulative and accelerating decline in population, beginning as early as in the first half of the second century, was as aggravating a factor as inflation; and that the process of decline was never really reversed, or changed in its remorseless challenge to the emperors, in the three hundred years that finished with the fall. Rightly, the author pays Diocletian the tribute due to that remarkable, farsighted, ruthless Illyrian for his logical but fruitless, vast but inoperable, administrative reorganisation between 284 and 304 AD. It is one of the ironies of history that the last persecutor of Christians should have bequeathed to the Christian Empire, which yet endured in the west a further uneasy century, every one of its fiscal, legal, military and administrative instruments.

But the rot which not even Diocletian could stop had set in nearly two centuries before. The Empire at its best, under Hadrian, had no machines, little urban industry, and little popular commerce; it was, for all its extent, still

basically agrarian; and productive manpower was mainly that of slaves. From about 125 AD onwards, the population began to decline—owing, in the first place, to plague (which even in the Middle Ages, Mr Boak says, had power to diminish populations for centuries). The decline was aggravated by imperial demands for the forces and, later, for the swelling bureaucracy necessitated by economic authoritarianism, by inflation (which reduced both savings and family size, both urban and rural productivity), by the progressive falling-off in the supply of slaves (as the emperors invited barbarian settlers to till strategic lands, now vacated), and by the economic despair to which all classes (save only the tiny top layer of rich owners of widening *latifundia*) were progressively reduced as the bureaucratic absolutism fixed almost everybody's status.

Again, rightly, Mr Boak names Diocletian as the formaliser and beginner of the feudal era. Workers in town and plantations, civil servants, tenants, even the soldiery and their progeny became of fixed status. "Flight" from such status (for which a special word existed) became widespread. The municipal councillors, one decurion and now curiales, fled their crushing duties, and men rejected from the forces were conscribed into assuming them. The trade unions (*collegiae*) were fixed, too, and on them and their members were clamped duties and taxes just as onerous. Personal rights disappeared as the state laid down more and more numerous and impossible personal duties. Arts, crafts, quality, efficiency, economy, all wasted away. The author sagely reminds us that even the "great age" of church-building after Constantine was a shoddy affair compared with the edifices of the heathen empire.

And so the empire in the west wound to its ruin: its armies now more barbarian than Roman; the stature of its recruits for police or the forces progressively reduced (an ominous parallel); vast tracts on its frontiers already settled by the close kin of the later-irrupting barbarian tribes; commerce and communications in decay, its cities now walled but one-third of their former acreage; virtually everybody a Roman citizen (shade of a mighty name) but crushed with duties; and the outward formalities of spectacles (in the arena), free bread and meat, subsidised housing and other amenities, and superabundant titles merely masking the collapse into the local Christian serfdom of the Dark Ages. As Mr Boak says, no enterprise, no initiative, no originality, not even

a revolution could come of such desperate fixity. None did, for a thousand years thereafter. The leaders of Western Europe and of Russia today really ought to study this disturbing document.

American Cobden

HENRY GEORGE.
By Charles Albro Barker.
Oxford University Press. 71s. 6d.
57s. 6d.

THE ECONOMIST is credited by Mr Barker with having published "one of the very few important 1880 reviews" of "Progress and Poverty." It is pleasant to be able to return the compliment. Mr Barker has written what is probably the most important and is certainly the most scholarly book on Henry George. It is only a few years since Anna George de Mille's life of her father appeared, supplementing at several, mostly feminine and familial, points the old "official" "Life of Henry George" by his son.

In a sense Mr Barker's book supplants neither of these, since they are source books in their own right. But in fact he has gathered up into his compendious (but never padded) pages most of what is of value in these earlier accounts. He has supplemented their story by research among the Henry George manuscripts and newspapers and—what is even more valuable and constitutes the book's supreme merit—he has for the first time given a historian's eye view of Henry George; he has drawn the man in the perspective of his time. This makes Mr Barker's book more than a biography; it is an important contribution to American history—and indeed to British history of the eighties and nineties, for Henry George's impingement upon Anglo-Irish relations and the rising Labour movement were as important as his radical activities in *post-bellum* California and almost certainly more important than his contest for the New York mayoralty and his association with the abortive United Labour Party.

Henry George is indeed a genuinely "Atlantic" figure, one of the members of that community of nineteenth century radicals who felt equally at home on either side of the ocean, who sympathised and agitated, with equal absence of self-consciousness, national or personal, all the way from San Francisco to Dover—and indeed beyond. Primarily, as we can now see—and as Mr Barker brings out very clearly—George was not an economist, still less a one-idea single-taxer. He was a radical reformer, an American Cobden, with something of Cobden's gifts for expressing economic thought in politically comprehensible language, all of Cobden's moral and humanitarian fervour, but unfortunately very little of Cobden's organising genius.

Mr Barker makes no inflated claims for his subject. He admires him, loves him, and at the same time evaluates him justly. His book is written this side of idolatry. It pays its subject a rarer tribute—that of careful, ripe, scholarly understanding.

Introducing Economics

ECONOMICS: AN INTRODUCTORY ANALYSIS. Third Edition.
By Paul A. Samuelson.
McGraw-Hill. 763 pages. 30s. \$5.75.

ECONOMIC ANALYSIS. Third Edition.
By Kenneth Boulding.
Hamish Hamilton. 925 pages. 35s.

INTRODUCTION TO ECONOMICS.
By Walter Birmingham.
Penguin Books. 124 pages. 2s.

HANDBOOK FOR ECONOMIC STUDENTS.
By Leo T. Little.
Jordan and Sons. 193 pages. 7s. 6d.

LIKE a modern army, economics today requires more tail than teeth—defining as "teeth" activities directed to the actual advancement of knowledge and as "tail" the transmission of that knowledge to a general public and to a body of aspirants to future academic status, which are both growing in numbers. Two important revisions and two short new introductory books illustrate, in differing ways, this tendency. Twenty years ago both Professor Samuelson and Professor Boulding would no doubt have been content to let their respective second editions stand for the time being; and neither Mr Little nor Mr Richardson would have found, or been commissioned by, a publisher for their decidedly specialised works. The need for revision is succinctly stated in Professor Samuelson's preface: "My first edition stressed depression. The second stressed inflation. Here... I have been able at every point to change the stress to *efficient growth and security*." Here, indeed, are the respective assumed norms—in America—of the forties, the early fifties, and the mid-decade. There is some good new stuff on underdeveloped countries and on international co-operation the price-analysis section is more shapely than it used to be; and monetary policy is treated at greater length. This admirable book—roomy, lively, realistic, constructed with extraordinary skill in exposition—prompts only one complaint; it is paradoxically too good, too self-sufficient, too perfectly adapted to the needs of "one-semester and two-semester beginning courses, and readers who may never go on to do any further formal work in economics."

Professor Boulding's considerably more austere "Economic Analysis" shows a significantly parallel development. There is a pulling into shape of particular analysis, an expansion of the macro-economic section—macro-economics, in Professor Boulding's view, has now settled down—an increased emphasis on dynamic growth with its associated fluctuations. Less concerned with current events, and giving less weight to description, than Professor Samuelson's book, "Economic Analysis" has a less stop-press appearance. But it has taken the same step forward to the mid-1950s.

From these refitted leviathans to that

cockleshell newcomer the Penguin "Introduction to Economics" is a far cry, not only in matters of bulk, comprehensiveness and price. Mr. Birmingham's little book is "the first introduction to economic theory written especially for West African readers"; it forms part of a projected Penguin series presenting "traditional subjects in the light of the African background." (The full excellence of this idea will only be apparent to those who have seen what even highly intelligent West Africans sometimes make of the standard English texts.) "Introduction to Economics" is necessarily slight, sometimes rather naïve, and a little uncertain about the degree of sophistication to be expected of its audience. But it is sensibly arranged and well written; it puts first things first; it leads up well to more advanced reading; and it stands an incomparably better chance than any existing textbook of convincing the West African student that economics is something more than an examination subject.

For Mr Little's "Handbook" one cannot predict any such happy rôle. An ingenious, if slightly old-fashioned, tabular summary of elementary theory, institutions, and current politico-economic controversy, it could, if consulted with self-restraint by students who had already read intelligently, thought hard, and done their best to marshal their ideas for themselves, provide a most valuable pre-examination check-up; indicating weak spots, highlighting relationships, serving as a visual aid in last-minute revision. It could similarly be a godsend to those luckless teachers who, innocent of economic training, find themselves called on to instil the elements into a C-stream group who have picked Economics, O Level, as a soft option. A very moderately cynical view of human nature suggests that it will, instead, be used as pure parrot-fodder. School and professional libraries should buy it—and keep it locked up until a week before the relevant examination dates.

A Liberal's Progress

THE WHISPERING GALLERY.
By John Lehmann.
Longmans. 351 pages. 21s.

MR LEHMANN has followed the example of many of his friends and contemporaries, and has started on his autobiography in mid-life. This book is announced as a first volume, and carries him to the outbreak of the war, in his thirty-third year. It covers his early years as the youngest child of a brilliant and happy family, and his boyhood at Eton; after Cambridge, a time in London, when he was assistant to Leonard and Virginia Woolf at the Hogarth Press, and took a part, both as poet and as publisher, in the coming together of the brilliant group of young writers which marked the thirties; then six years in Vienna and a growing mistrust of capitalism and fear of impending war; the foundation of *New Writing*; and, after the *Anschluss*, the collapse of

Ferguson's new Hire-Purchase Accounting Department is working smoothly, using one Sensimatic. Here is Mr. R. R. Paterson, the Burroughs man who helped Ferguson to put their new system into operation. (Right) Part of Ferguson's Enfield factory.

This man helped Ferguson to organize their hire-purchase accounting

THIS STORY is about Mr. R. R. Paterson, one of Burroughs' team of mechanized accounting consultants.

Ferguson Radio Corporation Limited are famous makers of radio and television sets. Increased business meant a new accounting job for them recently; they planned a new department to deal with hire-purchase, and decided to call in the Burroughs man, an experienced consultant on all mechanized accounting and record-keeping systems.

The Chief Accountant discussed the requirements of the job with him, and he suggested one Sensimatic Accounting Machine to handle the majority of the hire-purchase accounting.

The Sensimatic is now used to raise debit on the payment and ledger cards—showing cash price, hire-purchase price,

deposit and account number, and automatically printing a diminishing balance. The same machine fills in arrears letters—also automatically—with the balance due, the amount of arrears, account number and date.

Ferguson also employ this one Sensimatic Accounting Machine for posting cash, as well as for preparing the Dealer's Contingent Liability and for the Register of Agreements.

The result is that Ferguson's Hire-Purchase Accounting Department has worked smoothly from the start. It embodies a complete system, with clear, up-to-date records of all agreements.

Whatever your business, if you have an accounting problem, the Burroughs man can help you solve it. Call him in as soon as you like; you're committed to nothing,

and his advice is free. He won't upset your existing system just to suit certain machines. Rather, he will make a complete appraisal of your needs, and then suggest an efficient, economical and workable solution.

If he thinks no change is necessary, he will say so. If he does propose changes, he will plan the complete new system, help you get it working efficiently, and make sure you always get full benefit from your Burroughs machines.

Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. Call in the Burroughs man today.

Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

many hopes and illusions and a return to London and the Hogarth Press.

The linked story of writing and politics is familiar, but Mr Lehmann treats it individually. His is a specialised autobiography, confined to his public emotions; there is nothing in it of his private loves and hates, and only so much of his doings as illustrates his chosen subjects: his development as a poet and editor, and what he describes as "the search for meaning," which in practice means the evolution of his political thought.

The book starts slowly. It is a calm and pleasant story till he grows up, but not strikingly original. Thereafter the interest grows rapidly, and the reader gains by Mr Lehmann's concentration on his main subjects. He is modestly reticent about his own poetry; this theme serves mainly to offset his rival passion for publishing and editing. His account of the contributions and contributors to *New Writing*, from the editor's chair, is very good reading.

Mr Lehmann apologises for the familiarity of the story of his political development, but he need not do so. He was born a liberal, and a liberal he remains. At one time, like most of his friends, he played with Communism, and got so near it that he writes now, with hindsight, under the stress of a very strong revulsion. The story is one of emotion recollected in respectability; but it has not made him tranquil.

Mr Lehmann's generation of writers, at their zenith in the thirties, was a fine one, and he contributed much to them; his record is worth reading.

Against the Trend

SOCIALISM AND THE INDIVIDUAL.
By William Angus Sinclair.
Robert Hale. 168 pages. 10s. 6d.

THIS interesting book has as its subtitle "Notes on Joining the Labour Party." What distinguishes it from most other polemical treatises with a similar theme is its author's background. Colonel Sinclair, well known for his wartime broadcasts on "The Voice of the Nazi," stood as a Conservative candidate in the election of 1945. It was not until 1951 that he joined the Labour party. Unfortunately he lost his life last December in a sudden and violent blizzard while visiting a detachment of the Edinburgh University Training Corps. These posthumous reflections are a memorable testimony to a man who clearly thought long and deeply about the problem of his times. They are none the less memorable for reflecting a private quest that placed the author in a position where he was contending sharply against the political trend after 1945.

Colonel Sinclair joined the Labour party because he preferred its views of human nature and of social organisation to those of the Conservatives. He was not preoccupied with the facts of the economic situation or puzzled about inflation and financial crisis. Indeed he felt very strongly that "economics is

not an account of principles; it is an account of men." His sentiments were praiseworthy, but in his chapters on "Nationalisation and Planning" and "On our being Hard Up," he showed a blindness to many of the relevant issues. It was his particular stand on postwar economic questions that accounted more than anything else for his apparently unorthodox political evolution.

His distrust of economics sprang from deep philosophical convictions, which seem to have derived in part from a study of the anti-*laissez faire* writers (some of them Tories) of the nineteenth century. He has much of value to say about equality, the British class structure and the welfare state, and he always expresses his point of view in a lucid and non-emotive way—very unsuited, as he says, for a political platform. But eventually he has to make a leap, and to accept more dramatic decisions than his arguments seem to imply. "We shall not create a new way of life," he remarks, "or even blunder into it, by following a policy of watered-down socialism. Nobody could have invented constitutional monarchy by persuading Cromwell to be only mildly despotic and the people to be only half-heartedly rebellious." This is a full-blooded doctrine for a generation of political lukewarmness and compromise. It shows that Colonel Sinclair had something of that irrepressible zest which occasionally lifts British people from the habitual grooves of customary politics. In an age when the statistics of the pollsters pass for political analysis, there is still a place for the expression of opinions such as these.

Throgmorton Street

THE ART OF INVESTMENT.
By A. G. Ellinger.
Bowes and Bowes. 170 pages. 15s.

IN England the independent investment adviser selling his service for a fee and nothing else—neither seeking to obtain the client's order as a broker nor to sell the wares of any financial house—is a rarity. Good investment advice (as well as the other kind) is available; it comes from stockbrokers and bankers who will be paid by way of commission on the resulting transactions. Mr Ellinger saw that gap and proceeded to fill it, withdrawing from the market (and from stockbroking) in order to see the market more clearly. This book shows what he now observes as he inspects Throgmorton Street from Cambridge. It is clearly aimed for the personal investor—not for the big fund that can afford its own investment manager.

The book is good and, of course, transparently honest; but it is not perfect, for the author tries to do two things that do not both conveniently come between the same two covers. The first half is descriptive—how the market works and how ordinary share prices are formed by the interplay of three forces—the price of money, the level of dividends and confidence. The second half sets out principles for forming an investment

The Theory of ECONOMIC GROWTH

W. ARTHUR LEWIS

An authoritative survey of the causes of economic growth, its effects and the means by which it may be stimulated in the under-developed countries. 30s.

WESTERN GERMANY

From Defeat to Rearmament

ALFRED GROSSER

A brilliant analysis of the remarkable German recovery, it analyses the major political problems and the economic revival. "M. Grosser is scrupulously fair, experienced and erudite".—*Time and Tide*.

Translated by Richard Rees 18s.

GEORGE ALLEN & UNWIN LTD
40 Museum Street, London, W.C.1

Save yourself . . .

Almost certainly, you will be able to save yourself a great deal of time and trouble if you apply first to us for books on economics and on the political and social sciences. We make no claim to infallibility. Yet, inevitably, a bookshop reflects the interests of its clients. Our clients include Universities, Government Departments, libraries, banks, learned bodies—and learned men. Their discriminating custom has enabled us to build up a stock, and a service, that we are told is unrivalled in its field.

Mail orders receive the personal attention of the Manager.

The Economists' Bookshop

Aldwych, London, W.C.2.

policy (or an isolated decision) and is therefore more personal to the author. Mr Ellinger is a modified and most reasonable chartist. Any true disciple of investment charts would almost certainly disown him. He even admits that an investor "should take account of certain matters for which he can refer to a chart and of certain others for which he cannot." And he countenances the purchase or sale of a stock before it has broken through its trend lines, which to a true chartist must seem worse than shooting a fox or tickling a trout.

Even so the chart approach can sometimes obscure the obvious. For example, when he discusses choosing a share for recovery at the bottom of a slump the author mentions these desiderata: high ratio of earnings to dividend, high ratio of earnings to price and high ratio of assets per share to price. Capital gearing is not mentioned. Yet surely the share that is going to show the biggest rise from the bottom of a slump is not the equity of the strongest company, but the share (drawn from a recovering industry naturally) with the highest capital gearing: the marginal company with a big preference and debenture capital and a small ordinary capital on which it earns nothing at the moment, but where a small change in prosperity would mean big earnings per share, is what is wanted. And the place to look for it is among the balance sheets or the Moody or Exchange Telegraph cards, rather than among the charts.

The personal investor, particularly the investor for capital appreciation, will gain much from this book, and the mere fact that the author's advice does by now on occasion move the market will force him to read it. He will find plenty of good sense in it—not least the injunction to sell everything when convinced that the market trend has turned downwards. The investor is inevitably either something of a chartist or a follower of tips on his way to Carey Street. If the author can turn more of them into dissident and liberal minded chartists, he will have done good.

West Africa

AN INTRODUCTION TO THE HISTORY OF WEST AFRICA.
By J. D. Fage.
Cambridge University Press. 210 pages. 12s. 6d.

DR FAGE will never be the Namier of West Africa; his is not the type of mind that throws off ideas as a tinder box throws off sparks. Nor is he the type of historian who spends years in close relationship with the original sources of history, and then produces a work of historical scholarship which is an extension of the boundaries of knowledge. His book is exactly what it sets out to be: an introduction to the history of West Africa—an up-to-date statement of existing knowledge, written primarily for the general reader and junior students. Competent as it is, its chief difference from older surveys of the same kind is the fact that it is in print.

It leaves one a trifle disappointed that the first sizeable work by a historian to emerge from the new university colleges of West Africa should be of this kind.

Nevertheless, Dr Fage has performed his task admirably. Beginning with a brief account of the geography and peoples of West Africa, he takes the story through the great empires of the Western Sudan (with heavy reliance on that remarkable book "Caravans of the Old Sahara," by Mr Bovill), the slave trade and its abolition, the European scramble for West Africa, and finally the political and economic development of the British and French territories. Yet Dr Fage has not written "the history of the West Africans as a people," as his publishers claim; and his excuse for not doing so is quoted in words so obvious that they could well have been omitted. "I am strongly of the opinion," Dr Fage writes, "that it is impossible to relate the history of West Africa, and useless to comment upon it, unless account is taken of the influences which have reached the country from North Africa, from Western Europe, and from the Americas." Granted; but we still need to know more about the Africans.

The Bemused Geographer

THE WAY TO ILALA.
By Frank Debenham.
Longmans. 336 pages. 25s.

PROFESSOR FRANK DEBENHAM'S very readable book is a footnote to the literature of David Livingstone. Agreeably written, well produced, and beautifully illustrated, it is not another biography, nor a new assessment of Livingstone's achievements, though it contains easy recapitulation of materials relevant to either. It is a work of piety, a memorial from one geographer to another. It is an attempt, not wholly unsuccessful, to prove that Livingstone was the most remarkable geographer of his time. In preparing it Professor Debenham has had access to collections in the Rhodes-Livingstone Museum in Northern Rhodesia, including rough notes put together by Livingstone and used by him when writing his own books. Many of the maps and sketches are reproduced from Livingstone's originals.

Professor Debenham's case is well made until the last painful years; it rests on Livingstone's scrupulous care in collecting laborious detail and his flair for drawing conclusions from it, often correct. But for the last years it is only possible for him to defend Livingstone as a geographer at the cost of implying without admitting that his judgment was warped by obsession. "A strange hallucination has taken hold of a mind, to which there was none to minister or raze out the written troubles of the brain," he writes, describing Livingstone as "this strange lonely man," obsessed and bemused. He craves pity for foibles and frailties of a mind still noble, but "befogged by vain dreams and fevered fantasies," and suggests that Livingstone

was so completely obsessed with his desire to rehabilitate himself by discovering the sources of the Nile that, geographer or no geographer, he refused to accept geographical fact. Incidentally what with geographical detail and pleasant literary analogies from Bunyan, Milton and Shakespeare, Professor Debenham does not quite convey a true sense of the agonising, unnecessary, and inevitable tragedy of Livingstone's end (so well brought out by Sir Reginald Coupland in "Livingstone's Last Journey") and it is odd that in a book designed to set up Livingstone as a geographer the cause of the tragedy should be largely ascribed to an error in longitude.

Indeed the book as a whole is pervaded by an uneasy sense of shifting vision, an unconscious optical sleight of hand, on the part of its author. It is called "Journey to Ilala" because Livingstone died at Ilala; but nowhere in the text of the book is Ilala mentioned at all. Similarly the portrait Professor Debenham would evidently like to draw of Livingstone is not the one that really appears in the book. The raw materials he has himself assembled do not add up to the total he produces. What emerges, wrongly and unintentionally, from this involuntary debunker is a Livingstone incapable of serving, unfit to command, a philanthropist who opened up the heart of Africa to the intruding slave trader, a geographer who proved the best ways of how not to get to the right places, and one who died partly because of a faulty sextant. And yet Professor Debenham would wholeheartedly agree that whatever his faults, however many his mistakes, Livingstone was made of the very stuff of greatness.

Shorter Notice

THE SLIDE RULE.
By Burns Snodgrass.
The English Universities Press. 207 pages. 6s.

The author sets out to explode two myths: that the slide rule is a difficult instrument to employ proficiently and that its use entails a substantial inaccuracy—fallacies propounded principally by journalists and broadcasters. He guides the newcomer deftly through the fundamentals and through the complications which are of a complexity commensurate with the variety of scales found on either face of the instrument. The solution of the commoner problems that can conveniently be dealt with by the slide rule are illustrated by the theoretical employment of the appropriate type of instrument. The novice will manage to achieve a useful competence in the instrument without undue mental exertion.

The case for the instrument's accuracy is less convincing; a favourable comparison is made with the micrometer, which as a measuring instrument is of another genre, when many closer comparisons might be made nearer home. The argument that quantities of goods delivered do not always coincide with the quantity purchased, and that a similar error in calculating the cost should therefore be permissible, will receive sympathetic but inarticulate support.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Heart Attack

NOW that the President is, it is hoped, out of immediate danger, his heart attack is giving more pain to the politicians and the speculators than it is to Mr Eisenhower himself. How much permanent damage has been done to the boom on the stock market cannot yet be judged, but the President's illness has upset the confident certainty about the future—and particularly about the outcome of next year's election—on which that boom was based.

If Mr Eisenhower gets through the next week or two satisfactorily, the immediate effects of his illness on either the prosperity or the government of the United States should not be great. No one expects him to be able to take an active part before the end of the year, but Congress that is not due to meet before then and it is in Congress that his leadership is quite essential. It should be possible to consult him very soon on important questions, particularly on foreign policy where the absence of his decisive influence would be most felt. But the autumn is the season when Cabinet Ministers and government departments jockey for next year's positions in the Budget and in the congressional calendar. Plans will have to be made for the 1956 session of Congress and, even more important, funds will have to be allocated for the coming fiscal year without the President's arbitration, which has been badly needed in the past, particularly when it came to arguments over defence. His illness is likely to strengthen the budget-balancing hand of Mr Humphrey, the Secretary of the Treasury and the acknowledged strong man of Washington.

But even more the President's illness is likely to strengthen the hand of Mr Nixon, the Vice President, who will preside over Cabinet and other important meetings, and will be given many opportunities of proving that he is a statesman. He long ago proved himself a politician, although not always a tactful one. The stake for which Mr Nixon will be playing is the Republican nomination for the presidential election in November, 1956. The doctors may say that it is possible for Mr Eisenhower to serve for a second four-year term, but his family, his own inclinations and, indeed, the practical realities of the situation say differently. However certain his re-election, it is almost unthinkable that a man who has had a serious heart attack should be asked to become the oldest President the United States has ever had; Mr Eisenhower will be 70 in 1960. It would be a sentence of death which could hardly be imposed even by a desperate Republican party, or accepted even by a man who rated his duty to his party far higher than does Mr Eisenhower.

The Republicans are now forced, rather late in the day, to take seriously the President's earlier warning that he

was not indispensable and that they should look for men to take his place. He is not himself sufficiently interested in party politics to insist on choosing his own successor; if he did the man would probably be Mr Nixon, but the Vice President is today only one among many candidates for what, at the moment, most people think will be slaughter. For it was not the Republican party which was expected to win the 1956 presidential election, but Mr Eisenhower. The Democrats on their side were until last week looking for a candidate who would make a suitable sacrifice; today their nomination is suddenly worth having and the first guess is that Mr Stevenson will have it.

But it is far too soon to guess about anything. All that is certain is that everything to do with politics in America is now uncertain. The President's illness has struck not only at his heart, but at the heart of what was until then a unusually stable political situation, and both parties have been knocked off their balance. Their struggles to find new centres of gravity will make the session of Congress which begins in January as fascinating as the manoeuvres for presidential nominations which have begun already.

Tariff Bargains

Washington, D.C.

LAST week was published a long list of articles on which the United States is preparing to offer concessions when the General Agreement on Tariffs and Trade opens its bargain counter in January. The publication of this list may help to improve the present unhappy appearance of the Administration's foreign economic policy in the eyes of the world. For the list is a reminder that, for all the talk about bicycles and generators, the main news about foreign trade this year has been the extension, without crippling amendments, of the President's power to lower tariffs by negotiating trade agreements.

Mr Butler's sharp reference in Istanbul to the recent American backsliding came as no surprise. An exceptionally large number of newspapers all over the country had already attacked both the decision to raise the duties on imported bicycles, for the sake of domestic producers, and to accept the bid of an American manufacturer, rather than a lower bid from a British firm, for heavy electrical equipment for the Chief Joseph dam, in order to make work in the Pitts-

burgh area, where there was substantial unemployment. Both seemed rather pointless departures from the freer trade road; in practice the increases in the tariffs on bicycles are unlikely to affect anyone much except the consumer, and in Pittsburgh the level of unemployment was falling. It might have fallen below the 6 per cent of the labour force which is the statutory definition of "substantial" if the Secretary of Defence, with whom the decision rested, could have been induced to postpone it longer, as the State Department begged him to do. This decision was at least debated at length, but it is surprising to learn that the question of the tariffs on bicycles was not brought before the Council of Foreign Economic Policy, headed by Mr Joseph Dodge, which was set up precisely in order that the cumulative effect on America's face abroad of isolated administrative decisions at home should be realised in good time.

★

The two decisions, however, had the same purpose; they were both intended as gestures of obedience to congressional intent, as reflections of the "escape clause" provisions in tariff legislation, designed to save domestic producers from serious injury by increased imports. Tariffs are, by the Constitution, Congress's affair. The Tariff Commission, which recommends increases in duties, such as that on the bicycles, was originally meant to be an expert adviser of Congress and an instrument of its intent. Under the successive trade agreements Acts limited powers were delegated to the President for limited periods. The nagging suspicion of Congress is that Presidents of both parties have used this conditional authority to make the Tariff Commission their plaything and to bind the United States permanently to their liberal trade policies, through its membership of Gatt. An occasional bicycle decision, according to the President's excusers, not only shows that he is keeping faith with Congress but demonstrates that Gatt does not make it utterly impossible for a tariff to be revised upwards.

In a sense the publicity given to the bicycle and the dam cases, in both American and foreign papers, is welcomed as proof of the Administration's willingness to risk criticism in order to safeguard Congress's ultimate supremacy over trade regulation. Moreover there is a shrewd suspicion that the prominence given abroad to American backslidings is itself a little disingenuous, since European countries, including Britain, have their own good reasons for slowing down moves towards currency convertibility and other relaxations of trade barriers. The effect on the Administration's day-to-day decisions of the withdrawal of the prospect of convertibility into a more distant future is largely subconscious. American officials are aware of the strength of European misgivings and understand the dangers of leaping prematurely better than they did two years ago. But while, in the atmosphere of a "dash for freedom," all compromise with political pressure could have been resisted, on the ground that a single retrograde act would put the great prize in jeopardy, the same inflexible front cannot be maintained during a long period of co-existence with the evils of quotas and currency restriction.

Even if an entirely cynical view is taken, the Administration cannot afford to ignore the susceptibilities of Congress just because the President's powers to negotiate tariff reductions have been extended for another three years. There are still three important pieces of trade legislation that need to be fought through Congress

next year: the special tax incentives to encourage private investment overseas, customs simplification and American membership of the Organisation for Trade Co-operation.

This last measure is in serious trouble. Many people, indeed, are heartily sorry that it was decided to renegotiate Gatt, which Congress had never formally approved, so that its organisation could be put to a legislative test. The intention was to remove Congress's suspicions and by doing so to reassure the world about the stability of America's commitment to a liberal trade policy. But the attempt to rush the OTC through Congress in the last session, as part of the "package" that included the reciprocal trade legislation, was hastily abandoned. The mixing of the two issues, so far from ensuring the success of both, threatened to defeat them both, by lining up all the constitutional conservatives with all the protectionists. The postponement of action on OTC saved reciprocal trade but gave more time for arguments to be built up against OTC and Gatt.

It is extremely unfortunate that OTC will be placed before Congress next January at just the time when the Gatt negotiations will be going on in Geneva and at the end of an intensive period of hearings before the Tariff Commission, during which American producers of articles in the new list will have been developing their case against concessions that might affect their welfare. Two arguments will be heard: that Gatt's escape clauses are not broad enough to preserve the full legislative rights of Congress, and that they are too broad to prevent other countries discriminating against American exports by quotas and currency restriction. Moreover, the refusal of Britain and thirteen other countries to give the full advantages of membership to Japan will embarrass the Administration. Gatt, it will be said, is a club in which the United States is expected to shoulder most of the dues and expose itself to most of the fines.

Although American exporters grumble individually about the restrictions that affect them personally, as a class they have learnt to take the long view. They accept the fact that, despite the vocabulary of reciprocity used to describe the negotiation of trade agreements, American tariff concessions are largely payments on account, in the hope of strengthening the rest of the world so that quantitative restrictions may later be abandoned. However, this does not convince a dubious Congress that American membership of Gatt will make American constituents more prosperous here and now.

Decision Needed

THE constitutional lawyers are probably a little regretful that the President is making such good progress that there now seems no need for any formal arrangement for dealing with his essential business during his illness. For public attention has been drawn to a problem which has been worrying them for years: the lack of any clear definition in the Constitution of the point at which a President becomes unable to discharge the powers and duties of his office to such a degree that the Vice President must act in his stead "until the disability is removed." If the President dies, the Vice President succeeds automatically, but

only two Presidents, Garfield and Woodrow Wilson, have ever been incapacitated for long enough to hamper the transaction of public affairs seriously. In neither case was the Vice President asked to take over; indeed, Wilson resented it severely when his Secretary of State called Cabinet meetings without him.

Today Mr Eisenhower's military habits of delegating authority, streamlining chains of command, and organising his staff as a team, mean that it has become customary for the Vice President to preside over Cabinet meetings in Mr Eisenhower's absence and to share his responsibilities in other ways. They mean, too, that the President's aides understand his wishes, are allowed to take decisions on his behalf and can continue to do so. On the other hand, the burden of the Presidency is now far heavier than it was thirty-six years ago, when Mr Wilson had his stroke; for example, there is an average of sixty documents a day to sign. It appears that little of this burden can legally be shifted from the President's shoulders unless it is decided that he is constitutionally disabled. The unsettled problem, which brought the Attorney General flying back from Spain last week, is—who should decide?

The President himself presumably could but he might be unable or, as Wilson showed, unwilling to do so. It is too important a decision to be left to his family or his doctors, too political a decision to be left to Congress. It has been suggested that the Cabinet might be the most suitable body. The reassuring reports on Mr Eisenhower's health make it unlikely that Congress will be called into immediate session, as was being discussed last week, in order to answer the question of who should make the decision if it affects him personally. But next-year Congress may, and obviously should, be asked to answer the question as it affects Presidents in general.

Expansion for Civilians

THE first two decisions on the suspended tax amortisation programme have been announced and the hopes of both the steel and the aluminium industries have been dashed. This is the scheme under which the government encouraged industrial expansion to meet the needs of the armament programme by allowing firms to write off, for tax purposes, at faster rates than usual, the cost of new facilities needed for defence purposes. But in August the scheme, except where it concerned obviously military items, was held up for reconsideration after the Secretary of the Treasury had claimed that it was losing tax revenues for the government unnecessarily, that it was unfair to companies which were not eligible for its benefits, and that many of the applications were for expansions which were needed not as an emergency reserve but so that growing civilian requirements could be met in full even if war should come.

This last is the reason given for refusing to reopen the amortisation programme for the steel industry, which has had no fast write-offs since the end of 1953, and for denying any further benefits to the aluminium industry. The Office of Defence Mobilisation pointed out that steel ingot capacity, at nearly 126 million net tons a year, already exceeded the size required to meet defence and essential civilian

needs in wartime. Similarly, when current expansion of aluminium facilities is completed, the capacity of that industry will be 1,778,000 tons a year, more than is considered essential. The present shortages in both metals are explained by the growing demand which comes with prosperity. In the case of aluminium this demand has been accentuated by its increased use as a substitute for copper, often scarce because of strikes, and becoming steadily more expensive.

Both industries have in effect admitted the justice of the government's case by going ahead with plans for expansion without the help of tax benefits. The Republic Steel Corporation has announced that it will undertake a record increase, of 1,600,000 tons, about 16 per cent, in its capacity. Other steel companies are expected to follow suit; it is estimated that 150 million tons a year of steel will be needed by 1960. All but one of the four aluminium producers who had applied for fast tax write-offs have said that their projects will go on in spite of the denial of their applications. This suggests that the end of the amortisation programme will do little to choke off capital spending, although a month or two ago businessmen were arguing that the boom might be strangled altogether by the denial of the tax aid which has encouraged so much of the present expansion.

Mississippi Justice

AT first sight the acquittal of two white men on the charge of having murdered a Negro boy, Emmett Till, in Mississippi looks like a revival of those miscarriages of justice which used to be expected in the South when a white man was accused of a crime against a Negro. But a second look shows that within the courtroom the law was scrupulously observed, and that the jury was justified in its verdict of "not guilty," for no clear identification of the boy's body was offered. The blame for that lay not with the judicial authorities but with the law enforcement officers, who had neither the means nor the will to provide the evidence which would have been routine elsewhere in the country. Mississippi's lack of funds is the official excuse for this negligence, but the sheriff might have acted more energetically if he, like many others in the state, had not been angered by the outcry raised over the case in the North, by the public display of the corpse in Chicago, and by the suggestion that Mississippi was unfit to manage its own affairs.

But, as the prompt indictment of the two men for the murder showed, there were many in the state who felt that here was an opportunity to show that, although Mississippi still clung to racial segregation, the law there could be as fair to the Negro as to the white man. To this group belonged both the very fine judge and the able prosecutor assigned to the case, and to some extent they achieved their purpose; in particular, they succeeded in bringing Negroes into court to bear witness against the accused. The two white men are now to be tried for kidnapping the boy, a charge on which the evidence is much clearer. But evidence counts for little in this poverty-stricken community, where people have nothing to occupy their energies or to turn their minds away from prejudice and fear. Luckily in this respect Mississippi is no longer typical even of the Deep South.

Misleading Averages

New York

THE American Stock Exchange (until 1953 the New York Curb Exchange) made a sane choice when it decided recently to carry Standard and Poor's hourly index of stock prices on its ticker-tape. All such indicators contain traps for the statistically unwary, but the hidden pitfalls in those computed by Dow Jones and Company and by other experts are surprisingly deep. The investors and market technicians who, before this week's collapse, were trying to compare current prices with the highest point reached in the 1929 boom found that, according to Standard and Poor's index, the prices of industrial shares were 88 per cent higher than they were in 1929; according to the Dow Jones average, they were only 27 per cent higher and others put the increase at even less. These statistical discrepancies are explained by the differences in concept and coverage, in the methods of weighting employed, and in the various adjustments made for share splits, mergers and stock dividends. Because of the need for swift calculation, no daily or hourly index yet includes more than a small sample of the issues traded on the New York Stock Exchange. Such samples are biased in favour of the more important "blue chip" securities.

The official Securities and Exchange Commission and Standard and Poor take into their calculations the relative importance of the companies included. They are weighted by the number of their shares, and these indexes can, therefore, be described, accurately, as a "measure of the paper fortunes of all the investors holding stocks in the average." But the Dow Jones and the other averages start from a different basic premise. The *New York Times* index, avoiding "dangerous weightings," measures the change in the value of a hypothetical portfolio consisting of one share of each of the stocks listed in the index. This is a significant concept, but an unweighted arithmetical average, if interpreted as a measure of market movements, carries with it an unintentional but highly erratic form of weighting. A company with 100,000 shares, each priced at \$150, will have three times the weight in the index of a company with 3 million shares, each priced at \$50, although the second company has ten times the capital of the first.

Two indexes—the Dow Jones and the *New York Herald Tribune*—suffer from an additional defect: their statistical adjustments for stock splits are of such a character as to make both virtually useless for purposes of long-term comparison. If a stock standing at \$150 is split into three shares of \$50 each, the Dow Jones statisticians keep only one \$50 share in the index, but apportion the remaining \$100 equally among the entire 30 stocks in the average, thus arriving at the same market average as on the day before the stock was split. Although no deliberate weighting is intended, this means that the split stock loses nearly two-thirds of its weight in the index, while all the others show a fortuitous gain in weight. The patent absurdity of this adjustment should be apparent from the fact that the stocks most frequently split are often those of the most powerful and progressive companies.

The excuse given for the continued publication of these statistical anomalies is that they cannot be changed without

THE ECONOMIST, OCTOBER 1, 1955

destroying the continuity of the averages and the value of stockholders' records, because of the prohibitive cost of revising back data. Dow Jones has pointed out that its averages are not designed for long-term comparisons, but they are so used in practice. The management of the New York Stock Exchange, however, has indirectly underlined the deceptiveness of all these statistics by refusing to give its official sanction to any index prepared by a private organisation.

Trouble in Casinoland?

Las Vegas

IN the last few weeks three of the five new hotels opened this year in Las Vegas, America's Babylon of the desert, have been taken over by their established rivals after suffering heavy losses. There were various reasons for these setbacks but they may well be the first handwriting on the wall of the ten-year boom which is one of the great triumphs of the public relations artists. The economic mechanism behind this boom has been a simple one: those who came to Las Vegas to gamble subsidised those who came to enjoy its other lavish amenities—including the same easy divorce facilities as are available in Reno. Today more people are coming than ever before, but they have read the riddle of the Nevada sands and no longer flock to the roulette wheel. Instead, tourists driving through on one of America's great east-west highways, stop off along "The Strip," the hotel-lined golden mile outside the town boundaries, and enjoy a few days of the kind of "high life" they usually see only in films.

First class hotel rooms, with the use of a swimming pool, cost only \$8 (just under £3) a night. Every hotel has two nightly floor shows, the best in the country, the first for the fairly high price of a meal and the second for the very reasonable price of a drink. Stars of the entertainment world think nothing today of asking \$30,000 to \$50,000 for a week in Las Vegas although, for some mysterious reason, the desert air does not always suit them. Mr Noel Coward after a triumphant début, belied his own musical assertion that mad dogs and Englishmen need not fear the midday sun; Mr Mario Lanza, the Hollywood Caruso, fell silent and kept to his rooms; a television star called "Mr Peepers" proved to be so morose that his place had to be taken by a local comedian who has since been elected to the Nevada legislature.

But although the visitor cannot help seeing the large gambling hall that opens off his hotel foyer, no pressure is put on him to try his luck. Some people continue to play for high stakes, shifting stacks of silver dollars—a coin hardly used otherwise—but more and more merely make it a point of honour to lose a small amount in a brief flutter of legalised sin. The latter provided Nevada with almost all its revenue until this year, when the state swallowed its pride and imposed a sales tax. Despite all this, however, the accent is still on expansion and foundations have been laid for three new hotels. But those who are immune from the gambling instinct would be well advised to cash in on their virtue before charges go up in Las Vegas.

How to get your share of the BOOMING U.S. MARKET

American Industry is now at the highest point of production in history—and is still climbing. Not only is this expanding market bigger in size. Its consumption and capital equipment replacement rate is, per capita, far greater, too.

Even a fraction of this market could represent a substantial business for you.

So if your product is being sold, or can be sold, to American business and industry, your prospects have never been brighter than they are now—IF you go about it the right way.

For in America goods are not so much bought as SOLD—this means that sales and distribution must be backed by consistent and aggressive advertising in those business publications which your customers read. In America business publication advertising automatically means McGraw-Hill.

McGraw-Hill is the leading publisher in the United States of business and technical journals—34 in all—covering practically every field of industrial endeavour. And every journal is by far the leading one in its field—with many tens of thousands of subscribers who BUY through its pages. But McGraw-Hill's service does not end there. It also offers vital information—such as the market potential for your product... how to go about establishing your sales and distribution organisation and so on.

So why not have one of the London McGraw-Hill men show how you can gear your sales programme to today's opportunities? He has access to a wealth of specific and helpful data on your product market. His job is to make it freely available to you. Write or phone today. No obligation, of course. If you would like additional evidence on the long-term outlook for business write for a free copy of "The American Economy... Prospects for Growth."

New wings for a pioneer airline

Now flying between New York City, Bogota and Europe are three new Lockheed Super Constellations operated by AVIANCA (Colombian National Airways), the oldest privately owned airline in the Western hemisphere. A fourth Super Connie is soon to join the AVIANCA fleet.

AVIANCA's acquisition of these four American luxury airliners began in April, 1952, when Bank of America's International Department made a loan to Colombian National Airways. A second loan in 1954 enabled AVIANCA to expand further its passenger-cargo capacity.

Farsighted planning by AVIANCA management, coupled with the necessary dollar assistance from Bank of America's International Department, has helped to keep Colombian National Airways in its established position as a top international airline.

This is another example of how Bank of America serves the interests of industry and commerce around the world.

End of the Timber Trail

FROM A CORRESPONDENT IN OREGON

IN the far northwestern corner of the United States where the country's last big stands of virgin timber grow, and where lumbering has been the leading industry for more than half a century, the forest fire season just drawing to a close has been one of the most disastrous in the past ten years. The flames struck most severely—sweeping over more than 100,000 acres in September—in the counties on the Oregon-California border where vast forests of pine, fir and redwood represent for the American logger the end of a trail which began in New England three hundred years ago. The fires have only accentuated the fears of communities whose future livelihood depends on a continued supply of saw timber. The fact—the frightening fact to many families—is that the logging camps and the lumber mills have moved steadily south through the states of Washington and Oregon during the past few decades. In their wake remain ghost towns.

Employment in timber and lumber operations rose 140 per cent in Oregon from 1925 to 1953; in the same period it was dropping nearly 20 per cent in Washington. It was to Washington that the lumber men came first when they moved their donkey engines westward from the stripped white pine forests around the Great Lakes at the turn of the century. Now, with the first-growth forests coming to an end, the industry and the communities of which it is the life-blood are faced with a struggle for survival. Even in southern Oregon and northern California—the last of the rich stands—the end of the old-style, free-and-easy timber cutting is in sight.

Typical of the latter condition is Douglas County, the heart of the greatest lumbering activity in Oregon at present. A five-year inventory of forest lands has just revealed that there remains a maximum of 15,000 million board feet, of saleable perhaps as little as 11,000 million board feet, of saleable timber in private hands. This is being cut at a rate of nearly 1,000 million board feet a year, and the amount added annually by growth is only a fraction of that figure. Outside the private forests the only available timber in the county is that owned by the federal government in the Umpqua National Forest and other federally administered tracts. But cutting on these public lands is limited to less than 400 million board feet annually, not even half the current rate of cutting on private lands. The prospect is that, at present rates, there is at the most two decades of life left for Douglas County's flourishing lumber industry.

The situation is so serious in all three Pacific Coast states

that a special subcommittee of the United States Congress will conduct a series of hearings in November. Their purpose, according to Senator Richard Neuberger of Oregon, will be to insure that government-owned timber is distributed equitably, by bid, to small as well as to large operators. The committee will also try to discover some means of renewing the supply of timber for mills in communities where the ready supply of logs is nearly exhausted.

There is, however, a brighter side to be found in "The Forest Products of Oregon," a long-awaited study just published by the Business Executives' Research Committee, sponsored by Lewis and Clark College and Reed College, both of Portland. This committee concludes that Oregon's lumber industry is, indeed, cutting its way right out of business; but that, if it improves its forestry methods and makes better use of wood products, it can assure itself of a perpetual life at an even higher level of production. The committee found that the net growth of timber in the state is approximately 3,000 million board feet a year and that the annual net cut is nearly three times that total, more than 8,000 million board feet. Even so, the existing stands of timber on both private and government land in Oregon are sufficient to last more than fifty years, even if there were no net growth whatsoever.

The state of Oregon as a whole, therefore, has a comfortable cushion despite distress in some areas. But if this were all the committee had discovered, it would merely have provided a palliative, not a cure, for the ailment of the northwestern lumber industry. But the committee also found that the principal reason why the harvest of trees exceeds the growth is that so much of Oregon's land is still covered by the original timber, the prize that attracts the loggers and explains their migration. Trees that were standing when the first settlers arrived do not grow as fast as the younger ones. The report says:

When the old-growth timber is harvested and the timberland restocked with second growth, total annual growth will reach 9,450 million board feet, assuming that present forest management practices continue. . . . Under "ideal" conditions of intensive forest management, annual growth would be 15,750 million board feet.

In short, the report promises that Oregon's lumber industry can grow to twice its present size and stabilise its activity at that level indefinitely. But this depends on attaining the highest standards of reforestation, forest conservation and lumber utilisation. Moves in that direction include the widespread use of bark and scrap timber in pulp, hardboard and plywood production, and the cultivation of tree farms. But these are but the first faltering steps, taken mainly by the biggest producers with tremendous resources. The small and medium-sized lumber operators cannot yet afford the research and long-term investment which is required. But necessity is a convincing argument, and it is safe to predict that those companies and communities whose permanent livelihood depends on the forests of the Pacific Coast mountain ranges will strive to achieve the ideal conditions contemplated by the committee.

The lesson is clear. The lumber industry cannot hope to survive by the precepts that carried it from one rich virgin stand to the next across the breadth of the continent and from the Canadian border southward. It must become a cultivator and harvester of trees just as the farmer is a cultivator and harvester of grain. And it must call on all the ingenuity of science to make the most efficient possible use of the tree crops as they are harvested.

The World Overseas

The Peasant Asks Peking Why

THE full extent of the rural unrest that has affected China since the Peking government introduced centralised state marketing of grain in November, 1953, has only lately become clear—from the mouths of Communist ministers themselves. And their utterances reveal also the reason why they have felt obliged to set out these facts and figures. People have been asking questions; ordinary peasants, ordinary fathers with families to feed, and even loyal members of the Party itself, have been muttering together and, in moments of courage, bearding their masters. Why, they have asked, has food been so scarce in recent months? Is the government sending too much to Russia? Did the floods cause more havoc than we were allowed to know at the time? Does the government need to make such large compulsory purchases of food from us farmers? Has its food policy gone badly wrong?

Copious answers to these questions have now been given to them, and, in giving the answers, their rulers have blown the gaff. While Peking's talented propagandists have been flooding the free world, from Lucknow to London, with glowing accounts of progress and plenty, in Peking itself Mr Chen Yun, the deputy Prime Minister, has been speaking as a man speaks when his back is pressed against a wall, admitting that in some areas compulsory state buying of food had been "excessive," that in others the authorities had failed to supply grain promptly to "calamity-stricken" peasants, while in others again there had been a "break-down in supply" during the switch over to state marketing. "The fall in numbers of pigs and other livestock has been due to lack of grain after state buying," added Mr Chen. "Some counter-revolutionaries" had tried to take advantage of the resultant clamour, while "others, including Communist party members, joined in the clamour, hoping that the government would improve matters." These latter claimants were hastily excused. "They confused right and wrong, and accepted correction after they had been told," said the deputy Premier. Their "incorrect" actions, however, were not without effect: "Some of the errors (in state purchasing) are being corrected," Mr Chen went on, adding, almost plaintively, that "many members of the National People's Congress have made on-the-spot inspections, and can see that rural conditions are not as bad as is hinted by some people."

"Some people" have evidently been dropping pretty heavy hints. The Foreign Trade Minister, Mr Yeh Chichuang, protests that "some people ask if China is export-

ing too much and thus creating difficulties on the home market." Mr Chen says that "some people have asked if the tense situation as regards demand for grain in many places was due to the 1954 floods or to exporting too much." The Food Minister, Mr Chang Nai-chi, declares that "it is still impossible to satisfy the demands of the people for variety in food. . . . The government appeals to people to 'eat what you have.' This is a correct policy."

The scale of the discontent should not be exaggerated. Mr Chen may be right when he seeks to play it down with the words: "The peasants' enthusiasm in production is high . . . there has only been dissatisfaction at certain moments and with certain things." But even he is forced to concede that the discontent has been more than a mere counter-revolutionary intrigue: "Some of those who cried out about shortage of grain were really in need." And the Peking ministers have taken considerable pains to answer the angry talk that reached their ears from the hungry villages. This year's "tense situation" was not, they insist, the result of last year's floods; total grain output in 1954 was higher than in 1953. Nor, they say, was the shortage due to excessive food exports to Russia and Eastern Europe, although Mr Chen admits that in 1954 grain exports rose to 1.75 million tons, compared with a 1950-53 average of 1.55 and a 1927-30 average of 1.15 million tons.

Russian "Aid" Bought with Food

However, while China may not be eating much less because of its growing exports to the Soviet bloc, it is evidently eating less well. The Food Minister's remarks about the impossibility of providing enough variety in food have been clarified by the Foreign Trade Minister's revelation that in 1954 ten per cent of all eggs produced in China were exported, 27 per cent of all tea and six per cent of pork. "If we all eat less meat, eggs and fruit," added Mr Yeh wheedlingly, "quantities of these will become available for export." According to Mr Yeh, no increase in food exports is expected during the current five year plan; but a few weeks before he made this speech, Peking had officially announced that 1955 food exports would be ten per cent above the 1954 level, and that exports of tinned food are now 21 times as great as in 1951.

China evidently has to tighten its belt in this way in order to buy Soviet "aid." By Mr Yeh's own account, imports and exports were roughly in balance in 1953 and 1954, and

the first place on the import side of the accounts was occupied by equipment and materials for building "the 156 projects which Russia had helped China to design." The idea that these projects represent a large amount of genuine Soviet "aid" thus falls to the ground. Peking spokesmen now talk only of Soviet "technical aid," and make it plain that this refers merely to the services of designers and experts. Mr Yeh added that China's trade with the Soviet bloc increased fivefold between 1950 and 1954. Earlier, western estimates, based on Peking's meagre statistics, had pointed to a fivefold increase in this trade between 1950 and 1952. If the trade has stagnated during the past two years, it may well be because, despite China's urgent need for Soviet equipment, it cannot step up its food exports and thereby buy more from Russia.

"Just Wanting to Stock Up"

The ministers' main concern, however, has been to justify state marketing, in which the peasants have seen the most obvious cause of food shortages. The Food Minister, in a recent speech, sought to show that the government had levied or compulsorily bought only 18 per cent of last year's grain output. But the figures quoted by him and his colleagues show that in reality the government took at least 44.65 million out of a total of 146 million tons (husked), that is, over 30 per cent. Mr Chen has been frank about it: "Why did we start centralised marketing? Because the state could not get all the grain it wanted by buying on the market as before. . . . The peasants' consumption has risen, and they are not anxious to sell their surplus grain." The peasants' wary attitude to the state's monopoly was the main cause of this year's grain shortage, in the deputy premier's view. "For the past thousand years, the peasants had been used to having a free hand in disposing of their surplus grain." Now, after being forced to sell it to the state, some of them wanted to buy back more than they had sold. The majority, more-over, queued up to buy food from state stores in order "to pretend that they were short, out of fear that the government would buy more from them. . . . They just wanted to stock up a little more for a reserve."

The Peking government, however, has made clear its intention of cornering the reserves itself. "Reducing grain consumption is very important," in Mr Chen's words, "China must be prepared for any possible domestic or international incident. That is to say, we must have food reserves to meet a possible aggressive war or a serious famine. . . . Over a long period, we must practice food economy on a nation-wide basis." The authorities have lately announced that they will buy (compulsorily) 80-90 per cent of all surplus grain this autumn; that food rationing, already strict in many areas, is being extended (it comes into full force in Chungking today); that grain sales in cities are being sharply cut—by 11 per cent in Canton in August. The *People's Daily* explains all this as not only necessary because China cannot increase output "to catch up with increasing grain needs in various fields," but also as a vital step "to create a beautiful and ample life." But the political advantage that a totalitarian regime enjoys in holding large food reserves, and its individual citizens are not, are also obvious to Peking's students of "advanced Soviet experience."

Test for Norwegian Labour

FROM A CORRESPONDENT

THE municipal elections in Norway next Monday are of much more than local importance. National party leaders have immersed themselves deeply in the campaign, and the outcome will be generally interpreted as a popular verdict for or against the Labour party, which has held power nationally since 1945. The five opposition parties naturally hope for local gains out of which to make political capital on the national plane. Norway's next parliamentary elections are not due for two years, but the opposition will be grateful for any crumbs of hope and encouragement that the present local elections can give.

The key constituency is Oslo, where the Conservatives together with the Liberals and Christian Democrats are in a majority. No more here than in parliament can they work in harness, however, and Labour, the biggest single party, thus has effective control. Both Labour and the Conservatives are out for an absolute majority, and no one cares to forecast the result. The fervently partisan press has helped to raise the temperature in Oslo to a degree unusual in Norwegian election campaigning. Housing and communications are the two outstanding local issues; but the back of the housing problem has been broken, and while the Conservatives are making as much as they can of the housing shortage, Labour may be shrewder in emphasising communications, the improvement of which becomes increasingly pressing as more and more people move out to new housing estates far from their places of employment.

The government has taken a number of measures this year designed to restrict credit, reduce investments, and improve the balance of foreign trade and payments. These measures have not produced any serious internal repercussions—the level of economic activity and employment remains very high—and it is unlikely that they have caused the Labour party any embarrassment in the local election campaign. Moreover, the external trade and payments position has notably improved since the measures were introduced. Although the improvement is fortuitous to some extent—an important factor has been the increased earnings of the merchant fleet following the rise in freight rates—it is obviously welcome to Labour propagandists, who can also point to other positive features on the economic front, including the completion of the country's first large steel plant. This very costly state enterprise in northern Norway has now begun production and is reported to be doing well. It is contributing significantly to employment and prosperity in the north, and can hardly fail to influence voters there.

No Privacy for Tax Evaders

The remarkably fine summer this year has brought problems not foreseen by the economic planners. The drought has seriously affected farmers, and the repercussions are long term because livestock has had to be slaughtered. Government compensation for losses failed to satisfy the farmers entirely, and they stopped milk deliveries temporarily in protest; but this stoppage is more likely to aid than harm Labour prospects in the elections. More serious,

perhaps, are the consequences of the drought for industry. Hydro-electric supplies are being rationed, and, particularly in Oslo, consumers are hard hit by power cuts. But it is unlikely that rational Norwegians will put the blame on the authorities, especially as there has been a remarkable development of power resources since the war and electricity consumption has more than doubled.

A peculiarity in Norway is the publicity given to income-tax returns—anyone can find out, by going to the local tax office, what anyone else in the district is earning—and this year it has resulted in the publication of figures showing that in Oslo a number of businessmen, including some shipowners, are earning disappointingly little and paying correspondingly little, if any, tax. Wage and salary earners, who cannot engage in tax evasion, are indignant, and Labour party tacticians hope that some votes will rebound in their direction, even though Conservative newspapers this week have given much space to explaining that the figures are misleading.

The opposition parties have little of substance to offer electors in the face of Labour's quite impressive national achievements. A party long in office will normally lose support, but this has not been the case in Norway since the war. This is largely the result of the country's long spell of prosperity and stability, and while it can be properly argued that this is not entirely the government's achievement, it does make the task of a divided opposition extremely difficult. Only a serious crisis could make any substantial number of Norwegians change to a horse of a different party colour.

The Petrov Report

FROM OUR CORRESPONDENT IN CANBERRA

IT has taken the Australian Royal Commission on Espionage more than sixteen months, during which it has examined 119 witnesses and issued a 483-page report, to reveal that there has been no effective Russian political espionage in Australia since 1948.

While Dr Evatt continues his fulminations against the inquiry, but apparently with receding enthusiasm, the man in the street has been somewhat taken aback by the mountain's labours in bringing forth the mouse. The critics of the commission have probably been too insulting, and its sponsors too pious. Its report is still an interesting spy story, although not the kind that Hollywood would invent. It shows the MVD organisation as one which leaves no stone unturned—but blockheadedly turns up the most unprofitable stones. The story unfolded by the commission is frequently a sinister kind of farce; for instance, Moscow chose, as the man to be asked for details of American "economic, military and political penetration of Australia," a person certain to be a mine of misinformation.

The facts emerging, and their significance, can be briefly summarised. First, the inquiry indicated serious leakages of information from the Department of External Affairs up to 1948, but the Petrovs could not identify the informers, or the nature of the information; the leakages happened before their time. Secondly, it showed convincingly that the Australian Security Intelligence Organisation, set up by

the late Labour Prime Minister, Mr Chifley, did destroy the ring of espionage contacts in the department. Thirdly, it showed that if Petrov had not defected, and if the Labour Party had won the last Federal elections (as it nearly did), the Press Secretary to the Prime Minister of Australia would have been a man whom the Russians had "on the small hook." (This is a suggestive phrase used by Mrs Petrov to describe the situation of a person who has compromised himself by performing some service, and may be considered vulnerable to pressure and intimidation.)

Woomera the Prize

The fourth important aspect of the inquiry—and one that neither Britain nor Australia can underrate—is that the Petrovs had no knowledge of the operations of the GRU (military intelligence) in Australia. Petrov knew that Moscow had had no GRU representative in the Embassy for some time before his defection, but was sending a new GRU man to Australia. He knew that the real prize for Russian military espionage in Australia was the Woomera Long Range Weapons Establishment, but he did not know whether any penetration had been made there. He believed that an "illegal apparatus" of the GRU was still operating in Australia. Russia's interest in the guided missile project remains a fascinating, perhaps a frightening, mystery.

Finally—but this has nothing to do with the commission's own inquiry—the commissioners reported that the Petrovs had been closely questioned on behalf of the counter-intelligence organisations of other friendly countries, and had been able to give these countries information of great value. This is almost certainly the most important aspect of the Petrov affair.

Petrov was a comparatively high-ranking MVD officer, who had worked in its Moscow headquarters, and as an MDV "resident" in other diplomatic missions before he went to Australia. His wife also was an officer of some standing in the organisation. Both must have been able to add to the information on MVD methods that was already in the hands of western security services. Both would presumably know of its past operations in other countries, about which these countries would by now have been warned. And—a most important point—both must know a good many of the personalities in the MVD. The implication is that a number of trained, experienced MVD workers will have lost much of their usefulness to the Russians because they can be identified by the Petrovs. Although such agents indulge in frequent changes of names (Petrov had changed his), it could well be imagined that, in future, photographs of new Russian diplomatic arrivals in friendly countries could be sent to Australia for possible identification by Petrov or his wife.

"Document H"

The political significance of the Petrov affair was grossly overrated by Dr Evatt as Opposition Leader, although no one could have known this in the beginning. There is no word of criticism of his activities as Minister for External Affairs at the time of the "serious leakages" from the department. The commissioners have also completely cleared his protégé, Dr John Birch, who was head of the department towards the end of that period, and Mr Arthur Dalziel, who has been Dr Evatt's private secretary for many

years. They found adversely against Mr Fergan O'Sullivan, his press secretary, who admitted authorship of "Document H," a scandalous report on Australian political journalists which went to Moscow by way of the Tass representative in Australia. But Mr O'Sullivan wrote the document before joining Dr Evatt's staff; and Dr Evatt is no more held responsible for Mr O'Sullivan's private activities than his previous employers were.

Dr Evatt's frantic effort to establish the Petrov papers as fraudulent goes against all the weight of probability and coincidence, and has not made any headway with either the commissioners or the public. Probably the only real damage done to Dr Evatt by the Petrov affair was that which he inflicted on himself. Indirectly, however, there was some gain to the Menzies government in reviving the issue of Communism—one which it has exploited successfully in the past.

New Chapter for Uganda

WHEN the Kabaka of Buganda returns to his capital of Mengo, near Kampala, in mid-October, nearly two years will have passed since his exile began. That is a considerable reduction on his first sentence, which was a life one; but though his return will be triumphal, it will be to a transformed Buganda—and Uganda. Much of the transformation, admittedly, is on paper. But the Kabaka's first act will be to sign the new agreement between Britain and Buganda formally making him the constitutional monarch which, in fact, he has been since his representatives swore in the new Buganda ministers six weeks ago. The rulers of other provinces in Uganda, such as Bunyoro, have already learned the lesson of the past two years and had themselves converted into constitutional monarchs. The Uganda central legislature has been reformed, and a new multi-racial ministry is in being, one minister being a Muganda, and a member of the Uganda National Congress at that. Thus most of the things on which a progressive administration had set its heart over two years ago, and which the Buganda dispute put in jeopardy, have come to pass. A reorganised, more closely knit Uganda is settling down to take practical lessons in the arts of self-government within the framework of what can become a viable modern state.

There have, of course, been concessions on both sides. Britain has, at least tacitly, admitted that the exile of the Kabaka was an error and that the strength of Buganda tribal feeling was misunderstood. The Kabaka returns to an immensely strong personal position among his own people. The new agreement recognises, in effect, that there was something in his contention two years ago that the old treaty relationship put him in an impossible position between his own people and the British government. With a ministry responsible to the Lukiko has gone a closer definition of the limited functions of the British Resident. The British have had to put in writing the promise that no steps will be taken to federate East Africa; and the Uganda legislature has passed (with eight opposing votes) the necessary legislation to continue the present shadowy "federal" link, the East African High Commission.

Buganda has thus given up its separatism; it remains to be seen whether it will come out of the mood of nationalist

self-absorption into which the crisis threw it. The new Buganda constitution will justify itself in the long run only if it acts as a bridge between deeply rooted tribal needs and feelings and a wider allegiance to the common good of the protectorate as a whole. This may happen, ironically enough, through the unexpected emergence of the Uganda

National Congress as the only effective party in the central legislature—a party of four Baganda and one Busoga tribesmen. The Lukiko declined to accept the recommendation that they should nominate members to the central legislature, and proposed a complicated system of indirect elections instead, almost as if to dissociate the "Great Lukiko" from the new-fangled protectorate parliament. In the elections which followed, the notabilities of Buganda concentrated their interest on the elections to the Lukiko. They kept the Congress effectively out; but they neglected the elections to the legislature, availing that no Muganda of any importance would prefer a seat in the legislature to one in the Lukiko. The Congress concentrated its efforts on the legislature and won four out of five seats. When the Governor promoted one of the successful candidates, Mr Kironde, to be a minister, a sudden change came over Baganda attitudes and there was a scramble for the vacant seat—and again a Congress man won it.

Tempting Adulation

Whether or not the Congress can be credited with the wisdom to see it, it is logical that in the long run the central legislature will overshadow the Lukiko—if, that is, Uganda's new-won unity is to be maintained. This should give Congress members, as the representatives of Buganda, a new status in their own country, and one that would be further improved if they held their seats in the direct elections which may be introduced in 1957. This prospect should encourage them to build a proper party organisation in place of the makeshifts which have existed hitherto, and develop a coherent policy—it can hardly be anything but nationalist and pan-Ugandan—in place of the opportunism which brought them into bad odour with the traditionalists

in Buganda, who now dominate the ministry and the Lukiko. They will fix their eyes on 1961, which is the earliest date at which Uganda's constitution can be changed in the direction of further responsible government. Their opportunity is to gain administrative and parliamentary experience; their temptation will be to fritter their victory away in immature exhibitions of intransigence.

In Buganda itself, the Kabaka will be faced with temptations also; it will not be easy, amid all the adulation, to maintain the detached position of a constitutional monarch. There seems evidence that the Kabaka will, however, try to do so, and that his sojourn abroad has given him a clearer perspective of the position of Buganda in African developments. If he can pass this on, he can do his people, and East Africans as a whole, an invaluable service. He can certainly take warning from the recent retreat from politics of the Asantehene in the Gold Coast. His role could be the adaptation of tribal life to the needs of modern Africa.

The administration will now be able to push forward with many projects for economic and social reform, which awaited the constitutional reorganisation of the protectorate—the development of the African public service, the replanning of Kampala, the plans for expanding African agriculture and trade, and the expediting of industrial development, which has received something of a setback from the withdrawal of the Monsanto company from the Tororo scheme. The thirty African members of the legislature, the three new African ministers and two parliamentary secretaries will find in this type of work plenty to exercise their administrative and political talents.

Germany's Atomic Plans

FROM OUR CORRESPONDENT

SIR JOHN COCKCROFT is in North Rhine-Westphalia this weekend at the invitation of the Germans, a number of whom have recently visited Harwell. He will find a situation in the field of peaceful atomic energy which can be described in broad terms very simply. The Germans are at least ten years behind the British and Americans in practical work. They are still confused about the best way to catch up, but catch up they will, and the experimental work done in other countries has saved them much money.

A number of research institutions, which have had to confine themselves largely to collecting documentary material from abroad, have been working on atomic energy, with the financial help of interested industries. But no practical experience could be gained because it was forbidden until Federal Germany regained its sovereignty in May this year. Peaceful activities are now allowed, while the production of atomic weapons is still barred. If the German army has such weapons in future, it will be from American stocks. Dr Adenauer's government has been, and is now, loyally determined to do nothing that would arouse suspicion that the bans were being evaded. It is criticised for being too cautious and dilatory by industrialists and Professor Heisenberg. As a sign of his displeasure, the famous physicist of the Max Planck Institute refused to go to the Geneva atomic energy conference with the German official delegation.

At the Geneva gathering, the Germans were merely

onlookers. They were immensely impressed by the revelations of the progress that had been made in Britain, America and Russia in the practical application of atomic energy—not in the theories behind it, which their own physicists know all about. Since Geneva, there has been a new effort to speed up decisions on Germany's own production plans.

Munich and Karlsruhe

Of all the problems which face the Germans, finance is not regarded as by any means the greatest. Even the French, it is noted, are prepared to spend the equivalent of one billion marks (or nearly as much as Britain's £100 million) on their three-year programme, and Germans cannot and will not be more parsimonious than their competitors. This means that far more than the present government funds for "special research" will have to be found. For the first reactor, which will be built at Karlsruhe, much of the money is coming from industry, and this source is sure to provide a large proportion of the necessary capital in future. In return, the industrialists demand that the state should reduce its control over production to the bare minimum. There is little likelihood that atomic power will become a nationalised industry in Federal Germany, although the Bonn authorities have blessed the idea, and there is strong opposition to the French government's proposal that a new and powerful supranational authority should take over the whole west European atomic industry. Inter-governmental agreements would be approved, particularly if the United States and Britain were to join them. On this matter, however, the different views have not yet been crystallised.

Germany's greatest need is seen to be lack of a young generation of technicians. A big gap has to be made good before Germany can compete with the rest of the atomic world. At present, there is still uncertainty about the right way to bridge it. Apart from an administrative tangle which is not yet sorted out, the question has still to be solved whether it is better to wait and profit by the experi-

For Your Business Friends

They would appreciate the *Businessman's Guide to Britain* for 1956. The Guide is compiled by The Economist Intelligence Unit and has a foreword by Sir Graham Hayman, President of the Federation of British Industries. There are sections on:—

- What is Britain?—a picture of Britain in words and charts*
- How to get to know things in Britain*
- How to get about*
- Britain's major economic areas—descriptions and directories of thirteen areas*
- Special events in 1956*

In addition, the Guide provides many hints for travellers.

The *Special Presentation Edition*, obtainable in quantities of not less than one hundred, will be available at the end of October. Details from:

THE ECONOMIST INTELLIGENCE UNIT

ence of the Americans and British, or take the plunge by buying reactors now which may be out of date in a few years' time. Here the urgent need for training young Germans will prove decisive. The present prospects are that an American low-powered research reactor of the "swimming pool" type will be set up near Munich, using 20 per cent enriched uranium supplied on lend-lease under the same kind of agreement as the United States has signed with 23 countries. It will probably be under Professor Heisenberg and will be a training-ground for students at Munich university. Industrial funds will buy it with the help of the Land of Bavaria.

At Karlsruhe, another reactor will be erected by the Germans themselves—probably a low-powered, so-called "Model T" type, using either natural or slightly enriched uranium. In Professor Heisenberg's view, the two reactors should both be at Munich for the sake of efficiency; but the government has chosen Karlsruhe, near the French frontier and the American military base, in order to still any fears which might have been aroused if it had been installed near a Russian-controlled area. In addition, the North Rhine-Westphalian government and industry will set up a small training reactor for the Ruhr.

Though they are exploiting their fairly large uranium deposits in the Black Forest and Bavaria, the Germans are still dependent on imported fissionable material. Apart from good credit terms from the American firms, this fact inclines the Germans to purchase from the Americans rather than the British. But British help in training students would be very welcome to the Germans and would lead to collaboration which might later have great political as well as economic value.

Europe's Dollar Bill

DURING the past year and a half a number of countries in Western Europe have taken steps to liberalise their dollar imports. Some countries—Finland, Norway, and Austria are examples—have done this simply by administrative measures; permission to import goods from the dollar area has been granted more freely. In others, such as Western Germany, the Netherlands and Sweden, formal dollar liberalisation measures have been announced from time to time. The "free list" in these countries has gradually been expanded until something like 85-90 per cent of private imports from the dollar area (based on 1953 imports) has now been liberalised. The United Kingdom has followed a separate course of freeing from restrictions imports of raw materials and crude foodstuffs from dollar sources; about 50 per cent of private imports (1953 base) have been freed.

It was only to be expected that these measures would result in an increase in imports from the dollar area; but, as the Economic Commission for Europe (ECE) points out in its latest quarterly bulletin,* "the gap between dollar imports and dollar exports has grown very considerably." Indeed, Western Europe's dollar gap is now at a level of

* UN Economic Bulletin for Europe, Vol. 7, No. 2. HMSO, 3s. 9d.

\$200 million a month (calculated on a fob basis), and is thus twice as big as it was a year ago. The measures taken to liberalise dollar imports are not, of course, the only reason for this deterioration, but they have added substantially to the bill.

Imports into Western Europe from the dollar area have increased generally, but the rate of increase is higher in those countries which have liberalised. In some cases, such as imports of cotton, coal, steel and scrap, and animal feeding stuffs into the United Kingdom, of oil-seeds, vegetable oils and fats into the Netherlands, the increase has been substantial. There have been only moderate increases in

machinery and chemicals. An important and rather disturbing trend is the switch which has taken place from non-dollar to dollar sources of supply for certain commodities, notably nickel imported by Western Germany.

The ECE bulletin points out that a double purpose lay behind Western Europe's dollar liberalisation. Firstly, imports might be cheapened and downward pressure exerted on European price levels. This, the commission's secretariat considers, has been "fairly effective" in practice. The second aim was to bring pressure on the United States to adopt a more liberal import policy by setting a good example. The ECE is, perhaps, a shade too pessimistic in judging that it has failed in this respect.

As to the future, the ECE rightly points out that increasing difficulties lie ahead. Up to the present, because of the scope of the liberalisation measures and the high level of demand for Western Europe's products, "dollar liberalisation has so far represented not increased competition (for European industries), but—on the contrary—an improvement in their competitive position." This could be drastically altered in the event of a business recession in Europe. Furthermore, the scope for liberalising imports essential for production is now limited; further moves are likely to involve imports of such things as luxury goods and cars. Liberalisation in these sectors, besides hitting European competitors hard, could have a considerable effect on the structure of Western Europe's imports.

The ECE tends, therefore, to favour a cautious approach to further measures, especially in freeing imports of foodstuffs and raw materials. But there is no doubt that dollar liberalisation does have a valuable stimulating effect on European productivity. Rising production in Europe will not only facilitate, but also necessitate, further advances along this road.

**'High Time they
did something about
this place!'**

Are you one of those men who've been thinking of modernising their offices for years past, but who have never taken the plunge?

If so, why not let Catesbys Contracts do what's necessary quickly and quietly now!

Catesbys are specialists in remodelling and refurnishing old offices and fitting out new ones. Whether you propose to spend little or much, they will give you the full benefit of their experience, and co-operate intelligently with you to give you exactly the air and character you wish your office to have. They are quick, competent people, who know how to do the job without disorganising everything. Even if you contemplate little more than a new carpet, desk or fresh paint, it will pay you to get in touch with Museum 7777.

OUR SHOWROOMS FOR IDEAS ON BUSINESS FURNISHING

**Are you riding to a
prosperous tomorrow?**

An afternoon in Autumn . . . a country lane . . . two young people riding. Nothing unusual in that. They're ordinary enough young people. Not very rich . . . not very poor. But they've recently got engaged and they have great ambitions for the future. And that's why they're so important to you. For soon they will commence to buy. If they choose your products you will be starting on the ride to tomorrow's prosperity.

Like millions of other young people, they read the Daily Mirror every day, for the Daily Mirror, with the greatest daily net sale on earth, appeals particularly to the vigorous, younger generation. They are attracted to it because of its modern presentation of the news—its outspoken opinions, its fearless ferreting out of facts. Amongst all classes and all income groups it is the paper that is read by the people with the longest buying years ahead of them—potential buyers of your product today . . . next month . . . next year.

Money is our business

As our customers know well, we do many things besides handling money. But the whole business of banking is founded on notes and coin, and it is still essential that cash should be available wherever it is needed. On an average working day our own cash reserve, spread throughout our more than 2,000 branches, weighs about 2,200 tons, a reasonable enough figure; for after all, money is our business.

Barclays Bank Limited

THE BUSINESS WORLD

Wheat in Plenty

EIGHTY countries are being invited to the International Wheat Conference that opens in Geneva on October 26th to consider the renewal of the International Wheat Agreement which expires on July 31st next year. All the forty-eight signatory countries of the next year. All the forty-eight signatory countries of the present agreement will no doubt attend, and there will be influential voices among the non-members. Britain, the world's largest importer of wheat and the most notable absentee from the 1953-56 agreement, will be represented. Argentina, the largest non-member exporter, will probably be there; Turkey, an emergent exporter, is almost certain to attend and Russia and other Soviet countries may rub shoulders with the West. The responsibilities of this conference are great. The international grain trade and the wheat agreement are stuck in a rut, and fresh thinking is needed to get them out.

Looking back, it is clear that the expiring agreement was already out of date in April, 1953, before the signatures renewing it for a second term had dried. By then production of wheat in Europe and Asia had recovered from the ravages of war, and in some countries output comfortably exceeded the prewar average. In the four main exporting countries—the United States, Canada, Argentina and Australia—production remained high and exports fell further; as a result supplies available for export and carry-over on August 1st, 1953 rose sharply by nearly 440 million bushels to a new record of 2,090 million. A year later the carry-over was higher still at 2,155 million bushels, and it rose again to 2,374 million bushels on August 1st this year, despite poor crops in certain countries last season.

The adjustment to conditions of plenty has still to be made. This year nature has again been bountiful. The American crop is now estimated at 916 million bushels, only 54 million bushels less than last year. Canada is harvesting another better-than-average crop—the fourth in five years—of about 500 million bushels, compared with the bad crop of 300 million last year.

Europe's harvests are as heavy as those of last season but of much better quality. India has enjoyed a record harvest. It is early yet to be certain of Argentina and Australia, but Australia predicts a crop of 200 million bushels compared with 167 million last year.

Surfeit, behind a front of stability, now seems to be the norm in wheat. Better strains and fertilisers increase the yields each year; governments are reluctant to restrict production; and neither production nor consumption show much response to lower prices. It must be asked, indeed, whether in such conditions a wheat agreement of the present type has much point. It can indeed assure to an importing country a minimum quantity of wheat at a maximum price. And since no importer can be certain that the "free" price will always remain below the agreed maximum price, the degree of contingent protection that such a ceiling offers may still seem worth having.

But for exporters as a whole it is difficult to see much positive merit in the agreement. The assurance of a market for a maximum quantity of wheat at a minimum price was never worth much, and it would be worth even less if Argentina and other exporters were to come in. If the importers were called on under the present agreement to take up their quotas in full, the

exporters would sell more wheat because the importers would be forced to buy less from non-member countries. But if all exporters were in the agreement there would be no such advantage: no one would sell more wheat because the quotas are always fixed well below the importers' total annual requirements. Nor is the minimum price itself of any collective worth to exporters. All the exporters are single sellers in effect if not in name, and all have shown in face of towering surpluses that they can and will prevent a collapse in price. That, after all, was a prime reason for setting

up these state marketing systems. Prices used to collapse because thousands of farmers rushed to sell before they weakened further; now a collapse could only result from a deliberate decision of one or several governments to sell regardless of the consequences.

Why, then, do the exporters favour the agreement? For Canada and Australia the reason is clear; individually they feel that the obligation not to sell wheat at less than the minimum price, and the pressure of opinion in the meetings of the Wheat Council, helps to keep price competition from the United States within bounds. The bounds have admittedly been stretched pretty far. While the Canadian price never fell below 175 US cents a bushel compared with a minimum of 155 cents (basis No. 1 Northern, ex-Fort William) certain grades of American wheat have been sold at prices below the equivalent minimum, making full allowance for quality discounts. The United States itself has no direct need of the agreement. Indirectly, it may throw a cloak of respectability over the subsidy of wheat exports on a vast scale, and provide the American Administration with a plausible defence when Congress needles it to get rid of wheat at even lower prices.

Can the world be satisfied with a wheat agreement that obtains the support of importers and exporters on such negative grounds? To say this is not to attack the wheat agreement as such; no agreement can be any better than the policies of member countries. The

real ground for criticism is of the policies and the waste of resources they sanction. It is not America alone that is to blame. In Europe wheat production is artificially encouraged by support prices that match and exceed the American support price, and restrictions on imports of wheat ensure that home production is fully consumed. Canada and Australia, for all their criticism of the United States, have so far seemed content to await acts of God to reduce the surplus. And the United States deserves a measure of praise for having cut wheat acreage in recent years by one-fifth to 55 million acres, and the support price by one-fifth to 1.81 cents a bushel (on the 1956 crop).

Are there the makings of a fresh bargain here between exporters and importers? In return for the assurance of supplies at a lower maximum price, would importers undertake gradually to restrict their own high-cost production and give the exporters a larger market? Take the case of Britain. Last year 2.4 million tons of wheat were produced and sold in the free market at an average price of £22 a ton. That wheat cost the Exchequer another £10 a ton, for £24.2 million was paid out to farmers in deficiency payments. Suppose now that the exporters were prepared to conclude a new agreement, for five years, with a maximum price of say 180 cents a bushel. Britain then could not be asked to pay for No. 1 Northern more than it pays today, and with a realistic discount for quality it would be assured of supplies of soft wheat comparable to English at a cif price of not much more than £22 a ton.

If home production could be discouraged to the extent of half a million tons Britain could obtain similar wheat abroad at no extra cost to the nation as consumer, while the nation as taxpayer would save £5 million. It is not a question of taking land out of production; it can be put under coarse grains, for which there is a ready and expanding demand for animal feed. Britain has belatedly begun to recognise that a shift in emphasis from wheat to coarse grains is desirable, and farmers are being encouraged to sow less to wheat and more to barley and oats. Other European countries might well be prodded into a similar reduction in wheat output in return for a lower maximum price in the IWA. Conversely, the prospect of a larger world market should encourage the exporting countries to reduce their own acreage.

Specific obligations to reduce wheat acreage or output obviously could not be written into a new wheat agreement; the American Congress, for one, would not tolerate such interference, and neither would other farmer-conscious governments. But solemn undertakings to work in that direction could be given, and the meetings of the Wheat Council might eventually have some effect as the Council of OEEC has shown in shaming members into good behaviour. The choice before the conference is simple: either the world will go on devoting too much of its resources to wheat production; or an attempt can be made by means of a new wheat agreement to bring some order into wheat.

More and More Tankers

THE wholesale programmes of tanker building that began in the world's shipyards in 1950-51 are not yet over; at the end of June there remained about 7½ million tons deadweight still to be delivered. But with launchings of the order of 4 million tons a year, those programmes are now within sight of completion—on the time scale that tanker operators and shipbuilders have to use—and during the last few weeks large-scale tanker ordering has been resumed. Since the beginning of July contracts have been announced for the building of some 2½ million tons dw of new tankers—ordered by independent shipowners, some of them new to the business, as well as by oil companies. Thus P & O has entered the tanker trade with orders for 25 vessels

totalling more than 450,000 tons dw, and has this week been followed, on a much smaller scale, by William Cory and Sons. Last week Shell announced contracts for 34 large tankers, while Esso has added six of 36,000 tons each to its building programme; the new Shell programme is not yet complete, British Petroleum is expected to announce fresh orders soon, and other oil groups are also likely to order several "super-tankers." The programmes already on hand do not extend much beyond the early months of 1957; those now announced are for tankers to be delivered between 1958 and 1960.

It is little more than a year since the rate of tanker launchings (which reached a peak of 4.7 million tons dw in 1954) was proving an embarrassment to the tanker market; spot rates were still slipping steadily downwards, with few signs of recovery from the slump that hit them in 1952, and time rates remained low. There were 4 million dw of tankers laid up in August, 1954. The past year has seen a remarkable change. Today less than a million tons are laid up; about a million tons dw of tankers were scrapped during the year to June last, and perhaps 400,000 tons sold for conversion to dry cargo (mainly as bulk ore carriers). With the rate of launchings gradually declining, the world oil consumption rising faster than it did during the

American recession, tanker rates enjoyed their usual seasonal rise last winter and since have been fairly steadily higher than a year before.

With launchings past their peak and an increase in scrapping and conversion, the net growth of the world tanker fleet has moderated this year. Today the world fleet of commercial tankers totals about 41 million tons dw. That is about 75 per cent more than at the end of 1945, and the fleet's carrying capacity has probably increased more than that. During the same period oil consumption in the free world has roughly doubled. Tanker orders still outstanding and those newly announced promise a gross addition of about 10 million tons to the world fleet by 1960. What net increase in the world tanker fleet does this imply—and how does it compare with the demands that the oil industry can be expected to make on it?

★

Today, about 2 million tons dw of the world's tankers are 25 years old or more; by 1960, about 3½ million tons of the current fleet (assuming no scrapping) would have passed that age, and a further 2.7 million tons would be 20-25 years, becoming obsolescent and expensive to sail. Assuming that no further tankers are ordered, and that all tankers are scrapped at 25 years old, the net world fleet at the end of 1960 would be about 48 million tons. Neither assumption, of course, is valid. Further orders are likely, and could be delivered by 1960; and on the other hand any shortages of tanker tonnage that may arise prolong the life even of the oldest ships.

Yet there is an upper limit to the extent to which the world fleet can be inflated by retaining obsolete tankers in service. A certain amount of wastage is inevitable through accident and stress of weather, and older tankers need longer periods out of service for repairs and maintenance. Moreover, at present, there are attractions in other trades that might persuade independent owners of tankers to take some of their vessels out of the oil trade before they reach this age—the demand for specialised ore tonnage, to which conversion is comparatively easy, is likely to remain high for a few years. In the same way an upper limit to the further orders that might further swell the fleet is set by shipbuilding capacity outside the United States. Substantial orders for dry-cargo tonnage for delivery before 1960 have been placed since the last great wave of tanker ordering, and many of the yards capable of building big tankers must have their berths largely reserved over this building period. If deliveries of tankers between now and 1960 could be stepped up again to an average of 4 million tons over the whole period, and the scrapping of obsolescent tankers meanwhile limited to, say,

2 million tons, an upper limit for the size of the world fleet in that year would be about 60 million tons. But a fleet of that size would require the ordering and delivery of about 12 million tons more than have so far been ordered.

The size of the world tanker fleet in 1960, then, might lie in the range between 48 and 60 million tons deadweight—according to the demands of the oil industry. That is a range of increase from about 3 per cent to about 8 per cent annually. How much does the oil industry expect its need for tankers to increase during the next five years—which is only once removed from the question how much it expects demand for petroleum products to increase?

Even in an industry where demand shows the continuous increase that it does in oil, fluctuations can falsify the best guess; but the oil industry, whose production, refining, and transport facilities take a long time to build, has to think forward. The Shell group, indeed, has recently committed itself to estimates of world oil demand over the next ten years, and more particularly over the next five. Naturally, it offers a range rather than a single figure, and a wide one. It suggests that demand for petroleum products outside the United States and the Soviet sphere of influence, which last year totalled about 250 million metric tons, may reach between double and treble that figure in ten years' time. That means a rate of annual increase varying between 6.5 per cent and 10.6 per cent over the decade. For the five-year period to 1960 its forecast is more specific. Shell holds that the average increase in petroleum demand in the free world outside the United States during the next few years might be 7.6 per cent yearly—though the possibility of exceptionally high exports of American coal might reduce this rate of increase for oil to 6.35 per cent yearly.

How much more tanker tonnage is required for a given rate of increase in oil demand? There is no simple answer to that question, and even historical statistics may be misleading. Many other factors affect demand for tanker tonnage—the shifts in the pattern of world crude production, the construction of refining facilities in market areas, the speed and size of tankers, all of which have radically changed over the last 20 years, have probably together been more important in determining tanker demand than the simple increase in demand for petroleum products. In certain postwar years, the amount of oil entering world trade has increased much more than total oil consumption. But the estimate of demand for petroleum products quoted above excludes the United States, where demand is not expected to increase to the same degree. It might be prudent to assume, therefore, that the increase in demand for total tonnage, over the next five years, may fall slightly below that increase in demand for oil.

An annual increase of about 5 per cent in tanker tonnage up to 1960 might be considered desirable, therefore, if demand for petroleum expands as Shell thinks it may. Applied to the current world fleet (which

of course includes nearly 7 million tons dw under the American flag), this would suggest that a world tanker fleet of some 52 million tons might be required by the end of 1960. I would imply that from 2 million tons to 4 million tons more tankers may need to be ordered for delivery within that period than in the latest programmes.

That is one reading of an extremely murky crystal. But it seems quite apparent that the new round of tanker orders by the British-centred tanker groups could not have been delayed much longer, if the industry's most cautious hopes about demand are to materialise. And it is probably safe to conclude that further substantial orders for tankers must be placed for delivery by the end of the fifties—which means ordering fairly soon. Moreover, it seems likely that the oil companies centred on this side of the Atlantic may need the major part of the extra tonnage—which should offer good chances to British shipyards.

The cost of the tankers now on order—about 10 million tons dw of them—is probably of the order of £700 million, if one takes current building costs in the United Kingdom, which are as reasonable as any. The further tonnage that may be required by 1960, on the conjectures above, is likely to raise this figure to perhaps £1,000 million or more. It is hardly surprising that the oil companies, which have massive investments in exploration, production, and refining to finance as well as tankers, should be inviting more independent ship-owners to enter the tanker trade and to share some of

this financial weight—with its rewards. Their own forward estimates, it may be added, do not postulate any significant falling off in demand for petroleum products when one looks beyond 1960: it will be a long time before atomic energy begins to take much weight off oil, however rapidly it infringes on coal demand. And by the middle sixties, tanker owners are uncomfortably aware, they will be entering a period when the normal process of replacement begins to be accentuated, as the large numbers of tankers built during the war near the end of their economic working lives.

Business Notes

Waiting and Guessing

EVENTS always cast their shadows before them in Throgmorton Street. Three shadows slanted across the floor of the House this week. Next Tuesday the Chancellor and the Governor will speak to the City of London at the Lord Mayor's Banquet; the gold and dollar figures for September will have been published; and, conceivably, the terms of the conversion offer for the 3 per cent 1955 Serial Funding bonds—£524 million due for redemption on November 14th—will have been announced. It is not in the nature of the Stock Exchange to see these shadows without guessing at the shapes that make them. One surmise, stronger than a guess, is that the Chancellor will soon announce cuts in expenditure. Another, far more hazardous, is that the conversion offer will be "neutral."

Whether or not the events prove these guesses to be right, investors seem to have been willing to act upon them. Their assumptions would argue for a monetary policy that brings neither more nor less pressure. They would also

is right or wrong for the circumstances of today. But it is reasonable to think that such a distortion of yields as is illustrated in the accompanying chart argues that a readjustment is at work and is still unfinished. The concentration of buying upon the short to medium dated stocks, supports that view.

The P. & O. issue of £10 million of a 5 per cent debenture stock (1975-80) at 97 is out of the way, and the underwriters are left with 91½ per cent of it. "Failure" is the word to use but in a strictly limited sense. Private stockholders did not take up the stock, but the issue was aimed primarily at the institutions, which were the principal sub-underwriters at a commission of 1½ per cent. The stock opened at 1 discount. The sub-underwriting institutions which have the stock on their books are not out of pocket and are doubtless willing to hold. This further "failure" in the issue market implies that opportunities for making further substantial issues must be vanishing as underwriters become full up.

The Shadow of Wall Street

WHILE domestic shadows dappled the gilt-edged market, industrial equities fell under the shadow of Wall Street. President Eisenhower's illness hit the New York stock exchanges very hard. So much stock came on offer there on Monday that a market in some of the leading issues could not be immediately established. By the close on Monday 7,720,000 shares had been traded, the highest number for many years. Losses of up to \$10 were common and the Dow Jones industrial average—an indicator which is now under heavy critical fire—had fallen 31.89 points from the peak of 487.45 to 455.56. It is possible to describe this setback as an "emotional reaction" and to proclaim confidence in the buoyancy of the American economy in 1956. Indeed, these very points were quickly made, and when the President's physicians issued more cheering reports on his health the market rallied, bringing the Dow Jones industrial average back to 472.61 by the close on Wednesday. But even such a sturdy rally cannot entirely dispel the nagging question: can Wall Street prices, particularly of the second line issues, remain at their present height?

Dollar stocks in London had to follow the lead of Wall Street, and in a small way London took some dollar stocks from New York on the fall. The wave of reaction also spread to bring down the price of those British equities which in the last few months have been favoured by American investors. Yet, despite a widening of the jobbers' prices, some British investors were willing to buy

argue for no change in Bank rate—and, indeed, a conversion offer just around the corner would present a moral case for this view. On these lines of reasoning there is a short term case for the past week's strength in the gilt-edged market. The smaller banks, industrial companies and other institutions seem to have been among the buyers of stocks which offer an adequate running yield and, of greater importance, offer a good premium on ultimate redemption. It must be assumed that the Government broker, still making room for a new stock, has been the ultimate source of supply. The market wore the appearance of "grooming." It is profitless to argue that one particular structure of gilt-edged yields

back such stocks at lower levels. For all that, the *Financial Times* ordinary share index dropped 3 points to 191.5 on Monday. The Australian import cuts and the week-end reports hinting at economies and even of increases in taxes in this country did nothing to encourage optimism. But the bargain hunters came back into the London market when Wall Street rallied and prices, notably of those stocks recently depressed by rights issues, hardened slightly. Electrical equipment issues, for instance, gained strength after Lord Citrine's statement; even motor stocks were not unduly depressed when the worst was learnt from Australia; and a spot of bright relief was the prompt and heavy oversubscription of the Simon-Carves issue of 850,000 ss. ordinary shares at 22s.

Sterling Gaining Ground

THE firm undertone of sterling persists. Throughout this week there has been a steady commercial demand for dollars, some of it seasonal, such as the tobacco payments, others more regular, such as the needs of the oil companies. But significantly this big commercial demand for dollars had little impact on the exchange rate which has shown a persistent tendency to recover. On balance there has been little change in the spot rate against the dollar, which has held last week's improvement at around 2.78½-¾. European currencies, meanwhile, have all weakened against sterling, the movements being particularly marked in Swiss, French and Belgian francs and German marks. The short account in sterling has been reduced; some market guesses now put it at no more than £70 million to £80 million as against a pre-Istanbul peak of around £100 million. The covering purchases of sterling have dominated the markets in Continental currencies; they also help to explain the resilience of sterling against the dollar.

The improvement has been still more marked in forward sterling. The premium on three months' dollars, which at the end of last week was 1½-¼ cents, has narrowed to 1¼-½ cents. This also is an indication of covering operations reversing the bear sales that had been helping to widen the discount on forward sterling. Interest arbitrage, thanks to the improvement in the forward market, could again draw short-term funds to London. The Treasury bill rate in New York this week has been 2.1 per cent. The premium on the forward dollar rate now represents 1.7 per cent. The total of 3.8 per cent is now less than the rate of just over 4 per cent on British Treasury bills. So far, however, there is little evidence of this small margin attracting foreign funds to London.

The Squeeze Tightens

THE clearing banks' return for September—the make-up day was Wednesday of last week—will show that the credit squeeze is getting a firm grip upon their advances to the private section of the economy. When this issue of *The Economist* went to press, the month's statements were avail-

able for each of the "Big Seven" banks, and all of them showed a large decline in advances over the five-week period. A record decline had, indeed, been expected, because no less than £120 million had been paid up during the period in calls on the Gas and Electricity loans and, after providing for the current requirements of these massive public spenders, the greater part of this sum will have been used to reduce their bank loans—though not all of it will have reached the clearing banks. It is now evident that the advances of those banks will show an important decline over and above the big movement caused by these special repayments.

The seven banks whose figures are available show an aggregate decline of £121 million, which suggests that the reduction of advances by the clearing banks as a whole was probably in the region of £130 million, easily the biggest ever experienced in a monthly period. This implies that the advances of borrowers other than the gas and electricity industries probably declined during the five weeks by £30-£35 million, a perceptibly faster rate of decline than that indicated by the August return. The reduction of these advances since the end of June must be around £65 to £80 million, and the greater part of that contraction almost certainly reflects steps taken by the banks before the Chancellor's "directive" was added to the pressure upon liquidity in compelling restraint in lending policies. The full force of the twofold pressure has not yet been felt. Meanwhile, the big repayments of utilities' advances out of public issues mainly taken up by the "departments" have substantially improved liquidity ratios because the authorities have had to increase their borrowings on Treasury bills in order to finance the calls.

Costs Outstrip Production

HOLIDAYS make the production indices in July and August notoriously fallible signs of what is really happening to output; but, so far as they go, the latest figures suggest that industry, after recovering from the effects of the dock and rail strikes, is once again producing about 5 per cent more than it was a year ago. The provisional index of 121 for July (1948=100), was not quite 3½ per cent above July, 1954, and the figure forecast for August, 118-119, is about 5 per cent higher than a year before.

Statistical indications about the costs of this output are tending to confirm the warnings that businessmen—for example, Sir Harry Railing of the General Electric Company last week—have been voicing about Britain's power to compete in the export market. The Treasury recorded this week that in the first seven months of 1955 increases granted in wage rates amounted to about £218 million a year on the yearly wage bill, much more than the rise during the whole of 1954 or 1953; and earnings figures for April, published this week, show an increase of more than 9 per cent over April 1954, as compared with a rise of only 6 per cent during the previous twelve months. In August the index of basic materials prices was about 9 per cent higher than a year before. Output, clearly, is not matching increases such as these; so home costs per unit of output have gone on rising.

world's most modern chipboard
factory to make NEW *Gold label*

WEYROC
REGD.

WEYROC Man-made Timber was introduced by The Aircrew Company & Jicwood Limited in 1947 and has been made for 8 years from wood chips (waste from timber-mills) at Weybridge in Surrey. In this time Weyroc has completely established itself alongside the traditional forms of timber. New 'Gold Label' Weyroc carries the story a stage further. The opening of the new £400,000 factory at Annan—the first of its kind in Britain—has local, national and international importance. Almost fully automatic, this plant not only provides new employment for the district concerned and a productive outlet for waste Scottish Timbers, but helps save Britain importing expensive 'dollar' timber.

Since the introduction of Weyroc over 70 million sq. ft. of it have been sold and employed in building schemes of all kinds. The housing drive has been substantially assisted: more and more natural timber has been released for main structural requirements. And, because of its uniform quality and large size, Weyroc has given rise to new labour-saving and money-saving techniques in many industries. Now, with the opening of the Annan factory and the production of 'Gold Label' Weyroc, there are many new and varied industrial possibilities for this high-precision board.

The full range of Weyroc boards, now in production at Weybridge and Annan, includes:
Blue Label Weyroc (45 lbs. density) Plain, Plastic-surfaced and veneered in ½" and 1" thicknesses.
Gold Label Weyroc (35 lbs. density) Plain in ½" and 1" thicknesses.
Weydec and Hardec—balanced boards with decorative plastic surfaces.

- Till
- Birnam Wood
- do come
- to Dunsinane'
- MACBETH ACT V
- The 'leafy boughs' of Scottish forests are once more being put to good use. 'Thinnings' (timber up to the thickness of a man's arm) have until now, been wasted. But, with the opening of the Company's new factory at Annan, this waste material will be turned into an improved form of Weyroc Man-made Timber, to be known as Weyroc Gold Label. The improvements gained by using forest thinnings as the source of raw material in this, the most modern chipboard factory in the world, are substantial and of particular importance both to the Building and Furniture trades.
- A board with precise characteristics and more precise dimensions, Gold Label Weyroc possesses these advantages:
- higher strength characteristics • precision • easier working
- perfect surface for veneering of highest quality

Vast new wealth tapped by Turkey

This was an Eastern gold-rush—after chrome ore. For years, vast deposits lay in out-of-the-way places in Turkey virtually untapped. Except along the coast, no one could afford to exploit it. High transport costs left little profit. But in 1950, with the start of the Korean War, the price of chrome in world markets soared. Turkey launched out on a big programme to develop her chrome mines. Old mines were modernised,

new mines were opened up. Compressed air contributed to the success of this programme. Since 1951, Atlas Copco have supplied large quantities of rock drills, compressors and other equipment to the mines. From that year, output has doubled. Today, Turkey is the world's largest exporter of metallurgical grade chrome ore—the key product in the making of stainless steel.

Where hotel doors open themselves

Compressed air is versatile. Atlas Copco provide the means for all its many applications, from helping to revolutionise Turkey's chrome-mining economy to providing hotels with pneumatic door openers. Like those shown in the illustration, these doors open automatically when someone breaks the beam of the 'magic-eye' device. They are now being used extensively in hotels, hospitals, offices and banks.

Atlas Copco puts compressed air to work for the world

Atlas Copco compressed air equipment is manufactured or sold and serviced in 48 countries throughout the world by *The Atlas Copco Group*, which includes:—
UNITED KINGDOM: The Atlas Diesel Co. Ltd., Beresford Avenue, Wembley, Middlesex; SWEDEN: Svenska Tryckluft AB Atlas, Stockholm 1; FRANCE: Atlas Polar S.A., 29, Rue Marbeuf, Paris 8c; HOLLAND: N.V. Holland-Atlas, P.O. Box 6056, Rotterdam; ITALY: S.A.M.P.A., Viale Marche 15, Milan; NORWAY: A/S Atlas Diesel, Postboks 94,

Oslo; TURKEY: Atlas Copco Ticaret ve Sanayi. T.A.S. P.O. Box 490-Galata, Istanbul; SOUTH AFRICA: Delfos (Pty.) Ltd., P.O. Box 504, Benoni, Transvaal; CANADA: Canadian Copco Ltd., Montreal, A.M.F., P.Q.; U.S.A.: Copco Pacific, Ltd., 930, Brittan Avenue, San Carlos, California; Copco Eastern, Ltd., P.O. Box 2568, Paterson 2, N.J.; AUSTRALIA: Australian Atlas Company Pty. Ltd., P.O. Box 54, Auburn, N.S.W.; NEW ZEALAND: Atlas Copco (N.Z.) Ltd., Huddart Parker Building, Wellington, C.I.

Engineering Gets the Labour

ENGINEERING—the “metal-using industries”—has acted as the mainspring driving production upward in Britain this year. In the first half of the year output in this heterogeneous industrial group was about 12 per cent higher than in the first half of 1954, as compared with the rise of about 6 per cent for industrial production in general. The metal consumer goods—primarily motor vehicles—have led the advance; in the first seven months of the year car output was 16 per cent up. These particular sections of engineering are among the heaviest users of sheet steel, and have been responsible for the large imports of sheet that have become necessary.

These industries have achieved marked increases in productivity, both through utilising their equipment to the full and from improving capital equipment; but a significant part of the increase in engineering output has come from extra hands. They have obtained a lion's share of the increase in the manufacturing labour force. The total British working population is now only slightly higher than it was a year ago, by about 50,000; and some 550,000, or about 2½ per cent, higher than in mid-1953. Manufacturing employment in July was about 233,000 higher than a year ago, some 2½ per cent up, and about 5½ per cent higher than two years ago. But the much smaller labour force in the metal-using industries in July was fully 200,000 higher than in July, 1954—a rise of more than 5 per cent—and about 12 per cent higher than in the middle of 1953. One at least of the consequences that many people have always feared from brimful employment—that there would be insufficient labour mobility, and that people would not be prepared to go and work in the industries for which demand was highest—does not seem to have materialised in practice.

Mild Curb on Electricity

INVESTMENT in electricity distribution—the mains and equipment through which Area Boards sell to consumers the power that they buy from the grid—is being cut by 10 per cent this year; and “non-operational” investment—in, say, offices and canteens—may also be pruned. But, said Lord Citrine this week, the Government recognises the paramount need to affect the generating plant programmes as little as possible; and investment in generation and transmission, which last year accounted for about

£125 million of the £203 million that the industry spent on capital account, will presumably escape the credit squeeze. In its current operations, the Central Electricity Authority is pressing area boards to reduce their hire purchase sales, by refusing extensions of working capital for this purpose (which now stands at about £25 million), by increasing the rate of interest it charges from 6 to 7 per cent, and by stopping “promotional” selling of electrical appliances.

The authority's sweeping plans for new power stations, therefore, appear inviolate. During the six years 1955 to 1960, it intends to increase generating capacity by more than 45 per cent—from about 18½ million kilowatts to about 26,650,000 kW at the end of 1960. Nearly 2 million kW of old plant will be shut down during these years—“because it will no longer be usable or because it must be removed to make way for more efficient plant”—so the gross addition will be about 10½ million kW over the six years. The industry's capital programme from 1953 to 1960, as originally set out, was calculated to cost some £1,450 million; two years of that programme have gone by but the CEA now looks forward one year farther, so the cost of the programme about which it is now talking might be of the order of £1,250 million. That does not include the £300 million that is to be spent upon building the 12 nuclear stations that it is hoped to complete by 1965. Lord Citrine revealed that the Authority is now considering various sites for the earliest of these—on the Severn Estuary and the Essex coast. These regions have been indicated by the particular characteristics that have so far been identified for nuclear electricity stations. They are best put where normal fuels are expensive; near areas of heavy demand; and where they can get even more cooling water than coal-fired power stations of the same output would need.

Thermometer Pickings

THE twelve months that ended in March this year were profitably cold ones for the electricity supply industry. They enabled the British (now Central) Electricity Authority to achieve a surplus of some £18.8 million after, paying £35.6 million in interest, and therefore to salt away £10.5 million to a special reserve to supplement the £54.1 million that it provided for normal depreciation of its fixed assets at historical cost. The industry sold nearly 12 per cent more units than the year before (though its calculations of “effective working days at normal temperatures” would suggest that the “real” rate of growth of demand during the year was only about 6-7 per cent); and for that reason it actually made fuller use of its generating plant than the year before. Its load factor—which compares the amount of power supplied with the actual installed capacity of the generating system—went up, from 43.9 per cent in 1953-54 to 45.2 per cent in 1954-55.

That improvement—a more effective use of its capital equipment—seems, however, to have been exceptional. Since 1951-52, the load factor of the generating system has been declining—along with the decline in “plant shortage.” Barring unusually cold years like last year, it seems likely to continue to decline, as CEA continues to bring in huge

additions to its generating capacity. The increase of more than 60 per cent in capacity that is planned between 1953 and 1960, for example, was expected to be accompanied by an increase of only about 50 per cent in the sales of electricity. The authority would justify this decline in the effective utilisation of its generating equipment by the need to build up a reserve of capacity over and above likely demand, which it considers essential but during the postwar years simply has not possessed. But this decline in the effective use made of highly expensive equipment has to be borne in mind in considering the advances in technical efficiency, and in labour productivity, that the new and bigger stations bring.

Lord Citrine mentioned that he would be discussing with area boards this month the possibility of financing a greater amount of the industry's investment from internal resources than before, and did not conceal that this intention implied higher prices for power. During the current year, however, he thought the industry "will find it impossible to provide" this increased amount. The area boards immediately recover about half of the increased cost of a rise in coal prices, because many industrial consumers have coal clauses in their contracts, but the increases they made this summer in tariffs for domestic and commercial consumers have not taken effect until this month. And this summer the temperature has swung against the industry. It would need a very cold winter to give it a surplus in the class of last year.

Australia's New Import Cuts

DETAILS of Australia's long-awaited import cuts, announced this week only a few hours before they became effective today, have produced the inevitable reaction of pained shock among the British industries that are primarily affected. The guess is that they will cut British exports to Australia by £30 million in a full year, equal to 10 per cent. Mr Menzies, outlining the government's policy on Tuesday, showed that the intended reduction in Australia's import bill of £A80 million was designed to bring the Commonwealth's trade account into balance by the middle of next year. Only on that condition could the threat of depreciation of the Australian pound—which the Prime Minister categorically repudiated—be averted. Ancillary measures aimed at reducing the pressure of internal demand include a reduction in capital works programmes, and the promise of a pegged increase and stiffer repayment terms by the hire purchase houses to curb the violent expansion of consumer credit. Hire purchase absorbed £A50 million more to reach a total of £A200 million last year, sucking funds out of the market at increasingly high rates.

Given the limited instrumentalities in credit control that lie in the Commonwealth authorities' hands, this further resort to physical controls has to be accepted with resignation. Details of the import cuts show that dollar imports, which were untouched last April, are to be subject to a general reduction of one-eighth. Essential imports in Category A, of which machinery is typical, have since April 1st been restricted to 85 per cent of the 1950-51 base year quotas; these are now to be reduced by one-eighth, with

a list of exceptions which will carry a 7½ per cent cut.

Category B goods, including assembled cars, whisky, piece goods and a wide range of consumers' durables, have been on a 40 per cent quota since April; they will be further reduced by one quarter. Two classes of particular interest to British exporters will suffer a less severe cut of one-eighth—textiles for making-up and completely knocked-down cars. Several leading British car manufacturers have in recent years invested considerable sums in new assembly plants in the Commonwealth and will thus escape the worst blow. But they do not pretend that Australia's cuts (and New Zealand's too, which will reduce next year's import licences by one-third) will be palatable. On the bulk of the industry's exports to Australia—cars, assembled and unassembled, and unassembled commercial chassis—the cuts in a full year might amount to roughly £4 million out of, say, £24 million. These two markets together have been absorbing a quarter of the industry's overseas sales; competition in other markets, Europe and North America in particular, has become increasingly tough; costs are rising and would rise faster still if output declined even fractionally or new capacity could not be fully employed as it comes in; and at home there is the well-advertised threat (which may or may not come to pass) of an increase in purchase tax as part of Mr Butler's further measures.

Lancashire and the Potteries have joined in the chorus of regret about these latest cuts. The note of regret was not absent, indeed, from Mr Menzies' speech on Tuesday, when he conceded in almost apologetic tones that his policies "would normally appear to be restrictive." He looked for the stimulation of export income to avoid a chronic condition of unbalance in the Australian economy. Meanwhile the economic effects of Australia's attempts to do so much in so short a time are raising still further its internal costs—and these are already too high.

Mixed Progress in Cotton Futures

THIS week the Liverpool Cotton Exchange resumed futures trading in Egyptian cotton for the first time since 1941, and simultaneously the Alexandria market, after being closed for three years, resumed trading in a similar long staple contract and in a medium staple contract also. It was not to be expected that an active market in Egyptian cotton could be quickly established; but as it happened trading was perfunctory, prices nominal and much below

"Motor Business"

The September issue of this quarterly research bulletin for the motor and allied industries includes:

An Assessment of German Competition
The Small Car in Europe
Prospects for buses and coaches

The bulletin is fully illustrated with charts. For full particulars of this service apply to:—

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London S.W.1
Whitehall 1511 Ext. 47

parity with Alexandria. The main reason is that it has been impossible to establish a trading link between the two markets. The commissions and margins to be paid in Alexandria, and remittances from there, have still not been settled; and at the last minute the Egyptian authorities announced that Egyptian nationals would not be allowed to take up cotton against a maturing futures contract in Liverpool. The confusion will no doubt be cleared up soon.

It is typical of the trials of those who are valiantly trying to re-establish the Liverpool market that they should be obliged, while taking one hesitant step forward in Egyptian cotton, to take a step backward elsewhere. Business in the American contract, which has long languished under the uncertainties of American policy, has received a further set-back from the announcement of the grade and staple of cotton that the American administration will offer at "competitive" prices from January 1st. This special disposal of 1 million bales—out of a stock of 8 million—is all that came out of the protracted wrangle over surplus disposal this summer. But, as traders here had feared, the cotton to be offered will include grades and staples that are tenderable against both the existing 15/16th inch staple contract, and against the new 1-inch staple contract. It remains to be seen what bids the American authorities will regard as "competitive," but traders are not inclined to be conservative. In consequence, the price of March/April and more distant futures has fallen to a still larger discount, and is at present even below the price of comparable months in the New York market, disregarding the cost of shipment to Liverpool.

Egyptian Exchange Adjustments

THE reopening of the Alexandria futures market and the resumption of straddling operations in cotton between Alexandria and Liverpool have involved further adjustment in the Egyptian foreign exchange arrangements, which have been full of hideous intricacies. The spring cleaning has involved:

1. The abolition of the "dollar entitlement" scheme.
2. The suspension of cotton exports under "B" accounts.
3. The provision of facilities for dealing in forward sterling.

The "sterling entitlement" scheme which allowed Egyptian exporters to sell a proportion of their sterling earnings at a premium, thus raising the cost of sterling imports into Egypt, acting as a measure of discrimination against British trade, was abandoned at the beginning of September as part of the Anglo-Egyptian financial agreement. The "Deutschmark entitlement" scheme was also dropped at that time. The "dollar entitlement" scheme was, however, left intact.

That dollar scheme was dropped on Tuesday to facilitate the reopening of futures trading in Egyptian cotton. Had the reopening of futures trading in Egyptian cotton. Had the "entitlement dollars" continued to be available at a premium, they could have been converted into transferable sterling and there would have been a double set of cotton futures prices, one based on official sterling and the other on the unofficial "entitlement dollar" rate. The suspension of cotton exports under "B" accounts the same day was made for the same reason. These accounts are credited with Egyptian pounds paid out for certain imports into

Egypt and held for the credit of the central banks of Switzerland, Belgium and the Netherlands. "B" account Egyptian pounds have been offered in continental markets, mainly Zurich, at discounts roughly corresponding to the premiums on entitlement sterling and dollars. They could thus have been used by the three countries in question to buy Egyptian cotton at discount.

The resumption of futures trading in Egyptian cotton should create a demand for forward exchange facilities in Egyptian pounds. If the demand arises from Liverpool or elsewhere facilities will be available. The National Bank of Egypt is prepared to deal in forward exchange on a basis of 2 per cent per annum either side of the spot rate, though there is not yet agreement on the commission that the commercial banks will charge for such transactions.

Building Societies' New Front

WITH the announcement of the Abbey National Building Society's 5½ per cent mortgage charge to existing borrowers the adjustment to tighter money by the building societies seems almost complete. The normal in the new set-up may be taken as the rates now fixed by the Abbey National and the Woolwich Equitable societies—5½ per cent charged to both old and new borrowers and 3 per cent net paid on shares. There is a deviation at the cheap end to 5 per cent to be charged and 2½ per cent paid by the Halifax and at the dearer end to 3 per cent paid on shares and 5½ per cent charged to old borrowers, but 5½ per cent charged to new borrowers by the Co-operative Building Society and a few others. There is thus no uniformity even among the big societies, but the rates are not out of line with the new charge of 5½ per cent that the local authorities will be obliged to make for mortgages. Nor are they uncommercial in the sense of failing to make both ends meet with a reasonable margin for reserves. Most building societies consider that allowing for the increased tax burden on a higher interest rate the 2½ per cent margin between 3 per cent paid and 5½ per cent charged leaves about as much elbow room as the 2 per cent margin (between 2½ per cent paid and 4½ per cent charged) that existed before rates moved up.

Aggregate figures for the inflow of money since the societies increased their rates are not yet available, but individually the societies express themselves well pleased. A rush of money into the societies followed the increase in the interest paid on shares. The Co-operative for example experienced a record inflow of money in August and expects September to have beaten that record. There is also at present an undiminished demand for mortgages at the higher rate. Some societies, but not all, can now supply all the customers they wish to accept. That may explain why the Co-operative society (which in any event wished to curtail lending until it had restored its liquidity ratio) can charge 5½ per cent on new mortgages while others charge less; its funds are still—though not so drastically—on ration. It would be natural to expect that if the inflow of money remains high lending rates may become more competitive between society and society towards the end of the year, but that depends on the way money rates move in the next few months.

Brazil's Exchange Reform

CONFUSION still exists in Britain about the working of the joint payments arrangements between Brazil on one side and Britain, Germany and the Netherlands on the other. The old system of bilateral trade and payments agreements has been replaced by a multilateral one. Buyers from Brazil in all three countries can now enter the free market for Germany's "clearing dollars" (old cruzeiro balances), and take equal advantage of the discount below the official rate—which has now, however, all but disappeared. Furthermore purchases by Brazil from the sterling area, Germany and the Netherlands are being financed from a single pool of sterling, deutschemarks and guilders, sold at the regular Brazilian auctions of import exchange in one unit. The size of the Brazilian market open to exporters in the three currency areas accordingly fluctuates not with Brazil's holdings of a single currency but with its holdings of the three currencies together, which tend to be more stable.

A handicap to British exporters, who suffered from Brazil's acute shortage of available sterling, is thus removed. That shortage was due in part to the inadequacy of Brazil's sterling earnings, intensified by the diversion of exports to Britain through Germany, whose importers could sell the cruzeiros in the free market. It arose also from Brazil's commitment to repay at least £6 million a year from the arrears of commercial debts incurred in 1952 and earlier, and from Brazil's determination to allot up to £15 million a year for purchases of sterling oil.

Under the multilateral arrangements, Brazil will continue to pay £6 million a year off the commercial debt, though the escalator clause providing for a higher payment in years in which Brazil's sterling earnings exceeded £35 million (which has never happened) has had to be revoked. At the same time, it has been decided to abolish the ceiling on imports of sterling oil—which, like all other commodities, is now paid for from the pool of three currencies. If Brazil now spends more on oil, it will not automatically be forced to cut down other sterling purchases—only purchases from the three "Hague Club" countries together. The new arrangements unquestionably work in Britain's favour, and it is good news that the task of extending these liberal arrangements to other European currencies has begun. Belgium has opened preliminary negotiations with Brazil on the ending of the existing bilateral arrangements. In conjunction with the news that Brazil is about to make its belated reform of its export exchange rates, these arrangements offer the hope that Anglo-Brazilian trade may at last be lifted from the morass into which it had sunk in the past three years.

Remittances from Pakistan

FOR the investor in sterling tea companies and other sterling ventures in Pakistan Sir Percival Griffiths has this week brought moderately good news on his return from the mission he undertook immediately after the Pakistan rupee was devalued on July 31st from its unrealistic level of 2s. 2d. to 1s. 6d. He was specifically concerned

THE ECONOMIST, OCTOBER 1, 1955

with two problems that arose from devaluation: Would remittances from Pakistan to this country in future be more easily and quickly made? And would the tea companies, whose liquid assets in Pakistan had lost value in terms of sterling following the devaluation of the rupee, rank for a rebate of Pakistan's tax? In 1949, when Pakistan did not follow the devaluation of the pound, a tax claim was made on the appreciation of these assets.

Sir Percival returns without an answer to the second question. It is for the courts to decide whether any tax rebate would be due to the companies, and it is relevant that some of the tax claims filed in 1949 are still *sub judice*. An early answer can hardly be expected. The answer to the first question is, however, reassuring. Arrears of remittances from the tea companies' 1953 profits have already been permitted. There is an understanding that remittances from the 1954 profits will be allowed without delay as accounts are presented. And it remains for company managements to decide how much of their year's profits they will remit, though they must not try to transfer more than their relevant earnings; "relevant" must mean profits before making any provision against the fall in the sterling value of cash assets in Pakistan, for the tax question is not yet cleared and in any event the Pakistan rupee was devalued in 1955, not in 1954. Companies that have declared dividends subject to remittance will be able to pay them and though they will cost more rupees than were budgeted when they were declared, the 1954 results in general were good enough to stand the exchange difference. Bank advances in this country dating from the disastrous crop year 1952 are being immediately cleared. The short-term outlook for shareholders is thus better.

The further outlook contains the usual uncertainties. Will the Pakistan rupee be indefinitely maintained at parity with the Indian rupee? The black market in Pakistan rupees in India still deals on the basis of about 95 Pakistan rupees to 100 Indian. Before the devaluation of the Pakistan currency the rate was about 80 to 100. The Pakistan rupee has thus gained strength in India but not to parity. It was probably oversold just before devaluation, as currencies about to be devalued nearly always are, but the existence of even a small discount in India at this moment leaves the question of its ultimate strength unanswered.

Petrol Prices Straggle Up

IT took three days for the Esso Petroleum Company to come into line with the penny-a-gallon increase in the price of premium motor spirit announced at the beginning of this week by Shell-Mex and BP; in the meantime Regent, National Benzole and the Vacuum group had joined the file, raising their prices to 4s. 7d. a gallon. Esso was already selling its highest grade, Esso Extra, at 4s. 7d. a gallon and this is now up to 4s. 8d.; it put a halfpenny a gallon on the price of the "mixture" grade between this and its standard grade, but, like the other companies, did not raise the price of its standard grade. This departure from concerted action upon petrol prices—or at least this lag—is unusual, though in other recent changes, for example in fuel oil prices, it has taken some days for Esso to come into line. Shell-Mex and BP, which initiated the increase, put it

*It's fun
calling a spade a spade*

... yes — out in the garden — where no-one can hear!
But back at the office — digging facts out of files — an even temper is a real asset. So is a really good filing system...
it's no secret any more — that a suspension filing system is the best safeguard against a slip of the tongue. Everything (literally) runs so smoothly and easily.
Insist on a Twinlock VETRO Mobil System.
It's the finest suspension filing system in the world.

Round about business premises

... there's always a need for Nairn Vinyl Tiles

Proprietors, managers and executives of business premises all over the country are specifying Nairn Vinyl Tile Floors. Housewives, too, are making enquiries at their architects or builders about Nairn Vinyl Tile Floors. Rapidly the news of Nairn beauty and serviceability is spreading throughout the country.

Nairn Wear-ability Since the floors of the 53 laboratories in the new Biology building of Nottingham University would be subject to continual traffic and exposure to all manner of chemicals, the university laboratories themselves tested various types of floor covering. Nairn Vinyl Tiles proved to be the most satisfactory and were used exclusively.

Nairn Clean-ability Grease, oil, mud . . . bleach, alkalis, cooking fats . . . all the things that might ruin an ordinary floor don't affect a Nairn Vinyl Tile Floor. And all that's needed to keep it shining clean is an occasional polish.

Nairn Versatility Nairn Vinyl Tile Floors can be laid on any kind of suitable level surface, upstairs, downstairs, or in a basement. As a design component the Nairn Vinyl Tile—available in 21 colours—is extremely versatile, too. AND LAST, BUT NOT LEAST, THE COST IS SURPRISINGLY LOW.

For years, both here and in the U.S.A., laboratory research and stringent practical tests have proved the wear-resistance of Nairn Vinyl Tile Floors.

down to higher costs of distribution in this country which have until now "not been passed on." There has been considerable play made in recent years, it may be noted, with the economies achieved in internal distribution of petroleum products; these have not, apparently, been enough to outstrip rising costs. The increase, fairly logically, has been put on the premium grade gasolines that have continued to sell so much better than the industry ever expected—making the standard grade motor spirits, which have sold correspondingly worse, relatively a little cheaper.

Rayon near Recovery?

THE latest available figures on the output of cotton and rayon give no grounds for optimism, but during the last two or three weeks there has nevertheless been a growing feeling of quickening trade—at least where rayon is concerned. The fall in output continued fairly steadily in July; another 4,500 workers left the cotton industry, and cloth production was about 17 per cent lower than in July, 1954. Rayon production was high in the early months of the year, averaging 40 million pounds a month and more in the spring, but it has slipped sharply since then and by August was down to 35.4 million pounds. This is roughly the same production that was recorded for August last year, but the July totals were substantially lower.

The brunt of the depression in rayon has been borne by rayon staple fibre, while the demand for continuous filament yarn has both remained stronger and recovered earlier. In August, staple production fell further by 2 million pounds to 16.7 million pounds, while output of continuous filament rose by nearly a million pounds to 18.7 million pounds. This is a reversal of the post-war trend that carried the output of staple fibre from 4 to 20 million pounds a month and concentrated much of the expansion of the rayon industry on new staple capacity, until its output exceeded that of continuous filament. The slump in spun rayon reflects the slack trade in clothing early this summer—it is essentially a dress fibre and one for mixing with other textiles—while the steadier demand for filament reflects the growing industrial uses of rayon.

Rayon exports this year have been far from encouraging, but they too have recently shown signs of recovery: the slight increase in the volume shipped abroad in August compared with the previous month has been followed by reports of a greater number of orders booked in September. The steady volume of imports remains a thorn in the industry's side, but it will prick less painfully if the reports of the last week or so—that trade is brisker and orders flowing in again—are pointers to recovery and not the fugitive warmth of an Indian summer.

Aid for Forward Rubber Sales

THE Malayan government has taken a sensible step in revising the system of levying export duty on forward sales of rubber. Hitherto the duty, which is based upon the price of the highest grade of sheet rubber, whatever the grade sold, has been levied on the market price at time of shipment. If the price rose between the date of contract and

date of shipment the seller paid a higher duty, and a lower duty if the price fell. Until recently the producers have been ready to take the rough with the smooth. But for months past prices have been high—currently about 40d. a lb.—and duty, plus the new anti-inflationary cess, have taken a steeply rising toll. Producers have therefore steered clear of the risk involved in a regular forward selling policy of so many tons a month spread over a number of months ahead, which normally would be a useful stabilising influence in the market.

The growers naturally wanted their liability for duty and cess to be fixed when they made their sales. Discussions with the government have now obtained almost that. From October 1st sellers can register contracts for forward sales of rubber of not less than three and not more than twelve equal monthly consignments, provided that the first consignment is not due to be shipped before the first day of the second month after date of registration. When registration has been confirmed the duty will be fixed at the market price—still of the highest grade—ruling at noon on the date of the contract or immediately after registration, whichever is the higher. The working of this scheme is to be reviewed in a few months.

Mate for a Jaguar

SINCE 1952, when it stopped making the 2½ litre car designed before the war, Jaguar has had no medium-sized saloon in its range; it made only very few of its 1½ litre version after the war. This week the company introduced a completely new 2.4 litre (actually 2,483 cc) saloon, in the tradition of the 3½ litre Mark VII saloon but smaller, about 20 per cent cheaper, and presumably much more economical to run. No fuel consumption figures are given, but the new car uses the same engine, with identical bore, but the stroke reduced from 106 mm. to 76.5 mm., and develops only 112 bhp against the Mark VII's 190 bhp, while integral body construction, a new departure for a Jaguar saloon, has brought the weight down to 25 cwt for a full five-seater body (the last 1½ litre Jaguar weighed more than 30 cwt). The car has an original suspension system (at the rear it revives a modified form of cantilever springing) and uses a new servo-assisted Lockheed brake system. Priced at £895 (£1,299 including purchase tax), it invites comparison with, say, the Riley Pathfinder; but it is 5 cwt lighter and may seem to some eyes—since the Riley began to bear traces of body standardisation in BMC—of more distinctive design.

Half Agreement With Bulgaria

THE financial and trade agreement between Britain and Bulgaria provides a basis for trade up to the end of 1957, and detailed arrangements for trade in the next twelve months. It provides also for the payment over a period of years of £400,000—perhaps a quarter of the outstanding total—in settlement (apparently in full) of the claims for expropriated property, peace treaty claims and prewar commercial debts. It makes no provision for Bulgaria's bonded debt, which has been in complete default since the beginning of the war.

Bulgaria's only offer on the bonded debt was the insulting sum of £186,000 payable by instalments over a number of years. It was, on Bulgaria's own showing, 6.7 per cent of the nominal capital in British hands and ignored the gold clauses attached to several of the issues and all the arrears of interest. In fact Bulgaria seeks to reap the reward of its default by redeeming the bonds at the prices to which default has reduced them—a cynical line that unfortunately has had some appeal to Bulgaria's debtors in Switzerland and other European countries. Bondholders risk little by the refusal of the British Government, the Council of Foreign Bondholders or the League Loans Committee, to accept the offer.

SHORTER NOTES

The discount rate of the Reserve Bank of South Africa has been raised from 4 to 4½ per cent, and market rates for short money, bills and Government securities have likewise been increased by ½ per cent. The increase in the South African Bank rate, which has long been expected, represents

the first change since 1952, but money market rates had been raised by ½ per cent in March, following the two increases in the London Bank rate. The margin in favour of London, however, remained wide, and has attracted funds that might otherwise have moved to South Africa. The new rate for three months bills is 3 per cent and for deposits with the National Finance Corporation 2½ per cent. The Reserve Bank intends to enter the gilt-edged market to bring yields on the short stocks from 3 to 3½ per cent and on the long from 4½ to 4¾ per cent.

A four-year unofficial suspension of dealings in the 5s. stock units of Ely Brewery came to an end this week when the chairman, Mr L. Nidditch, withdrew his criticisms of the London jobbers. The stock reopened at 5s. 3d. and rose to 5s. 9d.

The Bowater Paper Corporation announces an interim dividend of 7½ per cent. This is at the same rate as last year, but payable as ranking capital increased to £9,600,000 by the recent one for three rights offer.

Company Notes

JOHANNESBURG CONSOLIDATED INVESTMENT.

With its indirect revenue from uranium and beer, "Johnnies" is no exception to the rule that South African mining finance houses have ceased to be dependent on gold alone. The important Randfontein Estates company, whose 1954 losses on gold were greatly exceeded by other revenue, and whose dividend was steeply raised, must have played a part in the finance company's increased investment income. On the other hand, profits from sales of shares were reduced, and Johnnies has lowered its dividend.

There has been heavy depreciation in the holding of nearly 7½ million shares in

shares that fall, without writing up those that rise, and the market value of its quoted investments last June, at £18½ million, was almost double the balance sheet figure.

In the past, tax had been charged on the footing that shares must in the aggregate be valued at cost or at market value, whichever was lower. Recently the courts have decided that the choice could be applied to individual items of trading stock—in this case, Freddie's Consolidated. The upshot is that tax has been over-provided in the past to the tune of £1.8 million; only small amounts of local taxation are due on 1954-55 profits, and British distributed Profits Tax is offset by double tax relief. The past over-provision, with undistributed earnings for the year, allows the transfer to Investment Reserve to be trebled. But the company's net UK rate, by being reduced to a mere 5d. in the £ (and likely to remain negligible for at least the next two years) underlines the limited attractions of the shares for managers of "tax free" investment funds. The year's earnings, before any tax, amount to 36 (against 41) per cent actual on capital, and at 43s. 3d. the £1 shares yield just 6½ per cent on dividend.

CALICO PRINTERS and WHITWORTH AND MITCHELL. The Australian import cuts will add another wrinkle to the furrowed brows in the cotton trade. That their worries began more than six months ago

is apparent from two company reports issued this week. One, a preliminary statement for the year to June 30th, came from the Calico Printers' Association; the other, a full report covering the same accounting period, was from Whitworth and Mitchell Textorial. The directors of Calico Printers say: "Several subsidiary and associated companies have continued to experience difficult trading conditions. Profits of the merchandising business in conjunction with the Association's spinning and weaving mills have suffered an appreciable decline during the year. Commission printing turnover has been about the same level, on the average, as in 1953/54. Royalties from 'Terylene' and other patents show little alteration in total from the preceding year." The wording of that note suggests that the difficulties, particularly in overseas markets, were increasing as the year wore on.

The Association's consolidated profit before tax and depreciation has fallen from £2.2 million to just over £2 million. That figure does not include the £666,948 written back from tax provisions no longer required. The directors have nevertheless left the ordinary dividend unchanged at 15 per cent, a decision which many investors expected. That dividend absorbs £173,426 from the parent company's net profit after tax of £241,369 (against £274,587), a figure which is struck after providing £343,512 (against £319,545) for current trading losses of subsidiary and associated companies and £153,604 paid to subsidiary companies in respect of previous years' losses.

The full report of Whitworth and Mitchell Textorial tells a much gloomier story. The ordinary dividend has been passed and after charging depreciation a loss of £4,313 has to be set against the 1953/54 profit of £145,893. After tax-

Freddie's Consolidated Mines, and this is responsible for major changes in the holding company's tax affairs. Like many investment trusts, Johnnies writes down

tion and other charges the net loss is £30,709, against a net profit of £71,822, so that in effect the preference dividend has been paid out of the £37,040 written back from general reserve. The surplus carried forward has been reduced from £15,420 to £188. The chairman's comment is brief, perhaps, too brief: "Trading conditions during the year have been difficult, particularly in overseas markets, and in consequence turnover for the year, both in quantity and value, showed an appreciable reduction in comparison with the previous year."

BEECHAM GROUP. In his review circulated with the full accounts of the Beecham Group for the year to March 31st the chairman, Lord Dovercourt, reminded stockholders that "a substantial increase in retentions is an essential feature of the board's plans for financing the group's future development." With, perhaps, a weary sigh stockholders may have construed this to mean conservative dividends. If so Lord Dovercourt's additional remarks at the meeting will have seemed refreshing. He said: "I am confident that in future years we shall reap a rich harvest in increased profits from all the hard work at present being undertaken all over the world. Your directors share the optimism of the whole executive in the company's future, and are confident that, subject to the financial position of the country, we can contemplate further increases in dividend in due course."

The two statements are not contradictory. The tree must be nurtured before it bears fruit. Some of that fruit will come from across the Atlantic for Lord Dovercourt is sure that the major development effort made in the United States in the last three years will result in a "large and profitable business." The administrative machinery and the capital structure of the Beecham Group have both recently been tidied up and the current

rights issue of ordinary stock should take care of all foreseeable cash requirements. The way for an ultimate increase in dividends is open and Lord Dovercourt's remarks do not, of course, diminish in any way the attractions of the rights issue.

QUALCAST. No comment accompanies the preliminary results for the year ended last June, but in such a competitive business as making lawn mowers an 11 per cent rise in trading profits is a gift horse into whose mouth it would be ungrateful to look. The 1953/54 record has been surpassed—and 1953/54 was a period when the rate of increase in turnover was greater than the rise in profit, for the company's policy is to keep selling prices low.

In the latest year, group trading profit has risen from £870,651 to £967,722, and from £688,185 to £771,314 after depreciation and other expenses. In spite of one or two minor setbacks, the general trend of profits since the war has been upwards, and the company was in consequence a sufferer from EPL. Helped by the removal of that tax, which required £36,000 in 1953/54, net equity earnings for the year 1954/55 are £359,009 against £266,048, equal to nearly 50 (against 38½) per cent on the present capital, after allowing for Profits Tax on a full distribution, though before crediting £12,000 tax over-provided. The dividend for the year of 24 per cent compares with the equivalent of 20 per cent.

A forthcoming free scrip issue of 1 for 10 will be the fifth capitalisation of reserves in six years. In that period, there have already been two capitalisation issues of 100 per cent, one of 5 per cent, and one of 50 per cent. The market is unlikely to expect the percentage rate of dividend to be scaled down, and at a cum bonus price of 23s. 9d., assuming the 24 per cent distribution is maintained on the increased capital, the yield on the 5s. shares is £5 1s. per cent.

LONDON STOCK EXCHANGE

Next Account begins: October 5th
Next Contango Day: October 5th
Next Settlement Day: October 11th

The buying of gilt-edged securities gathered pace this week with emphasis on the earlier maturities. National War Bonds 2½ per cent 1954/56 rose to 98 ½ and Funding 2½ per cent 1956/61 gained 1 to 90½. Of the medium-dated stocks Savings 2½ per cent 1964/67 and Savings 3 per cent 1960/70 improved ¾ and ½ respectively to 80½ xd and 81½. Long-dated stocks showed smaller gains and undated stocks remained firm but scarcely changed.

The heavy selling on Wall Street caused by the President's illness touched off a moderate increase in selling pressure on Monday. Marked bargains rose to 10.413 and industrials thinly supported last week declined sharply. Securities owing much of their recent strength to American support were marked down severely. On Tuesday Borax deferred had fallen to 138s. and International Nickel to \$145½. A firmer trend on Wall Street assisted a recovery to 142s. and \$146½ respectively on Wednesday.

The effect of the £11 million rights issue by English Electric was to lower the price of the old to 60s. 7½d. from 69s. 6d. at the close of the last account before a recovery brought them up to 63s. 3d. The premium on the new fell to 1s. before recovering to 3s. 6d. Motor shares were uncertain on the import cuts by Australia and New Zealand; Ford also suffered the loss of some American support and declined 2s. to 46s. 7½d. Brighter prospects for freight rates produced renewed firmness in tramp shipping shares; Rearden Smith rose to 36s. 6d. Coppers fluctuated with the Board of Trade's further offer of metal and the temporary weakness in the commodity, but the major producers rallied strongly on Wednesday, Rhokana recovering to 44.

Excess shares in Marston Valley Brick not taken up by shareholders were placed privately. The new opened at par and fell to 4½d. discount. Excess shares in Gallaher were oversubscribed.

(¹) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark and Greece exclude mining; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (²) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxembourg. Italy includes Trieste. (³) New drachmas introduced May 1, 1954 (1 new drachma = 1,000 old drachmas). (⁴) Thousand million drachmas. (⁵) Average for first quarter.

EXCHEQUER RETURNS

For the week ended September 24th there was an "above-line" surplus (after allowing for Sinking Funds) of £5,450,000 compared with a deficit of £22,276,000 in the previous week and a deficit of £22,276,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £9,707,000, bringing the total cumulative deficit to £507,265,000 (£394,412,000 in 1954-55).

Financial Statistics

THE MONEY MARKET

LOMBARD STREET has enjoyed a brief respite from the credit stringency. The Bank accordingly made some sales of bills "in reverse." This unfamiliar ease was attributable in part to official disbursements and in part to the market's small take-up of bills on the first two days of the week, owing to the possibility that their maturity may be postponed by one day if Tuesday, December 27th is declared a Bank Holiday. Monday's bills were sold at 92-day maturities, the market bidding at £98 19s. 6d. per cent and securing a full allotment; on the remaining bills it bid again at £98 19s. 8d. per cent, and was allotted 66 per cent of its bid. Its average allotment came out at about 69 per cent, against the unusually large one of 80 per cent in the previous week. The offer was down by £10 million to £280 million, and applications up by £25 million to £369.7 million.

Credit conditions tightened again in mid-week. The market had to make moderate repayments of seven-day penal loans, and as the Bank gave no special aid one or two houses were "in the Bank" for a small amount. The week's net repayments are reflected in the fall shown in the Bank return in discounts and advances, of £21.1 million, to £11.1 million.

The continued shortfall of silver supplies brought the London price to a new postwar peak, at 79d. an ounce for cash silver and 79½d. an ounce forward.

The affairs of men . . .

When it comes to appointing an Executor or Trustee you cannot do better than place your affairs in the hands of National Provincial Bank. The Trustee Department is staffed by specialists in the administration of Wills and Trusts and has the benefit of all the Bank's experience in financial and business matters.

No matter how complex your affairs may be, you may be sure that they will be handled courteously, sympathetically and efficiently.

Enquiries will be welcomed at any Branch without obligation.

THE LONDON OMNIBUS serves the public

Walter Hancock's steam omnibus was first introduced to a waiting public in 1833 and was named, appropriately, the "Enterprise". Another public enterprise is now presented by the London Assurance with this selection from their omnibus collection of policies.

HOME FIRES

Fires are quite all right in their proper place. When they break out elsewhere, within the house or outbuildings, they can quickly run through the property. Though nothing can put back what has been lost, our Fire Policy can make good your losses.

EDUCATION BILL

Schooling is a singularly costly business; plurally, it is even more so. The man who takes out an Education Policy with the London Assurance as soon as a child is born gets full marks for prudence and foresight.

ALL SPORTS

It has been written:

No game was ever yet worth a rap
For a rational man to play
Into which no accident, no mishap
Could possibly find its way.

But you need never be the loser if your person and paraphernalia are insured by our Sportsman's Policy.

THAT'S WHAT WE'RE HERE FOR

If you would know more about any of the policies outlined here, if we can provide any information about any particular policies or about insurance problems generally—pray make what use of us you wish. Our address is 1, King William Street, Dept. Y6, London, E.C.4.

THE LONDON ASSURANCE

"Very good people to deal with"

Perhaps you didn't know that WENGEN

one of the gems of the Bernese Oberland, is not only a world famous Summer resort but also one of the most popular Wintersport Centres in Switzerland.

*But everybody
knows*

how convenient it is to be able to negotiate one's Travellers' Cheques and Travellers' Letters of Credit at the Wengen Branch of the Union Bank of Switzerland.

COMPANY MEETINGS

UNITED DAIRIES LIMITED

A SATISFACTORY YEAR'S TRADING

ENCOURAGING EXPANSION OF GROUP'S ACTIVITIES

NO HALT TO RISING COSTS

TOTAL PRODUCTION AND SALES OF MILK MAINTAINED

MR LEONARD MAGGS'S STATEMENT

The fortieth annual general meeting of the members of United Dairies Limited was held on September 23rd at The Connaught Rooms, Great Queen Street, London, W.C., Mr Leonard Maggs (Chairman and Manager Director) presiding.

The Secretary (Mr Ernest Evanson, ASAA) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman to the Members which had been circulated with the report and accounts for the year ended March 31, 1955, and was taken as read:

I am pleased to be able to report to you that we have had a satisfactory year's trading, with encouraging expansion in most of the activities of our group.

The acquisition of The Cheshire Sterilised Milk Company Limited, with its subsidiary companies, to which I referred in my remarks to you last year, has, as was expected, made a useful contribution to the earnings of the group.

FINANCIAL POSITION OF THE GROUP

You will get a clear picture of the financial position of the group as a whole from the detailed consolidated statements published, but I feel I should draw your attention to the following.

In the Profit and Loss Account you will notice £300,000 has been set aside as provision in respect to an investment in a subsidiary company. This refers to our Australian company, and I will give you later in this report some information that will, I think, convince you of the prudence of this provision.

SETTLEMENT WITH MINISTRY OF FOOD

You will also see from the note on the Profit and Loss Account that there is an amount of £248,160 relating to prior years brought into the trading profits of the group. In the main this amount arises as a result of settlement having been reached with the Ministry of Food, for two years during the period of control, in connection with a scheme which was designed to adjust according to throughput the manufacturing costs used in arriving at government buying prices for milk products.

Until settlement was reached it was impossible to assess with any degree of accuracy the amounts of the group's participation and contribution, but it was felt prudent to make some provision, in the accounts of the years affected, against the group's liabilities.

As a result of our decision some ten years ago to adopt a straight line basis of depreciation at the rate of 10 per cent per annum of prime cost the plant and machinery

installed during the year ended March, 1946, have been written off; that is to say the total sum provided in depreciation equals the cost. For purposes of income tax, however, wear and tear allowances being computed on a diminishing value, these items have yet to earn their full rebates.

RESERVES

The following are the reserves of the group at March 31, 1955:

The share premium account	£ 41,706
Capital reserves:	
General reserve	354,548
Profits, less losses, on realisations of:	
Properties	213,566
Investments in subsidiary companies	99,582
Revenue reserves:	
General reserve	3,500,000
Insurance fund	100,000
Depreciation not required on properties sold, etc.	108,807
Future income tax	1,754,243
Profit and loss appropriation Account	4,157,772
	£10,330,224

The total of the reserves at March 31, 1954, was £9,787,373.

COSTS AND PROFITS

There is still no sign of a halt to rising costs, there having been increases during the year under review in wages, fuel and transport costs, which constitute the main items of expense of milk distribution and manufacture.

The dispersal of the population from urban areas, particularly from London, makes it impossible to maintain the quantity of milk served on individual rounds. On account of this, coupled with increasing costs, rounds are proving less remunerative, and we are driven to seek profits from other lines, such as orange drink: this was introduced on our retail rounds in June and has proved popular. We are also selling a milk chocolate drink, under the name of "Lactachoc."

Since I reported to you last year, the Ministry of Food's final buying prices for milk products have been agreed up to September 30, 1952, but settlement of the amounts due to and from the Ministry for that year has not yet been completed and is therefore not dealt with in the accounts under review.

The Ministry of Food has paid only "on account" prices for all products bought by them between October 1, 1952, and the date when they ceased to buy all manufacture except National Dried Milk, namely March 31, 1954, in the case of products other than butter and cheese, and September 30,

1954, in the case of butter and cheese. Proposals have now been received from the ministry for final prices for all products for the eighteen months to March 31, 1954: these are under consideration by the trade, and it is expected that settlement will be reached in time for an adjustment to be brought into the current year's accounts, which adjustment, over-all, will mean an addition to the profit.

MARKETING

From the time milk became controlled up to March 31, 1954, the Milk Marketing Board sold the milk from farms to the Government for re-sale to the trade, but after that date this practice ceased and the Milk Marketing Board began to sell direct to the trade. Before control farmers sold their milk to the purchasers on contracts prescribed by the Milk Marketing Board, but with the changes brought about during the war the Board now actually buys the milk from farmers and sells it to the trade at the first point of delivery. The milk producer has therefore lost the freedom to choose his buyer, but this is a necessary step to preserve rational collection of milk from farms.

The maximum prices of milk for liquid consumption and the margins of the trade continue to be controlled by the Government, while the Milk Marketing Board takes care of the marketing of milk for making into products.

The Board has entered into arrangements with the distributors and manufacturers for a Joint Committee to negotiate questions which may arise between the two sides of the industry, with recourse to a consultant on matters unresolved.

FULL RANGE OF PACKED PRODUCTS

The Government returned the marketing of milk products to the trade at a time when government stocks were heavy. However, co-operation between the various interests has enabled the changeover to take place with little friction.

We are now offering a full range of packed products under our brands of "Lacta," "Diploma" and "Moonraker." The products are sweetened condensed milk, evaporated milk, tinned cream, cheese spread, processed cheese, tinned rice puddings, blended butter and English butter: the latter is sold in our London shops under the brand of "Superity."

With the co-operation of the Milk Marketing Board we have also been able to revive some of the export trade in condensed milk.

MILK SUPPLIES

The total production and sales of milk during the year ended March 31, 1955, were nearly the same as during the year ended

March, 1954, but the summer production was higher and the winter production lower. As a result, the quantity of milk manufactured into products was much lower this winter, and our Cheddar cheese factories, which had been very busy during the summer, were nearly idle, thus adding substantially to the cost of making. It is not always realised that these fluctuations in quantity, inevitable as they are at times, result in comparatively high expenses.

YEAST

I have to report that our interests in the distribution of yeast have been disposed of to The United Yeast Company Limited.

It had been obvious for some time that the high cost of transport and distribution rendered the maintenance of two national distribution services uneconomic, and we were glad to make this arrangement.

The Standard Yeast Company Limited is still producing yeast at Harwich for distribution by The United Yeast Company Limited on agreed terms; we hope that this scheme will prove mutually beneficial.

TRANSPORT AND ENGINEERING COMPANIES

Last year I mentioned that U.D. Engineering Company Limited had secured a very substantial contract from the USSR for bottle washing and filling plant and crating and decrating machinery. The first year's contract has been completed, and our subsidiary company is busily engaged on the execution of the second one, which it is expected will be completed at about the turn of the year.

The large order for a special type of refrigerating plant for HM Government, which I also mentioned, has now been completed.

The demand for our engineering products from the dairy and other industries, both at home and overseas, continues to be at a high level, and to meet it further extensions to our manufacturing facilities at Park Royal have recently been completed.

CONTINUED EXPANSION OF DAIRY SUPPLY COMPANY

For The Dairy Supply Company Limited the year has been one of continued expansion. Their volume of sales has increased considerably, and the entry of this company into the field of specialised machinery and equipment for creameries and larger dairies, to which I referred last year, has met with success in both the home and export markets.

To meet the continued high level of sales an extension to manufacturing facilities has become necessary in the case of this company also, and has just been completed.

Mickleover Transport Limited, in addition to carrying out work for all subsidiary companies, has been entrusted by both commercial and government undertakings with a number of important development projects, and has again received large orders for vehicle bodies of all kinds.

Last year I mentioned that this company was giving particular attention to research into new materials and methods. One of these lines of research has now come to fruition in the production of fibreglass components for vehicles. Additional manufacturing space has had to be provided to meet the demand for this new material, which appears to have an important future.

In addition to these activities, the road haulage undertakings which this company operates have been meeting an increasing demand for their services.

OVERSEAS INTERESTS

Australia: It is with regret that I have to report the death on March 30th last of the Chairman of our Australian company, Mr H. E. Handbury, in whose business we took a majority interest when we made our investment in Australia.

In common with other UK concerns which in recent years have interested themselves in Australia, we are faced with difficult conditions. We made our investment primarily to produce condensed milk and milk powders for export, and at a time when milk in Australia was as cheap as, or cheaper than, anywhere in the world. As a result of the inflation which has taken place there, milk products (with the exception of butter and cheese, which are at present subsidised) produced in Australia have been priced out of all export markets: consequently there is a scramble for what market there is for these products in Australia itself, where to some degree selling prices have followed rising costs.

It is difficult to assess when we are likely to get a worthwhile return from our investment in Australia, as it is impossible to forecast when inflation will be halted. In the circumstances, and on account of our new factory out there having been erected during a period of very high costs for building and equipment, I feel it will be readily agreed that our decision to set aside this year £300,000 as a provision against this investment is a wise one.

New Zealand: The expansion to increase production to which I referred last year is now nearing completion. Our subsidiary company there has again earned a satisfactory profit.

During the year under review one of our manager directors, Mr H. W. Clements, visited our interests in Australia and New Zealand.

DIRECTORATE

The recommendation of the election to the Board of Mr E. Capstick, at present a Director of United Dairies (London) Limited, continues our policy of electing to the Board those of proved ability and who, we are confident, will add to our strength. Prior to joining the Company in September, 1946, Mr Capstick was for seven years at the Ministry of Food as Deputy Director of the Milk Products Division, and previous to that held the Chair of Dairying at Reading University. Whilst with the Company he has been Controller of Laboratories and in charge of our Inspection Department and Public Relations.

TRIBUTE TO THE STAFF

On behalf of the Board—and I am sure I may include the members—I should like to express thanks to the officers and staff of the company for their diligent, devoted and valuable service during the past year. I should like to pay a tribute to all who enabled the company to carry on, with only minor troubles, during the difficult days of the railway strike at the end of May and the beginning of June: it was, I think, a very praiseworthy achievement.

The report and accounts were unanimously adopted and a final dividend on the ordinary stock at the rate of 10 per cent actual, less tax, making 15 per cent for the year, was approved.

Mr E. Capstick was appointed a director of the company and the remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Company, having been fixed, the proceedings terminated with a vote of thanks to the Chairman.

Gestetner
LIMITED

TOTTENHAM, LONDON, N.17.

The Company manufactures the world-famous "Gestetner" Duplicating Machine and accessories. It has branches throughout the United Kingdom and subsidiary companies or representatives in all parts of the British Commonwealth, in the Americas, the Far East, and many countries in Europe. Extensive servicing facilities are available throughout the organisation.

Extracts from the Chairman's Statement are appended:—

"Your Company has always taken pride in its ever-expanding export trade. Once again your Company's exports increased, even though demand in certain countries remained unsatisfied due to import restrictions. More Gestetner duplicators were installed throughout the world than ever before.

"Shipments to hard currency areas, including the United States, were again a record.

"Your Company is now reaping the benefit of the continuous programme of extension and modernisation of manufacturing processes. This programme has made possible the partial absorption of the considerable increases in labour costs over recent years. During the year it became necessary to advance prices in order that the latest wage increases could be met without impairing our programme of research and development and the replacement of existing capital equipment.

"Estimated commitments to date for further capital expenditure by the Group amount to £415,000. To finance the expansion of capital assets, consent of H.M. Treasury has been given for the issue of £500,000 4½ per cent. Debenture Stock 1975/80. The Stock has been placed privately at 96½ per cent; subscription will be spread over the current year, as and when the money will be needed. The Debenture constitutes a floating charge and allowance has been made for any further finance which may be necessitated by expansion of the business.

"Development of our products has continued throughout the year. Photocopy, the exclusive Gestetner feature which I mentioned last year, continues to open fresh fields for the application of the duplicating process. The packaging and presentation of our entire range of supplies and accessories have been restyled by a leading designer and have been favourably received by our customers.

"Almost 500 people have been in Gestetner organisations throughout the world for over 25 years. They are symbolic of the loyalty and team spirit of which we are so proud. We face the future with confidence."

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Gestetner Works, Tottenham, London, N.17.

BRITISH MATCH CORPORATION

IMPROVED PROFITS FROM ABROAD

BRAZILIAN EXCHANGE LOSSES

INCREASING COMPETITION AT HOME

INTERESTS OTHER THAN MATCHES

The twenty-eighth Annual General Meeting of British Match Corporation Limited was held on September 28th at 66a Fenchurch Street, London. The Chairman, Lord Kindersley, presided. Extracts from his statement are given below:

ACCOUNTS

The Trading Profit of the Group, at £2,423,004, as shown in the Consolidated Accounts is higher by £176,154. This improvement was attributable to the Corporation's very substantial interests outside the United Kingdom Match Industry. The Corporation's Net Profit, as shown in the Profit and Loss Account, amounted to £327,926 as against £324,840 last year.

The Directors recommend payment of a final dividend of 5½ per cent less tax on the Ordinary Stock, making a total for the year of 9 per cent less tax.

The fall in the value of the Brazilian cruzeiro continued during the year and resulted in a further reduction in the sterling profits from your Brazilian Investment.

HOME TRADE

Sales of matches from your UK factories were slightly below those of the previous year. This was due to the increased competition from imported matches, largely from countries behind the Iron Curtain.

I would like once more to point out that for every 2d. box sold over the counter, more than 1d. is paid over to the Government in duty alone, and I think we can claim, without fear of contradiction, that we have kept faith with the public and that we still market our well-known brands at prices which are cheap in relation to those for other necessities of life.

At the end of June an official report on the subject of Collective Discrimination was published, and you will like to know that the British Match Industry does not engage in any of the practices therein described.

OPERATING COMPANIES

No doubt Stockholders are aware that the Corporation's largest investment is in Bryant & May Limited, of which it holds all the Ordinary Stock. The dividends we have received from that Company have always been the Corporation's principal source of income. Bryant & May has a stake in other industries and I would add that it will be our policy in the future to continue the expansion into other industries which can conveniently be combined with our main business of making and selling matches.

The Report and Accounts were unanimously adopted and formal business was transacted.

In his statement Lord Kindersley said that this year, for the first time, the Chairman of Bryant & May Limited had issued a written statement. A copy was enclosed with the Corporation's Report, and a précis of it follows.

PRÉCIS OF STATEMENT BY SIR ANTHONY ELKINS, CHAIRMAN OF BRYANT & MAY LIMITED

ACCOUNTS

The Trading Profit was down as compared with the preceding year. Apart from the effect of competition to which reference is made later, we are faced, as are other manufacturing companies, with continually rising costs. Fortunately, the reduction in the Trading Profit was more than counterbalanced by the increased revenue we derived from our various investments, both home and overseas. The net result was that, after charging taxation, the profit for the year was £396,000, as compared with £387,000.

HOME TRADE

Sales of Swan Vestas reached a new high record, but the turnover of our No. 1 Matches (the 2d. box) has fallen, due to intense competition from abroad, especially from Russian matches, which are being delivered to British ports at prices slightly less than we have to pay for materials alone. In October 1954 we had to close the long-established factory of W. J. Morgan & Company Limited and some loss of employment was unfortunately inevitable.

OVERSEAS COMPANIES

Our match interests overseas have, for many years, contributed an extremely important share of our income, and I am glad to say that they continue to do so. It is virtually impossible to export matches profitably from this country and therefore we derive satisfaction from the contributions we receive from factories in other countries. Steady dividends from Canada are particularly helpful and greatly in the national interest.

We have a large stake in the Match Industry, not only of Canada, but also of Australia, New Zealand, South Africa, Trinidad and South America.

INTERESTS OTHER THAN MATCHES

In all developed countries the consumption of matches naturally tends to become somewhat static and subject to competition from other allied devices. Your Directors have been and still are on the lookout for investment opportunities in other industries which will conveniently integrate with our main business.

Amongst our investments outside matches are Glue and Gelatine, Tin Boxes, Stamping Foils, Steel Wool, Bengal Lights and Sparklers, and Printing. Of these Printing is the largest, through our 50 per cent shareholding in Chambon Limited of Hamersmith, manufacturers of specialised printing machinery, who themselves have varied interests connected in some way with printing.

EMPLOYEE RELATIONS

Bryant & May were pioneers in co-partnership and their co-partners now hold almost £300,000 of Partnership Stock. They instituted a Staff Pension Fund in 1914 and have recently introduced a scheme for other employees. Bryant & May is a member of one of the first Joint Industrial Councils and is proud of the fact that there has been no industrial dispute in the Match Industry for more than 35 years. The policy of the Company has been to pay good wages and ensure good conditions for all who work in it.

Copies of the Chairmen's Statements, in full, may be obtained from the Secretary, British Match Corporation Limited, 66a Fenchurch Street, E.C.3.

HACKBRIDGE CABLE HOLDINGS

DIVIDEND INCREASE

The seventh annual general meeting of Hackbridge Cable Holdings Limited was held on September 23rd in London, Sir W. Wavell Wakefield, MA, MP (the Chairman), presiding.

The following is an extract from his circulated statement:

The overall results show a substantial improvement over the figures for the previous year in which all units—including the newly acquired subsidiaries—have participated.

Group trading profit was £638,819, and after providing £56,771 for depreciation and £273,646 for taxation, the net profit was £308,402 compared with £211,496 in the previous year. Your Directors feel justified in recommending a final dividend of 17½ per cent, making 25 per cent for the year, against the total of 20 per cent consistently paid since incorporation of the Company.

The very advantageous price at which the Company acquired the Bryce-Siemens unit has resulted in an increase of the Capital Reserves from £3,023 to £207,226.

The Revenue Reserves—apart from the substantial Reserve for Future Taxation—have increased during the year by £34,420, making a total of £315,636.

In conformity with the policy of modernising plant and machinery and in extending productive capacity wherever practicable, a further £74,413 has been expended during the year on projects of a capital nature.

Trading since the end of the year under review has continued to be satisfactory, and it is expected that the results for the current year will again be satisfactory, provided no exceptional unforeseen circumstances arise.

Last year reference was made to our principal manufactures as comprising electric cables, power transformers and capacitors and to the continuing increase in demand, both at home and abroad. Arising out of our acquisition of the Bryce-Siemens unit, there is now added to the Group's activities the increasing demand for a wide range of mechanical and electrical equipment manufactured or marketed by that unit.

Development work towards the further improvement of our facilities for sheathing cables with aluminium by the direct extrusion process as an alternative to lead, continues satisfactorily.

The report was adopted.

WESTERN MINING CORPORATION

VALUE OF GOLD SUBSIDY

The twenty-second annual ordinary general meeting of Western Mining Corporation Limited was held on September 15th in Melbourne.

Mr G. Lindesay Clark, BSc, MME (Chairman and Managing Director) presided and in the course of his speech said:

(All figures are quoted in Australian currency.)

Net profit from the year's operations amounted to £214,567, and was attributable chiefly to dividends received from Central Norseman Gold Corporation NL and Gold Mines of Kalgoorlie (Aust.) Limited. No dividend was received this year from New Coolgardie Gold Mines NL.

At the last Annual Meeting I stated that it was the intention of the Board to make a new share issue, and in October, 1954, the issue was made, members being offered one new share for every three shares held. The shares were offered at 12s. 6d. each; 1s. was payable on acceptance and the first call of 5s. per share was payable in February, 1955. There is an amount of 6s. 6d. per share uncalled on this issue. No decision has yet been reached as to the date of the final call, but it is unlikely to be made before 1956.

Two dividends, Nos. 14 and 15, both of 6d. per share, were paid on August 20, 1954, and February 25, 1955, respectively. Dividend No. 16, which was declared in the current financial year and paid on August 19, 1955, was also at the rate of 6d. per fully paid share; the partly paid new issue shares participated in this dividend at the rate of 3d. per share.

There has been greater activity in the prospecting side of the business for metals other than gold during the year. Extensive areas were examined for uranium, without locating any attractive deposit.

We have secured leases over extensive lithium deposits some 20 miles southwest of Kalgoorlie which some day may be of value. Work on this project is confined to investigation of treatment and possible markets.

There are other prospects under consideration but investigation of these has not yet advanced sufficiently far to reach any decisions.

No areas have been acquired warranting the search for petroleum.

VALUE OF GOLD SUBSIDY

The Chairman reviewed the extensive gold-mining interests and developments, and continued:

I referred in the last Annual Meeting to the decision of the Federal Government to assist the gold-mining industry by means of a subsidy. The Gold Mining Industry Assistance Act, which provides for the payment to producers of a subsidy of up to £2 per fine ounce of gold for a two-year period commencing from July 1, 1954, will be of real benefit to the industry. The subsidy is payable when costs of production exceed £13 10s. per fine ounce of gold and the subsidy payable per ounce is equal to three-quarters of that excess with an upper limit of £2 per ounce. The subsidy is enabling those mines which, at the moment, have small profit margins, to maintain a vigorous development programme without which they would almost certainly be forced to close. Applications for assistance have been made by those mines of the Group eligible for the subsidy.

The report was adopted.

GOLD MINES OF KALGOORLIE (AUST.)

MERGING OF ACQUISITIONS

The fourth annual ordinary general meeting of Gold Mines of Kalgoorlie (Aust.) Limited was held on September 12th in Melbourne.

Mr G. Lindesay Clark, BSc, MME, (the Chairman) presided and, in the course of his speech, said:

(All figures are quoted in Australian currency.)

The mill treated 211,332 tons, of which 199,950 tons came from the GMK leases and yielded 55,603 ounces of fine gold. This is equivalent to an average recovered grade of 5.56 dwts per ton and is 0.23 dwts below the recovered grade for the previous year.

Net profit, £102,922 was £81,343 lower than that earned in the preceding year. As indicated in the Annual Report the difference is accounted for by a fall of £24,824 in total operating revenue (£11,844 of which represents diminished gold premium receipts) and by increases of £43,498 in mining, mostly referable to the Paringa leases, treatment and development redemption costs and £13,021 in administration and interest charges, most of which was incurred on account of the mining companies taken over during the year.

Details of the new issue of 1,869,510 shares offered to members in March, 1955, are set out in the Annual Report. These shares, which were issued at 12s. 6d. each, are now paid up to 6s. (5s. capital and 1s. premium). The final call of 6s. 6d. per share (5s. capital and 1s. 6d. premium) will, on current expectations, be payable in November, 1955.

Dividends Nos. 6 and 7, each of 9d. per share, were paid on November 9, 1954, and May 5, 1955, respectively. Dividend No. 8, of 9d. per fully paid share and 4½d. per partly paid share, was declared on September 8, 1955, and will be paid on October 27, 1955.

MERGING OF ACQUISITIONS INTO ECONOMIC UNIT

Particulars of the acquisition, as going concerns, of the properties of Boulder Perseverance Limited, South Kalgorli Consolidated Limited and Kalgoorlie Enterprise Mines Limited, have been set out in the Annual Report. As a consequence of these moves, all the leases of the various properties have been assembled together with those of Gold Mines of Kalgoorlie (Aust.) Limited into a unit of economic size under present conditions.

The combined ore reserves of the Company and its subsidiaries were estimated at March 31, 1955, to be 1,558,000 tons at 5.8 dwts grade.

The enlargement of the treatment plant to treat the full tonnage is making excellent progress. As will be quite obvious, no economies have as yet resulted from the amalgamation.

This Company has made an offer to purchase the undertaking of New Coolgardie Gold Mines for fully paid shares in GMK. The price offered of 28 shares in Gold Mines of Kalgoorlie (Aust.) Limited for each 100 shares issued in New Coolgardie Gold Mines NL, requires the issue of 286,272 fully paid shares in Gold Mines of Kalgoorlie, equivalent to 7.7 per cent of its present issued capital.

The companies purchased during the year will qualify, in greater or less degree, for the Federal subsidy on gold mining until the date of liquidation in May last. In total, including probably a small amount for Gold Mines of Kalgoorlie itself, we expect these payments will amount to about £100,000.

The report was adopted.

LEWIS BERGER & SONS RECORD SALES

The seventy-sixth annual general meeting of Lewis Berger & Sons, Limited, was held on August 12th in London, Mr Thomas Lilley, chairman, presiding.

The following is an extract from his circulated review of the year to March 31, 1955:

There is further improvement in the trading profit, and the increased total of profit before taxation has been supplemented by benefits from the adjustment of taxation charged in previous years. The resulting group profit for the year after deduction for taxation is £474,101, compared with £377,066 in the preceding year.

Increased production at Group factories has supported the higher sales total which constitutes a new record. Factories in five Australian States have contributed substantially to group earnings and have surpassed even last year's record trading results. Group interests in South Africa contribute Trading Profit and Income from Shares in excess of last year.

The Group services all important categories of paint consumers, including the decorator through the merchant, the specifying authority and painting contractor, and the amateur home painter, shipping and transport interests; motor-car and vehicle manufacturers; engineering, electrical, domestic equipment and furnishing trades, and an extensive variety of other industrial users.

The new financial year has opened in a satisfactory manner and no factor yet known prevents a confident view of 1955-56 trading.

The report and accounts were adopted.

OLYMPIC PORTLAND CEMENT

RECORD NET PROFITS

The forty-fourth annual general meeting of this company was held on September 28th in London.

The Honourable Gerald H. G. Williamson, chairman, in the course of his speech, said:

During the year under review the plant at Bellingham produced 834,541 barrels of clinker and 872,355 barrels of finished cement. Clinker produced was approximately 220,000 barrels more than in 1953-54 and was the second largest annual clinker production on record. Cement shipped was the third largest on record at 864,369 barrels and exceeded the previous year by 200,152 barrels.

Manufacturing costs were lower by some 13 cents per barrel of cement sold, despite an increase in the hourly wage rate. These lower costs were undoubtedly due in the main to increased production but 1954-55 was also the first full year in which the five-day week, which I mentioned a year ago, operated in both the raw and finish grinding departments. This practice saved the high wage rates payable over weekends and resulted in lower over-all labour costs. A further factor contributing to lower costs was the fuel oil used in the kiln which showed a decrease of slightly over one cent per barrel.

The net result of all this was that trading profits amounted to £233,139, as against £143,119. Net profits were £89,227, compared with £37,082, and surpass our previous best of £83,461 in 1951-52. There was a distributable balance of £145,697. The interim dividend of 4 per cent took £11,000 and the final dividend of 8½ per cent now proposed will absorb, after tax, a further £24,438. The report was adopted.

LONDON ELECTRICAL AND GENERAL TRUST

HIGHER GROSS INCOME

The twenty-eighth annual general meeting of London Electrical and General Trust Limited was held on September 22nd at 53 Cornhill, London, E.C.3, Captain A. R. S. Nutting, OBE, MC (the chairman), presiding.

The Secretary (Mr I. H. Chatfield, FCIS) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts:

Total gross income for the year to June 30, 1955, amounted to £132,908, an increase of £27,663 over the total for the previous year. This increase was in part due to the receipt of income on the £240,000 raised by an issue of new Ordinary shares last January, and also to larger dividends received on many of our investments both at home and overseas.

The net amount available for reserve and for dividends on the Ordinary stock, after all charges including taxation and after paying the Preference dividends, is £49,589, compared with £32,739 last year. Of the amount available the directors have transferred £12,500 to reserve.

An interim dividend of four per cent was paid in January on the Ordinary capital then in issue and the Board is now recommending a final dividend on the present Ordinary capital of nine per cent. The dividends paid and proposed would absorb £30,120 net; the comparable figure last year was £19,800 net.

TAX RECOVERIES

The amount of tax recoverable under double taxation agreements has been steadily rising mainly because of the progressive increase in our investments in the USA and Canada. Hitherto it has been our practice to bring into account such recoveries of tax, as and when received, without distinguishing between the financial years to which they related. Owing to a change of procedure on the part of the Inland Revenue authorities we are now adopting a more regular basis and accordingly this year we have taken credit for £2,884 as being applicable to the year ended June 30, 1954, and have brought into account a further £4,713 for earlier years. Both these amounts have been agreed with the Inland Revenue and we expect to receive them shortly. It is hoped that henceforward we shall receive each year the major part of the recoveries claimed for the preceding year together with any balance of prior years' recoveries due to us.

Our estimate of revenue for the current year indicates a favourable trend.

THE ECONOMIST, OCTOBER 1, 1955

A table showing the classification and distribution of our investments is appended. It will be seen that the total of our USA and Canadian investments is now 29.0 per cent by value of the total portfolio, compared with 19.8 per cent last year.

CLASSIFICATION OF INVESTMENTS (based on valuation at 30th June)

	1955	1954
	%	%
Bonds and debentures...	3.7	5.5
Preference shares.....	17.4	23.0
Ordinary shares.....	78.9	71.5
	100.0	100.0
	%	%
UK and Commonwealth (excluding Canada)....	67.3	74.0
USA and Canada.....	29.0	19.8
Other.....	3.7	6.2
	100.0	100.0

The report and accounts were adopted and the dividend, as recommended, was approved.

The retiring director, Captain A. R. S. Nutting, OBE, MC, was re-elected and the remuneration of the auditors, Messrs Brown, Fleming and Murray, having been fixed, the proceedings terminated.

SCRIBBANS-KEMP

PERIOD OF CONSOLIDATION

The twenty-eighth annual general meeting of Scribbans-Kemp Limited was held on September 27th in London, Mr H. Oliver-King (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The year to March 31, 1955, was mostly one of consolidation with some success in the reorganisation of the Companies' factories and the establishment of depots for the distribution of the Companies' products. The new selling and distributive organisation is growing apace and is proving effective in handling the Companies' products.

The statement then reviewed the Group's activities in various parts of the country, including the reorganisation of the Barker & Dobson factories at Liverpool, and continued:

The retail side of our interests has had a fair year. The policy of the Company to modernise the whole of the branches is proceeding and some of the newer branches are showing most satisfactory returns.

The trading profit is £1,304,974, which is slightly more than last year. Taxation this year took £663,861 as against £783,191, leaving us with a net figure for the Group of £704,243 as against £521,783.

In the Balance Sheet Fixed Assets have risen from £3,593,238 to £4,103,481 and Current Assets exceed Current Liabilities by £2,653,248.

Such figures as have been presented to me for the current year show that results are being quite well maintained except in one division. The board has every confidence that when its plans come to fruition, shareholders will not be disappointed.

The report was adopted and a total dividend distribution of 12½ per cent was approved.

BRAITHWAITE AND COMPANY, ENGINEERS LIMITED

ANNUAL GENERAL MEETING

The Thirty-fourth Annual General Meeting of Shareholders of Braithwaite and Company, Engineers Limited, was held on September 27th at Dorland House, 14-16 Regent Street, London, S.W.1, Mr J. Harvey Humphries, AssocICE, MISTRICTE, the Chairman, presiding.

The net profit of the Group, including gross dividend from Braithwaite and Co. (India), Limited, and before charging taxation is £149,242 against £122,248 for the previous year. After charging taxation the consolidated net profit for the year is £60,567.

Resolutions were unanimously passed for the adoption of the Report and Accounts, the confirmation of the preference dividend already paid in respect of the year ended March 31, 1955, and the payment of a final dividend of 11 per cent, less tax, making a total of 16 per cent, less tax, on the Ordinary shares.

The retiring director, Mr S. J. Harper, was re-elected.

The directors were authorised to agree the remuneration of the auditors, Messrs Whitehill, Marsh, Jackson and Company, and the proceedings terminated with votes of thanks to the chairman, staff and workpeople.

Following the annual general meeting an extraordinary general meeting was held at which resolutions were passed increasing the capital to £750,000 by the creation of 150,000 additional Ordinary shares of £1 each ranking *pari passu* with the existing Ordinary shares and capitalising the sum of £225,000, part of the undivided profits at present standing to the credit of the General Reserve of the company, to be applied in paying up in full at par 225,000 Ordinary shares of £1 each to be allotted to the existing Ordinary shareholders on a one-for-one basis.

A. C. COSSOR

A SUCCESSFUL YEAR'S TRADING

The seventeenth annual general meeting of A. C. Cossor Limited was held on September 22nd in London, The Right Honourable Lord Burghley, KCMG, LLD (chairman) presiding.

The following is an extract from his circulated address:

Our financial year, which ended on March 31, 1955, was a very successful one. This success is reflected in the increased dividend of 15 per cent on the Ordinary Shares.

A substantial increase in the Group's turnover, from £7.3 million to £9.2 million (including £1.6 million of exports from this country), with practically the same profit margin as before, gave us a Group Trading profit of £652,545 (last year £527,419), and a net Group profit, after taxation, of £248,157 (£162,013).

We have decided, on this occasion to distribute to every employee who served throughout the year, and is still in our employ on September 30, 1955, the equivalent of one week's pay.

We well maintained our position in the trade, both in television and radio receivers. Our VHF/FM sets have taken a leading position in this new field. Our new radio-gram, incorporating VHF/FM, set a standard of quality in the lower-priced market which had hitherto only been approached by the most expensive models.

Within the last few weeks, however, the trade has been struck another blow by a further tightening of the hire purchase regulations. Nevertheless, our sales to date have exceeded those for the corresponding period last year, and we hope that the opening of the new commercial television transmission, coupled with the greatly increased programme time from the BBC, will stimulate and maintain the public demand for television receivers.

The report was adopted

THE ECONOMIST, OCTOBER 1, 1955

UNIVERSITY OF OTAGO

DUNEDIN, NEW ZEALAND
Applications are invited for a Lectureship and Assistant Lectureship in History. Salary range: Lecturer, £1,175-£1,600 p.a.; Assistant Lecturer, £679-£736 p.a. Further particulars and information as to the method of application are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.
Applications close in New Zealand and London on October 31, 1955.

THE NUHIELD PROVINCIAL HOSPITALS TRUST

Applications are invited for the post of Secretary to the Governing Trustees of the Trust. The appointment is a whole-time one, commencing salary according to qualifications and experience being between £1,500 and £1,750 a year, with superannuation and child allowances.
Applicants should have an informed interest in contemporary developments in health and hospital services. A strong preference will be shown to university graduates, between the ages of 35 and 45, of proved administrative ability in posts carrying wide personal responsibility and demanding imagination.
Applications, giving age and full details of qualifications and experience, with the names of three referees (no testimonials should be submitted), should be sent to Mr L. Farrer-Brown, Nuhield Lodge, Regent's Park, London, N.W.1, by not later than October 14, 1955.

PHARMACEUTICAL MARKETING MANAGER—Marketing Manager required by Genatosan Limited, a member of the Fison Group. Applicants should have had marketing experience in either an advertising agency or in an industry distributing consumer goods, and should preferably be under 35 and have a degree. A fertile mind and a progressive outlook, however, are the prime qualifications required. Conditions of service are excellent, and a salary commensurate with the job and individual will be paid. Write, giving full particulars of age, education and experience, to The Personnel Officer, Genatosan Limited, Loughborough. Please quote Reference PMM.

CENTRAL ELECTRICITY AUTHORITY require an Assistant in the Economics and Statistics Branch, Headquarters, London. Candidates should have a degree in Economics and preferably some experience of industry or commerce. The work will be concerned with general economic intelligence. Salary within Grade 3, N.J.C. £615-£677 per annum inclusive. Applications, stating age, present position and previous experience, to D. McNeil, Director of Establishments, Winsley Street, W.1, by October 19, 1955. Quote Ref. AE/668.

THE SINGAPORE EMPLOYERS' FEDERATION invite applications from experienced men aged 30-40, for the position of Industrial Relations Adviser to the Federation. The duties involve a study of labour conditions, legislation and employer/employee relations within the Colony and to advise the Council of the Federation thereon. No secretarial duties are involved.

The initial tour would be of three years, and the inclusive salary offered is Malaysian \$2,500 p.a. (equivalent to Sterling £3,500 per annum). Leave pay, two months for each completed year of service. First-class sea passages for successful applicant and family up to a maximum of four.

Applications, giving age, experience, whether married or single, should be addressed to The Secretaries, Messrs. Rennie Lowick and Company, P.O. Box 470, Singapore.

MARKET RESEARCH—The world's largest organisation in this field—A. C. Nielsen Company Limited—has vacancies for men to be trained at Oxford for future executive responsibility. The ideal applicant will be between 24 and 27, have a first (or very good second) in mathematics, some knowledge of statistics and be interested in applying his mind to problems of market research and management.

Technical mathematical ability is not, however, essential—though ability to deal with figures is; the successful applicant may have read Greats, P.P.E., Economics or Law, or may be a non-graduate whose background or experience will enable him to assimilate the training in this sphere. Market research experience is not essential but may be advantageous.

Applicants in the above age group or thereabouts should write, with full details of education, qualifications, experience, marital status, etc., to Personnel Manager at 109 St. Aldate's, Oxford.

COST ACCOUNTANT

SIMON-CARVES LIMITED require a qualified Cost Accountant, aged 25-30. It is essential that candidates should have some knowledge of cost accounting and costing procedure in a contracting firm. Initial salary will be not less than £900. The post is permanent and pensionable. Working conditions and scope are good. Apply in writing (quoting Reference AS45), to Staff and Training Division, Simon-Carves Limited, Chichester Heath Stockport.

INVESTMENT RESEARCH DEPARTMENT OF STOCKBROKERS has vacancy for young man wishing to make successful Stock Exchange career. Some relevant experience required. Write Box 222.

RESEARCH OFFICER required in managerial capacity for research organisation dealing with advertisers on consumer and market research. Applicant must be familiar with modern techniques and have had experience of consumer research. He will either with an advertising agency or with recognised research organisation. He will be required to manage the organisation's research department.

The position offers excellent opportunities to a man who is qualified and has initiative. Give full details of past experience, age, present position and salary, to: Box 233.

STATISTICIANS (two) required. Degree in Maths, Stat. or A.I.S. wanted for Operations Research Dept. of Europe's largest plain bearing manufacturer. Work includes design and analysis of experiments, quality control, linear programming, general operations research. If no experience in these fields, training will be given. Internship and willingness to probe into unexplored difficult applications important. Recent Graduate acceptable. Salary £600 per annum. Fully qualified man, with experience, up to £1,000 per annum. Apply Personnel Manager, Glacier Metal Co. Ltd., Ealing Road, Alperston, Middlesex.

LEADING firm of London Chartered Accountants requires qualified men as Senior and Assistant. Salaries in accordance with a Public Company within 30 miles of London. Experience of group organisation accounts, budgeting, costing and taxation. A flair for commerce and a capacity for a ready appreciation of financial matters connected with overseas business are required. Salary from £1,500, but commensurate with the qualifications and experience of the applicant. Reply to Box 221.

CITY CHARTERED ACCOUNTANTS with extensive and varied practice have vacancies for Unqualified Audit Clerks with some years' experience in the profession. Commencing salaries from £500 per annum upwards, commensurate with experience; pension scheme. Write Box 115, c/o Streets, 110 Old Broad Street, E.C.2.

LONDON STOCKBROKERS require fully qualified man to take over management of their Investment Department. Duties include correspondence and company research. Though previous Stock Exchange experience is preferred, a C.A., actuary or similar person with knowledge of investment matters would be considered. With a good commencing salary, prospects for the future are considerable. Write, in confidence, to Box No. 9185, c/o Charles Barker and Sons, Limited, 31 Budge Row, London, E.C.4.

MANNESMANN

Due to the steadfast policy of keeping pace with technical progress and constantly improving the basic principles of the Mannesmann brothers' revolutionary invention of the seamless steel tube, Mannesmann pipes today enjoy a firmly established reputation throughout the world for dependability, safety, and economy.

Whether it is a question of conveying gas, water, steam or oil, or providing service connections and plumbing systems, or whether long-distance transmission lines and penstocks - no matter how high the gradients - have to be constructed; Mannesmann tubes and pipes can be relied upon to meet fully the severest requirements of any particular application.

For many years Marconi's have collaborated with the Admiralty and other Government Departments in the development and production of radar equipments, and are at present entrusted with contracts to re-equip radar formations of the R.A.F. As a result of the experience thus gained in research, development and production, a unique knowledge of the detailed planning of radar stations and systems has been built up and is now being applied by Marconi's to the provision of integrated naval and air radar defence networks in many parts of the world.

Spun glass for the professor

The professor has a theory. If he's right a life may be saved. But to complete his experiments he requires a delicate piece of apparatus. Now it has arrived, after a hundred and twenty mile journey by road and rail. And what's more important, it's entire and whole and perfect—thanks to British packaging.

Over half the packaging board produced

in Britain is made by Thames Board Mills. And as life becomes more and more complex, as more and more delicate articles are sent longer and longer distances, so will the demand for "Thames Board" and "Fiberite" cases increase. Vital indeed is the part that Thames Board Mills have to play in the nation's economy.

THE CHAIRMAN SPEAKS

'Pricing ourselves out of foreign markets is an ever-present danger'

SAYS HALFORD REDDISH

"We are dependent in this island, probably to a greater extent than any other nation, on the export of our manufactured goods and we have to face the ever-present danger of pricing ourselves out of the foreign markets which are so essential to our existence. Competition from other countries, particularly Germany, is becoming increasingly keen. We should indeed be warned by the experience of other nations in the past, but alas! how very rare it is for human beings to learn from the experience of others."

Petroleum Charts a Continent's Course

A plentiful supply of petroleum products is vital to a nation's industrial and agricultural growth and to its national security. In Australia, a major step toward self-sufficiency in refining capacity is a new refinery at Kwinana. This refinery is owned and operated by Australasian Petroleum Refinery Limited, a subsidiary of the British Petroleum Company. Planned now to meet almost half of the continent's 45,000,000 barrel annual goal, Kwinana is already helping attract new capital and labour to Western Australia, and promises to have a marked effect on the continent's over-all economy.

As in the case of many other important refineries around the world, the over-all

engineering and construction of the Kwinana refinery was assigned to the Kellogg International Corporation and its parent company, The M. W. Kellogg Company even to the extent of off-site installations including roads, docks, and loading, storage and housing facilities.

The Kellogg organisation is proud to have placed Australia's largest and most modern refinery in operation three months ahead of schedule. This record was achieved through the co-operation of British and Australian equipment manufacturers and construction subcontractors as well as through the hard work of the hundreds of men on the engineering staffs and construction crews.

expressed gratitude

The time is sure to come when you want to recognise, at short notice, a shrewd deal, or an outstanding piece of work, with an original gift. The person concerned may perhaps serve you in a remote part of the world where ordinary gifts mean little, or he may be retiring after long and valuable service.

Why not give a high fidelity record reproducing equipment? It is personal, delightful, and will give endless pleasure—a thing of beauty, a joy for ever, and every time it is used the recipient will think of you.

If you do not want to specify the equipment, you need do no more than say how much you want to spend. As High Fidelity specialists we can select an appropriate equipment. We can dispatch it to any part of the world, and for an inclusive charge ensure that it is properly installed and working in a very short time. This is just a specialised part of the Classic specialised Hi-Fi service.

"Moh-Kari-Makka?" or "Making Money?" is another way of saying "Good Morning!" in Osaka

Since olden days Osaka has been the hub and center of Japan's economy. As the nation's greatest commercial city, all phases of the city's life have developed primarily for the convenience of business.

The same may be said of the Osaka dialect. Because it is mild and soothing it is unsuitable for quarreling, and therefore it is just the right medium for business transactions.

Everywhere in the world greetings are conventional and more or less the same, but nowhere but in Osaka, do people greet each other with such a straight-forward query as "MOH-KARI-MAKKA?" (Making Money?)

Attend the Japan International Trade Fair, 1956, in Osaka this coming April! "MOH-KARI-MAKKA?"—this is the password!

Businessmen Should Not Miss

JAPAN INTERNATIONAL TRADE FAIR, 1956

to run from April 8 through 22 in **OSAKA** on a scale twice as large as its predecessor.

For information, write to:

JAPAN INTERNATIONAL TRADE FAIR COMMISSION

Honmachi-bashi, Higashi-ku, Osaka, Japan.

Cables: **NIPPONFAIR OSAKA**

Corrosion under control now, Mr. Cusden?

Many waters in the natural state have a corrosive effect on iron and steel pipes. As a result, the flow of water in supply mains and industrial equipment is often restricted, pipes damaged and heating and cooling systems made inefficient. The addition to the water of a few parts per million of Albright & Wilson's CALGON will usually prevent or strictly limit these corrosive effects—and will stop 'red' water. The cost of applying this 'Threshold Treatment' is insignificant compared with the direct and indirect financial savings to water undertakings and industrial concerns.

fuel
is expensive
and scarce

yet 450 tons

(the approx. annual output of 1½ miners)

are wasted every year in this one factory

Repeated warnings of fuel shortage and the high cost of fuel are the pressing factors in favour of efficient thermal linings in industrial buildings. The accompanying graph, based on actual findings, is worth a few moments study. From this you can gain an indication of the amount of generated heat lost through a typical uninsulated roof—and the subsequent saving in cost due to effective insulation.

'Paramount' Insulation Gypsum Plasterboard is a building material specially developed, not only to provide the highest degree of thermal insulation, but due to its Gypsum base, it offers the maximum resistance to flame spread and fire penetration. It is the combination of these two properties which makes Insulating Plasterboard the obvious material for factory lining. With next winter in view, we suggest you give this matter your most urgent attention. Our Technical Representatives are always ready to advise and assist in constructional matters.

INSULATION PLUS HIGH RESISTANCE TO FIRE

Wives of SUCCESSFUL MEN HAVE PRESTIGE

If you were to look into the kitchen of any woman whose husband has made his mark, more often than not you would find 'Prestige' Housewares. And the reason's not far to seek. These beautiful and practical products are the obvious choice of people for whom only the best will do. This year be really thoughtful and give 'Prestige' to those important people on your Christmas list. 'Prestige' Housewares are ideal for business gift-giving because

they bring pleasure and real pride of possession, not just to one person, but to the entire family. It's so easy to send the right thing. Just

hand your Christmas list to your secretary and ask her to visit any store where fine housewares are sold. They'll have a wide selection of 'Prestige'... for your customers and for you. Illustrated is the 'Prestige' Holdster Set at 99/6.

A towel fit for the chairman

Looks a tall order, that; yet the answer's simple—the Towelmaster. Gone are the days of unspeakable roller towels, of paper-strewn floors like Hampstead Heath. At a pull, the Towelmaster presents a length of soft, dry, laundry-fresh towel. It gives as satisfactory and as pleasant a dry as a towel in one's own house. The same pull automatically winds up a used portion into a separate compartment of the gleaming white Towelmaster cabinet.

Yet it's far from being the case that the Towelmaster is for board-room level only. It's inexpensive enough for installation everywhere. Look at the figures. Each roll of towelling—all you have to pay for—costs a mere 5/-. Minimum usage is only one roll per cabinet per week for a minimum of two Towelmasters. All else is free—fitting, maintenance, replacement . . . no other charges whatsoever.

Each roll gives an honest-to-goodness dry to 180 pairs of hands. If that wasn't enough for 5/-, think of the goodwill gained from staff and visitors, of the added prestige conferred by these sparkling Towelmaster cabinets. And consider, above all else, this bargain price for a clean bill of health.

We welcome your enquiries.

The Textile WHOLESALER helps the NATION

THE Wholesaler reduces waste of manpower, time and money. He provides a centralized service for the distribution of the pick of the products of hundreds of factories to shops in every town and village in the country.

By buying in advance of the seasons and holding large stocks, he provides a buffer against rising and falling prices. His stocks are invaluable, too, in meeting sudden demands. He aids the manufacturer by prompt payment and gives helpful credit to the Retailer.

The Textile Wholesaler plays a vital role in the economy of this "Nation of Shopkeepers".

This is the **FOURTH** of a series of four announcements describing how the Textile Wholesaler helps the Manufacturer, the Retailer and the Nation.

Issued by
The **WHOLESALE TEXTILE ASSOCIATION**, 75, Cannon St., London, E.C.4
T16. 310

"When I first thought of writing these memoirs I had the best possible advice. From Buckingham Palace. I was sitting at dinner one night beside King George V, and I mentioned to him that I was thinking of writing a book. 'Lady Curzon, don't do that yet,' said the King. 'It is sure to stir up controversy. Wait for 25 years.'"

ROYALTY ROUND MY TABLE

by the
MARCHIONESS CURZON
of **KEDLESTON**

WHY did King George V ask his partner at dinner to wait for 25 years before writing the book she had in mind?

The reason he gave was simple. "It is sure to stir up controversy."

But now that book has been written. Its authoress? The Marchioness Curzon of Kedleston. The American millionaire's widow who married Britain's stormiest Foreign Secretary. The woman who became hostess to Kings and Queens and nearly every celebrity of her day. "Now I am ready to tell the story of my glittering world," says Lady Curzon.

She tells it candidly and brilliantly. It is a story of fabulous parties and of the great and famous off duty. It is also the story of the personal dramas behind some of the great events of our time.

Never before has the wife of a Cabinet Minister written so frankly and so searchingly about the personal day-to-day life of a man guiding our destinies.

She writes of—

- ☆ *WHEN the Shah of Persia fell down after dinner.*
- ☆ *WHEN they raised the cry, "The Queen of Portugal's on fire!"*
- ☆ *THE divorce error at an Ascot house party.*
- ☆ *PRIME MINISTER for a train journey—the blou that made Lord Curzon weep.*
- ☆ *THE embarrassment when the Prince of Wales went in by the wrong door.*

... it's part of Britain's progress,
to which The English Electric Company
contributes, at home and abroad ...

Britain's economic progress is something that can be seen in every shop, every home.

Since 1949, our industrial output has risen by 70% and the value of our exports by 42%.

More goods at home, more of the exports we depend on, mean better living for Britain. In both ways ENGLISH ELECTRIC plays its part.

Production needs power. 50 power stations have been brought into commission by the Central Electricity Authority since April 1948; output of current has risen by 60%. In these power stations, many of the turbines, generators and other equipment are by ENGLISH ELECTRIC.

And ENGLISH ELECTRIC makes the motors and other electrical gear by which industries use this

energy for production; a never-ending job of re-equipment, modernization. Thus, at home—more power, for more production.

Moreover, ENGLISH ELECTRIC is a vigorous exporter. About half the Group's business is overseas. All over the world, ENGLISH ELECTRIC earns currency for Britain—and a reputation that helps all British exports.

Because its activities range so widely, this Company acquires a great deal of varied experience, constantly extended. Without this precious asset, ENGLISH ELECTRIC's human and productive resources would be less effective than they are in contributing, at home and overseas, to Britain's continuing progress.

'ENGLISH ELECTRIC'
bringing you better living

The English Electric Company Limited, Queens House, Kingsway, London W.C.2

POWER FOR INDUSTRY. This transformer at Walsall Power Station helps control electricity needed in Midland factories, including many making TV sets.

EARNING MONEY OVERSEAS. Egypt has recently acquired 19 ENGLISH ELECTRIC five-coach articulated diesel-electric trains to operate a new high-speed passenger service.

DEVELOPING MARKETS OVERSEAS. Three 56,000-h.p. water-turbine generating sets, and all the other electrical equipment, were supplied by ENGLISH ELECTRIC to Comfrentes Power Station, part of Spain's big hydro-electric development plan.

To YOUNG MEN and their PARENTS

To any boy or young man considering a career in science or engineering, ENGLISH ELECTRIC offers almost unlimited opportunities. He will receive first-class training under excellent conditions, and can look forward to a choice of stimulating and rewarding jobs, at home or abroad. For details of ENGLISH ELECTRIC training schemes, please write to the Central Personnel Department.

Target for Margate

"MARGATE?" said Pilot Officer Percy Prune, staring disconsolately out of the old RAF training poster, which had something to do with the proper use of signals inter-communication; "Oh, I thought you said Target. Anyway, bombs gone." Prune's wartime admirers may feel a certain nostalgia this week-end as the delegates to the annual Labour conference gather in Thanet, with no more coherent thought after their election defeat than to drop bombs on their own organisation. It is, of course, absurd for Labour to pretend that its failure last May was due solely to organisational defects; the politicians cannot get away with putting all the blame on to the administrators. And yet it is also a mistake to go, as some newspapers have gone, to the opposite extreme: to forget that the Tories after 1945 showed that a reform in organisation can be the quickest, although often the unconscious, precursor to a change in policy. It is at least possible—although it is too early to say that it is probable—that the organisational reforms which Labour is now discussing may serve the same hidden purpose. To understand the basis for this hope, it is necessary to look rather more closely at Labour's troubles than the Margate conference itself is likely to do. It is also necessary to look at them sympathetically.

The Labour Party in 1955, like the Conservative Party in 1945, is suffering from a disease that can best be diagnosed as diehard rot. This does not mean that the Labour diehards—the constituency activists who still believe in the public ownership of every means of production, distribution and exchange, and in other dogma-eared pre-Elizabethanisms—are in control of policy. As the plight of Mr Bevan, the man who now writes articles on the back page of *Tribune*, shows, the activists have never stood further from control than they do this week-end. But a movement of opinion outside the party has served to bring Labour's disease to what doctors call (and sometimes com- fortably call) a critical stage. The fact is that the Labour party's diehards now arouse the same vague feelings of derision and dislike among the most crucial "middle-of-the-road" section of the electorate as the Tory diehards did before they were muffled ten years ago; to a broad mass of wavering voters "nationalisation" and some of the other brave battle cries of yesterday have become slightly dirty words. The reasonably modernist people who would really be in charge of the policy of any new Labour Government recognise this point; but they have not yet been able to "stifle by absorption" their reactionary left-wing tail.

Their failure is, at least partly, a matter of public relations; and it may be useful to them—as it will certainly be useful in writing the rest of this article—if an attempt is now made to introduce a new word into the English political language. The more one considers the history of Conservatism since 1945, the more one is impressed by the Tories' luck that Mr David Low had already given their public bogeyman a bad name, so that it was made easier for the

Butlerites to hang him. It was possible in the years of Tory reform after 1945 for a Butlerite to say that he was a Conservative but not a Colonel Blimp, and for most of the colonel's cronies in the Conservative constituency organisations to applaud this sentiment because they would not admit that the Butlerites were referring to them. The Gaitskellites today have no such Aunt Sally; it is not easy for them to declare that they are Labour but not, say, "old-fashioned Socialists" (that sounds heretical), or "Bevanites" (that sounds feudy), or "near Communists" (that sounds rude). They badly need a name that will convey mockery rather than melodramatics about the internal forces that they have to combat. The name that will be used here may not sound very original, but the need cannot wait upon imperfections in nomenclature. Let us call Labour's pre-Elizabethan bogeyman "Blump." There is a special reason why the time may be ripe for an assault upon him. It is a reason that lay at the bottom of the need for this week's Wilson report.

★

The election of 1955 has shown that Labour's voluntary organisations in the constituencies—which are the Blumps' special preserve, as they used to be those of the Blimps on the other side—are in an appalling mess; and the call has gone out that these organisations must be made rather more professional and streamlined. The Blumps themselves enthusiastically support this idea, without realising that professionalisation and streamlining—if properly carried out—would strike at the roots of their influence. That is what happened to the Tory diehards after the Maxwell Fyfe and Butler reforms of 1945-50; the dominant change in local Conservatism since those reforms has been the swing of control away from the squirearchy towards the whist drive set, although with the squire still turning up at the whist drive to present the prizes.

Does Mr Wilson, the would-be Pygmalion of Labour's organisation, realise that his recommendations should help towards a similar switch away from extremism within the local Labour parties? The answer, one suspects, is a quotation from Pygmalion itself. His immediate motives, and the details of his recommendations, are discussed in Notes of the Week on a later page; they are concerned with changes in the canvassing technique (which might bring in hundreds of old votes) rather than with changes in policy (which alone could bring in thousands of new ones). Indeed, whenever the report touches upon ideas rather than mechanisms, it is to insist that the central authorities should not use the machine that Mr Wilson wants to build for them "for the purpose of furthering particular policies which may be the subject of controversy within the movement." Nevertheless, as the Tories' experience after 1945 showed, it is not always necessary to recognise one's goose before one cooks it. The Tories were able to achieve their important changes in both

policy and party atmosphere after 1945 largely because they sent down three sorts of missionary to tame the local parties. The crucial point about the Wilson report—deny it though Mr Wilson may—is that it seeks to send out the same three educative influences into Labour's ranks. It is for this reason, and this reason alone, that it deserves to be regarded as a document which may yet be of prime historical importance.

In the first place, the report declares that "it will be necessary to create the nucleus of a National Agency Service, nationally staffed and paid and working under the control of regional organisers"; it envisages that the men made available for these posts should be trained people with professional qualifications, instead of stray Labour councillors who want a paid job and happen to be able to make rousing speeches to a constituency party meeting. This recommendation is immediately tempered with the statement that "care will be taken to ensure that recruits to this service . . . will be entirely relieved of any activities connected with the formulation of party policy"; but this qualification misses the whole significance of agency development. Once a genuinely professional agent is in the field, his job is to recruit as many active workers, or even inactive members, into a local party as he can; this inevitably means that he finds himself stretching out from the Blimps or Blumps (who feel strongly enough to play an active part in politics already) to the less militant masses who have hitherto been scared away by the Blimpish or Blumpish nature of the club. Labour will not be the loser if its local parties are broadened in this way as its whole-time agents become thicker on the ground, but less thick in the head; perhaps the Blumps would not take to any swamping of their present control as kindly as the Blimps have done, but they are even less likely to move out of the party—for they have nowhere else to go.

★

Secondly, the Wilson Report envisages—although, unfortunately, in rather a committee-compromising way—that active politicians in the public eye should take over some of the control of the machine that is now supposed to be exerted by paid servants of the party. At first sight, this proposed shift from Mr Morgan Phillips to (probably) Mr Harold Wilson might not seem to be a bad thing for the Blumps; but if any active politician takes over organising the organisation, this should represent a shift towards painless absorption of the local militants and away from the constant irritation of them that has hitherto been assuaged by partial absorption of their policies. In a party that has to look as if it is democratic, a high-powered paid servant cannot act as a moderating influence. Whenever he tries to interfere, he is regarded as a presumptuous hatchet-man. An active politician of the Woolton type—cajoling, persuading, acting as ear trumpet as well as *porte-parole*—must be much better placed, as well as, probably, less

clumsy. Indeed, it is probable that the Wilson reforms would serve to increase rather than to diminish the influence of the permanent staff at Transport House. There is an analogy to be drawn here from the field of Government itself. Some of the unconservative actions of Conservative administrations (or for that matter some of the unsocialist actions of Labour administrations) may have been helped forward by the pressure of civil servants; but the civil service would have much less opportunity for influence in these cases if there were no such thing as Ministerial responsibility. And if doubts are expressed about whether Mr Wilson is the right horse for this course, they can best be answered by a question: would anybody have believed in 1945 that the ideal man to lead local Conservatism away from its previous fatal connection with big commercial and industrial interests would have been Frederick, Lord Woolton?

The third important feature of the Wilson report is that it urges—indeed goes outside its terms of

Nato in a Warm Climate

IN the theatre of the Palais de Chaillot in Paris the curtain rises each evening on the intricate precision of the Moscow ballet. In a less elegant addition to the building, hastily tacked on a few years ago, the autumn sun shines each morning on Nato staff and Nato delegations immersed in the imponderables of the annual stocktaking. This annual review is a year-long process which normally culminates in the December meeting of the Atlantic Council, when the foreign ministers, defence ministers and finance ministers meet to appraise the year's progress and to set the planning goals for the future. The special session of the Council that has been called for the last week of October, to provide an opportunity to review political issues on the eve of the next encounter with the Russians at Geneva, is not connected with these regular procedures.

Although the full ministerial meeting sets the seal on the year's work, the critical stage in this process of developing fifteen national defence programmes and meshing them together to form a whole comes at the point when the international staff and the experts from member countries hold oral examinations of each ally in turn, and probe the soft spots and the inconsistencies in plans and performance. This collective self-analysis is now in full swing. The generals are also stocktaking. And next Monday the defence ministers of the fifteen countries will meet in Paris to hear, and to discuss, what General Gruenther and his colleagues at Shape have to say about the impact of the new atomic weapons, and the fact of the hydrogen bomb, on Nato strategy.

Probably little of what is said in Paris in the next few weeks will find its way into the newspapers. The layman cannot reasonably hope for enough information

reference to urge—that the national executive should undertake a separate and urgent review of "the whole subject of party education, publicity and propaganda." Once again the Conservative reorganisation after 1945 has shown that these are forces which—if they are handled imaginatively instead of mechanically—must tend to propagate new ideas rather than old emotions within a party; and any Labour review of the subject now can hardly be one that calls for less imagination. The Blump should be even more vulnerable to this sort of force than the Blimp. A pseudo-intellectual politician is always more likely to be baffled by science than a plain, blunt and selfish one. Or that, at any rate, is the hope—a tenuous but surging hope, based on a report that is not always consistent and not yet accepted, not always far-seeing and perhaps not even quite selfless—that the Wilson recommendations deserve to arouse. But they will, presumably, have to be supported by different arguments when they are presented next week in a gathering of so many Blumps at Margate.

to enable him to reach an independent judgment on the adequacy, or sense, of the Nato effort. Nor would his judgment be much good if the highly technical details were made available. The best he can do is to bring out a few broad principles, and hope for the best.

Mr Pearson, the Canadian Secretary of State for External Affairs, has stated the first principle in four words: "Nato is not negotiable." It is so obvious that without the strength that Nato built there would be no meeting in Geneva at the end of this month, and no new spirit of hopefulness abroad in the world, that it might be supposed even Moscow would now realise that Nato wears no price tag. What has been less clearly said is that there can also be no tampering with it. As M. Pinay pointed out in New York last week, there are Nato bases, but not foreign bases, in Western Europe. The organisation is not a scrap of paper, but an Atlantic defence community. Its members can agree to limit their forces; perhaps to dispose their forces differently, but there can be no question of nibbling away at its flexibility and coherence by treating either American participation, or German participation, as subjects for special negotiation.

★

The second broad principle is that there must be no weakening of Nato; and the third, that everything possible should be done as quickly as possible to shore up the weak sections that have begun to appear in the structure. The hydrogen bomb, the "Geneva spirit," and inflation, have together created a situation in which

the temptation to cut defence budgets and to reduce periods of military service is strong. How far the individual governments think they can do without the quick political gains these cuts would bring will come to light in the course of the examinations now being held in Paris. It is probably still true to say that in no Nato country would those charged with defence decisions argue that the time has come when cut-backs can safely be made. But the danger lies in the fact that many of the decisions which now have to be taken will not appear to involve a clear choice between strengthening or weakening Nato, between building up or cutting back.

A great deal has happened since last year's annual review, and most of the things that have happened have made the planners' headaches worse, and the unreliability of their guesses more apparent. A year ago the decision was taken to base Nato strategy on the use of nuclear weapons, and the programmes now being scrutinised reflect that decision. Early in the year, the British Government announced its decision to manufacture the hydrogen bomb, and the concept of "deterrence" was brought into the open by the White Paper that followed. Neither the economic nor the strategic implications of these developments have more than begun to be realised. The period of maximum build-up as projected at Lisbon has now been nearly reached in all the Nato countries except Germany, which has yet to start. All the indications are that even to stay on the plateau once it has been gained means rising defence costs. Any substantial shift to new weapons and new strategy means higher obsolescence rates, more airfields, more mobile and better equipped divisions, more specialised training.

Finally, in addition to the looming economic problem, there are the great strategic question marks. Does the deterrent power of the hydrogen bomb mean that conventional weapons, including the "new conventional" atomic weapons, are already either obsolete or unnecessary? Are we in danger of finding ourselves forced to resort to nuclear war because of our inability to defend ourselves by other means, even if our opponent, for whatever reasons, stops short of using weapons of mass destruction? Can we deal with brush fires?

★

At present the information submitted to Nato by the British Government runs only up to April of next year, presumably because the implications of nuclear defence have not yet been digested. Much more information, even if only of a preliminary nature, will undoubtedly be given orally. But there is the danger that preoccupation with the imponderables of the future may divert attention from the need to maintain and improve the quality of the only defence we now have. This feeling, that the future is so inscrutable and perhaps so different that a little marking time or a little cutting of corners can do no harm, is an Atlantic, not simply a British,

problem. What, it is asked, does one Danish battalion more or less matter? And much more insistently, there comes the question: is there any real need for German divisions?

Since midsummer the hopes raised by Geneva, and the tendency of governments to encourage these hopes, have added public confusion over the need for defence to genuine perplexity about the best kind of defence. And inflation in this country, and the pressure of socialist demands in others, have made it harder for governments to be frank; harder for them to explain to the public that the road from the "summit" does not run downhill; harder for them to go out of their way to make the public understand why it should not urge governments to do things they half wish to be pushed into doing.

★

There may, perhaps, be cuts that can be made here and there without weakening Nato. Only the experts can judge these intricacies. But three things are clear. First, even if we try to do no more than hold the allied defence effort at present levels, it is still bound to get more expensive. Second, cutbacks tend to set off chain reactions throughout the Atlantic structure. Third, no country is too small to matter. The strength of Nato lies in the fact that it is an alliance of partners. "Burden sharing," in the sense in which it was known in Nato's early days (that is, of attempting a precise mathematical division of the burden of defence among countries) has, rightly, been abandoned. Fair shares cannot be reduced to a neat formula when money, men, and geography all play their part in the calculation. But the concept of common responsibility, which is fundamental to Nato, remains. And only if all member countries feel that their partners are pulling their weight, however intangible the calculation of weight may be, will Nato continue to be more than a military alliance.

Moreover, although the danger of a premature relaxation is at once the most pervasive and the most insidious of the dangers that now beset Nato, it is not the only one. As the external threat appears less menacing and less immediate, all the latent divisive forces within the community become more obvious. The connection between American tariff policy and a strong Atlantic community tends to become obscured. The Greeks and Turks forget they are partners. The French withdraw their best troops to deal with urgent problems in North Africa. In the Saar, the larger issue of a united Europe is obscured by passion.

But when all is said, Nato is not falling apart at the seams, and it would be a disservice to paint the picture blacker than it is. Some of the present difficulties are growing pains; some are the inevitable results of the centre of the stage having shifted to Geneva. And some, and on the whole the difficulties that matter most, are ones that the member governments can themselves correct by plain speaking.

The Right to Move

THE year for which the basic travel allowance is granted runs from November 1st to October 31st, and an announcement of the arrangements for the next twelve months can therefore be expected any day. The limitation of private travel expenditure has always been officially regarded as a temporary expedient, as one of those unpleasant relics of wartime that will be done away with as soon as possible. As year succeeds to year, this attitude becomes harder and harder to uphold. He would be a very bold man today who would venture to predict when the need for a restriction of travel expenditure will be thought, in Whitehall, to have disappeared, or even when the basic allowance will be made so large that practically nobody will notice its continued existence. *Ce n'est que le provisoire qui dure.* It is not generally expected that the Chancellor will reduce the allowance for 1955-56 below the £100 that was granted for 1954-55. But if the announcement is one of "no change," it will be a long step towards the hardening into a permanency of the belief that British subjects cannot safely be allowed more than some such sum as an annual allowance for uncontrolled foreign travel. Before the provisional hardens into the permanent, the Chancellor of the Exchequer might be asked to give some thought to the first principles of the matter.

Personal mobility is one of those things to which a very different priority can reasonably be given in the short run and in the long. When it really is a question of a temporary emergency, no great harm results to the public interest if travel is closed down. In any one particular year, the damage done even by a complete stoppage is small—whereas any interruption to the imports of material goods has immediately visible effects. That is why, in a balance-of-payments emergency that really is temporary, it may be right to cut foreign travel more savagely than imports of goods—just as, in a sudden local emergency such as a shortage of fuel or water, it is obviously right to close the schools rather than the bakeries or the power plants.

But in the long run the case is surely reversed. The long future of a nation depends on nothing so vitally as on its schools, and similarly a nation that wishes and needs to live in the world should regard it as a matter of the highest importance that its citizens should not be either mentally or physically hooped up within its own borders. Moreover, from this long-term view of the national interest, it is not the short holiday or pleasure trip that is important (though they have their value) so much as the much smaller number of people who go to foreign countries for long enough to acquire real knowledge and understanding of them. If, as seems only too likely, some limitation of private travel expenditures is going to be necessary for a long time ahead, the nature and size of the limitation should be considered against the background of this long-term

public interest. And not against a background of collective interest alone, for the individual citizen has rights of his own, among which the right to move must surely be included. A permanent system of travel allowances should interfere as little as possible with the individual's right to go where he will and to stay there as long as he wishes.

When the matter is looked at in this way, the first specific point that needs to be made is that freedom of human movement should be given a priority in its claim on the available foreign exchange at least not inferior to the priority given to the freedom of movement of goods. At present its priority is far lower. In the exchanges between the United Kingdom and the countries of free Europe there is at present an open general licence for a long list of commodities, many of which could not by any stretch of language be called necessities. Of these goods a resident in the United Kingdom can import as many as he is willing to pay for. The British Government, to its credit, shows no sign of withdrawing any of these open general licences. If it can be done for goods, why not for persons? Why insist on direct controls in the one case and not in the other? Why not rely on general financial and fiscal policy to keep the demand for foreign travel in check, just as Mr Butler so proudly—and rightly—relies on it to keep the demand for foreign goods in check?

The second point that needs to be made if some limitation of travel expenditures is going to be permanent, is that any geographical exclusions are wrong in principle and damaging in practice. The present position is quite ludicrous, for a British subject is free to visit the Soviet Union without having to ask the Treasury's permission, but neither the United States nor Canada. This is the sort of thing that may be tolerable temporarily but not as the semi-permanency that it has become. What sort of a Commonwealth is it when the citizens of one part cannot freely visit another? Again, the immediate object should be to put human beings at least on a par with goods. Token import quotas for American and Canadian motor cars were granted some time ago, and have not been withdrawn. If dollars are not too tight for this, then they should not be so tight as to ban all private pleasure travel to the dollar area. (The allowance of about \$100 for visiting "close relations" is too small to be taken seriously.)

The third point concerns the form of the allowance. It is expressed as an annual sum. But this is really a misnomer. It is safe to say that nobody draws it over the whole year, at the rate of £2 a week. Expressed as an annual sum, it is really a licence to spend a very

few weeks out of every year outside the country. This serves well enough the needs of the holiday-maker and the casual visitor (though with the steady rise of prices in some continental countries the period it licenses is again becoming very short). But anyone who wants to stay longer than a brief holiday has to ask permission. It is no answer to say that additional currency will always be granted to anyone who has a good reason for going abroad. For one thing, the official definition of a good reason tends to be proof of necessity. But in the long run it may well be the least necessary travels that are the most rewarding, to individuals and nations alike. (Would Byron have received a Special Allotment to go to Greece?) Moreover what sort of a state is it that makes its citizens ask permission to stay out late, like schoolboys asking to be excused from lock-up?

There is a fairly simple way of meeting this point of principle, without abandoning all limits on the use of foreign exchange for travel. This is to grant the allowance not on an annual but on a daily basis. Let the allowance be (for example) either £100 per annum or £5 for each day actually spent abroad, whichever is the greater. The individual would then be free to go when and where he would and to stay as long as he wished, but there would still be a safeguard against the export of capital (which is the only abiding need for any control at all), since he would have to stay a very long time and live very hard indeed to accumulate any sum worth the trouble. If it be objected that such a system would not be administratively work-

able, the answer is that it is precisely the system that is already applied to business journeys.

★

If travel allowances are to be a permanent feature of our national life, the only system that should be tolerated would be a daily allowance without restriction of time or place. It is not really unreasonable or unpractical to press for this here and now, even in this difficult autumn. The cost in foreign exchange would be small—certainly no more than £10 million a year and probably less. It would be much smaller, that is to say, than the dollar cost of indulging the British public's taste for Virginia as distinct from other sorts of tobacco. If we really believed some of the generalities that figure in politicians' speeches about freedom, civil rights and international understanding, we would be willing to re-arrange the priorities to the quite tiny degree that would be necessary.

But if the Chancellor finds this idea too unsettling, there is a minor plea that might be enough to be going on with. This is that the freedom of personal movement should, in every area, be treated as not less important than the freedom of movement of goods. In practical terms, this would mean an open general licence for travel within the non-dollar world, and at least token trips to the United States and Canada. If the Chancellor says that he cannot afford even that, he may sound very judicious. But he will be admitting that he has not really thought about the matter at all.

Nationalism Without Brakes

THE two international sensations of the past week are closely connected. Both Egypt's arms deal with the Soviet bloc and the French withdrawal from the United Nations Assembly are facets of one broad general development, the impact of which no part of the world can ignore. There is, of course, nothing startlingly new about the Asian-Arab upsurge itself; indeed, the Bandoeng conference last April was essentially a solemnisation of a familiar reality. After the massive withdrawal of European power from the Orient during the past decade, and the successful creation of a whole new galaxy of sovereign states between the Mediterranean and the Pacific, it is neither surprising nor in itself disturbing that these new states are eager to assert their independence and to make their presence felt on the world's stage. No responsible person in the West begrudges them their progress. But, statehood once achieved, the way ahead for Asian and African nations is just as tricky as that which other states have to travel. A firm use of steering wheel and brake is as essential, if collisions are to be avoided, as pressure on the accelerator is essential to progress; and

there is perhaps nothing more important than a wide area of vision when approaching crossroads. No Highway Code in the world, whether printed in Roman, Arabic or any other script, advises drivers to ignore traffic lights when they are at red. Yet many Asians and Arabs seem in a mood to do just that.

The dangerous intersection of the moment is the one where the "Bandoeng" route meets the "Geneva" road. The loud assertion of Asian and Arab claims and complaints against the West would not endanger international stability if freedom was not already threatened throughout the world; nor would it if the threat to freedom was clearly and generally recognised, for most men would then put first things first. It is when claims and complaints (from any quarter) are voiced with a new shrillness because the threat has apparently been removed that the greatest danger arises; and it is thus that the mixture of "Geneva spirit" and "Bandoeng spirit" takes on explosive characteristics.

Egypt's right to buy arms where it pleases is unchallengeable in itself (pending worldwide agreement on disarmament), and in itself it is not being challenged.

But Egypt's insistence that it can demonstrate its complete independence only by buying from Communist arms manufacturers fits in perfectly with the gospel Moscow is now preaching—the gospel of neutrality for more and more nations, which, it goes without saying, are to be detached from association with the West, not from the Soviet bloc. At the very moment when the Turkish-Iraqi pact has been broadened to include Pakistan, while Iran is responding cordially to Turkish approaches, the Russians have achieved their biggest success to date with the argument they have been so assiduously using throughout the Middle East: the argument that, in the new atmosphere of relaxation, the Arab states can forget all about the possibility of danger from the colossus to the north. Implicit in this argument has always been the corollary that the Arabs can then devote their energies to the destruction of Israel. Soviet diplomacy has contrived to tighten nerves again along the Palestine frontiers, to sow new bitterness between the Arabs and the West, and to strike a blow against the Baghdad alliance—all by making judicious use of the conjuncture of Bandoeng and Geneva.

★

The same two elements prevailed in the UN Assembly when it decided, by 28 votes to 27, to debate Algeria, reversing the ruling of its own steering committee in an unprecedented manner and visibly surprising itself. At four previous Assemblies the Arab bloc, with Asian backing, had pressed the Tunisian and Moroccan issues, eventually goading French delegates into absenting themselves from the committee sessions concerned, but never securing, even from the "anti-colonial" Latin American representatives, enough support to carry their resolutions. This year, with changes under way in the two North African protectorates, the Arab-Asian pressure switched to Algeria, in the full knowledge that French resistance would be still sharper in the case of an area which is legally part of metropolitan France. "Bandoeng" feeling enlarged the Afro-Asian phalanx; Siam, the Philippines, and Liberia joined the Arabs and the Colombo group in demanding a debate. "Geneva" feeling disrupted the ranks of those nations that would, in tenuous times, have stood together to prevent a crisis; Greece (indignant at France's opposition to discussion of Cyprus) and six Latin American states voted for an Algerian debate, Iceland, Ethiopia and others abstained, and a debate was approved by a majority of one—a figure eloquently indicating that no positive resolution can possibly secure the two-thirds majority required by the Assembly's rules.

Thus in New York and Cairo last week, as in the Balkans in recent months, it was shown that Moscow's new and more intelligent policies are paying off, that when the bear sheathes his claws, and grins an apparently toothless grin, sectional animosities revive

among the free nations, and even allies shake off their inhibitions about quarrelling in public. Admittedly, a certain amount of argument, even of friction, is and ought to remain an identifying characteristic of the free world; only in a monolithic, totalitarian system can disagreement be totally extinguished. But must it then be conceded that the Marxist dogma is true which condemns the non-Communist world to tear itself to pieces through "internal contradictions"?

Given a normal amount of sanity both in Asia and in the West, that nightmare need not come true. Dispute need not always lead to disorder, or anger to anarchy, if certain obvious facts are grasped by the disputants. Both Asians and westerners have still to assimilate some ideas that do not appeal to them. In the West, it is first of all necessary to get rid of the illusion that all anti-western feeling in the Orient is the product of Communist intrigue. Undoubtedly, the Communists do not hide their intention of playing on this feeling for their own ends, and intensifying it wherever possible. But the underlying feeling is real enough (as is the widespread affection between Asians and westerners which, unfortunately, carries less political weight). Westerners have also to appreciate the exertions which many responsible Asian leaders often make to restrain hotheads among their own peoples, a task which generally involves some loss of popularity. Asian delegates at Uno do not automatically endorse every charge levelled at colonial authorities; at Bandoeng, the resolutions adopted in an atmosphere charged with anti-western emotion were notable primarily for their moderation; both at Bandoeng and in New York, spokesmen for free Asia have shown a good deal of wariness over accepting Communist arguments at full face value even when they are advanced by fellow Asians. All this should be taken into account.

★

At present, however, it is the Asians who are making the running, and it is among them that there is the greatest need for more careful reflection, particularly on two points. First, it is broadly true to say that the peoples of the Orient still have no idea what Communist rule would mean for them. Wrestling with their own vast changes and problems, they have simply not noticed what has happened in Eastern Europe since the war, and even China remains for most of them remote and mountain-girt, lavish in its propaganda but not an immediate reality such as the sight of the satellite regimes presents to continental Europeans. Likewise, in many Asian eyes Western Europe still seems a horizon-straddling giant; they do not see it as its own inhabitants now do, as a precarious foothold of freedom at one end of a land mass now bound by iron chains.

Second, most of the Arab leaders and many other Asians seem quite heedless of the harm their present

tactics are doing to the United Nations system—and hence to themselves. It is true that they have always emphasised Uno's function as a forum for the airing of disputes and grievances, as against the original concept of an organisation to defend peace; but they are not altogether unaware of its value as a shield for the weak, and they presumably recognise that in it they have obtained a much stronger position than they held in the European-dominated League of Nations. Do they now want to discredit or even destroy the very instrument that has proved so useful to them?

Many sincere supporters of the United Nations' cause seem to feel that they must, on principle, support the "right" to bring juridically domestic issues before it, and that it is a setback for Uno whenever such a debate is barred. The weight of argument, however, is very much on the opposite scale. It is the worst possible service to Uno to strain its procedure beyond the founders' original bond, to use it to stir up anger and fear, and then to reveal its impotence to carry its resolutions into effect. To do this is damaging to the United Nations' prospects of ever becoming a real protector of weak and peaceful nations. It is damaging even to those who hope that some day it will acquire proper powers to concern itself constructively with nations' domestic affairs, for the arbitrary hit-and-run tactics now pursued in effect set a premium on intransigence.

If France's Moslem citizens were as rigorously insulated from the outside world as Russia's are, would the Arab-Asian governments see any more point in demanding self-determination for Algeria than they now see in the case of, say, Kazakhstan? The impression has grown up that only a government which reveals liberal tendencies has anything to fear from Asian critics in Uno. It is the retreating "imperialists" who get sniped at, not the unbudging or advancing ones. And the effect is usually either to goad a conciliatory government into stubbornness, or to hasten its replacement by a more stubborn one.

Indeed, the only winners in the game as played at present are authoritarian regimes, of whatever colour, which give Uno no information about their minorities, blandly ignore its code of human rights, and cast their votes without scruple to set at loggerheads Asians and westerners between whom the essentials of freedom are common ground. Most of Asia's real leaders today are genuinely concerned to preserve and extend freedom, and their only excuse for playing the authoritarians' game for them is shortsightedness. The time has surely come when they should search their hearts, asking themselves what they want to do to the United Nations—to nurture it both as a forum and as a peace-maker, or to reduce it to futility, bitterness and ignominy, and thereby to leave a clear field for international politics based on naked power.

Notes of the Week

Which Froth?

THE Chancellor's after-banquet speech at the Mansion House on Tuesday contained one pleasant and one unpleasant surprise. The unexpectedly good news was that Britain had a small surplus on its current balance of payments in the first half of this year. Admittedly, this surplus was probably more than accounted for by the receipt of some of the last dribbles (£34 million or so) of American defence aid; admittedly, too, as the Chancellor dutifully pointed out, a country with heavy commitments for foreign investment should run not a small current surplus but a large one. Nevertheless the news that Britain was paying its way until the end of June sits rather oddly beside the cries of crisis that have been heard all through the summer. It suggests that the fall in the gold reserves—although it should be noted that this, too, amounted to only some \$82 million during those first six months—has not been entirely due to British extravagance: more potent

factors, probably, have been the Australian spending spree (which has been much bigger than the British one) and foreign speculation against the pound.

The Chancellor's unexpectedly bad news, however, was that this drain on the gold reserves was still in flood in September; another \$112 million was lost, and Britain incurred a new debt to the European Payments Union that will have to be settled by paying out \$80 million of gold next week. Although he was able to announce that "virtually the entire loss and deficit with EPU took place in the first half of the month"—which suggests that for the last fortnight we may at last have been back in dollar balance again—he had accordingly to be rather more specific than before in his references to the need for new measures of restraint. "The sum of the Government's proposals in the field of expenditure," he said, "and any other measures which are necessary to correct the situation, must, of course, be announced to Parliament as soon as we meet."

The tone of Mr Butler's speech—in particular the blame that he put upon private consumption and Government expenditure—does not suggest that his chosen weapon will

be to raise Bank rate again. But what "other measures" then? Cuts in the investment programmes for the roads and other essential public services? It will be a pity if the Chancellor assumes that these can lightly be switched on and off. Higher purchase tax on cars and other exportable goods? There is a case for this, but not an overtly strong one. A determination to follow up Mr Sandys's "very important" warning that housing subsidies should be cut with full-bodied reform of the Rents Restriction Acts? The case for this is overwhelming, and there seems to be increasing reason to hope that the Government will accept some part of it. The still, small—and probably unheard—voice of reason must murmur that there is a very strong case for a cut in the agricultural subsidies as well.

Under New Management

CONSERVATIVES will warm to the rich, expansive personality of Lord Woolton for the last time when he sums up the results of the annual conference at Bournemouth this weekend. Indeed, their leave-taking may be the most affecting feature of the whole Tory jamboree. For Lord Woolton it will be a most satisfactory "account rendered." He took over the chairmanship of the party the day after its defeat in 1945; he leaves it re-energised with probably four years of power ahead. His successor, Mr Oliver Poole, takes over a smoothly functioning machine; but that is not to say that his task will necessarily be any less difficult than Lord Woolton's. Lord Woolton started with a broken-down outfit and very little money, but with a group of young enthusiasts bursting with ideas: the very stuff of which a success story is made. Mr Poole, with no such national reputation as Lord Woolton enjoyed, takes over a fine business, equipped with immaculate departmental heads, but rather fewer ideas and effervescence; his problem will be to introduce even more scientific methods of vote-collecting, to fight the dry rot of complacency with relentless vigilance, to find—if possible—some new ideas, and to put over his own personality. Well-liked in business circles, he has yet to make his appeal to the housewife, the voluntary worker, the young Conservatives. In this, however, he will have the backing of Mr Donald Kaberry, who well knows how to pounce on an issue and make a Tory battle-cry out of it.

It may be that Mr Poole will concentrate on the problem of a new inspiration—he was political head of the Conservative Political Centre—while Mr Kaberry deploys his organising experience in the constituencies. Their immediate problem, however, is clear. They have to put over to the party workers the right story about the government's economy measures—and, it may be hoped, about other useful legislation for getting the distortions out of the economy—in the next year or two; to combat any incidental defeatism if the public sulks or Labour goes on to the offensive; and to prepare for the electoral success story which should emerge around 1958 or 1959. They have, in fact, a long term public relations assignment. They will do best to treat it as a whole, to balance the lean years against the fat, and to trust to the electorate's sense of further favours to come. And, of course, to keep the party's

fighting machine clean and oiled at all times—for even with a majority of 60 one never knows when the bridegroom cometh.

A Change to be Avoided

THE Government changes have been delayed. This can be interpreted—according to choice—as meaning either that Sir Anthony Eden is wisely refusing to be hurried in his decisions, or else that he is dithering. The rumours about whom these changes will affect vary almost from day to day. But one rumour which has been given some currency—and which deserves comment at this stage—is that Mr Thorneycroft may leave the Board of Trade: either, it is said, he may change places with Mr Boyd Carpenter at the Ministry of Transport, or else he may be rolled out of the Government altogether.

The Board of Trade is far too large a department for a single Minister or set of senior civil servants to handle conveniently, and there is a strong case for separating its external and internal trade functions. But in the last few months Mr Thorneycroft has been chiefly notable for two things. First, he has piloted through the Cabinet a proposal for monopoly reform that would go slightly further and faster than the reform proposed in the majority report of the Monopolies Commission would have done; and this has annoyed some of the Conservative party's paymasters. Secondly, he has been reasonably firm in dealing with the Lancashire lobby; and this may have led the Whips to report that he is unpopular with a certain type of Tory back bencher. If he is removed from the Board of Trade now, this will be widely taken as a sign that Sir Anthony Eden has capitulated before both these undesirable forces. The rumour that Sir Anthony has ever thought of moving him may be quite untrue; if it is true, then it is quite possible that Mr Thorneycroft himself would be rather relieved to leave his arduous office. But this does not alter the fact that his departure now would be a shattering blow to the general confidence that Conservatism can be kept moving on progressive instead of pressure-group-ridden lines; at a time when everybody seems to be engaged in amateur Cabinet-building, this seems to be the right week to bare one's teeth about a change that needs to be avoided.

Smoke Over Morocco

THE plan to settle the Moroccan question before the French parliament reassembled, and to present the deputies with a *fait accompli*, has misfired. The startling outburst of fighting in the Riff and Middle Atlas regions was not the only reason for this failure. The plan itself was distorted in its hasty, last-minute execution. The puppet Sultan, Sidi Ben Arafa, finally departed for Tangier, but he took along the imperial seal and at the last moment delegated his powers to a cousin, Mulay Abdel Hafid. M. Faure may argue that this is merely a temporary measure,

in no way precluding the creation of a Council of the Throne as agreed at the recent Aix-les-Bains conference. Frenchmen in Morocco, however, echoed by the colonialist lobby in Paris, maintain that the Resident General Boyer de Latour had promised them that *le provisoire va durer*.

The melodramatic search for the sultan's seal is, obviously, no more than a decorative arabesque. The first question is, now as before, whether Paris can impose its will in Rabat, whether the Prime Minister will be obeyed by his proconsul. It is doubtful whether M. Faure will dare to assert governmental authority any more firmly now that he is faced not only with recalcitrant ministers, but also with vociferous deputies. But unless he does, France may blunder into full-scale war in Morocco. Nobody, as yet, is seriously arguing that the latest tribal outbursts, apparently assisted from beyond the Spanish border, are the result of Arafat's departure. On the other hand, if French delays in fulfilling the Aix pledges exhaust the patience of the nationalists, the present violence is all too likely to spread from the tribal areas to the politically conscious towns. The way to avoid that is bluntly to order the Resident to carry out his duties instead of evolving personal schemes. An article on page 131 explains that M. Faure's chances of survival are in any event slim. If his majority is indeed on the point of disintegrating, he might do well to bid boldly for Socialist support for a really positive Moroccan policy. The premier must have learnt in this North African crisis that a government cannot save its head by hiding it in the sand.

Greece Mourns and Watches

It would be wrong to say that the death of Field Marshal Papagos has put Greek politics into a state of flux, for that had developed before the prime minister died. A national hero who drove back Mussolini's armies in the tradition of Thermopylae and decisively defeated the Communist forces in 1949, he again earned his people's gratitude by entering politics and restoring stability to them in 1952, when his Greek Rally party swept the polls. But in recent months, with the prime minister a prisoner of his own health, the Rally, having already lost its architect, Mr Markezinis, had been increasingly torn by antagonisms which revealed the hollowness of its imposing parliamentary majority. Only a few hours before the field marshal's death his delegation of powers to the foreign minister, Mr Stefanopoulos, provoked an open schism and a threat of resignation from several other ministers. Meanwhile, there had been open talk among a divided but restive opposition about simultaneous resignations from parliament with a view to forcing mass by-elections. And in an Athens clouded over by bitterness about *enosis* and by estrangement from Turkey, the atmosphere was as embarrassing for the forces of moderation and commonsense as it was encouraging for extremists.

The death of the prime minister may bring about at least a momentary lull. Few Athenians would wish to see brawling over his bier, and no politician would gain in stature by provoking such a brawl. But the respite can only be brief. General elections probably loom nearer now. Will the Rally hold together even long enough to fight them

as a party? A return to kaleidoscopic politics would appeal to many Greek instincts; but Field Marshal Papagos's tenure of office may have led quite a number of his fellow countrymen to reflect on the damage that further internal divisions must do to Greece's international bargaining power and status.

The Rusty Machine

IN pursuit of its devious objectives, the Wilson committee has not been sparing in its lurid description of the apathy, bungling and bureaucracy in Labour's present "rusty and deteriorating" election machine. Last May, the report says bluntly, Labour's "voluntary workers were fewer and less enthusiastic than at any previous time"; some of its instances from individual constituencies—such as the two rural areas in which "the only workers right up to polling day were the agent and candidate"—attain to the proportions of a horror comic. The primary target which the committee proposes for the new party organisation that it wishes to set up is one that the Conservatives reached long ago. By September, 1957, says Mr Wilson, Labour must have carried its inter-election canvassing far enough to be in possession of an adequate marked register in every marginal constituency, giving "a permanent record of Labour voters . . . with appropriate action to keep it up to date and to register potential postal and proxy votes." Much of the rest of his report is nominally concerned with the machinery necessary for bringing this register into being.

The report moves straight from its discussion of the Conservatives' superior canvassing techniques into its long-awaited attack upon Transport House. This section begins by advocating greater independence for the National Agent (who has hitherto been subordinate to Mr Morgan Phillips) and for the Regional Organisers (who have complained that Mr Morgan Phillips has given them too much paper work

Source: The European Housing Developments and Policies in 1954. Economic Commission for Europe.

to do): the feud in which Mr Wilson is indulging here is made a little too obvious, and it was not made any less obvious as he and Mr Phillips sat side by side at Wednesday's press conference at Transport House. For the blunt and embarrassing fact is that Mr Wilson is trying to pinch a large part of Mr Phillips's job. The Wilson report recommends that a "special standing sub-committee of the national executive" should be set up to "supervise the organisational work of the party." It proposes that the National Agent, his assistant, and the Chief Woman Officer should sit on this committee, but that Mr Phillips should not; the other members of the committee would be the party Treasurer (Mr Gaitskell) and three or four members of the national executive, under "the chairmanship of a member of the national executive" (almost certainly Mr Wilson himself). This sub-committee would be a very important—or, as Mr Wilson prefers to call it, "very busy"—body. It would "meet regularly and frequently, and should be charged with the duty of receiving and considering reports from the Regional Organisers"; above all, and it is with fulfilment of this recommendation that the strings of power would really move into its hands, it would be concerned with "organising training and recruitment of agents."

Nationalising Agents Now

THE present agency service in the Labour party is certainly in need of this proposed reorganisation. The Wilson report notes that at the end of 1954 the party employed only 244 full-time agents; and then—in what is perhaps the most striking sentence of the whole report—"during the past two years one hundred full-time agencies have collapsed, and a further number are in course of doing so." In view of the insecurity of the job, and of a minimum salary that has increased by only 78 per cent since 1939 (to a Grade I rate of between £450 and £550), it is not surprising that the committee finds most new applicants for this job to be "of very poor quality." Moreover, many of the nominally "full-time" agents in the constituencies are not trained organisers at all. They are local Labour councillors, who spend a large part of their time in local government work and another large part in running football pools to raise the constituency party's share of their own salary. The committee recommends that no new grants should be paid from party headquarters to keep this sort of person in office.

Instead, the party's aim should be that "of working towards a full National Agency service." "National appointment," the committee points out, "would, of course, mean national control over the agent, including insistence on adequate training, and the right to move the agent from one constituency to another"; although, to avoid the "thorniest problems" of "imposing an unwelcome personality upon a constituency," it is suggested that local parties should be allowed to choose their agent from a panel approved by head office. In any case, it will only be possible to set up a small "nucleus of a national agency service" in the beginning, and Mr Wilson therefore suggests a series of stop-gap schemes to ensure that the

all-important register of electors in marginal constituencies may be completed by 1957.

He suggests that the national executive should tell the proposed "special standing sub-committee" how much additional money can be spent, and that the sub-committee should allocate this among the regions according to need. Each Regional Organiser would then agree with the sub-committee how this money could best be spent in his own region. In some cases, the urgent need might be for new Regional Assistants, who could spend a month or more at a time as full-time organisers in particular constituencies. In others the need might be for grants to maintain an existing "worthwhile agency" which is in danger of collapse. In others it might be "to deploy nationally paid organisers full-time in particular marginal divisions, perhaps for a limited period." In others, it might be merely to pay students or other part-time workers to undertake a special canvass to bring the marked register into being. All of these are worthwhile proposals. But the effect that they could have on the sinews of power within the local parties has not yet been fully grasped.

Thoughts for Tory Councillors

THE Conservatives' usual curtain-raiser to their annual conference—the discussions by local government Tories on local government affairs—this year showed a refreshing capacity for novel and even radical ideas. The two Ministers who attended it could not say much. Mr Sandys had dropped his bombshell for the year two weeks before, and he would not expatiate widely upon the subject at Bournemouth. He voiced his conviction that cuts in the housing subsidy need cause no hardship if councils act sensibly and introduce differential rent schemes, but he added that he will not compel them to do so; he was also cautious about local government reform, saying merely that he "hoped" that we would be able to present agreed proposals during this session. Sir David Eccles, pointing out that local government now accounted for a quarter of total national investment, urged local authorities to make the public realise why many desirable things are not yet possible; he also indicated fairly plainly that he has been having a tussle with Mr Butler about education expenditure, and that he himself thinks that housing should now slide down the priorities list.

The two principal private papers read before the conference were in some ways more interesting than the Ministerial statements. In one of these, Mr Ivor Gowan urged the re-creation of a Local Government Boundary Commission armed with considerable powers. It would recommend which towns should become county boroughs, and would also take over the county council's job of reviewing the areas of county districts; as Mr Gowan rightly said, the county has become too interested a party to be trusted with this task. He also wanted the middle-sized urban authorities to be given back responsibility for preventive health services and the care of old people, and suggested that Ministers should make much fuller use of their compulsory powers to secure larger authorities for town and country planning, education and fire services. These interesting suggestions

kept within the framework of what Mr Sandys is believed to be prepared to do.

The second set paper from Mr J. D. Trustram Eve contained the surprising proposal that valuation for rating should be handed back from the Inland Revenue to the local authorities. Mr Trustram Eve claimed that valuation was too tricky a business to be put upon a fair uniform basis for the whole country, and that the attempt was upsetting the more important aim of keeping assessments comparable within the same locality. Mr Trustram Eve's argument deserves consideration—the present triangle of valuation officer, local authority and ratepayer is working none too well—but it was above the heads of this particular conference.

No Dealings with Grotewohl

IN formal Notes to Moscow, the three western governments have reaffirmed that the Federal Government is the only legal government in Germany and that the final settlement of German frontiers must await a peace treaty, and have asked for an assurance that Russia will respect its obligations concerning free access to Berlin. These Notes underwrite Dr Adenauer's declarations in Moscow, and counter the Soviet grant to the East Germans of the right to control civilian communications with Berlin. Dr Adenauer is concerned lest his agreement to accept diplomatic relations with Moscow should lead to the recognition of two German states, and has given notice that this would be regarded as "an unfriendly act, hindering German reunion." It was out of the question that the western powers would formally recognise the Grotewohl regime, but there have been rumours that Yugoslavia might do so, and thus give a lead to other neutrals. Moreover, the western powers must soon decide whether to withhold *de facto* as well as *de jure* recognition from the East Germans, who are going to Geneva in force and will ask to be heard there. They will, it seems, urge a reversion to the political clauses of the Potsdam agreement and demand that before elections all Germany must be cleared of "militarists, Nazis, Junkers and big business concerns."

Dr Adenauer is under pressure to send a delegation to Geneva too, even if this means admitting in effect the existence of two spokesmen for Germany. Since his Moscow talks he has been criticised for opposing talks with Herr Grotewohl. Herr Ollenhauer said in the *Bundestag* on September 23rd that efforts to improve communications with East Germany "must not break down over questions of prestige or protocol," that Bonn must be guided solely by the need to ensure the existence of Berlin, and that the Moscow agreement "could only be justified to the people in the Soviet Zone and Berlin if we are ready to accept the consequences of the new situation it creates." Other Germans have declared that the time has come for a "new realism" and an end to "ideological rhetoric" about the "German Democratic Republic." In these circumstances, the western foreign ministers should follow up their formal statements by refusing to listen to the Pankow puppets in Geneva. The lesson of the Moscow talks will have been lost on them if they still believe that Dr Adenauer can take a stiffer line than they do themselves.

Soothing Touch in Belgrade

MR ROBERT MURPHY, the American Deputy Under-Secretary of State, has a happy knack of smoothing out difficulties with the Yugoslavs. Last weekend, after his busy round of discussions with President Tito and senior government officials, full agreement was reached on the future use of American aid. This satisfactory result has been enthusiastically welcomed in the Belgrade press, which closely reflects the official line, and the occasion has been used to acknowledge Yugoslavia's debt to the Americans for their help. In view of the coolness which had been developing between the two countries, Mr Murphy's achievement is all the more creditable.

Disagreement centred on the American desire to carry out an inspection of the military equipment supplied to the Yugoslavs under the agreement of 1951. According to the Yugoslavs, the kind of inspection the Americans had in mind was far too close; but whichever side was at fault this difficulty appears to have been ironed out. As a result, negotiations for the use of economic aid to the value of \$40.5 million allocated to Yugoslavia have been resumed and look like being concluded soon. Yugoslavia has also accepted an invitation to take part in the United States plan for the peaceful use of atomic energy. It is clear that the Administration is determined to keep friendly with Marshal Tito, irrespective of the opinions of a few Congressmen. The Yugoslavs, for their part, are obviously pleased and, to judge from their comments, are contrasting American reasonableness with the obduracy of the Hungarians, who are proving most unwilling to reach agreement on the problem of reparations.

Reluctant Co-existers

THE Soviet Relations Committee set up by the British Council last May has got its teeth well into the business of arranging cultural and technical exchanges between this country and Russia. It is clearly, in the long run, in the interests of Russia itself that Soviet delegations to the West should be shown round by people and organisations that really represent western life, not, as was previously the case, by comrades who fed them the very party-line pabulum they had been reared on at home and sent them back still snug in their delusions. Communist-run societies are naturally still making every effort to steer Russian visitors their way, but the hard-headed leaders of the Khrushchev regime have begun to see that their technical emissaries learn much more from "capitalist" experience if they travel under respectable auspices.

This is all to the good. Every Russian who gets a chance to see the outside world, upshepherded by comrades eager to keep his blinkers tightly adjusted, represents another little opening in the curtain of imposed ignorance. But the scale of what has been achieved, and even of what can be hoped for, should not be exaggerated. The Russians still cling to the principle of limited visits by specialist delegations, and it will be long before it can be regarded as normal for a Soviet citizen to stay privately with friends here, or

vice versa. Nor has the committee any power to reach men's minds in Russia itself. It seems, shockingly enough, that the Moscow publishing houses have not issued a single book that gives a picture of modern British life—not even a hostile one. The evolution of the Commonwealth and of the welfare state alike is thus a sealed book to Russian readers, whose most up to date information on these islands is gleaned from Galsworthy (early Galsworthy at that). "Co-existence" can only be a nasty mockery of a word as long as a government imposes such a ban on understanding. Meanwhile the British Council committee might turn its attention to the large staff of the Soviet missions in London, among whom a certain discontent with their hitherto confined life has become articulate. If, as sadly seems the case, these men and women lack enough initiative to explore the real British way of life for themselves, ought not somebody to be coaxing them to come out of purdah?

Conference Under Suspicion

BRITAIN has no McCarthys; but three hundred indignant individuals from more than forty countries (the vast majority of them eminently respectable people) have gone home in the belief that it has now produced its own befuddled example of how to spread guilt by association. The unlikely victims of this muddle are the members of the International Conference on Regional Planning and Development which met last week-end in London. The conference was sponsored by eight British and one American Universities and educational bodies; it had the support of several score of academic, social, and professional organisations; its professed aims were wholly professional and academic, and its actual proceedings were quite free from any hint of international politics. It made two mistakes. It announced its intention of establishing a permanent centre for studying regional planning; and two or possibly three of the fifteen members of the preparatory committee were believed to be in some degree Communist sympathisers.

The Government has, of course, every right to be cautious about the political respectability of any large international conference in which civil servants had been asked to participate. But its method of showing its suspicions was extraordinary. They were shown first in steps privily taken by the Foreign Office to dissuade foreign governments from participating—as a result of which the Italian, Norwegian, Australian, Canadian, and South African delegations eventually withdrew. By contrast, the Colonial Office gave the conference its warm support, and was in fact instrumental in bringing a large number of colonial delegates to London. At the last minute, the Home Office stepped in and advised civil servants not to attend in view of the "undesirable political affiliations" of some of the conference organisers. The effect of all this on the conference itself was less devastating than might have been expected. About 60 of the 360 delegates withdrew. But the rest of the distinguished professors and experts fulfilled their allotted roles, although with faces far redder than their politics are ever likely to be.

Would it have been better if the Foreign Office had expressed its suspicions by informally approaching either the universities that were sponsoring the conference, or the preparatory committee itself? The Government's answer will presumably be that any such course would have led to even shriller cries of "McCarthyism" than have now been sent up. But this reply confuses the shrill objection to its chosen procedure with the real one. The real complaint now being voiced is not one of McCarthyism; that charge is too silly. The real complaint is that a clutch of eminently respectable professors feel that they have been most unfairly tainted with a hint of illicit conspiracy, and are murmuring fearfully to each other—for example—that next time they want a visa to visit America they may find themselves in difficulties. It is high time that the Foreign Office showed a little more diplomacy at home.

Counter-Revolutionary Proposals

IT is never easy to be reasonable yet counter-revolutionary; in his "Notes on Public Finance" in the latest issue of *Lloyds Bank Review*, Professor Lionel Robbins manages to be both. His thesis is that the revolution wrought by progressive taxation in the last thirty or forty years, and "the circumstances that it is now virtually impossible to build a fortune like Lord Nuffield's," should arouse apprehension rather than enthusiasm; he himself is apprehensive that it "will become more and more difficult for initiative to develop save within the ambit of established corporate enterprise," and that "there should no longer be any substantial blocks of individual wealth whose owners can defy fashion, foster minority causes, and give succour and support to the eccentric and the unpopular." But he is wise enough to restrict his proposals for early reform to three counts.

His first attack is upon the "tax on marriage" among the "rather better off middle classes"; the fact that the incomes of a husband and wife are aggregated, and may thus be thrust unfairly high up the surtax range, is not only a subsidy for "more casual associations," but an economic impropriety in itself. Under the American tax system, roughly speaking, a husband and wife may aggregate their incomes and each be taxed on only half of the aggregate; better still, under the so-called "quotient" system operating in some other countries this process of aggregation and division is extended to the family, with each child counting as a certain fraction of an adult for purposes of division. Professor Robbins wants quotients here.

His second charge is that the present system of death duties, under which the amount of duty levied depends upon the size of a man's estate instead of upon the size of individual legacies, militates against a wide spread of property; it helps to "enforce a rigid primogeniture," and with it the sort of society that Professor Robbins does not like. Legacy duties, as distinct from estate duties, used to be a feature (admittedly, only a minor feature) of the British fiscal system before Sir Stafford Cripps abolished them; Professor Robbins thinks that it was estate duties that should have been abolished, while legacy duties should have been made the sole principle of the system. Finally, although Professor

Robbins does not really believe in ordinary profit-sharing ("An entitlement to a share of profits is not property . . . it cannot be bought and sold . . . it does not carry with it a liability to loss . . . it involves no proportionate voice in control . . . there is an essentially *ex gratia* element in it all") he does believe that workers should own more equities; and he thinks that it would be easy to devise ways in which the tax system could encourage instead of discourage issues of this sort. None of these three reforms—even though the first of them, the repeal of the tax on marriage, would be by far the most expensive—should be financially or politically beyond the pale for a new Conservative Government. But are Conservatives counter-revolutionary now?

Janet's Little Bill

A FORTNIGHT ago the hurricane Janet struck Barbados, Grenada and northern British Honduras, before proceeding to cut a swathe through Mexico. Grenada, a poor island living largely from tree crops like coconut, cocoa and bananas, suffered most; according to the Governor, entire estates have been obliterated. As is usual on these occasions, the British Treasury has been induced to make an immediate grant for first aid (£50,000); the damage will then be assessed, and an argument will develop as to how much of the much larger total bill Britain shall pay, how much the local exchequers. In the case of Grenada there can be little doubt that Britain will have to pay for most, if not all, of the damage, which will include subsistence while crops are replanted and come to bearing. Barbados, hit for the first time in 57 years, can make a contribution of its own. When Jamaica was devastated in 1951, Britain made a down payment of £250,000 and agreed to pay £4,750,000 on the final assessment of damage, some part of which may be outstanding; it is also possible that relief payments of this kind partake of the nature of a capital investment.

Nobody will complain, though it should be noted that Britain, as a colonial power, in effect insures the islands against what is a periodic disaster. Only in a few instances are local insurances taken out to cover specific crops, or "disaster reserves" accumulated. The whole approach to disaster is curiously uneven—as perhaps impulses of charity should be; simultaneously with the Windwards being struck down, Bermuda was sending \$43,380 to the United States to help relieve distress caused by Diane earlier. Presumably when the West Indies become independent, the scale of aid will correspond more with that garnered by a stricken independent state; the new federal government will have to be the insurer. Meanwhile the loss and distress—and the money paid—will no doubt add to the West Indian emigration to Britain, now being put on a subsidised basis.

Elections in Brazil

IT will probably be a fortnight before most of the results of this week's presidential elections in Brazil are known. But the heavy proportion of abstentions, estimated at between 20 and 30 per cent of an electorate which is legally

obliged to go to the polls, suggests that a spectacular campaign by various candidates did not eradicate the sense of apathy and disillusion felt by many Brazilians since the end of the Vargas era. It also suggests that the swing to General Juarez Tavora, hoped for by the army and conservatives, has not taken place. So far, Sr Adhemar de Barros seems well in the lead, but this may mean only that votes are being counted most rapidly in the coastal areas around Rio de Janeiro and Sao Paulo and in other urban centres where his strength is concentrated. Expectations are still that Sr Juscelino Kubitschek, who proclaimed himself to be Dr Vargas's heir during a 45,000-mile election tour, will emerge as the winner. His vice-presidential candidate, Sr Joao Goulart, appears to be doing badly; this may be due, in part, to revelations about his contacts with the fallen Peronista regime confirmed by General Lott, the Minister of War.

If Sr Kubitschek does win the election, the army will find itself in an exceedingly delicate position. It has stated that it is the guardian of Brazilian democracy and has promised to respect the will of the electorate. On the other hand, it is opposed, in some measure, to what it believes to be corrupt forces associated with Sr Adhemar de Barros, and it is strongly hostile to the demagogic instincts of Sr Kubitschek. Moreover, recent events in Argentina have convinced many Brazilians that certain elements in political life should simply not be allowed to come to power even if voters are so misguided as to elect them. Sr Kubitschek, however, has warned his supporters of a possible army *coup*, and it would be impossible to deceive the country successfully about the real outcome of the voting. All that can be predicted now is that the next weeks will be tense and difficult.

Indonesia Swings Left

WHILE it is still too early to visualise the whole picture of Indonesia after last week's general elections, the outlines that have emerged so far are disquieting. Reports of the rapid growth of the Communist party (PKI) during the Nationalists' long tenure of office are proving to have been, if anything, an understatement. According to the first incomplete returns, the PKI alone had polled half a million votes more than the Masjumi (Consultative Council for Indonesian Moslems), which was believed before the elections to be the strongest party in Indonesia, because of its natural appeal to an Islamic people and the thoroughness of its organisation in the villages. The Masjumi may gain ground as returns from Sumatra and the remoter islands come in, but an actual victory for this moderate party can presumably be excluded, since most of the counting in Java, which contains 30 million of the 43 million registered voters, was complete at the time of writing. The partial eclipse of the Masjumi can be explained partly by its long exclusion from the election committee while the Nationalists were in power; and partly by the unexpected success of the breakaway Moslem party Nahdatul Ulama, the real "dark horse" of the election. Dr Sjahrir's Socialist party has been even more completely submerged than had been foreseen.

The energetic caretaker government under the Masjumi leader, Dr Harahap, is supposed to remain in office until

CARNAÚBA

Among the few trees that grow on the dry hillsides of the State of Ceará in Brazil is the valuable Carnaúba palm. Scraping the leaves of one hundred palm trees will yield some forty pounds of wax, and a process of decoction will produce a further quantity of a different quality. Carnaúba wax is brittle but has a high

melting point, and it has for many years been used in combination with softer waxes for making wax candles: today it is an ingredient in many polishes, paints and varnishes with names that are household words, and it enters into numerous processes, including the adulteration of beeswax.

Carnaúba wax is shipped to the United Kingdom and to other markets from the port of Fortaleza, where a branch of the Bank of London & South America has been established for many years. Carnaúba wax prices are mentioned in the commodity reports published in our Fortnightly Review, which also contains information from our other branches in South and Central America on trading conditions, exchange regulations and economic developments in general.

after the Constituent Assembly has done its work, and this larger body is not to be elected until the end of the year. But the trend of the elections does not encourage the belief that the Masjumi will be in power thereafter, or that Dr Harahap's work of eradicating corruption and facilitating foreign trade will be continued by his successor. If, as now seems likely, the Nationalists find themselves in a

position to form a government, the future of Indonesia, in terms of foreign relations as much as of internal prosperity, will depend to a large extent on which of the other parties are asked to join the inevitable coalition. The curse of Indonesian politics in the past few years has been the unwillingness of many of its leading figures to recognise the threat of Communism for what it is. And this short-sightedness appears to be as prevalent among the orthodox Moslems of the Nahdatul Ulama as in the Nationalist party itself.

Through Rose-Coloured Radarscopes

THE statements made by Air Marshal Sir Dermot Boyle, head of Fighter Command, at the end of the ten-day air exercise "Beware" last weekend were meant to be reassuring. They will have quite the opposite effect. They are of no help to those of his colleagues who are trying to bring home to the Treasury and the country the essentials of atomic strategy, and they raise the question whether Sir Dermot himself realises that the system of air defence that won the Battle of Britain ended ten years ago at Hiroshima. It is no longer sufficient to maul an enemy bomber force. Unless it is destroyed entirely the country remains, in effect, an open and obvious target for atomic devastation, so great is the striking power of the individual atom bomber. The Air Ministry has recognised for some years that even 90 per cent effective defence is technically impossible at present, and this realisation has led logically to the decision to rebuild Bomber Command as a long-range atomic striking force. The principal lesson of exercise "Beware," in which the RAF was using its new Hunters and a brace of Javelins for the first time, is not the value of more extensive radar and faster fighters. It is that the air chiefs have been correct in their presumptions that the threat of reprisal is the only effective defence at their disposal.

What the public needs to know about the present stage of the country's defences is not that Sir Dermot himself would be twice as reluctant to attack this country today as six months ago—and how reluctant is "twice"?—but how near is the RAF to possessing the deterrent, the atomic bombing force, promised in successive White Papers. The Valiants, which are the first long-range jet bombers to reach the RAF, did not take part in "Beware." If the RAF cannot prevent attack, can it at least retaliate?

The Law and the Homosexual

THE departmental committee on homosexuality and prostitution is still taking evidence, and it can be assumed that its report will not be forthcoming for many months. In the meantime, from the memoranda that have been published, it looks as if the most controversial question the committee will have to decide is whether homosexual conduct between consenting adult males in private should continue to be a criminal offence.

The latest body to air its views on the subject is the Magistrates' Association, whose memorandum of evidence to the committee was published in its annual report last week. The association recommends that homosexual conduct between men should not be an offence; but at the same time it proposes that the age of consent should be 30. This age limit is much higher than others who favour a relaxation of the law have usually thought proper—the Howard League (whose annual report has also just appeared), for instance, suggested 21—and, if adopted, would not prevent many of the tragedies that at present arise from too harsh an enforcement of the law as it stands. But perhaps the high age limit reflects a compromise dictated by disagreement on the main issue among the council of the Magistrates' Association, for the recommendation, even with this proviso, was carried only by 41 votes to 33.

The association's membership includes about 60 per cent of the active magistrates in England and Wales, and perhaps it is only the progressive and liberal-minded magistrates who bother to join. Even so, the forces of law and order tend to be so conservative when a controversial proposal of this sort is put forward that those who consider the present law relating to homosexuality wrong in principle should be encouraged by the memorandum. They will especially welcome the emphasis laid by the association—and here it is in full agreement with the Howard League—on the undesirability of sending homosexuals to prison, except as a last resort.

Russo-Japanese Price-Cutting

JAPAN has reached a time of decision in its long peace negotiations with the Russians. During the present recess in the London talks the chief Japanese delegate, Mr Matsumoto, is busily reconsidering his country's position with his leaders in Tokyo. The Russians are clearly hoping that Japanese resolution will crack during the interval as

a demand grows at home (carefully fostered by "Radio Free Japan") for a quick return of Japanese prisoners of war. To this end, suitable *entracte* music has recently been provided by Mr Khrushchev and Marshal Bulganin in an interview in Moscow with a group of Japanese parliamentarians. The Russian leaders drew their visitors' attention to the brevity of Dr Adenauer's recent talks in Moscow, urged the Japanese to come to terms with equal dispatch, and emphasised the economic benefits Japan would enjoy if only it agreed to end the state of war and exchange ambassadors.

Apparently the Russians have now withdrawn from their first demands, made at the beginning of the talks, for the neutralisation of Japan and the exclusion of non-Communist warships from the seas between Japan and Korea. Instead, to judge from Mr Khrushchev's hints, they are proposing an unconditional declaration to end the state of war; but are willing to tack on a promise to hand back a limited number of war criminals afterwards and to restore the small Habomai and Shikotan islands provided the Japanese do not fortify them. For his part, Mr Hatoyama is said to be thinking of dropping the former Japanese claim to southern Sakhalin and all the Kuriles, and of asking only for the two southernmost islands of the archipelago. It was unlikely that Moscow would ever have agreed to the original demands. But Mr Hatoyama would be wise to resist the temptation to follow too faithfully Dr Adenauer's example of quick results. Japan might profitably present the Russians with a list of "missing" Japanese prisoners and ask for a search to be made for them (an offer the Russians have already made to the Germans). And the Japanese are on good ground in insisting on a peace treaty that sets out the various points of agreement, instead of leaving the Russians to make *ex gratia* concessions. A little perseverance on their part might well persuade Moscow to cut its price still further.

Hanoi's New Trimmings

THE recent government reshuffle in the Communist republic of northern Vietnam probably reflects the realities of power. President Ho Chi Minh, much photographed in the company of youthful supporters, is to be kept safely upstairs where he belongs. He relinquishes the premiership in favour of Pham Van Dong, the real victor at last year's Geneva conference, who retains the foreign ministry. "Uncle Ho" may now be used more and more as a figurehead, while the Communist half of Vietnam continues to be ruled by the triumvirate consisting of Dong, the party theorist, Truong Chinh, the "Khrushchev" of Hanoi, and General Giap, the victorious war leader.

At the same time, efforts are being made to adorn the "Democratic Republic" of Vietnam with "western" democratic trimmings. The membership of the new Fatherland Front, formed last month with the object of reunifying Vietnam, includes some deceptively innocent-sounding names. There are "socialists," "democrats," delegates from the Cao daist and Hoa Hao sects in the south, and many other southern representatives, including a Buddhist and a woman described as "an agricultural combatant." But if the membership is apparently well-blended, there is no attempt to disguise the reality of Communist control

at the top. Ho Chi Minh is the "honorary chairman"—a further confirmation of his figurehead-status—and the next names on the list are Ton Duc Thang, an aged stalwart of the defunct Indo-Chinese Communist party, and Truong Chinh, the present party boss.

This political activity has not been matched, at any rate lately, in south Vietnam. But supporters of Mr Diem have visited Manila for a meeting of the "Asian Peoples' Anti-Communist League," where again, although in a different context, the list of members had a strange look. This non-governmental body, formed in June, 1954—at the time of the Far Eastern conference in Geneva—comprises delegates from Hongkong, Macao and the Ryukyus, as well as South Korea, Nationalist China, Siam, the Philippines and Vietnam.

So far, the activities of the League have been slight, one major obstruction being the South Koreans' resistance to a Formosan proposal that the Japanese be invited to join. It was decided at the Manila meeting to set up a sub-committee to examine the question of new members. But there is so far little sign that the organisation will prove a serious obstacle to Viet Minh ambitions, or indeed to Communist activities anywhere in the Far East. Whether even the Americans ever thought that it would is not known. The official American attitude is described as one of "benevolence but not active encouragement."

Peace or Truce Party?

In another article we have pointed out indications of an incipient intrigue to wrest from the country the fruits of its hard-won victory by a combination between such of the regular opposition as follow Mr Disraeli and such of the occupants of the cross benches as obey the impulses of Mr Gladstone and Mr Bright, for the purpose of urging the Government into premature negotiations. We have now to explain how little really pacific is the policy which these singular allies would recommend. We are as truly members of the Peace Party as the honourable representative of Manchester or any of his colleagues—nay, much more so. We have depicted the horrors and the mischiefs of war as earnestly and nearly as often. We have denounced the unequalled sin of unjust or unnecessary wars as sternly as Mr Bright. We have calculated the cost of strife even more closely and estimated it at a yet higher figure. We, like him, are advocates for peace. Nay we, like him, are advocates for "peace at any price":—only we are anxious to have the article we bargain for; while he, as it appears to us, is either indifferent to this, or blind as to the true means of obtaining it. Our ground of quarrel with him and his friends—the discrepancy between their views and ours—lies here:—that we insist upon the substance, while they would rest satisfied with the shadow; we long for a reality—they would put up with the hollow hush-money of a sham; we want solid and enduring rest—they aspire only to a temporary breathing-time and a delusive lull. In fact the title they claim—that of the Peace Party—is an arrogant misnomer to which we utterly deny their right. They are not advocates of PEACE at all:—they are simply thirsty idolators of a brief, armed, uneasy, unsound, and worthless TRUCE,—a truce which could not last because it would be based upon no natural arrangements and would include no self-supporting force.

The Economist

October 6, 1855

Letters to the Editor

Interim Report

SIR—The conclusion of the leading article in your issue of September 24th is that "all the experience of this summer suggests that it would be better to meet such a misfortune [of a balance of payments crisis] by raising Bank rate again than by using most of the other weapons that the Chancellor may find tempting to his hand."

This surely ignores the fact that the problem is not merely of the quantitative effectiveness of disinflationary weapons, but of their qualitative effects. Credit control operates mainly through reducing the level of domestic investment, short-term or long-term. Our balance of payments difficulties, however, are not due to excessive investment so much as to excessive consumption. The rise of capital investment in the course of 1954 may have contributed to the general pressure on demand, but from the long-term point of view a high level of investment is certainly to be welcomed rather than discouraged.

The advantage of using the fiscal weapon for eliminating an excess of demand lies precisely in the fact that it is capable of reducing consumption directly, whereas credit control is not. Since 1951 the level of taxation has been progressively reduced while the level of interest rates has progressively risen. If this tendency continues the danger is that we shall inevitably slide into a high-consumption and low-investment economy, with most undesirable long-run consequences on the growth of productivity and our international competitive power. Once governments are accustomed to regard Bank rate as the main weapon of short-term economic control, political pressures will force them to let up more and more on the fiscal field and to compensate for this by tighter monetary control each time the situation becomes inflationary as a result of fiscal laxity. In the long run this can only mean that while the proportion of resources devoted to consumption will get steadily larger the scope for capital investment will be steadily narrowed down.—Yours faithfully,

NICHOLAS KALDOR
King's College, Cambridge

[Mr Kaldor's problem is certainly a very real one. It can hardly be discussed in a footnote, but the following points may be made with dogmatic brevity:

1. Bank rate affects long-term investment less, and current consumption more, than might be supposed at first glance.
2. In any case investment must be limited to the national savings.
3. To try to increase the rate of national savings by running a large budget surplus is certain, in a democratic society, to be self-frustrating.

4. If the budget surplus is created by increasing an already intolerably heavy burden of taxation, the frustration—and the inflation—will come the more quickly.

5. The only way out is more private savings, either by the "ploughing back" of existing enterprises or by greater personal thrift.—EDITOR.]

★

SIR—Before you write your Final Report can you be persuaded to make explicit the precise mechanism by which Bank rate achieves the results which you claim in your Interim Report of September 24th?

The only mention of mechanism in that article is the paragraph in which you explain that the "traditional way in which a tighter money policy is supposed to work" is through a squeeze on bank liquidity. Exactly so: it is this which causes the contraction; Bank rate is a concomitant, not a cause. Yet throughout your article you persist in ascribing the results of a credit squeeze to Bank rate.

This hair must be split. The failure to do so has greatly contributed to the growth of a widespread Bank rate myth. In January the Chancellor was clearly a victim, but his resort to directives may indicate his subsequent disillusionment. Such disillusionment (and the directives) would have been quite unnecessary had official policy concentrated on the size of the credit base (your "traditional way") instead of concentrating (as you do in your article) on the level of Bank rate.—Yours faithfully,

W. T. NEWLYN
The University, Leeds

Facing the Future

SIR—In your issue of October 1st you say "The Conservatives have a briefing staff separate from the planners. . . ." This is not so. It was broadly true until 1948 but has not been the case since.

The Conservative Research Department in its present form is the result of the amalgamation, in the autumn of 1948, of three then separate departments of the Party Headquarters—the Research Department (long-term), the Parliamentary Secretariat (day-to-day briefing) and the Information Department and Library of the Central Office. Since that amalgamation specialisation in the Research Department has been by subject and not by function. That is to say, the officer responsible for a particular subject or group of subjects is responsible for both the long-term and the short-term aspects of the work.—Your faithfully,

MICHAEL FRASER
Conservative Research
Department, S.W.1

Black Market in Cars

SIR—May I be permitted to express my deep dismay at the smug complacency evinced by Mr W. L. Ricketts. Shoddy workmanship and poor finish in British cars? Why worry? They "seem all to be covered by the manufacturer's guarantee." But it is just these defects which are losing us our export markets in cars, and which would lose them even faster in a general world recession. A friend just home from Sweden tells me from her own experience of the growing dissatisfaction with the poor quality of the popular British cars, a dissatisfaction the effect of which can be seen in the recent sharp reduction in the percentage of total car sales in Sweden falling to British makes.

Perhaps this dissatisfaction is also "covered by the manufacturer's guarantee"?—Yours faithfully,

A. HUGHES
Stapleford, Cambridge

★

SIR—As manufacturers within the motor industry, we heartily agree with Mr Ricketts's sentiments in regard to the importance of the export trade and, in our field, we are indeed most active in our efforts to encourage overseas orders.

At the same time, we are most concerned to see the complacent attitude taken by Mr Ricketts in regard to "the regrettable defects" found in a brand-new British product. While these may well be covered by guarantee, the inconvenience and annoyance caused to users by such defects are contributing increasingly towards bringing British products into disrepute abroad. Even where guarantee claims were fully met, we know of at least one case where a large Swiss operator refused to place further orders because of "silly troubles" in the first three months.

These little defects may well have very serious results on our export position where we are in competition with countries such as Germany, where more attention is paid to detail.—Yours faithfully,

H. W. HEYMAN
Smith's Delivery Vehicles, Ltd.,
Gateshead-on-Tyne

New Broom in the Highlands

SIR—In your article of September 10th you overlooked the underlying principle involved. The question is whether to abandon the crofters' future and increase afforestation by far larger proportions than anyone has so far had the courage to propose or to subsidise the crofters still more so that their way of life and traditions may continue. In other words, economic reality is matched against sentimental loyalty and affection. One thing is clear: so long as compromise abounds neither out national resources nor our indigenous Highlanders will prosper.—Yours faithfully,

Peterborough P. J. M. McEWAN

Books & Publications

The Process of Growth

THE THEORY OF ECONOMIC GROWTH.

By W. Arthur Lewis.

Allen and Unwin. 453 pages. 30s.

THIS is an extremely important book. The critic may, and indeed must, pick some holes in it; its author is the first to acknowledge that it defies most of the decencies of specialisation; and it will probably annoy a certain number of people. It belongs, however, to that rare class of work, one that fairly and squarely fills an urgently felt want.

In the rapidly growing literature of economic growth there has hitherto been lacking any single work, authoritatively but untechnically written, to which the general reader could turn for light. There have been special and general historical studies, strictly theoretical economic analyses, statistical surveys, methodological critiques, case reports from particular regions, and pieces of special pleading. But no one has yet, at the commonsense level, brought into relation the various elements of that complex social-political-psychological-technical process whose end product, in the field of measurable economic events, is an increase in output per head. The lack is not surprising; for it takes a good deal of courage to jeopardise a scholarly reputation by so drastically eclectic a venture. Climate; religion; political institutions; mores; technical coefficients; the educational process; public finance; invention; investment; class structure; credit; international trade and relations; collective and individual initiatives; demographic trends; land tenures; migration; this list of topics by no means exhausts Professor Lewis's subject matter. His own comment, in his preface, cannot be bettered:

Maps are published in many different scales, for many different purposes. The articles in a technical journal correspond to a scale of an inch to the mile. This book is on a scale more like an inch to a hundred miles; this, too, should have its uses.

The metaphor can be carried farther. Mr Lewis supplies the sketch-map, based partly on personal observation both of advanced and of undeveloped economies (many readers will remember his admirable report of 1953 on "Industrialisation and the Gold Coast"), partly on wide reading, and marks the chief lines of communication and dangers to navigation; he does not try to predict the journey. Here are certain institutions, here the attitudes and beliefs which have given rise to them; behind

these again the interplay of earlier institutions, earlier beliefs and attitudes, material conditions, natural settings. These favour, hamper, or variously shape economic growth; and economic growth reacts on them in time, altering environments, institutions, and morality itself. There are no predestinate grooves to be followed. Mr Lewis totally rejects determinism, and has indeed a refreshing respect for the power of individual leadership to shape events. There are, however, possibilities and impossibilities, congruities and incongruities; and it is the confrontation of these, the practical interpretation of various relevant national experiences all over the world and throughout history, the sorting out of common factors and their examination in the light of today's conditions, which makes "The Theory of Economic Growth" a working hand-book for statesmen as well as a detached study.

The practical recipes vary, as one would infer, according to circumstances. In almost every case, however, the prescribed take-off mechanism is the raising of agricultural productivity, especially by agricultural education. To convert the productive power thus generated into a harmoniously growing complex of investment, to construct as it were an economic breeder-reactor, calls for a nice judgment of priorities—on social as well as on immediate economic grounds Mr Lewis gives a warning against a dash for industrialisation insufficiently matched by progress in housing, public works and technical training—for a realistic use of foreign capital, technical expertise and *entrepreneurship*, and for a tough and skilled fiscal and monetary policy.

On this last point, Mr Lewis's prescriptions are less convincing than elsewhere; for he shows a complacency about inflation that is both economically and politically unjustified. He claims that inflation undertaken for productive purposes is reliably self-liquidating; which begs the whole question whether projects and their timing can be rationally planned without a reliable unit of account. He prescribes inflation as a means of getting resources into Government hands when political and administrative shortcomings impede a suitable taxation policy; yet those same shortcomings are no less a handicap in the dosing and control of inflation, which is politically and administratively a notoriously difficult operation.

This is one point for debate; there are others. It would be absurd to expect the advice of one man, no matter how

intelligent, humane, imaginative and well-informed, to be uniformly impeccable. But it is hard to imagine any critic failing to agree that these are the lines, and these the materials, on which debate must proceed. This is how people should be thinking in Burma and India, in the Gold Coast and in Guiana, in the cabinets of newly self-governing states and of colonial powers, at the headquarters of the United Nations Technical Agencies and of the World Bank, and at lesser centres, private and public, of power and decision everywhere. That such a claim can soberly be made for his book is the measure of Mr Lewis's achievement.

Priestley Progress

JOURNEY DOWN A RAINBOW.

By J. B. Priestley and Jacquetta Hawkes.

Heinemann. 301 pages. 18s.

NO book quite like this has been published since Smollett's "Expedition of Humphry Clinker" in 1771. The technique is the same: a travelogue in the form of letters exchanged between contrasting personalities, and in Mr Priestley's portion there is a swiftness of moral judgment and a pugnacious common sense deeply of the eighteenth century. Where Smollett travelled from Gloucester to Edinburgh and back home, Mr and Mrs Priestley separated in Kansas City, the one bound for the fleshpots of Dallas and Houston, the other for the austere antiquities of the sites inhabited in the past and today by the Pueblo and Navaho Indians. After which, the two personages—both delightfully conscious of their private relations and public stature—exchange letters and small essays on their contrasting experiences.

Mrs Priestley's sections of the book are the less challenging but the more satisfactory. Following in the footsteps of D. H. Lawrence and Ruth Benedict, she takes the high desert and mountain roads to the Mesa Verde, Zuni and Taos. She describes some of the sites with the eye of a very fine archaeologist and does a traditional set piece on one of the dances in Santo Domingo. It falls well below Lawrence's variations on the same theme, but it is done with enjoyment.

The same cannot be said for Mr Priestley's pilgrimage through the air-conditioned province of Mammon. Mr Priestley believes in tweed suits, lukewarm beer and a somewhat defiant individualism. Instead, he found multi-coloured nylon shirts, frozen martinis and a community of millionaires and public relations men wildly anxious to cohere to one another in a pattern of mass vulgarity. His reactions are sometimes funny but often superficial and exasperating in their self-righteous misery. In fact, Mr Priestley did not see much beyond what he had wanted to find and his whole trip has a curious air of wrathful unreality. The result is a portrait of Mr Priestley rather than of America's new Eldorado. His few asides on Texas politics are naive, and he nowhere seeks to understand the

peculiar nature of a society in constant and rapid upward motion.

This is a book definitely worth reading—but how about a second volume with Jacquetta Hawkes going to Dallas and Mr Priestley marooned on the Black Mesa?

Riding the Storm

DOCUMENTS ON BRITISH FOREIGN POLICY, 1919-1939: *Third Series, Volumes VIII and IX.*

Edited by E. L. Woodward and Rohan Butler.

Her Majesty's Stationery Office. 644 and 622 pages, respectively. 50s. each.

THESE volumes are devoted to British foreign policy in the Far East from August, 1938, to the outbreak of war with Germany in September, 1939. In Europe this was a period of rapidly mounting crisis, which saw drastic setbacks for British policy and ended with a startling change in it. It did not see any major shift in the Far Eastern situation or any reformulation of the British attitude to the Sino-Japanese war, the issue that overshadowed British Far Eastern policy. The story is one of slow but continuous deterioration in the prospects of safeguarding British interests in China against Japanese inroads; of helpless inactivity alternating with useless activity on the part of the British Government and its ambassadors in China and Japan.

The immediate reasons for Great Britain's helplessness in the face of events were, as is stated by the editors in their preface to the first of the two volumes, and as is apparent in almost every document, the existence of a threatening situation in Europe, the military unpreparedness of Great Britain and the guarded attitude of the United States in the Far Eastern crisis. Hamstrung on all these counts, the British Government could only hope, as it had hoped since 1931, that the Sino-Japanese war would peter out or that some opportunity would offer itself for mediation to bring it to an end. Nursing these hopes, the Government played for time by being firm but conciliatory towards Japan, sympathetic but unhelpful to Chiang Kai-shek. But this policy only reaped, in the words of the British Ambassador at Tokyo, "the worst of both worlds—in Japan by creating the impression that we are doing more for China than is actually the case, in China because kind words are not followed by good deeds." And the hopes on which it was founded were ill-placed. Increasingly after the summer of 1938, unreason and extremism came to the top in Japan's China programme; and the threat that Japan would force China to accept a Sino-Japanese bloc to exclude all foreign interests, or that China, if it continued the struggle, would fall increasingly under Russian influence, loomed ever larger on the horizon.

Japan was encouraged on its course as much by British weakness in Europe as by British helplessness in the Far East. But if the Munich settlement

helped to convince Japan that aggression would pay, it does not follow that a European war over Czechoslovakia or continuing tension in Europe, following a German setback at Munich, would not have presented Japan with equal opportunities. On the contrary, it is clear from the second of these volumes that Japanese pressure on Great Britain only increased after the spring of 1939, when Great Britain abandoned appeasement in Europe and a German war became more imminent. Great Britain's attitude in Europe was in any case influenced by its inability to defend its interests in the Far East, as its attitude in the Far East was affected by its fears in Europe.

Underlying the immediate reasons for British helplessness in the Far East—the real explanation of the vicious circle that was set up between weakness there and weakness in Europe—was the relative decline in the British world position that had been taking place slowly for fifty years. It was only one of the consequences of this process that, to quote an Admiralty letter which is given in the appendix to Volume VIII, "it will . . . never be possible . . . for this country to build and maintain a Fleet equal or comparable to the combined strength of those [of Germany, Italy and Japan]. . . ." Another of the consequences was that Japan had acquired strategic control of the Far East by 1918. Given that control and the situation in China, there were bound to be far-reaching changes in the Far East. Given the great extent of its Far Eastern interests up to 1918, Great Britain was bound to suffer from those changes, at least until the United States would come forward to fill the vacuum created by British decline. In the intervening years Great Britain was riding the storm and could do no more.

Unwise Elevation

ALFRED AUSTIN, VICTORIAN.

By Norton B. Crowell.

Weidenfeld and Nicolson. 296 pages. 18s.

WHEN Tennyson died in 1892 the laureateship proved difficult to fill. Morris indicated that he would refuse it; and the Queen, who regarded the office as one in her personal household, objected to Swinburne, whose early poems had been immoral, and who had even written against the Emperor of Russia. Mr Gladstone, apparently advised by Jowett, was disposed to let the appointment lapse. But this sagacious policy was abandoned by Lord Salisbury, whose choice fell upon Alfred Austin in 1896. If there was any element of cynicism in the decision, it was promptly punished. Austin celebrated his elevation by printing an absurd copy of verses on the Jameson Raid. The Queen was disturbed. Salisbury, although careful not to read the effusion, had to admit having "heard it condemned by many persons, both from a political and literary point of view." After Tennyson, after Wordsworth, after Southey—an uninspired

SURVEY OF INTERNATIONAL AFFAIRS 1939-46

The Far East 1942-6

by F. C. Jones, Hugh Borton and B. R. Pearn

The history of the peoples of Eastern Asia and the Pacific from the date of the Japanese attack on Pearl Harbour in December 1941 to the surrender and occupation of Japan is covered in this volume. It was a period which saw the growth of nationalist movements throughout the Far East, movements at first encouraged by the Japanese and, after their defeat, by Communist influence. (Published on behalf of the Royal Institute of International Affairs.) 60s. net

The Bent World

A CHRISTIAN EXAMINATION OF EAST-WEST TENSIONS

by J. V. Langmead Casserley

Dr. Casserley begins this book with a summary of Russo-Marxism and explains the reasons for its wide-spread appeal. He then examines the characteristic weaknesses of the kind of secularized thinking which so often attempts to answer the Marxist challenge, and he concludes by stressing the central rôle of traditional orthodox Christianity in this situation. 21s. net

OXFORD UNIVERSITY PRESS

'TEA WITH AN AUTHOR'

Every Wednesday at 3.30 p.m. in the Georgian Restaurant.

Oct. 12. Martin Lederman, author of "The Slim Gourmet," will explain how you can eat as you wish—and yet become slimmer.

Oct. 19. L. G. Pine, Editor of "Burke's Peerage," will talk on the fascinating subject of "Tracing Your Ancestors."

Tickets, including Tea, 4/6, from the Book Department, Second Floor, please write for full programme.

fect, perhaps, but a capable man of letters—it was all a sad come-down.

Austin, in fact, both as man and writer, was negligible in every way. There is nothing to remember him by except a number of mildly entertaining stories, most of which will be found duly embedded in Mr Crowell's competent but rather solemn book. In conversation, Austin had invariably addressed his predecessor not as "Tennyson" (or even "My lord") but as "Bard" or "Immortal Bard." He expected something of the same respect when his own turn came—for had not his appointment been, in his own words, "a very simple matter," just the recognition that he was "at the head of English literature"? He took his inspiration very seriously (it figured regularly in his table talk as "It") and when grammatical mistakes in his poems were pointed out to him, he would say piously: "I dare not alter these things; they come to me from above."

As was inevitable, Austin's elevation attracted ridicule which in an obscure station he would have escaped. Much of this was cruel. But happily no pathos appears to attach to his figure. He was armoured in an invulnerable self-conceit, and lived to a serene old age, a happy and successful man. Wilfred Scawen Blunt ("Wilfred S. Blunt" to Mr Crowell) called him "an absurd little cocksparrow." Even if this is unjust, Austin was clearly in no substantial sense a representative Victorian. The elaborate setting—social, political and literary—which is here provided for him is somewhat in excess of his deserts.

Advance in Automation

AN INTRODUCTION TO PROCESS CONTROL SYSTEM DESIGN.

By A. J. Young.

Longmans. 395 pages. 42s.

THIS is a technical book of more than technical importance. Automatic control systems are very widely used in process industries such as chemicals and oil, but still mainly on the empirical basis of "cut and try." Automatic control in mechanical and especially electrical engineering, on the other hand, is based upon an extremely well developed foundation of theory. In spite of the talent and "hunch" good engineers can apply, there are obvious limits to the development that can be based upon empiricism alone; and this book is an attempt to provide process control engineers with an adequate basis of theory on which to develop their work—"to substitute intelligent thinking for rule-of-thumb methods in everyday plant problems."

The rather lopsided advance of theory and practice in the different fields of "automation" results partly from the emphasis placed upon the study of servo-mechanisms, and electrical communication by defence demands during and between two wars. But there is a more important reason for it: the characteristics of a machine or an electrical system

that their control engineers need to govern are readily measurable and predictable. Those of chemical reactions taking place in a succession of pressure vessels, stills, and heat exchangers, are not; indeed, the control engineer has often to identify the characteristics that are really significant in a process before measuring and steadying their fluctuations. A systematic quantitative study of the characteristics of chemical processes, providing full data for calculating most favourable operating conditions, is still in its early stages—the Central Instrument Laboratory of Imperial Chemical Industries, of which the author has been the head since 1946, is a pioneer in the field.

Meanwhile, Mr Young argues persuasively, the limitations of the data practically available should not preclude a logical approach to the application and design of process control systems: and it is such an approach, in comparatively simple language and drawing always upon the problems that the control engineer meets in practice and the tools he has to work with, that he presents in this book. Its general importance lies in reducing as much as is now possible the empiricism that has until now weakened this field of applied science. The advance of scientific knowledge, it has been said, consists in reducing empiricism.

Fiction Across the Channel

THE CONTEMPORARY FRENCH NOVEL.

By Henri Peyre.

Oxford University Press. 379 pages. 30s.

THERE are few things more difficult in literary criticism than to attempt to survey and assess the value of works by living writers. The problem is, perhaps, particularly difficult in the case of French contemporary writers, for the unprecedented experimenting in fiction that has taken place in the past three decades in France makes it almost impossible for the critic to formulate an enduring standard. Few critics are better qualified than M. Peyre, who is Sterling professor of French at Yale, for the formidable task he has set himself. Encyclopaedic learning and lucidity of thought are two of his advantages; yet they do not cause him to underestimate the obstacles in his path. He emphasises the need for courage, then displays it; his convictions are strong and he is insufficiently timid to be deterred from expressing them.

It would be pleasant to register wholehearted agreement with all M. Peyre's views. But so subjective is one's appreciation of fiction, and so fickle are the changes in public taste, that it is impossible not to dispute some of the writer's judgments. M. Peyre's outlook seems to be circumscribed by two propositions: that intellect, more than any other factor, determines the permanence of a novel, and that enduring fiction is unlikely to be found in the lists of best-sellers. This is not to suggest that an absence of intellect is desir-

able; merely that other qualities, such as observation, sympathy and perhaps even the outmoded virtue of narrative power, may be more important in the long run. As for best-sellers, while it would be foolish to assert that they automatically qualify as literature, it is as well to remember, with Mr Somerset Maugham, that few literary survivals failed to sell well in their own day. It is probably these propositions that cause M. Peyre grossly to underestimate the work of Simenon (whom he accepts, by inference, as "French") and, apparently, to omit all mention of Maxence van der Mersch.

Allowances must therefore be made for a point of view that many readers will reject, even if, proportionately, as many professional critics approve of it. And if such allowances are made, it must be admitted that M. Peyre has performed a feat of some magnitude. There is an admirable breadth about his work, and a sense of historical perspective, of the continuity of literature, that indicate a love of his subject which parallels his scholarship. His analyses of the major works of Mauriac and Malraux, probably the two giants of the period under review, are as penetrating as they are dispassionate. And although some of the omissions are curious, the book includes a useful alphabetical list of important French novelists, together with the titles of their works, and particulars of English translations. It may seem carping to and that much of M. Peyre's English, though always perfectly intelligible, reads like translated French.

Books Received

THE GREAT CRASH 1929.

By J. K. Galbraith. Hamish Hamilton. 186 pages. 12s. 6d.

The American edition of this book was reviewed in our issue of May 14, 1955.

SEAFARERS AND THEIR SHIPS: *The story of a century of progress in the safety of ships and the well-being of seamen.* Her Majesty's Stationery Office. 96 pages. 3s. 6d.

CAPITAL FORMATION IN CANADA 1896-1930. By Kenneth Buckley. Toronto University Press (London: Geoffrey Cumberlege). 173 pages. 26s.

BRITAIN AND THE BRITISH PEOPLE: 2nd edition. By Ernest Barker. Oxford University Press. 186 pages. 12s. 6d.

KONSTAM ON INCOME TAX: *Cumulative supplement to 12th edition.* No. 4. Stevens and Sons. 81 pages. 7s. 6d.

A HISTORY OF COMMERCE. By Clive Day. Longmans. 703 pages. 27s. 6d.

The fourth revised edition of this book, first published in New York in 1907, is now available in this country.

LANDMARKS OF ECONOMIC THOUGHT. Second Edition.

By John M. Ferguson. Longmans. 320 pages. 25s.

First published in New York in 1938, now available in the United Kingdom.

SPECIALISTS' GERMAN VOCABULARIES. By Kenneth Black. Pitmans. 189 pages. 10s. 6d.

The World is their Market

GLENLIVET

Beautiful Glenlivet lies deep in the Highlands of Scotland. Together with Nairn, Elgin, Forres, Dufftown and other famous distillery towns, Glenlivet produces the big-hearted Scotch whisky that has so many friends all over the world. But in Glenlivet they know that even fine Scotch cannot sell itself. Other countries make whisky too. Competition is keen. Brand names jostle one another wherever whisky is sold.

It's the same in any industry. *Making* products for the world is only half the job. You've got to show them, sell them—and *sell them hard*—wherever a market for them exists. Many manufacturers are doing this very successfully through TIME, The Weekly Newsmagazine.

IN TIME FOR BUSINESS

TIME's net paid audited circulation exceeds two-and-a-quarter million copies weekly (A.B.C.). There are five separate editions of TIME* with the same editorial content. One circulates only in the United States—the other four, the *International Editions*, are published simultaneously in English and read by important people in more than 100 countries outside the U.S.A.

Ninety-three of every 100 readers of TIME's International Editions hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

You can buy advertising space directed to those markets which interest you most—through one edition, any combination of two, three or four, or in all five of the world-ranging editions of TIME.

Advertising in TIME sells around the world!

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Admiral in Atomic Seas

Washington, D.C.

THE voyage of Admiral Lewis Strauss through the uncharted reefs and shoals of his course as chairman of the Atomic Energy Commission seems to be going a little more smoothly. The impression given by the gathering last week in Washington of the leading American industrialists interested in the "atomic art" is that a useful partnership is being forged between private and public enterprise. Although there are still symptoms of the admiral's obsessive regard for secrecy—such as his wry remark that Russian scientists seemed to manage very well behind a complete security blackout—a greater geniality has been observed at the commission since the atomic conference at Geneva showed how few secrets there really were. Even the time-lag between the snappish complaints about the dilatoriness and obscurity of the commission's policies, which come from time to time from Senator Clinton Anderson, the Democratic chairman of the Joint Congressional Committee on Atomic Energy, and the taking of remedial steps by the commission has been reduced, sometimes to a matter of days.

This improvement in mutual confidence, which may not of course survive the committee's next hearings, is up to a point very welcome. It had been the normal condition under the predecessors of Admiral Strauss and Senator Anderson, when a truly bi-partisan committee worked in the closest harmony with the commission. Unfortunately the admiral has been involved, almost from the moment he took the chairmanship, in a number of highly controversial actions, which included the suspension of Dr Oppenheimer and culminated in the unfortunate Dixon-Yates electricity contract. His difficulties have been due partly to his own rather uncompromising personality and partly to the fact that, in addition to being the chairman of a five-man commission, he is the President's personal assistant on atomic matters. This gives him a political role which is not shared by his fellow-commissioners. The suspicion has been germinated, especially by Mr Thomas Murray, a Democratic member of the commission, that Mr Strauss decides in his lone capacity many matters that should properly be decided collectively. This, for example, explains the rider attached to an appropriation Bill in the last session of Congress which guarantees to each commissioner equal access to all the papers of the commission.

But there are good public grounds for changing the relationship between the commission and the committee now that they are no longer merely a complicity of two groups of men with sealed lips. The commission, besides

remaining responsible for the production of nuclear weapons, is now the regulatory agency for a new civilian industry in which it must itself to a large extent still participate. It thus becomes the committee to maintain a certain detachment as the guardian of the public interest. It is a good sign that, instead of confining itself to treading on the commission's corns, the committee is launching a long-range study of the social and economic effects of the growth of the atomic energy industry; but it is rather alarming to discover that the expert panel is expected to report within four months.

★

The pattern of atomic development revealed by last week's convention of the Atomic Industrial Forum, coinciding with the first Atomic Energy Trade Fair, was not new. Since atomic power will not be competitive with conventional sources of fuel as soon in the United States as it will be in some other parts of the world, the Americans feel they can afford the luxury of experimenting in five different directions before settling on the type of reactor which will produce electricity most economically. They have also turned their backs on the idea of "dual purpose" reactors, which yield much more exciting figures for the cost of power because they also produce plutonium for weapons, which is bought by the government at high prices. The commission decided at an early stage that this kind of reactor, despite its superficial allure, was not the most efficient technically for producing power and that, by distorting the economics of electricity production, it withheld from private enterprise the full incentive to bring down costs.

The really hopeful development since the AEC issued its new regulations under the 1954 Act has been the willingness of private capital to make long-range investments, largely for the sake of gaining experience, since there can be little immediate economic return. Of the five types of reactor being tried out simultaneously, two are being developed on the old-fashioned cost-sharing basis—a pressurised water reactor by the Duquesne Light Company of Pittsburgh, which will be the first large-scale nuclear power plant in the country, and an experimental reactor, based on the concept of graphite moderation and sodium coolant, which is being built by the North American Aviation Company in California.

But private enterprise in a much more real sense has been stimulated by the demonstration programme, in which firms

The Jester gets a new look

SEEING THE FUNNY SIDE

British fads, frailties and institutions have, in fact, provided the Rank Organisation with material for comedies quite unlike those produced anywhere else. They have been the source of a distinctively fresh approach to this type of screen entertainment—with themes ranging from the antics of medical students to those of veteran-car enthusiasts.

Some have thought that subjects so typically British would not find a welcome overseas. But resounding success the world over for such films as *GENEVIEVE* and *DOCTOR IN THE HOUSE*, shows that these bright and original comedies are record-breakers wherever they are shown.

MOTLEY MADE TO MEASURE

The latest in a brilliant line of comedies which started with Ealing Studios' *PASSPORT TO PIMLICO* and *KIND HEARTS AND CORONETS*, is *TOUCH AND GO*, starring Jack Hawkins in his first comedy role. This too finds its humour in the milder forms of British eccentricity, and like many Rank Organisation comedies was specially written for the screen: in this case, by William Rose, who wrote the script for *GENEVIEVE*.

In its search for ingenious themes and its use of local colour, the Rank Organisation has given a refreshing new look to British film comedy: an amusing slice of the British way of life to be relished both at home and in an ever-growing market throughout the world.

THE RANK ORGANISATION

were invited to develop, build, operate and own large scale reactors, with the commission contributing free use of nuclear materials and its own laboratories and helping with the financing, provided some real scientific gain was in prospect. Under this scheme the Detroit Edison group is going to build a fast breeder reactor of 100,000 kilowatt capacity, which can be integrated into its service area by the end of 1959. Finally, three firms have spurned all public props and have applied for licences to build reactors which will be financed entirely from private funds.

Anticipating trouble from his political inquisitors if only the largest private utility companies have a foot in the atomic door, Admiral Strauss has now called for a "second round" of the demonstration programme, under which partnerships will be set up to develop power plants of between 5,000 and 40,000 kilowatt capacity. In particular this may give a chance for rural electrification co-operatives and other politically vocal advocates of publicly owned electricity undertakings to grasp the share of the atom which their champions have been clamouring for in Congress.

While private industry does not expect to get much return on its immediate domestic investment in the atomic future (and for every firm that it is actually building a reactor there are a dozen which have set up an "atomic division" so as to keep in the swing), it does have considerable confidence that the export trade will tide it over the interval during which the really economic reactor for American conditions is being found. For this reason two assurances given by Admiral Strauss in his press conference on Monday have been extremely welcome to the developing private industry. One is that Americans are now completely free to carry on business in atomic energy abroad without approval from the AEC, so long as they are not dealing in secret information. The other is a rather vague promise that America's foreign customers can rely on getting a fair share of enriched uranium fuel if they invest in American reactors.

But the admiral's most important contribution on Monday was to dispel some of the mystery about a development that was beginning to worry American businessmen and investors. This is the application of the principle of the hydrogen bomb to peaceful uses. Admiral Strauss confessed that, until the Indian chairman at Geneva broke the news, he had intended to keep this quiet. Now that it had come out anyway, he did his best to reassure those who have invested heavily in atomic fission by predicting that every dollar now being put into reactors will be amortised before the forces of atomic fusion can be harnessed for commercial purposes.

Marking Time

PRESIDENT EISENHOWER has begun to sign papers again and the official Assistant to the President, Mr Sherman Adams, is keeping the Denver hospital room in touch with Washington. There the Vice President, Mr Nixon, is presiding over Cabinet meetings, but he himself emphasises that no new policies need to be decided at the moment. It is now quite clear that, when decisions do have to be taken, they will be made wherever the President may be, provided his condition does not deteriorate. The military staff arrangements and the system for delegating

authority which Mr Eisenhower himself introduced into the presidential office have now come into their own. The practical political effect of this is that Mr Nixon has not yet been singled out as Mr Eisenhower's inescapable successor.

Whether Mr Nixon will be so singled out is doubtful, even though at the moment he is the most obvious Republican candidate for next year's presidential nomination. He is a controversial figure in his own state, California, and cannot guarantee the united support of his own party there; even more important, his name is anathema to the political independents and the Democrats who voted for Mr Eisenhower in 1952. Without their votes the Republicans can hardly hope to win an election and so far they have no candidate in sight who can approach Mr Eisenhower's appeal. The professional politicians are now claiming that he may stand again in spite of his illness and that there is as yet no need to consider any alternative. This sounds like whistling in the dark, but it is in fact something much more practical. The Republican leaders are playing for time in which to catch their breaths and to search for a new candidate who can make the best of what has suddenly become a very bad job.

The search may still be going on when the nominating convention meets next August, but at least the Democrats are in similar difficulties, although with a more hopeful prospect ahead of them. Their strategy for 1956 has been shattered too, and it is equally doubtful who will be at the centre of their pattern when it is re-formed. There is as yet no certainty that it will be Mr Adlai Stevenson, even though last week he had all the look of a focal point when he conveniently found himself consulting his party's two congressional leaders in Texas, where they both live and where there is strong opposition to Mr Stevenson within the official Democratic organisation.

Prosperity Carries On

THE fever chart of the New York stock market has been far more alarming than that of the distinguished patient in Denver, but with far less justification. Faced with the announcement last Monday that President Eisenhower was "a little tired," investors promptly took fright and a flurry of selling cost the market an estimated \$4 billion. On Tuesday, however, a reassuring medical bulletin restored confidence to a large extent and a third of the decline was recovered. In judging the market's reactions, it should be borne in mind that, on the Friday before President Eisenhower's sudden illness, the average of industrial stocks stood at its highest level in history; this meant that the market was extremely vulnerable to any sudden bad news and that many investors were expecting a downward movement or, at least, a levelling off.

But it would be extremely premature to suppose that the present flurries, which are so obviously psychological reactions to the President's daily state of health, will result in a major break followed by a general economic recession. In fact, all available evidence points to the contrary and it is being realised that Mr Eisenhower's illness does not affect the soundness of the economy. Numerous corporations have announced that they are going full steam ahead with

NO RIVER TOO LONG

WHEREVER THE DRILL GOES

..... SCHLUMBERGER GOES!

their expansion programmes; among the more spectacular are a \$350 million re-equipment plan announced by Eastern Airlines and the Ford Motor Company's decision to spend half a billion dollars in 1956 on expanding its productive capacities. Mr Henry Ford's words could serve as a summary of the mood of most businessmen:

The President's illness is a matter of personal concern and regret to me, as it must be to every American, but in no way does this misfortune affect the confidence of myself and my associates . . . in the basic strength of the nation's economy.

Behind such sentiments, moreover, there is a shrewd appraisal of political realities. After an initial psychological shock, businessmen and investors tend to realise that a Democratic Administration, with its preference for easy money policies and lavish public spending, would be as good for business, if not better, than a Republican government. In fact, the grain markets shamelessly advanced on the news of the President's illness; the view was taken that a Democratic victory in 1956 would probably mean a return to a policy of high and rigid price supports for agriculture.

Crowded Court

THE political spotlight was focused on the Supreme Court as it reconvened this week both because the Chief Justice, Mr Warren, has, against his own express wish, become a favoured possibility for the Republican nomination for President in 1956, and because several of the 700 cases pending before the Court involve important political and economic questions. The case that has, perhaps, aroused the widest interest concerns the constitutionality of the Subversive Activities Control Act of 1950 and the Communist Control Act of 1954. Another case full of political implications entails a ruling on whether the federal government or the State of Louisiana owns the rich oil deposits between the three-mile and the ten-mile limits on the continental shelf beneath the Gulf of Mexico.

In the field of anti-trust legislation the Court will be asked to decide on one of the major contests between the Department of Justice and a giant of private enterprise. The government has appealed against a lower court's dismissal of the case brought against the du Pont Company on the ground that its ownership of 23 per cent of General Motors stock constituted effective control of that corporation and a restraint of trade. But whatever success the government achieves against du Pont may be more than offset by two Red Indian tribes, the Otoe and the Missouri. Supported by the lower courts, the tribes claim that their ancestors were grossly underpaid for land granted to the government in 1880. Should they convince the Justices, the Department of the Interior may face the Treasury with the grim prospect of re-purchasing literally hundreds of millions of acres from other tribes eager to take a war-path to court.

Assailed by such conflicting interests, the Justices will not forget that

most of the occasions when the Supreme Court has come into virulent conflict with public opinion were those in which the Court disregarded its subtle tradition against needlessly pronouncing on constitutional issues.

These words were spoken by Mr Justice Felix Frankfurter in his distinguished address at the recent bicentenary celebrations for John Marshall, one of the early and most influential Chief Justices. Yet Mr Frankfurter would be the first to feel that fear of hostile opinion should not in any way prevent the Court from clarifying constitutional intent in such vital matters as civil liberty or the rights of individual states.

Turn for Turnpikes

THE opening of the 240-mile long Turnpike across Ohio leaves only two links to be completed—the Indiana Toll Road and a bridge over the Delaware River between Pennsylvania and New Jersey, both supposed to be finished in about a year—before the motorist will be able to drive from New York to the suburbs of Chicago without stopping except to pay \$9.95 (£3 11s.) in toll charges. On the Ohio section even this delay is being cut to a minimum by new electronic devices; here, too, the danger of hold-ups from accidents, for which some other toll roads are notorious, has been lessened by special safety precautions, notably by an unusually broad centre strip between the two roadways, each 24 feet wide.

Plans for toll roads have gone on sprouting all over the country this year in spite, or perhaps because, of the arguments in Congress over federal aid for ordinary free-for-all highways. There are now nearly 2,000 miles of toll road

in use and nearly as many again under construction; another 5,000 miles have been proposed. Some of the plans may, however, be stunted by the rising cost of borrowing money; already New York State has postponed a new bond issue which was to finance its Thruway. The total length of this toll road, to connect Buffalo with New York City and now nearly completed, will be 560 miles. It will have several offshoots to important centres, and Pennsylvania is proposing an even more extensive network of toll roads, in addition to its present Turnpike.

In this heavily populated, heavily industrialised north-eastern section of the country, there seems little doubt that these roads will be able to cover their costs. Individuals and companies are willing to pay substantial charges in order to avoid the delays and congestion on ordinary highways, with their crossroads and bottlenecks, and to ensure quick delivery of goods. The same considerations will probably apply to the north-south chain of toll roads being built through the middle west to connect Illinois, Iowa, Kansas, Oklahoma and Texas, particularly since here lower construction costs may make charges rather less. But the dependence of these roads on prosperity was illustrated in

1954, when a decline in receipts on the Pennsylvania Turnpike seemed to be the direct outcome of the economic recession. This year revenues have picked up satisfactorily here, but the new West Virginia Turnpike has discovered how much toll roads rely on lorry traffic. Private motorists appreciate the scenic beauties of this road, but commercial use has been disappointing and receipts are running below expectations.

Consumers' Boom

THE consumers who last year saved the economic recession from sinking into a slump have pushed this year's prosperity into a boom. Their incomes have risen—to an annual rate of over \$300 billion—and they are spending a higher proportion of them; personal savings had been running at over 7 per cent of income after payment of taxes ever since 1951, but they are now down to about 6 per cent, and outlays for personal consumption have gone up to a rate of over \$250 billion a year.

During the postwar period as a whole, the greatest increase in spending has been on services, which are now taking about 30 per cent of personal incomes. This is

partly because costs and interest rates have risen, but more because an improved standard of living has given people more possessions to be serviced: houses have to be painted, cars insured, washing machines repaired. Conversely, less is being spent on such obsolescent services as domestic servants, public transportation and cinema seats, which have been replaced by vacuum cleaners, private cars and television sets.

But in the past year the big increase in outlays has been on durable goods, now taking about 12 per cent of consumers' incomes. As might be guessed, the most important item in this increase has been spending on automobiles. The article in the September issue of the *Survey of Current Business*, on which much of this note is based, does not go into the inflationary effects of this type of spending; but hire purchases of cars are mainly responsible for the steady, and worrying, rise in instalment credit which has been going on since the beginning of this year. This rise was not checked in August in spite of the attempt of the

banking authorities to restrain it; at the end of that month automobile loans outstanding amounted to \$13.5 billion, 24 per cent more than a year earlier.

Prosperity has sent more consumers to the luxury counters of shops; department store sales in the first half of this year were 4 per cent above the comparable period of 1954, but the increase was proportionately much greater in sales of furniture, jewellery, sporting goods and furs. Spending on food and alcohol, now running at an annual rate of about \$77 billion, has been going up steadily and people are at last also buying clothes and shoes; expenditures on these categories have been rising much less fast than other types of outlays. In fact, manufacturers of all types of non-durable goods will not be altogether sorry when the demand for cars falls off, as it seems it must before long, for consumers should then have even more to spend on other things.

Bars Do Make Prisons

FROM A CORRESPONDENT IN BOSTON

AMERICAN penologists are becoming increasingly anxious about the postwar pattern of recurring prison riots; there have been about twenty this year, the latest at Deer Island prison in Boston. Prisoners seize guards as hostages, settlements are negotiated after a brief period of violence, an investigating committee is formed and the public becomes intensely interested in prison affairs. Afterwards a few make-shift reforms are rammed through state legislatures and public concern lapses. Penal experts, however, are proclaiming that penology has progressed to the stage where it is a recognised science which should no longer be applied in this haphazard and sporadic way.

The three nationally known penologists recently recruited by Governor Christian Herter of Massachusetts to study his state's backward prison system are emphatic in their contention that

essentially, correction should do more for the offender than was done by his community and its agencies and influences. This presupposes a well-planned programme of treatment embodying every possible use of the sciences and techniques known to the field.

Such programmes are already operating in other states and have achieved conspicuous results in California and Wisconsin.

California's success is rooted in its system of indeterminate sentencing. Californian courts do not condemn a man to a specific time in prison, but merely determine the question of his guilt and whether he should be jailed. The limits of the sentence are set by law, and how much of his term a man spends in prison is left to a panel of five carefully chosen professionals called the California Adult Authority. The institutions themselves also contrast sharply with those of most other states. Chino, California's best-known penal experiment, has no bars and its informally dressed guards carry no guns. Chino's 2,600 acres of farmland are surrounded only by a link chain fence; and yet less than one per cent of the 1,500 inmates escape. The men are taught trades and skills. A majority earn a small wage and they may finish high school and do some college

work during their term. Families are allowed to visit for four hours on Sundays and eat picnic lunches with the inmates in the grounds.

Wisconsin is regarded as a leader in prison reform because of its system of parole and probation. When a prisoner is considered ready to be sent to a minimum security unit, such as a prison farm or forest, he is, instead, put on probation. Occasionally a man with a long term will be released on parole after serving only a year of his time. This programme is administered by an experienced corps of parole and probation agents, all of whom have received a college degree in social work.

★

Decades ago, Massachusetts was in the forefront in penology and even today there is considerable pressure for reforms well beyond those that the public is ready to accept. Penal institutions are divided into three classifications—maximum, medium and minimum security. The latter are forestry camps and they in no way resemble the notorious, southern chain gangs which have almost completely passed from the scene. But although there have been no noteworthy incidents resulting from trusting prisoners out in the open, almost every community faced with the possibility of a camp being established nearby has shown opposition. Massachusetts also has an eminent penologist in Dr Miriam Van Waters, head of the Framingham Women's Reformatory, who tried to rehabilitate her "students" by allowing them to work as domestic servants in private homes. She also permitted them, accompanied by prison officers, to visit restaurants and other public places in the hope that they would become accustomed to the wise use of liberty—liberty which would soon be unlimited. Dr Van Waters was viciously attacked and, although she was completely cleared, there has been no move to permit her to continue her schemes.

The Governor's committee bluntly warned Massachusetts that if it did not shake off the "lock them up and forget them" philosophy "it will find itself eventually with an ever-increasing number of hardened and experienced criminals." Moreover, probation, institutional care and parole must be co-ordinated so that men released from institutions will be equipped to face the community and will not again become a public burden. Pointing out that 97 per cent of all prisoners will some day be freed, the committee urged the public to support a progressive programme of correction.

One reason why changes which penologists consider to be wise and safe for the entire community have not been more widespread is seen in the comment of Mr J. Edgar Hoover, chief of the Federal Bureau of Investigation. Mr Hoover and other law enforcement officials firmly oppose what they regard as "softness" toward criminals. Mr Hoover told a congressional committee that there is a great deal of concern about the fate of the criminal, but not so much concern about the seriousness of the crimes which he has committed, nor the anguish which he had caused his victims.

On the other hand, Dr Garrett Heyns, warden of Michigan State Reformatory and a former president of the American Prison Association, contends that one-third of the inmates of prisons in the United States ought to be released immediately. Another third of the prisoners, he argues, have "relatively simple problems that could be taken care of

in time" and only the final third are "hard core" and need long-term confinement. Moreover, he makes the point that it is possible to supervise five men on parole for the amount it costs the taxpayer to keep one man in prison. According to the Massachusetts investigators, the cost of maintaining a prisoner in a correctional institution ranges from \$1,000 to \$2,500 a year. The cost of an adequate and effective probation system for him for the same period was said to be between \$150 and \$250.

The Herter committee referred pertinently to many other aspects of the prison situation throughout the United States. It charged that the greatest scourge of penology is its traditional link with politics. In too many cases penal administrators are appointed for political reasons. In Massachusetts, moreover, there is a frequent use of solitary confinement in dark cells on bread and water. The committee felt that this should be discontinued and that isolation, where necessary, should be in light, well ventilated cells for a maximum of fifteen days with one full meal provided daily. In Massachusetts life term prisoners are not eligible for parole, although they are in most states.

Although it could have done so with pertinence, the committee did not compare the administration of state prisons with that of federal prisons. On the whole, federal prisons are managed by skilled personnel who are adopting practices advocated by penal reform experts. Adequate classification of criminals and their assignment to the type of institution that will rehabilitate them most effectively is the keynote of the federal system. At the state level, however, the committee's plaintive plea for public support and public education on penal questions is justified and it must be hoped that it will be heard before many more prison riots take place.

SHORTER NOTES

Timekeeping in the United States has for long been complicated not only by the existence of four different time zones across the huge continent, but by the fact that some states and cities observed summer, or daylight, time while others did not. This year there is a further complication, for instead of going back to standard time on September 25th, as was done elsewhere, New York, New England, New Jersey and most of Pennsylvania have extended summer time to the end of October.

★

On the basis of a report by a special consultant, the government has decided that, for two years at least, there will be more titanium available than is likely to be needed; the government has therefore suspended its programme for encouraging private industry to build more titanium storage facilities.

★

The Prohibition party is not only the oldest American third party, but also the quickest of any American party to get off the election mark; both qualities may be explained by its abstention from alcohol. It has already announced its candidates for the 1956 campaign—a retired professor for President, a retired general for Vice-President; in 1952 the Prohibitionists received 70,000 votes.

*What you
should know
about Brandy*

V.S.O.P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. All Remy Martin Cognac is made from grapes grown exclusively in these two areas. That is why people ask for Remy Martin and are never disappointed.

REMY MARTIN
Pride of Cognac

A doubled standard of living needs a doubled supply of sulphuric acid

A doubled rate of industrial productivity, which alone can make the Chancellor's prophecy come true, will require a doubled supply of sulphuric acid for British industry. To this end, new plants, such as Marchon's Solway Plant at Whitehaven, are rapidly approaching full production. The Solway Plant is already producing sulphuric acid from locally-mined anhydrite. The process has the added advantage of co-producing standard Portland cement to meet the pressing needs of housing and capital development programmes.

Marchon Progress Again

There is a direct relation between the nation's rate of industrial productivity and its consumption of sulphuric acid, as shown in the graph. The broken line represents the index of production for the period 1946/1955. The full line shows the sulphuric consumption for the same period. Both figures are relating to 1948 as 100.

Mr Diem Loses Favour

FROM A CORRESPONDENT IN PARIS

A CRITICAL point has now been reached in the internal politics of southern Vietnam, at a time when the Communist government in the north has been calling for observance of the Geneva agreements. The authority of the southern Vietnam government does not extend effectively over the whole of its territory. Large tracts of the countryside of Cochinchina are in the hands of the three rebel sects, the Caodaists, the Binh Xuyen and the Hoa Hao, all hostile to the government of Mr Ngo Dinh Diem. Even outside these areas there is little real security, as frequent robberies and murders show. The mass of the people in the south favour the Communist regime in the north, but for reasons of nationalistic sentiment rather than because of any doctrinaire attachment to Communism. They have been strengthened in their allegiance since Geneva by the high-handed and inept actions of Mr Diem. The kind of argument one hears is that the choice lies between an efficient dictatorship in the north and an inefficient dictatorship in the south.

When Mr Ngo Dinh Diem assumed power in southern Vietnam last year he was in a position to deal a death blow to Communism in his country. The war was over; and America offered him generous aid to repair the ravages of the civil war and to build up a prosperous state. Most of the nationalist intellectuals who had remained neutral in the Franco-Viet Minh war were prepared to give him their encouragement. Large numbers of the Viet Minh, disillusioned by the heavy emphasis placed by their government upon Communism rather than real independence and reconstruction, would willingly have supported an effective nationalist government.

The opportunity was missed. Mr Diem adamantly refused to put forward a political programme, and it quickly became apparent to all that the country would be run, not by the cabinet, but by Mr Diem's brothers and one or two of their close and trusted friends. Even the American advisers, whose protégé he was and with whose money he was paying his administration, found that he would accept little advice and no criticism. Officials and ministers were dismissed and replaced by young and inexperienced men who, on Mr Diem's own admission, were chosen because they would be "obedient."

One of Mr Diem's chief assets was his untarnished reputation for personal honesty. At last, it was said, one would see a Vietnamese government free from corruption. Unfortunately, although it has never been suggested that Mr Diem has enriched himself dishonestly, he has certainly failed to

prevent his colleagues from doing so. There have been no denials of reports alleging massive transfers of money to Europe by members of the Prime Minister's entourage.

Little headway has been made in resettling the 800,000 Vietnamese, mostly Catholics, who have come to Saigon from the north as refugees. Nearly all are still living in camps close to Saigon, where they receive a daily pittance from the government for their food and clothing. There is little doubt that they have been used by Mr Diem in well-organised "spontaneous demonstrations," and there is considerable friction between them and the native southern Vietnamese.

The ex-emperor Bao Dai has remained relatively inactive in France throughout Mr Diem's whole period of office. The enmity which exists between the two men is well known, and every effort has been made to denigrate Bao Dai in southern Vietnam. The Revolutionary Committee which was created by Mr Diem a few months ago for the purpose of removing Bao Dai from the political scene is thoroughly penetrated by Viet Minh agents, despite Mr Diem's denials. A referendum is shortly to be held to decide whether Bao Dai should be retained as chief-of-state, or whether southern Vietnam should become a republic with Mr Diem as President. Such a referendum would certainly favour the establishment of a republic.

Plots Without Plan

All shades of Vietnamese nationalist opinion are now agreed that the only hope of saving southern Vietnam from Communism lies in removing Mr Ngo Dinh Diem from office and substituting an effective nationalist government with a national assembly to control it. The advocates of such a solution are far from unanimous, however, about the means of achieving this desirable end. A number of plots are being hatched in Saigon and Paris, but there is, as yet, no indication that all the nationalists will join forces in a final effort to save their country. The three rebel sects have formed a "United Front" which is united in name only, and meanwhile the individual sects are in touch with the Communists and receiving aid from them in their struggle against Mr Diem.

Another group of nationalists is endeavouring to replace Mr Diem by Mr Tran Van Huu, a former Prime Minister who held discussions with the Viet Minh during the Geneva conference last year. This group advocates a prolonged period of coexistence between the two zones of Vietnam

and the creation of mutual confidence by inter-zonal trading—southern rice for northern coal—until the atmosphere improves enough for it to be possible to hold peaceful national elections. French influence is discernible in both of these groups. Other factions advocate the creation of a republic under the presidency of Mr Diem with a constitution which ensured that the president was no more than a figurehead. In this way, they argue, an effective nationalist government could be established while the good will and financial aid of the Americans whose nominee Mr Diem is—could be retained.

Many Vietnamese in the south have been criticising Mr Diem for his refusal to meet the Viet Minh leaders for discussions about the organisation of national elections. There may well develop a really spontaneous and massive demonstration by the people of southern Vietnam to demand elections. Mr Diem will then be faced with the choice of acceding to their demands, and certainly losing the election, or of opening fire on his own people and being overthrown by force. In either case the Communist Viet Minh will reap the rewards.

Until recently the Americans had not wavered in their support of Mr Diem. But now a wide measure of disagreement has become apparent among Americans in Saigon. One section, led by Colonel Lansdale, who enjoys Admiral Radford's support in Washington, advocates continuing support for Mr Diem whatever happens. The other section—and this has been growing rapidly larger of late—admits the failure of the Diem experiment and urges that another solution be found while there is still time.

Perhaps the only bright spot in the southern Vietnam picture is to be found in the northern part of the territory, which was under Viet Minh control during the war. The inhabitants of this area will accept any alternative to a further period of government by the Viet Minh. Reconstruction has made good progress in this region, where dams and irrigation works have recently been completed. The inhabitants did not object even when the better jobs in these reconstruction projects were, by Mr Diem's order, reserved for Catholics.

Mopping-up after Perón

THE inglorious departure for Paraguay of General Perón outwardly symbolises the end of an epoch in Argentina. But *Peronismo*, as a mechanism of autocracy and as a social doctrine, is deeply rooted in the country and it is already clear that the new regime of General Lonardi will have a long and arduous task of partial demolition to perform before new institutions can begin operating. Moreover, the successful army coup which finally sent General Perón toppling from his pedestal was a revolt rather than a revolution; it challenged a man and his more fanatical followers rather than the programme he had imposed on Argentina during a decade of autocracy. Second, it was a revolt whose success was owing, in large measure, to the fact that its adherents numbered representatives of nearly every political faction, including moderate *Peronistas*, ultra-nationalists and even certain groups whose main complaint against General Perón was his reluctance to carry *Peronismo* to its

economic extremes. These two factors necessarily limit General Lonardi's freedom of action and are bound to influence the character of the new regime.

One of the first tasks of the new rulers of Argentina is to destroy the personal myth centred on General Perón and Eva Perón. Scandalous revelations about Perón's life and loves after the death of Eva, disclosures of his private accumulations of wealth and conducted tours through his subterranean hide-away—a mixture of Hitler's bunker and the secret gardens of Sardanapalus—are all intended to convince the ordinary Argentine that he has been deceived by a corrupt and hypocritical idol. General Perón's swift flight to a Paraguayan gunboat and his decision to abandon his more resolute followers to the tender mercies of the military junta inside Buenos Aires will doubtless have contributed to the dissolution of the Perón legend.

Dictatorial but Liberal

As far as is possible, General Lonardi has been seeking to restore freedom through decree. Although he has assumed dictatorial powers "until the nation can be called to new elections," he has lifted the state of martial law imposed after the revolution of September, 1951. On September 27th, he announced a general amnesty and the prisons have opened for the numerous political victims of Perón's justice. Henceforth, Argentine citizens will be allowed to travel abroad without the notorious "good conduct certificates" issued by the *Peronista* police and disrespectful remarks about the government will no longer be considered a *prima facie* justification for arrest. Furthermore, General Lonardi has promised that he will seek to negotiate a concordat with the Vatican in order to heal the rift between Church and state created by the anti-clerical policies of General Perón during the final phase of his rule.

The problem of disentangling the economic vestiges of the Perón era will be an exceedingly difficult one. It falls under two principal heads: first, the question of general fiscal policy; and, secondly, the problem of personal corruption and state monopoly. Dr Raul Prebisch, who left the Bank of Argentina ten years ago under *Peronista* pressure and who has since been executive director of the United Nations Economic Commission for Latin America, has been called back to Buenos Aires to advise the government. The enormous growth of the national debt—some 30 per cent each year—and the high wage scales allowed by General Perón, in order to maintain the loyalty of the General Confederation of Labour, have produced a serious inflation. Monetary restraint and a policy of investment in greater production will have to be adopted. It has been suggested that the 25 per cent tax on the country's wage bill represented by the state pension funds should be reduced. The fact that confidence in the new regime is sound, despite a bad break on the market, has been shown by a 30 per cent excess of bank deposits over withdrawals in the last ten days.

Looking Into Corruption

But the new government will also have to clean house after a period during which much business was carried on at the personal level by General Perón, his associates and firms with which the regime had ties of amity and corruption. Some 40 firms are at present under scrutiny. Specifically, it is thought that the state trading monopoly, IAPI,

should be liquidated and that private enterprise should be restored. It is expected that there will soon be disclosures of the full extent of rapacity indulged in by *Peronista* officials, many of whom have taken refuge near their foreign bank accounts.

It is on the political front that General Lonardi's most recent moves have been less reassuring. Most of the new men are fairly inexperienced, and all are Catholics. But Dr Mario Amadeo, the Foreign Minister, and some of the lesser figures, are known to be extreme nationalists. Doubtless, these appointments are concessions to the anti-*Peronista* nationalists who supported that army revolt, but they are not calculated to encourage foreign confidence or to reconcile the most liberal elements in the country. At the same time, moreover, Sr Alfredo Palacios, a veteran leader of the Socialists, has been made ambassador to Uruguay, where he has resided in exile for nearly two decades. It will be disappointing if General Lonardi does not include in his government some of the perennial opponents of *Peronismo*.

To the outside world, however, the case of *La Prensa* will be the test of the new regime's colours. So far the paper has not been restored to Dr Gainza Paz, its famous editor, and the General Confederation of Labour has, in fact, stated that General Lonardi has promised not to restore it to its rightful owners. In a very ambiguous statement, General Lonardi has said that the matter "must be left to the courts." At the risk of alienating the confederation and even risking a showdown with this most powerful vestige of *Peronista* Argentina, General Lonardi should see to it that *La Prensa* is once again allowed to speak freely.

The Blue Danube Again

BY A CORRESPONDENT

THE Austrian sector of the Danube is beginning to run blue again, instead of red, and in theory at any rate the departure of the Soviet occupants from Austria, and the terms under which they have left (which include Soviet recognition of Austria's title to the assets of the Danube Shipping Company in return for \$2 million compensation), should permit goods and vessels to move more freely up and down the river than at any time since the end of the war. Unfortunately, there are still many snags, not only in the political and economic sphere, but even in the river itself. Channels have not been kept clear, wrecks still clutter the fairway, and buildings and installations are not what they used to be. There is less shipping, and fewer goods to be transported than before the war; and of course there are still hindrances arising out of the Iron Curtain and the cold war.

At the end of the second world war, the greater part of the ships which still remained afloat were concentrated between Linz and Regensburg where they came under American, instead of Soviet, control. Most, if not all, of these vessels were the property of the Danube Shipping Company, thus coming within the category which the Soviet government claimed as "German assets," and when the United States government refused to hand the vessels over

the Russians announced their intention of seizing any which ventured beyond the inter-zonal frontier at Linz. The vessels remained moored on the American side of the river, in full sight of the tantalized Russians, for several years. Gradually, however, more and more of them went into service between Linz and Regensburg until the Russians, who were hampered by a shortage of river tonnage in the sector under their control, began to issue special permits to allow the Danube Shipping Company's fleet to carry specific cargoes between Vienna and Linz. The ice having thus been chipped, if not broken, the Soviet government suddenly, and unexpectedly, threw the Danube open to the company's vessels in 1952.

In prewar days, the great powers, excluding the Soviet Union, policed the river under the international agreement

of 1921 and the Danube Shipping Company was an international affair with assets far outside truncated Austria. But at the Belgrade conference in 1948 Mr Vyshinsky, with the dutiful help of the Soviet satellites, steam-rolled through a new Danube convention which virtually confirmed Soviet control of the river below Linz (except where it passed through Yugoslavia) and completely ignored the rights and interests of all non-riparian states. The western

For Your Business Friends

They would appreciate the Businessman's Guide to Britain for 1956. The Guide is compiled by The Economist Intelligence Unit and has a foreword by Sir Graham Hayman, President of the Federation of British Industries. There are sections on:—

- What is Britain?—a picture of Britain in words and charts
- How to get to know things in Britain
- How to get about
- Britain's major economic areas—descriptions and directories of thirteen areas
- Special events in 1956

In addition, the Guide provides many hints for travellers.

The Special Presentation Edition, obtainable in quantities of not less than one hundred, will be available at the end of October. Details from:

THE ECONOMIST INTELLIGENCE UNIT

22 Ryder Street, LONDON, S.W.1.
WHITEHALL 1511, Ext. 144

powers refused to sign the convention, and much diminished and rather ghostly meetings of the 1921 international Danube commission are in fact still held every year in Rome.

The new Danube Commission, which is confined, against strong western protests, to the riparian states only, came into existence just as the Tito-Cominform quarrel was getting under way and the Yugoslav member consequently found himself obstructed and frustrated at every turn. But in December, 1953, the change of attitude of Moscow towards the Yugoslavs suddenly showed itself in the proceedings of the Danube commission: for the first time a Yugoslav was appointed as secretary, and the commission also adopted a long-standing Yugoslav suggestion that the seat of the commission should be transferred from Galatz in Rumania to the much more central Budapest. It is a striking commentary on the importance of the Danube as an international highway that, even when the cold war between Tito and the Cominform was at its height, neither side interfered with the Danubian traffic of its opponents and Yugoslav vessels passed unhindered through, or between, Hungary, Czechoslovakia and the Soviet zone of Austria, right up to Regensburg in Bavaria. The Yugoslav crews did their utmost to create alarm and despondency by scattering leaflets while passing Hungary and Czechoslovakia, but even this did not provoke reprisals.

Neither Austria nor West Germany had any voice in framing the provisions of the Danube convention of 1948. But it is evident that the Danube Shipping Company's fleet could be extremely useful in the lower reaches of the river where there is a shortage of suitable vessels. In theory there is nothing to prevent them sailing to the river's mouth today—indeed, as long ago as 1952 *Izvestia* and *Pravda* both began inviting them to do so, and to prolong their voyage to Moscow by way of the Don and Volga. But in practice there are still a good many difficulties; for instance, to judge by the rather meagre accounts of the proceedings of the Danube commission, navigation on the lower Danube is still not without danger; lack of goods as well as lack of tonnage have both played a part in making the removal of wrecks uneconomic. Austria has concluded agreements on the use of the river with all the riparian states, except the Soviet Union which controls the mouth of the river, and last May negotiated an agreement with Rumania that will allow it to transport 40 per cent of its imports from, and exports to, that country in its own ships; hitherto all the Soviet satellites have insisted that all their trade with Austria be carried in their own vessels. Whether Austria will now join the Danube commission remains to be seen; but there have been reports that Russia has invited it to join. (The German Federal Republic has also begun to make arrangements for the use of the Danube by German shipping; last July it concluded an agreement with Rumania on the use of each country's Danube ports by the shipping of the other.)

The importance of free and unimpeded use of the Danube to Austria can hardly be exaggerated. Like Czechoslovakia and Hungary, it is a land-locked state at the mercy of its immediate neighbours for its means of communication with the outside world. Federal Germany is well aware of this and has devised a highly ingenious system of preferential freight charges designed to attract Austrian export and import traffic away from all ports which are non-German. The preferences vary inversely with the distance

from the German frontier, so that goods going to and from Styria, on Austria's frontier with Yugoslavia, are carried over German railways at a lower mileage rate than goods from Upper Austria, which borders on Germany, and much more cheaply even than goods made inside Germany. These preferential tariffs do not apply to goods en route to and from such ports as Rotterdam and Hamburg. The effect of this system is that it is usually cheaper for Austrian manufacturers and merchants in Styria to route their merchandise via Hamburg, which is more than 500 miles away as the crow flies, than via Trieste, which is less than 150 miles from Graz. In any case, Trieste now has less attraction as a transit port than either Hamburg or Bremen, and unless it can again become the focus of central European trade, as it used to be in the days of the Austro-Hungarian empire, it seems to be condemned to gradual decay. If Austria's growing economic dependence on West Germany is not to go too far, it is clearly essential that the Danube should be re-established in its traditional role as an international waterway.

The Role of M. Faure

FROM A SPECIAL CORRESPONDENT

THE French parliamentary recess has not enabled M. Faure to cement over the cracks in his government. On the contrary, as the National Assembly returns from its holidays, he faces it at the head of a cabinet torn by dissensions, of which the departure of General Koenig, M. Palewski and two other Social Republicans (ex-Gaullists) on Thursday was the most dramatic, but far from the only symptom. Inaction over Morocco robbed M. Faure of a great deal of the prestige he formerly enjoyed; he antagonised the colonial extremists by his plans, and disappointed the reformers through the discrepancy between plan and achievement. Yet it might be argued that the Faure government was from the very start inevitably condemned to a permanent search for compromise; and that, politics being the art of the possible, his is the only practical method of governing with the present Assembly.

M. Faure was brought to power after the fall of M. Mendès-France because the remnants of his "leftist" reputation were a useful screen for a predominantly conservative majority. His role was recently compared in *Le Monde* to that of another Radical, M. Chautemps, who used to perform the same function under the Third Republic. M. Faure had the illusion that he could outwit his supporters ("France ungovernable?" he is alleged to have said, "It can be ruled by skill and dissimulation"), and, at first, he was allowed a good deal of latitude. Borne on by the impetus of his predecessor, he was able to bring the Tunisian deal to a conclusion and, at the cost of some concessions at home, to leave the foundations of foreign policy unchanged.

But his value as a façade for the conservatives grew progressively less. Sooner or later he was bound to find himself the prisoner of his majority; and over Morocco, as it turned out, the majority's policy was determined by the colonialist group within it. M. Faure rejected the alternative of submitting or resigning; instead, he chose to manoeuvre.

WHERE WE STAND WITH HELICOPTERS

IT IS ONLY over the past ten years that helicopters have shown the rate of progress which has been associated with fixed wing aircraft for decades. The advancement of conventional aircraft received two tremendous boosts during the two world wars, but the helicopter was not a working proposition in the 1914-18 war, and it became reasonably practical for specialized uses only in the concluding stages of the 1939-45 war.

The mathematics of the helicopter proved to be complex and new types of physical experience were continually encountered. It was therefore a vehicle that repaid particular care in the early stage and a cautious yet imaginative approach; above all it demanded considerable capital investment in laboratory and test facilities. This had to be provided in the teeth of other competing demands for technical manpower and factory equipment needed for new aircraft, engines and missiles.

But because of the progress of modern technology the rate of advance of helicopters has been sustained and today they are in ever widening operational use throughout the world. Nevertheless, the 6,000 or so helicopters built to date in all countries represent little more than six months' combined output of fixed-wing aircraft in Britain and the United States. So helicopters still form only a small fraction of airframe weight produced.

Whilst pioneering beginnings have been made in the fare-paying passenger use of helicopters, the maturing of helicopter commerce will still take some time. However, the expanding military use of helicopters is amassing a variety of operational experience in latitudes from the tropics to the Arctic Circle that will help materially towards the development of more economic commercial helicopters.

Helicopters were used in quantity for

the first time in Korea when they took part in tactical operations for their intrinsic capabilities and not merely as a useful adjunct to other forms of transport. The reliance that came to be placed on them is evident in one memorable operation when 12 helicopters moved an equipped battalion onto a Korean hilltop in six hours. British forces have made increasing use of the helicopter in Malaya and other areas when communications are difficult.

In the civil field, it is foreseen that expanding use will be found for helicopters as flying cranes; airlifting special equipment to remote spots; as means of inspecting cables and pipe lines; for spraying in agriculture and many other purposes, which, coupled with accumulated military experience, will lead to economic scheduled freight and passenger services.

The Bristol Sycamore was the first helicopter of British design to be used operationally. A single-engined general purpose aircraft, it is in regular military service in many parts of the world, in climatic and altitude extremes, as well as with the Services and British European Airways at home. The Bristol Type 173 twin-engine tandem rotor helicopter, which has been developed from the Sycamore, is the forerunner of larger machines which are expected to see service first for anti-submarine work with the Royal Navy and the Royal Air Force.

Looking into the future the need is for helicopters able to lift bigger loads—of 10,000 lb and more. Successful development of these heavy helicopters will in time see the replacement of the piston engine by gas turbines; Bristol is well advanced with plans for a turbine-powered version of the twin-engined helicopter as part of its progressive programme towards meeting the mounting requirements of civil and military helicopter operators.

3 MILLION agricultural and industrial tractors have been produced by the world-embracing International Harvester organization. To this imagination-defying total the IH plant at Doncaster has contributed in no small way. Six different tractors are in full production—among them the new International BTD-6 diesel crawler. The world demand for this rugged 50.5 horsepower tractor with its fine line of matched allied equipment clearly reflects the superiority of International Power and the unrivalled service provided by International Industrial Dealers.

He need not necessarily have fallen into the Moroccan trap. For once, parliamentary calculations and caution were possibly not the best guide to action. The conservative front was not united, nor were vested interests in North Africa all on the same side. At the risk of oversimplification, it might be said that French landowners in Morocco are uncompromising, whereas the industrial elements are in favour of an agreement. The "neo-colonialist" movement, which admits the need for a compromise, is also gaining ground in metropolitan France. Originally, the right-wing opposition might have given way to a Prime Minister determined to carry out his plan; it regained confidence when it saw that it was faced with a Premier whose greatest concern seemed to be to avoid a showdown.

Sabotage by the Generals

Even now, after the eventual departure of Sultan Ben Arafa, the question of succession is still wide open. On August 21st, after the Berber rising, Ben Arafa appeared to everyone to be an unimportant puppet. The delay accepted by the government enabled the "Arafists" in Morocco and Paris to regroup their forces. M. Grandval, sacrificed on the altar of right-wing superiority and government cohesion, was gone; the generals who held appointments in Morocco remained to sabotage the plan, relying on the support of the "ultras" within the cabinet itself.

The very appointment of General de Latour as the new Resident-General was a sign of governmental weakness. The generals, most of whom had begun their careers in the colonies, proved an invaluable support for the colonial lobby. Conscious of a weak executive behind him, General de Latour fell into line all the more readily with the body of military opinion headed by Marshal Juin. The creation of a Council of the Throne, designed to get round the crucial dynastic question, met with unexpected obstacles; an acceptable third man could not be found. The government's deepest humiliation occurred two weeks ago, when it had to beg a man awaiting retrial for collaboration—General Noguès—to try to persuade a Moroccan general to fill this role. But even this was in vain, because military discipline prevailed; it began to appear that once again a marshal was having the last word in France and the past of Alphonse Juin—France's only marshal—evoked memories of Vichy.

M. Faure managed to get rid of Ben Arafa, but the North African question remains unsolved and is likely to have a profound impact on the political situation in France. This struggle is being waged nearer home than that in Indo-China, and the call-up of reservists and the use of national servicemen inevitably make it a burning issue of domestic politics. Perhaps M. Mendès-France is the first beneficiary, since his own record in office shines bright beside the history of the last few months. After months of inaction, he has now started his electoral campaign, and the transformation of that lively weekly *L'Express* into a daily paper should provide him with a popular platform. Events in North Africa may, in the long run, help the Communists to put still more pressure on the Socialists for "unity of action." Meanwhile, they improve the electoral prospects of M. Mendès-France.

In the present Assembly, however, there seems no real alternative to M. Faure and to his government-by-manoeuvre. The conservative majority in the Assembly is

heterogeneous, and will accept, at least for a period, no one but a skilful matchmaker. The adroit M. Faure seemed an ideal choice and, if his successor does not follow his precedent, he is unlikely to survive for long. Strangely enough, although M. Faure's doom is generally accepted, Paris, for once, is not busy cabinet-making. M. Pinay would be a logical successor, but with the elections in prospect the conservatives prefer to preserve the disguise afforded by someone of M. Faure's position. The Christian Democrats may also refuse to serve under an openly conservative Premier. The next Prime Minister might thus be yet another Fabian Radical, and the crisis may simply prove the inevitability of a M. Faure.

Germans Try to Cut Prices

DR ADENAUER has assumed leadership of the campaign to lower German prices, which has been running for the past few weeks in a somewhat unco-ordinated manner. He has asked the Ministers of Economics and Finance, as well as the Federation of Industry, to let him have memoranda on the situation. The *Bank Deutscher Länder* already presents its views in its admirable monthly reports. The Chancellor himself is far from being an economist, but he can exert his authority to prevent conflicting remedies being proposed. He can also give the weight of his personal prestige to the psychological warfare which the ministers are conducting against rising prices. This may have some practical effect, as the "atmosphere" is an important factor in deciding which way the trend will continue to go. At present, there is no fear of inflation, as the Germans understand that dreaded word, but there is a general tendency to buy or build now because everything may be dearer tomorrow. It is this attitude of mind which the government hopes to change. Moreover, the trade unions may be induced to keep wage demands down, and, in face of public opinion, they will not be able to ban the importation of 100,000 Italian labourers.

The practical measures to restrict credit which the central bank has taken are having some effect in making money scarcer, but they are not yet sufficient. Eyes are concentrating on the extent of investment by public authorities, and the Minister of Finance has decided to give them no further federal funds for building. If prices go up, they must cut their coat to match. No minister, however, dares to restrict the subsidised building programme or the road fund. The restricted rents of flats in old houses have, however, recently been raised by 10 to 20 per cent to allow owners to undertake repairs and to relieve the need for new dwellings.

It is fortunate for Germany's trading partners that increased imports are still regarded as one of the best ways of keeping prices down. Dr Erhard, who has the courage of his liberal convictions, hopes to secure some tariff cuts which, if his psychological campaign is successful, will be passed on to the public. As it is, the growth of imports continues to outstrip exports, and there was actually a trading deficit in September. The central bank's reserves of gold and hard foreign exchange, however, are so great

that a further increase in imports may safely be faced for some time.

Oddly enough, one move is being made by the Finance Minister, Dr Schaeffer, which will increase purchasing power—or profits. He has remitted taxation on a few household commodities, and on working housewives, in order to carry out a decision of the *Bundestag*. He can well afford to do so, as his loss will amount to no more than the excess revenue which he has received. Unlike Mr Butler, Dr Schaeffer underestimated his tax revenue. An attempt will be made to see that the cuts are passed on to the public. Dr Schaeffer and Dr Erhard are both ready to reintroduce a few temporary controls for the purpose. That complete freedom is only possible with a hard currency is the maxim heard in Bonn, though the liberal economists maintain that a hard currency is only possible with freedom. So far, no drastic change in German economic policy is contemplated, or needed. There is no danger to the Deutschemerk—only the danger of a danger.

Unity for West Pakistan

BY A CORRESPONDENT

PAKISTAN'S so-called "one-unit" bill became law when it received the assent of the Governor-General on October 3rd. After a debate lasting more than a month, it had been passed by the Constituent Assembly by 40 votes to 13, with 27 members abstaining. The number of abstentions is significant, but the new coalition government can nevertheless be said to be safely over its first big hurdle, and its main task of getting the constitution passed should now be appreciably simplified. The bill has done away with the anomaly that East Pakistan, with a population of 42 millions, had only one provincial administration, whereas West Pakistan, with only 34 millions, had six or seven. The two units can now go forward on a basis of political equality.

A good many eggs were broken in the making of the "one-unit" omelette, but they were mostly added ones. Each province of West Pakistan, and each of the more advanced states, was top-heavy with its own apparatus of government—its cabinet ministers and junior ministers, its secretariat, its legislature and so on. There will doubtless be politicians who regret the passing of so many fields of opportunity, but the country as a whole will feel no sympathy for them. They were breeding grounds of provincial rivalries which have gone far towards destroying the unity of Pakistan.

The leader of the opposition, Mr Suhrawardy, was in no position to attack the measure, for he had been a prominent member of the government which originally sponsored it. He had to confine himself mainly to a rather unconvincing protest that it was being rushed through, and to advocating the calling of a round table conference to discuss it. The most vocal and uncompromising opposition within the Assembly came from Mr Fazlur Rahman, the Commerce Minister in the Nazimuddin government, who argued that the bill would bring about the disintegration of the country by creating "two Pakistans." To most people it would rather appear that the bill merely accepted the facts

of geography and adjusted the political structure of the country to those facts.

Outside the Assembly, the most serious agitation against the measure was from the veteran Pathan leader, Khan Abdul Ghaffar Khan; but his championship of the cause of Pathan separatism lost much of its force from the fact that his highly respected brother, Dr Khan Sahib, was a strong supporter of the integration and was, in fact, designated as the Chief Minister of the new West Pakistan government.

The interim legislature of the new province will be elected by electoral colleges formed by districts. Its life will not be longer than twenty months, after which elections will be held on the basis of a direct vote. There are to be

310 seats, of which 124 are allotted to the Punjab, 57 to Sindh and 42 to the North West Frontier Province. Representatives of the tribal areas will be elected by the *jirgas*. Ten seats have been reserved for women.

The new unit will consist of 50 districts, grouped in eleven divisions. Commissioners of divisions will exercise more extensive powers than heretofore; the government's aim is that remote control and political interference should be reduced to a minimum and that matters affecting the daily life of the people should be as far as possible decided within the areas in which they live. Of equal importance is the fact that the government will now be able to proceed with the development of the Indus basin as a single economic unit, no longer hampered by the artificial political divisions which have done so much to prevent this in the past.

RANGOON

Cubitts are the main contractors for the new Burma Pharmaceutical Industry project which forms part of the country's Industrial Development plan. Now under construction on a 140-acre site in the new industrial zone of Rangoon, the contract includes a main production building covering a quarter of a million square feet in floorspace, a complete Alcohol and Yeast Vitamin Plant, and a Biological Institute which will provide vaccines and sera for the whole of Burma.

Long experience of building and civil engineering at home enables Cubitts to undertake large projects overseas—invisible exports which contribute to Britain's prosperity.

Now, as in the past

Chancellor and Markets

A STRICTLY formal vote of confidence seems to have been the immediate response of the Stock markets to Mr Butler's eagerly awaited speech at the Mansion House this week, and that vote was seconded, almost inaudibly, in the foreign exchange market. The quiet seconding was perhaps the bigger tribute, for sterling on the morrow of the speech had to swallow its distress at the news that in September \$112 million of gold was lost and a further deficit of £38 million piled up at EPU, which will therefore claim \$80 million of gold from Britain this month. Sterling's steadiness, however, was probably attributable less to the proud faith shown in it by the Chancellor this week than to his affirmations of policy at Istanbul three weeks before; the greater part of September's strain, it is officially stated, occurred in the first half of the month.

For the City, the Mansion House speech offered perhaps a shade more ground for new hope than for new pessimism—but there was not much to justify either. The Chancellor said most of the right things about the intended direction of policy, but he has said most of those things before. He gave hardly any hint of the extent to which, and the speed with which, good intentions will become effective action. No judgment can be formed about that until the reassembly of Parliament, but a prompt statement of the "sum" of the government's proposals will be made then.

In the meantime, the City seems to have deduced, and probably rightly, that the authorities are satisfied—for the moment at least—that monetary pressure will exert its full share in the necessary squeeze without any new turn of the official screws. Any indication of the Chancellor's attitude to the much-discussed possibility of a selective increase in purchase tax could not, of course, properly be given on this non-Parliamentary occasion. But, aside from such possibilities as a direct assault upon particular forms of consumption, the speech confirmed the impression that the

emphasis in policy now shifts to the public sector. There is no sign, however, that any really large cuts in public expenditure are in prospect, nor did Mr Butler define any more closely the nature and extent of his efforts to achieve a slowing down or postponement of the capital projects of the nationalised industries and local authorities. On the central government's own current expenditures, governed by the estimates now being prepared for 1955-56, the Chancellor's promise is mild: "We shall certainly do our part in seeing that they do not exceed what can be clearly justified." The watchdog may growl, but will not bite.

These rather indistinct pointers to policy were, of course, set in a rough charting of the trend of the economy, but this sketch was likewise rather indistinct. The one important new fact—that Britain's current balance of payments showed a small surplus in the first half of this year, after crediting defence aid—affords little clue to the present trend. The Chancellor did not present this estimate as ground for congratulation; on the contrary, he emphasised again that Britain needs, not a bare balance, but a large surplus on its external accounts. And he drew attention to the special strains now arising from the need to import coal (to the extent of £47 million in the year to date) and the future strains implicit in the wage increases already granted or threatening. But these realistic comments were intermingled with statements plainly designed to give reassurance—whereas what is needed now is some degree of psychological shock.

If the test of these utterances is sought in the security markets, the provisional verdict must be favourable. The Stock Exchange has not greeted them, as on similar occasions in the past, with the blithe unconcern of "inflation as before." Gilt-edged were slightly better and industrials slightly lower; and at this stage that is probably the fairest conclusion. The Chancellor has three weeks to assemble and present his "comprehen-

sive remedies," but before that he has to deal with the replacement of the £524 million of 3 per cent Funding Bonds due on November 14th. In immediate market terms, the conversion is more important than the remedies, for its imminent arrival has coincided with the return of a degree of composure that the gilt-edged market, from the shorts to the longs, had conspicuously lacked during the summer months. If Mr Butler's speech has somewhat helped along the process of grooming of which the market has lately been conscious, that does not make it reprehensible. It is when grooming in the gilt-edged stable gives place to doping that the outside observer has ground for alarm about the rectitude of the authorities in running their book.

Nothing of that kind has been happening. It is, indeed, of the utmost importance at this juncture to pitch the terms of the conversion to avoid any appearance of forcing tactics—and the fact that it is less than three months since the 4 per cent Gas issue came so sadly to grief gives reasonable ground for supposing that the huckstering that was then attempted will not be tried again. But equally there is no need for the authorities to push the gilt-edged market down another step of the staircase that it has lately been struggling to climb. If monetary medicine is beginning (as now seems possible) to knock several more degrees off the country's inflationary temperature than some sceptics thought possible, it would be a quite unnecessary exercise in economic homœopathy to pour an extra dose down the throat of the convalescent gilt-edged patient. Whatever the authorities choose to issue, they should price it to sell, not to bang the market.

★

The gilt-edged market was inclined to make the most of Mr Butler's championship of sterling and his emphasis on restraint at home and bigger sales abroad. If the "comprehensive remedies" give these hopes the dimensions of a realistic policy—in terms of public expenditures, economic house rents, and a greater weight on discipline without frustrating incentive—then this first instinctive reaction may well set the market's course for some time to come. The days of defensive retreat against persistent selling by the banks and money market houses are over; in retrospect, the remarkable feature of that operation in the first part of this year, was the success of investors in absorbing a volume of stock that some observers would have regarded early this year as being frankly unsaleable. In this ordeal of taking hard knocks, the "shorts" have suffered as severely as any, and the yield structure, compressed from top to bottom when Dr Dalton was in charge of the concertina, has been forced up all the way through the list to 4½ per cent and beyond. Such conditions in past history have been characteristic of periods of monetary pressure, but they have not persisted once it became possible to see that the pressure would bring the required economic effect.

It may be early to say with certainty that such a stage has now been reached in the gilt-edged market, but a good deal of evidence points that way. A month ago it was possible to get 4½ per cent gross on 2 per cent Conversion, for a term of less than 3½ years—and not far short of 4 per cent tax free. Today the two redemption yields are below 4½ and 3½ per cent respectively. As between the middle dated stocks and the longs, there has already been a good deal of switching into the former; it is no accident, to take one set of comparisons, that 3½ per cent Conversion 1969 which was offering over 5½ per cent to redemption only a month ago should have recovered four points in price and fallen five-eighths of one per cent in yield, whereas Old Consols yield only a few shillings less than they did in the first week of September. There is no doubt that keener attention is being paid to the gilt-edged market by institutional investors to whom yields of 4½ per cent or better over a term of 25 years have a natural appeal. And it is not surprising, in these circumstances, that the government broker, working with his habitual deftness, has been able to prepare the way towards a government operation to a degree that would have seemed impossible only a few weeks ago.

But it must be recognised still that the foundations of recovery are not yet solid. They rest on a temporary scaffolding of the Chancellor's words, rather than upon a platform of concrete deeds. The words cannot take the strain indefinitely; the deeds, if they mean retrenchment in the public sector, will take considerable time to produce positive benefit. The recovery, in short, is predicated on the belief that, at least in the next few months, the squeeze on the private sector of the economy will begin to produce tangible effects in reducing the total weight of demand that is now falling on the country's resources. Unless a renewal of speculation against sterling breaks out on so incautious and unjustified a scale as to necessitate Bank rate action, the gilt-edged market may reasonably feel that the squeeze is not going to pinch much more tightly.

★

In the industrial share market, however, it is more difficult to see the way. Most equity investors will be prepared to assume that nothing that the Chancellor does will aim at producing avoidable unemployment on any material scale. They may well be right. But if they need have no worries about output in some prosperously employed industries falling towards break-even points, they must spare a little concern at the ability of even these industries to go on absorbing higher labour costs year after year. If Mr Butler's words have meaning, and intensified restraint at home creates the openings for more exports, the overseas markets will not pay so handsomely as the home market has lately been paying.

There is, then, at least a doubt about the continuing expansion of trading profits at the recent rate—though

there is no worthwhile evidence from the latest figures for the September quarter of any slackening in earnings or dividends. But if the profits being earned in 1955 are very good indeed—and in many cases they will be—the atmosphere in the board rooms next spring when dividend decisions come to be taken is likely to be much less open-handed than it was. This owes nothing to any false relation of wages and dividends (the Chancellor, it will have been noted, again linked the two in his speech); it will follow from the effects of the squeeze on the raising of new capital. The limitations of the new issue market when it comes under pressure have been only too evident in the last month, and the terms of the Tube Investments rights issue to shareholders this week show how far investors now expect to be courted. If access to the market should become more difficult, the consequences for dividend policy would be most pronounced—and particularly painful for those shares that have been valued on the assumption that the succulent filling can be taken from a large cushion of earnings and handled out to shareholders. In the course

How Shorn the Lamb?

IF the Australian economy rides on the sheep's back the rest of the sterling area is not far behind the tail. Wool is the largest single export not only of Australia but of the overseas sterling area, and Australia is Britain's largest single market. Many British industries were unhappily reminded of this common interest in wool last week, when the Commonwealth government announced a new round of restrictions designed to cut imports by about £65 million in a full year. The restrictions, which were as extensive as those introduced only last April, were probably inevitable in view of Australia's persistent tendency to over-spend its export income, but they were certainly aggravated by the further fall in prices of raw wool. In the season that ended last June the Australian wool cheque fell by £30 million to £282 million; now growers and the government are faced with another decline in income.

Neither of the other two wool-growing dominions has suffered to the same extent. New Zealand is less dependent on exports of wool, and enjoys the present advantage of being a producer of crossbred wool, the type that has fallen least in price; and though South Africa produces an even higher proportion of merinos than Australia it has a much more diversified export trade. The lot of the merino wool grower has indeed been unhappy. Between May, 1953, and the close of the last season in June the average price of 64's quality merino wool fell by 31 per cent, from 162d. to 112d. a lb (clean weight, c.i.f. UK). Crossbreds came through unscathed; the average price of 56's quality in fact rose from 91d. to 102d. a lb between May, 1953, and June, 1954, returning slowly to 91d. last June.

of the next twelve months there will be much less talk about the moral need for dividend restraint. The restraint, unless this analysis is wholly wrong, will be only too obvious, and doubly so to those who have been content with yields of between 3 and 4 per cent on the fashionable favourites among the growth stocks. The need for new capital resources is likely to take precedence over distributing the fruits of past growth.

This circumspect approach to the prospects for industrial shares does not rest, clearly, on any assumption of any major change of trend in the British economy. It is worth noting, perhaps, that the squeeze may have a more marked effect on new building work intended to be started next spring than some observers yet realise. But there is an immense amount of work in the building pipeline and there would be positive advantages in reducing it. Here, without doubt, is to be found some of the froth to which the Chancellor referred. In the industrial market, a good deal of froth has already been blown away; but he would be a bold man who claimed that none is now left.

It happens (perhaps because Australia's myxomatosis campaign has exceeded all expectations) that production of merinos has risen faster than that of crossbreds; crossbreds, too, have been substituted for merinos to cheapen the cost of some fabrics; and fashion in women's wear has favoured woollens rather than worsteds—and therefore crossbreds rather than merinos. Indeed fashion has lately shown an unnatural aversion from change, even when tempted by the sharp fall in the premiums for merino wool.

So far this season—with the heavy offerings of crossbreds admittedly still three weeks off—merinos have again borne the brunt of the decline. As last year, the season opened with the prospect of a small surplus of wool. The new clip was estimated at 2,625 million lb (clean weight), two per cent larger than in 1954/55. To this could be added unsold stocks from last season in Argentina and Uruguay of some 35 million lb, plus some 25 million lb that would be offered in the American market by the Commodity Credit Corporation, bringing total supplies to 2,685 million lb. The current rate of world consumption, on the other hand, could be estimated at roughly 2,530 million lb, leaving an apparent surplus of about 150 million lb.

That conclusion, however, is subject as usual to a margin of error. The estimates of the world clip may have to be revised one per cent or more; estimates of the rate of world consumption are subject to a wider margin of error. It is merely fair to say that production and consumption appear to be more or less in balance, with a bias towards surplus that is tiny in proportion to the size of the figures on both sides of the equation.

For two years now the selling of wool and other textiles in the main consuming countries has been a hard grind. Competition is severe and there is pressure throughout the chain of manufacture to reduce, or at least hold down, prices. In part these conditions reflect a return to normal after the public's postwar need to re-stock was satisfied; in part they reflect the struggle of producers of soft goods to catch a consumer's eye now tempted more towards the glimmering attractions of durable goods. Hence buyers had good reasons for trying to secure their supplies of wool more cheaply, and were quick to exploit the prospect of a surplus this season.

A touch of weakness came in the between-season's sale in London in July, and the opening sales in Australia and South Africa at the end of August confirmed it. Buyers were cautious and prices fell; that made buyers more cautious and the decline fed on itself. By the third week merino prices were 15 to 20 per cent cheaper than at the end of the previous season, and a limited quantity of crossbreds fetched 10 to 15 per cent less. For the first time in three years the New Zealand Wool Commission was called upon to take up at its "floor" price a few lots of New Zealand merino wool offered in London. But a sharp fall in prices always brings a reaction. By the fourth week buyers had evidently decided that their need for more wool came first: competition in the auction rooms increased, nearly all the wool on offer was sold and prices rallied. The market is now firm, with merinos showing a net fall of $12\frac{1}{2}$ to 15 per cent, and crossbreds a net fall of about $7\frac{1}{2}$ to 10 per cent. In Bradford, and no doubt in other manufacturing centres too, the rally has brought more business to spinners and topmakers. Prices of merino tops, which have often been up to 3d. a lb cheaper than the quotations, have risen by about 1d. and delivery dates are lengthening.

Has the market found what it likes to call "a basis"

at which trade will be stimulated to an extent that will absorb the surplus at current prices, or will the revival peter out and prices fall? It would be rash to venture an answer. A rally at this time last year proved a false guide; prices relapsed and did not begin to recover again until late in November. Yet it does not seem unduly optimistic to conclude that wool prices over the whole season, though they may again yield a smaller wool cheque, should not show a more radical break. There can be hardly any countries now that are overbought in wool.

There are several unknowns that could influence the market as a whole. The usual one at this time of the year is the weather; a sharp winter in the Northern Hemisphere could quickly transform the demand for heavy clothing. Another, of similarly wide influence, is whether disinflation in Britain and several other countries will be pressed until it touches the pockets of consumers or forces the producing chain to unload. So far the credit squeeze in Britain has strengthened the reluctance of the clothing trades to buy far forward and by the same token may force hurried buying later. It can hardly affect the topmaker and spinner until the New Year, when their purchases, and their need for finance, are at a seasonal peak. There is also the perennial possibility that Russia and other Communist countries may buy more wool; and the possibility that a party of the South American, crossbred clips will again be held back from the market.

If world production of wool in the next few years continues to grow at the recent rate, it is possible that prices will have to remain relatively low in order to stimulate consumption. That is hardly an encouraging prospect for the grower—particularly the merino grower in Australia, where prices are no longer far above production costs and where (in contrast to New Zealand and South Africa) there is no stabilisation fund to temper the wind to the shorn lamb. And, despite those funds, wool as a whole has to take its medicine through the price mechanism, without either the backing of the American government that holds up cotton throughout the world, or the holding off power of the big producer that stands behind rayon.

Business Notes

The Governor on His Armoury

THE speech by the Governor of the Bank of England at the Bankers' Dinner was notable for its carefully considered statement upon the role and worth of monetary weapons in modern conditions. Mr Cobbold, while still emphasising the limitations, is clearly satisfied that the money measures have this year made a major contribution. On the external side, he notes that the effect of the measures of February 24th was "immediate and decisive" upon sterling, and that the rise in London money rates (in conjunction with the more modest movement in the United States) influenced commodity prices so as to produce an improvement in the terms of trade.

On the domestic side, he concedes that the immediate results were disappointing—because it was widely thought at first that tight conditions would not persist and need not be taken seriously. But “from April onwards the measures were probably more effective than has been generally supposed.”

Without them there is little doubt that bank advances would have climbed much more steeply and the upsurge of hire purchase would have got out of hand. Against a general atmosphere of boom and expansion, the steady pressure of monetary policy through those months was gradually building up resistance to an exceptionally heavy demand for credit.

It is clear, however, that the direct impact of credit policy falls upon a smaller proportion of the economy than it used to do. Hence, "monetary action to restrict the borrowing and spending of individuals, firms and companies can be outweighed by the action of the Government, local authorities, and the nationalised industries" and, in consequence of the redistribution of incomes, the immediate impact on consumption may be outweighed "by the level of earnings and fiscal policy." (Is this a gentle criticism of last April's budget?) In addition, the high level of taxation makes business men less sensitive to an increase in the cost of borrowing; and the movement of international capital, though not insensitive to interest rate changes, responds less freely than it did before the war.

On all these grounds Mr Cobbold makes a sound case for requiring government policies to work in parallel with monetary policy, and remarks that people are now "waiting eagerly for action by HM Government." But he emphasises that although the direct impact of money policy is narrower than formerly, "it still exercises a gradual and pervasive influence over a much wider field." Therefore, whilst it would be unwise to blunt the money weapons by "loading them with more responsibility than they can effectively discharge," it would be "most unwise not to make full use" of them.

Sterling After the Banquet

IT was anticipation of what might be said at the Lord Mayor's dinner rather than the after-effects of the speeches that provided the main stimulus to sterling this week. The existence of a bear account was evident on the first two days of the week and the rate made considerable headway against almost every other currency under the stimulus of what seemed to be covering purchases. At one time the spot rate against the US dollar touched \$2.78 $\frac{1}{2}$, its best for two months. This recovery, however, did not spread to the cheaper varieties of sterling; the transferable rate on Monday remained unchanged at around \$2.75 $\frac{3}{4}$ and the rate for security sterling actually gave some ground to \$2.75 $\frac{5}{8}$. But the advance in the spot rate against the dollar was not fully held, falling back to \$2.78 $\frac{1}{8}$ while the rate for security sterling has declined further to \$2.75 $\frac{1}{2}$.

The failure of sterling to maintain the momentum of its advance could not be attributed to any absence of reassuring references to the currency in the Mansion House speeches. The Governor of the Bank of England asserted that sterling was still undervalued rather than overvalued in relation to most of the principal currencies of the world and suggested that this, "the most important point of all" was often overlooked. There will be general agreement with this view that in 1949 sterling was grossly overvalued; and there is much substance in his assertion that the devaluation of that year left sterling undervalued (he should know since he had a hand in picking the new parity). But six years of brimfull employment have passed since then. The acid test of under- or over-valuation of a currency is the balance of payments and the exchange market.

The reassurance for sterling brought by the Chancellor was a repetition of what he had already said in Parliament last July and in Istanbul last month but it was reinforced by the revelation that the balance of payments (including American aid) for the first half of the year had shown a small surplus and that the whole of the losses of gold and dollars and of the EPU deficit incurred last month had been suffered before the Istanbul speech. All these assurances were sufficient to enable sterling to hold its rate against the dollar and still to advance slightly against certain Continental currencies, notably against the German mark and the French franc.

Liquidity Ratios Recover

THE full statement from the clearing banks for their make-up on September 21st shows a slightly smaller fall in advances during the five-week period than was estimated here last week. The actual decline proves to be

£123 million. This is still by far the largest decline ever experienced, but at least three-quarters of it was attributable to repayments by the gas and electricity industries out of the proceeds of their market loans. Since these issues were so largely taken up by the departments, the Treasury's need for domestic finance must have been sharply accentuated by the financing of the large calls that had to be met on them during the period, when its visible overall deficit was some £60 million larger than in the corresponding (four-week) period last year. A substantial increase in the banks'

	September 21, 1955	Change on

† Ratio of assets to published deposits.

liquid assets was therefore inevitable, but the actual increase of £73 million showed a more moderate contrast with last year's movement of £20 million than might have been expected—despite the fact that £11 million of the expansion was attributable to commercial bills. The gap between the Treasury's indicated borrowings through the banking system and its apparent need for domestic finance is partly explained, of course, by the fact that sterling was accruing to the Exchange Account against its sales of gold and foreign exchange; but it seems evident that some additional resources must have been secured by further net sales of securities.

Thanks to the combination of a steep decline in risk assets with an increase in liquid assets, the liquidity ratio for the banks as a whole has been raised from 32.0 to 33.5 per cent, virtually restoring it to the level at which it stood at the corresponding date last year. Net deposits dropped during the five weeks by £46 million, whereas in the four-week period last year they rose by £21 million and in 1953 by £54 million.

Tube Investments Plan

SINCE the bulk of the P and O Debenture issue was left with the underwriters and since the effect of the English Electric company's rights issue was to bring the existing stock down more than half-way towards the issue price of the new shares, it has become clear that industrial companies requiring to draw big money from a reluctant market would have to think again. Tube Investments,

wanting over £8 million, has announced an unusual type of issue this week. The company, whose stock stood at about 95s. when the plan was being considered, had intended raising money by a normal rights issue below, but not fantastically below, the market price and simultaneously to make a one-for-one free scrip issue. Instead it combines the operations and makes a rights issue of one-for-one at the enticing figure of 22s. 6d. per share. Thus the company insures success. With the shares at 93s. 9d. the rights are worth 35s. 7½d. per share. Nor need underwriters be bribed or cajoled into taking it on.

The issue is not underwritten, but it has another peculiarity. Since the rights are of exceptional value steps have been taken to make sure that no shareholder misses them. Helbert Wagg and Co. and J. Henry Schroeder will (for a fee that is not disclosed) take up unexercised rights and sell the resulting shares for the benefit of the shareholders entitled. The plan has everything to commend it. The unexercised letter of rights whose value is lost to the shareholder often through his absence or infirmity is a recurrent problem to which this scheme should be the answer. But it has yet to be tried. Will the mere fact that it is for once impossible for a shareholder to miss his rights tempt him to take no action? And will the two merchant bankers therefore have an enormous block of new shares to sell on the last few days of stamp-free dealings?

A further deduction can usefully be made. Tube Investments in the course of getting this £8,153,360 and hoisting its capital plans out of reach of its bankers has to liberalise its conservative dividend policy, but it is not letting liberality go to its head. The final dividend this year is to be 12½ per cent, making 22½ per cent for the year compared with 17½ per cent. The dividend is none too generous, for profits before tax for the year ended July 31st have been about £8½ million compared with £5,741,000. On the increased capital an interim payment of 5½ per cent is to be paid in May and a final dividend of 7 per cent in December next year. Those rates have been closely calculated to make the equivalent of 14 per cent per annum on the enlarged capital allowing for the fact that the new shares will not be fully paid until the end of March, 1956.

Clan and Union-Castle

THE merger between Clan Line Steamers and Union-Castle Mail Steamship Company was among the best kept City secrets: the adjustment of prices after the announcement was therefore sharp. Clan Lines rose 30s. to £8 10s. on Tuesday while Union-Castle rose 2s. 6d. to 30s. The merger is cleverly devised, bringing to Union-Castle the ample resources that the conservative management of Clan Lines has built up, giving it a wider spread of trade routes (including Australia) and throwing into the common pool the export management on which Clan Line has conspicuously flourished. The improved 10-year mail contract recently agreed between Union-Castle and the South African government also helps in that direction. In practice the merger brings benefit to each class of shareholder in each company as the table of terms shows. This is

From Seurat's
"The Bathers"

We want margin to our lives—

THOREAU (1817-1862)

All trade requires a margin; a surplus that can be put to economic use after production costs have been covered by returns. Without it, the movement of goods and services which keeps us alive would stop next week.

A man's life too must show such a margin, if it is to be worth living; something that enriches his material day after his work is done. It may be a study or a sport; a language he is learning, a musical instrument he is practising. On a broader scale, a nation builds its picture-galleries and its playhouses; they are there to help it live beyond today's horizon.

To this wider life, of individual, and community, industry brings its contribution—leisure. Without this there can be no true civilisation, no lives that have 'a margin'. Modern industrial advances have extended, and redistributed, the nation's spare time; with the new, factory-made hours that they have brought, the Machine Age can one day transform itself into the Leisure Age.

Esso Petroleum Company, Limited

straight to the point

Here's yet another fully automatic Monroe—
another years-ahead calculator with the incredible speed
and infallible accuracy of automation.

Set the problem, press a key—and your Monroe 8N
literally races through complex calculations to the
right result. Automation short-cuts hundreds of
time-wasting intermediate steps. Zeros and decimals

flow automatically. Multiplication, division, addition, subtraction

—your Monroe 8N steers its own way through all stages of figuring

without operator intervention. Time-saving, too, is the new Monroe functional

colour scheme. Logical grouping of colour-identified control keys makes

accurate selection virtually automatic.

possible because it involves a loosening—perhaps overdue—
of Clan Line's purse strings.

The form of the merger is simple. A new holding company, still unnamed, will take over the capital of both companies (excluding only the Union-Castle debenture), and the two companies will continue to operate their individual fleets. Before the merger Union-Castle will pay for 1955 an unchanged dividend of 7½ per cent and Clan a dividend of 25 per cent (compared with 20 per cent). After the merger the new holding company hopes to pay 16 per cent for 1956 covered three times by earnings. That is not the degree of coverage to which Clan Line shareholders are accustomed, but a more liberal policy had to come eventually as the 2.9 per cent yield basis for Clan shares before the announcement implied. The present price of £8 10s. values the prospective £1 share in the

Present security	Amount £'000	Exchange basis	Security in new company	Amount £'000

Ord. £1	5,480			

holding company at 63s. 9d. with a yield of just over 5 per cent. Union-Castle ordinary shareholders will receive a mixed bag consisting of one-fifth of a 6 per cent redeemable preference share and two-fifths of an ordinary share for each Union-Castle unit; if the preference share is worth par, a price of 30s. for Union-Castle values the new ordinary share at 65s. and puts it on a yield basis of just under 5 per cent. On this construction, Union-Castle might at the moment be a shade dear compared with Clan.

The merger company which promises to be a big, and it is to be hoped a great, shipping group will clearly, and rightly be dominated by Clan Lines. The ordinary capital of the holding company will be divided in the approximate ratio 60 per cent Clan, 40 per cent Union-Castle. The board of directors, still to be appointed, seems likely to be drawn in roughly those proportions. But acceptance of the scheme, which requires the assent of 90 per cent of each class of shareholder is no certainty. It is already being attacked from the Union-Castle side on the grounds that Clan Line will be so much the dominant partner that it amounts to a take-over by Clan—a take-over that values all the securities of Union-Castle collectively at £11.2 million (taking the new ordinary at 63s. 9d. and the new preference at par) against a book value of £20 million for its net assets. It is not, however, a take-over but the acceptance of a minority status that Union-Castle shareholders are asked to swallow, recognising the fact that their company no longer dominates in the trade in which it has lived for 100 years. It is nevertheless to be hoped that the full terms of the offer to be issued later will show the relative assets (at current not balance sheet values) that the two groups put into the merger.

Transoceanic Development Corporation

THE revival of an international market in private capital is thoroughly welcome. International money for development has been found on a substantial scale since the war, mainly from government sponsored organisations, such as the International Bank, and by direct industrial investment. International finance of the private enterprise variety has found little encouragement to look for opportunities across exchange controls and trade restrictions. Transoceanic Development Corporation, backed solely by private capital and banking expertise from America, Britain, and other countries, is a major newcomer into this field.

The new corporation has been formed by Kuhn, Loeb and Company of New York, the First Boston Corporation of New York and S. G. Warburg and Company of London, with the support of a galaxy of banks, issuing and investment houses in the United States, Canada, Britain, France, Germany, Belgium, Holland and Switzerland. The experience and judgment of these institutions is reflected in the constitution of its board, headed by Sir William Wiseman, a partner of Kuhn Loeb; its vice-chairman is Mr George D. Woods, the chairman of the First Boston Corporation; and Mr Siegmund G. Warburg is chairman of the portfolio committee. The corporation has been registered in Canada (where it can secure double tax advantages) with an authorised capital of \$10 million, divided into 100,000 shares. Initially only \$50 a share has been called up. American and Canadian shareholders have provided about three-fifths of the capital and the European participants the remaining two-fifths. It is not intended at present to invite public participation.

Transoceanic Development Corporation will be interested mainly in selected equity investments in countries other than Canada and the United States. It envisages both investment in existing companies and the promotion, financing and development of new enterprises. Its first consideration will be to provide "new capital, in co-operation with local and other investors, for the expansion of mineral, manufacturing and commercial enterprises in countries providing attractive investment opportunities." The charter does not prohibit investment in prior charges (possibly with conversion rights), a device favoured by other development finance companies. But by placing the emphasis upon equity investment the corporation can fill a gap that the efforts of such institutions as the International Bank and the Commonwealth Development Finance Company have left unfilled. Those organisations like to carry other investors with them when they back a new venture so that co-operation between them and Transoceanic Development is a distinct possibility.

Silver's New Peak

SILVER in terms of sterling has this week touched its highest point since the boom that followed World War I. In 1920 it touched 89½d. per standard ounce; this week—now quoted per fine ounce—silver has touched 80½d. The rise in the sterling price follows a vigorous advance

in New York where silver this week has touched 92½ cents per fine ounce and where business has actually been done at 92½ cents. The figures are significant because silver now commands a premium over the price of 91 cents at which the United States Treasury is entitled to sell from its free stocks. It has indeed sold silver this week at 92½ cents, justifying the difference between that figure and the statutory price of 91 cents by explaining that the demand is centred in New York and that Treasury stocks of silver in the east of the United States have been exhausted so that buyers must bear the transport charge from repositories in the west. Appreciable amounts have been sold from the government stocks which are now estimated at the modest total of about 20 million ounces.

It was in March that the rise that has now carried the price of silver through both the US Treasury purchase price for domestic silver and its permitted selling price from its stock began. The advance was started by the news of substantial direct sales of Mexican silver to Saudi Arabia for coining, quickly followed by a similar sale by Mexico to Western Germany. But the importance of these operations lay in the publicity that accompanied them rather than in the amounts sold or the novelty of the traffic. Saudi Arabia has been buying silver for minting persistently since the end of the war. Some of the coinage has indeed been made in this country. Basically more important is the steady growth in the commercial demand for silver particularly by the photographic and electrical industries. Industrial demand now fully fills the gap created when several countries switched to other metals for their token currencies. Moreover that industrial demand is in its very nature more persistent; much of the silver that goes into industry is destroyed as it is used.

The Gold Drain

The fall in the sterling area's gold and dollar reserves by \$112 million in September brings the loss in the third quarter of this year to \$335 million. The recent drain marks the strong adverse psychological forces at work at a time when the commercial balance with the dollar area is itself burdened by heavy seasonal imports by the United Kingdom. The speculative pressures on sterling abated in the middle of last month, following the reassurances given

by Mr Butler at Istanbul. In the second half of September, and in the past week, sterling steadily gained strength in the exchange markets. The September deficit was "virtually all incurred" in the first half of the month. Some \$59 million of the gold loss was attributable to a payment to EPU; but last month's deficit with the Union was larger. At £38 million (\$106 million), it will call for a gold payment next week of \$80 million.

More Tinplate Needed

It is clear that Britain will have to import tinplate again next year; the question is how much. The demand for this material has been rising for over two years, and there is every sign that food canners and other users will need still more in 1956. Yet until the extensions at the Ebbw Vale mill come into operation in about a year's time and the new plant at Velindre is completed a few months later, no considerable increase can be expected in home production. To bridge the gap this year substantial quantities of American and some French tinplate have been imported for the first time. The bulk of the 80,000 tons ordered were delivered in the spring when stocks of tinplate and cans were built up in preparation for the peak canning season between June and September.

The same problem will emerge next spring, long before the new capacity in South Wales becomes available. Output and exports are both only slightly up on last year, when 872,000 tons of tinplate were delivered from the strip mills and from the 100-odd hand mills still in business, and just over 300,000 tons were exported. Food canners received 365,000 tons last year, some 67,000 tons more than in 1953, and this year's increase will be at least as much. All have heavy expansion schemes in hand both for traditional packs and for newer items such as milk and beer; and they see no difficulty in selling substantially more tinned foodstuffs next year.

Stocks of tinplate and empty cans are low and unless exports are squeezed in 1956, imports will almost certainly have to be much higher than 80,000 tons. These shipments

* Include settlements with EPU, governed by balance in previous month. † After payments totalling \$99 million to EPU creditors in initial settlement of part of UK's overdraft with Union. ‡ After payment of \$112 million to IMF for "repurchase" of sterling. § After payments totalling \$181 million on United States and Canadian loans.

were ordered and paid for this year by Richard Thomas & Baldwins and the Steel Company of Wales, the principal tinplate producers; and the difference between the delivered cost of imported tinplate and home prices, which must be approaching £1 million for the current year, has been borne by them. Home prices are, however, fixed by the Iron and Steel Board so as to make some provision for this loss and there is still a substantial premium on sales of British tinplate overseas, though this is less than the loss per ton on imported supplies. But the prospect of buying larger quantities from abroad must still exercise the minds of the Board and the importers. There is no shortage of customers in other countries for British tinplate, and the necessity to import more from the dollar and EPU areas next year will only be avoided if exports, over half of which go to sterling area markets, are deliberately cut. Whenever tinplate has been short in the past overseas orders have been held sacrosanct. But Britain has not previously had to exchange dollars and gold for tinplate.

Shipbuilding Prices

IN the last twelve months the world's shipyards outside the United States have been flooded with a spate of orders for dry-cargo ships and ore carriers; more recently the tide has been swollen by wholesale orders for tankers, with promises of more to come. Several yards in Germany and the Netherlands, as well as in the United Kingdom, must by now have all their berth space reserved at least until 1960; and it cannot be easy to place an order for a sizeable ship anywhere in the world for delivery before 1957, except in the United States (at prohibitive cost) or in Japan. In fact, contracts for delivery even up to the end of 1956 already command a substantial premium.

Owners who took advantage of the situation last year and secured early delivery on a fixed price basis at some Continental yards have reason to be satisfied. Shipbuilding prices on the Continent are again showing signs of coming more into line with British prices, as a result of persistent pressure for increased wages (accompanied by strikes in German and French yards) and increasing steel costs, but British prices may take another step ahead if further wage demands are conceded. The danger is that in the coming period of full employment for shipbuilding the effects of this competitive disability will be masked. The experience of last year, when new contracts did not start coming to British yards until Continental yards were nearly fully booked, may be forgotten. But next time there might be no overspill.

"Improvements" and Car Prices

SEVERAL car manufacturers have increased their prices during these last few weeks before the Motor Show. The table shows the amount by which prices of a number of basic models have risen. The increases do not affect all cars in a manufacturer's range. Only the continental

Bentley, for example, has become more expensive, and only the Silver Wraith model of the Rolls-Royce.

PRICES
(Including Tax)

	£	Increase
A.C. Sports.....	1,559	+ 120
Bentley Continental (Mulliner body)	7,027	+ 99
" " (Park Ward body)	6,765	+ 148
Hillman.....	667	+ 17
Humber Hawk.....	1,014	+ 28
M.G. MGA Sports (new car)	844	+ 64
Mercedes 220 Saloon.....	2,200	+ 77
" 300 Cabriolet.....	3,790	- 315
Rolls-Royce Silver Wraith	7,325	+ 673
Rover 75.....	1,297	+ 28
Standard Eight.....	524	+ 14
Standard Ten.....	610	+ 20
Sunbeam.....	1,184	+ 57
Vauxhall Wyvern.....	724	+ 21
Vauxhall Velox.....	797	+ 35
Volkswagen (de luxe s/h).....	745	+ 10

In every case the manufacturers justify their higher prices on the grounds of "improvements" that buyers in more competitive markets might expect to receive gratis as routine technical improvements. The price increases, incidentally, disturb the delicate competitive balance that has existed for some years between the models of different manufacturers: Rootes and Vauxhall have raised prices, Standard has raised those of its small cars and has a new Vanguard due at the show, but Ford and Nuffield this week announced they would not increase their prices.

Selling Chemists Automation

THIS week's conference in London on automatic control in the chemical industries was not simplified for the industrial layman to the extent of the one held so successfully in June by the Institution of Production Engineers, but nor was it addressed primarily to the expert in control engineering. It was designed primarily to educate chemical engineers who have to design and specify new plant about the reliance they can put on instrumentation and control systems in their current stage of development, and to suggest that they should base advances in the design of

chemical processes upon the possibilities of control that are clearly seen in the instrument laboratories. It is an earnest of the avid interest that the subject of automation now attracts—which properly handled can become the most positive factor in realising the control engineer's hopes—that the conference was planned for about 400 people, and in fact had to accommodate about 700.

In the chemical industries, which most outsiders would think of as having perhaps more automation already than any other except perhaps electricity supply, the control engineers have their own laments. They argue that their traditionally empirical application of instruments and controllers to chemical processes is now hampered by lack of an adequate theoretical foundation. They feel, too, that the people who design and operate chemical equipment are often insufficiently aware of what really goes on throughout the processes concerned—and therefore of the characteristics that it will be worth while to control. That is not an arguing point, but a sober fact; and identifying those significant characteristics is not the least difficult side of process control research. Moreover, some of them feel that the more or less immediate possibilities of instrumentation offer the chances of "leaps" in process design—for instance in the speed of chemical reactions and hence the output of capital equipment—which today's designers are simply not mentally equipped to take. Such problems, at the moment, are far more important than questions of the economics of control equipment, or of trade union reactions to it (which latter one or two speakers seemed to go out of their way to exaggerate). What matters today is to communicate the knowledge of the possibilities of automation to people who are in a position to do something about it—which this conference, within its limits, did.

Break in Wheat—

WITHIN a week the Canadian Wheat Board has reduced its prices by 5 and 7 cents a bushel. On September 30th the price of the top, second and third grades of Northern wheat were cut by 3 cents; grade 4 was cut by 4 cents. The new prices were: 1 Northern 172 (Canadian) cents a bushel, ex-Fort William; 2 Northern 169 cents; 3 Northern 166 cents and 4 Northern 161 cents. On October 5th the board again reduced prices; by 2 cents a bushel for each of the first three grades and by three cents for the fourth grade.

Are these reductions intended to clear the air before the International Wheat Conference on the 26th, or are further reductions on the way? It could be argued that the board has adopted not only a more competitive policy but a more flexible policy, too, for it is remarkable that it should have made a second reduction so soon after the first. Or did the board prefer to take two bites at the cherry, lest a single reduction of 5 and 7 cents scared buyers too much? The point is somewhat academic. Rightly or wrongly many buyers feel that the reductions are not enough in view of the surplus of wheat, and they are prepared to hold off and wait for more. Yet the board could hardly reduce prices much farther without incurring a loss. When allowance is made for the board's operating and stock charges, the

new price of 4 Northern cannot be far away from the 140 cents a bushel initially paid to producers at the beginning of the crop year.

—and Cotton

THE United States carried into the new season on August 1st a record stock of 11 million bales of cotton; its sales abroad have fallen sharply because it is being undercut by every other country, and a huge new crop is coming forward. Something just had to give way—and it was the price. In the past two months New York futures have dropped by 2 cents a lb or 6 per cent, and the average spot price in Southern markets, which hitherto had been resting on the support price of 33.75 cents a lb, has dropped nearly one cent below it. This week there came the sharpest break yet. It was touched off by a private estimate that placed the new crop at over 14.2 million bales, more than 1.3 million bales above the official estimate of the crop on September 1st. If confirmed, this means that by intensive cultivation of the best land cotton farmers have managed to produce half a million bales more than last season from the smallest acreage for half a century. So much for acreage restriction. While only the extremist would consider that American domestic prices are in danger of collapse, all traders fear that the American government will be forced to adopt more radical measures to relieve the surplus. Those fears were reflected in the sharp fall in New York, where May futures, for example, closed nearly one cent lower at about 30.90 cents a lb. That is about 4 cents below what it should cost to buy cotton back from the support agency next May, after carrying charges have been added to the support price.

4 per cent Defence Bonds

THE Government is not quick to alter the rates of interest offered by the securities in the National Savings Committee's ambit. It is argued with some justice that savers of that type do not react quickly to changes in interest rates; the amount they put into savings certificates, defence bonds and savings bank deposits has more to do with the pay packet, the cost of living and the supply of consumer goods, than with the tone of the gilt-edged market. This explains why the first adjustment of the national savings media to the new interest rates—the issue of new 4 per cent defence bonds on November 1st—comes almost a year after gilt-edged yields first turned upwards. The adjustment, however, is due, if not overdue. Defence bonds sales and encashments do in time conform to market rates of interest and the sales in the financial year so far of around £29 million have exceeded by a mere £5 million the amount of the encashments.

The interest rate has been raised from 3½ per cent to 4 per cent—the highest yet paid on a defence bond issue. At the same time the notice required for encashment within the first five years is reduced from six months to three

Steel men take an iron

Three men playing golf — grandfather, father and son. And they have something else in common, too. They are steelworkers at a large works near Glasgow. But they might be in Belgium or Brazil, Canada or France, on any golf course in the world. Wherever golf is played you will find British steel products. Steel in all its forms makes up over 40% of Britain's total exports. And sports goods too play their part in earning foreign currencies for Britain. Even your mid-iron is made of steel. Wherever there is steel there is British steel.

British steel leads the world

MORE POWER AT LOWER COST

The *Eland* is a turbo-prop aero-engine designed for use with a single rotation propeller. It has already reached the type test stage at its full initial rating of 3,000 e.h.p., and a 4000/4200 e.h.p. version is being developed. With its high power the *Eland* combines low weight, low fuel consumption, and ease of maintenance. Napier are installing *Elands* in an Elizabethan and a Convair-Liner 340 for demonstration to airline operators.

The *Eland* is an engine of great importance in world aviation and a fine example of the Napier principle: more power at lower cost.

ENC 26

months. In other respects the terms remain unchanged; redemption is at £103 after 10 years or optionally at £101 after five years, holders reserving the right to claim repayment at par on three months' notice before the expiry of five years. It follows naturally that holders of the last part of fourth issue of 3 per cent bonds (those bought between February and April, 1946, and maturing between the same months of next year) will receive an offer of conversion into the 4 per cent series.

The maximum holding of the new issue has been fixed at £1,000 in addition to the permitted maximum holdings (£3,500 in total) of all earlier issues together. Defence bonds therefore, despite the gross total of £1,700 million sold since 1939, remain widely spread in small holdings, even if those holdings are not all "small investors." The running yield of 4 per cent on the new issue should prove an attraction to a wide range of investors.

Buoyant Revenue: Lagging Expenditure

IT is risky, as the Chancellor reminded his audience at the Mansion House, to attempt to draw conclusions about the outcome of the year's budget from the half-year's revenue return. But there is no reason to question his confident expectation that the out-turn for 1955-56 will better the estimates, at any rate on current account. In the six months to September 30th total ordinary revenue reached £1,817 million, £35 million more than a year before, whereas the estimate for the full year is for a fall of £28 million. The rise in income tax receipts by £9 million, against an estimated fall in the full year of £15.6 million, reflects buoyant incomes but its significance is limited by the fact that a bare quarter of the year's income tax has yet been collected. The increase of £50 million in receipts from customs and excise, only £6 million short of the expected increase in the whole fiscal year, is what might be expected from a spending spree and from an economy at full stretch.

Current expenditure is up by only £55 million, whereas Mr Butler reckoned on an increase of £257 million in the full year. This is the more notable as the rise in money market rates has already increased the cost of debt interest by almost the extra £30 million budgeted for in the full year. As in 1945-55, supply expenditure is running considerably short of estimate — it was expected to increase by £223 million, but has so far risen by only £20 million. The upshot is that the deficit on the above-line account, at £219 million, is only £19 million larger than last year; in the Budget the Chancellor was prepared for a reduction in the unexpectedly large 1954-55 surplus of £433 million to £148 million in 1955-56.

The below-line account, in contrast, appears less favourable than the estimate. Net expenditure in the six months is up by £128 million, some £45 million more than the projected increase in the twelve months. The deterioration may however be temporary, as the increase of £90 million in loans to local authorities (expected to fall by £33 million in the full year) may have been affected by the forestalling of the increases in the Loan Board's lending rates that have taken place in recent months. The increases of £15½ million

in the capital expenditure of the Post Office and of £27 million in compensation payments under the Town and Country Planning Acts are broadly in line with expectations.

New Record for Diamond Sales

THE world's appetite for diamonds shows no ease; indeed, it seems that the giver of gem stones, the user of industrial stones and the American government are all such eager buyers that sales by the Central Selling Organisation will set a new record this year. Sales in the third quarter, announced by De Beers Consolidated Mines, amounted to £16.7 million, well over £2 million higher than in the same quarter of last year. This brought the total for the first nine months to a record £56.1 million, which was £10 million higher than in the same period of last year and £2.4 million higher than the previous record in 1952. Of the £10 million rise in sales between the first nine months of this

SALES BY THE CENTRAL ORGANISATION
£ million

Jan./Sept.	Gem	Industrial	Total
1952	34.4	19.3	53.7
1953	32.6	13.0	45.6
1954	34.7	11.3	46.0
1955	38.6	17.5	56.1

year and last, nearly two-thirds is accounted for by industrial sales, sales of which rose by £6.2 million to £17.5 million. Sales of gems, at £38.6 million, showed a rise of nearly £3 million after allowing for the 2½ per cent increase in prices at the end of last year. Only a major setback could now prevent the figures for the whole year from exceeding the previous best of £69.7 million in 1952. Apparently still more gem stones could be sold if production could be raised further; on the other hand, the producers will be hard put to sell their output of industrial stones after the American strategic purchases cease. The fall in demand will be tempered by the new applications for industrial diamonds that De Beers is developing, but it will take time before new uses can fully replace the strategic demand.

Television Agreement

A SENSIBLE solution has been reached to the squabble over names and initials that broke out between the Associated British Picture Corporation and the Associated Broadcasting Company after ABPC had received the contract to provide week-end commercial television programmes for the Birmingham and Northern transmitters that had been surrendered by Mr Maurice Winnick. The Associated Broadcasting Company is changing its name to Associated Television (ATV) to avoid confusion with ABPC's television subsidiary, and the change has paved the way for an agree-

ment on sharing studios and exchanging programmes between the two groups. Associated Television, which will provide programmes in Birmingham during the week, and which is now providing them in London during the week-ends, had tentatively arranged to share most of the cost of capital installations in Birmingham with Mr Winnick and, since he withdrew, has stood in some danger of having to bear the full costs of these alone. ABPC, on the other hand, was plainly going to find great difficulty in getting programmes ready in time for the opening of the Birmingham transmitter early next year. The two companies have now agreed to share both studios and programmes—so that during the week-end, viewers in London, Birmingham and Yorkshire and Lancashire will in effect receive a single commercial programme from the two companies.

Hire Purchase in Restraint

HIRE purchase figures, as far as they go, again show that the restrictions are beginning to work. They go as far as last month for motor cars and the other durables for which HP Information collects figures and show a continuation—at a slower pace—of the sharp drop that began in August. The total number of contracts recorded by HP Information fell from its peak of 87,842 in July to 65,181 in August and to 59,357 in September this year. Even so it remained well ahead of the total of 52,309 in September last year. Motor cars, motor cycles and caravans (but not commercial vehicles), show declines compared with August. Official policy must take the credit or the blame; the normal seasonal pattern shows a modest increase in September after a sharp fall in August. There is however an oddity. Hire purchase contracts for new cars in September (as opposed to total motor car contracts) showed an increase. They mounted to 6,012 compared with 5,346 in August and with 4,396 in September last year.

NUMBER OF HP CONTRACTS

	Sept., 1954	August, 1955	Sept., 1955
Cars	27,806	35,370	32,080
Commercial Vehicles	4,606	5,916	7,030
Motor Cycles and Side Cars ..	16,807	20,613	17,261
Tractors	619	706	706
Farm Equipment	584	614	630
Caravans	1,184	1,452	1,288

Source: HP Information.

Figures on radio and television sales collected by the British Radio Equipment Manufacturers Association for August also show a turn in the tide. Credit transactions, expressed as a percentage of total sales, fell—for radio sets from 41 per cent in July to 33 per cent in August, for radiograms from 67 to 54 per cent, and for television sets from 61 to 53 per cent. These were in the main percentages of a shrinking total trade. Radio sales fell from 84,000 to 73,000, radiograms from 13,000 to 11,000, though television sales in advance of the start of commercial television rose from 61,000 to 64,000.

Bargain in Flour

WHEN government control over the milling industry was removed in 1953 a disagreement arose between the country's biggest baking business, Allied Bakeries, and two of the biggest millers, Ranks and Spillers. Allied Bakeries held that it should receive special discounts related to the volume of its purchases of flour. The millers refused. Allied Bakeries, which is controlled by the Weston group, then countered by buying flour from Canada and blending it with English flour. Later it bought flour from Australia, too, until it was importing about half its total requirements. Other bakery groups also began to shop around in the world market for flour. A few mills had to be closed and others put on short time. The millers knew that the comfortable days of selling their output to hundreds of small bakers—each taking the same quantity year after year—belonged to the past. Small bakeries were being absorbed by groups, and bigness in baking could be troublesome. At any time a large customer could switch to imported flour, leaving the miller with idle capacity. The Co-operative Wholesale Society, the only miller of comparable size, had an assured market for the bulk of its output; was that not the path of prudence for Ranks and Spillers, too? Reluctantly the two companies decided that it was, and in their annual statements this year they announced laconically that their interest in baking, hitherto minor, had become substantial.

Late last month the two sides came to terms. Allied Bakeries are to take fixed quantities of flour from Ranks and Spillers on a three-monthly basis; the millers are to grant a special discount of 2s. on a 280 lb sack now costing 96s. delivered, equivalent to 16s. a ton. If the bargain proves satisfactory Allied Bakeries will not need more than a small quantity of imported flour for speciality uses, and Ranks and Spillers will not need to extend farther into baking. Both sides seem to gain. Allied Bakeries should have an assured supply of blended flour of regular quality; the millers should have an assured customer at a price that must still be economic. The industry has long argued that the Millers' Mutual—the shy trade association that promptly substituted its own form of control over output when governmental controls were withdrawn—could not exploit the consumer as long as bakers were free to buy imported flour. It is comforting to find that argument confirmed in practice.

Improving Retail Statistics

TRADERS who have been highly critical of the value of the 1950 Census of Distribution, the first of its kind to be taken in this country, may feel more kindly towards it when the process of revising the monthly retail trade figures in the light of data from the census has been completed. The first result of this revision has been a drastic overhaul of the least satisfactory section of the retail trade index, that which deals with the returns from the independent shops. Before the census was taken, little or nothing was known about these shops, and the statisticians knew that the index of their activities had many imperfections.

Who'd drop a
brick on
a boardroom table?

Surely, you might say, it's a waste of time to drag such a technical detail as a furnace refractory into a top-level discussion of policy? Surely, that sort of thing can be left to a technician?

But can it? If refractories were simply technical details we would agree. But they are not. They affect costs sharply.

The discussion of a broad refractories policy at top-level is far from being a waste of time—it is essential.

That is where Morgans can be helpful.

As manufacturers of an immense variety of refractories, Morgans can see the picture as a whole. As the operators of the most up-to-date refractories plant in Europe, they can put good ideas into practice. As manufacturers they have 70 years' experience to draw upon. As consultants they are authoritative. Their advice is yours for the asking.

The cure for acute labour shortage

If you find it hard to meet demands for increased production, look at Hull, where the labour position is easy.

Hull can give equal satisfaction on sites, transport, public utility supplies, export and inland distribution, and offers the products of many industries including—

Solvents and plasticisers, pigments, chemicals, adhesives, chalk, cement, oils and fats, latex; grinding media, hydraulic, chemical, electrical and general engineering services; wood, grain and oilseed by-products; containers (metal, wood, card), printing.

ON OFFICE FILING

Take care of your filing system; it is your business memory. Changes of filing staff, increases in the volume of business, can disorganise it quickly and completely; cost you dearly in time, labour and efficiency. If you have cause to think that your filing is slow in providing vitally needed information, call in the Man from Remington Rand for a discussion and a survey. It's free, and it carries no obligation.

***THIS IS VARIADEx** The filing system that expands naturally and easily with growing business. Variadex provides from 25 to 5,000 subdivisions for any size of installation; incorporates scientific alphabetic breakdown and a five-colour control system that automatically sets an impeccable standard of filing accuracy. Variadex already controls many of the world's largest filing systems; it would do as good a job in your office.

Send for the man from

An example given in the Board of Trade Journal last week-end demonstrates how correct their suspicions were. Figures prepared by the new method show that between April and May the sales of independent shoe shops rose slightly (taking 1950=100, the rise was 2 points to 121). But by the old method which has been in force up till now the index actually showed a sharp drop of 8 points over the same period. By next year, the Board of Trade hopes to have revised the other sections of the index.

SHORTER NOTES

The National Debt Commissioners have taken up a £15 million issue by the North of Scotland Hydro-Electric Board. The issue was of a Treasury guaranteed 4½ stock (1965-66) and it was placed at a price of 98; the stock will not be quoted on the market.

There will be no further freeing of imports from Europe for the time being. The British government has decided that balance of payments difficulties prevent it from fulfilling its obligation, as a member of OEEC, to raise the percentage of private imports freely admitted from 85 to 90 per cent (base year 1948).

British nylon prices have been reduced by 5 per cent for staple fibre and 10 per cent for filament yarn. Prices were last cut 18 months ago, but competition has since intensified. The new reductions follow the working up to full capacity of plant extensions at the British Nylon Spinners' plant, and present production is at the rate of 30 million pounds a year.

In his address to the autumn meeting of the Institute of Chartered Accountants the president, Mr. W. S. Carrington, gave some interesting—and significant—details about the employment of members of the Institute. There are about

18,800 members, of whom 500 are known to have retired; roughly they find employment as follows:

Engaged in public accountancy in England and Wales:—	
As principals	7,000
As employees	2,500
Engaged in industry, commerce, or retired....	9,500
Not in England and Wales	7,300
Total membership	18,800

In the last six years the number of new articulated clerks registering with the Institute has remained steady at close on 1,400 a year, of whom about 30 per cent pay premiums.

British Railways has decided to spend £350,000 on building a 3¼ mile stretch of special test track 20 miles from its research and engineering laboratories at Derby. Up to now the locomotive test beds at Swindon and Rugby and trials with dynamometer cars on ordinary track have been reasonably adequate for steam traction; but the conversion of railway rolling stock to diesel and electric traction will make larger off-line track and vehicle testing facilities essential. The new track should be ready in two years' time.

Experiments made in cocoa growing in Malaya by Malayan Cocoa Limited, a small company jointly owned by Harrisons and Crossfield, Cadbury and the Colonial Development Corporation, have encouraged these companies to register a new company, United Cocoa Development. It is hoped to interest Continental and American manufacturers of cocoa products in the project.

The BBC has just taken delivery of a colour television camera chain built by Marconi which will be used for experiments. Marconi demonstrated a "compatible" colour system—that is, one which can be picked up on black-and-white screens where necessary—some months ago, and the equipment delivered to the BBC is a development of this design.

Company Notes

GLAXO LABORATORIES. The latest dividend is covered about six times by a net profit of £1,556,000 (against £1,484,189). But earnings look high because Glaxo has to plough back such large sums—£1,100,000 has been put to reserves this year—to support research. Research and development have to be maintained at a quick pace to hold a high place in the competitive market for pharmaceuticals. Attracted, presumably, by the high earnings yield investors are still willing to accept a dividend yield of only 3.8 (on

the new dividend of 12½ per cent and at the current market price of 33s.).

That price was established after the publication of the preliminary report had brought the shares down by 1s. 9d. There was a reason for that too. Gross profits before tax have fallen by about £100,000 to £2,600,000. Thus it seems for the fourth year running trading profits have declined. Fierce competition in the market for antibiotics is probably the explanation. Such a decline, however slight, throws a shadow across growth potentialities. Does the base of the business need broadening? If so investors will find encouragement in the news that the offer by Glaxo for the issued capital of the Murphy Chemical Company has

been accepted by holders of over 90 per cent of the ordinary shares. Murphy Chemical is a private company engaged in the manufacture and distribution of insecticides, fungicides and fumigants for use in horticulture and agriculture.

FORD MOTOR. This company joined the growing list of industrial giants publishing half-yearly reports. Its unaudited profit statement has been issued with the interim ordinary dividend announcement. That dividend is 2½ per cent, which allowing for the 100 per cent free scrip issue is exactly equivalent to the dividend of 5 per cent paid a year ago. The most significant point in the statement comes at the end. The directors say "although the volume of home and export sales in the half year to June 30, 1955, has been maintained since that date, profit margins are now being affected by increases in costs of materials and labour."

	Six months to June 30, 1954	Six months to June 30, 1955
Sales, sales and profits:		
Sales	52,579,353	77,979,509
Profit before tax	9,370,723	11,382,120
Provision for fall in value of Govt. securities		1,121,174
Taxation	4,791,925	4,237,162
Net profit	5,078,803	6,023,784
No. of vehicles sold	115,262	182,392

The half-yearly figures themselves show some evidence of the squeeze on profit margins. The number of vehicles produced and the total value of sales have both gone up by about 25 per cent but profits before tax have risen by only about 15 per cent. Even though net earnings are high, that squeeze and the decision merely to maintain the interim payment throws a slight shadow of doubt across the confident expectations entertained earlier this year that the total dividend for 1955 would be 10 per cent.

ASSAM COMPANY is one of the larger British tea enterprises in India, and the oldest; over the turn of the year it was the vortex of a struggle for control when Mr Haridas Mundhra, presumably seeking control, ran the £1 ordinary shares up to 57s. 6d. Since then there has been a 50 per cent scrip issue and they now stand at 26s. 6d. (equal to 39s. 9d. on the old basis). With Mr Mundhra for the moment at least defeated, the flurry has died down and Mr Peter Remnant, the chairman, has nothing to say about it in his review except that since the reconstruction of February 7th "there has been no take-over bid or inquiries that might have led to such an offer." In surveying the accounts shareholders must forget the booming share market, forget, too, the knowledge that the company's assets are worth something in the region of £4 a share—though the recent sale of two of the company's outlying gardens at £292 10s 9d an acre, does not belie the highest estimates of its asset values.

Assam Company as a going concern paying a 3 per cent tax-free interim on its old capital and a 12 per cent tax free final dividend on the new capital last year gave shareholders the equivalent of 24.35 per cent gross against the equivalent of 8 per cent gross on the present capital for 1954. At 26s. 6d. its shares yield 18.4 per cent. From the glorious tea year of 1954 the company could hardly do otherwise. Its gross profit was £1,160,544 (against £565,199) and despite higher costs in various directions the net profit was up from £215,180 to £395,687. Reserves received in total £173,394, against £148,414. As these figures were realised from an average sale price in 1954 of 5s. 1.85d. per lb., an increase of only 1s. 3.37d. over the 1953 price, the outlook for 1955 (about which Mr Remnant says nothing) should not be discouraging. He evidently has some doubts and fears about long term prospects in India, for the board is "closely watching the possibilities of growing tea outside India."

LONDON STOCK EXCHANGE

Next Account begins: October 19th
Next Contango Day: October 19th
Next Settlement Day: October 11th

GILT-EDGED securities, which marked time at the beginning of the week, attracted some investment support on Tuesday and improved further after the Chancellor's speech at the Lord Mayor's Banquet. Gains ranged up to ½ on Wednesday, Treasury 2½ per cent 1975 rising to 56½ and Gas 3 per cent (1990/95) to 73½xd.

Industrial shares lost ground at the close of the old account in anticipation of a cut in Government spending and further domestic restrictions, the decline being accelerated in the new account. German bonds were unsupported with the exception of Potash Syndicate Loans, the 6½ per cent and 7 per cent both gaining 2 to 230 and 250 respectively. Insurance issues continued to weaken, Prudential "A" losing 2 to 44 and Pearl 1½ to 22½. Alliance at 79s. 6d. and London and Lancashire at 7½ fell to their lowest points for the year.

Electrical shares were marked down and radio manufacturers were affected by the downward trend in sales and fears of an increase in purchase tax. Dealings began on Monday in Simon-Carves at 3s. premium and strong demand brought the premium to 4s. 6d.; later the premium fell back to 4s. 3d. Hire purchase finance shares declined further, Olds Discount losing 1s. to 19s. while United Dominions Trust lost 3s. 9d. to 77s. 6d. Stores receded further on Wednesday, Great Universal "A" falling 1s. 7½d. to 41s. 6d. Tobacco shares showed small gains, Godfrey Phillips rising 1s. 3d. to 17s. 6d. George Dobie improved 7s. to 28s. 9d. on a tentative offer for the shares. Textiles were lower following a cut in prices by British Nylon Spinners. Bradford Dycers and Tootal were at the worst for the year.

Tramp shipping continued strong, but P & O declined fractionally to 30s. 10½xd. Oils became firmer on increased American support. Record sales of diamonds attracted support for De Beers deferred at 6½ and Anglo-American Investment at 9½. Kaffirs remained inactive.

THE MONEY MARKET

CREDIT has been continuously tight in Lombard Street in the past week. The stringency was most acute before the weekend. In these phases of acute credit shortage rates for overnight loans have been forced up to 4½ per cent, whilst December maturities have been sold at 4½ and 4¼ per cent.

Applications at the Treasury bill tender on Friday last were down by £10 million to £359.5 million. The offer was unchanged at £280 million, and as the market maintained its bid at £98 19s. 8d. per cent its allotment rose slightly from 69 to 70 per cent. At yesterday's tender the offer was reduced by £10 million to £270 million, so that new bills, as in the past week, will fall short of maturities by £10 million.

Sterling has continued firm in the exchange markets this week, against both the dollar and Continental currencies. The spot rate on New York touched \$2.78½ on Monday, and fell back only slightly thereafter.

The price of silver in the London market rose to a new peak following the weekend rise in New York. Cash silver is now quoted at 80½d. an ounce and forward at 79½d.

The Bank return shows an increase in the active note circulation of £3.1 million in the week to Wednesday last. This marks the end of the post-holiday reflux of notes, which reached £94.5 million through August and September, £13 million more than in 1954.

Our 93rd Year

On the dearth of Immortals

"O, King, live for ever!" the people cry. But under present imperfect arrangements even kings never quite manage to bring this off. The people's chances aren't too bright, either. Crown and sceptre, umbrella and briefcase, all have to be laid aside in time. The analogy is not exact. National revenues, after all, go on. Private revenues are apt to dwindle and stop... Unless the breadwinner pauses in his breadwinning to think: to think ahead to the day when, incredibly but inevitably, someone else will be going through the papers in his writing desk, his deed box, his office drawer marked "Private". To find what? With luck, a safeguard for the years to come. An assurance not only of capital today, but income tomorrow.

But seriously and urgently—

The SAFEGUARD POLICY means continuing security for your dependants when you are no longer on hand to see to it. It means material comfort for them in the future; spiritual comfort for you in the present. And all for a small additional premium to either Endowment or Whole Life Assurance.

Full particulars, with illustrations of how the SAFEGUARD POLICY works, may be had from

SAFETY-FIRST INVESTMENT

3%

Income Tax Paid

The interest rate of 3 per cent per annum on Share Accounts, income tax paid by the Society, represents a return on every £100 invested equivalent to **£5.4.4** per cent to all investors subject to the standard rate of income tax. Ordinary Deposit Accounts earn 2½ per cent per annum, income tax paid, which is equivalent to **£4.6.11** per cent where the standard rate of income tax is paid. Amounts up to £5,000 are accepted by the Society.

Interest Half-Yearly

Sums invested may be withdrawn at convenient notice; interest which is paid half-yearly, commences from the day after the investment is received and continues to the date of withdrawal.

COMPANY MEETINGS

MACONOCHIE FOODS

IMPROVED TRADING RESULTS

The eighth annual general meeting of Maconochie Foods Limited was held on September 30th in London, Mr R. S. Mays-Smith (the chairman) presiding.

The following is an extract from his circulated statement:

The most important factor resulting in the marked improvement in the trading results of the UK Company has been the substantial savings in costs by means of administrative reorganisation.

During the year under review the quality of the product "Pan Yan" was further improved and aided by an extensive advertising programme, resulting in an appreciable increase in sales of this product over the previous year.

A much improved Tomato Ketchup was marketed in December, 1954, and recently "Kep," has been manufactured to the original prewar formula.

I am pleased to report that sales of Canned Fish are also increasing.

Trade profits, less losses of the Group, plus dividends from trade investments, amounted to £96,087, compared with a loss in the previous year of £80,096. The net profit of the Group, before taxation, was £5,186, compared with a loss in the previous year of £190,008. After taxation (£2,126), the net profit of the Group is £3,060, after providing for a loss in the South African Company of £45,193.

Since March 1, 1955, as far as can be ascertained, the level of the Parent Company's profits has been maintained.

Negotiations for the sale of the South African Subsidiary are still proceeding.

The report was adopted.

Binding Cases

Binding cases for THE ECONOMIST can now be supplied. These cases, made by Messrs. EASIBIND LTD., are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold 13 issues of the normal edition, with the quarterly Index, or 26 issues of the air edition and 2 quarterly Indexes. The year can be stamped on the spine. The cost per case, post free throughout the world, is 11/-.

Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

EASIBIND LTD.

(Dept. E),

84, Newman St., London, W.1.

A binding case can be sent on approval if required.

CRYSTALATE LIMITED

INCREASED PROFITS

The annual general meeting of Crystalate Limited was held on September 30th in London, Mr Jack Lesser (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The consolidated accounts show a profit of £86,617 as compared with £55,393 for the previous year. The Board propose the payment of a dividend on the Ordinary Stock of 10 per cent, less tax, as compared with 7½ per cent for the previous year. The net liquid assets of the Group have increased from £318,020 to £343,064.

Crystalate Limited and Ebonestos Industries Limited: Last year I informed members that "provided business conditions continue as at present a reasonably optimistic view can be taken of the ultimate result of the current year's activities." The results and figures fully justify this optimism. As between the two companies the greater improvement of turnover and consequent profits was achieved by the Crystalate Company. The better trading conditions that we experienced in the year to March 31, 1955, are continuing and show an even further advance in turnover according to the internal figures available at the time of this statement. The orders in hand position is gratifying.

Mica Products Limited: This company also experienced a year of improved profit, and the Injection Moulding section of this undertaking continues to be very busy.

Conclusion: Providing business conditions continue as at present, there is justification to anticipate at the least a maintenance of the results. The report was adopted.

MALAY UNITED RUBBER ESTATES LIMITED

The twenty-ninth annual general meeting will be held on October 10th in London.

The following is an extract from the circulated statement of the Chairman, Mr J. W. A. Calver:

When I addressed you last year we had sold Malin Nawar estate. As a result of this sale we were able to repay 6d. per share to stockholders and our operational costs have fallen. This, combined with the increased price of rubber, has resulted in a profit of £10,838 before taxation and has enabled us to pay a dividend of 2½d. per share, equivalent to practically 10½ per cent.

The high prices which rubber is now being bought at in world markets will not mean that our profits will rise to anything like an equivalent extent. Not only are wages rising substantially but also, in addition to the swingeing taxation to which we are nowadays subjected as a matter of course, there are in Malaya cesses, a graduated export duty, and also a graduated anti-inflation levy when the price of rubber rises above one dollar in Singapore. The Economist has, quite rightly, advised that the optimum price of rubber from the point of view of net profits to plantation companies in Malaya is approximately 3s. per lb.

We have approximately 200 acres of old seedling rubber which we hope to replant before long, if possible out of profits. The areas to be replanted will be subjected to intensive tapping and in this way, together with, we hope, steadily increasing yields from our already replanted areas, the crop should be maintained and increased.

BRITISH HOMOPHONE

The Annual General Meeting of the British Homophone Company Limited was held on September 30th in London.

Mr Jack Lesser (Chairman and Managing Director), in the course of his speech, said:

The profit for the Group for the year is £28,819 compared with £23,570. The taxation charge is £15,548 leaving a profit of £13,271 as compared with £10,218.

The profit of the Parent Company, the British Homophone Company Limited, is £12,887 as compared with £14,828. After taxation the result is £5,102 as compared with £5,260. Ebonestos Industries Limited have paid a dividend to the Parent Company in respect of the year to March 31, 1955, which after deduction of Income Tax amounts to £5,189.

The Subsidiary Companies show an increase in profits. Before taxation the figure is £15,932 as against £8,742, and after taxation £8,169 compared with £4,958.

The Consolidated Balance Sheet continues to show a strong and healthy position, the Revenue Reserves and Surplus amount to £121,594. The Current Assets exceed Current Liabilities by £136,473.

The profits of the British Homophone Company Limited were adversely affected by increased costs of labour and raw materials. There was also a drop in turnover. The decreased turnover was the result of labour shortage. At the present moment the demand for your Company's products is quite satisfactory.

With regard to Ebonestos Industries Limited, the better trading conditions show an even further advance in turnover. The orders in hand position is satisfactory. The report was adopted.

BRADWALL (FMS) RUBBER ESTATE, LIMITED

OUTLOOK IN MALAYA

MR T. B. BARLOW'S STATEMENT TO SHAREHOLDERS

The Annual General Meeting of the Bradwall (FMS) Rubber Estate, Limited was held on October 3rd in London.

Mr T. B. Barlow, the chairman, said: One result of our recent amalgamation has been the erroneous comparison of the interim dividend of 7½ per cent which will be paid on November 30th next with the interim of 10 per cent in lieu of final paid on December 17, 1954.

DIVIDEND PAYMENT WELL COVERED

This year's payment is well covered by results to date and the Board decided that an interim dividend before Christmas would be well received not only for itself but for the implied hope of something better to come.

The recent Malayan elections and the political future of Malaya have been the subject of much discussion, but I think we can look forward with confidence to the future. The standard of living in Malaya is much higher than that of its neighbours because of the co-operation, goodwill and understanding which have existed throughout the century between the Malays, Chinese, Indians and Europeans.

The newly elected Government can count on the loyal support of the plantation industry.

The report and accounts were adopted.

THE UNIVERSITY OF HULL

RESEARCH STUDENTSHIP

The University proposes to award a Post-Graduate Studentship in the Faculty of Arts for full-time research in Arts, Economics or Law. The value of the award is at present fixed at £250 for one academic year, renewable for a second year. Further particulars may be obtained from the Registrar, to whom applications should be sent not later than October 22, 1955.

W. D. CRAIG, Registrar.

MIDDLESEX COUNTY COUNCIL

EDUCATION COMMITTEE
ACTON TECHNICAL COLLEGE

Applications are invited for the post of LECTURER in SOCIAL SCIENCE in the Department of Management and Production Engineering to supervise and teach graduate and other classes and to investigate and advise upon the relationship of industrial structure to technical training. Qualifications should include a degree in social or natural science and some experience of industry or social research. Salary in accordance with the Burnham (Technical) Report, 1954.

Application forms (stamped addressed foolscap envelope) from the Principal, to whom completed forms should be returned within fourteen days of the appearance of this advertisement.

C. E. GURR, M.Sc., Ph.D.,
Secretary to the Education Committee.

MINISTRY OF AGRICULTURE, FISHERIES AND FOOD: ASSISTANT AGRICULTURAL ECONOMISTS. The Civil Service Commissioners invite applications for a pensionable post in London. Age at least 21 and under 28 on October 1, 1955, with extension for regular Forces service. Candidates must have a first or second class honours degree in agriculture, economics, or related subject. If no honours course, a pass degree with equivalent standard will be considered. Inclusive London salary (for 45½-hour week) £554 to £999 (women to £901), but being improved under equal pay scheme. Starting pay above minimum in certain cases.

Particulars and application forms from Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 4507/55. Application forms to be returned by October 27, 1955.

WORKS DIRECTOR

ENFIELD CABLES LIMITED are seeking a WORKS DIRECTOR, with seat on Board, to take charge of the Company's factories. Must be a professional engineer with experience in modern production techniques. Preference will be given to a man who has been engaged in the cable industry. This is a top-level position and will carry a commensurate salary. Write, giving full details, to: E. Sunderland, Director and General Manager, Enfield Cables Limited, Brimsdown, Enfield, Middlesex.

STATISTICS

A leading Group of Companies, engaged principally in the distribution of motor vehicles, will shortly require the services of a Statistics Officer at its Head Office in the Midlands. The successful applicant should hold some professional accountancy qualifications and should preferably have had some association with the Motor Industry as his duties will include the extraction of statistical information from the depots of the Group and its collation and presentation to the General Management.—Apply to Box 24.

FAMILY SERVICE UNITS (Patron HM the Queen Mother) requires full-time National Appeals Organizer to raise funds for expanding an established and very important pioneer social work. Not less than £750 p.a. paid to energetic man or woman able to produce results with minimum of supervision.—Applications, in writing, giving full details, to Secretary, 25 St. Mary's Grove, London, N.1.

CHARTERED ACCOUNTANTS

A good four-figure commencing salary is offered to Chartered Accountants wishing to improve their knowledge and experience of Financial Control, Profit Planning and Costing. The advertiser is an Industrial Company of repute and the fullest scope will be allowed for initiative in the introduction of modern methods of Management Accounting. Men of the required standard are expected to qualify for a salary of £3,000 per annum within seven or eight years and the appointment is pensionable.—Applications will be considered from Accountants, over 35 years of age, and they should be sent in confidence to Box 239.

CHIEF ACCOUNTANT required by a public company in the Manchester area. Company's requirements are for a Chartered Accountant, aged 30-40 years, with some industrial experience, while qualification of I.C.W.A. would be an advantage. Position offers excellent opportunities of advancement, is pensionable and qualifies for special staff bonus scheme after qualifying period. Good salary, commensurate to qualifications and experience, will be paid.—Write, stating age, academic and other qualifications, experience, and salary required, to Box 240.

MOTOR MANUFACTURING GROUP in Coventry offer a position of unique interest and scope to young man, aged 20-25 years, with fluent knowledge of German and French.—Write to Box T.326, 6/0 Streets, 110 Old Broad Street, London, E.C.2.

NATIONAL COAL BOARD invite applications for the superannuable appointment of Assistant Manager of General Branch in Marketing Department at London Headquarters. Salary dependent on qualifications and experience, within the range £1,000 to £2,500 per annum. Applicants must be of first-class administrative and commercial ability, of good personality and address, and have knowledge and experience of the coal industry and of coal marketing and prices. Write, giving full particulars (in chronological order) of age, education, qualifications and experience (with names of employers and addresses) to: (Overseas) Hobart House, Grosvenor Place, London, S.W.1, marking envelope SS175. Original testimonials should not be forwarded. Closing date October 27, 1955.

THE Rank Organisation Limited wishes to fill the appointment of Group Accountant. This position carries direct responsibility to the Managing Director for the co-ordination of the Group's intricate accounting affairs, both from the technical and commercial viewpoints. Only men of proved record, preferably with commercial experience, in the age group 35-45, and who are already earning four-figure salaries, should apply to R. H. Dewes, Esq., Director of Personnel, The Rank Organisation, Film House, 147 Wardour Street, London, W.1.

PHYSICAL CHEMIST, age 21-30, with a good Honours Degree, required by large company in the West of England to take charge of chemical laboratory and undertake industrial research. Excellent working conditions and contributory pension scheme. Commencing salary, according to qualifications, up to £300 per annum.—Full particulars of qualifications and experience, if any, in own handwriting, to Box 236.

NATIONAL TRADE ASSOCIATION, with headquarters in Sheffield, invites applications for a Senior Executive post. Duties will comprise the management of certain functional departments already staffed, and the development of new areas of the Association's activities, and will involve high level contact with industry and with Government Departments. Starting salary £1,000-£1,200 per annum, but more will be paid if experience and qualifications are exceptional. The post is superannuable.—Applications to Box 211.

THE COPPERBELT TECHNICAL FOUNDATION LIMITED, KITWE, NORTHERN RHODESIA

APPOINTMENT OF PRINCIPAL

Applications are invited for the appointment of Principal of a Scheme of Education for the benefit of young Europeans entering industry in the four main centres of the Copper Mining Industry of Northern Rhodesia. The purpose of the Foundation is to bring into existence and subsequently operate, administer and develop, a series of Technical Institutes in leading towns on the Copperbelt of Northern Rhodesia. There will be four centres in the first instance, the Headquarters Institute being at Kitwe, while the others will be at Muldersburg, Gwelo and Lusitania. The distance between Kitwe and the centre furthest from it is 35 miles.

The Foundation, while a self-governing organisation, is fundamentally associated with the Copper Mining Industry of Northern Rhodesia and must be thought of in connection with that industry, although employees of the Foundation will not be employees of the Mining Companies and the benefits of the Scheme will not be confined to employees or prospective employees of the Companies. Adequate funds are available for initial creative work and the subsequent maintenance and development of the activities of the Foundation. The work of the Institutes will consist of post-school education mainly of young people of near adult stage, as follows:—
1. The education of artisan apprentices towards National Certificate examinations on a part-time basis, and the post-school education of Junior learner operators having had varying degrees of initial education.
2. Other technical education of young people related to mining or engineering.
3. The education and training of girls in commercial and other subjects.
4. The provision of tutorial facilities with a cultural background for students of all ages wishing to take approved correspondence courses.
The person appointed must be capable of creating the Scheme from first principles under the direction of a Council of Governors. He must be a member, and subject to the control of a Board of Governors. He must subsequently correlate, administer and develop the work of four technical Institutes.
Terms: £3,500 per annum, rising in five years to £4,000 per annum. A house and basic maintenance will be provided at sub-economic rent. Pension fund and other benefits.

An application form, together with further particulars of the Scheme, will be forwarded on receipt of a request addressed by Air Mail to:—
The Secretaries,
Copperbelt Technical Foundation Ltd.,
P.O. Box 134,
Kitwe, Northern Rhodesia.

APPLICATIONS are invited from Chartered Accountants, aged about 28 to 30 years, for a progressive appointment with an Industrial Company of standing. The position is one of considerable responsibility for the management of up-to-date management accounting. The prospects are excellent for men with personality and energy. A good commencing salary is offered and regular increases to over £3,000 per annum are assured. The successful applicant.—Full particulars of qualifications, experience, age, etc., should be sent in confidence to Box 241.

AN important manufacturing company with an established reputation in industry and the world wishes to interview a number of young men with good engineering qualifications who have decided interests and proved ability in a commercial career. We do not require salesmen. Appointments after training will be in London though candidates must expect to be mobile for some time. Salaries will depend on age and experience and there will be opportunities to rise to senior executive positions in the commercial organisation.—Replies should be addressed to Box 238 quoting COM/1766.

LESS: Experience City, seeks responsible position. Public School education, Local Government and political background should be valuable to those who require man with initiative and personality.—Write Box R.643, Willing's, 362 Grays Inn Rd., W.C.1.

MARKET RESEARCH EXECUTIVE. Hons. grad. with wide experience and proved ability in a responsible position seeks managerial or senior post in research or marketing with opportunity and prospects for the future.—Box 237.

B.Sc. (ECONOMICS) LONDON UNIVERSITY

EXTRUSIONS BY MARLEY

Buyers requiring rigid and flexible tubes and sections in thermoplastic materials should ask for a quotation from Marley Extrusions Limited, Dept. 99, Lenham, Maidstone, Kent, Harrietsham 381.

STERLING AFTER 1954.—An informed appraisal of exchange policy and of the likely modifications in coming months in Britain's attitude to convertibility. In the October issue of The Banker. For investors and analysts.—The Great Fear or the Little? by John Martin: a comprehensive discussion that analyses and portrays trends in markets, profits, dividends—and confidence—since the end of the '40s. An editorial article describes The Changing Curve of Gift-edged Yields.

The Banker for October includes also a full survey of Japan's Economic Problem: Australia's 1954-55 Budget, Denmark under Strain, and World Bank Leads the Way. Also full coverage of the latest developments in the credit market and of financial and economic news from the United States and other overseas countries. Price 2s. 6d., or 30s a year, post free, from booksellers or The Publisher, 72 Coleman Street, E.C.2.

EXPERT POSTAL TUITION

For Examinations—B.Sc. Econ., LL.B. and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education; many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G. 9/2).

METROPOLITAN COLLEGE, ST. ALBANS

Or call at 30 Queen Victoria Street, London, E.C.4.

Railways are *more* than Train

Five trains being unloaded at the same time at Hams Hall Power Station

MECHANICAL HANDLING alone makes possible the vast tonnages moved by rail every week . . . every day. It makes possible not only the loading or unloading of coal wagons at high speed, but on it also depends the swift delivery of coal to power stations (themselves a prime essential in the chain of capital equipment and investment behind the trains). Mechanical handling equipment of all kinds has long been a speciality of **MITCHELL**, introducers of the first side tippler to handle wagons. Tipplers, conveyors, transporters, coaling plant, space-and-labour saving mechanical marshalling yards—wherever they are needed to increase productivity and raise efficiency, Mitchell can be relied on to provide 'know how' for economic design and construction.

BUILDING CONFIDENCE

The most successful building operations today are the fruits of collaboration—the closest possible partnership of owner, architect and a widely experienced firm of builders and contractors. Wates are such a firm.

Wates believe in pre-planning, the scrupulous examination of all possible means of achieving the client's aims with maximum economy and at maximum speed. And the final drawings are those which crystallize optimum solutions to every aspect of the building problem. The Wates method invests the owner with complete control of costs: he gets his building at a price within his budget, and he gets it on time.

Architects and building owners find that Wates building operations are both economical and successful because they make full use of the latest mechanical equipment, and because they co-ordinate men, materials and machines to the maximum advantage.

These services are offered either on a fixed fee basis or at a fixed inclusive price. Consult Wates or put them on your tender list—it pays.

WATES BUILD

Wates Offer:

The advisory service of their experienced engineering, surveying and pre-planning departments.

Efficient and highly economical building to precise programmes.

Photographed for PICTURE POST by Bert Hardy

Who's the best judge of squash?

FATHER, who doesn't feel quite so strongly about his fruit drinks as about some other kinds, will probably be happy with anything sweet and cool and wet. Mother says some are more expensive than others and we don't always have to have the expensive kinds, dears. But it's Billy who knows the most wizard stuff that ever a chap poured down in pints after two hours of singles on a hot afternoon. 'Had it at the Smithsons' and there was an ad. in colour for it in PICTURE POST.' 'Very well, dear, let's get it,' says Mother, always glad

when someone in the family helps her to decide.

And to make it most likely that it's your soft drinks they buy, your best and cheapest way is to advertise in a magazine that goes right round the family and stays around a whole week—often more. Your best family magazine is PICTURE POST. It goes into over 1½ million households. It is read by 5 million people every week. It clinches innumerable family purchases.

**PICTURE
POST**

HULTON'S NATIONAL WEEKLY

Who chooses the family car, television set, confectionery, cereals, soap and toothpaste? They're all very much family purchases. They can all be sold through PICTURE POST.

Assembly work in progress at Marconi's Chelmsford factory. (Left) Mr. John Mabey, the Burroughs man called in by Marconi, with one of the Burroughs machines which have speeded up their accounting.

This man helped Marconi gear their accounting to rising production

HE IS ONE of Burroughs' world-wide team of mechanized accounting consultants. This is the story:

Marconi's Wireless Telegraph Company Limited export radio, electronic and heavy television equipment to the world. The demand for Marconi products increases every month.

At their Chelmsford factory, they needed to expand their accounting procedures in order to cope with the mass of extra work.

Marconi's decided to call in the Burroughs man, an experienced consultant on all accounting and record-keeping systems. Mr. John Mabey is the specialist sent by Burroughs.

A FULL ANALYSIS

Working closely with the Deputy Chief Accountant at Chelmsford, Mr. Mabey applied his experience to the problem. After a full analysis of the existing system they evolved a new plan, based on the speed and versatility of Burroughs Sensimatic Accounting Machines.

The plan was adopted. Now all Marconi's accounting is in line with their increased production. And Works Payroll is completed in *less than a day*; the same machines take Salaried Staff Payroll in their stride. Costing is now done on a single 15" card which shows eight running totals—hours, labour, overheads, purchased materials, manufactured materials, processes, aggregate balance and net balance.

So well has the new system worked at Chelmsford that Marconi have followed the same plan at their newly-opened factory at Basildon.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve

it. He will make a full analysis and suggest the most economical and *workable* solution. If he thinks no change is advisable he will frankly say so. But if he does recommend a change he will plan the new routine in detail, and see that you always get the full benefit from any Burroughs machine you install. Call in the Burroughs man—you're committed to nothing and his advice is free.

Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

That astronomical figure is the present production rate of Y.D. Copy Paper. Why should one sort of copy paper prove so extraordinarily popular?

There are two answers. First, this is without doubt the best paper for its purpose on the market—a fine, smooth copy paper made at the long established Yates Duxbury mills.

Secondly, only Y.D. Copy Paper comes in the distinctive economy pack—which makes storage easy and waste well-nigh impossible. Economical is use, and in price, Y.D. Copy Paper is fast becoming the sign of a well-run office.

Sounds, Shillings and Pence

IF SMELLS were the biggest curse of the nineteenth century, most certainly noises have taken their place as the greatest nuisance of the twentieth. In industry, noise nuisance is the unseen enemy employers have to face, contributing to inaccuracy, lack of concentration, careless mistakes and unwitting distraction from the job in hand.

Whilst the employees' need for adequate light, temperature and ventilation usually receive sufficient attention, is it not strange that so little regard is paid to the requirements of the ear? Heavy factory machinery is not the only source of noise in industry. The problem is becoming acute in offices where typewriters, adding and duplicating machines, and teleprinters are also making their own noisy contributions to unpleasant working conditions.

What can be done about this unwanted noise which so systematically lowers working efficiency? Nowadays the requirements of our hearing can be scientifically assessed so that the amount of noise reducing insulation can be accurately calculated. In many cases reduction of noise can be effected without structural alteration and without interruption to working arrangements of the factory or office.

It is worth a little thought to consider what contributions the elimination of undesired noise could make to the working efficiency of your factory and office. Newalls experience in this field as manufacturers and contractors is at your disposal on any aspect of sound insulation. Preliminary investigation and consultation are gladly offered and will cost you nothing.

Peace or Politics?

WITH a four-power conference again in the offing, it may seem invidious to nigger over the niceties of a foreign minister's statements—although in Moscow it is apparently held to be a good thing to attack, even to humiliate, a foreign minister just as he is gathering his brief together. Yet it must be said that it was disquieting to hear Mr Macmillan quoting again at Bournemouth the phrase he had used on his return from the "summit" in July—"there ain't gonna be no war." The natural reaction of many people will be to ask why in that case Lord Montgomery should now be making public his views on preparedness for a new-style war, and why defence ministers of the Atlantic alliance should have gathered in Paris this week to review the stark implications of such a conflict.

Admittedly the Foreign Secretary was defending himself against critics of the remark he made in July, and insisting that he had added a warning corollary. Admittedly both he and the Prime Minister were careful at Bournemouth to caution their hearers against false optimism and to review at length the reasons for continued vigilance. Read as a whole, their speeches were well balanced between hope and fear. But how many people read speeches as a whole? The automatic workings of the popular press may always be counted on to bring out, in banner-headline prominence, either a catchy phrase or a dramatic announcement. At Bournemouth Sir Anthony Eden provided the announcement with his news that Britain's armed manpower was to be reduced; Mr Macmillan unhappily revived a phrase which, when he first used it, made bold black headlines, and which was bound to attract attention when used again—particularly at a moment when a new move in regard to national service was already expected.

Today the coming of the hydrogen bomb has added a new reality to the ancient maxim, *si vis pacem, para bellum*. Nations that want only to live in peace are now able to warn a potential aggressor not merely that he will find it hard to overcome them, but that he simply cannot hope to launch an attack without himself suffering devastation that can hardly be imagined. But the vital condition of this new security is preparedness. In free societies, military preparedness can never be popular, or even accepted with resignation. Twice in this century the western world has suffered grievous and nearly fatal injury because it was neither equipped nor braced to defend itself. It is the first task of statesmanship in democratic countries to counter the inherent tendency of any peacefully inclined people to relax without restraint at the first hint of diminished danger. Indeed, this is a test by which a statesman may fairly be distinguished from a politician. But an experienced politician, for his part, should know just which of his words will echo most loudly in the public's ear; and, however partisan the occasion on which he is speaking, he will rise to statesmanship only if he eschews political temptation and chooses words that reinforce rather than weaken the prospects of peace.

Bournemouth and Margate

BY A SPECIAL CORRESPONDENT

THE main conclusion to be drawn from this year's party conferences is a rather surprising one. If the conferences had been televised *in toto*—as the BBC had originally suggested—the result would probably have been a small swing of opinion to Labour's side. Although the Conservative leaders showed once again that they are in complete control of policy, the Conservative rank and file made a less favourable impression on many of the attending journalists this year than at any previous postwar Tory conference; in consequence, one left Bournemouth feeling slightly crosser with the Conservatives than before. On the other side, although the Labour leaders are still fumbling with both their policy and their party followers, those followers no longer looked impossibly difficult to control; in consequence, one left Margate feeling slightly more hopeful about Labour's future than usual.

The vague sense of discomfort aroused by this year's Conservative conference was not primarily due to the voting or the speechmaking during it. The rude things said about some Ministers in some of the speeches (about which Mr Butler, for one, seems to have been surprisingly touchy) can be largely discounted, for they plainly owed more to individual opportunism than to any widespread *malaise*. In some cases the wide advertisement of last year's glutinosity had given certain regional interests the idea that a little pressure-politics would attract a great deal of attention; in other cases (as there was time for only four or five speeches on many of the resolutions) thrustful delegates had realised that they were more likely to be called to the rostrum if they said they were going to oppose instead of to support.

But the general atmosphere, the talk in the tea-bars and the timing of applause from the floor were more disturbing than the speechmaking. One got so terribly tired of the complaint that some of these horse-faced women could not afford to buy television sets, while their charladies (perhaps precisely because they are going out to work as charladies?) could and did. The Young Conservative movement, in particular, seems to be in a rather dangerous state of transition. Its members are no longer merely reacting intellectually against the reaction from the 1930s; they are reacting directly and emotionally against the economic injustices imposed upon their own class (broadly speaking, the clerkly class and higher) in the late 1940s. And they are tending to make the same mistake as some Socialists in supposing that the way to ensure economic advance for oneself is to get cross about the economic advances made by other people; there is a tinge of fanaticism in their attitude that will need to be watched.

While the Conservatives need to pay close attention to this possible development of a new and class-conscious right wing, Labour should also study, and

learn from, the superbly smooth way in which the Tory leaders are still keeping any such politically expensive tendencies under control. For it is just not true, as some Labour journalists at Bournemouth were alleging, that this tinge of Tory resentment is in any immediate danger of taking over from Tory reform as a determinant of party policy. The Conservatives' control of their own tail is not simply due to the fact that the Woolton organisation allows MPs and professional agents in the constituencies to sit down upon it, although this professional organisation is an important factor. It is also due to the fact that those who are genuinely interested in Tory reform are finding new and exciting intellectual fields to conquer.

It was extraordinary how many of the thirty to fifty-year-old delegates at the Bournemouth conference—and these are now, broadly speaking, the most progressive age groups in the Conservative party—were either local councillors or members of Conservative professional or social workers' organisations. One result of this was that the debates on such things as local government reform, education, the Children Act, and "ten shilling widows" were just about the best debates at the conference; this is a marked change from the situation of a few years ago, and Labour should take note of it. Another result is that those of the younger reactionaries who stay in politics can presumably be expected to become involved in this sort of work in time, and be reformed by contact with the progressive Conservative thought that is being bred in connection with it. The final conclusion to be drawn from Bournemouth was not that the new Conservatism is in decay: it was simply that the party leaders should not assume that there will be anything automatic about its continued progress. And so to Margate.

It is a good thing for the balance of power in British politics that the initial impact of a Labour Conference is still rather pleasanter than that of a Tory one. It was a lesson in tolerance to watch these rank-and-file Labour workers, as they came down to Margate for a sacrificially late annual holiday, dumping their unwilling wives and children into second-class boarding houses set well back from the front. They are, of course, often of the excitable type that one would expect from their left-wing reputation. But they are of a type which those with experience of them usually know how to control. "Don't be silly, Bert," said one solid and sensible woman, as her husband threshed about among the children's spades and buckets at Margate station on Sunday night, in some unnecessary commotion about the corporation's bus arrangements. Without realising it, she was giving a lesson in amiable

family management to her party's leaders, which those leaders are just beginning to imbibe.

For the historic achievement of the Labour leaders at Margate was that they managed to inculcate this atmosphere of "Don't be silly, Bert," on to the conference hall, instead of suggesting that it would be necessary to send Mr Arthur Deakin down to the floor with a knobkerrie. The right attitude was struck in the very first hour. "If you come to the ante-room afterwards," said Dr Summerskill, smiling sweetly at a delegate who was making a great fuss about some uncomradely point of order, "I am sure that you will be suitably dealt with." There was a split second of hush, and then Labour reached a possibly important stage in its postwar maturity as both the delegate and the floor started laughing. This was the atmosphere that ruled at the conference—at any rate until Mr Bevan set a maliciously deliberate spark of mischief alight at a private meeting on Tuesday. Throughout the conference the basic right-wing vote overpowered the basic left-wing vote by between three and four to one. Sometimes (as in Mr Gaitskell's victory over Mr Bevan for the Treasurership) the right-wing majority was slightly higher; sometimes (as in the vote on Mr Zilliacus's essay in cleverly controlled anti-Americanism) it was a little lower. But the new feature of this year's conference was that the left wing took its drubbing with plaintive good humour instead of with bared teeth.

The conference has therefore provided as good a springboard for advance to Labour reform as the responsible Labour leaders could hope for. The question now is whether the leaders are themselves calm enough people to use it intelligently. The three decisive factors will probably be the courses of organisational reform, of policy planning, and of the polite personal struggle for Mr Attlee's succession. As far as organisational reform is concerned, the task of implementing or amending the Wilson recommendations has now been passed back to the national executive; this is a happy result, even although it has been achieved largely because Mr Bevan set the Margate debate on the Wilson report chasing after a hare that had nothing to do with organisation at all. But the other two factors—policy planning and party leadership—are inextricably and rather awkwardly mixed up.

The business of policy planning is now nominally to be delegated to individual members of Labour's Research Department, who will draw up reports under ten different headings in the next three years; these reports will be supervised by editorial committees drawn from the national executive, possibly with the aid of "amateur" Labour sympathisers in the universities and elsewhere. There are two main forms that these reports could take. Either the ten reports could become ten embarrassing commandments, incorporating specific and "politically necessary" commitments to the left—and seriously impairing the policy of the next Labour

Government thereby. Or else they could be useful but unspecific essays on reform; they could fill the same role as Mr Butler's Industrial Charter, which everybody still admires today although nobody remembers exactly what it contained. The nature of the reports will not depend primarily on whether it is Mr Morrison or Mr Gaitskell who is the party leader during the period in which they are drawn up. But it may depend on how secure and unembarrassed that new leader feels in his office (and, if Mr Morrison gets the job for a short period, on how secure Mr Gaitskell feels about the succession). A clear case seems to be emerging for some working arrangement between the two men.

Certainly the lesson of Margate is that it will be a tragedy if the right wing now indulges in the luxury of a split of personalities, upon which the vanquished men of the left could and would play. "These are a decent bunch, aren't they?" said one moderately important Labour leader as he looked round the crowd at the delegates' ball on Tuesday night (perhaps aptly, it was held in the Winter Gardens, while the Labour agents held their cabaret in Dreamland). "It is so maddening that the party that ought to be made out of them is ruined by the Commies and the self-seekers." The time may be at hand when this message deserves to be directed to the two main leaders of the right, instead of merely to the ex-leader of the left.

The Economist Guide to Weights & Measures

This guide was compiled by the Statistical Department of **The Economist** for use within our own office; it is thought that it might serve a wider public and it is therefore being published at 10/6 (including postage throughout the world).

In 84 pages it provides facts and figures on the weights and measures of the world. For the most widely used units, tables of equivalents are given; for units that are used only in certain countries and trades conversion factors are given.

Applications for copies should be addressed to:

Europe Brick by Brick

UNTIL the announcement in Paris on Thursday of the formation at M. Jean Monnet's suggestion of the Action Committee for a United States of Europe, little had been heard of the "Messina" resolution since the foreign ministers of the Six resolved last June that the time had come to take another step towards the "building of Europe." Undramatic hard work has in the interval wisely been taking the place of ringing declarations, which ever since the collapse of the EDC have had a hollow sound. A spell of re-examination was certainly needed. But there is a danger that while the experts remain busy but quiet, ministers will avoid thinking about the questions they will soon have to decide, and that when decisions are needed the temptation will be strong to temporise or to give the easy answer. And, because of the special nature of the British participation in the work carried on since Messina, this will be particularly tempting for British ministers.

At Messina, the foreign ministers of the six members of the Coal-Steel Community (France, Germany, Italy and the three Benelux partners) agreed that their aim was the establishment of a common European market, free from all customs duties and quantitative restrictions, not only for iron and steel, but for goods in general. They also agreed to examine the creation of "a common organisation which would have the responsibility and the facilities for ensuring the peaceful development of nuclear energy." The further co-ordination of transport and conventional energy and the harmonising of social policies were also held to be desirable, although with a less clear commitment in principle to take action.

After Messina, M. Spaak was appointed to supervise the work of a series of technical committees set up to examine the practical steps required by these general decisions. Once these studies were completed, the ministers would convene conferences to draft specific treaties covering any subjects on which they decided to move ahead. The British government agreed to participate in the work of the committees on the clear understanding that this in no way committed it to the agreements in principle which the Six had reached at Messina.

The work of the "Spaak committees" should be finished this month, and their reports ready for ministers in November. They have taken somewhat longer than originally planned over their work. But the foreign ministers, when they met at Noordwijk early in September to review progress, seemed in no hurry to reach the stage when they would need to reach new decisions. To the extent that this leisurely attitude reflects a judgment by those who are setting the pace that speed and dramatic impact are less important than surefootedness, it is all to the good. No one seriously expects France to be in a position to take the kind of

decisions for which the Benelux countries, in particular, are pressing, before the French elections next summer. On all sides there is a reluctance to risk running into another EDC debacle through inadequate preparation, impatience or over-reaching.

Of the six or seven technical committees now meeting in Brussels, the two most important are those concerned with a general common market and with atomic energy. The first confronts a well-ploughed field, the second virgin forest; but it is an open question whether it is more encouraging to have too many precedents or too few.

★

Since the earliest days of the Marshall Plan, the question of a European common market has cropped up persistently and in various guises. First there was the customs union phase, led off by Benelux, followed with less success by the Scandinavians and with no success at all by the French and Italians, and finally petering out with the abortive concoction known variously as Fritalux and Finebel. Then came the "pools," the Schuman pool, the arms pool, the green pool, which aimed at common markets limited to particular sectors of the economy. And the OEEC, on a broader basis of membership, has struggled for eight long years to eliminate quantitative restrictions on trade among its members. This wealth of experimentation has made it easier for the Brussels committee to avoid false starts and to reach general, or almost general, agreement on what may work and what certainly will not.

One result is the present disposition to reject the "sector" or "vertical" approach and to concentrate instead upon the "horizontal" approach; that is, to remove, by stages, quantitative restrictions and other impediments to trade "across the board," rather than proceeding, as was done in the Coal-Steel Community, to integrate the market industry by industry. The experience of the ECSC has highlighted the difficulties of removing barriers and eliminating distortions based on national practices for one or two segments of six highly developed economies, while leaving the other segments untouched. Coal cannot be sensibly considered independently of gas or electricity, and the logic of "harmonising" international freight rates for coal and steel, but leaving all other rates untouched, is easy to question. Furthermore, proceeding to the creation of a general common market sector by sector means fighting the same battles each time a new sector is to be integrated, and fighting these battles without the help that arises from the fact that the producer of one commodity is the consumer of others.

There is another lesson that has been learned, although perhaps with little conviction by the French. It is that, to reap the benefits of a common market, the

THE ECONOMIST, OCTOBER 15, 1955

right procedure is not to list all the industries which may suffer from increased competition and give them special protection or assistance before tariffs and quantitative restrictions are touched, but to start from the opposite end—to provide funds to readapt industries and to re-train workers if particular plants or industries, in the event, cannot meet the new competition.

A third lesson already learned is that agriculture, the biggest stumbling block in the OEEC trade liberalisation programme, will have to be treated as a stumbling block, not simply as another industry, if any agreement is to be reached. And the planners are now also aware of the relationship between trade and monetary policy and of the impossibility of going very far until exchange rates are in line and show some prospect of staying there.

★

The committee on atomic energy starts with less experience, but with two big advantages. In the first place, vested interests are not yet dug in; in the second, this is clearly a game best played by giants. The committee's problem is not primarily whether it is sensible to establish a common market—although if the plans to establish the general common market (or Common Market, with initial capitals, as it is called, to distinguish it from common markets limited to particular industries) come to nothing, there will undoubtedly be pressure to go ahead with a limited common market for energy, both "classical" and atomic. Rather, the problem is how best to assure to Western Europe the advantages of co-operative effort and large-scale, expensive undertakings. The approach adopted has been the pragmatic one of listing all the things, from mining uranium ore to experimental research, that are part of this new industry, and then examining them to see which are better done on a combined than on a national basis.

Except for loading the dice in favour of a new European organisation for atomic energy, the Messina communiqué pointedly left open the question whether there should be new institutions and, if so, whether they should be supra-national (like the ECSC) or inter-governmental (like the OEEC), for the simple reason that the ministers were not agreed. The Brussels committees have therefore concentrated on technical and economic problems, and institutional and political questions will, in the main, be left for the ministers to tackle again. Although this has given a slight air of unreality to some of the discussions, it was the only way to cut through the jungle of dogmatic passion which grew up after the collapse of EDC.

The contest is not simply a jurisdictional one between two existing organisations and the advocates of some new ones, but a solid difference of opinion about the best route to take, which, in turn, arises from a difference of view about the objective. Some people, for whom M. Monnet is the recognised spokesman, feel that on political and economic grounds there is no

future for Western Europe without a merger of sovereignty and the creation of a United States of Europe. The Action Committee launched this week is an impressive group of party leaders and trade unionists from the six countries, who not only hold this view but are committed to trying to convert the groups they represent. Others, however, feel that this medicine is too strong; that the advantages of combined effort and of a broad area of comparatively free trade can be obtained without federation; and that Nato and Western European Union provide all the necessary political cement. This second group is not a cohesive one, and opinions within it favour various formulae, ranging from the loosest form of co-ordination to arrangements which could still evolve into the kind of European structure for which M. Monnet argues.

The British government's position on both the substantive and the institutional questions is still unknown. There is not the slightest illusion on the Continent that Britain would join a "supra-national" institution. But what is not known is how far the British government would go either in association with institutions of the Monnet type, or in participation in looser arrangements. There is uneasiness lest the British government should wait until after the European countries have decided on their course of action before seriously considering its own position. There is fear that if so French indecision will be the determining factor, but there is also hope that the British will not leave these questions for time to dissolve.

★

Like the Brussels Committees, the British government would be well advised to start with economic questions, rather than with the emotional, but in reality less difficult, subject of institutions. The traditional arguments against British participation in a European common market have been the existence of Commonwealth preferences and the uncertainties of competition, particularly German competition. These are arguments which should be dusted off and looked at once again before being reaffirmed. The Treasury Bulletin for September contained some forthright truths about the relative importance of trade with the Commonwealth and trade with Western Europe. Even on the most optimistic estimate, the time when any European common market would have reduced tariffs to a level that would endanger imperial preference is probably some ten years off. Is it clear that by then Commonwealth preferences will be important to either side? German competition has to be met in third markets; is this really an argument for not learning to meet it at home?

In the case of atomic energy, British reluctance to join with Europe has not yet had time to harden. Here again the task is essentially to set a long-term calculation against a short-term one. And the answer in this case would seem much easier to find.

The Lisbon Story

THE state visit to London at the end of this month of the President of Portugal, General Craveiro Lopes, draws attention to a country with which Britain is allied not only in Nato but by the tradition of six centuries, and in whose economy Britain has for long periods played a decisive role, both as main supplier and as best customer. This role, however, is now strongly challenged, and the President's visit would still be of great value if it served no other purpose than to remind British exporters that the Portuguese economy is expanding vigorously and that Portugal is a market worth close study and foresight of the kind lately displayed there by German and other continental firms.

Portugal, with its relatively small population of nine million and its lack of a technologically conscious working class, is pulling itself up by its industrial bootstraps. Hydro-electric power is the key to its future, and its engineers speak of the day when the "electric night" in the north-east and in the south will have given place to power lines and industry.

The previously neglected north-west, with its steep gorges, is proving to be a great reservoir of future prosperity. An ambitious system of power stations on the Cávado and Rabagao rivers is halfway towards completion; when the dam at Paradela is completed, probably at the end of next year, the total annual output of electricity from the north-western system will be around 920 million kilowatt hours. Of comparable importance is the network of dams, reservoirs and power stations being developed in the Serra da Estrela. The great problem remains the transmission of power to the underdeveloped south, where the earth dam at Arade is the only local source of hydro-electricity; but transmission lines already reach as far as Beja, and the government has wisely decided to put general electrification before the development of specific industries.

That the latter will profit in turn is certain. In the region of Vila Real and Bragança there are thought to be further important deposits of iron ore, tin and wolfram, which have not been exploited for lack of power. The import of iron and steel is a major item on Portugal's trade bill, but its steady increase is in itself evidence of the pace of industrial expansion at home. That the latter sometimes takes rather unessential, if engaging, directions is suggested by the fact that Lisbon, a city blessed with relatively small traffic problems, is building an ambitious underground railway and that

plans are on foot to provide it with a television system by 1958.

But perhaps the most dramatic element in Portugal's economic future is the development of its African territories. Oil, in what are claimed to be important quantities, has been found in Angola, conveniently near to the coast. Its exploitation will be financed jointly by Portuguese and Belgian capital. Coal has also been discovered in Angola, and copper mining in the Sierra do Poté is expanding. Overshadowing these developments, moreover, is the possibility of substantial uranium deposits in the Tete region and Zambesi province of Mozambique. The importance of these deposits and the programme for their exploitation are closely guarded secrets, but hints dropped at the Geneva atomic conference in August suggest that Portuguese expectations are high.

In considering the future of these lands across the sea, Portugal faces complex problems. On the one hand, it wishes to encourage emigration to Angola and Mozambique, especially by skilled men and those who can train the native population in modern farming methods. But it also wishes neither to interrupt the traditional flow of migrants to Brazil nor to lose too many first class brains and hands during its own industrial revolution. Moreover, Portuguese administrators are keenly aware of the problem posed by the growth of a white minority within an overwhelmingly black population, and they look with anxiety at events in South Africa. Hence the present doctrine is one of selective immigration to key areas, such as the Limpopo valley.

If the economic outlook at home is bright—the Portuguese having calmly accepted the fact that industrial expansion will often be accompanied by an adverse balance of payments—this is largely due to the very special political and social conditions under which Portuguese industry operates. These conditions can be, and are, described by a number of names ranging from "the corporative state" to "fascism." They include the prohibition of strikes—all disputes are subject to compulsory arbitration—and the strictest control of economic policies by the state.

But it is too often wrongly asserted that Dr Salazar has succeeded, where others have failed, in creating a fully-fledged "corporative state." He himself recognises that Portugal does not yet possess a complete system of corporations, representing employers and workers in each economic field, and in turn represented

in a national Chamber which would make a parliament organised on party lines unnecessary. The existing "Chamber of Corporations" is a makeshift; and even the prime minister, although still dedicated to his original doctrine, seems now almost resigned to the fact that the structure he planned will probably never be completed. And it may be added that *dirigisme* is, in itself, no warrant of success and that its undoubted achievements in Portugal have been the austere triumph of Dr Salazar and the team of dedicated pupils that he leads.

The cost of these achievements certainly seems greater to the outside observer than to the average Portuguese. When reminded of the existence in his country of political prisoners, some of them men of great distinction incarcerated without due process of law for years at a time, he tends to answer that they are a few. When told that the Portuguese parliament is a travesty of self-government and a debilitated debating club, he will observe with some shrewdness that the Latin temper may not be suited to parliamentary government and that the brilliance of Dr Salazar's colleagues derives precisely from the fact that they are men chosen purely on merit and without regard to years wasted in party politics. When queried about the absence of a genuinely free press or significant vocal opposition he will reply that to oppose the present regime on doctrinal grounds is to oppose Portugal's progress, and that to oppose it on specific grounds is only to heed Dr Salazar's wish that all men of good will should come forward with suggestions for the improvement of the *Estado Novo*.

★

Unfortunately, these answers cover only one part of the truth. The price Portugal is paying for the efficacy of Dr Salazar's economic planning and social paternalism may be larger than is shown by the outward quiescence of political life. It is a tangible dearth of intellectual and artistic achievement, a real deadness in the air of a country renowned for its adventurous instincts in the past. Serious writing is generally acknowledged to be at a standstill, although Brazil provides evidence that this is not due to any intrinsic decline in the creative power of the Portuguese language. The schools are archaic in many of their pedagogic conceptions, and intellectual life—the free clash of opinions and tastes—is absent from all but a small circle.

This fact is all the more striking in a country where the Platonic ideal of philosopher-rulers has been so impressively realised; the university at Coimbra is now the direct road to government, and many of today's ministers were, only yesterday, displaying their talents in one of its seminars. In fact, six former university professors hold the key posts around Dr Salazar, and in Portugal a withdrawal from politics, such as that of Dr Costa Leite, may easily lead back to a professorial chair. But the relationship between university and state

is not one of equals but one of servant to master, and there lies one of the causes of the anaemia in Portuguese life.

★

What of the future? Speculation regarding a potential successor to Dr Salazar now centres on the person of Dr Marcelo Caetano, formerly a professor of law and today Minister of the Presidency—a post specially created in 1950 for a deputy premier. But the only thing that can be predicted with some confidence is that Dr Salazar will be able to choose a successor without fear of opposition. What little opposition is permitted to survive tends to group itself around the not altogether serious cause of the deposed crown. But in that very fact lies one of the potential hazards of the *Estado Novo*. Should Dr Salazar's corporative utopia ever collapse, there is no responsible opposition to take its place or propose alternatives, and that may explain the oblique, but unmistakable, fear expressed privately by a surprising number of Portuguese about the future threat of Communism.

For the present, however, the British engineer and manufacturer might remember that Portugal has a growing economy in whose progress he can play an important part. And the British wine drinker should not fail to toast General Craveiro Lopes—with a glass of port.

England's Incompetence

We have unbounded confidence in the capacities of Englishmen for government and war as for the ingenuities and enterprise of peace—just as we have formed an unbounded estimate of the resources of England;—but what is the value of either if the former be not enlisted and well placed in the service of the country, or if the latter be not called forth and committed to able hands? We can neither conquer nor defend ourselves by latent strength or means—by grand possibilities of power. England yields to no nation in the deep intellect or daring and scientific energy of her sons; but what avail are these for winning triumphs in the domain of sacred learning or military enterprise, if we persist in sending our stupid sons into the Church and our vagabond sons into the army? We have youths of competent ability in the Queen's service;—but how can we expect that ability to bear fruit, if we pass it through no fit professional training? We have captains of genius and subalterns of long experience in our regiments;—but how can we expect our troops to be well led if we never place these men in positions of command? In short, we cannot deny that throughout this war we have made many unfortunate and damaging displays, which friendly and hostile observers are not far wrong in ascribing to incompetency—and we cannot wonder that this incompetency should be set down as national and not as individual, and that foreigners should be unaware how easily that operation of our institutions and habits, by which incompetency has found its way into positions where its power for mischief is so fearful, can be rectified by a simple expression of earnest and indignant feeling on the part of the people.

Notes of the Week

No Change

SIR ANTHONY EDEN'S decision to postpone the Government changes for some weeks is a bad one, and for the very reason he used to defend it. He argued that the present team should be left unchanged to handle the "essential work" of the coming weeks. But it is precisely because the current economic and defence work is so important that most people think Sir Anthony should have reconstructed the Government already, and should certainly not delay any longer. It may be administratively inconvenient to switch ministers while a department is in the middle of a complicated policy review; but there are even more obvious arguments against carrying out that review with marked—and because they know they are marked, unconfident—men in key jobs.

These arguments have clearly been put forcibly to Sir Anthony by his own backbenchers. Some of their protestations, of course, must be discounted; backbenchers are always wanting Cabinet changes. Sir Anthony may also console himself with the thought that hell hath no fury like a politician scorned, and that there may be something to be said for leaving his ambitious followers travelling hopefully rather than not arriving. But it is bad for a party leader to give the impression that he is either slow to make up his mind or very quick to change it. It is also unfair to prolong the suspense for men who have, after all, their own private and business futures to plan. It may well be that Sir Anthony is having to sift conflicting advice—whether, for instance, there should be a tougher Minister of Labour, such as Mr Macleod might be, or another Sir Walter Monckton in Mr Heathcote Amory (in which case, however, the party would insist that he should find another Mr Heathcote Amory at the Ministry of Agriculture). It is also true that the changes proposed in the direction of the defence effort may eventually set free at least two forceful personalities for other jobs. But, while Sir Anthony delays, Tory discontents are brewing; most unfairly many of them seem to have fallen not on his head but—despite the good news contained in the latest trade figures—on the guiltless and resentful head of Mr Butler.

Mr Attlee's Succession

THE question mark over the party leadership loomed large at Labour's annual conference. Mr Attlee's departure within a matter of months is now accepted as virtually certain, but the party arrived at Margate with its feelings still very mixed about who should succeed him. At first

the grapevine that always wraps itself around a conference town reported a growing feeling (even if a resigned one) that Mr Morrison—who was back in his chirpiest mood—should take his turn on the throne after waiting so long. But the complications are immense. The moderate left in the Parliamentary party (which elects the leader) would prefer Mr Gaitskell, partly because it fears that Mr Morrison might be more inclined to risk splitting the party by going out with a hatchet after Mr Bevan, especially in view of the latter's latest outburst. Despite this, the far left, which does not believe that any hatchet-blow at its leader would be mortal, prefers Mr Morrison to Mr Gaitskell; it wants Mr Bevan to have another shot at the leadership in four or five years' time. Some of Mr Gaitskell's friends are perturbed by precisely this point; they are telling Mr Gaitskell that unless he bids for the leadership now and settles the problem for twenty years, this manoeuvring for Mr Morrison's succession will distract the party from its search for a policy. If Mr Gaitskell does contest the coming election by the Parliamentary party, there will be no danger of letting in Mr Bevan on a split vote; the leader has to be elected by a clear majority, and on the second ballot the bottom of the two right wingers would stand aside.

Mr Gaitskell has steadily strengthened his position throughout the conference. In the vote for the party treasurership on Monday he gave Mr Bevan a bigger hiding than last year—by 9 to 2, compared with 2 to 1 in 1954—and the latest Gallup Poll shows that he has climbed to equal popularity with Mr Morrison and that Mr Bevan earns the support of only 23 per cent of Labour voters. This makes nonsense of Mr Bevan's claim that only a few power-drunk union bosses are standing in his way. But the Margate voting emphasised how much Labour depends on the unions to choke the seeds of apathy in the constituencies. Only one Labour voter in four wants Mr Bevan to be leader, yet in the voting for the constituency section of the national executive the Bevanite slate was returned by the biggest majority it has yet achieved; and among the also-rans three members of the far left polled more votes than a reasonable if insufficiently advertised right wing ex-Minister like Mr Gordon-Walker.

Apathy among Labour supporters is clearly leaving the constituency parties more than ever at the mercy of tight little left wing caucuses. But the Margate conference has shown again that they are caucuses that an intelligent and efficient organisation, working to a policy co-ordinated by a calm and confident leader, could fairly easily control. It is becoming increasingly clear that the most important point for Labour will not be whether Mr Morrison or Mr Gaitskell becomes that leader, but that whoever wins should not do so after a fierce struggle that could leave resentment by the loser or embarrassment for the victor festering behind it.

Voices Over Cyprus

SIR JOHN HARDING'S announcement that his three talks with Archbishop Makarios had ended without any agreement being reached neither came as a surprise nor should be allowed to obscure the fact that the new Governor had got off to as good a start as was possible in the very difficult circumstances that face him. The inclusion in his brisk first round of consultations of these talks with the Archbishop was notable not only in itself but also as a reminder of how many years had passed since a governor of Cyprus had been closeted with a head of its dominant church. In his first broadcast in the island, Sir John was at pains to emphasise that the London conference, far from slamming doors, "threw wide open the door to self-government. . . . Beyond that the future is left open, and no one has been asked to commit himself." But neither his fair words, nor his evident desire to re-establish personal contact and, if possible, confidence between all who seek to settle the island's problems by peaceful means, have saved him from being branded in Greek broadcasts to Cyprus both as "pseudo-conciliatory" and as a "war criminal." Nor has the activity of the EOKA terrorist group, to which Athens radio lends an aura of heroism, ceased.

It can hardly be expected that the new Greek government of Mr Karamanlis will take any effective steps to restrain the men who hurl abuse and exhortations to bloodshed from the safety of broadcasting studios 700 miles away from the island. Indeed, the Greek Rally, the ruling party in Athens, is all too likely to regard an intransigent attitude towards Cyprus as the only means of papering over its internal rifts now that the personality of Field Marshal Papagos is no longer a unifying force. And whether the Rally splits, or survives to face elections at an early date, the contest on the hustings will largely be one to see who can cry *Enosis* loudest. Thus the situation in Cyprus, already ugly enough, may soon be further bedevilled by wholly extraneous factors.

Byzantium and Geneva

VYACHESLAV MOLOTOV had managed to survive twenty-five dangerous years of Stalinism without a single open recantation. Last week, however, he was forced to produce a public *mea culpa* which was published in *Kommunist*, the Soviet party's theoretical organ, together with a stern editorial reprimand. Eight months after the event, a reluctant apology was extracted from him for a remark, but faintly smacking of heretical deviation, implying that only the foundations of socialism had yet been laid in the Soviet Union. This sensational rebuke is a reminder how little the outside world really knows about the personal alignments in the Soviet "collective" leadership. All that can safely be asserted is that a veiled, Byzantine struggle still goes on.

Last week's strange confession, however, is not only an episode in that fight. It also marks the end of any hope Mr Molotov entertained of remaining above the battle in the role of referee or elder statesman. If such was his

intention, it has now been thwarted in a most unpleasant manner; he has been kicked into the centre of the ring. Probably issues of both home and foreign policy have set him at loggerheads with the new ruling group in the Soviet leadership. The apparently innocuous dispute over the correct formula to describe present-day Soviet society may reflect a deeper conflict over domestic doctrine. But the fact that a manoeuvre that inevitably means loss of personal prestige for the foreign minister has been executed just before his journey to Geneva suggests that the Russians may, in connection with a change of course in foreign policy, be preparing to remove the man who has been so long at the helm, even if he did not plot the course himself most of the time. Under Stalin, Mr Molotov merely carried out policies. Since 1953 he may have, in attempting to shape them, hastened the beginning of the end of his long career. But it is still far from certain that he will follow Mr Malenkov's step downward. The "collective" leaders are now on a see-saw rather than a ladder.

Slowing Down the Call-Up

THE Government no doubt feels that it has chosen the least of several political evils in deciding to reduce the annual intake of national servicemen by decreasing the number of registrations per year, thereby progressively raising the age at which men do their service. The two-year period of service stays, so that the services will continue to get a quota of trained technicians and non-commissioned officers from their national service cadre; and though this will be reduced in proportion to the total decline in numbers, there will be a substantial saving in manpower, money and frustration from having fewer recruits to train. There will also be some advantage in getting recruits who are nearer to being men than boys. The Government and service chiefs presumably also hope that the retention of the two-year period will at least partially offset the psychological impact on other Nato countries of the decision to reduce British forces as a whole by some 100,000 over a period of approximately three years.

The decision also meets the public's predilection for "equality of misery" in the matter; they were political, not military, objections which ruled the proposals for selective service out of court. But the scheme does not meet the general preference for a straight cut in the period of service, and the Labour party has been quick to condemn it as "evading" the true issue; the Prime Minister laid himself wide open to this sort of attack by hinting that at a later stage a cut as well as progressive deferment of registration was not ruled out. In practice the Government may find that the scheme gives rise to nearly as much discontent as would a selective call-up, although without its military advantages. The uncertainty about the date of call-up will be increased, however many explanations of it are given official publicity. Parents and children will find it harder to plan ahead, even for a widening gap between leaving school and call up. Those taking higher education will be given an opportunity to be called up earlier or later than other people as they wish, and it looks as if occupational exemptions may be slightly extended. It will not take much of this, together

with uncertainty about the date of a boy's call up, to give the impression that the scheme is operating unfairly.

In any case it will have to be recast in two or three years. Meanwhile it has the virtue of flexibility: the number of registrations can be increased at any time, though that means increasing instruction facilities too. But in fact the scheme's main virtue is that it gives a brief breathing-space in which to recast service manpower more nearly in accordance with the needs of nuclear war.

The Direction of Defence

THIS reorganisation for nuclear defence is, indeed, the main justification for a reduction of service manpower at this time; the Atlantic allies, in particular, need to be reassured that smaller British forces will be accompanied by more British hitting power within the next few years. Sir Anthony Eden's significant reference at Bournemouth to a "long-term" plan for defence encourages the belief that he accepts the need for drastic changes; but it may be wondered if he chose the words "long term" in relation to the task of overcoming inter-service differences, or to the time required to re-equip with nuclear and other modern weapons (and to solve the problems connected with their use and control). It is clear, however, that Sir Anthony is convinced that defence must be centrally planned, and that this must mean a new role for the Minister of Defence. "The Minister of Defence," Sir Anthony said, "if he is to do his work effectively, must be able to direct policy over the whole of his field."

This field includes the Ministry of Supply as well as the three service ministries. If Sir Anthony's words mean anything, they must mean that before long Mr Selwyn Lloyd will cease to be a co-ordinator, chairman of committees and general go-between—and become what he is at present only titularly, Minister of Defence. If responsibility for research were placed under him, this would in any case give him increased power over the services; but the ultimate objective must surely be to make the service ministers subordinate to the Minister of Defence, in the same way as the two Ministers of State for Foreign Affairs are subordinate to the Foreign Secretary. The development of a common service policy would then be a matter for the Minister of Defence alone. The achievement of far closer service co-ordination is, in any case, foreshadowed in the proposal to appoint a single Commander-in-chief for all forces, whatever their uniform, in Britain. Although the Government does not yet quite like to say so, the "home defence" for which he will be responsible means in fact the planning of survival after catastrophe—in which the importance of reserve forces is that they are disciplined formations that will be able to operate if the ordinary structure of civil life has collapsed.

One Service?

WHILE the Government has been hatching these plans for closer co-operation between the services, Field Marshal Lord Montgomery has leapt a long way ahead of them. In his lecture to the Royal United Services

Institution this week he bluntly stated that the traditional separation of sea, land and air forces no longer accords with the type of functional specialisation demanded by the conditions of nuclear warfare; his candid references to service rivalries, empire-building, vested interests, "propaganda machines" and the impossibility of getting unbiased inter-service advice at present should be noted by Mr Selwyn Lloyd. Lord Montgomery will not be satisfied merely with the subordination of the service ministries to a consolidated Ministry of Defence; he also wants a Chief of Staff of all armed forces to advise the Minister, and a progressive integration of the services—beginning, he suggests, by making all staff colleges for senior officers inter-service organisations. Ultimately, the Field Marshal sees a single fighting service, with a single tradition, specialised only as to particular arms, only some of which would be confined to a single element. If the Government is thinking (although not yet thinking aloud) along these lines, it will certainly require an outside personality in defence ministers even to initiate the process; it is one thing to demand an end to committees, and quite another to find a substitute for them. But shock treatment might serve the country better than diplomacy; it can even be argued that Parliament would be wise to set a period within which integration should be achieved.

Unfortunately, some of the difficulties were unconsciously underlined in Lord Montgomery's own speech. He properly emphasised that, at a time of transition, forms of organisation have themselves to be transitional; but this did not prevent him from demanding that the fighting men should give clear instructions to the scientists. Yet the pace of transition is set by the scientists. There will also be controversy over his proposal that the Supreme Military Authority and its Commander for the West should be located in America. It is also clear that Lord Montgomery does not consider that war has changed as much as some people believe. He spoke of the possibility of "imposing our will" on the enemy (in lieu of "victory"); and he evidently envisages that, although the rear of armies will be subject to massive destruction, a new type of self contained army formation will continue to fight prolonged actions that will affect the outcome. Whether plans of this kind will still be realistic by the time a single service has been brought into being, and the atomic stockpiles have risen correspondingly higher, is another question. What matters now is that the transitional solution should be effective—and therefore an effective deterrent to war itself.

Threats to Dr Adenauer

DR ADENAUER'S illness is a matter for more anxiety now than it would have been six months ago. He is not only six months nearer eighty years of age, but he is more indispensable than ever to the West—and the West to him. The "Geneva spirit" and its German counterpart, the "Moscow mood," have made his task more difficult. Since his agreement to establish diplomatic relations with Russia, the political climate in Germany has changed. It is true that the Chancellor is more popular among the public than before, because he has secured the release of German prisoners from Soviet camps. But the public has also

How
does the
smaller
firm
raise new
capital?

As long as credit restrictions are in force, this may be difficult. For those firms concerned in work of national importance, the best answer may be ICFC. The Corporation provides long-term loans and share capital, in amounts between £5,000 and £200,000.

DAISEE JUTE

gets the
sack

THIS isn't the kind of sack you don't want. This is a jute sack—and that is a Good Thing. For sacks carry your coal, your sugar and your flour. Sacks carry fertilizers and seed and grain. And because sacks must be tough, the best sacks are made of jute.

Just like rope. And twine and hessian and scrim. All these are made of jute. Jute backs your lino and your carpets. Jute lines your shoes and shapes the shoulders of your suit.

What amazing stuff is jute. How unromantic and how unregarded. But how very vital! For always, everywhere, jute is at its necessary task. All praise to jute!

—makers of bags and sacks; twines, cords and ropes; jute carpets and furnishing fabrics; yarn for carpets, cloth for backing linoleum, for tarpauling, roofing felt, damp-courses and plasterers' scrim; cotton belting and webbing and canvas.

There may be an application of jute to your business. Why not write to us:—

The case of *Iridomyrmex humilis* . . .

In the past few years many Australian towns, especially in Western Australia and Victoria, have been increasingly plagued by Argentine ants. No jam pot or sugar bowl has been safe — wherever any sweet substance has been exposed the ants have congregated and made life miserable for everyone. The invaders were first identified in Australia in 1939 and have since become an unmitigated nuisance in some built-up areas.

The private wars waged on them by householders have now been superseded by organised campaigns of eradication. The insecticide finally chosen to wipe out the Argentine ant is dieldrin, recently developed by Shell. Dieldrin's greater potency and persistence make it ideal for open grid spraying, the method adopted. Infested areas are divided by spray bands into smaller units and the ants, including the foraging queens, must cross these insecticidal barriers sooner or later in their quest for food.

Two applications of 1% dieldrin solution, spaced a few months apart, are the complete answer to infestations of Argentine ant.

dieldrin

dieldrin and aldrin are  insecticides for world-wide use

For further information apply to your Shell Company.

Dieldrin is one of the newer Shell insecticides, effective against a very wide range of insect pests which attack crops or spread disease. Its exceptional persistence, sure kill and lower dosages are now in the service of agriculture and public health throughout the world.

Aldrin — another recent Shell development — is fast becoming recognised as the best of all insecticides for the control of pests in the soil.

Is there an urgent pest problem in your area?

softened its attitude towards the Russians, and is all the more inclined toward wishful thinking about the possibilities of an accommodation with the Communist system. The return of four Communists to the Bremen Diet in last Sunday's elections is a sign of the growth of such illusions. "Germany can be a bridge between East and West," and similar famous last words, are now being heard.

This new atmosphere has emboldened Dr Adenauer's opponents, and particularly increased the danger that threatens him over the question of the Saar. Dr Adenauer has very little public support, even in his own party, for his Saar policy, and there was a chorus of disapproval when he joined M. Faure in a joint statement intended to rally opinion in favour of the new statute. If the statute is rejected on October 23rd, it will be a black day for Dr Adenauer.

German Hostages Return

THOUSANDS of German Rip van Winkles, some of whom had been in Russian prison camps since 1942, returned to the Federal Republic this week, and the rest of the 9,600 whom Marshal Bulganin agreed to free are on their way. They are pitiful reminders of the tragedy which Hitler brought on the Germans as well as on the nations that defeated them. The Germans are too prone to behave as though they had a stainless record in the war, but in this case it is hardly likely that the men who are now returning were criminals. If they had been guilty, they would certainly not be alive today. Some of them, such as the youngest brother of Herr Alfred Krupp, were obviously held as hostages. All told, the ex-soldiers who have now been released represent one-tenth of the number who, according to German evidence, are still alive in Soviet hands, and only a small fraction of the 1,250,000 men of whom nothing has been heard.

The ex-prisoners reveal that it was not until Dr Adenauer's agreement was concluded in Moscow that conditions changed in the camps. Then vodka, caviare and brass bands were provided with assurances of Russo-German friendship. This last-minute cordiality has not, however, induced the released men to stay in the Soviet Zone of Germany, even if they had ties there.

Ex-General von Seydlitz is the most interesting of the freed generals. He incautiously revealed that he intends to work with the insignificant little party of Dr Wirth, the ex-chancellor who signed the Rapallo treaty and has never forgotten this claim to fame. The general was second-in-command to Field Marshal Paulus at Stalingrad. He was one of the founders of the "National Committee for Free Germany," and chairman of the "League of German Officers" which was formed in Russia after the annihilation of Hitler's Third Army. Field Marshal Paulus was returned some years ago to the Soviet Zone, and now conducts propaganda against Nato among ex-officers in both east and west Germany. Various officers of his staff and other members of the "League of German Officers" hold high posts in the Soviet Zone army and administration.

The officers who travelled back with General von Seydlitz sent him to Coventry. But this is not the attitude

of the whole of the former officer corps. Their criterion in such cases is, for the most part: did the commander in question save or sacrifice his men? Field Marshal Paulus is criticised by many former staff officers first and foremost for not disobeying Hitler's orders to fight to the death, and this is a view which is shared by the public. Generals are at a heavy discount in Germany today, even if they bear a famous Prussian name like Seydlitz.

M. Faure's Unfinished Battle

FACED with a swift succession of North African tests, M. Faure emerged from the Moroccan debate in the Assembly with flying, if not untarnished, colours. In two brilliant speeches he lucidly defined the government's policy and the need to negotiate with the nationalists—an opportunity which may no longer be available tomorrow. His evident awareness of the real problem and of its urgency naturally led Socialist critics to ask why he had tackled it so hesitantly. The answer is not hard to find; nearly half the deputies who had voted for M. Faure's investiture were against him last week on the Moroccan issue. The government's impressive majority for a policy of negotiation was mustered thanks to over 200 votes cast by Communists and Socialists, who shortly before had attacked the government violently for its weakness and delays. There is a majority in the chamber for a dialogue with Moroccan nationalists, but it is not the same majority as the one that usually supports M. Faure.

UNEMPLOYMENT IN GREAT BRITAIN [THOUSANDS]

His original conservative backers, thwarted over Morocco, may carry the vendetta into other fields. This could prove fatal over Algeria, since here the Socialists are unlikely to come to the government's rescue. On the other hand, it is somewhat difficult for the Gaullists to attack a policy of which one of their leaders, M. Soustelle, now Governor-General in Algeria, is the chief architect. The government's plans for Algeria are in general less likely to provoke conservative wrath than those for Morocco. Indeed, it is still somewhat difficult to assess what M. Faure's policy actually is. It is symptomatic of how little thought has been given to Algeria's future that, when the debate on this subject opened, selected ministers had to hold a special session to define what they mean by "integration."

This ill-defined concept seems to be situated somewhere between complete assimilation and Algerian autonomy with federal links. Yet, whatever its final shape, the very term "integration" was recently rejected by pro-French Algerian representatives. The government may thus find it easier to get its Algerian programme accepted in Paris than to apply it on the spot. France, however, cannot really afford a long-drawn North African conflict. The widespread disturbances among conscripts and recalled reservists are a portent of things to come. They can no longer be attributed to administrative errors alone; insubordination is spreading to lower ranks. Unless the government can destroy the impression that France is drifting into a second "dirty war," the effects of this mood are incalculable.

More University Scientists?

EVERYONE has had a say about the shortage of science teachers, and this week it has been the turn of the Convocation—the graduates' conference—of London University. On Tuesday, under the chairmanship of Dr Percy Dunsheath, a doughty fighter in this particular cause, it adopted a recommendation of its subcommittee that London University, if possible in conjunction with other universities, should consider increasing the number of its science students by between 60 and 100 per cent. This recommendation has now been sent on to the university authorities.

The proportion of science places in London is in any case being increased by the expansion of the Imperial College of Science and Technology, whose Rector, Dr R. P. Linstead, this week gave a progress report on the plan to increase the number of students from its present total of around 1,700 to about 3,000 by 1962. But most of these places will be for technologists, who do not usually become teachers. Plenty of objections will be made to such a large increase in the number of scientists as Convocation proposes. One is that the existing balance between the arts and sciences in the universities ought not to be upset—an argument which springs mainly from the much-talked-of "narrowness" of scientists, and which would have little force if their education could be broadened. A second objection arises from doubt whether enough talent is available to make so many science students; the failure rate is already alarming. But there are three sources of ability to draw on: the growing numbers who stay at school until they

are seventeen or eighteen; the people who, as things are, would choose to take arts degrees, but who might be persuaded to do science instead—if necessary by the offer of a preliminary science course at the university to make up deficiencies in the science they have learned at school; and finally, the increase—of about 40 per cent—in the potential student population when the "bulge" moves out of the schools. From these sources combined, 60 per cent more science students might be recruited within seven years without lowering standards of entry.

It is strongly felt by some in the universities, however, that to avoid lowering standards is not enough: they ought to be raised, as the potential student population increases, by closing the door to "duds." The scientists who would be kept out by this policy, they say, are the sort of people who would benefit more from courses at the technical colleges. The universities have only just begun to think about this question, but it is much the most important problem that they have to face.

Uncommitted Territories

THE appearance of a report (Cmd 9580) on the three High Commission territories in South Africa (Bechuanaland, Basutoland, Swaziland) is a reminder that while the British taxpayer is steadily underwriting their economic and social development, constitutionally and politically they remain in the ice-box. But how long can they stay there? The growth of African secondary education alone makes it clear that a politically-minded generation of Africans must arrive sooner or later. There is, however, not a reference to political development in the report, which is clearly stamped as a diplomatic rather than a Colonial Office type of document. Mr Strydom is now taking an extremely moderate line about the future of the protectorates; at the last Nationalist party conference he told his supporters that it would be settled by "agreement" and "between friends." Some indication of the lines along which he may be thinking may be found in an article which appeared recently in a nationalist newspaper: it suggested that while sovereignty could remain with Britain, the administration of the three territories should be progressively transferred to South African hands.

This would certainly be an ingenious way of getting around the evident reluctance of British public opinion to transfer the protectorates while South African racial policies are what they are, and the probability that if African wishes were consulted the reply would favour continued British rule (with some feeling in Bechuanaland for incorporation in the Rhodesian Federation). But no British government is likely to play the game that way, especially while development and welfare funds are being spent in the territories. No doubt South Africa would willingly take over this financial commitment if it strengthened its political claim—as it is, the Union is virtually offering Swaziland a new port on the Zululand coast and a railway link with it. But the choice has to be made between continued administrative stagnation and progress along Colonial Office lines—notably the setting up of legislative councils, especially in Bechuanaland

(where such a move could be a prelude to letting Seretse Khama return as a public man, though not a chief, to his people). To take such a step would rebuff and anger South Africa; but not to take it is to accept increasingly a transfer to South Africa as a mere matter of time and agreement "between friends." Britain cannot sit on the fence much longer, whatever the consequences for Commonwealth relations.

Egypt Sips Elixir

IT looks as if the Russians' would-be retort to the West's "northern tier" of Middle Eastern allies is a "southern cluster," and as if the policy is an initial success. All the Arab governments are anti-Communist, but all relish a chance of displaying independence of mind. The consternation into which the news of the latest Russian overtures to them threw Washington, and to a lesser extent London, does not say much for western imagination. To think that the West enjoyed an unchallengeable monopoly as a purveyor of arms and aid was over complacent, and what is surprising is not that the Russians have offered both, but that they did so only now instead of in the years when Anglo-Egyptian relations were bad. Today, Colonel Nasser has refurbished Egypt's shaken prestige by his act, and, as an article on page 231 points out, his western friends may yet find him easier to deal with as a result.

From the western angle the one unmitigated drawback of his policy is the path it opens to an arms race between Israel and the Arabs, to consequent financial strain on poor countries, and to the establishment of a new arena in which East and West may be viewed as taking opposite sides. In the realm of economic aid, the outlook is not all black. Undoubtedly the Russians will win headlines and score social successes, thanks to their Moslem connections and to their talent for mixing without condescension, but surely the British and the Americans can match them in other respects, and notably in that of repute as disinterested consultants, particularly in the field of engineering. Negotiations with one such British firm of great experience are in progress over the Aswan high dam.

Russian competition in economic aid may even, in time, provide some contrasts that will work out to western advantage. Once the West is no longer the only milch cow available, the opprobrium for inadequacy of generosity may be shared instead of being directed all one way as it is now. Experience both in Iran and in Iraq suggests that, once a choice is available, appreciation of western qualities tends to grow rather than to diminish. Certainly the Egyptian trainee despatched to a foreign university will for a year or two look for everything there is to praise in Moscow, and everything to criticise at Leeds or MIT, but after a while he will make more profound comparisons.

It is too early for an unqualified wringing of hands, except in Israel. But it is not too early to assert that the counterstroke to be avoided by London and Washington is that of rushing forward with rival offers that will start a bargaining game in which neither of them is a match for Orientals.

The Shah Takes Sides

AT the very moment when Colonel Nasser is winning round on round of Arab applause for a policy of flirting with both East and West, the Shah of Iran has abandoned the technique. This week he has secured the approval of the Iranian cabinet, and is seeking that of his parliament, for adherence to the Turco-Iraqi mutual defence pact of last February, to which Britain and Pakistan now also belong. If parliament falls in with his view, the gap in the "northern tier" is filled; apparently Russia's immediate neighbours feel less confident than Egypt that Russian smiles mean abandonment of disruptive aims.

This surprising departure from the policy of balancing between the great powers at which Iran has been an adept for decades seems to be the outcome of arguments pressed home by President Bayar of Turkey when he visited Teheran last month. The Shah has been known to favour it for some time; perhaps it was to wean him from it that Moscow placed him first on the list of reigning monarchs to get an invitation to Russia. But some of his people, remembering their long and vulnerable frontier with the Soviet Union, are bound to enquire what concrete advantages Iran is going to get out of the decision. To many Iranians, Turkish assurances about the quality of western help to allies will not be enough. It will now be up to the West to prove that it does better by its firm friends than by its flirtatious ones.

Russia has not taken the news lying down, and Moscow radio is already quoting "reports" that Turkish and Pakistani troops will now move into Iran. So far, Moscow has not mentioned the Soviet-Iranian treaty of 1921 in this context, but it is well to bear the exact purport of that treaty in mind. As originally agreed, its Article VI afforded Russia the right to "advance its troops into the Persian interior" in several contingencies, one of which was foreign use of Iranian territory as a base of operations against Russia. But the Majlis of the day raised such objections to an article that seemed to impair Iranian sovereignty that the treaty was capped by a Note in which the Russians made it clear that the article "was intended to apply only to cases in which preparations are made for a considerable armed attack upon the Soviet Union . . . by the partisans of the regime that has been overthrown." The treaty, therefore, was directed against Denikins or Wrangels, and they are not rising from their graves now.

The Map of India

THE full reactions to the state boundary changes proposed by India's three-man commission on reorganisation may take time to show themselves. It is the changes that have not been recommended that are the most probable sources of discontent; the Sikhs are not offered a Punjabi state which they could hope to dominate, and the Mahrattas' hopes that Bombay would be divided in their favour are likewise dashed. But meanwhile it can be seen not only that the changes proposed will greatly simplify the map of

Letters to the Editor

Interim Report

SIR—Mr Kaldor's fear that low taxation and dear money will make for a high-consumption and low-investment economy seems to be based on an over-simplification. Most business men, when interviewed by economists, say that their decisions about productive investment, designed to yield a direct return in the form of lower costs and higher output per man, are not much affected by changes in market rates of interest. It appears that uncertainty about the future makes many of them unwilling to regard such an investment as profitable unless it can be expected to show a gross annual saving in the region of 20 per cent or more of its initial cost. The kind of investment most likely to be affected by credit restriction is that undertaken because "It would be rather nice, and we can afford it," such as new office furniture, more impressive motor-cars, new shop fittings and so on. There may also be some cuts in expenditure on advertising and other "current" items, expenditure on which has been encouraged in the past by high taxation of profits.—Yours faithfully, J. L. CARR

The University, Reading

Political Suburbs

SIR—An article in your July 9th edition made numerous references to my work on the 1952 presidential elections. While much of what your "special correspondent" reported is a fair assessment of some of the work on the suburban vote in the last election, I take exception to two points:

1. In claiming that "In so far as Mr Harris's conclusions are based on surveys by a 'commercial' organisation, they are suspect, because such polling enterprises cannot use the very expensive but undoubtedly more accurate methods of latest academic efforts in this field," your correspondent did not check his facts. First, in surveying the 1952 presidential election, the Roper organisation spent considerably more funds in its research effort than the University of Michigan or any other academic effort. The Michigan group, for instance, had a budget of \$90,000 on a grant from the Social Research Council for its research. The Roper organisation spent well in excess of \$100,000. But money alone does not tell the full story. In addition, the Roper firm collected a good deal more data than the Michigan people. Again, to give but one example, Roper election surveys were taken at six separate time intervals from January, 1952, through election day. In addition, a special post-election panel

re-interview re-check of the last sample was made under grants from Professors Samuel Stouffer of Harvard and Paul Lazarsfeld of Columbia, who had access to some Ford Foundation funds, which they kindly made available.

2. Your correspondent further states, "The much touted swing of the female vote to Mr Eisenhower in 1952, to which Mr Harris devotes a whole chapter, is belied by the University of Michigan's study. . . ." There is some disagreement between the two studies on this point. But might I point out that the Roper conclusions are not based on one sampling as is the Michigan study? The Roper organisation used six separate samplings and independently came up with the same trend throughout—women were more heavily in favour of Eisenhower than men. What is more, if you analyse carefully the Michigan data, you will find that one major element in their claim is that more men than women voted for Eisenhower. But this is partly artifact, since more men than women also voted for Stevenson. More men voted than women. The critical fact, brought out by a number of independent measures, is that proportionately women voted more heavily for Eisenhower than did men. For example, in labour union families it was found that trade union women voted much more sharply for the Republican candidate than did their trade union male counterparts. I have seen no such detailed or controlled analysis from the Michigan study on this point.—Yours faithfully, LOUIS HARRIS
Elmo Roper and Associates,
New York

Hire Purchase in Restraint

SIR—A close analysis of the statistical return issued by "Hire Purchase Information" discloses that the drop in sales of motor vehicles is particularly high in respect of used cars and motor-cycles. Since July, when the new hire-purchase restrictions came into force, the decline in the sales figures of used motor-cycles has been of the order of almost 50 per cent; the number of used motor vehicles sold on hire purchase has fallen from nearly 38,000 in July to 26,000 in September. This drop is far greater than the usual seasonal one. The sale of new motor-cars on hire purchase during the month of September shows, in fact, an increase over the month of August. These figures bear out the fact that the recent hire-purchase restrictions fall particularly and unfairly upon a section of the motoring public to whom the use of a motor vehicle is a necessity. To many requiring a motor-cycle at, say, £100, or a used motor-car at between £200 and £250, the increase in the

minimum deposit has proved prohibitive.

Used motor-cars or motor-cycles are not diverted from export markets and do not constitute an additional drain on scarce raw materials; rather do they tend to take the pressure for new vehicles off the home market.

Surely there is a case for the differential treatment of used and new motor-cars and cycles, and to apply to used cars and cycles the same exemptions which have been accorded to the furniture industry, where the deposits have been left at 15 per cent.—Yours faithfully, I. C. H. BURTON
Ashbourne Insurance Brokers Ltd.
N.W.11

The Council Housing Nettle

SIR—As the chairman of a housing committee responsible for the building of council houses, it has been somewhat frustrating to find that successive increases in Public Works Loan Board rates have completely negated the effect of our efforts to achieve economies in the costs of construction. As a layman in the realms of economic theory, however, I am puzzled by the problem of the relationship of rates of interest on 60-year housing loans (no break clause) and the Bank rate and Treasury bill rate.

It would appear that the Treasury borrows in the market at one rate of interest and lends to local authorities at a higher rate—through the agency of the Public Works Loan Board. During the twenty years previous to last January, PWLB rates were from 1½ per cent to 2 per cent higher than the Treasury bill rate. During that period it would appear that the profit made by the Treasury more than offset the cost of Exchequer subsidies.

The proposals contained in your article on October 1st would lead to substantial increases in rents, especially in the case of tenants of prewar houses built for less than £400 and which bear an interest rate of 3 per cent. These tenants have already had their rents more than doubled in order to reduce the rents of postwar houses.

Can there be any moral justification for your suggestion that these tenants should "pay a full economic rent based on free market prices or on the replacement value of their house"?—presumably at present PWLB interest and repayment rates? These amount to £5 5s. 5½d. per £100 loan. Thus the rent on a £1,500 house would be £79 plus, say, £18 for repairs and supervision. Tenants would, therefore, pay in four years a rent sufficient to cover the original purchase price of the house which they occupy, and in two years they would pay sufficient to cover the total exchequer and local authority subsidy liability.

Differential rents are certainly not the answer to our present troubles. It is surely significant that 88 per cent of local authorities of very varied political complexions have not adopted this method of rent fixing.—Yours faithfully, SWANAGE, DORSET ARTHUR GASKELL

Books & Publications

The Oppenheimer Case

WE ACCUSE!

By Joseph and Stewart Alsop.
Gollancz. 208 pages. 13s. 6d.

ALTHOUGH the Oppenheimer case aroused considerable interest in this country, available information on it, outside specialist circles, has been confined to what appeared in the British press at the time. Disquieting as it seemed, as an example of the way in which the United States government rewards distinguished services, it was the element of personal injustice involved that mainly gripped the public's attention. Those who were tempted to draw wider conclusions tended in the main to regard it as merely the latest manifestation of the McCarthy malaise, even though the Senator was not personally involved at any stage in the proceedings.

The main value of the Alsops' little book is that it places the victimisation of Dr Oppenheimer in the only context that really makes sense, the political. It makes it plain that he was a casualty in a larger conflict, the battle of the policies of the Strategic Air Command. This thesis, familiar to readers of the American press, is fully and convincingly set out here. It cannot, in any legal sense, be proved, but the authors have marshalled very impressive evidence in its support. Certainly the trumpety character of the charges brought against Dr Oppenheimer forces one to look behind the "judges' verdicts for the real explanation of his "conviction."

The English reader, unfamiliar with the desperate inter-necine conflicts of which official Washington can be capable, is bound to ask why Dr Oppenheimer, if his advice was unacceptable, was not simply dismissed without being subjected to an investigation which was, in effect, a trial. The official reason, given by the Gray Board, was that even if he were relieved of his position he would still, unless expressly debarred, continue to receive "classified data." The Alsop reason is that the ruin of his reputation was an indispensable stage in the defeat of the policies which he advocated. To the outside observer neither of these reasons seems to explain everything.

There is the further point that, by all orthodox—certainly by all Whitehall—standards, of the proper relationship between policy makers and expert advisers, Dr Oppenheimer had strayed across the line that ought to separate the two and was firmly established in the policy makers' territory. Was this merely a special case of a familiar Washington phenomenon, the American government having in these matters, as

one knows, a set of standards different from our own? Was it a function of Dr Oppenheimer's own personality? Or was it something which follows inseparably from the discoveries and researches of atomic physics itself? One would like to know; if the last explanation is the true one it has implications for Englishmen as well as for Americans.

However, one further point suggests itself. How much of the Oppenheimer scandal might have been spared had the permanent officials concerned, particularly in the defence departments, been of a calibre, intellectual and moral, to stand up to Dr Oppenheimer when, in the course of their departmental duties, they found themselves in disagreement with him? As the testimony makes only too plain, the atomic physicist outpointed his critics in all the debates that preceded their final breach. They simply could not cope with a mind that moved as fast as the electrons it studied. And so, worsted in argument, they transferred the debate to an arena where it could be settled by the cruder weapons of a criminal lawyer's cross-examination and a majority of hanging judges. In so doing, they won their battle, but at a price which was, and perhaps still is, desperately costly to the Republic whose security they were so concerned to defend.

A Diplomat Diagnoses

THE HUNGRY SHEEP.

By David Kelly.
Hollis and Carter. 244 pages. 18s.

SHARP controversy is not often provoked by books written by retired ambassadors. Sir David Kelly offers an exception to this rule, as he has done to others. True, he is unashamedly fond of lauding nineteenth-century diplomacy, with its "essentially pacific outlook," and it is in the purest tradition of that diplomacy that he should display alarm and horror at

the ultimate effects of the gradual transfer of authority to the anonymous impersonal collective forces massed in the great urban agglomerations created by 19th-century industrialism.

One's own spine is momentarily chilled by the thought of these faceless hordes, these myriad tentacles clutching out of the dark streets. But the nagging thought then comes: has Sir David never met one of these anonymous agglomerated citizens, and found him quite a decent, even sensible, chap? One of his own liveliest whacks, in a book full of very readable debunking, is aimed at Sir J. G. Frazer, "who

admitted cheerfully that he had never met a black man." Sir David himself might profit from a tour of the Black Country.

But there is more in this book than a lament for lost dignities. Sir David is a considerable historian, and few will quarrel with his analysis of the disastrous working out of the effects of nationalism, doctrinaire materialism, demagoguery and wishful thinking, in past centuries and in our own time. He gives us "a brief run with the cyclists"—Spengler, Toynbee, Danilevsky and others—and it is heartening to find that a man so versed in their theories (and with a weakness for the Apocalypse) can still deny that our civilisation must disintegrate. Sir David sees western society as threatened from the outside by forces which it fostered itself, and from within by both "loss of nerve" and by facile optimism; but he holds that it can yet be saved by a bold return to spiritual values, a restoration of the individual's status in face of the state, a firm hold on realities in the taking of political decisions, and a stern rejection of catchwords. He himself has made an excellent contribution to the hacking away of shams and sophistries that must precede any such renaissance. But he admits that in all these things it is easier to diagnose than to prescribe; and it is disappointing that after so searching a diagnosis of "psychic cancer," the only practical remedies he seems able to suggest are on the level of his commendation of Belgium's "no politics" colonial policy in the Congo.

Anatomy of Britain

THE BRITISH WAY OF LIFE.

By K. B. Smellie.
Heinemann. 205 pages. 15s.

THIS book is not about the British way of life; at all events, it is not about the texture and colour, the flavour and savour, of life in these islands. Professor Smellie's title was prescribed for him by the series of which this volume forms part; what he has produced under that title is an historical explanation and assessment of Britain's political and economic institutions, buttressed by some sociological matter dealing with the family and with education.

On his own ground, dealing with political ideas and their emotional and philosophical roots, with political institutions and their practical working, Mr Smellie is dazzlingly good. Brilliance and balance, epigrammatic conciseness which never deceives the reader into a belief that the last word has been said, a gift for opening up diverse perspectives while remaining firmly on the main highway, combine through forty pages to produce that paradoxical achievement, a living anatomy. Nothing better of its kind could be offered to the enquiring foreigner.

In economic matters Professor Smellie's touch is less certain; he has neither the inspired confidence about what to leave out nor the sure eye for

the central thread to be followed: on the vitally important contemporary question of the relationship between full employment—the fullest in the free world—the free wage bargain, and the stability of money, he is totally silent; and on the equally vital question of an industrial exporting nation's role in an increasingly industrialised world he is painfully confused.

The chapter on education is a businesslike, self-contained, usefully informative little pamphlet which promises something more and fails to fulfil the promise; that on the family provides only some familiar demographic material and a sketchy account of the changed position of women. One chapter, to which these might have led up, is as obviously missing as an absent front tooth—a chapter on the British social structure, on class distinctions, barriers and interrelations. "The British Way of Life" is, in fact, a rather scrappy and uneven book; but its excellence at its best amply redeems the weaknesses and omissions of its less satisfactory parts.

Great Unpeopled Spaces

PEOPLING THE BRITISH COMMONWEALTH.

By G. F. McCleary.

Faber. 189 pages. 18s.

IN 1883 Seeley predicted that in fifty years the "Englishmen beyond the sea" would be "equal in number to the Englishmen at home"; and about the same time the Premier of Victoria promised Froude that by the nineteen-forties Australia would have fifty million people. Froude, more pessimistic, put it at ten million; in 1955 it is nine million—and the total number of "Englishmen beyond the sea," even including French Canadians and Afrikaners, is only half the population of Great Britain.

A dream has faded, and Dr McCleary has set himself the task of showing why it did so; he makes of demography a most readable and useful chapter in British social history. The basic plot of his story is simple: for Seeley's dream—quickly communicated to a generation of newly converted imperialists—arose from the fall in the death rate that gave Britain the surplus population to send overseas to pioneer the third Empire, and collapsed with the collapse of the birth rate which caused that surplus to vanish and Britain to become a country of immigration. "It seems," writes Dr McCleary, "that there has been laid upon our Commonwealth a painless hand—the painless, unseen, insidious, effacing hand of a willed sterility. It was not a foreign enemy that laid this hand on us. We laid it on ourselves." Both in the homeland and the new countries the British kept the cradles empty to enjoy an ever rising standard of life, neglecting the tasks to which the "vast resources" of the dominions called them.

But is demography quite the whole of the story of the Third Empire? For

even when the settlers were available by the million—between 1830 and 1914—they mostly went to the United States. And for a simple reason: capital investment in the United States, partly undertaken by Britain, produced the biggest opportunities. Precisely because the resources of the dominions were not, and are not, on anything like the same scale, the same rapid expansion has not followed. Now, it is true, greater resources (mainly in Canada) are coming to light, at a time when Britain, investing in its own boom, has brimfull employment and little surplus capital to put into dominion development. Yet despite the jobs vacant in Britain, settlers still go to the dominions, if in diminished numbers. The remarkable postwar transformation of Britain as a "processor" of British citizens—both sending a million overseas and bringing about the same number of aliens in—is hardly probed by Dr McCleary. For the truth is that Britain is as much a country of expansion as the dominions, whose vast resources—or the rate at which they can be converted into homes and jobs—can be overestimated. Dr McCleary contents himself with summing up the arguments for and against "mass migration"—the redistribution of Britain's population among the dominions—without venturing an opinion of his own. But he might have summarised some of the basic facts about economic growth and mentioned, for example, that Australia's population policy, based on political rather than economic considerations, helped to produce an embarrassing inflation. On the consequences of trying to engineer a population increase of more than 3 per cent per annum, Dr McCleary, as a demographer, is silent.

Law for the Hundred Thousand

THE LAW OF CIVIL INJURIES.

By Hamish R. Gray.

Hutchinson's University Library. 191 pages. 8s. 6d.

PRIVATE INTERNATIONAL LAW.

By J. A. C. Thomas.

Hutchinson's University Library. 174 pages. 8s. 6d.

BOOKS about law for laymen should be concise, accurate and readable. Both these additions to Hutchinson's University Library are concise and, as far as they go, accurate, but neither author has succeeded in bringing his subject to life. This is particularly disappointing in Mr Gray's book, for the law of civil injuries teems with entertaining cases which, well described, can illuminate the subject. Unfortunately, Mr Gray usually contents himself with a bare outline of the facts.

Mr Gray's chief fault is an approach which is too historical and abstract: it is hard to plunge the general reader on the sixth page of the first chapter into "assumpsit" and the Common Law Procedure Act 1852. Again, in dealing with the commonest torts—those which

arise out of factory accidents and the driving of motor-cars—Mr Gray assumes too much knowledge and says "the reader will no doubt be familiar with the infinitely variable details of 'running down' cases." Many practising solicitors find that most of their clients have to be somewhat carefully instructed on the law both on running down cases and factory accidents.

Mr Thomas can hardly be blamed for not making private international law entertaining. But he would have been well advised to begin by explaining the difference between public and private international law, which are almost always confused by laymen, and to emphasise that in spite of its name private international law is part of English law. Having done that Mr Thomas would still have found it difficult to know where to go next. Before it is possible to understand the rules of private international law it is necessary to appreciate in outline at least what is the English law on the subject in question. Mr Thomas should therefore either have prefaced his book with a warning not to read it until the series had produced several other books, or he should have begun each chapter with a comprehensive essay on the English law. As it is he has compromised: he has given a very brief outline of English law when necessary, but in doing so has fallen between two stools. Like Mr Gray, Mr Thomas has made an academic and historical approach to his subject and takes the reader back to Justinian on the third page of the first chapter.

The upshot is that both books would be very useful to students refreshing themselves for an examination, but it is not for them that they are intended. In the space which each author has at his disposal a great deal must be left unsaid and it requires much more skill to write a descriptive book for the uninitiated than to write a textbook for practitioners.

Apologia for Defeat

IN THE THICK OF THE FIGHT, 1930-1945.

By Paul Reynaud. Translated by J. D. Lambert.

Cassell. 694 pages. 45s.

M. REYNAUD'S able apologia for his role in the disaster of 1940, and the years preceding it, was originally published in 1951 as "Au Coeur de la Mêlée" and was reviewed in *The Economist* of April 12, 1952. This work was itself a documented expansion of "La France a Sauvé l'Europe" published in 1947. The English version, which is called an abridgment and runs to about two-thirds of the original, exemplifies the not uncommon publishers' practice of giving no indication of the principle upon which the abridgment has been made or of indicating the actual cuts. What has mainly been pruned, it seems, is M. Reynaud's criticism of other versions of the events concerned. These still bulk very large for a personal memoir, but the new

UNITED

NATIONS

Coming January 1956

Peaceful Uses of Atomic Energy

The United Nations will publish in January 1956 the complete papers and proceedings of the International Conference on the Peaceful Uses of Atomic Energy (Geneva, August 1955). This will be the only complete and official record of the Conference.

The series will be in 16 volumes (each of approximately 550 pages) and will contain the texts of all the papers (totalling more than 1,000) submitted to the Conference together with a record of the discussions.

Subjects covered in the volumes include: The World's Requirements for Energy; Research Reactors; Power Reactors; Nuclear Chemistry; Radioactive Isotopes in Medicine, Agriculture, Physiology and Biochemistry; Legal, Administrative, Health and Safety Aspects of Large Scale Use of Atomic Energy; Applications of Radioactive Isotopes in Research and Industry, etc.

* **Special Pre-Publication Offer.** A special pre-publication price of £39 (carriage extra) is offered on all orders for the set of 16 volumes placed before 31st December 1955

* A brochure on the series is available on request

OXFORD HOME ATLAS OF THE WORLD

The maps in this up to date world atlas have a remarkable vividness and clarity. A new technique gives them a moulded, three-dimensional effect. Twenty pages are devoted to Great Britain in this latest production of the Clarendon Press Cartographic Department. 10" x 7½", with 104 pages of maps in six colours, and a 32-page Gazetteer, this is the atlas for every home.

Nothing left to chance...

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (5½ tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.

THE MIDDLE EAST, OIL AND THE GREAT POWERS

By Benjamin Shwadran

The most complete account available of the development of the oil industry in the Middle East; its impact upon that area; and Great Power rivalry for concessions—from 1900 to the background of the recent oil discovery in Israel. Contents include 512 pages, bibliography, maps, tables, index.

Mr. Shwadran is editor of *Middle Eastern Affairs*, the only American monthly devoted entirely to the Middle East. Contributors include: James Baster, Norman Bentwich, Marcel Colombe, Hedley V. Cooke, Justice William O. Douglas, Major George Fielding Eliot, Richard N. Frye, Paul L. Hanna, Joseph G. Harrison, Sir Brian Horrocks, Bernard Lewis, Salama Moussa, Osman Okyar, Pierre Rondot.

THE MIDDLE EAST, OIL AND THE GREAT POWERS will be published in November by Frederick A. Praeger Inc. and priced at \$7.00. Subscribers to *Middle Eastern Affairs* can order the book at the pre-publication price of \$5.00. New subscribers may obtain a year's subscription to *Middle Eastern Affairs* (foreign subscription \$3.50) and THE MIDDLE EAST, OIL AND THE GREAT POWERS at the combined price of \$8.50.

sources made available since 1951, such as the British "Documents" or the memoirs of General de Gaulle and General Spears, are not incorporated, though one comes across an interpolation of some telephone intercepts which confirm General Spears's version of the impact upon M. Reynaud of the offer of an Anglo-French union.

The translation is adequate, but that familiar trap for translators—retranslation—has not been altogether avoided. This version makes Sir Winston Churchill write that the Russian proposal for a conference after the Anschluss was "accepted without enthusiasm both in London and Paris." M. Reynaud in the French version made Churchill say that the proposal *fut accueillie sans enthousiasme*; what Sir Winston actually wrote was that the proposal "met with little warmth." In fact it was not accepted but rejected. There are also a few footnotes intended to elucidate the French institutions and parties of the period for English readers. M. Reynaud has not succeeded in making his story readable for its own sake; the historian of the period will want to go back to the original.

Input-Output

INPUT-OUTPUT: *An Appraisal.*
Studies in Income and Wealth.

Vol. 18.

By The Conference on Research in Income and Wealth.
Princeton University Press. 381 pages.
\$7.50.

THE acceptability of any economic hypothesis depends ultimately on its power to predict. This is particularly true when the hypothesis is slow to gain wide *a priori* acceptance, as has been the case with Leontief's system of production functions. The conference to which seven of the eight papers in this volume were read met in October, 1952, "to acquaint the economic profession with this new source of information and tool of research and, on that basis, to make possible an assessment of the potentialities of the approach." The new source of information was the large-scale input-output table compiled by the Bureau of Labour Statistics, which describes in fine statistical detail the inter-relatedness of the American economy in 1947. Unfortunately for the second purpose of the conference, applications of the table to problems of industrial mobilisation were (and still remain) veiled in shrouds of official secrecy. Many of the contributors to the symposium recognised that without any practical testing of the method the attempt to appraise its usefulness might prove premature.

Nevertheless, some kind of assessment was in order at a time when a major contribution to economic research had been completed, and there is much in the papers, and more in the comments upon them, to interest both the specialist and the general reader who has even the slightest acquaintance with the study of inter-industry relationships. The papers in the latter half of the book—by Moore,

surveying, in rather general terms, a few inter-industry models; by Sigel, comparing at some length the structure of three social accounting systems; by Liebling, who offers several useful observations on input-output and national income theory, and by Gosfield, who has constructed a table for Puerto Rica—are more likely to interest the specialist. The general reader who wants to have the arguments marshalled on either side of the question will find Goldsmith's introduction and Christ's paper (with Friedman's comments) admirably suited to his purpose.

But the three papers by Leontief, Evans and Hoffenberg, and Norton, taken together, represent an attitude towards input-output research that the sceptic of 1952 could easily be forgiven for regarding as statistical empire-building. If some well-known American economists have recorded a Scots verdict of not proven upon the claims advanced by these American practitioners, this was because the claims were pitched injudiciously high. Experience in this country, in the Netherlands and in Scandinavia has since indicated that the construction and use of input-output tables has a valuable part to play in any programme of economic research—always provided that too much is not claimed too quickly.

Shorter Notice

THE ESSENTIALS OF ECONOMICS.
By Douglas C. Hague and Alfred W. Stonier.

Longmans. 173 pages. 12s. 6d.

In their "Textbook of Economic Theory" Mr Hague and Dr Stonier addressed a sharply delimited, clearly envisaged audience, to whose particular needs they shaped their work in the light of first-hand experience. Here they turn from this specialist audience to the general public. "This," says the publisher's blurb, "is that unusual thing—a book on economics which can be read with ease by the general reader."

The claim has been heard before; it is generally optimistic; as applied to "The Essentials of Economics"—close-knit, austere businesslike, avoiding, it is true, diagrams and technical terms, but equally eschewing all devices of popular appeal—it is positively starry-eyed. The authors display, here as in their earlier book, that architectural quality of thought that gives coherence and balance to a complex system of ideas; any fellow-practitioner will read their work with appreciation and respect for a thoroughly sound job; and an ideal "general reader," fired with a truly Victorian zeal for self-improvement, would by the time he had finished it have a better grasp of his subject than a good many economics graduates.

Such general readers are, however, few. In practice "The Essentials of Economics" is likely to be most appreciated, once again, by a fairly strictly delimited group; by students of higher-than-average mental quality, for whom economics is only a subsidiary subject and who therefore do not need so technical a work as the "Textbook of Economic Theory" but who are unwilling to make do with the lightweight productions designed for tired business men and schoolboys.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Open Season for Politics

Washington, D.C.

WHEN President Eisenhower's heart faltered, American politics awoke from a trance. Up to that point politicians and commentators had been going through the motions of analysing next year's election campaign in lacklustre fashion, for all were bemused by the President's strange immunity from the normal rules of political life. It was assumed that the Republicans would manoeuvre their hero into a position from which he could not in good conscience retire to his Gettysburg farm. The Democratic party's candidature was a sacrificial burden to be tossed to Mr Stevenson or Governor Harriman of New York. More youthful Democratic aspirants had begun to line up for the nominating convention of 1960, when their older leaders would be eliminated by age or previous defeat and when Mr Eisenhower would be out of the picture.

Now all is altered. The official Republican fiction is that Mr Eisenhower may be well enough to run and that the choice must be left to him. This at once satisfies the requirements of politeness and places premature hopes under some restraint of good taste. But the facts are plain: Mr Eisenhower would have preferred to be a one-term President even before his illness and had repeatedly mentioned that his state of health would be a key factor when he came to make up his mind whether or not to run in 1956. That he should now disregard it seems almost inconceivable.

There is little to be said for the idea advanced in some quarters in the last two weeks that, since everything has gone so smoothly without a President so far, a little extra efficiency in the staff organisation at the White House would enable the country to continue for another five years under a President with a weak heart. Indeed, despite the impressive way in which the crisis has been handled, it has nevertheless called attention to the truth that, under the American system, the President alone is the executive branch of government. If he is lucky or the staff work is good, there may be united advice but there can be no collective responsibility.

Under such a system the Cabinet is a gathering of those few of the President's numerous advisers who happen to head the traditional departments, together with anyone else he cares to invite. Only the National Security Council, a postwar device intended to give some continuity and direction to foreign policy and defence, has a statutory membership. Neither of these bodies has any authority to put the Presidency in commission or to make a ruling on the degree of presidential "incapacity" which, in the words of the Constitution, calls for the "duties of his office" to "devolve" on to the Vice-President. Besides being the

heir in the event of the President's death, resignation or this undefined incapacity, the Vice-President, Mr Nixon, is but three things in his own right: the chief officer of the Senate, the deputy leader of his party and a statutory member (but not by statute the vice-chairman) of the National Security Council. He is only a member of the Cabinet, let alone its acting chairman, by virtue of the President's invitation.

It is through his dignified acknowledgment of these limitations to his functions, at a moment when the whole nation turned instinctively to him, that Mr Nixon has grown in stature. One of Mr Eisenhower's earliest acts from his sick bed was to sign a letter confirming the Vice-President in the acting chairmanship of the Cabinet and of the National Security Council. The great unanswered question is whether Mr Eisenhower will go further and ask the Republicans to accept Mr Nixon as his heir in the leadership of the party.

★

At a time when the Republicans thought that their 1956 national convention would be merely a rally to demonstrate their loyalty to Mr Eisenhower, they fixed it for a later date than usual, August 20th, in San Francisco. They have decided to stick to this plan, which means that Mr Nixon's popularity will be exposed for ten months to the hard assessment of the professionals. According to a Gallup poll, if all Americans of voting age had to register, 54,300,000 would do so as Democrats, while only 34,300,000 would register as Republicans and 9,400,000 would prefer to be known as Independents. The Republican dilemma will become cruel if the polls go on showing that Mr Nixon is ahead of other regular contenders in his party but is failing to make any impression on the Democratic and Independent voters whose support he must have if he is to win. The clamour will then become great for a switch to a non-party national figure such as General Eisenhower was. But where is he to be found?

Simply because its prospects have been so dramatically revived, there has been a surge of life within the ranks of the Democratic party. Governor Harriman, who in his early sixties has suddenly discovered the joys of public applause and is beginning to wear his smile as if it belonged to him, although still "for" Mr Stevenson, has made it clear that he is not "morally committed" to him. Mr De Sapio, the leader of the Democratic machine in New York, is working night and day to promote the

Governor's chances and last week ex-President Truman gave Mr Harriman an indication of his favour. But Mr Harriman's mounting availability, which looks so impressive in the New York newspapers, does not seem to be lighting Democratic beacons in other parts of the country.

Mr Stevenson's first great test is to come on or shortly before November 19th, when he will formally announce his candidature, amid a spate of carefully planted articles in the press. Whatever his past reluctance, Mr Stevenson has planned a thorough-going effort now. His supporters and rivals alike will be watching the reaction. Above all it will be of crucial interest to the Democrats' third man, Senator Kefauver of Tennessee, whose main strength in 1952 lay in those states where there is some degree of popular election of the delegates to the party conventions, as opposed to those where the decision lies mainly in the hands of party officials.

With the choice of both parties wide open, some of these trial runs in the primary elections will be of great importance. Governor Harriman can say he is too busy governing the State of New York to campaign in the New Hampshire primary, the earliest of the series, which takes place in March, but Mr Stevenson lacks that excuse. If he does compete and is beaten by Senator Kefauver, who won easily in New Hampshire in 1952, his prestige will be damaged. As for Mr Nixon, he is already in trouble in his own State of California; there the Republican Governor, Mr Knight, has made it excessively clear that he will spare no effort to ensure that the California delegation to the convention is not committed in advance to the Vice-President.

Hard Times for Mr Dulles

FOREIGN affairs wait for no man and President Eisenhower's inactivity is coinciding with unexpectedly difficult days for American and western diplomacy. The President has dictated a preliminary reply to Marshal Bulganin's note on disarmament, but the Russian answer to Mr Eisenhower's "atoms for peace" proposals has not yet been considered. Mr Dulles has said that only in the case of an emergency would he or his colleagues feel entitled to draft replies involving "questions of high national policy" without the President's direct supervision. Moreover, there can be no doubt that Mr Eisenhower's illness has made Mr Dulles's role at the coming Geneva talks a difficult and limited one; in his short chat in Denver this week, Mr Dulles outlined his latest proposals for the conference, and the general lines of policy had been settled before Mr Eisenhower's heart attack. Nevertheless, Mr Dulles knows that without the President's personal backing in Washington he can do nothing very new.

But direct relations with the Soviet Union are not the State Department's sole, or even its most urgent, worry at the moment. Public opinion in the United States has been jolted by the announcement of the sale of Czechoslovak arms to Egypt and by the sudden increase of Soviet activity in the Middle East. The quick trip to Cairo of Mr George Allen, Assistant Secretary of State, has merely confirmed the impression that the West was caught badly off guard. Two other Mediterranean problems are also

proving particularly intractable during this period of political uncertainty: the situation in North Africa, with its effect on France and the United Nations, and the Cyprus question. Several Congressmen and commentators are saying angrily that France's defeat in the United Nations and its walk-out could have been avoided had Mr Cabot Lodge made American sympathies clearer and marshalled the necessary support. As to Cyprus, Mr Dulles has pointed out that the resulting antagonism between Greece and Turkey is jeopardising Nato's Balkan flank and threatening to break the system of alliances so carefully built up during the days of the Truman Administration.

In the President's absence, Mr Dulles is doing his best to prepare public opinion for the probable lack of results at Geneva and for further diplomatic difficulties with Russia. Despite Mr Stassen's confident assertion that "the major powers will move to a well-inspected, soundly controlled agreement" on disarmament, many observers feel that, if anything, the rhythm of the cold war may be intensified again. Mr Dulles knows that if this should prove to be true it will be his ungrateful task to say so; from President Eisenhower's lips the words would sound less dry.

Pigs Out of Clover

AS hog prices fell last week to the lowest levels since 1946, the Secretary of Agriculture, Mr Benson, was naturally under pressure to introduce a price support programme in order to stop the rot. For the decline in receipts from the sale of hogs has been almost entirely responsible for the disturbing drop in farmers' incomes this year, at a time when everyone else's incomes have been going up; and commercial hog farming is concentrated in the mid-western states, centred around Iowa, where the farmers'

political allegiance is uncertain and which the Republicans must hold if they are to win next year's election. Mr Benson may begin to buy small quantities of pork for school lunches and other relief purposes; this might save hog prices from falling as much as now seems probable during the present autumn season of heavy marketings. But such a programme would be too limited to have any lasting effect; a similar scheme, initiated in 1953 to help cattle farmers was only of temporary benefit.

How to get your share of the BOOMING U.S. MARKET

American Industry is now at the highest point of production in history—and is still climbing. Not only is this expanding market bigger in size. Its consumption and capital equipment replacement rate is, per capita, far greater, too.

Even a fraction of this market could represent a substantial business for you.

So if your product is being sold, or can be sold, to American business and industry, your prospects have never been brighter than they are now—IF you go about it the right way.

For, in America goods are not so much bought as **SOLD**—this means that sales and distribution must be backed by consistent and aggressive advertising in those business publications which your customers read. In America business publication advertising automatically means McGraw-Hill.

McGraw-Hill is the leading publisher in the United States of business and technical journals—34 in all—covering practically every field of industrial endeavour. And every journal is by far the leading one in its field—with many tens of thousands of subscribers who **BUY** through its pages. But McGraw-Hill's service does not end there. It also offers vital information—such as the market potential for your product . . . how to go about establishing your sales and distribution organisation and so on.

So why not have one of the London McGraw-Hill men show how you can gear your sales programme to today's opportunities? He has access to a wealth of specific and helpful data on *your* product market. His job is to make it freely available to you. Write or phone today. No obligation, of course. If you would like additional evidence on the long-term outlook for business write for a free copy of "The American Economy . . . Prospects for Growth."

McGraw-Hill

PUBLISHING COMPANY LTD.

94 Farringdon Street,
London, E.C.4
Telephone: CENTral 0911

A more far-reaching programme, already being advocated by the politicians, for government purchases of pork in large quantities for storage would not only lead to an expensive new surplus problem but would also, as the industry itself has pointed out to Mr Benson, encourage farmers to grow even more hogs. The present trouble is another illustration of the difficulty American agriculture is having in adjusting to the changing pattern of consumer demand, a difficulty which has been made stiffer by the government's attempts to keep prices from falling. The farmers bred extra hogs last spring in order to make up for the expected decline in their incomes from other cash crops such as wheat and cotton; this decline was coming as a result of the restrictions imposed on plantings by the government to reduce the cost of supporting prices. Furthermore, restrictions on plantings of maize apply only when the crop is sold; a farmer can grow as much maize as he likes to feed to his hogs and he is therefore now sending it to market on the hoof instead of by the bushel.

In consequence record quantities of pork are available but there are record numbers of people with record amounts of money in their pockets to buy it. If they were eating as much pork as they used to do, hog prices would hardly be falling as sharply as they are. Consumption of meat a head is going up, as it always does in times of prosperity, but it is consumption of beef. This is partly the result of an advertising campaign, undertaken by the beef industry when it was in difficulties two years ago; the pork industry is now thinking of taking a slice off the same joint. But the present preference for beef may arise in part from the move away from the farms and into the towns; pork is traditionally a country dish. It is also traditionally a southern dish and the change in eating habits seems to be equally related to another kind of population shift, the move away from the south and into the west, a beef region.

Too Few Volunteers

THE Geneva spirit and the attractions of civilian life in a booming economy are making it difficult for the American armed services to find enough men to meet their far-flung needs. For the first time since the second world war, the navy has had to resort to conscription; it plans to call up 10,000 men each month until it has obtained 56,000 new recruits. What especially worries naval leaders is the decline in re-enlistment among men who joined during the Korean war for a four-year period. Steps are therefore being taken to make naval life more attractive, particularly to married men and technicians. The army is also increasing its demands to about 13,000 men a month and the air force may have to turn to the draft if it cannot attain its authorised strength of 975,000 through voluntary enlistment.

It is hoped that the increase in the numbers being called up will help the army's new reserve programme to attain its target of 100,000 men. Under this scheme, youths aged 17 to 18½ can enroll for six months of active training followed by a 7½ year period in the reserve, with 48 weekly drills yearly and an annual seventeen-day summer camp; in this way they avoid the regular two-year period of active service. Instead of the 5,000 men the army had hoped to

begin with, however, only about 1,000 reported at the start of the new scheme. Unless enlistment grows, therefore, the army plans to ask Congress, which reconvenes in January, to give it legal authority to draft young men into the reserve. Congress previously refused to do so because this would allow universal military training, a traditional bogeyman, to "come in by the back door."

The lack of universal conscription, combined with the fluctuating needs of the armed forces, have made the draft a rather chaotic process. There are 3,920 local boards often acting as a law unto themselves; some can fill their monthly quotas without difficulty and take a liberal view of individual cases; others must scrape the barrel and are extremely severe in their methods. The result has been that some men in vital jobs and even with families have been drafted whereas others, often younger and less essentially employed, have gone uncalled. It is reported, however, that a number of steps will be taken in November to remedy this situation and to provide a younger contingent of conscripts. Men above 26 will probably be classified separately and called only in the last resort; fathers will be exempted wherever possible. Finally, men in important jobs will be urged to join the reserve programme even if they are over the 18 year age limit; in that way they can discharge their obligations on weekends and during summer holidays.

Squeeze on Housing

A CONGRESSIONAL sub-committee, holding hearings in various centres, is giving spokesmen for the building and real estate industries a chance, which they welcome, to criticise the recent official efforts to check housing loans. These efforts have included not only a general squeeze on credit, but also measures directed specifically at mortgage lending, such as the tightening of the terms allowed on mortgages guaranteed by government agencies. Such measures were begun some time ago, but the critics argue that they will not really begin to affect housing statistics until next year, because of the time lag between arranging mortgages and starting to build. Then, it is claimed, people will find that the government has not only squeezed mortgage lending more tightly than other types of borrowing, but has also curtailed home building to such an extent that the whole economy will suffer. The industry maintains that a chain reaction is being set off, which will appear later in a falling demand for the things which go into new houses—furniture, textiles, and electrical appliances.

The argument has just been reinforced by the figures for new contracts for residential construction, which in September were lower than in the same month of the previous year for the first time since the end of 1953; there seems little doubt that home building is at last beginning to taper off a little. But with total mortgage debt on houses now standing at over \$83 billion, compared with \$70 billion in the middle of 1954, it seems to be time for a check. The most recent official move, and the one which worries the building industry most, was in fact the outcome of the increase in the amounts people are borrowing compared with the amounts they are saving. In September

the Federal Home Loan Bank Board, which supervises credit for the country's 4,200 savings and loan associations, told them that the District Home Loan Banks could no longer supply funds for mortgage loans and that the associations would have to limit their lending for this purpose to funds obtained from new savings and repayments.

During the first half of this year these associations had lent nearly \$6 billion in mortgages, nearly 50 per cent more than in the corresponding period of 1954, while savings deposits had gone up by only \$300 million; the difference had been met by borrowing from the Home Loan Banks. Another inflationary lending practice, which is now being discouraged by Federal Reserve officials because it means that short-term credit is financing long-term investment, is the system of "mortgage warehousing." Under it lenders, insurance companies, for example, borrow money for mortgage loans from banks on the understanding the money will be repaid as soon as premiums and other payments come in to build up the lender's own funds. This type of credit has doubled in the past year; the argument in favour of it is that it smooths out the ups and downs in mortgage loans and makes them a steadier economic influence.

Operation Vanguard

THE Defence Department has announced that the initial contract for the production of the artificial satellite, entitled Project Vanguard, has been awarded to the Glenn L. Martin Company of Baltimore. This company will be responsible for the actual rocket-launching vehicle; it has made a subcontract with the General Electric Company for the rocket motor. Other firms are expected to take part in building the satellite itself and the rockets which will carry it and fire it into space. It has also been revealed, moreover, that American plans for participation in the International Geophysical Year, July, 1957, to December, 1958, call for the launching of about ten artificial moons in different altitudes and orbits. Whether these will be equipped with recording instruments, or whether they will serve primarily as targets for observation from the earth, remains to be seen. The main problem appears to be the enormous heat that may develop inside the satellite, thus making it impossible for sensitive instruments to operate. Nothing should re-assure the Russians more regarding the romantic nature of the whole project than the fact that it will probably be launched from the Banana River in Florida.

★

One further development last week suggests that the world of science fiction is moving nearer. The first telephone ever operated with solar power was inaugurated near Americus, in Georgia. A thin slab of aluminium, containing 432 silicon disks, transforms sunlight into electricity. It is connected to a battery which stores surplus power for use during the night and in murky weather. Built by the Bell Telephone Company, this solar generator is expected to prove of great value in underdeveloped areas where sunshine is abundant but where electricity plants and conventional fuels are lacking.

Chemicals on the Farm

FROM A CORRESPONDENT IN CALIFORNIA

CHEMICAL fertilisation is an agricultural practice about which American farmers long held reservations, if not outright suspicions; but in recent years it has enjoyed an impressive increase in popularity in the United States. Consumption of the three principal plant nutrients—nitrogen, phosphorus pentoxide and potassium oxide—which go into commercial fertilisers has grown from 2,500,000 tons in 1944 to 5,800,000 tons in 1954. Developing first on the newer, irrigated farms of the far west, the use of agricultural chemicals on a large scale has now swept into the cotton lands of the deep south and most recently into the mid-western maize belt, where artificial fertilisers were once generally considered poisonous. In 1954 alone, farmers in Iowa, the leading maize state, raised their consumption of fertilisers by 50 per cent.

The long range reason for the resort to chemical fertilisers is the closing of the frontier and the pressure of a still-increasing population on the limited land available. Between 1920 and 1950, farm acreage in the United States increased less than 2 per cent, but production of farm crops, going up by 87 per cent, more than kept pace with population. While mechanisation and improved methods of cultivation and insect control undoubtedly contributed to the rise in output per acre, an increase of 360 per cent in the use of fertilisers during the period was the most important single factor. A more immediate incentive to greater fertilisation has come from the fall in farm prices and from the government's agricultural programmes which impose restrictions on acreage rather than on output; both tempt farmers to do all they can to increase yields per acre. Ironically, the Agriculture Department, which administers the programmes designed to limit crops, has also provided much of the knowledge, experimental research and advice which have promoted higher yields by means of fertilisation.

To these pressures another formidable one has been added: the sales promotion activities of the companies, some of them among the largest in the country, which have entered the agricultural chemical field. By spending over \$1 billion a year on fertilisers, the American farmer has caught the eye not only of the long-established chemical undertakings, but also of a dozen oil firms, several steel makers, two electrical utility companies, a coal company, a farm equipment manufacturer and a steamship line, as well as several newly organised businesses, all of which are now making fertilisers. The considerable resources, financial and technical, of these companies and the sharp competition in the industry have produced an almost bewildering array of products and processes.

The basic economic requirement for a fertiliser is that its cost to the farmer must be less than the increase in crop value resulting from its use. This has meant not only that manufacturers of fertilisers have sought to reduce their basic costs of production, but also that their products have contained increasingly higher proportions of nutrients (to save transport charges) and have required increasingly smaller amounts of labour to apply.

The greatest expansion in the field of agricultural chemicals has been, and continues to be, in ammonia,

PROGRESS IN ELECTRONICS

The wonder of television is already lost to the millions who see and hear in their own homes events which may be occurring hundreds of miles away. It is already an accepted part of our lives, to be judged and debated not on its technical qualities, but on its value as an entertainment and its influence on our culture.

And yet what it is and what it may become depends largely upon the scientific research and manufacturing techniques that have converted light into electrical energy, and electrical energy into light.

Present day television would be impossible without the cathode ray tube. A beam of electrons, modulated by received signals, scans a fluorescent screen within the tube, and paints upon it a reproduction of the original scene or picture.

Mullard long-life cathode ray tubes are specially designed to maintain excellent picture quality over a very long period of service. Modern methods of production and rigid quality control permit large scale manufacture of tubes of consistently high performance, even though they are highly intricate and complex devices.

Mullard's contribution to the development of television is, therefore, a significant one. Great manufacturing resources are supported by extensive research and development facilities, and these are at the service of an industry which leads the world in the progress of electronics.

Mullard

MULLARD LIMITED, CENTURY HOUSE, SHAFTESBURY AVENUE, LONDON, W.C.2

Factories at:

Padiham	Raistrick	Simonstone	Southport	Waddon	Wandsworth

which is made by taking nitrogen from the air and combining it with hydrogen. American capacity for making ammonia increased ten-fold between 1939 and 1954 and is expected to be almost redoubled by 1957. Ammonia is the basic ingredient of most nitrate fertilisers, but the recent expansion is the result of an ingenious development which allows the pure liquid or "anhydrous" ammonia itself to be applied directly to fields. Thus the cheapest and most concentrated form of nitrogen (the nutrient content is 80 per cent, compared with an average of 25 per cent for all commercial fertilisers) is put into the soil with a minimum of the expense of transport, handling and application which is involved where ordinary solid fertilisers are used. Under this system, ammonia is sent in pressurised tanks from the producing plants to distribution stations where it is stored in huge spheres. Transferred to smaller tanks which are pulled through the fields by tractors, the liquid flows under pressure into the earth through tubes mounted behind blades which cut the soil to a depth of four to six inches. A disc cultivator immediately covers the ammonia (which becomes a gas upon its release from pressure) with earth before it can escape into the air. In 1954 this anhydrous ammonia was the source of 20 per cent of the fertiliser nitrogen used in the country.

In the far west, where anhydrous ammonia was first employed, an even newer method of applying nitrogen is showing impressive gains. This is an aqueous solution containing 25 per cent of ammonia, which can be injected into the soil in much the same manner as anhydrous ammonia or, even more simply, introduced into irrigation water which is sprinkled or allowed to flow on to fields. A further advantage over anhydrous ammonia is that such "aqua ammonia" does not require any considerable investment in equipment for storage and application. Its chief disadvantage is the cost of transporting the water in which the nutrient is carried, but this is minimised by the establishment of distribution stations to which pure ammonia is brought, released into water and then taken to nearby fields by lorry.

Another and potentially very great attraction of aqua ammonia is that other plant nutrients can be added to the solution. Several firms are already selling a mixture of ammonia and phosphoric acid in water, thus providing nitrogen and phosphorus at once. Phosphoric acid, which as a highly-concentrated liquid fertiliser offers the same advantages as does anhydrous ammonia, likewise required expensive distributing equipment made of stainless steel, because of its high corrosive powers. However, since an ammonia-phosphoric acid solution in certain ratios is chemically neutral, such mixtures can be handled in the equipment used for aqua ammonia. The possibility of adding further ingredients to such solutions may lead to liquid fertilisers made to order, with local dealers mixing them according to the individual requirements of each farmer's fields and crops. These fertilisers would contain the basic plant nutrients and also special elements and minerals which are often needed, but not economically available, in minute quantities.

Such mixtures are abundantly available, of course, in the conventional solid fertilisers which still account for the largest part of American consumption. But here, too, new products are reflecting the trend to more highly concentrated and more easily handled fertilisers. For example, one of the steel producing companies which has long

marketed a by-product of its coke ovens, ammonium sulphate, as a fertiliser, is changing over to diammonium phosphate, which contains 74 per cent of nutrients against only 20 per cent in the old compound. Similarly, many producers of "super-phosphate," the most widely used fertiliser in the country, are turning from this crude, bulky product (made of crushed phosphate rock treated with sulphuric acid) to "triple superphosphate," which contains a much greater proportion of nutrients. To make handling easier, fertiliser makers are now "pelletising" their products, so that they are granular instead of powdery. This is of particular value to the growing number of American farms on which aircraft are becoming important agricultural implements. Granular fertilisers, which can be dropped on to fields from the air with little disturbance by the wind, are widely used on rice fields and large acreages of pastureland, where ground application is impossible or prohibitively expensive.

SHORTER NOTES

The Office of Defence Mobilisation has now restored the eligibility of eleven industries for the tax privileges designed to encourage expansion needed for defence purposes; among the industries which may once more apply for permission for fast depreciation allowances are commercial aircraft, railway goods wagons and petroleum. A number of industries directly related to defence were never affected by the suspension, but 25 industries have now been denied this help permanently, on the grounds that their facilities are adequate for all expected wartime needs.

★

The Hoover Commission on the Organisation of the Executive Branch of the Government practised what it preached—economy. When it finally finished work at the end of September it returned \$83,000 in unspent funds to the Treasury.

★

The Secretary of the Navy, admittedly using his common sense, has over-ruled a special board which decided that a naval commission must be denied to a young merchant marine officer, Mr Eugene Landy, because his mother was once a member of the Communist party. The Secretary said that to disqualify Mr Landy would be contrary to one of the fundamental principles of the American way of life—the opportunity given to each individual to succeed on his own merits.

★

The latest report from the Public Health Service on the effectiveness of the Salk vaccine against poliomyelitis suggests that the number of cases of the disease found among vaccinated children was from 25 to 50 per cent less, and that the illness was much less severe, than among unvaccinated children.

The World Overseas

Arab Welcome to Arms

FROM OUR CORRESPONDENT IN CAIRO

COLONEL NASSER has bought Czech arms and the hearts of the Arabs at the same time. If there are some elder statesmen in the Middle East who mutter their private fears about the Egyptian deal, they are compelled in public to applaud this act of Arab independence. To their peoples, the deal seems wise, brave and praiseworthy—and it cocks a welcome snook at both Israel and the West.

The hallelujah chorus reflects the abiding lack of faith in western policy. The Arabs have never believed that they could trust the Tripartite Declaration to protect them against Israel and, as they incline to believe the almost unanimous opinion of the world press that Israel could win in a straight fight at any time, they cannot see the justice of a western rationing of arms as between Arab and Jew that perpetuates this Arab inferiority. (They are so busy reckoning in terms of arms and effectives that they forget the advantage Israel enjoys through unity of command.)

The Tripartite Declaration guaranteeing the frontiers of the Middle East depended on voluntary rationing of arms, and Colonel Nasser has now destroyed this basis. The crux of his argument rests on his contention that Israel has not been party to it, and, if this is true, the western powers have had their heads in the sand. They could not forever control the supply of arms to the Middle East because they had not a monopoly of them; and the Iron Curtain countries have for some time given evidence in the Middle East of surpluses available from Korea and the reduced garrisons of Europe. The very fact that Nasser was thinking about getting arms from Russia was sufficient warning, however confusing some of his statements on this subject may have been. Experience has shown that he bluffs only when he is willing to have his bluff called. He is like a barque which tacks laboriously towards a few harbour lights it clearly sees. And he clearly saw that it was illogical for western observers to repeat so often that Israel was the military superior of Egypt while the West conducted an arms policy based on the assumption of equality.

Nor did he believe there could ever be an understanding with Israel as long as the Arabs were in an inferior position. He would argue that the Tripartite Declaration, in helping to preserve an uneasy truce by perpetuating the inferiority of the Arabs, must hinder the western powers in their search for an Arab-Israeli peace and in the long run strengthen

the threat of Israeli aggression. It is, therefore, not surprising that he has pulled a prop from beneath western policy.

There are manifest dangers in his present position. However unsatisfactory the Tripartite Declaration may be to the Arabs, it did help to cement the shaky joints of the Middle East. According to reports reaching here, Israeli "activists" are arguing that, as Egypt has "wrecked" the policy based on the Declaration, this is a suitable moment to launch a war. There is nothing now to fear, they are reported to say, but the pious displeasure of the United Nations. A moment at which Britain and the United States are re-thinking their policies and France is at daggers drawn with Egypt is certainly an awkward hiatus.

Diplomats here are doing their re-thinking more tranquilly than did London and Washington when the arms deal was first announced. It is evident that a slightly happier view of Nasser's intentions is now taken, even though his ability to fulfil them is doubted. The problem is the same: to preserve peace between Israel and its neighbours. In addition, there is the need to plug the hole through which Egypt has given entry to Russian-controlled elements.

The consternation shown by Washington in particular has strengthened Colonel Nasser in the Arab world, but the Arab Foreign Ministers, who met last weekend in the Council of the Arab League at Cairo, are naturally anxious to know what happens now if Israel attacks. Their anxieties cannot be publicly expressed because of the welcome given to Nasser's action by the Arab peoples.

Yet western policy may well gain by the enhanced prestige of the Egyptian leader, for it is notoriously easier to deal with an Egyptian speaking from strength than with one speaking from weakness. His influence had been undermined by the Sudan situation, by the Turco-Iraqi agreement, and by the wearisome and incomprehensible double-talk about the Saudi-Syrian-Egyptian pact. Now, riding upon the tide of Arab good opinion, he is able to escape many of the frustrations of policy he has suffered this year. One of the signs that he is inclined to do so was his cordiality when the young Iraqi Foreign Minister, El-Sayed Burhan Bashayan, paid a courtesy call at the Presidency; he could afford to be forgiving now that Egypt's prestige within the Arab world is revitalised.

Nasser is realist enough to know the importance of Iraq, and when he met Bashayan he hoped that the two

countries could forget their recent anger. Whether he now feels sufficiently restored to forget about his proposed pact with Saudi Arabia and Syria is not clear. (Saudi Arabia will certainly work hard for its completion, if only to keep Iraq at arm's length from Egypt.) At any rate, if Egypt and Iraq can reach partial understanding which prevents their clashing at almost every stage of policy in the area, the situation in the Middle East will improve from a western point of view.

The concurrence of Egypt and Iraq is necessary for the success of western policy in the Middle East, including policy on Israel. Apart, they undermine each other. Together, they give the Arabs much greater bargaining power but make it reasonably certain that a bargain can be entered into and kept. If, therefore, the meeting of the Arab League can be made to mark the beginning of the end of the acute dissension which stemmed from the Turco-Iraqi agreement, the foundations of western policy in the Middle East will not be so weakened as the Czech arms deal would at first sight imply.

Fission Over Peaceful Atoms

FROM OUR UNITED NATIONS CORRESPONDENT

SEEKING, by a change of course, to find a haven from recurrent "anti-colonial" storms, the political committee of the United Nations Assembly began last week to discuss the peaceful use of atomic energy—only to find that even pacific atomic waters are not immune from squalls. There are two proposals under discussion. The first of these—to hold a second international conference in about three years' time—is assured of plain sailing. The first conference, held at Geneva in August, was such a success that delegates can now only vie with each other in enthusiastic support for its successor. But when the committee began to discuss the creation of an international atomic energy agency it found that the water had already become uncomfortably choppy. Since President Eisenhower first suggested an international "atomic pool" in a dramatic speech to the Assembly nearly two years ago, his proposals have turned full circle. By last autumn, when further details were sought from the American delegation, it appeared that the concept of a pool had been whittled down into a clearing house for bilateral agreements between member countries. There is little doubt that the Americans still at heart prefer directly executed bilateral agreements rather than an international agency over which they would have a more tenuous influence. But so critical was the reaction in the United Nations to the apparent American retreat from President Eisenhower's imaginative proposal that the atomic pool has now reappeared dressed in most of its original clothes.

The draft charter, circulated last August to all 84 states that belong to the United Nations or its specialised agencies (Unesco, the ILO and so on), has now been made public. It provides for an international agency with three main functions: to encourage, by mutual assistance, research on and the development of peaceful uses of atomic energy; to receive and allocate nuclear materials for peaceful purposes; and to promote the interchange of technical information.

It must also, of course, have the power to ensure that any assistance granted is used solely for peaceful purposes. The initial membership of the atomic agency would be open to all members of Uno or its specialised agencies. Its policy would be directed by a board of governors representing sixteen nations—the five most important contributors of technical assistance and fissionable materials (initially Canada, France, Britain, the United States and Russia—if it joins); five leading producers of uranium and thorium (initially Australia, Belgium, Czechoslovakia, Portugal and South Africa); and six others selected mainly from countries receiving assistance, with an eye also to the geographical balance of the entire board. Members could either give or sell nuclear materials to the agency. Policy decisions by the governors would be taken by majority vote, without veto, and no donor would have the right to stipulate the manner in which its contribution be used.

It is over the constitution of the board that the agency's sponsors have run into their first squall. Led by India, the atomic "have-nots" are showing their resentment at what they see as a *fait accompli* by the "club" of eight western "atomic powers"—the United States, Britain, France, Canada, Portugal, South Africa, Australia and Belgium—that drew up the draft charter. After the first year, the board itself is to designate the five most advanced atomic powers, and the eight most important producers of raw materials (of which five are to be selected for membership, by a vote of the 13 designees). There is in this arrangement a little "built-in flexibility." India itself, for example, if Mr Krishna Menon's claim that his country is the largest thorium producer in the world can be substantiated, could hope to secure a place as a producer. But the majority of the board, in effect, would be self-perpetuating. All that is left for the atomic "have-nots" is the opportunity to compete for a minority of six seats. Many Asian, African and Latin American countries want the constitution of the agency to be decided by the Assembly itself, where they are already tasting the sweet power of the majority vote. They also want a closer relationship between the agency and Uno than is implied by leaving this relationship to be negotiated by its board. And they are disappointed that the agency is to sell, and not lend, materials and equipment to users who may find the terms of payment too dear. Also rather hurt at their exclusion from the "club" are the Scandinavian countries, supported, at least in spirit, by the Secretary-General, whose close interest in the subject is given little recognition by the vague relationship of the agency to his own secretariat.

Reluctant Russians

Another important question is whether the Russians will join the agency. Marshal Bulganin said at Geneva that the Soviet Union would contribute nuclear materials to "an agency" if and when agreement on its charter could be reached. When the Russians recently sent the United States their "suggestions" about the draft charter, the Americans seemed encouraged by the conciliatory terms of the reply. But on Tuesday Mr Kuznetsov revealed that the Russians, were they to join, would insist on introducing the veto power by placing the agency under the Security Council. They also, evidently with an eye on Communist China, reject the idea that the initial membership of the agency should be limited to members of the

UN and the specialised agencies. If the Russians refuse to join, an effective agency can still be set up; it could also be set up by the "atomic powers" without regard to the wishes of the majority of UN members, retaining only a weak link with the world organisation. But if its original objectives are to be realised, as technical assistance programmes in non-nuclear fields have already made abundantly clear, the underdeveloped countries may need to have a larger part in guiding its policy.

Japan's Patchwork Socialists

FROM OUR CORRESPONDENT IN TOKYO

JAPAN now has a Socialist party—or so it is announced. After a year of word-splitting and circle-squaring, the left and right wings have managed to paper themselves together. There is a decent agreement to ignore the cracks still showing plainly in the united front, and to applaud, with slightly forced *banzais*, the spectacle of the tough Mr Mosaburo Suzuki, the former left-wing leader, and the gentle Mr Jotaro Kawakami, the former right-wing leader, unfurling, arm in arm, the pale pink flag of new-found Socialist unity.

The left wing, which has 89 members in the lower house of the Diet, compared with the right wing's 67, appears on the surface to have yielded most concessions to secure the merger. This complaint is made angrily by Sohyo (the anti-American trade union council). Conversely, Zenro (the anti-Communist union congress) complains, just as angrily, that the right wing made too many concessions to the left. This dispute between the still-sundered trade unionists, although it may suggest that a reasonable bargain was struck, is a poor omen for the durability of the Socialist merger. And if silence temporarily muffles the extremists of the left wing, no one can pretend that this sullen harmony will continue—especially if the new party, taking advantage of the conservative disunity, manages to scramble into office.

The most significant concession by the left wing has been the quiet dropping of the old "no-arms-at-all" pledge. Both factions are opposed to rearmament in principle, in the same way as they are opposed to capitalist corruption and sin; but the confused right-wing argument—that maintenance of a small defence force, even if of such a small size as to be worse than useless, is unavoidable—has been adopted as a hollow plank on the new party's platform. It would be foolish to believe that the strong pacifist bloc in the left wing has swallowed its previous implacable objections to any form of rearmament. Officially, however, absolute opposition to Japanese rearmament has now disappeared from the policies of all the major parties.

Some agile exercises in the higher semantics were needed to arrange a common front towards America, Russia and Communist China. The former right-wing manifesto had read that "Japan is an independent country, although her independence is incomplete," and was dedicated to "completion of independence." The left wing has always insisted that "Japan is a subordinate nation to America" and demanded "achievement of independence." The merger compromise reads: "Japan has failed to achieve her independence, due to military and economic pressure

by the United States, although nominally she is an independent country." The right wing had demanded "a thorough review," and the left "complete abrogation," of the American-Japanese security treaty and administrative agreement. "Abrogation" has now been discreetly forgotten, in favour of a pleasantly equivocal "settlement, which will be concluded with the two big camps of the world, with due consideration to the collective security system."

Significantly, the embarrassing word "neutrality" appears nowhere in the joint manifesto, but the need for friendlier relations with "Asian nations affiliated neither with the Russian nor American camps" is strongly emphasised. And the right wing have discarded their original declaration that "Japan belongs to the free nations as the result of the San Francisco peace treaty." The new party adheres piously to the same Rotarian hope, which the Prime Minister, Mr Hatoyama, blandly wrested from them at the last elections, that Japan can miraculously develop and enjoy the happiest and most rewarding relations at all times with both the Communists and the West. Chiang Kai-shek has been overlooked altogether, but "a high-level parley between Japan and Communist China" is earnestly sought "to settle all pending issues."

The delicate problem of leadership has been solved, in Japanese fashion, by adding extra wheels to the executive rickshaw. Mr Suzuki, who steadfastly denies membership of the Communist party, has become "chairman of the Socialist central executive committee." Mr Kawakami, a Christian, scholar and amiable old-style Fabian, has been hoisted into the giddy position of "supreme adviser" to the party, although it is unkindly suggested that Mr Hiroo Wada, a brilliant left-wing strategist, will—again, in Japanese fashion—exercise more power as a simple "adviser" to the party. The undistinguished right-wing veteran, Mr Inejiro Asanuma, fills the position of "secretary-general of the executive committee."

Tugs from the Left

The Communist party, which has already infiltrated deeply into Sohyo, and which is pledged to virtually the same policy as the former left-wing Socialists, is in an admirable position to make trouble among their more disgruntled members. Or, more astutely, the Communists can work through local Socialist organisations to promote the ascendancy of the left-wing bloc and the revival of the old leftist line, which harmonises perfectly with their own open policy under the new Communist line of "proper democratic processes." There is no evidence that the comrades are dismayed by the resolute pronouncement of the new Socialist party to "fight Communism equally with imperialism and capitalism." They have noted with satisfaction the harassed reply by Mr Yoshimichi Ito, chairman of the left-wing policy committee, to militant hecklers: "This reference concerns only the activities of the Japanese Communist Party. We criticise the Communist party but we are not anti-Communist."

The most disinterested aid and comfort received by the Socialist party at present comes from the conservatives, who are still struggling and conspiring vainly to achieve a merger that, without a strong and dynamic leader, can hardly hope to achieve even the ramshackle unity of the Socialists. The Socialists are still neglecting sources of potential support in farming areas. The strong and able Mr Suehiro Nishio, an influential right-wing member, who

is at present under a cloud as the result of unproven scandal charges, said incisively in a recent private conversation: "We Socialists will not become a real party until our representatives live among the people and make themselves a humble part of local communal life, instead of rushing off after their election to live in Tokyo and wear the same striped trousers as the conservatives." The Japanese Communists certainly do not make this mistake.

Away from Stakhanovism?

THE Soviet leaders may soon be taking another important step away from the path traced by Stalin. They are apparently preparing a general overhaul of the wage system consecrated by nearly a quarter of a century of Stalinist practice. A special manpower and wage commission, headed by Mr Kaganovich, was set up earlier this year, and the scope of its intended action may be gathered from articles now being published in Soviet economic periodicals. The projected reform should involve not only the simplification and raising of existing production norms as part of a great drive for higher productivity; it should also bring about a flattening of the steeply graduated system of piece-rates, a reduction of cash rewards and, generally, of the bias in favour of shock workers. In other words, it should mark a first breach in the pattern of wage-differentiation raised to a myth under Stalin.

The Socialist principle "to each according to his needs" could not survive for long in face of the problems involved in industrialising primitive Russia. The transformation of backward peasants into industrial workers laid the foundations for a system of incentives which rapidly spread throughout the Soviet economy. From necessity Stalin made a virtue. The very idea of equality—the *uravnilovka*—was soon branded as a dangerous heresy. Record breakers were given not only higher wages and rewards in cash and kind; they were also granted social privileges and were raised to the status of a labour aristocracy. Some twenty years ago a miner, Alexiei Stakhanov, broke a record in coal extraction and gave his name to a whole movement which was intended to lead Russia on the road of industrial efficiency. Penalties for under-fulfilment of norms, together with rapidly rising rewards for their over-fulfilment, were the new Soviet order of the day.

Death of a Hero

The name of Stakhanov has now disappeared from the Soviet press, and the system which it symbolised has come under fire not on the grounds of ideology but for practical reasons of efficiency. It is cumbersome, it does not work and does not pay—according to *Voprosy Ekonomiki*, the journal of the Academy of Sciences. The scope of the piece-rate system, which already covers over three-quarters of Russian workers, is to stay and even to be extended, but there is no longer felt to be any need to raise steeply the wage-curve above the norm. The spread of technical education has apparently rendered obsolete a method which was useful as long as skill was at such a premium. Thus, for instance, the proportion of skilled workers in the engineering industry now amounts to nearly three-quarters,

compared with less than a quarter in 1930. Ordinary piece-rates should prove enough to increase the productivity of these qualified workers. The article also attacks the system of cash rewards, which are either too low to act as an incentive or too costly to be worth while. Rising all-round productivity, rather than individual exploits in record-breaking, is now the goal. Indeed, in this attack on undue differentiation, even the principle of special regional rates (favouring particularly the east) is questioned.

Another feature of the intended reform will be welcome to Russian workers: the simplification of existing scales, which, through their complexity, have become a nightmarish puzzle for the average workman. Thus, for example, in the tractor industry there are 70 scales covering 103 rates; and in the Magnitogorsk combine 26 scales involving 232 rates. This state of things is now criticised as engendering bureaucratic waste and workers' discontent. Unfortunately, the necessary simplification is to be accompanied by the raising of production norms. This is part and parcel of the general programme for higher productivity which is to be the main feature of the forthcoming five-year plan. In this way the planners want to combat the growing danger of inflation. It has often been pointed out in these columns that Stalin's successors pledged themselves to raise rapidly the standard of life of the population, but disappointing agricultural results and, above all, the switch back to heavy industry seem to have caused a discrepancy between the released purchasing power and the available consumer goods. This inflationary threat is now admitted by no less an authority than *Pravda*: "A faulty ratio in the rate of growth of productivity and wages may upset the objectively necessary proportions between production and consumption, between the quantity of goods and that of money in circulation. This may finally lead to difficulties in supply, to the devaluation of the rouble and to a fall in wages."

Pride and Privileges

Raised norms are only a thinly disguised way of reducing wages. The workers will have to produce much more if the government is to keep its pledge. It is not astonishing that Mr Kaganovich's commission is trying out its ideas in specialised publications with a small circulation. This is particularly necessary since those features of the reform likely to have a popular appeal—above all, its "egalitarian" tendencies—are bound to provoke the wrath of powerful vested interests, of the entrenched workers' elite created under Stalinism. This labour aristocracy has strong ties with factory managers or local party dignitaries and will certainly resist this first encroachment on its privileges.

It is significant that these timid attempts to alter existing labour policy coincide with an eclipse of the official trade union leader, Nikolai Shvernik. Mr Shvernik had been secretary of the unions during the struggle against egalitarianism and in the heyday of Stakhanovism. In 1944 he was rewarded with the chairmanship of the presidium of the Supreme Soviet, but on the morrow of Stalin's death he was posted back into the trade unions. It would be quite logical if the present modifications of Stakhanovism coincided with the further disgrace of one of its apostles. The labour aristocracy and its allies, however, may still hit back, and next year's Party congress may well be the stage for a dramatic struggle between the two points of view. Its outcome will have a vital effect not only on the economy of post-Stalinist Russia but also on the political scene.

Men who guide the destinies of the world wear Rolex watches

NEVER before have the great men of the age been so well known to their contemporaries as today. News of almost all their words and actions is flashed round the world in seconds. Their faces and voices are made daily familiar to us in newspaper photographs, on the radio, in films and on television. We are intensely aware not only of their importance but also of their personalities. Their impact is enormous on us as well as on world events.

It would not be fitting to name them here, for

they include royalty, the heads of states, great statesmen and service chiefs. But there is one unusual thing we invite you to look at when you next see them or their pictures—the watch on their wrists. That watch will most likely bear the name of Rolex of Geneva.

Accustomed though they are to the very best, these eminent men are nevertheless amazed at the accuracy and reliability of their Rolex watches. Rolex are proud, if unsurprised, that they quickly take these qualities for granted.

The Rolex Oyster Perpetual Datejust, one of the most accurate watches in the world. Its accuracy has been objectively tested by a Swiss Government Testing Station, which has awarded the watch an Official Timing Certificate, with the coveted distinction "Especially good results," and the right to be called an Officially Certified Chronometer. Its movement is permanently protected from all harmful elements by the 100% waterproof Rolex Oyster case. The Datejust is also self-winding, powered by the new Rolex Perpetual "rotor." This keeps a constant tension on the mainspring, making for still greater accuracy. And the date is shown on the dial, changing automatically each night at midnight, and magnified by a "Cyclops" lens for easy reading.

A ROLEX
RED SEAL
CHRONOMETER

The Rolex Oyster Perpetual—culmination of three Rolex triumphs. In 1910, Rolex gained their first Official Timing Certificate for a wrist-chronometer. Now Rolex have produced 250,000 Officially Certified wrist-chronometers—three times as many as the rest of the Swiss watch industry combined. In 1926, Rolex invented the Oyster case, the first truly waterproof case in the world. The rugged Oyster case protects the movement, permanently, from water, dust and dirt. In 1931, Rolex invented the first "rotor" self-winding mechanism. The latest Perpetual "rotor" powers the Oyster Perpetual, silently and automatically.

Here's news of

TCA's

FAMILY FARE PLAN

Briefly, this is how it works. The husband or wife in charge of a family party pays the normal fare. The accompanying wife or husband, or son or daughter between the ages of 12 and 25 inclusive, will pay the normal First or Tourist fare less considerable savings (see example below). Children below the age of 12 pay half the normal adult fare, children under 2 years pay 10%.

...remember TCA means *SUPER* Constellation comfort!

Delhi Strikes at Managing Agents

FROM OUR CORRESPONDENT IN INDIA

IN 1696 in England there was passed an Act "to restrain the number and ill-practice of Brokers and Stock-jobbers"; in 1734 a further Act "to prevent the infamous practice of stock-jobbing." India's Companies Bill, which, after two patient years in parliament, should be ready for the president's assent by Christmas, might well have been entitled a bill "to restrain the number and ill-practice of managing agents." Had the back-benchers and the opposition had their way, it would have become a bill to prevent their "infamous practice" altogether.

The bill does not deal only with managing agents. It is largely based on the recommendations of a committee on company law reform which was appointed in 1950, and whose report drew heavily on the English Act of 1948; Indian company law has always been based on English law, from the very first Act of 1850, which followed the English Act of 1844. Much of the bill, therefore, is an attempt to protect shareholders and the public in a way that has aroused no controversy at all. Thus, prospectuses will have to give more details; balance sheets will have to make clear the whole position of the company—fixed assets, for example, are to be classified under ten headings, current assets under five; directors will retire at 65, unless the company resolves otherwise; private limited companies will have to register their balance sheets; a company which has raised money from the public will not be able to operate unless the public has subscribed the minimum amount.

None of these reforms is of major importance. Most of them are inspired by the idea that, if shareholders are to have any real control over directors and if the stock market is not to be manipulated by those with inside knowledge, as has occurred so often, shareholders must be told the full truth about what is happening to their companies. To this principle there is no real objection, though some of the provisions of the bill are unnecessarily detailed and cumbersome, and many directors may well feel uneasy about the penalties which carelessness without any fraudulent intent may bring upon them.

Abuse and Severity

But the heart of the storm which the bill has raised lies in its provisions about managing agencies. The managing agency is a specifically Indian institution, by which an individual or a firm promotes a company, helps finance it, provides it with management and consultant skills, and in return takes a commission on profits, or sometimes on sales. Without the managing agencies, Indian industry could not have been built up; and they were providing Indian business with professional managers when English business was still being run by sons and nephews. The managing agency system is, however, particularly susceptible to abuse. The managing agent can give sole selling agencies to his relations, and let the profits be made by the selling agency and not by the company. He can use the money of companies in which the public is largely interested to finance the operations of other companies he himself owns. He can

speculate in the market for his company's raw materials, and let the company bear the loss on speculations which go wrong. All this can happen, and during the years of war inflation and controls it often did happen. Some of the Marwari agency houses in particular have made the name of "managing agency" stink in the public's nostrils, until shareholders' associations as well as Socialists seem to have forgotten both that most of the agencies, Indian or British, are completely reputable and that, for most of Indian industry, there is still no alternative method of management.

The bill deals severely with managing agencies. Thus, their remuneration is limited to ten per cent of net profits; in a bad year when there are no profits, or few, the maximum will be £3,750 unless the government specifically permits a larger amount. The managing agent will not be able to issue debentures, or to invest the money of one managed company in another, or to borrow from the managed company, or to be a sole selling agent; in India he will not be able to make loans to anybody without a specific and tightly defined authorisation from the company's directors. And many of the disabilities which attach to him will attach also to his associates, defined to include a wide range of relations.

Moreover, it will not be possible to create or renew an agency without official sanction, which is to be given only if the government considers that the managing agent is proper, that the terms of the agreement are reasonable, that it is not against the public interest for the company to have an agent, and that the agent has fulfilled any conditions officially imposed upon him. Even if the agent gets through all those hoops an appointment may not be made for more than fifteen years, or a reappointment for more than ten. Moreover, all existing agency contracts are to expire on August 15, 1960; nobody will be allowed to be the managing agent of more than ten companies, and the government may notify any industry as being one in which agencies are not permitted.

Merge or Liquidate?

The list of restrictions, from which this is only a selection, is formidable. The income of many managing agencies will be halved or more than halved. The limitations placed upon them are sometimes crippling. Big agencies, if they cannot amalgamate their managed companies down to the number of ten, will have to let their weaker ones go. Amalgamations may mean fewer and stronger units, which will be all to the good; but the bill may equally mean a number of liquidations, which will be of advantage to no one.

However, if parliament's primary distrust is of managing agents, it has not shown much more confidence in directors. Nobody is to be a managing director of more than two companies; no managing director or whole-time director is to have his remuneration altered without government sanction. This is doubtless part of the campaign to reduce disparities of income. The powers and independence of auditors have been increased. The government may insist on board representation for an oppressed minority of shareholders, and may inspect the company on application of one-tenth of the shareholders, or if it thinks there has been managerial misconduct. The board may not even appoint sole selling agents except in general meetings.

The Companies Bill, in fact, puts the joint stock company and its management on trial. Everything they do must be done in full view of the world; the right of a company to

keep its affairs private is dead. In no circumstances must the company's management obtain any collateral advantage from its position; any sign that managing agents, in particular, are doing so will lead to the speedy abolition of the whole institution of managing agencies. Finally, and most dubiously, extra power in the hands of the government has been identified with extra protection for the public. A whole new department has been set up to administer the government's 82 separate powers, which will range from the approval of a change in the company's name to the amalgamation of two companies in the national interest. It will be needed.

The bill will result in a large diversion of India's best managerial time to reorganising at the very time when the second Five Year Plan is calling for expansion; but it was perhaps an inevitable sacrifice to what it is fashionable to call the "Avadi spirit," the spirit of equality at the lowest common denominator.

New Zealand's Credit Squeeze

FROM OUR CORRESPONDENT IN WELLINGTON

TWO successive increases in bank rate in July and September this year are clear evidence that New Zealand's National Party government is determined to make the money squeeze work. There is now no doubt that the country is facing a period of economic difficulties. Earlier, New Zealand importers, in response to the rise in national income stimulated by boom export conditions and the removal of a considerable number of import and exchange restrictions, had filled their shops wherever they could buy. But the prices of dairy products began to fall, and wool, though holding for a while, also began to cheapen; while the price of meat, which had been transferred to the open market, fluctuated widely.

The accumulated result has just been disclosed. New Zealand had a balance of payments deficit for the year ending March 31st of £38½ million, the highest for five years. The mood until some time after the general election in November, 1954, when Mr Holland's government was returned with a reduced majority, was one of buoyant optimism. The first warning of change came soon after the election when the New Zealand Reserve Bank, disturbed by increasing bank advances, increased the minimum reserve requirements of the trading banks. Since then there have been several turns of the same screw, reinforced with instructions to the trading banks to overhaul and cut down overdrafts wherever possible. Finally, bank rate was raised from 5 to 6 per cent, and from October 1st the reserve requirements were again raised. The money squeeze was on.

Mr Holland's new Minister of Finance, Mr Watts, did not go as far as Mr Menzies in refusing taxation reductions. He gave concessions totalling about £9½ million, but subsequently made it plain that the Reserve Bank was carrying out government policy in cutting back bank advances and that the process would continue until New Zealand could live within its overseas income.

At the moment the prospects of its doing so are remote. Import figures are still rising and, with the prospect that

wool prices will drop ten per cent compared with last season, overseas earnings may well be less. Mr Watts has already announced that motor vehicle imports, one of New Zealand's largest import items, will be cut by one-third next year.

There has been considerable criticism of the money squeeze on the general grounds that it was applied too late to check the present drift, that it is not sufficiently discriminatory and that it may damage production even more than it restricts imports. The trading banks, who are receiving the brunt of their customers' displeasure, may well feel that it should be referred to the Reserve Bank and the government.

Big Men and Small

The government, for its part, faces a difficult choice. If it returns to import controls, it will be accused of forgetting its election promises. If it decides to seek refuge in exchange manipulation, it will be accused of helping the farmers at the expense of other sections of the community. If it increases interest rates still further it will be accused of helping the "big man" at the expense of the small. If it tries to use tariffs, it may be in trouble with Gatt. With a current and continuous labour shortage, and an increasing drift to the towns, it has difficulties in stimulating export production.

Behind all the political problems there is the inescapable fact that New Zealand badly needs capital for development and to provide for an expanding population, that New Zealanders are saving less and investing less and that public capital works are absorbing a very large proportion of the money and labour available.

The unpalatable remedy, of course, is more work by the existing labour force. But when the government recently amended legislation to permit a greater extension of weekend trading, there was an immediate and very vigorous outcry by people who declared that this was an assault upon the 40-hour (closed weekend) week. The government will find it extremely difficult to force this issue.

A small, controlled earth tremor is one of the geophysicist's most important tools in his quest for the world's crude oil resources.

These earth tremors are set off by small explosive charges buried in the ground.

Earthquakes to order

When the geophysicist explodes a charge,

"shock waves" are sent downwards into the earth, and are reflected by layers of rock deep in the earth's crust.

The waves that return to the surface are picked up on sensitive

receivers. By measuring the time between the detonation of the charge and the return of the various "echoes", the geophysicist can glean valuable information about the strata beneath him. Indeed, he can often draw an "underground map" of the area and so predict where there might be oil.

The Nobel Division of Imperial Chemical Industries Ltd. is an important supplier of the specialised explosives and detonators used in 'Seismic Prospecting', as the technique is called, and their prospecting explosives have won an enviable reputation for reliability in the far-off tropical and desert lands where oil is found.

Thus, and in a thousand kindred ways, I.C.I.'s research and production are serving the Nation.

THE BUSINESS WORLD

Barely a Balance

THE "small surplus" in the United Kingdom balance of payments that the Chancellor recently claimed for the first half of this year turns out to have been £17 million, but if defence aid of £33 million is excluded, as it must be, the out-turn for this period is a true deficit of £16 million. These are small residuals compared with the vast turnover of payments to which they refer and lie well within the limit of the inevitable "errors and omissions." If, therefore, it is claimed that in the first six months of 1955 the balance of payments about broke even that is a generalisation as safe as can be made with this imperfect product of the statisticians' art.

There are, however, two broad pointers that swamp any haggling over the size of the errors and omissions. The first is that the figures underline a grave deterioration in the balance of payments compared with a year ago. In the first half of 1954 Britain had a true surplus of £141 million; the deterioration since then is no less than £157 million. Secondly, the whole of that deterioration and more was suffered on account of trade with non-sterling countries. Britain's current payments surplus with the rest of the sterling area rose from £100 million in the first half of 1954 to £119 million in the first half of 1955; while the balance on non-sterling account, again excluding

defence aid, swung from a surplus of £41 million to a deficit of £135 million. The shift has been most marked and most damaging in the payments balance with the dollar area. The deficit of only £3 million in the first six months of 1954 has been swollen in the latest half-year to £110 million.

TABLE I
THE SWING INTO THE RED
(£ million)

	1954		1955
	Jan.-June	July-Dec.	Jan.-June
All Countries:			
Exports	1,424	1,392	1,531
Imports	1,471	1,536	1,667
Balance of trade	- 47	- 144	- 136
Net invisibles	+188	+139	+120
Current payments balance	+141	- 5	- 16
Balance after defence aid..	+165	+ 21	+ 17
Financed by			
Change in reserves	+179	- 92	- 29
Change in sterling liabilities	+ 89	- 6	- 68
Net investment (plus) or borrowing (minus)*	+ 75	+107	- 22

*Residual; includes errors and omissions.

Even after adding defence aid, Britain's current deficit with non-sterling countries reached £102 million in the half year. Yet the gold and dollar reserves fell by only £29 million, and—a reassuring surprise contained in the white paper,* total sterling liabilities, net of official holdings of non-dollar currencies, fell by £68 million, of which £51 million was in liabilities to non-sterling countries. The explanation is partly that Britain benefited from the proceeds of the net surplus of £71 million earned by the rest of the sterling area in its trade with third parties and partly that the net

inflow of capital to the United Kingdom from non-sterling countries has increased (from £17 million in the first half of 1954 and £32 million in the second half to £53 million in the first half of 1955), while the net outflow of capital from Britain to the sterling area has fallen (from £92 million to £31 million).

*UK Balance of Payments, 1946 to 1953, CMD 9585. HMSO. 2s. 6d.

On balance, therefore, Britain is shown to have been a net borrower, to the extent of £22 million, for the first time since 1947. But the significance of this display should not be exaggerated. The "investment and borrowing" item includes on the credit side an adjustment of about £100 million. This margin of

error, greatly exceeding the final outcome of the whole calculation could easily relate to unidentified receipts that really hide a current surplus and are not a true inflow of foreign capital. Some foreign capital may have been beckoned in by the relatively high interest rates that London offered towards the end of the period but the amount is unlikely to have been large, for it is officially stated that there was little net movement of recorded capital in the period. The deficit for the second half of 1954, estimated six months ago at £38 million, has now been revised to a deficit of only £5 million. Any comfort that may be derived from the probability of an underestimate of the surplus for January-June 1955 must, however, be swamped by the fact that the second half of the year is normally less favourable than the first half, for both Britain and the overseas sterling countries. The out-turn for the whole of 1955 is, on present indications, likely to show a substantial deficit—and certainly a larger gold loss.

About £90 million of the deterioration of £157 million in Britain's current payments balance with all areas occurred in visible trade. Some of it can be attributed to the first effects of the swollen import bill

that must bear the main burden of blame. The dock strikes naturally played their part in that. The cost of all imports rose by £196 million to £1,667 million, and of imports from the dollar area alone by £114 million to £354 million—an increase of no less than 47½ per cent. The fall in the net surplus on invisible payments with all areas from £188 million to £120 million was mainly attributable to a decline in receipts from shipping and oil. The rise in tramp freight rates has had an adverse effect, as Britain has become a net buyer of tramp services—though it remains a net seller of liner services. The additional imports of coal and steel have also added to the debit side of the shipping account. The fall in receipts from oil operations may be transient, reflecting initial outpayments under the new arrangements with Iran and Iraq. The invisible payments are also being swollen by higher interest rates on sterling balances held overseas; this factor is believed to have involved an additional £30 million a year compared with 1954.

The gold and dollar accounts of the sterling area, summarised in Table II, reflect little credit on Britain and the sterling Dominions. Once again, the colonies have saved them from bearing the full brunt of their excesses. Britain's net balance with the dollar area showed a deficit of £65 million, compared with a surplus of £49 million a year before. The dollar deficit of the sterling dominions doubled to £58 million though a part of that may reflect merely the finance

TABLE III
STERLING LIABILITIES
(£ million)

	Dec. 31, 1945	June 30, 1951 (Peak)	June 30, 1954	Dec. 31, 1954	June 30, 1955
Liabilities to:					
Dollar area	34	73	61	97	86
OEEC countries	412	422	304	324	320
All non-sterling area countries	1,232	1,068	770	856	831
UK Colonies	454	908	1,185	1,223	1,294
Independent sterling countries	2,008	2,195	1,864	1,823	1,735
Total sterling area ..	2,462	3,103	3,049	3,046	3,029

Total sterling liabilities	3,694	4,739	4,334	4,378	4,339

by South Africa of a larger portion of its deficit through London side by side with increased sales of gold there: gold sales in London are up from £67 million to £82 million. But the only laurels are for the Crown Colonies, which improved their net surplus with the dollar area from £54 million to £60 million (rubber must have helped). Transactions with other non-sterling areas are not similarly broken down; but it is a reasonable

assumption that the deterioration in the whole sterling area's balance with these countries from a surplus of £38 million to a deficit of £48 million was in the main attributable to the inflation-prone mother country and Dominions, and that here too the Colonies cut down the deficit and stemmed the loss of gold and dollars.

The good work done by the Colonies in mitigating the external strain on Britain shows again in the figure of Britain's sterling liabilities. The total of these liabilities (excluding the somewhat artificial holdings by non-territorial organisations consisting mainly of uncalled capital in the IMF and World Bank) fell in the first half of this year by £42 million to £3,860 million.

Conversion the Hard Way

THE best of luck has attended the Government's plans for replacing the £524 million of 3 per cent Serial Funding stock, 1955. The terms of the new issue announced this week—a 4 per cent conversion stock offered at 99½, repayable at par between June 15, 1957, and June 15, 1958, must have been decided over the weekend. The sharp rise in the gilt-edged market that occurred on Monday and carried long-dated stocks up by 1½ to 1¾ points and the shorts by smaller amounts, was therefore an uncovenanted and unengineered help. The fine start has caught the market's eye and will no doubt help both the cash and the conversion offers even though the rally in the gilt-edged market has not been wholly maintained. The Bank of England, the Treasury and the Government broker appear to have played their hands well. Advantage has been taken of the fact that a rally in gilt-edged was in progress; probably the actual date of the operation was for that reason advanced by a few days.

But properly considered, this conversion operation has been planned and executed over a much longer period—a period of months, during which the movement of the gilt-edged market has on the whole been strongly adverse and during which it was rightly decided that the Government broker must be a net seller, in order to reinforce the credit squeeze by refusing to pick up the gilt-edged stocks that the banks and others had to sell. Tempting opportunities of acquiring the maturing 1955 stock—naturally the first stock to be sold by the banks—had to be allowed to pass by. Stock which in other circumstances would have been moving steadily into the portfolios of the departments has had to be bought scantily—almost surreptitiously, as part of switching operations in which the Government broker was not a net buyer. And since the banks were selling heavily, this meant that much stock moved into hands where its conversion is less sure than it would have been, either had it remained with the banks or been bought by the Government.

The authorities have thus had to plan this operation

Every group of Britain's sterling creditors reduced its claims with the sole exception of the Colonies, whose sterling balances rose by £71 million to a new peak of £1,294 million. The Colonial sterling balances have almost trebled since the end of the war, when they stood at £447 million. Part of that great growth has naturally been matched by an outflow of long-term capital from Britain. But the balancing is far from complete, and the shortfall is some guide to the extent to which Britain and some of the Dominions have built their welfare states and maintained their over-buoyant economies with credit advanced by the less developed members of the Commonwealth. •

with the dice loaded against them to an extent that has not been experienced in recent years. The lessons they have learned painfully through the unfortunate 4 per cent Gas issue and the more reassuring 4½ per cent Electric issue have doubtless added to the technique of debt management, and the experience may be needed again if the credit squeeze is to endure. The 2½ per cent National War Bonds, 1954-56, are a problem that must soon be considered, and the Government broker must already be considering how to buy this without becoming a net buyer of stock.

★

Government policy has gone much further than merely not being a net buyer of stock. The departments have throughout most of the period of the squeeze been substantial net sellers and have thus incidentally armed themselves with buying power. The extent to which that has been successfully done over the last few months may never be known, but the net selling cannot have been small. The very fact that the government broker is a seller of the 4 per cent Gas stock, created only last July, at over 5 points below its issue price, shows how far his previous policy of selling only at a profit and at rising prices has had to be modified.

It is naturally not desirable that the Government Departments should use their buying power to subscribe for one pennyworth more of the new issue than is necessary. Internal subscriptions naturally provide no new cash, and thus cannot directly help in the repayment of such of the outside holdings of 1955 stock as are not converted—which is the only real purpose of the "cash" offer. But in practice there is no such sum as £250 million available for investment in a new gilt-edged stock on any single day, so that some degree of official participation was inevitable. When the market learns, as it did on Thursday, that large applicants for over £5 million of the new stock received 78 per cent of their applications, it does not doubt either that departmental funds were used heavily

to produce the "over subscription" or that 4 per cent conversion, 1957-58, will be an addition to the stocks that the Government broker has to offer, as also for the next few weeks will be 3 per cent Serial Funding, 1955, "assented." In effect, the Government always makes its issue over a period (and usually at varying prices), instead of at a single price on a single day. The important consideration, if a policy of this kind is to remain circumspect and in harmony with present monetary policy, is that the new stock shall be such as will stand the best chance of speedy resale.

GROSS REDEMPTION YIELDS*

* To the latest date. † Clean.

Above all, the Government must stand the cost of its own policy to the extent of offering a stock that investors will wish to buy, turning aside from all temptation to induce them to buy on terms more favourable to the taxpayer. It appears that that principle has been accepted with the present issue, and the fact that after the announcement other short-dated stocks declined though the medium dates continued for a time to rise suggests that some investors were selling in order to buy the new stock. That is as it should be.

The new issue is a stock for "City" investors; it has obviously been tailored to suit the banks. The 4 per cent coupon should also appeal to the discount houses, when they have some money to invest again. Its running yield of £4 os. 5d. per cent and its gross redemption yields of £4 6s. 6d. per cent to June, 1957, and of £4 4s. 1d. per cent to June, 1958, are acceptable—though not so extraordinarily favourable that many of them will be induced to sell other stocks at heavy capital losses in order to buy it. It should appeal to the building societies now drawing in more ample funds again if they can be tempted away from the recent liking for Treasury bills. There is indeed a prospective profit in a society paying 2½ per cent net on deposit (equal at the composite rate to £3 5s. 6d. per cent gross) and investing the money at a shade over 4 per cent. Nothing in the market with a 4 per cent coupon has a life nearly as short as this stock with a maximum life of 2½ years, and recent experience suggests that a high coupon is scarcely less important to funds that are taxed as finance companies than a high redemption yield.

The big unknown is the extent to which holders of the 3 per cent Serial Funding stock will accept the offer of conversion into the new issue at £100 stock, plus a cash payment of 10s. per cent. The maturing stock is more widely dispersed than the comfort of the authorities requires. They hold and will convert a big block, though a smaller one than they would like. Some of the banks, despite heavy sales, still have some holdings, and will probably convert them; so, presumably, will the discount market—but the amount still held there has been exaggerated by some recent City comment. Substantial but not dominating amounts are held by some big industrial companies, including the oil giants. They would not normally be expected to convert, but there has been evidence in the last few days that one or two of them intend to do so. A large amount of stock is believed to be held by the overseas banks in London—banks of the Commonwealth and of some Middle-Eastern countries. These banks often co-operate on conversion offers, and may do so this time.

★

If much less than £300 million out of the maturing £524 million of stock is converted, the operation will be judged disappointing. If more than that figure highly successful. That calculation thus supposes that the total issue of the new 4 per cent stock taking the cash and conversion issues together, will not be smaller and will probably be a little larger than the £524 million of maturing 1955 stock. At the outset, inevitably, the Government must hold rather more of the new stock than it now holds of the old. It would have been better if at once the amount of the new stock in the hands of the public were higher than the public's holdings of Serial 1955. But that stage may not be far away. Of the three main stocks which the Government broker will have on offer—the Gas 4 per cent, 1969-72; the Electric 4½ per cent, 1974-79; and the new conversion 4 per cent, 1957-58—the last named should prove the quickest seller.

Business Notes

Pound and Franc Rally

STERLING has recovered strongly this week. So, a trifle more surprisingly, has the French franc. The recovery in sterling represents a continuation of the closing of bear accounts on a scale large enough to outbalance appreciable commercial purchases of dollars. The spot rate on New York has moved up to \$2.79½, and there is a strong impression in the market that the recovery would have been greater had it not been for modest sales by the British Exchange Equalisation Account. Part of the strength of sterling is reputed to be due to a renewed, though modest, inflow of short-term money attracted here by the narrowing of the discount on forward sterling. At 1½-1½ cents this represents an interest cost of about 1½ per cent.

Sterling has also been helped by a more generous flow of gold from South Africa to the London market. The South African Minister of Finance announced last week that his country intended to maintain its gold reserve at around £75 million and to sell the balance of the gold production on the London market for sterling. He discloses that total sales of gold for the first eight months of this year amount to approximately £106 million; of this, £48 million went to reimburse the United Kingdom for drawings on the sterling area dollar pool. This left £58 million retained by Britain in settlement of the Union's balance of payments with the sterling area and with the non-dollar world. The deficit in South Africa's balance of payments amounted to more than £50 million, so that the country will have achieved no increase in sterling balances so far this year.

★

The modest recovery in the French franc this week brought the rate on sterling down from 983½, touched towards the end of last week, to 982, though there was a subsequent relapse to 983½. It was a political recovery. The franc was under pressure last week when the fate of the Government appeared to be in doubt. The Government victory, coupled with more reassuring news from North Africa, produced the recovery which was the more notable for two reasons. First, a substantial part of the short account in sterling appears to have been built up in Paris with French francs as its counterpart and therefore the closing of those short accounts brings pressure against the French recovery. Secondly, French francs have been sold on the argument that the movement of French troops to North Africa places a larger defence burden on the French budget by reducing the amount of dollar aid.

Enough Coal in Stock

THE fact that distributed coal stocks at the beginning of the winter in November are likely slightly to surpass the "safety level" of 18 million tons to which the National Coal Board has once again retreated, derives from three causes:

throughout the year the Board has been importing as much as it needs to reach that level; because it will continue importing during the winter, 18 million tons is enough to start with; and Britain had a very warm summer and is having a fairly warm autumn.

The Board continues to have precious little else to boast about. The warm summer, apart from allowing consumers to use less coal, has enabled the opencast contractors to claw more out, and their production is now ½ million tons ahead of last year's total. Deep-mined output, however, is still nearly 4 million tons down. In spite of the very real fact that the mines are losing manpower, the number on colliery books in the first three quarters of this year was only 2,500 fewer, or less than half of one per cent lower than in the same period last year, while the number of face workers was only 400 fewer. Absence, voluntary and involuntary within the meaning of the Board's regulations, was up, and output per man-shift for all workers was also down, though face productivity was slightly up. In recent weeks some of these fallible indices of mining performance have looked better, but not all of them. And it is not easy to have any confidence that the current deputation of leaders of the Board and the Union who are going round pits where output is even worse than the average will make any difference, whatever.

No Slackening in Steel Demand

DURING the first six months of this year the stocks of steel in merchants' and consumers' hands in Britain rose by about 100,000 tons and another 100,000 tons was transferred from merchants' to consumers' stocks. Stocks at the end of June amounted to just over 3½ million tons of finished steel, almost exactly the same amount as was in stock a year before and at the end of 1953. Production of engineering goods and vehicles over the first half of this year appears to have been about 12 per cent higher than

a year ago. Steel supplies to the home market, which have been supplemented by considerable imports of finished steel, were 7 per cent higher than a year before during the first quarter of this year, 10 per cent higher during the second quarter and 14 per cent higher in July and August.

This rise in steel stocks held by merchants and more particularly by consumers may be counted as something of a corrective to exaggerated reports of the difficulties caused by extreme shortage during the last twelve months. But it is not particularly surprising that engineering companies producing more goods should be inclined to hold more steel in stock; and the fact that the increase in output over twelve months has been achieved with no increase at all in total stocks indicates some tightening in stock management, and probably markedly reduced holdings of some steel products.

Within these totals, there was a rise of 25 per cent in the stocks of sheet steel held by consumers. The output of the motor industry, which is the biggest single user of sheet, rose during these six months by 19 per cent. Clearly the motor companies, who have been paying very large premiums to import American sheet privately, have been ordering as far ahead as they could; with the current tightening of steel supplies on the American market, which is the only significant marginal supplier of extra sheet, this is not surprising. The Steel Board hopes that during 1956 home production of steel should rise enough to support a continuing rise in output of the metal goods industries. And even the motor manufacturers, who can hardly expect that they will get all the sheet they want from British strip mills, can hope that American supplies may be made easier by the downturn of automobile production that is likely next year in Detroit.

A Rally in the Markets

INDUSTRIAL shares rallied strongly in the middle of this week. The *Financial Times* industrial index that had been falling heavily for over a week touched 181.1 on Monday, which happened to be just over 19 per cent below its peak of 223.9 last July. It marked time on Tuesday and pulled up sharply on Wednesday to 185.1. London nowadays shows an increasing tendency to watch the mood of Wall Street and both the major movements of the last ten days—the fall on Friday of last week and the rally on Wednesday of this week happened to coincide with moves in the same direction there. It also happens that over the last three weeks Stock Exchange markings—that wholly inadequate pointer to the volume of trade—have suggested a slowly broadening volume of business in Throgmorton Street. The number of marks in the first three days of this week was 32,514, compared with 30,812 in the first three days of the previous week and with 29,087 in the first three days of the week before.

These few swallows make much less than a summer; they do not even add up to an indication of changing market climate. The simple explanation for the mid-week rally—that the market rallied because it was oversold—is reasonable and for the moment sufficient. Markets could hardly have fallen the distance they have over the time they have without some bear accounts being built up both inside the "House" and outside it. Gilt-edged were rallying strongly at the beginning of the week, and the offer of 4 per cent conversion stock 1957/58 was well received. Current trade reports still show signs of high public expenditure even

(Continued on page 232)

Markets on the Move

THE improvement in gilt-edged prices was carried a stage further this week. The gap between gilt-edged and equity yields, which at the top of the boom in the industrial market looked

unduly narrow, has widened again, though Wednesday's sharp rally in industrials checked the adjustment. The relationship between these yields is now perhaps more healthy.

The accompanying charts illustrate some facets of the stock markets in the last six months. In Throgmorton Street the change in mood from Mr Butler's Budget speech to his speech at the Lord Mayor's banquet—from a reduction in income tax to the credit squeeze—dominates the scene. The de-

cline in equity prices in Wall Street came later—triggered off by the illness of the President.

It is also instructive to compare the yields on some of Britain's leading and most favoured equities at the top of the boom (taken here to be July 21st) with their current yields. It is only just over two months ago that investors were prepared to accept dividend yields of under 4 per cent because earnings yields and prospects looked good. Now dividend yields close to 5 per cent.

Introducing the BEA Car Hire Plan

Off your BEA airliner into your hire car—and away you go! An important new service for travellers abroad—that's the BEA Car Hire Plan. You touch down. You pick up your car at the airport, town terminal or hotel. You drive away—or a chauffeur does it for you. Everything's as smooth as clockwork. Arrange your car hire when you book your BEA ticket. *No deposit needed. Up to £35 payable in U.K.* Important point: you're fully insured against damage. For details, get the BEA Car Hire Plan folder at your Travel Agents or at BEA, Dorland Hall, 14/20 Regent Street, London, S.W.1. Gerrard 9833.

Profit Platform

AN unexpectedly large increase in dividends can jerk the price of an individual equity up. But in valuing their portfolios investors have to estimate (amongst other equally important factors) currently earned and future profits whereas currently reported profits were in fact earned months before. Hence an analysis of reported profits can serve only as a platform from which the investor can soar in a flight of prophecy—or just plain honest guesswork. What planks are in the platform of profits reported in the July-September quarter?

Only 561 companies were put through the statistical mill of *The Economist* in that quarter. The mean date for the end of their financial years was March 31st. Those profits were earned around a mean date already twelve months old and investors who bought equities in the boom had long ago had a shot at estimating their shape. In fact, the trading profits of these 561 companies rose by just over 13 per cent (from £248 million to £280½ million). That advance coincides almost exactly with the increases reported in the last quarter of 1954 and in the first quarter of 1955, but it falls short of the 17 per cent advance recorded by the 1,000 companies (including almost all the international trading giants) which issued their reports in the second quarter of this year.

To see how that increase was absorbed the investor—and more particularly the politician—may give a passing glance to the modest increases in the depreciation and tax provisions (up by just over £3 million each) and to the addition of

about £18 million more to reserves, but he is much more likely to batten on to the increase in ordinary dividend payments (up by about £9 million to £39.4 million). It is as well, then, to try to show what that increase means, without denying that equity shareholders have fared better in the last few months, partly because EPL was no longer feeding on profits, than for many a long year. The ordinary dividends are shown in this analysis after deducting tax. Hence part of the £9 million increase is simply due to the change in the standard rate of tax from 9s. to 8s. 6d. in the £; roughly the change in tax accounts for between about £750,000 and £1 million of the apparent increase. An equally rough estimate suggests that the gross return of these dividends on issued capital is about 16½ per cent, compared with one of about 15½ per cent the year before. On the capital and reserves attributable to the equity the gross return is about 7 per cent, compared with one of about 6.2 per cent.

Neither profits nor dividends have risen uniformly throughout the industrial groups (whose accounts are analysed in detail on pages 245 and 246). The biggest proportionate increases have been reported by the tea and rubber plantation companies. Such groups as “electrical manufacturing” and “motors, cycles and aircraft” have also done well, though textile profits still show little change. The capital goods industries go on reporting higher profits, but one of the biggest increases (of 19 per cent) occurs in the “shops and stores” group, dominated in this

quarter by the GUS results. This batch of trading results helps to confirm the impression that hire purchase has been a particularly profitable business and it is noticeable that in those groups where hire purchase companies are well represented the rise in stocks and debtors has been most marked. The total stocks of the 561 companies have gone up from £442 million to £489 million and debtors from £349 million to £423½ million. So far the pressure on liquid assets has been almost imperceptible, but all that happened before the credit squeeze became a reality.

So much for the platform. What about the prophecy? Profits reported in the current quarter should show a good advance, if only because many motor companies will soon be presenting their accounts to stockholders. In absolute terms profits earned in 1955 will be high but the relative increases in earnings may not be so startling, simply because they will be set against the brilliant 1954 results. That is already discernible in some of the half-yearly statements recently issued by a few giant companies. Looking further ahead the bout of wage increases this year must ultimately act as a drag on profits, particularly on those earned by companies selling their goods in competitive export markets where prices have to be kept down. That possibility, to say nothing of the more onerous terms that now have to be paid for new money from the capital market and the likelihood that a curb on expenditure may make new contracts hard to get, may have its influence on dividend policy next year.

though active consumer expenditure probably owes something to anticipation of purchase tax increases. That may well be sufficient to prompt some cautious bear closing. The first reaction to the Bournemouth speech—the four point fall in the industrial index and the rally in gilt-edged—was a natural one. If a stiffer policy aimed at expenditure, public and private, is coming, that is good for gilt-edged and bad for industrials. The market, however, continues to show much resilience notwithstanding the readjustment it is undergoing and no doubt investors would like to see the measures before they make up their minds. For an outstanding example of those recuperative powers the new P and O 5 per cent debenture is hard to beat. After 96 per cent of the issue had been left with the underwriters and dealings had recently opened around 1 point discount, the new stock stands at around £3 premium.

Sharp Fall in Imports

THE encouraging fact about British overseas trade last month is the sharp fall in imports. The total of £304.2 million cif was £35.1 million below the average of July and August, two months in which the impact of monetary policy on imports appeared to have petered out. The trend appears in the chart, which shows how the cumulative value of imports during the first nine months of 1955 has moved in proportion to that of 1954. By May, imports seemed to be responding to monetary policy, though Britain was also reaping the benefit of a fall in certain commodity prices that had occurred months before. Whereas the cost of imports in the first three months of the year was 22 per cent higher than in the same period of 1954, the cost in the first five months was only 16 per cent higher. Then came the three months affected by the transport strikes, June, July and August, at the end of which the cost of imports for the first eight months was still 16 per cent higher than in 1954. Thanks to the sharp fall in imports last month, the nine months' tally was but 15 per cent higher than a year ago. One swallow does not make a summer but it does raise this question: has monetary policy started to bite again on imports, or was it simply that its effects in July and August were masked by the distortions of the strikes? The

detailed trade returns may provide a clue.

Exports last month apparently included some shipments held up by the strikes, but fewer than in August; the total was £243.2 million fob, £21 million below the exceptionally high figure for the previous month. The gradual clearing of the backlog of goods is reflected in the chart, which shows that in the first nine months the value of exports had recovered to a level 6 per cent above that of a year ago.

But there is still ground to be made up before the proportionate lead over last year is as high as it was before the strikes began, and much more before exports match the growth in imports. Last month, with re-exports at £10.6 million, the gross visible trade deficit fell by £17.6 million to £50.5 million. Welcome though that reduction was, it still left the average deficit in the nine months at £75.4 million a month, some £28 million larger than in the same period of 1954.

Copper Beats a Retreat

SUPPLIES of copper are gradually improving and the price reflects it. Cash copper closed in London on Thursday at £352 5s. a ton; just over a month ago it stood at a record £400. The first sign of easier supplies in the United States, where the shortage was most acute, came in the sharp fall in prices of copper scrap. Then the custom smelters dropped their price for electrolytic copper from 50 to 48½ cents a lb, and later to 45½ cents; this compares with 43 cents charged by the major producers. Prices in London weakened further, helped by the sharp break on Wall Street and the ending of a strike at a big Chilean mine. The knowledge that the remaining 13,000 tons of electrolytic copper to be sold by the Board of Trade would become available from November onwards, and the credit squeeze, also played a part. Buyers here and on the Continent appear to be pretty well covered until the end of the year and they are cautious in satisfying their outstanding requirements for the first quarter of 1956. The fall in American prices on the other hand would probably have gone further if consumers were not so keen on building up stocks before December 31st, in order to lighten their tax assessments.

So far copper has beaten an orderly retreat and a rout does not seem likely. It will be a month or two yet before the losses resulting from the recent bout of labour troubles have been made good, and world consumption remains buoyant. It is refreshing that normality is returning to the industry, but it would be imprudent to assume that copper is entering a long period of peace.

An End to the Levy?

How long will the transport levy be charged upon goods vehicles? This was imposed by the Transport Act of 1953 to pay for the cost of denationalising the bulk of the Transport Commission's road haulage fleets and to cover any capital losses incurred on the sales. Before July, when the Minister of Transport decided that the Commission should retain just over one quarter of its vehicles instead of the one-tenth originally intended, he had provisionally estimated the capital loss at £21 million, including £1 million compensation for the disturbance to the Commission's activities. This sum was to be paid in five equal annual instalments, with interest on amounts as yet unpaid and the accounts of the Transport Fund for 1954, published this week, state that the first instalment of £4.2 million was

LONDON, and all principal centres throughout Britain and the world

paid last January. They also show that £4.02 million was collected through the levy last year and that interest on future instalments and the expenses of the Disposals Board had amounted to nearly £400,000 by the end of the year.

Now that far fewer lorries are to be sold back to private hauliers, however, the capital loss should be much smaller. The Minister's provisional estimate of £20 million, compared with the £32½ million given in the Commission's accounts as the value of the goodwill of its road haulage undertaking, indicates that the Commission has been selling its depots and vehicles—and expected to continue selling them—at much more than their depreciated book value. Moreover the value of the goodwill attached to the trunk fleet that the Commission is now retaining should be substantial. Plainly the Minister's estimate needs revision; and the levy can be abolished sooner than was anticipated.

More Tanker Orders

TWO more oil companies have ordered new tankers from foreign shipyards within the last few days. Last week-end British Petroleum announced that it had placed contracts totalling £8 million for four 34,000-ton oil tankers with Italian shipyards; and Royal Dutch-Shell announced on Thursday orders for nine more tankers, thus bringing its total bookings in the last month to 43 vessels of 1,054,000 tons deadweight. Eight of these nine tankers will be built in Western Germany—two will be 32,000 tons dw vessels and six will be 18,000 tons dw. The ninth tanker, which will be of 32,000 dw, will be built in Britain. Altogether, Shell has now ordered in its latest programme 21 tankers from shipyards in this country, 14 from Holland and 8 from Western Germany.

These orders bring the total deadweight tonnage ordered since July by British tanker operators—both by established companies and by those entering the business for the first time—to between 2½ million and 3 million. These new vessels will become available from 1957 onwards, when the construction programme launched in 1950 and 1951, plus minor orders placed since then, will have been completed. The present round of new orders has not ended yet, however: British Petroleum has still to announce the major part of its programme, and the bulk of it is expected to go to British yards. Certain other owners also have a few more contracts to complete. More attractive prices and earlier delivery dates are the main reasons why orders have been placed abroad; but British tanker builders have no reason to be disgruntled with their share of the tonnage ordered so far. About three-fifths of the present programme has been placed in this country and there can now be few yards without berths booked up to 1960. By then, of course, tanker operators have to consider thinking of replacing "the large middle hump" of their fleets, consisting of vessels built during the war.

Compromise on Kuwait Tax

ONE of the minor but none the less significant attractions of British Petroleum Company's ordinary stock has been the claim lodged by the company with the Inland

Revenue for relief against taxes charged in Kuwait. That claim has now been settled—by a compromise. Up to the end of 1953 British Petroleum had set aside about £57½ million for Kuwait tax as a charge against profits; if the claim for relief against this sum had been granted in full the company would have drawn back about £20 million. In effect that claim has been dropped. But in 1954 British Petroleum set aside a further £36.7 million for Kuwait tax and this ranks for relief under the newly revised Kuwait regulations.

Kuwait has issued a new tax decree which ensures that any Kuwait tax payable this year and in future years will rank for unilateral relief against British taxation. As the taxes on the 1954 profits are payable this year and thus rank for relief, British Petroleum estimates that it over-provided about £10 million for British tax in 1954. The company has withdrawn its claim against the Inland Revenue in respect of the taxes paid under the old Kuwait tax decree. The £10 million, which, presumably, will be written back in the 1955 accounts, is somewhat less than some of the optimists had expected to accrue from the settlement of the tax claims, but current and future earnings on the ordinary capital will automatically benefit from the new arrangements.

Citroen Pulls Away

IT is more than twenty years since Citroen introduced its famous *Onze Chevaux*—a car that sold strongly in Europe and achieved an enthusiastic following in this country by reason of its strong integral body-frame construction, the cornering stability and unobstructed interior afforded by front-wheel drive, plus torsion bar springing and rack-and-pinion steering. That "Light 15," as Britain knows it, began to look obsolescent only during the last few years. The new 2-litre model Citroen introduced at the Paris Show and shown in London this week is as revolutionary today as the earlier car was in 1934, and may well remain technically ahead of its competitors for an equally long time. What the Citroen engineers have done is to produce a more powerful front-drive model that employs hydraulic circuits to render it pleasant and effortless to drive, with the remarkable level-keel pneumatic suspension already tested on the company's six-cylinder car applied to all its wheels; it is incidentally a better looking car than the old one and indeed rather better looking than its own photographs.

The clutch action is fully automatic, dispensing with the pedal, and a finger-tip lever protruding from the dash controls the hydraulically assisted gear change of a 4-speed synchromesh gearbox. A small button on the floor replaces the normal brake pedal and applies the brakes hydraulically through a circuit with separate accumulators and pipelines for front and back brakes, able to proportion braking effort to load carried, and using inboard air-cooled disc brakes (themselves revolutionary in any stock car) at the front. A normal pedal, which can be locked down by a hand control, actuates the front brakes mechanically for parking. The rack-and-pinion steering is hydraulically assisted and the steering wheel has a single spoke to safeguard the driver.

in the event of an accident, while a rubber crash-lining encircles the roof.

Good performance is ensured by a revised four-cylinder engine with overhead valves inclined at 60 deg. in a light-alloy head, 75 bhp being claimed at 4,500 rpm. An ingenious ignition system, like that of the little Citroen 2 cv, employs dual coils and contact-breakers instead of a distributor, and the fan has nylon blades. The 4-door saloon body has light-alloy bonnet and boot panels, uses a removable plastic roof, and provides very generous passenger and luggage accommodation, with good visibility. The spare wheel is carried under the bonnet head of the radiator and each road wheel is secured by a single nut. Ducted hot air warmed by two separate auxiliary radiators is fed to the body interior, which is very fully equipped. The new features of this car, it will be seen, depend heavily on hydraulics; but aircraft design has greatly advanced this technique in the last 20 years, and there is no reason to regard the new Citroen with suspicion though service of the system in this country might be a problem. In France, the car costs less than £950: here it will be priced at £1,404 after tax.

Spending in the Summer

THE rate of personal spending was a fraction less buoyant during the second quarter of the year than in the first. Returns from the Central Statistical Office put the total figure as £3,103 millions, or nearly 7 per cent higher than in the same quarter last year; the first quarter's increase was more than 8 per cent. If these figures are taken together with the retail returns for August, which show decided signs of a slackening rate of sales, they might be interpreted as a curb on the spending spree that has had such repercussions on the country's balance of payments.

Compared with the same period of 1954, a great deal more (£105 millions) was spent on food, as much as at last Christmas; more also was spent on rent and housing; on clothes apart from shoes; and on fuel and light. Alcoholic drinks, apart from beer, also captured a good proportion of the additional spending. But beer, tobacco, shoes, travel and entertainment showed only a slight improvement. Changes in prices have made little difference to the actual volume of goods received. Revalued at 1948 prices, the spending rose rather more than 3 per cent to £2,396 millions compared with the second quarter of 1954. But after the quarter had ended, retail sales in the big shops were down by 3 per cent compared with the previous August outside the food departments. Sales of clothes and furniture were the most severely affected, but sales of radio and electrical goods, too, suffered a check.

Russia Sells Less Silver

SILVER has fully maintained its recent firmness. Over the past week cash silver has crept up from 80½d. per ounce to 80½d. Among the reasons contributing to the strength of the market has been the shortage of Russian

offerings. A year ago Russian selling orders came in lots of as much as 500 tons; now when an occasional offer appears it is at most 20 tons. The Russian Government seems to have disposed of its surplus silver stocks during the 1953-54 selling campaign when it was financing increased imports of consumer goods. Current Russian selling, which continues to be made against transferable sterling, amounts, it is believed, to less than current production.

Another temporary reason for the shortage of silver in world markets has been that the hurricane damage in Mexico has stopped physical movement of silver from the mines and interrupted shipments from Vera Cruz and Tampico. A more lasting influence is the proposal now before the Japanese Parliament to use the Japanese stock of nearly 2,400 tons of silver for coining instead of selling it in world markets. This stock (formerly looted from China) was returned to Japan by the United States after signature of the Peace Treaty.

Freights in the Atlantic

COAL shipments across the Atlantic have undoubtedly been the mainstay of the tramp shipping freight market this year, and look like continuing to be so well into next. There has been a steady demand for tonnage on time charter for one or two years' trading, or on a consecutive basis, at good rates—a sign of hedging against further increases in freight rates. The National Coal Board and other coal charterers have been doing this: and a recent contract was let for the shipment of 1,150,000 tons from Hampton Roads to the near Continent at 65s. 6d. per ton between next December and December 1956, which compares with 72s. per ton for about 125,000 tons shipped between now and the end of the year.

Current rates for Transatlantic coal are now some 5s. to 10s. higher than a month ago. This may be partly due to a loss of shipping space through recent delays in the discharging ports and congestion in Hampton Roads. Although this has now improved, a similar effect will be brought on by winter conditions, coupled with observance of the winter loadline regulations, which reduce cargo capacity by up to 300 tons a ship. A similar steep rise has also been noted in Transatlantic grain rates. Barley from the St. Lawrence has risen from 75s. for October loading to 90s. November loading, which is double the highest rate paid for this voyage during last season.

Furniture and Its Council

A PRIVATE vendetta that has been fermenting in the furniture industry for several years has reached something approaching a climax. The furniture industry is the last that still possesses a statutory development council—the Cotton Board is excepted. The Furniture Development Council has pioneered research in an industry where laboratory methods are largely unknown, and its efforts have led

to the evolution of performance tests of durability for furniture that have been adopted by the British Standards Institution and are the foundation of the present scheme of certifying the quality—i.e., the durability—of modern mass-produced furniture. As such, the scheme is a major step towards protecting shoppers from poor quality in a class of consumer goods that is notoriously difficult to judge.

The industry, through its trade association, the British Furniture Manufacturers' Federation, after long and often bitter debate has decided to ask for the development council to be wound up, as its counterparts in other industries have been. Under this plan, the BFM would take over the research functions now performed by the FDC. Last week the Furniture Development Council stated its own case in a letter to the President of the Board of Trade, questioning whether the BFM in fact possessed the financial resources or the organisation to carry on this research. The FDC is supported by a compulsory levy on the industry which brings it in a revenue of £22,000 a year; this levy and its compulsory nature has been a stumbling block to manufacturers who do not hesitate to pay heavy dues—voluntarily—to the BFM. There is some justice in the arguments of the Development Council, and they are likely to receive much support among the more thoughtful sections of the industry.

Mr Beswick Looks at Aircraft

MR FRANK BESWICK spent a year between 1950 and 1951 as a junior Labour minister in what was then still the Ministry of Civil Aviation. He has therefore a

certain amount of first-hand information about the aircraft industry, and the description of production methods—and even more the sales methods—of sections of that industry contained in the paper* he published this week have the stamp of authenticity. But the conclusions of his thoughtful analysis—and Mr Beswick has not made any facile, out-of-hand condemnations—are sadly disappointing.

Having described the soil that fosters the present difficulties, the excessive dependence on Government finance for the greater part of the research and development of the aircraft industry, and the absence of any genuine competitive incentive to produce successful designs; having then demonstrated that nationalisation would not offer any solution, Mr Beswick lamely concludes that what cannot be done by nationalisation might be done by making the state a partner in individual aircraft companies to the extent that it provides them with capital assistance. This after he has quoted Short Brothers and Harland as an example of a company that has shown no spectacular improvements since it came under public ownership.

In spite of minor inaccuracies and the use of some obsolete figures, Mr Beswick's arguments suggest that he really knows more about the aircraft industry than to assume that its malaise can be cured so easily. The Ministry of Supply, and through it the chiefs of Air Staff, already exercise close control over the activities of aircraft designers and production engineers. What is necessary today is not more state control, but a great deal less control at the early stages of design, so that projects can be financed as private ventures. (Private ventures today, however successful, find themselves handicapped by attempting to compete

* Plan for the Aircraft Industry. Frank Beswick. Fabian Research Series No. 176. 1s.

Turn in Small Savings?

THE sustained improvement in small savings that began during 1953 has been reversed in recent weeks. New purchases of savings certificates and defence bonds, and deposits in the post office and trustee savings banks have continued to fall significantly short of encashments and withdrawals—whereas at this season in 1954 and 1953 the drain of the holiday months had already been checked. But in the first three quarters

of 1955 as a whole net saving has still been larger than a year before—£33.3 million against £17.0 million. Net withdrawals from the savings banks have been higher, but this has been more than offset by increased net sales of savings certificates and defence bonds—bolstered by the increases in limits of holdings made last November; and sales of defence bonds should be further stimulated by the new issue at 4 per cent.

with government-financed projects ordered off the drawing board.) Full government support at the later stages of development, which is unquestionably necessary, would then have a better chance of being directed towards the more successful designs.

Sunbeam's Very New Look

THE new Sunbeam Rapide is neither a big car, nor a powerful car, nor an expensive car, but it sets a standard in styling and finish that other and bigger British manufacturers may find it difficult to equal. The Rapide is one of the few really new cars being shown by a major British maker at the Motor Show next week. Its lines are unquestionably American in origin but Rootes' stylists, who have acquired a high postwar reputation abroad, have added a sharpness and precision that is visually most attractive. So is the high standard of interior finish, with a padded and covered dashboard, the good visibility and the sturdy seating, and the extent to which the car has proofed against wind and dust.

There are not many mechanical innovations on the Rapide, except for the bold decision to include overdrive as standard fitting, giving in effect six forward gears. This is at present an expensive extra on all but the most costly cars. The engine is developed from the overhead valve unit fitted in the Hillman; the compression ratio of the engine has been stepped up to the high figure of 8:1, and the power developed increased from 43 to 57½ bhp. In this country, the price of the Rapide is £695, or £986 after tax. This puts it in the price range of Rootes' own Humber models, of the most expensive Ford product, the Zephyr convertible, and some of the more highly developed models of the British Motor Corporation. The existing Sunbeam sports models remain in production, at a basic price nearly £150 more than that of the Rapide.

New Uses for Sugar

THERE is not much doubt that the world surplus of sugar is temporary; the growth of population and of living standards should take care of it in time. But that time is still far off, and meanwhile other remedies must be found. One is the restriction of production; that is done by the International Sugar Council, but it is a negative approach because many producing countries have no alternative cash crop. The positive approach is to try to discover new uses for sugar. Work to this end is being carried on in several parts of the world, notably in the American continent and in the British West Indies. Bagasse, the waste product of the sugar cane, has for many years been used as a source of pulp and paper products, and recently it has been made to yield furfural, an intermediate in the manufacture of nylon (du Pont now buys over 13,000 tons of furfural a

year from a producer in the Dominican Republic). But the main need is to find new uses for sugar itself rather than its waste products. An account of recent developments in this research was given to the last meeting of the Sugar Council by the director of the American Sugar Research Foundation, Dr H. B. Hass:

Sugar, he said, is not only a food, "it is also the purest, most abundant, and one of the cheapest organic compounds available for synthesis . . . there is no obvious limit to the industrial demand for raw materials to produce plastics, detergents, paints, insecticides, synthetic fibres and the like. . . ." The synthesis of detergents and other surface active agents from fat and sugar, instead of from fat and petroleum-based chemicals seems to be one of the most promising discoveries. ("Hang a fat tail on to sugar" was evidently his order to the laboratory; in three years it was done.) The factory cost is estimated to be 13 US cents a lb, well below that of the petroleum-based product. Such detergents have applications in washing, toilet, pharmaceutical and food preparations, and are being tested for use in secondary oil recovery. If the chemical companies come to share Dr Hass's enthusiasm and belief in the value of sucro-chemistry it should not be too long before industrial uses absorb a sizeable part of the world surplus.

Industrial Assurance Progress

INDUSTRIAL ASSURANCE, despite its inviting new name of "home service assurance," continues to advance more slowly than the other forms of insurance. It has not for one reason had the tremendous push that the "top hat" policy and the group pension fund have since the war given to the ordinary branches of insurance offices. That does not prevent the industrial life offices from showing a record year for 1954, and since industrial offices tend to do both industrial and ordinary branch business from doing more than £500 million of new business for the first time. Taking the two branches together, the Industrial Life Offices Association has announced new business for 1954 of £523 million, an increase of £36 million on 1953 which had shown a smaller rise of £22 million on 1952. The total consists of £285.9 million (an increase of £9.2 million) on the industrial side and £237.2 million (an increase of £26.9 million) on the ordinary side.

The industrial branch funds alone at the end of 1954 stood at £1,022.4 million, a rise of £64.8 million over 1953. The industrial and ordinary funds of the industrial offices together at £1,683.7 million showed an increase of £114.6 million, so that the growth was heavily weighted towards the ordinary branches, partly reflecting some business in the ordinary branches that came from overseas and partly the excellent figures of the Prudential. Taking the calculation either way, as the industrial insurance funds, or as the insurance funds of the industrial offices, these funds represent an important sector of public saving—largely of small saving that, as the chairman pointed out this week, can stand comparison with the £6,100 million invested in "national savings" or the £1,800 million invested in the building societies.

May we give your old Mahogany a new lease of life

Vintage furniture, like vintage wine, is good only when it's properly kept. Many a favourite desk, table, cabinet or chair can be restored to all its glory. Catesbys Contracts have craftsmen who've spent the best part of a lifetime at this sort of thing. They can work wonders on furniture that was good in the first place—and save your capital into the bargain. Why not let Catesbys Contracts have one or two of your favourite pieces and see how beautifully they do this work!

OUR SHOWROOMS FOR IDEAS ON BUSINESS FURNISHING

SIR WILLIAM C. CURRIE, G.B.E.,
Chairman of the Peninsular and Oriental Steam Navigation Company
and British India Steam Navigation Company Limited

Serving a changing world

Have you ever considered the problems which faced British shipowners after the war and the way they surmounted them?

They had to decide where lay the future for British shipping faced with possible competition from the air, restricted by currency regulations and beset by expansion of the fleets of many other nations. In the light of these factors, decisions had to be made to make good the war losses—of which the P & O Group alone bore the tragic total of 371 ships amounting to 1½ million tons. In such a situation half measures would not do. Capital expenditure of many millions was sanctioned and scores of keels laid down in the shipyards of the country. This in a period of inflation and rising costs when the price of building ships of a similar tonnage could, and did, increase by £3 million within the short space of four to five years.

The fruits of this bold policy we see to-day. Fast modern passenger ships once again link Europe with India, Australia and the Far East, while the contribution of such experienced cargo carriers as the B.I. and the New Zealand Shipping Companies and the Hain Steamship Co., has ensured that more freight than ever is carried in British holds throughout the world.

The emergence of a new industrial Asia opens up vast opportunities for the shipping trade which this country should not ignore. I feel confident that with enterprise in administration, plus a reasoned conservative policy in financial matters, the future for this group and for British shipping in general, is bright.

Round about business premises

... there's always a need for Nairn Vinyl Tiles

Proprietors, managers and executives of business premises all over the country are specifying Nairn Vinyl Tile Floors. Housewives, too, are making enquiries at their architects or builders about Nairn Vinyl Tile Floors. Rapidly the news of Nairn beauty and serviceability is spreading throughout the country.

Nairn Wear-ability Since the floors of the 53 laboratories in the new Biology building of Nottingham University would be subject to continual traffic and exposure to all manner of chemicals, the university laboratories themselves tested various types of floor covering. Nairn Vinyl Tiles proved to be the most satisfactory and were used exclusively.

Nairn Clean-ability Grease, oil, mud . . . bleach, alkalis, cooking fats . . . all the things that might ruin an ordinary floor don't affect a Nairn Vinyl Tile Floor. And all that's needed to keep it shining clean is an occasional polish.

Nairn Versatility Nairn Vinyl Tile Floors can be laid on any kind of suitable level surface, upstairs, downstairs, or in a basement. As a design component the Nairn Vinyl Tile—available in 21 colours—is extremely versatile, too. AND LAST, BUT NOT LEAST, THE COST IS SURPRISINGLY LOW.

For years, both here and in the U.S.A., laboratory research and stringent practical tests have proved the wear-resistance of Nairn Vinyl Tile Floors.

Oil Buys More

THE orders placed by the oil companies with British industry, to supply their installations in Britain and overseas, have taken a marked upward turn this year. During the first six months they reached £63 million, as compared with £80 million for the whole of last year and £67 million in the whole of 1953. Early this year the Council of British Manufacturers of Petroleum Equipment hoped that orders this year might reach about £100 million—which would top the £91 million ordered in 1952, the peak year of orders for the British refineries that have since been completed. Today that forecast looks conservative: the volume of orders in the second half of the year, if 1954 gives any pointer, may well be of the same order as in the first.

To call the manufacturers who supply these goods "the petroleum equipment industry" is convenient enough, provided it is realised that most of them normally wear different hats. In the latest quarter on record the biggest single block of orders, as usual, was for bulk chemicals, £5 million worth: "automotive equipment," building materials, metals, electrical equipment, laboratory and hospital supplies, machine tools and miscellaneous machinery accounted for another £8 million or so, while "Commissary and general requisites"—which may range from typewriter ribbons to tennis balls—took more than £1½ million worth of orders. The Council recently announced that it proposed to hold talks with the oil industry at appropriate levels, to find out the oil industry's current supply problems, telling its members what those problems are, and so jointly trying to meet them. Since oil is an industry by no means backward or unpractised in making its complaints public knowledge—and since its complaints have not wholly abated in recent months—this seems a prudent if belated move by the Council.

Compensating Airline Passengers

AFTER some weeks of argument at The Hague, an international conference has agreed that the financial liabilities of airlines towards their passengers should be doubled from the present ludicrously low maximum of about £3,000 to £6,000. This increase was first discussed two years ago. Now, although they have been approved officially, the new limits will not come into force until 30 countries have ratified the agreement, a process that may take two or three years more.

When air transport started, the airlines behaved like any other form of transport: they paid damages on a scale assessed by the courts when negligence could be proved. In 1929 the international Warsaw convention came into being, under which the airlines automatically accepted liability in the case of an accident, to cut down litigation, but only on condition that their liability was stringently limited. The present figure is 125,000 gold francs; the revised agreement reached last week will double this figure—when enough countries have ratified—to 250,000 gold francs, which is higher than the 200,000 originally put forward but a good deal lower than the 375,000—or £9,000—asked for by the Americans. In

these days of scientific accident investigation, it is probably easier to settle responsibility for an air accident than it would have been in 1929. The airlines' automatic acceptance of liability in return for a financial limit on compensation no longer looks so generous, especially when the limit bears so little relation to the earning capacity of many of those who travel by air.

Stability in Raw Jute

IT is long since the Pakistan market in raw jute has been as stable as it has recently. For over three months prices have rested on the official minima for export, with firsts at £80 a ton cif Europe (the minima are fixed in sterling). A big crop depressed prices to the minima, and the severe floods and the disruption of transport failed to lift prices off the floor. The hold-up in shipments, however, quickened interest in supplies on the spot or afloat, for which premiums of up to about £5 a ton are still being paid. Shipping delays would have been less troublesome had not many spinners run down their stocks in the belief that Pakistan would be forced to reduce the minimum export prices in face of the big crop. That reduction was taken for granted when the Pakistan rupee was devalued at the end of July, and European manufacturers of jute goods are still smarting under their disappointment. Their resentment can be understood, if not condoned; though the sterling price of raw jute remained the same, the competitive power of Pakistan manufacturers was improved as a result of devaluation.

In contrast to the stability of raw jute, prices of jute goods have weakened owing to the lack of overseas demand. When Pakistan devalued its rupee India felt obliged to remove the export duty on jute goods; since then buyers have obtained the full benefit of its removal and more besides. The price of a 10-ounce 40-inch Indian hessian, for example, has fallen by 12s. to about 58s. per 100 yards fob, and only 5s. of that fall is accounted for by removal of duty. It is this weakness, not the devaluation of the Pakistan rupee as such, that has made it so difficult for European manufacturers to compete with India in world markets. The new Pakistan industry is not yet producing sufficient jute goods for export to hurt the Indian mills, but sample shipments have been made to all the big markets at prices that compete with India's.

In 1947 nationalism put a frontier between the jute goods industry in Calcutta and the jute lands of East Bengal; and nationalism demanded that India should become self-sufficient in raw jute and that Pakistan should make jute goods. These policies are now nearing fruition. As India takes from Pakistan something of its monopoly in raw jute, and as Pakistan takes from India something of its dominant position in jute goods, European manufacturers must pray that they will not be squeezed too badly in the competition for world markets.

New Move on Textile Labelling

FOR months past, the British Standards Institution has been discussing with the textile industries whether, and to what extent, it is desirable to tell the public what fibres

go into the clothes and furnishings that they buy. They are no nearer agreement than when the talks began. To break what is essentially an amiable deadlock, the BSI is now about to put its own inquiry on foot—to discover instead what the shopping public would like to be told. A questionnaire will be distributed on the lines of a normal market research inquiry, and the answers should provide evidence to prove whether informative labelling is really felt to be necessary, and if so what data a label should carry. The BSI has already conducted its own private experiments to show that few people can correctly identify textile mixtures—or textiles that have gone through special finishing treatment.

Many members of the textile industries accept in principle that this confusion should be avoided, but they cannot agree in practice on how the information should be conveyed on the label. Although standard definitions for wool cloths, including mixtures of wool with other textiles, have been in use for some years, the Silk and Rayon Users' Association recently published a report condemning informative labelling on the grounds that it was unworkable. The BSI's private market survey should provide some ammunition to meet these arguments.

The value to the public of informative labels does not rest on their convenience alone. Those who attempt to enforce the Merchandise Marks Act, which now forbids "misleading" as well as false descriptions of goods, believe that an agreement on labelling would greatly strengthen the Act—which remains the only real bulwark to protect the public from being fobbed off with inferior goods. This prospect justifies some further effort to devise a series of agreed labels.

Company Notes

COPPER DIVIDENDS. One conclusion implicit in the quarterly reports of the Selection Trust group of Rhodesian copper companies was an increase in dividend payments. Bigger dividends from bigger profits have been duly recommended. *Roan Antelope* will pay 4s. per 5s. share (or 80 per cent) for the year to June 30th, compared with 3s. 6d. per 5s. share (or 70 per cent) in 1953-54. *Mufulira* will pay 20s. per £1 share (or 100 per cent), compared with 15s. per £1 share (or 75 per cent). *Rhodesian Selection Trust*, which owns 63½ per cent of the Mufulira shares, will pay 4s. 9d. per 5s. share (or 95 per cent), compared with 3s. 6d. per 5s. share (or 70 per cent). All these dividends are subject to a Rhodesian income tax and surcharge at 7s. 6d. in the £. As British shareholders receive their dividends net of that tax charge (and have to settle their individual liabilities for British tax on the dividends with their own Inspectors of Taxes) it is customary to calculate yields net of the charge of 7s. 6d. in the £. On that basis and cum the latest dividends the 5s. units of Rhodesian Selection Trust yield about 6½ per cent at the current price of 44s. 9d. and the 5s. units of Roan Antelope yield about 9½ per cent at the current price of 26s.

A comparison between these current yields and those, say, of two or three years ago indicates the willingness of investors to reassess the potentialities of the Rhodesian copper belt. The companies' heavy capital investments, the

	Years ended June 30,	
	1954	1955
<i>Sales and profits:</i>		
<i>Roan Antelope:</i>		
Profit	9,036,563	10,818,759
Replacements	1,000,000	1,000,000
Profit, before tax	8,036,563	9,818,759
Taxation	3,308,000	3,896,000
Net profit	4,728,563	5,922,759
Ordinary dividends	3,932,114	4,493,844
Production (long tons)	88,678	82,697
Sales (long tons)	84,706	79,746
<i>Mufulira:</i>		
Profit	9,663,931	12,313,958
Replacements	1,250,000	1,500,000
Profit, before tax	8,413,931	10,813,958
Taxation	3,543,000	4,420,000
Net profit	4,870,931	6,393,958
Ordinary dividends	3,819,432	5,509,244
Production (long tons)	87,972	86,004
Sales (long tons)	84,467	83,155

change in domicile and the upward trend in profits all played a part in encouraging investors to take a longer and a more optimistic view. The latest increase in profits—Mufulira's earnings, after a bigger provision for replacements, have risen from £8,413,931 to £10,813,958 and Roan's, after the same charge for replace-

SHORTER NOTES

The Federation of British Industries has performed a useful service for the industrialist and the company secretary by publishing a digest of the three reports of the Royal Commission on the Taxation of Profits and Income and the two Millard Tucker Committee reports. The digest, prepared by Mr Frank Bower, chairman of the FBI taxation committee, reduces the 900-odd pages of these reports to a summary of 83 pages for five shillings.

★

Associated Electrical Industries has offered to purchase the whole of the ordinary share capital of the Hill Top Foundry Company at 4s. 6d. for each 1s. share. As the issued capital of Hill Foundry is £60,000 the bid thus involves £270,000.

★

The prospective merger has been announced of the Imperial Bank of Canada and Barclays Bank (Canada), the wholly-owned subsidiary of Barclays Bank Ltd. Barclays are already shareholders in the Imperial Bank, and the amalgamation will give the group a substantial minority interest. The new business will continue under the name of the Imperial Bank of Canada and four directors of Barclays (Canada) will join the board. They include Mr J. S. Crossley, chairman of Barclays Bank DCO.

ments of £1 million, have gone up from £8,036,563 to £9,818,759—is but another straw in the wind.

A pleasing tailpiece to the Rhodesian Selection Trust results was the preliminary statement from *Tanganyika Concessions*. That company, too, has increased its dividend—from 55 per cent to 70 per cent for the year to July 31st. Through its holdings in Union Minière du Haut Katanga, Tanganyika Concessions has an important stake in the production of copper and cobalt—to say nothing of uranium—in the Belgian Congo. It also controls Benguela Railways. The bigger dividends and royalties from Union Minière are reflected in the advance in the net profit of Tanganyika Concessions from £2,519,282 to £3,000,830. Another titbit for investors in "Tanks" was the declaration of a maiden dividend by Benguela Railways and the elimination of that company's debenture interest arrears. "Tanks" holds 90 per cent of that debenture and its preliminary statement shows the receipt of £579,302 from the payment of these arrears.

★

HORLICKS. An increase in the Horlicks dividend is more than an event. It marks the end of a generation. From before the war the company has paid, come rain or shine, a steady 30 per cent on its ordinary capital. For the year to

March 31st last the directors have added a "bonus" of 5 per cent to that dividend, making 35 per cent. The 5s. ordinary shares have always had only a limited appeal, attracting only those investors who looked for income and not for capital appreciation. Even an unexpected bonus is unlikely to add any more life to the market. Indeed, after the dividend announcement the "middle price" remained unchanged at 21s. 6d. so that on the new dividend the 5s. shares offer a yield of about 8½ per cent.

The bigger dividend is amply justified by earnings. Profits before tax have risen from £497,527 to £749,108 and after tax they have gone up from £219,431 to £340,794, from which the ordinary dividend absorbs £123,698. The latest earnings include a credit of £70,428 (against £37,861) arising from the sale of investments and assets. Of that sum reserves—has accrued from the sale of American assets. In the last few years Horlicks has found it difficult to penetrate the American domestic market with its products and just about a year ago the chairman spoke of the "disposal of surplus buildings" in the United States. The sale of some of the American assets makes sense, particularly as the need to supply export markets from the American factory has largely ceased. The new Australian factory has been designed to supply these export markets. Nor is the sale of a not particularly profitable bunch of assets in contradiction to the company's efforts to widen its range of products.

WILLIAM DOXFORD. This shipbuilding and marine engineering

company has enough orders in hand to keep its yards fully occupied for at least another twelve months. In the last few years its profits have benefited increasingly from its capital development and modernisation programme. Hence the fall in trading profits (from £914,088 to £844,665) in the year to June 30th last must be attributed largely to rising costs, though the irregular pattern of contract completions running inevitably across the trading years rules out strict comparison of one year's profits with another's. But net profits, almost unchanged at £357,230, have been cushioned by the investment allowances on the company's heavy capital outlays. In the last financial year £578,000 was spent on new buildings, plant and machinery and the investment allowances of £43,000 on that expenditure have materially reduced the year's taxes. In fact, the tax provision is only £286,000, compared with £453,000 in 1953-54. The directors must have been satisfied with the trend in profits for they have increased the ordinary dividend from 15 to 17½ per cent. Ex that dividend the £1 ordinary stock units at the current price of 63s. yield £5 11s. per cent.

The directors can now report that "the work on the re-organisation of the shipyard and extensions to the engine works has now been substantially completed." The company's "quick" assets—at the end of June they added up to over £1,500,000—are more than sufficient to cover the remaining items in the development programme. Few boards can be as happy on the score of working capital. William Doxford's balance sheet at the end of June shows that instalments received on account of work-in-progress (amounting to £2,809,068) actually exceeded the valuation of work-in-progress at cost (amounting to £2,272,295).

LONDON STOCK EXCHANGE

Next Account begins: October 19th
Next Contango Day: October 19th
Next Settlement Day: October 25th

CONSIDERABLE buying of gilt-edged securities occurred on Monday when 2,399 bargains were marked in this section and gains of up to 1½ were made. That was one half of the market's reaction to the promises of a stiffer policy contained in the Bournemouth speeches of the Chancellor and the Prime Minister. The other half was the four point fall in the Financial Times industrial index on Friday. Investors continued to take advantage of the prevailing yields to buy long and medium dated gilt-edged stocks, Treasury 3½ per cent 1977/80 rising to 86 before profit taking on Wednesday brought the price down to 85½. Some selling of short-dated stocks developed after the details of cash and conversion offer for the 3 per cent Serial Funding Stock 1955 were announced.

Bear covering after the sharp fall in industrials last week produced a correspondingly sharp marking-up of prices in the thin market on Wednesday. The *Financial Times* index of industrial shares rose from 181.8 to 185.1, recovering most of the loss suffered on Friday.

Less interest was shown in foreign bonds and most sections declined. Japanese issues improved after being weak but German stocks continued to lose ground on reports of Dr Adenauer's ill-health. Although banks continued weak on Monday the strength of gilt-edged encouraged slight advances later, Barclay's rising to 48s. 9d. and Westminster "B" to 77s. 6d. Insurance stocks also benefited from renewed interest. Engineering and electrical shares improved considerably on bear covering, and steel issues were further helped by the increase in output. In a good market for paper shares, A. E. Reed ordinary rallied to 90s. after closing last week at 85s. Oil stocks responded to buying after their recent fall, British Petroleum regaining 3s. 1½d. to 101s. 10½d. and Royal Dutch ½ to 55½. Kaffirs brightened on Wednesday in anticipation of the quarterly reports, Free State Geduld rising to 4½.

THE MONEY MARKET

At the Treasury bill tender last week the discount houses bid at £98 19s. 8d. per cent, equivalent to a discount rate of just over 4½ per cent, for the sixth week in succession. The offer was down by £10 million to £270 million, and as applications rose slightly to £361.4 million the market's allotment fell back from 70 to 66 per cent. At yesterday's tender the offer was reduced by a further £10 million, but maturities next week will fall by £20 million, to the same level as new bills.

The credit stringency in Lombard Street has continued through the past week; rates for overnight money have ranged up to 4½ per cent, and December maturities have been resold by discount houses at 4½ per cent (though the more general rate has been 4½ per cent). Three or four houses were "in the Bank" on Thursday before the weekend, and one or two, for a very small amount, on Wednesday of this week. Special purchases by the Bank were necessary on Saturday and Tuesday.

Sterling topped \$2.79 this week, and the discount on sterling three months forward narrowed to 1½-1¾ cents.

The price of silver in London has risen to 80½d. an ounce cash. The gold price has fallen to around 250s. 7d. a fine ounce.

The Bank return shows a reflux of notes of £1.5 million.

VULCAN INSPECTS—AND PROTECTS

The crane with a load of mischief

RAISING a load of scrap just so far was one thing. But raising it that extra foot or two was another, and what with the increased acceleration and the jib angle, this mobile monster simply fell flat on its face.

What Vulcan say about it

No crane, mobile or otherwise, can be expected to do more than the lifting job for which it was designed. If it does, then accidents will happen, as sure as our name's Vulcan. Our Engineer-

Surveyors scent danger before disaster, and industrial machinery is their happy hunting ground. Everything, from a boiler to a vacuum vessel, comes under their expert eyes and receives that specialist scrutiny for which Vulcan is renowned. That's why safety first is Vulcan first.

FREE: For news of industrial accidents and ways to avoid them, ask us for 'Vulcan,' a quarterly journal for Power users. Please write to Dept. 17.

COMPANY MEETINGS

DAVY AND UNITED ENGINEERING COMPANY

MR D. F. CAMPBELL REVIEWS PROSPECTS

The eighty-second annual general meeting of the Davy and United Engineering Company Limited was held on October 7th at the Royal Victoria Station Hotel, Sheffield.

Mr D. F. Campbell, the Chairman, who presided, said:

Stockholders will learn with regret of the recent death of Mr K. C. Gardner, at the age of 78 years, who was a Director of this Company for 16 years and Chairman of our American Associates, United Engineering and Foundry Company. We have always been grateful to our American friends, and to Mr Gardner in particular, who was an outstanding personality in the engineering world, for their assistance in the development of the strip mill, which has revolutionised the tin-plate industry. His death will be keenly felt by his many friends on both sides of the Atlantic.

YEAR'S FINANCIAL RESULTS

The financial results of the year under review are shown in the Accounts and summarised in the Report of the Directors. Stockholders will note that the Trading Profit of the Group has increased from £551,742 to £626,153 and that the net profit, after the deduction of provisions, is increased from £264,862 to £365,014. The Directors feel that past results and future prospects justify an increase in the dividend from 10 per cent to 12½ per cent on the capital increased as a result of last year's Rights Issue.

I am glad to be able to report a further improvement in the productivity of our manufacturing plants, which is due not only to the consistent policy of plant renewal and the maintenance of productive assets at a high pitch of efficiency, but also to advances in manufacturing technique. Added to this, your Company is served by a fine body of staff and workpeople, whose enthusiasm and hard work have contributed much to the year's results. On your behalf, I offer them our warm thanks for their efforts and devotion.

LARGE ORDERS FOR STRIP MILL EQUIPMENT

In my Statement two years ago, I referred to the large orders for strip mill equipment which we had received from Richard Thomas and Baldwins Limited, and the Steel Company of Wales Limited. The wisdom of these companies in deciding to extend their plants at that time is amply justified by the large and increasing demand for thin flat rolled products which has taken place. This year it is estimated that 80,000 tons of duty-free tinplate will be imported, in spite of the continuing use of obsolete mills which must soon be abandoned or replaced. I am glad to say that the 5-stand Tandem and Temper Mills for the Ebbw Vale Steel Works were delivered promptly in accordance with our contract undertaking and that the similar mills for the Velindre Works of the Steel Company of Wales, while not yet due for delivery, have progressed fully in accordance with our manufacturing programme.

We have also put to work new rolling mill installations in Norway, Sweden, Italy, Australia and India, whilst several other important export contracts have been shipped,

notably to Turkey and again to India. This is a reflection of the large volume of export trade which your Company is undertaking.

COMPETITION IN EXPORT FIELD

International competition in the export field is becoming ever more severe and several of the projects which lie before us involve questions of payment on deferred terms. Indeed, the availability of credit for capital goods required by the so-called under-developed countries in particular is checking the flow of exports and there is a continuing need for the assistance given by the Government in this respect. Competition in credit facilities from Germany and France is especially serious, while the large quantity of dollars made available to foreign countries by the USA has diverted to America orders which might have come to this country under normal conditions.

We have, however, recently secured additional export contracts in Australia and in Sweden, and the prospects of further orders, both at home and abroad, continue to be good. Great care and judgment have to be exercised to determine what foreign contracts are truly advantageous.

SUGAR MACHINERY

The Sugar Machinery Department of our Duncan Stewart subsidiary has had a satisfactory year and the successful commissioning of a number of Continuous Beet Diffusers for the British Sugar Corporation is noteworthy.

Davy and United Roll Foundry has also made a substantial contribution to Group Profits from the sales of rolls and steel castings. Much consideration is being given to the development of your roll business, as rolls are consumable and their manufacture is a regular source of income during periods when capital expenditure on major installations may slacken. Consequently, this branch of the business adds stability to the Company's profitability. The output of spare parts, which are a valuable source of income, increases as new large units of equipment are put into service.

ENGINEERING RESEARCH

The new Engineering Research Department, to which I referred last year, has contributed to the successful results. Much light has been thrown on abstruse technical problems relating to the strength of rolling mill structures, by the use of strain gauges and other modern methods of investigation, and the manufacture of special instruments has become established, constituting a small but profitable department.

We still have an order book of great magnitude which, if all goes well, should yield good financial results during the next two years, and the shortage of thin flat rolled steel in the United Kingdom suggests the continuing need for steelworks expansion, of which your Company may reasonably expect to secure a share.

MEETING CHANGING CONDITIONS

Being mainly engaged in the construction of heavy machinery for the metal and sugar

industries, any question of disarmament will have little effect on your Company's activities. Your Management are frequently reassessing the probable market conditions two or three years ahead and adapting their technical and manufacturing resources accordingly.

Science and technology are moving at a great pace, but there are no indications of any slackening in the demand for wrought metals, or for the heavy machinery for the working of metals, which is the mainstay of your Company.

The report and accounts were adopted and the other formal business having been transacted, the proceedings terminated.

E. W. TARRY & COMPANY

ENCOURAGING PROSPECTS

The annual general meeting of E. W. Tarry & Company, Limited, was held on October 12th in London, Sir Harold F. Flannery, Bart (the Chairman), presiding.

The following is an extract from his circulated statement:

The turnover for the past financial year reached a record figure, yet the Trading Profit at £110,326 is lower by £31,242 than that of the previous year.

The main reason for this is that certain branches were unable to maintain profit margins at their previous levels because of intensive competition and also owing to the continued rise in costs throughout the organisation.

In view of the decrease in the net profits, the Directors recommend a dividend of 12½ per cent on the Ordinary shares.

Now that Import Control is being gradually relaxed, the demand for overseas goods has increased and the need for more working capital became pressing. It has also been found necessary to extend and modernise the Company's premises at several branches. Consequently, in April last, arrangements were made to raise a First Mortgage Debenture Issue of £350,000 at par, bearing interest at 5½ per cent, the redemption to commence on March 31, 1961, and be completed by March 31, 1980. The Issue was made privately, and the proceeds were applied in paying off our indebtedness to the Bank, and the balance invested to be utilised as and when required.

The turnover for the first five months of the current year is higher than that of the corresponding period last year, and with the development and increasing wealth of the Union and the Rhodesias the prospects can be looked upon as encouraging.

The report was adopted.

BINDING CASES

Binding Cases for *The Economist*, taking thirteen issues of the normal edition or 26 issues of the air edition, can now be supplied at a cost of 11s. per case, post-free throughout the world. British Films' Continued Success

Record Group Trading Results—Export Rise Continues

NET ASSETS NOW EXCEED £9,000,000

Manufacturing activities progress—but exhibition still bears unreasonable tax burden

The eighteenth annual general meeting of Odeon Theatres Limited and the Annual Meetings of its subsidiary companies, British and Dominions Film Corporation Limited, Gaumont-British Picture Corporation Limited, Odeon Associated Theatres Limited, and Odeon Properties Limited, were held on October 7 at the Dorchester Hotel, London.

Mr. J. Arthur Rank, D.L., J.P., the chairman, presided.

The following is an extract from his statement which had been circulated with the report and accounts:—

The Group Accounts, which I now present, disclose a further improvement in trading profits and a satisfactory financial position. The results, once again, constitute a record.

There have been many problems to face during the year, including the full cost of the wage increases granted last year and in particular television. In the last three years almost three million new licences have been issued creating materially increased competition. Fortunately, a modest revision in entertainment duty granted in the 1954 Finance Act, and the consequent adjustment of admission prices, coupled with a stringent control of outgoings, enabled us to show a net gain in exhibition profits.

Profits on film production and distribution were largely maintained and our policy of Group film production has certainly been justified.

The further improvement in the profits of the Group manufacturing activities is most satisfactory, and this now constitutes an important side of our business.

Odeon Theatres Limited

The Capital and Revenue Reserves at June, 1955, amounted to £5,724,014, of which £3,107,109 appears in the separate Balance Sheet of Odeon Theatres Limited, and compare with an Issued Ordinary Capital of £946,991.

Bank Loans and Overdrafts amounted to £4,190,515 at June, 1955, and show a further reduction compared with the previous year.

I mentioned last year that additional bank facilities of almost £1,000,000 had been employed in financing the Group Film Production Scheme, and this position still exists.

During the year substantial capital expenditure has been incurred, as a result of which the Group is being materially strengthened and I am happy that our financial resources are sufficiently strong to enable the Group to expand when opportunity offers.

In spite of the extension in the Group's interests you will see that, in fact, the bank indebtedness has been reduced during the year by £977,284.

Turning to the Assets Side of the Balance Sheet, Freehold and Leasehold Land and Buildings, the total cost, etc., of these fixed assets at June, 1955, was £58,342,626.

Cinema Theatres are included in the above total at a net book value of some £36,000,000

represented by 594 theatres in the UK and 141 theatres overseas. The replacement value of these theatres at present day costs would be vastly in excess of book value.

The total trading profits show a substantial increase at £8,727,035 compared with £7,704,084 for the previous year. This constitutes another record. After providing £1,618,674 for depreciation, and charging interest, etc., the Group profit for the year is £6,606,988, compared with £5,524,129 for the previous year.

Taxation still constitutes a heavy burden and requires £3,653,815, leaving a net Group profit after tax of £2,953,173 compared with £2,264,655.

After deducting the proportion of net profits applicable to outside shareholders, the net Group profit attributable to Odeon Theatres Limited is £1,327,939 compared with £1,031,080.

The statement then reviews the activities of Odeon Associated Theatres Limited, Odeon Properties Limited, Gaumont-British Picture Corporation Limited and British and Dominions Film Corporation Limited, and continues:—

British Optical & Precision Engineers Limited

This Company and its subsidiaries had a successful year's trading due to a marked expansion in turnover in which all sides of the Group's business contributed.

The Trading Profits for 1954 amounted to £1,399,284 compared with £652,884 in 1953. The available net balance was £310,400 compared with £160,584.

We have continued to make progress in our overseas markets. Exports in 1954 were more than 40 per cent. above those of 1953. It appears from figures recently published by the Board of Trade that our Group is now delivering approximately 70 per cent. of the export turnover of this country in the products which it handles.

Cinema-Television Limited and Bush Radio Limited

Cinema-Television Limited and its wholly owned subsidiary company Bush Radio Limited, have had a further year's successful trading. The policy of developing and broadening the business of the Parent Company has been continued.

The Consolidated Profit and Loss Account shows net Group profit of £428,764, compared with £305,650.

The increasing interest overseas in the Company's products has been particularly gratifying.

Bush Radio Limited continues to achieve a record turnover and record profits. Prospects as regards television are good.

Theatre Publicity Limited Screen Audiences Limited

J. Arthur Rank Screen Services Limited
I am happy to say that under the direction of the Managing Director, Mr. Gerard

Holdsworth, the Companies have had a record year and the facilities which they have to offer to advertisers, advertising agents and the public have received great appreciation.

We are taking an active interest in the making of films for Television and have formed a "live" television unit.

Personnel

In previous years I have paid tribute to the services rendered to the Group by Mr. John Davis, the Deputy Chairman and Managing Director. I would like to emphasise the very great contribution he has made in the achievement of the satisfactory financial and trading position which this Group now enjoys.

On behalf of the Boards of the various companies and of the shareholders generally I would like to thank him for his outstanding services during the year.

I am satisfied that we have now in the Group an able team of Executives in all Departments who are receiving enthusiastic and wholehearted support from the whole of our manpower in this country and overseas. I, on your behalf, as well as on behalf of my colleagues and myself, would like to thank each one of them for the part which they have played in furthering the activities of the Group.

We have continued with our Pension, Medical and other Welfare Schemes for the benefit of our employees.

Film Production—British Film Production Fund

Our production programme, which is achieving a measure of success, would not have been possible without the aid of this Fund. I reiterate what I said last year, that it is my considered opinion that British production cannot be maintained on an economic basis over a period without financial assistance so long as we do not receive a reasonable share of revenue from the American market, particularly bearing in mind the large sums which that country receives from the exhibition of their films in this country.

The Fund was due to expire in August last: after considerable discussion within the Industry the arrangements were renewed upon a voluntary basis for a further period of three years.

I regard it as a matter of major importance that the future of the Fund be set up in such a manner that its continuity will be assured.

Our theatres played during the year 40 programmes where the first feature was a British film. Of these 19 were films made and financed by us, so that you will see that over half of the British films played by us were ones in which we had no financial interest and were made by Independent Producers.

Entertainment Tax

The unreasonable burden of Entertainment Tax remains with us. In this country

our Group took at the box-office last year £29,461,579 and paid in Entertainment Tax £10,376,630, being 35.22 per cent. of the year's receipts.

It is in the national interest, as well as of this Industry, that this problem receives sympathetic consideration by the Chancellor of the Exchequer, particularly in view of the pending increase in competition from sponsored television. It could follow that unless the problem is tackled in time the net result would be a material loss of revenue to the Exchequer.

Exhibition

Domestic. We have equipped all our theatres with large screens, variable anamorphic lens, etc., which enables us to play any type of product, CinemaScope, VistaVision, etc.

I am pleased to tell you that of the 24 best box-office attractions played on our two circuits during the year 12 were British and 12 were American and the receipts from these two groups were almost exactly equal.

Overseas. Our overseas theatres, both those directly operated by us and those in which we are in association with partners, have with one exception continued to make progress, some of them having a record year.

Distribution

Domestic. This is the fourth year in succession that our distribution company has shown an increase in its total turnover.

Overseas—

Eastern Hemisphere. We have continued to make progress in the distribution of our films in overseas markets.

Western Hemisphere—United States. It is with regret that I have to report that in our opinion we are still not receiving a fair return from that market.

Dividends

Gaumont-British propose 15 per cent. as against 12½ per cent. a year ago. British

and Dominions Film Corporation propose 6½ per cent. as against 5 per cent. a year ago. Cinema-Television Limited propose 45 per cent. as against 30 per cent. a year ago. British Optical & Precision Limited has paid an Ordinary Dividend of 15 per cent. for the year ended December 31, 1954, compared with 5 per cent. for 1953.

Dealing now with Odeon Theatres Limited I think that the continued progress of the Company justifies the payment of an increased Ordinary Dividend. The Board therefore recommend that the Ordinary Dividend for the year ended June, 1955, should be at the rate of 25 per cent. on the existing Ordinary Shares of the Company as against 15 per cent. last year.

Capitalisation Proposals

It is obvious that the Issued Ordinary Capital of Odeon Theatres Limited, namely £946,991, is entirely out of line with the equity capital employed. The Group Reserves applicable to Odeon Theatres Limited at June, 1955, amount to £5,724,014 and the proportion of such Reserves in the separate Balance Sheet of Odeon Theatres Limited amounts to £3,107,109.

It is therefore proposed to capitalise £946,991 of the existing Reserves and to issue new free Ordinary Shares to the shareholders of Odeon Theatres Limited on a one-for-one basis.

It is also proposed to create 8,000,000 non-voting "A" Ordinary Shares of 5/- each, having the same rights as the existing Ordinary Shares except as to voting, which will be available for issue for cash or as consideration for the acquisition of further interests.

If this proposal is approved by the shareholders at the Annual Meeting, then it is proposed to issue approximately 5,500,000 of these shares, such shares being offered to the existing Ordinary shareholders upon suitable terms which will be governed by the market conditions at the time of issue.

The proceeds of the proposed issue, which has the sanction of the Capital Issues Com-

mittee, will be applied in reduction of bank indebtedness.

Change of Name—Odeon Theatres Limited

The world-wide distribution and exhibition of the films made by the Group has built up a very valuable trade name and trade mark, coupled with the "man-with-the-gong" symbol. We are therefore proposing a resolution at the Annual Meeting to change the name of the Company to "The Rank Organisation Limited," which title in our opinion will be more representative of the activities of this Company.

The Future

I am certain that the cinema will continue to occupy an important part in the life of the people of this country and of people throughout the world. The competition of television and other alternative forms of entertainment is a healthy factor of which we need have no fears provided we maintain the entertainment value of our films and the comfort and efficient service of our theatres.

I cannot prophesy the future as regards our trading results, but I am satisfied that each year the Group's position is being strengthened. I have no doubt that in the absence of circumstances beyond our control we shall give a good account of our activities in the future.

At the meeting of Odeon Theatres Limited the report and accounts were adopted, and at separate class meetings followed by an extraordinary general meeting the Board's proposals regarding the company's capital and alterations to the Articles of Association were approved. Agreement was also given to the proposed change of name to "The Rank Organisation Limited."

At meetings of each of the other companies, the report and accounts were adopted.

* A copy of the Chairman's full statement and Annual Accounts may be obtained from The Rank Organisation Limited, 38 South Street, London, W.1.

MANUFACTURING INTERESTS...

"The further improvement in the profits of the Group's manufacturing interests is most satisfactory, and this now constitutes an important side of our business."

Taylor, Taylor & Hobson Ltd. manufacture the finest lenses in the world. They also make engraving machines, one of which is seen here engraving the name and details on a lens mount.

ENTERTAINMENT TAX...

"Unless this problem is tackled in time the net result would be a material loss of revenue to the Exchequer."

Each £1 taken at the box office of all Cinemas in the United Kingdom in 1954 was divided in the following way		
6/6	ENTERTAINMENT TAX	
2/11	PRODUCTION Paid to the producer via the distributor for hire of film.	
6d	BRITISH FILM PRODUCTION FUND Levy to central fund divisible between producers of British films.	
1/8	DISTRIBUTION Print and other distribution costs. Distributors' remuneration to meet selling and administrative expenses, etc.	
8/5	EXHIBITION The sum available to the Exhibition Industry to cover all operating and administrative expenses, service of capital invested and maintenance and replacement of buildings and equipment.	

Diagram based on Board of Trade Statistics of division of Box Office takings

To help enlarge the circle of Britain's friends, no less than to provide good entertainment, is both the business and the privilege of
THE RANK ORGANISATION LIMITED

HOLLAND—Typical of Holland's modern transportation facilities is the "Koningin Juliana." This palatial Diesel-powered ferry carries 75 automobiles and trucks and 2,000 passengers between the islands of Zeeland province. The "Koningin Juliana" is lubricated exclusively with Caltex products. Caltex is proud of its share in such advances in the transportation system of this historic land.

INDONESIA—Exploring and drilling for oil in the Minas field, Caltex employs mostly nationals, a Caltex policy in all lands. Men—like this surveyor's helper—are trained in the many skills required by the oil industry, all of which give high income opportunities. The Republic of Indonesia benefits from development of its resources producing new government revenues.

SOUTH AFRICA—Fabulous land of gold and diamonds, South Africa is experiencing vigorous growth and modernization. Here in the shadow of the famous "Table Mountain" is the warehouse area of the Caltex Cape Town terminal—storage place for the fine fuels and lubricants for increasing numbers of motorists who "Travel the Caltex Way."

CALTEX serves the people of 67 lands

IN 67 LANDS—across half the world, through such developments as these, Caltex is able to supply better fuels and lubricants for industry, for agriculture and for motoring millions. These require a continual investment of funds and skills, backed by a faith in a better future for free nations.

Collector's Corner

A Painted Lady perhaps... what a prize for a youthful collector! But the obsolete machinery and metal scrap in the factory yard is a collector's item, too—for an organisation like Thos. W. Ward Ltd. who have the facilities to handle it on a large scale.

Scrap metal accounts for more than half the metallic charge fed into Britain's iron and steel furnaces. Much of this passes through Wards' depots where mountains of metal are sorted and processed every day.

In these modern times, scrap has become an industry itself, and, as in many other fields Wards are in the forefront of the industry.

THE MARCHING WIND

LEONARD CLARK's gripping record of a search for a mountain higher than Everest.

A WARTIME PILOT, flying off course in Central Asia with his altimeter showing more than 29,000 feet, found himself looking up at a mountain towering above him. It was Amne Machin. No white man had ever stood on its slopes.

In 1949, Leonard Clark, a tough American explorer, persuaded the Chinese general, Ma Pu-fang, to equip him with an expedition to solve the riddle of this uncharted peak. In his book "The Marching Wind," Clark has told the full story of his incredible journey, of how—dressed for safety in Tibetan clothes—he penetrated the unknown lands north-east of Tibet.

This is an absorbing story of an almost unknown people, of the curious mysticism of the Lamas, of feasting and temples, of savage fighting... above all, of Amne Machin itself, dazzlingly beautiful, worshipped as a god, jealously guarded by fanatical Ngolok tribesmen.

A 16,000-word book condensation of "The Marching Wind" is published as a PRESENTATION SUPPLEMENT in **JOHN BULL** OUT WEDNESDAY, 26th OCT. — 4d.

You can tell a Vantella!

You can tell it by its perfectly groomed Van Heusen collars and cuffs. You can recognize its air of easy comfort—its unshrinking neckband, its ample room in the chest, its coat-style cut... Yet, for all its good manners, it's only 49/-

VANTELLA

MADE-TO-MEASURE OR OFF-THE-PEG?

Would you rather have one beautifully tailored suit than ten "off-the-peg"? Do you like something that carries the personal touch of skilled craftsmanship rather than the hurried look of mass-production? Then you are obviously a perfectionist, and when it comes to buying a briefcase only a Unicorn will satisfy you. You will appreciate the superb workmanship of a Unicorn—beautifully stitched and hand-finished in natural leathers and carefully designed to give capacity without bulk; to carry all that a businessman might need yet still retain a handsome slimness.

The immaculate model illustrated is a "Combination" case in two senses: (a) retractable handles permit under-arm use as a *folio* case or, when the contents are more bulky, carrying as a briefcase—(b) the unique lock is a precision-made brass combination lock of miniature proportions designed for exclusive use on Unicorn products. Seven roomy compartments for files and loose papers, and two small ones for business cards, etc. Model C.F. Natural coach hide, 18" x 12", £8.8.0 (15½" x 10½", £7.18.0). Golden tan or Autumn tan pigskin, 18" x 12", £9.13.0 (15½" x 10½", £9.3.0). Hand grained black morocco, 15½" x 10½", £10.10.0. All are available without lock—less 10/6d. Post free and tax free in U.K.

Obtainable at the Unicorn Showroom, 39, Burlington Arcade, Piccadilly, W.1. (Phone Hyde Park 8939) or by post direct from the work benches at Woodhill Works, (Dept. E.T.9) Bury, Lancs. Bury 2133. U.S.A. Orders and enquiries: Sterling International, 225 Kearny Street, San Francisco, 8, Cal.

Retractable handles for under-arm use.

Miniature Combination lock—exclusive to Unicorn.

UNICORN LEATHER CO. LTD.

A precision-built typewriter, the Olivetti Studio 44 is designed with the painstaking attention to efficient detail that distinguishes all Olivetti products. Its completeness and versatility give it an essential place in the small busy office, where it will stand up to any amount of heavy work.

86 character keyboard - Full length platen - Carriage on roller bearings - Key-set tabulator - Personal touch tuning - Standard size ribbon spools - Half spacing - Attractive carrying case.

Mrs. Chapman's busy day

MRS. CHAPMAN is a housewife. Her husband runs a prosperous and expanding firm of builders' merchants in a town not far from the Surrey-Hampshire border. They live with their two small sons in a large house on a wooded slope a few miles out.

Mrs. Chapman has plenty to do, even though she has her own small car in which to get around and a full-time man to look after the garden. The children want watching and there are the hundred and one chores that have to be done even in a modern labour-saving home. Besides, her husband is president of the local ratepayers' association, which means rather a lot of voluntary secretarial work for her in the evenings.

There was quite a stir in the village when she was chosen to represent Surrey in a national floral decoration contest, and a brand-new enthusiasm for 'Sunday painting' has aroused great interest among her colleagues in the Women's Institute. Yes, she is indeed a busy woman.

Mrs. Chapman reads *The Listener*—chiefly for its reports of broadcasts on social problems, for the book reviews, and to keep in touch with the London art exhibitions; but she is always intrigued to discover how interested she becomes in

an article about a foreign country, or some industrial topic. Yet she is but one of thousands* who find that *The Listener* satisfies a need for stimulating and varied reading.

The Listener does have this unique influence among well-informed people, who in their turn enjoy considerable local prestige. Advertisers who wish to appeal directly and economically to a selective market of people of influence and discrimination will find no better medium than the advertisement columns of *The Listener*.

GRUNDIG bring the advantages of the dictating machine to every office — large or small...

THE STENORETTE does all that is required of a dictating machine—takes a full 25 minutes' dictation per spool; records meetings or conferences verbatim; records both sides of telephone conversations; notes down your engagements and other information that cannot be left to memory. It automatically adjusts the level of the recorded voice, suppresses background noises and plays back with an even, well modulated clarity that makes transcription clear to you as well as your typist. The tape can be used over and over again. Because of its robust construction, the Stenorette is genuinely portable and can be used for recording meetings or reports away from your office. Whether you employ one typist or many, the Stenorette can double their output while saving you time and money. Its operation is simplicity itself.

A fully descriptive folder is available, or your radio, photographic or office equipment supplier will be pleased to arrange a demonstration.

CADBURY'S REDUCE PRICES of chocolate biscuits

Mr. Laurence J. Cadbury, *Chairman,*
Cadbury Brothers Limited

*"Traditional policy of
downward
price adjustment"*

On the 26th September Cadburys announced the reduction in price of five of their biscuit lines, the reductions ranging from 1d. to 4d. per pound. Almost exactly a year before, on the 17th September, 1954, a new factory at Moreton on the Wirral peninsula was opened. It was built to specialize in the manufacture of chocolate biscuits by the most efficient modern methods.

We are glad to say that the new factory and plant have produced economies. In accordance with our traditional policy, as stated by the Chairman Mr. L. J. Cadbury, earlier this year, we are at once passing on the advantage to the public.

Milk Assorted	½ lb. 2s	2/0d.
Milk Shortcake	½ lb. 1s	1/10d.
Milk Wafer	½ lb. 2s	2/1d.
Choco'ate Sandwich	½ lb. 2s	1/11d.
Orange Sandwich	½ lb. 2s	1/11d.

Cadbury's new factory at Moreton on the Wirral peninsula, opened in September, 1954

Photographed for PICTURE POST by Bert Hardy

Who chooses the car?

Father pays of course—as always. So he is the one who has most say on how much, how big, how many to the gallon. But Mother has views of her own, especially about colour and comfort. Jimmy won't look at anything that's not a 'proper job' from boot to bonnet, and Joan, while trying the cushions, has a shrewd eye for whether the back will take the neighbours' Labrador standing up. Choosing a car is a family affair.

And to make it more likely that it's your car they choose your best and cheapest way is to advertise in a magazine that goes right round the family and stays around a whole week—often more. Your best family magazine is PICTURE POST. It goes into over 1½ million households. It is read by 5 million people every week. It clinches innumerable family purchases.

LIFE Talks Business

Who could do a job like this?

Maintaining contact with the people who hold the key to business in the world is a job which must be done by any company that hopes to increase its share of the international market.

Leading companies everywhere are doing this job very successfully through their advertisements in the two international editions of LIFE.

LIFE INTERNATIONAL's selective circulation around the world is complemented by LIFE EN ESPAÑOL's top-of-the-market circulation in Latin America. Between them these editions cover 120 countries outside the U.S. and Canada once a fortnight. 95% of the sub-

scribers to the LIFE international editions are in business, the professions or government. Four out of five subscribers in business are senior executives—company presidents, chairmen, managing directors, owners and partners.

LIFE INTERNATIONAL—average net paid circulation 250,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—average net paid circulation 250,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

The new high-speed Daimlers

No fewer than six of the eight models in the current Daimler range are capable of 100 miles per hour or over.

The new One-O-Four

Daimler now introduce the One-O-Four, a new 3½ litre car with greatly increased engine power producing a speed of 100 m.p.h. Acceleration is really vivid, with a particularly brilliant third gear performance so indispensable in modern traffic conditions. The extra large brakes are servo-assisted. There are also the famous Conquests and a new luxurious 3-seater Drophead Coupé. The really outstanding road holding for which the modern Daimler is renowned combines with the unique preselector fluid transmission to provide a silent smoothness of performance that is quite unequalled for rapid and tireless cross-country travel.

THE DAIMLER COMPANY LIMITED · RADFORD WORKS · COVENTRY

The new One-O-Four models

The One-O-Four 3½ litre model, 100 m.p.h. Servo-assisted brakes. Tubeless safety tyres. Also the unique One-O-Four Lady's Model, embodying many special features of feminine appeal. (Both One-O-Four models available with 4½ litre engines). The 4½ litre 4-light Daimler Saloon 100 m.p.h. Servo-assisted brakes. 4 door saloon body. Overdrive top gear.

The Century Saloon, 100 b.h.p. engine. Over 90 m.p.h.
The Conquest Saloon, 75 b.h.p. engine. Over 80 m.p.h.
The New Drophead Coupé, 100 m.p.h. Three separate luxurious seats.

Mr Butler on Trial

MR BUTLER'S quite unexpected decision to introduce an autumn Budget burst like a bombshell on Wednesday night. It is not usually wise to attack a politician for doing something that is politically disadvantageous; and since Labour's main case before the country is that Mr Butler pulled the Conservatives back to power by a fraudulently generous pre-election Budget, an autumn Budget will certainly heighten Labour's offensive. Nor is it safe to infer that Mr Butler is going all the way back to a Crippsian policy of restraint by high taxation alone, for his intention is to present a group of restraining measures, only some of which need to be incorporated in a Finance Bill. But these reservations still leave awkward questions for Mr Butler to answer. It is not the public's fault if it wonders why a supplementary Budget is necessary, for it has lately inferred from the Chancellor's own words that while his measures would be framed to protect the pound and get the British economy on something firmer than a tightrope, there was no "crisis."

It is unlikely that the explanation is that Britain's economic situation is worse than the country had previously been led to expect. Indeed, most of the latest evidence has suggested that it is rather better. The trade returns for September showed a visible trade position which was an improvement of fully £25 million on the monthly average in the first six months of the year; and during those first six months, it has recently been revealed, Britain's total external payments were in bare balance. The progress of the credit squeeze in the private sector of the economy began slowly but is now biting. It had previously been supposed that all Mr Butler need do next week would be to extend this squeeze to public investment and expenditure. And, quite apart from the squeeze, the two main increases in demand this summer, in fixed investment and consumer durables, have been of the lumpy sort, in which some downturn might be expected next year.

This does not mean that the economic troubles, which Mr Butler had already declared that he intended to restrain, have suddenly ceased to exist. Even if Britain's own external payments are now back in balance, or perhaps in temporary surplus, there is no margin against present and future strains. The effects of this summer's wage claims on British export costs (if they are granted) or on industrial unrest (if they are refused) have still to be faced. But the assumption was, and still is, that relatively moderate measures of restraint could bring the situation back to rights. Indeed, voices have already been raised to say that really stern measures against an undeniably inflationary situation now, piled on top of the credit squeeze and other measures for dampening the economy, might come into effect next year just in time to accentuate what Chancellors have learned to call "an undesirably disinflationary situation." And it is unlikely that Mr Butler's definition of an undesirably disinflationary situation has changed. He is, after all, a twentieth century politician.

But if Mr Butler's general objectives have not changed, and if the economic situation is not graver than all the available indicators suggest, there can be only one explanation of the decision to introduce an autumn Budget. It is that some of Mr Butler's long-promised "measures of restraint," while still relatively mild in their effect upon total consumption, are going to take a different form from that which had previously been expected. Up to Wednesday night the assumption had been that the cuts would fall only upon central Government expenditure (especially the housing, and possibly the agricultural, subsidies) and upon the investment programmes of the nationalised industries. It is still to be presumed, and it is certainly to be hoped, that measures of this kind will form the major part of Mr Butler's programme. But for none of them—not even the subsidies, which can be cut by Ministerial order—would the steps required be of a fiscal nature which need "to be embodied in a Finance Bill." Why, then, the Budget?

★

One answer to this question can surely be dismissed at once. It really is not at all likely that the explanation is that Mr Butler now feels the same way about his last Finance Bill as does Dr Edith Summerskill: that he thinks that all the economic troubles of this summer arise from the fact that he gave away sixpence off the income tax last April, and that he may therefore proceed to take it back next Wednesday. The argument against this explanation is not simply that it would be impracticable to revise PAYE schedules at this time of the year (although it very nearly would be). It is not simply that to put sixpence on the standard rate of income tax at this time would bring more disinflation than can conceivably be needed. It is that any such about-face would destroy Mr Butler's reputation as a forward looking Chancellor, who regards budgets as annual steps towards a new and freer system of society, instead of as administrative devices for controlling economic disturbances that could and should be dealt with by monetary policy instead. Indeed some damage has already been done to this reputation by the mere fact that there is to be a supplementary Finance Bill; since the march forward to a radical overhaul of the tax system, along the routes charted by the Royal Commission and the Tucker Committee, has still a long way to go, this hiatus is particularly unfortunately timed.

If there is to be any change in direct taxation next Wednesday, the only candidate for a Conservative Chancellor—and that a barely plausible one—would seem to be a cut in the investment allowance; even that would be an admission of weakened principle, and if it were coupled with any grading of investment projects at differential rates, no principle would remain. But news of the Budget has set alight two other speculations about the Chancellor's objectives.

It is to be hoped that neither of them is right, but

that does not absolve one from the duty of looking at them. The more tolerable explanation harks back to the rumour earlier this summer that the Chancellor might increase purchase tax on certain manufactures—such as motor-cars—which could be exported in greater volume but which are now being sucked away into the voracious home market. The force behind this rumour was that goods can be switched from one existing purchase-tax range to another without introducing a Budget; but they cannot be put into an entirely new range without a Budget, nor can changes be made in other forms of indirect taxation. It is just possible that, if Mr Butler really does believe that measures of this kind can help the export drive, then he might see no reason why his scope for manoeuvre should be restricted by the largely accidental fall of present purchase-tax ranges; why, for example, if he wishes to raise the purchase-tax rate on motor-cars above the present 50 per cent, he should be obliged to put it up to 75 per cent instead of 66½ per cent. But it will be a great pity if he does hold any such belief. It is administrative nonsense to suppose that jack-in-the-box tactics of this sort have much effect on either home demand or the export drive; sales in the home market depend on home incomes, and to increase sumptuary taxes does nothing to tauten the economy and make those incomes depend on work as well as union pressure.

★

The second, much more alarming—but, one hopes, more unlikely—suggestion is that this Budget might be a *quid pro quo* for some form of wage restraint. The spate of wage claims this summer undoubtedly worried the Government, and there have been reports that some Ministers believed that the spate might be calmed down by some sort of dividend freeze. The most cursory examination of how foreign confidence would react to any such attack—an attack not upon the rich (through income tax), but upon one particular form of one particular payment for one particular factor of production—ought surely to kill this idea at birth. But is it possible, is it conceivable, that the idea behind this Budget might be a different form of attack upon the free flow of capital—for example, by an increase in the distributed profits tax? Anybody who maintains his trust in Mr Butler's record in the past four years must still be able—or perhaps ought still be able—to say that it is not. But the fact of a supplementary Budget causes apprehension, not because it implies heavier burdens to be borne, but because Mr Butler may be tempted to use it as a short-term expedient to solve his "crisis"; and to forget that an inflation half-suppressed by fiscal devices is not the same thing as an economic policy that suppresses inflation as soon as it starts. Next Wednesday will reveal whether the principles of disciplined freedom and fiscal reform, which Mr Butler has propounded for the past four years will be compromised. If they are, his enemies will rejoice and his friends will despair.

Brief Case for Geneva

EVIDENTLY the Soviet leaders have few illusions about the prospects for the four-power meeting of foreign ministers that begins in Geneva next week. A barrage of accusations that the western governments intend to wreck the conference is being laid down. *Pravda* has flatly dismissed all the reported varieties of guarantees that the West will offer Russia as a mere "screen" with "nothing in common" with security. The Communist rulers are taking advantage of their monopoly of their subjects' ears to present a picture of wonderful possibilities blocked only by western recalcitrance.

It is easy enough in all conscience to show that it is Soviet, not western, stubbornness that darkens the outlook for this return to Geneva; to recall that at the "summit" talks in July each western government produced new and reasonable suggestions intended to add to Russia's security or to ease the way to disarmament, while the Russians brushed these aside, insisting on their former demands; to point out that in the three months' interval between meetings the Soviet government has not budged an inch from these demands, for all its beams and banquets. But it is obviously not enough merely to repeat this dismal story and to write off next week's meeting in advance. Since July the background to four-power discussions has changed, and it will go on changing.

What, in fact, happened at the "summit"? Nothing was decided, except to go on conferring. The outstanding feature of the talks was the Soviet leaders' frankness. More openly and flatly than ever, they declared their aims: to destroy the Atlantic alliance, to push the Americans out of Europe, to reshape Germany to their own design. They proclaimed their intention of blackmailing the Germans by withholding reunion until Nato itself had been scrapped. Those Germans who believe (as do, curiously, some people in Britain) that Russia has shown itself ready to grant the Germans reunion in freedom now if they merely "weaken" their links with Nato, can maintain this belief only by shutting their eyes tightly to what Marshal Bulganin actually said at the "summit."

This franker Soviet attitude, while hardly cheering in itself, could have done some good if public opinion in the West had noticed it. As it is, the fear expressed in *The Economist* at the time has largely been justified: that anybody who pointed to what had actually been said at Geneva would be accused of spoiling the "Geneva spirit." The Russians have had it both ways. They have maintained demands that the West could accept only if it contemplated a form of slow suicide, and they have beamed so broadly that in many quarters the West's distaste for suicide is criticised as most unreasonable.

The smiles and soap handed down from the summit like Mosaic tablets have encouraged western allies to squabble among themselves—over disarmament as well as over Cyprus and, it is to be feared, over the Saar on the very eve of the foreign ministers' meeting. Communist wooing of "neutrals" who are blind to the fact that Communism's progress to its declared goal will leave no hiding place for neutrals has gone ahead rapidly, with particularly dramatic results in the Arab world. Moscow's announced intention of reducing its military manpower has proved effective propaganda, although it cannot be verified and, if genuine (as is quite possible), still represents less than the cut already made by the United States.

★

It hardly seems necessary for the Russians to lay a smokescreen over the Leningrad submarine pens at a time when the general atmosphere is already so hazy with pipedreams that President Voroshilov's speech just a week ago, insisting that the Soviet forces must be kept "constantly in a state of fighting readiness," passes unremarked in the outside world. Not a ripple of interest followed even *Pravda's* strident hymn of approaching triumph last week:

Today half of Europe and half of Asia is living and working under the great banner of Communism. . . . Not only on a European but on a world scale, the balance between the two systems has for a long time been in favour of Communism. . . . This is a universal consequence of the development of mankind. . . .

Nowhere have recent Soviet tactics had more success than in Western Germany. "Geneva spirit," together with the cruder form of blackmail involving thousands of imprisoned men and women, forced Dr Adenauer to agree, without any matching concession on German reunion, to institute diplomatic relations with Russia—a step which has inevitably encouraged his critics to press for direct dealings with the East German Communist regime. There remains, of course, a great volume of largely inarticulate support in Germany for the policy of solidarity with the West lately reaffirmed by Herr von Brentano. But the Chancellor's illness, coming on top of the acceptance of diplomatic exchanges with Moscow, has led to increasing talk among less responsible German politicians about the opening of a new phase, to more wilful blindness to the declared Soviet intention of giving the East Berlin regime a decisive role in any reunited Germany.

To say these things, however, is not to write off the new Geneva talks as either useless or dangerous. Even if nothing can be agreed by the foreign ministers, some-

thing of real value may be established. Three weeks with Mr Molotov is a very different proposition from a few days of back-slapping at the "summit." Public opinion, which in July was mesmerised by photogenic grins, has now a chance to grasp the real issues. If the western ministers restate their case clearly, if people take the trouble to listen to it, and if the Russians do not spring some brilliantly distracting surprise on the conference, the West ought at least to emerge as the real champion alike of security and of German reunion in freedom, of disarmament and of free contacts between peoples.

The Russians are approaching the conference with their demands essentially unchanged. They demand the "liquidation of all foreign bases" (including withdrawal of American and British forces from Europe); the scrapping of Nato and of Western Union (after which Western Europe's only protection would be a "European security system" consisting simply of mutual guarantees, in which Marshal Bulganin himself sees no value); a disarmament programme which could not be properly verified on the Communist side; and equal status for their puppets in Eastern Germany, first as an independent regime and later as a sacrosanct element in a united Germany. To accept these terms would be to consign not only Western Germany but all Europe to piecemeal engulfment.

The West cannot possibly settle for the purely paper "security" that the Russians offer. It cannot trade in the Atlantic alliance, its one real source of security, in exchange for the winding up of the Warsaw treaty between Russia and the satellites; for the Soviet-satellite relationship would remain one of iron bonds, exactly as it was before the Warsaw treaty was signed last May. The West cannot rely on inadequate controls over disarmament, for these would give the Communists all the advantage of their fantastic system of top-secrecy. And it certainly cannot accept the Russians' demand that German reunion must await fulfilment of their other demands—both because to grant these would be suicidal, and because to take even a step along this road would naturally encourage the Russians to see how much further blackmail, and particularly exploitation of German hopes and fears, would take them. These are clear limitations on western flexibility, and they cannot be restated too often, either to the Russians or to the public.

★

What the West can do—as it did in July—is to offer new approaches to the disarmament problem and new assurances against any threat to Russia. Since July, Moscow has stalled on the first and scorned the second. It has said neither yes nor no to Mr Eisenhower's aerial inspection plan, to M. Faure's suggestion about budgetary control over disarmament, to the British "pilot project" for arms control in central Europe. It has repeatedly derided the mere suggestion of

western guarantees. "The Soviet Union does not seek anybody's protection," said *Pravda* last Saturday, virtually echoing Marshal Bulganin's brusque rejection of the offer in July. There is as yet no sign that the Russians' basic position will be modified, that they realise that the West cannot accept their demands and hope to survive, that they have any intention of letting Germans reunite except in a cage.

★

But it must never be forgotten that Mr Molotov, like Father William, can stand on his head with remarkable speed for a man of his age. Russia may have a surprise to spring at the meeting of the UN Disarmament Commission which it has requested this weekend, or at Geneva a few days later. Such are the advantages of totalitarian diplomacy, which need take no account of public opinion or of the now raw nerves of satellite satraps. Unfortunately, experience teaches that apparent Soviet concessions on the eve of a conference are usually well planned diversions. Real concessions come, if at all, after the hard bargaining, not just before it.

Real concessions, moreover, seem all the less likely at present because the Russians seem to think that time is working for them; and in Germany, at least, they have grounds for this belief. The western allies must obviously do all they can to maintain German morale and to show Germans who the true champions of their reunion in freedom are. But at the same time, indeed to the same end, they should tirelessly remind the Germans of the limits of possibility already described, and explain over and over again that to step beyond these limits will mean catastrophe for democrats alike in Germany and throughout Europe.

For the present danger, again alike for German democrats and for their friends, is primarily a threat to confidence arising out of confusion. After a long summer of "Geneva" sunshine, few people are at all clear what the stated Soviet demands are, and fewer are ready to face up to the Russians' underlying aims, with their fatal implications. Nor is it generally realised that to accept what looks like a *status quo* silently and passively can prove as fatal for the free nations as to accept Moscow's terms. Unless the western case is tirelessly recapitulated (and it is a complex case, much less easy to put over than are the Communists' glib slogans) it will go by default, and the *status quo* will prove to be not static at all, but rather a deadly drift in just the direction the Soviet rulers want, towards neutralism, isolationism, indifference and blindness. The western case—real security, real disarmament, German reunion in real freedom, real liberty of contact between peoples—should be pressed upon the Russians at every opportunity. And the basic arguments in that case should be set clearly and repeatedly before the public in the free world. The coming conference will be well worth while if it merely contributes to this end.

A Socialist's Faith

THIS is not the week to review in detail the progress of the Labour party towards a practicable political faith, if indeed it can be said even yet to have emerged from the slough of despond in which it has been bogged down for so long. But one pilgrim has reached a stage in his progress which calls for brief comment. Mr Hugh Gaitskell proclaimed at Margate last week that equality of opportunity—with reward for merit and work, not for wealth and position—is the foundation of his socialist faith; and he said that he regards nationalisation as a means for the realisation of this egalitarian ideal, not as an end in itself.

This definition of means and ends was adroit, for it leaves every delegate to decide for himself just how much nationalisation is needed to achieve equality, and how soon. It extricates the party from the hopeless position of seeming to demand nationalisation for its own sake, whether it works or not; and it redefines the ideal of public ownership enshrined in the party's constitution. But the importance of the formula is that it is Mr Gaitskell's; and Mr Gaitskell is more likely than anybody else to be the next Labour Prime Minister. What he thinks today may be of no small importance to the rest of the country in a few years' time. It is therefore worth while to examine the foundation of his faith with some care.

★

With Mr Gaitskell's definition of the socialist ideal there need be no violent quarrel. He does not demand an absolute levelling of real incomes. He accepts the principle of differentials due to acquired skill, applied effort and inherited ability. He is no Babeuf, demanding absolute equality even if society perishes in the process. His socialism would be satisfied, apparently, by putting the entire working population on a civil service scale of pay, with increments for promotion (on merit only) above the minimum, allowances (no doubt) for onerous duties or overtime, and family allowances to offset the economic disabilities to married couples of reproducing the cadre of citizen-worker-officials. It sounds rather drab, but what is drab to some may be the shining dream of a better civilisation to others; this can only be decided by votes. It can certainly be conceded to Mr Gaitskell, here and now, that there is still in Britain more inequality of real income than can be justified by differences in merit or in the contribution to national income or welfare made by particular individuals.

But there is all the difference in the world between one method of securing greater equality and another. One way is to level up; the other way is to level down. One way is to raise the real income of the worse-off wage and salary-earners, without cutting the standard of

living of those who have special abilities, or who make special efforts, or even who have been lucky enough to have rich parents; the other way is to deprive these people of the rewards of their abilities and efforts and luck, and to transfer them to those lower in the scale. One way is to raise the national average of real income, the other to drop it a few pegs. Which of these methods would Mr Gaitskell employ? Challenged, he would presumably declare that he intended to level up, except only for certain steps that he intends to take against inherited wealth; and it is no doubt true that he would wish to do so.

But, in that case, what has nationalisation to do with his objectives? The mere mention of this "means" gives him away completely. Nationalisation obviously does nothing to accelerate the process of levelling up. It may be argued that the miners or railwaymen have done rather better against the boards than they would have done against private managements, not so much in wage negotiations as in negotiations about whether they should be disturbed by Italian colleagues or by declarations of redundancy; but anything that they have gained in this way has been won from other members of the community, including the poorly paid, through higher costs. In so far as there is anything in the argument that workers in the nationalised industries have benefited from more benevolent bosses, then the process of levelling up, by raising real incomes of other work-people, has been slowed down. And nationalisation can do little to redress what socialists regard as gross inequalities of inherited wealth, if compensation to owners is paid in gilt-edged stock whose capital value is boosted by the socialist policy of cheap money.

★

The alternative aim would be to level up by raising the national income. If the Labour party would concentrate its energies on this objective alone, it would get all the equality it wants—or at least all that Mr Gaitskell seems to want. There are two reasons for this. First, the strength of the trade unions is such that they can be relied upon to divert a rising proportion of gross incomes into the pockets of wage earners—over a period, if not necessarily every year. Thus the gain from increasing the national income will go primarily to wage earners. Secondly, taxation converts a rising proportion of gross income going to wage earners into an even more rapidly rising proportion of net income going to them; it prevents an increase in the national income from benefiting the upper income brackets to any great extent. In this two-handed engine, in fact, Labour already has at its doorstep all the machinery it needs to secure a rapid increase in equality of income.

Indeed, the question that worries many people is whether the machine does not move too quickly for either detailed equity or efficiency.

However this may be, it is perfectly obvious that the quickest mechanism for levelling incomes, and the least damaging to the social fabric, is to push up the national income and let wage claims and taxation share it out. Nationalisation is not a means to this end. It is a red herring. It has nothing to do with the exaltation of the humble and meek, about whom Mr Gaitskell is supposed to have been talking; it is concerned only with pulling down the mighty (with compensation) from their seats in the boardroom. There are, of course, people

in the Labour movement who are far more concerned with humbling the bosses than improving the lot of the humble. They would willingly postpone the latter wage packet, the greater security of employment, simply to dish the big capitalist (and the small capitalist, for that matter). They are the Babeufs of the Labour party. They are also the people whom Mr Gaitskell is encouraging by committing himself to the false doctrine that nationalisation promotes equality. Does he really want to do so? If not, does he realise how now, perhaps at the threshold of his party's leadership, he could make most sense of his own particular socialist faith? It would be by throwing nationalisation out of the window.

Compromise in Capricorn

THE British people are accustomed to congratulate themselves on the fertility and originality of their ideas on constitutional problems. And the record looks well: the evolution of dominion nationhood from the Durham report onwards, the evolution of Empire into Commonwealth, and finally the evolution of the formula whereby republican India could remain associated with the Crown. Now the challenge of change comes from the colonies, and in the past ten years constitutions have been tailored to colonial measure with breathtaking versatility. But can it be said that, to meet entirely novel social and economic conditions, any striking political novelties have been worked out? Is not the recent history of the Gold Coast, for example, a rough adaptation of experience with the white dominions? There seems, indeed, to be only one really new constitutional device—that of the “multi-racial state,” devised to meet the problems set by the tiny British settler communities in the black sea of East and Central Africa. Perhaps because it is the only new thing to show, it has been given a lot of publicity, and vaunted as the liberal British solution to a racial problem so very illiberally solved by South Africa, France and Belgium.

Let it be said at once that the problem is a real one. The white settlers are in Kenya, Tanganyika, the Rhodesias and Nyasaland (as are the Indians) by right, and not merely the formal right of legal title. They have largely created the countries they live in; they have a vital political and economic function to perform; and the possibility of these territories emerging as modern states linked to the modern world, rather than as a chaos of tribalism, depends largely on their leadership. Economically, they constitute the main flywheel of woefully poor economies—and that goes even for the white highlands, Kenya's first large-scale industry. The possibility of putting into effect the recommendations of the Royal Commission on East Africa—the creation of an expanding market economy in place of a network of “reserves” and subsistence farming—

depends on their economic, social and administrative skills. The fact remains—as Lord Malvern has frankly said—that they are a privileged class, conspicuously different by colour, behaviour and wealth from the African masses amongst whom they live; masses that are increasingly conscious of their solidarity, increasingly nationalistic.

Multi-racial government, or partnership, is intended as the solution; the formula for harmonious co-existence of white haves and black have-nots. But what is its nature? Recently, in the Federal Parliament in Rhodesia, Sir John Moffat asked for an investigation into the principles of multiracialism; his request was refused, though he had every African but one in his lobby with him. Definitions of partnership remain vague, on the basis that everyone knows roughly what it means (raising the African to the level of the European—sometime). Of late, European leaders have made much play with the soothing idea that the whole question is a matter of economics alone. Race relations will become happy as the African standard of living rises; and it is hinted that this process will only be prejudiced if the tender plant is repeatedly dug up to see how it is putting down its roots.

It is easy to see in this “when the Africans catch up” attitude a convenient way of avoiding the issue. It is an attitude which makes plausible the allegations that multi-racial government, or partnership, is a screen of high-sounding phrases behind which Britain has transferred power to the white minority, with the inevitable loss of African confidence in imperial intentions. It would be rash to deny that there is any truth in this allegation, though it is too soon to say that race relations in Kenya and Rhodesia will go the way they have gone in Natal and Cape Colony. But there is as much partial truth in the suggestion that elsewhere—in the name of African self-determination—Britain has abandoned illiterate colonial masses to a coloured minority of educated politicians. It is not the whole truth, for there are African ministers in East

Africa, African MPs in the Federal legislature, and the coloured politicians elsewhere have to account to their electorates.

It should be clear enough that the outstanding feature of multi-racial constitutions is that they provide, in varying measure, for government by consent now, and that they make provision for change by consent in the period ahead. That change is quite clearly a progressive change in the balance of political power from European to African hands. If this is not intended, the situation—the Lyttelton settlement in Kenya for example—makes no sense. But if Africans have confidence that this is the plan, they can co-operate; they can accept, in an Africa of rising nationalism, white leadership and tutelage. Because their inheritance is secure, they can take the intermediate steps without impatience, and there will be no struggle for power between the senior and junior partners. That is the theory.

★

It may not be a bad theory. It is noticeable that, in the different conditions of the West Indies and West Africa, now that local leaders are convinced that Britain intends to withdraw, there is far less hurry to consummate the process in the final act of independence; there is far more emphasis on the partnership of British skill and experience with African readiness to learn the techniques of creating not just independent states of some sort—but modern states.

The question is: will the theory work given the attitudes of the settlers in East and Central Africa, and the present concentration of power in their hands? Attitudes are perhaps more important than constitution here. If the Europeans feel that every stage in the transfer of power to Africans is in fact a defeat for “their side,” then inevitably the Africans will feel that it is a victory for themselves, which had to be fought for because otherwise the concession would not have been made. Behind the façade of partnership there develops a racial struggle for power as Sir John Moffat predicts. Whatever the Europeans do, it is regarded by the Africans as part of a rearguard action. Indeed, their fears go further than delay. When the Rhodesians raise the property qualification for voters (on the plea that it must keep step with the value of money) it is seen as a method of preventing the natural transfer of power. Suggestions for educational and other “fancy franchises” by the Capricorn Africa Society, whose admirable if changing ideals have recently been set out by Dr Oldham,* run the risk of being taken the same way. Africans notice that the rich and privileged in India and Indonesia submit to the tyranny of the one man-one vote principle just as the British do at home. Talk of a vast white immigration into the Rhodesias appears to them another way of cheating at the game, whatever the reasons for increasing the stock of skill or western experience. The worst stage is reached when Africans—as in Uganda—

* New Hope in Africa by J. H. Oldham, Longmans, 7s. 6d. net.

object to industrialisation of any kind for fear that it will bring in Europeans who are sure to want political power out of proportion to their numbers. The whole scheme for giving East Africa an open and expanding economy could fail on African suspicions that it was intended simply to entrench a vastly increased upper class of European experts.

In such circumstances, Europeans who talk comfortably about the importance of building up an African middle class as the next stage are indulging a dangerous illusion. There is no more revolutionary class than a frustrated middle class, as history should teach them; and it is likely to prove the more revolutionary if its frustrations are deepened by discrimination based on skin colour. It is most unlikely to espouse fancy franchises, in preference to enfranchising the masses which it can organise politically. An African middle class makes sense in this context only if it can, fairly swiftly, expect social and political equality with Europeans: if, that is, the class and colour barriers are permeable and seen to be permeable.

★

These are the considerations which the 300,000 East and Central African whites can usefully bear in mind when planning their future. It is their existence which is at stake, after all, not that of 24 million Africans. Lord Malvern has sagely told them that a privileged class must yield its privileges, though he did not tell them at what rate. It is probably much faster than they think, and it will be related to the speed with which their efforts and entrepreneurship expand the economy. It is not too much to hope that the Europeans will courageously face this sentence to constructive abdication; the recent copperbelt decision is one straw in the wind, and a new liberalism about African representation is stirring in Kenya.

But what of the future of the Europeans, if they abandon the defensive attitude which was so skilfully but understandingly analysed by Mr Arthur Gaitskell in a recent lecture to the Africa Bureau? The art of being submerged without actually drowning may be difficult; but it can be seen practised in the West Indies, where the black majority rules at the polls but the whites reign in society and enjoy the full influence conferred by education and business leadership. The West Indies are far more crowded than East Africa, and one remarkable African quality is hospitality. Another is loyalty. Together, if not overlaid by fear and insecurity, they can guarantee a comfortable and permanent home in Capricorn Africa to Europeans who can accept the idea that multi-racial government can never be a stable political system, or a set of brakes; but rather a process for creating new modern states in which power will inevitably be in the hands of Africans—though in the hands of a generation and nation of Africans which present European leadership can educate and shape.

* What Have They To Defend? by A. Gaitskell, Africa Bureau, 2s. 6d.

Notes of the Week

Two Main Tasks

THE decision to introduce an autumn Budget will necessarily and temporarily overlay all other considerations at the re-assembly of Parliament next Tuesday; but it will be a pity if this is allowed to obscure the tasks that lie beyond. For the real challenge before the Government in the next few months will be to carry forward the dynamic of the new Conservatism, by introducing the sort of legislation that always looks very awkward and unpopular at first blush, and only brings in its benefits much later. Legislation of this kind has to be enacted during the first two sessions of a Parliament if it is to be enacted at all. It will be by their willingness to introduce two "politically awkward" measures in the next few months that the Conservatives will particularly deserve to be judged.

The first question is how the Government is going to implement its housing reforms. The real test of its policy here will not be what it does about the subsidies; it will be whether it moves forward this session to abolition or amendment of the Rent Restriction Acts. The second, and even more important touchstone, will be how determinedly the Government pushes through its Monopolies Bill. It needs to be emphasised again that the measure outlined by Mr Thorneycroft just before the recess was a surprisingly radical one; the procedure which he promised, of "calling up" restrictive practices and putting the onus of justifying them before a new tribunal on to the firms themselves, would really be a more streamlined version of the system of "bans subject to appeals" proposed in the now famous majority report of the Monopolies Commission.

But the trade associations that would be affected by Mr Thorneycroft's proposals, or at any rate the minority of them that realise what the Board of Trade is up to, will quite certainly try to turn the Bill into something very different. Plans already seem to have been laid to dilute the Bill by amendments, to try to swamp the proposed tribunal by lawyers' delays, to try to play off the new tribunal against the Monopolies Commission, and, as a possibly essential pre-requisite to all this, to get rid of Mr Thorneycroft himself. The most important question at the beginning of this Parliamentary session is whether Sir Anthony Eden is going to be a strong enough domestic liberal to stand up to these pressures. The news that Mr Walker-Smith has given up the chairmanship of the 1922 Committee, in order to become a junior minister to Mr Thorneycroft at the Board of Trade, is not a significant indication of Sir Anthony's state of mind. Mr Walker-Smith, of cruel wit and great debating ability, has hitherto been best known as a brilliant advocate of whatever brief is presented to him.

Minor Measures and Major Mistakes

THERE is another field of activity in which the Government is going to have plenty of scope for reforming itself in the new Parliamentary term—and also, unfortunately, plenty of scope for repeating mistakes that it has made in the past. This is the field of "technical," and nominally "uncontroversial," legislation—debates on which, after all, take up the greater part of Parliament's legislative time. The Conservatives' recent record in this field has been almost uniformly bad. One common—although relatively unimportant—failing here has been to enact legislation which cannot be enforced, in the belief that it is better to show willingness than to be wise. There are traces of this peculiarity in the new Road Traffic Bill, which seeks to increase certain maximum penalties that are inoperative even at their present level. The Clean Air Bill, published in the summer, admittedly avoids some of the traps which were ignored on almost every page of the Beaver report, but already the technicians have launched an attack on one of its provisions, which suggests, rather reasonably, that people should not be legally obliged to burn certain types of fuel if supplies do not exist. And the measure to implement the first instalment of the Gowers recommendations of 1947, to extend some of the provisions of the Factory Acts into farmhouses and other places of non-industrial employment, promises to give those who believe that inspectors can look at every farm kitchen very many happy hours.

A much more serious feature of recent technical legislation, however, has been the dominance that technicians have established over it, at the public's expense. Already this session the County Courts Bill has been ruined by an amendment sponsored by the lawyers' associations, which was designed to save lawyers from embarrassment and was pushed past an unwilling Government after a debate in which nobody except lawyers spoke. Already the Copyright Bill, among some otherwise excellent provisions, has slid in a clause about television copyrights that is principally designed to strengthen the monopoly bargaining power of the performers' unions against the competition of television in hotel lounges. And ahead there lies an even more important struggle. Any Shop Hours Bill which the Government introduces in this session should be designed to enable shops to give a more flexible service to the public; it will be a major mistake if, under pressure from the only people who are so far taking a real interest in it, the Bill tries instead to set up "fairer competition" by forcing small shopkeepers to shut their shops earlier than they would like.

M. Faure's Balancing Act

THE first vote of confidence in its existence did not in the event prove fatal to M. Faure's government, which mustered 308 votes against 254. It would be wrong, however, to see in this a real verdict on a policy for Algeria. Many other factors determined the final alignments. M. Faure survived partly thanks to his foreign secretary, M. Pinay, who managed to rally his conservative colleagues. Above all, he was saved by an extraordinary combination of foreign events. The recent United Nations vote enabled him to appeal to patriotism; many deputies did not like the thought of a vacant French seat at Geneva next week; and they could see, too, the effect a crisis would have on the forthcoming Saar referendum. It was this last which gained for the government the reluctant votes of the *Mendésistes*, who did not want to throw their leader's baby away with the bath water.

Thus M. Faure's stratagem of shifting majorities has shown its worth. He first leaned to the left to get round the Moroccan corner, then, approaching Algeria, recovered his normal position, more in keeping with his rightist support, and he is still in the saddle, with no immediate obstacles ahead in the parliamentary arena. But his position will become perilous again unless he can rapidly silence the sounds of gunfire which reverberate in the *Palais Bourbon* from the other side of the Mediterranean. Nearly half of the French army is now stationed in North Africa, and this bill will also have to be footed soon. The key to the government's future thus still lies in North Africa and in the degree of room for manoeuvre M. Faure can obtain from his coalition.

The quest for a peaceful solution has hardly begun. In Morocco, at least, the question is simple: is there still time to negotiate with the moderate nationalists, or has the creation of a regency council—sabotaged for so long by the local French administration—come too late? But the debate revealed no simple way out for Algeria, where even more French troops are bogged down. The short-term political and economic measures advocated are unlikely to halt the fighting. M. Faure has asked for three months to prepare a real solution. One ray of hope was his hint that in drafting it he will consult not only the Algerian deputies—who are dismissed by many of their compatriots as French stooges—but other nationalist representatives as well. Should he start a genuine *dialogue*, however, he may again be deserted by the "colonialist" wing of his majority.

After-Shave Lotion or Singe?

A FRENCH legend has it that a barber once made a fortune by keeping a permanent sign outside his shop: "*Demain On Rase Gratis*." Cynics were reminded of this story when M. Faure, in one of his many interventions during the North African debates, declared that "should it survive the day, the government will govern." Not much French logic was needed to ask what it had

been doing up to then, nor much French scepticism to doubt the lasting effects of this new resolution. Indeed, the government's weakness during previous months has been due less to M. Faure's character than to the nature of his coalition and of this parliament. The Fourth Republic adopted consciously the method of "government by assembly," of which the premiss was the existence of an agreement between strong disciplined parties. With this premiss unfulfilled the whole edifice has been creaking dangerously. Under strong pressure from outside events the Assembly may at times let itself be ridden roughshod, as it was by M. Mendès-France, but then the divisions reappear and the choice is between compromise and dismissal, between immobility and instability.

Recent examples of governmental impotence have prompted many French personalities, including the President of the Republic, to issue warnings about the dangers ahead. One particularly interesting plea has been made by an MRP leader, who urged M. Faure to be the last prime minister of this Assembly and, if defeated, to go to the polls. Not long ago it appeared that the nation's verdict would not greatly change the parliamentary balance of forces, but North African events are beginning to change this situation. "Only an African *Dien Bien Phu* can bring him back" was the most widespread comment after the fall of M. Mendès-France, and the new tide of discontent may carry him to power. It is rumoured in Paris that M. Faure, taking advantage of his latest respite, contemplates an early election, even before the end of the year. This would prevent M. Mendès-France from fully organising his forces and reaping the fruit of his current tour of France. Elections may not change much, but the strongest argument in favour of a new Assembly is the existence of the present one.

Moroccans Out of Tune?

IN Morocco, M. Faure is adding, item by item, to his reputation for achieving a desired end at the price of earning an undesirable measure of ill-will. On Tuesday, he successfully installed the Council of the Throne on which he had agreed with representative Moroccans at Aix in August. He was able to do so on the firm basis of last week's majority for his Moroccan policy in the Assembly, but has nevertheless drawn fresh fire from both flanks. His right-wing critics, who include his Resident-General in Morocco and a gang of serving generals now commanding the French forces there, upbraid him for failure to observe the wishes of ex-Sultan Ben Arafat (who asked, on departure, that a cousin and not a council should fill his throne). His left-wing critics, including all extreme Moroccan nationalists, blame him for adding a fourth man to the council of three agreed upon at Aix and so, they say, weighting it in favour of the forces of reaction.

So far he has to thank the great moderation and patience of two or three Moroccan leaders for the success of his policy. He is particularly in debt first to Si Bekkai, the former Pasha of Sefrou and now a member of the new council, who enjoys the confidence of the nationalists owing to his unswerving loyalty to the ex-Sultan at one remove,

Sidi Mohammed ben Youssef, and secondly to Ben Youssef himself, who has quieted some of the opposition to the four-man council by speaking up from his place of exile in Madagascar and endorsing its composition.

The snag that lies immediately ahead is that this council is supposed to reach its decisions unanimously, and, on the way to them, may well display all the shades of opinion that already bedevil Moroccan political life. Even in Tunisia, where almost the whole nation gave its support to a single party, the Neo-Destour, healthy and natural differences of opinion between Neo-Destourians are beginning to appear now that the bond created by the struggle for home rule has disappeared. How much the more will they do so in Morocco, where searing divisions exist even before any change of status has taken place.

Labour Sees a Light

UNEXPECTEDLY, the Labour party conference in its closing sessions produced a really interesting, and perhaps portentous, debate on old age pensions. The three main speeches came from Mr Bevan, Sir Alfred Roberts and Mr Richard Crossman, and the views they put forward were respectively those of the left wing constituency parties, the trade unions and the national executive.

With one of Mr Bevan's propositions there will be little disagreement. The national insurance fund is a myth. The surplus built up by the excess of contributions over payments is not a bank balance that can be drawn upon, as some Labour members optimistically suggested in 1950, to meet increased social service costs. But Mr Bevan also argued that any pretence at an actuarial basis should be dropped and that the insurance scheme should be financed wholly from the Exchequer, with pensions, and presumably other benefits, related to the cost of living index. The burden on the taxpayer that will in any case be imposed by the growing number of old people in the population would thus be increased without limit. It is the realisation that this burden would not be tolerated for long that makes the trade unions—responsible if somewhat unimaginative—cling to the so-called actuarial principle, which at least gives benefits as of right to those who have paid their contributions.

The significance of Mr Crossman's speech is that it showed that Labour leaders may be prepared to break out of these old grooves and work out a new national insurance policy that will fit the facts of old age. The chief of these facts is that half of the men retiring from industry have some form of superannuation, public or private. Mr Crossman put forward the proposition that Labour's aim should be a retirement income of at least half of working income—by the establishment of a Government superannuation scheme to which those not belonging to private schemes could belong. Old people should no longer be divided into the fortunate half with national insurance pensions and superannuation, and the unfortunate half with national insurance pensions only. It is not clear that Mr Crossman would agree to the logical conclusion of his argument: that those with private superannuation should not receive the national insurance pension, which

would be payable on proof of need rather than of right. But it is obvious that, under any such scheme as he adumbrates, the intermittent pressure to raise pensions would tend to be concentrated on those receiving only the lower Government benefits instead of embracing those receiving the higher private superannuation benefits as well: in other words it would introduce some element of selectivity into future demands on the public purse. His speech is therefore welcome as showing that the Labour executive is willing to consider renouncing outworn party beliefs in a matter that is very dear to the party's heart.

Law and Order in Kenya

THERE will be some surprise, if also gratification, that the commission appointed to inquire into the working of African courts in the troubled areas of Kikuyuland found only one serious miscarriage of justice; and that it felt impelled to recommend changes of procedure for only one African court. It was believed—and the evidence was impressive, if scattered—that at one stage in the Kikuyu civil war the terrorism practised by Mau Mau was, if not matched, certainly reflected by a considerable measure of intimidation and pressure by the loyalists. Presumably it was drumhead justice and did not get as far as the properly constituted African courts, which certainly have the advantage of their own procedure in obtaining evidence and do know their own people. The most disturbing feature of the commissioners' report is that its first part is not being published, on the grounds that this would be "contrary to the public interest." Apparently this section related to a judgment of the Supreme Court, but the reasons for suppressing it will have to be a good deal more cogent than that for the public to accept them; it is reported to have dealt with the district African court of appeal in the Nyeri district, the suspension of which has now been withdrawn by the government.

Even if the clean bill given to African courts by the second part of the commission's report is taken as definitive—as presumably it must be—this will go only a small part of the way towards stilling concern about the course of justice in Kenya. There can, unfortunately, be no doubt that there have been some very bad instances of malpractices in which Europeans have been involved; and that the sentences given to Europeans convicted of maltreatment of Mau Mau suspects, leading to their death, have been far more closely related to local feelings about colour and race than to justice. The Bill now to be introduced into the Kenya Legislature to withhold *ex officio* magisterial powers from temporary district officers plainly derives from the latest and perhaps most scandalous of these cases; and the news that all existing magisterial appointments are being reviewed is significant and probably overdue.

A European magistracy in which it is not possible to repose confidence is a grim liability to race relations in Kenya. But even if reforms in it are now in hand, this will not complete the story. The Kenya government will not have completed the overhaul of its legal machine until it is also ready to examine the problem of perverse verdicts by European juries.

CAPITAL ANNUITIES

ESTABLISHED 1844
EQUITY & LAW
LIFE ASSURANCE SOCIETY

20, LINCOLN'S INN FIELDS, LONDON, W.C.2

Give the finest pen in the world

Its name is Sheaffer. Treaties are signed with it. So are five-year film contracts. And the sort of cheques that hang framed in the Chairman's office. People whose names are as familiar to you as your own sign them with a Sheaffer. And all because the Sheaffer belongs to that way of living in which the best is only just good enough.

Go to the best pen counter you know. Hold a Sheaffer in your hand and you'll agree it looks the part with its slender silhouette, its unique tubular nib, its near-incredible Sheaffer 'Snorkel'.* Feel how smoothly it glides as you write 'To wish you a very happy Christmas'... and then you'll wonder who can be persuaded to give you a Sheaffer for Christmas too.

pneumatic filler
A flick of a finger—instantaneous filling on the downstroke. Cleans, flushes itself automatically.

the world-famous Sheaffer Snorkel
Wiping nib, wiping barrel, a thing of the past! Snorkel tube reaches down, drinks the ink, retracts!

14-carat gold feather-touch point
A marvel of delicate precision and strength

matching sets
'Ensembles'—pen and pencil; 'threesomes'—pen, pencil and ballpoint. In handsome gift cases.

Skrip
The finest ink for the finest pens.

Visiting Australia Next Year?

SAIL BETWEEN FEBRUARY 1ST AND MAY 31ST
AND SAVE AT LEAST £80

You can enjoy that visit to friends and relatives in Australia and gain the benefit of a substantial financial saving by travelling under our special P & O Boomerang Trips plan. What is a Boomerang Trip? Just this. You take your first-class outward passage between the first of February and the end of May. You return homeward between September 1st and December 31st 1956 or 1957. Reduced first-class fares run from £230. You save at least £80. That's the practical side of it. Once aboard a P & O liner—your home at sea—you can relax in an atmosphere of comfort which is the result of more than a century's experience of service. For full details see your local travel agent, or contact us at one of the two addresses below.

ONE WAY ONLY?

For passengers visiting Australia for an indefinite period, we offer our special P & O off-season terms. This means that during the months February to May you can have a wider choice of first-class accommodation for your money.

P&O BOOMERANG TRIPS

See Your Local TRAVEL AGENT
P & O: 14/16 Cockspur Street, S.W.1. WHITEHALL 4444 or
122 Leadenhall Street, E.C.3. AVENUE 8000

Glayva
SCOTCH LIQUEUR

Edinburgh, rich in architecture and in the natural beauty of its setting, has been called the modern Athens. It has also many distinctive arts and crafts amongst which is the making of "Glayva" a distinguished Scotch Liqueur which has made many friends far beyond its borders

RONALD MORRISON & CO. LTD. EDINBURGH

Pay on the Buses

THE wages of busmen all over the country are in a melting pot which threatens to boil over. In London the men are demanding an extra 25s. a week; but it looks as if they might have accepted an offer of 10s. in London and 8s. on its outlying services, if it had not been attached to a proposal for an 11-day working fortnight with more rest days but also a longer working day. A board of conciliation has failed to end the deadlock and can only recommend arbitration. This the employers are prepared to accept, but whether the men will do so will not be decided until Saturday. They are a militant lot and they may prefer to resort to their favourite weapon of banning overtime—or even to striking. Meanwhile, in the provinces, the municipal transport workers are asking for increases of between 18s. for unskilled workers and 32s. for drivers on the top rate of 148s. A similar claim by workers in privately owned transport is going to arbitration.

Against the background of an acute labour shortage the employers are in a weak position. London needs 4,000 drivers and conductors—a mounting scarcity—while other industrial towns are put to all kinds of shifts to keep their buses on the roads. Sheffield has taken to hiring privately owned buses. Wolverhampton employs Jamaicans (although the fury that this caused was calmed only by conceding that all such hiring should be done by a selection panel representing both workers and employers). Manchester and Birmingham want to pay more than the nationally agreed wage—indeed Birmingham already does so, for which sin it was expelled from the Municipal Passenger Transport Association. The other authorities fear a further depletion of their own staffs and a levelling up of wages to the highest levels. But in places where highly paid factory jobs are to be had for the asking a higher rate for busmen seems only common sense.

The fact is that a busman's lot is not a happy one. His hours are irregular, and in heavy traffic the strain and the judgment needed are great—probably greater than that required of the average engine driver, who, however, is better paid. The transport employers will eventually have to seek two remedies for their labour shortage: to prune their services and be less afraid of raising fares in order to get the money to pay higher wages. The weakest point about the busmen's case is that they always object whenever the employers try to take the first course (which cuts down profitable overtime); the weakest point about the employers' stand is that they cannot know how many busmen they need, or how much they can afford to pay them, until they take the second.

Dangerous Liaisons in Malaya

NEW dangers lie ahead in the Federation of Malaya. The amnesty proclaimed last month has evidently failed, and in failing it has, as some officials feared, even slowed down the normal number of surrenders. Meanwhile the Communists have staged a serious incident which may be of significance, one in which two British soldiers were

killed. This occurred as the Federation's ministers, and Mr Marshall, Chief Minister of Singapore, were considering the new Communist offer to discuss terms for ending the emergency. The obvious implication is that the Communists want a talk "as between Malaysians" with the alien British out of it. The whole point of the amnesty offer was that it was fully backed both by Malaya's newly elected government and by the British, and that Tengku Abdul Rahman had stated more than once that if the Communists refused it, he would throw the whole of Malaya into the fight against them. The Sultan of Johore came in for bitter criticism when he recently asserted that Malaysians were culpably unprepared to do any such thing.

The new Communist offer, like the previous offer made some months ago, cannot be taken as genuine until it is investigated. This Tengku Abdul Rahman and Mr Marshall propose to do, for they are endeavouring to meet Chin Peng, the leader of the Malayan Communist Party, to discuss matters. This prospect must please the Communists enormously. Their original offer was to negotiate as equals; their new offer, though it is wrapped up, amounts to the same thing. The two chief ministers may think that they are going to persuade the Chinese Communists to come in under the terms of the amnesty; they may find that they are being skilfully talked into letting them walk out of the jungles with the honours of war. Some sort of recognition of the party is what the Communists most covet, and they evidently feel they can talk the Tengku round from his former view that he would never concede it. But if they do, how can the British authorities endorse such a "settlement," whatever the terms in detail? Their embarrassment and the inevitable conflict with the new Malayan government is just what Chin Peng and his party want.

This is fully in line with the Communists' tactics for all divided countries (they would like to regard Malaya as divided in the Indo-China sense). To get "both sides" talking helps to open the door for political subversion. The parallel with recent moves by the Pathet Lao and Viet Minh is obvious. The Tengku and Mr Marshall seem to have the backing of Malayan and Singapore public opinion for their move and have discussed it with the Governor of Singapore; but unless they stick firmly to the line that the amnesty is the only offer being made, there will be untold difficulties, and certainly no real peace.

Dr Adenauer Loses a Doubtful Prop

DR ADENAUER has now completely lost the dubious support of the All-German Block, or Refugee Party. The party ended its association with the Bonn government last July, when it began to dissolve owing to disagreements over foreign policy. Half its parliamentary members voted against the Saar settlement, while its two cabinet ministers, Herr Oberlaender, minister for refugee affairs, and Herr Kraft, minister without portfolio, continued to support Dr Adenauer. The party called for their resignation, and declared the coalition ended. Dr Adenauer refused to accept the two ministers' withdrawal and they remain in the cabinet. With five other Bundestag members they have been "guests" of the Christian-Democratic party for the

last few months. The remaining 18 Refugee Party deputies are now going into active opposition.

The government will in future be ten votes short of a two-thirds majority, which it may need when the constitution Bill comes up in the *Bundestag*. But that will probably not be until the end of 1957, and by then a general election will have taken place, which will almost certainly complete the dissolution of the All-German Block. For some time past it has been clear that there is no longer room for a party representing the refugees, most of whom have been politically as well as economically assimilated. The Refugee Party remained a pressure group which mustered only 27 members in the Lower House, although no less than one in four deputies is himself a refugee. According to Herr Kraft, the party's failure is due to the fact that "radical elements" have gained control of the branches. In the Refugee Party, as elsewhere in German politics, there is an underworld where neo-Nazis become almost indistinguishable from Communists. Both propose a basically anti-western policy which would lead Germany to abandon its allies for the dangerous field of neutralism, and both are infiltrating the Social-Democratic Party. If the Refugee Party dissolves and its members join the Socialist ranks, Herr Ollenhauer's gain will be more a matter for anxiety than Dr Adenauer's present loss.

Tonic for Colombo Plan

BRITAIN'S decision to increase its contribution to the Colombo Plan technical co-operation scheme is not only welcome but well timed. At the meeting of the Consultative Committee which began last Monday in Singapore, some of the Asian member countries were inclined to be pessimistic about the Plan's progress, and the Indonesian delegate no doubt expressed their general view when he called on the richer countries to increase their contributions, especially of technical assistance. The offer by Britain of £7 million over a seven-year period beginning next April more than doubles the previous rate of contribution.

It now appears to be a foregone conclusion that the Plan will be extended for a further period after July, 1957, when its original six-year term runs out. Most probably the other donor countries—principally Australia, Canada and New Zealand—will follow Britain's lead and step up their contributions to the technical assistance programme. But it will be necessary also to take new decisions about the amount of capital aid which the donor countries will provide in the next period. Britain's contribution is likely once again to be mainly in the form of releases of sterling balances and of aid to the colonial territories out of the Development and Welfare Fund. The money will be well spent, for it is now clear that the Colombo Plan is one of the most successful instruments for channelling aid to South and South East Asia.

The report on the technical co-operation scheme published this week (which is further analysed in an article on page 310) mentions the close working links now established between the Colombo Plan, the UN Technical Assistance Administration, and the American International Co-operation Administration, each of which runs programmes in the

region. But there is still room for better co-ordination of the general strategy of aid to the underdeveloped countries of Asia.

Labour in Search of its Youth

IN deciding to scrap its separate League of Youth and integrate its youth movement with the party organisation at constituency level Labour has again paid Lord Woolton the compliment of imitation. "Youth sections" are to be created within each constituency Labour party, under the guidance of older party members; at Transport House there will be a youth sub-committee of the National Executive. The present national and regional machinery of the Youth League will disappear. The reorganisation was announced during the second secret session at the Margate conference, and although there seems to have been some vocal opposition, it was heavily outvoted.

The change was necessary, if only because the League of Youth was getting top-heavy; the body of the League was puny but it carried a swollen and separate national organisation on its shoulders. Behind the new plan lies the candid admission that the party's failure to appeal to youth is due in no small degree to the direct competition of the Young Conservatives. The Wilson Committee reported that the Tories were able to rally far more young workers at the election. However sad a commentary it may be on the political motives of so many of the young, there seems no doubt that much of the appeal of the Young Conservatives is social—even snobbish—rather than political; but the Young Conservative organisation has also made recruitment simpler. Every Tory under 30 has automatically become also a Young Conservative; Labour's League of Youth has had an upper age limit of 25 (which is being retained) and has had to depend on voluntary enlistment. The twenty-fives and under will now automatically become

members of the new youth sections. The problem now will be to make such sections lively social centres where the young may meet, gossip, play games, dance, date, and anticipate at least the possibility of romance while imbibing a political education—if Labour's young people are susceptible of such an appeal.

Transport House will draw one useful dividend from disbanding the League of Youth—the liquidation of what has apparently become another Left Wing thorn in its flesh. The thorn was scarcely big enough to be worth plucking if there had not been the need to reorganise to meet Young Conservative competition, but the story of the League of Youth carries a familiar warning for Labour: wherever there is apathy, wherever there are small numbers, a Left Wing pressure group is liable to take control.

White Collar Union

ON Thursday at the House of Commons a dinner was given in honour of Sir Ronald Gould, the General Secretary of the National Union of Teachers, who was recently knighted. This particular general secretaryship is more likely than most to lead to the honours list, involving, as it does, not merely the representation of sectional interests, but a great deal of work on committees and councils in the service of education. There are other differences from an industrial union. The NUT tries to keep clear of party politics. It is not affiliated to the Trades Union Congress, and it offers financial support to four parliamentary candidates from each of the three main parties. It is not the union's fault if more Labour candidates are anxious to avail themselves of this help than Conservatives or Liberals. At the last election Labour's chosen four—Messrs Chuter Ede, W. G. Cove, Horace King and George Thomas—were all returned; and one assisted Conservative was also successful—Mr Jennings. But that does not end the list of the NUT's friends at Westminster, for nineteen other MPs are members of the union.

That prosperity has eluded the teachers, in spite of so solid a pressure group, in spite of a shortage of teachers and strong professional organisations, shows what a handicap it is to have a sense of responsibility towards pupils and the public purse. Once in recent years—in 1951—the NUT went so far as to collect resignations. But this was not for money. It was because Durham County Council at that time insisted that teachers in its employ should belong to a union—a condition which benefited the union's membership list but offended its sense of professional freedom. It has never told its members to down blackboard chalks and walk out.

This year, however, gentlemanly methods have not paid too badly. One gain was the more generous allowances for advanced work; about 10 per cent of the NUT's 220,000 members are graduates, probably as many as in the "Joint Four" associations catering mainly for grammar school teachers. The other gain was the start towards equal pay, for which the union had long campaigned. The NUT's next big target, no doubt, will be a three (instead of two) year training for certificated teachers, a change which it hopes to see introduced around 1960, when classes will be getting smaller.

Moscow's Crystal Ball Cracks

ESTIMATES of western economic prospects have always played a key role in the shaping of Soviet foreign policy. It is not surprising, therefore, that the recently observed argument in Moscow over the general line has been accompanied by controversy about the likelihood and proximity of an American slump. The very editorial in *Kommunist* which attacks Mr Molotov (without mentioning him by name) also criticises Soviet economists who take for granted the automatic "self-strangulation of capitalism." It reminds them, with an appropriate quotation from Lenin, that the general tendency of capitalism to "disintegrate" does not preclude rapid growth in certain countries and at given periods, and exhorts them to "judge accurately the real strength and possibilities of capitalism."

This is in striking contrast with diagnoses of impending American and world crisis which are still appearing in other

The Bank Charter Act, 1844

It cannot be a matter for surprise at such a juncture, that public attention should be called to the Bank Act of 1844. We shall not be suspected, after the resistance which, almost single-handed, we offered to that enactment at the time it was passed, and the numerous occasions on which we have since pointed out its defects, of any desire to shield it from full and ample discussion. At the same time, it is but too evident, that the subject is being now approached in the heat and excitement of a most exaggerated alarm, which are ill calculated to secure for it a safe solution. . . . The truth is, that no one who believes in the necessity of convertibility, however much he may object to the unnecessary and pedantic restrictions of the Act of 1844, can refuse to recognise the justice of the original principle upon which it is based; or can fail to see that without any Act of Parliament the Bank would be equally bound to regard that principle, while, however, it would be exercised, not by an unbending and iron rule, but by sound discretion from time to time. What is that principle? It is simply that the Bank of England, having large obligations in the shape of bank notes and deposits, all payable at any moment *on demand*, shall keep such a reserve of bullion in its coffers as shall enable it at all times to meet its liabilities—that is, that the convertibility of bank notes, and the re-payment of deposits, shall always be secured. But in order to gain those objects to say that it is necessary, whatever the circumstances may be, whether a drain of gold is progressing or has been arrested, whether trade is sound or unsound, whether imports have been in excess or not, whether the dividends are to be paid the following week, or at a remote time, to maintain certain fixed and immovable relations between the notes in circulation and the bullion in the Bank, is simply to discard all judgment and discretion in the management of the Bank, and to expose the public at times, it may be, to the most needless pressure and inconvenience: an inconvenience too created mainly by the alarm consequent on the provisions of the act itself, as was made so manifest in October, 1847, when the panic was entirely allayed by a letter from the Government to the Bank, authorising the suspension of the Act, although after all its provisions were never invaded.

The Economist

October 20, 1855

OUTPUT OF THE BRITISH COTTON INDUSTRY
WEEKLY AVERAGES

Soviet periodicals. In the latest issue of *Voprosy Ekonomiki*, published by the Soviet Academy of Sciences, the author of a study of postwar trade cycles concludes that a free world slump on the 1929 model ought to occur soon, and that a fall in American production in the very near future may set it off. Its impact, he claims, should be even greater than in the 'thirties.

If Moscow really envisaged this as an immediate prospect, it would determine its foreign policy accordingly. The article in *Kommunist*, however, seems to dismiss it as part of a general tendency towards "dogmatism" and "rigid formulae." This important editorial is, among other things, a plea for opportunism, for a pragmatic approach towards foreign policy. The situation, it points out, does not remain static in either "camp," and a crucial passage refers to "the unceasing change of form and method in the struggle . . . between the progressive and reactionary forces." On the foreign front, we are told, the Communist Party should combine "principles and flexibility." In which of the two has Mr Molotov been found wanting?

Bao Dai Fires First

BAO DAI'S "dismissal" of his independent-minded prime minister, Mr Ngo Dinh Diem, seems at first thought unlikely to cause more than a ripple on the surface of waters long disturbed by greater commotions. There are few more futile gestures than that of the nominal boss who tries to fire an employee and finds himself fired instead.

In effect, the Vietnamese Chief of State is pitting the doubtful strength of his legal authority and standing against the physical assets at Mr Diem's disposal, such as control of the police and army, and the backing of the United States. The ex-emperor prepared the ground last Thursday by a Note addressed to various powers in which he reaffirmed his claims as Chief of State, recalled that he had himself delegated full powers to Mr Diem, who therefore had no authority other than his for remaining in power, and disclaimed any responsibility for the premier's actions. He specifically denounced the referendum Mr Diem intends to hold tomorrow, asking the people of southern Vietnam to choose between himself and Bao Dai as Chief of State.

Bao Dai's Note was not unexpected. More surprising was his communiqué dismissing Mr Diem and reserving the right to take any action which the situation might require—presumably the forming of a government headed by one of the "spare" prime ministers in exile now in Paris. Nobody can be sure how far Bao Dai's action is a last desperate throw, made with no hope of success, and how far he really believes that it has a chance of succeeding. What is certain is that, outside France, he can expect no support from the great powers—with the possible exceptions of Russia and China.

Officially, neither Britain nor America has reacted to the news of the "dismissal"; but their reactions can be guessed. The British will wait and see; the Americans will carry on, as far as proves possible, as though nothing had happened. The British, while aware that in the eyes of international jurists Mr Diem's regime may now be a revolutionary one, will no doubt be guided by the extent to which he retains control over his own domain. The

American government, which has reaffirmed its wholehearted support of Mr Diem, will presumably hold to this course. But memories of the personal message President Eisenhower sent Bao Dai last February may contribute to making the new situation embarrassing for them as well as for the other powers directly concerned.

Nenni and the Rising Sun

THE phenomenon of "Nenni" socialist parties is more interesting than ever these days. Docilely following Moscow's international line but hugging their formal separation from openly Communist parties, they are obviously of very special value to a Soviet regime which is relying more and more on the technique of the pull rather than the push. It has long recognised Signor Nenni himself as a major asset—he was the only "non-Communist" in the international galaxy of party bosses who presided over Stalin's funeral rites—and now he has enjoyed what his own newspaper calls the "unprecedented honour" of visiting the Soviet leaders at their Black Sea retreat. The Italian Communist press reproduced this news rather coolly; Signor Togliatti has never been thus honoured. The Russians can hardly expect this reminder of Signor Nenni's intimacy with them to win his party more support among moderate Italians. But they no doubt hope that his visit will encourage other Italian politicians, perhaps even ministers, to make pilgrimage to the "third Rome."

They may also hope that what Signor Nenni's party has been in Italy, the newly united Socialist party will in future be in Japan. On paper, the left-wing Japanese Socialists conceded more than the right-wingers to achieve the merger, but they have secured the leadership of the united party and have a majority of its Diet seats. Admittedly they face the risk that Japan's two conservative parties may now be spurred to unite in turn. But if the Democrats and Liberals continue to squabble about the formula for their unification, a united Japanese Socialist party dominated by its leftists, whose stand on international issues is often indistinguishable from that of the Communists, will put in the hands of Moscow and Peking a string which they can pull whenever occasion demands.

"Citizens of Tomorrow"

FROM time to time, some eminent man or woman publicly expresses concern about the state of modern youth and lets loose a flood of letters in the national press. It was one such spate of concern that prompted the survey undertaken by King George's Jubilee Trust of the influences, good and bad, affecting boys and girls growing up in Britain today. To carry out the survey,* published this week, the Trust appointed four working parties to cover the four

* "Citizens of Tomorrow." Published by Odhams for the Council of King George's Jubilee Trust. 3s.

phases of adolescent life: the period of full-time attendance at school; the period after leaving school—influences of employment; the period after leaving school—influences of leisure; the period of national service. Reading their independent reports, one cannot but be impressed by the number of times that they come to the same conclusions.

One of these is that National Youth Advisory Councils should be established for England and Wales and for Scotland. Any proposal of this sort is bound to be looked at askance—it is such an easy way out for a committee trying to think of concrete recommendations—but in fact there may well be need for a body, provided it is not unwieldy, to co-ordinate the work already done by the other advisory councils concerned with specific aspects of young people's welfare. Another recurrent theme is that pressure for improvement can most profitably be brought to bear in the schools. Opinions may differ on whether county colleges should, as the Trust proposes, be given precedence over raising the school-leaving age. No one will disagree with the contention that a country cannot afford to let most of its citizens of tomorrow leave school at 15 with no regular provision for further education, especially when for boys the prospect is overshadowed by national service. Here again there is unanimity among the working parties: national service should no longer be regarded as a distasteful necessity, but as a necessity that can be turned to good account.

Perhaps the one difference of emphasis in the reports is significant: the working party dealing with the period in the services does not stress the state of unsettlement to which the other reports say boys are brought by the gap between school and call-up. The services are, on the whole, satisfied with the material they are given. Modern youth, as indeed is implicit throughout these humane and sensible reports, is not so black as it is often painted—a truism that is rediscovered in each generation.

The Naval Tradition

THE hundred and fiftieth anniversary of Nelson's victory at Trafalgar is no ordinary naval occasion; and it is fitting that the Queen and the Duke of Edinburgh, himself a naval officer, should attend the Trafalgar day dinner at the Royal Naval College, Greenwich. The Navy renews its inspiration of service, and rightly, from the example of its greatest commander; it has also, and no doubt rightly, done all it can to draw the country's attention to it this year. The First Sea Lord, Admiral Mountbatten, will no doubt redefine the meaning of the Nelson tradition for the naval situation today, when Britain's Navy is the third largest, when most of the offensive role in nuclear warfare has been appropriated by the air weapon, and when, indeed—as the Defence White Paper last February showed—it was something of an afterthought that the Navy was allowed an offensive role in the modern world at all. Where in the Mediterranean nuclear-armed navies can today play a most important role for Nato, it is rather the American sixth fleet than the Royal Navy which forms the spearhead of the attack.

But Lord Nelson was himself often outnumbered (he was at Trafalgar), and his tradition is not tailored solely to the girth of the world's largest navy. He laid down

rules of sea strategy which are now relevant to the West as a whole as the potential commanders of the seas. But it is a tradition which must, as it can, be made to embrace the new facts of air power, supersonic speeds, and nuclear weapons. Among the various Nelsonian precepts, "engage more closely" in an age of steam lost the battle of the Coronel Islands, covered the *Jervis Bay* in glory, and won the battle of the River Plate; but Nelson's strategic grasp and tactical inspiration must now be further adapted to warfare in which (as Field Marshal Montgomery noted) the Navy flies, the RAF fights at sea, the Army takes to the air. The worst thing that could happen to the Nelson tradition is that it should become the Navy's preserve, a parochial tradition keeping one service in proud and fatal mental isolation from the others. Nelson would have dealt with any such atavism with the ruthless single vision that was peculiarly his.

Turkish Democrats in Trouble

THE misgivings aroused among foreign observers by the anti-democratic tendencies shown by the Turkish government since its sweeping victory at the polls eighteen months ago have now been reflected inside the ruling Democratic party itself. At the party's national congress, which ended early this week, nine members were expelled for their opposition to a section of the controversial revisions of the press law introduced last year, while ten others resigned from the party of their own accord.

The revised press law, under which a number of journalists have been sent to prison, denies those accused of libel of the right to plead justification; and the dissident members of the Democratic party believe that this endangers both the freedom of the press and the principles of their own party. It is no doubt true that the Opposition press has sometimes behaved with insufficient restraint and good sense. But Mr Menderes has given the impression that he resents any criticism, however justified, of the country's pressing economic difficulties and the government's handling of them. This impression, together with the use which the government has already made of the vague wording of the press law—it is open to very wide interpretation—account for the misgivings felt both inside and outside the country over the freedom of the press in Turkey. It is, however, only fair to add that two Opposition newspapers in Istanbul which were suspended after the Istanbul riots under the provisions of martial law (not under the press law) have just been allowed to resume publication.

The nineteen dissident members of the Democratic party, who include four former cabinet ministers, will now sit in parliament as independents. Although their defection does not endanger the government's huge majority, some newspapers have apparently suggested that Mr Menderes (whose hold over the rest of the party seems to be as strong as ever) will introduce a constitutional amendment allowing him to expel the rebels from Parliament. It is to be hoped that the rumour is false; and if it is not, that Mr Menderes will think again before he carries his animosity against the rebels to such flagrantly undemocratic lengths.

Indonesian Square Dance

IT will be several weeks yet before the full results of Indonesia's first elections are known; but the progress of the vote-counting has already modified the disquiet aroused by the earliest returns. The Nationalists (PNI) still lead, but the Communist party (PKI) has dropped from third to fourth place, while the moderate Masjumi has risen from fourth to second, the breakaway Moslem party, Nahdatul Ulama, falling back correspondingly from second to third. Since three million votes are being recounted in Central Java, where "widespread irregularities" were reported, the Communists may end up even further down the list. According to the first count in that area, they polled 1.9 million votes, running second to the PNI and well ahead of the Masjumi's 800,000 votes.

While the result of the recounting cannot be foreseen, the nature of the irregularities can be inferred from the vote-catching tactics adopted by the Communists, who in some places apparently made good use of a local superstition that pricking an effigy of one's enemy is the surest way to put the evil eye on him. They organised a whispering campaign among the villagers on these lines: "The Communists are your enemies. They have brought harm

to the country and to the last government. If you want to make sure they lose, prick your ballot paper through the Communist symbol." Since perforation of the favoured party symbol was the method used to enable the illiterate voter to exercise his democratic rights, this advice may have yielded them handsome dividends.

In spite of these wiles, the election again looks—as it did before the polling—like a fight between the PNI and the Masjumi, with the Nahdatul Ulama as a complicating factor. But it no longer seems certain that the PNI will win; the first returns from Sumatra and remoter regions strongly favour the Masjumi, and the allocation of parliamentary seats in these more sparsely populated areas is such that Masjumi successes there may offset a Nationalist majority in the total poll.

It is clear, in any case, that none of the four main contesting parties will emerge strong enough to form a government either on its own or in coalition with only one other party. Any new coalition will thus consist of a minimum of three parties, and the unwillingness of the Moslem parties to collaborate with the Communists would alone force the Nationalists, if they get first pick of partners, to leave the PKI in opposition. The PNI is, in any case, divided; and the balance of power is now such that its left wing may find it inexpedient, if not impossible, to respond to the advances of their erstwhile Communist friends.

party system, should be the policies of the "Blimps" and the "Blumplesskells"? Can we have an article on that?—Yours faithfully,

HINCHINGBROOKE
House of Commons

The Oppenheimer Case

SIR—While I am inclined to agree with your reviewer that the Oppenheimer case may prove to be desperately costly to the USA, I do not think that the whole affair can be dismissed as a witch-hunt conducted by revenge-thirsty officials.

Behind the campaign against Dr Oppenheimer there was a hidden fear which may have been unfounded, yet was by no means altogether illegitimate. There is no escape from the fact that the limitless energies derived from nuclear friction concentrated a frightening power over life and death of millions in the hands of a small number of scientists; a conglomeration of power utterly inconsistent with the principles and practices of democracy. Some of Dr Oppenheimer's opponents were, no doubt, motivated by the healthy repulsion that freedom-loving people must feel at the apparent emergence of a new aristocracy much more awe-inspiring than any of its historic predecessors. To see the most prominent member of such a formidably powerful clique bending to the decision of a constitutional body was, if not a noble, at least an understandable aspiration.

In the classical tragedy that took place we do not add to the stature of the hero by representing his enemies as pigmies. —Yours faithfully, GEORGE A. FLORIS
London, N.W.1.

Letters to the Editor

Mr Diem Loses Favour

SIR—I was distressed to read the article in your issue of October 8th. Your correspondent made no mention of the complex problems inherited by Mr Diem, who had no means of dealing with them because the army was in foreign hands and the police had been sold by Bao Dai to gangsters. It is gratifying to note, however, that though the author was severely critical of my government and its leader, he had the courage to admit that Mr Diem is neither a French nor an American puppet. Can the same thing be said of Ho Chi Minh and his "efficient dictatorship in the north"?

Perhaps Mr Diem's good intentions have not always been matched by equally good performances, but despite his shortcomings, he remains, by and large, the best hope for a free and democratic Vietnam.—Yours faithfully,

TO-NGOC-THACH,
Private Secretary
Vietnam High Commissioner's Office,
Paris

Wheat in Plenty

SIR—The argument contained in your leading article of October 1st, that too

much wheat is being grown in the United Kingdom, is no doubt correct, but the arithmetic about the saving to the taxpayer fails to take account of the subsidy on coarse grains. If, as you propose, wheat acres are diverted to coarse grains, surely more subsidy will be payable, not only because the acres paid on will be more numerous, but also because prices will fall relative to the guaranteed price used in the calculation of the rate of acreage payment. Your article simply ignores this debit and coolly swipes the whole of the saving in wheat subsidy for the credit of its clever idea. Of course, there probably would be a net credit, but not a gross one.—Yours faithfully,

R. N. HIGINBOTHAM
Robertsbridge, Sussex

Bournemouth and Margate

SIR—Three months ago *The Economist* was exhorting the Conservative and Labour parties to refrain from "Butskellism." Now the Conservative party is congratulated for shedding its "Blimps" and the Labour party is urged to do the same with its "Blumps." What, please, since you like the two-

Books & Publications

The Business Man in Politics

THE UNKNOWN PRIME MINISTER:
The life and times of Andrew Bonar Law 1858-1923.

By Robert Blake.
Eyre and Spottiswoode. 555 pages. 42s.

OFFICIAL lives of prime ministers usually impart a solid mass of the dead statesman's letters, with some reticence over personalities, much justification of the career concerned, and a certain flavour of moral purpose. This life has some features in common with its predecessors; but, as befits its sceptical subject, the preaching tone has been left out, and thanks to Mr Blake's terse and scholarly English the length is not excessive. Moreover, many details have been included of the kind that it has been customary to omit, details that show the *dessous des cartes* of politics: the tiresome, and essentially minor, questions of party management and of patronage that yet take up the energy of leading politicians, and absorb the entire attention of many of their followers—the tale, for example, of the noble earl who remained treasurer of a great party after he had ceased to be able to give any coherent account of his actions, and left obsequious legacies to royalty but no money to pay them. The dominant role so often played by accident and personality is given its full weight, neatly assessed against the economic and political background. In this connection, among several new points dredged up for the historian from the wealth of archives Mr Blake has consulted, comes evidence that a powerful, and probably a conclusive, factor in determining George V's choice of Baldwin instead of Curzon to succeed Bonar Law in 1923 was the communication to the King's private secretary, by one of Bonar Law's private secretaries, of a paper by another putting the case for Baldwin strongly; this communication was made without Bonar Law's authority and indeed against his instructions.

Bonar Law's father was an Ulster Presbyterian minister, and his mother a Canadian Scot; he spent his first twelve years on a New Brunswick farm. Then he moved to Glasgow, where he left school at sixteen; and he worked there for twenty-five years. By 1900, when he entered parliament, he was a wealthy man, and passionately ambitious for political success; for this his business career had prepared him, not financially alone. "People are always apt to think," he said in 1922, "that what has been will be." I am less inclined perhaps than most men to that error because of my early training. I was in the iron trade,

a highly speculative business with frequent violent fluctuations in prices." His combative spirit made him conspicuous; and he combined with it superb managing ability, rare concision as a speaker, and a transparent integrity that brought him, in the end, a mastery of the House of Commons as great as that of Peel, who was said to "play on it like an old fiddle." These qualities, helped by accident and zeal, brought him to the leadership of the Conservative party just as the Ulster crisis of 1912-14 began. On Ulster he was a bitter extremist, though he was far more prepared to contemplate home rule for the rest of Ireland than were most of his party companions.

Ambition was dulled by family disasters; his wife died comparatively young, and his two eldest sons were killed in the Great War. He did not push himself forward during the war; he had a far better claim than Lloyd George to be minister of munitions in 1915, and quite as good a claim to be prime minister in the following year; each time, he stood down. His steady influence as second-in-command over the volatile Welshman was of incalculable weight. The war once over, and his health weakening, he retired: yet the great ship of his personality, once under way, could not be brought abruptly to a stop, and he became prime minister himself before he died. Where was that ship going? One is tempted at first to apply Salisbury's judgment on Disraeli, "whose only final political principle was that the Party must on no account be broken up." Yet this would be unfair to the man who said at a Carlton Club meeting in 1916 that, in wartime, "we are bound to do what we think right in the national interest without regard even to the interests of our Party."

Freud and his Followers

SIGMUND FREUD: *Life and Work, Volume II, Years of Maturity 1901-1919.*
By Ernest Jones.
Hogarth Press. 552 pages. 30s.

THIS second volume of the biography of Sigmund Freud is more limited in its appeal than the first. Although some parts are of general interest, others require a rather more extensive knowledge of psycho-analysis than is possessed by the average lay reader. In particular the central section, dealing with the "Works," contains a series of brief notes that are often obscure without

a prior knowledge of the books and papers to which they refer.

Probably the most interesting section of the present volume is the inside history of the disagreement that led to the split between Freud and his early followers Stekel, Adler and Jung. It can perhaps be suggested that the history is so much an inside one that a good deal of bias remains. "Stekel had, however, a serious flaw in his character that rendered him unsuitable for work in an academic field; he had no scientific conscience at all." Adler was "a morose and cantankerous person," while Jung is pictured as a conventional Swiss, who lacked the courage to go on maintaining against opposition that sexual motives play the dominant part in human life. Poor neurotic Ferenczi, on the other hand, who remained faithful, escapes with the judgment that he "was an excellent analyst, and was also very good at analysing himself. But he had the unfortunate peculiarity of not benefiting adequately from self-analysis."

The personality of Freud himself, though it remains attractive, seems to have changed since the first volume. Instead of the scientist we seem now to have a philosopher and man of letters. In either case it is an oddly Victorian character that emerges, Victorian even in the leather shorts and Tyrolean hat worn on holiday in the mountains.

One general criticism remains, not merely of the present volume but of much psycho-analytic writing. In the chapter on "Opposition" Dr Jones points out that "The intense wave of hostility that greeted Freud's work in the years before the first World War now seems very remote." It has, however, been replaced in many quarters by an uncritical acceptance. This phenomenon itself should be familiar enough to psycho-analysts, but most seem content to accept it at its face value. The *ipsissima verba* of the Master are still used in a rather magical way, and Dr Jones too often says "Freud discovered" instead of "Freud suggested." Freud did discover a great deal with astonishing penetration, but it seems likely that he also made many mistakes. He himself was constantly groping. His followers do him no honour when they are reluctant to change or even abandon his theories. Dr Jones fails to communicate to his readers the important fact that what he is describing is but the beginning of a great enterprise, and that the end is not yet in sight.

A Stranger to Pretence

NO PASSING GLORY: *the full and authentic biography of Group Captain Cheshire, VC, DSO, DFC.*
By Andrew Boyle.
Collins. 384 pages. 16s.

"THIS," comments the author in a short epilogue, "has not been an easy book to write. Any biography about a famous man who is still young, alive and in mid-career is bound to be

W. ARTHUR LEWIS The Theory of Economic Growth

Keen insight and practical field investigations of the underdeveloped countries gives his study of the fundamental causes of economic growth and decay unique authority.

"An extremely important book... one that fairly and squarely fills an urgently felt want."—*The Economist* 30s.

The Role of the Economist as Official Adviser

W. A. JOHR and
H. W. SINGER

Describes the work of economists employed in government departments and international organisations who are called upon to give advice on official policy. A first-rate treatise on a new aspect of applied economics. 15s.

GEORGE ALLEN & UNWIN LTD
40 Museum Street, London, W.C.1

difficult if not actually invidious for a close friend to write." But it can be said at once, and with enthusiasm, that Mr Boyle has succeeded handsomely. Group Captain Cheshire emerges from this thoughtful and balanced account as an extraordinary complex mixture of the introvert and the man of action. His flair for self-advertisement, his ruthless impulsiveness, overwhelming self-assurance and general disregard for the opinions and advice of others have made many people feel that, even when all his obviously fine qualities are put on the other side of the scales, he is little more than a brilliant eccentric—and a somewhat unpleasant one at that. Anyone opening this book with some such pre-judgments in mind may find apparent support for his views in Baron's photograph of Cheshire. Here is the face of an intense, almost frighteningly alive man—a man who, one feels, might easily burn himself out. But is it also the face of someone who can find in himself the daily steadiness of purpose necessary to reach a high ideal? The title of this book is an expression of the author's hope (confident hope, perhaps, but not yet a certainty) that the answer is yes, that Cheshire's greatness will one day be measured not only, and not mainly, by his country's highest award for valour but by higher standards still.

Cheshire's childhood and upbringing, his misfit days at Oxford, his career in the RAF, his spectacular leadership of the famous 617 dam-busting squadron, his important contribution to increasing bombing accuracy by pioneering a new low-level marking technique—all this is told clearly, very readably, and with an authority which should effectively dispel much of the waffle that has been talked and written about Cheshire by so many people. In particular, the author is at pains to debunk the misconception that the final climax of Cheshire's career in the RAF—his observation of the atom-bombing of Nagasaki—was also the critical turning point in his life. The change, when it came, was gradual and was initiated, not by the holocaust of atom-bombing, but, if by any one event, then by the sufferings of one man dying of cancer some years later. The last sections of the book deal with Cheshire's peacetime activities, the so-called VIP homes for ex-Servicemen (which failed), the homes for the chronic sick (which succeeded) and with his adoption of the Roman Catholic faith, a process described with understanding and sensitivity by the author whose own religious beliefs are clearly apparent but never intrusive. One is left to reflect on a life of already great achievement and of even greater promise, the life of a man who has always chosen the hard way, who is, in the very perceptive phrase of his housemaster at Stowe, "a stranger to pretence in any form." Lesser mortals who, consciously or otherwise, carry into adult life the "let's pretend" of childhood as a protection against excessive bruising of the ego, should find this very honest book disturbing and exciting in just about equal parts.

Britain and Europe

COMMONWEALTH D'ABORD.

By Yves G. Brissonnière.
Paris: Editions Domat Montchrestien.
372 pages. 920 frs.

ANY work on Britain that comes with a preface from M. André Siegfried deserves respectful attention; as he says, also, there has for more than twenty years been no important French study of the Commonwealth, and some at least of the misunderstandings between the British and their European neighbours have been due to their ignorance of its rôle and functioning. M. Yves Brissonnière, a young French lawyer, has made a gallant if not altogether successful effort to explain the obstacles which the existence of the Commonwealth puts up to the incorporation of Britain in a Western European federation. His work suffers, as he admits, from the failure of British statesmen and publicists to do more than indicate that the obstacles exist; they rarely condescend to explain their nature.

Indeed the whole literature on Britain's relations with the West European movement is surprisingly inadequate. Apart from a brief *livre de circonstance* written by Sir Ivor Jennings as long ago as 1940 and another short study by Mr R. G. Hawtrey, M. Brissonnière is compelled to rely very largely upon what one may without disrespect call such marginal political figures as Sir Robert Boothby and Mr R. W. G. Mackay. The nuances of the British political and intellectual scene are not always apparent to the author—Lord Layton will not find it pleasant to be described as "another Conservative"—and although using English terms of set purpose, M. Brissonnière does not always fully understand them—he does not seem to know what is meant by "partition" in relation to Ireland. He suffers, like most continental writers, from a difficulty in handling British names and confers knighthoods with embarrassing facility. The proofs were not read by anyone with a knowledge of English.

It would be a pity to be put off by all this, for M. Brissonnière has done a useful service; he does show conclusively that, apart from any other considerations, and even if formulae could be found for getting round the technical difficulties of the position of the Crown, allegiance, and so on, the Commonwealth could not function if Great Britain ceased to be a sovereign country able to negotiate and confer with its Commonwealth partners on terms of complete equality of status. On the other hand, he argues that the Commonwealth idea springs so inescapably from the entire British heritage of legal and political thought—a heritage quite different from the continental one—that it cannot be recommended to continental countries as an alternative to a federal system.

M. Brissonnière's own positive solution for the problem is not worked out in detail. It consists in what he calls

"external association." It is fairly clear that he has not grasped how little that meant from the point of view of co-operation in the case of Ireland, or how little it would probably have meant even if it had been adopted in 1921. His reiterated conviction that Ireland is even now regarded as part of the Commonwealth shows an ignorance of the change in 1949; his references are mainly to Professor Mansergh's writings before that date. Nor does Burma, which he regards as externally associated in all but name, seem a happy parallel. Indeed the proposal for a joint council between Federal Europe and Britain (and any other externally associated member of the Commonwealth) suggests something quite different from what "external association" ordinarily implies. One would say that Britain's relations with its Brussels Pact and Nato partners have already gone further than "external association." Less law and psychology and more history and economics is what the continental discussion of these things most requires.

Intellectual Aunt Sally

RETREAT FROM REASON.

By Peter Nathan.

Heinemann. 262 pages. 15s.

THIS book is full of generalisations about an Aunt Sally called "the intellectual," who is, apparently, the normally intelligent human being. It debunks, with a good deal of repetition, and some gratuitous insults, his love, religion, family affection and integrity. All interpretation of history, says the author, is a distortion, since it selects events to fit in with a special scheme. The present selection leads, from the premise of the renaissance—"the great triumph of life over the morbidity of religion"—to the modern dilemma that man, finding a state of disillusion insupportable, fills the niche violated by the intellectual iconoclasts with other idols; lacking a system that allows him to live in peace with himself and his neighbour, he is isolated, insecure and afraid, without reverence or a sense of duty. The fundamental situation of the present-day European is found to be epitomised in Lawrence's introverted offspring of a marriage between a masterful, intellectual woman and a drunken, happy-go-lucky lout; or Turgenev's ineffectual idealist in thrall to the "world of mother."

These are Dr Nathan's distortions, but, in fact, there has never been a time when mankind lived at peace with himself and his neighbour, and the search for this utopian state (but the author is very acid about utopias) is as normal a part of existence as the search for food and shelter. To people who have their being in the much despised bourgeoisie, the world seems remarkably full of mothers who do not lust for power, and of young men and women working with intelligent enthusiasm for a chosen career, falling in love, marrying, having children, educating them at considerable sacrifice, and ignoring, with perennial

human courage and adaptability, the menace of catastrophe. And as this "neurotic bourgeoisie" continually renews itself from aspirants in the immediately inferior social strata, it is reasonable to suppose that the human situation will continue much the same.

Dr Nathan is more dangerous when he flippantly alludes to "the coming war between Russia and America," or "our twentieth century with its certainty of three world wars and the probability of more," implying that all striving for peace is too trivial to be noticed. He sums up in a collection of banalities: that there is a good deal of psychology in modern literature; that science will continue to progress; that the family is of paramount importance in the structure of societies; that a purely objective judgment is impossible; and that the wise man will wait upon events.

Much tiresome assertiveness tends to obscure the author's considerable wit and penetration, for, as his publishers assert, this is a readable book (a minimum requirement) and a provocative one. Dr Nathan packs punch. It is to be regretted that his blows are sometimes below the belt.

Early German Socialists

GERMAN SOCIAL DEMOCRACY
1905-1917.

By Carl E. Schorske.

Harvard University Press.

(London: Geoffrey Cumberlege.) 373 pages. 45s.

THIS is uphill work to read. Not only is the matter ponderous; the manner for British readers is unfamiliar. The diligent student of recent German history will, however, feel rewarded, for he must long have asked himself how he should reconcile the stormy history of the Social Democratic Party in its days of outlawry before 1890 or even in the period of the strikes in 1905 with the pale pink days of Ebert as President of the Weimar Republic. Mr Schorske has now provided a detailed and documented answer. The critical years, he shows us, were from 1905 to 1907. Before the Russian revolution of 1905, according to the teaching of Marx and Engels, the German Social Democrats were anti-Russian because Russia was, by the masters' definition, the "bastion of reaction." Further, the Socialists were champions of a citizen army in order to get the means to power into the hands of the people. But after 1905 the political significance of Russia became equivocal, and, after their losses in the general election of 1907, the German Social Democrats lost their revolutionary interest in an army of the people; the election was fought on a nationalistic issue, and thereafter the revisionists and the trade unionists wished above all to retrieve their position in the Reichstag by supporting national defence and a citizen army in Scharnhorst's sense.

The left-wing revolutionaries of the German Socialist party fought hard for the bold use of the general strike, for

intransigent anti-militarism, and for the mobilisation of Socialist sentiment among the young. But, although there was talk of a general strike in support of the campaign for the reform of the Prussian franchise in 1910, they were defeated all along the line by the trade unions. As Mr Schorske insists, "the ratio of trade union to party members in 1906 was approximately four to one," so that the trade union leaders controlled not only large-scale funds, but also a decisive number of voters. This is the background to Socialist support for war credits in 1914, and the subsequent break away from the party of the left-wing revolutionaries who thus became the parents of the German Communist party. The latter was but their illegitimate child. For Rosa Luxemburg and her comrades were not only genuine and intelligent idealists; most of them were also splendidly freedom-loving, several like Hugo Haase and Kurt Eisner being true to the radical rather than socialist origins from which they derived.

These highly individualistic intellectuals were, of course, easily outplayed by the organisers on the right wing such as Friedrich Ebert. Many people have become accustomed to think of Ebert, Noske and Otto Braun simply as figures in the Weimar period; it is interesting, in turning these pages, to ruminate upon their earlier life and to find how remarkably consistent most of them were. When Karl Liebknecht had taken up the matter of Socialist youth movements he found one of his warmest allies in the

schoolmistress, Klara Zetkin, who, as its oldest member, presided in the Reichstag in 1932, delivering a Marxist speech immediately before the election of Goering as its chairman.

Mr Schorske concludes with an elaborate bibliographical essay in which one of the most important points that he makes is that "The political histories of the separate states, so important to an understanding of Social Democracy, have yet to be written": his foregoing narrative is much concerned with the diversity of development in the different regions of Germany according to political traditions and industrial concentration or the reverse.

Prosperous Democracy

A HISTORY OF SWITZERLAND.

By Charles Gilliard.

Allen and Unwin. 116 pages. 8s. 6d.

BY some extraordinary chance a standard short history of Switzerland in English does not already exist. This translation of M. Charles Gilliard's book does go part of the way towards filling the gap, but it must be confessed that it is rather disappointing.

The fascination of Switzerland to a twentieth century reader is so obvious as to be almost banal. How have these prickly, obstinate people, speaking four languages and following two religions, living in a country with few material advantages, managed to overcome their differences, to achieve and maintain their independence, and, into the bargain, to evolve a prosperous democracy that really works?

The history of Switzerland is quite as complicated as that of its neighbours, and in many ways the same. But while they all, including the Swiss cantons, embarked upon conquests and were themselves conquered and annexed by other neighbours, the Swiss never quite lost sight of the first Swiss Confederation, the Everlasting League, sworn in the Rütli meadow in 1291. If it is complained of the present-day Swiss that they are smug about the happenings of seven hundred years ago, it can be answered that they have reason to be. In common with the Swiss cantons, other pastoral communities early evolved councils to control common tasks such as tending cattle on the summer Alps. Granted that they did not all have the luck to be placed across some of the most important routes in Europe which could hardly be used without their good graces; granted that they were not all so difficult to get at and conquer, only the Swiss had the ultimate common sense to subdue their own factional squabbles. The later additions of other cantons to the confederation, the successive weathering of the storms of the Reformation, of the economic struggles of the seventeenth century and the doctrinaire ones of the eighteenth, and of the French occupation, all stem from the first common

need and common sense which brought the cantons together.

M. Gilliard manages to cram most of the political facts into some hundred pages, but he only mentions a few economic facts in passing, so that the reader is left with some idea of how Switzerland evolved and held together politically, but with very little idea of how the country has got its bread and butter and how it is getting it now. But the greatest pity is that he seems devoid both of a point of view and a narrative sense, for a large number of closely packed facts, given equal importance, makes stodgy reading.

Shorter Notices

PAGEANTRY OF THE LAW.

By James Derriman.

Eyre and Spottiswoode. 224 pages. 25s.

This is a bedside book, for laymen as well as for lawyers. To read too much at a time leaves the erroneous impression that too much legal activity is occupied with the forms rather than with the substance of justice. Some psychologist could write an entertaining study about why lawyers, ostensibly the most hard headed and incisive of men (and women), should cling to ancient forms and dress; presumably their love of precedent overcomes their realism.

Mr Derriman does not venture any reason why, for example, the judicial wig still has a bare patch on the crown or, indeed, why judges and barristers continue to wear wigs at all; he is content to record the origin of this and other curious habits. Whatever the iconoclasts may think, most lawyers and quite a number of laymen feel that something valuable would be lost if legal pageantry, in which there is a certain time-wasting element, were abolished or substantially reduced.

The amount of research which Mr Derriman must have done is prodigious; in order to prove him wrong on any point, at least as much would have to be done. He describes in detail the customs and traditions of the Bar, devotes a short chapter to "attorneys and solicitors which are but ministerial persons and of an inferior nature," and discusses the dress, duties, privileges and even the pleasures of Her Majesty's judges particularly when they "ride the circuits." He retells several quite good anecdotes, but unhappily omits several other better ones. There are some excellent photographs, including one of "a handful of embarrassed policemen bearing staves" at the last Assize held at Monmouth. Mr Derriman can take comfort from the fact that, with the transfer of Monmouthshire Assizes to Newport, for some reason the policemen, although still bearing staves, no longer look embarrassed.

ELECTIONS AND ELECTORS.

By J. F. S. Ross.

Eyre and Spottiswoode. 480 pages. 42s.

All students of British Government have been indebted to Dr Ross for his work on "Parliamentary Representation." They will find its sequel of much less value. "Elections and Electors" is a mélange of articles and essays on aspects of elections and parliamentary government. Its most valuable section is that in which Dr Ross brings his

work on the membership of Parliament up to 1951. Elsewhere in the book many useful facts about elections are gathered together but, as a whole, it is likely to prove palatable neither to the general reader nor to the specialist; it is much too prolix and disorganised for the one and contains too little new material for the other. Against the extreme precision of the author's compilation of facts must be set his inability to select those which are significant and the vituperation which he heaps on those who do not share his views on lost deposits or proportional representation.

CAN YOU CLAIM? An insurance quiz on life and property, motor-car and other risks. By John Yaxley. Chatto and Windus. 74 pages. 6s.

The intention of this book is to guide the layman on how to make the most of his insurance policies by finding out what contingencies are covered and whether, by paying a small extra premium, he would obtain more benefit from the policies. Nearly two hundred questions and answers cover life assurance, house property insurance, household goods, valuables, motor-cars, personal sickness, accidents and other risks. The author believes that many policy holders fail to make full use of their insurance, and this well-indexed book should give them every opportunity to do.

PICK'S CURRENCY YEAR BOOK 1955.

By Franz Pick. 395 pages. \$35.00.

1955 BLACK MARKET YEAR BOOK.

By Franz Pick. 224 pages. \$25.00.

Pick's World Currency Report, New York.

Mr. Pick's painstaking annual catalogues of the complexities of world currency regulations—and, equally important, of the plethora of currency markets, black, grey and officially tolerated, that are the inevitable accompaniment of the regulations—are now well established as indispensable handbooks for all whose business leads them into the intricacies of the once simple matter of buying one currency with another. The "Report" contains not only a full account of the regulations, past and present, governing every individual currency, but also extensive tables of dealing rates in the diverse unofficial varieties of the currencies. But this aspect is covered more admirably still in the "Year Book," whose lavish production and strikingly clear presentation are beyond praise.

Despite the incredible diligence of Mr Pick's researches into the underworld of the exchanges, there could be no firmer opponent than he of the exchange restrictions on which the unofficial markets thrive. "I devoutly hope," he states, "that this edition of the black market year book will be the last." And Mr Pick is, happily, able to report some progress this year; not least in the freeing and simplification of sterling. Even Mr Pick is now able to count only nine varieties, where he once found sixty-nine. Only one complaint seems due—that in his classification of currencies according to the freedom with which they are controlled, sterling should be placed in the same category as the Brazilian cruzeiro and in a more restrictive one than, for example, the Chilean peso and the Austrian schilling.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Prosperity Takes Stock

Washington, D.C.

IF all the talk about the "built-in strength" of the American economy has any meaning at all, President Eisenhower's illness should have no major effect on the business situation. So far it seems to have had very little, and it has not produced a spate of retractions by economists of their forecasts that 1956 will be as prosperous as 1955. But the President's illness may have a significant impact in another sense: it should provide an excellent test of whether current prosperity is based in significant measure on confidence engendered by conservative Republican policies—as Republicans like to believe it is.

So far the only visible impact of Mr Eisenhower's illness has been on Wall Street, where the indices have shown three sharp breaks and three much smaller recovery movements. The pace of the decline has not been much slower than in the early stages of the 1929 crash. Yet so unconcerned have the authorities been about this setback that the Federal Reserve Board, after a full-scale meeting of all its top officials, decided that no alteration of the present restrictive monetary policy is warranted. The Administration as a whole—while prepared to change its plans quickly if necessary—believes that exuberance and not a slump is still the main economic problem.

There are several reasons why the stock market's performance is being so blithely ignored. By far the most important is the virtually unanimous feeling that stocks were "too high." Yields on the average had dropped below 4 per cent, or close to the yield on bonds, shortly before the President's heart attack. Stock after stock had soared to fantastic heights solely on the promise of future earnings mixed with a speculative wish for quick gains.

What is more, the current market is not floating on a sea of credit as was its predecessor in 1929. In every stock purchase now at least 70 per cent is covered in cash as a result of the Federal Reserve's powers over margins, compared with as little as 10 per cent in 1929. Moreover, stock values in relation to earnings or assets, though perhaps unduly high, have not been nearly as high this year as they were in 1929. The news from Denver did not, therefore, create a panic, and there has been a welcome absence of reassuring statements about the "fundamental soundness" of the situation from bankers and spokesmen in Washington.

The Secretary of the Treasury merely announced that the President's illness would mean no change in Administration policies. Indeed, the general feeling appears to be: let the market decline a little for its own good.

Elsewhere in the economy sharp dips in the price of some commodities—led by rubber and copper scrap—have been more than offset by further increases in others. The Labour Department's index of prices for "all commodities other than farm and foods" has actually risen from 118.4 for the month of September to 118.7 for the week ended October 11th. A number of surveys have uniformly shown that businessmen are not curtailing their investment plans. The big New York banks, apparently convinced that the Federal Reserve means business in its hints that restrictive policy is still the order of the day, raised their prime lending rate only last week—something they would not have done

had businessmen suddenly stopped rushing to their doors for advances.

There has been considerable private speculation that because of the tight money policy the boom was about ready to "top out" towards the end of this year. Few foresaw any more than a mild dip or levelling off, but it appears that the authorities in Washington will not even believe that until they see it. Dr Arthur Burns, the President's chief economic advisor, devoted a large portion of an address given ten days after Mr Eisenhower's confinement to hospital to an explanation of why it is necessary

to keep excesses from developing during a boom; but he emphasised the Administration's willingness to change quickly if conditions call for it:

A programme of monetary and fiscal restraints could be carried too far, just as it could stop short of what is needed. Such policies are means to the attainment of a stable prosperity, not ends in themselves. The only rigidity that we can afford to admit to our minds is the principle that the best way to fight a recession is to prevent it from occurring in the first place. That principle has of late ruled, and it must continue to rule, our government policies.

Perhaps the most interesting reaction to the President's illness has been the surge of second thoughts about the economic effect of the changed political picture. Everyone is assuming that chances of a Democratic victory in 1956 have been enormously improved and is asking himself what that means to his business. The general feeling appears to

be that a change of Administration would not make all that much difference. For the fact is that this is one of those peculiar times in American history when the two parties really have very little to fight about. They might shade tax policy a little differently, but they are both opposed to direct controls. They would differ in a few marginal areas such as the development of electric power, but they are both agreed on the value of a flexible monetary policy. The Democrats might be a bit more willing to spend public money, but the Republicans agree with them on the essentials of the government's role in economic affairs.

It may well be that a substantial segment of the business community has failed to recognise this gradual *rapprochement* in the economic policies of both parties, and thus will find the prospect of a Democratic victory unpalatable enough to cause them to change their plans. But this seems doubtful. Even if the "Eisenhower confidence" fails, it could easily be replaced by an "inflation confidence," based on the far from certain assumption that the Democrats will promote more inflation. Businessmen, after all, learned to take advantage of the presumably distasteful Democratic policies in the postwar years and made some of the highest profits in their history.

The problem in the next year may be to demonstrate that the more radical spokesmen of the Democrats—men such as Representative Wright Patman and Senator Hubert Humphrey—are not really forerunners of what a Democratic Congress and Administration would be like. The Republicans, in their own self-interest, will try to cast all Democrats in the radical image, and if Mr Harriman should receive the nomination their task may be somewhat eased. But businessmen, like other citizens, know how to discount the remarks of politicians, and the changed election prospects should, therefore, have little effect on a booming economy.

Democrats in Motion

MR ADLAI STEVENSON will probably not announce his candidacy for the presidential nomination until the Democratic National Committee meets in Chicago on November 17th. In fact, however, Mr Stevenson and his principal rivals are already campaigning actively. Spurred on by a somewhat equivocal endorsement from ex-President Truman, Governor Harriman of New York is trying to arouse among Democrats throughout the country the kind of enthusiasm shown for him in his own state. His lieutenant, Mr Carmine De Sapio, has travelled across the United States to marshal support for Mr Harriman. California was among his main targets, but on his arrival there a group of leading Democrats sent a message to Mr Stevenson urging him to declare his intentions and assuring him of their loyalty. Neither Mr Stevenson nor Governor Harriman, however, will have an easy time in California, for Democrats in that state strongly supported Senator Kefauver's bid for the nomination in 1952. With the opening of a "Kefauver-for-President" headquarters in Washington, the Senator from Tennessee is once again on the war-path, and his followers are hoping to take advantage of a possible stalemate between his two opponents.

Mr Stevenson has already indicated the main lines of his campaign. In a number of recent speeches he has cautioned listeners against an uncritical acceptance of the "Geneva spirit," has pointed to the Administration's constant dependence on the intelligent support of a Democratic Congress and has examined the crucial issue of agricultural surpluses and falling farm prices. At a time when hog prices are at their lowest levels since 1946 and farm income is falling steadily behind national prosperity, all politicians realise that the farmer's vote may decide the election. Politicians in both parties feel tempted to advocate alleged panaceas such as high support prices and increased government purchasing programmes. Mr Stevenson, however, has steadily refused to subscribe to any ready-made solutions.

In seeking to answer Mr Stevenson's challenge, potential Republican candidates are in an exceedingly difficult position. Until President Eisenhower announces his intentions, loyalty and good taste prevent all but the most brazen from actively seeking the nomination. Moreover, the very issues on which the Democrats can score their most telling points—such as agricultural policy, tax cuts, highway and school construction and American policies in the Middle East—are those issues on which the Administration cannot move forward without the President. While the Republicans wait, therefore, the Democrats are making hay.

The Legion Forgets

LAST week's annual convention of the American Legion showed once again that most of the Legion's 3 million members would support the plea of an American humorist for "less foreign policy." Nevertheless, there were indications that most Legionnaires are no longer prepared to let their distrust of foreign entanglements and American participation in international bodies go the whole way. By a vast majority, the convention rejected a resolution offered by the Illinois delegation and calling for American withdrawal from the United Nations. Cheering the declaration of one veteran that with the UN rests "our only hope for a peaceful world," the Legionnaires endorsed the view that America's withdrawal would mean handing the organisation to Russia.

This vote contrasted dramatically with that of the previous day when the Legion denounced the activities of the United Nations Educational, Scientific and Cultural Organisation and urged Congress to repeal the laws creating the National Commission to Unesco, a body which includes representatives from some 80 American organisations. The Legion's dislike of Unesco, which it regards as a centre of "materialism, world federalism and anti-Americanism" goes back to 1953. In that year it set up a special committee to inquire into Unesco and report before the 1955 convention. This group, headed by Mr Ray Murphy, a former national commander from Iowa, did its work carefully. Published last summer, its findings give Unesco an entirely clean bill of health and branded the charges against it as "utterly without foundation."

This report was expected to cause violent debate on the floor of the convention. Instead, Legion leaders brought forward a resolution denouncing Unesco and overruled

Kandy sleeps dreamily in the hills. Here was the home and last mountain stronghold of the last Sinhalese king. Here is the Temple of the Sacred Tooth. Here the great *Perahera* is held in August on the night of the full

moon. The Temple is the heart of Kandy and the Tooth of Buddha is the heart of the Temple; and the most romantic way to visit Kandy is by rail from Colombo via Kadugannawa Pass and Sensation Corner.

GROUP SERVICE

The expanding economy of the world demands ever increasing transport facilities. In many countries these must be conjured from existing railway track—often laid down in the last century and now narrow and inadequate. There is therefore, a growing demand for robust locomotives able to run continuously—with a minimum of maintenance—in high and humid temperatures, headwinds, sandstorms, sudden floods and every conceivable form of overload and hard ser-

vice. For example, Ceylon Government Railways are carrying out an extensive modernisation programme. Brush-built diesel-electric locomotives are replacing steam engines on all long distance runs. The Ceylon Government signed an order for the twenty-five 1,000 h.p. diesel-electric locos which Brush are building for C.G.R. Twenty of these efficient, smooth running engines are already improving express timings in Ceylon; they are ready for use over 90 per cent of the time.

ON THE SPOT ADVICE

At the heels of the pioneer comes the railroad—the organised transport that makes progress permanent. But each new terrain raises new problems that demand *individual* attention. This is where the Brush Group approach to overseas marketing succeeds. Through a world-wide network, it offers on-the-spot advice together with prompt delivery of a comprehensive range of power plant and equipment. On this basis, Brush have raised their production to over one third of the entire United Kingdom output of their type of power equipment—and steadily maintained Brush exports at over 10 million pounds a year, more than 50% of the total Brush sales.

a request to have it or the favourable report debated. The massive response of the delegates showed that they had judged the prevailing sentiments accurately. The Legion also called for the end of American aid to India—a nation which it suspects of siding with Russia under a neutralist guise—denounced the Chinese Communists as “savages,” endorsed the Bricker amendment which would limit the President's right to conclude treaties with foreign powers, and vowed to continue its battle against “atheistic Communism.” Not all veterans of foreign wars would support all these resolutions. Commenting on the delegates' work, Mr Truman remarked: “Most of them knew what they were fighting about. But they seem to have forgotten.”

Cotton in Excess

DOMESTIC cotton growers seem to have defied bad weather, unusually active boll weevils and severe acreage restrictions imposed by the government to produce a cotton crop which is likely even to exceed last year's output. The latest official estimate is substantially larger than previous forecasts and anticipates a crop of nearly 14 million bales—an increase of 2 per cent over 1954. This is a remarkable achievement; for everyone but the growers, however, it is unfortunate. With an unmanageable surplus already on its hands, the government intervened last autumn to cut the acreage under cotton by 14 per cent to its lowest level in seventy-five years. Cotton growers applauded this move, but responded by removing only the least fertile land from production, and by concentrating an increased supply of fertiliser and insecticides on a reduced area. The result has been acreage yields which, as Mr Benson, the Secretary of Agriculture, ruefully admitted, would have been considered “fantastic” twenty years ago.

If the current crop fulfils these expectations, total supplies of cotton will rise to 25 million bales, of which no more than 13 million will be absorbed in the coming season by the domestic and export trade. Moreover, exports have to contend with the abundant crops in other cotton-growing countries where no acreage restrictions are imposed. These estimates have shaken the cotton futures market and brought its sharpest decline in five years; they have also brought renewed demands for some method of subsidising cotton exports.

Mr Benson hinted some time ago that he might offer exporters a million bales of short-staple cotton on an open competitive basis. But it is doubtful whether, as the law now stands, he would be entitled to do this, since it would involve him in selling cotton at prices below the domestic level. In addition, the American textile industry actively opposes such a move on the grounds that its present competitive weakness against imports of foreign textiles would be further aggravated. The industry will have, in this instance, a staunch supporter in the Department of State which will be averse to offending other cotton-exporting countries.

Meanwhile, the Department of Agriculture already has its wary eye on next season's crop. It has decided to cut cotton acreages by a further 4 per cent to the lowest level permitted by law. Although no statement has

yet been made, it is expected to reduce the support price for cotton from the present level of 90 per cent of parity—a standard for relating crop prices to the prices farmers must pay—to around 86 per cent. But no one, as yet, has found an adequate solution to the problem of increasing yields and intractable surpluses.

Jets Go Commercial

LAST week Pan American World Airways placed the first large-scale order for American-built jet airliners. It has signed a \$109 million contract for 20 Boeing 707's and a \$160 million contract for 25 Douglas DC-8 jet airliners. The first Boeing is due for delivery in December, 1958, and the first DC-8—it is alleged somewhat optimistically—in December, 1959. The Boeing Airplane Company, which has a large contract for the military counterpart of the 707, has already flown the civilian prototype for nearly 300 hours, but the Douglas challenger is still under construction and is not expected to fly until March, 1958. Both aircraft will be powered by Pratt and Whitney engines and are designed to cruise at between 550 and 600 miles an hour. The Douglas Company claims that the DC-8 will be able to carry 108 first-class passengers non-stop on the London to New York route even against winter headwinds. Pan American is hoping that both aircraft will cover the distance in only 6½ hours. One interesting feature in both contracts, moreover, is the attempt made to appease the fears of communities near airports by assuring them that special jet engine silencers will be used.

A corresponding flurry of activity can be seen in the workshops of the Lockheed Electra turbo-prop airliner—a medium range aircraft not suitable for the North Atlantic. Two airlines—American and Eastern—have ordered between them 75 of these aircraft for delivery commencing in the second half of 1958, and have firm options to buy another 50. For both of these customers, the Electra will be powered by General Motors' Allison T-56 turbo-prop engine, but for future models the Lockheed Aircraft Corporation is anxious to be able to offer customers the Rolls-Royce RB-109 as an alternative.

Now that three major American airlines have taken the plunge into either jets or turbo-props, the others—especially United Airlines and Trans World Airlines—are under strong pressure to follow suit. But as late-comers to the scene, they face the fact that their competitors have pre-empted the production facilities of the three major American airframe manufacturers until about 1961.

Pan American has not cancelled its option to buy three de Havilland Comets, and the smaller Capital Airlines is fully committed to a Vickers Viscount turbo-prop fleet. Vickers salesmen this week unfolded the prospectus for their new Vanguard airliner, a direct competitor for the Electra and twice the size of the Viscount. They have started actively campaigning those American airlines that are still undecided, but may have to work hard to convince them that the company will not fall behind in delivery—offered tentatively for 1960-61.

Submerged Wealth

New York

THE controversy over the respective rights of the Federal Government and the State governments over underwater oil reserves has reached a new impasse. Last week, in a one-sentence opinion, the Supreme Court refused to solve the problem as to what constitutes the "historic boundary" of Louisiana. This curious question has arisen because of the wording of the two statutes which purported to settle the issue of the ownership of tidelands oil. In the Submerged Lands Act of 1953, Louisiana was given undisputed control over the submerged lands in the Gulf of Mexico within that state's "historic boundary." Similarly, the Outer Shelf Lands Act, passed shortly afterwards, established the jurisdiction of the Federal Government on the seaward side of this same boundary; but neither act defined precise locations. The state maintains that its historic boundary, dating back to Louisiana's entry into the Union in 1812, extends for three marine leagues (10½ land miles) from the coastline; the Federal Government contends that it stretches for only three nautical miles (just over 3½ land miles). In Texas, it has not yet disputed the state's claim to a three league boundary, while California, another state with important offshore oil deposits, claims no more than the three miles allowed by Congress.

The definition of "historic boundary," however, hinges on another imponderable which the Supreme Court was not asked to define: what constitutes a coastline? The Submerged Lands Act defined it as the line of ordinary low water, where the coast is in direct contact with the open sea, and as the line marking the seaward limit of inland waters, where it is not. Louisiana contends that the seaward limit of its inland waters is set by a chain of buoys which mark, for navigational purposes, the line between shallow coastal waters and the deep sea—a line extending, in some cases, as far as 25 miles from the shore. The Federal Government, not surprisingly, adopts a much more restrictive definition of inland waters. California, like Louisiana, feels strongly on this issue; it claims that its inland waters extend to a line joining several islands many miles off the Pacific Coast. It is thought that the Supreme Court may have decided not to pass on the Louisiana boundary issue in its present form because it would prefer to include these many aspects of the problem in one judgment.

A lot of submerged wealth is at stake within these legal definitions. Louisiana has so far received \$105 million in rentals and bonus payments for its leases on 2,600,000 acres of the submerged lands under its undisputed control. The Treasury has already earned \$250 million for tidelands oil leases. Moreover, the disputed belt may prove particularly valuable because the water covering it is not too deep for the offshore drilling rigs. Last April, both the government and Louisiana offered similar leases on some of the same land within the disputed area. The government received bids; Louisiana did not, but promptly threatened to sue anyone drilling in the disputed area. As a result of the Supreme Court's refusal to rule on the matter, Louisiana has won the first round; but the fight is far from over. Meanwhile, the oil companies are still waiting to find out who their landlord will be.

Walls Have Ears

MISLED by its enthusiasm for the "behavioural sciences," the University of Chicago's distinguished law school found itself last week at the centre of a storm of public and congressional indignation. In May, 1954, microphones were secretly installed in the jury room of the Tenth Federal Circuit Court in Wichita, Kansas, and recordings were made of the jurors' deliberations in five civil cases. Dean Edward Levi of the University's law school defended this unprecedented action by pointing out that it had been approved by the presiding judge and the attorneys concerned with the cases and that numerous legal authorities had praised the idea as a valuable contribution to the understanding of the jury system. Moreover, the recordings had been altered in such a way that no identification of the jurors would be possible.

Neither the Department of Justice, however, nor the Internal Security sub-committee of the Senate accepted this view. Mr Herbert Brownell, Jr., the Attorney General, declared that strict privacy of a jury's deliberations was at the very basis of a due process of law. Senator James Eastland of Mississippi and Senator William Jenner of Indiana went further and promised that Congress would pass legislation "to provide severe punishment" for anyone caught eavesdropping on juries. They hinted that they would refer to the Judiciary Committee of the House of Representatives the question of whether or not the judge who permitted the "jury tapping" should be impeached. Senator Jenner made the telling point that until juries are certain that this experiment cannot be repeated their thinking and free discussion might be cramped.

Common sense and public opinion seem to support this condemnation, but unfortunately Senator Eastland and Senator Jenner chose to weaken their case by giving it various political overtones. The University of Chicago's study of

(Continued on page 303)

(Continued from page 302)

commercial arbitration, income tax law and the jury system was financed by a grant of \$1,400,000 from the Ford Foundation. Although the Foundation had nothing to do with the actual research project, the Senators sought to place its many activities in the academic field in a sinister light. Moreover, they asked Dean Levi entirely irrelevant questions about his alleged connections with various left-wing organisations and examined Professor Henry Kalven, Jr., at length regarding his views on the Rosenberg trial. This heavy-handed attempt to find a link between a case of academic misjudgment and political subversion will only reflect discredit on a legitimate congressional inquiry.

Plan for Industrial Harmony

FROM A CORRESPONDENT IN OHIO

IN Newcastle, Indiana, where a recent labour dispute and an attempt at strike breaking led to violence and the calling out of the National Guard, the authorities might be well-advised to follow the example of Toledo, in neighbouring Ohio. In this automobile and glass centre, in the depression years of the nineteen-thirties, a wave of strikes caused grave damage to property and some loss of life; this pattern threatened to repeat itself after the war. But in 1945, a committee, representing labour, management and the public, was set up to study the industrial relations problem in the city. Out of this developed the Toledo Plan, adopted by the city government in February, 1946, as a method of mediation in labour conflicts. The study group, rechristened the Labour-Management-Citizens Committee, became part of the city government.

It has 30 regular and 18 associate members, representing the three groups equally. The labour members are nominated by the two big trade union associations, the American Federation of Labour and the Congress of Industrial Organisations; the representatives of management are chosen from among the industrial leaders of the community; the public is represented by civic leaders, including well-known clergymen, judges and educators, approved by both labour and industry. All members serve without pay. The committee has a full-time administrator and when a labour dispute occurs, he is usually informed by one side or the other; if not, he offers his services. He deals with small, uncomplicated troubles without help. In more serious disputes he asks the committee chairman to summon a panel from among the regular members and himself submits a brief, citing the issues and presenting his own analysis. Both sides are then asked to present arguments, with supporting data, at an informal hearing; where the tension is too great, separate hearings are held for labour and management. This is the "weeding-out" stage, where essential demands are separated from those put in for bargaining purposes and the aim is to reach a compromise without work being interrupted.

In most cases such mediation is sufficient, but if "emergency" action is demanded, all the 48 members of the committee may be summoned. This drastic remedy has been needed every year for the past five years to avert

threatened strikes at the utility plant which supplies Toledo with its gas. If all else fails, the committee recommends independent arbitration, in which case the issue passes out of its hands. In any event the only force ever employed is that of public opinion, but this is so persuasive that, after accepting mediation, workers seldom decide to strike, or managers to order a lock-out, even though both are free to ignore the committee's suggestions.

On its record, the Toledo Plan is an unquestioned success. In its first year of operation, 1946, the man-hours lost from work stoppages fell from 420,000 to 233,000. Except during 1950, the drop has continued steadily; last year only 63,500 man-hours were lost. In 1944, Toledo stood fourth among American cities for time lost through strikes; in 1953 it was 58th. And the total cost to the city for operating the Toledo Plan in 1954 was less than \$16 million. In its nine years of operation the committee has settled 576 labour disputes; it has actually averted 156 threatened strikes and has shortened the duration of many others. There is also concrete evidence that suspicion and rancour between labour and management has been lessened in the city. The whole idea has also encouraged a new spirit of co-operation between unions and companies in various civic activities; for instance labour groups have set up a committee to help attract new industry to Toledo and to assist the Chamber of Commerce in its programme for industrial development.

SHORTER NOTES

Led by the First National City Bank of New York, banks all over the United States last week raised the prime rate—the rate of interest charged to customers with the best credit rating—from 3¼ to 3½ per cent, the highest level for two decades. This increase reflects the continued high demands for loans and the shortage of available funds.

It has been reported that in the period January 1st to October 11th of this year Americans bought six million new automobiles. This figure exceeded sales in both 1953 and 1954.

In order not to disturb the wintering habits of the whooping crane, the Strategic Air Command has cancelled its plans to expand a bombing range on Matagorda Island, off the coast of Texas. The birds, of which only 26 remain in the world, are Canadian citizens for half the year, and were championed in this international dispute by the Canadian government.

To help the onion-growers of New York State, half of whose crop fell a victim to the hurricanes Connie and Diane, Canadian producers generously offered to sell six carloads of their onions in the United States and make over to their competitors the entire proceeds. But the Canadian well-wishers reckoned without the American tariff laws which proved too rigid to admit the gift duty-free.

The World Overseas

Soviet Plans for the South Pole

FROM A CORRESPONDENT

FIFTEEN months ago the Russians announced the spectacular exploit of setting two expeditions drifting on the sea ice of the Arctic Ocean. The Soviet press followed this up with what almost amounted to a running commentary on activities at these two lonely camps (see *The Economist* of October 2, 1954). One was evacuated in April of this year, after it had drifted over the North Pole and was nearing the coast of Greenland, but at the same time a new station was established in another unexplored patch of ocean. Thus there are still two parties at work today.

Meanwhile a no less ambitious Soviet expedition is preparing to go to the Antarctic in November. This, like the Commonwealth, American, and other expeditions lately announced, forms part of the programme of the "International Geophysical Year 1957-58," which, in its Antarctic manifestation, will shatter the usual silence of that continent; its population will increase from dozens to hundreds, and aircraft and over-snow vehicles will fan out from twelve of fourteen newly established bases. The Russians have never in their history set up a shore station on the continent; in fact, their interest has been limited to one excellently conducted circumnavigation of Antarctica 135 years ago, and to annual whaling voyages since 1946. But their experience in the far north is vast, and they may confidently be expected to apply it skilfully in the far south. Their effort is likely to be second only to the American, and much greater than that of any other country.

Three Soviet stations are planned. One is to be on the Knox Coast, which lies between 102° and 110° East; one in the region of the south geomagnetic pole (not to be confused with the magnetic pole), about 800 miles inland from

the first; and the third near the "pole of inaccessibility"—that is to say, the area which is the greatest distance from the coast, and perhaps another 800 miles beyond the second station. The only reason why there will not be a station actually at the South Pole itself is that the United States had earlier announced its intention of occupying it.

Equipment will be lavish. There will be two ships, of which the bigger will be the *Ob*, one of three Dutch-built freighters specially designed for the "Northern Sea Route" along the Arctic Coast of Siberia and completed last year. She can carry 6,500 tons of cargo, and has proved her ice-worthiness in a voyage along the whole length of the north Siberian coast. The possession of such a ship is an enormous asset—a fact which will be readily admitted by several countries participating in the International Geophysical Year, including Britain, as they seek to charter far less suitable foreign ships. The *Ob*, now undergoing a special refit, will carry helicopters for use en route and on arrival. Large transport aircraft will be flown in from beyond the Southern Ocean. Tracked vehicles and dogs will provide overland transport.

The whole undertaking is to be under the aegis of the Academy of Sciences of the USSR, and the leader will be Dr M. M. Somov, an Arctic specialist of many years standing. He is an expert on sea ice, and was leader of a drifting expedition in the Arctic Ocean in 1950-51. His second in command, Dr V. G. Kort, is an oceanographer of repute. The total number of men in the wintering parties is not known. The scientific work will be integrated with the International Geophysical Year programme, the basic idea of which is that observations of a similar kind will be made

THE ECONOMIST, OCTOBER 22, 1955

simultaneously in many different places. The subjects to be studied by the Russians include meteorology (especially upper atmosphere observations), terrestrial magnetism, the aurora, the ionosphere, and cosmic rays. Investigation of the Antarctic ice sheet is planned, and oceanographical work will be done from a suitably equipped vessel. Preparation for this work is involving a number of scientific institutes in the Soviet Union, including the Arctic Research Institute at Leningrad.

Although it is bad form to mention politics in the same breath as international scientific endeavour, it is nevertheless sadly true that nobody in these days does anything in the Antarctic with entirely pure motives. With modern techniques it is now theoretically possible to make some use of the apparently desolate waste of snow, ice and rock. The scramble for land has started. Most of the continent is already claimed, predominantly by Commonwealth countries. The coming expedition will provide some badly needed buttressing for the Soviet claim to take part in any political solution which may or may not be imposed in the far south.

The Issues in the Saar

FROM A SPECIAL CORRESPONDENT

NOTHING could be much more contorted than the situation in the Saar on the eve of the plebiscite next Sunday. Technically the population is being asked whether or not it approves the Saar statute, upon which Dr Adenauer and M. Mendès-France agreed exactly a year before the day of the plebiscite. In practice those who dislike a Saar economically linked with France have seized upon the plebiscite in order to demonstrate in favour of re-incorporation with Germany. "Vote No for Germany's sake," they cry, although the German government approved the statute. And although the German Chancellor has more than once asked them to support it, the Saar branch of his own Christian Democratic Party is campaigning against the statute.

Apart from the war of words, it is perhaps worth while to consider what genuine feelings and interests are involved. Many quite reasonable people will vote "No" for the very reason that the statute is to make the autonomy of the Saar more complete by abolishing certain special rights of the French. Many voters feel that this arrangement will perpetuate the separation from Germany, even though it is supposed to be provisional, and if the new referendum promised by the statute is in fact held at the time of the peace treaty—which they have been taught to doubt—they feel that it will be more difficult then than now to rebel. They wish to rebel because they are German and as such prefer to belong directly to the German community; they want their children to be educated like other German children—and not as what they are inclined to regard as bi-lingual freaks (in the schools in the Saar young children have six German lessons a week to five French).

Many opponents of the statute object most of all to the Saar's economic union with France. They want to be part of West Germany's prosperous society; each time they cross

the frontier they are impressed by the relative cheapness of the goods in the German shop-windows. The Saar economy, they complain, is going to ruin for lack of modernisation which so small a unit cannot itself finance: the French, they feel sure, will always be grudging towards the Saar, while Germany has always been enterprising in the matter of investment in industry.

The supporters of the statute are in the less agreeable position of being on the defensive. They can, however, point out that if the statute is accepted, the first completely free elections to the postwar Saar Diet will be held on December 4th. This would make it possible to turn out the much-abused Hoffman regime, which has become everyone's Aunt Sally; even the French have little to say for Herr Hoffman because he has often obstinately championed the interests of the Saar in Paris. As for French neglect of the Saar economy, there is some truth in the indictment, especially with regard to the construction of new steel strip-mills. In addition, uncertainty about the future of the Saar has restrained Swiss and other financiers from new investments, for instance in a much-needed chemical industry based on coal. But the fact remains that up to the present, in spite of much gloomy prophecy, Saar production has steadily increased since the war, and the population has enjoyed full employment, good wages and social services more extensive than those in Germany.

Of late the contention that Saar coal and Lorraine ore are fully complementary has come under fire. This is not so true as it was. The heavy industry of Lorraine is developing faster than that of the Saar and uses an increasing proportion of its own coal. But the Saar steel works remain technically adjusted to Lorraine ore and would need to build bigger blast furnaces if they were to use ore from Sweden or elsewhere. Lorraine actually competes with the Saar in selling steel on the South German market today, though this competition is less severe than that of the Ruhr. On the other hand, the existence of the common market for coal and steel has in fact enabled the Saar to sell more steel to Germany, in spite of competition.

The customs union with France is chiefly important to the lighter industry of the Saar—furniture, clothing and china goods. A well-known example is von Boch's porcelain factory at Mettlach, which employs between five and six thousand people and supplies a large part of the French market. These are people who might soon be unemployed if the Saar went back to Germany and their employer makes sure that they know it. It is generally thought that there will be a substantial vote in favour of the statute by such people, who are prosperous today and prefer to run no risks, prudent people who take little interest in the green and white banner of Europe which the pro-statute orators display.

On the other side the emotional appeal of the German flags and eagles and the *Deutschlandlied* is tremendous. It is interesting, however, that the violence which flared up at the beginning of the three months' plebiscite campaign has died down, which suggests that those who fomented it were subsequently persuaded that violence would not pay. Indeed, there is much less fear in the air than there was before the plebiscite in January, 1935. There is, on the other hand, more open and ugly abuse of France by the speakers at the "Vote-No" meetings than Hitler allowed the Nazis in 1934-1935, and this in the presence of members of the plebiscite commission. Anti-French tirades

are a speciality of Kurt Conrad, the pro-German Socialist leader: this pleases the big contingent of miners, some 66,000, who are excellently paid and should be content but who have an anti-French tradition as employees of the French state from 1920 to 1935 and again since 1945. In heavy industry the employers, too, are today anti-French, and without the sense of common interest with the French entrepreneurs which seemed to exist a few years ago.

On the eve of the poll nobody seems to expect more than 60 per cent of the votes to be "No," while many people fear a narrower majority which will scarcely relieve the tension. But the consequences of a "No" vote are shrouded in controversy; those who favour the statute believe that its rejection will mean not only that France will withdraw the offers it has made in the statute both to the Saar and to Germany, but also that it will leave the Coal and Steel Community. The pro-Germans, however, profess to know that France will be ready enough to re-open negotiations. The outside observer can but feel anxiety for Western European Union, under whose aegis the statute was to have placed the autonomous Saar.

Marshal Pibul Hastens Slowly

FROM A CORRESPONDENT IN BANGKOK

MARSHAL PIBUL SONGGRAM'S experiment of bringing a little more democracy to Thailand without disturbing the country's political stability seems to be meeting with a certain success. One of the more spectacular, if not really radical, developments is the use of the Royal Cremation Ground for public oratory of the Hyde Park variety; here the anti-government speakers attract the largest crowds, and two cabinet ministers were observed among the audience surrounding one speaker who demanded the immediate release of all political prisoners. This novel development is perhaps symptomatic of changes of greater consequence.

For the first time in several years, preparations are being made for the establishment and registration of numerous political parties to contest the 1957 election. It is claimed that registration will prevent the mushrooming of a multiplicity of splinter parties, as well as ensuring that the leadership, the main political aims and the financial backing of each registered party are publicly known.

So far, the response to this modest reform has been disappointing. Of the three groups which have applied for registration, none appears to possess enough public appeal, financial backing or influential leaders to compete successfully with the present junta. The latter, whatever its defects as an example of democracy, has undoubtedly gained considerable administrative efficiency; moreover, it has recently paid much attention to the raising of the standard of living and to public works, including irrigation, communications and a public health programme.

Would-be competitors will therefore require a realistic programme as well as leaders with considerable popular appeal. Most of the prominent political figures outside the self-styled "coup" group at first followed the lead of a former premier, Nai Khuang Aphaiwongse, in declaring that

they would not re-enter politics so long as the constitution permitted the government to nominate, in the king's name, half the members of the House of Assembly.

The list of office-holders in the new pro-government party hardly suggests that a radical reform policy is intended. Rather, there appears to be a half-hearted attempt to satisfy Siamese intellectuals and Western observers by suggesting that the mere creation of political parties is in itself a progressive move. The leadership of the new pro-government party consists of Field Marshal Pibul (at the head), the commanders-in-chief of the army and air force as deputy leaders, police general Phao as secretary-general, and a civilian closely linked with powerful financial interests as treasurer.

This suggests a "ministry of all the medals" rather than an orthodox political group. Yet it might be argued that the Marshal had gone as far as he could without risking a general upheaval which would be of little profit to anybody except the Communists. From the first, the Marshal has had to rely upon military support, and the time has not yet come when this can be dispensed with altogether.

Some of the more grandiose reform schemes—such as the abolition of legal opium dens—have had to be shelved for a while. The immediate suppression of the dens, for example, would not only have led to a sharp decline in revenue and required vast sums to compensate their licensed managers, but would also have produced gangsterism and corruption on a scale comparable with those which followed prohibition in America. On the other hand, a genuine attempt is being made to check opium-smuggling throughout the country, and the widespread corruption in government-sponsored financial and industrial concerns has also become the subject of reformist propaganda.

The recent decision of veterans like Nai Khuang Aphaiwongse to return to politics, in spite of earlier statements to the contrary, is a healthy sign. Nai Khuang returns at the head of his reconstituted Democrat party, who might be described as right-wing liberals. Even though several other popular figures, such as M. R. Seni Pramoj, the war-time Siamese leader in Washington, and ex-Foreign Minister Nai Direck Jayanama, continue to remain aloof, there is certainly room for cautious optimism.

Gradual but Inevitable?

The recognition of new political parties is less of an advance than it sounds, for there is very little general demand for them in Siam. Much more heartening than this is the widespread feeling that, by one means or another, Thailand is likely to become progressively more liberal from now on. Were progress to become too rapid, the whole programme of reform might be endangered, for the sudden attainment of full democracy would mean the end of those lucrative commissions now enjoyed by some of the Marshal's chief military supporters. It is imperative that changes for the better should occur slowly enough to avoid antagonising too many powerful personages at any one time.

For a little while it looked almost as though Marshal Pibul were being carried away by his own eloquence. Since then, he seems to have come to closer grips with reality, yet without in any way narrowing the scope of his ultimate intentions. In all these matters, the Prime Minister will no doubt receive the sympathetic, if unostentatious, support of the western diplomatists stationed in his capital.

Now!

Fly to New York and non-stop across the USA

WITH TWA's NEW SUPER-G CONSTELLATIONS

Quietest, most luxurious long-range airliners in the world

From November 1st you can fly to New York in TWA's new Super-G Constellations. On these great Lockheed aircraft, science works behind the scenes to make your trip quicker, more comfortable. Radar plots the smoothest course ahead. Turbo-compound engines, fed by wing-tip tanks, give greater speed, longer range. And the finest modern design has made the interior fittings of the Super-G the most luxurious ever. You can enjoy all this, linked with TWA's traditionally friendly service, at reduced fares!

TWA's Discount Fare Plan operates throughout Thrift Season (Nov. 1st—March 31st), gives big re-

ductions for families travelling together. (Example: A husband and wife flying first-class save a total of £128 for the round trip to New York.) For details of this and TWA's Time Pay Plan, see your travel agent or call TWA—200 Piccadilly, London, W.1. Tel. TRAfalgar 1234. Manchester. Tel. BLAckfriars 4649.

Canadian Argument Over Taxes

FROM OUR OTTAWA CORRESPONDENT

CHANGING fashions in economic theory are illustrated in the fiscal relationships between the central government and the provinces in the Canadian federation. Since the beginning of the second world war these relations have come to be a quinquennial crisis in Canada, and the country is now in the throes of a federal-provincial argument which may have lasting effects on the operation of the federal structure in Canada. The questions involved in regulating the division of taxation between the central government and the provinces are so complex that the little man at the base of the whole pyramid scarcely knows what is going on: he merely foots the bill and pays the consequences.

The decisions of eleven separate governments will be required to resolve the present dispute. They may have profound fiscal and economic consequences, but it would be naive to expect the decisions to be other than political. Both federal and provincial politicians are trying to determine, not so much what the people want, as who will get the blame for unpopular, or the praise for popular, solutions.

For fifteen years the powers of direct taxation have been divided between the federal government and the provinces in general accordance with a series of "tax rental agreements" whereby the federal government paid the provinces certain agreed sums in return for exclusive occupation of the fields of personal income tax, corporation income tax and succession duties. The agreements have never provided complete coverage except during the war which gave them their origin. Since the war there have been two five-year agreements, the second one being due to expire at the end of next year. In the first postwar agreement (1947-52) all the provinces signed tax rental agreements except the big central provinces of Ontario and Quebec. But double taxation was avoided because the federal government allowed provincial corporation taxes up to a certain level to be deducted from its taxes, and neither of the non-agreeing provinces exceeded these limits. In the second and current agreement all the provinces except Quebec acceded, though Ontario insisted on keeping its own succession duties. Quebec levied a number of taxes, mainly on business, which the other nine agreeing provinces were precluded from levying, but as most of them counted as deductible expenses from the federal corporation income tax, the hardship for business was not too severe.

Tax uniformity and centralised fiscal control—two of the main objectives of the tax rental agreements—were not complete, but they were near enough to establish a rough practical uniformity which was broken only in rather tiresome details in Quebec. Last year the breach in the uniformity became more serious when Quebec imposed and levied a personal income tax which conformed to the then-permissible federal deductions neither in rates nor in exemptions nor in definitions. The federal government took a step towards equalising things for the taxpayers of Quebec by adopting the device—questionable in principle but workable in practice—of "abating" its own income tax by 10 per cent for Quebec residents. This left some of them paying

less tax than anyone else in Canada, while some of them paid more.

The Quebec income tax at least established one point beyond doubt in the mind of the federal government. This was that the Quebec provincial government headed by M. Maurice Duplessis (under the name "Union Nationale") would never enter a tax rental agreement with Canada. The federal government, therefore, had to face the fact that the attempt to establish tax uniformity and effective fiscal control at the centre could not be established completely—at least not without a change of government in Quebec, which no minister could consider an early possibility.

The federal government chose to heal the rift with French-speaking Quebec by substituting for the existing tax rental formulas a new formula which provides unconditional subsidies for needy provinces and gives little incentive for any province to confine its own direct taxation to the fields vacated by the federal government. The new "equalization formula" will permit Ottawa to give equalization grants, calculated according to a complicated formula, to all provinces with the exception of Ontario. By this means Quebec will be entitled to a considerable payment from the federal treasury without conditions, and it will cease to suffer a financial penalty for insisting on its constitutional right to raise its own taxes. Politically, and perhaps even ethically, that is desirable, provided the English-speaking taxpayers do not regard it as a bribe to the French-Canadians.

Fears for Controls

But the real objections are economic. The premier of one of the other provinces remarked, after hearing the federal suggestion, that national unity was very much to be desired, but if it was to be secured at the cost of undermining national well-being the question would appear rather differently. He was worried lest, under the new proposal, the other provinces should all plunge back into the fields of direct taxation and effectively rob the central government of its power to influence the course of the economy through fiscal controls. But there is a new set of faces in Ottawa—a new Finance Minister in Mr Walter Harris, new officials in the Ministry of Finance, the Privy Council and the Bank of Canada. And the new men—in flat contradiction of the old—set little store by the need for absolute fiscal control in Ottawa. They are not worried by the prospect of provincial governments raising their income taxes when Ottawa is trying to stimulate the economy by dropping them. They are prepared to take their chance of that, in the belief that the central control is strong enough to override any provincial measures.

Tax uniformity still makes more appeal both to Ottawa and the provinces because politicians realise that most taxpayers would be incensed if they had to go back to filling out two tax forms and paying two different taxes. Most provinces still want to confine their taxes within the limits which the federal government will yield to them, and they prefer the federal government to continue collecting the tax on their behalf. Ottawa is likely to insist that the provincial rates stay within its limits if it is to be the collecting agency. From the taxpayers' point of view that will be satisfactory. But for the economists and the historians, the Federal-Provincial Conference which met at the beginning of this month is a turning-point. No one can yet guess the long range effects of the policy of leaving all the pro-

vinces free of restraints in their tax policies while paying all but one of them unconditional equalization grants. The new chapter in federal-provincial relations owes much of its character to the intransigent attitude of M. Maurice Duplessis, with his continued and unsupported claim that the provinces have a priority in the field of direct taxation. They have a concurrent and equal right with the federal government to levy direct taxes, but most of them have been, and still are, glad enough to give it up in return for assured revenues. Now they are to get the assured revenues anyway: it is anybody's guess how their own tax policies are likely to develop in the new freedom which is being thrust upon them.

South-East Asia in Search of Experts

THE momentum of the Colombo Plan's technical assistance programme was well maintained last year. According to the annual report* published this week, 129 experts and 1,023 training places were provided during the year; in both instances, this represents a substantial increase over previous years. In addition, large quantities of equipment for training and applied research were made available. In all, a total of £3½ million was spent between the inception of the scheme and June 30, 1955, and a further £2 million has been firmly committed for future projects.

But the requests for experts and training facilities continue to grow and barely half the number of experts applied for have so far been provided. The problem will be eased, no doubt, by the increased financial contribution announced by Britain, but money alone will not entirely solve the actual numerical shortage of experts who are able and willing to go out to South-East Asia. It is proving easier to provide extra training facilities, and great progress has been made in creating and improving training establishments within the region. In Ceylon for instance, with British help, a technical training institute has been set up at the Gal Oya multi-purpose project and places have been reserved for 15 Colombo Plan trainees. India's Reserve Bank has opened a banking staff training college. And in Pakistan a regional railway training centre has been established at Lahore, which will provide training for railway officers for the whole region.

The Report speaks encouragingly of the progress made in improving co-ordination with the United Nations and American technical assistance schemes in the region. Liaison officers have been appointed to secure better co-operation, and in some cases, such as in the establishment of the Institute of Technology at Kharagpur in India, joint action has been possible.

Help from Afar

The extent to which Australia, Canada, and New Zealand are participating in the Colombo Plan is not always fully appreciated. Australia, for example, has provided a greater number of traineeships than Britain, and it has so far sup-

* Report for 1954-55 by the Council for Technical Co-operation in South-East Asia. HMSO, price 1s. 3d.

plied 115 experts against Britain's 157. Canada and New Zealand too are making important contributions. Canada has helped Ceylon, Cambodia, and Indonesia to improve their fisheries. Among other projects, New Zealand has helped Ceylon in the setting up of a dental nurses' school at Maharagama. Within the region, mutual aid has been steadily increasing. India is better able than its neighbours to supply experts and provide training facilities, but nearly all the countries are actively participating in the work. As Sir Robert Black, the Governor of Singapore, told the Consultative Committee, the distinction between donor and recipient countries is no longer applicable.

The value of the technical assistance programme is accepted by all the members of the plan, and there is no doubt that a decision to extend the scheme for a further period will receive general approval. It is essential for the eventual success of the plan that there should be this continuity.

Beating India's Bounds

FROM OUR CORRESPONDENT IN INDIA

FIFTY years ago, Lord Curzon said the map of India should be redrawn. Ever since, people have been arguing how to do it. Mahatma Gandhi and the Congress wanted states based on language. A series of British statutory commissions, in the usual British way, wanted that and everything else too; administrative convenience, appropriate communications, common race and general unanimity. And, since partition, there has been amongst many a reluctance to do anything at all, in case India's unity should be imperilled by the clash of lesser loyalties.

Of late, however, India's unity has been four-square enough for a little tinkering with local boundaries not to disturb it, and two years ago a commission was appointed to see how those children of historical accident and strategic necessity, the states of India, could, unlike Humpty Dumpty, be put together again. This commission has just submitted its report. Before action can be taken on it the state legislatures must be consulted and Parliament itself must pronounce; but it is not likely that the report will be greatly changed.

The commission's recommendations will put an end to both of those last remnants of princely power, the Rajpramukhs and the classification of India's states under the headings A, B, C, and D, with the centre exercising closer supervision over "B" states than over "A" ones, and retaining a thorough control over "C" and "D" states. In future all states will be "A," except Manipur, the Andaman and Nicobar islands, and Delhi, all of which, like Washington, DC, will be territories under the centre's direct administration. The commission's recommendations leave that half of India which runs in a great arc from Rajasthan to Bengal, whose states are already unilingual, almost untouched. Bihar loses a little territory, Rajasthan and Bengal gain some. That is all. Not even Sardar Panikkar's brilliant advocacy has been able to persuade his colleagues to reduce Uttar Pradesh's preponderance by splitting it.

But the other half of India's people are to have their states altogether changed. On the two vulnerable borders

two strong states are being created. The Punjab absorbs Himachal Pradesh and Pepsu, with which its territories run in and out and whose people share its languages, Punjabi and Hindi. Assam absorbs Tripura. In the centre a Hindi state, India's largest in area, is to be formed out of the Hindi-speaking part of Madhya Pradesh, Vindhya Pradesh, Bhopal and Madhya Bharat. The south is split into its linguistic components. Mysore joins with the Kannada-speaking areas of its neighbours and with Coorg to form Karnataka. Madras exchanges Malayalee-speaking Malabar with Travancore-Cochin for Tamil-speaking South Travancore. Hyderabad, that obstacle to the natural development of the southern peoples, disappears; some of it goes to Karnataka, some to Bombay. The larger, Telugu half becomes a separate state, but if in five years' time its people have conquered sufficiently their fears of their own backwardness and their dependence on revenue from drink they will be

This map, which shows the new state boundaries proposed, may be compared with the map showing the existing boundaries on page 198 of THE ECONOMIST of October 15th.

able to join their fellow Telugus in advanced and "prohibition" Andhra. Only in the west are the commission's conclusions quite unexpected. Maharashtra has been split into two—the Marathi part of Madhya Pradesh is to be a separate state, Vidarbha. The rest of Maharashtra is joined with Gujarat, Saurashtra, and Kutch—all Gujarati speaking—in a bilingual Bombay.

Most of the commission's recommendations will be accepted cheerfully enough. There will be small local rows, but most of these can be adjusted with a little goodwill. The real trouble will come in the Punjab and Maharashtra. The Sikhs have not got the Punjabi-speaking state for which, not long ago, they were going to jail so cheerfully, and the Marathas have not got their long-desired unity. The commission has disposed of the Sikh claim elegantly enough. A Punjabi-speaking state is a nonsense. Everybody in the Punjab is bilingual; even in the Jullundur division most candidates at matriculation, given the option, do their papers

in Hindi, not Punjabi. The real issue is communal; and that cannot be solved. The Sikhs cannot have a state of their own because there is no large area, not even Pepsu, where they are in a majority.

In dealing with the people of Maharashtra, the commission has followed the example of the British, who split them up between three states, in none of which were they in a majority. In particular, it has denied them their unity and frustrated their desire to be alone. And to satisfy whom? Not those who believe, like Mr Morarji Desai, in composite states as valuable in themselves; these are too few; but rather the traders and industrialists of Bombay city who do not speak Marathi, the lawyers of Nagpur who are afraid they would lose income if Nagpur loses importance, the landowners of Berar who are afraid of land reforms. It is odd that in socialistic India, 30 million people can be denied their heart's desire to satisfy landlords, lawyers and businessmen.

Two Chances for Communists

With this one notable exception, the commission has respected the people's wishes. It has not therefore forgotten either the primacy of India's unity or the rights of linguistic minorities. It has turned down firmly the idea that a linguistic state can be a homeland to which Indians who speak that language can look wherever they may live. It has suggested means to ensure that minorities get their fair share in state government service and a fair opportunity to educate their children in their own language. It has reproved, delicately, the megalomaniacs of Assamese. It has, however, taken one risk. Both Kerala, the Malayalee-speaking state, and the new Telugu state of Hyderabad, will have Communist parties so large that these might, in conjunction with other left-wingers, be able to form governments. But the risk is limited; Communist morale just now is not high, and the new states cannot be formed more than a few months before the next general elections.

Half a century ago, redrawing India's map began badly with the partition of Bengal. It is ending well with the

commission's report. Only Samyukta Maharashtra will be left to make it complete. And the people of Maharashtra seem already to have realised that they need not be violent. India is a democracy. If they push long enough and hard enough, they will get the state Mahatma Gandhi advocated for them.

Flaws in East-West Trade

DELEGATES from twenty-six European countries, including the Soviet bloc, have been meeting in Geneva recently in the Development of Trade Committee of the Economic Commission for Europe (ECE). They can afford to take a fairly optimistic view of the present position of East-West trade. Figures recently issued by the ECE show that in 1954 the volume of trade between the two blocs had virtually reached the postwar peak level of 1949. Figures for 1955 show a continuation of the trend, and the total this year should be a new postwar record.

This is all very satisfactory, and the ECE is entitled to have part of the credit for its unremitting efforts to put trade back on a more normal level; but there are still a number of question marks. Chief among these is the future attitude of the Russian leaders towards trade with the capitalist world. At the moment, no doubt in preparation for the coming meeting of the Foreign Ministers, Soviet propaganda is hard at work telling the world that the Communist part of the world wants trade, and that it can offer huge depression-proof markets for the western world. Simultaneously, however, an entirely contradictory line is being taken by other spokesmen.

For instance, Mr Saburov, the chief Soviet economic planner, told an American newspaper correspondent that as a result of the embargo policy the Soviet Union had greatly increased its self-sufficiency in all goods and would soon "not need to trade with the West." A similar line was taken by a Rumanian, Mr Constantinescu, in a recent article in the Cominform journal. The burden of his article deals with the co-ordination of the five-year plans of the entire East European bloc which will take place from 1956. The writer dwells with significant emphasis on the advantages of the "new international socialist division of labour." These statements are clear evidence that the old idea of bloc autarky has not been abandoned, and has merely been temporarily kept out of the limelight.

Communist intentions about grain are equally puzzling. Until recently grain was the main export of the eastern bloc, but outcoming supplies have declined sharply and exports now tend to be more diversified. Future policy is still unsettled. Earlier this year, grain markets were taken by surprise when the Poles and other satellite countries entered the market and bought substantial quantities of grain from Canada. The Russians themselves, according to Mr Khrushchev, were also interested in getting American surpluses of wheat. Mr Lester Pearson was told during his recent visit to Moscow that the Russians were interested in buying Canadian surplus stocks of grain.

Yet the Russians and the satellites are claiming record harvests this year, and exports of Russian grain to Britain and Western Europe have recently restarted, though on a

modest scale. Moreover, the chances that the Russians will be able to resume substantial exports of grain to Britain in the near future were thought to be good by the British agricultural delegation which recently returned from an extensive tour of the Soviet Union. Clearly, however, no lasting expansion of trade between East and West can be built on a system which involves Soviet purchases of Canadian and American grain and simultaneous exports of Russian and Danubian grain to Western Europe.

The other big question mark concerns the future of Russo-German exchanges. The Russian side hoped that the delegation which went to Moscow in September from Bonn would discuss a five-year trade treaty as well as diplomatic relations. They were disappointed, for trade played hardly any part in the negotiations. The German government regarded their mission as strictly political, and had damped down hopes of big commercial results before Dr Adenauer left for Moscow. They were supported by the Federation of German Industries, which pointed out to the public that there were no longer the same prospects of extensive trade with Soviet Russia as in the days of the Weimar Republic. (In 1932 exports to the Soviet Union represented nearly 11 per cent of Germany's total and supplied 46.5 per cent of Soviet imports.)

For the time being, German order books are over-full, except in the consumer goods industries, and there is not the same eagerness to be rescued by Soviet contracts as in the 1920s. Nevertheless, even the most realistic Germans would like to see a long-term treaty with the Russians which would guarantee a steady market—even if a small one—as an insurance against the day when the present boom has perhaps changed to a recession.

Flattery for Germans

Though negotiations remained political during Dr Adenauer's visit to Moscow, preparatory trade talks went on after he left. According to the correspondent of the *Handelsblatt*, the Russians have offered to export, *inter alia*, timber, cotton, manganese ore, chrome ore, petroleum and its derivatives, phosphates and some chemicals. They would like the Germans to send them, in return, ships, machinery, diesel engines, lathes and other technical apparatus, non-ferrous metals, heavy and refined chemicals, dyestuffs, pharmaceutical materials and artificial fibres. The Russians suggested that German chemicals might account for about DM 100 million a year out of a total volume of German exports to the Soviet Union of DM 800 million to DM 1,000 million. But the Germans had the impression that they would not be able to sell many consumer goods to the Russians.

The Russians seemed genuinely unaware that there is full employment in West Germany, and hardly believed the accounts of prosperity which were given them. For prestige reasons they took the line that the Soviet Union did not really need German trade and could, of course, easily pay for imports. On the other hand, the flattery of German skill which has for some time past come from Mr Mikoyan and his subordinates is an indication that the Russians, for both political and economic reasons, are anxious to link Western Germany to their markets. But about the Russians' capacity to pay, the Germans remain sceptical. They heard stories in Moscow of the experience of other western countries, which have found that Soviet deliveries have fallen far short of promises.

Into a new world...

Watching the screen of the electron microscope, the Dunlop research worker finds his way into a new world... a world of particles which can be magnified up to 100,000 times. To the layman it is a mystery and a marvel; to the scientists and technologists of the Dunlop Research Centre, it is one of the powerful armoury of research tools that probes the present and ensures a progressive future. Behind Dunlop research

is a tradition of invention and discovery. In front lie new products, processes and principles... the inexhaustible promise of natural rubber and the new synthetic materials created by the polymer chemist. Dunlop research workers are planning for five, ten, twenty years ahead; planning now to keep Dunlop in the forefront of development... and to continue to make things better for everyone.

DUNLOP makes things better for everyone

DUNLOP RUBBER COMPANY LIMITED, ST. JAMES'S HOUSE, ST. JAMES'S STREET, LONDON, S.W.1

"Gentlemen— the new partner!"

HERE IS SOMETHING that can save you money: long-run manufacturing concerns have proved it. It is a polystyrene plastic—Lustrex. In many trades it cuts out whole processes—does away with preparation of material, finishing, assembling, colouring, and quite a few storage problems, too. You can get from the basic raw material to the finished, marketable part or product *in one go*.

There are five different grades of Lustrex, and between them they can replace many costlier and less stable materials. But Lustrex is no mere substitute—it is a material in its own right—tough, handsome and versatile. It has many uses in the making of refrigerators, radio, office equipment, household wares, motor accessories, electrical fittings, packaging, toys, photographic equipment, etc.

Action this day! Lustrex can cut *your* costs, speed up *your* production. Send the coupon for more information—now.

I stand here in favour of Lustrex . .
It brings you material gain
Of a kind that undoubtedly must vex
A rival with costs to restrain.

The point is that Lustrex is cheaper
Initially, and what is more,
Time and again it will leap a
Whole stage on the factory floor.

The trades which use Lustrex are legion:
Though new it is far from untried—
It's won a whole lot of prestige on
The fact that its scope is so wide.

A coupon awaits, gentle reader:
Depute a reliable aide
To fill it in *now*. It's indeed a
Task that should NOT be delayed.

TO: MONSANTO PLASTICS LIMITED, DEPT. 289, 25 CHARLES II STREET, LONDON, S.W.1.

Please send me full information about Lustrex.

THE BUSINESS WORLD

Recipes for Cotton

DELEGATES to this year's Cotton Board conference assembled at Harrogate in sober and anxious mood. The distress signals that were on the horizon a year ago have drawn close. Lancashire is losing ground to competitors, both European and Asian, in overseas markets and its precious home market has been invaded by duty-free imports from India and Hong Kong. Production is falling and young workers are no longer entering the industry in sufficient numbers to replace the high rate of wastage from an elderly labour force and from the vigorous bidding of Lancashire's other industries. The statistics tell a gloomy tale.

Output of yarn this year has fallen by about 10 per cent, compared with the first seven months of 1954, and output of cloth is about 7 per cent lower. Exports of cotton piece goods, which dropped to 637 million yards last year from 711 million in 1952 and 1953, were running at an annual rate of about 560 million yards in the first half of 1955. Nearly 50 mills have closed down this year; about 280 mills out of 1,600 and about 23,000 workers, are on short time, and the labour force has fallen by about 28,000 (8 per cent).

In addition to the depressing effect on production and profit margins of retained imports of cloth from India and Hong Kong—now equal to about 10 per cent of home consumption—production is also bedevilled by the general lack of confidence in raw cotton prices. The efforts of the American government to dispose of its huge surplus of cotton must be bearish (the main reason why prices of "outside growths" have recently fallen by 2d. to 4d. a lb below prices of United States cotton is the forthcoming disposal of 1 million bales of American cotton at "competitive" prices after January 1). Hence buying all over the world remains hand to mouth and order books are shorter than they otherwise would be.

The uncertainties of American cotton policy will

continue, and any hopes that the industry might have cherished of a change in the British policy towards duty-free imports were shattered on the opening night of the Harrogate conference. The President of the Board of Trade forcefully reaffirmed that the Government had no intention of granting protection against Commonwealth imports; so the duty-free and preferential policy that brings considerable advantages to British industry as a whole in Commonwealth markets still stands. Mr Thorneycroft reminded his audience that the industry had tariff protection against foreign competition in the home market; in foreign markets the industry must meet that competition on level terms. "The real question we must ask ourselves, and much hangs upon the answer, is not whether we can compete with Japan and India in the cheaper ranges of goods, but whether we can compete with Europe on Western wage scales or even with the United States on a much higher one." The answer—he implied—rested with the industry itself.

It cannot be expected that Lancashire will accept that doctrine enthusiastically. Mr Cyril Lord's sallies at the President of the Board of Trade are excellent entertainment value and his views have supporters. But the encouraging feature of the conference this year was that, reluctantly, Mr Thorneycroft's view seems to be gaining adherents. One indication of this was the interest aroused by the speech of Mr J. F. Simpson, chairman of Simpson and Godlee. Though he still maintained that the Government should limit the potential sales of imported cloth on the home market, he recognised the futility of continuing "to send deputations to Whitehall by the carriage load." It would be more constructive, he urged, for Lancashire to try to meet foreign competition, particularly from Western textile industries by its own energies.

"Speaking as a merchant, I know from bitter experience

that large contracts are being lost to this country for price differentials of around 5 per cent and less. I am well aware that the introduction of double day-shift working, for instance, will not produce dramatic reductions in the cost of yarn but reductions do not necessarily have to be dramatic when they are cumulative, and when, in addition, they are achieved at each stage of production." He also made the point that the present highly competitive conditions in the industry should be looked upon as normal.

What should be done? The road ahead is well mapped, and the progressive firms are treading it: re-equipment, the use of labour in the most economical way, including double shift-working, the production of quality goods marketed by intensive sales promotion. For the benefit of the sceptics the papers read to the conference, all of which were of a high standard, went over the ground again. One by Mr C. E. Harrison, vice-chairman and managing director of English Sewing Cotton, gave an illuminating description of how that company was meeting the problems and was a model of its kind. Never far from the discussions was the subject of redundancy, and it was perhaps natural that the thoughts of many should hanker after an "orderly" scheme of contraction, the better mills going over to two-shifts and the less efficient compensated for going out of production (a subsidy to the undeserving that worked well in war but has grave objections in peace time). An orderly adjustment has appeal. It attracts the trade union leaders, whose task in persuading their members to accept double day-shifts will be hard, and

could be worse if workers are lost to the industry because one mill closes down before another in the same district is ready to work two shifts.

Naturally, the idea of striking some bargain with the Government on the basis "we do our bit, you do yours" dies hard. The employers' representatives would find it easier to persuade their members to spend money on re-equipment, and the unions would find it easier to swallow double shifts if they could be assured of the very thing that they know the Government finds it hardest to grant—a limit on the sales of imported cloth in the home market down to, say, 25 per cent of home consumption. This idea may be behind the "new" approach that is to be made to the Government on imports.

Such a compact seems unrealistic. It is impossible to foretell what productive capacity in spinning and weaving will be needed; even if it were possible, it is doubtful if there is sufficient unity in either section to enable the spinners and weavers to agree upon and carry through a redundancy scheme. The approach, as now, must be empirical. Mills are closing down, mergers are being arranged and the progressive firms are broadening their interests—some vertically, some horizontally. The process is painful, but restrictionist policies of the past have not helped the industry to escape it. The fortunate fact that alternative employment is available in the north-west cannot fail to strengthen the Government's decision to leave the industry to work out its own salvation.

Ships and Votes

LITTLE more than 25 per cent of the ordinary capital of Union Castle Mail Steamship may be sufficient to swing the control of the company. That is the awkward consequence of the full voting rights attached to the two classes of preference capital. A buyer who has all the preference shareholders on his side needs to hold no more than 1,370,001 ordinary shares out of 5,480,000 to control the company. It is cheaper to pick up the 6 per cent "A" preference shares at 20s. 6d. per share than the ordinary £1 units at 35s. The buyer gets one vote per £1 nominal capital either way. There are not many of these fully voting preference shares in modern capital structures—Cheltenham and Hereford Breweries now exciting the share bidders happens to provide another example. When these votes do occur, they can put a queer twist into a highly controversial amalgamation scheme, like the proposed merger of Clan Line and Union Castle.

It is, for example, likely that both classes of Union Castle preference shareholders will accept an exchange into the preference capital of the new holding company. The scheme offers them both substantial increases in income, as the table of terms shows. It is

also to be expected that a substantial block of Union Castle Ordinary shareholders will accept. They, too, gain a little on the assumption of a 16 per cent dividend by the new holding company, and their dividend will be much better covered by savings. Many of them, however, think that in terms of capital assets they are being asked to sell a big birthright for a small mess of potage. It is therefore practically certain that the opposition coming from Union Castle ordinary stockholders will be so substantial that, in the absence of the preference voting rights, the merger must have failed. The opposition is still gathering strength. It started with Mr Jack Billmeir, who is thought to hold about £250,000 stock. By now it has grown into a formidable group, including leading investment trusts and other City institutions, and claiming to speak for at least £1 million stock. It is certain that the scheme cannot command the support of 90 per cent of each class of stockholder and that the new holding company, if it is eventually formed, cannot go to the Court and ask for the share exchange to be made binding on the minority. What could still happen is that the scheme could go forward and its sponsors settle for something

less than 90 per cent of each class: they could exercise control perhaps with a bare majority—perhaps even with a minority—of the Union Castle ordinary stock, leaving the dissentients to stew in their own juice as minority holders in a company dominated by Clan Line with its traditions of conservative dividends and generous reserves.

THE TREND IN EARNINGS

	Ordinary earnings £000's	Ordinary earnings %*	Ordinary dividends £000's	Ordinary dividends %†
<i>Clan Lines:</i>				
1951.....	211	58	110	35
1952.....	1,136	176	131	20†
1953.....	1,212	150	132	20†
1954.....	1,230	137	137	20†
<i>Union Castle:</i>

1952.....	1,087	28	226	7½†
1953.....	1,138	30	226	7½†
1954.....	559	15	236	7½†

* Allowing for distributed profits tax that would be attracted on full distribution, and adding back EPL where appropriate.
† On doubled capital.

Common sense and good dealing strongly suggest that this should not happen; there can be hard argument, but there should be no brute force. In any case, stockholders have yet to be given the full facts. The formal offer to stockholders of Union Castle and of Clan Line to exchange into the stock of the new holding company will not go out until the first week of next month. Those documents will contain information that is vital before stockholders can make up their minds—in particular the present replacement values of the two fleets. At the moment shareholders have nothing to guide them beyond an old estimate of the chairman of Union Castle that the 1952 replacement value of that company's fleet was £82 million. Market estimates and private opinions are flying around that put the value of the Union Castle fleet at several times the written down figure of £11 million at which it is shown in the

balance sheet. The question is: how many times? One market estimate puts the assets applicable to the equity of Union Castle at £66½ million and those applicable to the equity of Clan Line at £34 million. If, then, the argument runs, Union Castle is to provide two-thirds of the effective assets of the holding company, how can it be right to give the Union Castle ordinary stockholders less than 40 per cent of the equity in the new company? It is sweetened by a morsel of the new preference capital, but that really amounts to no more than a bonus of about 2s. per stock unit for accepting.

At this stage it is not profitable to examine such market estimates in detail. They may aim in the right direction but still be wide of the mark. Both companies use the shipping companies' exemption order to make and maintain hidden reserves—adopting it in different degrees and applying different accountancy techniques—so that it is impossible for the uninstructed shareholder to divine the exact asset values. Union Castle increases its depreciation by the tax savings arising from initial allowances; Clan Line carries them to "liabilities, provisions and undisclosed reserves." Clan Line also carries to hidden reserve its additional depreciation charges. Yet, whatever the full figures may eventually disclose, it is hard to believe that such technicalities can vitiate the general conclusion that a big surplus of assets is to be contributed to the amalgamation by Union Castle. Those surplus assets are attributable naturally to the ordinary stockholders, but they are to be handed over mainly by the votes of the preference stockholders.

Similar differences of accountancy upset most of what has been argued about the relative earnings of the two companies. In March, 1951, Clan Line and, indeed, the whole structure of companies controlled by the Cayzer family was reorganised, and any profit analysis that tries to stretch further back must ignore that reconstruction. It ignores, too, the important fact that in 1952 and 1953 Clan Line provided no less than

THE DETAILS OF THE SCHEME

Note:—£1,670,220 5 per cent Debenture stock of Union Castle will not be acquired by the holding company.

£373,000 in EPL, whereas Union Castle never graduated into the EPL class.

The argument so far amounts only to shadow boxing, brightened by one or two "unfacts," such as the claim that Union Castle provides 52 per cent of the equity earnings of the proposed merger company. The one certain point is that the sponsors of the scheme who

propose to make Union Castle a junior partner in a new company dominated, but not mathematically controlled, by the Cayzer family think that the ratio of about 60 Clan to 40 Union Castle is fair. They are

influenced obviously by the fact that Clan Line's earnings over a period of years have been rising while Union Castle's have been heading downwards, but they would also claim that the 40/60 ratio allows for future prospects as well as for past performance, in particular for the new ten-year mail contract with South Africa. From the Cayzer side there can be no question of a better offer. To make one now would be to admit that the present offer is less than just.

The present offer, it would seem, ought to be abandoned unless the reactions to the full offer are much more favourable than were those that the preliminary announcement evoked. To hold a large minority—possibly even a majority—of Union Castle ordinary shareholders prisoner in a company dominated by Clan Lines and chained there in fact by the tie of their own company's voting preference shares would be the kind of exercise of brute force from which responsible opinion would recoil. But if this scheme is not accepted, something will still have to be done about Union Castle and no mere concentration on high asset values will provide the answer. Union Castle, with its 100 years of history, now needs new money and new blood. A formidable replacement problem has to be faced. In or around 1960 six of the company's vessels, five of them big passenger liners, costing between £6 million and £7 million each, will be 25 years old and be shouting for replacement. If the Clan merger is abandoned, whence are the money and the management to come?

Business Notes

Before the Budget

UNTIL Thursday the atmosphere in the stock market was reminiscent of the lazy ease of a Sunday afternoon. The fret of Monday's work was still in the future. The cash lists for the 4 per cent Conversion stock were closed but the conversion lists were not. And the Chancellor's new measures were still some days away. It seemed to be a time to wait and see what the future would bring. Nor can there be any doubt that some of Mr Butler's speeches contributed to this sense of balmy comfort. The markets were thin and price movements thus tended to be exaggerated. The cuts in capital expenditure that the Chancellor was expected to announce, it was argued, were good for gilt-edged. So gilt-edged prices rallied. But equities, too, were better—with far less reason. Some of the electrical equipment issues led the way and in the week to the close on Wednesday (the first day of the new account) the *Financial Times* ordinary index gained 4.3 points to stand at 189.4.

	Oct. 13	Oct. 19	Oct. 20
Consols 2½%	59	58½	59
Savings 3% 1955/65	88½	89	89½

Brit. Petroleum	102/6	100/7½	98/9
F.T. Industrial Index	188.0	189.4	189.8

The atmosphere of indolent buoyancy was shattered by the news that an Autumn Budget is to be presented to Parliament on Wednesday. Gilt-edged prices were immediately given another boost; the undated stocks, which had been in the van of the earlier rally, took the lead, with War Loan rising ½ a point to 80½ on Thursday. Thursday was the day of justification for the gilt-edged market, but a day of unpleasant anticipation for the industrial market. The *Financial Times* ordinary index came down sharply by 5.6 points to 183.8. Losses were common throughout the list and were particularly heavy in those stocks, such as building, electrical equipment and stores, that had been rising at the end of the old account. That was only an initial reaction: markets cannot find their true level until the Budget is known.

Postscript on the Loan

THE second stage of the Treasury loan operation launched last week will not be completed until after this issue of *The Economist* goes to press—the list for conversion applications remained open until Friday—but there is no doubt that the cash side has achieved a greater measure of success than most people would have thought possible only a few weeks ago. This does not mean that the £250 million offer was oversubscribed in anything more than the customary technical sense. A large slice of this stock, ostensibly issued for cash, has merely replaced "tap" issues of Treasury bills in the portfolios of the "departments," which to that extent have become less liquid. But the proportion of genuine subscriptions has generally been estimated in the market as ranging towards £100 million, which is a substantial amount in circumstances of sustained stringency in the City houses to which a short stock of this kind makes its principal appeal.

It is not easy, indeed, to guess from what quarters such an amount could have been provided. The one surprise, by comparison with first expectations, was the response of the discount market. To the discount houses the stock looked attractive; unlike all existing "shorts," it offered a current yield in excess of the average cost of carrying the bonds on borrowed money. But at first sight the market doubted whether the credit squeeze really left it scope for increasing its bond portfolios. In the event, however, it found it possible in effect to exchange bills for stock, and probably applied for rather more than one-third of the amount estimated to have been placed outside the "departments." Some of the big banks are known to have shown little or no interest; others are believed to have taken moderate amounts, but they can scarcely have accounted for the £50 or £60 million assumed to have been taken beyond the discount market. Following their usual practice, the monetary authorities met the technical situation created in the short loan market on the day of the issue by heavy "special" purchases of bills. There does not seem to have been, as on some former occasions, any notable automatic neutralisation through operations in the bond market. Although the loan has caused some switches from other short bonds, no tidal movement of this kind has been set in motion. The first stage in the unwinding of these technical operations was seen at last Friday's Treasury bill tender, when only £230 million of the offer of £260 million was allotted.

Smoking Costs More

ALL four of the major cigarette manufacturers raised their prices this week, the first general increase since 1951, but not all brands are equally affected. For instance, Carreras' Piccadilly No. 1, which has been selling in the 3s. 9d. for twenty class will now cost 3s. 10d. whereas the price of twenty Churchman No. 1 has been raised by 2d. to 3s. 11d. Several minor brands have not been changed at all. But in the main, a penny has been added to brands selling at 3s. 7d. (or lower) for twenty and twopence to the more expensive brands.

Imperial Tobacco—which is the biggest manufacturer by far, making four-fifths of the cigarettes smoked in Britain—led the way by raising its prices on Monday and the other manufacturers all followed later in the week. It would not have repaid the industry's smaller fry to have hung back on all their brands. All have been faced with rising production costs; and those brands that are fast declining in popularity are losing on grounds of preference rather than of price. There are enough popular brands in the cheaper class of cigarettes, including Wills Woodbine in the Imperial Tobacco range which sell in enormous numbers, to absorb any switching to cheaper brands that may now take place.

What must concern the manufacturers more, however, is the effect that these increases may have upon total cigarette consumption. Total sales have been rising only slowly this year, the first since 1939 that has been free of general restrictions upon supplies, although the two leading brands, Players and Senior Service, have since had to be put back on restricted delivery. But in volume sales of all cigarettes are still nearly ten per cent below the level of the restricted deliveries that smokers eagerly snatched up nine years ago before Mr Dalton's increase in duty. Fierce competition has now broken out again in this industry. More of the smaller companies have been absorbed, new brands have been heavily and expensively advertised, and existing brands have appeared with extra wrappings. But bigger expenditure on packing materials is not the main reason for this week's increase in price; leaf, labour, and transport and fuel costs have also risen and tobacco wholesalers and retailers have been clamouring for some time for bigger margins to cover their own rising costs. Out of the new price of 3s. 8d. for twenty, distributors will now get on the average a little more than 4½d. and the manufacturers' share will be a little more than 6½d. But to begin with, some of the manufacturers' extra revenue will be repaid in slightly thicker cigarettes. Shareholders, it should be noted, have been warned not to expect larger dividends as the result of these price increases.

Atomic Tenders

THE Central Electricity Authority has announced the sites of its first two atomic power stations, at Bradwell in Essex and Berkeley in Gloucestershire, and preliminary specifications for those stations have already reached the four groups of companies who intend to tender for them.

The full, detailed specifications have still to be completed. The capacity of the stations will be of the order of 120,000 to 200,000 kW. Engineering teams of the groups have been working on power station designs, under the tutelage of physicists of the Atomic Energy Authority, since the end of 1954. These designs were more or less completed by this summer, and the groups have been waiting to receive the CEA's exact specifications so that they could then begin to fit their designs to the CEA's requirements. As construction of the first two stations is due to start in mid-1957, and a year's notice has been promised to contractors, the tenders will have to be submitted within the next few months. Construction of another two stations is due to begin eighteen months after the start of work on the first pair.

More Gas in the Home

SALES of gas to domestic consumers, who are the industry's most important customers, rose in 1954-55 after falling slowly but steadily for some years—and the Gas Council thinks they rose more than could simply be put down to a cold winter. During the past five years the replacement of a very large number of old gas cookers and fires by new and more efficient appliances has been enabling housewives to get more heat without using as much gas; the industry has gained extra consumers, but they have taken less gas. By now, the industry thinks, the modern cookers and appliances form such a large proportion of all those in use that rising standards of heating and cooking are once again beginning to be reflected in consumption of extra gas. The industry's competitors in the electricity industry had no such developments in appliance efficiency to complicate their progress, and their sales have continued to rise over the whole period.

In 1954-55, indeed, electricity sales to domestic consumers rose by 10.5 per cent, against the rise of only about 2.5 per cent in gas sales. The gas industry, however, continues to make progress in the industrial field, sales to which rose by 9.3 per cent last year.

About £181 million of the industry's gross revenue of £325 million in 1954-55 came from sales of gas; some £92 million was obtained for its chemical products of carbonisation, and nearly £37 million from the sale and hire purchase of appliances. During 1954-55 these hire purchase sales were continuing to benefit from the removal of restrictions on selling water heaters in August, 1953; the Area Boards sold about eight times as many of these heaters on hire purchase as in 1952-53, when restrictions were on. This year the re-imposition of restrictions on

credit terms of purchase has once again cut these sales in half. In the summer of last year the boards were selling four cookers on hire purchase for every one for cash; this summer the ratio is about 2.5 to one. The industry continued to make a modest surplus on all its operations; for 1954-55 the figure was £2,472,553 (ten area boards having likewise made surpluses and two having incurred deficits). The industry spent about £55 million on capital account last year, and had intended to spend rather more this year and next, after which its capital expenditure might have been expected in any case to decline. But its plans for this year and next are now "under review again."

£5 Million for BICC

BITISH Insulated Callender's Cables has come to the market with a conventional rights issue of ordinary shares. It has not adopted the technique recently used by Tube Investments of pitching the price of the new shares so far below the market that it was half-way between a scrip issue and a capital raising operation. So it has not been able to dispense with underwriting; Telephone and General Trust has underwritten the issue for a total commission of 7½d. a share. The offer consists of 2,650,000 £1 ordinary shares at 38s. per share; 2,470,000 of these shares are offered to ordinary stockholders in the proportion of one new share for every £5 of ordinary stock held. Stockholders are also invited to apply for the balance of 180,000 shares at the same price.

What inducement is there for the ordinary stockholder to put up more of his money? It is not in the value of the rights. They were worth about 1s. 6d. a share at a price of 47s. ruling on the old stock on the eve of the announcement. It is to be found rather in the projected dividend yield. For 1955 the directors intend, since profits so far this year are above those earned in the same period last year, to recommend an ordinary dividend of 12½ per cent. That compares with the 1954 dividend of 10 per cent, to which the directors added a special tax free distribution of 2½ per cent out of a "realised capital profits reserve." The new shares will not rank for the interim payment in December of 4 per cent but they will rank for the final payment. On a 12½ per cent dividend the new shares would offer a yield of £6 11s. 7d., about £1 5s. higher than that offered by the general run of blue chip equities. The directors have also given investors time to dig into their pockets; the first call of 20s. a share is on November 11th and the remaining 18s. does not have to be paid over until December 9th. The directors, however, were not lucky with their timing. After the news of the autumn Budget the old shares fell back to 45s. 6d.

Though its bank overdrafts are up it is not the credit squeeze that has forced BICC to come to the market. The company is in real need of permanent capital. It has a massive re-equipment and development programme, amounting to £9 million in the next few years; it will continue to invest in cable and allied industries abroad; and, thanks in part to a full order book, its working capital requirements are higher. Copper prices, too, have played

Driving force

It seems an odd machine to be connected with papermaking, this gigantic pile-driver looming ponderously above a river. But it is a symbol not only of the physical development but also of the wide-ranging activities of the Bowater Organisation. For, at Bowaters' Thames Mills, a deep-water dock is under construction. At all states of the tide it will take the ocean-going ships that bring cargoes of wood-pulp from the Bowater mills in Canada, Tennessee and Scandinavia—and carry away paper to ports all over the world. Soon there will be more ships; and as the number grows, so Bowaters are developing their road transport... building new workshops, maintenance depots and garages. Yet these transport developments are only a part of a world-wide expansion programme which has six new paper-making machines at its heart. Around them new factories, power stations, offices and laboratories are being built. A new chapter is being written in the industrial history of this century.

Deuced Lucid

design or accident?

Deuced lucid is just a phrase to remind you that the very latest Remington Rand ledger system uses translucent sheets to type on. These sheets produce any number of copies on ordinary paper, via the revolutionary Auto Dy-Printer which is based on the familiar engineering dye-line principle.

Every latest development in photo-copying, machine accountancy, visible filing, charting, is studied by Remington researchers, developed by Remington designers, made practical by Remington engineers.

All the 37,000 Remington Rand workers pool their international knowledge so that the problems of the business executive may be solved and his daily work made easier. It will pay you to keep an eye on Remington Rand developments: have you, for example, seen the superb work done by the Remington electric typewriter?

There are Remington Rand factories in Great Britain at GLASGOW · WEYBRIDGE · PARK ROYAL — and 50 plants overseas in 41 strategic world locations.

their part. The company buys about two-thirds of its copper from the Rhodesian Selection Trust group at fixed prices, but the increase in copper prices has swollen its working capital. Perhaps it is only here that the credit squeeze has had an influence—and, then, only a marginal one—on the decision to appeal for permanent capital.

Viscount and Vanguard

VICKERS-ARMSTRONGS' announcement of plans for the new Vanguard airliner was made this week so that Vickers salesmen could start the hard and slow business of interesting airlines in an aircraft that will not be available to them for at least six years. There has been considerable speculation about what form the "Viscount replacement" would take, and since Lockheed in America produced details of the Electra turbo-prop airliner some months ago (and has secured orders for 70 from two American carriers in the last few weeks) airlines have begun to ask what alternative Vickers would have to offer. The Vanguard has been tailored to meet the requirements of British European Airways, but it has also been designed for a far wider market. The aircraft can carry more than 100 passengers and should be able to operate over distances of up to 2,500 miles, but it is, like the Electra, classed as a "medium-range" airliner unsuitable for such long-distance operations as the North Atlantic even though its ultimate range compares with that of the early Comets and Britannias.

The Vanguard is not likely to fly before 1959; drawings have not yet been completed, but the engines are due to start flight trials early next year. These are the Rolls-Royce RB 109 turbo-props of 4,000 shaft horse power—renamed the Tyne, the engines in which both Lockheed and Douglas have shown considerable interest. By increasing the compression ratio well above current practice, Rolls-Royce expect to get a substantial fuel saving, and this economy holds the key to the Vanguard's estimated performance. Negotiations between BEA and Vickers to buy an initial fleet of about 20 Vanguards (costing with spares about £1 million each) for delivery in 1960-61 still await Treasury approval. The order is likely to mark for Rolls-Royce the end of a difficult period during which the company developed the Tyne engine entirely as a private venture since government support was not forthcoming for it. A development contract for the engine now seems probable.

Vickers is expanding its capacity substantially in order to be able to handle production of both Viscounts (which will be sold to customers who have not the traffic for 100-seat monsters) and Vanguards. Production of Viscounts is catching up on delivery schedules again, and is now five a month with six a month in prospect next year. The planned rate of 100 a year should be reached by 1957 and the following year will see the start of Vanguard construction. This will start slowly at the rate of about one a month for the first year, but Vickers plans for additional capacity have been laid in such a way that if Vanguard production fails to gain momentum after 1960, it will not be for lack of assembly space.

The New Cars

THE last of the new cars to be announced before the Motor Show opened in London last Wednesday was a slightly smaller, 2.3 litre version of the 3.4 litre Armstrong-Siddeley Sapphire offered with a choice of two engines. One is a 4-cylinder power unit giving 120 brake horse power and a top speed of 100 mph; in this form the car costs £1,510. The second version has a 6-cylinder engine of 85 bhp, with automatic transmission but without the same high speed performance of the more powerful engine, costing £55 more. The small Sapphire is only 3½ inches narrower and 1 foot 1 inch shorter than the 3.4 litre car, but at 26 cwt it is about 5 cwt lighter; this explains both the high performance and the estimated fuel consumption of 30 mpg. Daimler has announced a 3.5 litre saloon with 100 mph performance selling, with tax, for £2,671. The Standard Motor Company offers a redesigned Vanguard with a longer wheel-base at £850, or £63 more than the Vanguard II that it replaces. This is the biggest price increase to be made among the Show's mass-produced cars; the new Vanguard shows some important innovations but the change to integral construction, with a saving in weight and improvement in performance, would not necessarily be expected to lead to higher costs.

Until this year's Show, the choice of cars selling, after tax, at £1,000 to £1,500 was limited to two or three British-built cars and a number of European models whose prices were inflated by customs duty. This year's new cars, the Sunbeam Rapier which sells at just under £1,000; the small Jaguar selling at £1,269; the new Sapphires and even the Citroen that sells in this country at £1,403 seem deliberately designed to fill this price gap in the range of cars offered by British factories; here the new Jaguar seems to be capturing most of the immediate attention.

There are few changes among the smaller cars which, with their sugar-candy trim, create in a mass the strong impression that the makers have bought their paints from one supplier. This year the new Citroen stands squarely in the centre of Earls Court as a challenge to British designers in the adaptation of well-tried engineering methods to car design. To its side is the smallest Renault, retailing with purchase tax and duty at £616, which has a form of two-pedal control that serves the purpose of automatic transmission, a convenience offered by no mass-produced British car. These are an indication of the competition that British cars must meet in foreign markets.

New Outlook for Rubber

IT is time for fresh thinking about rubber. Both the commodity market and the share market seem to have made up their minds to that in advance of any statement that may emerge from the current meeting of the Rubber Study Group. The markets have lost their gay abandon. Spot rubber recently at 3s. 7d. per lb has dropped back sharply and has now steadied around 3s. The shares, too, are much below recent peaks and the share market is idle although producing companies ending their financial

years either in September or in December cannot fail to show fine figures. United Siam Betong, for example, at 54s. compare with 63s. 9d. a few weeks ago.

This does not mean that the supply and demand equation has changed suddenly from shortage to heavy surplus. It does not even mean that there will be no further end-of-the-month squeezes in the commodity market, though the fulfilling of Russian contracts that accentuated them in earlier months may not be so much in evidence as the Russians are not buying at the moment. Russian demand remains unpredictable and supplies of some grades of rubber remain barely adequate. But men in the markets try to take a longer view and feel that gradually some of the factors that produced the unexpectedly sharp rise in rubber prices this year may lose impetus.

The big surprise factor this year has been American consumption. Taking natural and synthetic rubbers together, it will amount to only little less than 1,500,000 tons for 1955, nearly 250,000 tons more than was expected earlier in the year and much more than in any previous year. Two factors contributed: car production running at record levels carried a record demand for initial tyre equipment, and the introduction of the tubeless tyre created an abnormal replacement demand. That abnormal replacement demand must have been largely filled, and the current tendency of American car dealers to cut prices on new cars suggests that even the giant American automobile market may be nearer to saturation than some have supposed.

If those fears should prove founded the American rubber manufacturing industry will again have a freedom of manoeuvre in which it can play off synthetic rubber against natural. The relative prices of synthetic and natural suggest that when that opportunity comes it will be used. Natural rubber in New York (December delivery) costs around 44 cents per lb. The domestic price of synthetic (23 cents ex factory) is equal to 24.10 cents delivered, while the export has been raised 2 cents to 26.10 cents per lb fas. It seems possible that next year—not in the early months perhaps—American manufacturers might have a little more opportunity for mixing natural and synthetic to suit their purses and that there might be more synthetic available for export. Britain alone, for example, proposes to import 70,000 tons of synthetics (including 50,000 tons of general purposes rubber) next year, compared with a total import of about 24,000 tons of all grades this year. To this country with a total consumption this year of perhaps a little over 250,000 tons the proportionate change is considerable.

Sterling Trade With Japan

THE payments agreement between the United Kingdom and Japan has been extended for eleven months from October 31st. That result follows protracted negotiations that have been running intermittently in Tokyo since last June. The background to these discussions was the exceptional amplitude of the swings in payments between Japan and the sterling area since 1953. In that year Japan had overspent its sterling earnings by more than £100 million; its reserves were nearing exhaustion and had to be fortified by exceptional measures. These included sub-

stantial drawings of sterling from the International Monetary Fund, the borrowing of sterling in the London market against dollar swaps, and a considerable use of sterling short-term credit facilities. The 1954 agreement, therefore, endeavoured to restore equilibrium by giving Japan better opportunities for earning sterling. Japan seized them in no uncertain manner and, by the end of 1954, was acquiring sterling at an impressive and even disquieting rate. That trend has continued this year.

The extended agreement endeavours to increase the total volume of two-way trade between Japan and the sterling area. Although Britain has long departed from bilateralism in payments arrangements, some attempt is also being made to secure a rough balance of trade between Japan and the sterling area at the high level of £250 million each way. This compares with a current rate of payments of about £210 million. This expansion *cum* balancing operation is to be secured in the main by inducing Japan to lift some of the restrictions that have been imposed on the import of sterling goods. The restrictions take the form of quotas, of a strict allocation of sterling in the foreign exchange budget and of administrative measures such as the compulsion placed on Japanese importers of certain sterling goods to deposit with the Japanese authorities a substantial proportion of the payments well in advance of the date when payment is due.

Many of these restrictions are being removed and Japan has allocated a firm £127,500,000 for sterling imports in the foreign exchange budget covering the first six months of the extended agreement. In addition Japan has raised the quota for imports of wool textiles. Increased use of sterling by Japan will also follow the unblocking of about £300,000 of earnings by United Kingdom film companies. Sterling expenditure should be further increased following the decision to leave Japanese importers free to choose whether they buy sterling or dollar oil.

The British counterpart to these concessions and to the elimination of the element of discrimination against British goods has been an undertaking to maintain all existing open general licence facilities and all quotas under the 1954 arrangement and to increase from £2,200,000 to £4,700,000 the quota for imported canned salmon from Japan. It is, however, in the trade between Japan and the rest of the sterling area that the hopes of an expansion and greater balancing of payments must lie. Already Japan is spending appreciably larger amounts on rubber, wool, cotton and other commodities from the sterling area. Japanese exports of textiles and light engineering goods to some of the colonies are also expected to increase over the coming year.

The Deltic Diesel

THE new 3,300 hp diesel electric locomotive exhibited by English Electric at Liverpool this week is remarkable for its combination of great power with relatively light weight. It is the most powerful locomotive of this type in the world and weighs 106 tons; this has been achieved by using the Deltic engine first developed about five years ago by the Napier subsidiary of English Electric for high-

More B.O.A.C. Transatlantic

Services by **DOUBLE DECK** **Stratocruisers**

This winter B.O.A.C. will operate more transatlantic "Monarch" and "Coronet" *Stratocruiser* services to U.S.A., Canada and the Caribbean than ever before. Higher frequency coupled with the substantial fare reductions offered by B.O.A.C. between November 1st and March 31st, make air travel still more attractive.

These are the ways you can save:

B.O.A.C. "FAMILY FARES" PLAN

Your family flies for less when you fly the Atlantic together. Only the head of the family pays the full fare. With a wife and two children between 12 and 25 a man might save £300 and more on a 1st Class return journey across the Atlantic.

B.O.A.C. OFF-SEASON SAVINGS

There are off-season reductions, too, on all normal transatlantic *return* fares. £14 off return fare for "Coronet" Tourist services, and £10 off return fare for First Class "Monarch" services. These reductions are in addition to the "Family Fares" savings.

Fly now—pay later

Take advantage of B.O.A.C.'s Ticket Instalment Plan. Only 10% down and up to 21 months to pay the balance. No fuss, no bother, no red tape.

Consult your local B.O.A.C. Appointed Agent or B.O.A.C. Airways Terminal, Victoria, S.W.1 (VIC 2323), 75 Regent St., W.1 (MAY 6811), or offices in Glasgow, Manchester, Birmingham and Liverpool (see your Telephone Directory for details).

All over the world

B.O.A.C.

takes good care of you

BRITISH OVERSEAS AIRWAYS CORPORATION

Ugly Duckling into Supersonic Aircraft

When the builders of the Canadian Pacific Railway struck the great Sudbury deposits of Nickel ore in 1883, the metal still bore the stigma of "be-devilled copper", existing uses were small and extraction was difficult. Then, world demand for the metal was given a tremendous impetus when it was found that Nickel could be used for the strengthening of steel. Dr. Ludwig Mond's discovery that Nickel would combine with carbon monoxide to form a gas led to still further progress through improved refining techniques.

To-day, uses for the metal have grown to such an extent that Nickel and Nickel-containing material touch Industry at every point from food manufacturing equipment to electronic tubes, machine tools to giant excavators, jet-engined aircraft to ocean liners.

*Our technical service is freely
available to advise on any use of Nickel.*

speed light naval craft where high performance with low weight is essential. The Deltic is a two-stroke 18 cylinder engine, with its cylinders arranged in three banks of six, each bank forming an inverted equilateral triangle. This structure gives the engine its name; it also makes it very compact, strong, and rigid, thus allowing light alloy metals to be used without raising problems of stress. The engine Napier has built for rail traction has a power/weight ratio of as low as 6 lb per hp against the more usual 10 lb per hp. The new locomotive, also named Deltic, is fitted with two of these power units each with its own generators, cooling systems, and silencers; it has a maximum axle loading of 18 tons and a total power/weight ratio of 72 lb per hp. This is much lower than the 104 lb per hp of the 2,400 hp Trainmaster, the largest diesel locomotive in use in the United States, and it is also lighter than the 85 lb per hp of the 2,000 hp Kraus-Maffei diesel hydraulic locomotive under development in Western Germany. English Electric is the largest diesel locomotive maker in this country and its marine and aero engine interests must be of considerable benefit to its traction department.

Over £500,000 has been spent in developing the Deltic locomotive in the last four years; it is plainly intended to cater for main-line passenger and express freight services on British Railways but it can also be built for service in overseas markets. At a price in the region of £120,000 the Deltic is the cheapest in terms of horse power of the thirteen locomotives the group submitted to British Railways in the summer when tenders were invited for the first batch of 170 main-line diesel locomotives. The Deltic will haul a 500-ton passenger train on flat stretches at its designed speed of 90 mph (it can be geared to higher speeds) and will take a 900-ton freight train at just over 60 mph, also on the level. The first model was passed to British Railways on Wednesday for a graduated series of operational trials which are expected to culminate in service on the regular Liverpool to London run later next month. Well before then, however, British Railways should be announcing the results of the tenders submitted three months ago.

New Zealand's Penal Rate

SOME astonishment was caused in the City this week by the news that the Reserve Bank of New Zealand had raised its minimum rate of discount from 6 to 7 per cent. The astonishment sprang first from the sheer height of the rate—by far the highest that has been seen in any Commonwealth country, or indeed in any major country, apart from the rather special case of Japan, for many years. The nearest recent approach to such levels was the German 6 per cent of 1950-52. Secondly, until quite recently New Zealand had shown no faith at all in the interest rate weapon. Until last year the Reserve Bank's rate had for years remained ineffective at a mere 1½ per cent. Then the orthodox weapons were suddenly seized and have since been wielded with extraordinary vigour. The rate rose twice in 1954, to 4 per cent, and the 3 per cent further rise has been compressed into the period since last July.

Moreover, this severe action has been associated with more direct measures to ensure a tight squeeze upon credit. The reserve requirements imposed upon the banks have

been raised twice in recent months, compelling the banks to tighten their grip upon advances. The rise in bank rate is especially designed to ensure that there is no comfortable way of escape from this pressure through borrowings by the banks at the central institution; the cost of such borrowings is now, presumably, prohibitive. This line of approach to the problem of correcting external disequilibrium presents an interesting contrast to the Australian approach, which looked first to import controls, and is only now turning to the domestic economy—so far without any recourse to interest rates. The comparative experience may yield some valuable lessons.

Settling East-West Payments

A WORKING party of financial experts from the Economic Commission for Europe met in Geneva recently and agreed on a series of recommendations for establishing a central agency to co-ordinate a multilateral East-West European payments system. Its recommendations are to be forwarded to the Governments of the 26 ECE member states. They include "arrangements amongst a comprehensive group of countries representing a substantial share of the volume of East-West trade whereby their central banks report to an agent such claims and liabilities arising in their bilateral accounts as they may wish to submit for multilateral compensation, on the basis of which reports the agent would make specific proposals for compensation." The difficulty that led to the discussions at Geneva was the virtual impossibility for West European countries, other than Britain and Germany (whose currencies are widely transferable) to compensate surpluses and deficits incurred in their trade with countries of Eastern Europe. If, for example, Italy has a surplus in its trade with Poland and a deficit in that with Czechoslovakia, there is at present no means of off-setting the two. Now a crude version of the first Intra-European Payments schemes under which OEEC countries began to move towards multilateral compensation is proposed. It will work only on a voluntary and non-automatic basis, each off-setting operation requiring the consent of all parties concerned. One point that emerged from the discussions at Geneva was that the so-called "rouble bloc" provides no compensation machinery among its own members comparable with EPU.

The main reservations to the agreement reached in Geneva came from the United States, the United Kingdom and Western Germany, whose currencies are either convertible or widely transferable. For them the problem of compensation hardly rises in their East-West trade transactions. All East European countries are in the sterling transferable account system and are prepared to use sterling in their transactions with the sterling area. Surpluses and deficits can therefore be offset through the normal transferable account facilities. It was agreed in these discussions that USSR uses transferable sterling widely in settling its external payments, not only with the non-Communist world but also with the satellite countries. A still wider use of transferable sterling could in fact do away with the need for setting up new machinery to compensate East-West payments—a point that was not lost in the Geneva discussions.

Air Fares and Profit Margins

THE international airlines plan to increase first-class air fares next April by about 10 per cent, while leaving the tourist fare structure unchanged and even extending in some areas the "third-class" rates for services run with old aircraft. These changes are subject to approval from their respective governments, but it would be unusual if this permission were refused. The decisions were reached at a rate-fixing conference of the International Air Transport Association, whose members carry 85 per cent of the world's air traffic. At IATA's tenth anniversary meeting held this week in New York, the director-general, Sir William Hildred, sketched in the background to the fare increases. The operators are precariously balanced between rising costs and rising traffic; one just managing to offset the other so that costs per tonne kilometre were shown to be stationary in a recent IATA analysis. But Sir William is constantly concerned with the narrowness of the margins on which the airlines operate. Their operating profit last year appears to have been \$71 million, the same level that it has maintained since 1952, and it gives the airlines a gross operating margin of about 3 per cent on Sir William's calculations. Capital expenditure last year was \$200 million. But when the profits of the American domestic carriers are deducted from the total, the true international operators are left with a margin of \$4 million only, or $\frac{1}{4}$ of 1 per cent and this, he suggests, is much too small for comfort even if the final figures should show that the international operators' margin is nearer 1 per cent. One moral, perhaps, is that the international airlines might learn something from the

American domestic carriers about the economic handling of large numbers of passengers.

Investment Still Growing?

NO sign has yet appeared of any slackening in the mounting pressure on the capital goods industries. During the first half of this year production of all engineering goods and vehicles rose by about an eighth, a bigger increase than in any previous year since 1946. More recent information about machine tool orders and applications for certificates to build new factories, which are as good a guide as any at present to investment activity, suggest no diminution in this pace of advance. There was the usual seasonal fall between July and September, but new machine tool orders in July and preliminary figures of applications for factory building certificates up to September were both still higher than a year ago.

By the end of July the machine tool industry had taken about £57 million worth of new orders, 45 per cent more than in the same seven months of 1954. Its output meanwhile had risen 12 per cent in value and about 10 per cent in volume. This could have been higher, but the industry is still very short of skilled labour and draughtsmen. The bulk of this new business came from industries in this country. These ordered about £44 million worth of new tools and took delivery of £31½ million of orders placed earlier. But orders remaining outstanding rose to over £70 million and, with about £22 million overseas business

Transport Traffic and Costs

SOME bold and interesting arguments about the costs and operations of different systems of public transport in Britain were given by Mr Peter Masefield in his presidential address last week to the Institute of Transport. Detailed information about certain sections of the transport industry is scanty; Mr Masefield is to be congratulated upon culling so much and perhaps also upon the bold forays from what he has been able to collect. His main comparisons are incorporated in the table. They refer to public transport; freight carried in traders' own "C" licence vehicles has been excluded, but the overseas activities of shipping companies and airlines are included.

For transport to develop its full potential Mr Masefield argued that three conditions were needed—adequate investment, operating units of the right size, and separate control for each competing form of transport. Sections of transport have certainly been starved of capital in the last two decades; he suggests, moreover, that the industry needs to earn about 7 per cent on the capital it employs instead of the 3½ per cent that on his reckoning it does. In air transport—Mr Masefield leaves the

post of Chief Executive of British European Airways at the end of this month to join the Bristol Aeroplane Company—he holds that there should be separate, competing units, each with a staff of perhaps between 12,000 and 16,000 for the most efficient results to be achieved. Mr Masefield is a firm believer in the advantages of competition; he dislikes

the system of air route licensing, and oddly enough in view of his insistence on the need for capital, the way that shipping companies have taken over the independent air lines, and he rejects suggestions for co-ordinating different transport services by integration. Competition in transport can never be perfect but some of it is far better than none.

Finger-tip control

Sit at this new Heal desk and everything is under your finger tips. The unusual curved shape brings files, trays and telephones all comfortably within reach. There's a hide centre-piece, and above the six generous drawers there are two pull-out slides to cope with books and overflowing papers. In fact this is the very pattern of all a senior executive's desk should be.

Come and see this desk and a wide selection of Heal furniture for boardrooms and offices in our Contracts Showroom. Your visit will show you just why so many of today's leading and most progressive companies—both in Britain and abroad—put their furnishing and decorating problems in the hands of our designers, craftsmen and specialised decorating teams. If you cannot call, please tell your secretary to write for our booklet, *Furniture for Special Needs*.

What you
should know
about Brandy

V.S.O.P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. All Remy Martin Cognac is made from grapes grown exclusively in these two areas. That is why people ask for Remy Martin and are never disappointed.

REMY MARTIN

Pride of Cognac

now in the industry's order books, toolmakers had 17 months' work on hand, against thirteen months' in July, 1954.

Plus Five Per Cent

THE shade of Cecil Rhodes was evoked this week. Appropriately it was conjured up by Mr Harry Oppenheimer, the son of the chairman of the Anglo American Corporation, in speaking of Rhodesia and, more prosaically of railway wagons. The wagons are the pith of the story for they represent the first substantial investment of the Anglo American Rhodesian Development Corporation, formed last June with an authorised capital of £2 million (£500,000 paid up). The Corporation has agreed to spend £5 million on the purchase of railway wagons. The wagons will remain the property of the Corporation but will be hired out to the Rhodesian railways for 25 years. The railways can use the wagons where they wish and are responsible for maintaining them. Thus a system of hiring common in the United States has been introduced into southern Africa. For Anglo American the investment is a piece of enlightened self interest. Like every other company in the copper belt it feels the need to improve rail facilities in Rhodesia and it will earn a "small turn" from its hiring charges.

The announcement of this investment by Sir Roy Welensky, the Minister of Transport in Rhodesia, gave Mr Harry Oppenheimer the chance to set out some of the broad objectives of the development corporation. The aim, he said, was neither "charity with the shareholder's money" nor "imperialism plus five per cent" but rather the "development of a new country—plus five per cent." He listed railways, the Kariba power scheme, secondary industry and mining as projects in which the development corporation is likely to take an interest. It would not be, Mr Oppenheimer added, merely a question of withholding a shareholder's profit to finance these developments but rather to use the credit and connections of the Anglo American to facilitate the raising of new capital. He recalled the loan of £2½ million the Corporation has just floated off in Holland as a way of introducing new money into the Commonwealth on a sterling security subscribed outside the sterling area. But why bring in Cecil Rhodes? Simply because 60 years ago De Beers, of which he was then chairman, began to finance new developments in South Africa in much the same way as the new Corporation intends to do in Rhodesia. It was fruit farms then; it is railway wagons now.

Buyers Market for Timber

NEXT week European timber importers and exporters will meet in Hamburg to discuss trade problems. Continental importers have let it be known that they will use the opportunity to urge their British colleagues to delay their entry into the softwood market this year. They are openly blaming Britain for much of the rise in timber

export prices since the opening of the 1954/55 season. British importers, it is said, bought too heavily last autumn and, because Britain is the major timber importer, Continental buyers had either to follow or to forgo supplies of the better qualities. The argument overstates Britain's influence on timber prices and is highly academic since there is no trade organisation in Britain with authority to control the importers' buying schedules. But the wish that British importers should delay their buying this year may well be granted. The new season opens with the outlook entirely changed.

Whereas Britain can count on timber supplies at least as good as last year, the financial problems of the trade will almost certainly delay new buying. The shipping delays and port congestion caused by the dock strike last June and higher interest rates on working capital have both hit the trade hard. If the importers are to avoid losses, they need to charge higher prices. But consumers have been fighting increases throughout the season and are growing more tenacious in their resistance as the credit squeeze tightens its grip. Importers have good reason for being cautious about their orders for 1956.

The first of the season's log auctions, which were held in Finland and Sweden last month, reflect the uncertainty about Britain's import requirements. At last year's preliminary auctions prices rose 8 per cent above the average for the previous year. This year prices were marked down by 14 per cent compared with 1954. This does not mean that sawnwood quotations will fall by a similar amount. Higher production costs at Scandinavian sawmills will absorb much of the gain from cheaper logs. Moreover, the main exporters have sold enough this season to be able to weather a temporary setback in demand. But the buyers market does seem to be reappearing.

Growth in Assured Pensions

SINCE the war the star in the insurance firmament has been the growth of assured pension schemes—both of the staff and "top hat" variety. Statistics just published by the Life Offices' Association and the Associated Scottish Life Offices show that yet more records were established in 1954. The principal figures on the recent growth of these pension schemes and of group life assurance are shown in the accompanying table. They are not the only records reported by the life offices. The total of new sums assured, for instance, rose by nearly 17 per cent to £961 million. Showing proportionate increases, new sums assured under staff schemes amounted to £284 million and new sums assured under individual policies not connected with staff schemes came to £671 million. And ordinary life and annuity funds continued to grow at an increasing rate; last year they went up by £202 million, compared with £172 million in 1953.

Covering about 99 per cent of the business of the British offices and of the business done by Commonwealth offices in this country, these statistics are the best—indeed the only—measure of the growth of the life offices' stake in staff pension and life assurance. They show that about 2,100,000 workpeople are covered either for life assurance

or pension benefits. In the Millard Tucker report it was estimated about 6,000,000 employees were covered by non-statutory pension arrangements. Many employees are covered by private pension schemes, such as those run by the National Coal Board and by many leviathans of industry. But the growth of assured pension schemes has set the life

* Including group endowment assurances.

† About 1,040,000 lives in 1953 and 1,123,000 lives in 1954 were covered under both group life assurance policies and group pension schemes. There was a similar duplication in the two sets of new business figures, amounting to 180,500 lives duplicated in 1953 and 194,000 in 1954.

‡ These figures are largely estimates.

offices new administrative and investment problems; they now have to think in terms of deferred pensions totalling over £275 million. For a few of the offices these pension schemes already overshadow conventional life assurance—once their bread and butter. And they are likely within a few years to become the salient activity of an increasing number of offices.

Hire-Purchase Questionnaire

At long last the Board of Trade's questionnaire to retailers and hire-purchase finance houses has been sent out, October being the first month on which a return is requested. It goes to 6,000 retailers and 450 hire-purchase finance houses with a letter from the President of the Board of Trade, emphasising the strict rules of secrecy that his department will apply to the individual returns. From the questions that are being asked it is possible to form an impression of the shape that British hire-purchase statistics will take when eventually they do appear.

Retailers are asked for a monthly return, each quarter consisting of two four-week and one five-week months. Department stores are asked to show the value of their hire-purchase business done, broken down into its main

commodity groups. Value is taken as the original hire-purchase price excluding down payment (i.e., excluding the deposit but including the service charge). The stores are also asked for their total turnover and for their total outstandings. The monthly figure of outstandings will not be broken down into commodity groups, but there is also to be a quarterly return which does so. Specialist shops in furniture and electrical goods are asked for a more detailed return on those commodities, and the finance houses—to avoid double counting with the retailers—are asked only for their direct collection agreements, excluding their block discounting.

Oils and Fats Mark Time

THE famous Onassis whaling fleet which sails under the Panamanian flag has been accused by the Norwegian Whaling Association of consistently breaking international regulations. The allegations include prolonging the authorised whaling season and catching undersized and protected whales. A protest was sent to the Panamanian government as early as September but it has not prevented the Onassis expedition from setting off for the new season. The other whaling expeditions will all be on their way to the Antarctic before the end of this month. Usually bargaining over the oil they will bring back next spring is in full swing by the time they leave, but this year sales have been limited by the doubt (which should be resolved by November 9th) whether the expeditions will ratify the International Whaling Committee's recommendation to reduce the blue whale catch by 3 per cent. So far only 26,000 tons have been sold—to merchants not to consumers—out of a probable 250,000 tons available on world markets next year. The Japanese have sold 11,000 tons at £86 a ton and the remainder is Dutch oil sold at £85-£85 10s. These prices compare with an average rate of £78-£79 a ton last season.

Business in the oil and oilseed market is now restricted by the uncertainty about whale oil prices and by the doubts about the size of the American cotton and soyabean crops. Philippine copra is now selling at around \$180 a ton cif Europe as against \$187 a ton a fortnight ago. But there is no sign of a big break in prices or of a return to the low levels of last spring and summer. The surplus cottonseed oil held by the Commodity Credit Corporation is near exhaustion, and with its disappearance the market is free from a bearish factor that has restrained it for nearly two years. Even if the higher estimates of the cotton and soyabean crop turn out to be correct, there is small prospect of a serious surplus this season.

When the year's balance sheet is completed the supply of oils and oilseeds is likely to be well matched with the demand. Palm oil output is down and Indonesian copra and coconut oil is only trickling to world markets. Indian groundnut oil is almost off the market until the end of the year when export quotas for the new crop will be announced. On the demand side, Russia has been a big buyer of liquid oils. Much of the Soviet requirement is obtained from China, and little Chinese oil has therefore been coming to the West.

SHORTER NOTES

The differences of opinion that appear to have existed within the broadly identical boards of Richard Thomas and Baldwins and the Steel Company of Wales (both companies are still in the hands of the Realisation Agency) have now been resolved by appointing separate directors for each company. It is stated that Steel Company will now become "a wholly Welsh enterprise with all its interests in South Wales." Sir Ernest Lever, who was formerly chairman and chief executive of both companies, is to remain chairman of Richard Thomas and Baldwins.

Last April the directors of Cunard promised to consider the question of the interim ordinary dividend in the autumn. They have now deliberated and have recommended an interim payment of 2½ per cent on a capital of £13 million. In 1954, the final payment of 7 per cent on a capital of £13 million was preceded by two interims, each of 2½ per cent, on a capital of £7,798,366. Those two interims taken together were equivalent to a payment of 3 per cent on the new capital.

Company Notes

STANDARD MOTOR. With production exceeding—by perhaps a fifth—the record figures of 1954, exceptionally high profits from the motor manufacturers publishing their reports this autumn must be expected. Profits will be high not simply because the manufacturers have been selling more vehicles but also because the greater utilisation of capacity will have reduced costs per unit of output—and widened the profit margin on each car produced. The drag on profits from increased costs of labour and materials, which the chairman of Ford Motor Company recently mentioned, is still partly in the future.

Standard is the first of the motor companies reporting in the autumn to bring out its preliminary profit statement. Profits for the year to August 31st were indeed handsome. Before all charges, the trading surplus has gone up by nearly 47 per cent—from £4,010,920 to £5,885,131. And despite much higher charges for depreciation and amortisation of tools and an increased provision for taxation, net profits have more than doubled, rising from £900,502 to £1,954,664. Those increases compare with a rise of about 35 per cent (from 72,749 to 98,647 units) in the number of cars sold and of about 15 per cent (from 61,411 to 70,909 units) in the number of tractors sold. That underlines the more than proportionate effect that an increase in output can have upon profits in this industry.

Such an upsurge in profits puts Standard among the motor companies with

high earnings yields. Earnings on the ordinary stock, after allowing for distributed profits tax, come to about 50 per cent. But the ordinary dividend is far from handsome. It has been left unchanged, for the fifth year running, at 12 per cent. The 5s. shares immediately and understandably lost 6d., to 9s. 4½d., offering a yield of 6.4 per cent. There are always reasons for conservatism. Standard Motor has to spend money on capital account, though not on the scale of some of its competitors. The profit it

Consolidated earnings:—	Years to Aug. 31,	
	1954	1955
Trading profit	4,010,920	5,885,131
Depreciation	1,041,021	1,337,003
Amortisation	582,955	1,034,101
Taxation	1,364,000	1,485,000
Net profit	900,502	1,954,664
Ordinary dividends . . .	338,415	353,798
Employees' fund	135,000	135,000
Retained by subsidiaries	14,243	20,620
Retained by parent co.	347,728	1,377,046

gains from the sale of each of its motor cars is smaller than that of most of its rivals. Of the "Big Five" it is, perhaps, the most vulnerable in keenly competitive markets and the one that would find it hardest to raise money in a difficult capital market; tractor production offers some though not complete protection. This decision seems to be taking conservative dividend policy to an extreme, but it is a warning that should be noted by investors. There will be other disappointing dividend decisions based on high profits in the coming months.

Britain's Terms of Trade were unchanged in September. Import prices held steady, a rise in the cost of manufactures being offset by a fall in the food and beverages group. Prices of British exports rose slightly; metal goods, engineering products and textiles all moving upwards, but the advance was insufficient to move the index (which is the ratio between import and export prices). It remained unchanged at 100 (on the basis 1954 equals 100).

The directors of Hoover are not going ahead with the capital reorganisation scheme as sufficient opposition has been received from the "A" ordinary shareholders to prevent the plan from being carried into effect. They are to consult the larger holders of the ordinary and "A" ordinary shares with a view to putting forward without delay a modified scheme.

With this week's announcement that Eagle Oil have placed a £12 million order for seven new tankers totalling 182,000 tons deadweight, the new tonnage ordered by British tanker operators since July has risen to 3 million tons dw. This last order has gone entirely to British yards, which have now received about three-fifths of the present programme of orders.

ANGLO-ECUADORIAN OIL-FIELDS. A battle of bids for the control of Anglo-Ecuadorian Oilfields has flared up between the British company Lobitos Oilfields, and an American company, South American Gold and Platinum. The intriguing twist is that exactly the same directors serve on the board of Anglo-Ecuadorian as on that of Lobitos. The association between the two companies has always been close. Lobitos owns £94,500 of the ordinary stock of Anglo-Ecuadorian; that is about 6.3 per cent of the issued capital of £1,500,000. In the last few months South American Gold and Platinum has bought 159,360 of the ordinary shares of Anglo-Ecuadorian, giving it an interest of over 10 per cent. Courted by both sides the other stockholders have seen the price of their holdings go up from 51s. to 58s. 3d. within three days.

South American Gold and Platinum opened the engagement in September by offering 50s. a share (in dollars or the equivalent in its own securities) for the ordinary shares. The bid was for "a minimum of 51 per cent" of the capital and was "conditional upon a detailed examination" of the Anglo-Ecuadorian's properties and accounts. Lobitos countered last weekend with an offer that was equivalent at the prices then ruling to 60s. a share for all the outstanding capital. That was the price set by independent advisers and endorsed by J. Henry Schröder and Company as being fair to shareholders in both companies. The offer was not in cash. Lobitos, instead, offered four 5s. ordinary units in Lobitos plus 10s. in cash for every £1 ordinary unit in Anglo-Ecuadorian. At prices now ruling that offer is equivalent

to about 60s. 6d. a share. South American Gold and Platinum was not slow in returning the fire. Its directors have stated that they are considering offering a higher price for the shares and will present a new offer in a few days.

Everything now turns upon the new American offer. Lobitos, having set a "fair price" of 60s., cannot very well raise its bid. But it does offer a continuing though indirect interest in the company to shareholders in Anglo-Ecuadorian—to say nothing of a forecast dividend of at least 14 per cent from Lobitos (as in 1954) plus a tax free 2 per cent distribution out of realised profits on investments. Lobitos has a trump card in that its offer runs out on October 31st. Thus with another bid in the wind it might be to the advantage of Anglo-Ecuadorian to ask for more time, but it would hardly suit Lobitos. But, then, the two boards are composed of exactly the same directors.

Why has Anglo-Ecuadorian suddenly become so attractive? The first reason is that new arrangements have been agreed between the Government of Ecuador and the company, extending the concessions until 1977 with an option to extend for another 10 years. (That such discussions have been going on has been common knowledge for some time.) Under the contract the company will have to build a new refinery by mid-1958 but prices will be fixed to ensure "a reasonable profit on the investment." Secondly, in anticipation of the new contract Anglo-Ecuadorian secured permission from the Treasury to transfer control for British taxation purposes to Ecuador. That transfer will result in "a substantial saving" in taxes. With that bait it is little wonder that Lobitos is fighting back.

WILLIAM WHITELEY. This department store, which prides itself on its title "the universal providers," has an unlucky history. In the hands of the late Mr Gordon Selfridge it was an expensive venture for its former parent Selfridges. Now long since separated from that control it has another bout of troubles following the death of its more recent chairman Colonel G. S. Brighten. In the year to March 31st it made a loss of £242,106, after taking credit for £9,045 for tax over-provided in previous years; in the fourteen months to March 31, 1954, it reported a loss of £30,307, after writing back non-recurring credits of £35,342.

The directors attribute the loss to:

- The need to provide over £100,000 for bad and doubtful debts owing to a lack of efficiency in the counting house;
- The floor space available and attendant overhead expenses being out of proportion to the store's present turnover;
- The inadequate revenue from outside properties.

The directors are taking "active steps" to overhaul the internal organisation and trading of the company. They have let at "satisfactory rentals" about 60 per cent of 4½ acres of the company's property at Avonmore Road, London, W.14, which previously provided no income at all. They have arranged to sell some of the property, "surplus to the company's requirements," at Queensway, London, W.2. The statement of the new chairman, Sir Harold Gillett, will be awaited with interest, not merely because he will refer to these new steps but also because he is to refer to changes in the directorate following the death of Colonel Brighten.

LONDON STOCK EXCHANGE

Next Account begins: November 2nd
Next Contango Day: November 2nd
Next Settlement Day: October 25th

The week in the stock market was divided into two distinct phases: before and after the announcement of an autumn Budget. Before that announcement gilt-edged prices began their rally on Tuesday afternoon. They spurred ahead on Thursday.

Before the announcement of the Budget, bear covering and renewed investment buying imparted a firm tone to the market in industrial shares. Building shares temporarily shook off fears of a curtailment of government spending and advanced strongly. John Laing gained 1½ to 4½ and George Wimpey reached 5½. In dealing on the last day for acceptance of the English Electric rights issue the premium was at one stage eliminated before fresh support subsequently strengthened both the old and the new. Planned expansion in Canada attracted the attention of American and Canadian investors to British Aluminium in which dealings took place at 50s. 3d. in a good market. Unilever recovered to 89s. 3d. on Wednesday and renewed interest in J. Bibby brought the price up to 68s. 9d. Following the defeat of the plan for reorganising Hoover's capital the "A" shares rose to 48s. before receding to 46s. 3d. Hire-purchase shares were firm early in the week in spite of the Board of Trade circular inquiring into credit transactions but came down on Thursday. After the announcement of the Budget, prices of almost all the leading equities came tumbling down. The biggest occurred in those shares, such as building and electrical equipment, which had led the earlier rally.

Kaffirs again weakened after disappointment with Freddie's Consolidated quarterly reports but hardened late on Wednesday. Higher prices for lead and zinc revived buying of Australian producers, Consolidated Zinc and North Broken Hill both showing small gains. Coppers were firm.

THE MONEY MARKET

CREDIT was in heavy demand in Lombard Street on Thursday before the weekend on account of the cash applications for the new loan; but the Bank of England gave large special help, through purchases of bills both directly from the market and indirectly through the banks. The proceeds of the loan permitted a sharp fall in the allotment of Treasury bills at the tender on the following day—to £230 million, £30 million less than both the original offer and the matching maturities.

The market again maintained its bid at £98 19s. 8d. per cent at last week's tender, and as total applications rose by £2 million to £363.8 million, the fall of £40 million in the allotment resulted in a sharp decline in the market's "proportion," from 66 to 51 per cent.

Conditions in Lombard Street over the week-end and on Monday were more comfortable than of late; but on Tuesday stringency returned, whilst on the following day three or four houses were obliged to take small loans at the penal rate. The Bank gave no special aid.

Sterling has regained the slight losses suffered before the week-end; by Wednesday the spot rate had recovered to \$2.79½. But the discount on sterling three months forward was slightly larger, at 1½-1½ cents; and as the Treasury bill rate in New York rose further this week, from 2½ to 2½ per cent, the margin in favour of London in covered arbitrage has now disappeared.

DIDIER-WERKE AG

WIESBADEN, GERMANY

(Manufacturers of Refractory Materials)

FIRST PHASE OF POST-WAR RECONSTRUCTION SUCCESSFULLY CONCLUDED

MR E. BIENECK'S REVIEW

The annual general meeting of Didier-Werke AG was held in Wiesbaden on July 30th.

Mr E. Bieneck, Managing Director, in his statement emphasised that Didier-Werke AG occupies a special position as the only large undertaking of its kind in Western Europe, and in consequence is obliged to conduct its publicity on definite lines.

"In this statement I shall confine myself to dealing with certain specific points of importance for the future, and to examine more closely a number of questions that could only be touched upon hitherto.

DIDIER IN 1954

The year behind us has been rather eventful. In its violent fluctuations between boom and slump, it has enabled us to discern clearly not only the strength we have regained but also our remaining weak points.

During the months of recession which, starting in 1953, continued into the second half of last year, our production and distribution organisation had to prove itself. Thanks to a wise long-term investment policy we were in a position to make full use of the advantages conferred upon us by the favourable location of our plants. This shows that the first phase of post-war reconstruction may be considered as successfully concluded.

On the other hand, the year showed us the limits set to us by circumstances largely beyond our control:

(1) We are facing increasing difficulties in the export field;

(2) We continue to suffer from the disadvantages imposed on us by the lack of balance, since 1945, in the structure of the undertaking.

Within the administration the term 'Didier Rump' has been coined in referring to these latter difficulties.

Elaborating on these two points, we can say with regard to (1) that the prospects for refractory products in the export market have obviously dwindled. The successes scored in 1951 and 1952—owing to exceptional conditions on the world market—are hardly likely to be repeated in the years to come. Even the increased share taken by Didier-Werke AG in the industry's exports last year should not prevent us from realising that, in spite of our efforts to promote this trade, our expectations for the future must be rather more modest. As a result we are forced to lay even greater stress on our home trade in order to safeguard our turnover. In general we shall only be able to maintain our present position both at home and abroad by continued research directed to improving existing qualities and to developing new ones.

There is one further point I should perhaps mention in this connection. There are signs that we may be able to make up for the loss in export turnover by supplying those countries who are beginning to produce their own refractory materials with advice and German 'know-how.' It should not be overlooked, however, that this export development, involving as it does at times considerable deliveries of capital goods, creates problems of its own.

The opinion is widely held that the underdeveloped territories of the world will ensure sufficient employment given a long period of peace and prosperity. Even here we should make reservations. Expensive machinery may stand transport over long distances at high charges; our products, however, do not. An expansion of the refractory industry in other parts of the world will necessarily result in a contraction of the German export business in this field.

It is for these reasons that DIDIER has held back hitherto in this matter of 'invisible exports.'

STRUCTURE OF CONCERN

The foregoing explanations show that in the field of exports our ability to influence developments is rather limited. With regard to the structure of the concern, however, whose weakness is referred to under (2), we can and must do something. We are faced with a problem here that urgently requires solution, and that assumes far larger proportions for us than it does for most other companies in Western Germany.

Shortage of coal, rising raw material costs, the need for rationalisation and modernisation and, last not least, labour questions—all these difficulties confront us as they confront other industrial concerns. However hard it has been for us to cope with all these problems, especially since we have only just managed to make good the worst damage suffered during the war by the West German plants we have retained, the task remains one that has faced every undertaking.

The difficulties peculiar to our Company, however, are due to the fact that after the German collapse there remained but a rump of the pre-war undertaking. If we want to take full advantage of favourable economic conditions, we must now close the remaining gaps. The successes of the last few years tend to make us forget the extent of the losses suffered. It should be realised, however, what it has meant for a concern like ours, with a structure peculiar to itself, to have lost ten plants with valuable sources of raw materials, as well as the large iron works for building operations, all of which had grown into an organic whole in the course of many years.

Such losses cannot be overcome in a few years, and they emphasise the extent of the

efforts needed to give DIDIER once again a balanced structure and a firm basis for the future.

CAPITAL REQUIREMENTS

The ordinary method of increasing the Company's capital is by itself of no avail. The tasks facing us can only be carried out by way of mergers and similar operations.

Last year's Annual General Meeting authorised a certain increase in the Company's capital, which subsequently enabled us to acquire a majority holding in an important family concern, and thus to secure access to an important source of raw materials.

Once again we are adopting this method this year, in accordance with the requirements of the moment, and we are taking steps to ensure that our shareholders are enabled to participate in accordance with their holdings.

This policy once again marks the prudence and circumspection for which the Company's Board are known, and it is based on a realistic assessment of the situation. Prudence and realism, however, must go with the ability to make the necessary decisions at the right moment."

The following are details of the report presented by the Board of Directors:

GENERAL REVIEW

Developments during the first six months of the year under review were in sharp contrast to those of the previous year. Whilst 1953 was characterised by an exceptional expansion of business, the first six months of 1954 were dominated by a stagnation affecting the whole of the West German refractory industry. The revival of the iron and steel industry in the second half of the year produced a corresponding recovery in the sector for refractory materials, and underlined once again the close interdependence of the two industries. This upward trend maintained its momentum until the end of the year and led to almost full utilisation of capacity in the case of Didier-Werke AG.

The production shortfall of the first six months could not, however, be made good by the recovery of the second half of the year, and the downward movement of output figures for the industry as a whole since 1952 continued during the year:

	Metric Tons	
1952	2,137,256	
1953	1,926,719	
1954	1,897,438	

Although home market sales rose slightly owing to the sudden rise in demand from the iron and steel industry, exports continued to decline:

	Metric Tons	Percentage
1952	328,347	16.4
1953	328,296	17.7
1954	296,545	15.7

As a result of this tendency towards a contraction of business in the refractory industry, prices continued to ease slightly during the year.

(1938=100):	Coal	Refractory Materials
1950	213	187
1951	238	215
1952	278	238
1953	328	237
1954	329	232

TURNOVER

Although the Company was necessarily affected by these business fluctuations, it managed to maintain a relatively even keel, and achieved a turnover exceeding the previous year's figures by an average of approximately 8 per cent. Turnover by value also rose slightly, in spite of adverse price movements. This success was due not only to measures of rationalisation, but to specialisation in certain products and to flexibility in meeting demands for higher quality.

Although the Company's exports suffered a setback in common with the industry as a whole, Didier-Werke AG succeeded in raising its own share of the industry's exports. It should be pointed out, however, that the difficulties in this field tend to increase from year to year, not least because of growing import restrictions and the trend to self-sufficiency in countries which formerly used to buy the products of the German refractory industry. The industry's future in the export market accordingly depends on its

competitiveness, and on the willingness of other countries to follow the German lead in abolishing export subsidies and liberalising trade.

DIDIER-WERKE AG AND SUBSIDIARIES

Turnover by Value 1948 to 1954 (1950=100)

	Home	Export	Total
1948	32.2	5.3	37.5

ing the Company's operations at an economic level during the period of recession early in 1954. Several projects of this kind are still being carried out, and many more will be required in the future to offset economic difficulties and the growing shortage of labour.

PERSONNEL

The number of people employed by the Company did not materially change during the year, and the ratio of manual workers to staff remained static. Allowance should be made in this connection for the fact that the Company has always employed a large number of technicians in its design and development offices.

The following are details of employment figures during 1952, 1953 and 1954, relating to:

(a) wage earners. (b) salaried employees. (c) ratio of salaried employees to wage earners:

	1952	1953	1954
(a)	3,724	3,428	3,446
(b)	975	1,009	1,024
(c)	3.9	3.4	3.4

Particular attention continued to be paid to the training of young personnel, and to the provision of housing accommodation.

Personnel expenditure during 1954, exclusive of housing construction, was made up as follows:

	DM	DM
Wages	15,480,300	
Salaries	6,943,300	
		22,423,600
Social Security Expenditure (incl. Statutory Payments)		7,181,700
		<u>29,605,300</u>

PROSPECTS

In view of the continuing active trend of business, results for the current year are expected to be satisfactory. The order book position remains encouraging, and developments in the iron and steel industry promise an even greater demand from that sector of the economy.

Further steps are being taken to safeguard the Company's long-term prospects, and the recent merger with Didier-Kogag-Hinselmann GmbH, a subsidiary, will help to marshal all available resources to the best advantage.

PROFITS AND DIVIDEND

Net profits for the year totalled DM 831,682.62, which, with the balance of DM 48,835.50 brought forward from the preceding year, raised the amount available for distribution to DM 880,518.12.

It is accordingly proposed to distribute a dividend of 8½ per cent, equivalent to DM 828,325.—, on the share capital of DM 9,745,000, and to carry forward the resulting balance of DM 52,193.12.

The report and the proposals put forward by the Board were adopted.

SUPERVISORY BOARD

Dr jur. Robert Frowein, Chairman; Dr Ing. e.h. Adolf Schondorff, Deputy Chairman; Alfred Broege; Wilhelm von Thelemann. Employees' Representatives: Jakob Eckes; Rolf Racky.

BOARD OF DIRECTORS

Edmund Bieneck, Chairman; Karl Springer; Johannes Dietze and Erich Schroth (alternate members).

JAMES HOWDEN & COMPANY, LIMITED

(Boiler Auxiliary and General Engineers)

RECORD OUTPUT

HEALTHY STATE OF ORDER BOOK

MR CRAWFORD W. HUME ON POTENTIALITIES OF POWER PRODUCTION

The forty-ninth annual general meeting of James Howden & Company, Limited, was held on October 14th at 195 Scotland Street, Glasgow, C.5, Mr Crawford W. Hume, MINA (the Chairman), presiding.

The Secretary (Mr John D. Young, CA) read the notice convening the meeting and the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts: The accounts for the year ended April 30, 1955, are in the same form as in the previous year except for a change in the arrangements of the headings. The change in the capital structure of the parent company brought about by the passing of the resolutions at the Extraordinary General Meeting on August 9, 1954, is now apparent in the accounts.

After taxation the profit of the group is £512,477. The total taxation provided for the year is £503,302. This taxation covers, as usual, a reserve for Income Tax on profits for the year due in 1956-57 as well as a provision for Profits Tax for the year ended April 30th last and for Dominions' Taxation.

The General Reserves of the parent company and its subsidiaries have been increased by £368,713, bringing the reserves as shown on the Consolidated Balance Sheet to £939,531.

The Group balance carried forward and unappropriated now stands at £107,950.

A POPULAR MISCONCEPTION

There is a popular misconception that sums placed to reserve are in cash and that when a fully paid scrip issue is made using accumulated reserves as was done last year the stockholders are receiving something for nothing. This, of course, as you know, is not the case. The reserves represent what has been ploughed back into the business in the form of new buildings, machines and the financing of increased work in progress and debtors, thus enabling the company to expand its business by greater production and in wider fields and to employ more people. In other words, the ploughing back of profits in this way leads to greater prosperity of the company and all connected with it, whether stockholders or employees, and should ensure the continued strength of the company in the years to come.

EFFICIENCY OF PLANTS MAINTAINED

The maintenance of the plant and the addition of new machinery in all our factories continues to have constant attention and the efficiency of the various plants is satisfactory. They are all fully employed and the year's output has been a record. The order book is good and the prospects of future business are satisfactory both at home and overseas.

Good progress has been made with the electro-precipitator which I mentioned last year and we intend to start its commercial development in the near future.

RELIABILITY OF EQUIPMENT

As you know, a large part of the company's business is in the ever-expanding field of power production, and it is more than probable that for years to come by far the largest part of the supply of power in the world will depend on oil and coal-fired steam plants for which we supply essential equipment. We are well aware of the amazing possibilities of atomic power production and are keeping in touch with its developments. We have already successfully completed installations, of unusual magnitude as far as we are concerned, for the British Atomic Energy Research Establishment, where the reliability combined with the high efficiency of our equipment is of the greatest importance.

On your behalf I should like to express thanks to all the staff and all the workpeople in the parent Company and in its subsidiaries for their loyal co-operation and friendly service throughout the past year.

The report and accounts were unanimously adopted, and the dividend, as recommended, was approved.

The retiring directors, Mr Crawford W. Hume, MINA, and Mr P. H. N. Ulander, MIMechE, FInstE, were re-elected and the remuneration of the auditors, Messrs William Hart Junior, and Wilson, CA, having been duly fixed, the proceedings terminated.

BRITISH OVERSEAS STORES

FURTHER EXPANSION

The thirty-fourth annual general meeting of British Overseas Stores Limited, was held on October 14th in London, Mr R. J. Blackadder, MC, CA, chairman, presiding.

The following are extracts from his circulated statement:

I have pleasure in submitting the Accounts for the year ended March 31, 1955, showing a group profit, before deducting taxation, of £161,427, an increase of £52,663 over that of last year. After deduction of taxation at home and abroad, the total profit is £82,415, compared with £56,463 last year. Our interests abroad have all done well, and the latest returns received in London show no falling off from the figures of the year now under review.

During the year various propositions were considered for extending the company's interests overseas, and on April 1, 1955, we acquired a hardware and lumber business in Belize, British Honduras. We have also taken an interest in a small lumber and general cargo vessel from which the returns to date show a satisfactory profit. We are also interested in the erection of a new office block in Salisbury, Southern Rhodesia.

We continue to look for further opportunities to extend our interests on the same principles as heretofore. The company has been built up on a number of widely spread interests in the past, and we think it best to continue this policy so that the risks inherent in trading overseas may be spread.

At the meeting the chairman again referred to lumber controls in Jamaica which are now effective and, even if modified, as expected, this side of the profits must be affected.

Dealing with Beira, he also reaffirmed the diversion of certain traffic to Lourenço Marques, but was still unable to estimate the loss of revenue that may arise. Lastly, he mentioned the further import restriction in Australia and the efforts being made to secure alternative markets for Bickley & Bell. Obviously, this could only be achieved slowly. The report was adopted.

LONDON TIN CORPORATION LIMITED

CHAIRMAN'S SPEECH

The Twenty-ninth Annual General Meeting of London Tin Corporation Limited was held on October 14th at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Mr J. Ivan Spens, OBE, chairman of the Corporation, who presided, said:

ACCOUNTS

It is hoped that the accounts in the form now presented will make clear to shareholders that the Corporation's subsidiary companies, whether wholly or partly owned, are, in the main, registered and administered abroad.

The observations which I have to make relevant to the accounts are therefore confined to the Corporation's profit and loss account and to its balance sheet.

The profit for the year, before taxation, was £1,402,833, compared with £1,202,664 for the previous year.

Taxation took £715,000, against £718,000 last year, the decrease being due to the cessation of excess profits levy and to the adjustments from previous years.

The net profit after taxation is thus £687,833, against £484,664 last year.

General reserve received £75,000, making it up to £800,000, and the dividend of 28 per cent, less tax at 8s. 6d. in the £, paid on June 16, 1955 (compared with 24 per cent, less tax at 9s. in the £, last year), took £582,536, leaving £30,297 to be added to the amount carried forward, which now stands at £339,514.

Following the procedure in recent years, the dividend was paid as an interim and was announced in May, 1955, with a statement that no final dividend would be recommended, and shareholders were informed accordingly.

Shareholders will probably be especially interested in the balance sheet changes, which show that investments increased by £451,509, whilst debtors and cash were lower by £370,826 at a total of £821,041. Against this latter figure current liabilities stood at £748,277, including £582,536 required for the dividend which was paid six weeks after the close of the year.

It will be observed that funds surplus to normal requirements had been invested at the close of the year, but it must be appreciated that it is often not possible or desirable to achieve such a position. An estimate has been made of the anticipated revenue from tin mining companies and other investments held by your Corporation as at September 30, 1955, and this indicates that it will be possible for the board to maintain the dividend of 28 per cent for the year ending April 30, 1956, unless any unforeseen circumstances arise.

PRICE OF TIN

The average London price of tin metal during the year was £723 per ton, compared with £660 per ton in the previous year. This improvement is reflected to some extent in the profits of tin mining companies and in the income of this Corporation, but the upward trend in mining costs continues whilst taxation and royalties abroad show no remission.

The requisite number of tin consuming

countries have ratified the International Tin Agreement but, on the producers' side, ratification by the Indonesian Government was deferred because of more urgent business, and is now further delayed because of the general elections in that country. Siam's ratification is also awaited. It is hoped, however, that the Agreement will be functioning by the spring of next year.

The United States Government has agreed to keep the Texas smelter in operation for 12 months from July 1, 1955, and the surplus of world production is being absorbed since the refined tin from the smelter is not being marketed. In the meantime, however, the smelter is being offered for sale.

As mentioned last year, the industry must provide a substantial amount of tin, or the equivalent in cash, for the buffer stock which is to be established under the Agreement, and companies will therefore have a portion of their liquid resources so occupied.

MALAYA

In Malaya precautions have still to be taken for the security of staff and mines, defences have to be maintained, and there must be no complacency even although the situation continues to improve. You will have seen in the Press that the authorities have declared an amnesty to the terrorists, but it is not possible to predict the result at this stage. Constitutional changes in the Federation have recently become effective whereby the nominated Federal Legislative Council has been replaced by a partially elected Council which is presided over by a Cabinet of Ministers. Mining interests are represented, and we look forward to continued stability of Government which will allow the resources of Malaya to be developed in the best interests of the country.

It was possible to undertake some prospecting during the year, but certain areas are still difficult on account of security and for other reasons. It remains of first importance to find and prove fresh ore reserves to take the place of those now being mined, and this need is receiving constant attention.

The output of tin concentrates during the year from the mines under the management of Anglo-Oriental (Malaya), Limited, was 17,595 tons, as compared with 15,916 tons during the previous year. Three dredges started operating after having been transferred to new areas, and two were closed down, having exhausted their ore reserves.

The dredges under the management of Anglo-Oriental (Malaya), Limited, in Malaya number 40. At the end of the year under review nine were idle, of which four are without reserves. Of the remainder, two are being transferred to new areas, one cannot at present be operated because of security conditions, one is to be equipped with special plant for treating tin-bearing clay, and one in an area which has been dangerous is to be rehabilitated when the necessary materials on order arrive.

It is noteworthy that the cost of dismantling, transporting and re-erecting dredges on new areas, including reconditioning and improvements, new camp sites, ancillary buildings, and equipment, has varied between £150,000 and £450,000 per dredge. These figures, which take no account of the cost of the new area, afford shareholders some idea of the money the tin mining companies must put away out of taxed profits in

order to ensure the continuity of their business, without, I would stress, any material increase in their treatment capacity, for the reconstruction of a dredge often does not permit any material increase in its treatment capacity, nor even in its output if the recoverable values in the ground remain the same. As I told you last year, the new deposits which are being found and which must be worked to maintain production are tending to be lower in grade per cubic yard and deeper than previously. An adequate tin price, is therefore, more than ever essential.

SIAM

In Siam conditions remained generally favourable for mining operations. The output of tin concentrates during the year was 626 tons compared with 368 tons in the previous year. Two dredges were operating at the close of the year under the management of Anglo-Oriental (Malaya) Limited. One of these had been successfully brought into production during the year. Two more dredges were in course of re-erection on a new property at the end of the year and one of these has since started production.

BURMA

Conditions of unrest in Lower Burma still precluded active mining by Tavoy Tin Dredging Corporation Limited, but a survey of one of the dredges has been carried out.

There is nothing fresh to report in connection with the proposal to enter into a joint venture with the Government of Burma but the proposal is still being considered.

NIGERIA

The production of tin concentrate from the mines under the management of A. O. Nigeria Limited was 4,441 tons, compared with 4,480½ tons in the previous year. Columbite production was 1,102½ tons, as compared with 940 tons in the previous year.

As chairman of Amalgamated Tin Mines of Nigeria Limited, in which company this Corporation holds a substantial share interest, I shall shortly be addressing the shareholders of that company at its annual general meeting, and a copy of my speech and the accounts of that company will be sent to the shareholders of this Corporation for their information.

NYASALAND

Prospecting continued during the year under review under the direction of London Nyasaland Mining Corporation Limited, but has since been suspended, in view of the doubtful results obtained and the uncertainty in connection with being able to market the niobium-bearing pyrochlore.

STAFF

Our thanks are again due to the managements and staff throughout the Organisation for the work carried out during the year.

Mr D. T. Waring, chairman of Anglo-Oriental (Malaya) Limited and a director of this Corporation, is with us today; Mr H. E. Wilson, chairman of A. O. Nigeria Limited, is also over here, which has enabled us to have discussion on current matters.

The report and accounts for the year ended April 30, 1955, were adopted and the retiring directors re-elected.

" in one of our new depots it now takes only 0.44 man/hours for each ton moved, whereas under the old system it took 1.22 man/hours

Lord Heyworth Chairman,
UNILEVER LTD.

. . . . Handling methods have been revolutionised by the fork lift truck and the pallet. This method has the advantage of moving and storing goods in unit-loads of a pre-determined number of standard packages to each pallet. It enables them to be stacked much higher without damage, and to be moved more easily both vertically and horizontally. It simplifies the administrative work in store-keeping and it greatly speeds up the turn-round of transport vehicles, both rail and road "

FORK LIFT TRUCKS are made by

There need never be another building destroyed by fire

THE MINERVA NUCLEAR DETECTOR GIVES INSTANT WARNING —AT THE FIRST SIGN OF SMOKE

THE first trace of smoke from anything which is smouldering (before any flame is generated) is instantly sensed by the MINERVA Detector, which immediately operates an alarm or brings into action automatic fire-extinguishing equipment. Thus, in buildings and equipment protected by MINERVA, fire has no chance to establish a hold before an alarm is raised. In tests carried out by independent public bodies concerned with fire prevention, the MINERVA Detector has responded up to an hour earlier than conventional heat-sensitive devices.

HOW THE MINERVA DETECTOR WORKS

The sensitive element in the MINERVA Detector is an ionisation chamber containing a small quantity of radium compound. This radium compound, which has a theoretical life of more than 1,000 years, continually emits streams of radioactive particles. The interception of these particles in the ionisation chamber by the merest trace of 'live' smoke instantly triggers a relay tube and so gives the alarm. The MINERVA Detector is continually on the watch, 24 hours a day; yet it consumes no current while on guard.

HOW THE MINERVA SYSTEM IS INSTALLED

The MINERVA Detector is no larger than an electric light bulb and is no more difficult to instal than an electric light fitting. MINERVA Detectors, suitably sited about the building which is to be protected (each detector protects up to 1,000 square feet of floor area) or built into equipment for which special protection is required, are connected to a combined control unit and signal panel. A display on the panel indicates the point at which the alarm originates.

If required, the alarm can be transmitted automatically to the Fire Station or to a watch office. It can also be arranged to activate fire-fighting equipment on the spot.

WHERE MINERVA SYSTEMS ARE USED

In vital defence installations costing millions of pounds, where 24-hour-a-day protection against fire is essential to the nation's safety; in factories, where fire losses mount tragically if any delay is tolerated; in department stores housing thousands of pounds worth of varied trading stocks; in warehouses where equipment and goods are left unattended for long periods; in museums and libraries where irreplaceable treasures are preserved... in hundreds of such installations throughout Britain, MINERVA Detectors are on watch, consuming no power whilst on guard but springing to action and summoning aid the moment smoke is sensed.

The MINERVA Fire Prevention System has been adopted by the Admiralty, the Air Ministry, the Ministry of Supply, and the G.P.O., as well as by the British Electricity Authority and the London Transport Executive.

An illustrated brochure has been produced giving full details of the MINERVA Fire Prevention System. Please write for your copy to: The Minerva Detector Co. Ltd., Richmond, Surrey. (Richmond 6431)

THE MINERVA TRADE MARK INCORPORATES AN OWL, SYMBOL OF THE GODDESS MINERVA, PROTECTRESS OF ANCIENT CITIES.

The world's
most modern

dictation

record

looks like

this

A partly recorded
Dictabelt record

This is the Dictabelt record, a red plastic belt, the exclusive recording medium of the Dictaphone Time-Master dictating machine. The Dictabelt represents the most efficient, most time-saving method of office dictation for the time-conscious business man.

The Dictabelt record stands up to treatment like this!

Crush it! Bend it! Tread on it! You can't impair the recording. You can't erase it by accident. The Dictabelt is virtually indestructible.

The Dictabelt record sounds like this!

Clear as a bell. And the Dictabelt gives you crystal-clear reproduction all through—uniformly clear from beginning to end.

The Dictabelt record files like this!

The Dictabelt can be filed in an ordinary filing cabinet like a sheet of paper.

The Dictabelt record mails like this!

Just like an ordinary letter, the Dictabelt can be slipped into an envelope and posted.

The Dictabelt record costs about this!

Actual experience proves that in use the Dictabelt costs only a few pence a day.

And it gives you completely visible recording!

Place-finding is easy. You see exactly where you left off. Corrections are simplicity itself.

DICTAPHONE

GREATEST NAME IN DICTATION

Only the Dictaphone Time-Master uses the Dictabelt—the world's most modern dictation record.

Who gave the OK for the TV?

'We want the one with the biggest, biggest screen,' the children said. 'We can't afford that one,' said Father. 'We haven't room for a console, anyway,' Mother told him, 'but we've got to think of the children's eyes. And I'd prefer a plain mahogany cabinet that tones with the table.' 'There's one in PICTURE POST,' cried the children, 'that looks a smashing job.' 'It's a good name so their stuff should be first-class,' Father said, 'and the price is about right. We'll all go and look at it together.'

And to make it most likely that it's *your* television set

they buy, your best and cheapest way is to advertise in a magazine that goes right round the family and stays around a whole week—often more. Your best family magazine is PICTURE POST. It goes into over 1½ million households. It is read by 5 million people every week. It clinches innumerable family purchases.

PICTURE
POST

HULTON'S NATIONAL WEEKLY

for family purchase

Who chooses the family car, soft drinks, confectionery, cereals, soap and toothpaste? They're all very much family purchases. They can all be sold through PICTURE POST.

The World is their Market

OUTER HEBRIDES

Up in the Outer Hebrides, the famous Harris Tweed is hand woven to meet the demands of fashion in many countries. The world has long recognised its superb quality. But the people who make it are not inclined to rest on their laurels. They know that the leadership of their product is continually being challenged by fine tweeds from other countries.

It's the same in any industry. *Making* products for the world is only half the job. You've got to show them, sell them—and *sell them hard*—wherever a market for them exists. Many manufacturers do this very successfully through TIME, The Weekly Newsmagazine.

SELLING IN OVER 100 COUNTRIES

TIME's net paid audited circulation exceeds two-and-a-quarter million copies weekly (ABC). There are five separate editions of TIME* with the same editorial content. One circulates only in the United States—the other four, the *International Editions*, are published simultaneously in English and read by important people in more than 100 countries outside the U.S.A.

Ninety-three of every hundred readers of TIME's International Editions hold influential positions in business, government and the professions. They look upon TIME not only as the best means of keeping abreast of international news, but as an introduction to the world's foremost companies and products.

You can buy advertising space directed to those markets which interest you most—through one edition, any combination of two, three, or four, or in all five of the world-ranging editions of TIME.

Advertising in TIME sells around the world!

"Sollid, Proporsionable . . . Masculine and Unaffected . . ."

— Hugo Jones (11/3 1052)

Can the architectural ideas of the man who designed the Queen's House at Greenwich have any possible relationship to modern techniques in construction?

We think so.

Wallspan is a speedy, labour-saving method of outer wall construction employing new materials to form facades which—while 'solid, proportionable and unaffected'—introduce a new atmosphere of light and air into workaday buildings.

What Wallspan is. The weight of modern buildings is borne by the structural frame: the outer walls are nowadays a protective facade only. Wallspan is a grid of aluminium alloy formed of vertical and horizontal members. The grid is bolted to the building's structure. Into it go windows and doors. The wall is then rapidly completed with suitable panelling.

Speed! One man can handle the Wallspan grid members. Joints are simple and there is an absolute minimum of fixing components. As a result, even multi-story walls can go up in a few days!

Beauty! A great variety of infilling panels is available in glass, metal and other materials, in numerous textures and colours. So your architect has unusual scope for beautiful and functional design.

Comfort! You can have panelling which gives up to 50 per cent better insulation against cold—or against heat—than 11-inch cavity brick walls.

Space! The Wallspan grid need be no thicker than 5 inches; the panels no more than half that. That means extra rentable space all round each floor.

Little Maintenance! The beauty of Wallspan is permanent. Pointing and painting are done away with. The walls can be kept clean by the window cleaners.

Why not have a word with your architect about the possibilities of Wallspan for any new building you may have in mind!

The truth about the middle man IN TEXTILES

THE 'middle man' in textiles is a genuine stock-carrying wholesaler. He selects the pick of the products of scores of factories and holds large stocks from which retailers in all parts of the country order in small economic lots.

Each year some £864,000,000 worth of clothing and household textiles is distributed through the wholesaler. In any system of supplying the public with textiles, the cost and work of selection, breaking bulk and distribution must be undertaken. The textile wholesaler does this in the most economical manner.

This is the FIRST of a series of four announcements describing how the Textile Wholesaler helps the Manufacturer, the Retailer and the Nation.

Tib. 307

The Derbyshire wagon tippler—
and the 17 ounce Apollo

Of this strangely assorted pair, one is part of a big mechanical conveyor plant at a power station, tipping coal into hoppers at 1,400 tons an hour: the other is an aluminium tubular billiard cue. But there is a connection, for both are made by different companies in the seven Divisions of Tube Investments.

The link between many necessities of industrial and everyday life—from rolling mills to bicycles, pressure vessels to electric cookers—is symbolized in TI, for each Division makes many products.

The TI Steel Tube Division, for instance, is the world's largest producer of precision and specialised tubes. It makes pressure and mechanical steel tubes, both seamless and electric resistant welded; tubes with diameters of over 3 feet to one thousandth of an inch, and it manipulates and assembles them into complete components and parts to customer's specification. TI also produces tubes in aluminium, plastics, titanium and other uncommon metals. When the demand arose in the peaceful uses of atomic energy for tubes in uranium, zirconium, thorium, beryllium . . . TI developed special fabrication techniques and needs were quickly met.

That is one among the seven TI Divisions which serve the world: Steel Tube Division; Engineering Division; Electrical Division; Aluminium Division; Steel Division; Cycle Division; General Division.

Summa 15

A small machine embodying new conceptions of mechanical efficiency, the Summa 15 is the adding-listing machine designed for the needs of to-day's business. Easy to operate, sturdy and compact, it has a place in every office and is the reliable instrument for fast, accurate figurework.

Hand operated - Capacity 10/11 columns - Automatic printing - Operates both in sterling and whole numbers -
Sterling Cut-off Device - Direct subtraction and credit balance

As Far as It Goes

A BUDGET should usually be regarded as a whole. Unfortunately, the economic and political measures that Mr Butler has now unfolded can only be regarded in bits and pieces. The excellent precepts, but less satisfactory practices, that he enumerated during his speech on Wednesday suggest that he is still marching along a road that is paved by good intentions; but there is a traditional doubt about where that road might lead. It will be best to discuss his points and peccadilloes in the order in which he raised them.

The first part of his speech on Wednesday was devoted to an explanation of why he had decided to introduce a Budget at all. This was by far the most satisfactory part of his performance. He was able to say at the outset that the assumptions which he made last April about production (which has increased by between 5 and 6 per cent on the year) and personal consumption (the rate of increase in which has so far been slower than last year) have not yet been falsified by events. It is investment, both in fixed equipment and in stockbuilding, that has outrun his expectations; while industrial production has increased this year by 5 to 6 per cent, the volume of imports has increased by 11 per cent—largely, presumably, because industrialists have been laying in the raw materials that they failed to stock last year (when imports increased by much less than production).

In the normal course, this surge in investment and this excess of imports above requirements might be expected to moderate soon of their own accord; but Mr Butler is not inclined to take a chance that they will. He clearly does not feel that he has the margin in hand to allow him to run any such risk. Some raw materials, and particularly steel, are still very short; labour is even shorter, for there are more than two vacancies for every man unemployed; the recent spate of wage claims suggests that personal consumption, if left on its own, may not obediently accord with his April forecasts for very much longer. Mr Butler agrees that the credit squeeze is slowly beginning to work, and that there has been a marked improvement in all the available economic indicators during the past month; but he is inclined to accept the still unproven view that Bank rate is very much less effective in conditions of rising production than of falling prices (the conditions under which an active monetary policy was first put into effect in 1952). He agrees that Britain may not be in deficit at present; but he says that now, when world trade is expanding, is a time when it should be in large surplus and building up its reserves. Hence his Budget.

This was a brave analysis, and it would be churlish not to praise Mr Butler for taking a decision that must have been so much against his political inclinations. If his fears about the future course of demand turn out to be too strong, then his actions now to bring about disinflation in the future (for few of his measures will be of great immediate effect) will merely represent a policy of *reculer pour mieux sauter*; if, on the other hand, his suspicions prove justified, then a failure to start disinflation now would spell disaster—or else a need to

go back upon his most fundamental policies—later. Up to this point in his speech he had enhanced, rather than tarnished, his reputation.

His next task was to find items of public expenditure that he could cut down. Here he announced three basically wise decisions. His aim to stop Exchequer subsidies on council housing altogether—except for slum clearance, new towns, and overspill areas—is undoubtedly right; and Mr Sandys's statement on Thursday that the Rents Acts will be reviewed heralds perhaps the most important point of the Government's whole programme. But the cut in the subsidies will apply only to new houses and therefore will merely slow down the rise in the subsidy bill instead of reducing it. The decision to raise charges for telephones, will cover their capital costs, and do something to cut the queue for them. The priorities with which Mr Butler blessed the erstwhile Cinderellas of Government investment—the roads, railways, schools and hospitals—were welcome; but although he is not going to swing an axe at these, he expects that he will have to block their further expansion.

Among his other prospective economies in the public sector, the cuts in government building were typical examples of projects that are too easily thrown to the wolves in every economy drive. The decision to force local authorities to borrow either in the market or at the going market rate is undoubtedly welcome in principle, even if it may raise some anomalies in practice. The cuts proposed in the investment programmes of the nationalised industries, on the other hand, seem to have been decided by bargaining with the boards, and without any obvious relation to market demands at all. The most disappointing feature of the Chancellor's whole shrimping expedition for economies, however, is that, as he himself admitted, he felt that he had to undertake it under the limitation that there could be no major change in policies. The agricultural subsidies, which provide the most obvious field for a change in policy, are to be looked at again by the Minister of Agriculture next spring. Most of this delay was probably inevitable politically; but is there any reason why the Chancellor should have felt obliged to leave the present bread subsidy unscathed?

★

It was under the burden of a conscience that has obliged him to act more swiftly in the face of threatened inflation than any postwar Chancellor has acted before, but of a temperament that has induced him to be as tender about Government spending as Chancellors usually are, that Mr Butler turned to the tax increases that were the reason for calling his policy statement a Budget. Once he had decided that he must raise £75 million more in a full year from personal taxation—which is just about as much as he gave away to persons on the reduced income tax rate last April—it was probably inevitable that he should increase the purchase tax.

The alternatives—a reversion to higher income tax, an increase in national insurance contributions or in the petrol tax—were all either economically unwise or politically unthinkable. But, having decided to restrict consumption by purchase tax alone, Mr Butler made one commendable and one dubious decision about it.

His commendable decision was to raise rates right across the board, and not to hit discriminately at those items that appeared to be in most inconveniently high demand or at "luxuries" that appeared to be politically uninvincible. The decisions to abolish the D-scheme, thus aiding producers of quality textiles at the expense of the mass market, and to re-impose purchase tax on pots and pans, which would never have been freed if Tory propaganda had not forced Labour Chancellors to discover political dynamite in the "housewife," fitted into this admirable pattern of non-discrimination. But, having started along this road, Mr Butler spoiled his whole case by finding two more shorn lambs—in silverware and cut-glass—to whom he could temper the prevailing economic wind. Such yielding to pressure in changing particular rates can only postpone further the evolution of purchase tax into a flat-rate sales tax imposed indiscriminately on all consumer purchases.

★

There remains the increase in distributed profits tax. This was a deplorable decision, and to examine the reasons for it is not to excuse it. It defies the principle that the Royal Commission laid down on differential rates of profits tax; and it is based on the kind of dubious economic analysis on profits and dividends that Labour Chancellors have always employed. In April, Mr Butler gave away £40 million in a full year to companies by the 6d. cut in income tax; he evidently aims at taking back approximately that amount from them in two or three years. His main concern for the future (and it must be emphasised again that it is concern for the future, not for the present, that has motivated his Budget) lies in the curve of wage claims; he may feel that a little bit of apparent beastliness about profits now will help him to induce more restraint from trade union leaders, if not from their rank and file, in the next few months. Nevertheless, this decision, more than any other, underlines the limitations of Mr Butler's—or is it the Prime Minister's?—wisdom as an economist and his strength as a politician. In effect, the Government is willing to embark on measures that provoke long-term economic disadvantages in the hope that those reasonable fellows at the TUC may be mollified. But already it is doubtful if this expedient is going to work.

What, then, must be the general conclusion upon the whole economic programme? Mr Butler's critics are in the embarrassing position of knowing that any of the Chancellor's predecessors would have avoided cause for criticism by a simple policy of inactivity; since there is no immediate crisis, they would not have introduced

immediate remedial measures at all. This is a major point in Mr Butler's favour. It is an improvement, even if necessarily an equivocal one, from seeing too little being done too late to see a mixture of right and wrong things being done in good time. It would therefore be unfair to say that by last Wednesday's performance the Chancellor has destroyed at a stroke the enviable reputation that he has built up over the past four years; but it is fair to say that his principles and his practices have become seriously entangled. He has shown less energy in looking for cuts in Government expenditure than his friendly critics had hoped for. He has been forced to use the engine of an interim budget to put right new strains superimposed on an economy

Middle Eastern Jackpot

THE rattle of the money-boxes in which the Egyptians and the Israelis are collecting funds for arms is a disturbing noise in the ears of the three western Foreign Ministers now in Geneva—the more unpleasant because it was not expected. When the invitation to a two-stage "summit" conference was issued in May, and indeed when the first stage was accomplished in July, none of the western powers conceived of the Arab-Israel frontier problem as a major item for their autumn agenda. It has become so through two developments. The first was Russia's sharp reaction to the formation of a "northern tier" of Middle Eastern states linked to Nato, in the shape of the Turco-Iraqi pact now also joined by Britain, Pakistan and Iran; the second, Egypt's desire to recover a leadership of the Arab bloc which it lost through Major Salah Salem's misguided diatribes, and its decision to use Israel's bellicose behaviour at Gaza as its rallying cry. The Egyptian-Czech arms transaction, which was the spark that illuminated the scene for western eyes, is for the moment equally convenient to Egypt and to the Soviet Union.

Naturally, the immediate reaction in Israel is to seek corresponding supplies of arms "from any possible source." The preoccupation of the western statesmen, therefore, is how to limit an arms race which is not in itself new—it has been going on since the Palestine war—but which can now become unbridled unless the Soviet Union is as ready as they are to curb it.

For more than five years, the western powers have kept it within bounds on the basis of their Three-Power Declaration of May 1950, which binds them to weigh all applications for arms in the light only of "internal security and legitimate self-defence needs," and to deliver arms only subject to specific assurance from each purchaser that no act of aggression is intended. They have been able to maintain these standards because, in the western world, no arms of importance

at full stretch, and has left largely on one side the considerations of economic policy that would reduce the stretch and enable the British economy to go ahead vigorously—but without the top hamper that now makes it unsteady whenever an adverse breath of wind begins to blow. It is not likely that his compromise on profits tax will make any lasting impression on labour's demands; and while increases in purchase tax will help to mop up purchasing power, they also provoke bigger wage claims and introduce further distortions into the pattern of output. This mixture of courage, wisdom, and expedient lacks the element that would have given it binding force—resolute attention to government expenditure and particularly to the subsidies.

are exportable without government licence. Until lately, two further factors have helped to stabilise the area. One was Arab acceptance of the assumption that Arab foreign relations must be founded on relations with the West; that this practice survived the Palestine war and the birth of Israel was due partly to the indeterminate nature of Soviet Middle Eastern policy, partly to the anti-Communist nature of Arab leadership, partly to hopes placed in western aid, and partly to the belief that Britain, at least, stood for a conception dear to Arab hearts, that of Arab League unity. The second stabiliser was—unlikely though it may sound—the presence of British troops in the Canal Zone. Lying athwart the line of communications between Egypt and Israel, they helped to put body into the third paragraph of the 1950 declaration, which asserted that the three governments would immediately take action both within and outside the United Nations to prevent violation of frontiers or armistice lines.

★

These guarantees of moderation may not have been watertight but, for five years, they have been fairly effective. Today, all three have vanished. Moscow has become active; the British troops are gone and Britain's adherence to the Turco-Iraqi pact has, as that pact has turned out, amounted to taking sides as between Arab League members. Arab eyes have opened to new possibilities, and the problem before Mr Macmillan, Mr Dulles and M. Pinay is that of inventing new stabilisers to take the place of the old. Policy designed to check the arms race could be put into effect at either of two points—in the Middle East itself, or at Big Four level. At which, or both, are they to try their hand?

Appeals to the better feelings of the Middle Eastern antagonists are being uttered, but the immediate out-

look for their success is not bright, for the crisis has served as a tonic to weak regimes on both sides of the border in Palestine. The Egyptians have recovered the lead and the initiative that they had lost, and have brought off, on terms highly favourable to themselves, the military pacts with Syria and Saudi Arabia that had been hanging fire for months. They have not become the allies of Soviet Russia and do not intend to do so, but they have secured—on the short term basis that is all Colonel Nasser has so far considered—proof of the advantages of dealing with both East and West. Their attitude, and that of all Arab states except Iraq and Jordan, is admirably summed up in a leading article in a Lebanese newspaper:

From now on we smaller nations need not hesitate to stand up to great powers. . . . We will smile at the West for a price, at the East for a price also.

The country least likely to be able to follow this programme unscathed is Syria, where a weak government, divided parties and a quarrelling officer corps form just the stuff on which Communist agents thrive.

★

Even in Israel, where anxieties about difficulty and expense in securing armaments are greater than those in the more feckless Arab states, the immediate effect of crisis has been a lifting up of hearts and a hardening of opinion. Cabinet-making, fraught since July with petty difficulties, has suddenly become easy; a visiting team of enquirers representing the principal source of American gift funds—the United Jewish Appeal—has been supplied overnight with fresh slogans; deputies in the Knesset are cheered when they call for a “siege mentality.” Simultaneously, Israeli listeners to Warsaw broadcasts in Yiddish are hearing that:

“If the Sharett-Ben Gurion government had shown a minimum of independent policy, say as much as Egypt” (instead of lining up with the antagonists of the “peoples’ democracies and liberation movements in the East”), they “could have obtained arms from Czechoslovakia too.”

In a word, blood is tingling on both sides of the Arab-Israel frontier and several different forces are interested in keeping it so. Even Asian apostles of peaceful neutrality, such as Mr Nehru (who successfully produced with Colonel Nasser a joint statement on the virtues of disarmament when the two men met in Cairo in July) may find it difficult to modulate so warm a welcome to arms.

The only immediate opportunity for lowering temperatures seems, therefore, to be at Geneva. Only if the Russians can be led to adopt the frame of mind that brought about the Three-Power Declaration of 1950 does any chance of curtailing an arms race survive. Yet the conversation with them will not be easy, judging by experience in Europe:

West: Do you really want relaxation of tensions? Because if so, why sell arms to Egypt?

Russia: We are doing only what you western powers have done for years. What is the difference between a Czech sale and a British or American sale?

West: The difference is that our deliveries were rationed. Will yours be, likewise?

Russia: Surely; if you will abandon your military pacts on my southern border.

The choices of policy now open to the western diplomats are narrow and none is attractive. Are not their good friends of the “northern tier” more valuable than ephemeral Russian smiles? Shall they invite Picasso’s dove to fly over Jordan and Mr Molotov to subscribe to their 1950 Declaration? The advantage would be the clear challenge to Soviet sincerity; the drawback, a price paid in fruitless conferences and abortive bargaining of the type so familiar in Europe. Or shall they allow matters to ride, hoping that time will prove that Russian helpers are less generous and more exacting than western ones, and that once the first heady excitements of multilateral flirtations are over, the comparisons drawn by the Middle East will turn out to be favourable to the West? The drawback about procrastination is the high risk that in the meantime there will be an outbreak of fighting on the frontier and a local war.

Yet, apart from these alternatives, what course is possible? Already, Mr Macmillan has sensibly discarded that of arming Israel to match, or of specifically guaranteeing Israel’s frontiers—either of which acts would pitch Egypt and Syria into the Soviet bloc. Equally it is impossible to establish anywhere on the adjacent mainland the semi-deterrent to war in the shape of a western force that existed so long as the British ran a Canal Zone base. Even if Gaza could be hired from Egypt at a substantial rent, who would man it in a year when Britain is cutting military commitments, France has not enough men for North Africa, and the United States holds the theory that small forces stationed overseas are more likely to involve the world in war than to prevent it? Sooner rather than later the West must arrive at the conclusion that nothing, now, can keep Russian embassies and emissaries out of the Middle East and that it is wisest to enlist them, as soon and as publicly as possible, in the ranks of those who do not want a second Palestine war.

Western statesmen can count themselves fortunate that, in most years between 1917 and 1955, they have been vouchsafed the chance to play in the Middle East a one-handed game, akin to patience. Its even rhythm has lulled them into forgetting that this policy was only open to them as long as the Arab governments looked westward only, and as long as Moscow pursued no active Middle Eastern policy. Today, provoked by the Turco-Iraqi pact, Cairo and Moscow have switched the game from patience to poker. The only course for the West is resiliently to play it; poker is, after all, a game that any player can win.

The Saar Fiasco

THE Assembly of Western European Union met in Strasbourg on Monday, and confessed itself speechless in face of the previous day’s referendum in the Saar. The meeting resolved simply not to talk about the subject, although the Saar problem is its particular responsibility. The ghosts of Hitler and Stalin might have risen and shaken hands over Sunday’s two-to-one vote against a new European solution for this old bone of contention between Germany and France. It is a defeat for Western European Union, including Dr Adenauer’s Germany, not for France alone. Indeed, the whole of Nato and the friends of freedom all over the world are involved in this collapse of an experiment in western unity.

A *post mortem* on the referendum is not a waste of time. On the contrary, it is essential to note the causes of the death of the Statute on which the Saarlanders voted. They are easy enough to discern. The basic reason why the Saar Germans rejected the Statute was that they did not believe in a new Europe. They were not convinced that they were being offered a genuine European status in a new community. They thought they were choosing, much as in 1935, between France and the Saarland government on the one hand, and Germany on the other; and naturally, when the bands began to play and the patriotic slogans resounded at mass demonstrations, these Germans chose Germany. It is, in the circumstances, a grain of comfort for the future that one third of the voters actually resisted patriotic hysteria and the fear of being branded as “separatists.” The number who voted for the new Statute was greater than might have been expected, considering that every party, except Herr Hoffmann’s and the Saar Socialists (as distinct from the Saar branch of Herr Ollenhauer’s Social Democratic Party), urged them to reject it.

The pro-German front was solid, and even included the Saarland Christian Democrats. They were united in a “patriotic union” for the referendum campaign, and had the full and active support of the Communists. The East German Communist headquarters denounced the Statute, and orders to fan nationalist feelings were transmitted down the line from Moscow through East Berlin and West Germany to the Saar. Some of the organised disturbances and forged nationalist leaflets which marked the campaign are believed to be typical crypto-Communist contributions to the work of breaking the “Europeans.” The Saar provided an excellent field in which to carry out the policy of tactical alliances with nationalists formulated by Stalin and followed by

Communists throughout the world with increasing zeal under his successors.

What had the European side to put in the scales against such a union of extreme left and right, flanking a half-hearted centre? Almost nothing but the exhortations of Dr Adenauer and the empty threats of the French; and both of these were denounced by the pro-Germans as “interference.” The contrast between the majestic title “Western European Union” and actual performance in the Saar was pitiful. No German could have seriously believed that the Saar settlement was really being sponsored by a great union of seven nations, including Great Britain, and backed by North America. What evidence was put before the Germans to show that this attempt to end Franco-German hostility is the most important business of Western European Union as such? In other respects the Union is little more than a working committee of the Council of Europe or of Nato, but the Saar is its own child.

★

It was intended that the territory should form a focal point for a new political community in Europe. The Union was to appoint a High Commissioner with power to supervise observation of the Statute, and to represent the Saar in the field of foreign affairs and defence, and the Council of Ministers of WEU was charged with receiving his reports. It might have been thought that the seven governments would have taken their new responsibility more seriously than they did, and that they would have impressed the Saarlanders with the weight of their authority and their new, progressive ideals. Instead, WEU simply appointed a commission to supervise the voting, and allowed it and the seven member states to be bound by a pledge of non-interference which left the contest to relapse into a dingy revival of the old quarrels between France, Germany and local autonomists.

No one seems to have realised that the principle of non-interference was out of place in the new European context—as out of place as it would be for a national government to refrain from propaganda in its own cause during a general election. It would have been far better to have allowed the voting to be supervised by neutrals outside WEU than to have turned the Union’s own commission into a neutral body. As it was, the cause of Western European Union was left to the Hoffmann government, stigmatised as separatist in the eyes of the Germans, and to the lone voice of Dr Adenauer. If the founders of the Union believed in it themselves, why did they allow their own voices to be muffled? If all the prime ministers of the Union

had jointly gathered on platforms to proclaim a new future, they might well have overwhelmed the nationalists. But, in the name of an entirely inappropriate principle of non-interference, the Union gagged itself, while leaving extremists to whip up hysteria to their hearts' content.

It may be said that Western European Union had no chance of creating any deep-rooted sentiment with which to counter resurgent German nationalism, since, before WEU was formed, the projected European Defence Community was killed by the French Assembly. There is much truth in this argument. And it is also true that Britain bears a good part of the blame for this French rejection of a French proposal. If, when the EDC was in view, Britain had committed itself to Europe to the same extent as it later did to bring about Western European Union, history might have taken a dramatically different course.

It may, again, be argued that the draft statute which M. Mendès-France pressed Dr Adenauer into accepting a year ago was much too favourable to French claims in the Saar, and might have been adopted by the Saarlanders if only it had been less grasping. There

is also some truth in this criticism of the French. But when all is said and done, it is evident that the Saarlanders would have voted for Germany, regardless of other circumstances, if their apparent choice was simply between reunion with Germany on the one hand, and political autonomy and economic union with France on the other. Indeed, some pro-Germans in the Saar felt that the better the statute, the more vigorously they must oppose it, because its merits would make it all the harder for them to carry through a reunion with Germany when the peace treaty was finally negotiated.

★

The basic fault therefore lies in the failure of Western European Union to provide a clear and convincing framework for a new order in the Saar. Blame must also be attached to the members of the Union for abandoning the field of persuasion to the nationalists, and for not insisting that a statute which the Union had to sponsor should be a more generous compromise with the wishes of the Saarlanders. It is with these findings in mind that the Union should now tackle the problem of what to do next.

In the first place, there can be no simple return to the *status quo* before the referendum. The Hoffmann government has understood this and has resigned. New elections will be held, and will doubtless mean a victory for the pro-Germans. Secondly, there must be no simple capitulation to the nationalists. Despite the present setback, there can still be no solution for the Saar except a European one, under Western European Union.

Finally, there is everything to be said for not trying to produce another statute immediately. Matters should proceed on a provisional basis, with WEU acting energetically to assert its authority and take part in a new settlement. The search for a new statute could go on, without the drafters again being pressed into an impossible and unwise attempt to compose a watertight agreement which would be untouchable for many years to come. During the interim period, while empirical methods were being employed, the western statesmen should put their combined weight behind efforts to give content to the idea of a European community.

When the time comes for a vote to be taken on a new statute, it would be unwise to hold another referendum. There has been enough experience to show that the issues are always distorted through oversimplification when a "Yes" or "No" answer to one question is asked for on a complicated subject. It would give the exponents of the European solution a better chance if the public were to choose in an election between parties standing for the new course and the politicians who cling to the nationalism of the unhappy past. But next time, if the present setback is not to be repeated, the Germans must be convinced that "Europe" is something real and inspiring and not simply another name for France.

Notes of the Week

Princess Margaret

IT is to be presumed that the Princess Margaret is now in the last, painful stages of making up her mind about her future. One by one, British newspapers have slipped off the leash to comment upon her problem, each in turn criticising the bad taste of the others that have spoken before it. In this typically British way the consensus of responsible opinion has become clear. It is neither as dewy-eyed as might have been expected, nor as sacramental as might have been hoped. If Her Royal Highness feels that she must enter into this marriage, then in democratic conscience one supposes that she must. But it will be a great pity if she does.

There is a real dilemma here. On the one hand, Royalty must have higher and stricter standards than other people. The reason why marriage to a *divorcé* would offend against those standards can be bluntly stated. It is not simply that such a marriage would be contrary to the religious views held by the majority of the Convocation of the Church that happens to be established in the southern half of the United Kingdom; it is that many people who are very far from being churchgoers would take such a marriage as one more sign that all this fussiness about church views upon morality, which could then apparently be flouted by the highest in the land, is old-fashioned nonsense that need not apply to them. And, whatever one's views about the Church of England's interpretation of Christian doctrine in this particular matter of divorce, it must be insisted that for a Royal Personage to spread any such impression must be a very bad thing. On the other hand, Princesses, as individuals, clearly cannot be denied their human rights. If a Royal Personage wants to do something that Royalty ought not to do, and persists in such a wish after mature consideration, he or she should be permitted to become a commoner and assume ordinary legal and personal rights. This should be permissible, but it must always be regrettable to those who devoutly cherish the institution of monarchy as a whole.

Everybody realises that this must be a painful dilemma for this particularly charming Princess herself; few people can be quite sure what they would do if they were unlucky enough to be in her shoes, and subject to standards of conformity that are a burden of such agonising weight. But the correct course for the Queen's advisers has been clear. It has been to make Her Royal Highness struggle past every obstacle before she reaches her decision. This is, quite obviously, the course that they have in fact followed. They deserve commendation, not the blame they have been getting, for having done so.

Parliament Reassembles

LABOUR was disappointed in its hopes of using Parliament's reopening day as a launching platform for a new rocket against the Government front bench. In two of the issues which came up at the outset Labour's own leaders are as heavily involved as the Government—the 14-day rule about broadcast discussions and the Burgess-Maclean case. There are plenty of topics on which Labour can pick a straight fight—the call up, Cyprus, monopolies and, above all, the Budget—but it does no harm for an Opposition to be reminded that a party's actions, in or out of office, can always catch up with it at the wrong time. The opening passages in the new Parliamentary chapter also served to remind Labour that in Mr Attlee—an unbelievably fitter and spryer Mr Attlee compared with his appearance at Margate—it still has a leader who knows no equal in the art of playing possum when things look tricky, and then snapping into action when he sees a good opening.

On the question of the 14-day rule, pressed by the Liberals, it was disheartening to find the Canutes of Westminster out in full force so soon. Sir Anthony Eden carried the vocal support of a majority of MPs, certainly on the Tory side, when he refused to drop the ban; he said that to allow a broadcast debate on any subject that the House itself would debate in less than a fortnight would not be "in the best interests of Parliament." But his defence of the system—as a good, old, illogical, but workable British institution—was unbelievably feeble. His dark reference to the disappearance of free speech in other European countries would have fitted better into an argument against the rule. There are good grounds for suspecting that the party leaders mind less what is said than who says it. Those MPs who are neither bemused by the Whips nor jealous of the TV stars in their midst should continue to press for a debate.

The Government itself has promised a debate on the Burgess-Maclean affair, and with each new fact unearthed, usually by the press, it becomes clearer that both front benches will have their share of explaining to do. Labour's leaders will have to answer for the apparent bungling which led to the escape of the two men; the present Government will have to explain a series of misleading answers to Parliament, extending over four years and culminating in a determinedly stonewalling White Paper. But back benchers must understand that more than an autopsy is needed. The most worrying aspect of the case—intensified with every damaging disclosure—is that there is no proof that the same thing could not occur again. It is not McCarthyism for Parliament to demand convincing assurances that behind four and a half years of covering up, security measures have been made really effective, if necessarily unobtrusive.

Workers' Education

Those whose memories extend back to the year 1825 and who took an interest in the dissemination of knowledge, will be aware that it was then considered a kind of heterodoxy to give scientific lectures, or lectures of any kind, to working men. Dr Birkbeck, Lord Brougham, Mr Millington, and one or two others whom we could name, at mechanics' institutes and literary societies, did occasionally collect an audience of the humbler classes, and deliver lectures on physiology, on the properties of timber and metals, or on political economy; but their exertions were rather derided than supported by politicians, and were sometimes, and even from the pulpit, denounced as dangerous. Now times are amazingly changed, and we have Lord Ellesmere, Mr Gladstone, Lord Stanley—the foremost leaders of the Conservative party—giving lectures on the war, on colonial government, on mechanics' institutions, etc., etc., to the people, at literary and scientific institutions. . . . It must at the same time be noticed that all the lectures delivered by noblemen and gentlemen have been to town audiences. . . . Nobody has yet, as far as we know, thought of collecting the agricultural labourers and of lecturing to them. They are supposed to be susceptible to religious instruction, but apparently to no other. Their habits of working separately and silently in the fields, their want of much social communication, except according to the old saw when thrashing, may make them less ready recipients of verbal instruction than townspeople; but, to thoughtful men, these peculiarities in their lot should be a strong reason for giving them social instruction, and so equalising their fate to the fate of others. . . . Landowners and clergymen cannot too soon imitate the example of Birkbeck and Brougham in past times, and Mr Gladstone, and Lords Ellesmere and Carlisle in the present times, and disseminate amongst the agricultural labourers the knowledge acquired and possessed by other men. It is necessary for their welfare and the safety of the state.

The Economist

October 27, 1855

After the Budget

CONSERVATIVE backbenchers have been magnificently inconsistent in their reactions to the Budget. Their most vocal complaints have been directed, respectively, at the most sensible and the silliest parts of the purchase tax changes. They are convinced that the Chancellor will infuriate the housewife by imposing purchase tax on kitchen ware; and they are baffled to know why Mr Butler gave such a hostage to the cartoonists as to lower the purchase tax on cut-glass and silverware while putting it up on everything else. There is no such thing as a cut-glass lobby. There is, however, a Lancashire lobby, and on Wednesday night it seemed to be pleased with the Chancellor's decision to wind up the D-scheme; whether this shows that Lancashire MPs are in, or out of, touch with their constituents remains to be seen. On the wider aspects of the Budget, the Tories have not yet said a word. But they are thinking plenty.

Labour naturally wasted no time in picking up any sticks of political dynamite strewn around by Mr Butler. Not even Lord Woolton has ever championed the injured housewife's cause more eagerly. Labour has suffered much over the past four years from the combination of Mr Butler's good luck and good judgment; and it was only human, if singularly graceless, that it should give him on Wednesday the roughest Parliamentary ride any Chancellor has had for years. But there was a significant note of "now or never" behind Labour's determination to mock the new Toryism and its chief architect. Labour fears that if the current medicine cures the economy of its slight attack of wind, then the Tories will be off on a gay procession of cheerful Budgets leading up to another election victory. Sensing rightly that there is at present no substitute for Mr Butler in the Tory ranks, the Opposition is going to do its best to badger him into seeking the less strenuous post he is reported to want. If Mr Butler listens carefully, he will catch a note of despair in the bugle calls from the Left; but he should not suppose that his compromise about the profits tax has anything to do with their chagrin. Pinching those old clothes has done him no good at all.

A Good Part of the Nettle

MR DUNCAN SANDYS'S statement on housing policy on Thursday is, in the long term, likely to be more important than the Chancellor's Budget on Wednesday. It is also much more heartening. The Government is not ready to grasp the nettle to the extent of cutting the subsidy on existing houses; but its proposals for subsidies on new houses are drastic and undoubtedly right. Above all, Mr Sandys has specifically promised that "it will clearly be necessary for us to review the Rents Acts. This we still now do."

The essence of the Government's decision is that, "for a year or so," all local authorities will get "a much reduced annual subsidy of £10 per house"; but that after that "the subsidy on future houses, built for general needs,

should be abolished altogether." These arrangements will not apply to houses built to replace slums, which will continue to attract the present subsidy of £22 per year; nor will they apply to new towns or districts that are being expanded to accommodate overspill populations, where annual subsidies will in fact be increased to £24 per house as part compensation for the recent rise in interest charges. Contrary to some people's expectations, there will be no special arrangements for towns with particularly heavy waiting lists; Mr Sandys believes that "most, if not all," of these "possess a big pool of existing houses on which they are receiving large amounts of subsidy," and that they will be able to afford to build all the new houses they require if they are sensible enough to introduce differential rent schemes.

In order to encourage the spread of such schemes, the councils are to be relieved of their present statutory obligation to pay into their housing revenue accounts a fixed contribution from the rates; this will "allow local authorities to use any savings they may make to reduce the rate burden, and will give them for the first time an incentive to adopt realistic rent policies." With the tightening of financial control, one other physical control can also be removed: local authorities will henceforth be left to determine the size of their own housing programmes.

All this should represent a major step towards reality in housing finance; and it can never be too frequently repeated that the motive for reform should not be jealousy of people who have hitherto been getting their houses too cheap—it should be ample that the distortions caused by the present system have meant that, with more house room available than before the war, a lack of adequate housing on the market has caused intolerable unhappiness among young people. The next step towards reform will lie in the review of the Rents Acts. If the Government were really far-sighted, it would abolish these Acts altogether.

Geneva Fizz

THE background against which the western and Soviet foreign ministers have gathered in Geneva is more complex and animated than was foreseen when the present conference was scheduled by the heads of government in July. Sunday's vote in the Saar is on the western ministers' minds, and Mr Sharett is on Mr Molotov's tail. There was little trace of the "Geneva spirit" in the Soviet bloc's new attempt to foment war in the Middle East, or in the blustering threats which Mr Khrushchev recently uttered to Mr Lester Pearson. Even the deathly hush that had lain over the Far East while the Sino-American talks began their quiet course in Geneva was broken this week by two minor but significant Chinese actions: a fresh bombardment of Nationalist-held Quemoy, and a sudden statement of claims to Portugal's tiny colony of Macao. Some at least of these Communist actions were doubtless meant to impress on the West the fact that the Russians are at Geneva to negotiate not from weakness but from strength.

If that meant that Mr Molotov was simply intending to stick to the letter of the unacceptable terms hitherto demanded by Russia (which include the winding

up of Nato and a complete American withdrawal from Europe), the western ministers at Geneva would at least have a clear, if barren, prospect before them. The West comes to Geneva with an agreed and reasonable programme; a straightforward show of Soviet intransigence would help the world at large to realise how reasonable that programme is. But it would be rash to assume that Mr Molotov's tactics will be at all straightforward. The Russians must have given much thought, in the past three months, to the best way of opening up fresh rifts in the western front by appearing to concede parts of the West's terms, while withholding the essentials—much as they did earlier this year in regard to disarmament. The Soviet press's comprehensive rejection in advance of all western proposals about European security does not bind Mr Molotov in any way. He knows that the West Germans are still fearful of any shift by their three allies in the direction of a security agreement that would leave Germany divided; he must have noted the unease with which some members of Nato, at this week's Paris meeting, greeted the idea of a system of guarantees which might include some of them and exclude others. It will be surprising if he does not see what discords can be created by playing on these keys.

Mao Drives the Peasants Harder

THE Chinese peasants have just been warned that they must travel faster along the road leading ultimately towards collectivisation. This is the real meaning of the lengthy resolutions issued by the central committee of the Chinese Communist Party. The new line is not brand new, as it is based on a speech made by Mao Tse-tung himself at the end of July, but unpublished until now. The most striking aspect of the affair is that Mao then explained his drastic plans to a meeting of regional secretaries of the Communist Party, but did not bother to reveal them to the National People's Congress, which was in session at the time, and which, on paper, is supposed to be the supreme body in China. There were good, if cynical, reasons for this secrecy. It is rash for even the boldest government to proclaim a new collectivisation drive just before the harvest; and the NPC session in July was largely preoccupied with reassuring a restive peasantry which had gone short of food in the preceding months because of the government's large compulsory purchases. Now, with what seems to be a good crop brought in, and a large part of it safely in the state warehouses, the deputies, together with the rest of the population, are at last told their master's plans.

The objectives of the new drive are clear. By the spring of 1958 half of China's 110 million peasant households are to be amalgamated into producer co-operatives, which are the halfway stage to collective farms on the Soviet model. In the northern and north-eastern regions of China the proportion should be much higher by then, and the setting-up of integrated *kolkhozy* should have actually begun. The "social transformation" of the countryside is to precede the provision of modern agricultural equipment.

Neither Mao Tse-tung, however, nor the central committee explains precisely how the pace of collectivisation is to be stepped up. "Right-wing deviationists," unable to understand that industrialisation will prove impossible with-

out a rapid spread of co-operative farming, are now being attacked, and the slogans of class war in the countryside are being proclaimed with new vigour. Yet the resolutions still insist on the "voluntary" character of the new drive. New measures have been introduced to make it more difficult for the peasants to contract out of the co-operatives, which are also to benefit from greater state assistance; but these steps alone will not be enough to achieve the new and more ambitious targets. It remains to be seen how Mao Tse-tung intends to preserve the "voluntary" character of the operation without himself falling into a "right-wing deviation."

Heir-Apparent for Dr Adenauer?

THE Saarlanders' repudiation of Dr Adenauer's agreement with M. Mendès-France is a blow to the Chancellor's prestige, particularly as it has been widely approved by the German politicians and press. Coming while he is still ill, and within sight of his eightieth birthday, this reverse has increased speculation about his successor. Dr Adenauer himself has the fault of most strong personalities who feel they have a mission to perform which no one else can take over. He has not picked any successor from his entourage; but it is high time that the Christian Democratic Party took the initiative and presented an heir-apparent to the eyes of the world. Germany's allies have for so long become accustomed to dealing with Dr Adenauer, and have always felt so certain of his power to manage his cabinet and swing the public, that his retirement would leave a yawning gap. The confidence built up over the years would be shaken, particularly if the new candidate were a dark horse. There is everything to be said for starting now to prepare for the inevitable change in Bonn.

In recent weeks, inspired speculation has centred round the names of two leading Christian Democrats: Herr Schaeffer, the Minister of Finance, and Herr von Brentano, the Foreign Minister. Herr Schaeffer, who is a Bavarian, is an unknown quantity as a political leader, though he has proved that he can handle the country's finances skilfully and cautiously, within the limits imposed on him by the federal constitution. Herr von Brentano is said to have done well at the foreign ministry, and he is being praised as a politician who can talk with Herr Ollenhauer more fruitfully than Dr Adenauer. This is important, because many politicians in Bonn, supported by a large section of the press, think that a coalition with the Socialists should be formed after an interim period during which a bi-partisan foreign policy would be followed.

The choice of a new Chancellor may thus fall on a man able to work with the Socialists and adjust his views on internal policy and Germany's western alliance to meet Herr Ollenhauer's. The Socialist leader has indicated his readiness to co-operate in the government on these terms; but it is not easy to know precisely what is the policy to which the future Chancellor might have to adapt himself, for Herr Ollenhauer often speaks in riddles. On two issues, however, he has recently made himself plain enough. He wants the western powers to release Germany from Nato, and he would like to see a certain amount of socialism introduced into the Federal Republic in order to facilitate reunion with the Soviet Zone.

Better Defence Planning

THE changes in the organisation of defence announced by the Prime Minister this week fall a good way short of recent proposals for drastically reforming the high command and integrating the services in accordance with the revolutionary implications of nuclear warfare. Nor do they fulfil widespread predictions after Sir Anthony's words on the subject at the Conservative annual conference that the service ministers would be subordinated to the Minister of Defence (probably involving ministerial changes). Sir Anthony's "comparatively modest step" does, however, strengthen the Minister of Defence in a number of ways. The new chairman of the Chiefs of Staff is responsible to him directly, though the Chiefs of Staff remain collectively responsible to the Government, and any one of them can make a minority statement of dissent. But pressure on the Chiefs of Staff to think in terms of integration should increase. Perhaps no less important is Sir Anthony's statement that the Minister of Defence's responsibility for allocating resources between the three services extends to a responsibility for ensuring that the composition of forces within individual services conforms to the Defence Committee's strategy. Reinforced by his greater control over the Ministry of Supply and his direct responsibility for all the services in home defence, this provision should enable the Minister of Defence to take a hand in the affairs of the individual service ministries.

But Sir Anthony endorsed the basic policy for defence organisation worked out in the Defence White Paper of 1946, though in practice it left the Minister of Defence little more than a chairman of committees; and recalcitrant service ministers, or their staff, may continue to take refuge behind this. The Minister of Defence seems to have no direct powers over the service ministries; committee rule, so bitterly criticised by Field Marshal Montgomery, remains. Possibly the promised White Paper will make inter-service relationships clearer. Meanwhile, the Minister may be able to prepare the ground for more thoroughgoing changes in the future. The appointment of Marshal of the Royal Air Force Sir William Dickson as chairman of the Chiefs of Staff committee makes it clear that the paramount importance of looking at strategic policy from the point of view of air power is fully realised. This is a hint, if no more, to the service ministries; but much will depend on the vigour and diplomacy of Mr Selwyn Lloyd and Sir William Dickson.

Second Thoughts on Teachers' Pensions

THE teachers will be unwise if they draw any hastily unfavourable conclusions about the new scheme for their pensions, which was announced by the Ministry of Education last week. This scheme has more important differences from, than similarities to, the one that brought such a storm on Dame Florence Horsbrugh's head (and, indeed, eventually lopped that head off) early last year. What offended the teachers then was that the 1954 Bill—which was dropped without reaching a second reading—would

have raised their contribution, and the employers' also, from 5 to 6 per cent without many countervailing advantages. They were unimpressed by the talk about an actuarial deficiency of £194 million while there was an actual credit balance of £232 million. They could point out, too, that many pensions schemes in industry were being allowed to show an actuarial deficiency without any fuss about raising contributions, and that teachers were the only public servants who were to pay more for this reason.

Those arguments will be heard again, for the new scheme still requires the teachers to pay 6 per cent. But it contains several minor favours, and one really major concession, to them. The minor favours are mainly of a book-keeping nature. The credit balance is to earn 3½ per cent, instead of 3 per cent as in Dame Florence's scheme; and the Government will meet all the existing actuarial deficiency (which has meanwhile grown to over £200 million), instead of only two-thirds of it as originally proposed. But the major concession is that if any new actuarial deficiencies arise in the future—and they will recur if (which means when) teachers' salaries are raised at any time in the future—then these deficits will be met by the local authorities, while the teachers' contribution will remain constant at 6 per cent. The extent of this concession can be gauged by a single hypothetical statistic. At present, at least in theory, teachers are supposed to pay half the ultimate cost of pensions. Under the new scheme, if prices rise by, say, an average of 2 or 3 per cent a year, and if teachers' salaries rise correspondingly, then a teacher entering the profession now and retiring after 40 years would have about two-thirds of his pension paid for him by someone else. The teachers will no doubt have several minor points to argue about the new Bill. But if they raise as great a storm about it as about the old one, they will be showing a poor sense of proportion. They will also deserve far less sympathy.

Restrictions and the Unregenerate

THE counter-attack on the coming Monopolies Bill has begun, with a remarkably unregenerate list of "recommendations" to Mr Thorneycroft from the National Union of Manufacturers. Under Mr Thorneycroft's promised Bill, it will be remembered, there is to be a call-up of successive restrictive practices that are regarded as *prima facie* against the public interest, and any trade association that wants to be allowed to continue them will have to prove its case for doing so before a new tribunal.

The Num's "recommendations" are nominally concerned with the procedure and staffing of this tribunal, which it naturally wishes to see as loaded with lawyers and as free from economists as possible. But the scheme that eventually emerges from its proposals would be the exact opposite of that outlined by Mr Thorneycroft. Instead of obliging a trade association to defend condemned practices before a tribunal, the Num suggests that the burden of proving that a restrictive practice is contrary to the public interest should be put upon a law officer pleading before a High Court judge (and with provision for appeals); moreover, no attempt should be made to define to the tribunal (which would mean, to this judge) what is and what is not contrary to public policy. The Num believes that the

tribunal should decide this point itself, and that it should have "regard to the body of existing law" in doing so. This last proposal—that a measure that is supposed to implement a radically new policy and new system of law towards monopolies should not have anything to do with new policy and new law—shows that the Num clearly has no idea what the present fuss over monopolies is all about. Evidently, some manufacturers believe that the new tribunal, so far from being a rod for their back, can be turned into something quite different: into a clutch of economically uninstructed lawyers, bound by existing law, who can be played off against the ordinary interventions of the Monopolies Commission. It is to be hoped that Mr Thorneycroft will quickly disillusion them.

The Evatt Case

IN the debate on Dr Evatt's attack on the inquiry into the Petrov case, Mr Menzies aptly said that the Labour leader had put himself on trial. Dr Evatt's appeal to Mr Molotov to deny what an impartial commission including three leading Australian jurists had affirmed has astonished Australian public opinion and given Mr Menzies an easy task. To charge a Royal Commission with misrepresentation and failure to realise that documents are forged is dangerous enough; but to do it in the teeth of so much corroborative evidence seems to be wild beyond belief. Mr Menzies had no difficulty in pointing to the identification of scores of Communist agents as the result of Petrov's disclosures. He was also able to appeal to "all Labour men who believe in decent standards" not to become involved in what was in effect a Communist assault on Australia, and thus to widen the breach between the two wings of the Australian Labour party. Just as Mr Menzies could enjoin Liberal candidates at the last election not to use the Petrov affair as an electioneering missile (as he knew that it had done its work), so he is now able to announce the date of the next election ostentatiously after the debate, to keep the exhibition which the leader of the Opposition has made of himself separate from the election issue—well knowing that the public will draw its own conclusions.

The problem of motive remains. It is only a few months since Dr Evatt crushed the Catholic Action revolt in his own party and won a dramatic victory for his own leadership in Victoria, and at least dented his opponents in New South Wales. But his obsession with the Royal Commission has now put his party at a grave political disadvantage, besides reopening all its wounds. The Australian newspapers, recounting Dr Evatt's distinguished career as jurist, diplomat, Australia's spokesman at the United Nations, and leader of the Opposition, can find no explanation for his political folly in so closely identifying himself with the Communist cause. His judgment seems to have become steadily more fallible in recent years; and, observing what an Australian MP described as the "decay of a once fine mind," his party seem more likely than ever to go through convulsions in the effort to produce a new leader. If Dr Evatt survives until December, his political future will certainly depend on the outcome of the election.

Judgment Day in France

PARIS is full of surprises these days. The admission of M. Jean Cocteau, so long the *enfant terrible* of French arts, to the conservative French Academy was no more startling than the prospect that the National Assembly may voluntarily decide to end its own life. True, it is not yet certain that the Assembly will agree to dissolve itself in December rather than wait for the end of its natural term next summer. Despite M. Faure's claim that, with vital decisions to be taken next year, it is essential to consult the electorate as soon as possible, his opponents are arguing that such a manoeuvre would only distort the nation's verdict. But if the Prime Minister gets his way, it will be difficult to lament the passing of the present Assembly. Except when, as in the case of Indo-China, a crisis has forced action on it, its divisions and indecision have contributed greatly to the apparent paralysis of the Fourth Republic.

The danger is that a new Assembly will be no more than the image of its predecessor, and M. Faure's critics accuse him of working to this end. The opposition alleges that the government is trying to improve its chances by hiding from the nation the cost—in terms of both men and money—of its North African policy; and that it is attempting to get a quick decision before the electorate has realised the full consequences of the government's wavering and hesitant course. M. Mendès-France has declared that the request for an early election is merely the "ultimate expedient" to avoid a clear judgment by the nation.

Some critics also claim that the electoral law must be altered before an election. A change in the method of voting would undoubtedly affect the results considerably; but the struggle over electoral reform is subsidiary to the main battle—that of timing. The conservative majority fears that it will lose some votes to the extreme right wing, and even more to the left if the latter are given time to organise their attack. The opposition wants time to prepare its campaign, to weld electoral alliances together, and to publicise the government's deficiencies. The later the election, the further the pendulum is likely to move to the left.

Mr Diem's Lucky Colour

THE result of the Vietnamese referendum was a foregone conclusion. A barely literate voter was unlikely to opt for Bao Dai, portrayed in traditional robes against a background of (unlucky) green, rather than for a smiling Mr. Diem surrounded by young people against a backdrop of (lucky) red; and still less likely to make the negative choice of declaring that "I do not depose Bao Dai and do not recognise Ngo Dinh Diem as chief of state with the mission of establishing a democratic regime." With the scales so weighted, it was surely unnecessary to make the gravitational pull of Mr Diem doubly certain by dubious means, and it seems a pity that the number who voted in the Saigon-Cholon area is reported to have exceeded the total of names on the register by 150,000.

The alacrity with which both the Americans and the French accepted the fact of Mr Diem's success has raised a few eyebrows in Whitehall, where there was, at that stage, a continuing desire to observe the diplomatic niceties. In view of the circumstances in which the Bao Dai regime had been internationally recognised, the tendency in London was to await formal notification of the results of the referendum before announcing recognition, or, hypothetically, the reverse. Outside official circles, there is even more surprise at the haste with which the French have dropped the man whom they themselves had chosen, albeit reluctantly, as chief of state, and for whose later evolution they bore some measure of responsibility.

In view of the remoteness of Vietnam and the complexities of its politics, it seems desirable that the British public should realise the exact nature of the *fait accompli* that confronts it. The referendum in southern Vietnam was clearly an instrument of power, rather than an accurate reflection of the popular will. It changed nothing in that Bao Dai had long ceased to exercise effective control over his government in Saigon; but it provided a firmer international standing for Mr Diem, and, by inducing several million voters to commit themselves in his favour, it further discouraged his opponents in the south.

It should not, however, be assumed that Mr Diem has any intention of "establishing a democratic regime." The forthcoming general elections in the south, while they will ensure that the letter of the Geneva agreements is deadlier than ever, are unlikely to bring democracy in the western sense any nearer to Vietnam; nor is the inquisitorial and authoritarian character of Mr Diem's rule likely to be relaxed. He is clearly inclined to interpret his new presidential functions not on French or even United States lines, but rather on the model of certain Latin American presidents. Yet it must be admitted that if southern Vietnam has to be held together by a dictator, his dictatorship should be an effective one. And that alone may be reason enough to recognise the deposition of Bao Dai.

Underpinning the Liberals

THE Liberals' announcement that they will fight the next election on a wider front may be merely a sign of their determination to hearten themselves; but it may also spring from their fatal misunderstanding of electoral logistics. A wider front will certainly be worse than futile if the party does not improve its constituency organisation out of all recognition. The curse of the Liberals in recent years has been their extraordinary obsession that it is possible to build a house from the roof down; and it is depressing to find them now setting up yet another national body, a general purposes committee which one suspects will spend most of its time getting into the hair of such professional organisations as the party possesses. But there are signs that they may be going to make a serious attempt to build some foundations in the constituencies. For a start local associations will be encouraged to carry out a simple canvass, designed to provide at least a card index. This should have been done long ago; it is a sign of realism that it is to be done at last. If, as is promised, this is to be the start of a two or three year drive to strengthen the party's

grass roots, then a modestly widened front could become a reality.

But the Liberals should recognise how limited must be their objectives. The best they can soberly hope for at the next election is to retain their present six seats and win two or three more—and even that would represent an immense achievement. For the rest, the party can only hope to make an impact on the electoral positions, and therefore the policies, of the two major parties. This, of course, is where the wider front argument comes in. If, say the enthusiasts, you have a candidate in every division you will frighten the other parties with your big national poll. That is entirely the wrong argument; the other parties can only be shaken in the small number of constituencies where Liberal votes hold the balance, and those are already perfectly well known. The only tenable argument for more candidacies in hopeless seats is that some candidacies may be necessary to keep local organisations alive; but there are dangers in pushing even that argument too far. In 1950 the party polled over 2½ million votes, but of its 478 candidates, 319 lost their deposits, and in the process the Liberals became a music hall joke. It would be a pity to court that catastrophe again.

Does the Call-up Hurt?

THE belief held by many parents, and some Labour MPs, that national service is injurious to the education and careers of national servicemen is not borne out by the Ministry of Labour's inquiry into the subject. Published under the unwieldy title, *Report on the Enquiry into the Effects of National Service on the Education and Employment of Young Men*, the results of the inquiry show that a very high proportion of the young men interviewed could be regarded as settled in employment or undergoing further education after completing their service. They were grouped according to their educational condition on being called up; and even for the most unfavourably situated group, those who had left school before reaching the age of 15½, the percentage of those who settled down satisfactorily was 88, while for boys who left school only three to six months before enlistment it was 96. But a large minority of the young men themselves were still convinced that national

Spanning the East

Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

TRADITION...and today

A reputation for prudent management and dependable service is good reason for selecting the Scottish Mutual when considering an assurance policy. Equally important, however, is the Society's wide choice of policies for today's needs, and the real benefits of the mutual principle of sharing profits among the participating policyholders themselves.

When choosing a policy for yourself or for others, get in touch with the Scottish Mutual—the long-established Society whose tradition serves the needs of today.

The Scottish Mutual Assurance Society

HEAD OFFICE: 109 ST. VINCENT STREET, GLASGOW, G.2

This man is NEWS

A new telegraph system developed by Cable & Wireless Ltd.'s engineers will automatically detect and correct errors in wireless telegraph messages caused by atmospheric disturbances, fading and other forms of interference during transmission. This new equipment will eventually be installed in all the Company's main wireless stations overseas. It is here seen being examined under test by the head of the team of engineers who developed it. Thus, the Company's programme of development constantly seeks to make the flow of news, business messages and information between the Commonwealth countries still swifter and more reliable.

The Company owns and maintains wireless relay

stations on the Commonwealth trunk routes, operates the overseas telegraph services of most of the Colonial territories and cable services in various other countries throughout the world. Furthermore, it owns a world-wide network of 150,000 miles of submarine cable and maintains it with a fleet of 8 cables.

Although it does not operate Overseas Telegraph Communications in this country, Cable and Wireless Ltd. is at your service day and night. The simple act of passing a cable form across a post office counter or 'phoning a message from your home or office to 'Overseas Telegrams' sets it working for you. Cabling is very easy, very swift, very sure and costs much less than you'd expect.

CABLE & WIRELESS LIMITED

ELECTRA HOUSE, VICTORIA EMBANKMENT, LONDON, W.C.2

service had changed their position for the worse. Over 30 per cent of those who had, within the definition of the inquiry, settled down believed that they were worse off; among those considered to be unsettled 40 per cent agreed that they were worse off (as against 17 per cent who thought they were actually better off). The definition of being settled, however, was simply being in regular employment or under systematic training; disappointed ambitions of still higher things could hardly be assessed in a factual investigation.

In general only ten per cent of those who were interviewed (the sample was ten per cent of the annual intake of national servicemen) failed to settle down; and it is clear that nearly all of these had led pretty unsettled lives before being called up—a high proportion of them had held more than four jobs between leaving school and enlistment. This, in the view of the report, exonerates the services, but makes it particularly necessary to give vocational guidance to boys who leave school early and face a prolonged transitional period before being called up. Evidently it will be the more necessary as the call-up age increases. The problem of finding better fittings for the misfits remains, and goes beyond vocational guidance. What the inquiry could not confirm or deny is whether the services improve the chances of many boys who would otherwise not settle down well in employment. The services believe that they do; and there may be some evidence for their view in the fact that two-thirds of those who had held over four jobs before enlistment subsequently were found to have settled down happily enough.

Home Truths for India

A PUBLIC defence of Britain's foreign policy has been long overdue in India, and both speaker and venue were well chosen when the Secretary of State for Commonwealth Affairs offered one in a talk to the Indian Council of World Affairs last week. It is extremely rare for the head of this ministry to make public statements which would not come equally harmlessly from royalty, but India's attitude to Nato and Seato, and the harm done by the suggestion that the provisions of Nato would extend to Goa, gave Lord Home the right to take over from Mr Nehru for once the role of candid friend. Mr Nehru is big enough to accept a British minister's right to state the case for the alliances in India, just as he usually states the Indian case against them when visiting London. But the unison with which the Indian press suppressed vital parts of Lord Home's address is regrettable and ominous; it extended apparently even to newspapers which are normally ready to give space to the unpopular point of view. Does this mean that India's doctrine of neutralism is now sacred and beyond criticism, while the Indian press freely reads the worst of motives into other peoples' alliances—whether those of Britain, Pakistan or the United States?

Neutralism suits the climate of Indian opinion well; it imparts an aura of high moral purpose; it is theoretical and Brahminical. It is largely made possible by the readiness of nations on India's flanks to defend themselves in concert. It permits India to share in the Colombo Plan,

which is held to be moral, but to stand aloof from the defence talks of the other Commonwealth Prime Ministers, which are not. Lord Home tried to make it clear in Delhi that defensive alliances were a natural and necessary reaction to the Communist bloc's monolithic, heavily armed, and expansionist system; and he warned India that neutrality has no meaning for world Communism. But apparently the Indian public is not to be allowed to hear this point of view. If this mental isolation in self-righteousness persists, Indo-British relations will increasingly lack the mutual understanding on which so much practical co-operation between the two countries is based. Lord Home did right to try to clear the air a little. His efforts lent reality to his office at the climax of a useful Commonwealth tour.

An Undignified Wrangle

As *The Economist* goes to press the UN General Assembly is making yet another attempt to agree on the disputed candidacy to the Security Council. It is to be hoped—but unfortunately cannot be taken for granted—that it will succeed. It is also to be hoped that it will take steps to avoid further repetitions of this undignified and time-consuming wrangle which since 1949 has cropped up with dreary regularity whenever the seat allotted to Eastern Europe under the 1946 "gentlemen's agreement" has fallen vacant.

For the last six years Yugoslavia, Greece and Turkey have filled this seat in turn and always, of course, in the teeth of Soviet opposition. This year the argument should have been shorter since the Russians, who in 1949 protested passionately against the election of Yugoslavia (Mr Vyshinsky went so far as to call it "a violation of the Charter"), soon abandoned their original candidate, Poland, in favour of Yugoslavia. The latter, being now *persona grata* to both East and West and geographically an indisputable part of eastern Europe, seemed to many other delegates, including the British, a good compromise candidate. But last week the Americans stuck doggedly to their original choice, the Philippines, and neither candidate managed to secure the necessary two-thirds majority.

The American argument, that the non-Commonwealth Asian countries that have achieved independence in the last ten years are without adequate representation on the Security Council, is a perfectly valid one. But it is no excuse for flouting the 1946 agreement on the distribution of the non-permanent seats in a way that is all too patently designed not merely to give the Asian states more representation but also to give the Communist bloc less. After all, so long as the Great Power veto exists, it makes no vital difference whether or not the Russians have an obedient echo in Security Council debates, while to deprive them of it does give the Communist bloc a legitimate grievance. The answer surely is to accept Yugoslavia as a compromise this time and to revise the 1946 agreement (which the Assembly clearly cannot manage without) so that one of the two seats now enjoyed by the Latin American bloc goes to a non-Commonwealth Asian country.

Apartheid à la Mode

UNDER Mr Strydom, the South African government's racial policies are beginning to wear a new look. Recently there have been intensive efforts by Nationalist spokesmen to win the Africans over to *apartheid*, the policy of racial segregation. But this intriguing shift of emphasis towards persuasion rather than naked imposition does not mean that Mr Strydom is turning away from the policy of his predecessor; his long-term aims are the same as Dr Malan's. He is, however, a younger man, and has more time.

It should not be too readily assumed that the Nationalist policy of wooing the African will fail. Indeed, it has already achieved some startling successes. Not long ago, a candidate who openly endorsed *apartheid* nearly succeeded in winning a seat to represent Africans in parliament. The energetic Dr Verwoerd, Minister for Native Affairs, has stumped the country explaining his policies to mass meetings of Africans, and even his opponents admit that this novel policy (in the South African context) has created a deep impression. More recently, the emphasis has been on economic developments. A number of government spokesmen have been proclaiming that the policy of industrialising the Native Reserves — territories set aside for exclusive African occupation—will be the salvation of the Bantu races. Plans for investing £115 million in these areas have been mentioned. There are two views on the economic wisdom of shifting the industrial centre of gravity to these largely underdeveloped regions. But the government seems to have made up its mind and intends to disregard the expert findings of the Tomlinson Report, which apparently—it has been suppressed—was unfavourable to the project.

Meanwhile the Nationalists are pushing ahead with other parts of their *apartheid* programme. At the cost of great injustice, and still greater confusion, the business of reclassifying the population in terms of the Population Register Act of 1950 is going ahead. People whose families had for generations regarded themselves as Coloured are being reclassified as Natives; others who called themselves white have been arbitrarily termed Coloured. Already 7,000 "difficult cases" have been reclassified and some 260 people have given notice of appeal; but the Minister of the Interior has not yet set up the board which will hear them. The urgency with which this far-reaching measure is being pushed through suggests that Mr Strydom is sensitive to suggestions, such as that made in the recent UN report, that the inherent impracticability of doctrinaire *apartheid* is being revealed by a slowing down in its application.

One Step Behind

THE London County Council's decision to raise rents and impose a "lodging charge" on its housing estates is not, as might be supposed, an intelligent anticipation of Government policy but a very belated adjustment to meet rising costs. The rents of almost all post-1919 dwellings will be raised by an average of 3s. 6d. a week, and tenants will be charged an extra 2s. 6d. if they have one lodger and

5s. for two or more. The extra revenue will amount to about £1.8 million a year, but two-thirds of this is required to meet the extra cost of repairs and renewals, which has been covered in recent years by the expedient of running down balances.

The increased charges are in themselves fair enough. Rents will be raised by widely varying amounts, according to the amenities of different dwellings. The lodger charge will not be applied to old people living with their children, but it will include—very reasonably—the 15,000 married sons and daughters who are believed to be sharing a dwelling with their parents. But, although administratively simple and fair, the lodger charge is a rather unsatisfactory expedient. The present charges will yield relatively little revenue; but if they were raised, they would have the bad effect of discouraging an economic use of house-room—and thus lengthening further the LCC's waiting list. This is just what a sensible rents policy should be designed to avoid.

The LCC has in fact again postponed the more drastic overhaul of its rent policy which is clearly necessary. The increased charges now levied will suffice to keep pace with rising costs, but will do nothing to bring about the economies called for by the Government's new housing policy. Thus the London ratepayer, who is already contributing annually twice the amount of his statutory obligation towards the cost of housing, may be called on for still more; while the average LCC tenant will be spending, even after the new increase, a smaller proportion of his earnings on rent than in 1946. Despite these facts the chairman of the housing committee, Mr Fisher, could still hope last week that a further review of rents could be avoided "for some time at least." By now, he may doubt it.

Stocks and Stipends

THE Church of England has lately taken to explaining its finances to the public, and last year the Archbishop of Canterbury held the first press conference on the subject of the annual report of the Church Commissioners. Last week not only was another press conference held, but the Commissioners issued, in popular form, with diagrams, a shortened version of the report that they must annually present to the Home Secretary.

This shows that the Commissioners have continued with the rearrangement of investments which was begun in 1948, and which largely takes the form of switching from gilt-edged securities into equities. Out of £19.6 million worth of securities sold in the year ending March, 1955, £18.6 million worth were gilt-edged; and of £19.4 million worth of securities bought, £13.2 million were equities. The total amount invested in industrial ordinaries rose from £3.5 million in 1949 to £40.6 million in 1955. Even so, however, over half the portfolio is still in British Government securities.

The object of these operations is not primarily capital appreciation. The Commissioners, for example, did no hasty selling before the recent slump in share prices. Their main object is to increase the yield on the portfolio, and how successfully this has been achieved is shown in the diagram on the next page.

In all, the Commissioners' income increased by £1.4 million, to £10.5 million. This has enabled them, among other things, to continue the good work of supplementing parsons' stipends and pensions, and of improving parsonages: objects that fall within the statutory limitation of "purposes directly concerned with the cure of souls and the living Ministry of the Church." The grants for stipends (which the dioceses distribute at their discretion), have mounted steadily and have now reached

an annual sum of £1.4 million. Almost no incumbent now gets less than the minimum income of £550 a year, plus a free house and his Easter offering up to £50 (but alas, the average Easter offering is only £15 and the parson pays tax on that). About half the dioceses have been able to set their own minimum above £550, and the Archbishop looks forward to a new minimum of £600 and later of £750. Further switching of securities may raise yields rather more, but the new targets will not be achieved without redoubled generosity on the part of the laity.

Straight Issue at Buraimi

THE Trucial Oman levies, which are British officered, but were acting at the behest of two Arabian rulers—the Sultan of Muscat and the Sheikh of Abu Dhabi—have this week moved against the Saudi Arabian "police" force that was squatting, by agreement, in the disputed oasis of Buraimi. There were no fatal casualties, and the motive behind the act, which is supported by the British Government, was to "resume previous control" of the oasis because settlement by arbitration had failed. The distorted course

of the arbitral proceedings was described in *The Economist* of September 24th; they have since become wholly abortive owing to the resignation of the Belgian and the Cuban jurists on the panel of arbitrators—proof that no international lawyer who

values his reputation will sit in the conditions created by Saudi bribery.

The real issue at stake is the survival of the sheikdoms of the Trucial coast as independent units. Some of these are known and all are suspected of possessing large oil resources; Saudi appetite for these is insatiable, and were it not for the British protection accorded in the nineteenth century, a Saudi advance seaward would no doubt have taken place long since. It nearly occurred in Kuwait in 1921; it was tried again at Buraimi in 1952. Were it to succeed at any one point, a precedent would be set for further Saudi bites at the cake.

The coastal rulers, and the oil companies who work for them, have a British flag to thank for immunity from pressure. Contrary to popular belief, these oil companies are not exclusively British. Those which are American include the Gulf Oil Company in Kuwait, the Standard Oil Company operating in Saudi Arabia is exclusively American, and the Standard Oil Company of New Jersey and Socony in Qatar and beyond; the interested French company is the *Compagnie Française des Pétroles*. Because the oil company operating in Saudi Arabia is exclusively American, and that in Abu Dhabi is British-managed, onlookers tend to rate the Buraimi quarrel as an Anglo-American one. In fact, the State Department has protégés on both sides.

From Sagres to Salazar

A FOUNTAIN of historical journalism has gushed up to greet the state visit to London of the President of Portugal, raising before the British public's eye not only the Iron Duke and the lines of Torres Vedras but also such remoter figures as John of Gaunt, Philippa of Lancaster, and her son, Henry the Navigator—the *Infante de Sagres*, as the Portuguese name him, after the bleak headland where he planned Europe's first great oceanic ventures. The press has, perhaps, insisted too much on the remarkable continuity of England's "oldest alliance." The 14th-century treaty did not prevent the 17th-century naval battles which enabled the English to establish themselves on the west coast of India, nor did it bring England to Portugal's rescue in 1580. But it may have seemed an incivility to recall these things when saluting a very welcome guest. Friendship between Portugal and Britain is real enough today, however tenuous it may at times have been in past centuries.

It is curious, however, that this week's intensive exploration of Portuguese history has not given prominence to the fact that the second centenary of the great Lisbon earthquake falls next week. Admittedly, the tragic cataclysm of 1755 would in itself be an unnecessarily gloomy memory to evoke at this moment. But to recall it is also to evoke the memory of the great work of reconstruction and modernisation in Lisbon carried out by the Marques de Pombal. In his vigour, his many-sidedness, and the dictatorial powers that enabled him to put through sweeping reforms, Pombal foreshadowed Portugal's present Prime Minister. But Pombal's fatal mistake was his complete failure to prepare a successor. Dr Salazar, for his part, has admittedly trained a whole generation of competent administrators. But the question remains whether any of them could take over the premier's unique role. Will his system remain workable when it no longer pivots on his highly individual personality?

Letters to the Editor

The Lisbon Story

SIR—I was painfully surprised to read in your issue of September 17th a letter by a Mr A. Ferreira, of Lourenço Marques, making an underhand attack on Dr Salazar, the Portuguese premier, who raised the country from the dust heap to its present-day prosperity and prestige. That does not look very much like treating its nationals as "cattle"; at any rate, the overwhelming majority of Portuguese do not think so. Only a tiny minority—mainly professional troublemakers—keeps raising the worn-out bogey, "lack of political freedom." The only political "freedom" denied to the Portuguese is that of making political "nuisances" of themselves.

It was the unscrupulous use of unrestricted political liberties which brought the country to the very edge of bankruptcy, with scores of revolutions and utter misgovernment, from 1910 to 1928. Happily, that period is now over. —Yours faithfully, PRAIA MONTEIRO
Lisbon

Hire Purchase in Restraint

SIR—The real effect—or lack of it—of hire purchase restrictions on motor cars (Mr I. C. H. Burton's letter, October 15th) cannot be assessed without a comparison of new car registrations with hire purchase car sales. Such a comparison discloses that no hire purchase restrictions will affect new car sales, for the simple reason that only a very small proportion of new cars are sold on hire purchase.

It is likely that over 150,000 new cars were registered since July, when hire purchase restrictions came into force. Of these, only 20,375 were sold on hire purchase, a little over 14 per cent.

If the Chancellor, in his unenviable position, can have regard to economic facts and economic justice, he should certainly reduce the minimum deposit on old cars. Nothing short of new car rationing or a penal rate of purchase tax will affect new car sales.—Yours faithfully, R. LEWIN
London, N.W.3

Mr Diem Loses Favour

SIR—The article in your issue of October 8th reveals in melancholy fashion the failure of the French-educated Vietnamese élite to provide the example and the leadership that it should be its function to give in a national emergency. Moreover the pretensions and the capacity for destructive criticism shown by many members of this élite have tended to obscure the

real worth of the Vietnamese people. For the rural population of Vietnam, whose stubborn resistance to the Viet Minh has been based both on attachment to its traditions and bitter experience of Communist tyranny, have paid the major part of the heavy toll in blood and suffering exacted by nine years of savage civil war. Ill-equipped, practically unpaid, without medical supplies or expectations of disability pensions, they have fought stubbornly and obscurely, as members of militia and auxiliary forces, as guards, partisans and coolies.

May I suggest that the existence of this race should be remembered when the bland statement in your correspondent's article is read to the effect that, as an asset second apparently only to American aid, Mr Diem could count on the encouragement of most of the nationalist intellectuals who had remained neutral in the "Franco-Viet Minh" struggle.—Yours faithfully, J. D. LANCASTER
Roquevaire, Bouches du Rhône

White Collar Union

SIR—It is true that the new allowances for advanced work (proposed by local authority representatives on the Burnham Committee, prompted by the Minister of Education) were officially accepted by the NUT. But your Note of October 22nd does not indicate the state of affairs in the rank and file of the union. The scheme has been bitterly condemned by many NUT local officials and ordinary members, and NUT majorities on local committees have at times directed their efforts towards delaying the implementation of the award. NUT headquarters would do well to discourage this attitude, which can only foster disunity in the profession.—Yours faithfully, C. M. CUSWORTH
Lichfield

Elections and Electors

SIR—Your reviewer criticises Dr Ross for using fairly strong language about certain people; yet he did so, not because those people disagree with him, but because they disregard facts and use terms like proportional representation without troubling to find out what they really mean. The worst example—because its influence is greatest—is provided by the headquarters of our two major political parties. They have, of course, a perfect right to oppose PR if they want to. But in candidates' handbooks which give facts and figures about everything else that may conceivably crop up in a political meeting, there is

not to be found a single fact about what voting systems exist or in what countries they are used. Conservative and Labour speakers are left to make fools of themselves through ignorance of such facts as that France has never elected her parliament by any form of proportional representation except in 1945 and 1946.—Yours faithfully, ENID LAKEMAN
Timbridge Wells

The Oppenheimer Case

SIR—It is Mr Floris, and not I, who regards the Oppenheimer case as a "witch-hunt." For what animates witch-hunters but "fear" or "awe," as Mr Floris variously terms it? And how else do they behave but by substituting their own "repulsion" for the proper workings of the judicial process? Whether the ensuing tragedy is "classical" or not, I would not presume to say. But I believe *Othello* is in good standing amongst the critics, despite the considerable role accorded to "honest Iago."—Yours faithfully, YOUR REVIEWER

Officers and Gentlemen

SIR—I have a suggestion which may well relieve anxiety about the recruitment into the civil service, and provide a simultaneous solution to the difficulty of retired officers in finding suitable employment to eke out their inadequate pensions. It is that suitable officers, on being retired from the active list, should be offered a transfer to the equivalent grade in the civil service, for employment solely within the appropriate service department. By this simple expedient, any shortage in the executive or administrative classes—and, if the scheme were extended to NCOs, in the clerical class also—can be speedily and efficiently made good. Most officers who have been to staff college spend some time during their service career working in their respective service department and are familiar with the administrative routine of their service, so that they would need no additional training. Their first-hand experience of active service conditions would indeed render them more rather than less capable of appreciating the problems with which they would have to deal.

In fact, Sir, such an arrangement seems to offer every advantage. It increases the productive service which can be obtained from an officer, thus affording the Treasury a substantial economic saving; it assists the civil service by releasing the dwindling number of permanent civil servants for employment in other departments where their special talents can be more fully utilised; and it helps the services first by rendering a service career more permanent and hence more attractive, and secondly by ensuring that the service departments are staffed by men and women whose approach to service problems is more likely to be sympathetic and based on personal knowledge.—Yours faithfully, CIVIS SOLDATUS

Books & Publications

The Peacemakers

LES DÉLIBÉRATIONS DU CONSEIL DES QUATRE. March 24-June 28, 1919: Volume I and II. Paris: Centre National de la Recherche Scientifique. 521 and 579 pages respectively. 39s. or 1,800 frs. each.

THE last meeting of the Big Four at the Paris Peace Conference was largely occupied with an inconclusive discussion about how its records should be treated. Wilson argued that the records were private and that his successors would have no right to them; Clemenceau that they belonged to the French state. All were agreed that publication was undesirable, and although the record of one meeting was put verbatim into the official life of Wilson, the whole series, largely through British insistence, remained undivulged.

The first important publication was of excerpts from the diary of the secretary to the Italian delegation, Count Aldrovandi Marescotti, published in his books: *Guerra Diplomatica* (1936) and *Nuovi Ricordi* (1938). These excerpts included notes of what was said at meetings at which Italy was represented and matters affecting Italy discussed, with lively comments on the bearing and behaviour of the participants. The first formal publication was that of the minutes drawn up by Sir Maurice (now Lord) Hankey, which take up Volumes V and VI of the Peace Conference records in the official series "Foreign Relations of the United States." These appeared in 1944 and 1946. Now a decade later we have what is the most illuminating of the sources, the full notes of the Big Four's interpreter, Professor Paul Mantoux. They do not, of course, supersede the Hankey volumes, since they do not contain the documents around which the discussions went on; but they add to them in two ways. Thirty-seven of the meetings do not figure at all in the Hankey records because he was not present, and while Lord Hankey's minutes are in *oratio obliqua*—that interesting Whitehall survival of an educational system based upon the classics—Professor Mantoux's notes represent, like Count Aldrovandi Marescotti's, an attempt to reproduce direct speech. It must be noted that neither the Frenchman nor the Italian wrote shorthand and that M. Mantoux simply dictated notes each morning based upon his jottings for translation purposes of what had been said on the previous day. Even now, therefore, we cannot claim that we have the actual words exchanged; but we can follow the course of the argument point by point, and the

result is a vivid historical document.

Professor Mantoux calls attention himself to two important points arising from meetings not recorded by Lord Hankey. In the first place, his notes show how the inclusion in the treaty of article 231—the war-guilt clause—arose from an effort by Mr Norman Davis to find a formula that would justify the compromise reached on reparations between the Anglo-French and the American viewpoints. In the second place, the early sessions provide further evidence of the complexities of the dilemma presented to the peacemakers by the civil strife in Russia. Other points not arising from Lord Hankey's minutes can easily be added, both from the meetings before April 19, when he was not regularly present, and from later ones. From the former there is, for instance, a lengthy discussion on the question of criminal responsibility with regard to the invasion of Belgium and to German breaches of the laws of war; from the latter there are the efforts in Orlando's absence to deal with the problem of Wilson's opposition to Italian claims in the Adriatic and (with Venizelos's help) with their encroachments in Asia Minor.

This text should also serve to efface the fantastic picture of the peacemakers which we owe to the frivolous acceptance of Keynes's caricatures. What we see are serious statesmen well aware, as their later critics have not been, of the intense difficulty not merely of making a just peace, but of making any peace at all; conscious both of the importance of the principles to which they had given allegiance and of the occasions where these principles gave conflicting guidance or none at all; we see methodical work carried on in conditions of great difficulty. For the student of international relations the interplay of actual problems with the public opinion to which each negotiator was in a different way responsible should provide an unsurpassed illustration of the realities of diplomacy; it is worth a thousand academic treatises.

Sleeping Beauty

THE STATE OF FRANCE. By Herbert Lüthy. Translated by Eric Mosbacher. Secker and Warburg. 487 pages. 35s.

IT is not new to describe France as the Sick Man of Europe, yet seldom has the diagnosis been presented in so effective and dramatic a way as by Dr Lüthy, who supports it with an impressive description of symptoms.

According to him, France is suffering from sleeping sickness, but, unlike the fairy-tale princess, this Sleeping Beauty decays in slumber, and the outside world does not wait for an awakening. The illness is the result of arrested development, of a collective hankering after former glories. France, once the vanguard of progress, has become the "kingdom of acquired positions"; with eyes fixed on the past, it fights a rear-guard battle against the industrial revolution.

A progressive accumulation of privileges has built up a Chinese wall of protection around an economy supported by state subsidies and foreign aid. "France's clocks keep a different hour," ran the original title of this book, which argues that attempts to alter them to the right time are powerless against the diffuse forces of vested interests. Parliament is capable of eloquent outbursts and of waging the battles of yesterday, but ultimately it always comes to the rescue of *Clochemerle*, whose privileges are protected also by a strong and centralised administration. In the resulting stagnation the live forces of the nation are paralysed. The benefits of industrial modernisation, carried out through the Monnet Plan, are lost on the way to consumers in an antiquated distributive system. At the same time, the unprivileged sections of the population feel themselves outsiders, with no stake in the regime, and this partly accounts for the strength of the Communist Party.

This conservative attitude could be justified if the French were really able to preserve their way of life against the encroachments of modern times. Dr Lüthy, however, rightly maintains that, in the long run, this social stagnation is bound to bring about a decay of France's cultural heritage to the detriment of world civilisation. What, then, is the solution? Dr Lüthy starts from the premise that nation-states are an outworn concept in the atomic age, a premise even more valid for other countries than for France. From this he jumps to a defence of "Little Europe" (that is, one based on the six countries of the Schuman Plan). He does not, however, describe how this European cure would be applied nor answer fairly the French objections: the fear of German domination in a continental alignment or of a supra-national assembly whose political colouring would be distasteful to France.

Indeed, Dr Lüthy, deploring the French habit of parish-pump politics, now joins the parochial battles of the French "ultra-Europeans." This may explain the brief dismissal of Indo-China and certain, now strange-sounding, errors over Morocco in an otherwise interesting survey of overseas France. It is also the reason why, instead of a reasoned argument for Europe, we are offered a garbled version of the struggle over EDC, a great deal of rhetoric and irrelevant polemics. The "European idea" is now at a low ebb, and a more objective, more efficient case will have to be made to revive it.

Dr Lüthy has been much more successful with his indictment of modern France than with his apologia for Little Europe. The mending of historical clocks has proved too much for this able craftsman from Zurich.

Misused Opportunities

FROM VIENNA TO VERSAILLES.

By L. C. B. Seaman.
Methuen. 227 pages. 9s. 6d.

MR SEAMAN'S brief, but clear, "re-examination" of European affairs from 1815 to 1920 should help to correct the increasingly popular belief that the sins visited on us are those, not of our fathers or even our great-grandfathers, but of more remote political ancestors—Louis XIV, or Luther, or even Pope Hildebrand. His almost surgical analysis reveals a nineteenth-century Europe pregnant with opportunities; and explains why these were stillborn or shortlived.

He professes by "elucidation and interpretation" to qualify or dissipate myths still unquestioned by too many writers, teachers and students. He is intentionally provocative "because historical study that does not challenge the reader to think is poor stuff." He claims to show students "how to interpret facts as well as to recite them in chronological order." But as the "common reader" envisaged by the publishers may not be so conscientious as Mr Seaman's students in testing his iconoclastic generalisations by reference to the bibliography, footnotes or explanatory references to other opinions at the end of each chapter would have helped the reader to trace the steps by which Mr Seaman reached his conclusions.

Among the legends attacked are: that there was such a thing as the "congress system"; that middle-class discontent caused the 1848 Revolutions; that Louis Napoleon "overthrew" the Second Republic; and that Bismarck deceived him at Biarritz and subsequently united Germany; and that a condition of international anarchy existed in the decade before 1914. In general the authorities mentioned confirm these contentions; but their support would be greatly strengthened if, in a second edition, the recently published life of Bismarck by Mr A. J. P. Taylor, whose conclusions are strikingly similar, were added to the list.

The general reader is likely to be more interested in post-Crimean Europe; and so, one guesses, is Mr Seaman. His treatment of Bismarck has all the merits of a good short story; while the chapter entitled "Cry Havoc . . . 1907-1914" justifies the book's purpose: it is a brilliant achievement to have disentangled the complicated diplomatic rivalries (and misconceptions) of the period between Bismarck's fall and Bethman-Hollweg's criminal folly so concisely—yet so clearly as to leave no doubt about the justice of the author's verdict.

The book is well printed, of handy size, and equipped with simple but adequate maps.

American Institutions

AMERICAN GOVERNMENT AND POLITICS.

By Allen M. Potter.
Faber. 318 pages. 25s.

AMERICAN scholars turn out a liberal supply of textbooks on the political institutions of the United States, but Mr Potter differs from his academic fellow countrymen in having written his for a British audience and against the background of experience provided by teaching in a British university. He is therefore able to provide an introduction specifically adjusted to the varieties of ignorance and misconception current in these islands about American politics, while at the same time retaining an authentic American appreciation of his own country's institutions.

Occasionally Mr Potter's translation of transatlantic idiom and intent stop just short of what is needed for full comprehensibility. What is a British undergraduate to make of such a term as "collegiate directorates" (page 193)? Nothing in his reading of Raymond Chandler will prepare him for the realisation that it means "governing boards" rather than "university handbooks." But in the main Mr Potter's book is refreshingly free from jargon, and he can, when he feels it necessary, fit a sharp point to his pen: "Federalism is like a heavy mortgage: it makes it possible to build a house, but it is very difficult to pay it off."

The layout of the book is sensible and straightforward. Beginning with a rather humdrum treatment of the constitution and the history of federalism, it goes on to a very lively treatment of "federalism today" and the history and working of American party politics. It would be too much to say that Mr Potter fully explains the intricacies of the congressional system, but at least he makes the British reader understand why it is inexplicable. There is a very up-to-date treatment of the executive and a critical chapter on those weakest of American institutions, the state governments (though one would have welcomed a fuller recognition of the growing political importance of the state governors). The concluding chapters on the judiciary are adequate, but may leave the inquiring British layman still somewhat bemused as to the exact nature and purpose of judicial review. But the book as a whole is a success and deserves to be widely used.

As They See Themselves

SELF-PORTRAIT OF YOUTH.

By G. W. Jordan and E. M. Fisher.
Heinemann. 187 pages. 12s. 6d.

IN this slim and unpretentious work lies an answer to the perennial headache of educationists and administrators, the problem of providing further education for the many. It is the story of a fascinating, original and moving experiment in a London recreational evening institute. The Grosvenor, the institute's

THE ECONOMIST, OCTOBER 29, 1955

pen name, discovered a method of building up a happy united community based on the real needs and problems of its individual members.

Mr Jordan found that one of the greatest disadvantages for a child leaving school was a sense of not knowing where he stood in relation to others. In his opinion, the two educational inquiries most needed at the moment are the discovery of "a means of ensuring that freer studies be taken seriously; secondly to devise tests compatible with new freedoms, which will give pupils an understandable end in view."

All young people are eager to find their own level; they need security as well as adventure; they ask how they stand in comparison with their contemporaries. Many suffer from an unnecessary sense of inferiority because they have never been tested.

This sense of inferiority was in its turn the cause of rowdiness, gangsterism and a general attitude of jeering and ridicule. In the words of one of the boys at the Grosvenor, "When they can't dance it disappoints them, and they hang round the walls and make themselves a thundering nuisance, to hide their feelings of inferiority." The repeated statements of the young people looking back on their school work emphasised that it was lack of confidence, and not lack of ability, that so often impeded their progress.

It should be pointed out that one of the secrets of Grosvenor's success is the encouragement given to its students to air their views on anything that concerns them, whether in organised "brains trusts" or in informal discussion. They are expected to be frank, and their frankness provides us, through their reported conversations, with a revealing picture of the world seen through adolescent eyes and especially of how they want to be treated by adults. Mr Jordan and Miss Fisher are to be congratulated on producing a piece of original sociological research. It should be read by all who have to do similar work with young people.

The Use of Symbols

CHRISTIANITY AND SYMBOLISM.

By F. W. Dillistone.
Collins. 320 pages. 21s.

CHRISTIANITY has always used symbolic language in its efforts to state ideas not susceptible of statement in bald, plain, sense-governed prose. It has talked about God as "up there," about sacrificial rites and slain lambs. Today it is contended, not only by non-Christians, that some of these symbols have ceased to convey any meaning and that it is necessary to restate, revise or jettison them. The ancient symbols were framed in an agricultural society which believed that the universe possessed three storeys. Most of us know practically nothing about agriculture and few of us think that the universe is storeyed. The New Testament has a poetic picture—"a stream of fresh water." How shall we understand the force of the analogy when reservoirs and

THE ECONOMIST, OCTOBER 29, 1955

cisterns and chlorine have mercifully deprived streams of most of their physical importance and left only an aesthetic pleasure to the hiker and the motorist? Yet symbols must be used if we are to express some of the deepest aspirations of the spirit of man.

This is the problem to which Dr Dillistone has addressed himself, with a formidable wealth of illustration from psychology and anthropology and the comparative study of religions. He defines symbol with care, though not all the sentences are immediately lucid ("the metaphorical process . . . is the secret of all life") and ranges the world of analogy, sign, image, mathematical equation, rite, psychological association, and even of symbol when it is loosely used to mean evidence or symptom. In this wide context of symbolic sign and language he asks whether the Christian sacraments are "outmoded," whether their symbolism is now unintelligible. He wraps the answer round with some sesquipedalian words and not so straightforward sentences; but one is relieved to find that he still thinks them intelligible. Indeed it does not seem to matter whether I wield a pen or a pitchfork, whether I get water from a brook or from a tap, whether I fetch corn from the fields or buy wrapped bread—I still need to wash and I still need to eat. So long as life persists the symbols of washing and eating will be understood.

Expansion in the West

EMPIRE ON THE PACIFIC.

By Norman A. Graebner.
New York: The Ronald Press. 287 pages. \$4.50.

MR GRAEBNER'S book is the result of an investigation into the precise circumstances in which the United States acquired those four jewels in the Republic's diadem, the West Coast states. American enjoyment of a Pacific coastline seems now so natural, such a perfect example of "manifest destiny" fulfilling itself, that it might seem to call for no very deep-delled explanation. Yet in the eighteen-forties it was by no means so certain that Britain, in addition to keeping its hold on Oregon, would not also lift California from the decrepit grasp of Mexico—and that, in any case, "the great American desert," as it was then regarded, would not for ever isolate the Pacific coast from the Mississippi Valley. The first two years of Polk's presidency changed all that, and added to the *lebensraum* of the United States the whole area from the Rio Grande to the 49th parallel, and from the Gulf of Mexico to the Pacific. How was this done?

Mr Graebner's contention is that it was planned that way. He thinks that the influence of "manifest destiny" propagandists and western pioneers has been over-rated, and the role of commercial interests and geopoliticians, who wanted the West Coast harbours, has been under-rated. It may be so. He has certainly brought out in high relief

the evidence in favour of a consciously planned policy to secure California and Oregon as gateways to the east. But, of course, there is no incompatibility between "manifest destiny," pioneering and mercantile diplomacy. The truth was that, provided it could be done without war with Britain, no one in the United States had anything to lose by the acquisition of Oregon and California, and a precise allocation of motive and influence seems hardly as important to the recorder as it obviously has to the author. Nevertheless, "Empire on the Pacific" is a carefully documented, useful study of a dramatic phase of American expansionism.

Foretelling Recidivism

PREDICTION METHODS IN RELATION TO BORSTAL TRAINING.

By Hermann Mannheim and Leslie T. Wilkins.
Her Majesty's Stationery Office. 284 pages. 17s. 6d.

THE authors of this book, which was officially sponsored by the Home Office, took as their starting point the following proposition:—

(a) Some youths return to crime after Borstal training, others do not.
(b) Recorded in Borstal files and in other places are data regarding the past criminal career, background and personality of each youth which were considered to be of use in deciding what type of Borstal institution he should be sent to (for instance whether "open" or "closed"), how long his training should last, and what arrangements should be made after his release.

They examined the information in (b) and carefully established what was most important to (a). Having found the most important objective and measurable criteria, and having determined their precise statistical correlation to the behaviour of Borstal boys after release, they then asked themselves this question: Is it possible, by using the same criteria, correctly weighted, to indicate in advance the chance of a particular youth going straight or relapsing into crime? They found they were indeed able to construct an efficient instrument of prediction for this purpose, and their results were at least three times as accurate as the subjective and intuitive judgment of Borstal governors who had known the youths personally for many months.

The study has yielded much useful incidental information, such as the need for revision of the data that ought to be kept in Borstal files. It has also shown that training in "open" Borstals, even for youths who constitute poor risks as regards subsequent rehabilitation, would produce better results than training in the sometimes prison-like "closed" Borstals. Then, too, the factors which have been shown to be significant for behaviour after release may prove important in future research into the causes of crime.

But the real importance of this pioneer work lies in the fact that it ought

to open the way for a much more effective and rational treatment of crime. The authors are careful not to underestimate the value of individual judgment, which can take into account special circumstances that cannot be fitted into a predictive device; nor do they claim that prediction can ever be 100 per cent accurate, for the vagaries of fate can never be foretold. But what they have done is to demonstrate that the present methods of dealing with offenders are little better than hit-and-miss, and that something a good deal more efficient could be substituted by the use of scientific methods to select the right treatment for the right person. The first task is, however, further research with different categories of offenders and different penal methods. The cost of crime to the community is so high that it is to be hoped that funds for such work will be forthcoming.

Australian Commander

BLAMEY.

By John Hetherington.
Angus and Robertson. 257 pages. 16s.

FIELD MARSHAL SIR THOMAS BLAMEY, Commander-in-Chief of the Australian forces during the last war in the Middle East, and later in the Pacific, was a very able soldier who learned his craft as chief of staff in the first World War to that great Australian general, Sir John Monash. Wavell and Auchinleck, under whom Blamey served as Deputy Commander in Cairo, admired him as a commander, though they found him on occasion difficult and obdurate to deal with.

Blamey was certainly a very determined—and at times a very wily—military leader. No doubt he needed these qualities to command Australian troops in battle and at the same time to cope with the cross-currents of the Australian politics in which his post inevitably involved him. He was outspoken, and right, on the dangers of the expedition to Greece in 1941. But the account which Mr Hetherington gives of Blamey's motives in insisting on the relief of the Australian garrison in Tobruk in the autumn of that year make less pleasant reading. This operation, which Sir Winston Churchill resisted vehemently because of the wasteful diversion of naval forces involved, was carried through because Blamey insisted at the time that the garrison was not physically up to any further fighting. It now seems that his motive was rather to gather into one force the scattered Australian formations—a result which could have been achieved without difficulty six weeks later when Tobruk was relieved by land.

Mr Hetherington, holding fast to the iconoclastic tradition of Australian journalism, has given us very much a warts-and-all portrait of Sir Thomas. There is much in it that is interesting. But there could have been a great deal more had greater space been bestowed on Blamey's campaigns and less on the more trivial incidents in his life.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Backing Mr Dulles

Washington, D.C.

MR JOHN FOSTER DULLES went to Geneva this week well protected from the rear. That, in itself, is perhaps the most important fact about the American approach to the conference of Foreign Ministers. Despite President Eisenhower's illness, control of American foreign policy is today firmly established where it should always have been, in the executive branch of the government. Before Mr Dulles left he briefed congressional leaders, who no doubt exercised their right of offering advice. But he did not think it necessary this time to take any Senators with him to Geneva to give him a certificate of good conduct on his return.

In the last two years the State Department has been strengthened in several ways. The 1954 elections transferred the control of Congress from Republicans, who still behaved as if they were in opposition, to Democrats who still behaved as if they were in power. This, in turn, brought on an era of intelligent co-operation between Democratic leaders on Capitol Hill and the men shaping the Administration's foreign policy. Moreover, the theory that the present world power of Communism and the whole complex of foreign affairs were the result of conspiracy and subversion lost ground. This was due partly to the mere passage of time and partly to the deadening effect of publication. The release of the Yalta papers ranks with last year's visit to Washington of Dr Syngman Rhee as a symbolic milestone in American foreign policy. When Dr Rhee called for marching orders in Korea a deathly pall fell on his congressional audience and the practical meaning of bellicose talk was revealed. Similarly, the Yalta papers, with their occasional indiscretions but no suggestion of malfeasance, stifled controversy with a yawn. There is nothing like several pages of solid type in the *New York Times*, which republishes such documents verbatim, to dissipate emotion. Last week another stiff dose of boredom was added: the Pentagon released the papers dealing with General MacArthur's attitude to bringing the Russians into the Far Eastern war, and this will have helped combat the right-wing myth that the Democrats lost the peace.

But Mr Dulles is also backed by something more positive. The Eisenhower approach, symbolising both in foreign and domestic affairs a distrust of stridency, has emerged as the authentic present-day tone of the American people. Perhaps the best proof of this is the speech on foreign affairs that Vice-President Nixon delivered two weeks ago. It is not long since Mr Nixon was stoking the furnace of partisanship by asking, for example, whether it was not

wonderful that the country now had a Secretary of State who could stand up to the Russians. The line which he has now decided to take, and which he will presumably adhere to during the election campaign in 1956, is entirely different. It is an attempt to make foreign policy non-controversial by generously attributing to such Democrats as Senator George and Senator Lyndon Johnson much of the credit for its authorship.

Moreover, Mr Nixon, to the delighted surprise of the State Department which had rather nervously offered to help him with the script, took the occasion to proclaim to the world that Mr Eisenhower's foreign policy was not peculiar to the President. The speech was an orthodox recital of the purest State Department doctrine, not omitting, as the ambitious Vice-President could have been pardoned for doing, even such politically distasteful points as the urgency of supporting the present government of India. With the Republican party casting desperately around for a man who will fit the image of Mr Eisenhower, the Vice-President has set a fierce competitive pace in the field of foreign affairs. To all this his rival, Senator Knowland, has so far offered only an acid reference to the kind of opinionless salesman who would be inappropriate in the White House. But unless the international situation deteriorates sharply before the nominating conventions, Senator Knowland's well-known views on the short way to deal with Communism will be an insurmountable handicap to his ambitions.

★

With Mr Eisenhower's cast of mind gaining such an ascendancy, and with the Republicans planning to exploit the theme of "peace" for the next election, the really encouraging fact is that the wild swing towards passivity, which Europe feared, has not taken place. There is little misconception in the United States of the "Geneva spirit" or excess optimism about the coming conference. Above all, there is a growing acceptance of the long-term character of diplomacy. Many Congressmen visiting Europe this year came back puzzled and troubled by speculations there about a facile American deal with the Russians and a withdrawal from Nato.

On the Geneva conference itself, two theories are in circulation in Washington, and they are not as contradictory as might appear. The first may be called the "acid test" theory: after the good will at the summit the time has come for good deeds a little lower down. The second is the theory of "continuous exposition." No hard conces-

sions are to be expected from the Russians at this time. But the opportunity must be taken to convince the Russians of three things: that the Americans do not intend to attack the Soviet Union and intend to arrange things so that a united Germany cannot attack it either; that Nato and a united Germany's freedom to join are not negotiable; and that Mr Molotov must define with more precision the security guarantees he requires in the event of German unity. Those who hold to this view do not expect that it will be possible to say at the end of the conference whether it has made any definite progress or not. The test will be the evolution of Russian policy over the ensuing months, particularly if, as is suspected, Mr Molotov no longer commands the full confidence of his colleagues. It is, however, obviously going to be much easier for the American government to hold its public opinion behind the present patient long-range policy if some firm, albeit minor, concessions can be obtained. The Russians would not have to give away very much; discontinuing their jamming of the Voice of America would be a useful point.

While Mr Dulles wishes to lay stress on German unity, it is expected that the Russians will seek to bring disarmament to the fore. The latter, despite all the bold talk of Mr Stassen, who seems to generate optimism from his inner being, still makes Americans a little nervous. This is not because they lack a good plan. The President's idea of aerial inspection, and his acceptance of the Russian proposal to send inspectors to various control points, have made a good impression. But these are essentially schemes for improving confidence between nations by stripping off secrecy rather than by disarming. When it comes to the point, the United States does not wish to disperse its strategic air force and it will be wary of any manoeuvre that will put its refusal in a wrong light.

Storm Warnings in the Boom?

THE latest report of the President's Council of Economic Advisers, surveying the third quarter of 1955, shows that the economy is still expanding at a formidable pace, but suggests also that areas of weakness need watching. The gross national product reached a record annual rate of \$392 billion, an increase of \$31.5 billion above the actual total for 1954. Individual incomes also showed marked increases over previous years and the second quarter of 1955. These figures are particularly impressive because they were achieved neither by an increase in government expenditure—the latter has, in fact, declined slightly—nor by an expansion of inventories. Moreover, while spending on new plant and equipment continued to rise, the housing boom showed definite signs of levelling off in response to restrictive measures on credits and mortgages. Residential construction stood at an annual rate of \$16.2 billion, the first decline in eighteen months. Finally, more people were employed in September, 1955, than in any other September on record.

But on the farm the picture continued to be less favourable. The annual rate of net farm income declined by 5½ per cent in the third quarter of this year to reach the lowest level since 1942. Compared with the first quarter of 1955, moreover, figures showed an 11 per cent drop.

Many farmers and politicians feel that the government should intervene with further purchases of farm products and the Democrats, with Mr Adlai Stevenson in the van, are asking for a return to rigid price supports. More dispassionate observers, however, believe that a decline in agricultural income is the first step towards solving the problem of unmanageable surpluses, and it is with reluctance that the Administration last week launched an emergency purchasing programme to stem the fall in the price of pork.

More disturbing, perhaps, is the continued rise in the index of consumer prices; an increase in September, the second of its size in the last few months, showed that the cost of living was within a half per cent of the record level reached in 1953. It is true that seasonally higher prices for food, apparel and housing accounted for most of the rise, but services, which are more difficult to measure statistically, also showed a distinct increase. This is a non-seasonal factor and preliminary figures for October suggest that it is growing in importance. It seems, therefore, that despite President Eisenhower's illness, the Administration's problem continues to be the threat of inflation and the need of keeping buoyancy under control.

Slow Justice

PRESIDENT EISENHOWER has demonstrated the importance which his Administration attaches to making American justice speedier and more efficient. In one of his first interventions in domestic politics since his illness, the President approved a six-point programme submitted to him by Mr Herbert Brownell, Jr, the Attorney General. Two of its proposals are designed specifically to end the ever increasing log-jam in the Federal courts. Litigants in civil suits in southern and eastern districts of New York have to wait more than four years before their cases can be heard; in Philadelphia and Pittsburgh the delay tends to be three years, and two and one-half years is not an unusual waiting period in Colorado. Such delays frustrate the due process of law and are a constant deterrent to litigants with small means. Many factors account for this unfortunate situation, among them the tendency of Federal judges to take long holidays. Primarily, however, the growth of population and the increasing complexity of social life contribute to bringing more civil cases into the courts.

With the President's approval, Mr Brownell will ask Congress to create some twenty new Federal judgeships. This is the figure proposed last March by the Judicial Conference of the United States. The Attorney General is also planning to send legal "task forces" from Washington to help expedite justice in particularly congested districts. It is hoped that these two measures will reduce the present backlog of cases by some 25 per cent. To make certain, moreover, that needy defendants in both civil and criminal trials will obtain effective legal counsel, the Attorney General is drafting a law instituting "public defenders."

President Eisenhower also agreed with a number of suggestions for improving America's relatively antiquated penal system. The Federal prison population has increased by 10 per cent in the last decade, and it is widely felt that this is due to the lack of an adequate parole and rehabilitation programme. Mr Brownell is proposing to summon a national parole conference in April.

He's got the date up his sleeve!

No—he hasn't palmed a calendar. What he's done you could do. He's got a Swiss calendar watch.

This is the complete timekeeper: it tells you the second, minute, hour and date. The numeral comes up behind a little window on the dial. On some, you get the day of the week, and month, as well.

This is immensely useful. Writing letters, signing cheques, filling in forms... "What's the date?" is one of the commonest questions

in the language. Here, at a flick of your wrist, you always have the answer. It's worth a visit to a good jeweller just to see a Swiss calendar watch. See some of the other marvelous Swiss watches too—self-winding watches, alarm watches, water-resistant watches... watches for sports or evening dress, for women as well as men. One way or other, a fine Swiss watch is one of the most perfect things you can own.

Your jeweller's knowledge is your safeguard

Time is the art of the Swiss

SWISS FEDERATION OF

WATCH MANUFACTURERS

A good jeweller is one who provides full servicing. He can give you really skilled advice when you are choosing your Swiss watch—and skilled care for it throughout its long life.

How to get your share of the BOOMING U.S. MARKET

American Industry is now at the highest point of production in history—and is still climbing. Not only is this expanding market bigger in size. Its consumption and capital equipment replacement rate is, per capita, far greater, too.

Even a fraction of this market could represent a substantial business for you.

So if your product is being sold, or can be sold, to American business and industry, your prospects have never been brighter than they are now—IF you go about it the right way.

For in America goods are not so much bought as *SOLD*—this means that sales and distribution must be backed by consistent and aggressive advertising in those business publications which your customers read. In America business publication advertising automatically means McGraw-Hill.

McGraw-Hill is the leading publisher in the United States of business and technical journals—34 in all—covering practically every field of industrial endeavour. And every journal is by far the leading one in its field—with many tens of thousands of subscribers who *BUY* through its pages. But McGraw-Hill's service does not end there. It also offers vital information—such as the market potential for your product... how to go about establishing your sales and distribution organisation and so on.

So why not have one of the London McGraw-Hill men show how you can gear your sales programme to today's opportunities? He has access to a wealth of specific and helpful data on *your* product market. His job is to make it freely available to you. Write or phone today. No obligation, of course. If you would like additional evidence on the long-term outlook for business write for a free copy of "The American Economy... Prospects for Growth."

Tariff Watchdog

Washington, D.C.

BEFORE the American delegation to the January negotiations of the General Agreement on Tariffs and Trade can be briefed, all interested parties are legally entitled to their "day in court"; hence the two sets of public hearings that start on Monday. For most aspects of the negotiations, such as the trade rules of Gatt and the concessions which the Americans will try to obtain, witnesses go before the Committee for Reciprocity Information, an interdepartmental body which will draft the final instructions for the conference. But Congress, sensitive to the interests of the domestic producer, prefers to test before a more independent body—the Tariff Commission—the basic assumption of the reciprocal trade acts: that there is room to cut some American tariffs without seriously hurting industry at home.

This commission is an official research organisation with an independent status designed to make it equally serviceable to the President and to Congress. An expert staff of some two hundred economists and commodity specialists, organised in seven divisions, works under six commissioners—three Republicans and three Democrats—who are appointed for staggered six-year terms. Oddly enough, in view of the Administration's pronounced commitment to a liberal trading policy, President Eisenhower has tended to fill vacancies with men known to have a protectionist background. The commission's routine functions include giving advice to individual Congressmen on their Bills, publishing statistical information on tariffs and trade, and producing studies of particular industries at the request of the President, the Ways and Means Committee of the House of Representatives or the Senate Finance Committee. In keeping with tradition, hearings are public.

The commission touches on American trade in four ways. First, if the Treasury has ruled under the anti-dumping law, that a foreign firm is bringing in goods at less than "fair

value," the commission finds out if "serious injury" to American competitors has resulted. Secondly, it may determine whether farm imports are undermining price support programmes. Thirdly, the commission can be called on by the President, Congress or any interested party to say whether imports resulting from a tariff concession are "causing or threatening serious injury to a domestic industry producing like or competitive products." Finally, it is trying to find for each item, on a list of nearly a thousand, the "peril point" beyond which any proposed concession would cut too near an American producer's bone. The President can override the commission's advice but must explain to Congress the reason why.

It is surprising, in view of all the clamour against extending the reciprocal trade laws, that relatively few witnesses have asked to be heard. This may partly be due to the fact that the limits of concessions permitted by this year's law are rather modest, and partly to the careful elimination from the preliminary list of most of the familiar contestants in past tariff battles. It is also true that some of the old belligerents are taking quick advantage of a new tariff section in the Office of Defence Mobilisation which is legally entitled to jog the President's elbow whenever an industry or skill essential to national security is in alleged peril from foreign competition.

Filling the Sweet Tooth

THE announcement earlier this month that the 1955 import quota for sugar would be raised by 100,000 tons—as it was in July—is a bitter pill to domestic sugar growers who have surplus stocks on their hands and who must again restrict their plantings to allotments laid down by the Department of Agriculture. The culprit from their point of view is the 1948 Sugar Act, due to expire at the

Travelling Americans

* First half, at annual rate.

"I think I'd like a White Horse
better than anything"

end of next year; this gives to United States growers (including Hawaii, Puerto Rico and the Virgin Islands) a fixed yearly quota of 4.4 million tons, and annually allocates the remainder among foreign suppliers on a scale which gives Cuba 96 per cent of a fluctuating total. For 1955, American sugar consumption is estimated at 8.4 million tons and as the population is increasing by nearly 3 million a year, it promises to show a substantial annual gain. Domestic planters are determined to deprive Cuba of its virtual monopoly over these windfalls, and to win for themselves a stake in the expanding market.

Their fight for the sugar market is, however, hotly contested. In the first place, Cuban sugar is cheaper than the domestic product and Cuba, therefore, enjoys the solid support of the large sugar-using interests—and particularly the soft-drink industry. Secondly, the government feels bound to maintain large-scale purchases of Cuban sugar, partly because of its dependence on them in wartime, and partly because of the unpalatable political repercussions which might follow a deterioration in the Cuban economy. And finally there is the important fact that Cuba is the world's sixth largest buyer of American exports; a cut in sugar purchases would back-fire. The fight is, moreover, a three-cornered one. Other foreign suppliers—Mexico, Peru, Haiti and the Dominican Republic—have a long-standing grievance that they have not received their fair share of this lucrative market.

Prompted by domestic growers, Congress considered numerous measures in the closing stages of the last session, calculated to give American producers a 50 per cent share of further increases in the demand for sugar. But it soon became clear that time was too short to settle a question which brought to Washington a host of high-powered lobbyists representing all the interests involved—foreign as well as domestic—and the fight will be resumed in January.

The Politics of Public Housing

Washington, D.C.

THE Public Housing Administration has had to establish a system of priorities for parcelling out the 45,000 public "housing units" that Congress has grudgingly authorised for the current fiscal year. Public housing has been a sharply fought issue in the House of Representatives for seven of the last eight sessions. On every occasion except one (in 1949 when the basic Housing Act was passed) the programme has been initially defeated in the House and only rescued, often in a mutilated form, by the insistence of the Senate.

Public housing was intended to be an integral part of a long-range housing programme adopted after much argument in 1949. The Federal government's role was to back the bonds of public housing authorities and to meet by an annual subsidy the deficit on the rents, which were to be charged according to the tenant's ability to pay. On this basis, 810,000 "housing units" were to be built, at an average rate of 135,000 starts a year, to provide "decent, safe and sanitary" quarters for poor families turned out of slums. Since some six million homes in the United States are classified as "substandard," this goal could hardly be thought overambitious.

Yet even in 1949, when Mr Truman was pushing the measure in a Democratic Congress with the prestige of his unexpected electoral victory fresh upon him, it scraped through the House by a majority of only four votes. Since the programme requires an annual appropriation, its opponents have since had repeated opportunities of replaying the match. The full rate of 135,000 starts a year has never been achieved; President Eisenhower has not even asked for more than 35,000 a year. Moreover, in view of the House's determined efforts to cut off the programme altogether, annual appropriations to cover even this tiny quota have had to be wrapped up in full-dress legislation with other less controversial housing provisions. To its opponents, public housing is the thin end of the socialist wedge, the first instalment of a scheme to turn families with low incomes into "wards of the government" and deprive them of any incentive to better themselves. This view prevails in the House year after year, despite elaborate provisions to preserve local initiative and local management, to eliminate the remotest possibility of competition with private enterprise, and to enforce the strictest means tests on needy families.

★

The division of opinion on the issue of public housing does not, moreover, run along clear party lines. The co-author and most active congressional proponent of the original "socialist" act of 1949 was the late Senator Taft. Moreover, although there has always been a rock-ribbed group, symbolised by Senator Bricker of Ohio, which has fought the idea, the Senate has on the whole favoured public housing against the opposition of the House of Representatives. Two reasons may account for this divergence. The first and less surprising is that the Senate genuinely is, as the founding fathers intended, a more deliberative body. There are fewer Senators, they are in office for a much longer term, and there is a tradition of examining matters on their merits. Certainly Mr Taft's conversion to public housing was the result of long hearings, which convinced him there was no other way of tackling the chronic slum conditions in the big cities. The second reason is that, despite the fact that the House is supposed to reflect the balance of population and that the Senate's membership is heavily weighted against the most populous areas, it is there that urban interests frequently get a better hearing. This is partly because the congressional boundaries within each state are fixed by the state legislature, in a way that often reflects the over-representation of rural areas in its own ranks. It is also because, however small the total population of his state, the successful candidate for the Senate has to remember that a fair proportion of his constituents live in cities.

In the House of Representatives the traditional divisions between town and country, Republican and Democrat, affect the housing issue. The northern Democrats almost all come from urban districts and almost all have a solid voting record in favour of public housing; the rural Republicans vote against it. Some urban Republicans, especially in the Midwest and west, show a conservative solidarity with their rural colleagues, others, mainly but not exclusively in the east, vote with the general urban interest.

The voting of southern Democrats, on the other hand, defies any logical interpretation. Mississippi has been solidly

against public housing through the years and Virginia is today. The majority of representatives from Georgia and Florida, however, have always supported the programme, though the Congressmen from Miami, which has a flourishing scheme approved by a local referendum, votes against it. The Democrats from Alabama and Kentucky support their northern brethren on this issue, but the majority of those from Louisiana and South Carolina repudiate their own Senators who were authors of the Act. There seems in the South to be no direct correlation between local benefit from public housing and support for it. Two of its staunchest supporters come from rural districts in Alabama and Georgia, whereas an urban representative from Texas is its most fanatical opponent. These unpredictable Southerners are of crucial importance since, not only do they hold the balance of votes, but they usually occupy favoured positions in the House's Appropriations and Rules Committees.

Behind these political complexities there is a genuine conflict of sentiment. Americans are anxious to do away with slums and better the lot of their less prosperous countrymen, but they are suspicious of government interference in what is a highly local problem and they feel that a man should pull himself up by his own bootstraps.

Traffic Jam in the Air

New York.

AT two international aviation conferences last week there was a single dominant theme: the need to ensure that the dramatic expansion of air travel is not retarded by obsolescent methods of air traffic control, by inadequate landing facilities or by cumbersome customs and immigration procedures. In Manila, these problems were tackled by the International Civil Aviation Organisation, a specialised agency of the United Nations; in New York, they were discussed by the International Air Transport Association, the organisation of the airlines.

According to the technical committee of the IATA, the art of handling aircraft in the air and on the ground is five years behind the art of building them. As a result, the United States is already "running out of air space." By 1960 American jet airliners and faster military aircraft will be making new demands on the traffic controllers; and by 1965 American domestic airlines alone are expected to carry 70 million passengers, compared with 32 million in 1954. Corresponding increases must be expected in business flying, international airline traffic, air freight and short-haul helicopter operations.

No airline dare compromise with safety. But unless new equipment and techniques are employed, this growth in air traffic will cause severe delays which will alienate passengers and cut sharply into airline profits. Air traffic controllers in the United States have less experience than their British colleagues in the technique of "mixing in" fast jets and turboprops with slower piston-engined aircraft. But much has already been done, as in Britain, to speed operations by the use of radar controls. The main cause of delay now, especially in bad weather, is inadequate control beyond the airport approach zones. The existing practice of separating aircraft at each altitude by ten-minute safety intervals is absurdly wasteful of air space. In the case of high-speed jets, for example, it would provide

sufficient room for only two or three airplanes at one time between New York and Washington.

The answer, it is generally agreed, lies in more radar equipment so that an aircraft can be tracked visually during its entire flight. In that way, the "cocoon" of air space surrounding each aircraft can be sharply reduced. Fortunately, a military long-range radar network already exists along the acutely congested airways of the east coast, between Boston, New York and Washington, and supplemented by civilian equipment, it will by 1958 provide radar coverage during a whole flight.

Changing Television

New York.

FIERCE competition for the highest audience ratings, the criterion of success in American television, is promoting changes in the industry as profound as any now taking place in Britain. Programmes are becoming shows rather than televised broadcasts. As the rivalry between the three major networks grows more acute, American television is looking to the legitimate theatre on Broadway and to Hollywood.

The success of last year's 90-minute spectacles in colour television has encouraged the National Broadcasting Company to stage many more this year, and its chief rival, the Columbia Broadcasting System, has been forced to follow suit. Owing to their high production costs, "spectaculars" are usually financed by groups of sponsors, each of whom may pay as much as \$70,000 for a single 90-second advertisement. Such shows also perform the important functions of helping the sale of expensive colour television sets.

The trend towards the use of films on television is increasing continually. The American Broadcasting Corporation, the smallest of the three major networks, now uses films in more than half of its programmes. They allow producers greater flexibility in the use of sets; they are generally of higher quality than the kinescopes obtained in the studio from the face of a television picture tube; and they can always be shown a second time at a relatively low cost. The cold war between the motion picture industry and television producers is over. It has been replaced by a grudging co-existence that has led, in turn, to mutual dependence. The concentration of the motion picture industry on the production of fewer and better films has left most of the major studios with unused capacity, and overheads can now be spread economically by making films for television.

Independent producers, who still make most of the television films, are not happy about this solution. The big studios, they argue, have little specialised experience in television, and regard television as a replacement for the second-class pictures that no longer pay their way in the theatrical market. Moreover, the big studios see in television a new medium for advertising their products. Some of their television films appear to be designed only to lure viewers away from their sets and into the nearest cinema. Even Mr Disney, the most highly regarded of the major entrants into the field of the television film, has been accused of dressing Mickey Mouse in grey flannel—this year's uniform of the advertising man.

The World Overseas

New Look for Nato's Divisions?

BY A MILITARY CORRESPONDENT

AT a press conference last Monday, Lord Ismay said that it was "very specious thinking" to imagine that nuclear warfare did away with the need for conventional troops. Nato planners are, indeed, imagining no such thing. It is generally assumed that any future war in Europe would begin with an all-out attempt by both sides to carry out as much destruction as possible of ports, airfields, production centres, etc., by means of concentrated atomic attack; but that after this initial stage, in which air power would clearly be decisive, there would still be fighting on the ground—even, in Lord Montgomery's opinion, prolonged fighting. It would be of primary importance to halt any Russian land advance as far east as possible, both in order to maintain morale and to prevent an attacker from establishing airfields and launching sites nearer to western industrial areas and to the ports through which American supplies would ultimately have to come. It cannot be too strongly stressed that even if such a war cannot be won, it certainly can be lost, by the West.

Whatever Nato army was in the field (and it would certainly be heavily outnumbered) would have to fight it out with its own resources in the initial phases; the prospect of reinforcements and supplies grow more remote as Russia's airforce and atomic stockpile increases. It is this problem which is now being considered in the reorganisation of the basic army formation, the division.

The organisation of Britain's divisions in the last war was partly a matter of experience, partly of shortages, notably in tanks. The lead which was lost before the war was hard to regain, and the infantry could never be given their own integral close support tank unit. The difficulty was overcome by armoured divisions often fighting in the wrong role, and by independent tank brigades—but without the intimate close support, which mutual confidence bred by long battle experience together can alone impart.

The division, as the largest self-contained formation, has stood the test of war and seems even better suited to Nato's requirements, if it is given a still greater degree of self-sufficiency, supplied with simplified fighting equipment, pruned of its vehicle strength and its administrative echelons and generally adapted to atomic tactics. The hitting-power of atomic weapons makes it necessary to disperse both the forward defensive positions and all HQs and administrative echelons. Good use of ground can alone secure this. Many areas, screened by hills, woods and other features, still offer difficult atomic targets. Divisions will have to be

prepared to cover fronts of 15 miles or more by holding selected brigade or battalion areas, with large gaps between them into which the enemy may be induced to concentrate so that he then offers suitable targets for atomic weapons and counter attack.

It seems that the few British divisions available in the early stages should be organised with armour as an integral part. What Lord Montgomery calls the Standard Division and General Gale referred to as the General Utility Division has been tested in BAOR this year and seems to be developing along the right lines. Divisional HQ should include a squadron of amphibious tanks and a flight of helicopters. The former are essential if the infantry are to lose their anti-tank guns. Each brigade would include, in addition to its three infantry battalions, an armoured regiment consisting of three squadrons of medium tanks and one squadron of heavy tanks (Conquerors). One field regiment of artillery would provide close support for each brigade. The 25-pounder has obviously had its day, and according to present plans will be succeeded by a self-propelled howitzer. It will, however, be some time before even a prototype of this appears, and it is sincerely to be hoped that the range will be greater than the 11,000 yards at present planned. Additional artillery support will be available within the division from a self-propelled medium regiment. If this is to be adequate over the divisional front in defence, a range of 20,000 yards will be required.

The Royal Engineers will be organised in a divisional unit as at present. It is intended that the infantry shall lose their mortars and anti-tank guns, retain some medium machine guns in the HQ company and the lighter anti-tank weapons, and rely on the tanks for other anti-tank defence. Methods for quick crossing of anti-tank obstacles such as rivers by means such as the new jet powered raft are vital if the assaulting infantry are to be properly covered.

The conception, then, of the fighting end of the new division is of three self-contained brigade groups each with its own infantry, tanks and supporting fire power. Such a formation should have both strong defensive power and the ability to deliver massive and sustained attacks when opportunity offers. Its tactics will largely be governed by the power of supporting atomic weapons, and the need to avoid offering targets for the enemy's atomic weapons and making them concentrate to offer suitable targets.

If the fighting end of the division is effective the next thing will be to tackle the administrative echelons, the work-

shops, and the replenishment of men, equipment, food and ammunition. The principle here appears to be to bypass the present Corps link and replenish direct from Army dumps to forward troops. A drastic reduction of the number of vehicles and air supply are the key to this.

Nato countries will realise that besides taking its place beside its allies in Nato, the British Army has other roles to play. It must be prepared at all times for a minor campaign or for a policing role. Nothing in the new divisional organisation seems to make this more difficult. Indeed, the simplification of infantry arms, and the greater rifle fire power this should give, will be an advantage.

When armoured regiments are an integral part of standard divisions, is there any longer a role for the armoured division? Atomic tactical weapons are likely to produce situations where very quick exploitation by highly mobile forces may give big rewards. An armoured division organised with a reconnaissance regiment of armoured cars, three armoured regiments and an infantry battalion transported in armoured carriers with a self-propelled medium regiment to support them, could do this. The tank is less vulnerable to atomic radiation effects than troops in the open, and a light mobile division organised to work in armoured regiment groups would have great mobility and hitting power in a disorganised situation. It would not be suitable for prolonged action and penetration to great depth, which is the function of the standard division. It can be argued that this armoured group is really only a brigade, but it is likely to fight dispersed over considerable distances and its command set-up should be on the divisional level.

A Programme for Algeria

FROM A CORRESPONDENT IN PARIS

FRENCH ignorance about overseas France is proverbial, yet in the last three months, the minority that takes North African affairs to heart has learnt with surprising rapidity how questionable is the old slogan that "Algeria is part of France." Frenchmen have swallowed, for instance, the hard fact that the standard of living of at least 8 million Algerian Moslems—that is, about a sixth of France's citizens—is scarcely higher than that of India. Their immediate reaction to this news was discussion of how to raise the level of the average income of the Algerian Moslem to that prevailing at home, as if such a change were quickly feasible. The absurdity of the notion was due both to the sense of emergency engendered by the present crisis and to the surprising illusions aroused by the two years of rapid expansion at home that have enabled M. Faure to promise a doubling of the purchasing power of the home consumer within the next ten years.

For Algeria the two remedies recently suggested, massive public investment financed from metropolitan France, and massive emigration to it, are both unrealistic. Public investment, already substantial, will certainly have to be increased, but France has not yet achieved a satisfactory rate of investment at home. And even if vast amounts could be raised, it would be difficult to put them quickly to economic use in Algeria. As regards emigration, the present situation is that about 300,000 Algerian Moslems have sought employment in metropolitan France, and more than a third of them have failed to find permanent jobs.

The basis for long-term development has recently been laid down in a number of reports published by the *Commissariat au Plan* and the Economic Council. Their authors, however, in their desire to administer a salutary shock, may well have overstated the case. Their purpose was to promote action; they may, however, discourage it by exaggerating the contrast between the increase in Algeria's population and the limitations of its resources. The natural rate of yearly growth of the Moslem population—nine-tenths of Algeria's total population—is put between 2.5 and 3 per cent, an almost incredibly high figure which cannot be accepted out of hand. (The rate cannot, however, be lower than 2 per cent; and since it will tend to increase fast, owing to the high proportion of young people and the falling death rate, a campaign for birth control will be indispensable.) Moreover, the oft repeated claim that the cultivable area cannot be increased is overstated: a huge task of land reclamation lies ahead. And finally—what are "natural resources"? Not only is more active prospection needed, but it is not unreasonable to think that the solution of the Algerian economic problem may lie in the improvement of techniques enabling the exploitation of resources now left idle. For instance, Algeria is well suited to the harnessing of solar energy and praiseworthy experimental work is being done in this field, but not enough if industrial application is, as it seems to be, already possible.

Help for the Fellah

There are other grounds for optimism. The Algerian Moslems are sober and thrifty and, if properly guided, are capable of becoming skilful workers, as has been proved in the Renault factories and elsewhere. The population is not riddled with alcoholism as it is in several other parts of the *Union Française*; nor has it sacred cows to feed. Moslem girls show an aptitude for learning, their attendance at schools is on the increase, and an improvement in the social condition of women will probably help to reduce the birthrate.

It is, however, the use to which available financial resources are put that is the decisive point. The Moslem peasant, the fellah, must have first call on the funds available. Nearly 80 per cent of the population lives on the land; and while the production of wine, fresh fruits and early vegetables has been expanded mainly to the benefit of a minority of advanced farmers of European origin, output of cereals is not much higher than in the first decade of the century—an average of 19.7 million quintels per annum in 1949-52, as against 19.6 in 1901-1910; there are also less cattle and sheep now than then. But experience in the SAR—*secteurs d'amélioration rurale*—where admirable work has been done, though on a tiny scale, has shown how much the fellah can be helped to irrigate the land he cultivates and to improve its yield. Increased expenditure must be devoted to this task and to a campaign against soil erosion. Here, money is not the main bottleneck; more agronomists, particularly rural engineers, are required. Until a more prosperous rural community is created there will be inadequate support for local industry, which supplies about 30 per cent of the Algerian gross product, but is not working to full capacity.

The lines along which a comprehensive ten-year programme could be framed are clear enough, but the present unrest, while demonstrating the need for economic remedies, raises a formidable obstacle to action. How can the vicious

circle be broken? The problem is mainly political. Hunger, though at the root of the unrest, was not its most immediate cause: the cereal crops in 1954 were the best since before the war. Nevertheless, the disposal of some of the French wheat surplus to Algeria, until local production can be substantially expanded, might contribute to better relations. Equally urgent is the need to look after the unemployed or under-employed Algerians in France, and to provide them with social services, housing accommodation, training and jobs. This should be a prerequisite to a further development of emigration, but would also help to relieve misery in Algeria, since the Algerian workers employed in France send more than half of their wages back to their families; it is said that 1,500,000 people in Algeria live mainly on this income. Lastly, the development of industry in Algeria will have to be subsidised in one way or another, until French firms can be persuaded to risk their capital there. The most obvious way would be to increase subsidies to house and school building, and land reclamation, thus satisfying urgent needs, reducing unemployment and enlarging the local market for consumer goods. All this will be expensive—but less so than a continuation of civil war.

Problems of the Viet Minh

FROM A CORRESPONDENT IN PARIS

THE conflict between nationalism and Communism was one of the principal problems confronting the Viet Minh government after the Geneva conference last year. Most of its followers were nationalists who had supported the Viet Minh loyally during the fighting in the belief that it was the only organisation capable of driving the French from Vietnam. Once the fighting was over, these people, many of whom held key positions in the army and the administration, might be expected to oppose the imposition of a full-scale Communist regime.

From the very beginning, however, the Viet Minh set to work to establish a rigid control over the people by means of a system known as *phat-dong*. A team of trained cadres is sent to each village in a selected area. These cadres take up residence with the poorest inhabitants and isolate the land and property owners from the rest of the villagers. They then collect all the information they can about these "bourgeois" villagers and compile a dossier on each. Next they explain to the poorer villagers how they have been exploited and misused by their richer neighbours. After this comes the people's court, which is composed of the poorest villagers and before which the property owners must stand trial. The final steps are the punishment of the property owners, the redistribution of all the land among the villagers, and the replacement of the old members of the village administrative council by some of the poorest villagers. The personnel of all other administrative bodies in the area are changed in the same way. The operation is then complete and the team of cadres moves on to the next area. The effect of such an operation is to remove all people who might be disloyal to the regime, and to make the land or their official positions of the remainder depend upon the continuing existence of the regime.

Moreover, the Viet Minh army has been completely transformed since last year and turned into a loyal instrument of the regime. The politically unreliable elements have been systematically removed, and replaced by new recruits selected from the regions in which the *phat-dong* operations have been completed, so that the loyalty of each can be guaranteed by the village administrative committee. In addition, the government has recruited, trained and armed local defence forces in all the villages. They are trained after the day's work in the fields and are intended for use in case of an attack from the south. They also form a useful reservoir from which reinforcements for the regular army may be drawn.

In the cities and towns the trading communities have been rendered as powerless as the landowners and officials in the countryside. It was made compulsory to exchange all Bao Dai piastres for Ho Chi Minh piastres at a most unfavourable rate before a certain date; and traders of all kinds, even the poorest street vendor, were taxed so viciously that it became impossible for them to continue their businesses, while government co-operative shops sold Chinese and Russian goods at a comparatively low price. The whole population has been obliged to join one or more of the "mass organisations" such as the Association of Women, the Association of Agricultural Workers, the Association of Buddhist Bonzes, etc. Through these organisations they are forced to listen to "explanations" for some hours every day, and constant repetition of Communist propaganda is, by its very insistency and volume, wearing down all opposition in the minds of even the most independent citizens.

The shortage of rice has remained one of the most serious problems facing the government. During his recent visits to Moscow and Peking, Ho Chi Minh pointed out that he would be obliged to invade the south for the sake of its rice unless supplies were forthcoming from some other source because his people were starving. This led to a gift of rice from Russia to northern Vietnam in the form of 150,000 tons of rice bought by Russia from the Burmese government. This, however, is clearly a temporary solution.

Ubiquitous Chinese Advisers

The provision of an efficient administration for the territory under its control is another problem that has not yet been solved by the Viet Minh. When it took over northern Vietnam, it had no trained administrative cadres of its own, and its appeals to the civil servants of the old regime to remain at their posts largely went unheeded. Although promised continued employment at their present salaries and a full pardon for all their fancied or real misdeeds, most of these men preferred to go to the south, or else to return to their own village in the north. The government was therefore obliged to make do with whatever personnel it could muster, and the inevitable result was an administrative chaos which still persists, although it is not now as bad as it was. Chinese advisers helped, but most of these were technicians and the help they rendered was of a technical nature.

These Chinese advisers remain remarkably inconspicuous in spite of their large numbers. It is difficult, at any time, to distinguish between Vietnamese and Chinese, but in northern Vietnam it is impossible unless one hears them speak because everybody now wears the same drab clothes. The Chinese have taken over complete control of the air-

ports, powerhouses, and other concerns which require technical skill, and it was Chinese technicians who built the new railway from Hanoi to the Chinese border. Doubtless they are equally active in Vietnamese politics, but precise information on this is very difficult to obtain.

Some very interesting political changes have, however, recently taken place in the north. A new "Fatherland Front" was created at a meeting of the Lien Viet in Hanoi last month, with the object apparently of soothing the suspicions of the northern regime that have been aroused in the south. Although the broad mass of the people in the south have a sentimental attachment to the Viet Minh, and although there are large numbers of Viet Minh cadres in the south, the Communists were unable to provoke any public demonstrations there against Mr Ngo Dinh Diem's refusal to meet the Viet Minh on July 20th to discuss national elections. The reason for this is the widespread fear and revulsion caused by the brutalities committed in the people's courts and by the merciless taxation of all businessmen. The people of the south are wealthier than their northern brothers and are justifiably apprehensive about their fate under a Viet Minh regime. Brutality therefore has disappeared from the people's courts while the new front's claims to incorporate "all social strata" "without distinction of social class."

A second change is the gradual removal of Ho Chi Minh from the centre of the stage. The Viet Minh cannot yet afford to dispense with him altogether because of his great prestige, but his real power is being steadily diminished.

The greatest fear of the Viet Minh is the establishment of a really effective nationalist government in southern Vietnam. Letters from people in the north that have been smuggled over the border to their friends in the south are surprisingly uniform in content. They may all be summarised as follows: "I detest Communism in all its forms, yet I have elected to stay in the north and support the Viet Minh because Vietnam must have a strong government to restore order and rebuild the country. The government of Mr Ngo Dinh Diem is corrupt and inefficient, so I am left with no alternative to giving my support to the only effective governmental force, the Communist Viet Minh." The writers of these letters and millions like them would not hesitate to give their full support to any nationalist government which showed itself capable of governing, and the Viet Minh is most anxious for the national elections to be held before such a government can be formed in the south.

No Hounds for Comrade Lapkin-Chapkin

IN the latest issue of *Krokodil*, the Soviet satirical journal, there is a cartoon of a smart woman on whose fur collar is written: "bribes." She sails straight into the director's office, with a pile of parcels in her arms, watched by an angry queue of onlookers in the waiting room. Underneath the caption says: "She always gets in without queueing." Thus satire joins in the vast campaign against corruption and bribery which has been launched in the

Soviet Union. Reporters and *feuilletonistes* have been told to brand this anti-social vice and they certainly do not lack subject-matter. Their attacks, serious or witty, show how widespread the phenomenon has become and how easily accepted by otherwise honest citizens.

Literaturnaya Gazeta reports the case of a naïve employee who assumed that, once a machine had been paid for, he only had to come and take delivery on behalf of his own firm. He was, therefore, surprised when the first accountant of the firm and then a higher official asked him for a personal commission (*pourboire*—say the French; "for tea"—say the Russians). Shocked, he pleaded his rights, refused to pay and, finally, appealed to the police. Naturally, he won his case, but by a strange coincidence he lost his job a few weeks later. Was it more than coincidence? The journalist dealing with the matter could not prove it, yet he was shocked by the attitude of the director who was chiefly concerned by the fact that his employee had gone to the police.

Corruption is accepted as a matter of course and this official complacency now comes under fire in the press. Bribery has permeated the system. It has not been invented by the Soviet regime: bribes in cash and kind were already prevalent under Tsardom. Judge Lapkin-Chapkin, in a play by Gogol, pleaded that he accepted no money, only hounds for hunting. In the Soviet Union corruption has flourished under the combined influence of low salaries, shortages and bureaucratic bottlenecks. Many a director preferred to give "for tea" and get his stuff rather than to act in an incorruptible manner and fail to reach the planned target. Bribes were used to oil the squeaking economic machine. Soviet leaders now consider that salaries are sufficiently high and the administration skilful enough not to require such oiling. The new drive against bribery thus forms part of a general Soviet campaign for moral improvement and economic efficiency.

Moscow Woos Madrid

FROM A CORRESPONDENT IN MADRID

IN the Russians' present drive for "peaceful co-existence" not even General Franco is being overlooked. Indeed, the Russians seem to be making a special effort to reach some measure of friendly understanding with the arch-enemy of the Communists. This is not so surprising as it seems at first sight. Moscow would stand to gain a good deal if Spain could be detached from its economic dependence on the United States and lured back to its traditional neutrality, for in that case the bases now being built in Spain by the Americans would presumably be denied to them. There have been a number of signs over the last eighteen months that the Russians think it worthwhile to make an effort to bring about this development.

Throughout 1954-55 commercial exchanges have been progressing between Spain and the Soviet bloc. Poland, Hungary and Czechoslovakia have all been trading with Spain. Poland, for instance, bought 300,000 tons of mineral ore from Spain in return for 200,000 tons of coal. The ore came from the Rif mines and went to Polish industries in Eastern Silesia, while the coal went to the Spanish

Assembly work in progress at Marconi's Chelmsford factory. (Left) Mr. John Mabey, the Burroughs man called in by Marconi, with one of the Burroughs machines which have speeded up their accounting.

This man helped Marconi gear their accounting to rising production

HE IS ONE of Burroughs' world-wide team of mechanized accounting consultants. This is the story:

Marconi's Wireless Telegraph Company Limited export radio, electronic and heavy television equipment to the world. The demand for Marconi products increases every month.

At their Chelmsford factory, they needed to expand their accounting procedures in order to cope with the mass of extra work.

Marconi's decided to call in the Burroughs man, an experienced consultant on all accounting and record-keeping systems. Mr. John Mabey is the specialist sent by Burroughs.

A FULL ANALYSIS.

Working closely with the Deputy Chief Accountant at Chelmsford, Mr. Mabey applied his experience to the problem. After a full analysis of the existing system they evolved a new plan, based on the speed and versatility of Burroughs Sensimatic Accounting Machines.

The plan was adopted. Now all Marconi's accounting is in line with their increased production. And Works Payroll is completed in less than a day; the same machines take Salaried Staff Payroll in their stride. Costing is now done on a single 15" card which shows eight running totals—hours, labour, overheads, purchased materials, manufactured materials, processes, aggregate balance and net balance.

So well has the new system worked at Chelmsford that Marconi have followed the same plan at their newly-opened factory at Basildon.

Whatever your business, large or small—if you have an accounting problem, the Burroughs man can help you solve

it. He will make a full analysis and suggest the most economical and workable solution. If he thinks no change is advisable he will frankly say so. But if he does recommend a change he will plan the new routine in detail, and see that you always get the full benefit from any Burroughs machine you install. Call in the Burroughs man—you're committed to nothing and his advice is free.

Burroughs make the world's widest range of Adding, Calculating, Accounting, Billing and Statistical Machines and Microfilm Equipment. You'll find the number of your nearest Burroughs office in your local telephone book. Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

For specialist advice on mechanized accounting methods

call in the **Burroughs** man

MORE POWER AT LOWER COST

To add power to an existing diesel installation the simplest and most efficient way is to fit a Napier Turbo-Blower. On a 2-stroke engine power output goes up by more than 50%. A 4-stroke diesel fitted with a Turbo-Blower develops as much power as two similar, but unblown, diesels. And both power gains are made at a lower specific fuel consumption.

The Turbo-Blower is a good example of the Napier principle: more power at lower cost.

NAPIER

national railways. Apart from developing trade relations, there have been a number of friendly gestures. As long ago as the early part of last year the Russians released 285 prisoners captured from the Blue Division during the Spanish civil war. This spring the Soviet government sent two delegates to an international congress on the standardisation of ball-bearings that was being held in Madrid. It chose to overlook the fact that Spain has no diplomatic relations with the Soviet Union or any other Communist country. And at the recent Venice Film Festival the Russians did something even more surprising; they invited the Spanish representatives at the festival to send delegates to an international congress of cinema technicians to be held in Moscow next year.

There have also been some gestures on the diplomatic front. When a vote concerning Spanish participation came up in the UN Economic and Social Council last August, Russia and Czechoslovakia contented themselves with a mere abstention. And last month Mr Molotov was seen to give a friendly smile to the New York representative of the Falangist publication, *Arriba*. When this correspondent asked the Soviet Foreign Minister whether the Russian proposal for a European security pact included Spain, he received the answer: "Naturally, if Spain cares to join." Since then it has been reported that Russian diplomats in Paris have been trying to establish direct contact with the Spanish Embassy there, with the object, apparently, of improving trade relations.

If Moscow decides to go on pursuing this conciliatory line until it reaches some sort of an understanding with Spain, it is in a strong position to do so. For one thing, it holds a great deal of Spanish gold. Bullion worth \$400 million was shipped to Russia by the Spanish Republic during the civil war, and it is believed that only a fraction of this was touched to pay for the Republic's war-time necessities. The Russians have already returned to Teheran the gold that it claimed. It is clearly not impossible that the same good fortune might come Spain's way. Moreover, the Catalonian textile industry is in the throes of a severe crisis. It desperately needs new foreign markets, especially now that Japan has now resumed its position as an exporter of textiles. Might not the Soviet bloc come to Spain's help here? Finally, it must be remembered that the Spanish

government is dissatisfied with the amount of American aid that it is receiving, and that the Russians might well exploit this weakness in Spanish-American relations.

NOTES ON INDIA

(These Notes are Contributed by Our Correspondent in India)

Stemming the Floods

THE whole of Northern India has suffered this year from floods unprecedented in their extent and severity. From the Punjab to Orissa there have been occasions when as much rain has fallen in 48 hours as in London in a year. Hundreds of lives have been lost, material damage runs into tens, perhaps hundreds of millions of pounds. Thousands of square miles of countryside have been under water, large towns like Amritsar have, for a time, been completely cut off. There has been water in the streets of Delhi itself. The disaster has been mitigated by the speed with which relief was organised and the admirable work of the armed forces. Moreover, there is the consolation that though the destruction wrought on the summer crop, especially in the Punjab, has been enormous, the silt and moisture the floods leave behind will often mean a bumper winter crop.

One result of the floods has been to stiffen the government's determination to provide against a recurrence of such disasters. Complete prevention is not possible, but £90 million is being allocated in the second five-year plan for some effective palliatives. There is to be more co-operation with Nepal and Sikkim, and even Tibet, to get better records of rainfall and quicker flood warnings. There is to be more afforestation and gully plugging to stop erosion in the main rivers' catchment areas. There are to be many more dikes built by village co-operatives or voluntary labour. The high dams will also help. This year's floods in Orissa would have been worse still had it not been for the half-built Hirakud dam. Floods cannot be done away with altogether without gravely reducing the fertility of many areas. But what is wanted is a gentle overflow, not an onrushing mountain of water. In five years' time this should be achieved for all except the worst rivers in the worst years.

Hindi versus Regional Languages

THERE have been many signs recently that India is settling down to the problem of just how Hindi is to replace English. The Official Languages Commission, appointed in accordance with the Constitution to suggest the steps by which Hindi should become the official language, has begun work. The Syndicate of Bombay University has recommended a gradual change over to Hindi as the medium of instruction, and a new university to be started in Gujerat, Vallabh Vidyanagar, will use Hindi from the beginning. In the Hindi-speaking states Hindi is already used for most official purposes, and even at the centre it is spreading gradually.

There have, however, been signs that the transition will not altogether be easy. Few are willing to see the present

widespread knowledge of English seriously weakened, though more would like to see India's educated men less fluent in English conversation. The supporters of the regional languages, moreover, are beginning to show a desire to set limits to the spread of Hindi. The Andhra Legislature, for example, has decided to adopt Telugu as its official language. The universities of Poona and Gujarat are to change over to their regional language as the medium of instruction. In a recent debate in the Madras Legislature the government benches showed nearly as much concern as the opposition that the changeover to Hindi should not go too quickly, that the advantages obtained from a knowledge of English should not be lost, and that Hindi should not be used where Tamil was possible. There was much emphasis on the fact that the constitution makes Hindi the official language, not the national language.

Certainly for most purposes it will be the regional languages rather than Hindi which will replace English. That has been generally accepted for such purposes as local administration. Controversy, however, still continues over what language should be used by high courts and universities. National unity argues for Hindi, efficiency and contact with the people for the regional language. Hindi's chances of success would be greater if its vocabulary were more settled and some of its advocates less aggressive.

Black Looks for Prize Competitions

THE role played in England by football pools has hitherto been taken in India by prize competitions, mostly of the crossword or missing word variety. Prizes have been high, sometimes running into thousands of pounds, and many people have spent more than they can afford on sending dozens of entries every week; even the illiterates have competed; they have their own tipsters to tell them what letters to fill in. These prize competitions arouse in the Indian intellectual the same distaste that football pools produce amongst most of England's educated. But in India the intellectual rules, and his dislikes are backed by a more than non-conformist puritanism in virtually the whole of the middle classes. This means that the Indian middle classes have very few vices. They do not drink or gamble or keep mistresses. It also means that a certain "Wee Free" air clings to all Indian politics.

The reaction to prize competitions has been not actually to ban them, but to reduce them to a level where they can no longer drive anyone to suicide ; the maximum prize will be £75, no competition can accept more than 2,000 entries and competitions must be licensed. Many an anxious mother will now be able to sleep soundly ; and every promoter of competitions will be assured of a fortune, which need not ever be known to the income tax, since only the first 2,000 entries will appear on his books, and though his prizes will be smaller, they will not be small enough to stop people from trying their luck.

Putting Over the Community Projects

THE community projects are an attempt by the government to help the peasant to help himself. They put into the countryside more people skilled in medicine and animal husbandry, agriculture and co-operation than it has ever had before. They bring demonstrations of better methods

to the peasant's own village, and they offer him public money to improve his life provided he will match it with his own money or labour.

his own money or labour.

They began in a small way three years ago, and by 1961 projects or the more dilute "National Extension Blocks," are to cover the whole country. Certain successes and certain difficulties have already become apparent. The peasant will everywhere accept very quickly a new method that he can see is profitable. Use of fertilisers is rising rapidly; the Japanese method of rice growing, which on suitable land can increase yields by half or more, is being adopted by the hundred thousand acre; the demand for improved seeds is constantly outgrowing the supply. The peasant is keen, too, on education for his children and health for himself. It is easy to raise contributions for schools and libraries, and the nation-wide DDT campaign against malaria arouses real appreciation.

But the peasant is less appreciative when the advantages are more recondite. He is often suspicious of the midwife ; he can be shy about learning to read at his age ; he may prefer the fields to a latrine. If he is to be persuaded, the project staff must treat him as an equal, as a man who has reasonable doubts which must be resolved. Endless patience, endless talk is necessary, and here the project staff sometimes fall down. They remember they are educated, and do not come down to the people's level. They remember they are officials, and exert pressure to make the villager do what is good for him, instead of waiting till he acts on his own initiative. Whenever that happens, there is failure. The villager is always willing to put on a show to oblige the government officials. But if the show is for their benefit, not his, he forgets it the minute they leave.

Austerity Weddings?

IT has been suggested by the Congress Party that the problem of raising enough money to finance the second five-year plan would be half solved if only people could be induced to spend less on weddings. This expenditure was put at some £500 million a year. The estimate was doubtless unreliable, but the expenditure is certainly enormous. The poorest family will spend six months' income or more on a single wedding. If that could be stopped, the major cause of unproductive debt and of the waste of money in gold and jewels and fine clothes would be cut off at a blow, and the saving would undoubtedly be large. Women who did not get silk and gold at their wedding would be unlikely to buy them afterwards; there would always be better uses for the money. But the government's problems would not all be immediately solved. The father who marries his daughter on the cheap may use the money to live a little better, or to improve his land, rather than to buy saving certificates. The gap in the plan would, nevertheless, be considerably reduced. Urban fathers who no longer have to bear the expense of an old style marriage may well buy some government securities as a nest-egg for their daughters. Farmers who do not have to contemplate ruinous wedding after ruinous wedding will be able to buy fertiliser with their own money instead of with government credit. The Congress was right. Nothing would help India's development more than to stop wasteful expenditure on marriage. The only question is: How?

**Is your Board
somewhat cramped
in your Boardroom?**

As the business grows or the board expands, it's no bad thing to see that the boardroom is made more expansive, too — and, if we may say so, no bad thing to leave the job to Catesbys Contracts. Catesbys' specialists have quite a flair for boardrooms. They know when to re-design a room and when to leave it alone. They'll redecorate yours in any style, period or contemporary, and, if you wish, fit it out from floor to ceiling to give you exactly the atmosphere and the distinction it ought to have. You will find Catesbys unusually co-operative, competent and quick. Why not ring Museum 7777 and have an executive round to see you!

structural plastics

*a new subject for
ventilation and
cold appraisal*

*What are
structural
plastics?*

Structural plastics consist of a reinforcing agent, such as glass fibre, bonded with a synthetic resin, most commonly a polyester type resin. Polyester/glass fibre mouldings can be made either mechanically or by hand fabrication and their essential characteristics are . . .

Lightness combined with strength—specific strengths comparable with steel.

High resistance to corrosion by a wide range of chemicals, including some acids, and to all but excessive heat.

Excellent electrical properties—high breakdown and low power factor, combined with good insulating and non-tracking properties.

Unlimited colour possibilities—in opaque or translucent shades.

Heating and ventilating engineers should see distinct possibilities in structural plastics for the production of ducting, louvres and fan units—especially where the more complicated sections occur. For structural mouldings are essentially light, strong and resistant to all but excessive heat and can be safely stored for long periods—in the open if necessary—without fear of deterioration. In refrigeration and chemical engineering too, corrosion-resistant structural mouldings can provide a sound economical answer to liquid storage and piping problems. Why not air your troubles to B-I-P—the polyester people—who are always ready to help.

THE BUSINESS WORLD

The Budget Proposals

MR BUTLER'S interim budget, as expected, proves to be compounded of non-budgetary as well as budgetary measures; and the former, likewise as expected, prove to be much more constructive than the latter. In each of these categories there are two major innovations, but only one of these will exert its main effect on the public sector of the economy. This is the welcome decision that local authorities shall no longer have the virtually automatic right to borrow from the Public Works Loan Board; in future they will be required to explore first the possibilities of obtaining finance through market channels. The other major—and equally sensible—non-budgetary change is that the Post Office will on January 1st adopt an economic pricing system for telephone and other services, with the result that its charges (mainly for telephones and parcel post) will rise to an extent that will bring in an additional £26 million in the calendar year 1956.

The two main budgetary measures are increases in purchase tax and distributed profits tax. Purchase tax is to be raised throughout the range by one-fifth, so that the rates in the three brackets become 30, 60 and 90 per cent, while the "D" scheme for furniture and clothing is to be abandoned and those goods will be taxed at either 5 or 10 per cent on the whole of their wholesale price. These changes are expected to produce £15 million of additional revenue this year and £75 million in 1956-57. The one thoroughly retrograde step is an increase in the rate of profits tax on the distributed portion of profits from 22½ to 27½ per cent—a change that will have negligible effects on the revenue in the current year, but will bring in £10 million in 1956-57 and £38 million in the first full year (presumably 1957-58). Including the Post Office charges, the total additional burden imposed in taxes

or charges payable in this current fiscal year will be no more than some £20 million, but in 1956-57 the burden will rise to £111 million, and two years after that will reach its full weight at about £140 million.

These specific new measures are to be reinforced by administrative pressures, of the kind first outlined or promised in the Chancellor's speech last July, to bring about a contraction or slowing-down of the capital expenditures of the local authorities, nationalised industries and other public bodies; by some postponements by the central government itself; and by the action, already announced in general terms, to curtail housing subsidies.

The decision to reinforce the credit squeeze and the previously promised administrative action within the public sector was not, the Chancellor made plain, dictated by any assumption that Britain now faces an immediate emergency. Its weakness still is its "over-ebullient prosperity"; and "things" have actually shown a "distinct improvement" during the past month. But the credit squeeze had worked since February "less rapidly than we expected or intended," and it was still impossible to be sure how great an effect would be exerted by the sum of the measures already taken. In the meantime, wage demands and industrial unrest, and rising expenditure on both consumption and investment, had revealed a "significant degree of inflation," so that the government feared that new pressures would reinforce the old before they had been sufficiently checked. In short, the government obviously feels that it has not been driven inexorably to new "emergency" action, but is intervening—as it claimed to be doing last February—"in good time." What a pity it is that the measures themselves are not as long-sighted as the professed intentions of policy.

Squeezing Municipal Finance

BY far the most important of the measures for pruning the public sector are those that impinge upon the local authorities, the investment outlays of which account for roughly one-quarter of the nation's whole investment. Their expenditures will be affected in three ways. First, the recasting of the housing subsidies, working in conjunction with the rise that has already occurred in the cost of local borrowings and the further modest rise that may now occur, will reduce next year's housing outlays substantially below this year's high level. Secondly, local authorities have been asked to keep all other capital expenditures in 1956-57 to a level not exceeding the amount spent last year; these expenditures are now running at well over £200 million a year. Thirdly, the authorities will have to face the discipline of the new arrangements at the Public Works Loan Board.

These arrangements mark a sensible and natural extension of the policy started at the beginning of 1953, when local authorities were released from legal obligation to borrow (for nearly all their long-term needs) from the Board and were left free to borrow in the market if it suited them to do so. They retained, however, the absolute right to borrow from the Board within the limit of their loan sanctions. Now this right is to be subject to the important qualification that all applicants will first be "put on inquiry as to their ability to raise the finance on their own credit, either in the stock market or in the mortgage market." This means that all authorities that can secure alternative finance on terms judged reasonable by the PWLB will be expected to do so. Moreover, the Board's lending rates, as prescribed by the Treasury, will no longer be kept approximately in line with those paid by the Government itself for corresponding periods but will be rates appropriate to the credit of "local authorities of good standing in the market." This test, however, will be used to establish only one single scale of rates, so that authorities that are unable to borrow in the market will get their finance on terms no less favourable than those secured by "good" authorities. Very broadly, the likely result is that the bigger authorities will normally now borrow in the market for all or most of their requirements while the smaller ones will secure a large part of their finance through the board. The present rates are 5 per cent on advances for periods of five years or over, and 4½ per cent for loans up to five years. Given current market levels, Mr Butler considered these rates "a fair starting point" for the new policy.

The aim is to foster the authorities' own sense of financial responsibility; undoubtedly this highly desirable purpose should be served in a material degree. But, for obvious reasons, it is not to be expected that there will be any quick impact upon the actual spendings of the authorities. Any extension of the use of the market mechanism in this sphere is, however, to be

welcomed, both on these broad grounds of promoting efficiency and economy, and for a more technical reason. Local borrowings from the PWLB have risen in the fiscal year to date to £223 million, or £83 million more than in the similar period last year, whereas over the full year they had been expected to fall from £353 million to £320 million. This pressure has naturally involved a similar increase in the Treasury's own borrowings, and since its requirements are met by Treasury bills, this means that the effort to impose the squeeze upon the supply of liquid assets to the banking system has been impeded. The new process, in its impact both upon the banking system and upon the wider capital market (including the mortgage market), will tend to accentuate the spreading money stringency.

Changes in Purchase Tax

THE Chancellor has made the most sweeping changes in purchase tax since he introduced his first budget in 1952. He has raised existing rates of tax by a fifth; he has brought into the scheme a range of household goods, including table china, that had until now been tax free; and he has completely recast the special schemes that applied to clothing and furniture by ending the "D" scheme, replacing it with a flat rate of tax at the low rates of 5 and of 10 per cent. The changes are expected to yield £15 million this year and £75 million in a full year. Of the three rates of purchase tax ruling before the budget the lowest, that of 25 per cent, goes up to 30 per cent, which can be taken to mean a 3 per cent rise in retail prices (about 7½d. in the £1). The second rate, 50 per cent, goes up to 60 per cent, equivalent to a 5 per cent rise (1s. in the £1), while the highest rate, 75 per cent, is raised to 90 per cent, representing 6½ per cent increase or 1s. 3d. in the £1.

In the first group, now taxed at 30 per cent, fall wall paper and stationery, drugs and bicycles, certain types of flooring, the chassis of commercial vehicles and most household goods, including many household items that have never been taxed before. The most important of these additions is table china which had enjoyed special exemption ever since purchase tax was introduced early in the war. A tinker's miscellany of saucepans, bread boards, pot scourers, coal scuttles, irons, kitchen scales and shopping baskets are also subject to tax for the first time, while an even stranger collection of items, such as cut glass, vases, gold and silver picture frames and trophy cups get concessions that mean they are taxed at the lower, rather than the higher rates. Clothing and furniture, which were also taxed at 25 per cent above the "D" levels, are no longer counted in with this group but are subject to new arrangements.

The goods that are now taxed at 60 instead of 50 per cent include most of the consumer durables, like cars, television sets, washing machines, and jewellery. No additions have been made to this category and there

have been one or two withdrawals, such as wool piece goods, cut glass and goldsmiths' products. Furs, for some obscure reason, continue to bear tax at the old rate of 50 per cent, the only goods to do so, but fur gloves will now go down to 5 per cent. The only goods in the top tax class, now 90 per cent, are cosmetics and the more lavishly coloured greeting cards.

The impact of these changes on retail prices is not severe in the group taxed at 30 per cent—except for those attracting tax for the first time. For the rest, it adds perhaps 10s. to the price of a £17 bicycle. But in the class of goods attracting tax at 60 per cent the increases are significant, even though they may not be weighty enough to put a brake on sales. The price of a car, which would have sold on Wednesday morning at £700 including tax, now costs £40 more. A £65 television set is £3 5s. dearer; a £20 vacuum cleaner, £1 dearer and a 5s. lipstick becomes 4d. dearer when it attracts tax at 90 per cent.

End of the "D" Scheme

THE most surprising of the changes in purchase tax is the decision to end the "D" scheme and in its place to tax all goods that were subject to it at a flat rate of 5 per cent, and in one or two cases at 10 per cent. The "D" scheme applied to furniture and clothing only, and was a legacy of the utility schemes in those industries. It laid down for each type of goods a wholesale price, or "D" limit, below which the goods were tax free. If their price exceeded the "D" limit, only the excess attracted tax. This scheme achieved two objects; it ensured that some tax-free goods were available, and it softened the impact of purchase tax on retail prices so that there was no longer a noticeable gap between the price of the taxed and the untaxed article.

The textile industries have, however, consistently maintained that a high rate of purchase tax, coupled with the "D" scheme, was doing serious harm to the development of better quality fabrics on which textile exports depended. Lancashire succeeded this spring in persuading the Chancellor to remove all purchase tax from non-wool textiles sold as piece goods, although he refused to extend the concession either to made up clothing (taxed at 25 per cent) or to wool piece goods (taxed at 50 per cent). The ending of the "D" scheme now means that there is no tax-free furniture and no tax-free clothing. Instead, most clothes and most furniture will carry a 5 per cent tax; some items like hats and wool piece goods, attract tax at the rate of 10 per cent and the few pieces of furniture that were outside the "D" scheme, office furniture in particular, attract tax at the rate of 30 per cent. Some textiles are altogether free of tax, notably non-wool piece goods and household textiles, and wool rugs and blankets. Babies' clothes and equipment are also exempt.

This change is likely to bring in the same amount of revenue as the "D" scheme, but it also brings substantial tax concessions to the better quality goods,

the price of which was too high to feel any advantage from the "D" concessions. A man's overcoat, for example, retailing at £5 was tax free under the old arrangement. It now carries 3s. 9d. tax. But a coat that cost £12, and formerly carried 10s. tax, now carries only 8s. 6d. and is therefore 1s. 6d. cheaper, and the higher the price the bigger the tax saving. Shoes that retail for £2 5s. and were formerly tax free, now carry 1s. 7d. tax; those that sold at £4 and carried 4s. tax, show a saving of 1s. 3d. today. The Chancellor told the House of Commons that these arrangements were specifically designed to help exports by removing the special handicap suffered by quality goods at home; it is now up to the textile industries to prove, by their performance, that it was in fact the effects of purchase tax at home that held them back abroad.

With the end of the "D" scheme the Chancellor has rejected one of the most cherished arguments of the opposition—and of some of his own supporters—the belief that the home market has a right to some tax-free output. His action may be welcomed by producers at the upper end of the textile trade, but it is certain to be greeted with an outcry by those producers who have profitably concentrated on tax-free lines—and it will be unpopular in the furniture industry, which has no export trade to speak of, which sold the bulk of its output tax-free, and which is just emerging from its spring slump. But the effect on furniture prices is not severe; a £25 wardrobe, which was tax free, will now carry 17s. 6d. tax, and a £17 table will carry 12s. At £22, the tax is the same, 15s., under both the old and new arrangements, above that, the new rates begin to show tax savings. These slight increases, even when they are spread over the furniture for a whole house, are likely to carry less weight with intending buyers than the hire purchase terms that they are offered.

Profits Tax Calculations

THE decision to raise the profits tax on distributed profits from 22½ to 27½ per cent can hardly come as a surprise to the City. The straws have been in the wind for some time. Has not Mr Butler in more than one speech urged the need for dividend restraint? His argument for following up the word with the blow is, to put it baldly, that higher dividends in themselves are directly inflationary. The Chancellor must be aware of the counter argument: that if dividends do go up some of the additional personal income accruing from them will be mopped up in surtax and that the fractional residue is at least as likely to be saved and reinvested as it is to be spent. He did not explicitly prop his decision with the argument that any measure likely to cut down the flow of dividends can serve as a counterpoise to claims for higher wages. Instead he seems to be content with the old argument, recently rebutted by both the majority and minority reports of the Royal Commission on Taxation, that retained

profits (which are encouraged by differential rates of profits tax) are in themselves good for the economy.

But the milk is spilt. The distributed profits tax has been raised while the undistributed profits tax has been left unchanged at 2½ per cent. How then, will the new tax work? The new rate of 27½ per cent will operate for all accounting periods beginning on or after November 1st. Arrangements have to be made to "split" earnings between the old and the new rates. For example, a company whose financial year ends on December 31st, will pay profits tax at the old rate on 5/6ths of the year's profits and dividends and at the new rate on 1/6th of them. The first full accounting year to attract the new rates will end in October next year, and payments at the new rate will become fully effective during the fiscal year 1958-59.

Investors will be concerned with the arithmetic for a full year's profits charged at the new rate. This can be put in the simplest terms. First, the taxable profits of any British company are subject to income tax at 8s. 6d. in the £. Secondly profits tax, as charged under the new rates, takes two bites—one of 2½ per cent on the total assessed profits and another of 25 per cent of the gross amount (that is the amount before deducting income tax) of any preference and ordinary dividends that are paid. So the 25 per cent slice varies according to the size of the dividend; hence any calculation of true earnings on a company's ordinary capital must take account of the additional profits tax that would have to be paid if profits were being distributed up to the hilt.

For such a full distribution it is possible to arrive at a simple equation. Taking profits as 100 and the net dividend (that is, after deducting income tax) as x , the arithmetic proceeds:

Income tax at 8s. 6d. in the £ 42½
Undistributed profits tax at 2½% 2½
Leaving to be divided between the net dividend and distributed profits tax 55

Therefore $x + \left\{ \frac{40}{23} \times \frac{25}{100} \right\} = 55$

Therefore x , the net dividend = 38.33.

Thus the following comparisons emerge:

OLD RATE		NEW RATE	
Income tax (8s. 6d. in £)	42½	Income tax (8s. 6d. in £)	42½
Undistributed profits tax (2½%)	2½	Undistributed profits tax (2½%)	2½
Net dividend	40.8	Net dividend	38.33
Distributed profits tax (20% of gross dividend)	14.2	Distributed profits tax (25% of gross dividend)	16.66
	100.0		100.00

From these calculations it can be seen that from any sum available for distribution (which will already have paid income tax and 2½ per cent profits tax), distributed profits tax will take 16.66 out of 55, or, more simply, ten out of thirty-three. Therefore only 23/33rds of retained earnings can be paid out in net dividends. The

rough rule of thumb is to reduce undistributed by one-third to allow for the additional tax that would fall due on full distribution.

How can this formula be best applied to actual calculations from a profit and loss account in which the dividend has already attracted income tax and distributed profits tax? There are a variety of ways of making the adjustment but the following two-stage method probably works most smoothly in practice. First, find the unadjusted gross earnings per cent by multiplying the gross dividend rate by the amount of net equity earnings and dividing by the amount of the net dividend. Secondly, deduct 10/33rds (or roughly a third) of the unadjusted rate of gross retained earnings (that is the difference between the unadjusted earnings rate and the dividend rate) from the unadjusted gross earnings rate. Here again an arithmetical example is the best guide.

Assuming that the amount of the net dividend is £50,000, representing a gross dividend rate of 10 per cent, and that net earnings after income tax and 2½ per cent profits tax on the whole profits are £400,000, then the unadjusted gross earnings per cent are:

$$\frac{400,000}{50,000} \times 10\% = 80\%$$

Net unadjusted retained earnings are thus:

$$80\% - 10\% = 70\%$$

If earnings were distributed in full, distributed profits tax would take about one-third of that 70 per cent, that is 23.33 per cent. Hence the true earnings rate is:

$$80\% - 23.33\% = 56.66\%$$

The statisticians can now get busy with their slide rules re-calculating earnings cover on dividends. But they will not have to go far in their calculations to realise that if, under the old regime of a 22½ per cent tax, there was an excess of earnings of about 4½ per cent over and above the gross dividend rate (that is, say, for an ordinary dividend of 12½ per cent earnings were 17 per cent) then it is still possible to pay exactly the same dividend under the new rate of distributed profits tax. Where the earnings cover is high investors need have no fears—so long as profits are buoyant—that the new rate of tax will lead to a cut in dividends. Their real concern, putting all arithmetic aside, is whether the impact of the higher tax in the boardrooms will reinforce the trend to conservatism and caution in dividend policies that the credit squeeze is already bringing out into the open.

Making the GPO Pay

THE supplementary budget provides the occasion for the Post Office to raise its charges; but these new charges are not emergency measures that might be withdrawn when the crisis is over. If no action had been taken now something like the additional £26 million that the Post Office is to draw from the public—

over £19 million of it from the telephone service and the rest from the parcels post and certain sections of the letter post—would have had to be imposed sooner or later, and the later the action the greater would the increase have had to be. The facts as revealed by the GPO Commercial Accounts each December provide a picture that is misleading in a way all too familiar in industry, both nationalised and private. The department shows a useful profit usually around £5 million, though wage increases and higher material costs would have turned that into a deficit of £3 million by the year ending March, 1957, if action had not been taken. The Post Office provides full normal depreciation (except on the telegraph account) and in respect of telephones which provide most of the apparent profit and absorb most of the investment (£87.7 million out of £95.2 million this year) the department has tucked away useful little additional sums towards the increased cost of replacements.

Yet the telephone account was on the road to insolvency. Normal "straight line" depreciation, plus the extra sums ploughed back, were deficient by £12½ million a year to replace the equipment at current cost; the greater the demand for telephones the greater the prospective deficit, for the very reason that the telephone was cheap and the demand for it insatiable. "A telephone in every home" was a fine slogan. A telephone at a loss in every home is another matter.

★

Wisely the Postmaster General has discarded all half measures and moved to a full replacement basis. He has also had to provide for the substantial increases in wages estimated to amount to £14 million between 1954-5 and 1956-7 and for a rise of £3 million in other costs. Fortunately, technical progress and managerial progress make it possible to absorb part of the extra cost.

Finally, this is the moment chosen—and a good one—to come to terms with the Chancellor of the Exchequer. The Post Office is not an autonomous tax-paying body like the more recently nationalised industries. It is a government department engaged in trading. It pays neither income tax, profits tax, nor even vehicle duty, but its profits accrue to the Treasury, and though profit is not the object, it is understandable that the Treasury should demand some contribution in lieu of the substantial tax exemptions that the Post Office enjoys. From the Postmaster General's point of view it is equally wise to make a long term bargain with the Treasury. He has been able to settle on a five-year basis at £5 million a year—a figure that happens to be less than half the £10½ million that the Post Office contributed annually to the Exchequer under the prewar Bridgeman plan. The department must also budget for a reasonable margin of safety. It has been decided to aim at a surplus of £5 million a year in place of the prospective deficit of £3

million. The margin is small in a turnover of over £300 million. The figure of nearly £26 million to be found can be expressed as a simple sum:

ADDITIONAL INCOME REQUIRED		ADDITIONAL INCOME TO BE PROVIDED FROM	
	£ Mn.		£ Mn.
Initial Deficit	3	Telephones:	
Exchequer Contribution	5	Rentals	9.75
Supplementary Depreciation	12½	Local Calls	7.00
Budgeted Surplus	5	Other charges	2.25
Improvements in Services	0½	Telegraphs:	
		Ship-shore	0.10
		Posts:	
		Inland services	5.70
		Foreign parcels	1.10
Total	25½	Total	25.90

The nature of the problem determined the solution. The postal services—particularly those sections of it that are uneconomic—express letters and parcels—had to make some contribution. The bulk of the extra charges had to fall on telephone rentals (the charge to subscribers for local calls is also being raised from 1½d. to 2d.; trunk calls—thanks to the coaxial cable they show a big profit—are left alone, and there is a technical as well as a political reason why the call box—the poor man's telephone—has to remain untouched). The two cheapest rentals, the country residential shared and the country residential exclusive, each rise £3 a year; the most expensive, the London business exclusive, goes up only £1.

To submit that bill has required political courage. There may be room for argument about details. Was it necessary to raise at all the London business telephone

TELEPHONE RENTALS

rental, already at £11 a year and showing a profit? Was it really worth while to do the cheeseparer operation on the extra ounces in the 2½d. letter post, which shows a good profit? But a welcome conclusion may be drawn. Recipients of the service are being asked to pay what the service really costs. While the principle is accepted there is no reason why the British Post Office should sink into the condition of permanent deficit that characterises the postal services of many other countries, not excluding the United States.

Business Notes

Snap Judgment

THE worst is known. And it is not as bad as Throgmorton Street had expected. That is the snap judgment of the City on the Budget. On Thursday the market's behaviour suggested that the Budget was not really disinflationary. As soon as the market opened industrial share prices were marked up sharply. Nor was that reaction confined to the leading equities on which the earnings cover is so high that the increase in the profits tax is no more potent than the bite of a gnat. It covered the purchase tax shares as well. Household goods, electrical equipment, store, motor, hire purchase and even building issues all went ahead. The technical rally that had begun before the Budget was sustained. By the close of the day the *Financial Times* ordinary index had risen by 5.4 points to 193.6—compared with 183.8, the point to which it slipped when the decision to have an autumn Budget was announced.

* Adjusted for 1 in 4 rights issue.

As a natural converse, gilt-edged prices, which had been rising in anticipation of cuts in capital expenditure, were marked down. Again the only conclusion from that is that Mr Butler had not done what investors expected of him. Towards the close the long-dated and undated gilt-edged stocks dropped sharply on the news that demands for higher wages were to be stepped up.

Mature judgment and the progress of the Budget debates could naturally modify that initial reaction. So could the credit squeeze still stealthily tightening its grip. And it will take some time to see how the new arrangements for local government financing work out. Time will also be needed to see how constructional and building programmes will

fare—perhaps here more than anywhere else Throgmorton Street may have to revise its first judgment. On the general run of equities the arithmetic effect of the increase in profits tax on the cost of dividends is only moderate but it may have a marginal influence on dividend policies, while there are other factors at work urging directors towards caution.

A Reassurance for Sterling

THE foreign exchange market shows little reaction so far to the Chancellor's reassuring references to sterling in his Budget speech. On Thursday the spot rate against the dollar, which had closed overnight at around \$2.79½, weakened slightly to \$2.79¼. But some Continental currencies moved in favour of sterling, notably the Dutch guilder and the French franc, and others, including the German mark, kept rigidly steady. Probably a substantial short interest in sterling remains uncovered and many commercial buyers of it are still living hand to mouth. The apathy can be understood for there was nothing in the Budget statement to make for a dramatic change in sentiment towards sterling, notwithstanding the tone of confidence in the currency that ran through the Chancellor's words.

He recorded an improvement during the past month, and noted that since he spoke at Istanbul in the middle of September, sterling has strengthened, and the British losses of gold and dollars had been checked, thus re-emphasising the earlier announcement that the whole of the \$112 million of gold lost during September occurred during the first half of that month, before the Istanbul speech, and that since then the gold and dollar reserves had held more or less level. The Budget reference moreover seems to imply that this check on the gold drain has held good during October and therefore that the settlement this month of the September deficit, with the European Payments Union, involving a gold payment of £21 million, must largely have been offset by gold and dollars regained by the Exchange Equalisation Account in its normal operations in the exchange and bullion markets. The Chancellor also announced that "our current deficit in EPU has been greatly reduced." In September it reached the exceptional figure of £38 million, of which in accordance with the new formula 75 per cent was settled in gold and dollars this month and 25 per cent by increasing the United Kingdom debt to the Union. The wording of the Chancellor's statement suggests that though this has not yet been converted into a surplus, the amount of the deficit for October should be much smaller.

Stripping the Strippers

THE Chancellor in the Budget turned his attention to the device of "dividend stripping," to which the minority report of the Royal Commission on Taxation gave some prominence. Measures will be incorporated in the Finance Bill to block this loophole through which those intent on tax avoidance—much to the annoyance of the Inland Revenue—have been able to wriggle. The dodge—it deserves no better word—has been employed by companies (mostly private companies) that had accumulated large balances of profits in a liquid or near liquid form. These profits, having been subjected to income tax, were available for distribution as taxed dividends—though they were still liable for a distributed profits tax charge, and in the typical private company, would have attracted a heavy surtax charge on the recipients.

If such companies were bought by a finance house the shareholders received a tax-free capital payment. The finance house could then extract the accumulated reserves by means of a special dividend and then immediately sell the residual assets at a corresponding loss. Since the finance house's receipt of the net dividend could be offset—in some cases more than offset—by the loss on the capital transaction, an amount corresponding to the current income tax on the capital loss could be claimed back from the Inland Revenue. The gain could then be shared out between the original owners of the company and the finance house. The measures designed to prevent such evasions will require a nice choice of phrasing, but they will be worthwhile—even though many have succeeded in doing what is now to be stopped.

A Two-month Treasury Bill

AN interesting innovation in Treasury practice in its borrowings on Treasury bills issued by tender will be seen in the near future. It was announced last week that "on and after" October 28th the regular Friday invitation to tender for bills on the following Friday (for payment during the week after that) may include bills with a currency of 63 days. Such bills will not be offered each week, but only as and when the needs of the Treasury so require. There is no intention, therefore, to displace the 91-day bill as the standard form of borrowing; but the Treasury is giving notice that at times, it may offer either both types of bills at the same tender or only 63-day bills.

The purpose of the change is, of course, to give additional flexibility to floating debt borrowings, so as to enable the Treasury to match its maturities more readily to the fluctuations, seasonal and otherwise, in the flow of its revenues, and thus to secure a smoother dovetailing of Treasury operations with the workings of monetary policy. Especially in the "revenue" quarter of each year, the task of employing the revenue surplus in debt repayment in such a way as to avoid dislocation in the flow of funds in the money market is a complex one. It threatened to be especially complex in the new year, because on this occasion it happens that there is no bond issue (or the remnant of a mainly converted

issue) maturing at that time. It is likely, therefore, that the two months bill will make its debut in the early future, so as to enlarge the volume of Treasury bills falling due in the weeks of peak revenue inflow. The issues when they appear, will not be unique. The Treasury has legal power to issue Treasury bills with any currency ranging from one month to not more than twelve months. Not since 1910, however, has it ever issued a two-month bill, and since 1917 all bills have had a life of either 3 months or 91 days.

Slower Fall in Advances

THE individual bank statements made up on October 19th suggest that in the preceding four weeks the pace of decline in the advances of private borrowers had almost certainly slackened. But that need not imply that the squeeze is abating: it may mean merely that the pressure on overdraft limits has yet to exert its full impact on actual repayments. Advances of the eleven clearing banks together fell by some £17 million. This fall is in no way comparable with the fall of £123 million in the (five week) September period, as at least three-quarters of that was attributable to repayments by the Electricity and Gas authorities from the proceeds of calls on their loans of £120 million.

In the latest four weeks there was only one call of £20 million, on the Gas loan; and after allowing for current requirements, it is doubtful whether net repayments by the two utilities to the clearing banks can have been very large. Of the total fall in advances of £17 million, repayments by private borrowers probably accounted for at least £10 million. This would amount to no more than around one-third of the estimated repayment in the previous five weeks; but it should be noted that the trend has been distorted by a special transaction for a giant customer of the National Provincial—so that this bank's advances were actually up, by £8.6 million.

The banks' investment holdings changed little in the October period, a reduction of £7.5 million shown by Barclays being a little more than offset by an increase of £6.6 million by Lloyds and smaller increases by three other banks. The fall in advances was more than offset by a rise in liquid assets, so that deposits rose (by £31 million) and liquidity ratios improved considerably in all the big banks save the National Provincial (35.8 to 33.6 per cent) and Lloyds (33.5 to 33.4 per cent). Barclays raised its ratio to the high level of 36.3 per cent; this ratio, and also that of the District and Martins, was actually higher than twelve months previously.

Conversion Success

THE result of the conversion side of the operation for refinancing the £524 million of serial Funding stock, due for repayment in a fortnight's time proved even more unexpected than that of the cash issue. Conversion applications for the new 4 per cent stock, 1957-58, totalled no less than £425 million, so that only £99 million

of the Funding stock remains to be repaid in cash. This means that the whole operation proves to be almost precisely self balancing, since the portion of the £250 million cash issue taken up by "genuine" cash subscribers—that is, by applicants other than the "departments"—is believed to have been not far short of £100 million. That in itself was regarded as a satisfactory response, but it was still generally expected to fall some way short of the cash requirement, so that some net addition to the government's borrowings on tender bills (and therefore some relaxation of bank liquidity ratios) seemed inevitable. Thanks to the scale of the conversion applications, this expected weakening of the technical position has been wholly avoided.

* Flat yield To the latest date

The departments, it now seems, must have previously acquired a considerably larger proportion of the maturing stock than had been generally supposed; for so large a conversion could scarcely have been secured if large amounts had been still held outside in the industrial and special quarters that were absorbing the stock when the banks were selling it earlier this year. It is believed that most of the holders of this kind have not elected to convert, whilst the regional holdings of the banks and discount market, though evidently converted, were not really large. The result therefore suggests that the departments must have bought considerable quantities of the Funding stocks in recent months, and yet did not force the Treasury into any undue additional borrowings on tender bills. In other words, official policy in the gilt-edged market was tough enough to ensure, despite these purchases, that the departments were substantial sellers on balance.

Wool Credit Shorn

THE acceptance credit facilities regularly made available by the London market to finance the movement of Australian wool to France are being curtailed this year. In each of the past two years these facilities, provided by a banking group headed by Lazard Brothers & Company, extended a revolving credit up to a maximum of £15 million. That credit is being cut to £10 million for the new wool season. It has been stressed that the reduction is in no way due to the credit squeeze, and this is true in the sense that the initiative for the cut has not come from the lenders: it has come from the credit users—the Groupement d'Importation et de Répartition de la Laine,

who have in the recent past used less than the full facilities to which they were entitled. After the fall in the price of wool, they expect to have still less need of sterling credits over the coming twelve months.

There have, however, been indications that many importers of primary commodities on the Continent have been able to finance themselves more cheaply in other markets, notably in Amsterdam and Zurich, than in London and this may well be one of the contributory factors in the less than full utilisation of the previous line of the wool credit and in the decision formally to curtail these facilities in the coming year. This cut in the wool credit is an illustration of a contraction that has been apparent in many other lines of sterling acceptance credit facilities; it shows credit restriction effective at its most immediately beneficial point, namely, in reducing the outflow of short-term capital from London and in contributing towards some reverse movement towards this country.

Mauritius Asks for a Little

THE Crown Agents for the Colonies have come back to the new issue market with a small but attractive offer. The Government of Mauritius has issued £2,090,000 of a new 4½ per cent stock 1972-77 at a price of 97; of the total amount £390,000 has been taken up on behalf of the Colonial Government funds, leaving only £1,700,000 for public subscription. The subscription lists closed immediately on Thursday. The issue was heavily oversubscribed with some stags in the picture. The lists open on Monday.

The Mauritius loan is the first from the Colonies since the Uganda issue of a 4½ per cent stock 1968-73 at 97 came so badly to grief in August. About 70 per cent of that stock was left with the underwriters and the stock opened at 1½ per cent discount. But thanks to the subsequent recovery in gilt-edged prices that stock now stands at ¼ per cent premium. The terms of the Mauritius loan have been pitched close to the market valuation of the Uganda loan. The attractions of this trustee issue are to be found more in the high running yield of £4 17s. 11d. than in the gross redemption yield at £4 19s. 6d. to the final date of maturity. The Crown Agents have thus successfully tested the market with a small issue, preparing the way for the other bigger colonial claimants standing in the queue.

Large Tankers for BP

BRITISH PETROLEUM is the first major tanker operator in Britain to plump heavily for larger size tankers. It announced this week that it has placed orders for 23 new tankers, and all of them are over 30,000 tons deadweight. One only of the vessels will be in the 32,000-ton class, sixteen will be of 34,500 tons, and six will be of 42,000 tons. Nearly half of the new tankers planned in recent months by the oil and shipping companies are standard 18,000-ton vessels, although Shell intends to build twenty 32,000-ton tankers. A tanker of 42,000 tons deadweight is not the

The cure for acute labour shortage

If you find it hard to meet demands for increased production, look at Hull, where the labour position is easy.

Hull can give equal satisfaction on sites, transport, public utility supplies, export and inland distribution, and offers the products of many industries including—

Solvents and plasticisers, pigments, chemicals, adhesives, chalk, cement, oils and fats, latex; grinding media, hydraulic, chemical, electrical and general engineering services; wood, grain and oilseed by-products; containers (metal, wood, card), printing.

FOR DETAILS OF SITES AND SERVICES

Hands off your money

Materials handling costs £800,000,000 a year; a third of industry's wage bill. Free it, and it is yours to share—to buy new plant, to increase production and to bring a higher income for everyone.

How? Take the "hand" out of handling. Let "Mechanised Muscle" do the drudgery and use human hands and human initiative to make more goods—with better wages and greater safety.

Lifting, stacking and towing are right up "Mechanised Muscle's" factory aisle. Lansing Bagnall's Fork Lift and Pallet Trucks, Tractors and Trailers have been developed over 37 years for just these jobs. They will get you your share of that £800,000,000.

Gale Warning!

"Force 8"! That's the way they describe on the radio the tearing winds which are rated as full gales, the gales that lash the freezing Arctic seas into frenzy as the sturdy little trawlers seek the fish for you and your family.

Very annoying those interruptions on your favourite programme, when the laconic voice of the announcer says... "there are gale warnings for the areas Rockall, Iceland, White Sea, Faroes"... That doesn't mean much in the warmth and comfort of your home. But spare a thought for "those in peril on the sea", when the wind whistling round the eaves makes the security of your fireside seem all the sweeter.

Think of the men of the Distant Water Trawler Fleet, to whom the radio messages crackling across the thousands of miles of Arctic wastes—mean fighting

for their lives with lacerated and bleeding hands, eyes streaming from the icy blasts and sweat pouring from their struggling bodies in spite of the freezing cold. Fighting for their lives, for their ship and for the precious cargo of fish, which not only gives you the cheapest first-class food money can buy—cheap to you but very dearly bought by the men who fetch it back—but also provides the precious cod liver oil which brings health to man and beast, and the prime quality fish meal for which the stock-farmer clamours.

Force 8 against the force of character, the strength of resolution and body of the men of the Distant Water Trawler Fleet! Think of this when next you hear the gale warning on the radio.

BRITISH TRAWLERS

Hull / Grimsby / Fleetwood

B R I T I S H T R A W L E R F E D E R A T I O

largest ever to have been launched, but there are few with a deadweight tonnage of more than 40,000 tons; this announcement thus marks a major shift for an oil company in this country and also for the British shipbuilders who are to build all the tankers in the BP programme, apart from six 34,500-ton vessels which have been ordered from Italian shipyards. Negotiations have been taking place for some time, and BP has been able to persuade eight shipbuilders in this country to undertake the construction of these immense tankers and to promise delivery in 1958 and 1959.

With the announcement of the orders placed by BP, the present programme of new construction ordered by tanker owners is almost complete. Since July, plans for the construction of about 3½ million tons deadweight have been announced; these include orders by the major oil and shipping companies for 106 vessels totalling nearly 2.7 million tons which have been published in the last six weeks. British shipyards are to build about two-thirds of this tonnage, and there can be very few berths that are not now fully booked up to 1959 or 1960. The total tanker tonnage sailing under the British flag is at present in the region of 8.1 million tons deadweight, and about two-fifths of this has been built in the last five years. Orders for close on 1½ million tons have still to be completed, but these vessels should all have been launched by 1957. By 1960, therefore, when all the tankers in the present building programmes will have been delivered, British owners should have about 8 million tons dw of new tankers that are ten years old or less. And by then they will have had to think about replacing the "large hump" of tankers that were launched during the war.

Busier Time for Shipyards

THIS heavy flush of new tanker orders has come at a time when the shipbuilding industry's order book has at last begun to turn upward. The revival started about a year ago and is already reflected in the larger volume of shipping tonnage it now has under construction. Since September, 1954, the industry has received orders for about 1.7 million tons gross of new ships, more than three times as much as in each of the two previous twelve months. Almost half this tonnage has been booked since June. Much of it—perhaps 500,000 to 600,000 tons gross—consists of tankers; the figures for the October to December quarter will similarly be heavily weighted by tanker orders. But bookings for new cargo vessels and ore carriers have also been rising; since January these have totalled over 600,000 tons.

Most of the world's shipyards have been enjoying a similar revival in new business. Although it takes a few years from the time a ship is ordered to the time it is launched and completed, ship owners have been greatly heartened by the recent strength of shipping freights and by the genuine increase in certain traffics. Tramp freights are now about half as high again as at this time last year. The tonnage of shipping under construction has risen in all shipyards, although launchings and completions are still lower than last year. German shipyards have about 2 million tons gross of orders on hand now whereas last year the total was just over 1 million tons. The increase in the order books

of British shipyards is rather less than this—about 250,000 tons to 4.67 million tons gross—but this is the first time since the total of outstanding orders reached a peak of seven million tons in 1952 that new bookings have exceeded current deliveries and cancellations. This improvement could blunt the incentive for shipbuilders here to continue their endeavour to reduce prices and delivery dates. British prices, and escalator clauses, are still less satisfactory than those offered in Germany, although delivery dates appear to have been growing closer together. But the British industry's share of world shipbuilding activity is still falling; it is now about 34 per cent of the tonnage under construction against 37 per cent in September last year. This industry will also have noted that fewer of its recent customers have been foreign ship owners.

Britain's Share of Trade

WHEN compared with the first nine months of 1954 the rise of 6 per cent in British exports this year is not unsatisfactory. But it is disturbingly small when compared, as it must be, with British imports on the one hand and with the exports of Britain's competitors on the other. This year imports have risen much more than exports, and though imports now seem to have passed the peak, the nine months' total was still 15 per cent higher than in the same months of last year—against the 6 per cent rise in exports. There is a similarly broad disparity between the rise in British exports and those of the rest of the world. Figures published by the Board of Trade show that world exports of manufactures, which have been rising steadily in the past two years, were 13 per cent higher in the first half of 1955 than in the first half of 1954. In contrast, Britain's exports of manufactures rose by only 4 per cent between those periods, and its share of world exports fell from 21 per cent to a little under 20. Exports of manufactures from the United States, it is significant to note, rose by nearly 16 per cent between the two periods and its share of world exports rose from 25½ to 26½ per cent. And West Germany's exports rose even more sharply, by over 20 per cent, and its share rose from 14 to nearly 15 per cent. As recently as the first half of 1954 the value of German exports of manufactures was still two-thirds of that of Britain's; by the first half of this year the proportion had risen to three-quarters.

One explanation of Britain's poor performance may lie in the fact that trade between the manufacturing countries is increasing faster than their trade with the primary producing countries, and it is to the latter group that two-thirds of Britain's exports traditionally go. Between the first half of 1954 and of 1955 the manufacturing countries' imports from each other rose by about 14 per cent, while their imports of primary products rose only slightly. The recovery of British exports to North America does not suggest that exporters are neglecting that market, though more could certainly be done. But the recent decline in exports to Western Europe, after the steady expansion hitherto, is disquieting; the increase of German competition cannot be wholly to blame. The new bout of import restrictions in Australasia and a stiffer monetary policy at home should

help to quicken British interest in European markets and in North America too. And it is worth remembering that if exports hit the Chancellor's target of an increase of "at least 10 per cent" this year, that achievement will not be as meritorious as it appears; the 1954 total lacked, and the 1955 total will have the benefit of, the exports that were held up by the dock strike of last autumn until the beginning of this year.

One Parcel for Sale

THE prospectus issued by the Transport Commission on Tuesday for the sale by tender of the shares in the company that owns and operates its fleet of lorries specialising in carrying parcels up to a ton in weight is no ordinary one. The Transport Act 1953 obliges a buyer to buy all seven million £1 shares in the company in one lot; it is for potential purchasers to bid what they think the company is worth and for the Transport Commission and the Disposals Board to decide whether to accept any of the tenders. The conditions laid down in the Act for the company method of selling nationalised lorries make it little different in practice from tenders for unincorporated haulage units.

Two groups, at least, have expressed some interest in the past in acquiring this parcels fleet; but they and any others would have to find a formidable sum of money. The book value of the company—which owns over 4,000 lorries, ranging up to 15 tonners, and well over 1,000 trailers and containers, employs nearly 13,000 people, and operates from 117 depots serving 13,000 places in different parts of the country—is put at £6½ million. But a purchaser is expected to pay much more than this. The company's premises and equipment have been valued at £1 million more than their book value, its vehicles similarly appear to be under valued, and by the time bids have to be sent in next January the company will have spent a further £1¼ million on new lorries. This makes at least £9½ million. On top of this the purchaser will have to pay additional sums, satisfactory to the Transport Commission and the Disposals Board, for the value of the special A licences under which the company will operate its fleet, and for the goodwill of the name "Carter Paterson." The parcels fleet has been made into a national network by the Commission out of the many businesses it took over.

Once the purchaser has bought the company, he will have to sink more money in it before he sees a return. The company is short of working capital; it needs to spend another £1.1 million in 1956 on more new lorries in order to bring the fleet up to scratch; and about £4 million will have to be spent within five years, and £1¼ million straightaway, to overtake arrears in building work. Thus any buyer will have to face total outlays of not much less than £13 million. The company's profits, before tax, appear to have been running during its year of separate existence at less than £1 million a year, which gives a return on capital employed (at present book value) of 12½ per cent. To sell this fleet will not be easy; certainly the Transport Commission cannot be accused of issuing a rosy prospectus.

Talking About Wheat

REPRESENTATIVES of about 60 countries gathered in Geneva this week to consider the renewal of the International Wheat Agreement, due to expire in July next year. This session of the conference, though not necessarily the last, is likely to be decisive. Governments were invited to suggest modifications to the existing agreement or alternative forms of agreement, and these suggestions are the starting point of the discussions. The next few weeks should reveal whether there is sufficient unanimity on principles to justify a second session in the spring. There are four possible outcomes:

- (1) The agreement in its present form could be renewed by the present members only;
- (2) It could be renewed to include other countries as well, and thus cover a larger part of world trade;
- (3) A new agreement could be devised;
- (4) The conference could collapse.

The first possibility can almost certainly be dismissed, for the present agreement is generally admitted to be ineffective without the support of Britain, the largest importer. The second possibility is not so remote. The present scheme no longer bears much reality to the world wheat trade, but if the conference fails to improve upon it then governments might fall back upon its renewal, if Britain would re-join. It is conceivable that Britain might find this politically expedient—given agreement on prices—for the sake of its relations with the Commonwealth producers, Canada and Australia. As between the third and fourth possibilities the odds seem about even.

Nearly all the 48 members of the agreement are attending the conference; the four exporters are the United States, Canada, Australia and France which, no longer a minor exporter, now ranks level with Australia. Argentina, the largest exporter outside the agreement, and Turkey and Sweden, minor ones, are also taking part. Russia and the Danubian countries are represented—all as exporters?—and Poland and Czechoslovakia too. The most notable newcomer among the importers is Britain, which refused to enter the present agreement in 1953.

The conference was offered an apt commentary on the vast surplus of wheat a few days ago, when the Canadian government announced that from November 15th it would grant farmers special facilities to borrow from the banks against wheat on the farm, and would guarantee the banks against loss. Canadian farmers are suffering from a new form of poverty. Prices have not collapsed in face of the surplus; the Wheat Board has seen to that. But farmers' incomes have fallen sharply because, with production so much in excess of demand, the Wheat Board can buy so little of their wheat.

Unilever Does it Again

STOCKHOLDERS in the Unilever diarchy will be forgiven if they confuse the document they received this week with the one that came through their letter boxes last December. The two documents bring exactly the same

The DARLINGTON GROUP at work here

One way or another, the companies in the Darlington Group supply indispensable goods and services to British Industry. Each is an independent company, expert in its own field, but when you buy the services of one, the materials and know-how of the others are automatically at your disposal. All over Great Britain you will find the Darlington Companies quietly at work, helping this country's industry to ever greater efficiency.

THE CHEMICAL & INSULATING CO. LTD.
Manufacturers of Magnesia for insulation and chemical purposes, heat resisting compositions, cements and high temperature materials. Darlington, England. Tel. Darlington 3547.

THE DARLINGTON INSULATION CO. LTD.
Heat, cold and sound insulation engineers and contractors. 38 Great North Road, Newcastle upon Tyne. Tel. Newcastle 23666.

S. T. TAYLOR & SONS LIMITED
Sheet metal and plate workers and marine sound insulation engineers. Kingsway, Team Valley Trading Estate, Gateshead. Tel. Low Fell 75076/7.

IPSCOL LIMITED
Manufacturers of automatic controllers for combustion and industrial process control. Hythe, Southampton. Tel. Hythe 2231.

THE BRITISH REFRASIL COMPANY LIMITED
Manufacturers of Refrasil lightweight extra-high temperature heat insulating material. Stillington, County Durham. Tel. Stillington 351.

An eye for protection

THE FISHERMEN of old China had a wily protection against the hazards of navigation. On the prows of their ships they painted eyes. A ship that could see was safe for a man to sail in!

No such artless gesture for the modern manufacturer launching his product into the seas of competitive selling. For him this business of protection means close and calculated provision for the safe arrival of his goods. He places his trust more in substance than in symbols.

At this moment millions of tins, jars, packets and

bottles are flowing from production line to shop shelf and larder protected by stout "Fiberite" cases.

But safe arrival is not enough. Modern packaging must help to sell as well as to safeguard the goods. So you will find in many of those "Fiberite" cases there are cartons made of "Thames Board". Cartons made to hold the shopper's eye with their crisp, attractive appearance. With rising standards of living, and the constant marketing of new products, the demand for "Thames Board" and "Fiberite" grows greater every year.

THAMES BOARD MILLS LIMITED

THE LARGEST MANUFACTURERS OF BOARD AND PACKING CASES IN BRITAIN

Purfleet, Essex  Warrington, Lancs

"THAMES BOARD" for cartons, boxes, bookbinding, etc. "FIBERITE" Packing Cases in solid and corrugated fibreboard

good news—though the news was not completely unexpected. As in December, 1954, Unilever Limited and Unilever NV are each to make a 25 per cent free scrip issue of ordinary shares. For ordinary stockholders in the British company it will be one new £1 share for every £4 of stock now held and for stockholders in the Dutch company one new Fl. 1,000 share for every four Fl. 1,000 shares now in issue.

A free scrip issue is nothing more than a sensible device to tidy up the balance sheet—unless it brings with it effectively higher dividend payments. That is what the Unilever scrip issues will bring, as they did last year. Using almost the identical words they used then the directors, "appreciating that these increases of capital may cause conjecture as to the amounts of the interim dividends," have decided to maintain the interim rate of 6 per cent for Limited company and of 5½ per cent for NV on the increased capital. Again that decision mirrors that made last December when exactly the same rates were maintained on the increased capital. Those interims were followed by the maintenance of the old final rates (that is 9½ per cent for Limited and 8½ per cent for NV) on the enlarged capital. The assumption in Throgmorton Street is that the same practice will be followed when the next final dividends are declared—hence the rise in the £1 stock units to 90s. 6d. At that price and, assuming that the market's guess of 15½ per cent for Limited's full year's dividend is right, then, allowing for the new scrip issue, the £1 stock units have been put on a yield basis of about £4 7s. per cent.

Boom in Tanker Freights

THERE has been an exceptional jump in tanker freight rates this week. Since August the spot voyage rate has been running steadily at about Scale minus 5 per cent (Scale rate equals 32s. 6d. a ton from Curaçao to London); last week it rose to Scale minus 2½ per cent; and this week the average rate is expected to be about Scale plus 20 per cent. Heavier shipments of oil to the eastern seaboard of the United States and to Western Europe usually bring about a rise in tanker freights at the beginning of the winter, but not normally as early as this. A shortage of tankers for early shipment is partly the reason. The increase began to appear last week in the rates quoted for moving oil from the Middle East; it has now been followed by rates for Caribbean oil and in the American coastwise trade and time charter rates have also moved up. The market appears to expect this rise to last. One of the major oil companies fixed a tanker on Thursday for a minimum period of six months after loading next month at a minimum rate of Scale plus 20 per cent.

Coal in Hand

SINCE the coal "winter" started almost a month ago the weather has been a little colder than October last year and coal consumption has inevitably been somewhat higher. But the coal situation is much better now than it looked a

few months ago; for this the Coal Board may thank the fine summer and the plump cushion provided by imports. By the end of May inland consumers had used over two million tons more than they took in the first five months of 1954, but they have since taken nearly 1¼ million tons less and total inland consumption of 165½ million tons to the middle of this month is only 410,000 tons more than a year ago.

Colliery output has been showing its customary rise since the summer holidays. But the total of 167½ million tons to last weekend was still nearly 3.9 million tons down on last year. Much of this drop—about 1.4 million tons on the Board's reckoning—has been lost in disputes; these have now cost the industry almost 2½ million tons since the year started. Absenteeism has also been higher and the industry has been losing about 130 miners a week since January. But export and bunker shipments have so far been cut by two million tons, about 9½ million tons of coal has been imported against less than two million tons over the same period last year, and over a million tons extra has been scraped from the Board's opencast workings since April. As a result coal stocks are much higher; at 20¼ million tons on October 15th they were nearly 2.7 million tons up. With this in hand and the prospect of several million tons more American coal still to come, the Board should be able to see the winter through.

Canadian Dollar Nears Par

THE Canadian dollar has in the last four weeks lost the greater part of its premium. At one moment last week it was actually quoted at par to ¼ cent premium on the United States dollar, although since then the rate has recovered slightly; on Wednesday of this week the middle rate on New York was 1.00¾. The Canadian dollar has stood at a premium over the United States dollar ever since March, 1952. A year ago the premium was as high as 3 per cent, but early this year it fell to under 2 per cent. The main reason for the recent weakening is to be found in an outflow of capital from Canada. In the first place, dearer money in the United States has induced an appreciable shift of short-term money from Canada to the New York market; in an attempt to check this movement, the Bank of Canada raised its re-discount rate in early October from 2 to 2½ per cent—the second increase in two months. Secondly, the ebullience shown by the American economy this year, in conjunction with apprehensions that Canadian prospects have been substantially over-discounted in security prices, have caused a virtual cessation of the movement of longer term capital from the United States to Canada. There have also been adverse movements on current account. In particular, it is reported that this year there have been more Canadian tourists visiting the United States than American tourists visiting Canada. The commercial demand for Canadian dollars has not recently reached its customary seasonal peak; this appears to be due in part to the bumper grain harvest in Europe, and also to postponement of orders for Canadian wheat in anticipation of lower prices.

Fracas over Newsprint

THE decision of two Canadian mills, Abitibi Power and Paper Company and St. Lawrence Corporation, to increase the price of newsprint by \$5—to US\$131 a ton delivered New York—appears to have raised a disproportionate amount of dust. After three and a half years of stability, a four per cent increase in the price of a commodity much in demand seems not unreasonable, bearing in mind that prices of other kinds of paper and board in America were raised this summer. But the mills' action has been roundly condemned as anti-social. Usually when one mill raises its prices, the others have quickly followed suit. This time, the Anti-Trust division of the United States Department of Justice has joined battle on the side of the newspaper proprietors in an effort to stop a concerted advance.

Consumers may not gain more than a respite. A third producer has just raised its price by \$4 a ton. The mills have an obvious trump in America's hunger for newsprint. A "grey" market is flourishing in New York at prices well above the contract price of \$126 a ton. For the first time since 1950, American newspaper advertising is holding its own against commercial television and with swollen papers newsprint consumption has risen sharply. Though the considerable increase in America's own newsprint output satisfies about two-thirds of the extra demand, the remaining third is straining world resources. Canadian capacity is being substantially expanded, but before the new machines are operating in two or three years newsprint may well be short.

British prices will no doubt be affected in time. The equalised price of home-produced and imported newsprint was last raised by 30s. to £54 15s. a ton in January. Pulp prices are edging upwards, paper is likely to follow and newsprint can hardly escape. Indeed, it was Sir Eric Bowater, chairman of Bowater Paper Corporation, which supplies nearly two-thirds of the newsprint produced in Britain, who first raised the dust by predicting an increase in prices when in New York earlier this month.

Three Shifts in Weaving

THE Weavers' Amalgamation deserves full credit for having thrown tradition overboard and accepted in principle the introduction of a night shift on Lancashire's looms. The union is the largest in the weaving section of the cotton textile industry, and its decision was subsequently supported by the smaller unions. The conditions on which they will be prepared to accept three shifts are now being settled, and will be submitted to the employers' representatives next month. The practical importance of this decision at the moment is small, but could be considerable in time. The conditions are likely to be such that only the most up-to-date mills, with automatic looms working on two shifts, will be able to introduce a third shift, and the number of these mills is small. Out of 330,000 looms in running mills, only about 45,000 are automatic and not all of these are on two shifts. Still fewer mills have sufficient orders or

male labour to justify three shifts at present. But as mills do go on to three shifts competition among weavers will increase and this should stimulate modernisation and shift-working all along the line.

In the spinning section of the industry, where only three per cent of the spindles are employed on two shifts, the problem is to introduce two rather than three shifts. Unlike the weavers, the spinning unions have not in the past accepted the principle of shift-work, although they have agreed to it at a number of mills. The employers' representatives argue that a prime reason for the lack of progress is the unions' insistence on a wage premium for shift-working that they consider too high; the unions ask why some mills can afford to pay that premium and others not. The employers are hoping that the premium can be reduced as part of a general agreement with the unions on working conditions. The gap between what both sides consider reasonable is not so large as to rule out a compromise, and it is much to be desired that one will be reached.

Anglo American Copper Dividends

IT was a foregone conclusion, as it often has been in the last few years, that the Rhodesian copper mining companies must pay higher dividends. In practice the dividends declared by two companies of the Anglo American group this week—Rhokana and its parent Rhodesian Anglo American—though increased, failed to come up to investors' high hopes. Rhokana is paying a final dividend of 212½ per cent, making 262½ per cent (52s. 6d. per £1 unit) for the year ended June 30 (compared with 250 per cent) and the £1 units quickly fell £1 15s. to £39 10s. Rhodesian Anglo American is paying a final dividend of 62½ per cent, making a total payment of 77½ per cent (7s. 9d. per 10s. unit) for the year (compared with 75 per cent); the stock units fell 3s. 9d. to £5 5s. after the declaration. Both companies' dividends are stated after deduction of Rhodesian tax. To British resident taxpayers they are paid subject to a provisional allowance for double tax relief and are eventually subject to tax at the individual investor's appropriate rate.

The reason for the market's disappointment lies in the modest advance that profits made in a boom year for copper. Production and sales were affected by the strike that ran from January to March this year. Rhokana showed a net profit after tax of £10,022,463, compared with £9,544,021, but the 1954 figure also benefited from a transfer of £400,000 from sales equalisation reserve made in accordance with the group's practice of drawing from that reserve when it replaces stock in its pipeline and paying into that reserve when it draws on the pipeline.

New Money for Harrods

A CASH issue of ordinary shares from Harrods, the London department store, is a very rare bird. The last time the company made such an issue was in 1919. Now it has come forward again with a conventional rights

THE ECONOMIST, OCTOBER 29, 1955

Are you riding to a prosperous tomorrow?

An afternoon in Autumn . . . a country lane . . . two young people riding. Nothing unusual in that. They're ordinary enough young people. Not very rich . . . not very poor. But they've recently got engaged and they have great ambitions for the future. And that's why they're so important to you. For soon they will commence to buy. If they choose your products you will be starting on the ride to tomorrow's prosperity.

Like millions of other young people, they read the Daily Mirror every day, for the Daily Mirror, with the greatest daily net sale on earth, appeals particularly to the vigorous, younger generation. They are attracted to it because of its modern presentation of the news—its outspoken opinions, its fearless ferreting out of facts. Amongst all classes and all income groups it is the paper that is read by the people with the longest buying years ahead of them—potential buyers of your product today . . . next month . . . next year.

THE ECONOMIST, OCTOBER 29, 1955

issue, of 677,209 £1 ordinary shares at 48s. per share; they will be offered in the odd proportion of 10 new shares for every £49 of stock now in issue. The offer has been underwritten by Morgan Grenfell for a total commission of 10½d. a share. Just before the offer the existing shares stood at 53s. 6d. but after the announcement, as is now the custom in Throgmorton Street, the price was marked down to 51s. 9d., so that the rights are worth about 9d. a share, and on Thursday the new shares were quoted "nil paid" at 1s. 9d.

The new shares will rank for the final dividend due next February. The directors do not forecast what that dividend will be, but as they say that sales so far this year exceed those of the same months of 1954 and that profits for the year to January 31st next will not be less than the average profit (about £1,700,000 before tax) of the last three years, the assumption must be that the full year's dividend will be maintained at 17½ per cent. On that assumption the new shares are being offered on a yield basis of 7.3 per cent, an attractive yield for one of the more conservative stocks in the department store group.

The net proceeds of the issue, about £1,593,000, will cover the cost of completing the purchase of some freehold and leasehold properties in Birmingham for £1,589,000. Stockholders have already been told that the group was actively considering the opening of a new store in Birmingham; this is the first big step towards that objective. But Harrods will not take possession of the properties for at least three years. Only then will the company start re-building—and then, perhaps, it will have to make another appeal to the market.

Woolwich Building Society

It is likely that the two big building societies that close their financial years on September 30th—the Woolwich Equitable and the Leeds Permanent—will this year present a different picture from the majority which account to December 31st. The preliminary figures from the Woolwich society issued this week should be read in that light. The accounting period includes the whole of the months in which the societies were under pressure of withdrawals (because interest rates were more attractive elsewhere). The society put up its share interest from 2½ per cent net to 3 per cent net on September 1st, so that only one month of the better conditions that followed comes into the present accounting period.

Against that background the figures of the Woolwich Equitable society look good. Total assets have risen during the year by £12.6 million to £116.1 million; shareholders' the year by £12.6 million to £116.1 million; and depositors' balances by £12.2 million to £110.5 million; and mortgage balances by £12.9 million to £97.5 million. Even the total amount advanced on mortgage during the year was £1.5 million higher at £23.2 million. On the other hand, liquid assets have inevitably declined; the fall was £364,000 to £17.8 million and the ratio of liquid assets to total assets has dropped from 17.56 per cent to 15.33 per cent. The fall in liquid assets is strikingly modest and the decline in the abnormally high liquidity ratio of a year ago has brought the society back to about its normal liquidity.

SHORTER NOTES

The new management of the British Industries Fair appears, after a slow start, to be having some success in bringing back into the Fair the industries that have left it in recent years to hold their own, separate trade exhibitions. One of the main exhibitors at the first of the two Fairs to be held in London, which opens in February, is the toy industry that is transferring its annual exhibition to the BIF; more support is also being given by the chemical, electrical and electronic industries. But the main defaulter, the textile industry, will not be present at all next year, although it may return in 1957.

City of London Real Property Company has announced an interim dividend of 3 per cent and forecasts a final dividend of 6½ per cent. The indicated total payment of 9½ per cent substantially exceeds earlier indications of not less than 7½ per cent per annum. From what source does the extra dividend spring? Before the scrip issue the company was paying 10 per cent and earning only about 11 per cent, but its properties include important office blocks in the City of London now being rebuilt. As they become available for letting revenue should grow.

The World Bank has made a loan of \$5.3 million to the Japan Development Bank, a Japanese government agency that supplies long-term credit for industrial development. The proceeds of the loan are to be passed on to the Yawata Iron and Steel Company, which produces nearly one quarter of Japan's steel; the money is to be used to finance imported equipment for the installation of a modern steel plate mill that is to replace three outmoded mills. The Japanese government has guaranteed the World Bank loan, in which the Manufacturers' Trust Company of New York is participating to the extent of \$791,000. The loan carries interest at 4½ per cent and is repayable in fifteen years.

Company Notes

BOWATER PAPER. The formidable bunch of explanatory memoranda and resolutions sent out by the Bowater Paper Corporation must make many stockholders dizzy. But dizzy or not, they will not miss the essential point that the capital reorganisation makes all the preference stockholders slightly better off. The immediate effect was that these preference shares were marked up, but the Stock Exchange was even more attracted to the proposed 100 per cent free scrip issue of ordinary shares, requiring the capitalisation of £9,600,000 from reserves. For those who take note of the nuances of directors' statements the comment from Bowater's boardroom that in recommending future dividends "regard will be had to the fact that the issued ordinary capital will have been doubled" will appear less grudging than the

Preference stockholders should also turn up to that meeting in a happy frame of mind. All the preference stocks of the parent company and its British subsidiaries, with their differing coupon rates, are being turned into a single class of 5½ per cent preference stock. As the accompanying table shows the terms of the conversion give stockholders either an effective increase in income or a tax free cash payment. Their rights on repayment have also been made more favourable and given a more up-to-date look. (The reorganisation will, incidentally, slightly raise the gearing on an already highly geared equity.) The conversion will give preference stockholders a more freely marketable stock and, as far as the company itself is concerned, the reorganisation is designed to "facilitate the financing" of future expansion. The

	Present Issued Capital	Proposed Exchange into 5½% Preference	Gross Annual Dividend per £100 of Original Stock	
			Present	Proposed

* Plus on conversion £2 10s. per £100 of stock as a tax free cash payment.

customary phrase on such occasions that a free scrip issue does not necessarily imply an effective increase in dividends. The new shares will rank for the next final dividend.

But the jobbers, in immediately marking up the £1 ordinary stock units by 8s. 6d. to 100s., based their judgment on something more than a turn of phrase. They took note of the recent history of the company—as did the American investors who once more re-entered the market to buy the stock. This is the third free scrip issue in eighteen months and last year's scrip issue was followed by bigger dividends. Profits from paper and newsprint are still running high and there can be little doubt that stockholders will turn up to the meeting at the Stoll Theatre, as they once turned up to the meeting at the Royal Festival Hall, with the knowledge that in itself a free scrip issue is nothing more than a piece of book-keeping but in the hope that Sir Eric Bowater and his co-directors will treat them to something more substantial than this truism. In the 15 months to December 31st last, the dividend was 22½ per cent, equivalent to a year's payment of 18 per cent. A full year's dividend of, say, 10 per cent on the new capital is within the range of possibility—and of speculation.

scheme is linked with proposals to merge the business of the three operating British subsidiaries into a single undertaking, Bowaters United Kingdom Pulp and Paper Mills Limited.

ELECTRIC AND MUSICAL INDUSTRIES. Electric and Musical Industries purchased 96 per cent of the common stock of the American company, Capitol Records, on March 22nd. The financial year of EMI closed on June 30th and hence profits earned by Capitol Records in the three months or so under the control of EMI have been included in the company's preliminary statement. The sum of these profits, which is not recorded in the statement, cannot be very large. The full year's net profit of Capitol Records in 1954 was put at about £246,000 so that at a guess perhaps £50,000 to £75,000 from Capitol Records might be included in the latest net earnings of "subsidiaries in British Overseas Territories and the United States." These net earnings came to £171,000 in the year to June 30th, compared with £127,000 in 1953-54. At the same time the net profits of "subsidiaries in other overseas territories" went up from £215,000 to £295,000 and of

"United Kingdom companies" from £204,000 to £366,000.

Thus net profits in all advanced from £546,000 to £832,000, in line with the increase in trading profits from £2,074,000 to £3,170,000; those gross profits include non-recurring credits of £105,000 (against £15,000). The re-organisation of EMI has clearly made its immediate mark and the group is now in a position to meet public enthusiasm for high fidelity equipment and for long playing records. The group made a bad start in the long playing record market but the latest results should do much to cancel out some of the criticisms that have been levelled at the company.

Not the least satisfactory item in the preliminary statement was the increase in the ordinary dividend from 10 to 15 per cent, more than restoring the cut in the dividend made in 1952-53. The 10s. ordinary stock units gained 1s. 6d. on this announcement. Standing now at 26s. 6d. they offer a yield of 5½ per cent, which takes some account of the future earnings that should blossom from the purchase of Capitol Records. That acquisition, it will be recalled, was expected not only to provide American recordings for other countries but also to provide an outlet for British and European recordings in the United States.

MORPHY-RICHARDS. Recently it has been fair weather sailing for Morphy-Richards, manufacturers of domestic electrical appliances. In the year to June 30th the value of the company's sales went up by nearly 49 per cent (from £2,644,179 to £3,936,386); within that total export sales in 108 different countries rose by 31 per cent (from £724,469 to £949,166). Trading profit advanced from £322,865 to £487,383. As so far in the current financial year trading results show a "substantial increase" over the previous year.

But the margin of profit on sales is low and there seems to be more squally weather ahead. The most threatening clouds are the hire purchase restrictions and the increases in purchase tax; the chairman, Mr H. D. Drysdale, tells stockholders that the hire purchase restrictions have already given a knock to the profits of Astral Equipment, the company manufacturing refrigerators which Morphy-Richards acquired in July. Nevertheless, the directors estimate that in spite of the steady increase in turnover there is still a "large unsatisfied demand" for the company's products. So they have recently concluded financial arrangements under which a new factory will be built beside the existing one and then rented to the company. The new factory, which will not be completed until the end of 1956, will double manufacturing space. Morphy-Richards is spared the capital cost of building the factory though it will have to spend a considerable sum in equipping it with plant and machinery. With more difficult markets in the offing and with money needed for capital expenditure stockholders must expect to be patient.

HAWTHORN, LESLIE. As profits in the shipbuilding industry wait on the completion of contracts, the lumpiness and irregularity of income makes any direct comparison of one year's profits with another of dubious value. Hence the attraction in Hawthorn, Leslie's profits in £1,155,354 to £977,478 for the year June 30 counts for little when set against the chairman's assurance that the strength of the order book and the company's financial strength justify an increase in ordinary dividends.

In fact the ordinary shareholders have fared substantially better; the 17 per cent ordinary dividend is an effective increase of 2 per cent over the 1953-54 dividend.

9s. ordinary stock at 32s. 6d. yields 5s. 5s. per cent.		

allowing for the 50 per cent free scrip issue in 1954. At the same time ordinary shareholders received a 40 per cent free scrip issue in 5 per cent preference shares. This was a true bonus and preference stockholders came to no harm as the coupon rate was raised from 4 to 5 per cent. These dividends were paid out of net profit of £422,895—not very different from the 1953-54 earnings, thanks to a decline in taxation of £167,510 to £8,113.

Since the 1953-54 report was published the company has separated shipbuilding from marine engine construction, setting up two operating divisions under the control of the parent company. The

engineering subsidiary also handles orders from outside the group. Hawthorn, Leslie—as the order from British Petroleum for two large tankers shows—is one of the shipbuilders that will benefit from the modernisation of Britain's tanker fleet. About £125,000 was spent during the year on modernising its equipment and a high rate of production is assured for some time. Plans for further expansion are mooted, for which considerable sums of money will be needed.

FAIREY AVIATION. The latest results of Fairey Aviation, excellent though they are, are not much of a guide to the future. The irregular completion of long term contracts gets in the way of firm comparison of one year's earnings with another; Fairey's gross profits in the year to March 31st were £2,159,568, compared with £1,249,216 in 1953-54, but it would be misleading to suggest that profits have risen by nearly £1 million. Moreover, the future profits of such a company as Fairey depends upon the Government's decisions on defence policy—and that policy is coming up for review quite soon.

But it is unwise to look a gift horse in the mouth and ordinary stockholders, having noted that the net profit is £802,394 (against £478,345), will doubtless welcome the increase in the ordinary dividend from 25 to 30 per cent and the proposal to capitalise £1,027,750 from reserves in order to distribute a 100 per cent free scrip issue. The 10s. ordinary stock units immediately gained 4s. to stand at 44s., offering a yield of 6½ per cent. This may seem high—indeed it is one of the highest in aircraft stocks—when the good profits the company is earning from the production of the Gannet and when the high earnings cover on the dividend are taken into account; but it does convey the warning that profits in the aircraft industry—more than in any other—depend upon the Government's actions.

LONDON STOCK EXCHANGE

Next Account begins: November 2nd

Next Contango Day: November 2nd

Next Settlement Day: November 8th

No extra selling of industrial shares developed before the Budget, and in a market short of stock jobbers were compelled to raise prices. By the close on Wednesday most leading stocks had recovered much of the ground lost on the announcement of the autumn Budget, the exceptions being found among those low yielding stocks where fears of an increase in distributed profits tax brought further small losses. All industrial stocks were marked up sharply in dealings following the Budget on Thursday.

Gilt-edged securities showed small gains on Monday and advanced again immediately before the Budget. Government securities were weaker on Thursday except for the shortest dated stocks.

Building shares regained most of their recent losses, Associated Portland Cement rising to 102s. 6d. and London Brick to 59s. 6d. from 97s. 9d. and 58s. 3d. respectively. Stores responded similarly, Marks and Spencer "A" climbing to 65s. (after 61s. 9d.) and GUS "A" advancing to 42s.

Among motor manufacturers, Ford Motors were slightly firmer at 43s. and Rolls-Royce recovered to 108s. 9d. after being a weak market on the announcement of an unchanged interim. Further tanker orders placed by the British Petroleum group were reflected in higher prices for shipbuilding shares. There was a large turnover in City of London Real Property on the 9½ per cent dividend forecast, though the price later reacted to 36s. 3d. Kaffirs were better on Wednesday, but demand was selective, Free State Geduld and Harmony showing small declines, while Middle Wits and Merriespruit improved. Frontino were sharply higher on the forecast of a greatly increased dividend. Oils advanced in line with other equities, British Petroleum recovering to 5½ and Shell to 6½.

Statistics

The following list shows the most recent date on which each statistical page appeared.

THE LONDON OMNIBUS serves the public

Walter Hancock's steam omnibus was first introduced to a waiting public in 1833 and was named, appropriately, the "Enterprise". Another public enterprise is now presented by the London Assurance with this selection from their omnibus collection of policies.

HOME FIRES

Fires are quite all right in their proper place. When they break out elsewhere, within the house or outbuildings, they can quickly run through the property. Though nothing can put back what has been lost, our Fire Policy can make good your losses.

EDUCATION BILL

Schooling is a singularly costly business; plurally, it is even more so. The man who takes out an Education Policy with the London Assurance as soon as a child is born gets full marks for prudence and foresight.

ALL SPORTS

It has been written:

No game was ever yet worth a rap
For a rational man to play
Into which no accident, no mishap
Could possibly find its way.

But you need never be the loser if your person and paraphernalia are insured by our Sportsman's Policy.

THAT'S WHAT WE'RE HERE FOR

If you would know more about any of the policies outlined here, if we can provide any information about any particular policies or about insurance problems generally — pray make what use of us you wish. Our address is 1, King William Street, Dept. Y6, London, E.C.4.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & CO., 4, London Wall Buildings, London, E.C.2.

COMPANY MEETINGS

AMALGAMATED TIN MINES OF NIGERIA

CHAIRMAN'S SPEECH

The Sixteenth Annual General Meeting of Amalgamated Tin Mines of Nigeria Limited was held on October 21st at Winchester House, Old Broad Street, London, E.C.

Mr J. Ivan Spens, OBE, the chairman, who presided, said:

I must first refer to the loss I and my colleagues have suffered in the death of Mr Farquharson in March of this year, who was appointed a director of this company in 1939.

ACCOUNTS

Where I refer to the year, I mean your company's and the subsidiary companies' year to March 31, 1955.

The accounts for the year will, I am sure, be considered by shareholders as satisfactory. The output of tin concentrate was very much the same as last year, but there was a fall in the production of columbite due to the reduction in treatment of mill tailings.

The profit for the year before taxation was £1,484,069, against £1,497,506 last year. Additional depreciation of £385,000 has been appropriated, of which £200,000 has been provided from the contingencies reserve.

Taxation takes £768,000, against £926,000 last year, the decrease being mainly due to the cessation of the Excess Profits Levy, reduction in the standard rate of income tax, and adjustments for previous years. Under the Finance Act, 1954, investment allowances will be claimed on capital expenditure and wear and tear allowances allowed on the cost of the new assets as opposed to wear and tear allowances on the cost less the previous 20 per cent initial allowances. This is obviously most helpful to any industry. The taxation relief on the investment allowances for the past year is approximately £29,000, and this amount has been transferred to a capital reserve.

The three dividends totalling 45 per cent already paid absorbed £494,812, leaving a balance for the year of £7,257, which increases the carry forward to £274,459.

PRICE OF TIN

The average price of tin metal realised during the year was £64 per ton higher at £721 per ton compared with £657 per ton last year. This is equivalent to a Nigerian f.a.s. price of £682 per ton, but we have to pay royalty on the higher tin metal price.

COLUMBITE

Our sales of columbite during the year were sold at the higher price based on the 100 per cent bonus price paid by the Government of the United States. In May, 1955, the bonus was withdrawn and we have since completed our forward contracts to the United States under the bonus offer. In the case of columbite we have to pay royalty on the gross price realised and consequently we are assessed for royalty on the amount of the freight charges, etc., of approximately £48 per ton on our shipments to America.

ORE RESERVES

Tin ore reserves at the end of the financial year were estimated at 44,051 tons, a net decrease on the year of 1,820 tons, against the 4,094 tons of concentrates won.

SUBSIDIARY COMPANIES

Keffi Tin Company Limited.—This company had a very satisfactory year. The columbite output was 433 tons of concentrate, an increase of 243 tons over the previous year.

A drilling programme to develop reserves in areas selected after consideration of the results of the geological investigation was continued throughout the year. Power drilling and prospecting is continuing.

Problems encountered in recovering primary columbite have been subjected to detailed study by the technical and geological staff with satisfactory results, but further study and work on improving ore dressing is required. Close co-operation with the Geological Survey of Nigeria has been maintained throughout the year.

The output of tin concentrates for the year was 72 tons compared with 60 tons in the previous year.

Plans are in hand for building a larger capacity commercial plant and a new mill for dressing the ores, and for this purpose a reserve for additional equipment has been created by appropriation of £325,000 from profit and loss account. A dividend of 100 per cent was paid during the year to the parent company.

London Nigerian Mines Limited continued to work satisfactorily, the output for the year being 250 tons tin concentrates and 10 tons columbite concentrates, compared with 271 tons tin concentrates and nine tons columbite concentrates last year.

LABOUR

Relations with labour have in the main been satisfactory. In January, 1955, a Joint Industrial Council and Joint Consultative Committees for the minesfield on the plateau were set up to help labour relations. The workers' councils which are organised by the company's welfare department and have operated for many years must continue their useful work in welfare and other matters, and will not, in my opinion, be redundant due to the formation of the joint consultative committees.

Since the end of the year new agreements have been signed, covering leave benefits and retirement gratuities.

A Federal Labour Advisory Council is being set up by the Minister of Labour and Welfare to consider and advise on matters relating to the application and operation of existing and proposed labour and social security legislation and the application of international labour conventions.

WELFARE

This subject continues to receive the closest attention of the board and the management. The technical managers' report included in the report and accounts records progress during the year.

GENERAL

I recently visited the mines, leaving this country by air on September 16th, and arrived back, again by air, on October 4th.

During my visit I had the pleasure of

meeting the Minister of Mines and Power and also the Minister of Labour and Welfare, as well as the permanent heads of their departments and the Chief Secretary and certain other officials of the Nigerian Government, including, of course, the Resident, Plateau Province, and the Chief Inspector of Mines.

Mr H. E. Wilson, who is chairman and general manager of A.O. Nigeria Limited, our managers in Nigeria, has been on leave, and we have been able to discuss various matters with him before and after my visit. Mr Farrington, the assistant general manager of A.O. Nigeria Limited, was in charge during my visit, and I would thank him for arranging my programme so efficiently.

As already announced in the press, a general strike of the African mineworkers throughout the tinfields in Nigeria started this week. Apart from the fact that all our plant has stopped, though some tin contractors are working, I have at present no further news to report.

STAFF

To both Mr H. E. Wilson and Mr Farrington and to all European staff and African staff under contract and also to all the employees I would again like to express our appreciation of the efforts they made during the past year.

The report and accounts for the year ended March 31, 1955, were adopted and the retiring director re-elected.

ARMSTRONG SHOCK ABSORBERS

ANOTHER SUCCESSFUL YEAR

The twentieth ordinary general meeting of Armstrong Shock Absorbers Limited was held on October 24th in London, Mr William Armstrong, BSc, AMIMechE (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The Consolidated Accounts show a Group profit of £180,267 compared with £128,833 in the previous year. The profit is arrived at after allowing for United Kingdom and Overseas Taxation of £140,342. The Directors propose a dividend of 35 per cent on the Ordinary Share Capital.

The Company has had another most successful year of operation and the factories at Beverley and York are still working at full speed to cope with the ever increasing demand from the Motor Car, Commercial Vehicle and Motor Cycle Industries. There is no indication whatsoever of any change in this happy position.

Besides the output of Shock Absorbers and Suspension Units for the above industries, the Heli-Coil Thread Insert is progressing favourably and the business potentialities are most promising in a wide variety of industries.

In Australia we have completed the building of our new factory at Melbourne and this is gradually swinging into production. Australia is the biggest single overseas market for British cars and I believe the establishment of our Australian factory will prove a very worthwhile step. The Australian Company had a very satisfactory financial year.

The Canadian Company also had a successful year. Our French Licensees continue to manufacture a large number of Telescopic Shock Absorbers under the terms of our Agreement with consequent benefit to your Company.

The report was adopted.

CAWOOD WHARTON AND COMPANY

SATISFACTORY RESULTS

MR ERIC W. TOWLER'S STATEMENT

The thirty-third ordinary general meeting of Cawood Wharton and Company Limited, was held on October 21st at the Great Northern Hotel, Leeds, Mr Eric W. Towler (the Chairman) presiding.

Mr Edward Binks (Director and Secretary) read the notice convening the meeting and the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts for the year ended March 31, 1955: The Group Trading Profit was £432,298 and, after providing £131,115 for Depreciation and Amortisation which is in excess of tax allowances, and £12,500 for Unsecured Loan Stock Interest, the Profit subject to Taxation is £288,683, an increase of £24,818.

The amount reserved for Taxation including the Profits Tax Distribution charge on dividends, less relief of £7,900 in respect of the new Investment Allowance and £5,768 transferred from Taxation Equalisation Reserve, is £164,468, leaving a Net Profit of £124,215, an increase of £60,730; relief from Excess Profits Levy is reflected in this improvement, although we are still denied any tax allowance for depletion of mineral bearing land worked.

With the amount of £116,781 brought forward from the previous year's accounts, and £5,961 Taxation previously overprovided, £246,957 is available for appropriation.

Dividends on Preference Shares and Preference Stock cost £5,657; the proposed Dividend of 1s. 3d. per Stock Unit, less Income Tax, on the increased Ordinary Stock will absorb £35,937; the premium on conversion of the Unsecured Loan Stock £5,000 and the costs of the capital reorganisation £3,566 have been written off, and after transferring £77,954 to General Reserve, the balance to carry forward is £118,843.

CONSOLIDATED BALANCE SHEET

The increased Issued Capital is the result of the capital reorganisation carried out in February last.

Capital Reserves are reduced by £142,396 capitalised in the bonus issue, and include £3,667 being Capital Profits on plant and Trade Investments sold during the year. The Capital Reserves in the Parent Company Balance Sheet were brought into line with the Consolidated Balance Sheet by adding thereto £69,426, being the excess of the book value of net assets over the cost of Shares in Subsidiary Companies acquired in 1953 and £28,108 Capital Profits realised by Subsidiary Companies between dates of acquisition and March 31, 1954; Shares in Subsidiary Companies in the Parent Company Balance Sheet were increased accordingly.

The amount in General Reserve was reduced by £82,954 capitalised during the year and now stands at £135,000, after transferring £77,954 from the profits during the year ended March 31, 1955.

The dates for the redemption of the Unsecured Loan Stock have been extended from 1956/61 to 1965/75 and the rate of interest reduced from 5 per cent to 4½ per cent. A Sinking Fund of 2 per cent will be set up from April 1, 1955, to provide for redemption of the major portion of the Stock in

advance of final redemption date by annual drawings.

Fixed Assets have increased to £649,525; the additions less sales amount to £129,262 and include, *inter alia*, freehold property, motor vehicles and quarrying, briquetting, concrete works plant and equipment.

The net Current Assets are £460,638, an improvement of £71,873 during the year.

REVIEW AND PROSPECTS

Certain of our activities suffered from severe wintry weather conditions; on the other hand we had an unprecedented demand for fuel of all kinds in that period; it is our intention to develop the sales of fuel oil.

Whilst the sales of sand and gravel continue to be satisfactory, competition in some building materials is developing at an increasing rate. We continue to investigate new building methods and materials; so far we have been unable to arrange commercially acceptable terms for the production of processed pulverised fuel ash as a concrete aggregate from power stations.

The small initial contract for prefabricated houses for Cyprus having been executed satisfactorily, orders for further houses and buildings have now been received from the Air Ministry; contracts have also been secured for a number of prefabricated schools.

Our transport fleets which carry substantial quantities of bulk material were well employed during the year and were of considerable assistance during the recent railway stoppage; we have renewed the contract for the haulage of all Opencast coal produced in the Notts/Derby/Leicester area from site to screens.

Coal prices continue to increase; in view of the implications on the national economy one cannot understand why Government neglects the opportunity to reduce the gap by its policy of restricting the production of opencast coal at its present level; there can be no doubt that a very considerably increased quantity is available, as well as facilities for its production, and if only this course were adopted either American imports could be further reduced proportionately, or the savage export cuts already announced could be mitigated.

Group capital expenditure for the current year has been approved at £179,300, including, *inter alia*, new and increased capacity plant at our Llanarmon Limestone Quarry which will not be completed until next year, motor vehicles, further mechanisation at existing works and quarries, forward reserves of sand and gravel land, and new administrative headquarters in Harrogate for the group.

The road programme is still totally inadequate for the country's needs; with the ever increasing volume of traffic it is hoped this work will be given the priority it demands.

Once again your thanks are due to all concerned in the attainment of the results, in a year during which conditions, due to weather and strikes, have been particularly trying to many of our people. The profits so far this year are encouraging.

The report and accounts were adopted, and a dividend of 1s. 3d. per unit on the Ordinary Stock was approved.

The retiring Directors, Mr E. W. Towler and Mr E. Binks, were re-elected, and the remuneration of the auditors, Messrs Knox, Burbidge, Henderson & Company, having been fixed, the proceedings terminated.

MIDLAND INDUSTRIES LIMITED

A SUCCESSFUL YEAR

The ninth annual general meeting of Midland Industries Limited was held on October 20th at Wolverhampton, Mr J. H. Bean, CBE (the chairman), presiding.

The following is an extract from his circulated statement:

The profit for the year, after all charges except taxation, amounts to £146,413, compared with £109,610 for last year, which I think you will agree is an excellent result. Taxation absorbs £76,600, against £68,550, leaving a net profit of £69,813, which exceeds that for the previous year by some £28,000. Your Directors have decided to transfer £30,000 to General Reserve and recommend a final Ordinary Dividend of 4½d. per share, less Income Tax. If approved, the total distribution for the year will amount to 7d. per share, compared with 5d. last year.

Whilst the total of fixed assets has again increased, the surplus of current assets over current liabilities now stands at nearly £220,000 and the Company's cash resources have again improved considerably.

NEW HIGH LEVEL OF SALES

During the year under review, sales reached a new high level. As I said last year, the Company's activities can be divided into two main sections: (1) "MIL" steam traps, reducing valves, stop valves, etc. (2) Agricultural implements.

Still further progress has been made in the sale of "MIL" steam traps and fittings and during the last two years these have increased by over 40 per cent. Their popularity is evidenced by the ever-increasing number of new customers on our books and the continued support for our products by many of the leading industrial organisations throughout the country, including British Railways, the Petroleum and Chemical Industries, Admiralty, War Office and Air Ministries, etc.

During the last twelve months the Company has acquired a revolutionary thermostatic design for the low pressure steam trap the trials of which have shown excellent results.

On the agricultural implements side the "MIL" hydraulic loader is established as a firm favourite with the farming community, both in this country and many countries abroad, due to its excellent design and trouble-free operation. In addition to the loaders manufactured for the Ferguson and Ford Tractors we have recently introduced loaders for the David Brown and Nuffield machines and a ready sale for these is becoming firmly established.

Sales for the first three months of the current year show an increase over those for the corresponding period last year; the orders for home and export continue to be satisfactory and in the absence of any major upheaval I feel confident that I shall, when next addressing you, have the pleasure of reporting another successful year.

The report was adopted.

THE GREAT UNIVERSAL STORES

ANOTHER RECORD YEAR

MR ISAAC WOLFSON'S REVIEW

The thirty-seventh ordinary general meeting of The Great Universal Stores Limited was held on October 20th in London, Mr Isaac Wolfson (chairman and managing director) presiding. The following is an extract from his circulated statement:

TRADING CONDITIONS DURING THE YEAR

The year under review has again been one of steadily increasing demand for all categories of household merchandise and wearing apparel which, as is well known, comprise the bulk of the trade of the Group. Both at home and overseas the volume of sales comparable with that of last year shows a satisfactory increase, with a consequent increase in trading profit.

In February, 1955, Hire Purchase trading, involving a wide category of goods in the consumer durable categories, was restricted by legislation which imposed a minimum deposit and a maximum repayment period. The impact of these controls, which were designed to contain the general consumption of credit in the country without placing undue emphasis upon any particular trade, has fallen, perhaps with unforeseen and unintended effect, most heavily upon the Furniture and Furnishing Trades.

Important though the part is that is played by Hire Purchase trading at home in the Group's business, I must emphasise that it now represents only some 20 per cent of its retail turnover, the remaining 80 per cent being sales of merchandise of all types and descriptions, marketed through our various channels of retail distribution on cash and short-term credit.

PROFIT AND LOSS ACCOUNT

The Consolidated Trading Profit is £18,856,896, being an increase of £3,369,155 over the previous year.

Out of this, profit Taxation takes £9,634,158, some 56 per cent thereof. The resultant Net Distributable Revenue, after Taxation, is £7,510,322, as compared with £4,760,768 in the previous year, an increase of £2,749,554.

It is interesting to note that, reviewing the last six years only, the Trading Profit of the Group has increased from £5,851,939 in 1949-1950 to £18,856,896 in 1954-1955 and that practically the whole of the development that produced this result has been financed from the internal resources of the Group, which have grown by the retention of profits and the consequent increase in Group Reserves.

SCRIP ISSUE

In view of the strength of the Company's Reserve position it is proposed that a Scrip Issue be made by way of capitalisation of reserves to the holders of the Ordinary and "A" Ordinary Stock of the Company of one new "A" Ordinary Share of 5s. fully paid for every ten 5s. Ordinary or "A" Ordinary Stock Units held.

PRESENT AND FUTURE TRADING

It is with renewed pride and pleasure that I am able to review the affairs of our Organisation and once again give you a satisfying account of a successful year's trading.

With regard to the trading in the current year, the results as at the date of this statement indicate that the decline in turnover in the Hire Purchase sections of our business, to which I have referred, will be made good and that the Group turnover for this year will again show an overall increase.

Diversification of the business of the Group represents a considerable advantage and facilitates the making of those necessary adjustments that follow the changes, often unpredictable, that arise from transitory phases in economic and trading conditions.

As regards the trading profits of the Group for the current year, I am pleased to tell you that for the period to date they compare favourably with those for the corresponding period of last year, and I am hopeful that a reasonable increase for the full year will again be shown.

The report was adopted.

GROUP PROFIT, APPROPRIATIONS AND CAPITAL FOR THE YEAR ENDED 31st MARCH, 1955

Group Trading Profit	18,856,896
Less: Depreciation, interest paid, interests of outside shareholders of subsidiaries, etc.	1,712,416

H. A. SAUNDERS LIMITED

RECORD TURNOVER

The Twentieth Annual Meeting of H. A. Saunders Limited was held on October 25th in London.

Mr H. A. W. Saunders (Chairman) in the course of his speech said: In making my report to you for the year ended March 31, 1955, it is again with pleasure that I am able to show profits that are an improvement on the previous year, £177,140, against £110,128. In achieving these figures, it has been necessary to increase our activities in nearly every Department and the turnover has reached a record of £6 million.

The Austin Motor Company seem to increase their activities and output every year and we have to expand to keep pace with them. To do this, we have built our new premises at High Wycombe which are now all completed and in full working order. It carries the penalty of carrying very large stocks. We are now finding that even these stocks are not sufficient for all the Austin vehicles on the road and it means further increases, in fact we are now negotiating the purchase of more land at Finchley so that we can build a really large Spare Parts Department. Negotiations are now completed to increase the size of our Service Department at Whetstone and we are now commencing to build and when completed, the premises will be three times as large as the present one. We have had to do this because we have not been able to carry out efficiently all the service required.

So far this year, for the six months ended September 30th, the profits are in excess of the corresponding period last year.

The report and accounts were adopted.

R. G. SHAW AND COMPANY, LIMITED

LARGER PROFIT AND DIVIDEND

The fourteenth annual general meeting of this Company was held on October 20th in London, Sir Harry Townend, chairman, presiding.

The following is an extract from his statement for the year to June 30, 1955:

The year under review has been a prosperous one, as was to be anticipated from the improvement in the prices of tea and rubber, especially the former. Largely for the same reason, dividends from Trade Investments improved also, and our general trading continued to be profitable. The Group profit before taxation was £154,126, showing an increase of £25,630. Your Board recommend a dividend of 17½ per cent, an increase of 2½ per cent.

Last year reference was made to the high level of prices for common teas. These continued to rise, and by the middle of January the average price of tea had reached the unprecedented level of 7s. 1½d. per lb. The inevitable relapse set in and by the end of June the average had fallen by half. Since then there has been a gradual improvement which has been more pronounced for quality teas than for "commons" and because of the near balance of the overall supply and demand position the tendency will be for the price concertina to open.

Rubber prices which were under 1s. 9d. per lb a year ago rose to 2s. per lb in the last quarter of the year and then with some fluctuations rose recently to 3s. 6d.

It is early yet to forecast the prospects for the current year but present indications are that they will not be unfavourable.

The report and accounts were adopted.

ANGLO-CEYLON & GENERAL ESTATES

RECORD RESULTS

The sixty-ninth annual ordinary general meeting of The Anglo-Ceylon & General Estates Company, Limited was held on October 20th in London.

Mr Francis W. Douse (Chairman and Managing Director), in the course of his speech, said: The trading profit for the Group set up a new record of £1,333,229 to which all activities of the company contributed. The crops of tea in Ceylon and of sugar in Mauritius were the highest ever produced.

CEYLONISATION

In my speech last year I referred to the subject of Ceylonisation and I am glad to say that the Ceylon Government has adopted a more realistic attitude towards the plantation industry by fixing for a period of time a quota system which will maintain the present proportion of European management of Estates. I am however sorry to say that certain far reaching proposals have been put forward recently by a committee of Ministers for consideration by the government affecting Mercantile establishments which will, if put into effect, have a very disturbing consequence.

To attempt to hasten evolutionary processes by compulsion cannot but have a damaging effect on the commerce of the Dominion to the detriment of its general welfare.

Now as to the marketing of tea, I referred last year to the need for the free market of tea and drew attention to the vulnerable situation which could arise if the seller was not at liberty to sell in the market of his choice. A few months ago following violent fluctuations which took place in the price of tea such a situation did arise when a complete collapse of the Colombo market compelled the Ceylon Government to release the restriction on export and to allow for a period of three months the free shipment of tea for sale at the London Auctions. It was only by this means that the chaotic conditions in the Colombo market were relieved. Unfortunately at the end of the three months period the system of export quotas was reimposed and the liberty of the seller again restricted which I think is very regrettable as the recent experience has demonstrated very

clearly a real danger of undue concentration in one market.

SITUATION IN MAURITIUS

As to Mauritius—in my speech last year I gave a very full report of the working of the Commonwealth Sugar Agreement and I also referred to the fact that this agreement had been extended until December 31, 1962. I further pointed out that the International Sugar Agreement had no connection with the Commonwealth Agreement except in so far as any surplus sugars produced by Mauritius might have to be sold at the World market price. Actually the position this year is that the quota of Mauritius sugar to be negotiated under the Commonwealth Sugar Agreement is 351,000 tons and of the balance of saleable sugar you will be glad to hear that this year sales have again been made to Canada to a total of 80,000 tons on the same basis as last year.

Mauritius has again been fortunate in having another good year as regards climatic conditions.

The report was adopted and at a subsequent extraordinary general meeting resolutions for the capitalisation of reserves were approved.

FINNEYS SEEDS

A SUCCESSFUL YEAR

The ninth annual general meeting of Finneys Seeds Limited was held on October 24th in London, Mr Ernest Cornwall (the chairman) presiding.

The following is an extract from his circulated statement:

The total group profits amounts to £41,988 compared with £27,086 after taxation. It is gratifying to note that the profits of each of our operating companies have shown an increase on those for the preceding year.

The directors propose a final dividend of 10 per cent and after various appropriations, the carry forward is increased from some £41,541 to £48,412.

The year under review can be considered to have been a fairly successful one. The very poor harvest of 1954 did create difficulties but with the help of seeds we were able to procure from Canada and the continent of Europe, these difficulties were largely overcome. With it, however, came high prices for the seed as a result of the famine conditions prevailing in regard to agricultural seeds particularly.

The very good summer we have experienced this year and the ideal harvest weather is producing extremely heavy crops of seeds of high quality and is having the effect of reducing prices very considerably on last year. Fortunately, the indications are that there will be an increased sowing-down with seeds next year, which we hope will offset the decline in prices.

The autumn seed grain trade has got off to a very good start and compares very well with last year and the sale of horticultural seeds also keeps pace.

The report was adopted.

KUALA PERGAU RUBBER PLANTATIONS

ENCOURAGING OUTLOOK

The twenty-first annual general meeting of Kuala Pergau Rubber Plantations Limited was held on October 20th in London, Mr E. G. Estall (the chairman) presiding.

The following is an extract from his circulated review: The crop for the past year totalled 339,000 lb, compared with 301,200 lb for 1953-54, and the output has been further improved during the current year. The earlier postwar replantings are now approaching maturity and some areas are already in partial tapping. The total crop realised a net average price of approximately 1s. 11½d. per lb, against an all-in cost including upkeep of the replanted areas of approximately 1s. 7½d. per lb.

This company is most fortunate as regards Export Duty as they only pay 2½ per cent on the price of the commodity, irrespective of the prevailing duty fixed by the Malayan Government. With improving crops and the present price of the commodity the future outlook is brighter than it has been for a long time.

Addressing the meeting, the Chairman said: I am pleased to be able to tell you that the increased output to which I referred in my review is being maintained. The total crop for the six months to September 30th amounted to 228,000 lb, compared with 151,000 lb for the corresponding period of 1954—an increase of 50 per cent. Thus the estimated crop for the year of 360,000 lb should be easily exceeded.

Of the crop to the end of September, 112,000 lb have been sold at the average price of 3s. 1d. per lb for all grades. The all-in cost is approximately 1s. 10d. per lb.

The report was unanimously adopted.

MANCHESTER COLLEGE OF TECHNOLOGY

APPOINTMENT OF BURSAR

The Governors of the Manchester College of Technology invite applications for the post of Bursar. The Manchester Corporation propose to transfer the College in the near future to a new corporate body to be set up under a Charter granted by Her Majesty the Queen. The Bursar will be the executive officer responsible to the Principal for such non-academic administration as may be assigned to him by the Governors, and in particular for finance matters and for matters relating to the development and maintenance of the estate and buildings of the College. Candidates must possess administrative and managerial ability of a high order and should possess qualifications in accountancy. The salary will be within the range £1,500-£2,000. The post will be superannuable.

Further particulars and forms of application may be obtained from the Principal, College of Technology, Sackville Street, Manchester, 1, and should be returned to him by November 30, 1955.

ORGANISATION AND METHODS

The Metropolitan Boroughs' (Organisation and Methods) Committee require two ORGANISATION OFFICERS.

The Committee is a joint authority providing an independent advisory service for the London borough councils. Organisation Officers conduct all types of organisation and procedural studies, as well as departmental reviews; they undertake research for publications relating to specific aspects of management.

Applicants should preferably be under 40 years of age and have O. & M. or local government experience. A degree or professional qualification would be an additional advantage.

The salary offered is £800 x £100 (p.a.)—£1,100, but point of entry will be determined by the applicant's experience and qualification. Posts are pensionable. Closing date November 30th. Further details from the Hon. Clerk, Westminster City Hall, W.C.2.

CIVIL SERVICE COMMISSION

Competitions will be held in 1956 for the following:—

Administrative Class of the Home Civil Service and Administrative Class of the Northern Ireland Civil Service (Methods I and II). At least one House of Commons Clerkship will be filled through the Administrative Class competition.

Senior Branch of the Foreign Service (Method II only). 12/56

Special Departmental Classes (Home Civil Service), i.e., H.M. Inspectors of Taxes; Cadet Branch, Ministry of Labour and National Service; Prison Officers, Ministry of Defence (Methods I and II). 17-20/56

Statistical Class (Home Civil Service) (Method I only). 21/56

Executive Class (Home Civil Service) and Branch B of the Foreign Service (Method I only) for university graduates. 22/56

Methods of Selection. Method I consists of a written examination in university hours degree subjects plus a preliminary and a final interview. Method II of a short written examination in general subjects, followed for selected candidates by tests at the Civil Service Selection Board and interview before the Final Selection Board. When two methods are provided, candidates may choose either or both.

Candidates for Method I must have, or obtain, a degree at a recognised university; the degree required for the Administrative Class and Senior Branch of the Foreign Service competitions is 1st or 2nd class honours.

Age Limits: At least 20½ and under 24 on August 1, 1956, with extension for service in H.M. Forces in addition for Statistician Class (21/56), extension up to three years for approved post-graduate experience.

For particulars (including prospects of promotion) and application forms write (preferably by postcard) to Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting the code number(s) of the competition(s) in which you are interested. Completed application forms for entry by Method II must be returned by November 30, 1955, and for Method I by February 29, 1956.

SOLARTRON

OPERATIONAL MARKET RESEARCH

Excellent opening for qualified Statistician (male or female) with university degree and experience of training in sales analysis and forecasting. Please write to The Personnel Director, Solartron Electronic Group, Limited, Queen's Road, Thames Ditton, Surrey.

LONDON news library requires man as assistant responsible for maintaining economic intelligence unit and for general reference work. Age 25-35. Minimum professional qualification. L.A. Registration Examination. Must be competent typist, accustomed to handling large quantities of material, and able to deal with current affairs. Shift duties, including weekend and night on a 5-day week basis. Contributory pension scheme. Salary £550 a year.—Write Box 260.

SALES MANAGER required by the English and Scottish Joint Co-operative Wholesale Society Limited to develop their ice cream and chocolate selling organisation in the United Kingdom. Knowledge of the trades involved will be an advantage, but will be of less importance than general ability and practical experience of organising sales. Intending applicants should write to the Secretary and Executive Officer of the Society at 100 Leamington Street, London, E.1, for further information and the appropriate form of application.

PERSONNEL ASSISTANT.—Man aged 30-35 required in London by Staff Personnel Office of a large industrial organisation to assist in recruiting, training and forward planning. Candidates should have had experience in interviewing staff of various grades. A graduate or qualified secretary or accountant preferred. Excellent prospects for future career. Applications will be treated in the strictest confidence.—Box 265.

TECHNICAL DIRECTOR

A qualified Metallurgist and Chemist, aged 50-55, with wide industrial experience of control research and development, is required by well-established Non-Ferrous and Chemical Manufacturers. He must be an able administrator and organiser at top level and should preferably have U.S.A. contacts.—Write, giving brief but essential details in first instance, which will be treated in strict confidence, to Box 267.

RESEARCH ASSISTANT required to join team of economists specialising in shipping. Initiative and originality of approach more important than specialised knowledge, although experience of statistical methods would be an advantage. Salary will be in accordance with age and experience.—Apply Box 263.

ACTUARIAL STUDENT (completed at least Part I) required by Canadian Insurance Company at its Chief Office for U.K. in London. Prospects, after qualifying, of obtaining experience in Canada (with option to transfer).—Please write, giving full details to the Secretary and Actuary, Confederation Life Association, 18 Park Lane, W.1.

ASSISTANT ACCOUNTANT, Chartered or Incorporated, recently qualified, required for London Head Office of International Oil Company. Age about 25. The position holds great possibilities for a man with a good brain and a pleasant personality. Box 335, c/o Walter Judd, Ltd., 47 Gresham St., London, E.C.2.

ASSISTANT ECONOMIST required by Colonial Office. Duties: review of economic trends and prospects; Economic analysis of Colonial Development plans; Economic Intelligence; Research studies. Provide advice and assistance in economic field to other departments of Colonial Office. Qualifications: University degree in Economics. Some post-graduate experience desirable. Salary scale £470 x £300-£680 x £135-£255 p.a. plus supplement £22 10s. 0d.—£30 p.a. plus 8 per cent. If 45½ hours per week regularly maintained. Post is temporary and non-pensionable.—Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates) to AC/1218, London Appointment Office, Ministry of Labour and National Service, 100 Leamington Street, W.C.1, by November 12, 1955. No original testimonials should be sent. Only candidates selected for interview will be advised.

ACTUARIAL STUDENT, Part II obtained or imminent, required for South African company; conducting all types of insurance, life and general. Full facilities for completing examinations. All passage paid and leave every 4 or 5 years.—Apply in writing, Traduna, 6 Aytoun Street, Manchester. Interview arranged anywhere.

EXPERT POSTAL TUITION

For Examinations—B.Sc.Econ., LL.B. and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial; General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (if any) or subjects in which interested, to the Secretary (G. 1/2).

METROPOLITAN COLLEGE, ST. ALBANS

Or call at 30 Queen Victoria Street, London E.C.4.

UNIVERSITY OF NOTTINGHAM

ASSISTANT AGRICULTURAL ECONOMIST

Applications are invited for the above appointment in the Department of Agricultural Economics at the School of Agriculture, Sutton Bonington. Candidates should be graduates in Economics and/or Agriculture. Salary scale: Men, £450 x £25 to £600 x £30 to £745; Women, £450 x £20 to £590 x £25 to £640. Form of application and conditions of appointment may be obtained from the undersigned, to whom completed applications should be sent not later than Saturday, November 26, 1955. H. PICKBOURNE, Registrar.

TRAINING POSTS

Applications are invited from Arts or Economics graduates, or Public Schoolboys with a good academic standard, aged 17½, for interesting training posts with the Engineering Components Group of Companies. Experience will be given in the major functions of the Group. The main factories are situated at Slough, Reading, Aberystwyth and Cleckheaton. In West Africa he receives experience on the selling side. On return to Manchester he is based on the Head Office as a buyer, travelling for short periods at the occasion arises to suppliers in various parts of the world and to West Africa. He will be expected to gain an intimate understanding of certain world markets and to anticipate consumption trends. The traineeship can be the start of an unusually interesting career with a large and growing organisation which can offer good opportunities for promotion, security and a pension on retirement. Candidates should be not more than 25 years old and have completed their National Service. A university degree is an advantage, though not essential. Starting salaries will be between £500 and £550 per annum, depending on age and experience, or slightly higher for trainees with exceptional qualifications.—Write for application forms to Box 264.

CAREERS IN COMMERCE

Traineeships in buying with prospects of progressive advancement for applicants of the right calibre are offered by a leading Manchester firm of West African merchants. The firm buys large quantities of a wide variety of goods for the rapidly expanding African trade and sells them through its trading stations. Training includes 12-18 months in the Manchester Head Office and a subsequent period of similar duration in West Africa. While at Head Office the trainee is given practical experience under senior buyers and is released for part-time study of technical aspects of the goods in which he specialises. In West Africa he receives experience on the selling side. On return to Manchester he is based on the Head Office as a buyer, travelling for short periods at the occasion arises to suppliers in various parts of the world and to West Africa. He will be expected to gain an intimate understanding of certain world markets and to anticipate consumption trends. The traineeship can be the start of an unusually interesting career with a large and growing organisation which can offer good opportunities for promotion, security and a pension on retirement. Candidates should be not more than 25 years old and have completed their National Service. A university degree is an advantage, though not essential. Starting salaries will be between £500 and £550 per annum, depending on age and experience, or slightly higher for trainees with exceptional qualifications.—Write for application forms to Box 264.

FEDERATION OF BRITISH INDUSTRIES

Assistant Economist required in the Economic Adviser's Department. The duties of the post will be to assist in the preparation of papers on industrial economic problems and in the general study of economic trends. Candidates should have a good honours degree in economics or economic statistics and possess skill in economic analysis and the handling of statistics. Commencing salary £650-£800 per annum, according to age and experience, with superannuation and excellent prospects of advancement. Apply not later than November 5 to the Secretary, F.B.I., 21 Tottel Street, London, S.W.1.

PERSONNEL.—World-wide manufacturing organisation invites applications from men aged 28-35, graduates preferably in a social science, for position as Assistant in its Personnel Department in London.

Successful candidate will be expected to assume considerable responsibility in advising a group of Associated Companies in Personnel policy and management development. The post carries interesting prospects, but considerable travel overseas is essential. Candidates must have had good training and experience in most aspects of Personnel work.

Applications in writing, with full details of education and career, should be sent to Box S.687, Willing's, 362 Kings Inn Road, London, W.C.1.

STATISTICIAN with knowledge of statistics of Tea and Rubber industries required for employment in London by Harrods & Co., Limited.—Apply in writing, with full details of qualifications and previous experience, to the Secretary, 1-4 Great Tower Street, London, E.C.3.

CONSULTING ACTUARIES require an actuarial student who has passed at least Part I of the Institute or Faculty of Actuaries examinations. Candidates should be prospects to suitable applicant. Applications, which will be treated in strict confidence, should state age, details of career to date, remuneration required, and should be marked "Actuary" and sent to Duncan C. Fraser and Co., 18 Hackins Hey, Liverpool, L.2.

IMPERIAL CHEMICAL INDUSTRIES LIMITED requires an Economist with 1st or 2nd Class Honours degree for industrial and commercial research involving the preparation of reports for higher management. Age 35-40. Must have personality, accuracy, and experience of economic and industrial statistics and statistics to industry. The work requires a broad outlook, the ability to recognise the essentials in a complicated situation, to exercise independent judgment and initiative, and to write clearly and concisely.—Applications should be sent to Head Office and Regions (Department of Economics) Imperial Chemical Industries Limited, Imperial Chemical House, Millbank, S.W.1.

COST ACCOUNTANT required for consultancy work for Trade Association. Qualified man preferred, aged 28-40. Work involves travel in U.K.—Apply, giving full details, including present salary, to Box 253.

MANAGEMENT CONSULTANT required to control and develop small team of consultants for a Trade Association; well experienced in costing, work study, clerical methods, planning and programming; age 40/50; work involves travel in U.K.—Apply, giving full details, including present salary, to Box 254.

A to fill two vacancies which have arisen in a small team which assists individual firms in the Iron and Steel Industry to solve problems associated with internal traffic movement; flow of materials; organisation and layout; production and quality control; efficiency and economy. Experience of the Iron and Steel Industry and of operational research and work study methods, although not essential, would be an advantage. Starting salary within the range £700-£1,100 p.a. Posts are superannuated under the F.S.S.U. Location of work London, with frequent visits to Iron and Steel Works.—Write applications only, quoting "O.R.2." to Personnel Officer, B.I.S.R.A., 11 Park Lane, London, W.1.

INDUSTRIAL ECONOMIST

Advertiser would like post either for technical work (economics and statistics department of industrial concern, research association) or administrative, but preferably combining both, such as economic aspects of current problems and future programmes. Qualified for economic advisory work on specific factory and distributive issues, as well as wider problems. M.A., B.Sc.(Econ.), age 40. Experience includes administration (distribution and production) and practical factory work; charge of major research project involving industrial efficiency, and publications.—Box 268.

PERSONNEL MANAGER

A Personnel Manager with first-class qualifications (Harrow and Cambridge, etc.) and an excellent industrial background, seeks appointment where initiative tempered by a balanced outlook would be useful.—Box 262.

DIRECTOR and General Manager (38) of small, light engineering works, unwilling to middle along, and frustrated by Board-room apathy, complacency and stubborn refusal to face facts, seeks change where wide experience, tact, ideas and drive are appreciated.—Box 266.

CONSULTING ENGINEER offers private services to suit the medium and smaller industrial organisation. Available shortly.—Box 250.

YOUR BUSINESS FRIENDS would appreciate the Businessman's Guide to Britain for 1956. The guide is compiled by The Economist Intelligence Unit and has a foreword by Sir Graham Hayman, the President of the Federation of British Industries. There are sections on: What is Britain?—a picture of Britain in words and charts. How to get to know things in Britain?—How to get about. Britain's major economic areas—industries and directories of thirteen areas. Special events in 1956. In addition, the guide provides many hints for travellers. THE SPECIAL PRESENTATION EDITION, obtainable in quantities of not less than one hundred, will be available till the end of October. Details from The Economist Intelligence Unit, 22 Ryder Street, London, S.W.1. Whitehall 1511. Ext. 144.

Railways are *more* than Trains

Five trains being unloaded at the same time at Hams Hall Power Station

MECHANICAL HANDLING alone makes possible the vast tonnages moved by rail every week . . . every day. It makes possible not only the loading or unloading of coal wagons at high speed, but on it also depends the swift delivery of coal to power stations (themselves a prime essential in the chain of capital equipment and investment behind the trains). Mechanical handling equipment of all kinds has long been a speciality of **MITCHELL**, introducers of the first side tippler to handle wagons. Tipplers, conveyors, transporters, coaling plant, space-and-labour saving mechanical marshalling yards—wherever they are needed to increase productivity and raise efficiency, Mitchell can be relied on to provide 'know how' for economic design and construction.

*Taking
care
of
bath
night*

Householders in Harrogate and surrounding districts will soon be drawing on a huge 5,000,000 gallon reservoir for water for baths, cooking and other domestic purposes. In times of drought it will act as a 'buffer' preventing serious shortages.

Under construction for Harrogate Corporation Water Works, this is one of many important contracts entrusted

to Henry Boot & Sons Ltd. They are the parent company of a group of specialised firms engaged in building and civil engineering work of all kinds for government departments, local authorities and others.

choice of a lifetime

If you have performed some signal service to your company, or you are retiring after devoting a lifetime to its interests, the company may wish to express appreciation in a practical way, and you may be asked to choose a gift which is both personal and fitting to the occasion.

What could be more suitable than a high fidelity record reproducing equipment to charm your leisure hours with fine music, so faithfully reproduced that it is a true re-creation of the original rendering? Such a gift would be a constant reminder of a job well done and duly appreciated, and an enduring hobby that will be a source of endless pleasure to you and to your friends and family.

As high fidelity specialists we can select an appropriate equipment of an agreed value, send it to any part of the world, and ensure that it is properly installed.

This is just a specialised part of the Classic Specialised service.

Wives of SUCCESSFUL MEN HAVE PRESTIGE

If you were to look into the kitchen of any woman whose husband has made his mark, more often than not you would find 'Prestige' Housewares. And the reason's not far to seek. These beautiful and practical products are the obvious choice of people for whom only the best will do. This year be *really* thoughtful and give 'Prestige' to those important people on your Christmas list. 'Prestige' Housewares are ideal for business gift-giving because they bring pleasure and real pride of possession, not just to one person, but to the entire family. It's so easy to send the right thing. Just hand your Christmas list to your secretary and ask her to visit any store where fine housewares are sold. They'll have a wide selection of 'Prestige'... for your customers and for you.

OXYGEN CORROSION

can be eliminated

WITH THE WEIR "OPTIMUM" DE-AERATOR

Dissolved oxygen in boiler feed water is the most important and most dangerous factor in corrosion in boilers, pipe-lines, etc. It can be expelled by a Weir "Optimum" De-aerator, which can readily be installed in existing plants, and acts as a feed-water heater by retaining in the feed water the heat in the operating steam.

Trouble on your hands with scale, Mr. Weston?

The high cost of heating water and raising steam for industrial purposes is often made greater still by the scale deposits and the corrosive effects of incorrectly treated waters. For many years, now, Albright & Wilson's Technical Service Department has been of immense help in advising on the use of phosphates in industrial boiler systems. Suitably applied—and at a fraction of the costs otherwise involved through inefficient heat transfer and enforced stoppages—phosphates by Albright & Wilson have put an end to some of the most obstinate problems of scale and corrosion.

Petroleum Charts a Continent's Course

A plentiful supply of petroleum products is vital to a nation's industrial and agricultural growth and to its national security. In Australia, a major step toward self-sufficiency in refining capacity is a new refinery at Kwinana. This refinery is owned and operated by Australasian Petroleum Refinery Limited, a subsidiary of the British Petroleum Company. Planned now to meet almost half of the continent's 45,000,000 barrel annual goal, Kwinana is already helping attract new capital and labour to Western Australia, and promises to have a marked effect on the continent's over-all economy.

As in the case of many other important refineries around the world, the over-all

engineering and construction of the Kwinana refinery was assigned to the Kellogg International Corporation and its parent company, The M. W. Kellogg Company—even to the extent of off-site installations including roads, docks, and loading, storage and housing facilities.

The Kellogg organisation is proud to have placed Australia's largest and most modern refinery in operation three months ahead of schedule. This record was achieved through the co-operation of British and Australian equipment manufacturers and construction subcontractors as well as through the hard work of the hundreds of men on the engineering staffs and construction crews.

Which are the family sugar babies?

Not much doubt about that. Father knows all right who thinks lollies are the scrummiest things and which is the most yum yum kind of choc bar. But that's not all Father knows. Mother has her favourite chocolates, too; and it's long odds that Father himself has quietly slipped into the hall-drawer his own private cache of candies or caramels, toffees or mints, for adult consumption at leisure. When he buys sweets for the family he buys for sugar babies of all ages.

And to make it most likely that it's *your* sweets

they ask for, your best and cheapest way is to advertise in a magazine that goes right round the family and stays around a whole week—often more. Your best family magazine is PICTURE POST. It goes into over 1½ million households. It is read by 5 million people every week. It clinches innumerable family purchases.

PICTURE
POST

HULTON'S NATIONAL WEEKLY

for family purchase

Who chooses the family car, television set, soft drinks, cereals, soap and toothpaste? They're all very much family purchases. They can all be sold through PICTURE POST.

WROUGHT TITANIUM

can you use it?

British Industry now has at its service

a new wrought metal—titanium.

Years of pioneer research and the development of special extraction and melting techniques by I.C.I. have heralded its debut in Britain. Now it is ready to revolutionise progress in our aircraft industry and in other engineering fields.

can you afford not to use it?

Titanium is only half the weight of steel. Alloys (I.C.I. is now producing a steadily widening range) can be made which, besides being phenomenally resistant to most forms of corrosion are as strong as many high-tensile steels.

Already, I.C.I. titanium and titanium alloys are available in sheet, strip, rod, tube, wire, plate and forging stock. I.C.I. will be pleased to advise on the known and potential applications of this new and outstanding material.

IMPERIAL CHEMICAL INDUSTRIES LIMITED, LONDON, S.W.1.

There's always another use for gas . . .

Glass blowing

... for heating processes

You cannot take chances with process heating. That is why gas is chosen for such an impressive range of processes covering practically every industry. Its use means fewer rejects.

Varnish boiling

... for heating liquids

From swimming bath water to salt bath solutions, gas heating has no rival. Gas goes to work rapidly and is simple to operate. Whatever the quantity, whatever the liquid, it burns clean and constant to give you the precise heat you require.

Any Pennies for the Guy?

THERE is a danger that public comment on the budget and censure debates will harp on the question whether the Labour Party, in misusing the best opportunity for economic criticism it has had in years, has been unnecessarily rude to Mr Butler; after the Chancellor's scintillating reply on Monday to allegations of dishonour and deceit, many floating voters will probably conclude that it has. But this is a matter of very small moment. It is Labour's own affair if it manages, by poor Parliamentary tactics, to throw away some of the votes that the continuing instability of the British economy, the dockworkers and Mr Butler's short-term economic miscalculations (in that order) have won for it. The nation's job is to judge whether a Conservative or a Labour Government would be more likely to mitigate that instability and to avoid those short-term miscalculations; and the first series of major economic debates in the new Parliament has now provided new evidence on which a judgment can be based. For those who are more concerned about the direction of economic policy than about the distribution of offices between politicians, the real question to be answered by these debates was a simple one: if, as the Opposition alleges, the April Budget helped to keep Labour out of power, is that an argument against that Budget or the greatest single debating point in its favour? To answer this, and to borrow a phrase from both Mr Bevan and Mr Butler, one need not look into the crystal; one can now read the book.

There are three main criteria by which a Government's economic policy deserves to be judged. The first is how far it manages to keep an overloaded British economy—assuming that it is still to remain overloaded—from toppling into exchange deficit at the first unfavourable gust of wind. It is on this issue that both parties have so busily paraded each other's dirty washing during the past week; but most of the arguments about hypothetical degrees of past culpability have missed the main point. The fairest reading of the postwar record is surely that all three Labour Chancellors—including Mr Gaitskell in 1951—consistently cut back spending power by rather less than expert opinion at the time considered necessary; and that Mr Butler, in very different conditions, has consistently—and especially this Spring—expanded it by rather more. Both parties, in fact, have been more inflationary than at the time it seemed that they ought to be. The principal difference between them, until the last fortnight, has been that Mr Butler, partly because of astonishingly favourable terms of trade, but chiefly because his other general economic measures have been much more successful than he or anybody else had expected, has hitherto had the gods of good luck or better judgment on his side.

The new development in the past fortnight is not that those gods have temporarily deserted him; that happened some months ago. The new development is that Mr Butler has become the first politician in office to introduce measures of restraint at a time when the economy is probably still in small surplus, and therefore before a crisis has

arisen; while Mr Gaitskell has become the first principal spokesman of Opposition deliberately to try to wreck those measures, by intimating that purchase tax changes which increase the cost of living by less than one per cent provide a justifiable basis for new wage claims. It is no answer to this criticism to say that some of the particular measures that Mr Butler chose (as distinct from his objective) are ill-advised, or that Mr Gaitskell is in a peculiar political phase where he has to show certain people that Mr Aneurin Bevan "need no longer stoop to conquer." Both these points are true. But the main point remains—that during the recent debates Mr Butler did something to make the combination of price stability and full employment more possible, and Mr Gaitskell did quite a lot to make it harder. It is quite clear which man has advanced his claim to showing the greater responsibility on this first issue during the past two weeks.

★

The second criterion by which a Government's economic policy deserves to be judged is how far it seeks to maximise enjoyment and efficiency by removing distortions from the economy. Everybody knows what these distortions are. When the Conservatives came to power in 1951 the consumption of some things was too high and too cheap, and the production of other things was too high and too profitable; and it did not need any great arithmetical genius to realise that this could only be achieved by holding back the consumption and production of other things, either by direct controls or by other means. Once again, it should be admitted that Mr Butler's success in removing some of these distortions has been partly due to good luck. The two things that were most obviously too cheap when he came to power—namely, food and money—had to be made dearer to meet the economic crisis of 1951; and once they had been made dearer, by measures to which Mr Gaitskell himself would probably at last have resorted after (note that word "after") the election of 1951, a surprising number of other distortions came to pieces in Mr Butler's hands. In particular, it was the resort to a more active monetary policy in 1951 that made possible the progressive liberalisation of imports and the freeing of raw material markets in subsequent years; and it has been the freer and assured flow of imported raw materials to every factory that has largely explained the extraordinarily heartening increases in production since 1952. Whenever the Conservatives have prodded at other politically awkward distortions, as in Mr Macmillan's last Rents Act, they have rarely recaptured the efficiency of their first frightened flush.

The latest measures take another prod at the housing muddle; but they leave the other great current distortion, the agricultural subsidies, supinely alone. They are therefore in the aggravatingly slow-moving Conservative tradition. But, once again, the Opposition has seemed set on diverting justifiable economic criticism from the Government on to its own accustomed head.

The principal "cures" for the "crisis" suggested by Labour speakers during these debates have been deliberately to recreate distortions that have already been removed (such as "selective" import restrictions and some price controls); and to resist the advance that is proposed on the housing front.

★

In the third, and most important, criterion of economic policy it is less easy to strike a balance between the two parties: for the simple reason that few members, on either side of the committee, seemed to realise that the criterion exists. The real charge that should have been laid against the Government during these debates is that none of its major measures seems to have any relevance to what should be the central objective of British economic policy: namely, to expand the national income, and to increase the incentive to save and invest more of it. For the full absurdity of the present *impasse* needs to be emphasised time and again. Because fixed investment has at last increased a small part of the way towards the level it ought to have achieved several years ago, it has been found necessary to cut down spending—including some spending on investment itself. Even where proper priorities have been observed, the results are profoundly depressing; the motor-road programme of this country now seems to be permanently settled at fifty miles of tantalising example between St. Albans and Rugby.

The Government may think that this criticism is unfair. After all, present troubles have arisen through a sudden if belated surge in investment. And the whole object of the Budget—and especially of the purchase tax changes—was to cut back consumption in order to allow some of this surge to continue. But Mr Butler must not make the traditional error of assuming that a measure to cut consuming is the same thing as an incentive to increase saving; it is quite probable that by taxing some incentive goods such as washing machines beyond the reach of some overtime workers, he may be destroying part of the dynamic behind the increased earnings from which higher savings almost invariably flow. And the tax on distributed profits is even harder to fit into any long-term vista. If Mr Butler had really faced the future, there are several experiments he might have made. He could have readjusted income tax rates at the margins where disincentives to work become most apparent: there are certain novel types of security, involving a promise of stability in terms of real income, that he might have found it worthwhile to float; and there is a left-wing economist's scheme for basing direct taxation on expenditure, rather than on income, which might have repaid study. Even if these schemes proved impracticable, every step in his programme should have been determined by whether it would help to create a more restless dynamic to produce, to earn, and to save. It is quite clear that Mr Butler did not judge any of his steps by this criterion at all; nor

did the House of Commons. Therein lies the principal criticism of his administration. Therein, and not in any palsied charge of personal rudeness, lies the principal charge against the Opposition.

When the final balance of these debates is struck, it will be found that the Conservatives' most fortunate escape is that Labour did not deserve any pennies for the particular guy it fabricated. It has been a ludicrous—not an immoral—idea to try to persuade the public that the bland features of Mr Butler are a cloak for dark treason and plot. But if only the Labour Party would lift its eyes from yesterday to tomorrow, it would be easy to show it how to make a guy of this Government, it would be a pleasure to show it how to be constructively cruel and really rude to this Chancellor. The guy should not be a greedy and cunning capitalist's friend; that is hopelessly out-of-date. It should be a dull and tattered thing of straw and sloth

Wraps Off At Geneva

MONUMENTAL nudes are not, happily, a dominant feature of the Geneva scene. Last week, however, the Palais des Nations was presented with two: the rival programmes tabled by Mr Molotov and by the western governments. The fig leaves of July have been stripped away, and the two plans stand massive and naked against a damp sky. Their juxtaposition does not make a cheering sight; but the unveiling itself should be welcomed. It was high time the wraps were taken off Mr Molotov, so that the world may get a good look at the stony outlines of Soviet policy. The Russian demands in regard to Germany and Europe now formally presented again are essentially those that were expected, and that were discussed in *The Economist* of October 22nd. Few people can have imagined that they would be very different. But in some quarters it has evidently been supposed that the western governments, for their part, ought to have yielded ground decisively before the conference began. That seems the only possible explanation of the fact that the offer now formally made by the West has been branded as "cynical and hypocritical" in a responsible British newspaper.

Those seem strange words to apply to the latest in a series of attempts to free the East Germans from a hateful regime, to give Russia practical and visible assurances against any future danger from Germany, and to lower both barriers between peoples and concentrations of arms. Should not the question rather be asked whether the West has not once again set its sights too low? The Russians have followed their now stereotyped tactics; they have returned to Geneva with a full set of maximum demands, so extreme that Mr Molotov has plenty of scope for making apparent concessions later and thus gaining kudos without sacrificing his real objectives—which are to get all American

and no imagination, a tinkerer with troubles, instead of the architect of a grand design for expansion.

The portrait might not be wholly fair, and it might not be as easy for Labour to unite against as the present fashionable bogey of deceit and reaction; but it would have the advantage that it would bear some recognisable resemblance to the present (instead of the past) weaknesses of the Tory party, and would therefore help to jostle public opinion in the direction in which it ought to be going. The one thing that is certain is that the country will continue to suffer from completely irrelevant politics, from very moderate Government and from unprecedentedly bad Opposition until some new leader of Labour manages to create this image in the public mind, and to lead the fight against it. At the moment, unfortunately, Mr Gaitskell seems to be principally concerned in trying to look as much as possible like the guy himself.

forces out of Europe and to reshape the whole of Germany the way Russia wants it. Admittedly, no western negotiator can play this haggling game so freely and ruthlessly. Western governments must take pains to show themselves reasonable in the eyes of their domestic publics, of their allies and friends, and of other watching nations (some of which still apply the "double standard," expecting no matching reasonableness from Moscow). But it is still arguable that, subject to these limitations, the western position at the outset of any meeting with Mr Molotov ought to allow for at least a modicum of manoeuvre.

In fact, when one examines the western proposals now tabled at Geneva, do they not correspond much more closely to the minimum than to the maximum? It is certainly not easy to see at first sight what points could be readily conceded from them; for, unlike the Russians, the West is making an offer rather than a demand. To induce Moscow to do what Moscow had long professed itself ready to do—that is, to allow the Germans to reunite under a government of their own choosing—the western powers are offering to conclude a treaty of reassurance, from which they themselves can expect no benefit. They are not touching the Russians' rawest nerve by raising the question of Eastern Europe and its people's right to choose their systems of government freely. They are offering to help establish a zone of limited and supervised armament along Germany's frontier with the Soviet empire, together with a radar "early-warning" system on each side of the frontier. Finally, they are offering to take the considerable risk that a reunited Germany might not join the Atlantic alliance—with all the hazards that that would mean for the maintenance of American forces in Europe.

This last point cannot be emphasised too often, for

it is here that the present western position seems most lamentably misunderstood. It was to be taken for granted that Communist propaganda would now resort to numerous distortions of the West's terms in order to confuse opinion (one such is a charge that the western plan involves stationing a German army in Poland). Nobody will be surprised, then, to see the Soviet press accusing the West of "stipulating that the united Germany must enter the military alignments of the western powers whether the German people want it or not." But it is surprising to find some western commentators falling into this error. The western governments have always explicitly maintained that a united Germany should have a free choice between alliance and neutrality. Common sense alone dictates this. Just how, one wonders, could the Atlantic allies compel a sovereign Germany to join their ranks, if its own freely elected government was unwilling to enter Nato and sure that its refusal to do so would be supported by Russia?

★

What is, however, to be found in last week's statement of western policy is the condition that the treaty of assurance offered to Russia would take effect only upon reunited Germany's deciding to join Nato. The Soviet press pretends that this amounts to the same thing. Yet it obviously does not. The Russians may indeed have good reason to believe that they and their puppets in East Berlin have so alienated and alarmed German opinion that a united Germany would enter Nato without hesitation. The western allies will note this tacit Soviet self-criticism with interest; but they themselves cannot take German adherence to their ranks so firmly for granted. Three questions may here be asked. First, as the Russians have repeatedly dismissed all the West's proffered assurances as valueless, what would they lose if the assurances did not take effect? Second, if a united Germany chose neutrality and thereby jeopardised the whole structure of Western Europe's defences, what interest would the West have in extending its commitments by giving assurances to Russia and its satellites?

Thirdly, does not the essence of the assurances now offered to Russia consist in the fact that they would not be mere paper promises, but would be backed by the real ability of the Nato-Western Union system to exercise restraint over individual member countries? If reunited Germany kept out of Nato, it would not be subject to the practical inhibitions which would arise from the integration of its defences with WEU and the Shape command. Herr Grotewohl insisted last weekend that reunited Germany "being a sovereign state, will dispose of its own national armed forces." And the very fact that the Russians now seem happier to see Western Germany remain for an indefinite period in Nato than to contemplate a united Germany that might be outside it lends strength to the argument

advanced by the West last week that its defensive alliances, far from menacing Russia, add to Russia's security. It seems often to be forgotten that the western powers and Russia are alike committed, on paper, to restraining any aggressor, under the United Nations Charter and the Assembly resolutions of 1950; assurances given in respect of a Germany that did not belong to Nato would not noticeably strengthen these.

But the West's basic dilemma in the present negotiations is a simpler affair than these problems. At bottom, the choice is between granting a set of Soviet demands which, embracing as they do the snuffing out or tapering off of Nato, the removal of American forces from Europe, and the rigging of German reunion to produce a "democratic and peace-loving" regime *à la Russe*, point inexorably to the death of freedom in all Europe; or holding on and haggling in a way that is bound to earn the western negotiators odium for their apparent stubbornness. Yet this alleged "stubbornness" consists simply of rejecting Soviet demands that the West cannot accept and live—while the West is not asking Russia to sacrifice even its advanced *glacis* of satellite regimes, let alone to submit tamely to western hegemony. Mr Molotov's momentary readiness to set aside discussion of the more extreme Soviet demands, scarcely veils his real intentions; these may be illustrated by *Pravda's* recent verdict that Nato is "incompatible with the interests of European security."

The fundamentals of the western position, on which there can be no giving way without disaster, may be summarised as: foolproof and total freedom to enable an all-German government to be set up through fair elections; the holding of these elections at the earliest possible date, in order to set a term to the indoctrination of youth in East Germany and the growth of partnership between nationalists and communists in West Germany; and the retention of American forces alongside their allies in Europe.

★

There may be room for adjustment in regard to the membership of the treaty of assurance, the extent of the controlled military zone, and other secondary issues; the western powers have made it clear that their proposals are no more than an outline and that they are willing to discuss any reasonable amendments. But, while compromise on essentials is impossible, so, too, is any sort of complacency. Merely to accept the present *impasse* would be to court the gravest danger. The western powers should both keep up their pressure on the Russians, and themselves examine every alternative formulation that does not mean throwing away the essentials of their safety. And it must not be thought that these efforts on the part of the West are needed merely to satisfy German impatience for reunion. On the contrary, the idea that the *status quo* can be maintained indefinitely is illusory, and the consequences of a German loss of patience could prove fatal for the whole western world.

Graduated Deterrence?

THERE is fairly general agreement in the western countries that the policy of the deterrent—to put it more bluntly, the threat to use the hydrogen bomb—has improved the chances of peace. Indeed, the facts are plain. Once full-scale war becomes a suicide pact it can no longer be regarded even by the most cold-blooded aggressor as the continuation of policy by other means. Even before the July conference in Geneva it was evident that both the western and the Soviet governments had grasped this fact; at that conference, they had a chance to convince each other that both had grasped it. They seem to have succeeded. The "hydrogen stalemate" is a great deal better than a dangerous unbalance, and a great deal surer than a balance in conventional arms.

This is something gained. But that does not mean that anybody can feel very happy about the present state of affairs. Indeed, who can be content to entrust himself to the monstrous paradox of building safety on a threat to destroy human civilisation? It is not only in conscience that many people are troubled, but in reason too. For suppose that something were to slip, and the bombs, which can preserve peace only because they are so awful, came to be dropped in earnest. And can one believe that the age of slips and errors of judgment is gone for ever?

Moreover, there is the dilemma of the "little wars." Is the hydrogen bomb to be relied upon to prevent them also? If so—and Mr. Dulles, with his talk of "massive retaliation" last year seemed to be implying that this was American policy—then two difficulties arise. The small nations of the world are alarmed lest any action anywhere in the world that displeases the possessors of the hydrogen bomb will lead to total destruction. And if the hydrogen bomb is the only answer to the "small war," would-be aggressors will guess (and almost certainly correctly) that it will not in fact be used. In short the friends of the western powers will be alarmed and piecemeal aggression of the Korean type will be encouraged. But if on the other hand it is admitted that the policy of the deterrent applies only to full-scale war involving great powers, then two other difficulties arise. First, other and less destructive weapons of defence have to be kept to deal with small wars, landing countries in the appalling expense of arming themselves on two (or three) levels at once. And secondly, if little wars are not to be prevented from happening by using the ultimate threat against those who start them, how can they be prevented from growing into big wars and bringing the bomb into action? How to make a threat real and sincere and believed in (which is the best hope of peace) while also making sure that it is never used (which is the certainty of utter destruction)?

It is not surprising that many people, wrestling with this dilemma in their minds, are advocating the idea that the deterrent, the threat itself, should be graduated—that just as the biggest war can be prevented by the biggest threat, so smaller wars can be prevented by smaller threats. It is an attractive idea and one which clearly requires the most careful thought. Not the least of the difficulties in thinking clearly and logically about it arises from the words that are used to distinguish the various categories of weapon that are now (or soon will be) available. Most people find it difficult to distinguish in their minds between different grades of the inconceivably abhorrent. In current discussion "conventional" is the adjective that has come to be applied to all the weapons of destruction that were in use before the first atomic bomb was dropped in August 1945. "Tactical atomic" weapons—the middle category—are those whose effect, dreadful though it may be, is confined within the radius of a mile or two. The third category, the strategic, consisting of the hydrogen bomb with its unpredictable fall-out, is the civilisation-destroyer. This threefold classification is doubtless very crude, but it will serve for the present purposes. Not all the new weapons, of course, result from atomic fission or fusion. Chemical warfare (poison gas and the like) can probably be put in the middle category. The little-discussed bacteriological weapons might be so appalling in their results that they deserve to be put into the worst group.

★

In its simplest form, the proposal of graduated deterrence amounts to no more than the advocacy of a declaration by the western powers that they would employ, in the face of a threat to peace, no more force than would be needed to remove it—for example, to hit back with roughly twice the force employed in any local aggression. Other versions are more sophisticated. One of them proposes an undertaking by the western governments that they will not be the first to use weapons of mass destruction (the third category) against any targets—though they would retaliate if the aggressor used them; and, as a further step, that they will not be the first to use tactical weapons (the second category) against centres of population. This would be an attempt to confine any future war to the weapons of the war of 1939-45 plus tactical atomic weapons in the fighting area itself, while still retaining the ability and the willingness to hit back with the full horrors if the enemy used them first.

This, in outline, is the proposition that requires analysis. There are two main questions to be asked about it.

1. *Would the giving of such an undertaking strengthen or weaken the chances of peace?* This, clearly, is the critical issue where logic has to do battle with instinct. For though logic says that the most unutterably horrible war that does not happen is preferable to the most humane war that does, instinct tends to concentrate only on the horrors and to jump at any chance of lessening them. Would a graduation of deterrence lead a would-be aggressor to believe that the game might conceivably be worth the candle? To be quite specific: would it diminish the western powers' ability to deter a Russian aggression, the only likely cause of major war in the near future? If the answer to either question is in the affirmative, then it is a very dangerous proposal.

In the earlier part of the postwar decade there can be no doubt that a western undertaking not to use the heaviest available bombs on Russian cities would have increased the risks of war. Indeed, as Sir Winston Churchill has so often said, the fact that the Americans, and the Americans alone, had the atomic bomb was, in those years, the main and perhaps the only guarantor of peace. The situation is now changed, in that both sides have (or soon will have) substantially the same power to destroy each other. But in conventional arms the Russians still have an enormous preponderance, while there is no evidence that the West possesses enough tactical atomic weapons (the middle category) to stop an aggression. To give the Russians the power to decide whether or not hydrogen bombs would be used would surely be, as things stand now, to restore to them the power to overrun Western Europe while keeping their home base intact. If so, then a declaration of graduated deterrence in present circumstances could not do other than increase the risk of war.

★

Whether these circumstances will change in future is very hard (at least for the non-expert) to assess. A time may come when the forces of Nato will be large enough and sufficiently well equipped with atomic cannon and other gadgets that they can be quite sure of stopping a Communist invasion without having to drop bombs outside the war zone itself. If so, then hydrogen bombing will not be necessary to make this sort of aggression obviously unremunerative and it could therefore be forsworn without increasing the risks of aggression being undertaken. But will this time ever come—a time, that is, when a defending land army can be quite sure of defeating an attacking force many times its size? And if Europe can some day defend itself in this way, what about the rest of the world?

*These considerations do not perhaps wholly invalidate the case for graduated deterrence. But they do seem to postpone for a long time the day when the deterrent can be graduated without thereby losing some of its power to deter.

2. *If war comes, will prior declarations limit its eventual horror?* It is difficult to be other than sceptical. The modern world has not produced much evidence of a willingness of states to keep their promises. It is true that poison gas was used in the first world war and not in the second—but surely not because Hitler believed in keeping promises. If he had thought that using poison gas would help him he would have used it. If the Germans had tried to land in England in 1940, can anybody be sure that the British Government would not have used gas on the beaches—or that it would not have been justified in doing so? Furthermore, the undertakings that would be given under a policy of graduated deterrence would not be absolute promises, but conditional ones. In view of the fog of war and the paramount importance of speed in timing, could much reliance be placed on promises not to do something unless the other fellow did it first?

★

Moreover, there is the question of definitions. When does a method of killing large numbers of human beings enter the definition of a "weapon of mass destruction"? What is a war zone? (We would have to beware of definitions that would appear to mean that it was all right to destroy Germany provided London and New York were spared.) To draw a distinction between legitimate military targets and centres of population may make sense in the wide open spaces of Russia and America—but hardly in Belgium or in Britain. Would the "war zone" include submarine bases, even if they were right back in the enemy's homeland and close to large cities? If so, what remains of the distinction? If not, would that mean that Britain could not hit back in the only effective way at one of the greatest menaces to its existence? It is difficult to believe that each warring nation would not give itself the benefit of the doubt in all these instances, and that a fatal competition in the use of "minimum" doses of superior force would then be started.

With regret, therefore, the conclusion must be that a policy of graduated deterrence, in any form that attempts to lend precision to the idea, does not stand up to the test of logical examination. One reverts to the major premise—if the effectiveness of the deterrent resides precisely in its certainty and its horror, then any attempt to reduce either the certainty or the horror will reduce its power to deter.

But this cannot be more than a provisional conclusion. It is difficult for the human mind to comprehend all the issues that are involved and to assess the weight of so many imponderables. Circumstances may change. It is certainly right that these issues should continue to be debated and that even those who believe most firmly in the policy of the maximum deterrent—perhaps they more than anyone—should continually re-examine the foundations of their belief.

Unfair to the Inn

BY A CORRESPONDENT

RUMBLES of complaint from the pubs, the tourist interests, the Magistrates' Association and behind the scenes at the Conservative Party Conference have suggested that all is not well with the drink licensing laws. As these laws have not changed for many years, while social and economic conditions have, it would be surprising if all was. Unfortunately, it is always difficult to discuss this problem soberly because the two pressure groups concerned, the temperance interests and the licensed victuallers oppose each other at every point, sometimes hotly. It will be wise to try to probe the present situation in search of light rather than heat.

The English licensing system began just over 400 years ago in 1552. Since then, with an interlude of "free trade" between 1830 and 1869, its essential principles have remained unchanged. Those who framed the present licensing laws had two objects. One was to curb drinking; the other, less generally appreciated, was to protect drinkers from exploitation by the monopoly which the curb itself set up. Although the two objects become entangled with each other, present controls can be briefly summarised as follows:

(1) *Control of Conduct.*—A new licence is granted only to a suitable person, and if the justices consider it will satisfy public need. It carries an excise levy, for "monopoly value," which is supposed to measure the difference between the value of the house licensed and unlicensed. The structure of the house is subject to the justices' approval both when the house is first built and when the licence comes up for annual renewal. The justices' permission is also required for alterations that change drinking space, conceal a part of the house from the bar, or affect access to the licensed rooms. Their authority is required for transfers of a licence from person to person and from premises to premises. At the discretion of the justices, licences may be declared redundant and compensation paid to the owners.

(2) *Regulation of Hours.*—Licensed houses may remain open all round the clock, but the hours during which the sale of alcoholic drinks is permitted are limited by law and fixed for each licensing district by the justices. Broadly speaking, weekday permitted hours are limited to nine hours between 11 a.m. and 11 p.m. in London, and eight or eight and a half hours between 9 a.m. and 10 or 10.30 p.m. elsewhere; there are compulsory afternoon closing periods everywhere. In Wales pubs may not open at all on Sundays, and in Scotland drinks may only be sold on Sundays to "bona fide travellers." Permission to sell drinks for an additional half hour in summer, or for special purposes, such as the televising of the cup final, must be sought by separate application to the justices or the police magistrates.

There have been three main changes since these controls (except hours) were last significantly amended. One—which, of course, is much stressed by publicans—is that drunkenness has changed not only in extent but also in kind since the turn of the century. Then there

were more than 200,000 convictions a year in England and Wales in a population of 33 million; now there are 50,000 in a population of 44 million. Then drunkenness was an excusable, or at least an expected, escape from sordid living conditions; now it is an inexcusable lapse from good manners. The temperance people may justly retort that, although these changes are gratifying, they do not justify any relaxation in the law; yet it is not only the law, but also the improvements in living standards and social habits, that explain the increased sobriety of the English people.

A much bigger change since 1900, however, has been the swing from monopoly to competition. That some in the trade are not alive to it is no evidence that it has not happened. Beer and the pub once had few rivals for the working man's leisure and spare cash; now they are humble contenders among many for the public's favours. The cola soft drinks, espresso coffee bars, and competitive television are the pubs' most recent rivals; they will not be the last. In a few socially backward areas the poor and rather sordid pubs—with amenities far lower than the average—may still attract the safe custom of a few immobile old men swilling draught beer off their pensions; but when they die these pubs will die with them. Elsewhere, in an age of greater competition, the licensing laws have been replaced, for several key decisions, by the laws of supply and demand. A new house today requires not only a licence, which in the old days was a valuable property rarely refused, but also some prospect that there will be enough customers to make it pay. The amenities of a house depend not, or not only, on the justices' requirements, but also on competition: pub improvement is essential to keep customers. And houses may be shut not only when the licences are declared redundant, but also when they become uneconomic.

★

The third change has been the growth of evasion. In part, this is due to the fact that a licensing system based on devolution of responsibility on local justices, who have different problems to deal with in different areas, is ineffective in an age when the internal combustion engine has made distance insignificant. If the justices do not grant summer extensions in one district, the inhabitants can go where they do. Anyone who wants a drink in Scotland on Sunday gets it by becoming a "bona fide traveller." Those in Wales who want a drink in a pub on Sunday get it by crossing the border to England.

But, even more important, evasion has been due to the growth of the clubs. In conception the club is a self-governing, private meeting-place for people of like

interests. And so it often is. But it has also been used to by-pass the licensing laws; and it is often little more than an unlicensed pub. It is subject to almost no licensing control: it pays no monopoly value; its structure may be what its members like; it may open when pubs are closed; it may supply any lawful services, amusements, games, and entertainments its members want; it may admit children; and it need seek no favour from the authorities. In 50 years clubs have grown from 6,000 to 22,000, while pubs have shrunk from 100,000 to 73,000. And, if the licensing system remains as it is, the number of pubs may further decline and the number of clubs further increase.

That is the present situation. It is a pretty silly situation. How to repair it? Many of the temperance people, some of the magistrates and the more socially backward of the pubs seem to think that control of the clubs would be the right answer. This idea of using suppression as a cure for a condition that results from suppression would not be likely to have very enduring results. Just as controls on the pub stimulated the club, so controls on the club would eventually stimulate some other form of institution in which drinking could take place outside the law's clutches and farther from the public eye. The alternative "reform" would be to free the pubs from at least some of the restrictions that are put upon them, but not upon their competitors.

★

The feasible reforms require careful consideration. One possibility is that—even if the hours for the sale of drinks must remain limited as at present—the pubs should be allowed to vary their morning and evening sessions without legal authority (in some places there is little trade from 6 to 7, when pubs are open, but there might be some after 10 or 11, when they are shut). Another complaint is that the regulations determining "monopoly value," which may raise the cost of a new house by 20 per cent or more, are absurdly stringent in an age when the pubs' monopoly is as circumscribed and precarious as it is today. These suggestions naturally raise political issues, but there are other points in what might be called the "pubs' charter" that do not seem to be so much matters of politics as matters of common sense. For example, it seems odd that the law should still insist on two public rooms in houses with full licences; if the customers naturally fall into two groups and are happier in separate rooms, the pub will have two bars without bringing in the law to force all pubs to have two bars. And the compensation system, already a dead letter in about half the licensing districts, should surely now be revised. Far from easing the cutting out of dead wood, it often delays it by encouraging the trade to hang on to uneconomic houses.

Some other suggested reforms would require changes in the attitudes of the justices rather than changes in the law. The justices' views upon the right structure for a new house often go far beyond a proper insistence that certain minimum standards

should be met. They are sometimes strangely averse to trade methods that make economic sense at a time of increasing competition: the use of tenants with a part-time job to keep small country houses going; the use of outstanding licensees to run more than one house, and so on. They could refrain from requesting licensed houses to be open when the law does not require them to be. The licensed trade may have to consider closing one day a week if it is to attract staff away from five-day-week industry. Finally, justices could surely be more liberal in permitting games, music and other facilities.

In any dispute about the liquor laws economic and libertarian considerations are liable to clash with a particular kind of morality. People who are fed up with the inconsistencies of the present laws need to realise that the only liberalisations that would—and should—have a dog's chance of enactment are those which avoid this clash so far as possible. The proposals which have been outlined in this article, most reasonable people may think, do in fact avoid it. As such they seem to make up a better case to lay on the Home Secretary's desk than the case for controlling the clubs. It is a pity that the Home Office—more, perhaps, than any other department of state—has shown the greatest sloth in recent years in allowing such problems to accumulate; and then, when they have accumulated, has shown the greatest energy in either running away from them or dealing with them by repression.

England and America

It cannot be denied . . . that the state of feeling subsisting between the United States and this country is by no means as harmonious as it ought to be. . . . Yet there never were two nations whose amity, it should seem, ought to be closer or sincerer . . . both are free, both are progressive, both are powerful. A great part of this ill-feeling arises, we are satisfied, from groundless jealousies and pure misconceptions of fact . . . we observe among our transatlantic brethren a touchiness as to their position . . . they have something of the feeling of *parvenus*, who feel that their proper place is not given them. . . . Conscious of vast energy, proud of their wonderful progress, and sanguine as to a far-reaching and lofty destiny, they yet perpetually torment themselves with the notion that we do not recognise all this. . . . So far from any feeling of this kind, we rejoice in their progress almost as if it were our own. . . . We adopt their inventions, we prize their discoveries, we copy their improvements; we hail every fresh step they make in civilisation as a gain and glory to the world. . . . We find there prevails an almost universal notion across the water that we are politically dictatorial. . . . We can only assure them that . . . we are no longer either an aggressive, an ambitious, an intermeddling, or a dictatorial nation. . . . Our sin and our danger now lie in a precisely opposite direction. . . . We now only long for peace—to lead a quiet life—to keep out of hot water. We ask only of our neighbours—and of our American neighbours most especially—that they will not, by unendurable encroachments, bully us out of our indolent repose.

The Economist

November 3, 1855

Notes of the Week

The Path of Duty

PRINCESS MARGARET has made the decision which must have been most painful for her, and which must also be in the best interests of Crown, Commonwealth and people. Her dilemma arose only partly out of her royal position. It is strange how universally it seems to be assumed that she decided to obey the teaching of her church only because she is a princess. But from what is known of her it is an insult thus to regard her as only an *ex-officio* conformer. There are thousands of men and women every year who face the same dilemma and answer it in the same way. The example she has set is not merely of obedience to royal duty but obedience to individual conscience, and even if all consciences do not put the same definition on duty, her example may have a more steadying effect on some humbler homes, and some troubled homes, than is dreamt of in certain newspapers' philosophy.

It only remains to pay respect to her, and to beg, in common decency, that the press should now leave her alone. Her Royal Highness has set an immaculate example of conscience and duty at great cost to herself; it is for the press to try, in some small way, to emulate it. This Sunday's newspapers, please note.

How Much Deflation?

THE most important question that should have been answered in the recent economic debates was not answered at all. It concerns the degree of disinflation at which the Government is aiming. The measures of restraint in the Budget are rather sterner than most people had expected. Does this mean that the Government has concluded that the prospect is more inflationary than current economic indicators suggest, or does it mean that the Government is now deliberately aiming to carry greater reserves of slack in the economy than it has done in the last few years? Mr Gaitskell, of course, said that it means both. The Chancellor, in his view, is having to combat a very grave inflationary crisis of his own making, and is also seeking to create undesirable unemployment in order to teach trade unionists a lesson; it seems rather odd that Mr Gaitskell should believe that just over £100 million of tax changes can swing the economy from one of these extremes to the other.

But Mr Butler's reply also seemed to be looking in two directions. He said that he "flatly rejects the defeatist and

restrictionist conception" that a Chancellor "should budget for a certain amount of deflation, so that he will always have a margin in hand, and that would be a margin of less production and less employment"; he still believes in "taking risks" to secure maximum production. On the other hand, Mr Butler warned the House that, in addition to his new measures, "the credit squeeze . . . will increase in severity during the coming months"; and his recent references to the need for discipline have undoubtedly been sterner than usual. One suspects—or rather fears—that the actual course of his policy may be to allow unemployment to increase to about its average level under the Labour government, and then to start re-inflating again as soon as it has gone far enough to lose him that talking point. The question of how much unemployment is desirable, to strike a balance between maximum production and reasonable price stability in a country with free trade unions, is very difficult to answer. But the Government should be told now that the problem cannot be answered by convenient political calculations of this sort.

Wages and the Budget

THE moderate men of the Trades Union Congress have been put in a difficult position, not so much by the Budget (the cost of living index will rise by less than one per cent as a result of the purchase tax changes) as by the reaction of some constituent unions—and of Mr Gaitskell—to it. The chosen spokesman for the moderates was Mr Douglas Houghton, Labour MP for Sowerby and a member of the TUC's general council; he said in the Budget debate that although "there are not more grounds for pay increases in higher taxation than there are for pay cuts following reductions of taxation," he did "not suppose for a moment that that will stop them being made." It was on Mr Houghton's initiative that the Prime Minister and Mr Butler met the TUC on Tuesday; but the statement issued by members of the TUC's economic committee afterwards, though it refers to the trade union movement's "obligations under full employment," does not suggest that the unions should moderate their claims. The new political embarrassments apart, the TUC has to keep its pleas for wage restraint down to a ration that its members will tolerate.

But, with the need for some restraint so obvious, there has been one unacceptable and one sensible suggestion this week about how the country might move towards it. The unacceptable suggestion was the reiterated plea at last week's conference of the British Employers' Confederation that employers should practise their own form of wage restraint by refraining from overbidding each other for scarce labour—"poaching," the speaker called it. This is completely to mis-

understand the meaning of a free economy. How is labour to be channelled into efficient firms, which can afford to pay higher wages, if they feel themselves bound not to do so? More constructive was a suggestion made in the House of Lords on Tuesday by Lord Perth. This was that the unions might be persuaded to couch some of their current wage demands in the form of deferred benefits, such as the guaranteed annual wage (i.e., guaranteed payments in the event of unemployment) that has recently been successfully sought by several unions in America. Another possibility would be increases in industrial pensions, which, however, would have to be transferable if they were not to root the personnel of British industry to the spot. The proposal bristles with such difficulties; but, in so far as "moral" campaigns for restraint have any effect, it might be wise for the Government and other pressure groups for moderation to start to try to influence union policy in this direction. To suggest that the workers should agitate for deferred loaves might be more promising than to ask them to agitate for no bread. It would also be to the workers' advantage.

France's Political Immortals

EVEN in its death throes the French National Assembly has remained faithful to its traditions. By accepting premature elections, it has signed its own sentence of execution; but by rejecting all the suggested substitutes for the present electoral law (which no one attempts to justify) it has in effect done its best to ensure that its successor will be modelled on its own unsatisfactory image. If anything can be discerned in the present confusion, it seems probable that elections will take place in December under the old voting system—which everybody admits is obsolete and a fraud. It is perhaps natural that the parliamentary majority should have chosen to hold the election before the opposition has had time to prepare its offensive and before the tragic events in North Africa have made their full impact; what is more difficult to comprehend is its refusal to amend so indefensible an electoral law.

The majority was assisted in its massacre of alternative electoral bills by the divisions within the opposition. The crux of the matter is that the Right is less divided than the Left. As a result, a system designed to combat a specific danger looks like straying in force even though that danger no longer exists. The present electoral law was devised in 1951 to prevent extremist "anti-parliamentary" forces gaining control of the Assembly. A system of *apparentements*, or alliances, was superimposed on proportional representation, so that alliances of orthodox "parliamentary" parties which polled more than 50 per cent of the votes in a constituency would pocket all the seats.

The system was justified at the time as the only way of defending democracy against the assaults of Gaullists and Communists. Now the Gaullist wave has receded the argument is no longer valid; but the centre-Right majority believes that to maintain the system will help it best to hold on to its power despite its poor record in office. The chief victims of M. Faure's manoeuvre are likely to be the Socialists and M. Mendès-France, who will be tempted to counter the disadvantage of an early election by entering

into Popular Front alliances which include the Communists. Probable defeat or a perilous liaison with the extreme Left: that, unfortunately, is how they may see the dilemma with which they are faced.

Turncoats in Morocco

THE story of the *volte face* of El Glaoui, Pasha of Marrakech, from fervid antagonism to ex-Sultan Sidi Mohammed ben Youssef to acceptance of his return to the Moroccan throne looks, at first sight, a collector's piece for the connoisseur of unlikely tales. Yet there is an explanation of what went on in El Glaoui's venerable head.

He is much influenced by the diehard French element of which Marshal Juin is the prototype in France; within Morocco he belongs to a group, Moroccan as well as French in composition, that has made fortunes out of investment in successful French business enterprises. From the moment of Ben Youssef's deposition in 1953 until October, 1955, this group and its sponsors in France worked might and main to keep these investments intact under the ægis of a puppet sultan, Ben Arafa. But once it became clear, this autumn, that their puppet must go and that the installation of a Council of the Throne was bound to increase the power of younger, more modern elements within the state, this group reasoned that a throne (even if occupied by a personality who was not to their taste) was better than a patchwork arrangement that might well lead to some more plebeian form of government. With El Glaoui as mouthpiece, and with a bad grace, the diehard element in France and Morocco therefore turned to the right about.

This theory about a development so sudden that it left everyone gaping is borne out by the fact that the French Right, and its blood-brother, the *Présence Française* in Morocco, have uttered little or no comment on happenings that they would not have brooked in silence three weeks ago—for instance, the stately official welcome offered to ex-Sultan Ben Youssef on arrival in France from his Madagascar place of exile and on his unequivocal statement that Rabat will be his next address.

Rouble Diplomacy in Asia

THE arrival of the *Stalingrad* at Alexandria on October 20th to unload 133 huge cases of Czech arms only ten days after the announcement of the Egyptian-Czech arms deal has given a fine fillip not only to Egyptians but beyond Suez, for it is tangible and gratifying proof of "independence." Yet the kind of stir the news has made seriously distorts the proportions that Soviet aid has so far assumed in the countries to which it has been offered.

For instance, an item that has been selected for poster publicity is an alleged Russian offer to build the new high dam at Aswan. In fact, all the Soviet ambassador to Cairo has so far mentioned is that Russia would be ready to lend technicians and to barter materials such as machinery and cement for Egyptian cotton—that is, a transaction

different only in size from the agreements to barter cotton and rice for oil made in April and August of this year. Meantime, the contract to act as consulting engineers on the high dam scheme has been awarded to the British firm of Sir Alexander Gibb and Partners; the commissioning of British firms of this type, already possessing immense and successful experience in the area, is taken so much as a matter of course that it seldom makes headlines, even in Britain.

Before hands are wrung about Soviet competition, it is well to remember what has happened in countries to which Russian "aid" has been offered. In some cases it is vastly publicised at the start, but later (when the receiving country's accounts are published) turns out to be a transaction at ordinary commercial rates. China's foreign trade minister recently revealed, for instance, that the peasant must toil at increasing food exports to the Soviet Union if China is to pay its very heavy bills for Russian help. In other cases it is concentrated on one spectacular scheme, as in the case of India's steel projects, and is not spread broadly, as is western aid, across the local economy. Finally, it is not made available as an encouragement to "progressive" regimes, but on a much more cynical calculation of its effects. In recent years, while Moscow tirelessly assured the Asians of its eagerness to help them, it extended only one credit of any real substance—to General Perón's fascist regime, to sustain it in its anti-United States policy; and in non-Communist Asia the most favoured recipient even of modest Soviet help has been Afghanistan.

Rouble diplomacy in Asia is not to be underrated, but the healthy reaction to it is to brace for a race that the best British firms still know how to win, as long as too plentiful work in steadier markets does not damp their ardour for tendering in the Middle East.

The Real Objective in Housing

IN about five years' time—that is, by about the time of the next general election—the Government believes that the waiting list for council houses will have been cleared by its new housing policy. That is the sensible objective of the policy, and it would represent a great human achievement. That is also the first and most important point that emerges from the official memorandum published this week at the time of the first reading of the new Housing Subsidies Bill. But the second point that emerges is that the Government seems to expect little, if any, alleviation of the strain on national resources caused by the present building programme. It still seems probable that the Government is being too pessimistic about this. Certainly the figures in its memorandum require close scrutiny.

The Government believes that, under the new policy, local authorities in England and Wales will continue to build houses at about their present rate of 160,000 a year for the next five years; if houses for private owners also continue to be built at their present rate, which is only a little below the local authorities' rate, the country will therefore still be building 300,000 houses a year. The Government also believes that about half of the local

authorities' output—that is, about 80,000 houses a year—will attract subsidies under its slum clearance and "overspill" schemes. It thinks that local authorities will build their other 80,000 houses a year for "general needs," despite the fact that these houses will no longer attract an Exchequer subsidy; and it is this rate that it thinks will suffice to clear the councils' waiting lists within about five years.

One point which can be made—and which certainly will be made by Labour speakers—about these figures is that local authorities may not be at all willing to build as many as 80,000 houses a year for "general needs" without an Exchequer subsidy. It would be more reasonable to expect some shortfall below this rate. But this does not mean that the objective of clearing the waiting lists within five years will not then be achieved. The missing element in the Government's calculation is that it fails to realise how far the demand, and the need, for new houses may fall if an increase in rents causes a significant number of existing but under-occupied houses to come on to the market. The increase in rents that is required is not principally in the council housing sector. Indeed, the Government has this week produced figures to show that, if its estimates of future building are correct, weekly rents in four actual and fairly representative local authorities would need to rise by an average of only 8d. a year—that is, by 3s. 4d. over the whole five-year programme—to keep the local authorities' accounts in balance. It is the level of restricted private rents that most obviously needs to rise; the new level of council rents will appear inequitable until this happens. It will be a great pity if the Government is bemused by this week's calculations into believing that its main political objective—that of clearing the waiting lists by the time of the next election—can be achieved without grasping the real nettle. That nettle must be a quite drastic amendment of the Rent Restriction Acts.

The Housing Bill

ALTHOUGH reform of the Rent Restriction Acts is, or should be, the most important part of the Government's programme, the details of the Housing Subsidies Bill, published this week, deserve separate attention. As Mr Sandys had already announced, the general housing subsidy, now reduced to £10, is to be abolished as soon as possible by ministerial order; it has now been decided, however, that there will be a special subsidy for any local authority that would then face "an unreasonably heavy rate burden" in satisfying the urgent cases on its general waiting list. The Exchequer will also continue to pay subsidies at the present standard rate (£22 rs. a house per annum) towards the cost of slum clearance schemes, and at a slightly higher rate (£24) for various kinds of "overspill" schemes. The subsidy for housing agricultural workers will also be continued. These arrangements apply only to England and Wales. For Scotland, the Government has now introduced a Bill that will abolish the system of owners' rates and put valuation for rating upon roughly the English basis. It has been decided that other measures north of the border must wait until this Bill is in force; in other words, the whole programme of reform there will lag one step behind.

The estimate that, under the new system, the Exchequer will still be subsidising 80,000 new council houses a year in England and Wales is arrived at in the following way. There are, to start with, over a million slum houses waiting to be cleared and, because of the overcrowding within them, a much larger number of families needing to be rehoused. If, as Mr Sandys hopes, the back of the slum problem is to be broken in the next fifteen to twenty years, around 60,000 new dwellings may be needed annually for this purpose. The cost to the Exchequer will be increased by the high proportion of flats in these schemes, on each of which it will pay a special (and rather surprisingly) high subsidy of between £32 and £60, varying with the height of the block—in addition to the extra subsidy for expensive sites, which will now be available for houses and flats equally so as to encourage more mixed development.

The various "overspill" subsidies are intended to assist the process of dispersing population from congested cities. They will apply to houses built in new towns, to schemes approved under the Town Development Act, and to large-scale projects undertaken by congested cities in distant areas. At present the new town corporations are building about 12,000 houses a year; few projects under the Town Development Act and the "distant areas" scheme have yet been started, but when they are in full swing they will raise total "overspill" building to at least 20,000 houses a year. Government aid in these cases is partly necessary because of the lack of a pool of prewar council houses which can help to keep down the rents of new houses; but it also represents an endeavour on Mr Sandys's part to integrate housing and town planning policies, and to persuade local authorities to build in what he regards as the right places.

The Term of Service

THE debate on the White Paper on National Service (Cmd 9608) turned largely on what makes a national serviceman efficient. To the Government's insistence on the need for a two-year period of service, even though by raising the age of the call-up the number of conscripts will be reduced between 1953 and 1958 by 170,000, the Opposition retorted that men demonstrably become fit to fight after six months' training. Labour speakers were able to ask whether Britain's retention of a two-year period of service, when other Nato countries are content with 18 months or less, means that allied forces are less efficient than British ones. Their argument that the Government has surrendered to the generals who are merely greedy of manpower will find a measure of easy popularity.

But the generals—and, even more obviously, the admirals and air marshals—are still right; indeed, if they were realistic but rude, they could point to France's military condition as an answer to the Opposition's taunts. But the decisive point is that the national servicemen are not now wanted to create a big reserve to be mobilised in war, or to maintain the absolute size of the armed forces; they are needed to maintain the services' present minimum efficiency. As Mr Selwyn Lloyd pointed out, of the 200,000 national servicemen in the Army, 6,000 are officers, 27,000 are NCOs, and 88,000 are tradesmen—all men giving indispensable service in the second twelve months of their period of service. Half the skilled men in many

units are conscripts; and the turnover amounts to twice every three years for 55 per cent of national servicemen in the average battalion and once in that period for the remaining 45 per cent. This puts a very heavy load of responsibility on the Regulars, and there simply are not enough regulars to bear any increase in it.

The Government has, however, laid itself open to trouble and endless pressure by adopting what is obviously a stop-gap expedient. For—despite the optimistic hints thrown out by Sir Walter Monckton during the debate—there are few signs that it has convincing plans for rebuilding the regular forces on the scale needed to cut the period of call-up within the foreseeable future (although the new education allowance will be a welcome relief to many hard-pressed regular officers and some regular other ranks serving overseas or subject to frequent transfer). Until the country has evidence of such plans, it will rightly conclude that, however important the trained national serviceman can be shown to be to the forces, the basic problem has not been faced. Meanwhile, the fairly rapid rundown of Britain's armed forces certainly does not lag behind the "reductions in service commitments" which, though Labour speakers waxed enthusiastic about them, are more apparent than real; and the efficiency of these forces is now dangerously poised on a political compromise.

The Four's First Week

THE early stages of the Geneva conference scarcely seemed to justify the words of cheer which Mr Dulles uttered on Wednesday. Perhaps he was encouraged by the mere fact that Mr Molotov, after a dogged effort to separate the questions of German unity and European security—in defiance of the "summit" directive, which required them to be discussed as one item—had at last tabled the Communist programme for Germany, nominally drawn up by his puppets in East Berlin (it is described in an article on page 491). But the programme itself offered no encouragement, based as it was, according to Communist commentators, on the thesis that "free elections are a device for enslavement" (a chilling echo of Orwell's "1984" slogan, "Freedom is Slavery"). And Mr Molotov took care to double-lock the door by emphasising that the absence of East German representatives from the Geneva conference table made any discussion of reunion futile.

In its first week, indeed, the conference had the appearance of exactly the kind of exchange of monologues which M. Pinay, in his opening address from the chair, had begged his colleagues to avoid. But it has been a one-sided affair. The western ministers deserve credit for the way they have tried both to explain why they cannot concede Russia's demands, and to penetrate behind Mr Molotov's curtain of jargon in order to grasp what he really wants. He, however, has shown little interest either in listening to the western explanations or in giving any himself. The Soviet case is again being presented in stereotyped formulae, almost, one might think, in looking-glass language. Thus, reunion must be arranged by "the Germans themselves"; but Mr Molotov is deaf to the western argument that that is precisely why all Germans should be granted free elections. Again, tension is "caused" by alliances; in vain have the

western ministers pointed out that Nato and Western Union were created because, and long after, Moscow had solidified half Europe into a monolithic bloc.

There has been no sign yet of the "other matters" which Mr Molotov once hinted that he would raise. The real "other matter" at Geneva has been the presence of Mr Sharett, who found Mr Molotov fully as unresponsive as did the western ministers. Present Soviet policy towards Israel seems to be governed simply by considerations of what will ingratiate Russia further with the Arabs.

Hands Across the Minefields

THERE are touches of imagination in the proposals which the western ministers have tabled at Geneva for the removal of barriers between the free and the Communist worlds. The idea that radio networks on each side should give an hour or so periodically to a spokesman authorised to explain the other side's point of view is admirable; one hopes it would not run into trouble in connection with the fourteen-day rule. It is certainly fair to point out that Soviet jamming of broadcasts is "incompatible with the directive from the four heads of government and should be discontinued." But the West should not only press all its proposals; it should add others. Obviously there should be exchanges between libraries of books, periodicals and newspapers, but why only between libraries (access to which can be, and often is, severely controlled in Communist countries)? *Pravda* and *People's China* can be bought by individuals in London; how much longer are the many Russians who understand English and other western languages to be barred by their rulers from purchasing foreign books and journals?

This is no mere debating point. The Soviet government is increasingly aware of its hermit-like reputation and of its own subjects' eagerness for contact with the outside world. It is, in fact, strenuously trying to make out that it no longer imposes barriers. "The Soviet Union throws its doors wide open to foreign visitors," declared Moscow radio last month; and Russian spokesmen tirelessly recapitulate the numbers of "delegations" exchanged with other countries. On Monday Mr Macmillan patiently and rightly told Mr Molotov that these selected, limited and escorted visits are of scant interest to peoples accustomed to free and uninhibited contact. Fear and suspicion will, indeed, be significantly lessened only when individuals can move freely across the mined and high-voltaged-wired barriers with which the Communists have scarred the face of Europe. And the jovial assurance given by Mr Ankudinov, the head of "Intourist," in London last week, that British visitors will find no restrictions on movement within Soviet territory would ring less hollowly if whole areas, such as the Baltic states, had not been virtually sealed off from outsiders' eyes for a decade and more.

Not surprisingly, Mr Molotov's main response to western suggestions about lowering barriers was to demand unrestricted trade—and, intriguingly, to hint at a new eagerness for credits from capitalist countries. He thereby reminded his audience that Marxist regimes are more interested in machinery and minerals than in men, and that the Com-

munist bloc is still as keen to obtain western supplies as to learn from western "advanced techniques." Two other reminders might usefully be added: that Communist regimes naturally control all their foreign trade, so that a scrapping of western controls would produce a decidedly one-sided situation; and that, despite all that Mr Molotov may say, friendship and understanding do not, in reality, always follow the trade flag. Machine-tools and manganese are no substitute for personal freedom of movement, and the West ought not to accept Mr Molotov's argument that the two are inseparably linked.

Party Games in Singapore

THERE could hardly have been a more blatant demonstration of Communist techniques for gaining power than that staged at the first annual conference of Mr Marshall's Labour Front party in Singapore last week. The Communists showed their contempt for the efficiency of the newly-created party organisation by packing the hall with delegates who were not properly accredited, and with their aid elected a president who was not Mr Marshall's nominee. But Mr Marshall had evidently counted the total of authorised votes beforehand, and, when the result came out wrong, promptly demanded a check of the delegates' identity cards, whereupon the intruders made for the door, trampling a junior minister in the process. The reconstituted assembly then voted the elections void and proceeded to a new election the following day.

The meeting itself was an earnest of Mr Marshall's desire to develop the Labour Front as a strong and organised party to combat the growing strength in the colony of the People's Action Party, which, though weak in the legislature, is rapidly recruiting members to its militant group of trade unions, notably the Factory and Shop Workers' Union. It makes little secret of its objective—to discredit Mr Marshall's government and to seduce the Singapore Trade Union Congress group of unions to the PAP side. The TUC group are politically passive, and perhaps none too well organised, though they hold on to their members by a fairly successful record of wage negotiations. Yet there is plenty of evidence that the process of infiltration has begun, and there can be little doubt that the PAP leaders

rely upon this process to obtain increasing control over the colony economically and, in due time, politically. Meanwhile, Mr Marshall plans a series of goodwill visits to neighbouring Asian countries, culminating in a visit to London to make contacts and discuss the agenda for the constitutional conferences next spring. These visits will no doubt yield useful results if he can leave his party and the TUC unions in safe hands while he is away; but last week's incident should perhaps suggest to him that the ground is moving under his feet.

Bread Against the Budget

THE announcement that the bread subsidy is to be raised by £2 million a year, leaving the price of bread unchanged, was a masterpiece of bad timing. Only two days before, the Chancellor had said that

the criterion of economy and efficiency will have to be applied at the right time to the range of subsidies falling within the field of the Minister of Agriculture

and the bread subsidy more than any seems ripe for abolition. But the announcement, of course, had no connection with the Budget. Discussions had been going on for some time between the Ministry and the industry about bakers' profit margins; and it had been agreed that the existing margin of 5s. per 280-lb sack of national flour, unchanged since 1941, had been seriously eroded by rising costs. To some extent the Ministry has meant it to be so eroded, as a way of squeezing bakers' profits. But if the policy is still to have a bread subsidy it necessitates fixing bakers' margins, and their increase (by 2s. to 7s.) could hardly be postponed any longer.

The change does not rule out an abolition of the bread subsidy in next year's review of agricultural prices. It had better not. But there are two obstacles in the way. One is that abolition of the subsidy would raise bread prices by 2d. a loaf and would mean an increase in the cost of living index. The other is that it might bring about the demise of many small bakers, who would find it hard to face the competition of the plant bakeries without its help and that of the special additional subsidy of 4s. per sack on the first 25 sacks that they use. There would be some regrets at seeing their nice crusty loaves further ousted by wrapped and spongy factory products, but it most emphatically is not worth a subsidy now costing £41 million a year to keep these small and inefficient firms in being.

Largesse for Laboratories

SEVENTEEN important companies in British industry have this week made a solid contribution to the problem of producing more scientists. They have raised a fund of £1,500,000 for "the advancement of science in the schools"; and this may be only a beginning, for it is hoped that other firms will wish to contribute also. From this fund capital grants will be made towards the building and improvement of science buildings in independent and direct

grant schools, whose applications will be considered by a committee under the chairmanship of Sir Hugh Beaver. Maintained schools are excluded from these benefits, the companies' statement points out, because they draw on public funds to finance their capital works (including 1,000 new laboratories built since 1945); the independent schools get no such help, and even the direct grant is a capitation grant towards general running costs only. In spite of increases in fees most independent schools are hard put to it to modernise and equip their buildings as they need to do. The grants from the new trust will therefore be of very great value to them—and incidentally may lessen the bias towards classics and literary subjects, which is still characteristic of so many public schools.

The fact that the industrialists' intention is to remedy a relative disadvantage now suffered by the independent and direct grant schools would not have saved them from a charge of class prejudice if something were not simultaneously done for the maintained schools. In a written answer on Tuesday, therefore, the Minister of Education announced that he is prepared to consider any projects for new laboratories costing more than £10,000 (below that figure his permission is not required). These projects will presumably be added to the building programmes for 1956-57, which, as Sir David Eccles was happy to inform local authorities this week, have escaped Mr Butler's axe. Only one thing will then be needed to produce a very real improvement in school science—more, and better, teachers.

Copyright Mistakes Repeated

THE brief Copyright Bill which was introduced into the House of Lords early this year, and which expired with the last Parliament, has now been replaced by a comprehensive codifying measure replacing the Act of 1911 and extending the scope of copyright. It is a complicated subject, and consequently a complicated measure is needed to deal with it. But perhaps the hard work involved in grasping the intricacies of the new Bill will persuade both Government and Opposition to give it a great deal of time and consideration.

For the objections that were raised last March to the limited aim of the old Bill have not been met in the new. In order to ratify the Brussels revision of the Berne Convention, the Government is persisting in its intention to interfere with the arrangements under which some cheap editions of the works of recently deceased authors are published; it is going to repeal the provision in the Act of 1911 that at present enables any publisher, on payment of a statutory royalty, to publish a work in the second twenty-five years of the fifty-year period of copyright.

Furthermore, not only does the new Bill repeat the provision in the old to set up a new form of copyright in television broadcasts; it is also extending it to sound broadcasting—though in the latter case no infringement of copyright will be involved merely by turning on the wireless in a hotel lounge. But, under this part of the Bill, public (however small and restricted the public) viewing of television programmes will be subject to the new copyright, which means on payment of a licence fee and, possibly, against a background of continual pressure from the actors'

SHREDS OF EVIDENCE

But evidence of what? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

The Roxburgh Hydro Electric Project on the River Clutha in Central Otago, New Zealand, is now in an advanced stage of construction. The Dam when completed will be 1,200 ft. long and will rise 200 ft. above the river bed—the largest in the Dominion. The station is designed to feed 320,000 kilowatts into the South Island grid system. The contractors are Holland & Hannen and Cubitts (New Zealand) Ltd., Conrad Zschokke Ltd., Geneva, and Downer & Co. Ltd., Wellington, New Zealand, working together under the title Cubitt Zschokke Downer. Cubitts' long experience with large contracts at Home and Overseas thus gains exports both visible and invisible and adds to Britain's prosperity and a Dominion's development.

Now, as in the past **CUBITTS** build for the future

and musicians' unions that licences should be refused wherever live entertainers could be employed. It is true that the proposed Performing Rights Tribunal is intended to prevent unjustifiable refusals to grant a licence as well as to determine disputes over tariffs. But the problem of finding more revenue for the BBC and the ITA could surely be solved more simply than by this cumbersome proposal, which first sets up a new form of copyright and then a tribunal to try to mitigate its possible abuse.

Siren Songs for Japan

LIKE Ulysses on his perilous homeward voyage, Mr Hatoyama is finding it difficult to keep his crew on their proper course as the Sirens' songs echo seductively from the Communist mainland. He has recently been faced with the return of four Japanese delegations from visits to China and North Korea, all of them having undergone intensive blandishment intended to draw Japan closer to the Communist bloc. Mao Tse-tung himself has offered to visit Japan in person. Two parliamentary delegations, to Peking and Pyongyang, have been persuaded by their hosts to sign joint statements calling, in remarkably similar language, for "positive efforts" to restore normal diplomatic relations, for an extension of trade and cultural exchanges, and, in the case of China, for the "swift abolition" of the United Nations embargo on the supply of strategic goods. In addition, both the Chinese and the North Koreans last month signed brand-new trade "agreements" with private Japanese business groups, neither of which can be properly implemented while the strategic restrictions last, and which are clearly designed to excite Japanese irritation with the trade controls.

As the Chinese-American talks in Geneva languish, the Communists are plainly concentrating their attentions on Japan. The proposal to turn the Chinese trade exhibition in Tokyo into a permanent organisation (to which the Japanese parliamentarians signed their names) is the thin end of a wedge which, by forcing Mr Hatoyama to grant step-by-step recognition of the Peking regime, is intended to open a gap between Japan and America. The Japanese must decide how far they are prepared to let the process go. It is surprising that the Diet delegation to Peking, which included both Liberals and members of Mr Hatoyama's own Democratic party, should have been so naïve about the Communists' purpose. It seems particularly dangerous, at a time when Japanese relations with South Korea had shown signs of improving, to begin to flirt with the North Koreans once again; even Mr Shigemitsu's hasty disclaimer may not be enough to quell Dr Rhee's suspicions. The Japanese might do well to recall the ugly sight that confronted Ulysses's men near the Sirens' home: the spars of wrecked ships that had been tempted too close to the shore.

Shorter Hours in Belgium

A NATION-WIDE strike which would have paralysed Belgian industry was narrowly averted by an agreement signed in the early hours of last Saturday morning.

The unions, it is clear, have substantially won their case for a 45-hour week spread over five working days. The agreement, which became possible only after the Prime Minister himself had intervened, will cause misgivings not only among Belgian industrialists but also among Belgium's partners in the Benelux Union and the Coal and Steel Community.

Some industries, notably the chocolate-making industry, had already conceded the 45-hour week and, under the new agreement, it will be introduced into all other industries by stages. Although in most countries of Western Europe a 45-hour week would be regarded as normal or even somewhat excessive, in Belgium, owing to such factors as the comparative poverty of natural resources and inadequate investment in new plant and machinery, costs in industry tend to be high, and a reduction of working hours might well add to the problem of keeping the country's industrial products competitive. The problem of Belgium's high labour costs has often troubled economic relation with its Dutch neighbours. It would be a pity if the Belgian action caused a set-back to the steady advance of Benelux. In the coal-steel pool, moreover, the high-cost difficulties of the Belgian coal mines have been recognised by the other partners and, during an interim period of five years, they were granted a subsidy out of High Authority funds in order to modernise and increase productivity. Here, too, eyebrows will be raised at the new agreement.

The Belgian Prime Minister, M. van Acker, who heads the Liberal-Socialist coalition, was admittedly in an unenviable position, for the demand for shorter hours was supported by all sections of organised labour, Christian and Socialist unions alike. But if economic and political difficulties are to be avoided, a strenuous effort will be needed to see that the cut in working hours is compensated for by an increase in productivity.

Togoland Dilemma

THE report of the United Nations mission to Togoland puts an embarrassing choice before the British Government. It declares that, if a plebiscite is to be held among the Togolandese now in British trusteeship to determine their wishes when the Gold Coast becomes independent, they must be given a real choice: between joining the Gold Coast or remaining a British trust territory. Later, the report envisages, the French could hold a plebiscite in their segment of Togoland which might lead either to French Togoland joining the French Union organically, or to its becoming an independent state which the British Togolandese (some 400,000) could then join. If they did that, it would subsequently be open to a reunited Togoland to "federate" with the Gold Coast.

This report is particularly awkward because British statements for some years have insisted that when the Gold Coast becomes independent the Togolandese must join it, or find a new power to take them in trust for the United Nations, since Britain will not continue to exercise sovereignty in the area. Britain has therefore strongly supported the Gold Coast government's case before the United Nations to take over Togoland as a mandatory power. The British argument makes sense in terms of West African colonial policy. It is of the highest importance that the

Gold Coast, when it becomes independent, should get off to a flying start, realising at once the sincerity of British motives and perceiving the advantage of staying in the Commonwealth (presuming that the other full members will all accept the new member—which now seems more likely than it did some time ago). For Britain to rule in Togoland would certainly be regarded by Dr Nkrumah and his colleagues as a breach of promise made in the past to get out completely; it would give Gold Coast extremists a chance to work up anti-British feeling, and would probably strengthen Ashanti separatism.

Yet the visiting mission's argument is valid; a plebiscite with only one answer is no plebiscite at all. The United Nations is most unlikely to accept any other alternative—such as extending French trusteeship now; and no plebiscite would be regarded as fair unless the United Nations sponsored it. In the United Nations there is a deep, if surprising, suspicion of the "black imperialism" of Dr Nkrumah's government—and little less of British motives in supporting it. And some of the United Nations, of course, would be delighted to see Britain embroiled in another colonial muddle. It will not be easy to find a way out—not least because of the practical difficulties imposed by the probability that the Northern and Southern parts of Togoland will vote differently.

A Matter of Face?

QUESTIONS about the "14-day rule" (the ban on broadcast discussions of subjects that are to be debated in Parliament within a fortnight) have now become a staple part of the Parliamentary diet whenever the Prime Minister or the Postmaster-General has to take his share of Question Time; and there is a real danger that Sir Anthony in particular, in his repeated defences of an indefensible rule, is one day going to make a statement from which he can never retreat. This week's crop of questions boiled over after a ludicrous confusion about the application of the rule to the Budget. The debate on the Budget resolutions ended at teatime a week ago this Friday. The ITA rightly interpreted this as meaning that from that point onwards discussion of the Budget on its programmes was permissible, at least until the publication of the Finance Bill. But the BBC still banned discussion last weekend, on the grounds that the Budget was mentioned in the motion for Monday's censure debate. The readiness with which it did so (in theory at least) suggests that it may be more ready to make the rule look ridiculous than to make the best of it.

Another puzzle set by the rule was raised in the Commons on Tuesday. Parliament knows about its coming business at most eight days ahead. MPs are told each Thursday what is to be discussed in the following week, so that on any Wednesday they do not officially know even what they are going to talk about the next Monday. But if the BBC and the ITA are to operate the 14-day rule effectively, they must always know what is happening a fortnight ahead. In theory the BBC and the ITA should not know before Parliament, but they must if they are to apply the rule. Sir Anthony's explanation of this conundrum was that anyone can be told about future business if he asks. But, as an old Leader of the House, Sir Anthony knows quite well that any backbencher who asks about business more than a week ahead is always tartly told by the Leader, "I am only announcing business for next week." It is going to be too absurd if this barrier to free speech, and to public education, has to be maintained much longer merely to save the party leaders' faces.

SHORTER NOTES

The defence programme is being delayed by strikes of aircraft workers. At the Hawker factory at Blackpool 2,000 men have been on strike for eight weeks for a compensatory bonus for night shift workers. A meeting between the local engineering employers' association and the unions appears to have been called both too late and at too short notice. It failed to find a settlement. At three Rolls-Royce factories in the west of Scotland 7,500 aircraft engine workers also came out on strike last week to try to get the management to sack a colleague who had been expelled from the union for contravening a local union agreement to limit bonus earnings; the strikers say that the man was "hogging" more than his share of overtime work. The management's attitude is that they like their workers to belong to a union, but they refuse to suspend a man who has not broken any agreement to which they are a party. So the strike continues. But at least it will not spread to the company's seven English factories, which are prepared to give moral support, but nothing more.

★

In Birmingham the strike at one of the Rover factories also failed to spread to the other five, and the strike itself collapsed this week, against the advice of local officials of their union. This is a reversal of the usual situation, but the men had more sense than to follow left-wing leaders in an area where jobs are to be had for the asking.

★

Following Mr Sandys's visit to Oxford, the city council has dropped its proposal for a road across Christ Church Meadow, and is likely to adopt instead the southerly relief route which was sketched in as a "suggested alternative" on the map published in *The Economist* of September 3rd. This seems to be very wise of it. The line of the northern relief route has also been shifted to avoid the University Parks. It is intended, when the new routes are completed, to close Magdalen Bridge to buses and heavy traffic.

Letters to the Editor

Home Truths for India

SIR—One may reasonably share your regret that Lord Home's recent address to the Indian Council of World Affairs has not been more widely publicised in India, and that certain very relevant passages appear to have been missed out of such reports as did appear. But what grounds are there for saying that "vital parts" have been "suppressed"? What evidence is there for implying that some mysterious censorship exists to place India's doctrine of neutralism beyond criticism whilst the Indian press must be free to criticise everyone else?

Those who have had to do their journalistic work on the basis of the raw material provided by internal news agencies in India know the latter's limitations only too well. The Indian Council of World Affairs corresponds to our Chatham House and its proceedings are not ordinarily open to the public. For an address by an important visiting minister there may have been some relaxation of the usual practice and, if my own fairly long experience is any guide, it would be quite on the cards that an agency reporter would miss an important passage in the speech, particularly if the Secretary of State was speaking extempore. Indeed, I would have expected that if the proceedings of Lord Home's meeting were open to the press the precaution would have been taken by the Council itself to issue an official report of his address.

Those who are concerned with Indo-British relations deplore the ill feeling which is being whipped up by the bickering of newspaper correspondents on both sides on what seem minor issues. By and large the foreign press is extremely well treated in India. Ministers and senior civil servants are much more accessible than in many other countries. I greatly doubt whether there has been an abrupt reversal of the Indian government's traditionally fair and courteous treatment of ministers or newspaper correspondents from other countries. By all independent accounts Lord Home's Delhi visit was a great success and has done nothing but good. —Yours faithfully,
London, W.2

GEOFFREY TYSON

As Far as it Goes

SIR—In accordance with Mr Butler's drive to restrict capital spending, the nationalised industries, including the Central Electricity Authority and the National Coal Board, are making their contributions. It is stated that the nationalised gas industry, by making do with older equipment, will reduce expenditure by £3 million.

Similarly, should not London Transport be directed to abandon its squandered programme of £12 million for new buses and the scrapping of the trolleybuses worth many millions? Why has London Transport disposed of hundreds of buses since the war, presumably at scrap prices, which have been bought by other cities and towns, like Belfast, where they are still running satisfactorily? London Transport now says the trolleybuses are worn out; manufacturers say they are not. Who gets these bargains at disposal prices and who pays the piper? Does the public realise that poisonous bus fumes will increase by 25 per cent if nearly 2,000 trolleybuses are replaced by diesel buses, with a corresponding increase in street noise? —Yours faithfully,
J. HANCOCK
Ealing, W.13

Restrictions and the Unregenerate

SIR—The Note in your issue of October 29th reads more into the National Union's recommendations than they can be made to contain. Mr Thorncroft declared himself undecided on the nature of the tribunal to be set up. The National Union's plea is that it should be a fully judicial one, governed by judicial principles and procedure and therefore most likely to arrive at a just decision in what must be a difficult question of fact. This plea does not seem to be an unregenerate one except on the Irishman's assumption that the accused would not be in the dock unless he were guilty. You yourself seem to have made this assumption by referring to a practice under inquiry by the tribunal as already "condemned" and to the tribunal itself as a rod for the back of the manufacturers. It is precisely this assumption which must be challenged in the interests of both justice and commonsense. —Yours faithfully,
C. F. WILLIAMS

National Union of
Manufacturers, E.C.1

Second Thoughts on Teachers' Pensions

SIR—Your Note of October 29th counsels teachers to look more favourably on their new pensions scheme, stating that "if prices rise by, say, an average of 2 or 3 per cent a year, and if teachers' salaries rise correspondingly," such and such advantages will accrue to them. The London and Cambridge index of retail prices shows an increase from 100 in 1938 to 234 in 1954, equivalent to an average of around 5 per cent

a year. The Burnham Scale applicable to four years trained graduates rose over the same period from £480 to £821, or an average of around 3½ per cent a year. Had the Burnham Scale risen correspondingly with retail price increases, the figure of £821 above would now be £1,120, and were this so, I am sure teachers would be more ready to heed your advice. —Yours faithfully,
London, N.W.3

D. H. C. AUBURN

Compromise in Capricorn

SIR—Your leader of October 22nd on East and Central Africa skirts the issue with admirable tact. Unfortunately the concept of "partnership" is not undefined. We have been told repeatedly that people of equal levels of civilisation will have equal political rights without regard to race or colour—an admirably liberal theory.

The rider is, however, added that it is much easier to educate the African than to civilise him, i.e., the natives will need many generations of contact with western culture before they become equal. Meanwhile, Dominion status cannot be withheld for long from these states: the stature of their leading statesmen like Lord Malvern and Mr Blundell alone should ensure this. But at the same time, as happened in South Africa, the advocates of racial *apartheid* are making their bid for power: Mr van Eeden has won a significant by-election on this platform in Kafue. Those are the heirs of East and Central Africa when your Liberal statesmen have passed on. And they are bound to pass, as the United Party in South Africa has done, so long as they have to outbid the crypto-Fascist groups for the support of a privileged, frightened, racial minority. The only solution seems to me the radical one—give the native an equal vote and thus make him politically powerful. Then no party which wants to survive can preach *apartheid*. Otherwise the South African story will be repeated. —Yours faithfully,
London, W.C.1
