SIR—The articles entitled "The Map of India" and "Beating India's Bounds" in the October 15th and 22nd issues feature maps which show Jammu and Kashmir as an integral part of India. This is not so. Jammu and Kashmir is disputed territory and both India and Pakistan stand pledged before the United Nations to allow its people to decide their allegiance by plebiscite.

The accession decision taken by the so-called Constituent Assembly of Indian occupied Kashmir—a "packed" Assembly in no sense representative of the people—was taken in flagrant violation of India's solemn commitments. Even the Indian prime minister has said that the accession decision would not prejudice India's pledge to agree to the holding of a plebiscite. —Yours faithfully,
S. M. HAQ

Frenchman with a Vision

THE CALL TO HONOUR: War Memoirs of General de Gaulle. Volume I, 1940-42. Collins 320 pages. 18s. Documents, 447 pages. 25s.

"MA patrie se lève," Rimbaud exclaimed, "j'aime mieux la voir assise..." General de Gaulle's lifelong cry must have been exactly the reverse. For him France was condemned to greatness and could be viewed only in terms of Greek tragedy, a conception which was his chief asset when he decided to carry on the fight despite his country's collapse. The unknown young brigadier who landed emptyhanded in England in June, 1940, did not have greatness thrust upon him, but his vision helped him to achieve it. He saw himself as the chosen instrument of his country's destiny and donned the mantle of Charlemagne as his own and as if France were still a great power.

A myth can look very different when viewed dispassionately, and General de Gaulle was treading on a dangerous frontier between the sublime and the ridiculous. There was a strange contrast between his desperate quest for a handful of French volunteers and the proud tone of his official statements. Except for its introductory chapters, dealing with the decline and fall of France, this book is mainly concerned with the lesser happenings of the war. The battles of Dakar or Bir Hakeim, however heroic, were merely minor episodes in the struggle against Hitler; Anglo-French quarrels over Syria or Madagascar were secondary events on the diplomatic front; while the "Muselier affair" was a curious squabble in the heart of a London at war. General de Gaulle managed only to set a foothold on the borders of the French Empire, but he behaved like an emperor, and as such he guarded jealously his prospective domain against encroachment from his allies.

Behind the visionary, however, stood an astute nationalist statesman. These memoirs are proof that he chose intransigence consciously. Condemned by the Vichy regime, abandoned by the North African proconsuls, weak and isolated, his only capital was France's past; he had no source of credit except its future. Ultimately the fate of his country would depend not only on the allies, but also on its own resistance, on the France, stunned by the *débâcle*, that was barely beginning to stir behind the Vichy façade. A people is sensitive in

defeat, and what seemed like the antics of a prima donna in London found an echo in France.

Other factors contributed to the growth of the Gaullist myth. The various elements that were to enter the resistance movement needed a rallying cry, and what could be better than the all-embracing slogan of "eternal France"? Their leader, as a result, was something of an enigma to the West. Some saw in this authoritarian, unbending general the stuff of which dictators are made; others, a revolutionary willing to deal with the Communists.

Symbols, however, have to fit into the pattern of social forces. This artificial unity could not survive for long once back on French soil. General de Gaulle had to identify himself with one of the various political groups or be relegated into the already overcrowded collection of French myths. Was he well equipped for the postwar task confronting him?

The introductory chapter, in which he retraces France's decline without probing deeply below the political surface, makes it appear unlikely. But one ought not to anticipate. This volume takes us only to the middle of 1942; it retraces the two dramatic years during which a stubborn leader, supported by only a handful of men, succeeded against odds in winning outside recognition and in keeping France's flag flying. At the end of the book General de Gaulle still has only 70,000 people under his command, but Russia's entry into the war and the tipping of the balance against the Axis mark the beginning of France's revival. Gaullism was now to find its troops.

Having renounced a political life, General de Gaulle is now gathering literary laurels. In this book, his description of France's fall, the superb portraits of Weygand, Reynaud, Pétain and Churchill in the hour of crisis, the rapid analyses of the military situation show his great gifts as a historian. The real measure of the writer's spell can be gauged from the fact that the reader has to pick up the accompanying volume of documents to realise that he is describing skirmishes, not battles, that his events are merely marginal episodes. In its original French General de Gaulle's prose, moulded on the classical heritage, with the clarity and concision of the eighteenth century, was hailed as masterly. Although it has inevitably lost something in transit, his memoirs are fully worthy of a place on the shelves next to Sir Winston Churchill's history of the war

Tudor Government

ENGLAND UNDER THE TUDORS. By G. R. Elton. Methuen. 504 pages. 25s.

THE work of many scholars in the last fifty years has so enlarged and revised our knowledge of sixteenth century England that this new survey, written to replace the volume by A. D. Innes in the series edited by Sir Charles Oman, is very welcome. Mr Elton has not been content to write a textbook which takes due account of the new work of others, but has attempted something very much bolder. He warns the reader that he has "gone rather farther in being up to date than may be generally liked," and this remark applies, as Mr Elton intends, to his conclusions and, as perhaps he did not intend, to his manner and sympathies. Mr Elton's central theme is what he calls "the nature of the English polity," the scope, structure and policies of government. He assigns a decisive importance to one man and one decade. Thomas Cromwell in the 1530s "founded the modern constitutional monarchy in England and organised the sovereign national state." He was the one great constructive statesman of the period, "an administrator of genius," "England's first parliamentary statesman," who adopted an enlightened social policy. Earlier Henry VII had merely made old expedients work, while Wolsey was an arrogant failure. As for the Elizabethan period, "the startling outburst of originality associated with Thomas Cromwell gave his successors quite enough to do"; and Elizabeth's ministers merely ran the new machinery in, making some conservative modifications. In all this Mr Elton is drawing on and developing the thesis advanced in his study of Cromwell's administrative reforms, published two years ago. Other scholars have recently read the evidence differently and less dramatically; and it is unfortunate that, as Mr Elton admits, he has had to ask his readers to take so much on trust, assuring them that "the evidence exists, but much of it is not the kind that can be recited here."

This volume is also "up to date" in its tough, unsentimental tone, acquired perhaps from Mr Elton's sympathy with administrators in a difficult period. He regards spiritual values as outside the competence of the historian. Of Thomas Cromwell's ruthlessness he observes that "the end does not indeed justify the means, but at least it explains and to some extent excuses it." Discussing economic and social dislocation he comments that "inflation is the natural state of mankind," adding that "the times were hard for poor people, but then they always are." His survey of literary and artistic achievement is brief and rather laboured, and perhaps this may be connected with his opinion that "few men of action ever learned their jobs or ideas from books." Even in the bibliography he is capable of equally brisk comments: "best ignored... best left unread... time that this old standard work was

superseded... obtrusive prejudices... needless flippancy."

But though his main thesis is over-dramatised and though the nature of his sympathies cut him off from much of the heroism, tragedy and achievement of the period, Mr Elton has given us a remarkably able, fair and compact account of the problems confronting government under the Tudors: economic changes and overseas expansion, political faction and war, religion and regionalism. Much nonsense is swept away, and on most controversial issues he states the problems and the difficulties clearly and fairly. In a revealing sentence Mr Elton writes: "The truer English doctrine exalted the power of government because it represented the joint will of an organic body politic." His analysis of society and government is more thoughtful and sometimes more original than one expects in a textbook; but his impatience with "political squabbles" means that his account of politics and personalities is dry and compressed.

Irish Model?

THE IRISH AND CATHOLIC POWER. By Paul Blanshard. Deutsch. 368 pages. 18s.

IN 1951, writes Mr Blanshard, "a Jesuit scholar... challenged me in effect to take the Irish Republic as a 'pilot model' for a future Catholic America. I have accepted this suggestion and here is my answer."

With all respect to challenger and challenged, the result has been a great waste of time. Mr Blanshard is entitled to frame his own definition of un-American activities and to denounce them; but there is no obvious reason why the Americans should follow the Irish model if they became a predominantly Catholic people. If it comes to that, what is the Irish model? No where does Mr Blanshard make up his mind whether things, good or bad, are as they are in Ireland because the Irish are predominantly Catholic, or because they are Irish or because this or that practice is native or inherited from British rule. As elsewhere, many things in Ireland have their roots in history and are only secondarily, if at all, the result of Roman Catholicism; others are directly due to Catholicism and appear as much among Italian, or even American, Catholics as among the Irish.

Clerical control is suggested by an impressive display of quotation and narration. As happens when any kind of control, clerical or bureaucratic, is criticised, there is the pitfall of proving too much, by ignoring the unspoken assumptions on which people organise their life. Here again, the author does not make up his mind what clerical control may be or to what ends it is directed. He seems to oscillate between regarding the Roman Catholic church in Ireland as merely an instrument of the Vatican and as a body that is virtually independent of Rome.

Mr Blanshard's details are fairly stated in the main, even if here and there

his leg has been well pulled. He does not seem to have employed well-chosen interpreters. He regards mixed marriages as a form of recruitment to Catholicism; anybody living in Ireland would tell him that it is a form which the Roman Catholic church is singularly unwillingly to use. Also, it is at the least ingenuous to cite court decisions on the custody of children of mixed marriages without adding that their principles have also been used to give custody to Protestant parents. One further example may be cited. For years the Irish government has provided free transport to school for Protestant children in areas where they are few. Anybody who has bothered to think about this arrangement might say that it is a neighbourly thing to do. Mr Blanshard's comment is that it guarantees "the social isolation of the Protestant children from the children of the community in which they lived."

Apart from its other implications, the comment suggests that Mr Blanshard is rather at sea in these matters. Segregated education was developed under the British regime because all the churches were determined to retain control of the education of their children. This is a point on which all churches in every country have taken the same stand. Most of the issues raised here are not peculiar to Ireland or Catholicism; they involve all churches anywhere and the states with which they have to deal. It is a recurrent theme in European history. Mr Blanshard notes with disapproval many things that are ultimately based on principles which Protestants in Ireland, as elsewhere, share with Catholics. A more perceptive writer might have fastened on the theme of an emergent state feeling its way towards a restatement of its relations with the churches.

Ten Years After

HIROSHIMA DIARY. By Michihiko Hachiya. Translated and edited by Warner Wells. Gollancz. 256 pages. 16s.

ON the fringe of the atomic explosion that flattened Hiroshima city stood the hospital that served the staff of the Ministry of Communications, and a few hundred yards away lived the director of the hospital, Dr Hachiya. The blast destroyed Dr Hachiya's house and injured him and his wife fairly severely; it wrecked but did not raze the hospital, which became one of the principal medical centres operating in the devastated city, the goal of a macabre procession of the injured and the dying. Dr Hachiya kept a diary of the days and weeks after the explosion, which he spent as a patient in his own hospital. This diary was later published in the medical journal of the Ministry of Communications and subsequently translated by Dr Wells, an American who arrived in Hiroshima five years after the explosion as surgical consultant to the Atomic Bomb Casualty Commission. He, in turn, spent three years after the first

translation was made in revising and editing.

This regrettable lapse of time between the first rough translation and the final publication would seem to outweigh the advantage of publishing the English of Dr Hachiya's diary ten years to the day on which the bomb fell. For it is impossible to tell how much of the original has been lost in this lengthy editing. The value of Dr Hachiya's account lies in its first-hand authenticity; and while Japanese is one of the most difficult languages to translate, the reader is left wondering whether the diary needed quite so much polishing.

During the first few days, Dr Hachiya recorded matters common to all bomb-devastated cities in the last war; fire, devastation, dreadful injuries, heroic improvisation and the human spirit growing in proportion to the difficulties it had to meet. Only the scale of destruction was different from Coventry, Cologne or Berlin. Later, it became obvious that some injuries were not normal and the apparently unharmed began to arrive at the hospital to die without visible cause. With their apparatus destroyed, the doctors could not do much to find what these people were dying from. Patients became panically obsessed with a hunt for symptoms. When the hospital got a microscope, and began to perform crude autopsies, the nature of radiation sickness was uncovered.

The diary is more than a simple record of destruction. The inferno of fire that

followed the explosion, the absence of medical supplies, the failure of communications and the difficulty of getting assistance from the districts just beyond the reach of the bomb all underline the critical importance of civil defence in an atomic age. So much could have been avoided at Hiroshima had the administration been able to meet the strain. The second lesson is one that might be pondered by military strategists. It is that a major city could be flattened, and hundreds of thousands killed in it, without the rest of the country being aware of the scale of the disaster. Many of Dr Hachiya's friends, living relatively close to Hiroshima, told him they had no idea of what had happened; so effectively did the official bulletins play down the effects of the explosion. Such is the power of mass communication.

Legal Essays

CURRENT LEGAL PROBLEMS 1955. Edited on behalf of the Faculty of Law, University College, London, by G. W. Keeton and G. Schwarzenberger. Stevens and Sons. 247 pages. 32s. 6d.

THIS year's volume of legal essays is disappointing compared with its predecessors. In the first place, it gives the impression that it has been a bit of an effort to assemble enough current legal problems to make a book. Secondly, too many of the essays or lectures stop short when their subjects threaten to become interesting. For example, few would claim that the position of foreign sovereigns before English courts, which is the subject of an erudite contribution by Professor Hanbury, is a problem of great currency; what is of increasing importance is the sizeable company of officials of international organisations who enjoy considerable immunities. Again, Professor Keeton has written an essay on "Natural Justice in English Law" which promises to throw light on questions of individual liberty arising out of the activities of civil servants and trade unions. In view of the Government's decision to hold an inquiry into part of this subject, constructive proposals would have been helpful. Instead, Professor Keeton treads some well-worn paths and finishes with a generalisation about individual rights not being trampled on and about deprivation of livelihood with which he should have begun.

Likewise, Mr Dennis Lloyd's contribution on "Law and Public Policy" is sound as far as it goes. Rightly, he contrasts Mr Justice Macnaghten's reported statement that "I never give a decision unless I can find a case to support it" with Lord Justice Denning's iconoclastic declaration that "the truth is that [the judges] do every day make law, although it is almost heresy to say so." Unhappily, after such a promising start Mr Lloyd loses himself in the sands of the French civil code and private international law. What would have been entertaining is an analysis of the attitude of the courts over the last twenty years to claims by injured work-

men, or of the judges' exercise of discretion in favour of or against petitioners for divorce. Expressed opinions on matters of public policy are revealing enough; more illuminating are the "inarticulate major promises," which can be unearthed only by patient and laborious excavation and which in some branches of the law have done as much as legislation in the cause of change.

Professor Glanville Williams occupies most of his 24 pages with what he himself describes as the semantic aspects of the definition of crime, whereas he only hints at a subject that is crying out for analysis—the use of the machinery of the criminal law for regulating the welfare state and the economic planning of society.

Other contributions are nearer the target. Mr D. C. Holland draws a frightening picture of "Equality before the Law" as "it exists in some British colonies. There is growing disquiet in this country about the standard of British justice beyond the seas and it seems likely that before long there will be a substantial movement of public opinion asking for an inquiry and reform. In a short and well-reasoned essay Mr E. H. Scammell joins the attack on the rule which lays down that only a party to a contract may sue on it, unless the contract falls within one of the well-defined exceptions.

All twelve contributions naturally contain a great deal which is of value and interest but, while it is foolish to expect that each annual volume must be as good as the best which has gone before, the book would have gained if more of the authors had followed the pattern of Mr Holland and Mr Scammell who both deal with legal problems which are undeniably current.

A SHIPOWNER TAKES STOCK

Transporting 145 million tons of cargo

SIR WILLIAM C. CURRIE, O.B.E.,
Chairman of the Peninsular and Oriental Steam Navigation Company,
discusses the vital work of our cargo fleet.

Have you ever considered the size of the job which our Merchant Fleet is doing year in, year out, without fuss or fanfare?

Carrying the world's goods involves a wide knowledge of other countries, their produce and customs. It also calls for considerable skill in the safe handling of a bewildering variety of raw materials and finished products. Ships of a special design must be built to take specialised cargo—refrigerated ships for fresh meat, temperature controlled vessels for the fruit trade, tankers for fuel transport and so on. All this the efficient shipping company takes in its stride.

We have our difficulties, of course. The deplorable waste of time in turn-round experienced in so many different parts of the world is one. This causes a direct increase in the tonnage needed to maintain a given frequency of sailing, and when five ships are needed to do the job of four, the cost of transport becomes needlessly high.

Despite developments in other directions, ships still carry practically all the world's overseas cargo and a large part of its passenger traffic. Our own greatly increased export trade, on which our prosperity depends, relies on our Merchant Fleet. That Fleet has been a bulwark of the national interest in two great wars and in peace a powerful and consistent support of the balance of payments. We cannot afford to see it other than strong and prosperous.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Bread on Foreign Waters

Washington, D.C.

NOTES delivered to the State Department will not resolve the "recurrent uncertainties" about America's farm export policy which were the subject of a recent lament by the President of the Board of Trade. The only sure way of ending them would be for the United States to dump its vast agricultural surpluses on the world market and watch the bottom fall out. This it will assuredly not do, despite formidable pressures from farm interests at home, and much of the uncertainty arises precisely because the American government is seeking devices whereby to run a bargain sale without actually cheating.

American policy has been greatly and, on the whole, fortunately inhibited by the evil sound of the word "dumping." By invoking it, successive Administrations have been able to quell congressional urges to set up a two-price system for current farm production in place of the present method of supporting basic commodities. This has been partly because there have been enough members of Congress with a care for America's international reputation, partly because such farsightedness has coincided with powerful domestic interests. If, for instance, subsidies only went to that portion of the wheat crop allotted for human consumption at home, American producers of other feed grains would feel the unwelcome blast of competition as strongly as foreign growers of wheat. Similarly with cotton; not only do many of the domestic producers fear that their total income would fall still further if the export price was allowed to find its own level on the world market, but the textile industry does not relish having its prices undercut by imports made from cheap American cotton.

But the unmanageable stocks which the government at present holds are another matter. The Commodity Credit Corporation is not obliged by law to offer its surpluses on the world market at the same fixed minimum prices which effectively keep them from competing with producers at home. Until recently, however, and for a variety of reasons, it has kept the same price for both markets—and has consequently been priced out of both. Wheat has been an exception, since what is in effect an export subsidy is in this case given a colour of respectability by the mechanism of the international wheat agreement.

Over the last eighteen months, this policy has been modified, in a rather piecemeal fashion, but with certain discernible patterns. The central machinery for handling the problem of getting rid of the farm surpluses has been greatly strengthened. There is now an effective operating committee, on which representatives of the different government

departments concerned have become accustomed to working together; above it there is a high-level policy committee, headed by Mr Clarence Francis, a part-time assistant to the President. Moreover, since the beginning of September, the Department of Agriculture has had an experienced sales manager, whose main job it is to seek out fresh markets for American farm products. As a result a new atmosphere of bustle is apparent.

The changes should not be exaggerated. There is still great emphasis on the importance of doing nothing that will undermine American foreign policy. There is still insistence that the United States wants only its "fair share" of the world's agricultural market and will scrupulously avoid using its great economic power to depress prices. But there is a much stronger feeling that no one will give Americans their "fair share" unless they go out and get it. As it is impossible, furthermore, to find a precise measure of a "fair share," the American government must retain its complete freedom of action to make its own definition in individual cases.

★

The Administration insists that there is no dumping and will be none, but its definition of dumping (when exports of farm products are in question) is selling below the prevailing world price in such quantities as to force it down. It does not accept the idea that to be respectable it may not sell below the American supported price. A special difficulty arises over cotton. The world's total acreage remains about the same as it was twenty years ago, but American growers have been forced to cut back their acreage while in other countries it has been rising. In particular, it has been rising rapidly in Mexico and Brazil, whither large American merchants, who disapproved of the domestic support system, have transferred much of their operations. With world trade in cotton stabilised, the United States has gradually become the residual supplier. This has been underlined by recent figures: total farm exports have gone up by 20 per cent over the third quarter of 1954, whereas the value of cotton exports has decreased by 65 per cent. Mr Benson, the Secretary of Agriculture, has, therefore, decided to make a trial in January of selling by "competitive bid." It is typical of the tentative nature of this "aggressive" policy that only a million bales of low-grade cotton will go under the auctioneer's hammer.

Together with the determination to be a little less sensitive to each and every cry of "foul" from abroad has gone

a shift of emphasis from the sale of farm products for local foreign currencies to the sale for dollars. The Department of Agriculture's sales manager has a veto over any deal with a country for its currency if he thinks he can make the same sale for dollars and, armed with the agricultural attaché's reports, he can carry the argument on to the State Department's own ground when it comes to deciding what a foreign purchaser can afford to pay. This does not mean, however, that aid is being abandoned for trade. This is simply the one form of economic aid that is thoroughly popular in Congress.

★

A second method of exporting surpluses is provided by a special law under which more than a billion dollars' worth of commodities can be sold to foreign countries for their own currency over a three-year period. The law insists that such sales must be in addition to normal trade. This is obviously difficult to define, but precautions are taken. Market studies are made, the State Department has an opportunity to bring its objections, and, if necessary—as in the case of a rice deal with Japan, which seemed likely to upset Burma and Siam—before the President. Much to the Department of Agriculture's disgust, moreover, rival suppliers are warned just ahead of time. The foreign currency that is obtained is available for a host of purposes, one of which is the holding of exhibitions and the financing of advertising campaigns to build up American farm exports.

It is quite certain that when Congress resumes its sessions in January, the pressure for pushing American bread and cotton on to foreign waters more rapidly will be hard to resist. While there is every reason to believe that President Eisenhower would veto a Bill that ran a serious danger of embarrassing his foreign policy, there is no doubt that the issue of surpluses will be handled energetically. It has already proved a godsend to the Democrats and promises to be one of the crucial issues of the 1956 elections.

The Cost of Defence

AMONG the problems brought most urgently to President Eisenhower's attention during his convalescence have been the conflicting interests of a Treasury intent on balancing the Budget and of a Department of Defence confronted with the rising cost of modern weapons and an expanding Soviet arsenal. The issues involved are, keenly political: the Administration knows that a failure to fulfil its promise of a balanced Budget or demonstrable shortcomings in the defence programme would provide the Democrats with excellent campaign material. Moreover, the high policy decisions involved in cutting the armed forces can be taken only by the President. Consequently, Mr George Humphrey, Secretary of the Treasury, and Mr Charles Wilson, Secretary of Defence, have avoided a major debate and appear to have worked out a compromise solution along general lines approved by the President.

When indicating last summer that a balanced Budget was in sight, Mr Humphrey urged all government departments to cut their spending by some 3 per cent. This would have

meant a reduction of \$1 billion by the Pentagon. With the Geneva spirit in full swing and a confident President at the helm, such a move seemed possible and there were numerous rumours of cut-backs in all the armed services. Challenged by Democratic leaders in Congress, Mr Wilson gave the assurance that national security would never be sacrificed to fiscal balance and indicated that he was merely examining possible economies at the Treasury's request. The result, announced on October 18th, was a decision to trim defence spending by only \$500 million; this means that next year's estimated defence expenditures would remain at the present annual level of \$34.5 billion. The intended saving would be obtained by a 6 per cent reduction in the Defence Department's civilian staff, and by careful scrutiny of various procurement plans. The armed forces—now numbering some 2,850,000 men—will not be materially reduced.

At present, however, the armed services are preparing their own detailed estimates and when they are submitted to Mr Wilson he may find it difficult to stay within his intended budget. The air force is deeply concerned over recent revelations of the number of Russian long-range bombers and is urging rapid expansion in the production of B-52s—each of which costs \$8 million. The navy wants an atomic-powered aircraft carrier, costing some \$300 million, and a construction programme for nine nuclear submarines each year. The army demands more men to implement President Eisenhower's reserve training scheme. Whether economy or defence will weigh more heavily in the President's mind obviously depends on future Russian policies.

Dykes Against Oil

LAST week, Mr Arthur Flemming, Director of Defence Mobilisation, instructed American oil companies to reduce their imports of crude oil—from areas other than Canada and Venezuela—by some 7 per cent. This reduction, amounting to about 25,000 barrels daily, will bring imports for 1955 into line with a formula recommended last February by a special Cabinet committee; this group had decided that future imports of crude oil into the United States should bear approximately the same relation to domestic production as existed in 1954. Mr Flemming is basing his request on a provision incorporated by Congress into the Trade Agreements Extension Act of 1955; under its terms, a domestic producer can appeal to the Office of Defence Mobilisation if he feels that imports are threatening the level of domestic production and productive capacity essential to national defence.

This pious formula and the recommendation of the Cabinet Committee on Energy Supplies and Resources Policy, thinly disguise a case of the perennial conflict between the Administration's overt commitment to free trade and the realities of home politics. As soon as the trade Bill had been passed, domestic producers and nearly 30 Senators from states that produce oil and coal brought pressure to bear on the ODM. Early in September, Mr Flemming asked 18 major oil companies to work out voluntary restrictions on their imports. Several of them pointed out that the domestic oil industry was booming, that coal exports in

Linking the trading cities of the world

To businessmen with foreign interests, the extensive system of overseas branches of The First National City Bank of New York offers a unique and unrivalled service.

Fifty-nine branches all over the globe, together with nearly three thousand banking correspondents in every important centre of commerce, ensure a complete and up-to-the-minute knowledge of the world's markets.

In London, at the disposal of the client, are the services of a specialized staff, long experienced in the conduct of international business and particularly well qualified to advise on matters of trade with the dollar countries.

GOING

TO

CANADA?

Fly TCA and save money!

From now until March 31, 1956, you can fly to Canada aboard the most luxurious aircraft on the Atlantic crossing, at low, off-season fares!

Overnight by

TCA SUPER Constellation

Aboard giant TCA SUPER Constellations (with your choice of First Class or Tourist accommodation), Toronto and Montreal are only a night's journey away from London or Glasgow.

Same-day TCA connections across Canada and to the U.S.A.

Flying across Canada or to the U.S.A.? Why change airlines? TCA fly you all the way! You can enjoy TCA Viscount travel on many Canadian inter-city routes, and, by the same famous turbo-prop aircraft, fly to New York (only 95 minutes away from Montreal), Chicago, Detroit (Windsor), and Cleveland.

SAVE £214

TCA's Family Fare Plan offers really worthwhile fare-savings to families travelling to Canada from now until March 31, 1956. A family of 4 can save up to £214, London to Montreal (Tourist return)—ask your Travel Agent for details of how much you can save on one-way or return flights.

FIRST CLASS RETURN FARES

London to Montreal - £237. 9.0

London to Toronto - £253. 10.0

TOURIST RETURN FARES

London to Montreal - £168. 19.0

London to Toronto - £182. 10.0

Approved IATA off-season fares

TRANS-CANADA AIR LINES

27 PALL MALL, LONDON, S.W.1, AND GLASGOW

Serving Europe, Canada, U.S.A., Bermuda, Nassau and the Caribbean

A doubled standard of living needs a doubled supply of sulphuric acid

A doubled rate of industrial productivity, which alone can make the Chancellor's prophecy come true, will require a doubled supply of sulphuric acid for British industry. To this end, new plants, such as Marchon's Solway Plant at Whitehaven, are rapidly approaching full production. The Solway Plant is already producing sulphuric acid from locally-mined anhydrite. The process has the added advantage of co-producing standard Portland cement to meet the pressing needs of housing and capital development programmes.

Marchon Progress Again

There is a direct relation between the nation's rate of industrial productivity and its consumption of sulphuric acid, as shown in the graph. The broken line represents the index of production for the period 1946/1955. The full line shows the sulphuric acid consumption for the same period. Both figures are relating to 1948 as 100.

AGENTS AND OFFICES IN PRINCIPAL CITIES OF THE WORLD

By Appointment To Her Majesty Queen Elizabeth II—Wine Merchants

This Christmas...

Give a case of wine from **HARVEYS** of Bristol

Each and every one of these cases contains wines of fragrance and nobility from the famous "Bristol Milk" cellars. Choose with confidence from this selection which has been guided by the wine wisdom of 150 years—or send for the complete Christmas Case List, together with our illustrated brochure.

* The charge includes carriage and packing, and any case will be delivered to any address in Great Britain in time for Christmas. If the order is received by December 14th.

Case for Christmas Day—106/-
1 bottle Merienda Sherry, pale medium dry.
1 bottle The Abbot Port, very light tawny dry.
1 bottle Médoc Claret.
1 bottle Graves Supérieur.
1 bottle Harvey's Pirrot Champagne.
1 bottle Harvey's Hedgecock Sloe Gin.

"Sportsman's" Case—88/-
1 bottle Select Shooting Sherry, full golden.
1 bottle Hunting Port, fine old tawny.
1 bottle Harvey's Golf Blend Scotch Whisky "The 19th Hole" (25 u.p.)

Case No. 1—40/-
1 bottle Falanda Sherry, superior rich golden.
1 bottle Brown Cap Port, old tawny.

Case No. 3—50/6d
1 bottle Fino Sherry, light pale dry.
1 bottle White Cap Port, old full tawny, dry.
1 bottle Sauternes Supérieur.

Nothing left to chance...

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (5½ tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.

ROYAL "EDISWAN" LAMPS

the first seven months of 1955 exceeded the previous year by 63 per cent, and that restrictions on the import of crude oil would impose higher prices on the consumer and be contrary to American interests in the Middle East.

In the absence of a voluntary response by oil importers, the ODM decided to work out its own formula. In doing so, it had to solve complex technical problems posed by the wish of domestic producers not to reduce imports of residual oil, by the need to maintain the flow of Canadian oil into the new refineries of the Pacific Northwest, and by the necessity of avoiding the kind of concerted action by the oil companies that would expose them to anti-monopoly legislation. Mr Flemming has announced that he would ask for systematic reports from the oil companies concerned within the next ten days. If they still refuse to accept voluntary restrictions, he can ask the President to impose quotas. Whether Mr Eisenhower will be prepared to do so is not certain.

The Coming of the Robots

A RECENT radio poll in Detroit discovered that next to Russia what frightened people most was automation. On Friday of last week, a subcommittee of Congress ended hearings designed to find out "what, if anything" the government should do to prepare for what many observers believe will be the second industrial revolution. Among the witnesses heard were youthful "automation consultants" and engineers, industrialists, labour leaders and Mr Mitchell, the Secretary of Labour. Their testimony was often conflicting, but nearly all agreed that the substitution of electronic devices for human beings in industrial operations would pose important political, economic and social problems.

For American labour, particularly in its more enlightened moods, automation is a crucial dilemma. Local unemployment and the obsolescence of traditional skills are bound to come with the age of electronic factories. Labour leaders realise, moreover, that their own wage claims are forcing industry to put a high premium on every kind of labour-saving device. Simultaneously, however, union chiefs, such as Mr Walter Reuther, know that automation is inevitable and are seeking to approach it with the sympathetic attitude towards technological improvement that has paid organised labour such good dividends in the past. What they are seeking to do is to assure labour's rightful share in any increase in productivity and to educate both the government and employers to the economic and human responsibilities that will come with the new industrial age. Labour's programme includes various forms of guaranteed unemployment compensation, a shorter work week—probably 30 hours—and schemes to retrain workers.

Industrialists, on the other hand, tend to soft-pedal the whole issue of unemployment, claiming that automation is a logical extension of mechanisation and that it would create more jobs than it would take away. Appropriately, Mr Mitchell took a middle view, recognising that the transition to new forms of production would involve hardships but asserting that automation ultimately meant a higher standard of living and far more leisure for everyone. Congress will probably feel that it is still too early

to take specific action on automation, but any signs of a slump or of a rise in unemployment could make this complex issue a ground of bitter political contention.

Print to Fit the News

New York

THE expectation of a general increase of at least \$4 a ton in the price of newsprint has prompted American newspaper publishers to condemn the Canadian producers who have initiated the higher prices, and Sir Eric Bowater who first suggested three weeks ago that an increase might be justified. In the ensuing battle of words the only topic left untouched has been the basic economics of the newsprint industry.

The publishers, pointing to the recent rise in the earnings of newsprint producers (five major Canadian firms are earning nearly 22 per cent more than last year) as con-

trasted with the much less profitable record of the newspapers, claim that dearer newsprint will put some of the weaker papers out of business. In reply, the producers point to the rise in labour costs that has taken place since the price of newsprint was last raised in 1952, and claim that higher prices are essential to finance plant expansions. But the price of newsprint is not based on considerations of equity, nor is it determined solely by costs of production. Like any other commodity newsprint must bow to the law of supply and demand. And, as the existing "grey market" in the United States shows, demand there exceeds supply.

There is in the United States a perennial temptation to accuse the Canadian producers, who supply 80 per cent of the newsprint used in American newspapers, of conspiring to restrict production and raise prices. On this occasion,

Democrats and Republicans alike have been unanimous in demanding somewhat unspecified action from Washington. But Canadian mills have been operating above rated capacity for some time, and it is understandable that they cannot risk expanding until they are satisfied that the increase in the demand for newsprint is permanent. The postwar expansion of the North American industry, on the other hand, hardly indicates a conspiracy to restrict output.

What is questionable, however, is whether a policy of equating demand and supply in the short run by "charging what the traffic will bear" is in the long-term interests of the newsprint producers themselves. While it is unlikely that the proposed price increases will send a significant number of newspapers to the wall, it is true that, in the face of competition from television, press advertising—which accounts for nearly 60 per cent of all newsprint consumption in the United States—has become acutely sensitive to any rise in rates. And there is also no doubt that the Canadian price increases, even if they are followed by the American mills, will provide a strong incentive to increase production capacity in the United States. In some other industries, notably the oil industry, the leading firms have "held the line" on prices and foregone short-term profits during periods of shortage in the hope of assuring a steady increase in consumption over a longer period. The newsprint industry might be well advised to take a leaf from the same book. In view of its favourable earnings, it is well placed to do so.

History Today

BITTER debates about the interpretation of recent history are a traditional feature of American politics. There is, at present, every indication that this will hold true for the 1956 election campaigns. The fact that many of the protagonists in the most controversial postwar events are alive and eager to publish will make the politicians' use of history all the more dramatic.

General MacArthur has been first in the field. In a book entitled "MacArthur's Rendezvous with History," written by one of his most loyal associates, the General argues that President Roosevelt's Administration thwarted his efforts in the Pacific, handed Asia to Communism against the General's foresight and advice and nearly wrecked his efforts to keep Russia out of Japan. The MacArthur version of the Korean war, moreover, is that Democratic weakness, aggravated by internal subversion and British intrigue, prevented him from defeating the Chinese and uniting a free Korea. Although the brunt of General MacArthur's charges falls on the Democrats, the present State Department chose truth above politics and promptly published papers showing that the General had constantly urged Russian intervention in the war against Japan.

An even more telling reply is awaited from Mr. Truman, whose fascinating memoirs, now being serialised, are expected to show a different view of General MacArthur's conduct. Mr. Truman, moreover, is refreshing the memories of his readers about his own achievements in foreign policy and about his decisive role in bringing General Eisenhower to the fore. Above all, the Democrats are seeking to show that the picture of a deliberate

"sell-out" at Yalta and of a State Department undermined by fellow-travellers is a figment of the Republican imagination. Mr. Acheson, after a long-suffering silence, is publishing a book, "A Democrat Looks at His Party." In it he seeks to show that what is good in President Eisenhower's foreign policy is a continuation of the Truman-Acheson doctrine, and that what is bad results directly from a Republican hostility to intellect, from Mr. Dulles's heavy-handedness, and from the adoption of such unrealistic slogans as "massive retaliation."

But the Republicans also are seeking aid and comfort from the recent past. During his long service as Secretary of the Treasury, Mr. Henry Morgenthau, Jr., kept a diary which ran to some 900 volumes. In it there are bound to be numerous references to his assistant, Mr. Harry Dexter White, who was cited shortly before his sudden death as guilty of espionage for the Soviet Union. Under congressional pressure, the General Services Administration, which has control over the diary, may be forced to publish parts of it. Republicans are hoping for revelations about "the mess in Democratic Washington."

Too Many Tins

FROM A CORRESPONDENT IN CALIFORNIA

TWO years of poor crops for many of the footstuffs which go into tins have at last brought the canned goods industry the much-needed benefit of higher prices. Widespread disease in the orchards in 1954 and heavy frosts early this season have helped reduce supplies of canned fruits to their lowest level since the war. Crops of peas and tomatoes—the two major canning vegetables—have been similarly below average; the tomato fields in the eastern states were devastated by the recent hurricanes just before harvest time. Although there is not a serious scarcity of tinned fruits and vegetables, the large grocery chains are offering higher prices to canners—for the first time in five years—in order to assure themselves of adequate stocks.

The postwar experience of the canned goods industry has not been an altogether happy one. A growth in population and a rise in individual consumption have steadily increased the sales, but profit margins have dwindled as increased costs have outstripped prices. Although canners point out, usually with some pride, that retail prices for canned goods have risen by only 30 per cent since 1945, against a 60 per cent rise for foodstuffs generally, it has not been virtuous restraint that has kept their prices low. The increasingly popular frozen foods and pre-cooked preparations are competing with canned goods by rivalling their convenience and offering alternatives should their prices prove too high. But, until this year, the chief restraint on canned food prices has been the abundance of canned goods themselves.

In an increasingly centralised economy, the canning industry continues to consist of a large number of independent firms. In buying from farmers and in selling to distributors, canneries engage in a degree of price competition between themselves which is unusual, if not entirely unknown, in many major industries. Particularly on the Pacific Coast, where half of America's canned food is packed, they are confronted by strong farmers' marketing organisations

world's most modern chipboard factory to make NEW Gold label

WEYROC

REGD.

WEYROC Man-made Timber was introduced by The Airscrew Company & Jicwood Limited in 1945 and has been made for 10 years from wood chips (waste from timber-mills) at Weybridge in Surrey. In this time Weyroc has completely established itself alongside the traditional forms of timber. New 'Gold Label' Weyroc carries the story a stage further.

The opening of the new £400,000 factory at Annan—the first of its kind in Britain—has local, national and international importance. Almost fully automatic, this plant not only provides new employment for the district concerned and a productive outlet for waste Scottish Timbers, but helps save Britain importing expensive 'dollar' timber.

Since the introduction of Weyroc over 70 million sq. ft. of it have been sold and employed in building schemes of all kinds. The housing drive has been substantially assisted: more and more natural timber has been released for main structural requirements. And, because of its uniform quality and large size, Weyroc has given rise to new labour-saving and money-saving techniques in many industries. Now, with the opening of the Annan factory and the production of 'Gold Label' Weyroc, there are many new and varied industrial possibilities for this high-precision board.

The full range of Weyroc boards, now in production at Weybridge and Annan, includes:
Blue Label Weyroc (45 lbs. density) Plain, Plastic-surfaced and veneered in 1" and 2" thicknesses.
Gold Label Weyroc (35 lbs. density) Plain in 1" and 2" thicknesses.
Weydec and Hardec—balanced boards with decorative plastic surfaces.

'Till
Birnam Wood
do come
to Dunsinane'
MACBETH ACT V

- The 'leafy boughs' of Scottish forests are once more being put to good use. 'Thinnings' (timber up to the thickness of a man's arm) have until now, been wasted. But, with the opening of the Company's new factory at Annan, this waste material will be turned into an improved form of Weyroc Man-made Timber, to be known as Weyroc Gold Label. The improvements gained by using forest thinnings as the source of raw material in this, the most modern chipboard factory in the world, are substantial and of particular importance both to the Building and Furniture trades.
- A board with precise characteristics and more precise dimensions, Gold Label Weyroc possesses these advantages:
- higher strength characteristics • precision • easier working
- perfect surface for veneering of highest quality

which can exert more bargaining pressure than the individual canner. In selling, they are now faced with the relatively few buyers for the giant grocery-store chains, who can demand low prices as a condition for their large-scale purchases. Moreover, canners have been forced to assume in the last few years almost the entire risk and expense of holding large inventories. Where once a grocer bought enough canned foods to last him a year, buyers today "order" but do not actually buy until they need the goods. As a result, canneries borrow to finance inventories, and offer discounts to encourage buyers to take early delivery.

The growth of supermarkets has maximised the demand for canned goods; since profit margins are lower there, turnover must be rapid. Canners, eager to employ as fully as possible their large investments in plant and equipment which are used only seasonally, over-reach themselves to meet this condition. Expanded production, which should reduce per-unit costs and raise total profits, has instead merely depressed prices. Until this year's fortuitous curtailment, production of tinned goods has regularly been in excess of total sales.

The modernisation of canning plants and the introduction of labour-saving devices has been restrained by the difficulty of attracting capital to an industry that already borrows heavily in its operations and which has in recent years had net profits of less than 3 per cent. Many canners are trying, with some success, to re-enter the European markets to which they sent a substantial portion of their output in prewar years. The National Canners Association and individual companies are now hoping to find abroad an answer to their problems.

Civil Rights in the Northwest

FROM A CORRESPONDENT IN OREGON

ALL over the United States, and particularly in the Far West, the Negro, the Mexican, the American Indian and other dark-skinned minorities are winning rights and privileges long denied them. Legislation opening thousands of restaurants, hotels and places of entertainment to "non-Caucasians" and assuring them against racial discrimination has been passed in a number of states. Its impact has not been so dramatic as the Supreme Court's famous ruling on segregation in schools, but these laws and the change in public attitude which they have helped create are no less significant.

Two direct consequences of the Japanese attack on Pearl

Harbour brought on a change in the pattern of racial relationships in the Pacific Northwest. One was the summary evacuation from their Pacific Coast homes of thousands of Japanese-Americans. The postwar reaction to this "security" measure took the form of public sympathy for the dispossessed Japanese, a sentiment that embraced other non-white residents. A second consequence of the war was the sudden and enormous growth of the shipbuilding industry in the region. Entire trainloads of unskilled workers, a large percentage of them Negroes, moved from the Atlantic seaboard to Portland, Oregon, to man the new shipyards, and the city, which had a stable population of about 2,000 Negroes, found itself in a few months with more than ten times that many. With this influx came an awareness of racial discrimination and the growth of agitation against it. Both the Oregon and Washington Legislatures passed Fair Employment Practices Acts, outlawing racial discrimination in hiring, and civil rights laws, making it illegal for hotels or places of public entertainment to refuse service to anyone because of race, colour or religion.

Many Oregon citizens, while disapproving of racial segregation and discrimination, felt that laws forbidding them would merely inflame prejudice and make for greater friction. These fears have proved groundless. Oregon's Act has won such wide public acceptance that, in the six years since it was passed, there has been only one occasion on which the authorities have had to go to court. This legislation, moreover, has created countless new job opportunities for non-whites. A Negro has been appointed assistant commissioner in the Oregon State Department of Labour; Negroes teach college classes, drive buses for the Portland Traction Company and work on the editorial staffs of the city's daily newspapers. Public opinion in Oregon has been transformed on the whole issue of discrimination. In 1950, citizens of Portland voted 76,444 to 61,058 against a municipal civil rights law after a spirited campaign. But less than three years later, opponents of the law adopted by the State Legislature could gather only 11,000 signatures in a vain attempt to obtain a public referendum.

★

But when it comes to housing, there is still room for improvement. The bulk of Portland's Negro population is concentrated in one sector of the city which displays the classic combination of inferior accommodations and high rents. During the past year the Urban League has been engaged in an extensive study of the effect on property values caused by the introduction of a non-white resident into a neighbourhood. Its bulletin states:

"The ghettos—the areas of non-white concentration—have continued to expand. . . . But there are some positive developments worth reporting. Now and then it has come to our attention that a non-white family has been able to move into a home outside the ghettos. In only one instance was a furore raised, and this proved an excellent opportunity for community education."

Oregon still has its problems in racial relationships. But many have been solved, and others are on the way to solution. Oregon's progress is especially significant, for it was this state that, in 1859, wrote into its Constitution a celebrated article excluding from its territory all Negroes, whether slave or free. This provision was never enforced, but it was repealed only recently.

The World Overseas

Mr Sharett's Mission

FROM OUR CORRESPONDENT IN TEL AVIV

THERE is at present in the Knesset in Jerusalem no majority for a preventive war. This is the most important fact to be noted in the present tense political scene in Israel and in the very dangerous situation along its frontiers.

The only party which has come out forcibly and unequivocally for a preventive war is, of course, Heruth, always "activist" and scornful of methods other than those of the mailed fist. Heruth enjoys today a much stronger position in Parliament than it did before the elections last July which made the party the second strongest in the House. But Heruth has until now been unable to attract partners or satellites in the Knesset. The General Zionists appear to have changed the guarded, rather anti-activist attitude which they retained when still in the cabinet to one more in sympathy with that of the extremists. But they might veer round again. The Labour parties, Mapai, Mapam and Achduth Avodah follow Mr Sharett's lead which, while calling for arms, will first try every political expedient before resorting to war. So does the religious bloc. The small Communist party is, of course, as busy as ever in following the Moscow line.

The majority in the Knesset for Mr Sharett's line does not mean that the thinking of Heruth is confined to its own ranks. In the debate on foreign policy two weeks ago a speaker from the Mapai party who was the chairman of the foreign policy committee in the last Knesset attracted notice by advocating preventive war. The same speaker followed this up with an appearance at a public meeting in Tel Aviv, at which he appealed to world Jewry to send a hundred thousand young people to Israel to help defend the country.

The arguments for immediate action offered by Heruth are simple in their deceptiveness. In a year or two, it is said, Egypt will be much stronger than it is today; and when the Egyptian army has mastered the use of modern weapons which are reaching Alexandria in considerable quantities, it will attack Israel. The Egyptians have until now obstinately refused to make peace, to arrive at a settlement of the thorny border problems or to lift the blockade. It would be suicidal for Israel to miss its opportunity now when its army is still superior, its morale high and its organisation well-knit.

This sort of appeal is strong, especially in the tense atmosphere of Israel today. The advocates of a more prudent policy have a difficult task. They have to try to show that war, although possible, is by no means inevit-

able; that in any case every other possible means must be used before the final grave decision is taken. But their main argument today is the complete change which has occurred in the Middle Eastern scene with the appearance of the Russians. It is understood in Israel—albeit slowly—that the supply of arms from the Communist bloc to Egypt and probably to some other of the Arab states involves the work of experts and technicians from Communist countries among the Arab armies and that the entrance of the Russians into the region gives the Israel-Arab conflict a global significance. Thoughtful Israeli observers realise that a conflict between Israel and Egypt might well now not be isolated.

Since this sort of argument is much more involved than that of Heruth, it does not penetrate easily to the masses. What is more, it runs counter to emotions which are already thoroughly aroused. Israel has always had a leaning to what may be called isolationism. The long years of frontier friction have made people familiar with the idea of an endless small war which could flare up easily all along the long borders. The public has become accustomed to the thought that the nation may have to stand alone in danger, and that the western powers would not go out of their way to redress the balance once it was weighted in favour of the Arabs.

These feelings are today more intense than ever. The appeal for gifts to buy arms is being met with alacrity and enthusiasm by people from all walks of life. Patriotic feelings, always strong, are being raised to fever-pitch. Life in the towns goes on as usual, with packed theatres, concerts and cinemas, and an innocent observer would not detect anything unusual in the crowded streets with their neon signs. But people closely follow the border-raids, and are well aware that one of them may turn out to be not just one more link in a chain of guerilla affrays but the beginning of the real thing.

It is against this tense background that the mission of Mr Sharett to Paris and Geneva must be understood. Mr Sharett made his dramatic move in order to explain Israel's position to the Powers. If he should come back empty handed, without a promise either to give arms to Israel or without the prospect of a stronger and better guarantee for its borders or a security treaty, the repercussions in the country will be serious. If he can report to Parliament that Israel can reasonably hope to retain its place in the changed Middle East situation he will be

able to strengthen the prudent elements. Otherwise emotions and extremists might well carry the day.

Mr Sharett went to Geneva as the head of a caretaker-government. The formation of a new cabinet has taken even more time than observers predicted. When the elections in July brought about the rise of Heruth, the defeat of the General Zionists and the decline of Mapai, it became obvious that it would be difficult to form a cabinet. Mr Ben-Gurion tried at first to form a "broad coalition" including all the parties except Heruth and the Communists. He failed conspicuously, and veered to a five-party labour coalition; but difficulties that arose over the division of portfolios were unresolved when the third Knesset met, so that Mr Sharett remained in office.

This week, under the pressures already described, the five-party arrangement has come into being. A cabinet of sixteen, comprising nine ministers from Mapai, two each from the left wing parties Achduth Avoda and Mapam, two from the orthodox Hapoe/Hamisrahi group and one from the centre party Progressives is likely to command 80 out of 120 votes. But the inclination to form a broader coalition is not dead; its survival is helped by the feeling of national emergency which demands a cabinet based on as much popular support as possible. The General Zionists, who until recently held back from coalition talks, now advocate a cabinet which would include all parties, even Heruth, leaving out only the Communists. Though this call may meet with no immediate response it may well prove to be a straw in the wind. A narrow coalition could be reshuffled after a few months to allow the inclusion at least of the General Zionists; Heruth will probably be reluctant to renounce its new advantage as the biggest opposition party.

Should prudence prevail, a flare-up be prevented and Mr Sharett come back with some sort of achievement, the political scene in Israel will still not be the same as before his dash to Geneva. The last weeks have brought about the complete acceptance of activism, that is, retaliation for infiltration and frontier violations by military raids. And these raids have step by step gained in extent and intensity. This development is taken in Israel as a matter of course, but it is dangerous. Bigger and bigger raids tend to become a small war which could imperceptibly change character. Some day it might easily progress beyond the point of no return.

Norway Remembers Quisling

HARD memories linger long in the Norwegian climate. The fall from office last week of the young and brilliant Minister of Justice, Hr Jens Hauge, was brought about by the refusal of a majority of Norwegian MPs, including some members of Hr Hauge's own Labour party, to forget the record of 183 civil servants who had been Nazi sympathisers during the war. In common with about 100,000 other Norwegians, these men had been members of *Nasjonal Samling* (NS), the pro-German party of Hr Quisling, and were suspended from duty for a time after the war. They have since been claiming compensation for the salaries they lost during that period on the grounds that they had resigned from *Nasjonal Samling* before the

Norwegian government—in exile in Britain—passed its law on collaboration in 1944.

The Supreme Court approved their claim, and Hr Hauge recommended that back-pay be allowed to them; but his recommendation was rejected in the *Storting* by a fairly substantial majority which must have included some members of the usually well-drilled Norwegian Labour party. There does not seem to be any doubt that the men had in fact resigned before the date in question, but Hr Hauge's parliamentary critics suggested that the matter was so old that the claims ought to be held to have lapsed. This argument had a somewhat legalistic air, especially in view of the slowness of earlier proceedings to deal with the claims.

In any case, the 183 men involved were only the small fry of *Nasjonal Samling*. A handful of Norway's major collaborators, including Quisling himself, were executed at the end of the war, but it has been Norwegian policy to refrain from reprisals against the rank and file of NS unless specific crimes could be laid at their door. The case of the civil servants makes an interesting comparison with what happened recently in Denmark, when a proposal came before the *Folketing* to grant an amnesty to a number of German war criminals and former Danish collaborators who were still in prison. Although the Danish Minister of Justice, Hr Hækkerup, came under fire from ex-Resistance groups, the measure was carried and the men concerned had about a third of their sentences remitted.

Hr Hauge is succeeded as Minister of Justice by another lawyer, Hr Jens Haugland; but it is unlikely that his distinguished career is at an end. After leading the military section of the Resistance in Norway during the war, he was appointed Minister of Defence in 1945, and was the youngest man ever to hold Cabinet rank in Norway. He had recently been chosen to go with Hr Gerhardsen, whose protégé he is, on the Premier's coming trip to Moscow. Hr Hauge is, however, credited with a rather un-Nordic warmth of temperament, and it may have been this which caused his abrupt decision to resign.

Between the Dragon and the Tiger

SOME 500 million people, or about one-fifth of the world's population, live in the Chinese countryside. The collectivisation of their 110 million holdings is certainly the most gigantic social experiment in history, overshadowing even its Soviet precedent. From time to time information is released about the progress and prospects of this crucial movement. But the most authoritative statement yet on this subject has only now reached this country. It is a major speech by Mao Tse-tung himself, analysing past achievements and current problems, outlining the regime's intentions and the opposition they arouse within the Communist Party itself.

It was always assumed that prominent members of the party and the army, fearing a peasant upheaval, opposed the speeding up of the collectivisation drive; this may, indeed, have been the reason for last year's purges. Mao Tse-tung, in fact, confirms the existence of such an opposi-

The case of *Blatella germanica*...

The cockroach has always sailed the seven seas, infesting ships' galleys and quarters, fouling food supplies, spreading disease and creating discomfort by its presence. Until a few years ago the control measures available rarely eliminated this very persistent pest, and had to be repeated at short intervals. But now, for the first time in history, seafaring cockroaches are being dealt with ruthlessly, by a revolutionary combination of insecticides and transparent lacquer.

The insecticides used in this remarkable development are aldrin and dieldrin, products of Shell, and much of Britain's great mercantile fleet is already 'de-cock-roached' by dieldrin treatment. The surface layer of insecticidal crystals is constantly renewed from within the lacquer — even the friction caused by the movement of an insect over the surface has this replenishing effect.

However heavy the infestation, one lacquering with aldrin and dieldrin means 100% control — and a clean ship for at least two years.

Aldrin and dieldrin tackle insect pests with unrivalled effect and economy. Their 'surer kill' is achieved with lower dosages. Their wider range includes many pests never before dealt with satisfactorily. Aldrin is fast becoming recognised as the best of all soil insecticides; dieldrin as the best control for weevils, beetles, flies, etc., on foliage. It is also extensively used as a residual spray against disease-carrying insects.

Have you a stubborn pest problem to be solved?

aldrin & dieldrin

aldrin and dieldrin are  insecticides for world-wide use

tion and his speech throughout attacks the comrades lacking faith and courage, who fear "dragons ahead and tigers behind." He accuses them of advocating too slow a tempo for spreading co-operation, of always timidly calling for halts in order to consolidate. Producer co-operatives can only be consolidated while others are being set up—he argues—and a pause would merely give capitalism a chance to grow in the Chinese countryside, where, Mao admits, "in recent years spontaneous capitalist influence has daily developed, with new rich peasants emerging everywhere" and the "division into two extremes" is thus liable to get worse, with those peasants who are still in dire poverty "saying that we do not rescue them even if they are dying." Furthermore, the industrialisation of the country is dependent on growing agricultural surpluses which, he maintains, can only come from the larger and more efficient collective units. This is why Mao finally brands the opponents of the present policy as the effective allies of "the bourgeoisie and the rich peasants."

How fast are the Chinese really proceeding towards the goal of large-scale collective farms? It was clear from the very beginning that the agrarian reform, which cut down the larger estates, could only be a temporary measure for the new regime. Peasants with their small plots were soon encouraged to combine in seasonal or more lasting mutual-aid teams. The next stage—the "semi-socialist" stage, to use Mao's expression—was the transformation of these teams into permanent "producer co-operatives," in which, though the work is done in common, members still get a rent for their land and a payment for their tools and draught animals. The drive began in the wheat-growing regions of the North, where the reform had taken place earlier, but it spread progressively southwards to the rice-growing areas.

Number of Producer Co-operatives in China ('000)

Dec. 1951	Dec. 1953	Oct. 1954	Oct. 1955	Oct. 1956 (plan)
0.3	14	100	650	1,000-1,300

These co-operatives already cultivate about 15 per cent of China's arable land. Their number was to reach a million by next year's harvest, but Mao Tse-tung judges this target too modest and calls for at least 1,300,000. Half of China's 110 million holdings should be amalgamated in 1958, i.e. the year following the end of the first five-year-plan, and the process should be roughly completed by 1960. The mass transformation of the co-operatives into *kolkhozy* on the Soviet pattern—the creation of larger units, the elimination of payments other than wages, etc.—is to follow and is to be achieved in the late 'sixties. There will still remain the task of pumping modern machinery and equipment into the countryside and Mao himself admits that a quarter of a century will elapse before it is really fulfilled.

Much of his speech is taken up with advice on how to convert peasants progressively to collective farming. Example and propaganda are to play a large part. 80 per cent of the co-operatives have increased their output, it is claimed, and Mao has given stern warning that co-operatives must in all cases achieve higher yields than individual farms—although they will receive very little machinery for seven or eight years at least. The whole party machinery in the countryside is to be mobilised for this vital job and it will get outside assistance. Special cadres are to be trained rapidly and sent into the field. In carrying out their function they must never forget the social differentiation which still exists in the countryside despite land reform. Mao

estimates that poor and "poorer medium" peasants account for between 60 and 70 per cent of the rural population. They can most easily be won over and must form the backbone of the drive. Indeed, *kulaks* are to be barred from joining any co-operatives which are still at an early stage.

The snag in this argument is, as Soviet experience has shown, that even the poor peasants mistrust the collective farms. Mao may think that he will overcome this resistance by his gradual method, but his opponents apparently fear that he is going too fast and risks provoking a peasant upheaval which could wreck the regime. They apparently quote the tragic Soviet experiment as a warning: "Some comrades have also found grounds in the history of the Communist Party of the Soviet Union for criticising what they call impatience and rashness in carrying out agricultural co-operation in our country at this stage." Mao Tse-tung himself takes an equivocal position. He takes the "Soviet road as an example," but euphemistically glosses over its most bloody passage, and, somewhat ominously, stresses the need to "learn through struggle." According to him, in China, for the moment, adventurists "dizzy with success" are a lesser danger than the laggards fearing to advance. He, too, undoubtedly remembers the dangerous episodes in the history of Soviet collectivisation, but he is also conscious of what prompted that drive and now prompts his own: "the ever-increasing demand for marketable grain and industrial raw materials." If that rising demand cannot be met during the next 15 years, Mao recognises that "socialist industrialisation" cannot be achieved.

The parallel should not be pushed too far. The garden-like agriculture of China has its special problems. Land hunger is even greater here. The average family has a plot of about one hectare, the average co-operative—less than 30 hectares. The farms will have to be expanded before mechanisation can be applied efficiently and even then rice cultivation will present a special case. This explains why the mechanisation of agriculture has been relegated to a later period. In the next 15 years some 30 million hectares of waste land are to be reclaimed or about a quarter of the area now under cultivation. The conquest of new land may prove the decisive battlefield of the Chinese Communist regime. Yet, before waging it, Mao Tse-tung must first steer the Chinese economy between the "dragon" of capitalism and the "tiger" of peasant wrath. The progress or failure of Peking's titanic venture will be watched by rural peoples throughout Asia and in other peasant communities across the world—and note will be taken of the degree of ruthlessness that the Communists employ.

Two Conundrums for the Sudan

EVEN a Parliament hoary with age and experience might quail at the two problems that face the Sudan Parliament as it reassembles this week. One is by what process to bring about the complete independence that everyone wants, at a time when fear and uncertainty of northern *bona fides* riddle the three southern provinces of Equatoria, Bahr el Ghazal and the Upper Nile. The other is how to repair the almost total breakdown of civil administration in the south.

Parliament's summer recess has been shorter than usual because, unseasonably, it met in August in order to hasten the steps it must take before the nation qualifies for self-determination. (The processes whereby it then got rid of the troops of the two co-domini—Britain and Egypt—and voted to determine the Sudan's future by plebiscite rather than by means of the Constituent Assembly prescribed in the Anglo-Egyptian agreement of 1953 were described in *The Economist* of August 20th.) Since then, both its problems have swelled in gravity owing on the one hand to the dimensions of the revolt in the south Sudan, which has been wider in range than the first stories of a mere mutiny led to suppose, and on the other, owing to unpredictable variations in Egypt's statements about what Cairo is and is not prepared to back in the way of arrangements. Indeed, the complexity of both Egyptian and Sudanese changes of heart about the form which self-determination is to take are as baffling as the figures in some intricate country dance.

Briefly, when *The Economist* last abandoned the tale, the Sudan was for a plebiscite and Egypt, under the baleful influence of Major Salah Salem, was backing the factions in both south and north that opposed the present government, formed by the National Unionist party that used to favour union with Egypt, but now—to Egypt's chagrin—favours independence. Once it dawned on Cairo that

Major Salem was barking up the wrong tree, he was dropped from the junta and—allegedly—the wishes of the Sudanese became paramount. But last month, at a moment when those wishes were still, officially, for a plebiscite, Cairo unilaterally issued invitations to the seven chosen neutral umpires to supervise elections to the Constituent Assembly laid

down in the statute. (The motive, it seems, was to brand Britain as behindhand in completing the self-determination process.) Since then, the Egyptians have switched back to smiling upon a plebiscite, whereas many of the Sudanese who voted for this system in the summer now realise how difficult it is to execute on account of the trouble in the south.

Unravelling so far as is humanly possible, these curvets and volte-faces now confront the Sudan Parliament with three choices: Either it can stick to the 1953 plan of supervised elections to a Constituent Assembly, or it can declare itself competent to become that Assembly, so incurring some criticism but avoiding fresh elections in troubled times, or it can ask the co-domini to recognise its right to decide the Sudan's future. Its difficulties in deciding on either of these latter two simplifications of an old arrangement are: first, that any such plan must entail domestic agreement as to who is to draft the constitution and who to rule while it is drafted, and secondly, that any

extension of the powers of the present house is bound to be queried by the South, whose members are sadly out of touch with constituencies that they have not lately been allowed to visit because to do so would be risky to life and limb. Indeed the paramount difficulty of taking any immediate step towards self-determination lies in the outbreak of parochialism, uncertainty and mistrust of northern intentions that now riddles the whole southern Sudan. These emotions, all latent in the years between the British-inspired conference on unity at Juba in 1947 and the rebellion of August last, must be quieted before any solution worth reaching can be achieved in Khartoum.

Unfortunately, the northern authorities have clamped so stern a censorship on news from the three southern provinces that it is difficult to know what is happening there. Stories range from accounts of vengeful punitive expeditions by northern troops to tales of conscientious northern political officers toiling to show that the North is now mature enough to take the South seriously. The southern Sudan is a big area; probably, therefore, each tale is true at some point or other. Pieced together from the accounts of travellers and the evidence given at the public sessions of the official enquiry into the cause of the revolt, the story seems to run as follows: Long before the actual outbreak on August 18th, governors and district officers had warned Khartoum of southern discontents, but their reports were pigeonholed or filed by newcomers to office who were too liable to be abroad placing their new country on the map, and therefore inattentive to the worst problem on the home front. Only the chance arrest of a tribesman who shot an arrow at a policeman and who, when arrested, was found to be carrying subversive leaflets, prevented an army mutiny from becoming a much wider revolt. But only about half the mutineers responded to Khartoum's appeal to surrender. The rest either took to the grass or crossed into neighbouring British, French or Belgian territory, where, more lately, their numbers have been swelled by fresh fugitives from the northern military expeditions sent to restore order.

Grounds for Grievance

The North has some grounds for grievance; over 400 northerners were killed or murdered by the mutineers and even by police, some with peculiar brutality. Many northern merchants have therefore left the South and no northern schoolmaster wants to serve except in towns where a northern garrison is likely to be within call.

The most depressing of the many disturbing news items that are percolating outwards is a press report that, owing to the necessity for enlarging the Sudan Defence Force and the police, the country's education budget for the next five years, outlined at £22 million, will have to be reduced to £8 million. Clearly cuts of this type are inevitable if the southern Sudan has perforce to be run in the only way that is at present possible, which is by means of military government. But it follows that unless active steps are taken to curtail the period of such government, the whole Sudan must suffer in the realm of development and welfare. Yet to propose the simplest way out—which is a federal solution, and a request for temporary foreign help with administering the southern part of the federation—would require a measure of moral courage that very few Africans possess, for it would be undertaken to an accompaniment of booing from the whole Arab-Asian block, and from

Egypt in particular. This puzzling scene is not a suitable atmosphere in which to hold a vote on self-determination; the Prime Minister, Ismail el Azhary, spoke only too appositely when he recently reminded a questioner that, by the terms of the relevant Statute, the self-determination decision need not take place for another 17 months.

Herr Ulbricht Returns to Potsdam

THE East German government, which has from time to time pretended to agree to reunification by way of free elections, has now frankly reverted to the Potsdam agreement—as understood by the Russians. A memorandum has been presented to Mr Molotov in Geneva, outlining the Communist plan for reunification and the Soviet Foreign Minister has taken it as the basis of the plan which he presented to the conference on Wednesday. It is the counterpart of the international security agreement which the Soviet government is proposing to the western foreign ministers. Mr Molotov proposes a security pact which would be based, explicitly or implicitly, on the continued division of Germany for some years to come; while Herr Ulbricht and Herr Grotewohl lay down what should be done meanwhile to ensure that when Germany is reunited, it will become a "people's democracy."

The Communist plan comes as no surprise. It follows the principles laid down by the Soviet leaders when they passed through East Berlin on their return from last summer's Geneva conference, and echoed by Mr Suslov at the anniversary celebration of the founding of the East German Republic in October. In the first place, they provide that elections shall not be held until the enemies of "democracy" (Communist-style) are removed from the Federal Republic. A statement issued by the central committee of the Socialist Unity Party on Tuesday, to accompany the memorandum in Geneva, declared that the western idea of free elections as a preliminary to reunion was nothing but a means of "enslaving the German people." The Communists, the Social-Democrats and the trade unions, it is said, must unite to oust the militarists. Innumerable other declarations made since last July have added to the circles which must be eliminated before "free elections"—landlords owning more than 250 acres (to be dispossessed without compensation) bankers and "monopoly capitalists."

Merging Two Economies

The East German memorandum does not suggest that an all-German administration should wait until the ground had been politically cleared in the West, and "free elections" held. It reverts to a proposal made years ago, which is based on the terms of the Potsdam agreement. It declares that a nominated all-German council should be formed, consisting of delegates from the *Bundestag* and the East German People's Chamber. Negotiations on the formation of this body should begin at once between the two governments. The Communists do not demand that it should be set up on the basis of numerical parity between the

Bundestag, representing 47½ million Germans, and the People's Chamber, which has not been freely elected, representing 16 million inhabitants of the Soviet Zone. But it does provide for the council's decisions to be approved by both parliaments, which would continue to exist. The People's Chamber would therefore have a right of veto over the council.

The task of the all-German body, according to the Communists, would be to prepare the merger of the Communist and capitalist economies and social systems. In all previous statements by the Soviet and East German leaders it has been made abundantly clear that the changes would have to be made in the Federal Republic, and that "the workers' achievements will not be sacrificed" in Soviet Germany. This aim is obscured by the statement in the memorandum that capitalist and socialist enterprises will remain in the united country. A small and dwindling proportion of privately-owned enterprises still exist in the East German Republic, as in all people's democracies which have not yet become full "socialist states." The statement that both types of enterprise would exist in reunited Germany does not therefore mean that any de-nationalisation in the Soviet Zone would be tolerated, and all the evidence points to the conclusion that, on the contrary, West Germany would have to expropriate a large proportion of its industries to satisfy the Communists. It should not be forgotten that the East German authorities are pressing on with the formation of their army, with the plain intention of using it in civil war against the recalcitrant capitalists of the West. Only this week a speaker has exhorted the factory "fighting groups" to emulate the "Red Ruhr" commandos which played a role in the abortive German revolution after the first world war.

Converging Views

Every responsible German, if asked his opinion of the Communist memorandum, would say that it was entirely unacceptable. Nevertheless, it would be unwise to base western policy upon the assumption that there is a firm front in Bonn which will maintain the *status quo* indefinitely. Two points may be mentioned to indicate that the cleavage between the two sides—deep though it is—is not as great as might be imagined. In the first place, the advisory council which is attached to the Ministry of All-German Affairs has concluded that the larger enterprises in the present Soviet Zone must remain nationalised in the event of reunion, only the smaller firms being returned to private ownership in due course. Similarly, large estates would not go back to their former proprietors.

Another sign that views may gradually converge is to be found in the latest statements of the Social-Democrat leaders. Herr Wehner, who is the party's dominant voice on all matters concerning reunion, and is chairman of the *Bundestag* committee on all-German affairs, has declared in a broadcast this week that the authorities in East and West must combine to form joint administrations dealing with posts, transport and similar technical matters, while maintaining the political distinction between a democratic and undemocratic government. In other words, the Social-Democratic Party would also revert to this part of the Potsdam agreement. And there is no reason to think it would object to the provisions, recalled by Herr Grotewohl, for abolishing "monopoly capitalism" and "militarism." Much will depend on whether it interprets these words in

the same way as Herr Grotewohl, or continues to reject any co-operation with the Communists. In the meantime, it is evident that there are politicians in Germany, and not only on the left-wing, who are ready to take risks with the East Germans, in the happy belief that the American forces will always be there to protect them from catastrophe.

Journal of Geneva—I

THURSDAY, October 27th. M. Pinay, in the chair, rapidly won agreement on the agenda and various matters of organisation. Each Foreign Minister then made an introductory general statement; on the western side, the emphasis was on the urgency of ending the division of Germany, while Mr Molotov dwelt on Russia's contributions to the "Geneva spirit" and the need to take precautions against a resurgence of German militarism. When the western ministers tried to table their proposals on Item 1 (European security and German reunification) Mr Molotov protested that it was too late (the time was then six o'clock) and after a warm argument, lasting until 7.30, the West agreed not to table its plans formally until the next day.

Friday, October 28th. The rival proposals on Item 1 were tabled together with the ministers' explanatory speeches. The western plan was in two parts: a nine-point draft security treaty and a five-stage plan for German elections and unification. It was stipulated that the treaty would come into force only if and when a freely reunited Germany elects to join Nato; the West argues that if Germany should choose to stay outside Nato the Russians would have no grounds for their alleged fears. The main proposals of the draft treaty are: (1) Each signatory would promise to take "appropriate action to meet the common danger" if any party initiated an attack across the East-West boundaries. (2) In a zone on either side of the eastern frontier of a reunited Germany, the size of armed forces would be limited; a system of inspection would be set up to guarantee that the limitations were observed; and each side would have the use of a radar network in the other's territory. (3) Collective self-defence pacts would be permissible, but foreign bases would be allowed only so long as the host country gave its consent.

The western plan for German reunification was virtually the same as that presented by Sir Anthony Eden at the Berlin conference of January last year, and envisages the following stages: (a) free elections throughout Germany, guaranteed by a detailed list of proposals for secrecy and freedom of expression; (b) the establishment of an all-German National Assembly; (c) the drafting by the Assembly of a constitution; (d) the formation of an all-German government; and (e) the signing of a peace treaty.

Mr Molotov attacked the western security plan because, he said, it would encourage German militarism and perpetuate the existing blocs. He then revived the Soviet security plan which was presented to the heads of government in July. This would embrace the United States and all European countries, including the two Germanys until reunification is achieved; its core is a simple undertaking by all parties to assist any member which suffers armed

attack. After a first-stage period lasting two or three years Nato would have to be abolished. Mr Molotov produced no suggestions for German unification.

Saturday, October 29th. The western ministers tried unsuccessfully to draw Mr Molotov into producing his plan for German unity, but the Russian Foreign Minister insisted that European security was the basic issue, and that before German unity could be discussed he would have to raise the question of inviting German representatives to join the conference. He repeated the familiar Russian criticisms of Nato, and the western ministers their equally familiar justifications of it; they in turn berated the Russian security proposals as entirely lacking in any solid guarantee against aggression.

Monday, October 31st. The western ministers put forward a 17-point programme for ensuring closer contact between East and West. This included: (1) The gradual elimination of censorship. (2) Wider exchanges of books, periodicals and newspapers. (3) More private tourism. (4) An end to radio jamming. (5) Exchanges of students, and more meetings of scientists and professional men. Mr Molotov expressed his support for the idea of closer contacts, but hinted that progress would depend on the West's willingness to raise the embargo on strategic goods. The ministers then referred the matter to a committee of experts with instructions to report back on November 10th.

Mr Molotov then produced a new Soviet version of the proposed European security treaty. The chief differences from the earlier Russian plan were: (1) The new proposal was for a "provisional" treaty, with an indefinite lifetime during which Nato could continue to exist. The earlier plan had condemned Nato to be abolished "after two or three years." But the new Russian proposals, by including both Germanys in the provisional treaty, assumed that the division of the country was to be prolonged indefinitely. (2) The new plan included a scheme for arms control in east and west Germany and possibly the neighbouring states. Mr Molotov also proposed that delegates from the two Germanys should be present at the conference; but as Mr Dulles refused to accept the presence of East Germans, it was decided not to invite either side.

Tuesday, November 1st. With Mr Dulles in Madrid and M. Pinay in Paris, this was a day off for the conference. The East German observers published a plan for German unification which, it was assumed, would be the basis of the official Communist proposals.

Wednesday, November 2nd. Mr Molotov made another unsuccessful bid to obtain German representation at the conference, and hinted that "fruitful discussion" of Germany would be impossible without it. He then produced the Russian proposals for reconciling the two Germanys, which were on the lines of those published by the East German delegates the day before. The kernel of the plan (which is further discussed on page 491) is the creation of an all-German council composed of representatives of the two Parliaments. This would be only a consultative body, which would, however, "bring about accord" on military matters and would provide for mixed governmental committees to deal with economic and administrative relations between the two states. The all-German council would also "consider dry mutual agreement" the problem of unification. Mr Macmillan had earlier reasserted that the western powers could only consider the problem of security on the basis of a reunited Germany.

why don't you talk to the people at Harland?

They are in the forefront of centrifugal pump, hydro-electric and rotating

electrical machinery manufacture. In over fifty years they have tackled many

thousands of electrical and hydraulic problems. The name Harland is famous in

the world's waterworks industries and wherever water, hot or cold, is to be pumped.

It is equally well known to users of electric motors and generators and in recent

years Harland hydro-electric plant has been installed in every continent in the world.

Harland engineers are at your service to assist you to solve your problems.

CHINCHONA

The Chinchona is an evergreen tree which is native to the well-watered eastern slopes of the Andes near the equator. Although it has been successfully grown in other parts of the world, it is still exported from Peru and neighbouring Republics.

In almost all the important commercial centres of these countries and throughout South and Central America, branches of the Bank of London and South America serve the needs of traders. Reports on local produce markets, trading conditions, exchange regulations and economic affairs in general are sent by the branches to the Bank's Head Office; the contents of these reports are published in our *Fortnightly Review*, which is distributed to our customers and correspondents.

The Countess of Chinchón, wife of the Viceroy of Peru, was cured of a fever in 1639 by taking a potion prepared from the bark of a tree which, a century later, was named Chinchona by the botanist Linnaeus. The indigenous name of the bark in Peru is quina-quina; it has saved countless lives for it is the natural source of quinine, once man's only weapon against malaria.

THE BUSINESS WORLD

The Market for Aircraft

WHEN orders that run—on paper—into hundreds of millions of pounds are placed by some of the world's major airlines for aeroplanes that are themselves still largely creations of paper, the signs point as plainly as the coming of swallows points to summer, to the start of a major process of re-equipment in the air transport industry. Here are the orders and negotiations of the past few months:

United Air Lines has placed an order for 30 Douglas long-range jet airliners, the largest single order ever placed for a commercial aircraft: value £62.5 million.

Two major American airlines, Eastern Airlines and American Airlines, have ordered a total of 75 Lockheed Electras, a turbo-prop airliner for medium-range operations: value £59 million.

Pan American World Airways has placed an order for 25 long-range jet airliners from Douglas and 20 from Boeing, both for non-stop North Atlantic services: value £96 million.

British European Airways is negotiating an order for about 20 Vickers Vikings, a new medium-range turbo-prop airliner of the same size as the Electra: value £20 million.

Canadian Pacific Airlines has placed an order for three long-range turbo-prop Bristol Britannias with an option on another 5: value £3½ million, without options.

Without taking account of options these orders run to a total of £240 million and orders for another £60 million worth are almost completed. They have one feature in common: they are for aircraft of great size, carrying 100-150 passengers, that have not yet been built, let alone proved and flown, and they all involve radically new types of equipment.

From time to time a major upheaval of this kind takes place in civil aviation; operators who have been apparently content to replace ageing equipment with newer and larger variants of the same family of aircraft turn their back on tried and trusted designs in favour

of the new, the untried and the revolutionary. The first postwar cycle has seen the evolution of the giant piston-engined airliner, thundering non-stop from coast to coast, from San Francisco to New York, from New York to London. Operators are now looking to the gas turbine for greater speed than the piston engine can give.

The cost, and no less the technical difficulties, of designing modern airliners and their engines is now so great that the choice of types open to the airlines at any one time is restricted. Very roughly, aircraft can be grouped into three categories: long-range aircraft, which today means machines capable of crossing the North Atlantic non-stop in all weathers; medium-range aircraft for distances of anything from 500 to 2,500 miles; and short-range, feeder line machines that have to be designed with an eye to their use in undeveloped countries with spartan airports.

★

The topography of the North Atlantic has a decisive—and a distorting—influence on aircraft design. With its distances from coast to coast, and the ferocious headwinds that play across it during winter, it demands of an aircraft greater power and greater range than any other trunk air route in the world. There are only three new aircraft now being designed for this kind of "North Atlantic Operation," two jets and one turbo-prop. The jet airliners are the Boeing 707 and the Douglas DC8, both aircraft using four Pratt and Whitney jet engines. The turbo-prop is the British long-range Bristol Britannia; this is the third mark of Britannia to be designed, and its prototype is now under construction. This will have an advanced version of the Bristol Proteus engine. Neither of the two earlier marks of Britannia are capable of crossing the North Atlantic non-stop; nor is de Havilland's jet Comet IV. No

more work is being done on the big jet transport that was once being developed by Vickers-Armstrongs as the VC 1,000, and it is indeed doubtful whether the partly built prototype will ever be completed.

On the medium-range routes (which a year or so ago would have been considered as long-range), there is a choice of two aircraft only. One is the turbo-prop Vickers Vanguard, the other is the turbo-prop Lockheed Electra. Lockheed has, for the time being, no new candidate for the North Atlantic. These two big turbo-props have both an effective range of 2,500 miles; the Vickers Viscount is likely to stay in production for routes of up to 1,000 miles, its only competitor for this type of work being the Convair 440. This aircraft deserves some comment; Convair have recently experienced great difficulty in selling the piston-engined Convair 340 in competition with the Viscount. The 440 version is basically the same aircraft, but the cabin has been sound-proofed with a new efficiency, and the engine power stepped up to carry the extra weight.

In the really short ranges, a number of types are under development here, in France and in America, but many airlines are quite content to continue re-furbishing their DC 3s for this type of operation where new, modern equipment is of second importance to economy.

These new aircraft will come into service around 1960, and until then the market will follow its established pattern of using long and still longer range piston-engined aircraft, built by Lockheed and Douglas, and a growing number of medium-range turbo-prop Viscounts built by Vickers. The point at issue is the extent to which the battle of paper aeroplanes that is now being carried out by the industry's salesmen will upset this pattern in the future.

★

Air transport is dominated by American manufacturers and American airlines. There are, in round figures, 4,000 aircraft in operation outside the Iron Curtain. More than a quarter of these are very small, although they are not necessarily old equipment. Of the balance, about 2,000 had been built by Douglas and more than 1,400 of these are the undying workhorse, DC 3's. Lockheed aircraft, Constellations and developments of them, accounted for nearly 300, and twin-engined Convairs for about 350. The number of Convairs and Dakotas in service suggests that the market is going to require about 1,500 medium- and short-range aircraft to replace them during the next few years, assuming that the growing size of aircraft roughly balances the increase in traffic—as it has done recently, for the number of aircraft has remained static while capacity has grown. There were only 43 Viscounts in service at the end of 1954, but the numbers are rising rapidly and Vickers have to date delivered 77. The 1,000 longer range aircraft provide the market for Lockheed, Douglas, Boeing, Bristol, the Vickers Vanguard—and for the Comet IV—and if British manufacturers

are to get a reasonable production run, it is essential for them to sell at least part of their output to the American airlines. For American operators own a high proportion of the world's air fleet. The largest single fleet, 188 aircraft, is owned by American Airlines, followed by United Air Lines with 180, neither of which operates outside the United States. These are followed by Trans World Airlines with 146, Pan American World Airways with 127, and Eastern Air Lines with 119. The biggest of the European carriers, Air France, musters no more than 102 aircraft, and of the British corporations, British European Airways have 99 aircraft and BOAC 57. All of these fleets fall due for replacement every eight years, and the long-awaited decision of some of the bigger American carriers to change from piston engines to gas turbines, as shown in the recent orders, represents the kind of technical advance that tends to accelerate the process of re-equipment.

★

When the choice of aircraft is so restricted, there is no longer any question of operators choosing to "Buy American" or "Buy British." They buy the aircraft most suited to their routes from the company in which they have most confidence. When civil aircraft are ordered from the drawing board, the question of confidence becomes all-important, and British manufacturers, who are only slowly acquiring an international reputation as civil airline constructors, are aware that the best salesmen for their new airliners of the 1960s are the older types that they are delivering, or about to deliver against current orders. This question of confidence, of the performance record of past designs, has introduced a new, unexpected, but, from the British point of view, not unwelcome complication into the market. In the design of big gas turbine engines for civil use, and especially of turbo-prop engines, British factories have a better record than American factories. Lockheed's plans to launch a turbo-prop airliner for North Atlantic operation next year failed for want of a suitable engine; so did Douglas's plans for a turbo-prop DC 7D. Lockheed have repeatedly stated that although an Allison turbo-prop engine is provisionally pencilled in for the Electra, the choice is not final. The decision of American manufacturers to build jet, rather than turbo-prop airliners, and the interest of American operators in them, owes much to the lack of suitable turbo-props, and even the available American-built jet engines have yet to prove themselves.

These considerations explain the large number of American aircraft engineers who have lately visited British engine factories, and they have led, among other things, to suggestions of various combinations of British engines and American airframes: a Lockheed Electra airframe with a Rolls-Royce turbo-prop RB 109 (the engine for the Vickers Vanguard); a long-range Lockheed 1649 Super Constellation with the Bristol turbo-prop BE 25; and the use of Rolls-Royce jet engines

in Douglas airliners and Napier Eland turbo-props in Convairs. There has been some impatience among American aircraft makers with the slow response that British engineers have made to suggestions that they should sell their engines in America; the reason lies not in any reluctance to enter into American contracts, but on a soundly based refusal to sell a new engine to a foreign factory until it has been extensively proved nearer home.

The close discussions between American and British manufacturers arise also from realisation of the difficult task that Boeing and Douglas have set themselves in building non-stop, trans-Atlantic jet airliners. These aircraft become, for technical reasons, so heavy that few airports outside London and New York have runways long enough and strong enough to take them, and some

Qualms About Cotton

THIS season something novel has happened to trade in raw cotton. Competition has returned to world markets, and prices of "outside growths" (American-type cotton grown outside the United States) have fallen much below the United States export price: it is being foreshadowed that competition will grow and prices fall further. That is not a happy prospect for producers or for consuming industries. Weakness in cotton prices inhibits buying throughout the textile industry. It is especially painful for Lancashire, suffering as it is from a loss of export markets and from the invasion of the home market by Asian cloth.

For several producing countries falling prices may bring political as well as economic troubles. For Egypt especially, where cotton is the mainstay of the economy, the outlook may be grim. A government not rich in resources has promised the farmer a minimum price for his crop, and now faces the possibility of having to implement its guarantee. Cotton is not much less important to Mexico, Brazil, Turkey, Pakistan and the African territories, and it is a growing political issue in the United States—the country that is largely responsible for the fall in its price.

When the United States supports the price of a commodity at a high level it automatically invites producers in the rest of the world to come under its umbrella. That is more noticeable with cotton than with wheat, because the United States has in recent years refused to subsidise exports of cotton as it sub-

engineers have yet to be convinced that it will be possible to give these aircraft the performance that is being claimed for them—and on which the orders for them have been based. The de Havilland Comet IV, which is a one-stop North Atlantic aircraft, and the non-stop long-range version of the Britannia, do not operate under these handicaps. They are lighter, and being less ambitious, have a more comfortable margin of performance in hand. But these are as much paper judgments as the aircraft themselves. Airlines are liable to place orders at an apparently precipitous rate to get a good position for deliveries, much as people rent a stool in the gallery queue. But they take up the orders only when they are satisfied with the way the aircraft transforms promises from paper into the fact of performance.

disables exports of wheat. The law requires that cotton acquired by the government in supporting the market must not be sold at home at less than the domestic market price or 105 per cent of the support price plus carrying charges, whichever is the higher. That restriction does not apply to sales abroad, but up to now the government has chosen to apply it. Hence the American support price normally holds up world cotton prices too. The foreign as well as the domestic producer of cotton—and also of rayon—is thereby encouraged to expand production, while the United States government is left holding the surplus. A glance at the chart of world supplies shows that in recent years, despite the steady rise in world consumption of cotton, world production has persistently exceeded it. The United States' share of world production has declined, as has its share of world exports.

The American Administration is painfully alive to the absurdities in its policy, and is moving gingerly towards reform. Acreage restriction has been tried, but has helped little. The 1955 acreage was cut by 14 per cent to the smallest figure in history, but the growers countered this by raising the yield to the highest figure in history. Now the Administration is faced with a crop of at least 14 million bales, half a million bales larger than its predecessor, and with the dismal prospect that the carry-over on August 1 next year may be two million bales larger at about 13 million—a stock that would cover one year's home and export requirements. While the United States has restricted

acreage, foreign producers have increased theirs. How could it be otherwise when the United States held its support price at the high level of 33½ cents a lb?

A radical change in American policy must come, and cotton traders know it. It was widely expected that exports in the new season beginning last August would be subsidised; that is why world trade slowed down to a crawl after the spring. In the event, after a prolonged inter-departmental squabble, the Administration shelved the main problem but decided to make a small start towards disposing of its big stock. Even that involved an important change of policy. In August it was announced that from January 1 the government would offer for sale abroad up to one million bales of the shorter-stapled cottons at "competitive" prices; i.e., at less than the domestic or the support price.

It is now clear that in taking that small step towards an export subsidy the government made a rod for its own back. It did nothing to restore confidence, and it gave America's competitors a five months' start. A year ago the Department of Agriculture told foreign producers that if they increased their acreages while the United States restricted its own, the government would be forced to re-examine its export policy. That warning fell on deaf ears. These countries are now "on notice that the United States finds it necessary to make a start towards more competitive marketing of some of its heavy stocks." Their producers have taken the hint and have been selling as much as possible before January 1. As a result, prices of outside growths are up to 6d. a lb below prices of United States cotton, and exports from the United States have slumped. By the New Year, selling pressure from other producers may have diminished, but the American government will probably have to offer the shorter staples, which are in any case those least in demand, at much lower prices than it first supposed.

The persistent lack of confidence in cotton prices disrupts trade. Buyers throughout the chain of manufacture live from hand to mouth and keep their stocks down. Merchants do not hold cotton because they cannot hedge it at a price that will repay them for

the cost of carrying stock and responsibility for carrying stock is pushed on to the spinners, who have to hedge as best they can. For most of this year the trend of prices on the Liverpool futures market has been downwards, the discount on the current price increasing with each forward trading month: May/June, for example, is now as low as 24½d. a lb, for the old 15/16th-inch contract, 3½d. a lb below the price of October/December. The extreme weakness of this contract partly reflects the possibility that cotton sold by the American government after January 1 will be tendered against it. But May/June futures on the new 1-inch staple contract, against which that cotton will not be tenderable, is only 1¼d. a lb higher at 26d., compared with the spot price for 1-inch of 32¼d. Rightly or wrongly, the market believes that the surplus of American cotton is now so heavy that the government will be forced to offer all grades at competitive prices before the season ends; if it did so it would be going back on its previous assurance.

The Secretary of Agriculture, Mr Benson, has clearly defined the direction in which he hopes to go. He wants Congress, at its next session in 1956, to take action "to encourage farmers to produce the grades and staples most desired by both the domestic and export markets . . . and to permit adjustments in price-support levels which will put our cotton in a more competitive position with synthetic fibres and with foreign cotton of comparable quality." No country can question the right of the United States to win back a larger share of world exports, provided that a reduction in support prices goes hand in hand with a reduction in export prices. Mr Benson seems to agree with that proviso. The doubt is whether he can carry Congress and the White House with him during an election year when the Democrats are already promising the farmers a return to high and rigid supports. (This week, from Denver, the President said that his Secretary of Agriculture and he were agreed that "we should not go back to old policies [of rigid price supports]" that have failed to meet the problem in the past.) If the United States did make a general reduction in export prices while maintaining the support

price, the domestic textile industry would clamour for increased protection against competition from foreign industries, and foreign producers of raw cotton would accuse the United States of dumping its exports.

The surplus of cotton can be remedied in time. Marginal production in the United States and elsewhere must be squeezed out by allowing the price to fall, and lower prices will help to stimulate consumption of cotton textiles. They will also diminish the competitive advantage of rayon and—what is closer to Lancashire's heart—the competitive advantage of Indian textiles based on Indian cotton at less than world prices. The United States can be expected to

move by degrees, not least in its own political interests, and the precise methods to be adopted are its own affair. But other countries are entitled to ask that trade in cotton should not be brought almost to a standstill each summer while the world waits for the United States to make up its mind on the programme for the coming season. This is a view that the British and other governments have forcibly expressed to the American government, and Britain can be expected to say it again. Unfortunately, in a commodity so politically charged as cotton, it seems unlikely that Mr Benson can declare the American government's plans far enough ahead.

Business Notes

A Rally in Markets

THE gold and dollar figures for October turned out better than most people expected; the improvement of sterling was quicker and more impressive than had been foreseen; the meeting between the TUC and the government was more amicable and perhaps more constructive than had been feared in the City. All those events demanded a rally in investment markets, yet the extent of that rally—Wednesday saw the best of it, and the market lost some ground on Thursday—surprised most experienced market observers. Advances of up to ½ were recorded among the medium and long-dated gilt-edged stocks. Industrials marched in step, the *Financial Times* index rising 1.9 to 193.2. The upward movement was widely spread. This was a rally based on thin business; bear closing certainly had something to do with it in both the gilt-edged and the industrial markets. Indeed, it is arguable that the rally was sharp just because the market was thin. Dearer money is now exerting a noticeable pressure on the size of jobbers' books, particularly in the gilt-edged market, which is almost the only section of the Stock Exchange in which the jobbers do on occasion still hold big books. If jobbers have to decide between being tiny bulls and being tiny bears there is little cushion to absorb even a moderate wave of buyers or sellers. Prices take the impact sharply and at once.

In the industrial share market where falling prices should in logic be the consequence of a tightening credit squeeze and increasingly cautious dividend decisions, another influence—temporary if not technical—has emerged. The pressure of big new issues on the market has for the moment lightened because borrowers know that the big institutions have little money for investment. There will be a fair number of smaller refinancing operations. This week's placing of part of the capital of Williams and Humbert, the sherry shippers, is an example of the better

type of smaller family business that can still come to market. Most of the company's £200,000 6½ per cent preference capital will be available at about 20s. 9d. per share and about a quarter of its 800,000 5s. ordinary shares at around 10s. 9d. per share. On a dividend of 20 per cent a yield approaching 9½ per cent is offered. In the new year more of the big issues may be forthcoming, for by then the institutions should again have more money for investment. The industrial market meanwhile enjoys a useful breathing space from the pressure of new capital demands.

Sterling Above Par

THE sterling-dollar rate has this week broken through the line of the official parity. At the beginning of the week the spot rate was hovering around \$2.79½. On Tuesday, following the Chancellor's counterattack on his budget critics and his assurances that the drain on the gold and dollar reserve was slowing down, the rate moved up and for a fleeting moment touched \$2.80. On Wednesday, however, the advance gathered momentum and although reputedly held back by some official offering of sterling against dollars the rate crossed the parity line and closed at \$2.80½ on the reassuring gold figures. It closed at \$2.80¾ on Thursday.

The improvement has also spread to the forward rates. A week ago the premium on three months dollars was around 1½ cents. It has since narrowed to a middle rate of 1¼ cents. The foreign exchange market in London reports little commercial demand for dollars, though normally it is still in spate at this time of the year. Part of the seasonal demand for dollars was undoubtedly anticipated in July and August when rumours of an impending devaluation or freeing of sterling were rife. The run on sterling, which in one week of July is believed to have cost the reserve over \$70

million, in part took the form of premature buying of dollars and other foreign currencies in respect of requirements that would normally have been satisfied later in the year. To that extent the autumn pressure was merely advanced.

The firmness of the official rate has been reflected in the unofficial rates for sterling against dollars. Transferable sterling has moved up to \$2.77½ and security sterling to \$2.75½. Even the decidedly "grey" rate for resident sterling in which there is an active market in New York is now \$2.75, the margin of dealing rates for that type of sterling being appropriately wide—\$2.74½–\$2.75½. All these rates lie within the range of a 3 per cent variation either side of parity which, in the discussions leading up to the European Monetary Agreement, was deemed to be the maximum that could be tolerated for any currency that became convertible and required greater flexibility. The only rate for sterling in New York that lies beyond this 3 per cent range is that for pound notes, now at a post-tourist season ebb and quoted \$2.63.

Sterling has also been steady in terms of most Continental currencies, though in these markets it has not advanced as strongly as against the dollar. There are widely conflicting reports of the extent to which the short position in sterling on the Continent remains uncovered. The funds lent to London discount houses by overseas and foreign institutions seem to be much below normal. That implies that the running down of sterling working balances—a major factor in the run from sterling earlier this year—has by no means been made good. Once the balances are restored sterling should benefit.

Output in the Third Quarter

MANY of the production statistics of the engineering and metal goods industries are now collected quarterly, and these are not reflected at all in the indices of industrial production that have so far been published for the third quarter—the revised July figure, provisional

OUTPUT IN THE THIRD QUARTER

	All Industries		Manufacturing	
	1954	1955	1954	1955
January	128	134	130	139
February	130	139	133	144
March	132	141	136	147
April	124	132	128	138
May	133	138	138	145
June	128	136	133	143
July	117	121	120	126
August	113	117	115	121
September	133	138–139	138	...

August figure, and forecast for September issued this week. The motor industry is the outstanding exception; its figures are produced quickly enough to go into the forecast that the Central Statistical Office produces, as a range, four weeks after the end of every month. Most of the other industries whose figures are available in time are basic industries or services: coal, steel, electricity, gas, and water,

plus a few sections of the textile industries. Moreover, the varying incidence of holidays in the third quarter makes indices for these months notoriously fallible signs of the trend of output.

The fact that production in the third quarter, as so far measured, was only about 3½ per cent higher than in the corresponding quarter of 1954, while increases of about 6 per cent were recorded in the first two, cannot yet be taken as any evidence of a real slowing in the upward growth of output or of the effects of restraint in the economy. So far this year, output in all industries appears to have been about 5½ per cent higher than in the same months of 1954. There is no chance of equalling the 6.7 per cent increase of 1954 over 1953; but for the whole of this year the increase might still approach 6 per cent.

Dollar Balance Recovers

THIS week's surge of confidence in sterling was vindicated by the gold and dollar figures for October announced on Wednesday afternoon. It had been known that the reserves would be burdened in October by the payment of \$80 million to the European Payments Union on account

(\$ million)	Gold payments (–) or receipts (+)*		U.S. Aid	Reserves

§ After payments totalling \$181 million on United States and Canadian loans.

of the September deficit; yet they fell by only \$48 million. About \$3 million was received in American aid, so that the residual balance was a surplus of \$29 million. This balance reflects the sterling area's balance with the dollar area itself, together with the net operations of the Exchange Equalisation accounts and capital transactions (including the \$2 million paid each month to EPU creditors in settlement of past debts to the Union). October is the first month of 1955 in which this residual dollar balance has shown a surplus.

The Barber of Seville

HE IS AN ARTIST; and, as artists should, he chooses his instruments most carefully. He chooses British-made razors.

So do millions of self-shavers all over the world. Nearly six million British safety razors went overseas last year and close on seven million gross of blades went with them.

Razors and rolling stock, paper clips and cars — an infinite variety of British steel goods is helping to raise Britain's exports to record levels.

Wherever there is steel there is British steel.

British steel leads the world

If you're looking for a way round the complications of PAYE, if payday is a recurrent peak that means overtime in the accounts department—it is time you found out about Foremost. Here is a mechanized accounting system, developed by Remington Rand, that can be tailored to fit your accounting system exactly; that adapts within minutes to any kind of accounts work, however complex or specialised; in fact, a system that does *much* more than settle your PAYE problem.

THERE IS A BOOKLET called *As Easy as ABC*. It explains how Foremost provides all pay records in one printing; gives proof of accuracy at all stages; makes instant PAYE adjustments with mechanized legibility, speed and labour-saving. It also details five other applications of Foremost—the most flexible and adaptable of all accounting systems. They will interest you too; MAY WE SEND YOU A COPY?

* *Send for the man from*

The sterling area's payments with Europe are still in the red. The balance with EPU in October was a deficit of £15 million—substantially less than the deficits of £38 million, £28 million and £25 million incurred in September, August and July; and as the short accounts in sterling built up by continental operators had by no means all been closed by the end of last month, the deficit of £15 million need not be too discouraging. But it does call for a payment in gold of \$31½ million next week.

Report on Atomic Energy

THE first annual report of the Atomic Energy Authority, covering operations from its inception in July, 1954, to the end of March, 1955, is not the detailed financial document produced by other nationalised industries. This is a new industry and the authority was brought into being so that it should develop along normal commercial lines, a task that has taken up most of its time during these first months. But it has, however, two inhibiting legacies from the past when it was a department inside the Ministry of Supply; one is the Treasury accounting rule, under which any unspent surplus must be returned at the end of the year, the other is the civil service scale of salaries.

The authority differs from other nationalised industries in being financed by an annual grant from Parliament. Some years must pass before it can expect to earn any income other than receipts from the sale of atomic weapons to Service departments and the pin-money from the sale of radio-active materials. Tribute should be paid to the successive governments that have never stinted either money or materials on atomic expenditure—and tribute also to the scientists who have given the country an exceptionally good return on its investment. But it is explicitly stated in the report that the funds are granted not in a lump, but under specific sub-heads so that special permission has to be obtained to use savings under one head to finance others. The report gives one specific instance of receiving permission to use savings made on stores to meet additional purchases of land and extra loans for uranium production. This is a far cry indeed from the vague duty laid on other nationalised industries covering their outgoings "taking one year with another." It is the method least likely to encourage realistic estimates in a field of engineering where financial forecasting is notoriously hazardous, and it is largely the result of good luck (and good window-dressing?) on the part of the scientists and the open purse of the Government that this Treasury requirement has not caused more friction. The attention drawn to it in the report suggests that the authority, for one, is aware of the sand that it throws into the gears as well as the doubts that it casts on how autonomous this new nationalised industry is intended to be.

Looking Backwards

THE long arm of the Treasury also reaches to the wages policy of the Atomic Energy Authority. The principal threat to the Authority's time-table of research and construction is not money nor materials, but skilled and semi-

skilled scientific and engineering manpower. The supply of these people, at any one period, is relatively inelastic; the demand is expanding as more companies in the electrical and engineering industries become interested in atomic developments. The Authority is paying its managers what the report implies is near their market rate, but this affects only 300 to 400 out of a total staff of 20,000 and the Authority is paying its other scientific workers and its industrial staff the kind of Civil Service scales that expect skill, experience and the highest integrity all for £1,200 a year. It is quite plain that unless this policy is revised—and quickly—the Authority will find itself in difficulties.

The report contains little indication of what long-term atomic policies the Board is considering; it is exclusively concerned with a backward looking review of technical development, much of which received exhaustive treatment during the atomic energy conference at Geneva. The AEA presents this in a tersely summarised and more accessible form, but little is actually new, beyond the announcement that work is being done at Harwell on reactors making use of ordinary water and reactors built on the "homogeneous" principle.

For the time being, the Authority's relations with industry consist of providing technical help to companies developing atomic power plant designs—the four groups competing for the Central Electricity Authority's first tenders. This is beginning to involve the use of material for which the Authority holds patent rights, and in those cases where the information is not secret, non-exclusive licences are granted to UK companies.

But countries looking to Britain for atomic leadership will search in vain for any hint of the Authority's policy towards the production of "enriched fuels," i.e. uranium, whose fissile content has been boosted by adding more uranium 235 to the natural uranium metal; these are scarce in Britain and needed for certain types of atomic development. Nor is there any hint of the Authority's attitude to the move gaining support in Europe for an atomic community on the Schuman pattern. It is suspected that Britain is not anxious to use up the time of scientists needed at home to help atomic development in other countries. This is a short-term view that ignores the long-term advantage this country would gain from a more generous policy today. And if the key is, in fact, the scale of salaries paid to authority scientists, then this first report—which has all the clarity of expression and felicity of style that has so far stamped official publications about atomic developments—suggests that the effects of Treasury control on the long-term development of the Authority need to be considered seriously—and at once.

The Coal Balance

THE chance of a coal shortage this winter is slight, but not to be ignored. If Britain has an unusually severe winter and coal output remains as disappointing as it has been this summer, there may not be enough coal to go round. If so, the power stations, gas works, iron and steel industry and the railways will be guaranteed the coal they need, and the domestic consumer will get his ration; the shortage will be spread over the rest of industry. The country has now about 2.7 million tons more coal in stock

than it had a year ago, and moreover, coal imports are already running at the rate of 1 million tons a month, which offers about 1½ million tons more foreign coal during the coming six months than the National Coal Board could import last winter. Moreover, exports during this coal winter are likely to be much less than the 6 million tons exported in the winter of 1954-55.

But if coal should become short, imports would not be increased until supplies to industry in general had been cut considerably. Demand for tonnage to import coal cannot

not be allowed to hamper Britain's imports of iron ore more than it has done already; nor can the country afford the foreign exchange. As the table shows, the inability of Britain's mines to produce as much coal as the country needs has swung the trading account on coal from a surplus

of more than £50 million in 1954 to a deficit of about £20 million this year; and the need for many industrialists to switch to fuel oil has been one element in increasing the net cost of petroleum imports to this country.

The Government has this week begun a campaign urging industrialists to save at least 10 per cent of their coal consumption this winter, which would completely insure against any shortage and would, incidentally, save importing 2 million tons of foreign coal at a cost of about £14 million. Such savings, the National Industrial Fuel Efficiency Service is quite sure, can be obtained with little or no capital expenditure, simply by using space heating equipment more moderately and training stokers properly.

Argentina Devalues

THE decision to devalue the Argentine peso to a new parity of 18 to the US dollar compared with the previous official rate of 5 pesos to the dollar, the preferential rate of 7½ pesos and the official free rate of 13.98 pesos, is more than a devaluation: it is the beginning of a revolution (perhaps a reformation) in economic policy. The intention is to cut away the jungle of differential rates in which Argentine external trade had become entangled during the past decade. This is a devaluation to less than a third of the previous official rate; it will give the peso a sterling equivalent of 50.40 to the pound, compared with the previous 13.98 to the pound, though the black market rate has recently been between 80 and 90 to the pound. It is considered too drastic to be allowed to take immediate, unrestricted effect on the exchange market or on the Argentinian

economy. It is, therefore, being cushioned at a number of points. And for that very reason the Argentine devaluation as an isolated act does not—at least not yet—clean up the Argentine foreign exchange tangle.

The new rate will be used for all imports and exports entitled to the facilities of the official market. But behind the official market will lie a free market in which rates will be determined wholly by the play of supply and demand. This free market in which the sterling rates are expected to settle somewhere between the new parity of 50.4 and the former black market rate of 80 to 90 pesos will be fed with foreign currencies by inward capital movements, financial remittances to Argentina such as claims under insurance policies, and the proceeds of exports not on the official list. The free market will supply exchange for financial remittances from Argentina and for payment for imports not on the official market list. Previously financial remittances, where allowed, were made at 39 pesos to the pound. That rate had, however, acquired a merely academic significance. If remittances can be hastened a depreciation in the free rate and a consequent higher cost of the remittances will be well worth the cost.

The Remittance Problem

THERE is no intention of at once freeing the substantial arrears of financial remittances and the foreign capital, now blocked in Argentina, awaiting repatriation. It is, however, intended to allow full remittance of profits accruing after June 30, 1955 to foreign investment. The blocked remittances that accumulated earlier will be progressively released by quotas as foreign exchange is accumulated. The more realistic rates now quoted for the peso should hasten that accumulation by encouraging Argentine exports which in recent years have been hampered by the differential rates of exchange that discriminated harshly against some of Argentina's primary products.

The impact of the devaluation on Argentina's economy is however being cushioned by special export taxes on those products which will suddenly receive the benefit of the sharp depreciation in the official exchange rate. Part of the peso, proceeds of export bills will be retained and used to subsidise certain imports the cost of which would otherwise have risen and reacted too suddenly on the cost of living. Details of these compensatory taxes and subsidies have not yet been announced. Unless they are operated with restraint and as short-term devices the last state of the Argentine foreign trade and payments structure may be no less entangled than that from which it is being rescued.

Bank Liquidity Prospect

THE full return from the clearing banks for their October make-up, tabulated below, confirms the figures given last week from the statements of the banks individually. Whilst the decline in the banks' advances to the private

sector of the economy seems to have been barely maintaining the moderate rate attained in the two preceding months, the declining trend of deposits has been accentuated. Net deposits rose during the four weeks by only £17 million, whereas in the corresponding periods—covering, however, five weeks—of 1954 and 1953 they rose by £75 million and £60 million. As noted last week, only one of the banks showed any significant increase in investment holdings (Lloyds, by £6.6 million), and the aggregate portfolio rose by a mere £2 million, showing that the

banks' take-up of the cash portion of the new 4 per cent Conversion Stock must have been small. There is no sign of any substantial switching operations, for three of the big banks show no change at all in the total of their portfolios.

This cautious attitude to an attractive issue was evidently dictated by considerations of liquidity. The average liquidity ratio rose during the period by 0.3 per cent to 33.8 per cent, which compares with 34.3 per cent at the corresponding make-up day last year. At this level the banks have only a small cushion to meet the pressure of the seasonal decline in deposits and repayments of floating

House Prices Stop Rising

A CREDIT squeeze, one reduction in housing subsidies already made, another expected and many of the building societies running short of lending money in the summer months—what effect did those happenings have on house prices? The best indication comes from the indices prepared by the Co-operative Permanent Building Society, which now run up to September of this year. The first chart shows that the price of new houses continued to rise despite the adverse turn in the underlying conditions. The index (basis 1952 equals 100) was 104 for the September quarter compared with 100 in September last year. But it did not rise as fast as did the index of house building prices (from 104 to 112). A suspected distortion in the index of building costs may explain that divergence.

The second chart shows that prices with vacant possession for existing houses have ceased rising, the cheapest class—the up to £1,500 house (up to £2,000 in London) actually shows a significant decline in the latest period.

The cream may already have been skimmed off the housing market in some areas, but the map shows by area and for the best type house built between the wars the percentage increase or decrease at the end of September this year compared with a year earlier. Housing remains at a substantial premium in London.

debt that will occur in the opening months of the new year. Unless the decline in advances speeds up, the liquid position may become very taut then.

Profits from Motors

PROFITS earned by the motor companies are falling into a pattern—but it is the pattern set by the half-yearly statement from Ford Motor rather than that set by Standard Motor for the full year to August 31st. The Ford statement showed that the improvement in earnings lagged behind the rise in output; the Standard report indicated that an increase in sales, thanks to a greater utilisation of capacity, had had a more than proportionate effect on profits. The preliminary reports from British Motor Corporation and Rootes Motors seem to confirm Ford's experience that the rise in labour and material costs is acting as a drag upon earnings. The trading profits of British Motor in the year to July 31st have improved (by about 11 per cent from £20,056,027 to £22,333,776) but that advance is certainly smaller than the increase in sales; and Rootes Motors, which also probably sold more vehicles in the year to July 31st, has actually had to report a slight drop in gross profits (from £3,604,217 to £3,557,325).

EARNINGS AND DIVIDENDS
(£'000s)

Years to July 31	British Motor		Rootes Motors	
	1954	1955	1954	1955
Trading profit	20,056	22,334	3,604	3,557
Taxation	10,277	9,103	2,118	1,809
Net profit	7,145	10,180	1,341	1,357
Non-recurring credits ..	118	549	76	146
Ordinary dividends ..	1,769	2,207	220	230
Retained profits	5,241	8,567	1,142	1,183

All the motor manufacturers, with the "Big Three" leading the field, have costly development programmes on hand. That, now linked with the credit squeeze and the increase in purchase tax, makes for cautious dividends. Standard Motor left its dividend unchanged and this week, to the disappointment of Throgmorton Street, Rootes Motors has also effectively left the payment unchanged, paying 8 per cent on the capital as increased by the 400 per cent free scrip issue. Ordinary stockholders in British Motor have, however, done a little better. A final of 8½ per cent on a capital of £31,839,709 (as increased first by the one for ten rights issue and then by the one for eight free scrip issue) has been added to an interim of 4 per cent paid on a capital of £28,301,963 prior to the free scrip issue. The assumption must be that the old dividend rate of 12½ per cent is being maintained on the new capital after the scrip issue. That is in line with market forecasts. The 5s. ordinary stock units at 10s. offer a yield of 6½ per cent; in contrast the Rootes 4s. units offer a yield of only 4½ per cent at the current price of 7s. xd.

Dumping British Pipes

BEFORE British manufacturers of cast iron soil pipes comment upon the United States Tariff Commission's ruling that they have been dumping these pipes on the American market, they are waiting for full details from Washington. It appears that to reach this finding the Commission had to satisfy itself on two points—that the prices charged to American importers were "less than fair value," and that the domestic industry had thereby suffered injury.

British manufacturers have been shipping two kinds of soil pipes to the United States, the standard British type and the American pattern pipe which has the same dimensions except that an extra socket makes it three inches longer. The prices charged to American importers for some of the shipments of British standard pipes appear to have been lower than those charged here and certain discounts allowed on other shipments of the same kind of pipe may have had the same effect. Although most of the fifty or more producers of cast iron soil pipes in the United States manufacture in the eastern half of the country, the Commission argued (by a 4-2 majority) that seven firms operating in California constituted an industry under the terms of the Anti-Dumping Act 1921 and have suffered injury even though the sales of Californian plants are reported to have risen from 66,000 tons in 1954 to an annual rate of 82,000 tons this year against imports of standard British soil pipes of 1,800 tons and 1,600 tons. Sales of all American manufacturers have risen every year since British shipments started and they are reported to be running at the annual rate of 892,000 tons this year against an import rate from Britain of 4,500 tons of American pattern pipes and 3,000 tons standard pipes. Last year British firms sold 3,900 tons.

Once a charge of dumping is held to be proved imports become liable to a special duty levied by the American Treasury equal to the difference between home trade prices and what American purchasers have to pay. But if British firms raise their charges to the level of their domestic prices then no duty is levied. Whether this would price these British standard pipes out of the American market is not yet clear; sales of American pattern pipes, which form more than half British exports, have been excluded from the Commission's finding.

British Contractors Abroad

THE appointment of Sir Alexander Gibb and Partners as consulting engineers for the gigantic high dam scheme in Egypt was announced a day or two after the Board of Trade published the results of its first census of overseas construction work undertaken by British firms. Some fifty firms had contributed information about their foreign activities, including the work of their overseas subsidiaries and associates, in the twelve months to last March. Between them they did about £70 million worth of work, and they had a similar amount of business outstanding at the end of the period. Not all this money finds its way to this country—labour and some materials are obtained

It's a bland, benevolent typewriter, the Standard Imperial '66'. It seems to understand that a girl wants her machine to work for her and with her, and not against her. She wants to get off home on the dot, and she wants to know that she will be off on the dot tomorrow, and this day next week, and next year. That spells Imperial '66'.

What you
should know
about Brandy

V.S.O.P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. All Remy Martin Cognac is made from grapes grown exclusively in these two areas. That is why people ask for Remy Martin and are never disappointed.

REMY MARTIN
Pride of Cognac

locally—but this was equivalent to six per cent of the total amount of building and civil engineering work undertaken in this country during 1954. It is mainly the big contractors who are active overseas. About a third of the fifty firms in the census did less than £250,000 each whereas seven contractors did more than £3 million apiece. For many of these bigger firms overseas activities roughly equal their work here; for a few foreign work is more than half their total business.

Although the bulk of this overseas work—£65½ million—was undertaken in various parts of the sterling area, business elsewhere was showing marked signs of growth. British contractors carried out £2½ million worth of new construction in the United States and Canada in the twelve months and secured contracts for a further £6¼ million despite keen competition from local firms. About £2 million worth of work was done in Western Europe (including Turkey) and orders were received for another £11 million. The *Board of Trade Journal*, in which these figures are published, suggests that opportunities for increasing this business should be considerable in Burma, where an immense amount of development is planned, and in the Middle East.

British Petroleum's Dividend

IMMEDIATELY after the autumn budget, in which the Government pressed the button for dividend restraint by increasing the tax on distributed profits, British Petroleum announced a bigger interim dividend on its ordinary capital, 51 per cent of which is owned by the Government. That was the modern touch—in keeping with Lord Strathalmond's earlier forecast that "it should be possible in future to distribute a larger proportion of the profits available." Indeed, the more liberal dividend springs logically from events that are already past. It is no pointer to what British Petroleum or any other company may do in the future. The archaic touch was the decision to declare the interim and future dividends free of tax. That was made "in view of the materially changed position of the company as regards United Kingdom taxation." That obscure phrase may imply a link with the fact that any distribution from the moneys credited to British Petroleum from the consortium would have to be made out of a capital reserve.

The interim dividend of 5 per cent, free of tax, was higher than investors had been expecting. After a full year's dividend of 15 per cent, less tax, for 1954 most forecasts went no higher than an interim of 5 per cent, less tax, for 1955. The £1 ordinary stock units—one of the most active of all securities this year—were immediately marked up from 105s. to 115s., carrying the stock of Burmah Oil (which is a large stockholder in British Petroleum) up with them. The final dividend is now—more than ever—anyone's guess, but Throgmorton Street assumed that it could not be less than 10 per cent, free of tax, making 15 per cent, free of tax, for the whole year. On that assumption the £1 ordinary stock units have been put on a gross yield basis of 4½ per cent.

Merino v Crossbred Prices

AFTER prices of merino wool settled down at a level somewhat above the low point of the new season market, interest shifted to the opening sales in New Zealand, which would provide the first real test of prices for crossbred wool. The results of the first three sales suggest that crossbreds are still the buyers' favourite. Prices opened about 12 per cent below the close of the last season, and then held firm. That is a smaller fall than that suffered by merinos. It did no more than bring New Zealand into line with the level established by smaller offerings of crossbreds in Australia and London, and it left unchanged the differential in price between these wools and merinos. The premium for merinos had shrunk to the point at which crossbreds might have seemed dear, and it was thought by some that the premium would be opened out by a sharper fall in crossbred prices. The opening sales are not necessarily conclusive, and the market was undoubtedly strengthened by demand from East European countries.

The new series of London wool sales has also gone well. Competition is keen and the bidding for certain types of wool suggests that buyers have allowed stocks to fall too low for comfort, and are willing to pay premiums for spot supplies in London.

Respite for Small Savings?

SAVING through the national savings movement has recently been flagging. In the last week for which figures are available, that to October 22nd, withdrawals exceeded new savings by £2.3 million—whereas in the corresponding week of 1954 there was a net surplus of new saving of £2.6 million. In this particular week the outflow this year was prompted in part by the pre-budget buying spree in goods expected to be taxed. But "small" savings have been showing a deterioration on the year ever since the beginning of July. By this time last year the inroads made in the holiday season into holdings of savings certificates, defence bonds and deposits in the post office and trustee savings banks had been more than made good; this year dissaving through these channels has continued in the early autumn. Between the beginning of July and the third week in October receipts fell short of repayments by £33.8 million; in the corresponding period of 1954 they exceeded repayments by £2.6 million.

All four channels of national savings have been affected, though defence bonds have fared worst. It is welcome, therefore, that a big stimulus has been given to purchasers of new defence bonds, which from November 1st carry interest at 4 per cent, against 3½ per cent on the previous issue. But a boost has also been given to savings certificates and deposits in the trustee savings banks. An increase in the permitted maximum of holdings of certificates from 1,000 to 1,200 (i.e. from £750 to £900 if they all belong to the current issue) was announced by the Chancellor in his budget speech; and most trustee savings banks that

maintain special investment departments are raising interest rates by ¼ per cent on deposits in these departments (which may normally be withdrawn only after a month's notice). Existing rates are generally 2½ per cent or 3 per cent; the rate on deposits in the ordinary departments is 2½ per cent, and is not being changed.

The BSI's Year

ONE of the new features in the work of the British Standards Institution is the amount of time that now has to be allotted to international standards and to consumer goods. The BSI's annual report for 1954-55 says that the number of committee and sub-committee meetings on international standards so multiplied during the year that it ate into the time available for discussion of specifically British standards. There is little likelihood of this trend being reversed. Internationally agreed standards are having an increasing influence on those drafted for use in this country, and are of considerable importance to exporting industries.

Work on standards for consumer goods began in earnest when the utility schemes were ended in 1952, and although a great deal of time has been spent in discussing draft standards for different industries, progress has been erratic. Most headway has been made in the furniture industry, where a comprehensive series of tests for durability have been evolved. More than 300 manufacturers, accounting for half the output of the industry, now use these tests and sell their furniture with the BSI mark attached, while the principal trade association in the bedding industry, accounting for 85 per cent of the output, makes the use of BSI standards a condition of membership. In contrast, little or no headway has been made in arriving at acceptable standards for textiles: partly because of technical difficulties in devising tests, partly because of arguments about the level of quality that standards should incorporate and the section of the textile industry which should be responsible for making such a cloth is up to standard. The alternative, that of labelling textiles, has been considered by the BSI to the extent of setting up a committee and distributing questionnaires to women's organisations—but only the most incorrigible optimist would feel that these steps have much chance of surmounting the stonewall opposition of large sections of the trade.

Industrial Assurance Records

TO cap the figures recently issued by the Industrial Life Offices the annual report of the Industrial Assurance Commissioner has now been issued. It confirms the steady, unspectacular progress that industrial (home service) life assurance has made since the war. Records were established last year in new sums assured, total premium income and aggregate funds. In one respect only is ground being lost; the number of new policies being issued and the total

number of policies in force is falling each year. These are the salient figures:

INDUSTRIAL ASSURANCE RECORDS
(£ million)

	1952	1954
New sums assured	278.8	287.1
Premium income	143.0	148.4
Total funds	969.1	1,034.3
Number of new policies issued ('000)	6,016	5,885
Policies in force ('000)	121,200	121,500
Average expense ratio (companies)	30.5	29.9
Average expense ratio (societies)	35.3	35.0
Average lapse ratio (companies)	18.3	17.8
Average lapse ratio (societies)	22.1	20.8

Industrial life assurance has survived more than its fair share of criticism through its century of existence. To-day it still stands as an important contributor to personal savings in the strict sense of regular collection, weekly or monthly, from the homes of policyholders. The £62.5 million of net addition to funds last year, though much smaller than the increase of £202 million in ordinary life and annuity funds, still represents a significant proportion of personal savings as a whole.

Fourteen companies and 107 collecting friendly societies do industrial life assurance, but the companies and 12 of the societies accounted for 99.8 per cent of the business last year. The expense and lapse ratios—the main targets of the critics—continued to move in the right direction. The lowest ratio of all expenses, including superannuation and bonuses, was as usual that of the Co-operative, 27.4 per cent, followed closely by the Prudential with 27.7 per cent. The Pearl, with a lapse ratio of 12 per cent, and the Liverpool-Victoria, with one of 14.6 per cent, had the lowest lapse record again amongst the companies and the big societies.

SHORTER NOTES

Shell Chemical Company and Fisons are embarking on a joint project for fertiliser production. Shell will spend £6.5 million on plant to convert refinery gases into ammonia and nitric acid; Fisons will in turn build a £4.5 million plant to convert a proportion of this ammonia into fertiliser.

★

The last two of the six references to the Monopolies Commission that were announced by the President of the Board of Trade in June have now been formally placed before the Commission. The first concerns the main classes of chemical fertilisers, and the Commission is directed to report whether conditions of monopoly as defined in the Act exist and how these effect the public interest. The second is a general inquiry into agreements and arrangements among suppliers for common prices and collusive tendering.

★

British Petroleum is to build a £6.5 million plant for aviation spirit at the Kent Oil Refinery, the estimated capacity being 130,000 tons a year and the installation should be in operation by 1958. The expansion in air

transport has led to a substantial increase in the demand for high octane aviation spirit in spite of the fact that almost all military aircraft now operate on a mixture of kerosine and low-octane petrol; the new plant will supplement production from the re-opened alkylation units at Abadan.

By declaring an ordinary dividend of 16 per cent for the year to June 30th on a capital of £3,870,684, as increased by the 25 per cent free scrip issue, Crompton Parkinson has effectively paid the same dividend as in 1953-54. In the latest financial year both earnings before tax (up from £2,047,291 to £2,236,420) and profits after tax (up from £764,125 to £899,532) show a slight improvement.

Company Notes

BROOKE BOND is one of the largest, perhaps the largest, tea distributors in the world with a turnover in 1954-55 of £87 million. It produces profit figures for the year ended June 30th, the year of the greatest tea boom in memory, that at first glance seem miserable. Group profits after tax were down from £1,199,194 to £337,492. The parent company—the British tea distributing business—actually made a loss of £592,550. The market at first looked askance at the figures; the 5s. ordinary shares that had been 16s. 3d. dropped to around 15s. 9d. Then they quickly turned upwards and had reached 16s. 9d. before the full accounts came out. Those accounts tell another and more heartening story. The bad times are past.

Mr John Brooke—the Monopolies Commission should be greatly reassured—now discloses that the company last year subsidised its customers to the tune of £1,200,000 and that it was at one time losing a shilling on every pound of tea sold. He claims that those figures reflect a "deliberate and sustained effort to stave off increases in the price of tea to the British housewife." Evidently nothing except the company's plantation interests overseas has prevented it from showing a big actual loss in the year now ended. Those who knew the tea trade knew that though retail prices were rising distributors were selling their stock below replacement cost. But a year ago when Mr Brooke gave a warning that supply and demand were only marginally out of balance, cynics proclaimed that he had read the market wrong and wanted the price lower. He evidently did, and his speech temporarily brought the market down. But it is also now clear that he sold at a loss with his eyes open. He may indeed have misread the market too, but what is not so fully understood is that an organisation of the size of Brooke Bond can never do anything other than sell stock below replacement cost if markets are booming. It is physically impossible for them to vary prices and

relabel their packets quickly enough or to buy exceptional quantities without adding to the rise. The very fact that Brooke Bond has maintained its dividend at 12½ per cent shows that the bad phase is over, and now the board—not given to over-confidence—reports that earnings this year are excellent to date and the prospect is favourable. What the last year's trading has done is to leave the group short of working capital. Cash is down from £2,514,185 to £1,860,415. Bank overdrafts are up from £1,455,868 to £2,087,437, and creditors from £4,175,722 to £6,236,680. Therefore the company proposes to raise fresh capital.

DEBENHAMS. Not long ago the 10s. ordinary stock units of Debenhams were much in the eye of the take-over bidders, who fancied the large undisclosed property values of this, the biggest of the department store groups. They failed to gain control and the stock has settled down to a more sedate life. The stockholder should not forget those asset values but he should not expect much sparkle in the stock or in the dividends until a new bull market brings the asset values—and the bidders—out of hibernation. The reason for that is to be found not in the latest results (sound but unexciting) but in another aspect of the company's recent history. Last February the directors announced their intention of spending about £6 million on reconstruction within about three years. About £2 million was to come from retained profits and the other £4 million from a redeemable debenture (an obvious alternative to the release of hidden asset values by the sale of freeholds). But the loan was postponed owing to "uncertainty in the money market." Since then the new issue market has grown more difficult and the stock is still unissued. It may not be floated off for some time. Stockholders must therefore be prepared, unless the directors drop the reconstruction pro-

The new 63-day Treasury bill, the coming introduction of which was discussed in *The Economist* last week, made its debut at yesterday's tender. The offering then of a maximum of £260 million of bills to be taken up in the coming week included £60 million of the new maturity. The remainder comprised the usual 91-day bills.

The controlled prices of domestic coal in London will rise by 1s. 8d. a ton next week, as a result of increases in distributive costs. The Minister of Fuel and Power has conceded this increase to cover general increases in merchants' costs, and in particular newly increased wages for workers who deliver the coal.

gramme altogether (an unlikely decision), for conservative financing.

Against this background the decision to maintain the ordinary dividend for the year to July 31st at 27½ per cent makes sense. In other circumstances the advance in profits—the group's trading profit went up from £4,797,347 to £5,025,131 and the net profit from £1,609,970 to £1,892,128—could easily have justified an increase in dividend. But the directors put the extra earnings back into the business—and that seems likely to remain their policy for the time being. Hence in buying the 10s. stock units at the current price of 37s. 9d. on a yield of about 7.3 per cent the investor has to look a little further than just around the next corner. But if he does the stock pays for its keep and the asset values are still there.

TUBE INVESTMENTS. The preliminary statement issued by Tube Investments for the year to July 31st sets out in more detail the profit figures that the directors revealed when they announced the recent rights issue, of 7,247,431 ordinary shares at 22s. 6d. a share. Then they indicated that profits after depreciation would be of the order of £8,500,000 for the year to July 31st (compared with £5,741,000); the exact figure is £8,526,577 (compared with £5,741,824). Gross profits before depreciation rose a little more sharply—from £7,685,666 to £10,800,864. Although taxes are over £1 million higher at nearly £4,400,000, net earnings have risen from £2,701,036 to £4,442,730. As they promised at the time of the rights issue, the ordinary dividend on the original capital is to be 22½ per cent, taking only £937,636 from net profits. The rights issue was made on bonus terms and the directors then indicated that the 1955-56 dividend would be equivalent to about 14 per cent on the new capital.

FISONS. The latest results of Fisons—for the year to June 30th—are mildly disappointing. The disappointment is not so much with the ordinary dividend as

with the earnings. The final dividend has been left unchanged at 10 per cent, making 15 per cent for the year, on the capital increased by the rights issue to £5,804,863. That is as much as was expected. What came as a mild surprise was the fall in the consolidated trading profit, before all charges, from £3,817,154 to £3,683,949. A year ago the chairman reported that the rise in costs might reduce the margin of profit on fertilisers but he then hoped that an increase in sales would counterbalance the effect on total profits. Have sales failed to come up to expectations? Or have costs risen more sharply than he then anticipated?

Taxes, however, are also down (from £1,932,247 to £1,384,029) and on the most strict reckoning net earnings available for equity distribution have risen slightly—from £906,363 to £927,139. Allowing for the new rate of distributed profits tax that means that the dividend of 15 per cent is covered by earnings of about 25 per cent. The £1 ordinary stock units fell 9d. to 56s. 6d. on the preliminary results. They offer a yield of 5½ per cent.

JOHN I. THORNYCROFT. This group has an interest in several industrial fields, including heavy commercial vehicles, marine engineering, ship building and specialist ship repairing. Specialisation rather than long-run production is the keynote. One example of its versatility was the installation of the stabilisers on the *Queen Elizabeth*. For the fourth consecutive year earnings from these activities have expanded. The report for the year to July 31st shows that a gross profit of £1,061,304 was earned

from a turnover of about £11 million, compared with a profit of £826,853 in 1953-54. Profits were thus close to the 1950-51 record and the directors had no difficulty in maintaining the dividend rate of 15 per cent on the ordinary capital of £1,500,000, as increased by the 25 per cent free scrip issue a year ago. All the industrial divisions of the group have been active and though the total turnover of the commercial vehicle division was slightly lower the value of vehicle exports increased. The group still has a number of orders in hand for some of its specialised vehicles. But competition in export markets is growing and like other companies in the industry a shortage of labour is limiting output and forcing up costs.

	Years to July 31,	1954	1955
Consolidated earnings:—			
Trading profit		826,853	1,061,304
Exceptional credits		253,105	128,262
Depreciation		142,184	142,344
Taxation		474,314	522,617
Net profit		467,066	562,254
Ordinary dividends		99,000	129,375
Retained earnings		366,191	361,141
£1 ordinary share at 48s. yields 6 13s. per cent.			

The shortage of labour and a slower flow of materials into the factories put a brake on the capital development programme that the directors had planned. Hence the total of liquid assets rose from £1,506,445 to £1,646,911. Of the total more than £750,000 was put in Treasury bills and deposits by the end of July. The chairman, Sir John E. Thornycroft, emphasises that liquid assets have been accumulated in anticipation of further investment in fixed capital and he draws attention to the £233,000 of outstanding capital commitments.

LONDON STOCK EXCHANGE

Next Account begins: November 16th
Next Contango Day: November 16th
Next Settlement Day: November 8th

A SHARP recovery in gilt-edged securities followed the publication of the more encouraging gold and dollar reserve figures for October and the recovery in sterling. Earlier they had been drifting downwards in a fairly inactive market. On Wednesday British Transport 3 per cent 1978/88 gained ½ to 76½, but the rally was not fully held on Thursday. The new Mauritius 4½ per cent 1972/77 stock opened at ½ premium on Monday and improved to 1 premium.

At the close of the old account industrial equities had come down slightly from the levels reached immediately after the Budget. The new account opened on a hesitant note but some bear covering in a market still short of stock produced a slight improvement in prices. Building shares hardened and stores improved; Marks and Spencer "A" touching 67s. 3d. and Woolworth 61s. Harrods new shares were quoted at 1s. 7½d. premium, but William Whiteley lost 1s. 6d. following the chairman's statement. The possibility of higher prices for newsprint revived interest in Bowater Paper and A. E. Reed, which both improved 2s. 6d. on Wednesday. Argentine issues were helped by the new economic measures. International Nickel attracted American support in front of the interim dividend and were ½ higher on the week at \$138 though at one time they had slipped back to \$132½. Steels were active on reports of expansion in the industry; Hadfield's offer sent the Millspaugh shares up 6d. to 8s.

Trinidad Leaseholds gained 3s. 9d. to 41s. 6d. in anticipation of the results in a market that was for oil shares until Thursday. The strength of sterling was one factor contributing to the weakness of Kaffirs and although Brakpan and Springs were helped by favourable monthly returns other shares fell to their lowest points for the year. Free State Geduld were extremely weak, dropping to 72s. 6d. The peak price for spot tin stimulated demand for tin shares, Beralit rising to 35s. 6d. and Amalgamated Tin to 12s. 3d.

EXCHEQUER RETURNS

For the week ended October 29th there was an "above-line" surplus (after allowing for Sinking Funds) of £18,124,000 compared with a deficit of £11,024,000 in the previous week and a surplus of £14,719,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £11,763,000, bringing the total cumulative deficit to £615,927,000 (£449,138,000 in 1954-55).

THE MONEY MARKET

Stringency has returned in Lombard Street. The Bank return shows an increase in discounts and advances of £15 million, to £35.3 million, in the week to Wednesday last. In the first three days of this week market supplies of credit have been adequate for demands, though on Tuesday and Wednesday some houses only just avoided recourse to penal loans. Overnight money from outside banks was taken at rates up to 4 per cent. No relief through special purchases of bills has been given by the Bank during the week.

At the Treasury bill tender on Friday last the offer of £250 million was still wholly in 91-day bills; at yesterday's tender the offer consisted of £60 million of the new 63-day bills and £200 million of three months' bills. The market maintained its tender rate at 498 1/8d. per cent last Friday; total applications rose by £9 million to £381.7 million, that is by fractionally less than the allotment, so that the proportion of the market's bid to be allotted rose slightly from 51 to 52 per cent.

The price of gold has fallen in sympathy, from 250s. 3 1/2d. an ounce on Thursday last to 248s. 8 1/2d. at the fixing this Thursday. The price of silver fell slightly again at the end of last week, to 79 1/2d. an ounce spot.

The outflow of notes in the week to Wednesday reached £4.8 million, compared with an outflow of £7.7 million in the corresponding week last year.

"The Legal & General actually saved my business"

"Did they, indeed — how?"

"Well, it's just a year now since the factory was burnt out and it'll be another three months before we're straight."

"I suppose it will be — but where do the Legal & General come in?"

"At the start, my dear fellow, right at the start! You see, I was fully insured with them against loss of profits and increased cost of working following a fire."

"And they've really seen you through?"

"Indeed they have, including help in fixing up temporary premises. You can rely on them. They have *all* my insurances — personal as well as business. In fact, we've had a 'family' association for very many years now."

Buying a Cracking Plant

Here is one way of spending money that is *not* to be discouraged in the interests of the national economy! Instead of buying *things*, this couple decided to buy security for themselves and their family through Life Assurance—thereby investing in the country's prosperity, too. Their premiums are helping to provide the capital needed to equip British industry with the means to meet growing competition from abroad.

A good thing, Life Assurance. But how, you might ask, can it compete with the lure of consumer goods! Only one way: by meeting the real needs of the policyholders. Proof of its success lies in the fact that the people of this country save more money regularly through Life Assurance than in any other way.

LIFE ASSURANCE

INCREASED TURNOVER IN ALL SECTIONS

35 PER CENT OF EXPORT SALES TO DOLLAR COUNTRIES

SIR GREVILLE MAGINNESS ON TASK OF HALTING INFLATION

The forty-eighth annual general meeting of Roneo Limited was held on November 1st at the Connaught Rooms, Great Queen Street, London, W.C., Sir Greville S. Maginness, KBE (chairman of the company), presiding.

The secretary (Mr A. C. Hall) read the notice convening the meeting, and the representative of the auditors, Messrs Barton, Mayhew & Co., read the report of his firm.

The chairman said: Ladies and gentlemen, the Directors' Report and Accounts for the year ended June 30, 1955, have been in your hands for the requisite period and I assume that you agree to take them as read. (Agreed.)

TRADING

During the year under review all sections of your business, both at home and abroad, showed satisfactory increases in turnover compared with last year and to this can be attributed the main cause for the satisfactory results now placed before you. When I last addressed you I informed you that the demand for our various products was increasing and that your Board had decided to spend the sum of £400,000 to increase our productive capacity. I went on to say that we should derive some advantage from this expansion programme during the year under review, but that we should not obtain the full benefit until the current year. Owing to delays entirely outside our control, we have not been able to adhere to the time-table then fixed, and the position now is that we shall reap some gain from these additional facilities during the current year, but the benefits of the entire capital outlay will not be reflected until the subsequent year. In the meantime I am happy to be able to report that the demand for our products generally still remains at a high level. Whilst this position is a cause for satisfaction we are—in common with other Companies engaged in manufacturing and retailing businesses—constantly faced with increasing costs. In this connection it cannot be too often emphasised that the standards of living of the people of this country depend upon our exports, and these continuous rises in costs constitute a serious threat to our ability to maintain—let alone expand—our export trade in face of keener foreign competition.

Having given you a general outline of the state of the Company's affairs from a trading point of view, I now propose to deal with the Accounts and the activities of the various sections of your business.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The profit on Trading before providing the sum of £59,916 written off the cost of shares in a Subsidiary Company—to which I shall refer later—is £743,470, as compared with £619,862 for the previous year, representing an increase of nearly 20 per cent. As you will see from the Accounts, we have brought back £75,000 representing Taxation Reserve no longer required, and, after pro-

viding for taxation, depreciation, and amounts written off, the net profit for the year is £256,603, against £205,143 for 1954. The profit brought forward was £292,678, to which has to be added £256,603 for this year, making a total of £549,281. Your Board proposes to appropriate the sum of £181,028 to General Reserve and to transfer £20,000 from Investment Reserve, bringing the General Reserve to £540,000. You will note that the Investment Reserve now stands at £10,000, against the cost of investments of £25,122.

The Preference dividends on the 6 per cent and 10 per cent Stocks have already been paid, together with an Interim of 5 per cent, less tax, on the Ordinary Stock and it is now proposed to pay a Final of 10 per cent, less tax, on the latter, thus making a total of 15 per cent, less tax, for the year. After payment of the foregoing Dividends the balance to be carried forward to next year will be £285,302.

DUPLICATING MACHINES AND SUPPLIES

This section of the business continues to make satisfactory progress and sales once more showed a substantial increase compared with the previous year, reaching a new record in the history of the Company. I am gratified to be able to report that our Electronic Stencil is becoming ever-increasingly popular with users of Roneo "500" Duplicators, thus enabling the scope of possible work on a Stencil Duplicator to be considerably widened. During the past year we have extended the installation of Electronic Stencil Cutting Machines to all our Branches in order to provide prompt service to our many customers throughout the country who are interested in this unique feature.

FILING SYSTEMS

Roneo Lateral Filing has fully justified the confidence which I expressed last year when this new System of Filing was put on the market, and the demand is such that we have had to take special measures to increase production to meet the requirements of our customers. Furthermore, interest in our Visible "30" System continues to grow and sales both at home and abroad have attained a high level.

VISIBLE RECORDING EQUIPMENT

Here again our facilities are sorely taxed to meet the ever-growing demand for our many lines of Recording Systems, the principal of which are the well-known Roneodex Visible Recording System, Stripdex Reference Equipment, Production Charting, Mechanical Posting Equipment, and Card Indexing Systems. The uses of these various Recording Systems are many and of general application to any business, large or small. The Company is at all times only too pleased to discuss with those interested their particular problems and to advise on the best

Visible Recording Equipment to meet their needs.

EXPORTS

For many years past it has been my pleasure to report a steady increase in our Export trade. Notwithstanding the increased costs to which I have already referred, we reached last year another record in the sale of all our lines, both in volume and value. This has only been made possible by the pursuance of an aggressive sales policy and our representatives have covered an ever-increasing field in pursuit of business. These efforts have enabled us to establish ourselves in many markets as Consultants to Foreign Architects, Government Departments and Banks in the matter of Office Equipment, Records and Systems.

Our total sales abroad last year were over 40 per cent greater in value than they were during the previous year and this is an achievement which I feel not only calls for special comment, but reflects great credit upon all those who have contributed to this gratifying result, which is all the more noteworthy because of the continued high tariffs, import and currency restrictions which hamper freedom of trade with many markets.

Our sales to dollar countries represented no less than 35 per cent of our total Exports—a figure which is much in excess of anything which we have hitherto accomplished.

In order to still further strengthen our business in dollar markets we have acquired during the past year the whole of the shareholding of a Company in Canada. It will take a little time to organise the business on a satisfactory basis but we are satisfied that from the long-term point of view it will prove to be a sound investment. This is the Subsidiary Company to which I referred when dealing with the Consolidated Profit and Loss Account.

NATIONAL SITUATION

At our Annual Meeting last year, in giving you my assessment of the industrial position and prospects of this country, I felt able to strike a fairly optimistic note. My optimism was, however, qualified by some concern as to whether we should be able as a nation to maintain exports at a sufficiently high level. In this connection I referred to the increases in our internal costs which have handicapped us in competition with manufacturers from other countries and particularly from Western Germany.

In the past year weekly wage rates, as measured by the Ministry of Labour's Index, have increased by over 6 per cent and the indications are that average weekly earnings have increased even more. The result has been that prices have inevitably risen too, so that the final outcome of the whole process is that a further twist has been given to the inflationary spiral and the task of many exporting industries in the face of keen foreign competition has been made more difficult. In dollar markets and some others we still secure some benefit from the devaluation

of 1949, the full effects of which are probably not yet spent.

To my mind the most important immediate problem we have to solve in this country is that of stopping inflation in conditions when our resources are fully employed. Mr Gaitskill recently coined the graphic phrase "brimful employment" to describe our present position. Although the Ministry of Labour's figures indicate that there are more than twice as many unfilled vacancies notified to the labour exchanges as there are persons unemployed registered at those exchanges, the Ministry itself believes that these figures understate the extent by which the demand for labour outruns the supply because many vacancies in present circumstances are not notified individually to the exchanges. The overall figures, moreover, do not paint the picture in sufficiently vivid colours because the unfilled vacancies naturally tend to occur in industries and trades in which there are virtually no people unemployed. The effect of these conditions is to distort our whole economy and to introduce into it a degree of rigidity which is quite out of keeping with our need at the present time to have the maximum flexibility in using our resources of manpower and materials where they can be most profitably employed from the standpoint of our long-term economic well-being. No one wishes to see large scale unemployment return to this country to cause the havoc and misery which was suffered 25 years ago but the continuance of the present position will itself increase the possibility of such an outcome.

NEED TO REDUCE GOVERNMENT SPENDING

The truth is that we are all trying to spend too much too quickly. This is especially true of the Government. There must be a big reduction in Government spending, not only in order to reduce the still heavy burden of taxation on industrial enterprise but also in order to relieve the constant inflationary pressure which is progressively diminishing the purchasing power of the pound sterling, raising costs of production, particularly those of our exporting industries, and causing hardship to those members of the community who have to live on fixed incomes.

The measures announced by the Chancellor last Wednesday will give some relief to our economy by reducing the strain on it made by the demands of local government capital expenditure. The Chancellor, however, appeared too readily satisfied with the slight reduction in the burden of central Government expenditure which has taken place over the past four years by which the proportion of the national income spent by the central Government has been reduced from 29 per cent to 26 per cent. It is difficult at this stage to see how the fiscal measures announced by him at that time will have any serious effect on relieving the current inflationary pressure. His estimates recognise that the increase in the distributed profits tax will have a negligible effect in the current financial year. Increases in purchase tax, too, are unlikely to reduce demand and may merely help to push up costs and prices all round.

By putting the responsibility on the shoulders of the Government in this way, I am not suggesting that Government action alone can solve this problem. The Government's attempts can very well be frustrated if trade unions continue to press for wage increases which can only have the effect of pushing up prices and thus increasing the cost of living at home and the difficulties of our exporters abroad. Moreover, employers themselves often adopt a short-sighted policy in endeavouring to recruit and retain labour in conditions of over-employment by offer-

ing wages and conditions of employment considerably in excess of those negotiated on their behalf between their organisations and the trade unions concerned. This practice can only lead to an unnecessarily high rate of labour turnover and also to discontent among the employees of companies which seek loyally to abide by the agreements to which their organisations are parties.

IMPORTANCE OF OVERSEAS TRADE

While I believe that the halting of inflation presents us with the most pressing of our immediate domestic problems, events have confirmed the view which I have so often expressed in the past that the perennial problem of this country is the maintenance of its overseas trade. Although this year's trade figures have been seriously distorted by the effects of the dock strike, the picture they present is a disquieting one. It is most doubtful whether the measures now taken by

THE CALICO PRINTERS' ASSOCIATION LIMITED

A DISAPPOINTING YEAR

The fifty-sixth annual general meeting of The Calico Printers' Association, Limited, was held on November 2nd, at St. James's Buildings, Oxford Street, Manchester.

Mr R. M. Lee, the Chairman, in the course of his speech, said: The Association's profit on trading, before provision is made for repairs and renewals, and before taxation, is shown in the Profit and Loss account to have declined by £198,000 to £1,968,000. The Group's profit on trading, as shown in the Consolidated Profit and Loss Account, declined by £269,000 to £2,041,000. These are the two points most relevant to a consideration of the current progress of the Association that emerge from accounts which have been unavoidably complicated by a number of adjustments relating to earlier years.

Last year the accounts recorded the reimbursement of losses sustained by subsidiary companies in the United Kingdom for the year to June 30, 1952, by means of subvention payments enabling the Association to set the subsidiaries' losses against its own profits for tax purposes. This has now been done for the three years to June 30th last and in future each year will bear its own charge in this respect, thus obviating adjustments from earlier years.

Other adjustments of previous years' taxation have been made in consequence of the change in the standard rate of income tax and the progress of negotiations on computations left open while the Association's Excess Profits Tax position was undetermined. Settlement has now been reached for the nine years to June, 1948, and it is hoped that outstanding matters will be cleared in the course of the current year but the next Accounts are not expected to show any substantial credit from taxation provisions.

One further item on the Profit and Loss account calls for comment. For the year to June, 1954, income from Investments in Subsidiary and Associated Companies included £204,000 paid to the Association as dividends by Subsidiary Companies from their provisions for Excess Profits Tax no longer required. On a true comparison with the previous year, the reduction in the Association's income from this source is £26,000, instead of the apparent decline of £230,000.

the Government will prevent a serious shortfall in our balance of payments on the entire year. Thus, the most strenuous efforts will be called for from all industries for whose products there are overseas markets. In these efforts they will need the maximum support which industries catering for the home market can give them by way of efficient service at minimum cost.

In conclusion, I would like to express on behalf of the Board sincere thanks to all those in the service of the Company, both at home and abroad, who by their efforts have enabled us to report a year of further progress, and I am sure that Stockholders will desire to associate themselves with these sentiments.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mr P. G. Carew, was re-elected and the proceedings terminated with a vote of thanks to the chairman.

REVALUATION OF FIXED ASSETS

In the Association's balance-sheet, the main feature calling for comment is the revaluation of the Fixed Assets. The last revaluation was in 1928 and on account of the inflation of values since 1939 a further revaluation became necessary, not only for balance-sheet purposes, but also to confirm that the annual upkeep provision was adequate. The valuation has been made on a going concern basis by independent professional valuers and shows a surplus over previous book-values of £5,365,000 which has been transferred to Capital Reserve. The Upkeep charge for the year to June 30th last was £1,059,000 and the revaluation has confirmed that the increases made in the annual charges since the war have kept pace with the inflation of costs.

The total volume of commission printing offered to us in 1955 was practically the same as that in 1954. The forward position, however, is less satisfactory. In my remarks last year I referred to the probable adverse effects of the conclusion of the Sterling Area Payments Agreement with Japan. Sufficient time has now elapsed for us to assess the results, and we find our worst fears confirmed. Just to touch on the effects in one of our traditional print markets, we find that in Nigeria imports of cotton prints from Japan have risen from less than 1 per cent a year ago to 50 per cent of the total cotton print imports during the first quarter of 1955, while those from the United Kingdom have declined from 72 per cent to 35 per cent.

Our Merchandising Departments have had a disappointing year. In common with the industry as a whole they have suffered major losses of turnover in several overseas markets, and despite an increase in the Home Trade, total sales are down on last year, although they have substantially exceeded any other postwar year.

TERYLENE

Royalties from sales of Terylene show a satisfactory increase during the last twelve months, but this was offset by a decline in income from other patents, some of which are nearing the end of their effective life. However, I can tell you there has been a substantial increase in the production of Terylene polyester fibre in the United Kingdom during the year, the first large plant of Imperial Chemical Industries Limited having been brought into operation at the end of 1954. We understand the building of the second Wilton plant is proceeding up to schedule and that it will be ready for operation in early 1956.

The report was adopted.

BERALT TIN AND WOLFRAM

MR F. GATES'S SPEECH

The twenty-seventh annual general meeting of Beralat Tin and Wolfram Limited, was held on October 28th at Winchester House, London, E.C.

Mr F. Gates, chairman of the Company, in the course of his speech, said: It is a pleasure to be able to report another year of satisfactory trading which is reflected in the Board's recommendation of a final dividend of 80 per cent, bringing the total dividend for the year ended March 31, 1955, to 130 per cent.

FINANCIAL RESOURCES

The Company's position, as plainly set out in the Balance Sheet, displays a financial strength that provides a strong shield against adverse conditions.

We are working in a foreign country in a district which depends largely on our mining operations for employment of its people; and, even if we were permitted to do so, we should not consider it right, or in the Company's long-term interests, to discharge large numbers of our employees out of hand, should the price of wolfram fall to an uneconomic level.

It is not, therefore, difficult to visualise a situation in which very heavy drafts might, for one reason or another, be made on the Company's cash resources before normal working conditions were restored.

I well remember when the Company had very little cash and the difficulties which resulted therefrom.

We have now progressively built up a really strong financial position; and I consider it of great importance that the Company should at all times retain substantial resources in readily available form.

ORE RESERVES

I remember that some 35 years ago I assured members of The Wolfram Mining and Smelting Company, the forerunner of this Company, that they need have no worry about our ore reserves. I am glad to say that I can give the same assurance today with even greater emphasis. The Panasqueira mine is no small one.

WOLFRAM SALES

You will have noticed a reference in the Directors' Report to favourable long-term contracts for the sale of wolfram concentrates negotiated in earlier years.

At the beginning of the year under review, namely at April 1, 1954, two of those contracts were still running, the first for 100 long tons per month with the Ministry of Materials at the market price current from time to time, but subject to a fixed minimum price, and the second for 40 long tons per month with the US Government at a considerably higher fixed price.

The Ministry exercised their right to cancel the former contract as from September 30, 1954, but up to that date this contract was of great value in a period when the wolfram price was unduly depressed. The American contract remains in force until end September, 1957, and is our only present contract at a fixed or minimum price.

The remainder of our production is covered for the most part by running contracts under which each month's deliveries are paid for at the average market price for the month

plus a premium in recognition of the quality of the concentrates.

Operations for the current financial year are so far showing a satisfactory margin of profit and, although I am never likely, after my long experience of the wolfram market, to forget its mercurial possibilities, I feel justified in describing the Company's immediate outlook as bright.

PUNITIVE TAXATION

Unhappily, it seems that this year's profit, like profits earned in recent years, will still be subject to punitive taxation.

Over the last four financial years approximately 80 per cent of the Company's net earnings has been absorbed by tax demands in Portugal and England. We would not seek to contest the right of our Portuguese friends to levy tax on our operations at a rate commensurate with rates of taxation in other parts of the world, nor can we complain if they choose to levy such taxation mainly in the form of an export tax instead of as a tax on income.

We do, however, feel that we are the victims of a flagrant injustice by reason of the fact that, merely because the Portuguese authorities have decided to collect their tax in that form, we are deprived by the inflexibility of the UK tax code of the benefits of double taxation relief which are enjoyed by mining concerns operating in other countries, where taxation is levied in a form more comparable with UK income tax.

The Company's loss arising out of this obvious inequity is no small one. If the Portuguese tax had been admitted for purposes of double taxation relief, the total amount available for distribution over the last four years would have been greater by well over one and a half million pounds.

We had hopes that the representations made to the Royal Commission on Taxation of Profits and Income on this matter in general by the British Overseas Mining Association, and by the Company on its own individual case, might have led the Commission to recommend the removal of the restrictions on double taxation relief under which we and some other mining companies suffer, but although the Commission recognised the problem in paragraph 700 of their Report, they made no proposal for its solution.

STRATFORD-ON-AVON PRODUCE CANNERS, LIMITED

INCREASED PRODUCTION

The twenty-third ordinary general meeting of Stratford-on-Avon Produce Canners, Limited, was held on October 31st at Stratford-on-Avon, Colonel N. C. Joseph, the chairman, presiding.

The secretary (Mr G. E. Smith) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Directors, circulated with the accounts for the year ended May 31, 1955:

Your Directors have to report the Trading Profit for the year amounts to £60,285, compared with £68,787 last year. The Profit and Loss Account shows the Net Profits amount to £25,908, compared with £30,003 for the previous year, and the Directors recommend that this shall be dealt with as set out in the Company's Appropriation Account. You will observe that after provision for Dividends, the balance to be carried forward

HOVIS LIMITED

ANOTHER YEAR OF STEADY PROGRESS

The fifty-seventh annual general meeting of Hovis Limited was held on October 28th in London, Mr J. F. Morton (the Chairman) presiding. The following is an extract from his circulated statement: The accounts, which are the subject of detailed comment in the Directors' Report, reveal the satisfactory result of another year of steady and purposeful progress.

Despite the diminution which occurred for a time in the consumption of home-milled flour our trade in Hovis and other flours produced was not only maintained but showed an increase and I am glad to report that this satisfactory trend continues.

Your Company has continued its policy of extensive advertising and very many appreciative expressions have been received from shareholders and the public in general. At the same time every endeavour is made to assist the baker to produce a loaf of the highest quality by the technical and practical assistance given by our demonstrators, by exhibitions, competitions and by many other means.

The present International Wheat Agreement is due to expire next year and I understand that the question of its renewal is to be discussed within the next few months. No doubt this country, as the world's biggest importer of wheat, will be pressed to rejoin, but it would be against the interests, not only of bread consumers but of this country as a whole, to resume membership.

The businesses conducted by our subsidiary companies continue to give us cause for satisfaction and, in particular, that of Locomotors Limited has made most promising progress. As regards our interests overseas it is hoped that negotiations now proceeding will, in time to come, result in satisfactory dollar earnings.

In expressing appreciation of the work of employees I wish to add how proud we are of our record of excellent relations between employers and employees, which we have done our best to foster, and to which our employees, by their unfailing loyalty and zeal, have contributed in considerable measure. The report was adopted.

TURNOVER MAINTAINED

Increased production in a market of falling values has maintained our turnover. The small decrease in Trading Profit is due to unstable prices of imported materials and unsatisfactory crops of home grown vegetables and an increase in selling costs due to an extension of our activities. Your Directors have every confidence in the maintenance of and a steady increase in production and turnover.

In accordance with the Articles of Association, Mr G. E. Smith and Mrs D. Edkins retire from the Board and, being eligible, offer themselves for re-election. We take this opportunity of thanking our employees for their continued loyal services during the year. The Auditors, Messrs James, Stanley & Company, have intimated their willingness to continue in office.

The report and accounts were adopted; the proposed final dividend of 19 per cent on the Ordinary shares, making, with the interim dividend already paid, 25 per cent for the year, was approved and the retiring directors, Mr G. E. Smith and Mrs D. Edkins, were re-elected.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 RYDER STREET, St. James's, London, S.W.1. Postage on this issue: Inland 2d.; Overseas 2½d.—Saturday, November 5, 1955.

The Avonmouth Zinc Works is one of the largest and most modern in the world. It has been modernized with the latest equipment. Extensive

works of Imperial Smelting cover approximately 100 acres and in addition to the aerial ropeway and sidings within the area. Here for many years Consolidated Zinc have been enlarging and improving their processing methods to keep pace with the demand for zinc and its by-products. The new plant on the most modern lines has resulted

in higher efficiency and increased production. Although the primary production at Avonmouth centres on that of zinc, many other activities concerned with its by-products occupy a large part of this busy community. Here at one of Europe's largest smelters is the vital link between the many centres of production controlled by Consolidated Zinc in the United Kingdom.

*You're wasting
600 tons of Fuel you know!*

Yes, 600 tons a year and you'll agree, Sir, that's a heavy burden for your overheads to carry. I do agree; but I question your estimate of 600 tons. We all know that an uninsulated structure radiates heat to the surrounding atmosphere, but how do you arrive at those figures? In that case Sir, I refer you to a bulletin issued by the Fuel Efficiency Committee. The figures they supply are based on a roof structure similar to this one. To quote them, 7.8 tons of fuel are burned annually to replace the heat losses through 1,000 sq. ft. of structure.

Quite! Now this is where you can save fuel. After erecting a suspended ceiling of Insulating Gypsum Plaster Board it was found that only 1.8 tons of fuel were required, a saving of 6 tons—in your case it would be 600 tons.

Right! Get your people to prepare an estimate for me. I want to get this work in hand well before the winter.

'Paramount' Insulating Gypsum Plasterboard provides the highest degree of thermal insulation at competitive cost and you get maximum fire protection as a welcome bonus. Have you considered thermal insulation? Send for our brochure on this subject, or consult our Technical Staff right away.

All of our building materials are clearly identified by the Blue Hawk symbol of quality and service.

They pack them tighter in America—

or do they?

Circulations are impressive things. But they become even more interesting if you look beyond them to a revealing little figure called "circulation-density." The results can be very surprising.

For example, many British advertisers regard the U.S.A. as the home of mammoth-circulation magazines. There, "Life" magazine has the biggest national weekly circulation of all—5,600,000. Measured against the total population of the United States, it is bought by 34 Americans out of every thousand. Now take our own Radio Times; not only is the circulation greater—8,832,579* . . . but on the same basis it is bought by no fewer than 174 people in every thousand.

This means that the circulation-density of the Radio Times is more than five times as great as that of the most-bought weekly magazine in the U.S.A.

A British businessman advertising his goods or services in the Radio Times is getting his advertisement

seen by a higher proportion of his potential market than anyone else advertising in any other magazine in the world. But the story does not end here. Each year independent readership surveys continue to show that the Radio Times has not only the highest number of readers of any British publication but also a greater proportion of readers in the higher income groups. It goes into nearly four out of every seven homes and is read by every other man and woman in the country—not once, but several times a day for at least nine days.

When you consider, too, that the Radio Times carries with it much of the authority of its parent the BBC, it is not surprising that it is the most sought-after advertising medium in Great Britain. Unfortunately, space in the Radio Times is still limited. But the time will come when this unique publication can be the backbone of every national campaign.

THE UPWARD TREND OF COMMERCIAL TELEVISION (1)

Bigger and bigger grows the audience

How is the audience for commercial television increasing? That is the question we have been constantly asked in the last few weeks. What is the answer?

We gathered all the available figures from the leading independent research firms. We collated them, and took the mean average. The results you see on the graph. These figures show the terrific rate of growth in the numbers of sets capable of receiving com-

mercial TV programmes.

They are remarkable figures. They are figures that are far larger than anything we could have hoped for. And they are figures that are rising by leaps and bounds, week by week. Commercial television, in fact, has already succeeded beyond all expectations; and nothing succeeds like success, that's why wise advertisers are making sure of their TV time by booking now.

'NO-CARBON' PAPER

Paper which, of itself, produces multiple 'carbon copies' without the use of carbon paper, or any visible backing substance.

JUST LIKE MAGIC

There is no visible reason for the appearance of the multiple copies. It has to be seen to be believed.

FIRST IN THIS COUNTRY

Leading the field, we can now supply 'No-Carbon' Continuous Forms printed up to our usual very high standard. Write for full details to:—

ALACRA LTD.

WESTERN AVENUE, LONDON, W.3.

A Subsidiary of W. H. Smith & Son Ltd.

This revolutionary new product is based on a chemical system developed and patented by the National Cash Register Company.

This paper has been used in America for over 18 months and we have been fortunate in having at our disposal the experience of one of the leading manufacturers of Continuous Stationery in that country.

Our own tests have been completed and we can now supply Alacra Continuous Forms in this medium.

If you're giving cigars
this Christmas—

Play safe when you're buying cigars for somebody else! Choose from the fine imported Jamaicas—for most men prefer a mild cigar and most fine Jamaica cigars are mild. Choose La Tropical—a cigar that is notably mild without loss of character. For the gift that runs to 25 cigars, choose the exclusive Pan-Climatic jar—and know each cigar will be smoked at the peak of perfect condition!

PAN-CLIMATIC JARS of 25

DIPLOMATS 4½ INCHES • PETIT CORONAS 5 INCHES • CORONAS 5½ INCHES

From 72/9d. the jar.

A dream come true...

A more efficient way to lower accounting costs

BUSINESS has rarely had the opportunity to make such savings in accounting costs as Burroughs Sensimatic Accounting Machines provide. The Sensimatic is so automatic, so simple to operate, that even beginners quickly become experts. And, by a turn of the knob, the Sensimatic can switch in a moment from one job to another—doing the work of several machines. It has thus created a new concept of speed and economy in the handling of accounting work. Five series of Sensimatics make it possible for you to select the machine exactly suited to your particular needs. See them today at your nearest Burroughs office. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

Who has the say about cereals?

MOTHER buys them, of course. And if she had her way it would always be the extra crackly, extra crunchy ones. But she doesn't always have her way. There's Bob, who doesn't mind which he eats so long as the packet shows *Great Liners of the World*; there's Barbara, who prefers the sugary kind; and there's Father, who says every other week 'I should like those long, malty things for a change—you know, they were advertised in PICTURE POST.' The cereal story is a family one.

And to make it more likely that it's *your* brand

they choose, your best and cheapest way is to advertise in a magazine that goes right round the family and stays around the whole week—often more. Your best family magazine is PICTURE POST. It goes into over 1½ million households. It is read by five million people every week. It clinches innumerable family purchases.

Who chooses the family car, television set, soft drinks, confectionery, soap and toothpaste? They're all very much family purchases. They can all be sold through PICTURE POST.

G.E.C. AND THE CHANGING WORLD 3

ELECTRIC POWER GENERATION

The world was startled some 200 years ago when Benjamin Franklin succeeded in drawing electricity from a thunder cloud with the aid of a kite. Today, electricity is an accepted necessity of everyday life. And still the demand for electric power grows.

Every new industrial, commercial and domestic development requires an immediate supply of electric power. Electricity is bringing modernisation to traditional industries, too—and this means increased productivity.

To meet the world demand the G.E.C., which has over half a century's experience in designing, building and installing electrical generators, plans to produce giant machines some two or three times larger than the largest yet installed in existing power stations. These giants, operating at higher steam pressures and temperatures, will give correspondingly higher efficiencies.

Built and tested in two vast new works, they are destined not only for installation in the conventional power stations of the future but also

in the new atomic power stations which the G.E.C. is now ready to build.

A turbo-alternator of 120 MW capacity is being manufactured by the G.E.C. now. It will look very much like that in the illustration. Another development—a more efficient method of cooling alternators—makes it possible for the Company to build even larger units up to 400 MW capacity.

Whatever demands the future makes in the field of power generation the G.E.C. with its unrivalled staff and unique research facilities will be ready and able to supply the need.

A towel fit for the chairman

Looks a tall order, that; yet the answer's simple—the Towelmaster. Gone are the days of unspeakable roller towels, of paper-strewn floors like Hampstead Heath. At a pull, the Towelmaster presents a length of soft, dry, laundry-fresh towel. It gives as satisfactory and as pleasant a dry as a towel in one's own house. The same pull automatically winds up a used portion into a separate compartment of the gleaming white Towelmaster cabinet.

Yet it's far from being the case that the Towelmaster is for board-room level only. It's inexpensive enough for installation everywhere. Look at the figures. Each roll of towelling—all you have to pay for—costs a mere 5/-. Minimum usage is only one roll per cabinet per week for a minimum of two Towelmasters. All else is free—fitting, maintenance, replacement... no other charges whatsoever.

Each roll gives an honest-to-goodness dry to 180 pairs of hands. If that wasn't enough for 5/-, think of the goodwill gained from staff and visitors, of the added prestige conferred by these sparkling Towelmaster cabinets. And consider, above all else, this bargain price for a clean bill of health.

We welcome your enquiries.

On taking din with your dinner

MANY PEOPLE will admit to a preference for the soft lights/sweet music type of atmosphere for their own meals. But consider what goes on in the works canteen. There, the scrape of the chairs, the clatter of cutlery, the tintinnabulation of trays make their own noisy contribution to the lunch-time chatter. A lot of factory canteens are—let's face it—just a bit makeshift, so far as construction goes. A partition here, a little hardboard there and a corner is labelled "Works Canteen". Well, space is limited and such things must be, but the noise takes its toll in tempers and digestion, and edgy nerves affect productive efficiency. Ask the Works Doctor. There are, however, answers, and simple ones at that. It's fairly easy to absorb much of the surplus noise by the application of

acoustic insulating materials to walls and ceilings, thereby preventing the reflection of unwanted sound. Newalls (Reg'd Brand) Paxtiles for instance, are one of the most widely used acoustic tiles available for this purpose and, what's more, they are decorative and easily fixed—normally without any interruption of the daily use of the area concerned. For irregular surfaces Newalls Sprayed 'Limpet' (Reg'd) Asbestos, which is applied by spray gun, adheres on impact and is, therefore, free to follow the shape of any surface to be treated. Listen to the din in your canteen today and get in touch with us about making your works a less noisy place. You can expect economy-conscious suggestions to put matters right. Consultation is gladly offered and will cost you nothing.

"We've chosen Ford"

Shrewd car buyers demand a high standard of looks, comfort and performance. Such qualities have created the demand for Ford '5-Star' cars. And their prices are right. Skilful production economies and continuous quality inspection cut out waste. Ford policy is to look after pennies to save motorists pounds. But Ford provide shrewd motorists with much more than first-price value—"the best at

lowest cost." Ford Service—everywhere—keeps down running expenses and maintains the value of your car. Your local dealer has a complete stock of factory-reconditioned engines, special equipment and spares for every model. There is, therefore, always a greater demand for used Ford cars to assure you a good resale price. Motorists who buy Ford today drive safely and contentedly into the future.

Awaiting the Monopolies Bill

THE Monopolies Bill is likely to be published soon; and Mr Thorneycroft, in answer to a supplementary question in the House last week, confirmed that the action which he has promised "goes somewhat further than the majority report" of the Monopolies Commission. It is high time that industry realised this. Under the scheme announced by Mr Thorneycroft on July 13th last the Government will call up restrictive practices, one by one, for what is to be called "registration," but will in fact be a system of banning subject to appeals; and the onus of proving that any particular industry should be allowed to continue to operate a practice on the "registered list" will be placed fairly and squarely on the shoulders of the trade association concerned.

It is a complete misconception to say that, if any such measure becomes law, restrictive practices will still be on trial. They will not be on trial. They will have been condemned. The majority report of the Monopolies Commission, which Mr Thorneycroft has decided to exceed, made that quite clear. But, among the industrial organisations, the penny seems to have taken a long time to drop. For example (to quote only one case) the National Union of Manufacturers, in its recent memorandum to the Board of Trade, could still "recommend" that, when the new tribunal is set up to decide whether any isolated trade associations should be allowed to continue restrictive practices, no attempt should be made to define to that tribunal "what is and what is not contrary to public policy." And the director of the National Union, in a letter to *The Economist* last week, could still claim that any other sort of Bill would be based "on the Irishman's assumption that the accused would not be in the dock unless he were guilty." The false parallels drawn by industrial organisations would normally be their own affair; but it is now important to draw attention to them, in case they succeed in muddling Mr Thorneycroft as well.

If the analogy with a criminal trial is to be used, it is advisable to get the analogy straight. When a man is arraigned for killing his mother-in-law, he can plead justification in certain special and restricted circumstances: but he is not allowed to claim that the judge should not make any "Irishman's assumption" about whether the slaying of mothers-in-law, in general, "is or is not contrary to public policy." The accused can, of course, say that he has not killed his mother-in-law, but it will obviously not be open to any trade association appearing before the tribunal to say that it is not using the condemned practices; its only reason for appearing will be to plead that it should be allowed to continue them. In proceedings before this tribunal, as in all murder trials, therefore, the offence at issue will have been declared to be an offence before the accused ever enters the court room; as in some, but not all, murder trials the accused will already have pleaded guilty. In those circumstances the law of murder is that he should always be sentenced to hang—but that, if he can show extreme provocation or some other good excuse, he may ask for, and

get, an administrative decision to reprieve. It is with this appeal for reprieve in consequence of special mitigating circumstances, and not with general legal judgments, that the new tribunal should be concerned.

This has an important bearing on the questions about the procedure and make-up of the new tribunal which Mr Thorneycroft threw out for "discussion" in his speech in the House of Commons on July 13th. As he is undoubtedly getting a lot of advice about how to answer these questions from people who have a vested interest in this matter, it now seems essential to give him countervailing advice from those who have not.

One of Mr Thorneycroft's questions on July 13th was whether there should be room for appeals from the decisions of the tribunal to another court. The industrial organisations will certainly press for this, but a glance at the analogy with reprieves suggests that the Government would be very unwise to grant it. The most that should be agreed is that—after, say, three or four years—an industry should be allowed to come back to the tribunal for review of an unfavourable decision, if it can show that circumstances have changed; and the tribunal itself should be obliged to review any grants of exemption after a similar period.

Another question posed by Mr Thorneycroft was whether the tribunal should be a strictly judicial body, packed with lawyers—or whether it should be a less judicial body whose function should be to advise the Minister. There is a real dilemma here. Lawyers are not usually the right people to decide on questions of mitigating economic circumstance, as distinct from on points of law; but there would also be disadvantages in bringing each decision within the orbit of domestic politics. Perhaps the best compromise would be to make the tribunal an advisory body to the Minister, but to establish the precedent that it should be very rare for the Minister to act contrary to its advice. Such a tribunal might conveniently consist of three members. One of these might be a lawyer, skilled in the rules of evidence; the other two, ideally, might be found from among the non-lawyers who signed the recent majority report of the Monopolies Commission. It is, after all, an extended version of the majority report which the Government is supposed to be bringing into effect.

The analogy with a murderer's reprieve is also to the point in considering how swiftly the tribunal can operate. A condemned man obviously has to present his appeal for a reprieve by a given date; his lawyers' deliberations are concentrated wonderfully thereby. It seems clear that trade associations that are going to present appeals before this tribunal should be given notice of a similar "execution date," by which their case must be completed if they are to escape the big drop. The initial appeals might become *causes célèbres*, and require several days of pleading; but after that the proceedings should be quite curt, for those initial cases will already have shown what sorts of argument are irrelevant to the tribunal's judgments.

Another question raised by Mr Thorneycroft on July 13th concerned the grounds on which permission to continue a particular practice might be granted. The Monopolies Commission suggested some possible grounds for exemption in its majority report last summer, and the industrial organisations will certainly seek to persuade the Board of Trade to extend them. There is, however, a very good reason why the list of grounds, so far from being extended, should now be cut shorter. The commission had assumed that the law about individual resale price maintenance would remain unaltered; and some of the grounds which it suggested for exemptions from the ban on collective restrictions were based on the belief that this ban might occasionally make the enforcement of individual resale price maintenance impossible. Mr Thorneycroft intimated on July 13th, however, that the Government has decided to make contracts for individual resale price maintenance enforceable through the courts. This is a regrettable decision, but it is important to take advantage of the one benefit that may emerge from it. That benefit is that some of the grounds for occasionally excusing collective restrictive practices, as suggested by the Monopolies Commission, can now be swept away.

★

There are several other points that will need to be emphasised as the attack on restrictions gathers pace. It is quite crucial that the agreements to be "registered" should not merely be those that impose binding obligations on their signatories; they should include those which rely on "gentlemanly" recommendations that have the same effect. It is important that the existing operations of the Monopolies Commission should continue, even if this means that some industries will be caught in its particular claws before the more generalised claws of the new tribunal would fasten upon them. On these, and other, points Mr Thorneycroft may have a great deal of pressure from the industrial organisations to combat. But his principal duty is clear. For many weary months and years restrictive practices in British industry have been on trial; until particular practices are placed on the registration list, that trial, in a sense, continues. But the moment they do reach the list, the trial is over. With the usual provisions for reprieve in cases of quite exceptional provocation, they assume the grim status of those who have passed before the judge's black cap.

This attitude will, of course, be attacked as one of hostility to industry. The answer should be quite obvious; but, in case it is not, let it be put formally on record. Unless private industry can shake itself clear of the accusation of restriction and monopoly, it will have no defence against the creeping tide of public control and collective ownership. It is because we believe in the system of individual enterprise and the market economy, and wish to see it preserved, that we urge Mr Thorneycroft on.

Timeless Test or World Series?

ONCE again the West is being advised to turn away from defence pacts and to give the central place, in its effort to preserve peace and freedom, to economic aid, particularly for Asians and Arabs. The controversy is no new one. It raged during last year's debates on Indo-China and on the South East Asia treaty. Earlier still, there were many who welcomed Marshall aid for Europe, but looked askance at Nato. Today, the argument is newly sharpened by Communist moves. Russia, reacting quickly to the completion of the "northern tier" alliance in the Middle East, has blown on the embers of Palestinian war and of Afghan imperialism, using bellows made at the Skoda arms factories, and has also conjured up visions of large-scale economic aid for free Asian countries. These visions, admittedly, have been dangled before Asian eyes ever since the Moscow economic conference in 1952, evoking both impatience and scepticism; but now, with Soviet technicians already at work in India and Afghanistan, and fresh offers made to Burma and Egypt, the promises have a less hollow ring. Next week, when the Baghdad Pact allies hold their first conclave, many commentators—in Europe as well as in Asia—will doubtless be arguing that their alliance is a needless provocation, and that, in the relaxing climate of 1955, defence treaties are outmoded while non-alignment and a sack of roubles are *dernier cri*.

It was pointed out in *The Economist* of October 8th that the confluence of "Geneva spirit" and "Bandoeng spirit" made a dangerous mixture—that the apparent abeyance of any threat from the North had led many free Asians to think that they could crusade to their hearts' content against the receding West without imperilling their own freedom. This background, and the new Communist moves in the immediate foreground, present the West with a nice problem in perspectives. The extent to which defence pacts stabilise and reassure some Asian countries has to be measured against the suspicion and jealousy they arouse in others; and in all such calculations there is obviously an important place for economic aid. But the point that urgently needs making is that to state the issue as a simple choice between alliances and aid programmes is wildly misleading.

★

The choice is not so simple, and the issue is not so restricted. Neither a military nor an economic formula will solve a problem that is fundamentally political; nor will a concentration of effort on Asia solve a problem that is world-wide; nor should the pressures of the moment blind anyone to the fact that the real problem is a long-term one. Least of all should the nature of this problem be mistaken because it has been plastered

with such mild-looking labels as "competitive co-existence." What the free societies of both the West and Asia now face is a challenge to mortal combat—no less mortal for being largely non-military.

Last Sunday, addressing the world in the key speech of the Russian revolutionary anniversary, Mr Kaganovich proclaimed this "the century of the triumph of Communism"; and, after tossing in a few phrases presumably meant to reassure Colonel Nasser, U Nu, and other Bandoeng friends that they will not be toppled for a few years yet, he proceeded to give the Communist empire its marching orders for the advance to ultimate and total victory. The same thesis has been exhaustively set out by Soviet writers and broadcasters in recent weeks. "Country after country" is to be pushed or pulled into the Sino-Soviet orbit until freedom is finally extinguished. Every "contradiction" arising in other countries must be exploited to this end. This very week, one official Communist spokesman illuminatingly described the revival of conflict between Israel and Egypt as "a very good thing for the comity of nations and world peace."

★

It would be naive to identify this, the real challenge, with the bluff invitation to a fair contest in economic progress between "capitalism" and Communism that Mr Khrushchev lately issued. If a fair contest was really in prospect, the free world could face it, not, indeed, with complacency, but without alarm. Its strong position was tacitly conceded by Mr Kaganovich himself on Sunday, for he had to admit that it was "essential for the victory of Communism" to secure "the rapid and extensive introduction of the latest achievements of foreign science and technology." But in fact the Soviet rulers show no readiness for a fair economic contest. They have preferred to fight mainly with political weapons—and to fight foul. And in such an all-in bout they have many advantages.

They begin with the advantage of a docile population schooled from infancy in false ideas about other countries' patterns and standards of living. Despite oblique admissions such as Mr Kaganovich's, they still make costly and elaborate efforts to ensure that only the best features of their own system are publicised, while themselves making the utmost propaganda use of every mote in the democracies' eyes—with the help of the plentiful material provided by democratic newspapers and politicians. They foment labour unrest outside their borders, while within those borders they have made trade unions into slavish tools of the state. They have not hesitated to squeeze their own subjects, who have no means of protesting, in order to extract resources

for use either as economic lures or in building up over-awing military strength.

No greater scruples and no less flexibility mark their political tactics. Last week, the men who have built up the greatest monolithic power bloc in all history—extending from Bohemia to Tonking—readily joined U Nu in publicly condemning the whole idea of blocs. They claim credit for relaxing world tensions while simultaneously fanning the flames of war in Palestine and on the Afghan-Pakistan border (by “ordinary commercial transactions”), and shattering the Germans’ hopes of attaining reunion through free elections (which Russia had promised them only last July). Professed champions of self-determination, they yet deny that right not only to Germans but also to fellow Slavs, to the three Baltic peoples, and to a dozen Asian peoples between Azerbaijan and Tibet. They see no discrepancy between their revolutionary creed and their present courtship of some of Asia’s most reactionary rulers. U Nu’s short-lived belief that Russia is Asian was gladly seized upon by Mr Khrushchev, despite the effort his propagandists have made in recent months to emphasise that Russia is “the greatest European power.” China’s solemn promises to respect India’s territorial integrity have not prevented its troops from crossing the Garhwal border, any more than Moscow’s talk of peace has prevented Mr Khrushchev from personally uttering threats to representatives of Canada and Turkey in recent weeks.

★

This superb flexibility in manoeuvre is something that the free nations cannot hope to match. They cannot keep their own peoples in blinkers; they cannot restrict visitors to tours of show-places; their difficulties and internal quarrels are bared to the world; they cannot gag their politicians and journalists and thereby hush up criticism of other countries that loses them goodwill. Lacking the absolute control that the Communist machine enables Moscow and Peking to exercise over their satellites, they can close ranks only by forming defensive alliances—which provoke automatic protests from the “uncommitted,” and provide Communist propagandists with a major theme. They cannot imitate the Russian technique of directing offers of economic aid and munitions to wherever a latent conflict between non-Communist countries can be livened up.

Moreover, western aid is already so taken for granted by many countries that the subject becomes “news” only when there is talk of tapering it off, while Soviet aid has the glamour of novelty. It is thus that the strange picture takes shape of Asians and others rapturously hailing isolated and limited Soviet offers, while scarcely acknowledging the much larger amounts of western aid already received. Particularly ironic is the way countries that have preferred to receive western aid through multilateral mechanisms, such as the United Nations, the World Bank and the Colombo Plan, in

order to avoid the shame of direct obligation to one donor, seem ready to accept Soviet offers in a nakedly bilateral form. They thus give Russia a propaganda advantage which it would have lost if it had dutifully played its part in the multinational programmes alongside the West.

★

These facts alone show that merely to step up western economic aid can provide no more conclusive answer to the Communist challenge than the extension of defence pacts has done. Political and psychological factors will be fully as important in determining whether freedom survives, in both Europe and Asia, as economic and military factors. The Communist challenge is neither to war nor to a straight economic race in the open; it is to a contest to see which side can more favourably and forcefully impress the peoples of the whole world. Moscow and Peking would like it to be a rigged contest, in which they, and they alone, would be able to advance claims that cannot be checked and to disrupt other competitors’ efforts by every kind of splitting tactic.

The free nations cannot break or bend the rules so ingeniously; their institutions as well as their ideals make that impossible. But they can at least show imagination in putting their achievements and attitudes across to the “uncommitted,” to peoples under Communist rule whenever opportunity offers, and to their own peoples. This will not be achieved merely by a high-powered, glossy propaganda operation; the world grows more sophisticated every day, and to seek to veil blemishes and errors that are all too apparent is to invite total disbelief. Much will have to be done on the level of personal relations—and particularly race relations. Perhaps the most important element is time. There is already growing up in Russia itself a generation sceptical about its fathers’ dogmas and about official descriptions of the outside world, a generation more concerned to secure decent living conditions than to shoulder the burden of winning the world for Communism. Again, the time may soon draw near when the novelty of Soviet gestures wears off, and Asians and others come to expect as much help, and as much honesty, from the Communist powers as they now expect from the West. Experience is an effective, if painful, eye-opener.

Seen in this light, the great contest is by no means a hopeless one. But the first thing that needs to be recognised is that the Communist rulers’ ambitions sentence the whole world—not just the West—to a long period of “struggle,” which may take many forms, and in which there will certainly be apparent lulls. The free peoples, too, have to learn to take the long view, to be misled neither by moments of calm nor by new twists in the game, and to remember that real peace will come only when the doctrinaires in Moscow and Peking recognise that they cannot make this or any other “the century of the triumph of Communism.”

A Place for Spain

“RATHER than go through that again,” said Hitler of his meeting with General Franco in 1940, “I would prefer to have three or four teeth taken out.” To the cautious dictator of Spain, these words from a recognised master in the art of out-talking must have read like the most delicate of compliments. And as it turns out, he has not merely out-talked but out-sat most of his fellow dictators. Emerging from the war with some of the advantages of nominal neutrality, he managed to stay in power, to deflect the combined execration of the victorious allies, survive the singularly ineffectual denunciation of his regime by the three western powers in March, 1946, and flourish—within reason—despite the exclusion of his country from the benefits of Marshall Aid or of membership of the United Nations.

Indeed, General Franco has lived on to become a military partner of the United States and to be knocking gently at the gates not merely of the UN but also of the Atlantic alliance. More, he has reached the enviable position of receiving courteous attentions from the Communist powers (described in *The Economist* of October 29th) and a visit from the American Secretary of State. This, then, is surely the point at which the western nations as a whole should re-examine their policy and decide whether the time has not come to draw Spain back into their comity. Specifically, this means deciding how to answer two questions. The first is “Shall we support the move by the Canadians at the UN Assembly for the admission of eighteen new members, Spain being one of them?”; and the second, “Should we support an invitation to Spain to join Nato if the Spaniards let it be known that they would like to join?”

A fair case for an affirmative answer to both questions can certainly be made out. It could start from the axiom that General Franco’s Spain, with or without American aid, is unquestionably anti-Communist; and that with American aid in modernising its forces and in building air bases, Spain has a substantial military contribution to make to western defence. Although the concept of “peripheral” defence is outmoded, the strategic importance of the country is evident. Spain’s ports and air bases command access to the sea routes of both Atlantic and Mediterranean, and it could provide the American forces, in time of war, with points of entry less vulnerable than those of north-western Europe.

★

It need hardly be pointed out that the now vestigial policy of ostracism of Spain is unrealistic and therefore self-defeating. But in the present context of the tactics of “co-existence unlimited” pursued by Moscow, it holds an additional danger. This danger is not that

General Franco will be driven into the arms of Mr Khrushchev; it is rather that a Spain disappointed with the volume of American economic aid may be driven into a commercial—and perhaps eventually a military—neutralism on the Nasser model.

There is no question in this context of blindly rushing to “outbid” the Russians, who in any case have not, so far, entered a bid for General Franco’s favours in the same sense as they have for those of Colonel Nasser. But this does not mean that the western countries should, by sins of omission, encourage what could be a dangerous drift. As regards the specific and more limited issue of Spain’s admission to the United Nations, there has never been a legally valid case for excluding its government from UN membership, or indeed—at the time—from participating in the Marshall Plan; exclusion could be defended at any time only if it benefited the Spanish people, which has never been the case. Spain is, moreover, already a member of several UN specialised agencies and other international organisations. And if there is to be any question of providing new seats in the Assembly for Outer Mongolia, Bulgaria, Albania and other entities whose governments have no will of their own, it would then be ludicrous to leave Spain outside the doors of the world’s main representative organ.

★

It cannot be denied, on the other hand, that many objections to a complete western *rapprochement* with Spain can be raised. Some of them are sentimental or demonstrably irrelevant; but others are concrete, topical and valid. The two kinds need to be considered dispassionately and in isolation. Among the emotional objections, by far the strongest is the abhorrence of Franco Spain that developed, during the Spanish civil war, in all non-fascist countries. The overtones of the civil war are still heard, however faintly, above the more insistent hum of preparations to meet a threat from the East; and the most sensitive ears belong to men of an age to have fought in that war on the Republican side. In short, antagonism to General Franco is still a political fact in the western democracies, and it cannot be ignored.

The Spanish civil war, however, ended sixteen years ago. The readers of western newspapers, who have seen scarcely a word in his favour during those years, may not like General Franco any more now than in 1946, when the western powers hoped to bring about his downfall by the mere fact of their denunciation. But his regime also is a fact, which western antagonism has done nothing to alter and may, indeed, have consolidated. The Franco regime is today, moreover, a perceptibly less virulent autocracy than during the after-

math of the civil war. The great majority of the political prisoners have been amnestied; there is now a fair measure of freedom of speech and of person; even the censorship of the press, stifling though it remains, has shown signs of tentative relaxation; and too little has been written about Spain's social legislation which, though it has tended to encourage economic stagnation, has also noticeably enhanced welfare.

Even to the extent that Spain remains totalitarian—and it is far less so than any “people's democracy”—the character of its regime seems of limited relevance to the point at issue. Only two weeks ago, the Queen and the people of London were welcoming the President of neighbouring Portugal, who presides over a proudly anti-democratic regime. During the same week the British and other western governments gave recognition to the authoritarian regime set up by Mr Diem in southern Vietnam, so similar to the personal dictatorship of Dr Rhee in Korea. And no one suggests that western friendship for Yugoslavia implies wholehearted approval of Marshal Tito's brand of Communism.

Another objection to friendship with General Franco rests upon his record during the war. It is not necessary to accept the view, diligently pressed by Spanish spokesmen, that Britain should be grateful to General Franco because he refused to join Hitler. But if ex-enemies can be readmitted to international bodies, cannot ex-neutrals come in too?

★

When the less relevant objections are disposed of, however, it remains true that there are strong arguments against Spain's admission to Nato, if not to a western *rapprochement* with Franco outside the Nato alliance. The original instruments that bind the western countries in alliance—the Brussels Treaty and the North Atlantic Treaty—comprise definitions of moral and political aims that exclude Franco Spain. If this interpretation is still considered valid in the light of the admission of Portugal and of the evolution of the Franco regime, then two courses of action are theoretically possible.

The first is that the preambles of the relevant treaties should be amended, and that Spain should then be invited to join Nato; the second, that Spain should remain outside Nato but be regarded as a “member of the family,” even, perhaps, to the extent of liaison between some Nato commands and Madrid. Of these courses, the second is far to be preferred. The surviving antagonism felt towards the Franco regime, though it may be irrelevant to the question of a general *rapprochement*, remains an important factor in so far as it affects membership of Nato itself.

If the reactions of member governments in the Atlantic alliance when the point was raised by the Portuguese Foreign Minister last May are still a reliable guide, the Norwegians and Danes as well as the British

and French would strongly object to Spain's admission. It is thus very doubtful that the benefits of admitting Spain would outweigh the disruption it would cause among the present members of the Atlantic alliance. But there seems no reason why Spain, already linked with Portugal by a pact of friendship and with the United States by economic and military agreements, should be treated any differently from Yugoslavia, whose co-signatories of the Balkan treaty are also members of Nato.

★

It should perhaps be added that the western nations might reasonably ask a price of Madrid for a general abandonment of western ostracism. It is that the Spanish government should desist from indulging in the international pinpricks that periodically irritate certain western nations without bringing any corresponding benefits to Spain. Gibraltar is a case in point; so is French North Africa. The Spaniards are entitled to whatever reservations they may wish to make about the status of Gibraltar; and they are within their rights in giving asylum to nationalist leaders from French Morocco. But they cannot expect the British people to react with enthusiasm to anti-British incidents over Gibraltar, such as those of last year; nor can they expect the French government to condone the harbouring in Spanish-controlled territory of guerrillas bent upon killing French soldiers. If hatchets are to be buried it should be a mutual process.

True Pursuit of Sobriety

Drunkenness is so great an evil, that it probably requires, as we see from the abstinence or temperance of those who can command any quantity of wine or gin, no correction but its own consequences. But when zealots who have formed a theory derogatory alike to man and nature, believe that the natural motives for sobriety are not all-sufficient, set about establishing a system of restraint, or the creation of numerous artificial motives for the practice of sobriety, they beget, and cannot avoid begetting, the belief that there is something pleasant, advantageous, and even delightful in drunkenness, or there would be no reason whatever for their conduct; and thus they make drunkenness appear a delight and probably increase the vice, by their hasty ignorant zeal, they are most desirous to extirpate. At any rate, the success of the zealots for sobriety has hitherto been so small, that the least reflection should make them doubt the wisdom of their own proceedings, and willing to believe in the possibility, if not in the probability, that they may act on an erroneous theory. If this be possible, let them further reflect that the drunkard only destroys himself, but that they, if they promote drunkenness by a false theory, destroy great multitudes of drunkards and injure the national character. Is it not possible that the upper classes might, with equal advantage to themselves and all others, interfere less with the morality of the people?

Notes of the Week

Molotov's Monster

“WHY did they do it?” is the first question naturally evoked by the Soviet government's decision to celebrate Guy Fawkes's weekend by halting the Geneva debate on Germany not with a whimper but with a bang. But a second question also at once arises, which is less easy to answer: what are the prospects that this Soviet policy will achieve its aims—and what risks does it involve for all parties, not excluding the Russians?

In flatly repudiating the July directive from the four heads of government, which called for “the reunification of Germany through free elections,” Mr Molotov used arguments which he evidently did not expect anyone to take more seriously than he did himself. He denounced Nato as an arch-enemy and supreme danger, although he had just suggested, with every sign of calm, its continuing for an indefinite period. He preferred to accept Federal Germany's present membership of Nato rather than take a chance on a united Germany deciding to stay out of it. He claimed that free elections would deprive East German workers of “their factories and wealth,” overlooking the way they are fleeing from that “wealth” at the rate of over a thousand a day “especially the skilled workers,” as the East German prime minister complained last week.

The Soviet rulers' real motives, however, are not far to seek. They presumably think it worth while blackening their own faces momentarily by letting off this week's thunderflash, so that, starting from that extreme position, they can later offer apparent concessions to German opinion. They hope eventually to be able to deal, either directly or through their puppets in East Berlin, with German ministers less clear-headed than Dr Adenauer and Herr von Brentano, and to lure them on to the primrose path that leads to a Soviet-dominated Germany. But one wonders whether the patient planners in Moscow have foreseen the exact shape and dimensions of the monstrous growth they propose to nurture?

Almost by definition, the kind of West German politicians with whom they might some day reach a bilateral agreement must be men prepared to turn their backs on western friendship and on western traditions of liberty, prepared to accept at least the essence of the bogus electoral methods which Mr Molotov last week described as “highly satisfactory” in Russia (they satisfied Hitler, too), and infected with the arrogant notion that they can “handle the Russians.” Has Mr Molotov a nostalgic yearning to sign, some day, a new pact with a new Ribbentrop? The ignorant over-confidence so lavishly expressed in Moscow during this week's revolutionary anniversary carries with it a very real threat to the future not only of the German and West European, but also of the East European, peoples.

Geneva's Other Visitors

FOR every member of the four participating delegations at the foreign ministers' conference, there has been at least one outsider whose journey to Geneva was less demonstrably necessary. Some of these travellers have been “observing,” with varying degrees of legitimacy, the proceedings of the conference; others have been standing in the wings hoping to pick up a few crumbs worthy of a nibble. Some have installed themselves in dignified aloofness in the less bespoken hotels; others have been prowling the *Maison de la Presse* under cover of press cards of dubious professional authenticity, lobbying as much as listening.

Mr Sharett was among those whose excuse for dropping in on the party was unquestionably valid; and Azzam Pasha, former secretary-general of the Arab League, could at least claim that where Mr Sharett trod, there might he also; while Mr Fawzi, the Egyptian foreign minister, came no nearer to Geneva than Zürich. Mr Ngo Dinh Nguyen, brother of the South Vietnam prime minister, had genuine business to discuss with M. Pinay. On the other hand, correspondents were tempted to wonder, in no spirit of spoiling other people's sport, how so many “official observers” from West as well as East, and, indeed, Middle East, had come to be regarded as their colleagues.

But the most interesting of the visitors to Geneva could at least claim that he was by no means an outsider, for Mr Wang Ping-nan, the Chinese ambassador in Warsaw, got in first. And in the six days of each week in which he has not been engaged in talks with Mr Alexis Johnson, the American ambassador in Prague, on matters of common interest, he has found much to occupy his energies. He has already been successful in persuading the Italians to agree to the appointment of a technical committee of experts to consider the furthering of commercial exchanges between China and Italy; he is reported to have sounded French officials on the possibility of talks, and to have exchanged views with Japanese representatives. At this rate, Mr Wang may well leave Geneva with more in his hand than any other visitor.

The Problem of Treachery

THE practical outcome of the debate on Burgess and Maclean is not an altogether happy one. The convening of a small, informal conference of Privy Councillors from both sides of the House to examine security arrangements in the Foreign Service, though it will certainly keep

the crucial problem of reconciling national security with the liberty of the subject in parliamentary hands, will also keep further investigation of the Burgess and Maclean case itself in the hands of those who have been reporting to the nation about it all along; and who have therefore most interest in continuing the present degree of reticence. As the Prime Minister rather naively observed, the proposal was not made because Privy Counsellors can claim to be better than other people (judges, for example), but because those who dealt with these matters before "can now usefully discuss them further." Such an inquiry will hardly elucidate many points still in dispute—whether, for example, security arrangements as they existed in 1951 could have picked up Maclean or Burgess sooner or stopped them escaping, and whose was the responsibility for the failure.

But it is of more importance that any inquiry should find out if the apparently far more thorough security checks brought into operation since 1951, and described in general terms by Mr Macmillan, are effective. These checks sound as exhaustive as any that a liberal society may impose on its civil servants or scientists. They are not yet too exhaustive, and it is vital to avoid the atmosphere of McCarthyism in which they could become so. The House obviously and rightly disapproved of some incipient signs of this attitude which emerged during the debate, such as the allegations of treachery reprehensibly thrown against a former Foreign Office servant from a privileged place. Although Labour suggestions that the real trouble lies in a class or educational bias in the Foreign Service were designed as good clean party fun, there was a danger in them too. The idea that it is Blimps in striped pants who are particularly soft upon commies in their class may seem too silly to be taken seriously; but it was precisely this association of silly ideas in the Acheson age that gave McCarthyism its initial popular impulse. "Widening of entry" to the Foreign Service—which simply means lowering standards—really would not help.

The Cost of Insecurity

ASIDE from these undertones, however, what really emerged from the debate was that it was not until several years after the war against Hitler that the need for a new approach to the security problem was realised; the question now is, are enough resources of time, personnel, intelligence and money even yet being devoted to it? It is clear that not only the British public, but also Britain's allies, need to know that they are. The injury inflicted by Maclean and Burgess in passing secret information to the Russians may have done less damage than the extent to which their defection, following the Fuchs and Pontecorvo cases, undermined American confidence in British reliability; and forced Washington to maintain atomic security bars which, as Lord Mountbatten pointed out last week, have set the Royal Navy back a year or two in building atomic submarines. The effect on smaller allies, some of which have to cope with a far larger communist fifth column, must also be discouraging.

There is, however, another side to the affair. It is a facet of the particularly difficult character of the world struggle: while both parties in the wars of religion showed

intolerance, today one side is attempting to defend tolerance, which can only be done by practising it. This is a short-run tactical disadvantage; but it should be a long-term advantage. The damage that could be done by restrictions of liberty that would betray the cause of the West itself would be the greatest of all. It is commonly complained that in recent years American diplomats under the shadow of McCarthyism have feared to take action on delicate matters, have even feared to send frank reports home, lest they got into trouble for revealing allegedly subversive attitudes. The Communist states, whose diplomats live permanently under the shadow of a statutory witch-hunt, often lose goodwill and even miss tactical chances because of the resulting inflexibility of their diplomatic machine; which, even so, does not prevent an occasional defection to the West.

The case of Burgess and Maclean may be regarded as an honourable casualty to which the West was laid open by the very nature of its cause; but the lesson must be learnt, and methods must be devised to make another such betrayal improbable if not (as the Prime Minister properly cautioned) impossible. One useful course would be for the Privy Counsellors to extend their inquiry to the anti-espionage methods used by other liberal countries—a sort of Nato productivity team on security. There is something to be learned by all these countries from each other.

Hedging and Ditching

ONE of the most interesting features of the post-budget debates has been the appearance of a far larger lobby than usual in favour of cutting the burden of agricultural subsidies, which now amount to about £250 million a year. Mr Butler himself has thrown out a hint that farmers should expect unpleasant shocks at next February's price review. Although they have had a profitable year, the farmers are preparing their defences. They indignantly point out that they face the possibility of substantial increases in both rents and wages, which (if they materialise) will far outweigh the extra profits of between £10 million and £15 million which the elimination of rabbits has added to the value of this year's harvest.

The case for higher agricultural rents is overwhelming, and is at last being actively pressed by the Country Landowners' Association. Agriculture is one sphere where long-term investment is already sagging and is in fact well below the requirements of improved efficiency. A major cause of this—and of the poor state of repair of many farms—is that rents now take only 6 per cent of average farm expenditure, compared with 15 per cent before the war. But if rents were raised merely enough to keep pace with the repairs' bill, the effect would be to add at least £40 million a year to farming costs. The farm workers' current claim for £7 a week in place of the present £6 7s. is more controversial, but their economic position has undeniably deteriorated in the last few years. Partly as a consequence, no less than 5 per cent of regular full-time workers quit the land during the last year. This wage claim, if conceded in full, will add about £16 million to farmers' costs.

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

presents the two-way stretch

WHO says jute can't make news? Look at this: it's revolutionary. Hessian (that's jute) sewn on the bias to form a tube with a two-way stretch. Now when manufacturers want to package things like carpets, linoleum, blankets, they draw the tube straight on to the product, cut it to the required length, and tie both ends. The hessian clings to whatever's inside it. And packaging becomes that much quicker, neater, more efficient and cheaper.

And jute doesn't only wrap things up. It ties them up (it's twine and cord and rope). It backs them up (look at the back of your carpets and lino). It lines shoes and stiffens the shoulders of suits. And of course it makes the vital, unsung sack.

Wonderful stuff, jute! We'd be lost without it.

—makers of bags and sacks; twines, cords and ropes, jute carpets and furnishing fabrics; yarn for carpets, cloth for backing linoleum, for tarpauling, roofing felt, damp courses and plasterers' scrim; cotton belting, webbing and canvas.

There may be an application of jute to your business.

Southampton to South Africa every Thursday at 4.0 p.m.

Give the finest pen in the world

Its name is Sheaffer. Treaties are signed with it. So are five-year film contracts. And the sort of cheques that hang framed in the Chairman's office. People whose names are as familiar to you as your own sign them with a Sheaffer. And all because the Sheaffer belongs to that way of living in which the best is only just good enough.

Go to the best pen counter you know. Hold a Sheaffer in your hand and you'll agree it looks the part with its slender silhouette, its unique tubular nib, its near-incredible Sheaffer 'Snorkel'.* Feel how smoothly it glides as you write 'To wish you a very happy Christmas'... and then you'll wonder who can be persuaded to give you a Sheaffer for Christmas too.

pneumatic filler

A flick of a finger—instantaneous filling on the downstroke. Cleans, flushes itself automatically.

It is against this background that the February bargaining will take place. The Government will be under great pressure to say merely that farmers must absorb these new costs themselves; and to leave the subsidies to run on at their present, though not at an increased, level. But this would be very cowardly. Government policy next February should begin to move away from the cost-plus conventions of fixing guaranteed prices in agreement with the farmers towards concentrating limited Exchequer aid at those points where it will genuinely assist agricultural efficiency. This approach will be politically awkward, the more so as last February the Government ran away from the problem under the shadow of the election. But no other way now exists of squaring the agricultural circle; and, despite the threatened increases in costs, there will be no better year in which to start doing so.

Dalmatian Encounter

ONE is tempted to think that if more international meetings could be held in the idyllic surroundings of a small Dalmatian island, with trips in a motor-boat thrown in, the world might get on a good deal better. At any rate Mr Dulles and Marshal Tito seem to have been well pleased with their discussions last weekend, even though they did not see eye to eye on everything.

The mere fact that the visit took place at all was gratifying for the Yugoslavs, since it gave them an opportunity to demonstrate their independence from the Russians in

the international field. (The independence of their economic policy is discussed in an article on page 572.) Moreover, Mr Dulles did not go to Brioni to iron out American-Yugoslav difficulties and misunderstandings; this was done a few weeks ago by Mr Robert Murphy, with such success that *Politika* can now say that relations between the two countries "are today firmly based on mutual respect and are not at present troubled by any unsettled questions." Mr Dulles apparently went to exchange ideas on some wider international problems, such as Germany, on which there remain differences of opinion, and the Middle East, where he perhaps hopes that Marshal Tito may play a moderating role when he visits Colonel Nasser next month. Mr Dulles's visit was in fact a notable compliment to the skill with which Marshal Tito has raised his country's international status.

One rather unexpected outcome of the talks was Mr Dulles's disclosure that the two statesmen had agreed in "recognising the importance of the independence of those states (of Eastern Europe), non-interference from outside in their internal affairs, and the right to settle the social and economic order in ways of their own choice." The words belong to Mr Dulles, but there is a strong flavour of Marshal Tito's ideas about them. In the Yugoslav view, the way to salvation for the countries of Eastern Europe does not lie through free elections but through a breaking of the bonds that tie them to the Soviet Union so that they can each find their own way to the socialism which, according to a recent talk on Belgrade radio, is "an imperative, an unavoidable necessity." The Brioni statement was unexceptionable as far as it went, but it may unfortunately contain the seeds of disagreement between Yugoslavia and its western friends in the future.

UNEMPLOYMENT IN GREAT BRITAIN (THOUSANDS)

Whose Commandment for Sinai?

THE impression given by a visit to the Egyptian and Israel armies in northern Sinai is that of two dogs circling and snapping with hackles stiff, and liable at any moment to break into sustained fighting. Every day the sound of gunfire somewhere along the 155 miles of truce line emphasises how narrow is the margin between truce and war. Yet deterrent factors exist on both sides.

Egypt is ruled by a soldier and realist who—whatever he may say—knows in his heart and mind that, militarily speaking, a real battle at the far end of tenuous trans-desert lines of communication could not be won. What suits him is just what is happening—encounters frequent enough to produce the headlines in Cairo that make him indispensable as his country's leader. Simultaneously, every Israel probe or attack serves to recover his lost position in the Arab world; lately, they have won for him the military agreement with Syria and Saudi Arabia that he had failed to bring off when tension was lower.

Israel is far less well served by an atmosphere of tension and eve-of-battle. What it needs is the permanent settlement from which weak Arab governments would derive no advantage, and many of its citizens think that a sharp onslaught intended to force a settlement now would be the best way to its goal. Yet, if the Israel army were to attack Egypt in force, in the hope of reaching the conclusion that

would suit it, there is nothing to go for short of the Suez Canal. The aggression would be so flagrant that it might endanger the flow of help from official American sources. Many an Israeli politician must be pondering how far Egypt's policy of filling its arsenals from Soviet bloc countries can be used to make Washington see red.

Yet the very existence of such deterrent factors suggests that a third-party peacemaker, such as Mr Hammarskjöld, Sir Anthony Eden and Mr Dulles, have some practical foundations on which to build as they exert their moral strength. In their different ways, they have all proposed the holding

ing of a line, if the combatants will agree to fix one. But the fixing is, as it has always been, the rub; to agree to fixture is as much as an Arab politician's life is worth, and there is no way to alter this constant factor except by persuading Israel to make territorial compromises, which again is asking the impossible. The target for the present, therefore, is to prevent Israel from trying to force the settlement of a line; and now that the British base on the Suez Canal is gone, the only external physical ability to do this lies in the United States Treasury.

"To Catch Up With America"

MR LAZAR KAGANOVICH, an elder member of the party hierarchy, was chosen this year to define Soviet policy on the 38th anniversary of the Russian revolution. In dealing with foreign affairs he elaborated the line of "competitive co-existence" which is now being plugged throughout the Russian press. Indeed, he branded as "fools or provocateurs" those who talk of "revolution for export"—firmly ignoring the way that "revolution" was undoubtedly brought into Eastern Europe on the bayonets of the Red Army. It is now argued that capitalist countries will fall one by one into the Soviet basket like rotten plums. A world conflagration is not needed, when time and some adroit prodding will do the same job.

The Soviet Union now shows no inclination, while awaiting or speeding this decline of the West, to draw back even for tactical purposes. Mr Kaganovich on Sunday foreshadowed very clearly Mr Molotov's intransigence on Tuesday over German reunification. The Soviet bloc is not willing to cede territory as a prelude to the extension of its orbit. In the meantime, much remains to be done in order to consolidate the bloc and the Soviet Union itself. Mr Kaganovich proudly proclaimed the overfulfilment of the current five-year plan, but he did not entirely forget the seamy side of the picture: poor housing conditions, need for more grain, the technological lag behind the West

in many fields. In fact he resurrected the old slogan—"to catch up with and outdo America."

Comparisons with the West are now presented in rather more reasonable terms. For years Soviet propaganda has insisted only on the fact that Russia is the biggest industrial power in Europe. Now the party journal, *Kommunist*, while reiterating this claim, adds that the next stage must be "to equal and outdo" the advanced western countries, particularly the United States, in terms of production per head of major commodities. Total production is the yardstick of a country's striking power, production per head throws more light on its living standards. The next five-year plan, which will be disclosed before the February congress of the Soviet Communist Party, should show how quickly the Russians expect to close the gap and to what extent housing or other consumer needs will be taken into account in this economic race with the West.

When Unions Can be Sued

A JUDGMENT of great importance in trade union history was given in the House of Lords on Monday. Their lordships unanimously allowed the appeal of the widow of Mr Harry Bonsor from a decision of the Court of Appeal that he was not entitled to damages for his wrongful dismissal from the Musicians' Union. The Court of Appeal in 1954 had already ruled that his expulsion was null and void under the union's rules; but it had also ruled that Mr Bonsor was not entitled to recover damages. Damage had certainly been done to him: as the Musicians' Union is a closed shop union, he was unable to follow his profession, and took first to chipping rust off Brighton pier and then to working in an engineering shop at much lower wages than he could have earned as a musician. But the Court of Appeal considered itself bound by a decision in 1915 of the same court, in the case of *Kelly v. National Society of Operative Printers' Assistants*. The court's reason for refusing damages to Kelly was that a member of a voluntary association who was injured by some wrongful act done by an agent of the association's members could not recover against his fellow members, whose responsibilities in the circumstances were no greater than his own. In other words, it said that a union member could not sue his own union.

This week, however, their lordships decided that Kelly's case had been wrongly decided. They referred back to the famous Taff Vale case of 1901, when a railway company successfully brought an action against the Amalgamated Society of Railway Servants, which had called a strike, and which subsequently had to pay large damages. That case had shown that a registered union is a legal entity which can sue and be sued. Subsequently the Act of 1906 deliberately reversed part of the Taff Vale judgment. It laid down that a union cannot be sued for tort, but it did not say that it cannot be sued for breach of contract. And both the printers' union in 1915 and the musicians' union in 1953, in their lordships' view, had committed a breach of contract.

It would be wrong to say that the Bonsor judgment will be a powerful influence against the principle of the closed

shop. Unions can still exclude a man from membership, and therefore from his job, if they keep within their own rules. But this decision may impose some check upon tyranny by local officials, who sometimes stretch those rules to accord with their own personal dislikes or views upon working habits or political opinions (and whom union headquarters find it embarrassing to control). The Bonsor case, unlike some other cases in the trade unions' long history, should not therefore be regarded as a blow against unions as such; it is a small but significant blow against occasional and contemptible despotism.

Doubts on Defence

THE services' doubts about the new arrangements announced by the Prime Minister for strengthening the authority of the Ministry of Defence found forceful expression in the House of Lords debate. The attack came from retired officers and former ministers; but their fire was as accurate as the services could have wished; the Government's reply was hesitant. General agreement on the need for progressively closer service co-ordination left the service spokesmen solidly opposed to amalgamation for its own sake, or before technical developments required it. And none of them could see how the appointment of a chairman of the chiefs of staff could improve a degree of co-operation already ahead of that in most other countries.

The chiefs of staff certainly need a permanent representative at Nato; but his duties there will be surprisingly light if he is also to dominate the chiefs of staff at their regular meetings. The service view was given by Lord Hore Belisha when he said that an extra chief of staff for Nato could be more easily added by making the chief of staff to the Ministry of Defence (now General Brownjohn) a full member.

It may be argued that these views reflect service resistance to the control of the Ministry of Defence; in fact the services fear rather that the new arrangements will mean less decisive Government intervention on matters in

GOLD AND DOLLAR RESERVES

US DOLLARS (THOUSAND MILLION)

dispute between the chiefs of staff, not more. Such disputes do not usually occur on technical matters but on political or economic issues—such as the allocation of resources to each service. They feel let down if the Government does not settle such disputes outright. It is open to the Minister of Defence to sit in on their meetings and give directives on these matters; he could have, it is argued, as much power as Sir Winston Churchill wielded in wartime. But how can a service chairman with no departmental responsibilities help? His lack of responsibility offends against the principles set out in the Defence White Paper of 1946, which the Government firmly endorses; he is in danger of becoming a mere buffer. The danger will be that decisions—on integration or anything else—will be evaded. The Government spokesmen retorted that the plan is to proceed step by step; but it will evidently be necessary to take the next step very soon if the four-legged race is not to end in a hopeless mix-up.

Tackling the Slums

THE Minister of Housing has issued a summary of the local authorities' plans for slum clearance during the next five years. According to these local estimates there are altogether 847,000 "unfit" houses in England and Wales, of which 375,000 are to be demolished and another 88,000 are to be temporarily renovated during this first period. These plans envisage a quite rapid rate of progress, which would entail the provision of at least 80,000 new dwellings a year to cope with all the displaced families—a larger provision than Mr Sandys has so far considered likely to be needed.

The most striking feature of these proposals, however, lies in the extraordinary variations among the local authorities themselves. Newcastle has only 4,600 unfit dwellings, but Liverpool has 88,000; the County of London has 21,000, which is the same as Leeds and only a third as many as Manchester. Partly as a consequence, there are equally great variations in the expected rate of progress. Many authorities, including London, mean to complete their programme within the five-year period; but others—including Birmingham, Manchester, and Liverpool—will end the period with around 90 per cent of their present slums still standing.

Some of these figures are based only on "broad estimates," while some authorities are more zealous (or fussy) than others in their definition of what constitutes an unfit dwelling. But, even so, some cities face a very long haul; and if the spectacle of already condemned houses continuing in existence right up to the turn of the century is to be avoided, some rechanneling of Government aid—in addition to the measures already announced—is probably going to be essential. Moreover, Mr Sandys needs to look ahead. So much of Britain was built towards the end of last century that there are a vast number of old sub-standard dwellings which, helped along by the Rent Restriction Acts, are liable to decline rapidly into the category of "unfit dwellings." The slum lists being so long, it is clearly important that the power of condemnation should be used with sense and discrimination, and with greater

Strange as he might look
arriving at Hatfield Station on an English summer day,
the Eskimo would not have to travel far to feel at home.

For almost within sight of the platform lies De Havilland's low-temperature test room.

The North Pole comes to Hatfield

Here, gloved and helmeted against intense cold, research workers study the behaviour
of aircraft parts under Arctic conditions.
The large test chamber in which they work
can be cooled to 135° of frost
in less than an hour and a half —

thanks to 'Drikold', the solid carbon dioxide or 'dry ice' refrigerant made by I.C.I.
'Drikold' is widely used, not only by British aircraft manufacturers and other industries
that require coldness without fuss or mess, but also by those needing a convenient source
of carbon dioxide gas. In the engineering, ice-cream, meat, fish,
brewing, soft drink and many other industries, 'Drikold' plays its part
in providing coldness, freshness, 'head' or 'fizz' all the year round.

Thus, and in a thousand kindred ways, I.C.I.'s research
and production are serving the Nation.

uniformity throughout the country. (Apart from anything else, differences in definition of what are slums will exacerbate the coming storm about compensation to owners for pulling them down.) And it is still more important that everything possible should be done to prevent so rapid a rate of housing deterioration. This is another facet of a familiar problem. All discussions of housing policy come back to the same simple starting point: for the sake of tenants and prospective tenants, and not just for that of the landlords, the coming amendment of the Rent Restriction Acts has got to be drastic.

The Two German Armies

EX-GENERAL VON MANTEUFFEL, who commanded the *Grossdeutschland* panzer division in the war, and former Vice-Admiral Heye are members of the security committee of the *Bundestag* which is studying British defence organisation, particularly the relationship between civil and military powers. The two former officers represent something novel in Germany. In a country where military men traditionally looked down on politicians, it was striking enough when they stood for parliament. It was still more encouraging when the two led the movement in the *Bundestag* last summer against the government's hastily-drafted Volunteers' Act, on the grounds that it made no provision for civilian control of the new forces. They won the day. There is, it is true, still no German army to control—apart from the frontier guard, which will probably be incorporated in the future army. The first volunteers have still to be called up, and it is not certain whether there will be enough to provide the scheduled 150,000. The main body of legislation has not yet been passed. But the principle of civilian control has been established, to the great annoyance of many die-hards.

It is perhaps not sufficiently realised outside Germany how basically this West German army will differ from the force which exists across the zonal frontier. The Soviet German army is being groomed for civil war against the "class enemy" in factories and streets, while the Federal German force will be trained for normal defence under Nato. Soviet German propagandists extol their army as "the German working-class in arms," and declare that the armed factory groups are modelled on the "Red Ruhr army which fought heroically against the *Reichswehr* and struck terror into the iron and coal-masters and the Junkers."

Such warnings have not gone unheeded in the Federal Republic, where many responsible Germans believe that the most urgent need of the West is to create a force which will be morally prepared to fight for democracy in a civil war. Their fears have been increased by the Russians' nomination—without waiting for Bonn's *agrément*—of Mr Zorin as their first ambassador in Bonn. Mr Zorin, it is recalled, was in Prague at the time of the *coup d'état* which put the Communist minority in power in 1948, and he wants to bring a staff of many hundreds with him to Bonn. These symptoms of Soviet policy, and Mr Molotov's blunt indications that Germany must become a "people's democracy" or stay divided, have increased the number of Germans who look upon the Atlantic alliance as a vital protection rather than as a barrier to reunion in freedom.

Home Truth From India

THERE are occasions when it is a genuine pleasure to confess oneself in error. In *The Economist* of October 29th a comment on the visit to Delhi of the Secretary of State for Commonwealth Affairs included the accusation that important parts of Lord Home's address to the Indian Council of World Affairs had been suppressed in Indian newspapers. Information from more than one quarter had led to this misunderstanding and to the levelling of a charge which, it now appears, was unfounded. In fact, the majority of India's leading newspapers included the passages in question in lengthy reports of the speech. It is not only heartening to learn that the despondent deduction made in these columns was baseless; it is also fitting to address an apology to the journalists of a country whose greatest men have on occasion seen nothing unworthy about admitting that they had made a mistake. To term this particular affair a Himalayan blunder would be presumptuous; but one can stumble fatally even over molehills, and they need to be cleared away if two friendly and free nations are to continue in friendship and freedom.

Clean Air in the Commons

THE Clean Air Bill is causing the controversy that was to be expected. On the one hand, MPs from the smokier areas have warned Mr Sandys that they will try to "strengthen" his measure by a series of "toughening amendments" in committee; they have been joined by newspapers which think that, whenever a complicated Bill of this sort is under debate, the most impressive course for uninstructed leader writers is probably to make vaguely hortatory noises alleging that the Bill ought to go further. On the other hand, as an inevitable reaction to the exaggerated hopes that the smoke abatement propagandists have aroused, an opposition has sprung up to the whole Bill. A doctor wrote to *The Times* this week that if the Bill makes the British people "sit over coke fires all winter, health will deteriorate."

Amid this conflicting advice the Government has so far steered a surprisingly sensible course. Its Bill will not make many people sit over coke fires all winter, and will not multiply bureaucrats to come and peer at the grate. It holds out the hope of ridding the air of a good part of Britain's industrial smoke, and a small part of its domestic smoke, within the next few years. And the plea that should now be addressed to the small group of MPs interested in the Bill is that, until they know more about the subject than they showed in their speeches at the second reading last Thursday, they should please hold back from supporting amendments which, under the guise of "strengthening" the Bill, would in fact make it too top-heavy to work.

This plea does not apply to any amendments designed to increase the number and efficiency of factory inspectors under the Alkali Acts; those amendments should probably be pressed. But to every other criticism Mr Sandys, albeit rather timidly, seemed to give exactly the right answers on Thursday. The choice before the mass of frankly bewildered MPs on this very technical measure is really quite simple. The department that has advised Mr Sandys that the present

Bill goes "as far as practicable" is the department that has considered successive Town and Country Planning Acts to be eminently workable. If any MP thinks that this department is likely to underestimate the extent to which a measure may be workable, he may justly join forces with those who are seeking to scare Mr Sandys into allowing Mr Nabarro's amendments through. But if he maintains any sense of proportion, or even of humour, it is difficult to see how he can really allow this to happen.

How Not to Appoint a Committee

IT was Philip Guedalla who said that the ideal investigating committee should consist of "four just men and a statutory woman." The Franks Committee, which has been set up to inquire into the practice and procedure of administrative tribunals, offends against this admirable precept in every respect. It consists of fourteen men and two women; and its members have been deliberately listed as "representing" industry, the trade unions, landowners, the social services, the political parties and almost any other group that might be interested.

There are two criticisms to be levelled against this committee before it even starts its deliberations. In the first place, it is far too large. This means that it is bound to take a long time to do its job; and at the end it is all too likely to produce either a negative report, or a positive one flanked by a confusing array of minority and dissenting opinions. Secondly, "representatives" of special interests have no place on a committee of this kind. The proper function of "representatives" is to give evidence to a compact committee of independent judges, not to sit down and haggle together in the hope that somehow a synthesis of their separate views will emerge.

The inquiry stems from the intense disquiet generated by the Crichton Down affair. It was promised first in the Conservatives' election manifesto and then in the Queen's Speech opening the new Parliament. Some Tory MPs have feared that the terms of reference might not be wide enough; but the Prime Minister confirmed on Tuesday that the committee will be able to consider what is obviously the central issue—how a citizen aggrieved at the handling of his case by the administrative machinery might be given some right of appeal to the courts. It is a pity that the citizen seems destined to wait a long time for his new deal; and then when it comes it seems certain to be compromising instead of a clear cut one. Indeed, this does not look like an investigating committee so much as a burial ground for this burning issue.

Filling the Dental Gap

THE Dentists Bill, which was concocted by the Labour Government and then left over from the first Conservative Government, has been warmed up, covered with a sauce and sent to the parliamentary table again. It received its second reading last week in an amiable atmosphere. Even the one practising dentist in the House of

Commons, Mr Baird, the Labour MP for North East Wolverhampton, expressed qualified approval of it.

Dentists, in general, are slightly more tolerant of this Bill than of its unsuccessful predecessor. They have always approved of the proposal to make their profession self-governing instead of a dependant of the General Medical Council (although they think that the proposed General Dental Council will be overweighted on the academic side and not representative enough of the ordinary dental practitioner). But the sauce that is really making the Bill more palatable to them lies in the stronger safeguards now surrounding its other main proposal: namely, the overdue experiment with the training of dental ancillaries, who will work in hospitals and local authority clinics. The treatment these ancillaries will carry out, which will include the extraction of milk teeth and the filling of teeth, will now be undertaken only on the direction of a qualified dentist—which means that he must see the child's mouth first. Furthermore, the Minister of Health assured the House that the experiment would not begin until after the McNair committee on recruitment to the dental profession had issued its report.

For the background to the whole proposal is that there are only about 12,000 dentists in active practice, which is probably less than half the number needed to give an adequate service; and the number of first-year dental students is now below 500, compared with a peak soon after the war of 650 and with the 900 which the Teviot committee on dental manpower recommended some ten years ago. Yet dentists are now earning comfortable incomes. Their average earnings before the recent restoration of the 10 per cent cut in fees were £1,500-£1,800 a year, net of practice expenses; and Mr Baird suggested that this probably means an average of about £3,000 a year for the 35-50 age group. The public's only hesitation about the Bill must be whether this proposal will make any real difference to the gap, since the ancillary workers, if eventually employed on a large scale, would presumably have to be drawn from the ranks of young women whose services however are competed for by so many other professions.

France's Forked Radicals

MENDES-FRANCE emerged from last week's Radical congress with a great personal success and with a better hold on the party machine; but M. Edgar Faure, the Prime Minister, still commands the support of most Radical deputies in the Assembly. The fact that the Radical eagle has two heads is nothing new. The split personality of this political "club," which provides ministers for every government and premiers for many, epitomises the indecision of the French centre whether to turn left or right. Thus the rivalry between the two former friends and colleagues is at the heart of the unfinished electoral battle. An early polling date, without any great alterations in the electoral system, ought to reinforce the rightish coalition which gave M. Faure the premiership. M. Mendès-France, on the other hand, hopes that a delay would give him time to consolidate his position in both party and country and that the system of *arrondissement* (single-member constituencies with double ballot) would enable him to return with a strong bloc of *Mendèsistes* and Socialists.

In this contest the chances of M. Mendès-France seem the less bright. True, the party congress has endorsed his programme—including the reduction of military service and a progressive policy on wages—which will prove more palatable to Socialists than to any other party. Radicals, however, have an art of combining high-sounding principles with electoral interests, and it would be an extraordinary departure from precedent if deputies elected with conservative support should now decline it for reasons of political purity. The character of the *arrondissement* method should enable M. Mendès-France to look beyond his party for support. The two-ballot system would allow his own and Socialist candidates to exploit, during the week's interval, either the "red peril" or the fear of "reaction." Yet, even allowing for such a victory of "lesser evil" candidates, the Socialist-Mendèsiste bloc cannot hope to command a clear majority in the next Assembly. Since the former premier emphatically refuses Communist backing, he would have to look rightwards for support; and, for the moment, M. Faure has a better reputation for directing coalitions wagged by their conservative tail. Besides, the *arrondissement* idea, thrice rejected by the deputies, can be saved now only by a crisis. If Frenchmen are to go to the polls next month, it will have to be under some form of proportional representation.

Unions Called to Account

THE registration of a trade union does not only involve the ability to sue and be sued. It also imposes an obligation to present to the Registrar of Friendly Societies an annual statement of accounts, and these are summarised in the Registrar's annual reports. The report published this week for 1954 shows that the average expenditure per head of the 410 registered trade unions was £2 4s., while the average contribution was only £2 2s. 11d. Within these averages, of course, there was considerable variation; for example, the craft unions levy a larger contribution than the general unions.

The figures do not mean, however, that the unions are gradually becoming insolvent. They have an income from investments to meet the deficit, and their total funds increased by over £3 million during the year to £73.9 million. Not all of them, however, were so thrifty; the Communist-controlled Electrical Trades Union, for example, spent so much money on strike pay—17s. 10d. a head—that it drew down its funds from £724,000 to £441,000. Expenditure on strike pay in general was higher than in any year since the war, and at £483,000 was nearly twice as great as in the previous year. Expenditure on benefits varies widely according to what the union provides. For political purposes the average contribution per head was 1s. 7d., whereas average expenditure per head was only 1s. 2d. The political funds have therefore been mounting, and at £981,000 were nearly twice as great as at the end of 1945. Mr Morgan Phillips may contemplate this hoard rather ruefully, as well as the figure of 899,000 obstinate trade unionists who insist on contracting out of the political contribution. But the Labour Party is now likely to get more of the accumulated funds.

The political expenditure of employers' associations—

over 100 of which are registered trade unions within the meaning of the Act—is not high considering that the members are in effect firms, not individuals. Contributions averaged £3 13s. a head and expenditure £3 19s., of which 7s. 9d. was used for political purposes. But the finances of employers' associations may well be a matter of envy to trade union officials with their relatively meagre salaries; some day soon they will have to persuade the membership that contributions only 19 per cent higher than 1938 are hard to square with the rise in prices, of which elsewhere trade unionists are so deeply conscious.

Graduates in Industry

THE demand for more graduates in industry, especially more scientists, technologists and first class honours men generally, is increasingly voiced at business conferences. But the actual proportion of the annual out-turn of graduates that industry is recruiting has hitherto been conjecture. The PEP inquiry* has thrown useful light on the subject. Questionnaires were sent to those who took their degrees at British universities and university colleges in 1950 asking what positions they had since held; some 30 per cent replied, so the sample is felt to be representative, though it perhaps under-emphasises the number who took up careers overseas. It appears that industry in general—including mining, oil and building and contracting—took 30 per cent of all those who graduated in 1950, and commerce another 7½ per cent. Taken by itself, manufacturing industry accounted for 23.4 per cent; and, rather surprisingly, it took as high a proportion of those who got first-class honours in 1950—23.7 per cent of them. Less surprisingly, it took 45.4 per cent of those who took a degree in technology, 33.8 per cent of those who took a degree in science, and only 10 per cent of the arts men.

The principal competitors for the graduates are, of course, the professions and civil service—especially teaching, with school teaching taking the largest number of graduates and university teaching taking its pick of the firsts. Obviously the professions must be staffed; and if teaching is undermanned the next generation of industrial scientists and technologists will not appear. It looks as if the demands of industry can be met only by increasing the proportion of those taking science and technology, or by producing more graduates in total. But to increase the number of scientists is a matter of finding more teachers and probably more young people with a scientific bent, which will at any rate take time. To produce more graduates may well mean simply manufacturing more poorish thirds, which would be less use to industry than the "sandwich course" men. Is industry perhaps demanding more brilliant minds than nature herself is prepared to produce? The top five per cent of the nation's intelligence is itself a small cadre which should be used economically. And since the PEP report disclosed that between 1950 and 1954 industry lost ten per cent of the graduates which it originally attracted to the idea of a business career, it had perhaps best consider how to prevent its own wastage before it encroaches on the needs of other occupations, or presses claims which the educational system cannot meet.

Letters to the Editor

As Far As It Goes

SIR—Your correspondent, Mr J. Hancock, is completely inaccurate in suggesting that London Transport is "squandering" money on road vehicle replacement. There is no unnecessary expenditure involved either in London Transport's future plan to replace trolleybuses, or in the disposal of any other road vehicles which has taken place since the war.

On trolleybus replacement I need only say that the old vehicles, when replaced, will have run some twenty years on the streets of London, will have had a mileage of about 900,000 miles per vehicle, and have already had their bodies completely rebuilt once. The replacement of these vehicles is both necessary and economical. The vehicle chosen for the replacement is the oil bus, because of its great advantages of mobility and operational flexibility over the trolleybus; but the need for this renewal programme and its cost would have been the same whether new oil buses or new trolleybuses had been employed.

London Transport's postwar disposals of oil buses have also consisted for the greater part of very old vehicles which, owing to war conditions, had far outlived their normal lifetimes, plus a much smaller number of wartime and immediate postwar "austerity" buses of non-standard design.

Nearly all London Transport's old buses have either been broken up or else resold overseas for service where neither traffic conditions nor the standards demanded by passengers are comparable to those of London. A small number of the "austerity" vehicles has been sold for operation outside London in areas where traffic conditions are in general far less onerous.

There is one point I should like to emphasise strongly. The traffic congestion on London streets which continually grows worse makes a fleet of first-class modern buses essential if running schedules—as far as possible—are to be maintained for our passengers. It is because London Transport designed and introduced the present RT bus fleet, with their excellent road performance and handling qualities, that we have been able, to a considerable extent, to counteract the severe effects of increased traffic congestion.

With regard to Mr Hancock's reference to noise and fumes of oil buses, the RT bus is certainly not noisy, and no public vehicle operator is more scrupulous than London Transport in its pre-

cautions to avoid public nuisance from exhaust fumes.—Yours faithfully,

R. M. ROBBINS
London Transport Executive, S.W.1

Any Pennies for the Guy?

SIR—You show a close and flattering attention to the affairs of the Labour party, which constantly receive more notice in your columns than do those of the Government party. This being so, it is unfortunate that your discussion of Labour party policy should almost always be conducted in totally unrealistic terms.

The Labour party agrees with you in wanting a rapidly expanding, high investment economy, but in little else. It believes, as a matter of fundamental principle, in a more equal distribution of the national income and wealth. For the combination of these two objectives, amongst other reasons, it wants more—and not fewer—controls than we have today. It does not share your instinctive aversion to "distortions" in our economy; it regards many of them as essential weapons against the inherent unfairness of a free economy.

You do not accept these views. You are indeed still further from accepting them than are Mr Butler and the bulk of the Conservative party. To this attitude you are of course fully entitled. But you should also recognise that the objectives which the Labour party seeks, and which you reject, are desired by a very large number of electors in this country. Do you want these views to go unrepresented? What possible constitutional theory prompts you to expect Labour policy to be founded upon your advice rather than upon its own beliefs? Yet this is the assumption on which you work. You proclaim an economic policy somewhat to the right of that of Her Majesty's Government. When the Opposition does not accept it, you accuse them not only of being wrong, which would be permissible, but of being either stupid or dishonest, which is merely silly. It is a pity that your comments on politics at home should be made increasingly uninteresting by this foolish arrogance.—Yours faithfully,

ROY JENKINS
House of Commons, S.W.1

[If we give more space to Labour's affairs it is because there are so many of them.]

Mr Jenkins first says that Labour agrees with us on objectives, and then says that we reject them. Obviously he is confusing objectives and methods. Like all Socialists, he thinks that all those who doubt the wisdom of Labour's methods must be disagreeing with its benevolent objectives. Yet it is he who accuses us of arrogance.—EDITOR.]

Political Suburbs

SIR—I am indebted to Mr Louis Harris for amending my suggestion that commercial polling enterprises could not afford the expensive methods used by the University of Michigan survey of the 1952 American election.

Mr Harris's second objection to my review must surely be the result of hasty reading on his part. He quotes me correctly: "The much touted swing of the female vote to Mr Eisenhower in 1952, to which Mr Harris devotes a whole chapter, is belied by the University of Michigan study. . . ." Then, after admitting the existence of "some disagreement between the two studies on this point," and then further depreciating the completeness of the Michigan study, he concludes: "The critical fact, brought out by a number of independent measures, is that proportionately women voted more heavily for Eisenhower than did men." That this is a fact, though hardly a critical one, I have never questioned; the issue, which Mr Harris does not face, is the shifting of votes. Women supported Mr Eisenhower more strongly than did men; but in 1948 they supported the luckless Mr Dewey more strongly than men, too. Before one discovers an important clue to the Eisenhower victory in a feminine landslide, it would be prudent to see whether women shifted more, or less, than men towards voting Republican in 1952, as compared with 1948, the year of Republican defeat.

The Michigan survey does indicate, however, that women who did not vote shifted more markedly in sympathy towards the Republicans in 1952 than did men who did not vote. Is it possible that the Roper surveys did not wholly succeed in distinguishing between voters and non-voters, and hence overrated the feminine role in the Eisenhower triumph?—Yours faithfully,

YOUR SPECIAL CORRESPONDENT

Confucius, He Say . . . ?

SIR—As I understand it one of the main objects of monetary policy exercised through the Bank Rate is to force the country to work on smaller stocks and thus reduce imports and improve the balance of trade.

When the present Chinese Government came into power in Shanghai they were faced with an inflationary situation to the nth degree. They solved it with conspicuous success by imposing a monthly tax on stocks of all commodities. If it were administratively possible to impose such a tax in the United Kingdom with a tax rebate if such stocks were subsequently exported, would not monetary policy be made much more rapidly effective?

Should this suggestion not be too impractical, the principle might be extended to taxing bank advances every month if they exceed what the Chancellor considers safe. I mean, of course, tax the bank and not the customer.—Yours faithfully,

R. SCHLEE
London, E.C.3

MORE TRANSATLANTIC SERVICES LESS TO PAY

B.O.A.C. double-deck Stratocruiser services across the Atlantic are doubly attractive this winter. There are increased First Class "Monarch" and Tourist Class "Coronet" services and special fare reductions. So if you travel between November 1st and March 31st to U.S.A., Canada or the Caribbean—these are the ways you can save.

B.O.A.C. "FAMILY FARES" PLAN

Only the head of the family pays the full fare. With a wife and two children between 12 and 25, a man might save £300 and more on a First Class return journey across the Atlantic.

B.O.A.C. "OFF-SEASON" SAVINGS

£14 off the return fare for "Coronet" Tourist services, and £10 off the return fare for First Class "Monarch" services. These reductions are in addition to the "Family Fares" savings.

Fly now—pay later. Take advantage of B.O.A.C.'s Ticket Instalment Plan. With only 10% down payment you fly now!—and pay the rest over a period of up to 21 months. No fuss, no bother, no red tape.

Consult your local B.O.A.C. Appointed Agent or B.O.A.C. Airways Terminal, Victoria, S.W.1 (VIC 2323), 75 Regent Street, W.1 (MAY 6611), or offices in Glasgow, Manchester, Birmingham and Liverpool.

BRITISH OVERSEAS AIRWAYS CORPORATION

SUCCESS BEGETS SUCCESS

Ready availability of power is a determining factor in the success of any American plant operation. More power is now generated and consumed in New York State than in any other of the forty-eight states. Enormous new power resources—thermal, hydroelectric and nuclear—are in course of development. Another reason why more industries—and a greater variety of industries—operate at a profit in New York State than in any other. A good reason for establishing your American plant here!

New York State is prepared to give you the facts—professionally analyzed—on which you can decide exactly where in New York to locate YOUR PLANT. Our booklet—"Industrial Location Services"—explains what we do, and shows how you can put our knowledge to work. For your free copy write, New York State Department of Commerce, Albany 7, N. Y.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Stevenson at the Post

Washington, D.C.

UNLESS there is a last minute change in his plans, Mr Adlai Stevenson will announce next Monday or Tuesday that he is a contender for the Democratic presidential nomination in 1956. In striking contrast to his situation in 1952, when he was drafted by the party's convention, this time he will become the first candidate in either Republican or Democratic ranks to be formally in the field.

This distinction bears certain perils. The combined effect of the President's heart attack and the late dates of next year's nominating conventions has been to lengthen the pre-convention phase of the election campaign in relation to that of the campaign proper. During these two phases the public opinion polls have opposite functions. Before the conventions their results are of great importance to the candidates, since the parties are seeking the man in their midst most likely to succeed; once a candidate has been nominated, however, it is up to the polls to prove that they can, in fact, forecast the outcome. By declaring his intentions thus early Mr Stevenson will expose himself to the erosion of public scrutiny for nine long months before coming up for his party's selection and for three months after that. In 1952 he was in the line of fire for rather over four months and only after the Democratic party was committed to him.

On the other hand the image of himself which Mr Stevenson most needs to eradicate is that of a Hamlet-like character, whose hesitations as a politician presage indecision as a statesman. In the last four years much has altered. Before the 1952 elections, Mr Stevenson shared the widespread view that it was "time for a change" in Washington; privately he may even have agreed that General Eisenhower was the man to bring it about. After he had accepted the nomination he fought the campaign largely as an amateur—although one who knew the rough and tumble of Illinois politics—and surrounded himself with academic and amateurish advisers. Since then two things have happened: Mr Stevenson has become deeply convinced that a Republican Administration was an unfortunate experiment and he has acquired professional status.

Nothing endears a defeated candidate so much to the professionals in his own party as hard work after the election to help pay the party's bills. Mr Stevenson devoted nearly two years to this task, and in the course of it made himself acceptable to many party workers who had felt slurred by the prim line he tended to draw in his campaign

speeches between himself and the politicians. Although urged by northern liberals to become a true "leader of the opposition," a personage unknown in American practice, by proclaiming a programme antithetical to the President's and unwelcome to the right wing of his own party, Mr Stevenson has preferred to help mend the divisions between Democrats. This has also been the main pre-occupation of the party's congressional leaders.

★

Of the three Democratic candidates most prominently in the public eye, Governor Harriman of New York, Senator Kefauver of Tennessee and Mr Stevenson, it is the last who least offends the South—a region vital to the party. It is he, moreover, who stands nearest to that middle road and sense of non-partisan tolerance which people sought when they turned to General Eisenhower. In effect, Mr Stevenson's great strength lies in the breadth of his appeal, attracting the liberals by his intellectuality and the conservatives by the moderation of his views.

Against these advantages his rivals do not look very strong. It is hard to take Governor Harriman's candidature as seriously as some of the eastern newspapers have done. In one way he may be helped by his association with New York's Tammany Hall, that most famous of big city machines, but in many parts of the country this very association arouses traditional hostility. The full-blooded "new dealism" on which he relies puts him out of key with the present era of good feeling. New York is a powerful state but even there signs are accumulating that Mr Harriman is very far from being a united choice.

His main chance appears to arise from a possible deadlock between the forces of Mr Stevenson and those of Senator Kefauver. The latter will seem powerful when the Democratic convention meets only if he can repeat his 1952 performance, when he won thirteen out of the fifteen presidential primaries he had entered. These primary elections—in which voters indicate their preferences among their own party's potential candidates—are a conundrum for the political strategist. Only in 17 of the 48 states is there any machinery for the voters to choose by direct election the delegates to the national party conventions. The delegates from the majority of states are chosen by county and state conventions. It is therefore perfectly possible, as happened in 1952, for a candidate such as Senator Kefauver to win the great majority of his party's primaries and be eliminated

at the national convention by a candidate such as Mr Stevenson who had not entered a single one. Moreover, not only does this make the sampling of popular opinion highly erratic, but the ground rules are different in each of the states concerned.

Some of Mr Stevenson's advisers, fearing a trap, were in favour of keeping him aloof from these trial heats. But it soon became clear that such a plan would not work. A candidate cannot be coy a second time. There would be rough hints from the South, from Mr Truman and from other politicians, that what applied in 1952 to a Governor of Illinois who was unwilling to run unless drafted, would not in 1956 apply to a private individual who wanted the nomination. Furthermore, if Mr Stevenson can eliminate Senator Kefauver before the convention by decisive primary victories it is difficult to see how he can fail to win the party's nomination. It seems, therefore, that Mr Stevenson is thinking of entering half a dozen primaries.

Apart from these, however, there is a special danger for Mr Stevenson in becoming a full-time presidential candidate during a whole year. In a period of peace and prosperity he will be obliged, in order to find election issues, to harp repeatedly on occasional Republican misfortunes. In the process, he may forfeit some of the freshness of impact that aroused so much enthusiasm in the United States and abroad in 1952. Mr Stevenson's neatly syllogistic formulations will not work for ever. It is very well for him to say once that Republican farm policy has failed, that high and rigid price supports are not the sole answer either, and that fresh thinking is required. If he says it too many times, people will ask why an unemployed intellectual such as himself does not do the fresh thinking. If he rises to the bait Mr Stevenson may suffer the fate of any opposition leader who produces a constructive policy that could divide his own side.

Moreover, the one factor which seems most seriously to have aroused Mr Stevenson against the Eisenhower Administration was its foreign policy. He was deeply upset at the decline in American prestige throughout the rest of the world and blamed it on Republican misjudgments. It would be a pity if, as is suggested by his recent speeches, Mr Stevenson were to overlook the changes that have taken place in the Administration's ways. The rest of the world was profoundly thankful for Mr Stevenson's protests against a foreign policy of menace by slogan. It would be sad to see him become obsessed with the subject of Mr Dulles's past inflexibility.

Fords for Sale

New York

EARLY next year the public will have an opportunity to buy a share in the world's largest family-owned business. The private empire of Henry Ford, a conspicuous anachronism in the industrial society it once led, has finally bowed to the principle of broadening the base of business ownership. The Ford Foundation, a non-profit-making trust financing educational projects, at present owns over 88 per cent of the outstanding stock of the Ford Motor Company. Its trustees have decided to sell about 15 per cent of

this holding on the open market in order to diversify its investment portfolio. At the same time the members of the Ford family, who at present own all of the company's voting stock, have agreed to relinquish to the public at least 60 per cent of their voting rights. But since the shares sold to the public are expected to be widely distributed, a close-knit holding of as little as 10 per cent of the voting stock could keep the controlling voice within the family. These decisions mark the end of fifty-two years of family rule, and the negotiations behind them have kept dealers and prospective clients in Wall Street excited for over a year.

Seven large investment companies will share the coveted task of underwriting the issue and the selling group is expected to include some 500 firms in all parts of the country; they will be charged with giving the largest equity financing in history the widest possible distribution, especially among small investors. But the most eagerly-read document will be the registration statement that the company is now preparing to file with the Securities and Exchange Commission. It will disclose for the first time the earnings, assets, dividends and financial record of the company's fabulously successful operations. The chairman of the board of directors, Mr Ernest Breech, has already revealed that the company's profits for the first nine months of 1955 are greater than total profits in any previous year. For all of 1955, they will surpass the total earnings of the company for the twenty-one years prior to the second world war. This suggests that the net profit after taxes in 1955 will be between \$325 million and \$350 million; this would be equivalent to between \$6 and \$7 a share on each of the 53,500,000 shares which will be outstanding when the Foundation's holding is split 15 for 1 and the Ford family's shares 20 for 1. If the stock is valued by the underwriters at the conventional rate of ten times net earnings, its initial price would be between \$60 and \$70—and the entire initial offer of nearly 7 million shares may yield a record \$400 to \$500 million. The Foundation may, however, prefer to set a slightly lower price in the hope of ensuring a steady upward movement of the market price, thus guaranteeing the popularity of the stock when more Ford shares are "dribbled out" of its portfolio. What makes this so unique an operation is the fact that all of the profits gained in Wall Street will go to charity.

Rainbow over Indiana

TUESDAY'S elections in fourteen states were concerned with local and state officials and with referenda on local questions, especially bond issues for highways and other improvements. Beforehand the search for national political significance was concentrated on the east coast—on the votes for a Governor in Kentucky, a Mayor in Philadelphia and a State Legislature in New Jersey. But on Wednesday the Democrats found a rainbow of results shining in the midwest over Indiana, where about a hundred mayors had been chosen. On Monday less than a third of them had been Democrats; soon two-thirds of them will be an extraordinary shift. The crock of gold at the foot of this rainbow lies in the memory that there was a similar swing to the Democrats in the mayoral elections in Indiana in 1947, before Mr Truman's unexpected presidential victory in

1948, and to the Republicans in 1951, before Mr Eisenhower's triumph in 1952. The glowing Democrats interpret this week's success as proof that the Republican agricultural failure is driving the farmers into their arms. This seems an oversimplification, for Indiana is also an industrial state and these were urban elections; it is, however, true that the decline in agricultural incomes is of almost as much concern to the shopkeepers and manufacturers who supply the farmers as it is to the farmers themselves.

Elsewhere Tuesday's results showed that the pendulum which moved in the Democrats' favour last November had not swung back this year. Even though they had an able young candidate untouched by the local party machine and specially endorsed by President Eisenhower, the Republicans did not succeed in winning the mayoralty of Philadelphia. The independent voters in that city were apparently satisfied with the competent Democratic reformers whom they put in office four years ago. In Kentucky, the emotional Mr "Happy" Chandler kept the governorship in Democratic hands, even though the party in the state was far from united in his support; it was not until the last minute that he received the backing of such influential Kentucky Democrats as Senators Alben Barkley and Earle Clements. Mr Chandler may not be in as close control as a Governor usually is of the state delegation to the Democratic convention next summer, but his victory adds to the uncertainty about what will happen there; he is no liberal. New Jersey at least brought some comfort to the Republicans, for they retained control of the State Legislature which they had feared they might lose.

Trade Plus Aid

IN a study entitled "American Imports," two private research organisations, the National Planning Association and the Twentieth Century Fund, have boldly urged the Administration to adopt a genuinely free trade policy. The study frankly acknowledges that the increase in imports which would result from lowering tariffs, and abolishing special devices for the protection of domestic industries, would cause distress in certain areas and would create further pockets of unemployment. But the answer, argues Dr Don Humphrey, author of the study, is a double programme combining free trade with help for domestic industries and communities injured by imports. In other words, if America's message to its allies has been "trade not aid," its message at home should be "trade plus aid."

It is unlikely that the Administration could persuade either itself or Congress to let down all trade barriers and replace "Buy American" with "Buy abroad whenever the prices warrant it," but President Eisenhower and his economic advisers appear to agree that more protection for domestic industries is not the right way of solving the chronic problem of America's depressed areas. The President will ask Congress next year to approve a domestic aid programme to those communities which, in spite of general prosperity, "still have persistent unemployment." They include textile-producing towns in New England, and coal towns in Pennsylvania and West Virginia. A year ago, 51 areas were officially recognised as suffering from serious unemployment; at present there are only 26, but they depend on industries which are among the most vulnerable

to imports and whose claims persistently impede the Administration's efforts to liberalise trade.

The President's proposals would establish a special agency designed to show communities "how to help themselves." Federal loans would be made to assist in establishing new industries and technical aid would be provided to help re-train unemployed workers. No one expects such a programme to abolish "pockets" of unemployment altogether. It would, however, weaken the case of those who argue that the best way of restoring full employment in Pittsburgh, for instance, is to reject a bid by the English Electric Company to build distribution transformers for a project in Idaho, although this bid is substantially below those made by American competitors. The political attractions of this "domestic Point Four" plan are obvious and the problem for the Democratic majority in Congress is whether to go one better than the President and offer a programme of its own, or to reject the plan on some plausible pretext and rob the Administration of the credit.

More Power Politics

THE Democrats are keeping up their running fight against the Republican Administration's alleged favouritism toward private electricity companies. Ever since last spring a subcommittee of the House of Representatives has been trying to find out whether the Department of the Interior is in fact giving preference, as the law requires, to publicly-financed systems of electricity distribution when selling the power generated from government-owned facilities. The Democratic majority on the committee claims to have evidence that the spirit, if not the letter, of the law is being ignored as the result of enquiries into the lengthy negotiations over the sale of electric power from the Clark Hill Dam on the Savannah River on the border of Georgia and South Carolina.

Rural electric co-operatives in Georgia have the right to purchase this power directly from the government, but the Department of the Interior has, since February, 1954, been proposing that they do so through the Georgia Power Company, a private firm associated with the notorious Dixon-Yates contract. The Administration argues that, in the absence of transmission lines between the co-operative

How to get your share of the BOOMING U.S. MARKET

American Industry is now at the highest point of production in history—and is still climbing. Not only is this expanding market bigger in size. Its consumption and capital equipment replacement rate is, per capita, far greater, too.

Even a fraction of this market could represent a substantial business for you.

So if your product is being sold, or can be sold, to American business and industry, your prospects have never been brighter than they are now—IF you go about it the right way.

For in America goods are not so much bought as *SOLD*—this means that sales and distribution must be backed by consistent and aggressive advertising in those business publications which your customers read. In America business publication advertising automatically means McGraw-Hill.

McGraw-Hill is the leading publisher in the United States of business and technical journals—34 in all—covering practically every field of industrial endeavour. And every journal is by far the leading one in its field—with many tens of thousands of subscribers who *BUY* through its pages. But McGraw-Hill's service does not end there. It also offers vital information—such as the market potential for your product... how to go about establishing your sales and distribution organisation and so on.

So why not have one of the London McGraw-Hill men show how you can gear your sales programme to today's opportunities? He has access to a wealth of specific and helpful data on *your* product market. His job is to make it freely available to you. Write or phone today. No obligation, of course. If you would like additional evidence on the long-term outlook for business write for a free copy of "The American Economy... Prospects for Growth."

McGRAW-HILL

PUBLISHING COMPANY LTD.

distributing centres and the generating stations, and so long as Congress is not prepared to provide money for new lines, a "middleman" arrangement is the only practical one. Faced with strong opposition from the co-operatives, the department withdrew its proposed contract with the Georgia Power Company and began working out a scheme whereby the latter would not act as seller but merely as transmitter. Simultaneously, however, the Department of the Interior consulted the Attorney General who ruled that there should have been further attempts at direct negotiations with the rural co-operatives. Mr Aandhal, an Assistant Secretary of the Interior, did not disclose this

ruling to any of the parties concerned and continued to work out an arrangement with the private firm.

It is on this fact that Mr Earl Chudoff, the Democratic chairman of the subcommittee, has based his allegations of impropriety. According to Mr Chudoff, Mr Aandhal, a known opponent of publicly-financed utilities, has been deliberately carrying out an Administration plan to "blackjack" the co-operatives and promote private enterprise in the region. Mr Chudoff, moreover, claims that the plot was hatched at "secret" White House conferences and has demanded a list of all who attended the meetings concerned with the Clark Hill contract. Mr Sherman Adams, the President's Assistant, has refused to comply.

Flow of Funds

THE fact that the government today is relying so much on credit regulation to keep the United States on an even economic keel makes especially timely the publication of the Federal Reserve Board's new method of analysing the national economy. For this "flow of funds" system covers all transactions that involve transfers of credit or money; it thus goes farther than the two current systems which deal with national income and product and with "input-output," or technological, relationships between industrial groups. The new analysis includes transfers of existing assets, such as land, second-hand cars, securities and mortgages, as well as purchases and sales of new products. In effect it provides a balance of payments statement, similar to those worked out for international accounting, for each of ten groups, or sectors, which are responsible for the country's business activity.

Every transaction recorded is entered at least four times in the accounts: a cash purchase appears as a purchase, a sale, a reduction in the buyer's cash and an increase in the

seller's cash. The figures are in most cases obtained by adapting existing data and the main purpose is to clarify the links between financial and non-financial processes in the economy. The annual record has been carried back to 1939, but the board realises that quarterly figures, which it hopes to provide later, would be more helpful. The present form of the accounts is not final and they can be adapted as more practical experience is gained in their application and as statistical techniques improve.

Practical experience is also needed to show economists and businessmen how these new figures can best be used, but there is little doubt that eventually they will be valuable guides to many economic trends—to future demands for capital, to the composition of private debt, and to the probable effects of inflationary pressures and tax changes. In particular the new method of analysis should make it easier to forecast the financial prospects of consumers of all kinds and therefore to assess their coming demands for goods and services.

Farmers Union

FROM A CORRESPONDENT IN COLORADO

HALF a century ago ten men, united in common poverty, sat around a pine table in a country school-house in Texas, and by the light of an oil lamp drew up the articles for a new organisation with the ambitious title, "The Farmers Educational and Co-operative Union of America." They included a country editor, a doctor, a school teacher, a county clerk, and six local farmers. Together they borrowed \$1,000 to put their basically simple plan into effect. They proposed to organise local associations of farmers to buy supplies and necessities and sell the products of their farms co-operatively, thus by-passing middlemen, processors and others who, they felt, were sucking their lifeblood. Savings were retained in the common treasury to provide more working capital, and a small part of them went to support the National Farmers Union, as it came to be called, and its state and local affiliates, in order to carry on the educational functions implied in the original title.

The organisation spread over the Great Plains like wild-fire, among farmers who felt themselves oppressed, as the Populist and Granger movements had spread a few years earlier. Later, it ran into difficulties, largely because of the too ambitious co-operative programme. Then it was almost extinguished by the sweep of another organisation with an even more ambitious programme, the Nonpartisan League, which wanted to take over state governments. After the first world war, the Farmers Union made a slow come-back as the Nonpartisan League receded. But it was almost wrecked again in the depressed nineteen-thirties when its officials ignored the unspoken mandate to keep it out of partisan politics and tried to rally its members behind William Lemke, of North Dakota, the presidential candidate put up in 1936 by the fascist Father Coughlin, of Detroit.

★

After this the union adopted a new rule, that officers must not play a personal role in partisan politics. A few years later the union elected an aggressive and dynamic young man, Mr James Patton, of Colorado, as its national president, and since then its membership and influence have been climbing steadily though slowly. The union enjoyed high favour in Washington during the New Deal Administration, and worked for most of the farm programmes which were inaugurated then, such as soil conservation and rural electrification; it also believes in high price supports for farm products. Alone among major farm organisations, it backed the so-called Brannan plan for direct subsidies to the producers of perishable crops; in fact, the union's policies agreed so closely with those of the Democratic Administration that in some quarters it was described as the farmers' wing of the Democratic party.

When the Republican Administration came in, the American Farm Bureau Federation, the huge, powerful and conservative rival of the Farmers Union, took its place in Washington. The Farmers Union has since grown increasingly critical of the Administration's agricultural policies. In particular it argues that they are undermining family-type farming, of which it has always been the champion, and favouring the large farm units, run like

THE ECONOMIST, NOVEMBER 12, 1955

businesses and worked by machinery and hired labour. The union has provided the spearhead of opposition to many of President Eisenhower's farm proposals, particularly through its influence in Congress, where many members from rural districts sympathise more with the Farmers Union than with the Farm Bureau.

In the last two or three years, as dissatisfied farmers have become increasingly concerned about falling prices, the union has moved right into some of the strongest Farm Bureau states, such as Indiana, Pennsylvania and Virginia. This has required little aggressive action on the part of the union itself; it has always been strong in the wheat areas but now it is invading the maize-hog belt. The union has branches in about thirty states but its twin bastions remain in North Dakota and Oklahoma, at opposite ends of the Great Plains; in each of these states it is by far the most important farmers' organisation.

★

Today the Farmers Union is growing rich. Many co-operatives bearing its name have gone their own way and no longer contribute their share of savings; but there are still enough such contributions to provide more than \$1 million a year. The union has recently moved into a new national headquarters building in Denver, twelve stories high and costing \$3,500,000. When planned it was widely publicised as proof against anything except a direct hit by an atomic bomb; now even its builders admit that a near miss by a hydrogen bomb would vaporise it. Basically it is a hollow cube of the strongest reinforced concrete and it is the first large building for a long time to carry its weight on its walls.

After the last war the union, always seeking to organise vertically from raw materials to finished products in the interests of greater savings for its members, spent several hundred thousand dollars on prospecting for potash and phosphate in the western states. These explorations "hit the jackpot" and the union holds valuable leases on rich deposits of both minerals in New Mexico and Utah respectively. It has recently dramatised its emergence from rags to riches by going into partnership with two large private concerns, Kerr-McGee Oil Industries Inc. and the Phillips Petroleum Corporation, for joint development of these deposits.

The ultimate purpose of the union's economic growth is to serve farmers cheaply and at the same time to amass funds to expand its elaborate educational programmes. Technically, it is an organisation of farm families—nearly 300,000 of them by now—and its educational and propaganda activities are directed at every member of such families from the toddler up; it also has a department of religious activities. When Mr Charles Brannan, Mr Truman's last Secretary of Agriculture, left Washington, he became the union's general counsel; since then the national organisation has hired so many of his former officials that some people have referred to the Denver headquarters as the New Deal agricultural department in exile. The suggestion seems to be that Mr Brannan and his friends will keep their hands in, and return in triumph to Washington, if and when the Democrats resume control of the national Administration. This is doubtful, but there is no doubt that the Farmers' Union will remain a powerful, articulate and probably influential critic of the Republican Administration.

PROGRESS IN ELECTRONICS

A phase in Mullard research on multi-cavity magnetrons—essential components of modern radar systems.

PATTERN

This scientist is concerned with a specific problem in one particular field of electronics. But his work fits into the overall pattern of Mullard research—a pattern for progress.

Working hand in hand with the designers of leading equipment manufacturers, Mullard scientists

FOR PROGRESS

are helping to establish Britain's leadership in electronics.

When the time comes for you to invest in new electronic techniques, you will find it pays to remember that this combination is helping to produce the most efficient and reliable equipment in the world.

This man is NEWS

The staff of Cable & Wireless Limited is indeed a family of Nations. Literally scores of nationalities play vital parts in the passing of news, business messages and information between the countries of the Commonwealth. Here, you see an Indian technician at one of the many transmitters at the Company's Singapore branch.

The Company owns and maintains wireless relay stations on the Commonwealth trunks routes, operates the overseas telegraph services of most of the Colonial territories and cable services in various other countries throughout the world. Furthermore,

it owns a world-wide network of 150,000 miles of submarine cables and maintains it with a fleet of 8 cables-ships.

Although it does not operate Overseas Telegraph Communications in this country, Cable & Wireless Limited is at your service day and night. The simple act of passing a cable form across a post office counter or 'phoning a message from your home or office to 'Overseas Telegrams' sets it working for you. Cabling is very easy, very swift, very sure and costs much less than you'd expect.

The World Overseas

Dispirited Geneva

FROM OUR SPECIAL CORRESPONDENT

THE "better baggage" Mr Molotov said he was bringing back with him from Moscow turned out to be a match with which to explode the Spirit of Geneva. The report of the explosion was the louder for the fanciful stories in the western press, attributed to well-informed Communist sources and claiming that the Soviet Foreign Minister would come back from the revelries of October Revolution Day, bearing caviare in the shape of an offer to accept free elections in Germany. But the speech he made to the Ministers when they reassembled after their three-day recess was "better" only in the sense that it was more uncompromising than ever—a demonstration of Russian intransigence that was not unwelcome in the context of this abortive sequel to the "summit."

That the three Western Foreign Ministers must have derived some satisfaction from the sensation of having a door slammed so violently in their faces is less paradoxical than it might appear and does not imply a touch of masochism. It is wrong to believe, as one British newspaper has suggested, that the three Western Foreign Ministers put forward their proposals for German reunification and European security in a spirit of cynicism. But it would be straining the imagination to suggest that they expected Mr Molotov to accept their plan. They would have been delighted at being proved too pessimistic; but if their pessimism was to be justified, they had everything to gain from a clear and brutal Soviet rejection.

And if this was indeed what the doctor had ordered, Mr Molotov dispensed it with pharmaceutical precision. By stating at the outset a thesis in which they sincerely believed and which, by its nature, scarcely allowed any possibility of bargaining, the Western Ministers succeeded—with Mr Molotov's help—in demonstrating beyond controversy that the Russians are afraid of free elections in Germany; that they oppose German reunification for political reasons and not for considerations of security; and that their conception of security is a Western Europe rendered defenceless by the retirement of the American and British forces.

This western propaganda success—for such it was—must have been the more gratifying to Mr Macmillan, Mr Dulles and M. Pinay, because of the shakiness of their initial onslaught and the comparative vigour of Mr Molotov's first counter-attack. The joint statement on German reunification and European security tabled at the outset by the three Western Foreign Ministers, pre-supposed

Germany's entry into Nato. The wording of the relevant passage lent itself to the interpretation that a reunified Germany would be deprived of freedom of choice as to the direction of its alliances; and Mr Molotov was prompt to seize the opportunity to secure a debating point. The truth was, however, less unfavourable to the West than Mr Molotov felt himself entitled to suppose. The offending passage read:

the final stage (of the proposed treaty of assurance) would become effective when a reunified Germany decides to enter Nato and the Western European Union.

In the absence of explanatory clauses, this bald statement could seem to impose certain choices upon the government of a united Germany. But this was not the point, though it was fair game for debating purposes, and Mr Molotov was adroit enough in pretending incomprehension. The point was, as M. Pinay belatedly made clear last Tuesday, that a new security pact, as such, is of no interest to the West—which already has its security pacts, Nato and Western European Union. The western offer of a treaty of assurance is designed solely to meet possible Russian fears arising out of the reunification of Germany; and since a neutral Germany or a Germany that decided to join the Warsaw powers would not constitute a threat to Soviet security, the western attitude is that a security treaty would be pointless unless Germany joined Nato and WEU. If this was insufficiently clear from the original western draft it became plain beyond a doubt when M. Pinay said: "If reunified Germany became a member of the Warsaw group, it would obviously not be ourselves (that is, the western powers) who could guarantee that Germany would not commit any aggression."

Mr Molotov was, perhaps, on firm ground when he complained that the western draft treaty proposed a zone of limited armament "on both sides of the line of demarcation between a reunified Germany and the Eastern European countries." He was able to remind his western colleagues that Sir Anthony Eden in the pilot project of arms inspection that he put forward at the summit conference, had suggested as a line of demarcation the present zonal frontier across Germany. It would be childish to pretend that this reminder did not embarrass the Western Ministers in spite of the explanation that the Eden project was proposed in the context of disarmament, while the western draft treaty was concerned with security. Mr

Macmillan, bubbling over with impromptu parliamentary additions to his prepared speech, was able to taunt Mr Molotov with being afraid to face the verdict of the people of Germany; M. Pinay made capital out of the mounting flow of refugees from east Germany; and Mr Dulles was able to point out that the Western Ministers had followed the directive handed out to them by the heads of government, while the Soviet Minister had not.

The subsequent statements by the Communist side were free gifts to the Western Ministers. The Russian proposal for the creation of an all-German council to pave the way for reunification on Communist terms was the clearest admission of Communist unwillingness to put the popularity of Herr Ulbricht's regime to the test of a secret ballot; and last Sunday's statement by the leader of the east German observer delegation in Geneva rejecting the western proposal of all-German elections next September caused the western spokesman to observe—perhaps optimistically—that every shade of west German opinion would now be united in opposing all political dealings with the east German government. Even the optimistic Mr Dulles, is reported to have sunk into a mood of profound pessimism on seeing the contents of Mr Molotov's baggage. The dinner party which brought all four Foreign Ministers together that same evening must have been a severe test of everybody's capacity for good humour.

What then are the prospects at this stage of the conference? For technical reasons no concrete progress was expected on disarmament, and little seems likely to emerge from the deliberations of the committee on East-West contacts beyond a broad declaration of common principles. As to the main issues it can be said that the Western Ministers have no intention of departing from their principles. A Russian concession of substance, at the last moment, cannot be excluded but seems slightly improbable. Unless the Russians do climb down it seems unlikely that the conference will drag on beyond the middle of next week. But it cannot be predicted with certainty whether the break will then be final. While continuing East-West contacts on a lower level are regarded as pointless, there are arguments in favour of yet another Foreign Ministers' conference next spring. And that, at the time of writing, seems the only concrete decision likely to emerge from the present gathering.

Israel's New Government

FROM OUR CORRESPONDENT IN TEL AVIV

MR BEN-GURION, back again at the helm as Premier and Minister of Defence, drives a very different team from that of his former coalition. Instead of the General Zionists, the champions of private enterprise, he has as his partners the two leftist parties, Achduth Avodah and Mapam, in addition to the Hapoel Hamisrahi, which represents the Labour wing of the religious bloc and the liberal Progressives. If this is not a Labour government in the traditional sense of the term, it is certainly Left-centre with the emphasis on Left.

The Hapoel Hamisrahi is certain to go along with Mapai, Mr Ben-Gurion's party, both in matters of foreign as well as social policy; on all religious issues it will fight for its

own aims. The two leftist parties, especially Mapam, will probably have differences with Mapai over both foreign and domestic policy. During the negotiations on the new coalition Mapam set down its reservations on foreign policy in a letter to Mr Ben-Gurion. It opposes the granting of foreign bases to any power whatever. It opposes a security treaty and reserves the right to leave the government should such a treaty be concluded. One of Mapam's leaders declared in the debate on the new government's policy that his party was in favour of a four-power guarantee of Israel's borders. Thus for the first time in years neutralism has entered Israel's cabinet.

Between Mapai and its colleagues on the left there are also differences over domestic policy. Achduth Avodah and Mapam both came out strongly during last summer's election campaign for the abolition of the wage-freeze which has been maintained by the trade unions over the last year or two and demanded a rise in basic wages. Ministers belonging to Mapai have again and again pointed out that in Israel, where wages are already high in relation to output, basic wages should be raised only where this is warranted by increased productivity. A group which favours higher wages does exist within Mapai, but up till now it has been outvoted. The problem will soon become acute, because collective agreements between the trade unions and the manufacturers' associations are to be renewed in January. Between now and then the Cabinet will have to thrash out the issue; time will show whether government responsibility and the more intimate knowledge that comes with ministerial office will influence Mapam and Achduth Avodah. It will not be at all easy for them to drop their demand for higher wages, because they advocated it so strongly during the elections. As wages and salaries in Israel are linked throughout to the cost of living index, rises will certainly exert strong inflationary pressure and destroy the present relative stability of prices.

Mapai Predominates

The new Ministers belonging to Achduth Avodah and Mapam all believe in quick development by public authorities. They will give vigorous support to Mr Ben-Gurion's programme for the drive "South," the development of the Negev, irrigation plans, and dispersal of the population over sparsely populated regions. Both parties, although opposed to war and certainly to preventive war, are strongly "security-conscious," as they are steeped in the traditions of the Haganah. One of the new Ministers held a regional command in the war of independence; all four of them are members of collective settlements or formerly belonged to one.

Although the coalition is a five-party one, it is predominantly Mapai. Despite Mapai's decline in the last elections, it has managed to keep for itself the main Ministries—the Premiership and the portfolios of Defence, Foreign Affairs and all the departments dealing with economic matters—that is Finance, Agriculture and Labour. Even the Ministers of Commerce and Industry—until now the domain of the General Zionists—has been taken over by Mapai. The leftist parties had to be content with Development, Transport, Health and the Interior.

In his opening speech to the Knesset, Mr Ben-Gurion offered to meet Colonel Nasser and other Arab leaders in order to make peace. In his closing one, he offered condolences to the families of the fallen in the battle of Nizana

which had been fought on the previous day. The atmosphere of "war and no war" in which the new cabinet takes over gives a strange impression of living in twilight. The five-party coalition, which looked frail at first, may derive more stability than anyone expected from the feeling of emergency that prevails throughout the country.

Afghan Ambitions

BY A CORRESPONDENT

THE Afghans are playing with fire. On the one hand they are allowing themselves to become even more closely involved with their big and powerful neighbour, the Soviet Union, and on the other they are redoubling their propaganda attacks on Pakistan over the familiar issue of "Pakhtoonistan"—the hypothetical state which the Afghans want to create, at Pakistan's expense, for the Pathan frontier tribes who mainly live on the Pakistan side of the border.

The connection between the Russian overtures and the revival of the Pakhtoonistan issue can hardly be treated as fortuitous. Hitherto Pakistan has been able to treat the Afghans' provocative behaviour with some contempt. But closer relations between the Afghans and the Russians, and thinly disguised Soviet military aid for Kabul, will make for a different situation. Unlike other recent recipients of Russian aid or arms, Afghanistan is contiguous to the Soviet empire, and the ugly possibilities arising out of this fact are obvious. For a weak country lying on the perimeter of a vast empire it would be more prudent to keep the powerful neighbour at arm's length than to open the door to him.

There are two recent developments in the growing *rapprochement* between Afghanistan and the Communist bloc. One is the news that Marshal Bulganin and Mr Khrushchev are to visit Kabul next month on their way back from India. The other is the acceptance by Afghanistan of an invitation to send a military mission to Prague to inspect the latest types of military equipment. The Afghans, unable to obtain American arms because of their bellicose attitude towards the United States' ally, Pakistan, are now, like the Egyptians, being tempted with offers of Czech arms.

Russian Economic Stranglehold

They have, it should be noted, been getting considerable American economic aid, particularly for irrigation, flood-control and power schemes. But the Russians, too, have for some years been extending economic credits to the Afghans, although on a much smaller scale, for such projects as the construction of oil storage tanks and grain elevators, and in the process they have lost no opportunity of increasing their political and economic influence. Some 500 Soviet technicians and construction workers are now in Afghanistan. They have distributed Communist literature amongst Afghan workers, and on at least one occasion Communist slogans have had to be removed from the masonry of a building into which they had been built. The country's foreign trade is being gradually re-orientated towards the Communist bloc; 35 per cent of its exports now go to the Soviet Union. Afghanistan has become largely dependent on Russia for its oil supplies; and when supplies through

Pakistan were cut off last summer, the Russians sharply reduced their own supplies as if to ram home the fact of their growing economic stranglehold over the country.

So long as the British balanced the scales in Asia, it was repeatedly made clear to the Russians that their southward expansion across Central Asia must stop at the Oxus. The first Afghan war was the direct result of Dost Muhammad's bid for Russian help in forwarding his ambitions in the Indus valley. The second, forty years later, was provoked by a similar leaning of the Amir of the time towards his northern neighbours. The departure of the British has left Pakistan to act as the warden of the marches; this it may be capable of doing, in the sense that it is well equipped to repel invasion, but it has no influence to restrain Afghanistan from going astray.

Last month Pakistan decided to merge West Pakistan into a single administrative unit. This involves the disappearance of the North-West Frontier Province, the Pathan homeland, as a separate unit, and gave the Afghans a plausible excuse to revive their propaganda in favour of "Pakhtoonistan." The Afghan Minister in Karachi has been withdrawn in protest against the proposed merger,

although he has denied that his recall meant any rupture in diplomatic relations between the two countries. Last week Karachi radio asserted that the Afghan government had doubled its troops west of the Durand Line and was openly threatening aggression against Pakistan; and this week the Pakistan government has protested against Afghan attempts "to create trouble" inside Pakistan.

Until recently "Pakhtoonistan" had cut little ice with the Pathans; it was anything but a spontaneous agitation and only one prominent *malik* had gone over to Kabul. Unfortunately, however, the fuss over the integration of West Pakistan has brought it an influential recruit in the person of Khan Abdul Ghaffar Khan, the veteran Pathan leader. The Khan is of course a natural rebel, and the score is made equal by the fact that his respected brother, Dr Khan Sahib, is the Chief Minister of the new united province of West Pakistan. Nevertheless, the Pakistan government must be feeling more anxiety about the effect of Afghan propaganda on the frontier than before.

There is really nothing to be said for the creation of an independent homeland for the Pathans. Even the Afghans seem to have recognised that it would be an economic impossibility without an outlet to the sea; hence their invention of a sea coast for this Bohemia by the inclusion of Baluchistan, Kalat and the Makran coast (entirely non-Pathan areas) in the national Pakhtoonistan. Pakistanis can also effectively challenge Afghan good faith by pointing out that they envisage self-determination being offered only to the Pathans on the Pakistan side of the Durand Line, and not to those on their own side. There has probably

never been an international issue more artificially contrived and resting on such a flimsy foundation. The Pathans are shrewd judges of their own best interests, and these certainly lie with Pakistan. The industrial development of the North-West Frontier has brought them a greater measure of prosperity than ever before, and they are still receiving subsidies from the Pakistan government on the same scale as those paid by the British.

Trade Across the Elbe

THE German Social-Democratic Party could not be prevented from presenting its own proposals for German reunification during the Geneva conference, though Dr von Brentano, the Foreign Minister, was satisfied with the case made by the three western powers. The SPD's proposals are confused and contradictory; they contain some far-reaching suggestions for collaboration with the Soviet Zone authorities as well as a declaration against "so-called unity of action between democratic and anti-democratic organisations." It is proposed that "agreements or understandings with official quarters or government authorities in the Soviet-occupied area" should be concluded, and the surprising statement is made that in the field of administration of justice as well as of social services and education, both the Federal Republic and the Soviet German government must legislate "with a view to facilitating alignment or convergence of practices." It is unfortunate that the Social-Democrats should suggest in this way that the western system should be *gleichgeschaltet* with that of "Red Hilde Benjamin," the Communist German Minister of Justice.

The Socialists also tackle the question of evening up the economies of the two parts of Germany, and make some proposals for increasing interzonal trade. At present, barter trade lags far behind the DM 1,000 million which the Communists insisted should be the target for 1955. They blame the western authorities for refusing licences and complicating the procedure unnecessarily. The real reasons are very different. The eastern side is constantly failing to deliver the goods for which licences have been issued, and the western authorities are forced to take defensive action by stopping deliveries from the Federal Republic. An effort has to be made to ensure that valuables such as iron and steel are not sent to the Soviet Zone without comparable deliveries of brown coal and similar "hard" commodities. The Communist side has to be prevented from selling synthetic silk stockings for Ruhr steel.

Stockings for Steel

Another ground for western defensive action is the Communist practice of dumping. The Communist authorities do not commit themselves to deliver any given quantity of goods over the year, but only a stated value. Their prices often bear little relation to costs in the Soviet German economy, and western German manufacturers naturally demand protection against a sudden flood of cheap and shoddy goods from over the interzonal border. The Social-Democrats' proposals ignore the real grounds for this situation, and declare flatly that if both sides concede what is necessary to "ensure opportunities for jobs and enter-

prise" the West can simplify its formalities, and obtain guarantees against dumping.

Similarly, the real problem of interzonal payments is ignored. At present, goods are valued in the western D-mark, which is called a "unit of account" in order to save the face of the Soviet Germans. The purchasing power of the eastern D-mark is still less than half that of the western currency, and the ordinary public are even prepared to pay four to one in favour of the Federal Republic's notes. But in interzonal trade, owing to the arbitrary pricing of goods by the Communists, it is not possible to affix a definite exchange rate to the two marks, and the complicated method of barter, using the western mark as a basis, is the only expedient which can safely be adopted by the western authorities. The Social-Democrats, however, have now put forward a proposal that a clearing system should be established "between the areas of validity of the Soviet Zone and West German D-marks." The area of the eastern mark is only East Germany; but it may be that the Socialist proposal means that Soviet Germans should be included in the area of the Federal Republic's transferable D-mark, which is now very wide. The Communists could, however, only benefit from such a concession if they had a surplus in trade with any other country in the transferable D-mark areas. The Socialists, on the other hand, are possibly only suggesting that the Federal authorities should abandon their practice of balancing hard goods against one another and should agree to take stockings for steel.

On previous occasions, Social-Democrat proposals have shown that the party's leaders are aware that the very existence of two currencies is a crucial hindrance to the amalgamation of divided Germany; and they have hinted that help should be given to the Soviet Zone economy in order to bring it up to the level of the West. On this occasion, they do not go so far, and the measures they suggest are put forward only as palliatives. The fact remains, however, that the path along which they would proceed would end in the West having to give financial help to the "Democratic Republic." But this is hardly a feasible proposition to put forward as long as the Soviet rulers refuse to allow free all-German elections.

Jugoslavia's New Course

JUGOSLAVIA'S economic planners show no signs of being influenced by the present trend in the Soviet bloc, in spite of Belgrade's more friendly relations with Moscow and its prospects of obtaining considerable economic help from Russia. On the contrary, whereas in Eastern Europe the emphasis has once more swung back to heavy industry and more collectivisation, in Yugoslavia the consumer goods industries are now the apple of every planner's eye, and in discussing the backward state of agriculture no one thinks of suggesting that the remedy lies in a reversion to collectivisation on the Soviet model.

Although there is some talk of a "new course" in Yugoslav economic policy, Belgrade spokesmen are careful to point out that the course plotted at the end of September, when economic experts from all over the country met under the chairmanship of President Tito, does not represent a complete about-turn, but merely a fresh stage in Yugoslavia's

The English coach used by George Washington during his presidency.

Accurate and Tough

For no practical purpose—merely to show how accurately it could work—an abrasive-coated belt by CARBORUNDUM was used, on a belt grinding machine, to grind the print off a sheet of newspaper, which was left completely plain. To achieve precision of that order, an abrasive belt must be manufactured with great care. For instance, we control the thickness of our coated abrasives by means of special nucleonic gauges, which use Beta rays to provide an exact and continuous check on the thickness of the backing material, the combined thickness of backing and adhesive, and the overall thickness of the finished product. Again, most coated abrasives by CARBORUNDUM have the abrasive grains applied to them by an electro-coating process in which electro-static attraction is used to lift the grains and arrange them on the backing material in an erect position, so

that their cutting edges are effectively presented to their work.

Coated abrasives by CARBORUNDUM are tough as well as accurate: we make abrasive belts that stand up to such punishing work as the dressing of metal castings, the bevelling of plate glass, and the lapping of tungsten-carbide tools.

We make waterproof coated abrasives for grinding operations that require the use of liquid coolants, and waterproof sheets and discs for rubbing down painted, lacquered, or cellulosed surfaces. These surfaces (especially cellulose) would soon clog the abrasive if it were not repeatedly rinsed. The photograph shows a typical use of waterproof paper. Here it is used with a reciprocating hand sanding machine to rub down existing cellulose on a motor car wing, to provide an absolutely smooth foundation surface for re-spraying.

Abrasive and Refractory products by CARBORUNDUM

THE CARBORUNDUM COMPANY LIMITED, TRAFFORD PARK, MANCHESTER

economic development. Yet although the planners have apparently been meditating some changes in policy for a year and more, the present draft of the 1956 economic plan will have to undergo considerable revisions to bring it into line with the new directives, and consequently it will not be ready for presentation to the National Assembly before December. Meanwhile the new course is being exhaustively expounded throughout the country.

The need for some change in economic policy, which now has behind it all the weight of President Tito's influence, is simple and obvious enough. The Yugoslav people have not only been having a thin time for years, they are still having one. And while they might be expected to accept the necessity for high prices, short supplies and a general tightening of belts during the immediate postwar years; and during the crisis that followed their break with the Cominform, they are bound to feel discouraged and disillusioned when this state of affairs looks like going on indefinitely. They will not long be impressed by Marshal Tito's successful foreign policy if he cannot match this with less austerity at home—and this apparently goes for a good many members of the party as well as for those outside it.

The Yugoslav Communist leaders, unlike their opposite numbers in Eastern Europe, now appear to be ready to pay more than lip-service to the needs of the consumer. "It would be wrong," said President Tito, when opening a new hydro-electric plant some weeks ago, "at the present time to add more and more enterprises to the burden of the people and to deny them the right to a better life." Yugoslavia's economic development will not now come to a halt, but it will build enterprises "whose production will be felt in the standard of living of our working people as soon as possible. . . . We do not have to build to such an extent that we put our bones and lives into these stations . . . today this is no longer necessary." The government, however, is resisting the temptation to pretend that higher living standards can be reached without plenty of hard work by everyone; to increase wages before there is a considerable increase in the supplies of consumer goods will, it is made clear, only increase the inflationary pressures which are already serious enough.

Local Extravagance

Over the last three years as much as 30 per cent of Yugoslavia's annual production has been re-invested in capital goods. Now it is to be the turn of agriculture (which is still stagnating at the 1939 level) and of the consumer goods industries. Investment funds are to go where they will yield the quickest returns for the smallest expenditure, and to ensure this the federal authorities are preparing to play a much more active role than in recent years. They could, in fact, hardly avoid doing so; decentralisation has clearly been pushed too far, and has gone to the heads of many individual enterprises. Local spending has, as might be expected, too often been inflated by local ambitions, and there have been dark grumblings about cars for managers, expensive junketings to trade fairs, and luxurious administrative buildings built entirely of marble and furnished in the most expensive woods.

While no doubt some enterprises will resent the curtailment of their spending sprees, the general public is already expecting great things from the proposed economic changes. How far the government will be able to fulfil these expecta-

tions remains to be seen, but with economic aid now coming from both the East and the West, it will be working under more favourable conditions than it might. Moreover, this summer has been a wet one in Yugoslavia; and while this is depressing for the tourist industry, it does mean a harvest that will probably be rather better than usual. And without good harvests (or continued dependence on American generosity) it is hard to see how the government can both maintain adequate food supplies and grapple successfully with its balance of payments problem. But even good harvests will not help unless the authorities can really regain the confidence of the peasants and secure their willing co-operation in the sale and distribution of their produce.

After Brazil's Elections

FROM OUR CORRESPONDENT

DESPITE the victory of Snr Kubitschek in the presidential elections on October 3rd, the political atmosphere so far remains calmer than might have been expected. The military leaders have accepted the election results to the extent of formally announcing that they are determined to guarantee that Snr Kubitschek shall take office. The recent shake-up in the army and the dismissal of some of the more vocal commanders shows that they are practising the restraint they preach by curbing those who want to deny Snr Kubitschek a chance to disprove their suspicions of him as a resurrector of the Vargas regime. But Snr João Goulart's success in his bid for the Vice-Presidency is a more difficult pill to swallow. One thing is evident—that Snr Kubitschek will be governing with the armed forces looking over his shoulder, and this brings silent comfort to many Brazilians.

One reason why responsible Brazilians and the military leaders are accepting with outward equanimity the distasteful verdict of the polls is that they seem to appreciate more than ever that the country cannot afford any more political distractions. Moreover, they recoil from the distasteful and perhaps dangerous expedient of tampering with the verdict of the 5 million voters who came out for the two "candidates of the people," Snr Kubitschek and his rival, Snr Adhemar de Barros, who came third in the running. (Those who voted for the conservative candidate, General Juarez Távora, backed by the Church and the traditional element, numbered 2.5 million, while another 700,000 preferred Snr Plinio Salgado, the former fascist leader.)

The result of this election shows, as did those of 1950 when Dr Vargas, as the "Father of the Poor" defeated two conservative candidates, including the government nominee, that most Brazilians are loath to deposit much confidence in an aspiring leader who represents a class which they identify with employers and capital. But the average Brazilian voter today is far less susceptible to demagoguery than he was in 1950. And his reaction, despite his disillusionment with the last Vargas regime, in voting for a man who campaigned as the heir of the Vargas "true mission" and as a champion of ordinary people, is causing a good deal of soul-searching in the conservatives' ranks. Two middle-class Brazilians, one of them a minor official, made a revealing remark which appears to typify the attitude of many voters. In effect, each

said: "Normally, I would vote for Távora, whom I respect as a person. But as a wage-earner I suspect his associations and his commitments to a class other than my own more perhaps than I do Kubitschek and his associations."

The three chief candidates differed little in their approach to the broad issues of national and economic policy. The average voter appears to have decided between them on the basis of class and of his attitude towards the Vargas regime, and the election results seem to show that the Brazilian people have become neatly divided into two by these two issues. The question now is, how far will the new government succeed in leading the division? The leaders of the armed forces are anxious to avoid any further strife with all the economic damage that this entails and they hope that Snr Kubitschek will not take his pledge to champion the ordinary people too far. They hope that he will spare them further embarrassment by discarding the influence of at least some of the company he has been keeping, and they have the Communists particularly in mind. The Communists, however, may be easier to shrug off than the rabid, strident populist element, the *Janguistas*, who will now be represented at the new President's side by his vice-President, Snr Goulart.

Snr Kubitschek is already behaving as if he realised the difficulties that beset the path before him and a sense of mission is discernible beneath the surface of his elation. He has, for instance, announced that one of his first preoccupations will be the reorganisation of agricultural credit and conditions and not the wholesale review of urban wages that had been expected. He also plans to make a "study tour" of the United States and Europe including England and Eastern Germany before taking office, in order to "sell Brazil" and to discuss trade and investment. It will be the first time that a Brazilian President-elect has undertaken such a mission.

Snr Kubitschek may never be a new Vargas, either in the sense that the masses hope for or that other Brazilians fear. So far, the defeated parties, like the army, are accepting the situation, hoping for the best, and showing restraint in spite of inflamed arguments by some leaders who are demanding that the result of the election should be declared null because Snr Kubitschek was supported by the outlawed Communist party. Political restraint is certainly a quality which would be beneficial to Brazil.

Queen Juliana's Tour

FROM OUR CORRESPONDENT IN HOLLAND

QUEEN JULIANA and her husband returned this week to Holland after a brief but memorable tour of Surinam (Dutch Guiana) and the Netherlands Antilles. By common consent, the visit could hardly have been more successful or more timely. The presence of the Sovereign in these overseas portions of the Kingdom less than a year after its reorganisation into co-equal partners, appropriately underlined not only the uniqueness but also the underlying unity of the new-style Netherlands Kingdom. Each of the partners enjoys complete internal autonomy, and both Surinam and the Netherlands Antilles have their own parliaments elected by universal suffrage. In dealing with "Kingdom affairs," such as defence and foreign policy

which are of common concern to all parts of the Kingdom, elaborate provision has been made in the constitution for joint consultation and the participation of the overseas territories in making and executing common policies.

By these wise and far-reaching constitutional reforms the Dutch have succeeded in doing two things: they have secured the willing co-operation of the peoples of Surinam and the Netherlands Antilles, and they have succeeded in persuading the United Nations that self-government in these overseas territories has become a fact. Only recently a highly critical UN Committee agreed to release the Dutch Government from the obligation to report on these territories.

But if the constitutional problems have been settled the economic ones remain. Surinam—lying between French Guiana to the east and British Guiana to the west and

sealed off from the interior of Latin America by impenetrable jungle—has a population of 240,000, more than 90,000 of whom are crowded into the capital, Paramaribo. There has been a persistent drift of population from the country areas to the capital and to the bauxite mines at Moengo and Paranam which has emptied the interior and diminished the agricultural labour force. If this drift is not arrested the country will soon have to rely on food imports; at present it can still produce a small surplus for export.

The most profitable source of income at present is from bauxite; 3.4 million tons, making up 83 per cent of the country's total exports, were exported in 1954. Production can be increased further and now that it has been decided to build a new dam at Sara on the Surinam river which will produce the hydro-electric power needed for the establishment of an aluminium factory, the future of the industry is assured. But the fact remains that the economy is too narrowly based. In 1947 the so-called "Prosperity Fund for Surinam" was set up by act of parliament in Holland. Its object is to provide finance for economic and social projects. Surinam itself has not the means to provide capital out of its own savings, which amount to no more than 5 per cent of the national income. Increasingly, however, the mother country has rebuilt its own savings and can now afford to make substantially

bigger investments in the overseas territories; but foreign capital is still welcomed.

The Dutch have been able to contribute not only money but also their specialised knowledge and experience of hydraulic works and intensive agriculture. Some of the most successful projects have been rice growing in reclaimed swampy areas. Timber production might, however, eventually become one of the country's most valuable sources of wealth.

The six islands of the Netherlands Antilles, with their total population of 181,000, face fundamentally the same problem as Surinam: their economies are too narrowly based. The southern group, the ABC islands—Aruba, Bonaire and Curaçao—are economically the most important. Aruba and Curaçao, thanks to their natural harbours, are by far the richest. Their prosperity is derived from a single source, the refining and shipping of oil from Venezuela. The oil refineries have acted as a magnet upon the population of the islands, who have deserted their farms and let agriculture fall into neglect. The great need is to revive it, by the introduction of the new methods that have been found necessary in a dry climate.

All are agreed that the spontaneous warmth with which the Queen and Prince Bernhard were welcomed is a good augury for the future of the Netherlands Kingdom. The new task is to consolidate this good will by energetic steps on the part of the Surinamese and the Antilleans and, with the help of the Dutch, to develop the economic wealth of the territories and to raise their standard of living.

Journal of Geneva—II

Thursday, November 3rd. The Western Ministers criticised the Soviet proposal, made the day before, for an "all-German council" to be composed of representatives of the West and East German parliaments. Mr Macmillan said that it would merely confirm the existing division of the country; and Mr Dulles, pointing out that what the Russians were suggesting was co-operation between the two halves instead of their reunion, complained that this was a violation of the directive laid down by the heads of government in July. Mr Molotov made his first comments on the plan for free elections in Germany submitted by the West six days earlier. This took the form of a defence of the single-list voting system as used in Communist countries, which he saw "no reason to regret." The signing of the Paris Agreements, he said, had made it impossible to consider all-German elections now.

Friday, November 4th. The Western Ministers took their five-stage proposals for German reunion a step further by suggesting a date for the first stage—free and secret elections—in September 1956. They proposed that a four-power commission should be set up to prepare the election law, in consultation with German experts, with instructions to report back by January. Mr Molotov countered this by promising to give his considered reply at a later date, but suggesting once more that East and West German representatives should be introduced to the conference at that stage—an idea that the conference had already rejected. He argued again that the question of elections was of "subordinate significance," and made no direct reply to a

pointed series of questions from Mr Macmillan asking him whether (a) he favoured the earliest possible reunification of Germany; (b) he agreed that the four powers had a duty to arrange free elections; and (c) he approved the western proposals for safeguarding the freedom of elections.

Outside conference hours Mr Molotov talked with M. Pinay and Mr Macmillan about Indo-China and the admission of new members to the United Nations.

Saturday-Monday, November 5th-7th. No meetings.

Tuesday, November 8th.—Mr Molotov came out flatly in opposition to the Eden plan for German elections on the grounds that the existing regime in the eastern zone must be preserved. He could not agree that the east German workers "should be deprived of their factories, their land and their wealth." Mr Dulles then said that the Soviet Foreign Minister's speech was so disturbing that he would prefer to wait before commenting on it, and the meeting was adjourned overnight.

Earlier Mr Macmillan had explained two obscurities in the western plan for a European security treaty by saying: (1) that although the full treaty would apply only if a reunified Germany joined Nato, the West was willing to sign a treaty—and apply the opening stages—if the Russians permitted the unification process to be set in motion; and (2) that Poland, Czechoslovakia and some western neighbours of Germany could be included in the treaty.

Wednesday, November 9th. All three Western Ministers attacked Mr Molotov's speech of the previous day. Mr Macmillan said that Russia had repudiated the "summit" directive, which required that German reunion should be achieved through free elections; it appeared that Russia would allow reunion only on condition of the Bolshevisation of all Germany. Mr Molotov, in reply, repeated that the western security proposals were unacceptable to Russia and that conditions for an immediate German election "do not exist, since the problem has not matured." Mr Macmillan then proposed that further discussion on Item I be adjourned in favour of Item II—disarmament—but Mr Molotov tried to keep discussion going by (a) suggesting a 50 per cent cut in the size of foreign forces in Germany and (b) reviving the Soviet proposal made in July for an East-West non-aggression pact. In the end the meeting was adjourned, but Mr Molotov was apparently left with the option of raising the matter again later.

Round about business premises

... there's always a need for Nairn Vinyl Tiles

Proprietors, managers and executives of business premises all over the country are specifying Nairn Vinyl Tile Floors. Housewives, too, are making enquiries at their architects or builders about Nairn Vinyl Tile Floors. Rapidly the news of Nairn beauty and serviceability is spreading throughout the country.

Nairn Wear-ability Since the floors of the 53 laboratories in the new Biology building of Nottingham University would be subject to continual traffic and exposure to all manner of chemicals, the university laboratories themselves tested various types of floor covering. Nairn Vinyl Tiles proved to be the most satisfactory and were used exclusively.

Nairn Clean-ability Grease, oil, mud . . . bleach, alkalis, cooking fats . . . all the things that might ruin an ordinary floor don't affect a Nairn Vinyl Tile Floor. And all that's needed to keep it shining clean is an occasional polish.

Nairn Versatility Nairn Vinyl Tile Floors can be laid on any kind of suitable level surface, upstairs, downstairs, or in a basement. As a design component the Nairn Vinyl Tile—available in 21 colours—is extremely versatile, too. AND LAST, BUT NOT LEAST, THE COST IS SURPRISINGLY LOW.

For years, both here and in the U.S.A., laboratory research and stringent practical tests have proved the wear-resistance of Nairn Vinyl Tile Floors.

March into the future... No. 11

Maybe one day...

Already — in his imagination — he's the engineer whose responsibility it is to extract the oil that lies deep beneath the desert.

When that ambition is fulfilled, he'll have learnt to put his trust in Philips. An obstruction in a pipeline hundreds of miles long? Philips radio-active isotopes will locate the trouble-spot at once. Some fatal — but invisible — flaw on the surface of vital machine parts? Philips electronic roughness tester will reveal it in seconds. A query about the structure of some crystal? Philips X-ray diffraction equipment will provide the answer. Then electronic measuring apparatus, electronic welding equipment . . . all these and other Philips achievements will help to make his work easier and less hazardous yet infinitely more efficient.

Squeezing the Local Authorities

IN the fortnight since the Chancellor of the Exchequer decided to constrict the tap through which money has for years been flowing freely from the Public Works Loan Board to the local authorities, it has become increasingly clear that his action is at once a major component in his wider economic policy, and also a radical challenge to the easy postwar conception of the local authorities as spoon-fed agencies doing the central government's bidding. It will take much longer than a week or two before the full implications of the Chancellor's move are clear. He represented it as a monetary reinforcement of the Government's request that the local authorities should trim their capital programmes in 1956-57 to their spending of 1954-55. But too many authorities have been spending too freely out of PWLB funds not to feel chastened, and even frightened, by this change. In successive periods since the end of the war, the local authorities were first compelled to go to the PWLB for their capital funds and then allowed, if they chose, to go to the market. Now the board is to act as a lender only of last resort.

Most of the local authorities in future will have to run the gauntlet of the market, instead of enjoying virtually automatic access to PWLB funds whenever they wanted them. Mr Butler spoke of ensuring that this transition to open market borrowing should be carried out as smoothly as possible. But it was obvious that the transition could not be easy—and from all present indications is not going to be made any easier. The board might be thought by some local authorities to have a certain responsibility for honouring loans for which departmental sanctions had been deposited. But the board, conscious perhaps that some local authorities have been able to exploit its automatic lending to suit their own convenience, is now taking a tougher line. Loan contracts already fixed on October 26th are of course to be honoured; but mere intentions

or preparations to borrow that might have been in train on that date must be put into regular form and take their turn with the rest. The PWLB loans "in the pipeline" to which the board is committed and which thus escape the new discipline are in fact much smaller than might be supposed from the £300 million of sanctions that the local authorities hold permitting them to borrow.

The screw is in fact turning more quickly and more tightly. A sanction no longer opens the tap to PWLB funds. Before it grants any advances in future, the board is putting all applicants on enquiry about their ability to raise the money they need on their own credit, in the stock market or in the mortgage market. Mr Butler intends that those who can borrow on their own credit shall make "full use" of the capacity of both markets. Given present market conditions, it is difficult to determine what "full use" means. But the questions that are now being put to the local authorities by the PWLB are specific:

1. Give an estimate of the authority's probable external capital requirements and details of maturing capital liabilities (e.g., maturing stocks, mortgages due for repayment, etc.) over at least the next twelve months.
2. What steps have been taken to raise the loan, or any part of it, in the mortgage market, or from private lenders, and with what results? What terms have been quoted?
3. What advice has the authority received as to the amount and the terms of any loan, or loans, which the authority could raise in the stock market?

It is possible to answer the first question honestly and faithfully. But honest answers to questions two and three may not help very far. Take, for example, the present state of the mortgage market. At the moment, the small number of specialist broking firms in this market, whose job it is to match institutional, banking and industrial lenders with local authority borrowers,

are busy issuing chits to authorities (down to the smallest district councils) setting out the rather nominal quotations for mortgage loan business. Armed with these documents, the authorities can then approach the board with evidence that they have tested the market.

*

But the intention, in general, is that the board will not lend to any authority that can satisfy its requirements in the market. That is a question of fact, and one that in this transition period, particularly, is not easy to determine; Mr Butler did well to recognise the serious addition to the burden of unpaid work done by the commissioners which the test of a genuine approach to the market will entail. The rates quoted in the mortgage market earlier this week were $5\frac{1}{8}$ per cent for 7-year loans; $5\frac{1}{16}$ per cent for 10 years; and 5 per cent for 15-20 years. But these rates, against the cheerless background of the gilt-edged market, were very largely nominal, for little money was being offered on these terms. Later in the week, indeed, seven-year loans were being arranged at $5\frac{1}{4}$ per cent and fifteen-year loans at $5\frac{1}{8}$ per cent.

Even when rates are in tune, however, the mortgage market is of a relatively limited capacity compared with the capital demands to which the local authorities have grown accustomed. One of the specialist firms in the market reports that in October it arranged loans for seven years and upwards as follows:—

Rate per cent	Number of Loans	Amount
5	9	380,000
$5\frac{1}{8}$	5	76,000
$5\frac{1}{4}$	8	390,000

It is impossible to measure the total turnover of the market, but if these figures from one of the leading firms are to be taken as a guide, it would hardly seem that the mortgage market is capable of satisfying much more than, say, a tenth of the local authorities' recent rate of capital spending. That rate is intended to fall, and there are potential changes that could further increase the contribution that the mortgage market could make towards their requirements. One of these would be the withdrawal of the present ban on local authority mortgages for a term of less than 7 years, which the Treasury has under consideration. Another is the power of stiffer rates of interest to stimulate offers of money to the market.

It is natural that, at present rates of interest, the authorities should be anxious, if they can, to borrow for periods as short as possible. Mortgages with three to five year terms would attract funds from sources that are not interested in seven-year loans; they would give the local authorities a chance to escape 20-year commitments at rates of 5 per cent and upwards—which they might think well worth the risks of refinancing after a few years. Given the weakness in the funds, and the new demands that are likely to be made on

the mortgage market by authorities that cannot persuade the PWLB to oblige them, stiffer rates seem inescapable. Things have moved so far in the past fortnight, indeed, that it is possible to question the consonance of the board's rates with the market rates. Since September the PWLB has been charging 5 per cent on advances of five years or more, and $4\frac{1}{2}$ per cent for advances under five years (of which there are very few). In his Budget speech, Mr Butler regarded these rates as "at least a fair starting point for the new policy of local loans rates based on local authority credit." But he also made it perfectly clear that they would be adjusted to conform with broad changes in the market's rating of local authority credit. It seems possible that such a change is afoot.

*

What, then, of the chances of borrowing by stock issues? The last such issue was by Bristol, which issued £5 million of $3\frac{1}{2}$ per cent stock 1970-74 at £99 10s. exactly a year ago. It now stands at 83½, and the yield has risen from £3 10s. 9d. per cent at the time of issue to £4 17s. 6d. per cent at the present price. For trustee borrowers (and it is an odd fact that even some of the English counties do not enjoy trustee status) the feel of the market is that a $4\frac{1}{2}$ per cent stock, of 15-17 year life at 95 might be about right; these terms would offer a redemption yield of about a shilling under £5 per cent. But in present market circumstances, this is very much a formal exercise. Those members of the London Stock Exchange who advise and act for the local authorities would have a most unenviable task in trying to stage a successful issue in the present condition of the market, with anything up to a fortnight involved in the final arrangement of terms, underwriting and issue. The pressure for money on the part of the biggest counties and cities is likely to be so great—they could easily make use of £50 million in the course of the next six months—that someone will have to make a stock issue sooner rather than later. But those concerned with it are not going to sleep very well while the offer is open, and they will need all the blessings of good luck in fixing the terms.

Many authorities would regard a stock issue as a relatively expensive method of borrowing—not because the rate of interest is higher, but because of the incidental costs of brokerage and new issue expenses, stamp duty (which the local authorities pay), registrars' fees and preparation of interest warrants. The inclusion of these expenses would raise the effective rate of borrowing over 17 years to, say, £5 5s. per cent, which is higher than the PWLB and mortgage market rates. And there is no likelihood of the authorities being able to place a 7-year bond in the stock market. For long money, the effective rate to the borrower must be at least $5\frac{1}{4}$ per cent under present conditions. For seven-year money, the mortgage market has had to raise the rate to $5\frac{1}{4}$ per cent to attract funds. And for shorter

borrowing, such as the authorities used to be able to do for three to five years with convenience to themselves and no great danger to the country's financial stability, the fiat of the Treasury must first be given.

These are changes of a most dramatic kind for the local authorities. They aim, in the Chancellor's words, at "restoring financial responsibility to the local authorities"—a change that could not be complete until they were in a position to decide for themselves, without direction or advice from the central government, what capital programmes their ratepayers would approve and be prepared to pay for. No doubt the

past system has encouraged them (because they could easily get finance, and counted on 60 per cent grants towards education and subsidies for housing) to add many frills that a sterner financial accounting like the present one will cut out. The government, the PWLB, and the authorities themselves are taking these measures most seriously. Their effect on local authority finance will be severe but salutary. And their effect on the building industries (in conjunction with the credit squeeze in the private sector of the economy, and with the revised subsidies for housing) is likely to become noticeable before many months have passed.

Background to Bargaining

IN the winter round of wage negotiation that has just begun claims have been presented or are known to be imminent for increases that together might add £5-6 million a week to the wage bill of British employers. Already, this year, increases totalling nearly £5 million a week have been conceded: in the first nine months alone the wage bill went up by £4,850,000 a week, more than it did in the whole of any year since 1951. For good or ill, 1955 seems likely to be a record year for rises.

In individual industries, as in the whole economy, this surge is simply explained: labour, in the boom of 1955, has become the scarcest resource of all, and its price is reflecting that scarcity. No single snapshot of the British economy today is as telling as the "opening of the scissors"—the way in which since early 1954 the number of vacant jobs has risen above the sinking number of unemployed people available to fill them. Western Germany today is getting hot under the labour collar with only just over two people unemployed for every one of its vacant jobs. Britain is paying the high price of having more than two jobs waiting for each person out of work.

No doubt, in many industries, there is some inflation in those figures of jobs on offer; personnel managers today cannot afford to be conservative. But in some industries, on the other hand, one does not waste time registering vacancies that the labour exchange has no chance to fill: the coal mines have about 6,000 vacancies on register, but need at least 15,000 miners.

The first table, on page 582, summarises claims already made or proposed by trade

unions who want this winter to take advantage of this sellers' market for labour. Since the Budget, only one of these claims appears to have been specifically increased; but the vast engineering and shipbuilding claim presented last week was significantly put forward for "a substantial increase," which is generally interpreted as a demand for more than the 10 per cent, costing about £2 million a week in wages, that had previously been hinted at. And the miners, already demanding a bonus now paid on attendance as an automatic right, a third week's holiday, and the benefit of "reform" in the piece-rate wage structure, this week announced that they would also make a general wage claim.

Salient factors in the bargaining situation of five of the major industrial groups that face claims this winter are indicated in the chart on page 582. In all these industries—even the coal mines—output has risen rather more over the last few years than employment, indicating some increase in productivity; but in the last twelve months, at any rate, it seems unlikely that

labour productivity has been rising as rapidly as earnings. Labour costs in most of these industries—and probably in industry as a whole—must therefore have been rising. But for four of the five—coal is the sorry exception—output has recently been rising and profitable.

Three of these broad industrial groups are privately owned; for these, indices of average earnings and profits (plus, in the special case of building, income from self-employment) are shown together. For "engineering, shipbuilding and

This Year's Wage Increases—So Far

The New Claims Pending

Industry	No. Involved	Maximum rate (men)	Details of Claim
Engineering and Shipbuilding	3,000,000	Skilled, 155s.-160s.	" Substantial " claim submitted this week.
Railways—			
(a) NUR	372,000		40 hour week, higher Sunday and overtime pay, 3rd week's paid holiday, have been demanded. A wage claim (10% or more) will also be made.
(b) ASLEF	78,000	Driver 3rd year, 198s.	Full implementation of the 44 hour week.
(c) NUR and ASLEF	450,000		Sick pay, adjustments in mileage and night work pay.
(d) Workshops	131,000	Patternmaker, 163s. 6d.	" Substantial " increase has been claimed.
(e) Salaried workers (TSSA)	73,000	Special, £850 p.a.	Claims for 38-hour week and an extra week's leave have been made. May join the NUR in a wage claim.
Coalmining	700,000		Consolidation of bonus shift, reduction of working week and 3rd week's paid holiday, have been demanded. Wage claim also planned.
Retail Trade	750,000	Clerk, 130s.-160s.	Claim has been made for 15s. increase and higher proportionate rates for women.
Provincial busmen	177,000	Drivers, 147s.-148s.	Municipal busmen, claim 15s.-32s.; company employees, 16s.-33s. (latter claim went to arbitration this week).
Building	1,000,000	Craftsmen, 3s. 11½d.-4s. 1½d. an hour.	Claim for 4d. an hour now raised to 6d. as a reaction to the Dudget.
Chemicals	200,000		" Substantial " claim will be made.
Electricity Supply	123,000	194s. 4d.	Claim will be presented on November 17th.

vehicles" and for the chemical trades, the figures of profits are chain indices constructed from *The Economist's* quarterly analysis; for building and contracting, where public companies are few and quite unrepresentative, figures of profits and income from self-employment have been taken from the blue book on National Income and Expenditure. In the nationalised industries earnings have been plotted beside prices.

Such figures and indices of profits require essential qualifications to be borne in mind. First, they relate

to what has happened, not what is happening; they stretch no later than approximately 1954 (for *The Economist* figures accounts published between July, 1954, and June, 1955, and accounting usually to dates within 1954). Secondly, they are gross figures: gross of tax, which is right for the purpose because wages are paid before tax is levied; gross of depreciation,

which is wrong but unavoidable, since no true basis for a depreciation charge that will really keep assets intact exists. Thirdly, *The Economist's* figures are based upon a broad sample of public companies; they exclude private companies and unincorporated traders. Finally, the indices are based on 1950, a year quite arbitrarily selected to show the "medium run" for output. Certainly, other years of origin would alter the various pictures. Bandyng base dates is fashionable but fruitless. One may be sure that a far better set of bargaining curves could be produced for employers by using 1938—which is social history; or for the unions by using 1952—which is dishonest nonsense.

But wage negotiators today look more widely than the limits of their own industries. They have in mind the total size and in particular the general growth of profits and wages in the economy; and close to the trade unionist's mind, the cost of living. All of these are rising though not in parallel, as the chart, based on blue book figures, shows.

Moreover, hardly any economic indicator yet clearly shows the effect upon industrial activity of the successive measures that have this year been put in hand to restrain that inflation. Employers and unions, this winter, are bargaining about what labour should be paid in an economic climate that as yet they can only sense. Immediately, the advantage is with the striker in this game. But it is not only among businessmen that one meets deep uneasiness about industry's competitive prowess abroad—or about harder times next spring.

Business Notes

Emphasising the Squeeze

THE morale of the gilt-edged market has been rudely shaken in the past week by fears of new pressures upon it from the credit squeeze. This sudden fright sprang in part from press reports and a crop of City rumours of what the Governor of the Bank of England had to say at a meeting last week, a regular quarterly one, with the Committee of London Clearing Bankers. As the proceedings were private, and as no information about them has been officially released, it is not surprising that the unofficial accounts have shown notable divergences—and some of them have certainly exaggerated the significance of the occasion. In particular, there is no foundation for the supposition that a new "directive," or indeed any specific

request, has been given to the bankers about the conduct of their advances policy. The authorities are not venturing upon any more detailed guidance to the banks than the Chancellor's bald request last July for a "significant reduction in advances within the next few months"; nor, it seems, are they contemplating any innovations in their technique. There is no doubt, however, that the Governor, presumably expressing the wishes of the Chancellor, has emphasised the importance of keeping up the pressure upon advances at least for some time to come, and certainly well into the new year.

Roughly half the apparent decline of £220 million in clearing bank advances between end-June and October 19th was attributable to repayments by the Gas and Electricity industries out of their recent issues of stock, and a further significant part was due simply to the running-down of the intra-bank clearing items that most of the banks group

in their advances total. The reduction in loans to the private sector has, therefore, been small by contrast with the big expansion that occurred in the first half of this year, and the rate of contraction in the latest period was no better than in the summer. Whether or not the authorities regard this performance as unsatisfactory, they certainly regard it as insufficient—in the sense that the squeezing process must go steadily on until all measures of restraint acting together have brought the level of aggregate demand upon the economy within reasonable bounds.

All this should have been self-evident to any discerning observer, and the violence of the gilt-edged market's reaction measures the unrealistic attitude of some City opinion about credit policy. For that reason, and also perhaps because the July request had referred simply to the "next few months," it was desirable to remove any possible doubt about the broad intentions of policy. But statements made behind tightly closed doors, and even then not to the whole company of bankers that are affected by the policy, are scarcely calculated to achieve that purpose. If the authorities mean to be firm, then their task as well as that of the commercial banks would be greatly eased if the essence of such statements as this was publicised.

Trumps in Threadneedle Street

"GUIDANCE" from the authorities may serve a useful purpose, but it is no substitute for action in the market-place. In former times, if there were doubts about the City's understanding of the aims of policy, the point would have been promptly driven home by an increase in Bank rate, or at least by an unmistakably sharp pressure upon the money market. In present circumstances, if the authorities are still anxious to keep the Bank rate weapon in reserve, they have only limited scope for showing their determination by action in the money market, since the bill rate—which rose by a further $\frac{1}{8}$ per cent to $4\frac{1}{8}$ per cent last week, the first rise for two months—is now drawing near to the official rate. The only alternative weapon, therefore, is pressure upon bank liquidity; and it is only by recourse to this that the pressure of the whole policy can be tightened without a rise in Bank rate.

It seems probable that the authorities are fully aware of this, and are also determined to ensure that their "guidance" is well supported by orthodox action of this kind. The liquidity of the banks has in fact been kept much tighter than many of them expected. It is technically difficult, though not impossible, to tighten it much further in the next few weeks of heavy seasonal deficits; but after the turn of the year nearly all the trumps will be in Threadneedle Street. The introduction of the 63-day Treasury bill, which made its debut last week, has ensured that the official hand will be even stronger than it usually is in the new year. The £60 million of these bills placed last week and the further offering yesterday will strongly supplement the maturities of 91-day bills in the second and third weeks of January. If yesterday's bills have been fully allotted, the aggregate maturities in these two weeks will be no less than £640 million—creating almost unprecedented scope for compressing the banks' liquid assets.

Sterling's Silver Lining

WHILE gilt-edged prices crumble and the discount market is caught in the grimmest scramble for credit that it has had to endure since monetary discipline was revived, sterling is holding up well—as, indeed, it should. The spot rate against the dollar has been held this week at around \$2.80 $\frac{1}{2}$. There have been indications that it would have risen beyond this level but for modest official intervention in which the Exchange Equalisation Account must have acquired small amounts of dollars. The net gains to the account cannot have been large for the rate for transferable sterling has had to be supported. On most days this week the transferable sterling rate at the opening of the New York market has been slightly below the current rate in Zurich and other Continental markets. On almost every day of the week there has also been a small downward adjustment in the rate, which has carried it down to \$2.77 $\frac{3}{4}$. This weakness in the transferable rate owes something, it is believed, to the fact that Egypt is paying Czechoslovakia for arms with transferable sterling. The fall in transferable sterling has been slowed down by official support, most of which has been channelled through the Zurich market. Sterling has been exceptionally firm against the Canadian dollar rising this week to \$2.80.

Movements in the Continental currencies have been more mixed. The Dutch guilder has been moving against the pound, as has the French franc in the official market, though sterling banknotes in the unofficial Paris market have simultaneously been moving upwards and have changed hands at up to Frs. 1,010. The firmness of sterling against the dollar has naturally been accompanied by another slight decline in the London price of gold which has fallen to 249s. 8d. There has been a good turnover at the fixing with a fair demand from the Middle East encouraged by political and military tension there. There is also evidence of a slight revival of hoarding demand from the Continent.

Unhappy Markets

INVESTMENT markets have fallen steeply this week. The *Financial Times* index of government securities which stood at 91.75 at the end of last week was down to 88.70 by the close of business on Wednesday. The industrial index in the same period fell from 191.8 to 187.8. All sections of the market moved together. Even the gold share index dropped from 77.73 to 76.21. The table shows the movements of selected gilt-edged stocks and industrials since the day before the autumn budget. Selling particularly in the gilt-edged market this week was widespread and partly—but only partly—speculative.

It is always possible to rationalise a movement on the Stock Exchange after the event. The new reminder to the banks, the indications that the credit squeeze will "bite harder this winter" as the Economic Secretary to the Treasury put it last week, the rumbling volcano of pending wage claims, gathering tension in the Middle East and dead-

Yale trucks are on the job!

Yale industrial lift trucks are handling heavy materials of all kinds, materials which formerly were lifted and moved with backbreaking, gruelling human effort. But, no matter where Yale trucks are used — no matter where Yale trucks are made; whether in the U.K., Europe, U.S.A., or anywhere in the world — you can be sure that wherever you buy, they will be manufactured from American design to the exact same high standards which have been synonymous with Yale & Towne since 1868. When you are considering equipment to solve your handling problems, insist on Yale, your guarantee of quality.

It is the interest of the commercial world
that wealth should be found everywhere—

EDMUND BURKE 1729-1797

We draw our energy supplies from Yorkshire—and Iraq; our corn from Hampshire—and the Argentine; our timber from Inverness, and the Baltic Coast. Nature has scattered tin, rubber, copper and cotton throughout the world. The continents exchange her riches.

But there is another kind of wealth besides the bounty of Nature — that to be found in men's brains, and in their vision of the future. It is present in every section of the community; without it the deepest mine and richest oil-field would remain geological curiosities. It can transform the poorest raw material into the most useful or important finished product. Its aids are courage and knowledge.

Modern industry forms the framework within which Nature's wealth, and man's, can each work together. In alliance, they provide the material basis for our civilization, and for the human values that spring from it. With each new discovery of wealth, in desert or mountain, or in a man's own head, those foundations are deepened and consolidated.

Esso Petroleum Company, Limited

lock at Geneva, can all be cited as causes for the present decline. That does not alter the fact that when investors are not in the mood to sell the market can take threats like these in its stride. But when investors are in the selling mood and jobbers have not foreseen it, the decline is magnified. In the industrial share market further selling had been foreseen, but in the gilt-edged market jobbers seem to have been taken by surprise.

In the gilt-edged market the present wave of selling may be passing, but the market will remain subject to other pressures. One of these is the sharpening competi-

tion for the few favours that the new issue market can still bestow. The market had an unwelcome reminder of that competition this week in the shape of the Rhodesian and Nyasaland Federation's issue of £10 million 5 per cent stock 1975/1980 at £99 10s. Evidently the Federation and its advisors have done their best to ensure that the terms should be attractive. It is the first occasion for many years on which a trustee stock has been offered with a 5 per cent coupon and below par. The flat yield is £5 os. 6d. and the redemption yield to the latest date £5 os. 8d. per cent, and only £10 per cent is payable on application. The market naturally read the issue as yet more evidence of the shortage of funds for investment and the terms announced on Tuesday contributed to the weakness of the gilt-edged market.

Exports Highest Ever

THE provisional returns of British overseas trade in October contain both good and disappointing news. Exports were higher than ever before, amounting to £268.1 million fob. This was £32 million—13 ¹/₂ per cent—more than the monthly average in the first nine months and £4 million above the previous peak in August, when the bulk of the over-spill from the transport strikes was being cleared. Exports are normally high in October after the summer slackness, and it is impossible to guess how much of last month's exceptional figure is attributable to shipments previously held up by the strikes. Imports, unfortunately, were also high; the total of £333.4 million cif was £13 million—4 per cent—more than the average in the first nine months and £29 million higher than in September. That dampens earlier hopes that monetary policy was beginning to bite on imports. With re-exports also higher at £12.8 million, the gross visible trade deficit was £52.5 million, slightly higher than in September but nearly

£23 million below the average for the first nine months. Exports to North America shared in the advance; in fact they reached a new record of £33 million, which was £7.3 million—29 per cent—more than the nine-monthly average. Shipments to the United States set a new record of £19.2 million, but shipments to Canada still lagged behind at £13.8 million.

Dollar Drive Again

THE renewed dollar export drive that was launched this week at a dinner of what Sir William Rootes called the "top brass" of British industry, and sped on its way at a press conference which was itself somewhat brassbound, is a rather fresh technique in this Government's dealings with business. It has carefully been channelled through the Dollar Exports Council, which is largely composed of businessmen, and emphasis is being placed upon the rewards of exporting to dollar markets in the United States, Canada, and Latin America, rather than on telling business to do what the Government thinks the economy needs.

Both the rewards and the needs are very real. The dollar markets are large, rich, and growing; so is their propensity to import. Britain's exporters have very creditably been gaining an increasing share of the United States' import trade since the war, though they have not quite as much of it as they had in 1938; in Canada, where imports per head of population are more than four times as high, Britain has been losing business, and does only half the share of imports that it did before the war; and its share of Latin American trade has not been rebuilt to anything approaching the prewar proportion, though Germany has been able to encroach quite markedly upon the dominating position of the United States in those markets. Yet individual British companies, when they take the trouble, have found these dollar markets extremely rewarding. The starkest expression of the need is the increase of more than 40 per cent in Britain's dollar bill for imports over the first three quarters of this year.

Sir Edward Boyle, at the press conference as at the dinner, emphasised that it was the Government's policy to make dollars readily available for all kinds of trading investments in Canada and the United States which will increase our exports to that area, increase the supply of raw materials available to British interests, or promise a high yield on invested capital.

Both Ministers emphasised that despite the Government's concern at some recent American decisions affecting import trade, it remained assured that the United States was not departing from a generally liberal trade policy. The attitude they have to soothe, as regards both these matters of import policy and the commercial difficulties of the dollar markets, had been epitomised the week before in Sir Edward's hearing by Mr J. L. S. Steel, a director of ICI and chairman of the British National Committee of the International Chamber of Commerce: "If I had charge of a small business making a useful product, nothing would induce me to try to export it to the United States." It is precisely that task of inducement that the Dollar Exports Council and the Government have to attempt.

Union-Castle Plan Revised

TERMS of the offer to ordinary stockholders of Union-Castle Mail Steamship Company to exchange into the shares of a holding company controlled by Clan Line Steamers have been slightly modified. The new offer is 10s. nominal of ordinary capital in the new company for each £1 of Union-Castle ordinary capital in place of 8s. nominal of ordinary capital plus 4s. nominal of 6 per cent preference capital originally offered. The offer to Clan Line shareholders is also increased—from eight £1 shares in the new company for each 3 £1 Clan shares to 41 10s. ordinary units for each 7 £1 Clan shares (equal to about 58s. 6d. nominal of the new capital in place of 53s. 4d.). The new company is thus to have an ordinary capital of £6,430,000 in place of £5,552,000 and still to pay 16 per cent—a further loosening of the Cayzer pursestrings. In terms of prospective income, Union-Castle ordinary shareholders are offered a small improvement, and in terms of control their proportion of the new company's equity goes up from 40 per cent to 42½ per cent.

From the preliminary skirmishing that has already taken place two facts emerge. The boards of Union-Castle and Clan Line disclaim any thought of pushing the merger through against the wishes of the majority of the ordinary stockholders in either company. That removes the most objectionable feature of the scheme—the possibility that the votes of the Union-Castle preference stockholders might be used to override the wishes of the majority of the ordinary stockholders. But it is doubtful whether the concession (too little and too late) will detach many from the opposition now organised and in full cry. The decision not to use—at least not to abuse—the bludgeon of the preference votes may therefore mean that the plan is already dead. A week ago, Mr H. C. Drayton announced that the opposition had the support of 50 per cent of the Union-Castle ordinary stock and 40 per cent of that company's total votes. These figures naturally may not now be exact, but the opposition is formidable.

The other conclusion already discernible is that whichever way the battle ends, a drastic reorganisation of the Union-Castle directorate can hardly now be avoided. New money and new blood have long been needed. Now the opposition shareholders are bitterly blaming their own directors. Mr Drayton accused them last week of withholding information, and his argument calls for an answer. A month of active sharedealings has already elapsed since the offer was first mooted. Shareholders have had no valuation of assets yet, and Mr Drayton argues that some information not granted to shareholders in general must have been supplied to the Clan Line directors as a basis for the offer. Unless it is suddenly converted by the full offer, which goes out to stockholders this weekend, the opposition will therefore press ahead with the requisition for a meeting. At such a meeting three-fourths majorities—probably out of reach—would be needed to force a capital reorganisation, but simple majorities would suffice to remove directors. The final choice for shareholders may therefore be between new money and management provided by Clan Line and the Cayzer family at the cost of losing control, or the same commodities provided by the opposition. The opposition

has not yet shown its whole hand, but the shipping knowledge of Mr Jack Billmeir and the financial resources controlled by Mr Drayton seem to be among its cards.

Death of a Salesman

LAST month the new government of Argentina devalued the peso and took other steps towards exchange reform. Now it has announced another major step towards setting external trade free. According to Dr Bunge, the Minister of Commerce, the government wishes to replace bilateralism by multilateralism, and state trading by private trading. IAPI, the state trading agency, is to be liquidated and other state intermediaries, such as the national institute of grains and elevators and the national meat institute, are to be "rationalised." IAPI will always be the symbol of Peron's policy of milking agriculture for the benefit of the towns. In the early postwar years this was simply a matter of paying the farmer a fixed price far below the price at which IAPI sold his produce abroad; latterly, when world prices had fallen, the price that the farmer received never kept pace with the domestic inflation. Is it surprising that today production of several of Argentina's staple exports is smaller than before the war? This year the agency, while retaining its monopoly for the import and sale of oil and certain other materials, lost two of its major exports. The institute of grains and elevators became wholly responsible for the marketing of grains and the meat institute took over responsibility for the marketing of meat.

It should not take long to wind up IAPI, and the private organisations stand ready to take over. What of the "rationalisation" of the other agencies? The meat companies, which are now obliged to act as the agents of the meat institute, will no doubt act as principals again. In the grain trade, however, it is hardly to be expected that the elevators, which were nationalised as long ago as 1941, will be returned to their former owners, the big international grain houses. But the government's statement suggests that it would like the private trade, which now buys on fob terms, to take over the marketing of grain from the interior onwards. Official intervention, it is said, will be limited to fixing minimum prices and to taking up grain—and other produce—at the minima if private offers are too low. The international grain houses would probably be willing to co-operate provided that they could come to a satisfactory arrangement with the government for the renting of elevator space. The grain institute's outstanding commitments and stocks cannot be disposed of quickly, but the government will probably seek to relieve it of its marketing functions as soon as possible. The international grain houses, which lost much of their business as a result of political favouritism, would no doubt seek assurances that they would be allowed to trade on equal terms.

New Liner Orders

IT is somewhat ironic that at a time when the eclipse of travel by sea due to competition from the air is being prophesied, orders should be announced for three passenger liners in the 40,000-tons class within less than a fortnight.

One of four hydrogen-cooled generators supplying the CEA grid in Lancashire, this giant has an output of 75,000 kVA. It was built by Metropolitan-Vickers — and A.E.I.

A transistor like this — the smallest kind of valve — may be used in a deaf-aid, or in equipment that controls whole industrial plants. They are made by British Thomson-Houston — and A.E.I.

LARGE & SMALL

Electrical equipment may weigh hundreds of tons or but a fraction of an ounce. This turbo-alternator is part of an installation which covers an acre of ground, the tiny transistor barely a thumbnail. Both are made by A.E.I. companies. Associated Electrical Industries is a practical partnership of great firms collaborating in research and economy of manufacture.

An investment in A.E.I. is an investment in all these companies:

The British Thomson-Houston Co. Ltd.
&
Metropolitan-Vickers Electrical Co. Ltd.
&
Birlec Ltd.
&
Coldrator Ltd.
&
The Edison Swan Electric Co. Ltd.
&
Ferguson Pailin Ltd.
&
Newton Victor Ltd.
&
The Hotpoint Electric Appliance Co. Ltd.
&
Premier Electric Heaters Ltd.
&
Sunvic Controls Ltd.
&
Siemens Brothers & Co. Ltd.
&
Australian Electrical Industries Pty. Ltd.

&
A.E.I.

The Holland-America Line announced the placing of an order for a new trans-Atlantic liner of this size to run with the *Nieuw Amsterdam*, and little more than a week later came an intimation from the P & O group that the P & O and Orient Lines had plans under "immediate consideration" for the building of two 40,000-ton liners for the service to Australia. The more difficult decision to take was perhaps that of the Dutch line, as it is on the North Atlantic that competition from the air is keenest. But despite the enormous growth of trans-Atlantic travel by air, travel on this route by sea is still increasing.

From the technical aspect, the British ships will represent the greater advance. The new Dutch liner (to be called *Rotterdam*) will be similar in dimensions and tonnage to the *Nieuw Amsterdam*, but the Orient-P & O vessels will be a good 10,000 tons larger than any of the six vessels that maintain the group's Australian service at present, and will also be five knots faster. If the volume of trade and the depth of water at the terminal ports permit, an increase of size is the logical way of keeping down operating costs, and the higher speed follows more or less automatically for economic reasons.

The P & O orders, it has been reported, may be followed for orders for four new 18,000-ton liners from the Royal Mail Line, though the company has not confirmed this. These orders will be welcomed by British shipyards, despite their full order books. The great majority of present orders are for tankers or cargo vessels, and with ships of these types the proportion of work for the finishing trades (those concerned with the fitting out of accommodation spaces) is low. Passenger liners, and to a lesser extent warships, serve to correct the balance. One yard where the balance of work at present is particularly bad is the Belfast shipyard of Harland & Wolff, Ltd. This firm built the most recent addition to

the P & O passenger liner fleet, and will no doubt hope to secure one of the two new orders; it is also, incidentally, the yard where Royal Mail vessels are normally built.

German Steel Passes British

THE British steel industry is now fairly confident of producing 19½ million ingot tons this year—and fairly certain to become the fourth largest producer of crude steel in the world, not the third. Its output in October, 399,500 ingot tons a week, brought the annual rate for the first 10 months of 1955 to 19,615,000 ingot tons, and the industry normally produces more steel in November and December than the average for the rest of the year. But the West German industry, which produced almost as much steel as the British last year—1,430,000 tons a month, against Britain's 1,543,000 tons—has this year moved decisively ahead. In the first nine months of the year it produced 15,500,000 tons of crude steel; in the same period Britain's steel mills turned out 14,600,000 tons.

Capital for Chemicals

THE chemical industry, successful at exporting and successful at holding its prices down, has bulked large among the seekers of new capital this week. No fewer than four major capital projects have been announced: Marchon, nursed to maturity by ICFC, is to be sold to

Albright and Wilson for £2.6 million; Albright and Wilson is raising £4½ million to make the purchase and extend its other activities; Shell Chemicals announced a £1½ million detergent project; and Laporte Industries is to raise over £2 million.

The offer that Albright and Wilson has made for the entire share capital of Marchon and that of its partly owned subsidiary, Solway Chemicals, should remove the capital shortage this group has suffered from for some time. Even for a chemical manufacturer, the Marchon group has grown quickly; and it is now selling in four highly competitive markets—synthetic detergent materials, sulphuric acid, phosphates, and cement. The institutions that have provided £3½ million of the £4½ million capital it employs might reasonably feel that their work was done; but the timing is not good for a public offer. The Treasury has lent £2.35 million under the Distribution of Industry Act to the subsidiary, which operates the sulphuric acid plant. ICFC holds £476,000 ordinary and preference shares in the two companies. A £600,000 debenture was placed last July with the Prudential Assurance Co. And Colgate-Palmolive-Peet owns a tenth of the Marchon equity. The rest of the group's share capital—about £340,000—is held by the directors. Up to last December the group had tucked £400,000 away in reserves; it made a profit last year (before tax) of over £280,000, before the acid plant came into operation.

For Albright and Wilson the acquisition will open up new fields. To provide the purchase price and to pay for further expansion at Marchon and in its existing activities, that company is making a rights issue of six million 5s. ordinary shares on the basis of one new share for every two 5s. units of ordinary stock already held. The issue price, still to be fixed, will be in the region of 15s. 6d.; the stock now stands at 20s. 1½d.

Shell Chemicals, which supply alkylbenzene, a petroleum based detergent ingredient, to manufacturers of synthetic detergents, are building a plant at Shellhaven with an initial capacity of 20,000 tons a year. The plant should be ready in January and will be the first major chemical unit to come into operation at Shellhaven. The Laporte rights issue involves 3½ million 5s. ordinary shares at 12s. 6d. each on the basis of one for three 5s. ordinary stock units held. The issue brought the existing units down from 17s. 3d. to 14s. 9d., the new shares changing hands nil paid at around 2s. premium. Proceeds of this issue will help to pay for an increase in the group's output of hydrogen peroxide, titanium oxide and other products.

A Spurt in Hire Purchase

SIGNS of vigorous hire purchase buying in October are to be found in the latest returns from HP Information. In particular, a sharp jump in the number of HP sales of new cars is reported. An element of budget forestalling—fears of higher purchase tax that proved well founded and, perhaps, of fears of further restrictions on hire purchase terms that did not—probably helped to swell the month's figures, although the normal seasonal trend in hire purchase motor sales is now slightly upwards.

The total number of contracts reported during October was

NUMBER OF HP CONTRACTS

	Oct., 1954	Sept., 1955	Oct., 1955
New cars	4,784	6,012	8,295
Secondhand cars	21,254	26,068	26,075
Commercial vehicles	5,436	7,030	7,650
Motor cycles and side cars	15,147	17,261	15,591
Caravans	1,097	1,288	1,149

Source: HP Information

60,571 compared with 59,357 in September and with 52,309 in October last year.

Automation in the Small Firm

TO judge by their response to Mr John Diebold's lecture on automation the large sample of British managers gathered at the British Institute of Management's conference at Harrogate last week felt that this development in production technique was the most interesting—if sometimes two-edged—gift to management from the scientist of all those discussed at the various meetings. Not all business men were prepared to swallow the need for a grandiose "philosophy of feedback" to transform their outlook in the factory. But there was evident agreement on the need for mechanical and electronics engineers to get together in a new partnership to exploit the practical possibilities. Before Mr Diebold spoke, there had already been lively exchanges in another sectional meeting on the performance of the British machine tool industry in recent years, and some allegations that production men had to go abroad both for special purpose and standard tools that a measure of enterprise would have produced at home. Mr Diebold gave it as his opinion that machine tools designed for fitting with tape electronic controls were a promising competitive export line for Britain and added a rosy picture of the dollar market

Investment To Come

IT is difficult to detect signs of any slackening in the pace of industrial investment from the latest information about plans for new factories and orders for machine tools. The Board of Trade has announced that between July and September this year it approved 813 projects for new factories with a combined floor area of 20½ million sq. ft. Although this is less than the 29.6 million sq. ft. authorised in the previous three months (which included four gigantic projects) it is somewhat more than the Board's first estimate of the plans it approved in the third quarter of 1954; and the scale of applications in August and September were quite up to the level of earlier months if the large projects are left out.

Provisional figures of new factory space started and completed between April and June this year, at 15.2 million and 8.5 million sq. ft. respectively, are very much higher than the first estimates that were made for the corresponding period a year ago. The Board of Trade suggests that the final figure for schemes on which con-

struction began in the second quarter may be 17-18 million sq. ft., which compares with 12.6 million sq. ft. started between April and June last year. There may be a thinning out of plans yet to be formed, and a higher proportion of current projects may never reach fruition; but the vast number of schemes in the pipeline must mean a hefty increase in production space later next year.

New orders for machine tools placed

by British firms in July totalled just over £6 million and another £1.7 million worth of business came from overseas, against £3.8 million and £1.5 million in July, 1954. This is a much smaller increase in comparison with the previous year than the 50 per cent recorded between January and June. Even if the flow of new orders is now starting to tail off, as the industry is inclined to believe, it still has over £90 million of business on hand and its physical output has grown this year only by about a tenth.

for them; whereupon a Dutch delegate rose to explain the fruitful collaboration of a Dutch and a French firm in developing a range of such tools, simple and flexible in use, for even small factories. There was some fluttering of the conference "Who's who" as he did so.

A general disposition to regard automation primarily as a logical further extension of mechanisation—even though it makes possible some processes and products that have hitherto not been possible by older methods—did not detract from a rapt interest in the catalogue of the uses made of "automation" by American firms, large and small, reeled off by Mr Diebold. There was much discussion of the application of instrumentation to the small firm, which thereby may steal a march on its competitors, though the purchase of electronic equipment such as computers by the smaller firm must be regarded as a spur to rather rapid expansion of operations to keep it working fulltime. This, however, is but one of the complications introduced by new scientific advances to management routine; managerial adjustment to science was the theme of the conference. The rival draw to Mr Diebold was a session on maintaining the health (and nervous equilibrium) of the manager. That too was well patronised.

Should Poachers Play the Game?

MOST of the wage rates negotiated in collective bargaining are formally minimum rates, but if any employers' association is to maintain its bargaining power it must try to ensure that none of its members pay more. Employers, however, are perhaps at all times more competitive animals than trades unionists, and less easy to keep in line; in times like these, their competitive zest to obtain the scarcest resource of all, labour, is liable quite to extinguish their desire to co-operate in resisting wage increases. During this summer readiness to pay more than the standard rate has been only one of the methods used to lure labour to one's factory; special bonuses, and gifts to workers who introduce recruits, have been among the further blandishments offered. Among the better boys of the trades association this opportunism goes by the name of "poaching"; and it is not surprising that the British Employers' Confederation, at a recent two-day conference on "Industrial Relations" in London, should complain darkly of "short-sighted actions" by individual employers that "easily damage each other's interests" and "in the long run harm themselves as well."

Where prices are broadly competitive, the companies that are prepared to pay higher wages tend necessarily to be the more efficient ones, and the public benefits when they do attract labour from less efficient competitors. Labour "poaching," therefore, deserves mainly to be considered as one of those usefully emotive terms, like "cut-throat" competition, for those who want to protect the weak from any strong winds that blow in the market economy—though on occasion companies that pay higher wages than the rest are merely inviting labour to join them in a carefree conspiracy against the consumer.

Expansion in Steel

THE steel industry finds itself with no dramatic plan in hand, having largely completed the spectacular projects in its postwar development. But it is engaged on many important schemes over the next two or three years that are designed to raise the industry's crude steel output towards the 22½ million tons that the projection of the present level of demand seems to imply. One good example of such development—significant because it comes from a group covering a wide spectrum of the steel industry—is the heavy programme in which the constituent units of the United Steel companies are engaged. The Samuel Fox subsidiary, which specialises in alloy and stainless steels, is installing a new 80-ton electric furnace alongside the present 60-ton furnace; it is reconstructing its billet mill and installing a new rod and bar mill—all at a cost of £5.2 million. At Steel, Peech and Tozer work has started on a new medium width strip mill to cost £3.3 million; this will also be in production in two years' time and its output is already booked. Thirdly, the great mild steel works at Appleby-Frodingham—the scene of major advances in ore preparation, sintering, blast furnace practice and steel making since the war—is to spend £2½ million on a new battery of 66 coke ovens, and the reconstruction of the Appleby plate mill will cost £3.2 million.

On the major projects alone, therefore, United Steel faces commitments of the order of £14½ million, and the total bill will doubtless be considerably expanded by lesser though still considerable, ancillary development. The bulk of these expenditures can no doubt be met from internal resources—earnings set aside in various forms in 1953–5 were of the order of £5½ million, and in the latest year September 30th they will no doubt be even higher. Moreover, the group has presumably drawn the balance of £6 million on its 4½ per cent debenture stock subscribed by the Steel Agency during the past year.

The Ravenscraig scheme of Colvilles, near Glasgow, which is to cost £22 million, and should be in production in the autumn of 1957, is designed to produce 350,000 tons of iron and 400,000 tons of ingots a year. This will use mainly imported ore. The present plan provides for one blast furnace of 25 ft. 9 in. diameter (the "Queen Victoria" furnace at Appleby-Frodingham, incidentally, is of 28 ft. 6 in. diameter) and three 200-ton open-hearth steel furnaces. Finishing will be carried out at the Lanarkshire and Dalziel mills a mile or two away. The physical possibilities of expansion at Ravenscraig after the first stage construction has been completed are impressive; but the second stage rests on future decisions.

Vans in Higher Gear

IF the major car firms think they ought to be selling more cars than they are, particularly overseas, they should at least have little cause for complaint about their commercial vehicle sales. In the first eight months of the year total production of commercial vehicles rose by 27 per cent, and the greater part of this boom has been occurring in the

Fractional Horsepower MOTORS

BTH fractional horsepower motors are second to none in quality and proved performance. All types are available in sizes to meet every domestic, commercial, and industrial need. Precision-built of highest grade components, and fully tested, they will give long and trouble-free service. No manufacturer can offer a wider choice in fractional horsepower motors. Whatever the conditions of service or type of drive, there is a BTH motor well suited to the job.

TRAVEL BY TRAIN

-to be sure!

And go by French Railways to be on time. Their service and comfort are unequalled, and many economies make them the businessman's most practical means of travel within France and to the borders beyond. To quote the *London Evening Standard*—"French Railways lead Europe for speed and punctuality."

DAY TRIPS. You can leave in the morning, travel from 350 to 500 Km., have several hours in which to conduct your business and return the same evening, in comfort. Examples: Day return trips from PARIS include La Rochelle, Lyon, Antwerp or Sarrebruck.

HALF-FARE CARDS which entitle the holder to unlimited travel between two particular stations or in a particular zone at half the standard fare can now be purchased without deduction from the basic travel allowance.

OVER-NIGHT TRIPS. You can leave in the evening, travel from 500 to 600 Km., stay the night at an hotel, devote most of the following day to your affairs and return that night. Examples: Over-night return trips from PARIS include Bordeaux, Grenoble, St. Nazaire or Zurich.

NEW DIESEL RAILCARS. Ideal for businessmen! New diesel railcars offer travellers high speed with noiseless running and complete comfort on many long-distance non-electrified runs between large centres.

harvests and health

The snake was an ancient symbol of Time
and the turning year, with its earth-seasons
of spring planting, summer growth,
autumn harvest and winter sleep.
And the snake of Esculapius has,
since classical times, been a symbol of healing.

*Agriculture to produce man's food,
and medicine to care for his health...*

The improvement of crops
has been the main business of Fisons
for a hundred years and more,
almost since the science and production
of chemical fertilizers began.
And, in recent years, Fisons have struck roots
in the field of chemicals for medicine.
Fisons today contribute to the harvests
and health of the world.

FISONS LIMITED • Harvest House • Felixstowe • Suffolk.....

FERTILIZERS • HEAVY CHEMICALS

Fisons are among the largest manufacturers
in Great Britain of pharmaceuticals, medicinal
food preparations and fine chemicals for
Industry. Many of Fisons products in
these fields are household names

it's all in **FISONS** field

lighter ranges of lorries and vans which the car manufacturers make in large quantities. The whole industry turned out 202,000 vehicles during these eight months, 112,000 for the home market and 90,000 for export against 78,000 and 81,000 last year. Home sales of vans with carrying capacities smaller than 15 cwt. were up by 61 per cent, and deliveries for export were up by 14 per cent. In the range of larger goods vehicles with capacities between 15 cwt and 6 ton home deliveries advanced 31 per cent and exports 8½ per cent. Only in the heaviest classes of trucks and special duty vehicles was the growth less than moderate: deliveries to home customers rose by only 2 per cent and exports by 6½ per cent. Car manufacturers are barely represented in the higher ranges; the makers of the heavier lorries all have substantial backlogs of orders reaching up to a year and a half for some of their models.

The increase of only 11½ per cent in exports of these vehicles should be compared not with the massive growth in sales at home, but with the much smaller gain in car exports and more particularly with the increase of only 6 per cent in exports achieved by the other major lorry producing countries. American exports have shown very little improvement, and French sales overseas have in fact fallen. Only the West German industry has chalked up a gain—about a quarter more. But this was mainly in lighter vehicles such as the Volkswagen Transporter; German exports are still less than a half the number shipped from Britain.

Traffic Barriers

THE only good point in the campaign that the three motoring organisations have recently launched against the use of parking meters is their insistence that the Minister of Transport construct more off-street parking accommodation. This is the major and essential part to any balanced programme designed to alleviate traffic congestion in big cities; and there is yet no sign of any serious programme of garage construction. A certain amount of space is being reserved for cars in some new shops and office blocks, but the relief this will afford will be negligible. The Minister's advisory committee on London traffic reported in 1951 that there were 25,000 parked vehicles at peak periods in 250 miles of streets in the inner area (and 8,000, mostly occupied, off-street parking places, including those on bombed sites that have since been built upon); by 1953 the number of parked vehicles in the innermost area had risen by about

forty per cent. Enforcement of further traffic regulations is now becoming a farce; and it is placing an impossible burden upon the police, whose shortage of numbers has already become grave.

The main barrier is the formidable cost of buying land to construct garages in central areas; it frightens private enterprise (as it has done in the United States) and even the LCC will be willing to build and operate garages only if it receives a 75 per cent grant from the Exchequer as well as the net revenue of parking meters. Expenditure on the scale that has been undertaken in many American cities is certainly far more than could be expected here. But the construction of the few new roads that for many years have been considered essential in British cities has also been delayed because of the amount of money they involve. The Minister of Transport has lately wielded a pneumatic drill on his department's section of the three-mile Cromwell Road extension scheme intended to ease westbound traffic into and out of London; when his task has been completed in 1959 it will be the first of its kind to have been cut for half a century. A similar scheme, to widen Park Lane, still awaits a decision on whether an underpass or a roundabout should be constructed at its southern end. An underpass would be much more costly, but Hyde Park Corner is believed to be the busiest traffic intersection in the world.

Advice on Chemical Engineering

THERE is still a measure of disquiet in the chemical industry about the standard of chemical engineering in this country—some of the biggest chemical projects built here since the war have relied heavily on advice and blueprints obtained from the United States. The industry and the plant manufacturers, who have had discussions on this since the Cermer report pointed out some of the shortcomings four years ago, have decided at last that what both industries need is not a central research association for chemical engineering, but an advisory service "to stimulate a proper appreciation of the economic advantages of applying chemical engineering knowledge" and a research committee to look at the engineering requirements of the chemical industry and to suggest methods of filling the most noticeable gaps. The Association of British Chemical Manufacturers is setting up such a joint research and advisory committee, the part of the plant manufacturers apparently being restricted to the appointment of a liaison member. It is probably true that a substantial amount of research is already being done both by manufacturers and universities, and that what the industry most needs is the better distribution of information about available processes. The ABCM's committee is intended to do this, and to do it where necessary on a confidential basis.

Price Averaging in Sugar

ALL markets are marginal, but some are more marginal than others. The New York sugar market, for one, is criticised because the turnover can be so small that the world price quoted there cannot be called representative.

The trade in this country hopes to change that when the passage of the Sugar Bill allows the government to return all imports of sugar to private hands, and allows the trade to reopen the London futures market in raw sugar. London, it is hoped, will again set the world price, and a fully representative one. Hence some traders are worried by the amount of sugar that British refiners have bought, or have taken options to buy, on a price averaging basis; the quantity is about 500,000 tons, of which 250,000 tons is from San Domingo and 200,000 tons from Cuba. The sugar will be for delivery next year at a price based on the average of the world price, *fas* Cuba. It will thus be priced on the market but not pass through the market which will to that extent be narrowed.

Such shipments assist buyer and seller to take a longer view of the market, but if they form a large proportion of the trade, the market price becomes a small tail wagging a big dog. Buyers are no doubt aware of this danger. The quantity so far affected is small compared with a turnover in London that will reach over 3 million tons, but sales on a price averaging basis will probably tend to increase when arrangements are being made for the purchase of Commonwealth sugar from the Sugar Board.

Nylon Still Tops

OUTPUT of the newer man-made fibres as a whole is still growing apace. World output has nearly doubled in the past four years, from 212 million lb in 1951 to 403 million in 1954, though it remains a mere tenth of world production of the first of all synthetics—rayon. By the end of 1956 world capacity is expected to double once more and reach 810 million lb. The expansion is general among producing countries and widespread among the synthetic fibres. But the United States remains predominant among producers, and nylon among the newer synthetics. In its latest review* the Commonwealth Economic Committee

observes that the United States still accounts for over two-thirds of world production; nylon accounted for over half the American output in 1954 and for an even higher proportion in other countries. The capacity for nylon production in the United States is expected to rise to 320 million

lb in 1956, compared with an output of 175 million last year, and plans for expansion are under way in almost every other country where nylon is made.

There are now more than a dozen types of the newer synthetics, grouped into seven main categories: the polyamides, nylon and perlon; the polyester Terylene, produced in the United States under the name Dacron; the polyethylenes; the acrylic polyvinyl fibres which, intro-

* Industrial Fibres. HMSO. 5s

duced mainly in the United States, have had a full share of disappointments; the non-acrylic polyvinyls, developed notably in the United States, Japan and Germany; the protein fibres such as Fibrolane and finally the mineral (glass) fibres. It will be some time yet before the most appropriate applications for these fibres, alone or in blends, have been found, but the prospect is exciting.

SHORTER NOTES

Limits sanctioned by the Government for temporary borrowings by the nationalised industries will stand at £58 million on December 31st, compared with £298 million on September 30th last. This reduction, disclosed in a Parliamentary answer this week, will result from the heavy repayments that are now being made by the Gas and Electricity industries from the proceeds of their £300 million of stock issues placed last summer. These official limits give no precise indication, however, of either the amounts actually borrowed or of the limits granted by the banks. The banking limits that will operate in the new year have yet to be determined, but will certainly be much lower than those to which the nationalised industries have been accustomed in the past.

Details are announced of the terms on which Hadfields is prepared to reacquire Millspaugh, the makers of paper and pulp machinery. The offer is two £1 ordinary shares of Hadfields (market price 28s. 9d. per share) for seven ordinary units of 2s. 6d. (market price 7s. 9d. per unit) in Millspaugh. Hadfields acquire any dividend in excess of 12½ per cent declared by Millspaugh for the year ended September 30, 1955, and the new shares offered exclude the 3½ per cent interim dividend recently declared by Hadfields. Group profits of Millspaugh before tax for the year ended September 30th are estimated at about £450,000 (against £209,569).

The number of industrial insurance policies in force at the end of 1954 was 121,200,000 compared with 121,500,000 at the end of 1953. In last week's issue of *The Economist* the figures were reversed and the comparison wrongly presented as between 1952 and 1954. The net addition to industrial life funds last year was £65.2 million, not £62.5 million as printed.

The directors of International Nickel Company of Canada have declared a quarterly dividend of 65 cents and an extra year-end dividend of \$1.35 on the no par value common stock—making a total of \$3.75 on each unit for 1955, compared with \$2.90 for 1954. Since the announcement the common stock units have gained \$1¼ to stand at \$143½ on the London Stock Exchange.

Company Notes

FISONS. From a turnover of £32 million Fisons earned a profit, after depreciation and interest payments, of £2,656,276 in the year to June 30th. In 1953-54 the group gained a profit of £2,956,476 from a turnover of £28 million. The volume of sales was not lower, but the profit margins on fertilisers, despite some increase in prices, were squeezed. As the chairman, Mr F. G. C. Fison, explains, "a continuous rise in cost in virtually all items entering into fertiliser manufacture prevented the group from maintaining profits." The chief culprit was freight rates. The prices of some of the raw materials that the group uses, such as phosphate rock, went up, but 60 per cent of the increase in the bill for raw materials was accounted for by increases in freight rates, principally on phosphate rock. Much of that increase took place in the first months of this calendar year. Mr Fison refrains from making any direct forecast about immediate prospects, though he does say that he believes that "the out-turn for the farmer this year will be better than he has experienced for some time." And British farmers with more money in their pockets should bring custom to Fisons.

Among the group's immediate concerns is the decision by the Government to submit the fertiliser industry to an examination by the Monopolies Commission. Mr Fison does not consider it yet proper to make any detailed comment. But he fires off an opening shot in expressing the hope that

the Commission will recognise that insofar as our own activities are concerned at least, there are no restrictive practices of any importance, the industry is very progressive technically, and that profit margins are entirely reasonable.

Mr Fison adds that profits before tax in 1953-54 represented a return of only 10 per cent on sales and in 1954-55 the return was smaller.

Stockholders, who receive a 15 per cent dividend, will note that the group has to find big sums of money, either from internal or external sources, to finance research and development. Among those investment projects can be listed the further development of Fisons Pest Control and the spending of about £4½ million on building a plant at Shellhaven to convert a proportion of the ammonia produced in the Shell Chemical plant into fertiliser.

STANDARD MOTOR. Lord Tedder, the chairman of the Standard Motor Company, in his statement with the full accounts sets out three reasons why liquid resources should be conserved, and therefore by implication why in his view the ordinary dividend had to be left unchanged at 12 per cent. He points to the need "to meet competition, to buy the expensive capital equipment essential to modern production methods, and to help the country's fight against inflation."

Stockholders, in assessing the future of Standard Motor, will undoubtedly concentrate upon the first two of Lord Tedder's arguments. They will also see from the consolidated balance sheet that on August 31st the company was not short of liquid resources. Indeed, despite substantial expenditure on fixed capital, the total of cash and tax reserve certificates came to £8,189,137, compared with £3,764,879 the year before. The reinforcement of liquid resources had been helped by the £3 million preference share issue and by the ploughing back of nearly £2 million into reserves.

The need to meet competition is Lord Tedder's first point. No doubt he is keenly aware of the vulnerability of the company, whose profit margins are smaller than those earned by most other motor manufacturers, in competitive markets. The increase in purchase tax should sharpen that competition. Standard Motor is preparing to meet a competitive struggle by continuing its production of the Ferguson tractor, by adding to its manufacturing and assembly plants abroad and by concentrating at home on the production of "baby cars." Significantly out of a total production of 435 cars a day, 325 are 8 hp and 10 hp models.

All these steps are linked with Lord Tedder's second argument that liquid resources must be conserved to buy the new capital equipment the company needs. He points out that in 1954-55 the company spent about £4½ million on new plant, equipment, dies and other capital assets and is committed to spend at least another £4 million. The programme includes a plan for "the complete revision of the company's factory layouts." That, Lord Tedder adds, will mean "some temporary dislocation of production," cutting down output and revenue.

JOSEPH LUCAS. The summer of booming profits, dividends and markets has now given place to an autumn of prudence. Profits are still high but dividend payments have become more conservative and stock markets more uncertain. The frost of disappointment is in the air. Its nip was felt in Throgmorton Street this week when Joseph Lucas left its ordinary dividend effectively unchanged. Following the 100 per cent free scrip issue, its directors halved the interim ordinary rate and now they have halved the final rate. On the new capital the dividend for the year to July 31st is 7½ per cent, exactly equivalent, allowing for the 100 per cent scrip issue, to the 1953-54 payment. Because of the big earnings cover on the dividend and because the demise of EPL would swell those earnings still further investors had hoped that the directors of Joseph Lucas would be more generous. The winter of discontent was made manifest when the £1 ordinary shares were marked down 3s. 3d. to 39s. (to offer a yield of £3 17s. per cent).

The group's preliminary profit statement is defective in another sense. In a year in which the company's main customers, the motor manufacturers, have earned record profits it is not clear from the Joseph Lucas statement whether profits have gone up or not. The statement says that the surplus after tax was £1,801,346 and that the 1953-54 figure was £1,451,498 "after charging £675,300 for EPL and income tax not now required." The statement goes on: "after allowing for these adjustments the comparative figure becomes £2,126,798" and that in arriving at the 1954-55 surplus "a reserve of £350,000 has been made to cover increases arising on the valuation of basic materials." Amid all that confusion—and the statement must rank among the most confusing published this year—stockholders should cling to the one firm fact that taxation absorbs £5,056,177, compared with £5,460,127. The 1953-54 figure for tax included £439,046 for EPL; the inference must be that gross profits before tax have risen. But it is only an inference. And from a preliminary statement stockholders are entitled to be certain about the trend in profits—not merely to infer it.

ANGLO-ECUADORIAN OIL-FIELDS. The battle of bids for the control of Anglo-Ecuadorian Oilfields, discussed in these columns on October 22nd, is over. The two sides, the directors of Lobitos (who also constitute the board of Anglo-Ecuadorian) and the directors of the American company, South American Gold and Platinum, have come to terms. The settlement has led to a new offer by Lobitos to stockholders in Anglo-Ecuadorian. The first offer from Lobitos was of four Lobitos 5s. ordinary stock units plus 10s. in cash for every Anglo-Ecuadorian stock unit. The new proposal is that the Anglo-Ecuadorian £1 stock units should be split into three 6s. 8d. units. For every two of these new units Lobitos offers two of its own 5s. ordinary stock units plus 15s. in cash; the remaining 6s. 8d. unit of Anglo-Ecuadorian will remain in the possession of the stockholder. Since the second offer both the price of the Lobitos units and that of the Anglo-Ecuadorian units have fallen (to 11s. 10½d. and 54s. 6d. respectively). That was due to selling by bulls who had been hoping that South American Gold and Platinum would make a bid better than the original Lobitos offer. On current prices the new Lobitos offer makes each Anglo-Ecuadorian unit worth about 57s. (compared with the market price of 54s. 6d.).

Lobitos and South American Gold and Platinum will adjust their respective holdings in Anglo-Ecuadorian, by transferring the 6s. 8d. units from one to the other at 20s. each, until both companies hold exactly the same amount of stock. Each company will be represented by the same number of directors on the board of Anglo-Ecuadorian but Lobitos will nominate the chairman, who will have the casting vote. In recommending the new offer the Lobitos directors point out that Anglo-Ecuadorian stockholders will receive a larger cash payment; that the

management of the company will be broadened by the inclusion of the directors appointed by South American Gold and Platinum, which already possesses considerable oil interests in Ecuador; that Anglo-Ecuadorian stockholders will retain a direct stake in the company; and that Anglo-Ecuadorian will benefit from the retention of a public market in its stock. In addition they will secure an interest in Lobitos. This amicable settlement has much to commend it—especially since it does not disturb the plan to transfer control of Anglo-Ecuadorian for tax purposes to South America. It is worth noting that South American Gold and Platinum has accepted the original estimate by Lobitos that 60s. was a "fair price" for the Anglo-Ecuadorian stock units.

Planet Trading Company was acquired. That acquisition is but one example of how the group has been adding to its investments in the hotel trade and in distributive outlets for bottled beer.

At the current price of 8s. 6d. the 5s. ordinary stock units yield 7½ per cent, a yield that makes some allowance for the fact that money is still needed in the business to push the sale of bottled beer and to attract a bigger proportion of the shrinking number of draught beer drinkers into the company's public houses and that, therefore, the directors are likely to be cautious about dividends.

BIRMINGHAM SMALL ARMS. This company cannot be classified simply as a motor manufacturer. Indeed, its interests in small arms, cycles, motor cycles and machine tools are at least as important as those in the production of motor vehicles. Its trading experience in the year to July 31st was also different from that of the vehicle producers. They have reported increases in profits; BSA reports a fall in gross trading profits (from £3,079,826 to £2,865,676). That decline, the directors say, reflects the effects of the dock and rail strikes and of "the continued effort to maintain the lowest possible selling prices in the face of increasing costs."

Thanks to a decline in taxation (from £1,937,269 to £1,610,992) and thanks in particular to the demise of EPL, the consolidated net profit has risen from £1,196,416 to £1,610,992. The directors have taken this as an opportunity to raise the ordinary dividend from the equivalent of 8½ per cent to 10 per cent. On that dividend the £1 ordinary stock units at the current price of 37½ yield 5.4 per cent.

THE ACTUARIES' INVESTMENT INDEX

LONDON STOCK EXCHANGE

Next Account begins: November 16th

Next Contango Day: November 16th

Next Settlement Day: November 22nd

LARGE falls occurred in gilt-edged securities on Monday when prices were lowered on small offerings, and further heavy losses followed the announcement of the projected Rhodesia and Nyasaland loan with a coupon rate of 5 per cent. The turnover in government stocks was considerably higher, 3½ per cent War Loan being particularly active. This issue bore the brunt of the selling and declined from 78 xd to 74 xd during the week. Old Consols fell to 55½; 4 per cent Funding 1960/90 at 89½ was—as was War Loan—at its lowest point for the year. In dealings on Thursday gilt-edged prices were firmer. Corporation and Dominion stocks were all marked down in sympathy.

German bonds advanced strongly at the beginning of the week but lost part of their earlier gains later on the news from Geneva. Japanese stocks also lost some of the ground they had gained before the week-end. Greek loans were still supported; 6 per cent Peruvian National bonds rose 1½ to 91½ while the Corporation debenture issue improved from 87½ to 88½ in anticipation of the scheme of arrangement now under consideration.

Leading industrial stocks were marked down in the absence of buyers; and many of the dividends announced recently came as a disappointment to investors. In the week to the close on Wednesday the *Financial Times* ordinary index declined from 193.2 to 187.8, the biggest loss occurring on Wednesday. Debenhams fell to 36s. xd, the lowest for the year. The bigger interim dividend from Marks and Spencer was followed by a fall of 1s. 3d. in the "A" shares to 64s., but they rallied quickly to 65s. British Xylonite were lowered to 44s. after an unchanged interim.

Disturbances in the Middle East were reflected in the weakness of British Petroleum and Burmah Oil, but Royal Dutch improved to 58. Free State Geduld and Randfontein fell to 66s. 6d. and 44s. respectively on Wednesday, pulling other Kaffirs down with them, though a rally was staged in late dealings on that day.

A sad case of over-heating

THE MONEY MARKET

THE first offer of the new 63-day bills at the tender on Friday last produced a surprising result. The market lowered its bid for the £200 million of 91-day bills by 2d. per cent to £98 19s. 6d., raising the discount rate by $\frac{3}{8}$ per cent to $4\frac{3}{8}$ per cent. Yet for the £60 million of new two months' bills on offer it tendered on a discount basis of just over $4\frac{1}{2}$ per cent— $\frac{3}{8}$ per cent above the new rate on the longer maturities and $\frac{3}{8}$ per cent above the rate at which January maturities of last month's 91-day bills were currently being sold to the banks.

Total applications at the tender fell by £12 million to £369.7 million—of which £69.5 million was for the 63-day bills. The market secured 84 per cent of its application for the 63-day bills, and 46 per cent of that for 91-day bills; its average allotment came out at 55 per cent, compared with 52 per cent at the previous tender. The average rates of discount came out at £4 2s. 5.19d. per cent for the 63-day bills, £2 1s. 11.65d. for the 91-day and £4 2s. 0.93d. per cent for the aggregate allotment of £260 million. At yesterday's tender the offer of the two months' bill was cut by £10 million, to £50 million, but that of 91-day bills was stepped up by £20 million to £220 million. Lombard Street suffered two phases of acute stringency. On Thursday before the weekend three or four houses were obliged to take a small amount of loans at the penal rate, and again on Wednesday of this week.

A sad case of over-heating

A detailed black and white illustration of a large, horizontal metal pipe that has failed due to overheating. The pipe is heavily deformed, with a large, jagged crack running along its length. It is surrounded by debris, including several rectangular blocks of material that appear to be broken pieces of the pipe or its supports. The background is a simple, light-colored surface, possibly a ground or a wall, with a dark, triangular shape in the upper left corner. The overall tone is somber and emphasizes the severity of the failure.

What Vulcan say about it

They are the specialists who know where to look for likely danger and disaster in every heating plant going—or not going. In lifts, hoists and cranes, too: anywhere there's an accident coming up, they're down on it before it has even thought of starting. In other words, safety first is Vulcan first.

SAFETY-FIRST INVESTMENT

3%

Income Tax Paid

The interest rate of 3 per cent per annum on Share Accounts, income tax paid by the Society, represents a return on every £100 invested equivalent to £5.4.4 per cent to all investors subject to the standard rate of income tax. Ordinary Deposit Accounts earn 2½ per cent per annum, income tax paid, which is equivalent to £4.6.11 per cent where the standard rate of income tax is paid. Amounts up to £5,000 are accepted by the Society.

Interest Half-Yearly

Sums invested may be withdrawn at convenient notice; interest which is paid half-yearly, commences from the day after the investment is received and continues to the date of withdrawal.

Security of Capital

Abbey National is one of the largest and oldest established building societies in the country, with over £200,000,000 total assets — a token of the confidence of more than 500,000 investors.

COMPANY MEETINGS

FISONS LIMITED

SALES TARGETS ACHIEVED

PROFITS AFFECTED BY RISING COSTS

MR F. G. C. FISON ON THE AGRICULTURAL
POSITION

The sixty-second Annual General Meeting of Fisons Limited will be held on December 2nd at Harvest House, Felixstowe, Suffolk.

The following is the review of the Chairman, Mr F. G. C. Fison, which has been circulated with the Report and Accounts for the year to June 30, 1955:

THE ACCOUNTS

Sales for the year, including for the first time those of Fisons Pest Control Limited, were £32 million compared with £28 million in the previous year. The figure for 1954 included our trading in grain and certain factored goods, amounting to £700,000, which has been discontinued. The Group Trading Profit, including dividends from our Associated Companies and after deducting interest charges, was £2,656,276 compared with £2,956,476. An important reason for this reduced profit has been the lower margins on fertilizers.

I referred in my statement last year to the fact that large increases in costs in the current year had occurred and that, consequently, we had been obliged to increase our fertilizer prices. I said, *inter alia*, "These increases by no means absorb the whole of the increased costs, and we have again relied on achieving some increase in turnover to maintain the level of profitability. Whether in view of the difficult harvest and the uncertainty attending decontrol our sales target will be achieved is a matter on which I could not yet make any confident forecast." In fact the sales targets were achieved, but a continuous rise in cost in virtually all items entering into fertilizer manufacture prevented us from maintaining our profits.

SHOWING FARMERS' DIFFICULTIES

It is true that price increases were made during the course of the year, but it was the view of the Board that the Company should share to some extent the difficulties which the farming community was experiencing at the time. As I mentioned last year in the passage from which I have quoted above, there were considerable difficulties due to the weather and to the Government's new agricultural policy and, undoubtedly, there was serious concern amongst the farming community. In the Spring the Government took some very necessary action to revive confidence, but it was then too late for us to recoup the profit which we had voluntarily sacrificed. Whether our restraint and desire to share the difficulties of the farmer were appreciated I cannot say, but it was the view of the Board that it was our duty to give some assistance.

There has been considerable discussion recently concerning the advisability of publishing half-yearly or quarterly statements, but

in a business such as ours, of which such a large proportion is seasonal, a half-yearly statement would be completely misleading, and we do not, therefore, propose to publish such statements.

RAW MATERIALS

I have referred to a continuous rise in cost during the year under review, and this affected all our materials. To a minor extent this was the result of price increases made by the producers of raw materials, i.e., phosphate rock, potash and sulphate of ammonia, but the larger part of the increase resulted from the very rapid rise in freight rates, particularly in the second half of the year. Inflationary conditions in the majority of countries and a very large increase in fertilizer usage in Europe, have resulted in the present year in even greater increases in costs, while freight rates for a variety of causes have continued their very steep upward trend. I do not think that it is generally appreciated how large a part freight rates in fact play in our economy. It may be of interest if I say that in the present year, disregarding a quite exceptional increase in the price of sulphate of ammonia, 60 per cent of the increase in the raw material bill is accounted for by increases in freight, principally on phosphate rock.

TENSION IN MOROCCO

It is, I suppose, widely known that the major part of our supplies of phosphate rock come from French Morocco, and in view of the very serious political situation in that country I may be expected to make some comment on the outlook. It was reported in the Press that very substantial damage had been done to the installations at one of the mines on which we largely depend, and we despatched a member of our staff to Morocco to report on conditions. I am glad to say that the management of the phosphate mines has shown the utmost energy in dealing with a difficult situation and supplies of rock have at no time been held up. We have, during the past few months, suffered serious anxiety, however, in regard to rock supplies due to the inability to obtain sufficient shipping. It will undoubtedly be the wish of the majority of users to increase their stocks in view of the serious tension in Morocco, and I think that it is quite likely that the Moroccan mines will be unable to meet such a general demand as their production capacity was already stretched at the previous level of demand. Fortunately, such marginal supplies as may be required, unless there is further serious trouble in Morocco, are likely to be available from other sources.

I think it will be realised that the dependence of Europe on the Moroccan mines for phosphate rock is such that if there were any breakdown of supplies for more than a few weeks there would be a major crisis in the industry over a large part of the world.

The sources of phosphate rock are many and given time all demands could be supplied from other countries. It would not be possible, however, to develop the mines in America and elsewhere sufficiently to provide for the requirements of Europe in less than one or two years, and during that interval a very serious situation would undoubtedly prevail.

FERTILIZERS

United Kingdom fertilizer deliveries, in terms of plant nutrient, compare with the previous year as follows:

	1953-54	1954-55
	tons	tons
Nitrogen in terms of N ...	241,600	248,100
Phosphates in terms of P ₂ O ₅ ...	380,600	334,600
Potash in terms of K ₂ O ...	251,000	252,400
Total	873,200	835,100

It will be seen that there was an increase in nitrogen and potash and a decrease in phosphates. For our own part, we achieved a moderate increase in sales in terms of total plant nutrient.

I told you last year of our intention to employ all the available means of sales promotion in order to convince the farming community of the value to it of a higher level of fertilizer consumption. We have made considerable progress since then in establishing our Technical Sales Service, which is now in operation in the South West of England and in Scotland and has been accorded a most favourable reception by both farmers and merchants. We shall shortly extend this service to cover the whole country. In particular we intend to stress the importance of the better utilisation of the country's grassland.

IMPORTED FOODSTUFFS

The Chancellor of the Exchequer has recently drawn attention to the staggering bill for imported feeding stuffs, the tonnage of which rose from 4,750,000 tons in 1953/54 to 5,500,000 tons in 1954/55, and much of this came from dollar areas. If we assume an average price per ton of £35 the bill came to £166,250,000 in 1953/54 and to £192,500,000 in 1954/55. Imported feeding stuffs are fed to three main classes of livestock—cattle, particularly dairy cattle, pigs and poultry. In the case of pigs and poultry cereal grains, milling by-products and fish and meat meals are the main imports consumed. These types of feeding stuffs are low in fibre and high in energy value and cannot be replaced to more than a small extent by higher fibre crops, such as fodder crops, grass, hay or silage. Dairy cattle, however, require relatively more

protein and can utilise high fibre foods so that it is possible to replace concentrates by fodder crops or by grass in one form or another.

A greater degree of self-sufficiency in feeding stuffs for cattle should, therefore, be relatively easy. The estimated average utilised output of British grassland is 16.7 cwt per acre Starch Equivalent, whereas in Denmark it is 22.3 cwt per acre Starch Equivalent. It is true, of course, that examples of grassland production equal to the Danish figure can be found on many of the better grassland farms in this country. An increase, however, in grassland production of 50 per cent is not only technically possible, but should be attainable. It could be done by using more fertilisers and by better management.

SIR WILLIAM OGG'S STATEMENT

Sir William Ogg, the Director of Rothamsted Experimental Station, has stated that only about one-third of the temporary grass and less than one-fifth of the permanent pasture receive regular dressings of fertilizers and that there are considerable areas which receive next to nothing. If a 50 per cent increase in grassland production could be achieved it would mean an extra 8 cwt Starch Equivalent per acre, which would be sufficient to provide food for one gallon per day from our total population of cows and heifers in milk. This would represent a saving of about 1,700,000 tons of feeding stuffs, or approximately the amount by which our imports have increased during the past two years. Thus there would be a saving in foreign exchange amounting to £59,500,000.

I am glad to report a very marked increase in our horticultural trade, which has been expanding at a very satisfactory rate during the past few years.

Our fertilizer factories have all been working at full pressure throughout the year, and in particular our triple superphosphate factory at Immingham has achieved an output much higher than its rated capacity, which reflects great credit upon the Management and operating staff.

We have paid particular attention to Work Study and its application to production problems, and as a result productivity has shown a steady improvement.

FISONS PEST CONTROL LIMITED

Since my last review we have completed our reorganisation of this company and I think it is now as well managed and efficient in all departments as any of its competitors. We have also made considerable progress towards putting the business on a financially satisfactory basis and the downward trend in trading results has been arrested and we anticipate a progressive improvement in results. Chemical sales showed a very satisfactory increase, but we did not reap the full benefit of this in profit owing to the very difficult weather conditions in the early part of the year, which hampered our contracting operations very seriously. We are pursuing actively a policy of rationalisation and concentration on the contracting side, and closed down during the course of the year seven of our branches.

We are also attempting to limit our commitment in some of the extraneous activities in which the company was engaged at the time of acquisition. I would mention in this connection that we have segregated the aviation side of the business and formed a joint company with Airwork Limited, called Fison-Airwork Limited, to carry out aerial crop spraying and general helicopter contracting. The Chairman of Airwork Limited, Mr Miles

Wyatt, very kindly consented to become the first Chairman of Fison-Airwork Limited and this small but interesting enterprise appears now to be successfully launched. It may well be that we shall follow a similar course with certain other activities.

The pest control industry is young, expanding very rapidly indeed, and is highly competitive. It is only by the production of new compounds, the efforts of original research work, that real progress can be made. We have, therefore, during the year substantially enlarged our research and development facilities and I am hopeful that as time goes on we shall make available original contributions. Although it is not of great commercial significance, I would mention a radical innovation in spraying machines recently made by our Research Department, and which will render experimental herbicide work cheaper and more efficient than hitherto. The machine is likely to become a standard research tool in all major institutes concerned with this type of work.

NITROGEN

Although, through our Subsidiary Company Nitrogen Fertilisers Limited, we produce a small quantity of ammonia, our demands for the manufacture of compound fertilizers have increased very greatly in recent years and, in consequence, we are very large purchasers of ammonium sulphate. The terms on which we buy this material have not, in recent years, been satisfactory, allowing us insufficient margin for the services which we render in processing and distributing this material to the final consumer. We had also to take into account the fact that our requirements are still growing and that new ammonia capacity is obviously necessary in the country. We have, therefore, recently entered into a long-term contract with Shell Chemical Company Limited to purchase from them a large quantity of ammonia to be produced from a new plant at Shell Haven.

This ammonia will be processed by ourselves in a plant adjacent to their new ammonia plant and will then be distributed to our various works for incorporation in our fertilisers. The project involves a capital commitment on our part of the order of £4½ million, and is therefore the largest construction undertaking we have decided on since the Immingham triple superphosphate plant.

THE AGRICULTURAL SITUATION

Since our business is primarily concerned with agriculture, and to an even greater extent now that we have acquired Fisons Pest Control Limited, it has been my practice to comment on the agricultural situation in general. I have referred above to the conditions obtaining during the year under review, and which were partly responsible for the shortfall in profits which I have reported. It is very satisfactory, therefore, to note that there has been a remarkable improvement in the position during the present summer. Although the sowings were comparatively late, the unprecedented good weather resulted in grain harvests being well above average, while certain livestock products, which had suffered severe declines last autumn, have staged a remarkable recovery. How far the farmer will benefit from the excellent harvest depends, of course, to a large extent on Government policy and the movement of wages and other costs. I think that even if these circumstances are not as favourable as the weather, the out-turn for the farmer this year will be better than he has experienced for some time.

We are also, of course, interested in world agricultural conditions. In the first place the position of the farmer in this country is closely affected by conditions in the primary producing countries abroad, although the Government may in some cases act as a buffer. Secondly, we have extensive fertilizer and pest control interests abroad, particularly in Africa, and their fortunes of course are more directly dependent on conditions there. It cannot be, therefore, without some concern that we observe the failure to absorb certain large agricultural surpluses that have arisen. The incomes of agricultural producers, other than perhaps tobacco in Africa, appear to have passed their peak, at any rate for some time.

A MEANS OF REDUCING COSTS

This is already having some repercussions on trading in general, but so far the fertilizer and pest control industries have not suffered in the majority of countries. As I have mentioned so often in these reviews, fertilizers, and I must now add pest control chemicals, offer the most readily available means of cost reduction to the farmer, and he has shown himself increasingly aware of this. As, therefore, prices decline, the farmer is turning to fertilizers and pest control chemicals to reduce his costs and maintain his profit. I think this trend is likely to continue unless there is any sudden and major fall in farm incomes, in which case the mere inability to finance the purchases might set a limit to further progress.

In the past, however, it has not been unusual for the prices of primary commodities to fall below the cost of production. The intervention of Governments in agricultural policy is now such in all the principal producing countries that it is unlikely that this will happen again, but a policy of restriction of acreage, together with low supporting prices (or deficiency payments) is likely to be enforced. In the longer term, it is possible that pest control products will not suffer from weaker agricultural markets since their applications are so important in tropical countries for the prevention of pests virulent to both men, animals and plants.

MONOPOLIES COMMISSION

The Government recently announced its intention to submit to the Monopolies Commission various industries for examination, amongst which was the fertilizer industry. I do not think that it will be proper for me to make any detailed comment at this stage. I am hopeful that the Commission will recognise that insofar as our own activities are concerned at least, there are no restrictive practices of any importance, the industry is very progressive technically, and that profit margins are entirely reasonable. The last question is of course largely a matter of opinion, but I stated last year that our profits before tax were only approximately 10 per cent of turnover; in the year under review they were less. Overhead expenditure is continually increasing as is necessary in order that the industry may progress. The balance between a reasonably prosperous and very progressive industry and a poor backward industry is very fine, and depends on marginal amounts in the selling price. I do not think that the Commission or anyone else will fail to see where the real advantage to the farmer and the community lies.

I am hopeful that the report of the Commission, when finally published, will be favourable to us and our industry. In the meantime I can only say that the Board of the Company endeavours to conduct our affairs in the interests of all those whom it

serves, the shareholders, employees, the farmer, and the country as a whole.

NORTH EAST YORKSHIRE POTASH

I reported in 1952 that with the completion of our fourth bore in North East Yorkshire we had concluded our drilling programme and that the exploratory work carried out by Imperial Chemical Industries Limited and ourselves had proved the presence of extensive deposits of potassium salts at depths from between 3,500 feet to 4,500 feet. These deposits extended over an area of 24 square miles and were estimated to contain about 350 million tons of potassium chloride. The winning of this potash, however, presents difficult problems involving special deep mining techniques which our organisation was not qualified to control. Early this year Imperial Chemical Industries Limited announced that they had reluctantly decided not to proceed with the development of the Yorkshire potash deposits. We, for our part, decided to investigate the remaining possibility of separating the potash from brine by chemical means. We have now come to the conclusion that this chemical process is uneconomic and we are, therefore, abandoning our development work and have written off our expenditure amounting to £152,371.

The work that has been done in Yorkshire has proved the extent of the potash deposits and exposed the presence of a National asset which undoubtedly will be exploited in the years to come, and we are glad to have been able to make our contribution to this discovery.

FISONS CHEMICALS LIMITED

During the year we have completed the absorption of this Company into the Group, and it has now become a wholly owned subsidiary of Fisons Limited. The trading profit of the Group shows an improvement and we expect this to be maintained in the current year.

Last year, it will be remembered, I reported a substantial increase in profits from this side of our business, while pointing out some anxieties we had both in regard to milk products and pharmaceutical chemicals. During the year milk products were decontrolled by the Government and as a consequence of this and other factors we are now faced with considerable difficulties as regards our milk drying plant at Coleraine. The profit accruing from this has been considerably less than in previous years and the outlook is uncertain.

COMPETITION INTENSIFYING

Competition in pharmaceutical chemicals, the products of Whiffen & Sons Limited, has also been acute, largely from German sources, and is becoming more intensive. In spite of this, profit margins have been maintained in most cases, due to improved process efficiencies. There has been a considerable increase in the volume of exports. Whiffens have also secured increased sales, both at home and for export, in industrial chemicals. In particular, new derivatives of hydrazine, of which we are the only manufacturers in the United Kingdom, are becoming of increasing industrial importance, and plans are well advanced for expanding production.

Amongst new products which will be added to Whiffen's range I must mention ethylene diamine, for which a plant will shortly come on stream. This versatile chemical has previously been imported from Germany and the United States and is in demand as a raw material for fungicides, pharmaceuticals, surface coating agents, adhesives and other uses.

BENGER'S AND GENATOSAN

Benger's new product "Imferon," for the treatment of iron deficiency anemias, to which I referred last year, has lived up to its early promise and has been accepted by the Ministry of Health as a new drug of proved value freely prescribable under the National Health Service. The discovery has created world-wide interest, and in countries which are not readily accessible to us licence arrangements are being concluded.

Genatosan-Limited have achieved increased sales and profits, and in particular the sales of Sanatogen have broken all previous records.

Our Group export trading company, Fisons Chemicals (Export) Limited, had a most satisfactory year. As I have mentioned in the past, we have devoted considerable energy to the establishment and building up of an overseas organisation covering every major country in the world. As a result, we have seen great progress in turnover which is still continuing in spite of the intensive competition which I have referred to above. The organisation which we have created will become increasingly valuable as our range of products widens. I should mention, also, that Fisons Pest Control Limited, when we acquired that company, contributed a substantial export business which is being rapidly developed.

ASSOCIATED COMPANIES

In Canada we have maintained our share of the trade in the area in which we operate. There has been a general decline in farm incomes in the North American continent, with a consequent reduction in fertilizer usage. Our Associated Company has, however, achieved a small increase in profits.

In South Africa we have had a very satisfactory year with a substantial increase in sales. During the year another excellent maize crop has been harvested and a continued increase in fertilizer usage is expected.

In Rhodesia, sea freights on raw materials have been responsible for the continued high prices of fertilizers. Nevertheless, demand continues to grow and we have recorded a further increase in sales.

I reported in 1952 that we had formed a joint selling company in Rhodesia with African Explosives & Chemical Industries (Rhodesia) Limited to cover the sale and distribution of fertilizers in Southern and Northern Rhodesia and Nyasaland with the object of cheapening the distribution of fertilizers.

In view of the growth of fertilizer requirements in these areas necessitating extensions of manufacturing capacity at both factories, it has been mutually agreed between us that we shall resume independent marketing of our fertilizers with effect from April 1, 1956.

The Société Industrielle d'Acide Phosphorique et d'Engrais, a Tunisian company manufacturing triple superphosphate in which we have an interest, has made marked technical progress during the year and the factory is now operating at rated capacity. Considerable losses have been sustained during the development period and we have thought it prudent to write £75,000 off our investment in this company.

Murgatroyd's Salt and Chemical Company Limited and Fine Chemicals of Canada Limited have both traded at a profit. The United Sulphuric Acid Corporation Limited commenced production in the year under review.

RESEARCH

We continue to make substantial investments in research. In 1954 we spent on

research and development £213,000. In the year under review we have spent £362,000 and in 1956 we plan to spend more than £500,000. A considerable part of this expenditure must be regarded as an investment and while it results, at first, in a reduction of our annual profits, as has been the case this year, it must be remembered that the future profitability of our industry depends largely upon the achievements of our research workers, and so it is our intention to increase our research effort progressively in the years to come.

The building of the new Research Station at Levington in Suffolk is making good progress, and during the year another experimental farm has been acquired in the West Country. It is our policy to keep a proper balance between sound practical experience and laboratory science: neither must be exalted at the expense of the other. Farmers are rightly and naturally conservative, and new ideas developed in the laboratory need full confirmation in the field before they can be accepted.

DEMAND FOR TECHNOLOGISTS

The provision of the physical facilities for good research is now a costly but essential step in maintaining progress in the chemical industry. Equally necessary, and in some ways more difficult, is the building up of a scientific staff suited in kind and quality to the needs of the Company's business. It is now widely recognised that the demand for high-grade technologists, alike in industry, in the Government Services, and in the Colleges, exceeds the supply. There is no simple answer to this important problem, but we have thought it right to give substantial help in various ways to a number of Schools and Universities. We have, for example, recently provided funds for a Research Fellowship in Soil Science to be held at Nottingham University and administered by the School of Agriculture there. The encouragement of close contact between workers in the Universities and those facing the problems of industry is, we think, most helpful to both. If this country is to increase steadily the productivity of its industry, it is important, among other things, that more young people should be attracted to the study of science and engineering. This will occur only if our teachers are keen and able, and provided with the necessary tools.

In its many activities your Company makes demands on a wide range of scientific and technical skills, and a considerable effort is now being put into creating the conditions under which imaginative and effective research can take place. The organisation and management of scientific work on behalf of industry is, by comparison with management for production and sale, relatively new, and if we are not to be outpaced by our competitors abroad, it is necessary for us to apply now the techniques and principles which have already been proved right both here and in the USA.

STAFF

The welfare of all our employees in factory and office is something to which we pay great attention, believing as we do that good human relations are essential for the well-being of the individual and the company. It is interesting to note that this year, for the first time, our invested Pension Funds exceed £1 million.

I would like to express on behalf of my colleagues and myself our great appreciation of the services rendered to the Company by all those working for it, both at home and abroad.

ROOTES MOTORS LIMITED

EXPORTS INCREASED DESPITE INTENSE COMPETITION

INFLATION AND INDUSTRY'S FUTURE

The annual general meeting of Rootes Motors Limited will be held on December 2nd in London.

The products of the Rootes Group are Humber, Hillman and Sunbeam cars and Commer and Karrier Commercial Vehicles and Diesel Engines.

The following is an extract from the circulated statement of the Chairman, Sir William Rootes, KBE:

The Consolidated Accounts for the year ended July 31, 1955, show a Profit on Trading of £3,557,325.

The Consolidated Net Profit after taxation was £1,689,449:

It is recommended that a dividend of 8 per cent less Income Tax on the Ordinary and "A" Ordinary Share Capital of the company be paid. Our distribution policy continues to be conservative and we are confident that we are pursuing the right course in the interests of both our shareholders and those employed throughout the group.

Turning to the Consolidated Balance Sheet, it will be seen that Current Assets of £24,110,470 exceed the Current Liabilities of £13,053,367 by £11,057,103.

The year to July 31, 1955, was again one of record production. In spite of intensive competition our volume of exports increased. Improvements are constantly being made in our cars and commercial vehicles and better value for money is being offered to the public.

PROBLEM OF RISING COSTS

There has been a great amount of publicity recently regarding our industry, its competitive position and its future; this shows that there is considerable appreciation of its importance to this country and its economy. Our industry's position has already been dangerously weakened by inflation, but my own view is that—while I in no way underestimate the increasing competitive position—there is a good chance that we can maintain and I hope increase our overseas business. I must qualify this view, however, by saying that it is based on the hope that the Government's action at this juncture to halt inflation will be successful.

Your Directors in their determination to hold internal costs as far as it is in their power are continuing the policy of increasing volume and employing the most modern equipment and technique, at the same time giving every possible encouragement to greater productivity on the shop floor. Our suppliers co-operate with us and I know are doing all they can to hold costs; notwithstanding their efforts, however, the costs of materials and parts which we purchase rose seriously. As I stated to the shareholders of Humber, Limited, this to some extent was inevitable, arising from the various increases in the prices of imported materials and the effect of wage awards, not only in our industry but brought about by other external factors, such as increased costs of coal, steel, rail transport and electricity. Whilst Price adjustments have recently been made which barely cover the improvements incorporated, nevertheless during the year under review the prices of our products remained unaltered and, in consequence, the margin of profit was reduced.

EAST ASIATIC RUBBER ESTATES

The thirty-second annual general meeting of East Asiatic Rubber Estates, Limited, was held on November 9th, in London.

Mr H. T. Karsten, the chairman, presided and, in the course of his speech, said that the year's result showed an increase in the trading profit from £47,846 last year to £78,592 mainly brought about by the improvement in sales prices which had been just over 1s. 11d. per lb against 1s. 9½d. per lb. The cost of production was 1s. 2½d. per lb.

The crop of rubber harvested was 3,128,600 lbs, some 80,000 lbs more than the estimate. The estimated crop for this year, was three million lbs and the output for the first six months was just above the estimate.

After referring to the Board's replanting programme, the chairman continued: There has been a spectacular increase in the use of "a" kinds of rubber, especially in the USA, where the changeover to tubeless tyres has increased the demand. Almost all available supplies of both natural and synthetic rubber will be required, and at the moment there is no competition between the two kinds. With such a difference in price between natural and synthetic, it is obvious that consumers are seeking all the synthetic rubber they can get, and an increased use of synthetic both in the UK and other countries is expected. However, I am not unduly pessimistic about the long-term outlook. I hope and believe that the two industries will be able to supplement each other to the benefit of both.

The report was adopted and the dividend of 10 per cent for the year approved.

FOISTER, CLAY & WARD

The twenty-ninth annual general meeting of Foister, Clay & Ward, Limited, was held on November 10th, in London, Mr P. A. Clarke Vincent, FCA, chairman, presiding.

The following is an extract from his circulated statement:

The accounts for the year to June 30th last, show that after all charges, including depreciation £166,432 (1954, £145,398), there was a net profit for the year of £448,169 (1954, £502,293).

Your directors have decided to recommend a final dividend of 9 per cent, making 15 per cent for the year. These dividends for 1955 are on a capital increased over 1954 by a 25 per cent bonus issue a year ago, and so compare with an equivalent of 14 per cent for the previous year.

Trading conditions have been getting steadily more competitive, but despite this most departments continued to progress and the results of the year under review in these departments were satisfactory. We are very large manufacturers of full-fashioned nylon stockings which are distributed by one of our subsidiary companies, and for the last 10 years we have been one of the leaders in this field. For many years practically the whole of our output was exported and when, as a result of foreign competition and import restrictions, exports became more difficult and there remained an unsatisfied home demand, your directors decided to make LOR stockings and their outstanding qualities more generally known in the home market by advertising in the national Press, on television and by other means.

Trade in other departments has been and continues satisfactory.

The report and accounts were adopted

RANSOME AND MARLES BEARING

EXPANDING DEMAND

The thirty-ninth annual general meeting of Ransome and Marles Bearing Company, Limited, was held on November 3rd at Newark, Notts, Mr Edward W. Senior, CMG, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1955:

The past year has been another year of progress. The developing facilities have been fully employed in all our factories and the result has been a very satisfactory rise in the turnover of the group, which has enabled us to meet the increased demand of the Engineering Industry. The export trade has continued highly competitive, but as a result of an active selling policy it is encouraging to report that sales have increased in the past year.

Our subsidiary companies continue to operate successfully.

INCREASED TRADING PROFIT

The trading profit (before taxation) shown in the consolidated accounts amounts to £827,267; an increase of £72,670 on the previous year. After deducting taxation at £433,176, the net profit of the group is £394,091, of which £347,239 is transferred to the Appropriation Account of the Holding Company. The Directors recommend a final distribution of 7½ per cent, less tax, and a bonus of 2½ per cent, less tax. The Consolidated Balance Sheet shows a position of considerable strength.

The criticism has been levelled at industry that rises in profits and dividends, often accompanied by bonus shares, have been allowed to outstrip increases in wages; consequently it is felt that the following facts in relation to this Company are of interest.

Comparing the year ended June, 1951, with the present year: Trading profit increased by £155,811 (from £671,456 to £827,267); dividends increased from £235,000 to £300,000, i.e., £65,000, whilst the amount distributed in wages and salaries rose by more than ten times this amount, viz., £679,118. In the same period tax absorbed £2,169,547, whilst capital expenditure amounted to £2,223,047 largely provided by ploughing back profits. Unless companies can earn adequate profits, development becomes impossible.

RESEARCH AND DEVELOPMENT

Your Board firmly believes that re-equipment, development and research have a very strong claim on our resources in providing the most up-to-date facilities both for expansion, improved productivity and quality, and technical service. The energies of Management and of our Research and Development Departments are directed to the same ends with the object of improving the quality of our products.

The past year has shown a very marked upward swing in demand, both immediate and prospective; this applies in general, but is most marked in the requirements of the motor industry.

With the present demand for our products, there is every prospect that, not only the present factories, but the increased facilities as they become available, will be fully employed in the current year. If productivity keeps in step with wages there is every prospect of another satisfactory year.

The report and accounts were adopted.

THE CEMENTATION COMPANY LIMITED

LARGER PROFITS

MR A. R. NEELANDS' STATEMENT

The thirty-fifth annual general meeting of The Cementation Company Limited will be held at Grosvenor House, Park Lane, London, W., on December 6th.

The following is an extract from the Statement by the Chairman, Mr A. R. Neelands, circulated with the report and accounts:

The trading profits of the Group for the year ended March 31, 1955, at £632,140 are £30,541 greater than last year. Taxation is reduced by £30,528 to £371,755, mainly as a result of the cessation of the Excess Profits Levy and the net charge is further reduced by bringing in £62,000 from Taxation Equalisation Reserve.

We have decided to transfer to General Reserve the sum of £100,000 and to recommend a dividend on the Ordinary Shares of 12½ per cent, requiring £105,117 (after Income Tax), leaving to be carried forward to next year £108,850.

The financing of major contracts, particularly those where competition is international, is a considerable strain on the Group's liquid resources. During the year under review the Group expenditure on capital items has been of the order of £800,000.

WORLD-WIDE ACTIVITIES

The most important of our recent ventures has been the purchase of the controlling interest in Diamond Drillers Limited, now registered as "The Cementation Co. (New Zealand) Limited."

We are somewhat concerned about the present sterling shortage in Turkey but would like to say that during our years of contracting in that country contract terms have been honoured to the letter. Excellent progress has been maintained on the three Schemes at Armutcuk, Karadon and Catalagzi, thus we would expect to complete the first two shafts before March 31, 1956.

THE PERAK RIVER HYDRO-ELECTRIC POWER COMPANY

FURTHER SATISFACTORY PROGRESS

The twenty-ninth annual general meeting of The Perak River Hydro-Electric Power Company Limited was held on November 4th in London, Mr Hugh G. Balfour (the chairman) presiding.

The following is an extract from his circulated statement:

The Directors' Report and Accounts for the year ended July 31, 1955, show further satisfactory progress. The Power Stations generated 432.1 million units, as compared with 389.7 million units in the previous year, an increase of 11 per cent, and the peak load on the system was 67.4 mW., as compared with 64.0 mW. previously.

The Hydro-Electric Station at Chenderoh, owing to a lower average effective river flow, generated only 184.5 million units during the year, as compared with 204.4 million units in the previous year, but the Steam Stations generated 247.5 million units, compared with 185.3 million units last year, an increase of 33.3 per cent. The thermal efficiency increased from 18 per cent to 18.1 per cent at

We have again been responsible for a large proportion of the National Coal Board's shaft sinking and development programme. The Hem Heath Shaft was completed during the year and several other shafts are approaching completion. The Coal Board's plans, however, provide for a considerable volume of prospective work and we are maintaining our position in meeting competition in this activity upon which we have been engaged for nearly 50 years.

IMPORTANT CONTRACTS

Apart from a large volume of specialised cementation work in England we completed successfully two important contracts—one in India and one in South Africa—for the strengthening and raising of existing water storage dams by the stressing of cables anchored into the foundation rock.

Although competition abroad is increasing, we are maintaining our fair share of business. Work commenced on the military hospital in Cyprus and we completed the arrangements for the large rock sealing work at Dokan Dam—one of the largest operations of its kind in the world—where we are working in co-operation with Entreprises P. Bachy of France.

At home, the Lawers Hydro Electric Project in Scotland made very satisfactory progress. The contracts for the river channel deepening and barrage connected with the Erne Hydro Electric Scheme and the drainage of Lough Erne, are well ahead of schedule.

Our piling business has had a successful year. Two important foundation contracts were for buildings of public interest—Bucklersbury House in the City and the new Coventry Cathedral.

The Cementation Co. (Africa) (Pty.) Ltd. continues to grow in strength, both in so far as its mining works are concerned and also in specialised civil engineering.

As a result of some three years' work on site investigations for the Southern Rhodesia Irrigation Department, the Group has been awarded a £1½ million contract for preliminary works on the Kariba Scheme.

John Thom Limited have well maintained their turnover and position in the fields of

drilling. This Company has recently completed the deepest diamond core-drilled borehole in Great Britain, obtaining cylindrical samples of strata from surface to 4,604 feet.

The volume of sales, turnover and profit of Thermaconst Limited all showed a further steady increase. After much experimenting a successful method of producing a plaster-faced slab has been developed.

GEOPHYSICAL PROSPECTING

We have always regarded The Geophysical Prospecting Company as a long-term venture and I am very pleased to say that the Company has this year shown a marked improvement in profits.

It is also encouraging to note that The Geo-Technical Development Company Limited, which is concerned with mineral, including uranium, prospecting, had a record turnover in 1954 and 1955 and that there is every prospect of this being maintained.

In North Africa the Compagnie de Prospection Géophysique Nord Africaine made a small loss on its first nine months to March 31, 1955, but this has been balanced by a small profit in the first quarter of this year. It has good contracts in hand.

Quickset Water Sealers Ltd. continues to carry out many important waterproofing contracts in all parts of the country. Betonac Flooring Aggregate continues to be in demand by the building industry.

TRIBUTE TO STAFF AND EMPLOYEES

From the details I have given you regarding the world-wide activities of The Cementation Group of Companies you will appreciate the increase over recent years in the responsibilities and work of your Directors in their conduct of the Group's affairs.

To obtain the year's results everybody in the Company's employment has contributed in hard work, loyalty and intelligence. The Company's chief officers have travelled many thousands of miles. All have given of their best, and to all I wish to express my thanks and appreciation, from the humblest Junior to the highest Seniors, Managing Directors and Directors of Subsidiary Companies.

the Malim Nawar Station, and from 18.4 per cent to 18.7 per cent at the Batu Gajah Station.

Your Directors have given careful consideration to the question of providing new plant, as in planning this it is necessary to have regard to the future construction programme of the Central Electricity Board, particularly as regards the possible development of hydro-electric power in the Cameron Highlands. The situation in this respect is not yet quite clear, but, in view of the increasing load on our system, an order was placed during the year for a new 12 mW. turbo-alternator and ancillary 140,000 lb per hour boiler which is scheduled to go into operation at Malim Nawar during 1958. Further substantial capital commitments for new generating plant may require to be incurred during the next few years.

The Kinta Electrical Distribution Company, Limited, had a satisfactory year. While the trading profit at £59,367 showed an increase of £7,288 over the previous year, the dividend was reduced from 10 per cent to 5 per cent in order to conserve cash for extensions and development.

CAPITALISATION OF RESERVES

Your Directors propose the capitalisation of £437,500 of the reserves, and the issue to

the Ordinary Shareholders of one fully paid Ordinary Share of £1 for every four Ordinary Shares of £1 each held at close of business on November 15, 1955. The consent of HM Treasury to this issue has been obtained.

Turning to the Balance Sheet, Current Assets at £1,610,828 exceed Current Liabilities (including income tax provision for 1956-57) by £812,452, as compared with an excess figure last year of £312,157. This degree of liquidity is required in consequence of the order for new generating plant to which I have already referred.

The Revenue Account shows that our Gross Revenue, at £1,592,999, is £143,428 greater than last year; against this our expenditure in Malaya has increased by £62,193. The Directors recommend payment of a dividend on the Ordinary Share Capital of 10 per cent.

With regard to the current year, the returns to date are satisfactory, and unless circumstances change adversely, I think that the results should be at least comparable to those presented to you this year. In that event there should be no difficulty in maintaining the existing dividend on the increased Ordinary Share Capital.

The report was adopted and the Board's capitalisation and scrip issue proposals approved.

LIFE TALKS BUSINESS

These four companies all make the same products, offer the same service

These four businessmen need the products those companies make

One lives in India, one in Egypt, one in South America, one in New Zealand

... yet all four bought the products of the same company ...

WHY?

Because, through advertising in the international editions of LIFE, the products of one company are known throughout the world. The products of the others are known only within certain areas. The formula for success in world markets today can be as simple as that—and this is why.

In 120 countries outside the U.S. and Canada, advertisements in the international editions of LIFE, are seen by the people who can do more than any others to develop markets for your company's goods or services. Survey after survey has shown that wherever the international editions of LIFE circulate,

they are read by the most successful and influential citizens—leaders of business, industry and government—the people who sanction orders and contracts, who want and can afford the best of the world's products for themselves and their families.

Advertise in the international editions of LIFE, and you build recognition, prestige and business for your company among the people who constitute the world's richest market for goods and services of all kinds.

LIFE INTERNATIONAL—average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—average net paid circulation 250,000-300,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

ATV's Share of the Audience

EVENING 'AA' 8—9.30 p.m. 76% EVENING 'A' 7—8: 9.30—11 p.m. 72% AFTERNOON 'B' 3—6 p.m. 48% SATURDAY Average 65%	EVENING 'AA' 8—9.30 p.m. 78% EVENING 'A' 7.30—8: 9.30—10.30 p.m. 76% AFTERNOON 'A' 2—6 p.m. 76% SUNDAY Average 77%
---	---

Seven out of ten of those viewers who can choose their television programmes choose ATV at the weekend. This is, of course, an average figure. We collected all the available information from the leading research organisations for the period September 25th to October 30th, and took the mean. The result shows that ATV holds an average of 71% of the audience over the whole of the weekend viewing. The panels on the left give all the details. In the nine short weeks since com-

mercial television made its debut in this country ATV has built an astounding following. ATV has kept it. And ATV is still increasing it. The audience for commercial television is growing dramatically. Last month alone another 40,000 sets capable of receiving ATV programmes were sold. And thousands more were converted.

Commercial television is a medium of immense impact. Make sure of your time by booking it well in advance.

THE GIFT FOR A LIFETIME . . .

The pen that fills itself

Esterbrook 447 Writing Set

This graceful pen is the ideal gift for office or home. It is, in effect, a fountain pen—with the ink in the base instead of in the barrel. The pen refills itself immediately it is returned to the socket and is always ready to write a full page without redipping. There are no less than 30 personal writing points to choose from. In Black, Grey, or Ivory, 34/3d. and 37/10d. from all leading stationers: also a

two-pen model in Black (model 487) at 68/5d. and 75/8d.

- 1 Pen closes spill-proof base, prevents evaporation.
- 2 Combined ink-feed and writing point (30 to choose from).
- 3 Exclusive filling device also cushions point against damage.
- 4 Reservoir holds 40 times more ink than a fountain pen.

Esterbrook **447**

Density and Discrimination

MANY AN ADVERTISER wishes to reach two publics—the masses, upon whom he depends for his sales, and the opinion-forming minority, upon whose goodwill depends his reputation in no small degree.

RADIO TIMES, with the largest weekly magazine circulation (8,832,570*) and the highest circulation density (174 copies per 1,000 population) in the world, gives the advertiser the finest medium in existence for penetrating the mass market.

It is read and re-read by every other man and woman in Great Britain.

THE LISTENER is an opinion-forming journal. It is read thoroughly from cover to cover by 139,752* seriously-minded people—mostly of professional standing. They are the people upon whom reputations depend, and they constitute a body of readers that no serious advertiser can afford to neglect.

The world's
most modern
dictation
record
looks like
this

A partly recorded
Dictabelt record

It is the Dictabelt record, a red plastic belt, the exclusive recording medium of the Dictaphone Time-Master dictating machine. The Dictabelt represents the most efficient, most time-saving method of office dictation for the time-conscious business man.

The Dictabelt record stands up to treatment like this!

Crush it! Bend it! Tread on it! You can't impair the recording. You can't erase it by accident. The Dictabelt is virtually indestructible.

The Dictabelt record sounds like this!

Clear as a bell. And the Dictabelt gives you crystal-clear reproduction all through—uniformly clear from beginning to end.

The Dictabelt record files like this!

The Dictabelt can be filed in an ordinary filing cabinet like a sheet of paper.

The Dictabelt record mails like this!

Just like an ordinary letter, the Dictabelt can be slipped into an envelope and posted.

The Dictabelt record costs about this!

Actual experience proves that in use the Dictabelt costs only a few pence a day.

And it gives you completely visible recording!

Place-finding is easy. You see exactly where you left off. Corrections are simplicity itself.

The Rolls-Royce way to Stockholm, Oslo and Copenhagen

Non-stop and fastest by BEA Viscount

When you fly BEA to the Northern Capitals, they really put down the red carpet for you. You fly non-stop and fastest in the wonderful Viscount, powered by its four Rolls-Royce engines. You enjoy admirable food and drink. You have both steward and stewardess service. Flying BEA Viscount is a new experience in air travel. Which is why Lord Strathalmond, Chairman of the British Petroleum Company, said, after a recent flight, "I could not have wished for anything better in terms of both aviation and comfort". Consult your Travel Agent about the Rolls-Royce way of flying and ask too for details of the BEA Car Hire Plan. COPENHAGEN. 6 non-stop services weekly. Only 2½ hours. Tourist return fare £39.3.0. OSLO. 4 non-stop services weekly. 3 hours' flight. Tourist return fare £42.6.0. STOCKHOLM. 6 services weekly — in 4½ hours (on Monday and Saturday non-stop 3½ hours). Tourist return fare £50.17.0.

The ancients shut their eyes

"SHUT YOUR EYES and make a wish." The ancient custom was to make a wish to the sun; the eyelids had to be lowered as protection against the glare. Nowadays we still shut our eyes when making a wish—although, since we no longer worship the sun, the protection is scarcely necessary.

But there is one form of protection to which no modern manufacturer shuts his eyes. In today's competitive market the manufacturer must be certain his product reaches the consumer in the condition in which it left his production line. That is why leading manufacturers entrust the safekeeping of their nationally known brands to

the sound outer protection of "Fiberite" cases.

Packaging does much more than deliver the goods intact. It displays, identifies and often even sells the product. Many of the products that dominate the shelves owe their crisp, attractive appearance to the high quality of the "Thames Board" used for their cartons.

The spread of Self-Service stores may make packaging even more important to the manufacturer. But whatever the future holds, Thames Board Mills will be ready to draw on a wide experience and deep knowledge of packaging techniques and materials to keep ahead of all developments.

The Go-Devil Detective and the Bangkok Tram

This story is, in its way, a "who-dun-it". The Go-Devil Detective is a flameproof panel that lights up and blows a klaxon when an irradiated piston—or "Go-Devil"—reaches a certain position in an oil pipeline: the Bangkok Tram has a pre-fabricated body which reached Thailand in a box and was assembled in an hour or so. Can you detect the connection? Both were made by companies in two Divisions of Tube Investments.

All over the world products of TI are providing service in many forms—as bicycles, wrought aluminium products, electric cookers, aeroplane parts, precision tubes in many metals and plastics, paints, pre-fabricated buildings, and steel.

The TI Engineering Division, for instance, makes rolling mills, wire-drawing and tube-making machinery, machines for shearing and working sheet metals, mechanical handling plant, gland packings, mechanical seals, heat exchanger packings, machine tools, and it is Britain's largest producer of seamless high-pressure steel cylinders and gas bottles.

This is one TI Division among the seven which serve the world: Steel Tube Division, Engineering Division, Electrical Division, Aluminium Division, Steel Division, Cycle Division, General Division.

That astronomical figure is the present production rate of Y.D. Copy Paper. Why should one sort of copy paper prove so extraordinarily popular?

There are two answers. First, this is without doubt the best paper for its purpose on the market—a fine, smooth copy paper made at the long established Yates Duxbury mills.

Secondly, only Y.D. Copy Paper comes in the distinctive economy pack—which makes storage easy and waste well-nigh impossible. Economical in use, and in price, Y.D. Copy Paper is fast becoming the sign of a well-run office.

*"Beauty, Firmness and Convenience
are the principles"*

— Sir Christopher Wren (1632-1723)

If ARCHITECTURAL VALUES CHANGE with the centuries, architectural principles don't. Some of the basic concepts of Wren are curiously applicable to modern office blocks, factories and other large buildings constructed with Wallspan outer walls.

Employing new materials, Wallspan brings a happy atmosphere of light and air into workplaces and schools. It also gives rare beauty and colour to facades, as well as fantastic speed in their construction.

What Wallspan is. The weight of a modern building is borne entirely by the structural frame: the outer walls are simply protective and decorative. Wallspan is a grid of aluminium alloy, which is bolted to the weight-carrying frame. Into it go windows and doors.

Wallspan Beauty. The Wallspan grid is completed with any of a vast range of beautiful panellings faced in glass, stone, metal or other material—giving your architect striking opportunity for freshness and colour in design—giving you a building to be proud of.

Wallspan Firmness. Wallspan walls lose nothing in strength or durability by being light and bright. A Wallspan wall is as durable, stable and weatherproof as walls of traditional materials. It offers, in fact, more—not less—internal protection, since you can have panelling which gives up to 50 per cent. better insulation against cold—or heat—than cavity brick walls.

Wallspan Convenience. Wallspan affords altogether new standards of convenience. The grid members are so light that one man can handle them. So simple to erect that multi-story walls go up in days. So sensible that no painting or pointing-up is ever needed. Your window cleaners can keep Wallspan walls clean.

Finally, owing to its slim section, Wallspan can give you extra rentable floor space round every floor of a completed building whose human occupants enjoy a wonderful sense of airiness and freedom.

Why not have a word with your architect about the possibilities of Wallspan for any new buildings you may have in mind!

Hats off to

structural plastics

the new
lightweight
material
that is making
such rapid
headway

Already well known for their more spectacular applications,
such as moulded boat hulls and motor car bodies, structural plastics

offer unending economic possibilities for light, strong
products of modest dimensions. Protective headgear, for
instance, and many items of service or personal equipment
made from structural plastics would be essentially light and
yet have specific strengths comparable with steel. In these,

as in structural engineering applications, wherever weight/strength
problems arise or high resistance to corrosion is a prime requirement,

structural mouldings may well provide the answer. Why not get in touch with B.I.P.,
the polyester resin people—perhaps they can help take weight off *your* mind!

manufacturers interested
in the potentialities of
structural plastics

What are structural plastics

Structural plastics consist of a reinforcing agent,
such as glass fibre, bonded with a synthetic resin,
most commonly a polyester type resin.
Polyester/glass fibre mouldings can be made either mechanically
or by hand fabrication and their essential characteristics are . . .

Lightness combined with strength—specific strengths comparable
with steel.

High resistance to corrosion by a wide range of chemicals,
including some acids, and to all but excessive heat.

Excellent electrical properties—high breakdown and low power factor,
combined with good insulating and non-tracking properties.

Unlimited colour possibilities—in opaque or translucent shades.

Fog Over Germany

THE breakdown of the Geneva conference has left British public opinion in a state of confusion over Germany which the Government has so far done nothing to remove. To the Germans the three western powers sent post-haste a declaration in which they justifiably blamed the Russians for the breakdown and reaffirmed their intention of continuing to press for German reunification. But at home, enlightenment on the real issues involved is urgently needed, if the Government intends to carry the British public along with it in pursuing a policy on which the fate of the whole western world depends.

At present, there are two strong currents of public opinion about Germany which are both exaggerated, and both dangerous. The first is the complacent view, which feeds on the British tendency to find justifications for the easiest course. To this school of thought, it seems unnecessary to worry about German reunification, particularly if insistence upon it should impede friendly relations with the Soviet Union. The West Germans are getting on very well and their country is much less dangerous divided than reunited. Why not thankfully accept Mr Molotov's rejection of the western offer at Geneva? If the Russians want the present *status quo* to continue indefinitely, is there any good reason why Britain and America, and even more so France, should not agree? This is the one way of thinking.

The second, more cynical, school of thought is the exact opposite—but it serves the Soviet purpose just as well. The Germans, according to this view, will never be trustworthy. They are so determined to be reunited that they will sell out to Moscow as soon as Mr Zorin sets up his embassy in Bonn. They joined Nato only to secure an army as a means of bargaining for the Soviet Zone, and later for the Polish-occupied territories. Their big industrialists are waiting for the chance of a new Rapallo treaty with the Soviet Union, which would give them markets from the Elbe to the China Sea, while the German working class will soon insist on "socialist" changes to bring the Federal Republic into line with the "German Democratic Republic." In short, Mr Molotov's proposals will in any case be accepted by the Germans sooner or later. Why make such strenuous efforts to keep the Germans in line with a western policy that may itself be abandoned?

Between these opposite doctrines, the realities are being overlooked. It is being forgotten that the western governments have pledged themselves in the Paris treaties to make German reunification a prior aim, and that they cannot evade this obligation without a gross breach of faith. Germany will undoubtedly be reunited at some time and in some way; only the "how" and the "when" remain in question. It is certain that if the West, including the western-minded elements in Germany, does not initiate and control the process of reunification, the Russians and their helpers in Germany will do so. Both the Soviet programme for Germany, and the attitude of the Germans themselves, make the *status quo* impossible to maintain for very long.

It is the complacent view—that the Germans will accept indefinite division—which is the bigger illusion. Admittedly, there is not the slightest reason to suspect Dr Adenauer and his colleagues of preparing to do a deal with Russia. On the contrary, if one good result came out of the Chancellor's visit to Moscow, it was to explode the myth that Germans know how to manage Russians; they now know that if they go all alone to expose themselves to the Russian mixture of blackmail and bonhomie, they at once find themselves struggling in a quicksand. Nevertheless, it will be very hard indeed for Germans to resist Mr Zorin once he is established in Bonn, unless the western statesmen continue to urge a policy which seems to the Germans to offer them more hope. If America and Britain seem half-hearted in their support for German unity, or if they look like yielding to the temptation to do a deal with the Russians at Germany's expense, the pro-western party in Germany will shrivel up. Then, indeed, there would be a reunion of the two Germanys—but on Russia's terms, and with the serious risk that the Iron Curtain, or at least the effective limits of Soviet power, would be moved forward to the Rhine. That this would be disastrous for British security is obvious—even if it did not bring as a consequence the withdrawal of American troops and American support from Western Europe. We should then be back in 1939, an infinitely more terrible 1939.

★

It is from the desire to avoid this calamity, not simply in order to please the Germans, that the need arises to insist on German reunion in freedom and in concert with the West. It is perfectly true that, after all the delays, nobody can guarantee the success of the policy. Dr Adenauer's age puts a narrow time-limit on the safe period for the West in Germany, and few of the other party leaders are as clear-sighted as he. The Social-Democrats reject neutralism in theory, but they want Western Germany released from its Nato obligation before free elections are held; and without specifically demanding that reunited Germany shall be kept out of Nato, they propose that it should join a general—and toothless—"security" system containing no Nato from which to be excluded. When the contradictions of this programme are examined, it can be seen that there is dangerously little difference between it and Mr Molotov's plan. Moreover, the leader of the Free Democrats, Herr Dehler, has now affirmed that a "security" system should precede free elections, and his party—which forms part of the governing coalition—is toying with the idea that Federal Germany should be released from the Paris agreements.

It would be silly to pretend that the risk of a German landslide does not exist. Nevertheless the present policy is the only possible one for the western powers to pursue. For one thing, any weakening in it would at once bring about the disaster that is feared. The car may indeed run off the road; but that is the poorest

of reasons for taking one's hands off the steering wheel now.

Moreover, the general pessimism has been overdone in recent months. There are evident reasons for apprehension; but there are also still good reasons for confidence that the western policy will continue to pay dividends, as it has done hitherto. The opposition to Dr Adenauer's policies in Germany may be more articulate than the support; but that is the way of oppositions, and the Chancellor has always hitherto proved himself an accurate prophet of what the German voter really wanted. His support has been increased by Mr Molotov's bluntness at the Geneva conference. Many Germans have been alarmed by the discovery that Russia's price for reunion is not only the liquidation of Nato but also that the electorate in Western Germany shall be pre-digested for Communist consumption. The forces in Western Germany that would resist any attempt to introduce the elements of Herr Ulbricht's "socialism" should also not be underestimated. If the western governments can find means to keep the German public continuously conscious of what reunion on Russian terms would mean, the task of maintaining Dr Adenauer's policy after he has left office need not prove impossible.

★

Nor is there any reason why the present Russian obduracy should be assumed to be permanent. There is, it must be admitted, no sign now visible of the slightest willingness to let the East Germans out of their prison. But in rejecting free elections so categorically, Mr Molotov opened a large chink in his armour, and if western policy will thrust a blade in, and keep it turning in the wound, it must have an effect in time. The demand for a free election is a means of forcing the Russians on to the defensive which should be exploited to the utmost. When one reflects how many complete switches in Russian tactics there have been in the past five years, it does not seem impossible that a sustained irredentist campaign could, within a few more years, make Eastern Germany seem to the Russians more trouble than it is worth.

Nothing that has happened, or failed to happen, at Geneva makes a case for changing the western governments' German policy. On the contrary, the case for pursuing it with energy and firmness is as strong as ever. But there is one condition of its success that is being neglected. Like any policy of strength and resolution it makes demands upon those who pursue it, demands upon their pockets and, at times, upon their nerves. It cannot be pursued consistently to its conclusion unless public opinion understands the necessity for it. This can hardly be said to be the case in Britain today. Since the argument within the Labour Party over German rearmament died down, there has hardly been a single authoritative voice raised in either party to explain the necessity for making free elections in Germany a condition of any settlement with Russia.

It is quite true to say, as western ministers have said, that to deny the Germans the unity they want is both unjust and unsettling; but it is not enough. The memory of the Nazis' crimes is still vivid, and not many people in western Europe, including Britain, are prepared to struggle hard over a long period merely to satisfy a German longing. What needs to be said—clearly, authoritatively, and repeatedly—is that with Germany divided, there is no enduring *status quo*; that

Luddism on the Record

THE very sensible attitude of the Opposition in the House of Lords has opened up a real possibility of making the Government's unsatisfactory Copyright Bill a symbolic step towards the re-establishment of consumers' rights; and Conservative backbenchers should seize this opportunity with both hands when the Bill comes before the Commons. In order to concentrate attention upon the main issue, it will be simpler at this stage to ignore the many subsidiary controversies about this Bill. The major point, and major opportunity, that needs to be emphasised concerns copyright in mechanical contrivances—particularly the right of restricting public performances of gramophone records and, now, under the proposed Bill, also of television broadcasts.

This may seem to be a rather esoteric subject to make a fuss about, but it is a subject of some psychological importance. For the present law about gramophone performances has degenerated, and the new law about television broadcasts could degenerate, into a breeding ground for Luddism; and it is the sort of Luddism, since it is run by a trade union, from which Parliament usually either runs away or else actually helps to extend. If Labour in the Commons, following the example of Labour in the Lords, can now join with sufficient Conservative backbenchers to frighten the Government into taking offensive action against it, then a stage will have been reached in the British worm's turning which many people will consider to be both promising and exciting. At any rate, this is clearly the moment to urge any such potential rebels on.

The historical background to the existing right to demand licences for public performances of gramophone records is very simple: it is a right which the Copyright Act of 1911 appears to have created by mistake. In evidence before the committee which paved the way for that Act, the representative of the gramophone record manufacturers specifically agreed with the chairman that "the purchaser of a disc should not merely acquire the right to use it in his own private surroundings . . . but to use it in public." For more than twenty years after the Act of 1911 it was assumed that this was the principle on which Section 19 of that Act was based. Then, in the Carwardine case of 1933,

once there is no longer a place on German soil for American forces, the Atlantic bridge will become little more than a rainbow; in sum, that to let Germany slide into the Soviet scales is to surrender western freedom in advance. The Prime Minister and the Foreign Secretary will find their policy slipping away from under their feet unless they address themselves, repeatedly and insistently, to the task of explaining the necessity for it.

the courts ruled that it was not. As a result of the Carwardine decision, the gramophone record manufacturers were enabled to license, and collect fees from, every dance hall, music hall and social club in which public performances of gramophone records take place.

It should be emphasised at this point that the right to levy this fee has not proved to be a very profitable one to the gramophone record manufacturers, to whom it was nominally granted; the manufacturers told the Gregory Committee in 1952 that the fees they receive from public performances are "of little or no importance" in their total receipts. Nor, although the manufacturers now "voluntarily" share out the licence fees they receive among other interested parties, has the Carwardine decision been generally welcomed by the composers, songwriters, music publishers or even by all the solo artistes; representatives of all these interests told the Gregory Committee, with varying degrees of emphasis, that anything that slows down the sale of records and the public performance of music is against their interests.

The view that the Carwardine decision should be reversed by Parliament has, of course, been even more strongly pressed by music users, and not merely by commercial concerns; the National Council of Social Service (representing boy scout groups, youth clubs, women's institutes, YMCA and YWCA branches, community associations and many others) and the Parliamentary Committee of the Co-operative Union gave forthright evidence to the Gregory committee to this effect. There is, in fact, no real pretence but that this licensing right, which is so much against the interests of the greater part of the community, is maintained for one reason alone. The Musicians' Union, representing the rank and file players in orchestras and bands, has intimated that its members might go on strike, and refuse to make any records at all, if the Carwardine decision were reversed—or if the record manufacturers ceased to use the licensing power in order to maintain in employment those of its members who might otherwise be displaced by machines. The public now has to consider whether it should stand up to this threatened strike, and it should take note of what will continue to happen if it does not.

The Musicians' Union's interest in the present system is not mainly that it gets money from the licence fees; although the gramophone record manufacturers do in fact give the union 12½ per cent of net receipts. The union's main object is quite simply to use the existence of the licensing power to prevent some public performances of gramophone records from taking place. Licences issued by the record manufacturers embody a reference to "conditions inserted at the request of the Musicians' Union"; one of these is that no record shall be played "where musicians could, having regard to the size and nature of the theatre, music hall, dance hall, or other place of entertainment, be employed." This is Luddism in the raw. The Gregory committee had to decide whether it should launch an attack upon it; it decided, on the whole, that it had better not.

It was after consideration of this committee's report that the Government introduced its Copyright Bill. It is therefore perhaps not surprising that the Bill's treatment of the subject is so unsatisfactory. The Bill confirms the licensing power over public performances of gramophone records; indeed, it writes the principle of the Carwardine decision in more specific terms into the law of the land. Having made this regrettable decision, the Government then takes one step towards mitigating, but also one step towards extending, the network of restrictive practices to which the Carwardine case gave birth.

The backward step, extending the scope for restrictionism, is that a licensing right in television broadcasts is now to be created, broadly similar to that in gramophone records; any hotel, restaurant or other public meeting place that turns on its television set will have to get permission from the BBC and the ITA, and pay a licence fee for doing so. The excuse for this clause is that some sports promoters have requested it, in return for allowing the BBC and ITA to televise their events. The Government denies that it will enable any other live entertainers to indulge in new restrictive practices; but it is no secret that those connected with many seaside shows, who have been hit fairly hard by the new tendency of hotel patrons to sit watching television in the lounge, have for months been licking their chops over this provision. The mitigating feature of the Bill—and it is only fair to emphasise this—is that a Performing Right Tribunal is to be set up "to adjudicate in disputes between persons seeking licences to give public performances of television broadcasts and records and the owners of the copyright therein"; this tribunal may temper some of the worst results of the existing law and the new one, but it is clearly not intended to eradicate a system of restrictions which should never have been set up.

This was the situation when the Copyright Bill came up for second reading in the House of Lords last week.

In that debate, as also in a debate on the abortive Copyright Bill which died with the last Parliament, Labour speakers said all—or most of—the right things. In particular, Lord Jowitt, until last week the leader of the Labour peers, spoke strongly against imposing upon hotels the extra charge and licensing procedure for television broadcasts (although he accepted the case for imposing it upon cinemas). As for the performing right in gramophone records, he said that "it has nothing to do with the law of copyright, and the sooner it goes the better." "I really cannot," he said, "be diverted by threats of strike action from what I think is right." Parliament as a whole will soon have to decide whether to echo Lord Jowitt's determination, or to tag along with the Government's fears.

★

Which will it do? Some MPs, on both sides of the House, may incline to hold back lest they be accused of launching an assault upon trade union rights. But they ought to take three relevant considerations into account. First, this is not a question of whether Parliament should pass a law to stop a particular trade union from indulging in restrictive practices; it is a question of whether Parliament should pass a law that deliberately sets up the only system by which it can continue them. Secondly, the system which fosters this Luddism, under the guise of a copyright law, has nothing to do with the essential principles of copyright at all; a close analogy would be if the drivers of horse-drawn carriages had been given the right to restrict the spread of motor taxicabs as a by-product of a law for the prevention of cruelty to animals. Thirdly, if ever there is to be any move against isolated instances of restrictionism among the trade unions, it is important that Labour should appear to take at least some part in it. It may be that Labour in the Commons will not follow the trail so bravely blazed by Labour in the Lords; the Opposition as a whole may not be as willing to cut itself free from the less desirable activities of its industrial associates as the Tory party, to judge from its project for monopoly reform, at long last seems to be shaping to do. But in that case it is surely up to Tory MPs to jostle Labour along.

The case against linking a general campaign against restrictive practices among employers with one against restrictive practices among unions has always been a case for priorities; it is probable that the second sort of campaign would slow down the first. But this makes it all the more essential, when individual opportunities occur, that apostles of the new Conservatism (and, for that matter, of the new Socialism) should show that they are as much in earnest about attacking restrictionism among the workers as they certainly ought to be about attacking it among the businessmen. Here, in the unexpected shape of a Copyright Bill, the opportunity lies to hand. It will be a great mistake to muff it.

Masters of Their Fate?

THE Assembly of the United Nations is rarely at a loss for something to talk about, and one of its favourite topics is the principle of self-determination. The phrase rumbles continuously in the background of most of the contentious issues that the Assembly or its committees feel called upon to take up, and this year it is cropping up in a number of specific ways. There is the organisation of a practical exercise in self-determination in the British trust territory of Togoland. There is one proposal for a commission to examine alleged denials of the right of self-determination, another for another commission to conduct a survey of the whole concept of self-determination. And in the Assembly's third committee (social and cultural affairs), protracted controversy over whether the "right" of self-determination should be included in the human rights covenants looks like being the rock on which these covenants may finally founder.

Self-determination is a fine, woolly concept which lends itself to high-sounding speeches, but when dispassionately dissected reveals all sorts of practical difficulties. It is not surprising that a committee of the United Nations should stumble over it; but it is rather surprising that historical memories should be so short as to overlook all the complications and illogicalities that arose out of the Allies' attempt to base a peace settlement after the Kaiser's war on this principle. Even the most famous champion of the idea, President Wilson, who at one time proclaimed it to be "an imperative principle of action," later came to realise that he had stirred up a hornets' nest and had created more difficulties than he had settled.

On general grounds, few would want to quarrel with the principle that all peoples have a right to be independent and to choose their own form of government. But the principle can neither be pushed to its logical conclusion without producing a *reductio ad absurdum*, nor applied indiscriminately without creating endless confusion, difficulties and hardship. If self-determination is acknowledged as an absolute right, there is logically no reason why, say, the Liverpool Irish or the Istanbul Greeks should not set up their own little *imperium in imperio*; nor is there any reason why the Walloons should not disrupt Belgium, the Sikhs India, the Indians South Africa, or the Red Indians America if they had a mind to do so.

In practice, of course, self-determination never has been applied either logically or indiscriminately. The American colonists broke away from the rule of George III, but later the majority of their descendants went to war rather than allow the same right of secession to the southern states. After 1918 the principle of self-determination was invoked to justify the break-away of the Czechs and the Slovaks from the Austro-Hungarian empire, but it did not stand in the way of

the inclusion of the Sudeten Germans within the frontiers of the new state. When Westminster relaxed its hold on Dublin, the Ulster Protestants were allowed to remain free from Catholic Irish rule, but the Catholic elements in Tyrone and Fermanagh—and for that matter in Belfast—have not been granted the right to secede from the rest of Northern Ireland. India successfully threw off British rule, but it is not prepared to allow the Kashmiris to choose their own future for themselves, and neither the Indians nor the Portuguese are as yet willing to allow self-determination to the Goans. Similarly the Burmans and the Indonesians, who have both freed themselves from alien rule, have both forcefully prevented minorities such as the Karens and the Ambonese from paying them back in their own coin. And, of course, there are a whole host of unfortunate peoples from the Latvians and the Lithuanians to the Tibetans and the Kazakhs who are now deprived of their independence and their political freedom by either the Russians or the Chinese.

★

There is, of course, nothing at all to be said for the denial of self-determination to those who once enjoyed it and are perfectly capable both of exercising it again if they get the chance, and of forming a viable state. But the refusal to do as you have been done by in the matter of self-determination is not necessarily and universally to be condemned. Clearly a line must be drawn somewhere and commonsense and practical economic realities usually indicate fairly plainly where it must lie. Nobody has ever regarded "balkanisation" as a very desirable and happy state of affairs; and those who are now determined to prevent this fate from overwhelming their own countries can legitimately point out that in the past many peoples of different nationalities have pooled their resources and settled down together, and that some of the most successful and prosperous states today, such as Switzerland, Belgium and Canada, would not enjoy their present position if their component peoples had decided to secede. Many small groups are better off enjoying—and contributing—their share of the economic resources, prestige and protection of a larger state than they would be if left to make their own way in the world. Moreover, experience has shown that the amalgamation of several nationalities in one state does not inevitably mean the suppression of each nation's identity; Lord Durham, who, in 1839, pronounced any attempt to preserve a French-Canadian nationality among the Anglo-American majority to be a "vain endeavour" was, in the event, proved wrong.

What is objectionable, however, is the tendency of so many countries, most of whom have at least one

self-determination skeleton rattling in their own cupboard, to press on others a principle that they have no intention of observing themselves. One reason for their attitude is obvious; the idea of self-determination, which not only appeals strongly to heady nationalist feeling, but is also closely associated with the idea of self-government, provides a splendid weapon to brandish against the "imperialist" powers. Mr Robert Lansing, who was President Wilson's Secretary of State, described it as a phrase "loaded with dynamite." But while he was appalled by its potentialities, today Communist mischief-makers and under-developed and formerly dependent countries with a chip on their shoulder are delighted. They may not manage to blow up the imperialists with it, but they can certainly hope to cause them a good deal of trouble and inconvenience.

Ironically, Britain, which has set more people free to go their own way than any other country has ever done, is now among the principal targets of the self-determination-at-any-cost school and among the opponents of the attempt to write self-determination as an absolute right into the human rights covenants. On the other hand, the worst offenders today, Soviet Russia and China, are left in peace because those who shout loudest and longest for the principle are either Communist sympathisers or else realise that the Communist powers are much too tough a nut to crack—a reputation that Britain, unfortunately, does not enjoy.

Everybody's Servants

IT comes as something of a surprise, in reading the report of the Royal Commission on the Civil Service, to remember how narrow its terms of reference were. The commission was told to examine whether any changes are required in the principles that govern civil service pay, and to put forward proposals for pay and conditions that would accord with any new principles that it might adumbrate. This has inevitably excluded many interesting matters about modern bureaucracy from its purview. It also means that any criticism of this brave effort of a report—and inevitably, there is room for such criticism—should not be directed primarily against Sir Raymond Priestley and his colleagues; it should be directed against those who confined the commission's deliberations within such cramping limits. For the commissioners were given two almost insuperably difficult tasks to perform. First, they were asked, in effect, to decide what is the just price for a commodity, a task that has been the ruin of every commodity scheme since interferences with the market were first invented. Secondly, they were asked to make this decision in a vacuum.

The starting point for the commission's deliberations had to be the principle on which civil service pay has allegedly been decided hitherto. This is enshrined in

Thus, in practice, the issue of self-determination has today come to be concentrated upon those backward peoples for whom it may easily prove to be a dubious blessing. Britain, for instance, has agreed to let the Togolandese pronounce on their future status. In the present climate of opinion it could hardly do otherwise; but it is a moot point whether the Togolandese are really as yet sufficiently advanced to make the best choice for themselves. To clamp down indiscriminately on nationalist aspirations and the desire for independent statehood is clearly wrong. But it is hypocrisy to claim, as Afghan and Saudi Arabian delegates (of all people) on the UN Third Committee have done, that "self-determination is a prerequisite to all fundamental human rights." On the contrary, it may mean a denial of human rights to a minority in the "self-determining" country (can anyone say for certain that this will not be true of the negro tribes in the self-determining Sudan?). Even where there is no minority problem, unlimited exercise of the right to self-determination may lead to a denial of other rights, such as freedom from want and freedom from fear. To say that self-determination is a guiding principle to be put into action when other things are equal, is to lay oneself open to a charge of hypocrisy. But those who try to maintain that it is an absolute right are either blind to past and present history or else simply mischief-makers.

what is known as the "Tomlin formula" of 1931. It is a vague formula, and it was differently interpreted by the staff associations and the Treasury in their evidence before the commission; but broadly it requires that pay and conditions should be sufficient "to recruit men appropriate to their particular duties and to retain them in the service without loss of keenness and efficiency." The crucial point to note about the Tomlin principle, in this basic form at any rate, is that it is not a principle at all. It is merely an admirable economic platitude. In effect, it says that the market economy will always show what is right for the gentlemen in Whitehall, which sounds like a pleasing reversal of the usual situation but is really simply a necessary recognition of the market's power. There can be no suggestion that the Tomlin formula is wrong. There can only be the question whether it has been adhered to.

Quite obviously, it has not. That is why the commission had to be set up. Notoriously civil service pay has lagged behind the rise in salaries in general, ludicrously so at the top; and it has been unscientifically supplemented at odd times by special allowances, overtime pay and similar expedients. On the Tomlin formula, therefore, the staff associations had no difficulty in showing that pay is unattractive,

and all down the scale. This year there is no surplus of acceptable candidates for the administrative class; and for some years there is reputed to have been a poor catch of really brilliant minds. In the executive grade, there is still a surplus of acceptable applicants over vacancies, but it is falling precipitously; the professional grade has unfilled requirements, and the clerical grade needs far more recruits than it is now attracting. These were the disturbing facts that faced the commissioners from the start.

Their next task was to decide whether any more precise principles could be found which might be easier to adhere to than the Tomlin platitude. There were believed to be several possible principles in the field; and from them the commission chose the principle of comparable pay for comparable work. Civil service pay, it recommended, should equal the current rate for comparable work in outside employment, after allowance for career prospects, hours of work, leave, security of tenure, superannuation terms and so on. Everything, including the commission's own packaged proposals on pay and conditions, turns on the application of this formula. Certainly it is by reference to this principle—and by reference to the question of whether it can be made to work—that the commission's own proposals must be judged.

There are three initial points to bear in mind here. First, most of the staff associations tried to secure information about the pay of comparable jobs outside the service, and found it very difficult. Secondly, the commission evidently was not impressed with such facts as were collected, since it pared down, except for the top administrators, the claims that were based upon them. Thirdly, the commission recommended that a fact-finding unit should be set up to make the comparisons on a secure basis, and to keep them regularly up to date—comparing like with like, and, where likeness could not be found, making special job analyses to reach a fair comparability.

Yet the commission claims that it has fixed most of its own detailed proposals in accordance with the principle of broad comparability. This ought to mean that it has got better figures than were offered in the staff association's evidence, and hence that it has done some of the work of the proposed unit already. But, if it has, no detailed statistics are offered in proof. On the contrary, the report expresses the "hope" that private employers will co-operate in providing such figures in future. Many branches of the civil service fear that any comparisons will tend to be, not with a comprehensive range of private employment, but with local government scales, teaching, the nationalised industries, and perhaps (for some) banking or insurance. If this were the chosen list, civil service rates would be determined by reference to rates which are themselves partly determined by reference to civil service rates. This sounds like an excellent recipe for perpetual immobility, and for ensuring that in an age

of inflation civil service salaries would again fall behind the market rate—which means behind the Tomlin formula.

Do the commission's own packaged proposals, for pay adjustments now, themselves accord with this formula? Would they enable the civil service to recruit and retain sufficient "men appropriate to their particular duties"? The best feature of these proposals is the courageous decision to "pull the concertina out" by recommending quite sizeable increases at the top of the scale. There should be unalloyed praise for this. But some of the other proposals, as shown in the accompanying table, look rather odd, in view of the admitted difficulties about recruitment. Under the commission's scheme, and in consequence of its understandable desire to get rid of overtime and overtime pay, some of those in the lower grades would actually get less pay, though for fewer hours of work, than they get now.

There are, of course, some counteracting advantages in the commission's proposals that might help to stimulate recruitment. The consolidation of overtime pay into salaries would automatically raise pensions; the

SOME CIVIL SERVICE SALARIES

	Staff Associations' Claims excluding Overtime	Present Pay including Overtime or Extra Duty Allowance	Proposed Pay
Administrative Class (London)			
Permanent secretary	6,000	4,500	6,000
Deputy secretary	4,800	3,250	4,250
Under secretary	3,800	2,600	3,250
Assistant secretary	2,400-3,000	1,700-2,200	2,000-2,600
Principal	1,600-2,200	1,344-1,684	1,300-1,850
Executive Class			
Senior executive officer London	1,250-1,525	1,215-1,431	1,220-1,450
Executive officer London	350-925	346-940	340-950
Clerical Class			
Clerical officer London	195-640	214-685	225-650
Scientific Officer Class			
Principal scientific officer London	1,600-2,200	1,344-1,620	1,300-1,850
Scientific officer London	...	555-999	575-1,000

incentive of the move towards a five-day week, by way of the ten-and-a-half-day fortnight, should not be underestimated; and, above all, higher pay and shorter hours in the middle grades would improve the long-term career prospects of the service. But here an immediate problem arises. If career prospects are to be the main new incentive, there must be reasonable prospects for promotion to senior levels; and, unfortunately, civil servants complain that promotion prospects were rarely worse than they are today. There are two reasons for this. One is the traffic block created by the heavy postwar intake of temporary officers into the permanent civil service; in the administrative class, for example, there is now a big block of them at

principal level. The other reason is that while the civil service as a whole has expanded so swiftly, the number of Ministries and therefore of really top jobs has not expanded in proportion. A larger number than usual of those to be attracted into the administrative class by the new deal will never rise beyond principal level—on a retiring salary of £1,850. This problem of promotion, however, was not within the narrow terms of reference of the commission.

Criticism of this report therefore returns to its starting point. The commissioners were asked to find out what the market rate for civil servants is, and yet they were not allowed to consider some of the factors that most seriously affect the market. It is therefore, unfortunately, very doubtful whether their chosen principle of comparable rates will prove to be any more valuable than the Tomlin formula. What, then, should the Government do? There can be no dogmatic answer to this; indeed, the Treasury itself might be wise to become a little more free from dogma. Perhaps the best advice that the Priestley commission could have given to the Government would have been that it should constantly follow the market, instead of periodically setting up commissions to find out what the market is. If the Government finds that it is short of recruits for

particular grades, that provides a *prima facie* case for putting up salaries in those grades. If it finds that it is not attracting sufficient brilliant men to fill its top posts in thirty years' time, that is a reason for supposing that pay in the top posts which those brilliant men can hope to attain is not sufficiently attractive. Special enquiries into other employers' rates may sometimes help (although they may also sometimes obscure), but the basic problem should be as simple as that.

There are, of course, two principal difficulties about following the market now. One is that it would almost certainly involve bigger increases in some salaries than the Priestley commission has proposed; but that misfortune for the taxpayer should be accepted. The other is that although supply and demand will always indicate roughly how much the civil service will need to pay to get the men it wants, there is no market indication which will tell the taxpayer exactly how many men the civil service *ought* to want; perhaps that is a matter for Parkinson's law, or for another commission. But salary increases should not be refused for this reason. An inflated bureaucracy may be an expensive evil, but an inflated bureaucracy which could only afford to recruit second-class men would be no sensible sort of economy.

Notes of the Week

Parliament Against the People?

PARLIAMENT is going to debate the fourteen-day rule and other restrictions on broadcast discussions next week, and the Government is apparently at last prepared to agree that a Select Committee should look into them. Before examining whether there can be any sensible compromise about these restrictions, it is necessary to distinguish between the utterly false and the barely plausible arguments for them. The utterly false argument, which the Prime Minister and other supporters of the restrictions have sometimes unfortunately used, is that "everybody agrees that Parliament should be the main forum of discussion in a democracy." It should be made quite clear that everybody does not agree with that proposition; on the contrary, most democrats should passionately oppose it. The main forum of discussion in a democracy certainly should not be Parliament. It should be the pubs and clubs and hearths and homes of the British people; and one of the peculiarities of television and radio is that they thrust the raw material for discussion right down into them. It is strange enough that leaders of the Conservative party should have fallen for this monopolistic "main forum" argument. That members of the Labour party—which has

grown up from an entirely non-Parliamentary pressure group in the last sixty years, solely because of unfettered rights of discussion outside Parliament—should subscribe to it, is more extraordinary still.

The real argument for the restrictions (apart from jealousy felt by politicians who are not airworthy for those who are) is that unconsidered broadcasts by members of Parliament might bring occasional embarrassment to the party system of voting in the Commons; an MP might pass an off-the-cuff judgment on a new Bill over the air, and then find that his party, after maturer consideration of the rights and wrongs (or the political opportunities) of the case, comes to precisely the opposite one. Some people may think that this is a criticism of the party system rather than of broadcast discussions. But the conclusion to be drawn from it is plain. There is no argument against allowing members of the public to talk about anything they like over the air; at the most, there is merely an argument against allowing members of Parliament to do so. If Parliament wants to continue these restrictions, then let it continue them for MPs only; and if it wants to make them workable, then probably the only way to do that will be to ban MPs from broadcasting at all. On the whole, any such ban would be a pity; but any other continuation of the restrictions, if continuation there is to be, will raise an issue of Parliament against the people in a very dangerous form.

Butterfingers and Bad Tactics

THE only apt comment on the Government's handling of the Finance Bill is "Butterfingers." However much Ministers may protest that they knew what they were doing, it strains belief that any Government would knowingly allow any Bill to be dropped, even temporarily, from the Commons Order Paper.

What went wrong? Labour began the fatal night with a clear determination to force Mr Butler to relinquish his record of having never had to use the closure on one of his Finance Bills. But even some of the Tories were surprised that the closure was moved so quickly on what was the main debate about purchase tax. Labour MPs found themselves with a genuine grievance, and got their own back by arguing among themselves for two-and-a-half hours on a minor procedural point. They then tried to wind up the proceedings for the night, with the Government's weary acquiescence, by moving to "report progress". To everybody's dismay, however, the chairman refused to accept this motion, on the grounds that no progress had been made. In calm reflection here is a point that needs clearing up. Does "progress" in this procedural context mean the actual passing of clauses or amendments, or simply a passage of time? It would be more convenient if it meant the latter.

The chairman's refusal had the House hog-tied until Mr Wilson—or, as some observers thought, the wily Mr Chuter Ede at his elbow—unearthed an alternative motion, "that the chairman do now leave the chair". This was accepted and joyously passed; only later did most MPs realise that the effect of the motion was to wipe the Finance Bill off the Order Paper. Then, of course, everyone claimed to have known all along, and the matter was only put right after a good deal of verbal horseplay. This was a storm in a tea cup which probably could only have blown up towards the end of an all night sitting. But there is a more serious objection to this sort of nonsense than most MPs probably realise. The objection is not simply that high jinks on the Finance Bill do not seem very funny to the taxpayer. It is that if members go into paroxysms of delight on the one side, and fits of ill-concealed irritation on the other, about procedural tussles of this kind, Parliament's prospects for sober and reasonably sensible debate will be unnecessarily impaired. It would be unwise to be too stuffy about this, but there is no need to be unduly appreciative either.

Old Men Remember

WHAT is going on inside the national executive of the Labour party? It is no secret that at Margate the younger bloods in the party had thought that the informal seniority rule within the executive was at last to be overthrown. Plans had been laid—and, as the three gentlemen concerned probably thought, accepted—that Mr Gaitskell, Mr Wilson and Mr Crossman should become the chairmen of important sub-committees. But Mr Wilson and Mr Crossman have been on the executive for only a few years and are ex-Bevanites to boot, while Mr Gaitskell has been

a member for only one year. This has been regarded by the older members of the executive as arrant presumption, and the union members have put their almost united feet down. The result is that the main chairmanships, with one possible exception, have gone to familiar elders—Mr Griffiths for policy, Mr Morrison for publicity, Mr Earnshaw for finance, and Mr Sam Watson for international affairs.

The fact that the chairmanship of the policy committee has gone to Mr Griffiths seems a particular misfortune; this is the committee that will play an important part in editing the major policy statements that are to be presented to the party conferences over the next three years, and at Margate it had been widely assumed that Mr Gaitskell would get the job. Mr Griffiths's main qualification seems to be that he was chairman of the former committee on policy and publicity; his main handicap is that he may not realise that these two matters are very different things.

An even bigger misfortune, however—it is quite wrong to regard it as an even bigger joke—is that Mr Wilson has not yet been elected as chairman of the organisation sub-committee; indeed the whole question of party organisation is again in the melting pot, and some announcement may be made about it while *The Economist* is in the press. In last week's election Mr Wilson tied for the chairmanship of the organisation group with the trade unions' nominee, Miss Alice Bacon; and a new ballot will presumably have to be held. With due respect to Miss Bacon, who is rather unfairly regarded in the party as a right-wing hatchet-woman, the idea that she could act as Labour's Lord Woolton in taming the wild men of the constituency parties is absurd.

It is clear that politicking for higher places has lain behind these manoeuvres. The unions are apparently suspicious of the growing liaison between Mr Wilson and Mr Gaitskell. They do not challenge Mr Gaitskell's claim to succession to leadership, but they seem bent on reminding him that he has climbed by courtesy of the unions and that they will expect him to pick a union man as his running mate. But that choice will rest with Labour MPs who, on the whole, like the results of Mr Gaitskell's attempt to throw bridges across the gaps in the party. They have a good reason for this. With the vital proviso that the traffic across should be solely from Left to Right, it seems no bad thing for Labour that its next leader should go in for bridge-building—and gather new allies, but not new policies, while he may.

Sugar Coated "Kelloggs"

"ALLIANCES are the root of all evil"—so runs the latest theme-song now being broadcast from Moscow and Peking. It is topical and timely in both Europe and Asia; it fits in neatly with Mr Molotov's attempts to winkle the Germans out of Nato, and with his masters' exploitation, in Delhi, Rangoon and Kabul, of local suspicion of the South-East Asia treaty and of the new Baghdad pact. In countries remote from, or feeling remote from, the world's storm centres, the desire to stay free from entangling alliances is as natural as it was to George Washington; and there is a corresponding appeal for such countries in the proposals, sponsored by Russia and China, that alliances

such as Nato and Seato should be wound up and replaced by "security systems" or "peace pacts" open to all parties. The Chinese are even inviting the United States to join in just such a pact, embracing the whole area of Asia and the Pacific. There is, of course, a grim object lesson: the total failure of the prewar "Kellogg pact," in which war was solemnly and finally renounced by several dozen nations which a few years later found themselves at death grips. But there are even more serious objections.

There seems to be an odd but fundamental misconception about alliances. When concluded between free countries they are freely created and as freely left. They are thus diametrically opposed to the chain-gangs into which expansionist and totalitarian regimes marshal their often unenthusiastic satellites. Japan in the 1930s needed no alliance with "Manchukuo," nor Italy during the war with its puppet Croatia, nor Nazi Germany with Tito's Slovakia. Similarly, today Russia has in no way tightened its iron grip on its East European satellites by carrying through the solemn farce of this year's Warsaw treaty; nor does China's hold on North Korea depend on an alliance (has it, in fact, an alliance with the Pyongyang regime? and does anybody care?). It is thus as easy, and as meaningless, for the Communist powers to offer to wind up their formal alliances as it would have been for wartime Japan formally to liquidate its Co-Prosperity Sphere, or for Hitler to renounce his "New Order" in Europe.

The free alliances, in direct contrast, are needed by their members precisely because their relationship is not that of serfs and slave-owners, and because their partnership helps them to withstand Communist efforts to "exploit the internal contradictions in the opposing camp." The existence of those "contradictions" is both undeniable and natural—again, simply because the allied free nations are free partners, and the only means of limiting them is self-control. Strong allies are at least as responsible in this matter as their weaker partners, and even their opposition politicians must share that responsibility. These latter need frequent reminders of the damage their utterances from party platforms—German, American, British or whatever—can do to the fabric of their nations' friendships.

Susceptibility Week in Baghdad

So there is now a "Meto"—a Middle East treaty organisation—to fill the gap that used to yawn between Nato and Seato. This is the outcome of the meeting of like minds from Turkey, Iraq, Iran, Pakistan and Britain that has just taken place in Baghdad. The child now brought into the world is much less sturdy than either of its still-born forebears would have been—either the Allied Middle East Command conceived in 1951, or the Middle East Defence Organisation proposed in 1953—for both of these had a backbone; both provided for a joint active, or "reactivable," base at Suez. "Meto" hymns goodwill, abhors bases, and covers practical down-to-earth arrangements only where these existed already—as between Turkey and Nato, for example, or between Britain and Iraq. In a word, the susceptibilities of the Asian members—meaning their nervousness of great-power dominance—prevailed over all other considerations, and the weakness of the Baghdad

alliance is the weakness of its most susceptible link. While this mood prevails, the best its new military committee can hope to achieve is standardisation of weapons and training.

In the economic field, its sponsors sought more substantial results: if it leads to arrangements which channel all western aid to its members through a single agency, it will remove some of the wasteful duplication of effort that has so far proved a costly way of aiding the area. But those who hope for great new developments from the offers of aid—including "atomic aid"—advanced by Mr Macmillan and by American observers at Baghdad need to remember that up to now the principal limiting factor in Middle East development has been at the receiving, not the giving, end. Wherever western aid has failed to achieve its maximum

effect, the chief obstacle has, again, been Asian susceptibility, including a natural dislike for the everlasting role of pupil and a preference for doing things the Asian way. A further handicap has been Asian inability to gear the national machine to development at the desired pace owing to inexperience of the administrative work involved.

Before the Baghdad partnership can be rated a success, it must prove that, beginning in the economic field, it can mitigate these susceptibilities. If, at the regular meetings for which it has arranged, its Asian members were to become convinced that their western friends are no longer "colonial expansionists," and if mistrust were to be metamorphosed into trust, it could demonstrate to the whole Orient that quick change is possible without resort to Communist bulldozing. Only the pact's Asian members can set the tone that is needful to its success.

Failure of an Amnesty

THE Malayan Communists evidently believe that they are the masters of the situation, now that they have lured the Chief Ministers of the Federation and of Singapore into agreeing to direct talks on the conditions for a cease-fire. They now have a regular envoy keeping in touch with the Malayan government; he began by scooping some useful publicity and then made it clear that his masters would not discuss the amnesty at all. To make their point doubly clear, they have mounted a successful attack on one of the new villages from one of the safe areas set aside for Communists to surrender in—though in fact since September a mere handful have responded to the new offer. Either they wish to demonstrate, by their contempt for all conventions, their fixity of purpose and military strength, or they are "turning the heat" on what they believe to be a weak administration, already well softened up, and too far committed to ending the emergency to draw back at this stage. They are trying to show the Chief Minister, Tungku Abdul Rahman, and Malayan public opinion that they can hold out longer than the British said they could, and longer, perhaps, than the Tungku can.

It looks, however, as if for once they may have overreached themselves. The Tungku, already irritated by the long delay in their response to his offer to talk, and by the arrogance of their tone at the preliminaries, has responded toughly to the latest outrage; the safe areas have been withdrawn, the "shout before you shoot" rule has been rescinded, and only the terms of the amnesty stay. Once again the Tungku has said he can finish the Communists by force if he has to, though he is anxious to stop further bloodshed. Perhaps this will take effect. It is likely enough that the Communists' directive is to get out of the shooting war, now entirely out of keeping with the new international party line, and get into the profitable task of subversion, already paying such promising dividends in Singapore. They will earn bad marks in Peking for trying a bluff that failed—especially if the outcome is to strengthen the Tungku in the belief that it is unnecessary as well as foolish to relax in any way the terms of the government's offer for ending the fighting.

Mr Sandys's Sevenpence

IN the second reading debate on the Housing Subsidies Bill Mr Sandys pleaded persuasively—indeed, too persuasively—that the new arrangements for housing finance need cause nobody any real hardship. As Labour speakers (or rather the few that have got their arithmetic right) have pointed out, the combined effect of smaller Exchequer subsidies and higher interest rates will be to add more than 10s. a week to the cost of a new council house built for general purposes. But the Minister could report that an average annual increase of only 7d. a week, spread over the existing stock of 2½ million council houses, would provide local authorities with the extra funds needed to continue building at their present rate. Moreover only 2d.

of this 7d. will be due to the cut in subsidies (although it is true that there will be another 2d. to come when the transitional £10 subsidy on general housing is finally abolished). The other 5d. in the calculation is due to higher interest rates; and it is by no means certain that those higher interest rates will remain for ever.

Nevertheless, there were two reasons why Mr Sandys was unwise to lay so much emphasis on this "average" burden. The less important of these is that his emphasis may prove to be a political boomerang in some areas. Local authorities are unlikely to react to the new order as rationally or as uniformly as he tended to suggest. Some councils will add an additional sum to the rent increases to make up for increased repair costs. Others, by contrast, will funk putting up rents by the necessary amount and will prefer either to reduce their rate of building or to put a heavier burden on the rates—or to do both. Among the local authorities there will also be a small number of genuine hard cases. Some blitzed cities, for instance, have now relatively few slums, but a large amount of overcrowding, in tackling which they will apparently get no help.

The second reason why Mr Sandys was unwise to emphasise how small the "average" increase need be is that this may discourage local authorities from imposing much heavier-than-average increases on some tenants, while letting other rents stand still. The rents of most of the 1½ million prewar council houses are still low in relation both to their real present-day value and to the rents of postwar houses. The prewar tenant often pays around 12s. a week, while his postwar counterpart pays twice as much for a house situated double the distance from his place of work. Clearly it is the tenant of the prewar house who ought to be asked to bear the biggest increase now. The other sort of tenant who ought to pay much more, if the Government is going to try to bring about a proper use of all existing housing resources, is the tenant in certain types of privately owned but rent-restricted dwellings. Mr Sandys has still to decide what to do about the Rent Restriction Acts. He could easily be led to the wrong decision if he goes on trying to prove that no rents anywhere need rise by much.

Wages in Precept and Practice

THE general council of the Trades Union Congress has this week reminded Mr Gaitskell how to be a Butskell in Opposition. Its statement on economic policy is orthodox Labour Party stuff, singularly unimaginative, and ponderously responsible; in the circumstances these are admirable qualities in a document from which many trade unionists will catch a hint, but which very few unlucky people will have to read in full. The TUC's warning about the danger of a wage-price spiral does not, of course, mean that it is opposed to new wage demands; but it does indicate that it will not actively egg the more extravagant demands along. And this is important at a time when the flood of wage claims has reached a familiarly critical sector of the economy.

For the Transport Commission has this week received some formidable wage demands. The National Union of Railwaymen has asked for an increase of 10 per cent.

Having reacted so fiercely to the Budget, it could not even wait for its general secretary's return from the United States; but at least the claim—though high—is no higher than the figure that was discussed before October 26th. The Budget, on the other hand, has made a considerable difference to the attitude of the Transport Salaried Staff's Association. It still refuses to join the NUR in a joint claim, but it has moved a long way from its original argument that it would prefer a fall in the cost of living, and now asks for an extra 7½ per cent. The Associated Society of Locomotive Engineers and Firemen has not yet put in a money claim, but is first awaiting an answer to its demands for improved working conditions, adjustments in mileage allowances and a "full implementation of the 44-hour working week."

The commission, of course, cannot consider claims for improved conditions in isolation from wage demands. Even before it received this week's wage claims it had already been presented with large and costly demands by the NUR and the TSSA for shorter hours and for a third week's holiday. Against all this it had, at the end of last year, an accumulated deficit of £39 million; it lost several millions through the rail strike and has to pay out an extra £15½ million in wages; and the higher charges introduced in June will bring in only £25 million in a full year. The claims will therefore have to be pared down a good deal before they can even provide a basis for discussion. But this does not mean that Christmas will again be overshadowed by the threat of a rail strike. The unions are conscious that it is too soon to make a new trial of public sympathy, and of public willingness to stay at home.

No Core

NOT content with having turned a committee into a House and thus having temporarily killed a Bill, Parliament has learned this week that it has also compressed a terms of reference into an absurdity and thus temporarily throttled a Select Committee. The Select Committee on the Nationalised Industries, consisting of thirteen MPs from all three parties, has now issued its first report on all matters affecting the nationalised industries—outside its forbidden territory of questions which "clearly engage the responsibility of Ministers," matters of "day-to-day administration," wages and other questions that "fall to be considered through formal machinery established by the relevant statutes." The committee says, quite simply, that outside this wide-ranging forbidden territory, it considers that there are no matters of any interest to inquire into at all.

After this farce, there are three courses that Parliament can take if it is to exercise some degree of control over the nationalised industries. First, as Mr Herbert Morrison has always argued, it can content itself with debates on the Boards' own annual reports and on the reports of the independent (and non-parliamentary) committees which are to inquire into the working of the nationalised industries every seven years or so. Secondly, Parliament could set up its Select Committee again, but Ministers could be asked to be less naughty about claiming that so many matters "clearly engage" their own responsibility. (The layman cannot avoid the impression that, in their claims to responsibility before the latest committee, Ministers have been more

sweeping than they need.) Thirdly, Parliament can take Ministers' claims to responsibility at their face value, in which case the part that the affairs of the nationalised industries may play at Parliamentary question-time may substantially increase. On the whole, the second course would seem to be the best. But it may also be the one that Ministers would now feel to be the most embarrassing to follow.

Duet in Vienna

A PERIOD of coolness in official German-Austrian relations has ended as a result of Herr von Brentano's visit to Vienna. The chill set in last summer, when the Germans were shocked to find that the Austrian State treaty provided for confiscation of their assets in the western zones as well as those which the Russians had seized and which Austria is now buying back. Various long-established private German firms were to be treated as ruthlessly as, for example, the former Hermann Goering steel-works. Exceptions were made only for private property of a low value and for charitable institutions. Too hastily and too sharply, the Bonn foreign office sent a protest to Vienna, although Germany's legal rights had been relinquished in a blanket clause of the Paris treaties. At the same time, Dr Adenauer made a biting reference in the *Bundestag* to the Austrians' welcome to Hitler, and the German representative in Vienna was withdrawn.

It seemed that old scores might be brought up by both sides, but it is hard to quarrel with Austrians, and common-sense has prevailed. The Austrians showed themselves ready to do what they can to right justified German complaints—and there are some which cannot be dismissed—without violating the treaty, which forbids German property-owners to regain control of their old firms. It is probable that everything possible will be done to compensate the Germans, though their demands will be offset against Austrian counter-claims.

Precise ways and means of settling this complex matter were not the subject of Herr von Brentano's trip. He and the Austrians were concerned to establish friendly co-operation in general and their success will help to solve the economic dispute. An agreement has been reached to set up mixed commissions which will deal with all questions of German-Austrian relations and an exchange of diplomatic and consular representatives will follow soon. The German foreign minister also stated on his return to Bonn that the federal government of course recognises Austria's neutral status. This is a declaration which the Austrians would like formally repeated in the *Bundestag*—for the record.

Vietnam Courts London

ALTHOUGH Sir Anthony Eden shared with Mr Molotov the chairmanship of last year's Far Eastern conference in Geneva, this fact has hitherto commanded little attention in either Saigon or Hanoi. But the present coming and going of emissaries from the rival Vietnamese capitals

BP HAULS THE TRAINS

ON ROADS AND RAILWAYS ALIKE, the power of BP petrol and diesel fuel is helping to move Britain's trade more economically, more efficiently than ever before.

Overseas the story is much the same. Power for trains and for transport by road,

air and sea is provided by oil processed in fourteen BP refineries in nine countries. BP products around the world are speeding the pace of progress in commerce, in industry and in the rapidly growing field of private motoring.

The BP Shield is the symbol of the world-wide organisation of

The British Petroleum Company Limited

whose products include BP Super Motor Spirit and BP Special Energol 'Visco-static' Motor Oil

suggests a new recognition in both of the importance of London. The co-chairmanship of the 1954 conference commits Britain to a strict interpretation of the agreements that ended the Indo-China war; and London, while no more "neutral" than Moscow, possesses a stronger aura of impartiality than either Paris, the seat of the former colonial power, or Washington, where Mr Diem has found his principal support.

The south Vietnam foreign secretary, Mr Vu Van Mau, paid a flying visit to London this week. He will doubtless have sounded the Foreign Office about Britain's attitude to the Geneva agreements now that south Vietnam has become a republic and is planning general elections. He may well have been tempted to ask whether Britain would regard these elections as making redundant the country-wide elections prescribed at Geneva. And it would be in keeping with the official purpose of his journeyings—described as a tour of inspection of diplomatic posts—that he should request British *agrément* for his nominee as Vietnam's first ambassador at the Court of St James.

Another visitor from Vietnam has come and gone with a minimum of publicity. Mr Nguyen Manh Ha, a former Catholic Action leader in north Vietnam and more recently an intermediary between the Viet Minh and exiled nationalists in Paris, came to England earlier in the month to attend a "world conference for colonial liberation" at Margate. After his visit the Viet Minh radio was enthusing over the proposal made by Mr William Warbey, MP, in a question in the House of Commons on November 7th, that Britain should open an embassy in Hanoi. Mr Warbey is reported to have been one of the names on Mr Ha's crowded list of engagements, which also included Mrs Pandit, the Indian High Commissioner. Mr Ha, whose plans to overthrow Mr Diem before the recent referendum badly misfired, left London for Hanoi after the conference at Margate.

If Mr Ha's visit was in any sense a tentative opening bid for British favours, it should now be clear to him that Mr Diem has a lead which he is unlikely to overtake on Ho Chi Minh's behalf. Whatever the demerits of the recent referendum that deposed Bao Dai, Mr Diem has undoubtedly emerged from it with his authority greatly enhanced. And, in view of the great efforts made by the Viet Minh to organise a boycott of the referendum, the fact that the percentage of abstentions was minimal amounted to a powerful rebuff to the Communists.

Doubletalk in Delhi

THE Foreign Office's verdict of "thoroughly hypocritical" on Marshal Bulganin's address to the Indian parliament was a typically British understatement. The marshal's speech was an insult to the intelligence of his hosts—all the more insulting because he clearly assumed that India's elected representatives provided as ignorant and unthinking an audience as a mass meeting of Ukrainian peasants, or a session of his own docile Supreme Soviet.

The marshal claimed that Russia had no military bases on foreign soil. It maintains, in fact, in Germany alone, more divisions than India's whole army could muster. He claimed "non-interference" in other countries' affairs as a cardinal Soviet principle. Indians have had ample oppor-

tunities of learning from Yugoslav visitors that the contrary is true. He repeated the fantastic assertion that he had already made to U Nu, that Russia—which the Chinese government hailed just a fortnight ago as "leader of the world camp of peace and democracy"—is opposed to all blocs. But Mr Khrushchev, as usual, outdid his nominal superior. Russia, he said, had been "forced" to make hydrogen bombs; he omitted to mention its rejection, ever since 1946, of repeated western offers to surrender all nuclear-weapons to a world authority. The October Revolution, said the head of the Soviet Communist party, was the most bloodless of its size in history; Communism had never been forced upon anyone (Indians who know Prague or Warsaw know better); he did not even wish to circulate propaganda, for Communists respected the individual conscience—"there are in our country persons who are not members of the party."

Marshal Bulganin, however, had earlier secured a head start in the doubletalk stakes by calling for wider international contacts as soon as he reached Delhi, just four days after Mr Molotov at Geneva had slammed the iron curtain down on every proposal for freer contact, movement and exchange of ideas. Mr Nehru, who, in contrast, is a genuine believer in free movement and free speech as vital conditions of peace, may already have queried his guests on this contradiction. Some Indians may also have noted that while Mr Khrushchev was praising Russo-Indian friendship, Mr Molotov in Berlin was praising Russo-German friendship; and that, while both the Russians were speaking, cattle-trucks full of German prisoners whose release had been promised were being reversed back into Russia because the Federal German government's behaviour did not please Moscow's eyes—so the Soviet German puppet premier admitted at the weekend. "Friendship" has evidently joined "democracy" and "peace" in Mr Khrushchev's standard dictionary of doubletalk.

Trade Unions and the Law

THERE are indications that the general council of the Trades Union Congress is examining very carefully the consequences of the recent Bonsor judgment, which showed that a trade union can be sued by one of its own members for breach of contract. Certainly some trade unions consider the implications of this case to be shattering. In the December issue of *Labour Research*, Mr O. H. Parsons, a practising solicitor experienced in trade union work, maintains:

The vital importance of the Bonsor decision lies in its effects on industrial disputes. Most industrial agreements contain an arbitration clause. If there is a strike before arbitration is exhausted, that is a breach of the agreement. If the union makes the strike official and pays strike pay, it is aiding and abetting the breach of the agreement and is causing damage to the employers thereby.

Mr Parsons concludes that the unions are now where they were after the "infamous Taff Vale judgment" of 1901.

Another legal view, however, is that the Bonsor judgment has established nothing new, other than the light it has thrown on the relationship between a union and its own members. The Act of 1906 removed the right of

Diary

The Christmas present for the man who seems to have everything.

A memorandum book, an appointments register, and a complete reference book.

A diary lay-out specially designed to meet the needs of the busy man.

A week's appointments at an opening; a book that lies open flat on the desk.

Facts and figures covering the world always available when required.

All information easily found by means of handy thumb-indexes.

Bound throughout in red leather; title blocked in gold.

Price (U.K. only) **41/-** (including postage and purchase tax)

Prices to overseas addresses vary widely; a schedule will be sent on request.

Full details are given in an illustrated pamphlet available from:

DIARY DEPARTMENT

The Economist, 22 Ryder Street, London, S.W.1

employers to sue a union for tort (which was the issue in the Taff Vale case), but the right of employers to sue for breach of contract remained—and some solicitors say that they always knew it remained. Why then have employers not made frequent claims for damages against unions that have called strikes in contravention of an agreement not to do so until arbitration machinery has been exhausted?

Assuming that employers knew what their legal rights were, there seem to be three main answers. First, Section 4 of the Act of 1871 specified certain kinds of contract which should be unenforceable in the courts, and one of these was an agreement between trade unions. Since many industrial agreements are made between the employers on the one hand and more than one union on the other, they would be unenforceable in the courts. Secondly, even where employers could sue for breach of contract, they would be likely to think that it would be unprofitable further to embitter relations with the union by doing so. Thirdly, the majority of strikes, at least since the war, have been unofficial strikes, in which the unions have not been concerned. In those that have been official, such as the strike of engine crews in the summer, the prescribed procedure has usually been followed. This has not always been true of some strike threats, including possibly some railway strike threats. But as those threats succeeded, there was no breach of contract.

Teachers Unimpressed

THE National Union of Teachers is almost as angry about the new scheme for teachers' pensions as it was about the one that Dame Florence Horsbrugh tried to introduce, and a conference on Saturday instructed the executive to employ all the union's resources to defeat it. The general secretary argued that the raising of the contribution from 5 to 6 per cent was equivalent to a cut in salary at a time when everyone else was getting increases; that local authorities carried a smaller proportion of the cost than any other employers; and that they were almost alone among modern employers in not shouldering the cost to pensions of higher salaries, longer expectation of life and earlier retirement ages. It therefore seems probable that MPs and others must expect the same shoal of protesting letters, and of visits from indignant teacher-constituents, as they had to bear at the time of the Horsbrugh Bill.

But this time they should stand fast. Even although their union does not seem to realise it, teachers have been given a very important concession in the Eccles proposals—namely that in future their employers will be solely responsible for any changes in contributions that are needed to keep the fund solvent. In an age of inflation by far the best kind of pension to have is one based upon the salary earned at the time of retirement, rather than one which offers a set sum that is calculated actuarially. Teachers have always enjoyed pensions based on pre-retirement salaries, but hitherto they have been supposed to pay for it by contributions to an actuarial fund. Under the Eccles proposals, that actuarial principle will be abandoned. Compared with most of the rest of us pensioners-to-be, teachers are very lucky people now.

The Ban on Heroin

THERE are only some fifty-four heroin addicts in Great Britain; indeed, addiction to manufactured drugs of any sort is not a serious problem, nor is it in itself a crime. In some other countries, addiction, especially to heroin, is—to quote the Minister of Health—"a very substantial social evil"; and the ban on manufacturing heroin in Britain after December 31st has been imposed to foster international good will. The Government is falling in line with a recommendation of the World Health Organisation (itself acting at the request of the Permanent Central Opium Board), and is reducing the licit supplies from which the illicit international traffic can be fed.

Before imposing the ban, the Home Secretary consulted the Minister of Health; and the Minister of Health consulted the standing medical advisory committee of the Central Health Services Council, which advised him that satisfactory substitutes for heroin are now available. But this advice has since been repudiated by individual doctors up and down the country, who maintain that for some conditions, particularly extreme pain and certain coughs, heroin is the only effective prescription. In apparent support of their view, some hospitals are, it is said, laying in stocks of the drug. Why, these doctors ask, should patients, however few, be deprived of an essential drug in order that Britain may conform with the wishes of an international body anxious to stamp out heroin addiction in other countries?

Short of submitting to being a guinea pig, the layman will find it difficult to take sides—at least until he has been given the answer to several questions. Are the upholders of heroin in fact seizing the chance to express resentment at interference with clinical practice? Are Mr Lloyd George and Mr Macleod persisting in maintaining the ban merely because they are afraid of losing face abroad? Could they not first try the effect of a ban on exports of heroin and allow manufacture to continue for home consumption only? Have they considered the warning of an American doctor who spoke to the international congress on criminology in London in September? In the United States, he said, the ban on heroin had made the addiction problem worse, for it had turned addicts into criminals and promoted all the racketeering associated with an illegal trade. Is the Home Office convinced that there is no danger of the same thing happening here?

Hammer Cut Sickle?

MR KHRUSHCHEV has recently been trying to file away at the resolution of Canada, as well as of the two countries that form the wings of the Nato crescent in Europe, Turkey and Norway; and his tools have been his now familiar ones of joviality and the half-concealed bludgeon. Earlier this month, at a dinner held in Moscow to celebrate the Bandoeng conference, he explained to the Turkish Ambassador that past misunderstandings between the two countries—including Russia's denunciation of

their treaty of friendship and Russian claims to parts of north-eastern Turkey—were, like the quarrel with Yugoslavia, all the fault of the executed Beria. The Turks, said Mr Khrushchev, ought to quit Nato while they could, for they would be "the first to be eaten up if there was any difficulty." Fortunately his euphemisms show no signs of weakening Turkey either in its loyalty to Nato or in its enthusiasm for the Baghdad pact.

★

No doubt the same kind of argument was put to Mr Gerhardsen, the Norwegian premier, during his recent visit to Moscow. The Russian leaders obtained from Mr Gerhardsen a repetition of the 1949 assurance that Norway would not allow foreign bases to be set up on its soil unless it were attacked or directly threatened. But the clearest *exposé* of Russian tactics has been given by Mr Khrushchev in his conversations with Mr Lester Pearson during the Canadian foreign minister's recent visit to Russia. He dropped dark hints about Russia's trans-Arctic guided missiles, and promised that if Canada was still in Nato when a war started it would be "right in the firing line." (Clearly Moscow is intent on emphasising to the free world that there will be no rear areas or rest zones in any future battlefield.) He went on to say that he believed the democracies "would not accept the sacrifices that prolonged defence expenditures involved" and that Nato would eventually "fall apart." Mr Khrushchev has stated the West's problem lucidly. If tension persists in the world, the fainter-hearted members of the western alliance will tend to flinch away; if tension is relaxed, they will assume that the burdens of communal defence can be abandoned. It is small wonder that Mr Molotov can afford to be so blunt and brusque at Geneva when, by alternating promises of amity with threats of obliteration, Russian diplomacy stands to achieve so much elsewhere.

CHANGES IN EMPLOYMENT
in GREAT BRITAIN
INCREASES OR DECREASES SINCE JUNE 1951 [THOUSANDS]

Turkey's Freedom Party

THE nineteen Turkish deputies who (as described in *The Economist* of October 22nd) fell foul of Mr Menderes over the application of the press law and either resigned or were expelled from the Democrat party, have now set up a new party. They have called it the *Hurriyet* or Freedom party; and in view of the cavalier attitude adopted by the Turkish prime minister towards democratic liberties, particularly those of the press and the universities, the name is sadly appropriate. Paradoxically, the present Turkish government, which in its foreign policy shows a lively sense of the need to guard against Communist totalitarianism, in its domestic policies is showing a grave tendency to slip back towards authoritarian rule.

It is too early to say how much influence the new party is likely to have. At present its numbers are small—twenty-one in all—but its quality is high; it contains several former cabinet ministers and founder members of the Democrat party. Discontent with the Democrats' present leadership seems fairly widespread among the rank and file. The obedient party congress which last month put its rubber stamp on all that Mr Menderes had to say was not an altogether reliable guide to the real state of mind within the party, since a good many of the more critical delegates were not allowed to attend. Moreover, the surprisingly strong opposition to many of the Democrat party's candidates at the recent municipal elections suggests that dissatisfaction is growing among the general public. The new party is better placed to resist the present trend away from democratic ways than is the People's Republican party, for it has no authoritarian past of its own to live down. If it is given a fair run for its money, it may provide a focal point for many different strands of constructive criticism as well as of discontent.

Lights Flicker in South Korea

THE severe power shortage that has put the lights out in South Korea in recent weeks has given the North Korean Communists another opportunity to try to inveigle Dr Syngman Rhee into intergovernmental talks. Their minister of electricity, Mr Kim Tu Sam, has announced that the north can meet the requirements of the whole peninsula (most of Korea's natural power resources lie in the more mountainous north, which sent supplies southwards as late as 1948). He offered to transmit power for the use of "peaceful industrial establishments" as well as domestic purposes, on condition that the South Koreans sent a delegation to Kaesong to discuss arrangements. The offer has been rejected by the south, although it is undoubtedly in acute difficulties, since it would have been the first step towards recognition of the Pyongyang regime. The Communists' proposal is not the first of its kind—they have long been calling for a joint conference on fisheries—and it represents what is by now a familiar technique in divided countries where they know that general elections would mean defeat.

A breakdown in a transformer, and the withdrawal by the Americans of two generating ships, have contributed to the South Koreans' power problems. They now claim that by next March new construction, aided by American funds, will have overcome most of the difficulties; and last week Dr Rhee opened a reservoir thirty miles north of the 38th Parallel, close to the truce line, which will provide Korea's second largest source of hydro-electric power. Meanwhile the population in the south has to steel itself to face a bleak winter. All electricity for private use will be cut off, except for a five-hour period each day after sunset; basic industries will get only 18 hours' supply daily, and other kinds of industry a good deal less. In October over 1,200 people who were caught illegally using power were handed over to the tender mercies of the South Korean police, and those who offend in future will be completely deprived of electricity until the end of 1956. Dr Rhee is wise to refuse the Communist bait; as the UN Assembly's political committee emphasised this week, the only safe road to unity in Korea lies through properly supervised general elections. But the coming months are likely to provide a severe test for the resolution and loyalty of his subjects.

America and Europe

It cannot, we fear, be denied that, in the contest which we are now carrying on with the gigantic despot of Northern Europe, the feelings and wishes of a considerable portion of the citizens of the United States are not with us, but against us. This is explicable enough; there are many reasons for it, some creditable, some much the reverse. Russia and America are both great slaveholders; both are given to aggression and territorial aggrandisement; both indulge in dreams of universal dominion; the one aspires to the supremacy in the Old World; the other to the sovereignty of the New. As yet there is no rivalry between them; nor can there be for generations; nor need there ever be. They come into collision nowhere; their commercial interests are nowhere competitive or hostile. The Russians, moreover, have taken considerable pains to cultivate the personal goodwill of the Americans, especially of the travellers and manufacturers of the great Republic; and of late they have purchased "golden opinions" among the industrial interests by large orders for machinery, ships and other articles of American production. Great Britain, on the other hand, though the best customer and the closest business connection of America, is also everywhere her commercial rival and most formidable competitor; and severe competition, in narrow minds, often breeds incipient enmity. The Americans, too, have a strong impression that we are haughty and dictatorial, and they would not be sorry to see us humbled. . . . Now, we may fairly allow . . . that a slight and transient jealousy may be excused on the part of a young and powerful State of vast energy and unlimited pretensions. But we have no hesitation in saying that this jealousy and uneasiness ought not to be shared or encouraged by reflecting and honourable Americans. They should leave it to the filibusters, the annexers, the slave-dealing Southerners, the Western barbarians. For it is only such that have anything to dread from French and British interference. The alliance between France and England can be dangerous to no American designs *except such as cannot be openly avowed*: it is hostile to no pretensions except such swollen and aggressive ones as ought not to be for a moment entertained.

Perfect weather for his **water-resistant** watch!

TRUE, there is no water. But look at the dust; think of the sand, and the humidity. What sort of watch will keep them out? Only a water-resistant watch. The Swiss make their water-resistant watches to keep out everything!

It doesn't matter whether you're caught in a rainstorm or a sandstorm—sealed in its special case, the fine Swiss jewelled-lever movement ticks on untroubled.

Any good jeweller will show you how the Swiss water-resistant seal works. He can show you other exciting Swiss watches too—that never need winding, that show the date as well as the time; watches that record the tides, and the phases of the moon . . . beautiful ladies' watches in exquisite settings.

Whatever sort of watch you're looking for—see that the one you choose is Swiss. There are no other watches like them.

Your jeweller's knowledge is your safeguard

Time is the art of the Swiss

Buy from a jeweller, who can service a watch as well as sell it. His advice is skilled and knowledgeable—and very

Letters to the Editor

Parkinson's Law

SIR—We owe you and your unknown, but obviously knowing, correspondent thanks for his exposition of Parkinson's law. I know Parkinson. He is one of an élite who during the past decade discovered such laws as Tawney's—that the better-off and more equal becomes a mass-democracy, the emptier become titles of personal distinction, but the more they multiply and are striven for; or Herbert's—that the more a state rules and regulates individuals' behaviour, the more crimes and criminals multiply, prisons overspill, and police fall short; or the first law of thermoeconomics (the Coal Board, *alias* Alice's, law)—that the more new capital is sunk down coalmines, the less coal is produced; or the inverse Kipling law—that the airier, more tenuous, and more centrifugal an empire becomes, the louder and more lyrical become its laudators; or Butskell's and Gaitler's law—that reduction of a money's purchasing power by 4 to 5 per cent per annum brings overfull employment, indistinguishable party policies, and a quiet life.

Such laws, being British, have no connection with the Russian law of self-help (by smiles), the French political law (*plus ça change . . .*), the Latin American political law (*plus c'est la même chose, plus ça change*), and the Norteamericano social law vulgarly epitomised as "Sure he's cheatin'; it's his Deal, ain't it?" All these laws of our time of troubles await a Toynbee.—Yours faithfully, GRAHAM HUTTON
Abingdon, Berks

SIR—It appears from your correspondent's evidence that the annual rate of pure staff accumulation (expressed as an average over a period of years) was approximately 5½ per cent prewar, but in the postwar period is 6½ per cent. Is there perhaps a tendency for an increasing rate of pure staff accumulation?

This would appear to be confirmed (as is the whole analysis of your correspondent) from statistics of the National Coal Board. These show an increase in "real salaries" (money salaries/cost of living) in the NCB from 1947 to 1954 of 44 per cent, or an average of 6.3 per cent per annum. As your correspondent points out, the rise is unrelated to the volume of work. The output of coal over the period rose by only 13 per cent; from 1952 to 1954 "real salaries" rose by 10 per cent while coal output increased not at all. Nor could the 44 per cent rise in "real salaries" be said to

be a response to rising wages in mining (as institutionalists might claim), for the "real wage bill" increased only 17 per cent over the period.—Yours faithfully, JOHN HUGHES
Sheffield, 7

SIR—The enunciation of Parkinson's law by your correspondent on November 19th is a most important event in the history of administration. The law, however, should be extended to research establishments and the work that they do as they increase in size.

One problem within such establishments is to maintain liaison in order to get a cross-fertilisation of ideas and to prevent duplication of work. It may be assumed as a first approximation that the amount of time which any individual worker has to spend in this task is proportional to the total number of other workers in the establishment. This means, therefore, that the amount of time that he has to spare for his own operations is proportional to (A—kN), where A is the number of hours in the week, N is the number of workers in the establishment and k is the time spent in liaising with each other worker in the establishment on an average. The total output of the establishment may, therefore, be assumed to be proportional to N(A—kN).

This function rises rapidly at first, but passes through a maximum and then declines, becomes zero and may ultimately become negative. The possibility of negative output from a large research establishment arises from the assumption that a man can spend more than the whole of his working week in liaison with other men. Even the most hard-pressed research worker will rarely do this, and I think it fair to say, therefore, that one should restrict the application of this law to the point at which the total output of the establishment becomes zero.—Yours faithfully, TECHNOLOGIST

SIR—I was most interested to read your botanist's account of recent manifestations of Parkinson's Law in the Civil Service. Frankly, until then, I was under the impression that since the big clean-up which followed Florence Nightingale's indictment of Foreign Office incompetence during the Crimean War, the Law had become out of date. But I must confess to lack the opportunities of your correspondent for watching other people at work and for studying just how fast and cunningly the weeds grow.

To take his theory a little further, I had a look at the figures for the Depart-

ment to which "E" hopes to transfer, the Ministry of Pensions and National Insurance. Surely the thousands who flocked to what was the Ministry of National Insurance in 1948 must have multiplied a good deal since then? On the contrary, I found that although, as a Department, it has steadily taken on more and more work, for example, of war pensions and welfare foods, its numbers have steadily declined. The figures from the Digest of Statistics are as follows:

<i>Ministry of National Insurance</i> :—	
April, 1949.....	38,506
" 1950.....	35,539

This seems to indicate a reduction of 4,993 since 1.9.53, or a decrease of rather nearer 12 per cent, than the increase of 5.89 per cent each year propounded by Parkinson's Law. Can it be that this Department is a victim, not of Parkinson's Law but of Parkinson's Disease, or am I on the verge of some new discovery about the eyesight of correspondents and MPs who devote themselves dangerously to watching men at work?—Yours faithfully,

H. TREVOR WOOLSTON
Editor

"Civil Service Opinion"

Better Neighbours in the Pacific

SIR—The final sentence of your article of October 15th reads: "If the non-Communist nations in the Pacific are to preserve any kind of unity, Japan must tread quietly in the presence of those who have bitter memories of the 1940s."

In my opinion the principal weakness of the free world position is the great importance placed on surface appearances. By suggesting that Japan "tread quietly" we are recognising that Japan still has its aggressive aims and are simply urging it to hide them temporarily, until other countries forget and let down their guard. Increasing evidence shows Japan either pro-Communist or conceitedly planning to make a marriage of convenience to be dissolved after Japan achieves domination over all Asia.

The optimistic tone of your article apparently was based on two news items, one concerning Philippine-Japanese problems—still a long way from solution—and the other Korea's move to purchase fertiliser from Japan. By this time you already know how Japan rebuffed us. In addition to asking a price much higher than that quoted by other countries, Japan refused to promise delivery of more than a small portion of the quantity asked and that six to eight months after the date specified.

The problem of Koreans detained in the Omura prison camp in Japan exists because Japan refuses to recognise Korea's independence and conclude a friendship treaty. Japan still lays claim to eighty-five per cent of the property in Korea despite relinquishing all title to it in signing the Peace Treaty. As long as the Japanese contend that the Republic of Korea Government was created in violation of international law, and refuse to recognise the outcome of World War II, there is little chance for close relations between Korea and Japan.

The logical course in the present situation is for the countries which united to defeat Japan jointly to insist that Japan respect the terms of the Peace Treaty and show real evidence of a democratic spirit.—Yours faithfully,

J. C. KIM for M. M. LEE,
Minister of the Republic of Korea
Korean Legation, London

[Japan will be wise to "tread quietly" by giving what compensation it can for wartime injuries; and by making allowance for its neighbours' bitter memories. But to say this is not to suggest that Japan now has the same aggressive aims as it had in 1941.—EDITOR.]

An Established Church?

SIR—You are in error when you describe the Queen's Lord High Commissioner as "presiding over the General Assembly of the Church of Scotland." He does not preside. In his official capacity, he is not a member of the Assembly. He does not even sit "inside" the House. The Assembly begins, continues, and ends its business without the leave or consent of the Queen's Lord High Commissioner. The struggles of centuries are dramatised in the ritual that the Lord High Commissioner only addresses the Assembly after formal leave of the Assembly.—Yours faithfully, JOHN BUYERS
The University, Glasgow

Afghan Ambitions

SIR—You stated in your issue of November 12th that the first Afghan War was the direct result of Dost Mohamed's bid for Russian help against the Sikh kingdom. Surely this is not the whole truth. Dost Mohamed would have preferred a British alliance, but Alexander Burns, the political agent of the Indian Government at Kabul, was not empowered to offer him a "quid pro quo."

The Dost's agreement meant little because Orenburg, the nearest Russian base, was 2,000 miles away. Yet in October, 1838, Palmerston was writing to Clanricarde, the British ambassador at St Petersburg, that the Russian menace was so great that "Auckland [the Governor-General] has been told to take Afghanistan in hand and make it a British dependency." It was a war of aggression prosecuted for unreal political and strategic ends.—Yours faithfully,

DOUGLAS GOURLAY
Masham, near Ripon.

Books & Publications

Now We Know

THE BRITISH GENERAL ELECTION OF 1955. *Sponsored by Nuffield College, Oxford.*
By D. E. Butler.
Macmillan. 236 pages. 24s.

AT ten o'clock on the night of May 26, 1955, half the adult population of Britain was looking at the face of Mr David Butler. The fact that he was able to intimate who had won the election after the very first result, and that his first forecasts of the Conservative majority were some forty or fifty too high, contributed in about equal measure to making a substantial minority of that mass audience exceedingly irritated with him. There could be no greater tribute to the progress of psephology, of which he is now the most public priest. The study of swings, which until so recently had been regarded as a fanciful and theoretical abstraction, was being derided because it is not an exact science.

A wry appreciation of this compliment runs through Mr Butler's book. The greater part of the book, of course, is not concerned with statistics at all. With the aid of four collaborators, Mr Butler is chiefly concerned to set down a first-class journalistic account of the election, as raw material for future historians. The story of extraordinary Conservative good luck just before the campaign, of continuing Labour dispiritedness during it, of the purr and the clanking of rival constituency organisations, of the role of the trade unions (this in a revealing appendix by Mr Martin Harrison), and of the broadcasting battle is told with just sufficient touches of humour to keep it a-sparkle. ("The Liberal candidate who maintained that trade unionists should be whipped through the streets like harlots was not in the main stream of Liberal thought." "The Labour candidate . . . said that he himself was not a Bevanite, but there was always a need for an active and vocal left wing to do for Labour what Lloyd George had done for the Liberals in his early days. No opponent was churlish enough to press the parallel further.") If one searches for criticisms to make of this part of the book, one can find in it only two minor respects. There is perhaps not enough research into how the generally progressive stream of Conservative candidates managed to avoid friction with the reactionary people who were the key amateur figures in so many of their local organisations. And there is nothing at all about the extraordinary

things that went on at Labour headquarters during the campaign; history will have a right to know about them.

It is only at the end of his book that Mr Butler turns from these impressionistic studies to the sifting of statistics for which he is most famous. The average swing in Great Britain, he says, with the gleam in his eye almost showing through the printed pages, was 1.6 per cent; and it was much more uniform than some people have suggested ("Only East Anglia, Cornwall, rural Wales, and North East Scotland had swings notably below the average; only the Midlands area had swings markedly above it."). Yet, Mr Butler agrees, the Conservative majority was twelve smaller than this swing should have caused, according to empirical pre-election calculations. He produces from his correlations one principal explanation for this discrepancy. The average swing against Labour was 0.3 per cent smaller in those constituencies where a sitting Labour member was involved; if this widespread benefit from "squatters' rights" had been foreseen before the election, the swingsters could have got their calculations of the majority almost exactly right.

With this discovery underneath his slide rule, Mr Butler is inclined, perhaps a little too inclined, to discount the other statistical quirks of the election. He is concerned to rebut the argument that there were no conversions from Labour to Conservatism in this election, that there were only conversions from Labour to the "don't cares and won't vote." It is not true that the swing to the Conservatives was greatest in those areas where the drop in turn-out was greatest; and Mr Butler believes that abstentions were much more bi-partisan than has been commonly supposed. He also does not agree that variations in the efficiency of local organisations (although they were immense) had as much effect upon the result as Mr Harold Wilson assumes; before the election Mr Butler asked the party organisers, in confidence, which they considered to be their best and worst local machines, and the answers they gave bore no recognisable correlation to the actual results. Although he would like to believe that politics may after all be healthily influenced by personalities, he is plainly still more than half-inclined to accept the old adage that "no candidate or organisation is worth more than 500 votes."

The upshot is that he believes that—

with the principal and possible exception of the discovery that squatters' rights may slow the swing of the pendulum—the statistical side of psephology stands very much where it did. At the next election it should take a swing of just over 2 per cent to bring Labour back to power, and if one assumes that the phenomenon of "squatters' rights" is repeated, then this average swing would have to be increased to . . . But no matter. The student of elections can now thankfully file away the figures in Mr Butler's appendix for another four years. They will be very useful then.

Man and His Past

THE HISTORY OF MAN: *from the first Human to Primitive Culture and Beyond.* By Carleton S. Coon. Cape. 450 pages. 28s.

THIS book may be warmly recommended to anyone interested in mankind, as distinct from particular individuals or societies. It treats of human history in a way that illuminates, or at least sets in perspective, some of the outstanding problems that confront humanity today. Professor Carleton Coon treats his immense subject in the comprehensive fashion one might expect of an anthropologist with an exceptionally wide range: his approach is global and his treatment biological in the sense that his prime concern is with life.

Mr Coon's thesis is that the choice before us today between peace with abundance and war with poverty (if not extermination) is the logical outcome, not of modern history but of history as a whole; and, equally, that the most dangerous obstacles to the unified culture demanded by modern science and technology are legacies of the more or less remote prehistoric past. When we look back over history, we find evidence for an ever-accelerating advance in the control of natural forces together with an increasing subdivision of labour and complexity of institutions: first the emergence in the frost-free zone of the Old World of small communities based on hunting and gathering, followed towards the end of the Ice Age by the expansion of more advanced hunters over the colder territories of the Old World and into the New; then the origin of settled civilisation based on farming and later also on metallurgy and writing, civilisations which tended to diverge as they developed and spread; and, finally, beginning with the age of gun-powder, printing and geographical discovery, a trend towards unification, a trend which with the growth of modern industry and science took on more and more of the character of a remorseless drive towards a universal technology and a single world-wide civilisation. The outstanding question is whether this final process can be carried to its logical conclusion without the wars which have speeded up its earlier stages.

Here we have to reckon with the survival of old patterns of thought and behaviour. There is first of all the fact

that men are only partly tamed and conditioned to life in large-scale social units—they have been fashioned by, and have spent almost the whole of their history practising, a purely predatory form of economy in small social groups in conditions far removed from those under which almost all of them have to live today. Secondly, although societies based on hunting and fishing can be ignored as factors in world politics, those whose members "still live in villages and perform tasks invented by Neolithic men" assuredly cannot: indeed, Mr Coon would regard the survival of this Neolithic mentality and way of life as a major "impediment to global peace and unity." Many of our worst problems in Africa and Asia (and even to some degree in Europe also) stem from this cultural lag, or rather from a realisation of the inequality this involves—a realisation made easier by modern means of travel and entertainment and more bitter from the fact that too often it coincides with more or less pronounced racial differences.

Although the author is only too well aware of the dangers of living at a climax of world history—like a true American he seems to sleep with the atomic bomb under his pillow—his book is far from gloomy and not at all portentous. He tells a lively story, uninhibited by academic caution, but well informed and honest where controversial, and his illustrations are often illuminating.

The Blackguard

HORATIO BOTTOMLEY.
By Julian Symons.
The Cresset Press. 287 pages. 21s.

THIS is a readable biography, but it contains one or two glaring inaccuracies—not important in themselves but bad enough to make the reader wonder how much care has been given to checking other facts that really do matter.

Bottomley was born of working class parents both of whom died in his early boyhood. His mother's brother was that sturdy fighter for Socialism and rationalism, G. J. Holyoake; and Holyoake, having first helped his orphan nephew with money, got him placed in an orphanage in Birmingham. It was characteristic of the adult Bottomley that in the days of his prosperity he went back regularly to the orphanage and, in the role of old boy made good, spent money freely on the entertainment of the children. On these visits he was usually accompanied by an attractive girl whom he introduced as his niece; and on every visit it was a different niece.

As a very young man he started a concern grandiloquently called the Hansard Publishing Union Limited. The tricks he played with its finance led him to the dock at the Old Bailey, where he defended himself successfully against the Attorney-General and was told after the trial by Sir Edward Clarke that his future career should be "one of distinction and high repute." In 1906 he was

elected MP for Hackney and in both of the elections in 1910 he was returned again. In 1911 or 1912 he went bankrupt and in 1912 he retired from Parliament. In 1918 he got his discharge and was again elected. Roughly speaking, he was an undischarged bankrupt whenever he was not an MP and an MP whenever he was not an undischarged bankrupt.

Throughout the years of his bankruptcy he was spending money like water, living on champagne, playing the part of country squire, editing newspapers, stumping the country as the great commoner, blackmailing right and left, making £7,800 a year out of religious articles that had been ghosted for him, organising fraudulent sweepstakes and finally running the war loan fraud which landed him in Wormwood Scrubbs en route for Maidstone. Bottomley was in fact the complete blackguard. In his whole make-up there was not an ounce of decency, sincerity, morality or loyalty. And what is more remarkable—the blackguardism was obvious to anyone with half an eye to distinguish good from bad. At the first meeting of the Hansard Union a shareholder who had never seen him before left the hall after Bottomley had been speaking for a few minutes and went straight off to his stockbrokers to give them an order to sell his holding. Yet the man mesmerised crowds and readers for twenty years, and was openly spoken of as the next prime minister. How was it done? There is no answer.

The South Sea Bubble left behind it nothing except two very respectable insurance offices. Bottomley left nothing at all, but three concerns with which he was connected do remain—the newspaper *John Bull*, a financial newspaper and the printing works which set the type you are now reading.

Currency Warfare

HITLER'S PAPER WEAPON.
By Wilhelm Höttl. Translated by Basil Creighton.
Hart-Davis. 187 pages. 15s.

IN total war, the only criteria in deciding whether to make use of a new weapon are its effectiveness and the possibility of boomerang consequences. In the last war, both belligerents examined at an early stage schemes for breaking the economy of the enemy's country by the introduction (probably from the air) of large numbers of forged currency notes. The idea was rejected in this country, principally on the grounds of impracticability. It is interesting to find from Dr Höttl's book that it was also rejected as impractical in Germany.

Here the similarity in policy of the two countries ended, since England contrived, with American help, to secure the minimum of foreign currency necessary for its war needs, while Germany suffered from an acute shortage of foreign currency. The German Secret Service, therefore, forged considerable quantities of Bank of England notes and

used them for its own purposes in other countries. Hitler himself agreed to this, though he forbade the forging of dollar notes while the United States was neutral. Their use, moreover, was prohibited in occupied or friendly countries, where the Nazi government was interested in the stabilisation of the local currency. It seems, in fact, to have always been regarded as a definitely Secret Service operation, which the less flamboyant Nazi leaders avoided like the plague.

Dr Höttl's book is the remarkable story of Operation Bernhard, as the making and circulation of these notes were called. Dr Höttl, a young Austrian historian, was recruited soon after the Anschluss for the Nazi political Secret Service; with short periods when he was in disgrace, he operated in the section dealing with the Balkans and Italy, first in ascertaining how the forged Hungarian franc notes were distributed in 1935, and later on general political work. He maintains that he was neither a manufacturer nor a distributor of forged notes himself, but he was clearly associated with both and describes the two processes with obviously close knowledge. The rest of the book is pure cloak-and-dagger stuff. It describes various operations (in some of which Dr Höttl was personally concerned and which were all financed by forged English notes), including the release of Mussolini, the escape of the Cianos, and the proposed purchase of supplies for the famous Alpine stronghold.

It is possibly the result, in part, of a certain disingenuousness about his own position that Dr Höttl, while providing some good cloak-and-dagger writing for the public, adds little to what was already known of Operation Bernhard from a technical-point of view. Nor does he produce much evidence in support of his fears that the Russians may have acquired some expert technique from those concerned in the operation. In any case, much of the information would presumably now be out of date.

Divided Germany

WESTERN GERMANY: from defeat to rearmament.
by Alfred Grosser.
Translated by Richard Rees.
Allen and Unwin. 249 pages. 18s.

M. GROSSER'S "L'Allemagne de l'Occident, 1945-52," has been a most useful compendium on postwar Western Germany since its publication two and a half years ago. Here, at last, is an English translation. Despite some slightly misleading minor slips, it is excellent and, moreover, has given the author the opportunity to revise the bulk of the book up to April, 1954, and his ending up to the Paris Agreements.

He is not happy about those agreements. He deplores the decision to rearm Western Germany; but he recognises that it was inevitable if Europe was to be rearmend, and he has removed from his book a rueful reference to the possibility of America bearing the

burden of military defence alone while helping Europe to establish economic prosperity and social justice.

He shows how the gulf opening up between the wartime allies became a frontier dividing Germany in two. He describes the policy of the Western occupying powers, from punishment to partnership, in all its inconsistency. In his description of the first phase of occupation M. Grosser rightly points out that it was the French who most often frustrated the Allied Control Council by their veto. What, perhaps, he brings out insufficiently is how, even before that body broke up, the Russians carried out a revolution in their zone under the guise of denazification, demilitarisation and democratisation—four-Power objectives which were taken no less seriously in the West, only the words meant something different there. This is a matter of the greatest relevance to the present debate about the terms on which the two Germanies might be reunited. We ought to be reminded of the purposefulness and despatch with which the Russians acted in the process of division. For one who disbelieves in the likelihood of military aggression from the east, M. Grosser shows curiously little interest in the different methods of conquest.

His diagnosis of Nazism and his description of the treatment applied by the Allies and of its effects are full of sense and sensibility. But a deeper diagnosis would have required a more precise appreciation of the moral and religious motives of the Germans who really opposed Hitler. Any process of regeneration must build on the remaining healthy parts of an organism. The different powers of occupation are characterised neatly. The chapter on Germany's economic recovery is weak, but is followed by an excellent one on youth, the trade unions and the refugees, as aspects of the "social background." A chapter on "the moral background" deals with the churches, education, literature, the cinema and the press, and is followed by a description of postwar politics. This contains little acknowledgement of Dr Adenauer—as does the whole book. But it does admit that the Social Democrats, for all their "preventive nationalism," could not have achieved more and had no coherent alternative policy.

The chapter on Franco-German relations and the concluding chapter both stress the fact that we are all members of one another and shall get "the Germany we have deserved." M. Grosser does not tell us what policy the West should pursue to deserve a better Germany than we have had in the past. But he has, in this book, given the general reader enough idea of some of the facts and forces at work to rid him of the customary clichés in which Germany is so often thought about. One may not agree with all his views. But he deserves thanks for a sober, serious, witty and factual approach to a complex subject, and for a reminder that we neglect the human side of politics to our cost.

Newly published

The Great Economists

by Robert L. Heilbroner

With two supplementary chapters on the post-war scene in Britain by PAUL STREETEN.

"It fills such an obvious gap that it is surprising one has not been written before. It is instructive and very readable. A most useful introduction to the lives and contributions of the outstanding economists."

Air Power

THE THIRD SERVICE.

By Philip Joubert de la Ferte.

Thames and Hudson, 274 pages. 21s.

THIS is a disappointing book. In his foreword, Sir Philip Joubert states that it "is intended as a study of inter-Service jealousies and the perils they incur, and as a warning to the British people..." This theme is highlighted in the few pages which deal with this subject in the epilogue, but the book itself, though interesting, is not sufficiently well documented to establish the author's case. The struggle for a separate existence for the Royal Air Force, he says, has gone on with hardly a pause since 1912. And now "the Navy is clamouring for the return to it of Coastal Command; the Army virtually controls its tactical air forces and it is to have its own Transport Command."

Some of this can be put down to inter-Service jealousy, but much of it is due to a fundamental ignorance of the nature and use of air power. Even Sir Philip is guilty of this in places. Not only does he talk about Bomber Command's "private war" but in Chapter XII, where he attempts to forecast the nature of a third world war, we read "The advent of the atomic age has produced no fundamental alteration in the role of the armed forces." Surely there is a fundamental change, namely that today the role of air power is to prevent a third world war from happening. Neither the navy nor the army can play any significant part in exercising this deterrent.

The real change that has come about with the development of thermonuclear weapons and the growth of Russian air power is that, while all three services will have conventional roles to play in cold, warm or limited wars of the future, the vital service in preventing global war is the Royal Air Force, operating in close collaboration with the American air force. Britain must have the finest possible Bomber Command with the most up-to-date aircraft operated by highly trained men. It must also have adequate fighters or guided weapons or both, not only to ensure that these deterrent forces are not knocked out by an all-out thermonuclear Pearl Harbour, but also to prevent a peacetime reconnaissance of the United Kingdom that would be an essential prelude to a surprise attack. Having thus provided our Sure Shield, we should then make the best possible use of our remaining resources to maintain small, highly-efficient, mobile, conventional forces for limited wars and police actions.

"Air Power is Indivisible"; if you divide it up you have aeroplanes but no real air power. This surely is the message and the warning for all to heed. Unfortunately, through trying to cover too much ground in a short book the argument is not clearly or forcibly developed and the result is superficial and unconvincing. The book will be read by service people, but it has neither the wider appeal nor the cogency necessary for it to fulfil its author's aim of being a "warning to the British people."

Canada builds world's deepest causeway

Crossing the rough, icy Straits of Canso between Nova Scotia and Cape Breton Island once meant a slow, drawn-out trip by ferry—when it ran. Now, on a massive causeway of dumped granite three-quarters of a mile long, 200 feet deep and with a base spreading 800 feet across at its deepest point, cars and trains can at last make their own way across the Straits; a constant, two-way stream of traffic bringing trade, tourists and increased prosperity.

Blocking the great depth of the Straits of Canso called for immense quantities of rock. This was taken from Porcupine Mountain which overlooks it. From there, the contractors, the Northern Construction Company and J. W. Stewart Limited, quarried 10 million tons of rock, 90 per cent of the rock drills were supplied by Atlas Copco. With this compressed air drilling equipment Canso Causeway was completed in the short time of twenty-eight months.

Protecting plants in Dutch nurseries

Compressed air is versatile. Atlas Copco provide the means for all its many applications. After competitive trials, a number of Ecco spray guns manufactured by the paint-spraying division of Atlas Copco are now being used in Dutch nurseries for spraying plants with insecticides. The guns, which can spray 15 ounces of insecticide in only 75 seconds, are driven by small Atlas Copco air compressors.

Atlas Copco puts compressed air to work for the world

Atlas Copco compressed air equipment is manufactured or sold and serviced in 50 countries throughout the World by *The Atlas Copco Group*, which includes:
UNITED KINGDOM: *The Atlas Diesel Company Ltd.*, Beresford Avenue, Wembley, Middlesex; SWEDEN: *Svenska Tryckluft AB*, Atlas, Stockholm 1; FRANCE: *Atlas Polar S.A.*, 29, Rue Marbeuf, Paris 8e; HOLLAND: *N.V. Holland-Atlas*, P.O. Box 6056, Rotterdam; ITALY: *S.A.M.P.A.*, Viale Marche 15, Milan; NORWAY: *A/S Atlas*

WHO LAID THE RAILS TO U. S. MARKETS?

European businessmen helped lay the rails to U. S. markets. Throughout the 19th century they financed a large part of the American railway system as well as other basic industries.

Today European businessmen are interested in reaching American markets on a greater scale than ever before, but there are many problems in selling products in the United States.

Banks abroad desiring to obtain a favorable position for their customers in U. S. markets are invited to use the facilities of Manufacturers Trust Company. Through our complete branch coverage in New York City and our thousands of correspondent banks throughout the United States, we are exceptionally well equipped to obtain data on local market conditions in the United States and to handle all types of banking transactions in this country.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Geneva's Over

Washington, D.C.

IN Washington there was both disappointment and relief at the outcome of the Geneva Conference. American leaders were disappointed because they had expected that the Russians would make a better offer in connection with East-West contacts and because they had hoped that Mr. Molotov would adhere to the principle, at least, of free elections for Germany. But if there had to be deadlock, they were relieved that Mr. Molotov was so candid about the Russian unwillingness to make any real concessions. The dramatic perils of splits in the western alliance that had been foreseen for the summit meeting and its aftermath had been avoided. American opinion was not so blindly excited by the prospect of international settlement that failure at Geneva produced an atmosphere of alarm, nor was the western front fractured by popular clamour in other countries for a softer response to Soviet approaches.

Mr. Dulles has, of course, come in for some criticism. But the old identity of disagreement with his views shared by three groups, diplomats from allied countries, independent American experts, and Democratic party spokesmen, has passed with its occasion, which was Mr. Dulles's addiction to war paint and verbal thunder. The first group was largely appeased by a tactic which baffled the American press and led to an odd episode in the reporting of the conference. This was the careful prearrangement with the allies which resulted in Mr. Macmillan and M. Pinay saying the tough things in the early stages of the conference, while Mr. Dulles laid stress on whatever common ground could be found with the Russians on the subject of European security. This manoeuvre had a double motive. It gave an appearance of reasonableness and flexibility to American policy, which absolved the United States from the part of tough ringmaster whipping its allies into line. It also

sounded an encouraging roll of drums for Mr. Molotov's delayed proposals on Germany, which would either make him feel he could not disappoint the crowd or, if he had nothing to offer, would produce an unmistakable anticlimax.

Some commentators, however, misunderstood the manoeuvre; reports appeared about Mr. Dulles's "unjustified

optimism," and it was strongly suggested that the advertising men in the Republican party were giving the Secretary of State a new look for reasons of domestic politics. Mr. James Reston, of the *New York Times*, complained before a congressional subcommittee that Mr. Dulles was making the press "an instrument of his policy," which of course he was doing but not quite in the way the press thought. Although the State Department's feelings were hurt, the outcome of this criticism was to the good, since American readers, warned not to be misled by Mr. Dulles's softness of tone, were not let down by the failure to reach agreement.

Mr. Dulles's second group of critics, a small but highly articulate group of American experts outside the State Department, of whom Mr. Walter Lippmann and Mr. George Kennan are the most distinguished, has

been thrown into almost unrelieved pessimism. To them Mr. Dulles's tactical restraint was as nothing compared with the "rigid, sterile positions without alternatives and without latitude for manoeuvre," by which, to quote Mr. Kennan, "the western governments are safely boxed in by walls of their own making." In this view Geneva would finally prove to the Germans that reunification could not be achieved through negotiations among the great powers; from now on, or at least from Dr. Adenauer's final retirement on, the Germans would seek to work out their own salvation by direct negotiation with the Russians and the East German regime.

It is not quite clear what alternatives Mr. Kennan has in

"Well, It Was Nice and Warm in July"

Herblock in the *Washington Post*

mind. Presumably they range from the offer of a security pact to Russia, regardless of whether United Germany opts for the North Atlantic Treaty Organisation, to the full-blooded neutralisation of Germany which Mr Lippmann has long favoured. Mr Kennan's thesis is being discussed anxiously among his former colleagues in the State Department. Everyone is agreed that the immediate effect of Mr Molotov's attitude was to solidify German membership of the western alliance. Some officials are inclined to accept Mr Kennan's longer term estimate, but the predominant view is that no government which succeeds Dr Adenauer's could accept anything like the present Russian conditions, and that the western position is stronger since Geneva, since it showed how bleak these conditions are. It is insisted, however, that the West Germans cannot be denied the right to negotiate with Moscow or with East Germany if they wish.

★

From the direction of the Democratic party have come various and uncertain sounds. Some of Mr Adlai Stevenson's advisers, notably the former Secretary of the Air Force, Mr Thomas Finletter, think that, in trying to promote the slogan of "peace and prosperity," American policy is becoming too soft, that defence expenditure is being kept too low, and that such offers as the President's plan for aerial inspection are dangerous because, if the Russians were to accept them, they might harm America. Others think the Democrats should advocate more tempting offers. Both Mr Stevenson and Senator Kefauver have tried to box the compass by deploring partisanship in foreign policy while characterising Republican foreign policy as a failure. Governor Harriman, in his zeal to outdo his rivals, proclaimed on Monday that "our national policies are confused and uncertain, our leadership is questioned, our alliances are creaking and American prestige has declined."

However, all this sound and fury rather loses its impact when the Republicans bow deferentially to the revered part-author of their policy, the Democratic Senator George of Georgia, who has already blessed Mr Dulles's performance. In developing foreign policy as an election question Democratic candidates will be much inhibited by the jealous primacy of the Senate in this field. The party's leader there, Senator Johnson of Texas, chose his first speech since his heart attack to declare that the Republicans had inherited Democratic foreign policy and that it would be absurd to make a serious issue of it.

One development, however, is everywhere recognised to be for the worse, the Russian incursion into the Middle East. The first reaction was incredulity that the Egyptians had not been bluffing when they threatened to play the Russian card; the second was something near panic at the thought of the "northern tier" being outflanked and the whole Middle East collapsing. A calmer mood has returned, but Americans are frankly puzzled about what to do. The first objective is to prevent a renewal of the Arab-Israeli war, which would mean a real defeat for American policy. Apart from that, the whole question of the proper American response to Russian economic initiative has yet to be resolved.

It so happens that this is the time of year when at roughly the same moment the foreign economic aid voted for the current fiscal year is being finally allocated and when the request for appropriations for the next fiscal year is being

drawn up. Mr Hollister, the conservative business man who was put in charge of foreign aid when it was brought under the wing of the State Department earlier this year, is trying to help balance the budget by withholding part of this year's allocation and cutting back the estimates for next. But there is an element within the Administration which urges that the engines be reversed and that an expanded programme of foreign aid be announced. The State Department is in two minds about this; it knows that it must not fall behind the Russian effort, but it wants to avoid getting involved in a "giveaway competition" in which the smaller powers can play the United States off against the Russians.

Moreover, it is not merely quantities that are involved—it is also priorities. After years of inducing backward countries to put first things first in their economic development, America does not want to see Russian money financing the flashy project that will appeal more to the imagination of the crowd; nor does America want to be forced to build the project itself in order to forestall the Russians. Furthermore, the State Department has not only to induce Congress to vote the money for more economic aid but to prevent Congress from voting the wrong kind of economic aid. The department is developing a strong conviction that the special schemes for getting rid of American surplus food, which are attractive to members of Congress, bring little credit to the United States from the recipients, who feel they are doing American farmers a favour, while the schemes cause much ill will among rival suppliers.

It is certainly to be hoped that the extent of President Eisenhower's recovery has not been exaggerated, since the decisions which have to be made now that Geneva is over are of a kind which must be made soon and can only be made by the man who is President.

Sedative from the Fed

THE recovery of the American economy from the shock of the President's heart attack has been even more satisfactory than that of Mr Eisenhower himself and now the chief danger for it, as for him, is over-exertion. That, at least, is the diagnosis of the Federal Reserve Banks which last week raised their discount rates, the interest charged to commercial banks when they borrow, for the fourth time since March. At 2½ per cent the rate is higher than at any time since 1934 and it may discourage banks from borrowing from the Federal Reserve as freely as they have in recent weeks, to fill the gap between the heavy demand for business loans, particularly from companies financing hire purchases, and the short supply of loanable funds. Banks are likely to become more selective in giving credit rather than to increase the interest charged to their best customers; the prime rate has already gone up twice this year, to 3½ per cent. But other money rates will probably stiffen; already this week short-term Treasury bills were sold at a price equal to a yield of 2.44 per cent and banks have raised the cost of loans to stockbrokers.

The renewed exuberance of the stock market, and the boom in both automobile output and Christmas trade, partly explains why the Federal Reserve authorities decided so suddenly to give the economy another dose of soothing

syrup; this had not been expected until after the Treasury had completed the refunding operation which falls due next month. Indeed, only two weeks ago it was rumoured that some relaxation of credit restrictions was being considered, largely because of the depressing effect they were having on residential building. However, it seems in fact to be building statistics which drove the central bank to act. A total increase of from 3 to 5 per cent in spending on

construction is forecast for next year, with non-residential building making up for a continued decrease in the number of new houses. On top of this came the latest survey, from the McGraw-Hill Department of Economics, supported by announcements from individual companies, showing that businessmen are planning to spend \$33.4 billion, 13 per cent more than this year, on new plant and equipment in 1956.

Such capital expenditure must be financed largely by borrowing, and carries with it a great danger of inflation at a time when men and materials are already becoming scarce and prices of industrial commodities are going up. But the Democrats argue that to put up the cost of borrowing money is to administer a knock-out dose to the housing industry, to small businessmen and to farmers, all groups with substantial numbers of votes in 1956. Government officials are to explain to Congress next week why they prescribed a sedative instead of the tonic which had been asked for; to non-politically minded observers, the prescription seems the right one for the American economy today.

Stevenson Turns Professional

WITH promises of support from influential Democrats as a prologue and a press conference and a full-dress political speech as epilogues to his formal announcement of his candidacy for the Democratic presidential nomination in 1956, Mr Stevenson managed to dominate the headlines for the whole of last week. This expert handling of his appearance on the stage, the first candidate to show himself officially, was accompanied by the appointment of several experienced professional politicians to direct his campaign. Among them is Mr James Finnegan, who has had much to

do with the Democrats' striking successes in Pennsylvania. Mr Stevenson's intellectual advisers, the devoted "egg-heads" from university incubators, are this time apparently to remain behind the scenes. This evidence that Mr Stevenson is now taking his political career confidently and seriously, that he intends to fight whole-heartedly for the Presidency, endears him to local leaders and Democratic machine minders, many of whom are now backing him as a likely, indeed, almost a certain, winner.

This is the type of support that can assure Mr Stevenson the nomination when the Democrats convene on August 13, 1956. But it is also the type of support that would disappear very quickly if he began to look like a loser. This is why he must make good in the popularity contests, called primary elections, which various states run for party hopefuls. In 1952, Mr Stevenson, waiting to be drafted by the convention, avoided these tests. He has now announced that he will enter the Minnesota primary on March 20th. His chances of victory there are excellent, for the leading Democrats in the state are enthusiastically behind him; but he is well advised to avoid the New Hampshire primary a week earlier, for there the party machine favours Senator Kefauver, who will probably be the next Democrat to announce his candidacy officially.

Mr Stevenson is already feeling the pressures which are another penalty of a long campaign—pressures to make him fight in the way certain Democrats, notably Mr Truman ("give 'em hell"), think he should, pressures to bargain for the help of particular groups—farm leaders, labour spokesmen, southern conservatives and others. If he resists these pressures, he may lose the nomination. But if he gives way to them, he may lose the election. For he would then be forced away from the moderation which still appeals to the main body of voters, particularly to the vital group of independents, as it did in 1952. As long as the present peace and prosperity lasts, and in spite of Governor Harriman's claim that "there is no such word as moderation in the Democratic vocabulary," it looks as if any Democrat who hopes to follow Mr Eisenhower into the White House ought also to stick to the middle of the political road.

Cause for Thanksgiving

THE shower of descents by deafened Cabinet Ministers and shivering presidential advisers upon muddy landing strips near Gettysburg and Camp David, during the week before the Thanksgiving holiday, gave almost as much publicity to the helicopter industry as it did to the rapidity with which President Eisenhower was catching up with the state of public affairs. The most concrete piece of information to emerge from these conversations and meetings was almost as good a cause for national thanksgiving as was the President's apparent ability to resume work just when it was becoming essential to have his views on such vital questions as next year's budget and the 1956 legislative programme. For the Director of the Budget, Mr Hughes, was able to announce officially the hitherto unconfirmed news that there was every hope that the budget would be balanced in the current fiscal year, ending next June 30th, as well as in the coming 1956-57 year.

It was particularly encouraging, for the taxpayer, at least, that this statement did not come until after the failure of the Geneva conference, and that it was accompanied by assurances that this failure was not expected to bring any increase in defence spending. The figure for next year is being put at about the same as for 1955-56, some \$34.5 billion, out of a total budget of around \$63 billion; the Administration is congratulating itself on having worked out a long-term programme for maintaining the country's military strength with no need for sudden spurts from fright. The Secretary of Defence has, however, suggested that spending on armaments may be pushed up in future years if the national income continues to expand.

It is this year's economic expansion which explains why the prospect of a deficit next June, put at \$1.7 billion only three months ago, is now vanishing. During the first third of the current fiscal year, tax revenues were running ahead of the same period in the previous year by \$1.4 billion; this is almost as much as the total increase predicted officially for the whole of the year. Unfortunately spending was also running higher than last year, although, according to the estimates, it should have been lower; but Mr Hughes believes that outlays can be kept down if government departments make determined efforts. He refused to commit himself on the question of a tax cut next year. But if the current budget is really balanced, it would require a great deal of austerity for the President not to ask for a reduction, and an unimaginable amount of restraint for Congress not to insist on giving the voters this reason for gratitude in time for the election.

Teachers Wanted

FROM A SPECIAL CORRESPONDENT

WHEN the 2,000 delegates to the White House Conference on Education meet in Washington next week, they will be discussing some of the most urgent questions in the United States today. Among them will be the shortage of teachers; this is put at 100,000 now and will, it is estimated, grow to 300,000 by 1960 unless effective remedies are found. Poor pay has reduced some teachers to driving taxis or tending petrol pumps in their spare time; it has discouraged entrants into the field, to the point where the number of new teachers just balances the number who leave the profession annually through death, retirement, or change of jobs. Yet the school population will increase by well over 20 per cent in the next five years.

The shortage is worse in the elementary schools and here other considerations besides low pay are undoubtedly involved. It is perhaps no longer common for teachers to be expected to live like Puritans while being treated like pariahs. But the prestige of teachers remains low, in spite of a massive campaign in their favour over the past few years, and an increasing realisation of their crucial importance to society. Many a university professor, advising his students about careers, treats the occasional would-be teacher almost as if he or (usually) she were choosing the life of a missionary to a tribe of cannibals. Even with some improvement in teachers' pay, to end the teacher shortage

may require a revolutionary change in public attitudes towards the profession.

The lack of qualified teachers casts its shadow over all the current controversies regarding children's schooling in the United States. There has been a spate of books, articles and speeches criticising the schools, including Mr Rudolf Flesch's *Why Johnny Can't Read*. Their special target has been the "educationists", instructors and administrators of the teachers' training colleges, who are alleged to be an all-powerful oligarchy devoted to the advancement of anti-intellectualism under the guise of progress. The critics have sometimes argued from isolated horrendous examples as if they were typical, and have assumed a far closer relationship than really exists between the current writings of educational theorists and the actual practices of the schools. They have blamed the educationists too much, and the anti-highbrow and pragmatic traditions of the American public too little. The defence, on the other hand, has often talked as if any critic of current methods in the public (i.e. state) schools was *ipso facto* an enemy of publicly-financed education, a sinner against the democratic heritage, and an educational reactionary, ignorant of the facts of child psychology.

There is no doubt that the concept of the "child-centred" education dominates the elementary school world to-day. To the critics, this means that teaching discipline is being watered down in deference to an excessive concern for the child's social adjustment. They maintain that basic skills are neglected; they are critical of the widespread practice of keeping no child back from promotion to the next class at the year's end, no matter how inadequate his performance, and of the reports to parents which stress the child's individual progress instead of comparing him with other children of the same age.

To all such charges there are, of course, answers. Standard disciplines were meaningless to many children; the modern "core" course, which combines many kinds of study in an integrated whole, and which emphasises problems and situations taken from the child's own immediate experience, is more likely to arouse real interest in the pupil. Automatic promotion arises from the discovery that children who were "kept back a year" under the old system usually learned even less the second year than the first, and certainly less than they would have acquired by moving on with their classmates. The modern report card is defended as taking into account individual differences in background and aptitude.

Upon the general argument, that mass education has so far meant mediocre education, that the gifted child is too often neglected under present conditions, there is, however, much soul-searching. Several answers have been tried. The unusually gifted child can be allowed to skip a class now and then, and so finish faster; this is the oldest method, and has obvious shortcomings since physical growth and social adjustment often do not keep pace with mental growth in such cases. Alternatively, special sections can be set up for children of high Intelligence Quotient. Of this the commission was wary; such separation is often held to be undemocratic, and to encourage an unfortunate snobbery among the favoured ones, as well as jealousy and feelings of inferiority among the rest. Actually, it would take more than the dividing of classes on the basis of intellect to shake

How to get your share of the BOOMING U.S. MARKET

American Industry is now at the highest point of production in history—and is still climbing. Not only is this expanding market bigger in size, its consumption and capital equipment replacement rate is, per capita, far greater, too.

Even a fraction of this market could represent a substantial business for you.

So if your product is being sold, or can be sold, to American business and industry, your prospects have never been brighter than they are now—IF you go about it the right way.

For in America goods are not so much bought as **SOLD**—this means that sales and distribution must be backed by consistent and aggressive advertising in those business publications which your customers read. In America business publication advertising automatically means McGraw-Hill.

McGraw-Hill is the leading publisher in the United States of business and technical journals—34 in all—covering practically every field of industrial endeavour. And every journal is by far the leading one in its field—with many tens of thousands of subscribers who **BUY** through its pages. But McGraw-Hill's service does not end there. It also offers vital information—such as the market potential for your product... how to go about establishing your sales and distribution organisation and so on.

So why not have one of the London McGraw-Hill men show how you can gear your sales programme to today's opportunities? He has access to a wealth of specific and helpful data on your product market. His job is to make it freely available to you. Write or phone today. No obligation, of course. If you would like additional evidence on the long-term outlook for business write for a free copy of "The American Economy... Prospects for Growth."

the American school child's conviction that excellence in studies is at best an achievement of the third rank, well behind athletic and social skills. But no doubt many a school board, fearful of popular protests, or simply not equipped to organise separate sections in each class, would rather attempt the commission's third alternative. This is to "enrich" the curriculum for the gifted by giving them bigger and more challenging assignments, encouraging them to take extra courses, and dealing with a class as individuals or in small groups related to ability, rather than as one mass.

The point has often been made that progressive methods of education would work well if all teachers were as good as the best, but that in fact they put too much burden upon persons of routine abilities. Merely to glance at the manifold tasks that the modern elementary school teacher is expected to undertake is to realise how impossible it is for most teachers ever to achieve this ideal combination of mother, tutor, social adviser, psychiatric counsellor and spiritual guide. Now, with the shortage of teachers of any calibre reaching such alarming proportions, the hope for giving real opportunity to the best as well as to the average intelligence must inevitably seem dim.

Clearing the Air

FROM A CORRESPONDENT IN CALIFORNIA

IN Los Angeles, in contrast to London and Manchester, November brings an end to the annual smog season. From now until next July, citizens of the once "sunkist southland" will no longer listen each day for the routine forecasts of "Smog Green" or "Smog Red"; the latter means fume-filled fog with badly irritated eyes, poor visibility, possible hazards to health and to crops, and generally exacerbated tempers. The 1955 smog season has been the worst since 1947, when standards of measurement were first established. And there is an uneasy conviction that smog will, in the next few years, get a great deal worse before it becomes even a little better.

Since July, 1955, the Air Pollution Control District, a super-governmental, county-wide body created by state law in 1947 to solve the smog problem, has found it necessary to establish a procedure of declaring first, second and third stage alerts. A first alert indicates that smog concentration is approaching the maximum allowed before preventive action is required, while a second alert indicates that a smog-induced menace to health actually exists in its preliminary stages. A third alert comes when the menace is dangerous; as yet no second or third stage alerts have been declared, although a number of the thirteen first alerts have closely approached the danger level. Thus it has not yet been necessary for the District to order more than a ban on the burning of rubbish in outdoor incinerators or open fires; it has the authority, during third alerts, to shut down all industry and stop all vehicular traffic. The smog has had other farther-reaching consequences. Residential areas out of the smog belt have become more and more desirable and valuable, and political reputations in city and state have been made and broken, sometimes unfairly, because of the demands that the problem be solved.

Smog is, in fact, a misnomer, for the haze which hangs so irritatingly over the Los Angeles Basin, between the

mountains and the sea, during the summer months. As Dr De Voeur, the originator of the term, defined it to describe London conditions in 1905, smog was a combination of man-made smoke, primarily from the burning of soft coal, and England's natural fog. Los Angeles' version of smog is quite different. Practically no soft coal is used in southern California and the fog only begins to roll in from the Pacific Ocean long after the smog season has ended. Los Angeles' smog appears to come from a complex of many pollutants thrown into the air in a variety of ways. There is general agreement on only one point—that the smog occurs mainly when the area is affected by a combination of temperature inversion, weak winds and sunshine.

During these periods of inversion, higher altitudes are warmer than lower ones and thus the polluted air, unable to rise, hangs motionless like a blanket over the city. The weak winds do not blow the air out of the basin and the sunshine then acts chemically on the pollutants accumulated under the warm layer to create still more airborne irritants. But the sources of the pollutants are still almost as obscure as the outlines of the huge city under the greyish-brown cloud which now envelops it so frequently.

★

At present, there are three major suspects accused of throwing more than forty foreign substances into the air: industrial operations, motor vehicle exhausts and garden incinerators where household rubbish is burned. But, as yet, no accurate determination has been made of the relative importance of these three or of ten more possible minor sources of air pollution; these include dust clouds from turkey farms and matter thrown into the air from the daily abrasion of millions of rubber tyres against thousands of miles of city streets. Indeed, there is not even any exact assessment of blame within each category of suspect. The oil refineries claim that they are only minor offenders, a claim just as assiduously asserted by all the many other fuel consuming or producing industries in the area.

Even though never before in the world's history has air been measured so frequently, in so many places and with as many instruments as it is at present in the Los Angeles Basin, the authorities have been forced to act before they have complete knowledge. While research goes on, in co-operation with industry, restrictions have been placed on new industrial operations which will pollute the air; some 2,000 plants are inspected every month; there is a law covering smog control devices, and an educational campaign for the public. For the future, the Air Pollution Control District hopes to plan new industrial sites in accordance with meteorological knowledge of wind currents, to eliminate outdoor incinerators by substituting additional municipal collections, and to prevent automobiles from being registered in the area if they do not have a contrivance for reducing pollution from their exhausts.

However, it is obvious that the District will be opposed by some segments of industry. Even now, its right to refuse a building site is being challenged in the courts. But as the air grows hazier and hazier, the threat to the community grows clearer and clearer. And under pressure from its citizens, whose tempers have become as irritable as their eyes, the politicians will eventually be forced to press for either voluntary or enforced solutions of the problem. To the community at large, hardly any solution could be nearly as noxious as the present air itself.

The World Overseas

Double Jeopardy in Nepal

THE young King Mahendra of Nepal, who succeeded his father only last spring, has already had to warn his country's numerous political factions that they had made democracy a "laughing stock" since the authoritarian rule of the Rana clan collapsed in 1951. India, which presided benevolently over the ousting of the Ranas and the inauguration of constitutional monarchy in Katmandu, and has become accustomed to provide political advice as well as economic and military aid for Nepal, is openly concerned about the present situation, which presents two linked dangers. One is the threat of a fresh breakdown of internal order in the Himalayan kingdom, which is larger than England and geographically more divided than classical Greece; the other, political infiltration, either suave or violently subversive, from Communist China, which has now consolidated its military occupation of Tibet. Peking's professed loyalty to the "five principles of peace" may be reassuring for Indian public opinion, but does not blind responsible Indians to the need to keep a wary eye on the buffer state which shields India's heartland, the Ganges valley.

In recent months the young king has had to exercise personal rule, because the rival leaders of Katmandu cliques—none of which really deserves the name of party—had resisted all his efforts to bring them together into a representative government. On the eve of his departure for the tour of India which he has been making this month—a fortnight ahead of the Soviet leaders, and with much less imperial pomp—he obtained a provisional agreement for the setting up of a three-party ministry, but even then he was forced to postpone any formal decision until after his journey. Nor were the circumstances of this belated coalescence between rival politicians at all happy. There was an obvious link between their sudden readiness to work together and the equally sudden reappearance in their midst of a man whom most of them fear, Dr K. I. Singh.

Dr Singh has spent the last three and a half years in Peking. He fled into Tibet in 1952 after failing to seize power by a coup which the Indians helped to frustrate. Up to that time he had been an outstandingly bitter critic of Indian influence in Nepal. Although a price had been

put on his head, he was pardoned the moment he returned from China in September, and he lost no time in launching an uninhibited political campaign, starting with the largest political meeting Nepal has ever seen. The reaction of some Katmandu politicians was to beg the King to confer power upon them at once—before Dr Singh's bandwagon began to roll; the reaction of others was to climb on to it. Dr Singh is a national hero in many Nepalese eyes because he opposed the Rana regime so stoutly, and in some because he also attacked Indian tutelage. He is now proclaiming himself utterly converted to friendship with India and exuding gratitude for Indian aid; but neither the Indians nor the more sophisticated Nepalese are wholly convinced that this is a genuine conversion.

Dr Singh was never known as a Communist or sympathiser, and denies that he is one now. But he was an honoured guest in Peking, feted, on one occasion, as a "public leader" of his country alongside the emigré Siamese ex-premier, Pridi—a somewhat ominous parallel; and it would seem probable that the Chinese have returned him to Nepal now in full confidence that his influence there would be to

their advantage. His reappearance has set the Indians a really difficult puzzle. Dr Singh's position may now become so strong that the King will have to take him into a new government—after which he might gradually switch to an overtly pro-Chinese attitude; but if he is kept out of power, he may foment unrest and separatism in the less accessible parts of the country, as he did before 1951, and thereby throw Nepal back into disorder. If King Mahendra, who is as sincerely concerned to make Nepal democratic as the Indians are (and who has also shown himself a decidedly shrewd young ruler), has been asking his Indian hosts for advice during his three-week stay with them, they must have found it difficult to offer any very precise suggestions. Meanwhile, Dr Singh himself has been stumping his country, has formed a new political party and has outlined a programme of radical reforms and promises of rapid economic progress. The only subject on which he has proved reticent is what he saw in China and Tibet.

Cartel Compromise

BY OUR SPECIAL CORRESPONDENT

PROBABLY the most difficult piece of unfinished business inherited by M. Mayer when he became president of the High Authority of the Coal and Steel Community was the fact that "Georg" (for the Ruhr) and other coal-selling arrangements still flourished in flat contradiction to the terms of the treaty.

Article 65 of the Schuman Plan treaty forbids all agreements, decisions, and concerted practices which impede the normal operation of competition within the common market, and, in particular, proscribes arrangements which fix or influence prices, restrict production, or allocate markets, products, customers or sources of supply. Given the clear language of the treaty, the High Authority might, at any time, have acted against the coal sales agencies and simply announced that unless they ceased violating the treaty the penalty provisions would be applied.

The High Authority chose to avoid a head-on collision and, by negotiation, to persuade the principal offenders to modify their practices so that the High Authority could find that they conformed to the treaty, which permits specialisation and joint buying and selling arrangements that have the effect of improving production and marketing without impeding competition.

At the Common Assembly meeting last May, Herr Etzel, the vice-president of the High Authority, outlined the arrangement with Georg (the most important of the sales agencies) which the High Authority was then confident would be found acceptable. But during the summer and autumn, with its position bolstered by the strong demand for Ruhr coal, Georg continued to press for more favourable terms. Faced with the fact that not only the coal industry but also the trades unions and the German government felt that in the tight market situation Georg was an indispensable stabilising and rationing device, the High Authority must have been tempted to leave the nettle ungrasped.

The statement made on Wednesday before the Common Assembly in Strasbourg indicates that a settlement is once again in the offing. Georg will now be split into three selling agencies, rather than the six forecast in May. As in the earlier proposal, selling in common, now by a

jointly run central sales bureau, will be permitted for sales to large purchasers, like the railroads, who buy more than 48,000 tons of coal a year. The most important new wrinkle is that the three sales agencies may now request the central bureau to act (subject to the High Authority's veto) in a period of *près penurie*, which appears to mean in a situation such as the present when there is no absolute shortage of coal but a large unfulfilled demand for Ruhr coal and substantial imports of expensive dollar coal.

The new arrangement will not mean competition in the present coal market, when every ton of Ruhr coal can be sold without difficulty at the ceiling price. But it does mean that the actions of the new sales agencies and the central bureau will be subject to continuing scrutiny by an impartial body and that the possibility (however slight) of competition will exist in a buyers' market. Some will consider this a small mouse for almost three years' labour. But, as the impeccable behaviour of Georg during the period of negotiation has demonstrated once again, the restraint of publicity can be a real one.

Coal from the Chindwin

FROM A CORRESPONDENT LATELY IN BURMA

THE Burma Government's decision to engage the services of a British firm to help develop the coalfield at Kalewa brings a familiar dream one stage nearer to realisation. It has long been known that there was coal at Kalewa, but its exploitation has been obstructed by three things: its poor quality, which made it a wholly uneconomic proposition in the prewar days of cheap coal; the Communist and other rebellions that have ravaged postwar Burma; and the difficulty of moving it out of the remote north-west. Kalewa lies well up the Chindwin river, on the route from India by which the 14th Army re-entered Burma in 1944.

Ever since independence, the government has had the coalfield high up on its development programme. A reconnaissance was made in 1948 by Dr Ba Thi (now Director of the Burma Geological Department), who found 30 seams about 4½ miles west of Kalewa. Nothing followed because of the rebellions. In November, 1951, an investigation at Kalewa was made by a geologist of the "KTA" group of American specialists, whom Burma had engaged to survey the country's resources.

The KTA report (August, 1953) gave a guarded recommendation in favour of exploitation. The potential yield was estimated at 750,000 tons per annum. The best mine would be exhausted in 17 years, the second site in 34 years. It would entail four years' work to get the area ready. It reported adversely on the quality of the coal, finding that its

friability "precludes its satisfactory use as a hand-fired fuel for most industrial purposes," but that it might be used in furnaces or in briquette form on the railways. KTA estimated that Kalewa coal could only be put on sale in Rangoon at a price about £1 per ton above the price of imported Indian coal. It therefore urged that, complementary to any development at Kalewa, a Burmese "Ruhr" should be created nearer to the field, at Myingyan, near the junction of the Chindwin with the Irrawaddy. Time has shown that almost all the KTA proposals erred on the side of optimism. A mission sent to Burma by the International Bank in 1953 was especially scathing in its comments on plans which relied on the interdependence of industries that might or might not take shape.

However, the government of Burma has continued with its plans. Prospecting and drilling have reached an advanced stage; a small drift mine, intended mainly for training purposes, has been yielding 20-30 tons a day. The coal has been successfully used in boilers with mechanical stokers, and, mixed with Indian coal, the best screened Kalewa coal has been proved usable on the railway. A project has been worked out (partly by a UN mining consultant) for two collieries to work the main seam, producing 500 tons a day of mine coal from each unit giving a total of 300,000 tons per annum—enough for Burma's railways, river shipping and electric power stations. The cost of the project is estimated at two crores (£1½ million) spread over three or four years.

Certain problems have not yet, however, been squarely faced. First, where will Burma obtain the 1,000 miners and skilled technicians that will be needed? Mining is notoriously hard and unpleasant, and Kalewa is regarded by all Burmans, with much reason, as the last place on earth to settle in. Personnel problems in the relatively pleasant government textile factory at Rangoon have been almost insuperable. Kalewa may prove a practicable proposition only if Indian or Japanese labour—and technical skill—is imported. Secondly, the Chindwin is almost un-navigable in the dry season: its draught is some two or three feet, and there are shifting sandbanks. Very special craft will be needed to transport the coal—even if the Myingyan project should materialise. Transport costs are likely to be even higher than KTA suggested; but this aspect of the problem does not appear to have been very thoroughly considered—possibly because it comes under a different ministry.

Kalewa, for all its potential value to Burma, has all along been handled too much as a matter of national (and much more of ministerial) prestige. It may yet turn out to tie up valuable men, materials and effort to little purpose.

Holland's Open Economy

FROM OUR CORRESPONDENT IN HOLLAND

IN recent weeks a note of mild anxiety has crept into official comments on the Dutch economic outlook. Some cautious steps have already been taken to nip in the bud the inflationary symptoms that have appeared. Nevertheless the balance of payments picture, which is all-important for a country as dependent as Holland is on foreign commerce, is still remarkably healthy. This is remarkable because in the past eighteen months Holland has moved

swiftly towards a position of freedom of exchange and liberalisation of imports that makes it one of the most open economies in Europe.

Great strides have been made in freeing Holland's dollar imports from discriminatory controls; dollar goods can now be imported virtually as freely as goods from the rest of the OEEC area. Yet officials in The Hague are convinced that this process of dollar liberalisation has not only been healthy for the Dutch economy, but has also been absorbed without too much difficulty.

It is clear, however, that once the barriers were removed Dutch industrial and private consumers indulged in a modest dollar buying spree. The figures show that the proportion of Holland's imports coming from the dollar area has risen more steeply than that from other areas. But with prosperity breaking out all over, Holland's propensity to import, particularly raw materials, was bound to be high; for instance, imports of cotton from America have risen steeply. Moreover, the new freedom to import materials from the dollar area happened to coincide with a period when other areas were experiencing growing difficulties in supplying Holland's requirements of both raw materials and manufactured goods. Items such as coal, chemicals, carbon black, cellulose and steel, for instance, were readily available from America—and, moreover, at cheaper prices and earlier delivery dates. Another substantial factor behind the increase in dollar imports was the switch from Argentinian to American grain as a result of the former's export difficulties. The tendency of the crop of American-owned subsidiaries set up in Holland after the war to import raw

materials and semi-manufactured items from their home sources of supply also helped to step up dollar imports. And, finally, dollar liberalisation enabled Dutch manufacturers to replenish their stocks, which, during the period of dollar shortage, had been unduly low.

On the other hand, dollar liberalisation has not led to a large increase in manufactured consumption goods. The official explanation for this is that dollar exports of this category were, in contrast to raw materials, uncompetitive in price, and also that the Dutch passion for saving mitigated the potential demand.

It is thought in Holland that many of the factors making for the increase in dollar imports since liberalisation are likely to prove temporary. But, while a return to a more normal pattern of imports would be welcomed, the official view is that the policy of dollar-liberalisation has been

triumphantly proved by the trend of Holland's gold and dollar reserves. Far from declining, as might be expected, these have actually increased. This is due not only to Holland's favourable balance with other OEEC countries, but also to the export of dollar capital to Holland, in particular the selling of Dutch securities in America. Nevertheless, no one is complacent about the balance of payments problem, for it takes only a relatively minor set-back in world trade to create for Holland serious economic difficulties.

South Africa's Small Brother

BY winning 16 out of the 18 seats contested in last week's general election, the Nationalists, who are a branch of the governing party in the Union of South Africa, have increased their domination of the South-West African legislature. Yet although in every constituency they added to their votes, it would be unwise to assume that the 26,000 white electors in the territory are wholehearted supporters of Mr Strydom. In fact, it is largely their knowledge that the Nationalists hold big brother's purse strings that accounts for the party's strength in the former German colony.

But the South African Nationalists were determined to leave nothing to chance. They mounted an impressive election campaign, bringing in such "big guns" as Dr Verwoerd, the Minister of Native Affairs; and at a strategic moment the Minister of Railways, Mr Schoeman, arrived to announce a new programme of railway development in the territory that will cost £5½ million. But it was a sheer stroke of luck that the United Nations Assembly should decide to debate South-West Africa and thus afford the South African delegation the opportunity of staging a melodramatic walk-out in protest against allowing the Rev. Michael Scott to give evidence on behalf of two of the territory's African tribes. This action is strongly approved by all the white voters in South-West Africa.

But the opposition was, in effect, beaten from the start. The South-West United Party received only token support

from its South African counterpart. It was forced to build its small hopes of doing better than at the last elections, when it gained only three seats, on the discontent that certainly exists in spite of the prosperity that has come quickly to South-West Africa. Its exports, for example, have in recent years grown at a rate of more than £1 million a year and last year totalled £36.8 million. Minerals account for almost half of the total, and next in importance is the karakul

(persian lamb) industry which in 1954, a relatively bad year, accounted for earnings of foreign exchange worth £3.8 million. A brisk trade is done also in the export of meat

and butter to the Union; the territory at present supplies something like a quarter of the Union's butter supply. On the coast, a most profitable fishing industry has been established. Yet in spite of the recent progress many people are convinced that only the surface of South-West Africa's wealth, mineral and other, has been scratched, and there are many who blame the Union for not doing enough to speed this development.

Lack of communications is one of the chief hindrances to further progress. Many people accuse the Union of dragging its feet in railway development, and it is true that the railway and road systems scarcely exist over large tracts of the territory. Mr Schoeman's announcement of a new deal for South-West Africa's railways could not have been more timely. But there are complaints also from the farmers, particularly from karakul breeders. Fortunes have been made out of the sale of pelts to world markets, which draw nearly half their total supplies from South-West Africa. In recent years, however, the karakul sheep has been introduced into South Africa, where, to the dismay of the South-West Africans, it has flourished and multiplied. The Union government is blamed for not regulating more carefully this expansion, which threatens the prosperity of the territory.

With the growth of South-West Africa, however, the local Nationalist party, in spite of the grumbles about the Union government's policies, has been gathering strength. At one time it was thought that the German-speaking element, which comprises 22 per cent of the electorate, would turn against the Nationalists, because they feared the consequences of incorporation into the Union as a fifth province; for most people, and not only the Germans, fear that incorporation would mean paying the higher taxation that rules in South Africa. But whatever might be Mr Strydom's ultimate objective the "fifth province" cry was not raised at the recent election. The fears of the German-speaking community about their language rights were put at rest shortly before the election by an announcement that a commission would be appointed to consider means for protecting their rights.

With four senators and six MPs in the South African parliament the handful of white voters in South-West Africa have little to grouse about in the matter of political representation. But Mr Strydom and his colleagues well realise that South Africa's young brother is rapidly growing up, and, moreover, is beginning to have a mind of his own. The price of buying his respect and support in the future is certain to grow.

Mexico's Sanctuary for Exiles

FROM A CORRESPONDENT IN MEXICO

MEXICO has extremely strict laws to control immigration; paradoxically, however, it is one of the most hospitable of Latin American states in granting asylum to political exiles. At the time of Colonel Castillo Armas's successful revolt against the Arbenz regime in Guatemala last year, the impassive correctness of Mexican behaviour displeased Guatemalan anti-Communist extremists. In addition to the discomfort of having to harbour Colonel Arbenz and some of his henchmen in his embassy, the

Men who guide the destinies of the world wear Rolex watches

THERE is a small group of men whose names will live on. Their faces and voices are overwhelmingly familiar. In the newspapers, on television, on the radio, the impact of their personalities is inescapable. So is the impact of their words and actions on our lives.

It would not be fitting to mention their names, for they include royalty, the heads of states, great service chiefs and statesmen. But next time you see them or their pictures, look at something you might normally overlook—the watch on their wrists. That watch will most likely have been made by Rolex of Geneva.

We are proud that Rolex watches serve so many eminent men. Accustomed though they are to the very best, they often express amazement at the accuracy and dependability of Rolex. We are pleased that they soon take it for granted.

Every Rolex Oyster Perpetual Datejust is a chronometer. This means that it has been submitted to a Swiss Government Testing Station to undergo strict accuracy tests, and has been awarded an Official Timing Certificate. And every Datejust gains the coveted distinction "Especially good results." The watch is powered by the new Rolex Perpetual "rotor" self-winding mechanism that keeps the tension on the mainspring constant, making for constant accuracy. The date is shown on the dial, changing automatically each night at midnight, and magnified by a "Cyclops" lens for easy reading. The mechanism is protected, permanently, from all harmful elements by the famous 100% waterproof Rolex Oyster case.

Thirty-five years of watchmaking progress are contained in the Rolex Oyster Perpetual. In 1910, Rolex produced their first Officially Certified Chronometer. Now they have produced 250,000 chronometers—three times as many as the rest of the Swiss watch industry. The first truly waterproof case in the world, the famous Oyster, was invented by Rolex in 1926. And in 1931 Rolex invented the first "rotor" self-winding mechanism. A new refinement of this Perpetual "rotor" powers the Oyster Perpetual, silently and automatically, actuated by every slightest movement of the wrist.

Mexican Ambassador to Guatemala endured many insults. Even when Arbenz and his associates had been safely escorted to Mexican soil, the Guatemalan authorities made every attempt to obtain the extradition of those who they claimed were common criminals. However, in spite of the dossier of atrocities allegedly committed by Arbenz's police chiefs, Mexico stood firmly by the principle that those who had claimed asylum were first and foremost political refugees. This decision did not pass uncriticised in Mexico, but the government refused to abandon the principles of asylum as interpreted throughout Latin America—principles dramatically illustrated in recent weeks by the journeys of General Perón.

A man who knocks on the door of a Mexican embassy need only show that he is a victim of political persecution in danger of imprisonment or execution. The mere fact of his being a fugitive entitles him in Mexican eyes to protection which is normally granted on the condition that the refugee refrains from any political activity. When ex-President Arbenz attempted to organise a press conference in order to obtain publicity and probably to excite anti-American feeling, the government swiftly prevented this abuse of the sanctuary granted to him.

Café Society

The most spectacular example of Mexican hospitality to those in distress has been the welcome given to Spanish Republicans who fled from Spain in 1939. It is estimated that some 20,000 Spaniards and their families were admitted. Very few of them have accepted Franco's amnesty and returned to Spain. Most have settled down to a new life despite very difficult circumstances—for many of them arrived penniless. Such refugee Spaniards have lost all desire to return permanently to Spain. A celebrated Spanish composer was recently approached by a travelling propagandist from the peninsula: "Come back," said the propagandist, "the Generalissimo has forgiven you." The ex-refugee replied: "I am a Mexican citizen now. And tell the Generalissimo that I have not forgiven him."

There is, however, another smaller but more vociferous group of Spanish refugees who have not given up the struggle. And the fact that so far Mexico has withheld recognition from the Franco government has encouraged some ardent Republicans in their dreams of returning in triumph one day to Madrid. Although an unofficial agent of the Franco government is allowed to live in Mexico, and commercial relations with Spain have been ensured by bilateral agreements, the Mexican government still recognises the enfeebled cadre of the "Spanish Republic Government in Exile" and allows it to "function" in a decaying mansion in Mexico City. The die-hard Republicans (among whom there are a few active Communists, who are occasionally bundled into jail for a day or two) are still to be found every day, and almost all day, sitting over coffee in the smoke-laden atmosphere of the *Café Campoamor* and other congenial haunts.

The list of political refugees who have found shelter in Mexico during the last twenty years is a long and colourful one. Trotsky lived unmolested and largely ignored by Mexicans in a fortified house in the suburb of Coyoacán until the long arm of Stalin's secret police struck him down in 1940. His murderer, the mysterious Jacques Monard or Frank Jackson, is serving a 20-year sentence in the Mexico City jail, his life saved by the fact that there is no death sentence in the Federal District. Rómulo Gallegos,

ejected from the presidency of Venezuela in 1948 by a military *putsch*, has resumed his life as a novelist, associating freely with the Mexican *literati*. General Pang Tsu Mow, accused of misappropriating official funds by the Chinese Nationalists, now lives quietly in the luxurious weekend resort of Cuernavaca. Anti-Communist Poles have created a flourishing dairy-farming community. An element of political sympathy sometimes creeps in; it was a left-wing government, for instance, which threw open the doors to the Spanish Republicans. Nevertheless, having itself suffered from violent civil warfare in this century, Mexico now seems eager to set an example of tolerance to other Latin American republics; there are no Mexican exiles today.

NOTES FROM CANADA

(These Notes are Contributed by Our Correspondent in Ottawa)

Liberal Cabinet's Twentieth Birthday

CANADA'S Liberal Government held no public celebration this autumn in honour of its 20th anniversary of uninterrupted office. But the two remaining Ministers who have been in office throughout this period no doubt made a private salute to themselves or the patience of the Canadian people or some pet object of private veneration. Mr C. D. Howe, now Minister of Trade and Commerce and of Defence Production, joined Mr King's Cabinet after the defeat of Mr R. B. Bennett's Conservative government on October 23, 1935. Mr J. G. Gardiner joined as Minister of Agriculture on November 4, 1935, and has held the same portfolio ever since. Mr Gardiner is approaching his 72nd birthday, Mr Howe his 70th. The Prime Minister, Mr St Laurent, is 73.

Between these three veterans and the rest of the Cabinet there is a considerable gap of age and experience which may partly account for the uneasiness of Cabinet relationships which is now being increasingly reflected throughout the government machine. For five or six years after Mr St Laurent became Prime Minister in 1948, the Cabinet enjoyed an almost preternatural sense of unity and well-being. Nobody would claim that for it now. In the view of most political observers it cannot yet be assumed that the electorate is losing confidence in the Government, and most Liberals think they are safe so long as they have the avuncular charm of Mr St Laurent to embrace the party. But the results of recent mid-term by-elections have been disappointing to the Government, and some people think it significant that a Cabinet vacancy has been filled by doubling up portfolios rather than risking another by-election in Quebec.

★ ★ ★

Defence Dilemmas

A SERIOUS examination of next year's defence estimates has just been started in Ottawa. Canada has not yet taken up any position in the difficult argument about establishing an integrated air defence system in Western Europe. But in the pressing terms of next year's budget some decision will have to be reached about the Canadian attitude to the extension or termination of the Nato infrastructure programme. Its extension might involve Canada, as well as the United States, in the form of defence aid which is least politically acceptable—straight dollar grants without detailed

power of supervision over their spending. On the other hand the military arguments for integration are impressive, at least to military men here.

A somewhat similar conflict arises over the projects now being executed for the air defence of North America. Politically Canadians can find almost as many objections as any European to the manning of defence installations by Americans. Militarily nothing but the most complete integration of North American defence makes any sense. There has been recurrent discussion in the press about the desirability of bringing back Canadian troops and RCAF formations from Europe in order to take over a greater share of the northern defence installations. But Canadian strategic thinking is impressed with the psychological importance of maintaining the Nato front in Europe. In the long run Canada will probably find itself practising the doctrines of Nato solidarity which it preaches. Northern defence will remain a shared responsibility of Canada and the United States, and Canadian forces will stay in Europe even if it is for their psychological rather than their military effect.

* * *

A Mug's Game with Wheat?

MR C. D. HOWE, who is the Minister responsible for the Canadian Wheat Board and its marketing policies, has made an impressive case to western farmers for the present policy of maintaining prices and trying to persuade the United States Government not to demoralise the world wheat market any more than its political necessities imperatively demand. But the farmers are naturally restive. With elevator capacity overflowing, they cannot deliver their stocks of grain to the local elevator where they get paid for it. They have been offered a Government scheme for guaranteed bank loans up to \$1,500 at 5 per cent on the security of their farm-stored grain; but many of them want the Government to carry the responsibility of selling their wheat and pay them for it anyway.

This demand is inevitable when American farmers just over the border get a higher price per bushel than any Canadian grower can hope for at the best of times and without having to worry whether the wheat is ever sold to consumers or not. But the Canadian authorities realise that there are no possible terms on which this country can compete with the resources of the United States Treasury if it comes to forcing wheat into consumption abroad. Price-cutting in conditions of world surplus seems to the farmers to be a mug's game, because no end is in sight. Washington, as it seems here, has the power to reduce wheat to an almost valueless commodity if it insists on doing so. But in its own interests it will probably stop short of the final plunge into the abyss, and Canada derives some comfort from the thought that importing countries, led by the United Kingdom, have no more wish than Canada to see the world wheat market driven back into the ruinous condition of the thirties.

* * *

The American Stake

IN the early postwar years it was common for observers from Britain and Europe to remark that Canada was "being bought up by the Americans." Most Canadians, in the glowing flush of their boom, were indignant at the aspersions or put it down to jealousy. Now the mood has changed.

Mr Walter Harris, who has been Finance Minister for less than two years, repeated in a New York speech the other day that 85 per cent of Canadian investment was still Canadian-owned; but he got less popular acclaim than his predecessor, now Mr Justice Abbott, could get a few years ago for a similar claim.

Nowadays any attempt to minimise the extent of United States participation in Canadian growth is met with more realistic questions. If it is true that Canadians still own 85 per cent of the national wealth, what does the 85 per cent consist of? It includes houses and real estate and farms and utilities. But how much of the dynamic resource development does it include? No adequate statistical study is now available, though an attempt is now being made to provide one for the Royal Commission on Canada's Economic Prospects. But the available indications point to a predominance of American control in some of the most prosperous sectors of the Canadian economy—particularly in oil and gas.

These indications are getting increasing attention, even in the financial and business circles which were at one time the most ready to welcome American capital. Such an influential organ as *The Financial Post* of Toronto is repeatedly urging American companies to make a deliberate effort to expand the Canadian ownership of their Canadian subsidiaries. It is beginning to seem possible that unless they do this, Canadian public opinion could break out in active revolt against "absentee ownership."

Newfoundland Cod—Frozen, not Dried

NEWFOUNDLAND and Nova Scotia are feeling very pleased with Soviet Russia this year because Moscow has bought up Iceland's frozen fish, and thereby removed the most serious competitor for Canadian frozen fish in the American market, where tariff troubles are constantly liable to crop up.

Newfoundland is still producing the same amount of fish (about 1.2 million dry quintals a year) as it did thirty years ago. But more than a quarter of it is now processed into frozen fish blocks in newly established processing plants which have to look to the American market. The tedious process of dry-salting the cod, which requires endless labour for turning the fish-flakes in the sun, used to be the Newfoundland fisherman's way of preparing his fish for market in the Caribbean and the Mediterranean. But it has fallen into disfavour, both because of currency difficulties in these markets and because of the new independence of the fishermen's families since the Union with Canada. With family allowances and old-age pensions bringing a cash income into homes which had seen remarkably little cash in the old days, family labour is hard to recruit.

Employment in the fisheries, moreover, has declined to about one-third of what it used to be—about 15,000 compared with 45,000. Many of the fishermen, then as now, fish for only a few months and find other occupations for the rest of the year. The increasing scope of pulp and paper operations by Bowaters and the Anglo-Newfoundland Development Company accounts for some of the new employment. Possibly even more comes from the public works instituted by the Canadian Government, which have amounted to about \$25 million since the Union of 1949; and from the construction and maintenance work at the American military bases on the island.

There's plenty of
fish in the sea...

it should be cheap... it's free, isn't it?

It has been said that "Britain is an island made of coal and surrounded by fish." That's perfectly true in a sense and might lead you to suppose that you can get all the fish you want at next to nothing!

However, it's not quite as easy as that! Our island is surrounded by fish all right but it's not *closely* surrounded, for the near waters are largely fished out, and the great shoals are today only to be found far away in wild and icy, distant waters. Yes, there's plenty of fish in the sea, but getting them out of the sea and bringing them home to you is one of the most difficult, dangerous and expensive jobs in the world. The ships of Britain's Distant Water Fleet have to be built to fight the heaviest weather, and equipped with the latest and very expensive radar and electronic devices so that they can find the fish many fathoms deep in the great Arctic wastes. They cost upwards of £200,000 and a voyage of three weeks—a week out, a week fishing and a week home—costs about £6,000.

This vast expense has to be covered before the Trawler Venturers can begin to receive any reward for the great risks they take. Only too often the price realised by the fish doesn't cover the cost. Two years ago the Hull, Grimsby and Fleetwood trawler companies lost over £2,000,000*. Things are better now, but, with prime cod averaging only 5d. a pound at the dockside, many a trip shows a loss if the skipper's luck is out—if the fish elude him or a gale cuts down his fishing time and prolongs his voyage for several days, at £300 a day! Yet, in spite of the hazards and costs, fish is still the cheapest first-class food money can buy!

... it's part of Britain's progress,
to which the English Electric Company
contributes at home and abroad ...

Full employment, increased production, building activity everywhere, more goods in our shops and homes—here's striking evidence of Britain's economic progress.

Since 1949, Britain's industrial output has risen by 20% and the value of British exports by 42%.

More goods at home, more of the exports the country depends on ... mean better living for Britain. In both ways ENGLISH ELECTRIC is playing a vital part.

Production needs power. Fifty power stations have been brought into commission by the Central Electricity Authority since April, 1948; output of current has risen by 60%. Many of the turbines, generators, transformers and other equipment were provided by ENGLISH ELECTRIC.

And ENGLISH ELECTRIC makes the motors and other electrical gear by which industries use this energy for production.

Export Success

Moreover, ENGLISH ELECTRIC is a vigorous exporter of heavy equipment—and of engineering skill. *Approximately*

half the Group's business is overseas. All over the world, ENGLISH ELECTRIC is earning foreign currencies for Britain—and a reputation that helps all British exports.

World-wide experience is a precious asset: lessons learned in one job may avoid difficulties in another, far distant. The co-ordination of experience with its great technical and manufacturing resources enables ENGLISH ELECTRIC to play its important part—at home and abroad—in Britain's economic progress.

To YOUNG MEN and their PARENTS

To any boy or young man considering a career in science or engineering, ENGLISH ELECTRIC offers almost unlimited opportunities. As a student or graduate apprentice, he will receive first-class training under excellent conditions, and can look forward to a choice of stimulating and rewarding jobs, at home or abroad, in this great organization. For details of ENGLISH ELECTRIC training schemes, please write to the Central Personnel Department.

'ENGLISH ELECTRIC'
bringing you better living

The English Electric Company Limited, Queens House, Kingsway, London, W.C.2

POWER FOR INDUSTRY. This 60,000-h.p. steam turbine generating set is one of six supplied by ENGLISH ELECTRIC to Whitebirk Power Station in Blackburn, which provides power for Lancashire industries.

POWER IN INDUSTRY. An ENGLISH ELECTRIC 85-h.p. screen-protected motor drives a Kennedy crushing machine in the Groby Granite Quarries. ENGLISH ELECTRIC motors are used to drive machinery in a great variety of industries in Britain and all over the world.

DEVELOPING MARKETS OVERSEAS. An ENGLISH ELECTRIC 1,440-b.h.p., 600-r.p.m. diesel engine is unpacked at Accra, Gold Coast, where three similar engines and two of 558-b.h.p. are installed in the power house.

THE BUSINESS WORLD

Adventure in Copper

THE best view of the Rhodesian copperbelt is from the air. The dark sweep of the bush is threaded by the roads and railways linking one mining centre with another, each centre a small clearing wrested from the bush. To the north-west of the copperbelt stretches the corridor that has been hacked through the bush to bring hydro-electric power from the new Belgian station on the Lualaba river, 300 miles away. Construction there is ahead of schedule, and its generators should come on load by the end of 1956. The copper companies are laying their own power lines, just as they have built roads, railways, houses and shops, hospitals and schools. In Central Africa, mining is much more than digging holes in the ground.

Northern Rhodesia now ranks second among the world's copper producers. One day it may be the first. As the copper mining business grows, so will the new Federation of the Rhodesias and Nyasaland grow. Already the taxes paid by the copper companies provide over half the Federation's revenue and copper makes up over 60 per cent of the Federation's exports. For many years more the Federation will have to rely upon the companies to help to provide such services as power and transport. It is upon the companies, too, that the main responsibility for bringing about a working partnership between black and white rests.

In what shape are the companies to face these tests? The financial year ending last June was an eventful, even historic, year for them. Consumption of copper was buoyant; production in Rhodesia and elsewhere was hobbled by strikes,

and the shortage drove copper up to a record price of £400 a ton. In an attempt to secure a measure of price stability the Selection Trust group (but not the Anglo American group) started to sell at a fixed price instead of on the basis of London Metal Exchange prices. In this year, too, the Federation government decided to go ahead with the Kariba hydro-electric scheme—a decision that should assure adequate supplies of cheap power for the copperbelt after 1960. Finally came the agreement between the European workers' union and the companies on the advancement of African labour.

The trading results of the four producers had a virile look. The loss in revenue and the extra costs arising from the strike were largely offset by the higher price of copper; profits from all four producers were bigger, though those earned by Rhokana expanded less than those of the other companies. The strike reduced stocks in the pipeline between the mines and overseas consumers, and the Anglo American group specifically makes sure that sudden arbitrary alterations in these stocks do not distort profits; it balances them by transfers to and from a sales equalisation reserve.

The trend in costs is also reassuring, for the rise in operating costs (shown in the accounts of the two

groups on slightly different bases) has slowed down. Earnings were high enough in all four companies to provide for immediate capital needs and for bigger dividends. Stockholders expect rising dividends from young mines, but they should note that capital development still makes big claims on profits and that one parent group, Selection Trust,

distributes rather more closely to the hilt than does the other.

Stockholders in the Selection Trust companies have to put a further question. How is the policy of fixed prices likely to affect earnings and dividends? In the April-June and July-September quarters the profits of Roan Antelope and Mufulira must have suffered, because the fixed price was usually well below the market price. The "loss" of profits cannot be calculated, for the group always sells an undisclosed part of its output in America at fixed prices. And the latest quarterly

returns issued by Roan and Mufulira show a sturdy advance in sales and profits.

Certainly Mr R. L. Prain, the chairman of the Selection Trust companies, does not conceive his fixed price policy as a subsidy to consumers, though he does believe that it is worth forgoing a short-term advantage in prices in order to safeguard the markets for copper from encroachment by other materials. At the moment both groups can sell in full at different prices, but only because there is a demand for all the copper they can produce—and more. If the free price were to fall because of a surfeit of copper, Selection Trust would have to meet the market, and the concession it has made to consumers on a strong market could not be recouped on a weak one.

What else lies in the future? There is still a heavy development programme running up to 1960. But most of the money has been found or will be found from earnings. When Chibuluma (with an output of about 20,000 tons of copper and 250 short tons of cobalt) and Bancroft (which by 1960 should produce about 85,000 tons of copper a year) are in full production the total capacity of the copperbelt in 1960 should be over 500,000 tons, compared with 400,000 tons a year at present. The two new electrolytic refineries will have been completed before then. And there is the possibility that the exploration programmes being carried out by Selection Trust at Baluba and Chambishi and by Anglo American at Kansanshi will have produced tangible results by then. The programme does not stop there. Both groups are setting aside large sums for power supplies, housing and other services. The magnitude of the programme can be gauged from the estimate that the Anglo American group alone will be spending well over £20 million in the next five years. That leaves out of account the substantial sums both groups are willing to invest in the Kariba scheme.

Expansion of this order is founded upon two assumptions. Firstly, that the consumption of copper will continue to grow and secondly, that the costs of

production in Rhodesia will continue to compare favourably with those in the rest of the world. Both assumptions appear reasonable. Consumption of copper may not immediately match the expansion in output planned in Rhodesia and elsewhere. But the additional output is unlikely to be pushed on the market at the expense of prices, for much of it is under the control of a few American companies prepared to defend the price. Moreover, so long as the sterling area is a net importer of copper, Rhodesian producers will naturally feel that their market should be assured. On the cost side of the equation three facts can be set against the steady rise in the cost of materials:

(1) Royalties, an element in costs, fall if the price of copper falls.

(2) Savings can be expected in fuel costs, initially through an improvement in transport facilities for coal and later from the use of hydro-electric power from the Lualaba and more especially the Kariba scheme.

(3) There is scope for raising productivity below the surface and even more so above ground (automatic control systems, for example, are now being introduced).

The copper companies are, in fact, in vigorous manhood. This is reflected in the secular decline in yields offered by Rhodesian copper shares. From mining assets stockholders expect—and will undoubtedly receive unless the bottom falls out of the market—rising dividends. But they must also realise that the copper producers have accepted the responsibility for playing a full part in the development of the Rhodesias—a part

that goes well beyond the business of mining copper. Both groups have active exploration programmes outside the copperbelt. Both have spent and will spend money on hydro-electricity. The Anglo American group has set up a development corporation which has already agreed to spend £5 million on rolling stock

that it will hire to the Rhodesian railways. The Selection Trust group is interested in a cattle-breeding ranch and in the agricultural potentialities of the Kafue Flats. The examples could be multiplied, but they all point, as Mr Harry Oppenheimer said recently, to "development plus five per cent." Nor is this solely enlightened self-interest. The copperbelt is, after all, in a country named after a great capitalist—and a great pioneer.

Mr Ferguson and the Motor Industry

LONG before Mr Harry Ferguson resigned the chairmanship of the Massey-Harris Ferguson combine formed to take over the rights of his hydraulic tractor-implement linkage and retired to Stow-in-the-Wold, rumours had been accumulating about a revolutionary new vehicle—jeep, people's car, or agricultural runabout were the favourite guesses—that he was preparing to launch on the motor world. In effect, these were broadly true: Mr Ferguson has returned to an earlier brainchild put aside 25 years before, the time when he decided the tractor came first. In detail, the rumours and forecasts about his new vehicle were largely speculative, based sometimes upon tidbits culled from people who had seen at least some of the earlier experiments. This summer, when Mr Ferguson had tested his eventual prototypes to his final satisfaction and began to seek manufacturing facilities, speculation naturally redoubled—and it has now become fanciful enough to embarrass the organisation that has now been fortified by the acceptance of a seat on its board by Sir Miles Thomas and the weightily-expressed approval of Lord Chandos.

Any such embarrassment is Mr Ferguson's business—he is not without talent or expert assistance for backing into the limelight. But it is easy to appreciate that he finds it ticklish to know what to say about a vehicle that at best could hardly be on the market for two or three years. And it may be in the public interest that his current purpose should not be smothered in speculative froth. He is trying to interest some established organisation, capable of manufacturing in sufficient volume to ensure cheap output, in his new vehicles. They use a chassis system that does sound to some extent revolutionary, but Mr Ferguson avers that it is simple and practical and gives remarkable motoring qualities.

The Economist is not among the distinguished and growing company whom Mr Ferguson has taken for a ride in the mud in one of his vehicles; all it knows about them is what the company has told it. What is on offer, it is said, is a light, simple and cheap motor vehicle chassis with automatic transmission and optional four-wheel drive, with exceptional braking qualities that largely obviate the possibility of a skid; fitted with

COPPER DIVIDENDS AND TAXATION

A notional calculation of tax deductions on dividends declared by the Rhodesian copper producers is as follows:—

	s. d.
Gross dividend per share.....	20 0
Less:—	
Rhodesian income tax at 6s. 3d. in £	6 3
Northern Rhodesian surcharge at 1s. 3d. in £.....	1 3
	7 6
Net dividend received in Britain.....	12 6
Less:—	
British income tax at 4s. 3d. in £ (i.e. half standard rate) on the net dividend of 12s. 6d. grossed up at 4s. 3d. in £, that is 15s. 10½d.	3 4½
Net amount per share.....	9 1½

The deduction of tax at the reduced rate of 4s. 3d. in £ instead of at the standard rate of 8s. 6d. in £ represents a provisional allowance of unilateral relief at 4s. 3d. in £. The final rate of relief allowable to an individual shareholder depends on his personal rate of tax. If, for instance, the shareholder has an "effective rate" (i.e. the rate calculated by dividing his total tax by his total income) of 7s. 6d. or more in £ he can claim 3s. 3d. out of the 4s. 3d. provisionally deducted. Then he will have had to bear 7s. 6d. in Rhodesian tax and 1s. in British tax. If the shareholder's effective rate is less than 7s. 6d. in £, then he can claim relief on the difference between 4s. 3d. and his "effective rate." Thus the shares are more attractive to shareholders paying a high rate of tax than to tax free funds.

SALES AND EARNINGS (£'000s)

four-wheel independent suspension, it offers very good road-holding qualities (using the four-wheel drive, for example, in fast cornering) and better off-the-road performance than any motor vehicle the Ferguson organisation has been able to find to test in comparison.

Few technical details have been released for publication. The automatic transmission is what it says, not merely an automatically-operated gearbox; the company is confident that it could be produced for a third of the cost of the American units now fitted to cars such as the Rolls-Royce, Bentley, and Armstrong-Siddeley. The four-wheel drive is not based upon individual drives or turbines for each wheel, nor is there any question of braking by some reversal of hydraulic force; braking is by inboard disc brakes fitted to a mechanical transmission, automatically distributing the braking force necessary to each wheel through the axle differentials. This inboard system, dispensing with brake drums and simplifying the anchorage of the wheels to the chassis, lightens the whole chassis and in particular the unsprung weight. The four-wheel independent springing uses vertical coil springs. Any engine one likes to use can go more or less anywhere one likes—Mr Ferguson's concern with where it goes has been confined mainly to its effect on the weight distribution and road-holding qualities.

This chassis system is at present mounted in four different types of vehicle, prototypes of which, as Lord Chandos emphasised this week, are on offer without commitment to manufacturers for experiment and test. They are:

1. An ultra-light military version, with a motor-cycle engine, built to carry four men who could if necessary manhandle it over a wall;
2. A larger, jeep-style military vehicle, which the company claims to have superior performance, especially on rough ground;
3. A civilian estate car, "with performance comparable to a jeep"; and
4. A 4-5 seater family saloon car.

Both automatic transmission and four-wheel drive, to automotive engineers, ordinarily sound expensive. But the company's cost estimates suggest that, given volume comparable to current popular family cars, this car version could be produced at a cost comparable to the present medium-sized popular cars or even slightly below. At such a price, if all the claims were sustained, it would offer safety and convenience superior to far more expensive vehicles, outside the popular price range. The economy of the family car version has recently been improved to better than 30 miles per gallon.

A number of distinguished engineers from the Services and from industry have examined and tested these latest prototypes: none, as yet, from the motor industry, though at times during the development period discussions did take place with some of them. It is an open secret that the major motor manufacturers,

up to now, have been inclined to say that they have already on their plates plenty of cars to make and plenty of plans for cars to make next. It is also clear that Mr Ferguson, ideally, wants a major motor manufacturer to produce his vehicles—and a British one.

Other obvious possibilities have not been neglected. Certain British engineering companies outside the motor field have expressed interest, and there has been talk of raising money in the City to set up a big new vehicle manufacturing concern. A completely new manufacturing venture, at any rate, sounds rather unlikely: Mr Ferguson, by temperament the inventor *par excellence*, has never seemed anxious to burden himself with the organisation of production. It seems rather more likely—in spite of the official interest of which Sir Miles Thomas's appointment may to some extent be a symbol—that he would if necessary go abroad to produce, as he went to Detroit in 1940 with the tractor system. Whether that would entirely preclude manufacture in Britain is purely conjectural, as Mr Ferguson is known to favour eventual local assembly and manufacture of his products in major markets. But he would clearly prefer, however and wherever an assembly network might develop, that the nucleus should be British.

★

Official "encouragement" such as assisted Mr Ferguson to find a manufacturer in Britain for his tractor system (and proved an excellent bargain for the Standard Motor Company) no longer takes place, and should not. The big motor companies are entirely capable of making up their own minds whether manufacture of this highly unconventional chassis would offer rewards exceeding the inconvenience, and possibly the extra risk, of altering their own long-term plans, and nobody can assist them. They are now being offered the fullest opportunity of examining its possibilities before doing so.

Their decisions, no doubt, will depend partly upon the vehicles' intrinsic qualities, both in saleability and potential ease in manufacture—and partly upon their reading of motor market prospects at home and abroad, for this or more established types of vehicle. Some of them would reject even the question whether the current British range of well-produced conventional cars is now beginning to design itself out of markets that take for granted certain features which the British industry still considers to be eccentric. Nor everyone would give as blunt a reply to that question as Mr Ferguson sometimes does; but many people are beginning to ask it. Confidence in the flexibility of mind and progressiveness of design of the British motor industry does not finally rest upon what the industry decides to do about Mr Ferguson's vehicles. But it could possibly be affected by the thoroughness with which the major companies examine his project before they make up their own minds.

Business Notes

The First City Borrower

GLASGOW (which once refused to accept the terms proposed for a loan on the London market) is the first of the local authorities to make a stock issue since automatic access to the Public Works Loan Board was stopped four weeks ago. It is issuing £5 million 4½ per cent stock, 1966-68 at 98½, on which the effective yield to redemption will be £4 18s. 2d. per cent. To keep the discount at a moderate size, Glasgow has found it necessary to borrow at the slightly awkward coupon rate of 4½ per cent and for a shorter term than had recently seemed necessary. Evidently the Northern Ireland Electricity issue has set the standard for a maximum life of 13 years, and this stock, it may be noted, is yielding only a penny or two less than 5 per cent to final redemption.

With a succession of local authority stock issues in prospect, a resounding success for Glasgow when the lists open next Wednesday would greatly help, but on present signs the response is likely to be dutiful rather than enthusiastic. Nor is the rate that Glasgow is paying—say, 5½ per cent, including all costs—likely to deter other local authority borrowers from seeking mortgage money, if they can find it, at the same rate and for the same term. One county is understood to have negotiated a considerable sum at 5½ per cent for ten years. Other smaller authorities are considering approaches to ratepayers in the expectation that local patriotism will give them some slight advantage in the rate that they will have to pay.

The authorities at present have a healthy fear that the board will say only No in the future. This fear is exaggerated, but if the mortgage and stock markets are able to supply an appreciable part of their needs, so much smaller will be their dependence on the PWLB. Release from the seven-year minimum for mortgages, which the Chancellor is considering, would open the new field of three-year mortgages—for which the authorities might be prepared to pay considerably more than the present 7- and 10-year rates. No doubt the possibility of incidental embarrassment that might then result for the Exchequer is one factor in the Chancellor's deliberations.

Investors Mark Time

Too many issues chasing too few investors—that is the common diagnosis for the present malaise in investment markets. The condition cannot quickly be cured if the credit squeeze is to do its work. Bank loans are hard

to get and capital projects that are well advanced are equally hard to postpone. And has not Mr Butler assured the National Production Advisory Council that the government has no intention of cutting back productive investment? The backlog of capital construction demand in this country is, he said, sufficient to maintain full employment for a long time.

How can the market be expected to react against such a background? Clearly the scope for any broad advance among industrial shares and, until reductions in public expenditure become effective, among gilt-edged stocks also, is limited by the knowledge that an increased flow of new issues is ready to take off any head of steam that may develop. But within that limitation the market has behaved well. There has been little selling and a trickle of buying has held prices a shade better than steady. The *Financial Times* government security index on Wednesday was 90.78, compared with 90.70 a week earlier. The industrial index was 189.9, compared with 189.4. It seemed that some of the cash resulting from the repayment of the Serial Funding at the beginning of last week was still seeping into the gilt-edged market. The new issues—not considerable in volume—were being well absorbed. The private placing with quotation of £3,608,000 3½ per cent Cyprus stock 1960/71 had no effect on the gilt-edged market. Nor indeed is it being sold on the market. In the industrial market there was a rush of stags, in contrast to the general behaviour of the market, for the 5s. ordinary shares of Hall Engineering. As this issue goes to press the results of the offer of 1,400,000 £1 6½ per cent preference shares at par and the same number of ordinaries at 6s. 9d. is unknown, but it is certain that the offer of ordinary shares was many times over-applied for.

These signs show the market in good heart, encouraged by the high export figures for October and by the fact that the current tone of sterling seems to promise that the November gold and dollar figures may not be bad. They cannot be read as indications of an early broadening of business or of a quick return to the optimism of midsummer.

Car Makers' Confidence

CAN the expanding output that the motor industry plans be sold? If home demand contracts by reason of taxation or saturation can the export market take the balance? That is the question Sir Leonard Lord poses in his statement to the shareholders of British Motor Corporation (which, together with the accounts of one of the chief suppliers of the motor industry, Joseph Lucas, are discussed on page 783). The question is echoed in the

recent speeches of other motor company chairmen and paraphrased in the conservative dividend policies these companies have pursued.

As far as British Motor Corporation is concerned, Sir Leonard believes the answer to be Yes. But in the same breath he draws attention to the "growing strength of foreign competition and the adverse effect of continually rising costs of wages and materials." The drag of rising costs on profits is as apparent in the British Motor accounts as it was in the half-yearly statement of Ford Motor and, even more noticeably, in the accounts of Rootes Motors, which showed a slight dip in earnings despite a rise in production to a record level. Many of the manufacturers, but not British Motor, have tried to offset these increases in costs by raising selling prices. British Motor did not raise its prices because it hopes that the expanding output it has planned will counterbalance the rise in costs. A similar decision was taken by Joseph Lucas, but both Sir Leonard and Mr A. B. Waring point out that it is the high level of production alone which makes this policy possible.

It may seem strange that the motor manufacturers, after their recent record-breaking achievements and with capital expansion programmes well under way, should be chary of predicting higher profits and, by implication, higher dividends. Indeed, Sir Leonard discusses the possibility of lower profits. But they can point to the facts of rising costs, the credit squeeze and the costs of their capital programmes, and to the imponderable effects of an increase of purchase tax at home, of import restrictions in the Commonwealth and of competition from foreign manufacturers.

Steel Makers' Risk

THE biggest risk that may be involved in the car makers' confidence that they can sell the increased output all of them are planning is the one that they are asking the steel industry to take. It would cost roughly £100 million to put down a fourth integrated strip mill, probably more than all the major motor manufacturers plan to spend put together. Sir Patrick Hennessey complained at a press conference a fortnight ago that the steel industry had failed to keep in step with the forecasts of demand that the motor industry put before it two years ago. That is undoubtedly true; Britain is importing about 450,000 tons of steel sheet this year, and the motor makers are having to pay the world price for it. But to increase steel output—even at existing mills—is more of a step-by-step process than pushing up car production; and in terms of investment in new capacity it costs a vast amount more.

The steel industry, therefore, has for eighteen months been making plans to stretch flat steel output at the existing three mills to the limits—which have been found to be more

flexible than was believed even six months ago. At present, output from these mills is exceeding $1\frac{1}{2}$ million tons of hot rolled strip a year; announced and prospective increases in capacity at all of them may raise this to about 3 million tons by about 1959. The increases in motor production that manufacturers now contemplate would require more flat steel than that, and their hopes for the early sixties would push a good way beyond. Whether those plans and hopes justify putting down a fourth strip mill now is the hundred-million-pound question, which is still undecided, though a project—as yet still in outline—exists.

Europe Buys Sterling

THE foreign exchange market has this week provided an interesting contrast. Sterling has been losing ground against both US and Canadian dollars but has shown further advances in terms of most European currencies. The weakening of sterling against dollars reflects partly the emergence of seasonal demand for dollars—a demand that has been particularly strong for Canadian dollars required to pay for grain. The Canadian dollar which at one point fell to parity with the US dollar rose in London towards the end of the week to \$2.80, which represented $\frac{1}{8}$ premium on the US rate. In terms of the US dollar sterling has also weakened slightly. The spot rate of \$2.80 $\frac{1}{2}$ compares with \$2.80 $\frac{1}{4}$ in the middle of this month; the weakening is believed to be due to official purchases against forward sales. These official "swap" operations may have had something to do with the change in the underlying tendency of the forward dollar market following the rise in the official rediscount rates in the United States and Canada and the accompanying stiffening of open market rates in New York. Normally this credit stiffening would have been followed by a narrowing of the forward discount on sterling against dollars. In fact, the forward rates this week have been

as steady as a rock—a fact that may reflect official intervention implying the acquisition of more dollars for the Exchange Equalisation Account this month. The Exchange Equalisation Account will also have benefited from the persistent covering of short accounts in sterling by operators on the Continent, which has been the dominant feature of the exchange market this week. The open position, which is far from covered yet, is said to be particularly large in Stockholm, Brussels and Zurich. During the past week the Swedish rate has moved from 14.51 $\frac{1}{2}$ to 14.53 $\frac{1}{2}$, the Swiss rate from 12.24 $\frac{1}{2}$ to 12.26 $\frac{1}{2}$ and the Brussels rate from 139.65 to 139.82. The impression of dealers in the market is that the volume of business in Continental currencies has been substantial and that this will show itself both in the gold and dollar figures for November, and in the EPU figures for the same month.

A dream come true...

A more efficient way to lower accounting costs

BUSINESS has rarely had the opportunity to make such savings in accounting costs as Burroughs Sensimatic Accounting Machines provide. The Sensimatic is so automatic, so simple to operate, that even beginners quickly become experts. And, by a turn of the knob, the Sensimatic can switch in a moment from one job to another—doing the work of several machines. It has thus created a new concept of speed and economy in the handling of accounting work. Five series of Sensimatics make it possible for you to select the machine exactly suited to your particular needs. See them today at your nearest Burroughs office. Burroughs Adding Machine Ltd., Avon House, 356-366 Oxford Street, London, W.1.

Do your products score with him?

If you are thinking of the future they certainly should do. For he is one of the vital, younger generation whose decisions can effect your business for years ahead. Vigorous and vital . . . receptive to new ideas, he is forming buying habits today which may last the rest of his life.

With its realistic approach to the problems of our time, the Daily Mirror has gained the biggest daily sale on earth and offers you the most powerful mass market coverage in the history of daily newspapers at the lowest square inch per thousand rate of all national dailies.

But even more vital to you as an advertiser is the fact that the majority of its readers are young readers. Your customers today . . . next month . . . next year.

A sherry that is sheer delight

A perfect gift to the most critical palate, Pintail is an exceptionally fine sherry, both pale and beautifully dry. Specially selected at Jerez, this proud product of Spain is available in a trial pack of two bottles at 42/7d; subsequent supplies at £12 per dozen bottles. Your orders will have prompt attention.

On this evidence the November statement should reveal an appreciable recovery in the gold and dollar reserves, the amount gained in the course of market operations being greater than the loss sustained by the settlement this month of the October deficit with EPU.

The Squeeze Tightens Slowly

IF the credit squeeze is judged solely by its effect on the outstanding volume of bank advances, it is developing only slowly. All but one of the individual statements from the clearing banks for the mid-November make-up—the aggregated statement is not yet available—show a further contraction of advances, and the total decline, of just over £51 million in four weeks, looks impressive at first glance. At end-October, however, the Central Electricity Authority received a further £50 million for the penultimate call on its £200 million issue. After allowing for its current expenditures and for those of the Gas Council, this probably means that about £35 million of the month's decline in total bank advances was due to net repayments of bank indebtedness by these two nationalised industries, so that the outstanding loans of all of the borrowers from the banks were reduced by only about £16 million. A similar calculation to allow for the effect of a call on the gas loan in the preceding four-week period suggested that the private sector's loans then declined on balance by about £12 million—but the smallness of this movement was partly explained by the £8½ million rise, believed to be due to special temporary influences, in the advances of one bank. It therefore appears that the pace of decline has been barely maintained in the latest period.

The force of the credit squeeze cannot be adequately measured, however, simply by this test. Ultimately, it must depend upon the impact on the whole volume of credit, and this has risen seasonally during the past month by less than half as much as it did in the corresponding period last year. Because of the pressure of the squeeze in its wider sense, the banks have had to take further steps to strengthen their liquidity. Their investment holdings have declined by a further £47.8 million—obviously because of retentions of unconverted holdings of the Serial Funding stock that matured on November 14th. The Midland Bank, which accounted for no less than £27.7 million of this movement, has stated that the reduction in its portfolio—the first for more than a year—was wholly attributable to this factor. In consequence, its liquidity ratio has risen sharply, from 32.2 to 35.0 per cent, at which it is now the second highest among the big five banks. The highest is Barclays—at 36.2 per cent.

TI and Automation

THE comments about automation in industry made by Sir Ivan Stedeford in his statement to stockholders in Tube Investments last week showed a fuller and more balanced appreciation of its implications than any other industrial leader has publicly displayed. Sir Ivan was

familiar with its uneven rate of progress, and the fact "that here in the United Kingdom automatic methods are likely to be applied more widely to particular processes and assembly lines than to entire factories." He presented the main economic argument for a more rapid pace of mechanisation in clear perspective: that by achieving higher productivity in this way, probably at the cost of greater standardisation in much of industry's output, "we should be nearer a solution of the embarrassing conflict between internal economic expansion and external financial solvency which has harassed us ever since the war." And he had what seems broadly the right answer to the inevitable question whether automation need lead to unemployment: that so far it appears likely to create as many production jobs as it will abolish, but that it may well thin out white collar workers. Automation, after all, has come to the factory at a point when the first stage of primary mechanisation is largely complete; on the office floor, that stage is only half begun.

Tube Investments, which has invested heavily in further mechanisation of its plants since the war, has recently set up a "control engineering section" in its technological department, which is generally concerned with the practical application of research results achieved in the group's laboratories. Other sections of this department, incidentally, include a section concerned with the commercial application of irradiated materials: and the group, which has produced already a wide range of special tubes and couplings for the British atomic energy industry, has now set up a liaison organisation to co-ordinate the services of its subsidiary companies to the new industry.

Testing the Diesels

MOST of the 141 main line diesel locomotives the Transport Commission has ordered from makers in this country and the 30 locomotives it will build in the railway workshops with power plant supplied by sub-contractors are a little smaller and less powerful than may have been expected from the Commission's earlier statements. Three-quarters of these locomotives will be between 1,000 hp and 1,250 hp for hauling mixed traffics and only twenty-five will be heavy-duty engines of 2,000 hp and over; the other twenty will be 800 hp freight locomotives. But these 171 locomotives are needed for a pilot scheme of extensive operation trials in two to three years' time, before British Railways finally makes up its mind about the types of diesel locomotives it will use. Altogether 2,500 main line diesels are to be built by 1970; the range of variation in engine size and performance opened up by diesel traction are very wide—with electric traction, which is to come later, the range is perhaps even wider.

These orders, to a total value of about £10 million, have therefore been spread over the six major groups of main line diesel locomotive builders in Britain (some tenders came from overseas) and manufacturers have been encouraged to incorporate their own ideas of design and construction within the general specifications laid down by the Commission. English Electric, the largest firm in the diesel electric field, is to build 30 type B locomotives of 1,000 hp to 1,250 hp, and 10 type C of 2,000 hp. Its

immensely powerful 3,300 hp Deltic locomotive is already in the hands of the Commission for trials. Orders for 31 locomotives have gone to North British—10 of type A (800 hp), 16 of type B, and 5 of type C. This firm uses Paxman engines for diesel electric locomotives; and its contract includes the 11 diesel hydraulic locomotives the Western Region plans to use west of Exeter. Since 1954 North British have been building MAN engines and Voith hydraulic transmissions under licence. Orders for another 60 type B locomotives are shared by Metropolitan Vickers, which uses Crossley engines, by Brush Bagnall, a company jointly owned by the Brush Group and Heenan and Froude, and by Birmingham Railway Carriage. British Thomson-Houston, besides building 10 800 hp locomotives itself, will supply the railway workshops with power plants for 20 type B locomotives.

The 10 type C locomotives the workshops are to build will have Swiss Sülzer engines, which are also made here under licence. The locomotive industry in this country has switched from steam to diesel traction, in association with firms making diesel engines and electrical equipment, with commendable speed in the last few years; it now has its reward in this small reopening of its home market with the prospect of much larger contracts to come.

Argentina's New Exchange

THE accession of General Aramburu to power in Argentina is not expected in London to involve a major shift away from the programme of economic reform begun by General Lonardi. One of the first acts of the new president was to confirm the appointment of the liberal economist Dr Raúl Prebisch as economic adviser to the government. It was Dr Prebisch's masterly report on the economic legacy of a decade of Peronista rule and on remedial measures that led to the devaluation of the peso last month. Further details of the new exchange arrangements that accompanied devaluation are now available. The new official exchange rate of 50.28 pesos to the pound applies to virtually the whole range of Argentina's agricultural exports. After subtracting the payments that exporters will have to make into the reconstruction fund, the effective rates are: 45 pesos to the pound for grains and oilseeds; 42 pesos for meat and most dairy products; 38 pesos for greasy wool and 40 for scoured wool. Under the former multiple rate system all major grains and fresh meat were subjected to the artificial rate of 14 pesos to the pound and wool had an effective rate of 17½ pesos.

The official rate will also apply to a long list of imports that includes fuels (previously 14 pesos to the pound), essential raw materials, paper, certain chemical products, many iron and steel goods, certain types of agricultural machinery, and aircraft spares. Most of these previously came in at 21 pesos to the pound. Another list of goods can be freely imported through the new free exchange market without any prior exchange permit. The list includes certain chemicals, spare parts for bicycles, electrical generating equipment, and spares for motor vehicles and for certain types of machinery (which are subject to a surcharge of no less than 56 pesos to the pound).

The rate in the free market has fallen slightly in the

last week or so, but is still almost 90 pesos to the pound (against up to 100 pesos in the first weeks of the new market). This rate applies to financial remittances; current remittances may now be transferred through the free market without formality though of the accumulated arrears only those derived from profits or interest earned after June 30th of this year have so far been freed. The present rate in the free market certainly offers British investors little inducement to remit current earnings, but it is hoped that the rate will in due course fall to a more reasonable level. The Argentine authorities at present feel unable to spare any foreign exchange to support the peso in the free market; indeed, Argentina has recently been obliged, for the first time since the war, to draw on the sterling credit of £25 million made available by Britain; some £20 million has been used so far. However, the free market may soon benefit from the repatriation of capital that was deposited abroad in the period of Perón's rule. Provided that the new government continues its policy of economic reform the more realistic exchange rates may help to attract foreign investment as well as to stimulate exports.

Buna for Britain

It has long been clear that Britain would have to produce a general purpose synthetic rubber on a commercial scale; the only question was when. The Dunlop Rubber Company has been experimenting with synthetic rubber for years, and recently started to construct a small plant for the production of special purpose synthetics. Now, with three other companies, it has announced the formation of the International Synthetic Rubber Company, which will build a plant to produce initially 50,000 tons of general purpose rubber (GR-S) a year, beginning in 1958. That quantity is equivalent to two-fifths of Britain's annual consumption of rubber for tyre covers now. Subject to Treasury consent, it is proposed to raise £7 million, with provision for a further £2 million if required. The initial ordinary share capital will probably be £4 million, and it may be that subscriptions will be in proportion to the subscriber's offtake of synthetic rubber; that should make Dunlop easily the largest participant. The other members of the new company are subsidiaries of foreign tyre and rubber companies—Goodyear, Firestone and Michelin; other tyre manufacturers are being invited to participate. The presence of two American-owned companies suggests that the new company will be able to draw on the manufacturing experience of their parents in the United States.

Two main considerations lie behind the decision to build this plant. One is the technical superiority of synthetic rubber for certain purposes; the other is the strong possibility that the supply of natural rubber will not keep pace with demand. Hence manufacturers that cannot offer tyres with a synthetic content will not be competitive technically; nor will they compete in price in periods when, as now, a shortage of natural rubber has driven the price far above that of GR-S. That disparity, indeed, is the main reason why manufacturers in Britain will import about 50,000 tons of GR-S from North America in 1956, twice as much as their provisional requirements for next year and five times

Accurate and Tough

For no practical purpose—merely to show how accurately it could work—an abrasive-coated belt by CARBORUNDUM was used, on a belt grinding machine, to grind the print off a sheet of newspaper, which was left completely plain. To achieve precision of that order, an abrasive belt must be manufactured with great care. For instance, we control the thickness of our coated abrasives by means of special nucleonic gauges, which use Beta rays to provide an exact and continuous check on the thickness of the backing material, the combined thickness of backing and adhesive, and the overall thickness of the finished product. Again, most coated abrasives by CARBORUNDUM have the abrasive grains applied to them by an electro-coating process in which electro-static attraction is used to lift the grains and arrange them on the backing material in an erect position, so

that their cutting edges are effectively presented to their work.

Coated abrasives by CARBORUNDUM are tough as well as accurate: we make abrasive belts that stand up to such punishing work as the dressing of metal castings, the bevelling of plate glass, and the lapping of tungsten-carbide tools.

We make waterproof coated abrasives for grinding operations that require the use of liquid coolants, and waterproof sheets and discs for rubbing down painted, lacquered, or cellulosed surfaces. These surfaces (especially cellulose) would soon clog the abrasive if it were not repeatedly rinsed. The photograph shows a typical use of waterproof paper. Here it is used with a reciprocating hand sanding machine to rub down existing cellulose on a motor car wing, to provide an absolutely smooth foundation surface for re-spraying.

Nothing left to chance...

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (5½ tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.

Visiting Australia Next Year?

SAIL BETWEEN FEBRUARY 1ST AND MAY 31ST
AND SAVE FROM £80 TO £140

You can enjoy that visit to friends and relatives in Australia and gain the benefit of a substantial financial saving by travelling under our special P & O Boomerang Trips plan.

You take your first-class outward passage between the first of February and the end of May. You return homeward between September 1st and December 31st 1956 or 1957. Reduced first-class fares run from £230. You save from £80 to £140.

That's the practical side of it. Once aboard a P & O liner—your home at sea—you can relax in an atmosphere of comfort which is the result of more than a century's experience of service. For full details see your local travel agent.

ONE WAY ONLY?

For passengers visiting Australia for an indefinite period, we offer our special P & O off-season terms. This means that during the months February to May you can have a wider choice of first-class accommodation for your money.

TRAVEL BY TRAIN

-to be sure!

And go by French Railways to be on time. Their service and comfort are unequalled, and many economies make them the businessman's most practical means of travel within France and to the borders beyond. To quote the *London Evening Standard*—"French Railways lead Europe for speed and punctuality."

DAY TRIPS. You can leave in the morning, travel from 350 to 500 Km., have several hours in which to conduct your business and return the same evening, in comfort. Examples: Day return trips from PARIS include La Rochelle, Lyon, Antwerp or Sarrebruck.

HALF-FARE CARDS which entitle the holder to unlimited travel between two particular stations or in a particular zone at half the standard fare can now be purchased without deduction from the basic travel allowance.

OVER-NIGHT TRIPS. You can leave in the evening, travel from 500 to 600 Km., stay the night at an hotel, devote most of the following day to your affairs and return that night. Examples: Over-night return trips from PARIS include Bordeaux, Grenoble, St. Nazaire or Zurich.

NEW DIESEL RAILCARS. Ideal for businessmen! New diesel railcars offer travellers high speed with noiseless running and complete comfort on many long-distance non-electrified runs between large centres.

FRENCH RAILWAYS

CVS-125

their imports this year. The price of GR-S produced here may not be much higher than in the United States; support for that view comes from the estimates for a similar plant at Huels in Germany. For a capacity of 45,000 tons a year it is estimated that German costs will be little more than 2s. a lb, which compares with an ex-works price in the United States of 20½d. a lb. The styrene for the British plant will doubtless come from Forth Chemicals, where capacity is being expanded, and the plant itself will presumably be sited close to an oil refinery that will supply butadiene, the chief raw material of the copolymer from which GR-S is made. It is being suggested that the site will be in the Southampton area, near Esso's Fawley refinery.

October Trade

THE full return of British overseas trade in October underlines both the unsatisfactory and the satisfactory features of last month's trading. The rise in the value of exports to the record figure of £267.8 million fob was well spread; the rise in the value of imports was too widely spread for comfort, and the trade deficit with the non-sterling area remained high. Exports were 16½ per cent above the average of the previous six months. That comparison may exaggerate the real improvement because the October total probably includes some shipments delayed by the strikes, but it leaves the buoyancy of British exports in no doubt. Shipments of metals, machinery and "other manufactures" (notably chemicals) were particularly high, compared with the April/September average. Commercial vehicles also did well, but not cars, which remained near the average for the previous six months; that was also true of cotton yarns and fabrics.

Imports, at £333.4 million cif, were 6½ per cent above the April/September average. Proportionately the biggest increase was of 11½ per cent in arrivals of "manufactures," that somewhat misleading category which includes semi-manufactures such as metals as well as machinery and other finished products. Imports of basic materials were little higher than the previous average; a fall—heavy but seasonal—in arrivals of raw wool and edible oils almost offset larger arrivals of softwood, rubber, metal ores and scrap. Among foods, beverages and tobacco the seasonal changes were mainly upwards and the total for this group was nearly 10 per cent above the April/September average. There was no change in prices of imports and exports as a whole, and for the third month in succession the index of the terms of trade stood at 100, the average for 1954.

Total exports (including re-exports) to the non-sterling world amounted to £145 million, nearly 17 per cent above the April/September average. But, as so often before this year, the expansion in imports was fed from that same area, with the result that the deficit with non-sterling countries was £63 million, only £1 million below the average of the previous six months. The trade balance with the sterling area, however, improved from an average deficit of £10½ million in the previous six months to a surplus of £10 million in October.

More Consumption at Home

ALL this year, the retail trade has enjoyed a boom in the sales of household goods and electrical equipment that has at least partially compensated it for the relative quietness of textile and clothing sales. It is now plain from an analysis made by the Treasury that this rising home demand has accounted for almost all the increase in output that has taken place this year in passenger cars and metal consumer goods (which include television and radio sets). Production has gone up by roughly a fifth in the first seven months of this year; last year's increase was of the order of 25 per cent. Exports of these goods over the same period show almost no change—and in some cases, such as washing machines, electric shavers and motor cycles, exports show a sharp drop.

The Treasury analysis points out that the increase in output in these industries has inevitably meant a rise in the demand for steel and non-ferrous metals out of which they are made. Home deliveries of steel are about 10 per cent higher than a year ago and those of virgin aluminium, 40 per cent higher. Going still further back along the production line, imports of steel and steel-making materials were nearly 50 per cent higher than a year ago, and those of non-ferrous metals, 34 per cent higher. Their combined value was £102 million and they accounted for a quarter of the total increase in imports during the first nine months of the year. It is not suspected that all this extra metal went to the consumer industries, but a high proportion certainly did.

The purchase tax increases made in last month's budget were designed to check home consumption of metal goods and thus to make room for greater exports. But few retailers believe that the increases are sharp enough to have this effect. The most that the Chancellor can hope is to mop up some of the surplus spending power. To bring about a significant drop in the home sales of these goods would probably call for drastic revision of hire purchase terms, and in particular, a substantial increase in the size of the initial deposit.

Atomic Agreement with Belgium

THE agreement just signed between the British and Belgian governments to exchange information about atomic materials and reactor design follows closely the pattern of an earlier agreement reached in June between Belgium and the United States. The extensive help that both the uranium customers have undertaken to give is the price asked by Belgium many years ago for pledging its Congo uranium production to the Combined Development Agency, a body set up by Britain, Canada and the United States to buy the ore. Belgium needs atomic power more urgently than any other country in Western Europe; the agreements with Britain and the United States should save much of the heavy cost of developing it and this possibility appears to have been in the mind of the Belgian government all along.

The kind of information to be provided is likely to go further than that which Britain is at present prepared to give

to other countries, although the Atomic Energy Authority has been giving more practical technical assistance to Western Europe than it usually receives credit for. Most of these talks are conducted informally, but the advantage of signing this latest agreement with Belgium is that it puts British manufacturers once again on an equal footing with their American competitors in what is likely to be one of the most important markets. Companies such as Westinghouse are already beginning to put a foot in the door by selling reactors that are plainly too large to be described as research tools—they are rated at 11,500 kW—but too small to be counted as commercial installations. These reactors have a natural fair-ground appeal; an attempt was made to buy one to light the winter Olympic games in Italy, and another has in fact been ordered to light the Brussels World's Fair in 1958. But no one would suggest that they will produce economical power.

The Jobber's Mite

INVESTMENT markets are narrow partly because the public is not minded towards investment, but they are also narrow because there is not enough capital in the jobbing system to provide a decent cushion. The jobbers are, the argument runs, being taxed out of existence. Modern surtax gives them no chance to build up their working capital in step with inflation. They use bank loans instead of their partners' own money, and when bank loans are expensive and hard to get at any price, there is little incentive to keep a respectable book running. In the latest issue of the *Stock Exchange Journal* an unnamed member of the House dissects this problem. He finds that between 1947-48 and now the number of jobbing member firms has shrunk from 237 to 134, though many amalgamations have resulted in bigger and presumably more economic firms.

But there has undoubtedly been a shrinkage of jobbing activity. The article goes on to discuss the possibilities of attracting money, including risk capital from non-members. Such an innovation would naturally need an alteration to the rules of the Stock Exchange. It would need also a great deal of thought; for a plan would have to be worked out in which half a partnership would be subject to the discipline of the Stock Exchange Council and the other would not. But what happens if the non-member does things that would be breaches of the rules for its member partner? For example, it might advertise or deal outside the market without trying the market first. The proposal to bring outside equity capital into the Stock Exchange will not mature for many a long day. But the erosion of jobber's capital is a symptom of a much larger problem.

Stock Exchange members, along with Lloyd's Underwriters, enjoy one tax concession not available to other professional partnerships. Some, but not all, of them find that it pays to turn themselves into corporate members, the corporate member enjoying the right to carry specified sums to reserve; on such transfers, income tax and undistributed profits tax are payable but not surtax. The present Finance Bill extends slightly the parallel concession that Lloyd's Underwriters enjoy. They have the option to carry sums to special reserve paying income tax and profits tax on them but not surtax, and with the right to withdraw those reserves without paying surtax only at death

or in settlement of a trading loss. The maximum reserve, under the scheme that was started by Sir Stafford Cripps in 1949 and extended by Mr Butler in 1952, has now been raised again from £5,000, or 35 per cent of profit (whichever is less), to £7,000, or 50 per cent of profits. But the additional £2,000 is to be subject to a major restraint: surtax accrues when the money is withdrawn even at death. The surtax on it is thus not a conditional gift but a loan.

Railways Seeking Labour

THE Transport Commission may think that its proposal to bring 2,000 Italians to Britain to work as permanent way labourers was a modest one in face of the 6,000 or more extra men now needed in these gangs—about an eighth of their present strength—and the 1,000 Italians whom the Commission imported four years ago. But the National Union of Railwaymen so far appears unconvinced. The shortage of railway labour has become serious: it is particularly acute among staff who operate trains, such as firemen, shunters, engine cleaners, and signalmen, whose rate of turnover has been running at between 10 and 25 per cent a year, with wastage consistently exceeding recruitment. Well over 20,000 vacancies are now listed by four of the six railway regions and an appreciable number of scheduled freight services have had to be cancelled. Scotland and the North Eastern region are less troubled with labour shortages than the regions drawing staff from London, the Midlands, and South Wales.

The railway unions have inevitably countered with the argument that higher wages would attract men needed from other industries. This ignores the labour shortages those industries are themselves facing and the failure of higher wages to raise employment in coal mining and farming, where Italian labour has also been suggested and turned down. The Commission ought to be able to squeeze an agreement over Italian labour in return for accepting part of the wage claims. But no one in the unions can imagine that these can be granted without pushing the railways further into the red; and it will be many years before the modernisation programme brings a noticeable financial return. At present steam locomotives have to spend two-thirds of their lives in depots or workshops; engine drivers spend on an average only about five hours a day on the footplate in traffic; and each wagon is carrying loads on running lines for less than an hour a day.

AEI in India

THE appointment of Associated Electrical Industries as consultant to the Indian Government in establishing a heavy electrical manufacturing industry there is a success for the company, which encountered German and American competition. It may offer the British electrical equipment industry as a whole opportunities in accommodating itself to the Indian desire for self-sufficiency. Whether or not heavy electrical manufacture in India can justify itself on comparative costs, India is going to have it. It is an industry in which labour costs form a very significant proportion of total costs, so that India may look hopefully towards the successful engineering industry built, for example, by Japan. But it is also an industry that will demand for some time a considerable amount of foreign technical advice, training and capital equipment.

The appointment is for a period of 15 years, during which time India hopes to build up an industry capable of producing generators, transformers, switchgear and turbines. The company will act as consultants in the design, layout and construction of one or more factories, on procurement of equipment, and on training of recruits to the industry. The Indian Government intends the new industry to employ about 10,000 people, and the capital investment may reach £20 million; it will not, incidentally, produce light electrical equipment in competition with AEI's existing subsidiary in India. AEI hopes to submit a detailed report on the new project to the Government in about a year; it is expected to take about seven years to build the factory and bring it up to full production.

A Bristol-Convair Airliner?

THE prospect that the Bristol Aeroplane Company in England and the US General Dynamics Corporation in America may become partners in the design and development of the airliner to replace the Britannia in the early sixties is likely to have sharp repercussions on the aircraft industries in both countries. The risks and sheer technical difficulties of designing a modern civil transport and its engines have assumed such dimensions that the number of projects under development at any one time gets steadily smaller. General Dynamics has massive technical resources, but has been inexplicably slow in putting forward any successor to its existing piston-engined transports, the Convair 340 and 440. It is now the only major American constructor without either a jet or a turbo-prop airliner to offer its customers.

The Bristol Aeroplane Company has one very large engine under development, the turbo-prop BE 25 which is potentially capable of 8,000 shaft horse-power, and the company has done a fair amount of preliminary work on the type of airliner which should succeed the Britannia. But Bristol's resources are limited, especially in technical manpower in spite of its investment in Short Brothers in Belfast. Bristol has already had dealings with General Dynamics' Canadair division, which is building a piston-engined, marine reconnaissance version of the Britannia; it is now sending a technical team of engineers to Convair's plant in San Diego, to see whether a common project for a long-range, 120-seat airliner can be worked out with General Dynamics. There is some urgency in the dis-

London's Growing Trade

LONDON is Britain's largest port. It has been dominant in the country's import trade for a generation and its share of total trade has been growing. Changes in the pattern of trade on the whole favour London. The bulk export trade in cotton piece goods that used to go out largely from Liverpool and Manchester has shrunk to a shadow of its former size. The coal export trade that once provided great tonnage outwards

from the North-East Coast and from South Wales is no more, and the coal import trade, much of which comes into London, has taken its place. Industry has drifted southward and brought trade to the Port of London.

The chart shows the net register tonnage of vessels, excluding naval ships, that entered and left British ports in 1948 and 1954, compared with the movements for the other principal ports. There is an important element of double counting in the figures, since a vessel that calls at several British ports is reckoned at each.

London is still predominantly an importing port. The table shows for the years ended March 31, 1939, 1954 and 1955, the Port of London Authority's accounting years—the breakdown by tonnage of the goods—not the ships—that came into, went out from or were transhipped through London. In total the latest year's figure was a record, despite the fact that a strike in October last year brought the port's trade almost to a standstill for a month. Unfortunately, it was coal imports from overseas that accounted largely for this

increase, these imports also were offset in part by a decline in coastwise coal shipments to London from the North-East coast. Exports to foreign destinations through London also declined.

cussions, for Lockheed, Douglas, Boeing and Vickers-Armstrongs are all booking orders for competing transports for delivery in roughly the same period. If the engineers work out a joint design that interests the airline operators, then the two companies will have to decide how the aircraft is to be financed and where it is to be built. The Ministry of Supply, for example, has provided a substantial portion of the funds out of which both the Britannia and the BE 25 engines have been developed, and its role in this proposed new partnership will need clarification.

World Bank Borrows Cheaply

THE International Bank has a good nose for smelling out the cheapest centre in which to borrow. It has this week made an issue of 50 million Swiss francs at 3½ per cent and offered publicly at par by a syndicate of leading Swiss banks. Such terms could not be matched today by any other international capital market. The issue is to be repaid in instalments between 1965 and 1974. It is the thirteenth bond issue offered publicly by the bank for currencies other than United States dollars.

The money raised is not needed for any specific Swiss franc requirement, but for the general purposes of the bank, which the fully convertible Swiss currency can satisfy, and the bank's general requirements are mounting with the rising tempo of its operations. In the third quarter of this year it made twelve loans totalling \$111,600,000 in nine countries. Disbursements on loans in that quarter amounted to \$88,200,000. The main projects now under consideration are participation in the Nile high dam plan, the Indian second five-year plan and the Italian Vanoni plan. Each of them bids fair to strain the bank's lending and advisory services more severely than any of its previous ventures, and will probably call for further reinforcement of the bank's lendable resources. In addition the World Bank will find half the sum of \$50 million that South Africa proposes to borrow for railway development; the other \$28 million is to be raised on New York market.

Competition in Sterling Markets

THE essence of the Board of Trade's summary of sterling area trade in the first half of this year has already been revealed, in modified form, in the White Paper on the

UNITED KINGDOM AND REST OF STERLING AREA TRADE
(£ million)

THE ECONOMIST, NOVEMBER 26, 1955

British balance of payments. But some points of interest remain. One is the remarkable extent to which the sharp increase in the sterling area's imports benefited the non-sterling countries rather than Britain and the rest of the sterling area. The tables tell the story.

Why did Britain lose ground in sterling markets? A more liberal import policy towards goods from the dollar area and Japan (particularly Japanese textiles) certainly contributed, but that cannot be the whole explanation. In the first quarter of this year exports of manufactures from the OEEC countries to the rest of the sterling area amounted to £118 million, an increase of 14 per cent compared with the quarterly average for the first half of last year; exports of manufactures from the dollar area in the first quarter were 32 per cent higher at £82 million. The absolute figures are still small compared with British exports, but they leave no doubt that other countries are making headway in Britain's established preserves.

Hope for Peruvian Corporation

PERUVIAN CORPORATION has a chequered history. Never since it was formed in 1890 has it paid an ordinary dividend; not since 1930 has it paid a preference dividend. The debenture interest, despite recent fairly regular payments, remains six years in arrear; the moratorium expires this year, and the court has made it clear that it will not again be renewed. The choice lies between action now and the receiver that the debenture-holders would surely appoint when the moratorium came to an end. The scheme that S. G. Warburg and Co. announces this week will be judged against that background and against the fact that, with all its miserable history, Peruvian Corporation is still an important British asset owning the whole railway system of Peru, the steamers on Lake Titikaka and a feeder line in Bolivia.

The scheme—ingenious and even daring—is based on three moves. First, the corporation will transfer to Canada, and Treasury consent has been granted. Secondly, its capital is to be exchanged, after writing down, for securities of a new company called Peruvian Transport Corporation, a foreign business resident in Canada which will thus escape Canadian income-tax as well as British tax. Thirdly, the Corporation is to place for cash at par \$4 million "A"

THE ECONOMIST, NOVEMBER 26, 1955

No other loader comes up to the International DROTT!

International Drott Skid-Shovel—Model 14-K3

International Drott performance on paper is impressive.

On the job—where the profits are—it's more impressive still!

Drott has the bucket capacity—plus the capacity to fill it. Drott has the digging force—and tremendous leverage to make it effective. Drott has the power and speed on tracks—and can put them into action to skid the bucket over the site fast, without spillage, stresses or strains.

An hour's demonstration proves this up to the hilt.

It's highly probable there's a job on your contracts or in your business that the International Drott could do better, faster and more economically. You should most certainly get in touch with your International Industrial Dealer and fix a time and place to put the Drott through its paces *yourself*, on *your* kind of work.

COMPARE THE FIGURES!

Bucket Capacity—2 cu. yds. (Extra Heavy Duty)	
3 cu. yds. (Light Duty)	
Break-out force.....	17,000 lbs
Bucket Roll-back.....	42°
Lifting Capacity.....	6,000 lbs
Loading height (bucket dumped).....	9 ft
Forward reach.....	62 ins

COMPARE THE FEATURES!

Pry-over-shoe break-out. Skid-Shoe transportation.
Reverse cylinder action—greater power for digging,
higher speed for dumping and lowering.
Hydro-Spring shock absorber—cuts shocks by two-thirds.
Single lever control.

Progress in view

The Mersey air is full of noises. Outside, the sounds of building ring sharply on the ear. In here, complex machinery beats a powerful rhythm as the endless, many-layered web of kraft paper is swept on its way to become multiwall sacks—adaptable, strong carriers of an infinite variety of materials.

As well as sacks, Bowater factories convert paper into many kinds of corrugated containers, fibre drums, protective packaging papers and paper bags; turn timber into hardboard, insulating board and acoustic panels, woodpulp into paper towels, tissues and handkerchiefs. On every side of this sack factory in Cheshire

the Bowater policy of diversification can be seen in action. Here, the ground is being surveyed for a new board mill. There, the foundations of another container factory are being laid. And nearby, new pulping equipment will soon come into operation to feed the mills' great paper machines.

Here, and elsewhere throughout the Organisation, the pattern of progress has been set. The work is going on.

Bowaters

THE BOWATER PAPER CORPORATION LIMITED

Great Britain United States of America Canada Australia South Africa Republic of Ireland Norway Sweden

share capital in New York. This is how each class of capital fares under the scheme:

The 6 per cent debenture bonds receive per £100:\$100 (US) 6 per cent debenture stock, plus \$70 5 per cent convertible debenture stock convertible into "B" shares at par, and £40 cash—a total worth with good luck £100—so that holders sacrifice 36 per cent of arrears and interest on them.

The 5 per cent non-cumulative preference shareholders will receive 34 "B" shares of \$1 (US) for each £100 stock with a maximum value of perhaps £12.

Ordinary shareholders 13 "B" shares for each £100 stock, which might be worth just over £4 10s.

The "A" and the "B" shares of the new company rank equally for dividends and votes, the "A" having priority for capital.

Announcement of the scheme produced an immediate rise in all classes of the company's capital. The debenture stock jumped 1½ points to 88 on Wednesday, for the scheme, thanks partly to the elimination of British taxation and partly to the saving in interest and sinking fund, leaves the company earning (and if earning why not paying?) a surplus after the reconstruction and change of residence. An average deficit over the past five years on the present

capitalisation of £109,000 is transformed into an average surplus of £244,000, and that is equal to earnings of 8.85 per cent on the new share capital.

SHORTER NOTE

The Chartered Bank of India, Australasia and China has set up a development corporation to finance projects in south and south-east Asia. The new institution, named the CBI Development Corporation, is a wholly owned subsidiary of the Chartered Bank; its authorised capital is £2 million, of which £500,000 has been paid up. The chairman is Mr V. A. Grantham, chairman of the Chartered Bank, and the directors also are drawn from the board of the bank. The corporation is expected to provide funds mainly in the form of medium term loans. It will work in conjunction with the national development corporations that have been set up in a number of Asian countries, including the Industrial Credit and Investment Corporation, in which the Chartered Bank has an interest.

Company Notes

BRITISH MOTOR CORPORATION. Costs have put a brake on the profits of British Motor Corporation, as they have with almost every other vehicle manufacturer this year. In the year to July 31st the number of vehicles made by the Corporation was 418,705 (compared with 353,834 in 1953-54), showing an increase of about 18 per cent. But trading profits before all charges rose by only 13 per cent, from £21,061,844 to £23,796,806. Output was running at about 10,100 vehicles a week

stages, "it is obvious that if production does not rise and costs of supplies do increase we shall have to raise our prices."

Behind the increase in output lies an immense capital programme. In the latest trading year the corporation spent £5,780,000 on capital account and at the end of June its outstanding capital contracts came to £6,565,000. But, thanks in part to the rights issue and in part to heavy reserve appropriations, the corporation has a handsome balance of liquid resources, totalling in all over £33 million.

The question is whether the corporation can sell all the vehicles it plans to produce. Sir Leonard's answer is:

"... whilst I have little doubt that we shall be able to sell our output, including a proper proportion of it abroad, it would be unreasonable to expect profits in the current year to be higher than those disclosed for the year under review; in fact, despite increased turnover they could conceivably be somewhat lower."

The nominal rate of ordinary dividend has been maintained at 12½ per cent, but in effect that represents an increase, for the new shares just issued as a one for eight free distribution rank for the final payment of 8½ per cent. Dividends from the motor companies this autumn did not change much, and, judging by Sir Leonard's remarks, they may again show little change next autumn.

JOSEPH LUCAS (INDUSTRIES). It is the practice of Joseph Lucas (Industries) to show a "consolidated surplus" after making a series of deductions for depreciation, tax and reserve appropriations. Stockholders would be advised to make their own

calculations from the profit and loss account. If they do they will find that, on a conservative reckoning, the gross trading surplus before all charges has risen from about £9.3 million to over £9.9 million and that the net profit after tax has gone up from about £2.6 million to nearly £3.6 million. Thus the maintained ordinary dividend, which after tax takes about £540,000, is most amply covered. The charitable view of accounts whose first entry shows an actual decline in the "consolidated surplus" is that the directors have tried to set out the figures on a comparable basis. The uncharitable view is that such a reckoning provides the directors with another buttress for their decision not to raise the dividend. In justifying this policy they use the phrase "in view of the results." They have considered all the factors bearing on the company's affairs and those concerning the motor industry and as if to emphasise that nothing that supports a conservative policy has been forgotten, they add that "the influence of immediate national circumstances has not been overlooked."

If stockholders make another calculation from the breakdown of the group's total income they will find that turnover has gone up from about £72 million to over £85 million. This was to be expected from a year in which the group's chief customer, the motor industry, was breaking all records. Trading profits have not risen as steeply, as sales for the group has had to meet much higher costs (notably in the price of the raw materials it uses). The chairman, Mr A. B. Waring, says that if the volume of output were to fall "there would be the utmost difficulty in keeping prices at anything like their present level." He adds that the company's "best interests will not be served by large profit margins but by a regularly expanding market." These are necessary warnings, for the company enjoys a commanding position over much of its field.

towards the end of the trading year and the directors hope to raise that figure to about 12,500 vehicles by the middle of next summer.

In making the decision to leave selling prices unchanged in spite of rising costs the directors, Sir Leonard Lord points out, had in mind "the possible savings from the increased production which is planned from the factories between now and the summer of next year." But he adds that while the Corporation is to forgo some of its profit in the early

MONTAGUE BURTON. This multiple tailor changed its accounting date from March 31st to August 31st because the end of March is a period of peak stocks in front of the Spring sales. Hence no direct comparison of profits can be made from the preliminary statement for the 17 months to August 31st last. The statement shows that in those 17 months the group, after charging tax of £970,000, earned a net profit of £1,299,678. That profit is entered after crediting £241,409 transferred from provisions for losses on forward commitments. In the year to March 31, 1954, the net profit was £633,515 but that sum also included a special credit of £271,546. Roughly if the latest figures are put on an annual basis and the special credits ignored, profits before tax have gone up from about £700,000 per annum to £1,400,000 and earnings after tax from £250,000 to £750,000. Both sets of figures include the earnings of the subsidiary, Jackson The Tailor. Evidently the group has moved further along the road of recovery.

That progress was indicated by the payment of two interim dividends this year of 5 per cent each, compared with a total dividend of 5 per cent for the year to March 31, 1954, the year in which Montague Burton came back after a year's absence to the list of dividend payers. The two interims have been followed by a final payment of 10 per cent, making 20 per cent in all for the 17 months. This is equivalent to an annual rate of 14.1 per cent. On that dividend the 10s. ordinary shares, at the current price of 33s. 6d., offer a yield of about 4½—a yield that suggests that investors hope for still more progress.

ELECTRIC AND MUSICAL INDUSTRIES. Not the least of the achievements of the new management of Electric and Musical Industries is to present fully consolidated accounts. These show that an increase of 22 per cent in the value of sales to about £40 million lay behind the advance in profits (discussed in these columns on October 29th) and the increase in the

ordinary dividend from 10 to 15 per cent. The turnover figure excludes the sales of the newly acquired American subsidiary, Capitol Records, but profits do include the earnings of that company between March 15th and June 30th.

The acquisition makes its mark in the consolidated balance sheet where the net value of fixed assets is up from £4,758,000 to £5,781,000 and where a new entry of £1,206,000 appears against intangible assets, representing "the excess of the cost of shares of Capitol Records over the value of its net assets at the date of acquisition." The inclusion of the Capitol company's assets must also partly be responsible for the increase in stocks (from £10,307,000 to £12,951,000) and in debtors (from £6,543,000 to £8,789,000),

	Years to June 30, 1954	1955

10s. ordinary stock at 25s. yields £6. per cent		

though turnover has clearly been expanding through the whole group. The rise in working capital commitments has been partly balanced by the growth in "sundry creditors" from £6,952,000 to £9,549,000 but the group is not strong in liquid resources. Although the cash balance has risen from £663,000 to £1,224,000 bank overdrafts are up from £1,545,000 to £2,141,000 and "fixed loans" from £353,000 to £600,000. That kind of balance sheet with capital commitments high at £999,000, against £162,000, and liquid resources meagre might be expected after the acquisition of an important subsidiary. But the growth in capital commitments does show—as the latest results and the Capitol Records purchase show—that the new management has a mind for expansion.

LONDON STOCK EXCHANGE

Next Account begins: November 30th
Next Contango Day: November 30th
Next Settlement Day: December 6th

THE market remained quiet throughout the week and prices fluctuated within narrow limits, no clear trend emerging. On Wednesday gilt-edged securities were firm while industrial stocks were easier. The new 4½ per cent Northern Ireland Electricity stock 1967/68 declined to ½ discount after dealings had started at par on Tuesday. Bank shares lost more ground, Midland £1 paid touching 71s. 3d. before recovering to 72s. 6d. An exception was a 5s. 6d. rise to 35s. in the Australia and New Zealand Bank shares, £1 paid, following an increase in the dividend. The fully paid "B" stock advanced to 38s. Mercantile Credit rose to 5½, also on an increase in the dividend.

Bass at 125s. and Guinness at 43s. 6d. were outstanding among brewery shares and GUS "A" improved to 39s. 9d. xc. among the stores. Decca rose to 40s. after the announcement that the company had secured a contract from the BEA for its Navigator. ICI declined 1s. 7½d. to 46s. 1½d. Bowater advanced to 104s. 4½d. and Turner & Newall to 102s. 6d. but Unilever lost 1s. 3d. to 89s. 6d. Steel shares were bought on Wednesday and prices moved higher; Stewarts & Lloyds rose to 72s. and John Summers gained 1s. 3d. to 42s.

Although demand for British Petroleum was at first hesitant due to the Middle East troubles it revived later. Shell also attracted buying in anticipation of the interim dividend. British Petroleum rose to 112s. 6d., Shell touched 7 and Royal Dutch gained 3½ to 62½. Kaffirs had a good day last Friday but buying faded and shares were marked down sharply on Wednesday. Anglo American lost ½ to 8½. No great adjustments followed the release of the reports for the Anglo American copper group. Bancroft lost 1s. 1½d. to 39s. but Rhodesian Anglo American gained ½ to 5½. High prices for lead and zinc brought sizeable gains in Australian producers on Wednesday. New Broken Hill rose 2s. 3d. to 43s. xd. and Consolidated Zinc 1s. 3d. to 54s. xd.

Financial Statistics

EXCHEQUER RETURNS

For the week ended November 19th there was an "above-line" deficit (after allowing for Sinking Funds) of £19,762,000 compared with a surplus of £13,313,000 in the previous week and a deficit of £20,094,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £1,591,000, bringing the total cumulative deficit to £604,307,000 (£439,846,000 in 1954-55).

THE MONEY MARKET

CREDIT in Lombard Street has been in taut supply in the past week. The market has generally just managed to balance its books without official intervention; but on Monday, two or three houses were still obliged to take a small amount of loans at Bank rate. Rates for outside money have ranged between 2½ and 4 per cent. Dealing rates for January and February maturities have been mainly at 4½ and 4¾ per cent.

Following the news late last week of the increase in rediscount rates of six US Federal Reserve Banks from 2½ to 2½ per cent, the premium on the forward dollar fell by ½ cent to 1½-1½ cents. Hence, even after the rise in the US Treasury bill rate this week to 2.44 per cent, the margin between New York and London rates is still perceptibly smaller than the cost of obtaining forward exchange cover.

The discount market made no change in its bid at the Treasury bill tender on Friday of last week, offering £99 5s. 9d. per cent for the £50 million of 63-day bills and £98 19s. 6d. per cent for the £240 million of 91-day bills. But total applications fell considerably—by £3.7 million to £64.3 million for the two months and by £23.1 million to £315.2 million for the three months maturities—and the market's allotment rose from 70 to 75 per cent and from 47 to 66 per cent respectively. Its average allotment on all bills rose from 51 to 68 per cent. At yesterday's tender, the total offering remained at £290 million, but the amount in 63-day bills was raised from £50 to £60 million.

Over 670 Offices in Africa

Our 93rd Year

... a residential township 4 miles from East London, the important agricultural, dairy and fishing centre of Cape Province. Nearby is the magnificent Horseshoe Valley, through which runs Nahoon River. Our Cambridge branch offers complete banking facilities to this busy community and its visitors.

Banking and YOUR JOB...

"I'm a Professional Man"

Professional men in every walk of life appreciate the services which a bank can render in bringing order and method to their monetary affairs by the use of a banking account. Equally appreciated are the services which professional men render to the banking industry. Having thus exchanged compliments we would say that Martins Bank welcomes every opportunity of being of service to customers whether it is advice on financial matters, help with travel arrangements or custody of securities, to name only three ways in which the Bank can be of assistance.

Our Managers are friendly and understanding and you will always find them ready to help.

MARTINS BANK LIMITED

London District Office: 68 Lombard St. E.C.3.

HEAD OFFICE: WATER ST. LIVERPOOL 2

Total Assets (as at 30th June, 1955): £330,928,759.

DO I GET A PENSION?

Both in commerce and industry more and more employers are learning that a pension scheme attracts the best type of man. Prudential Pension Schemes WITH PROFITS are available for businesses both large and small. Employees over age 50 are eligible to join. For full particulars apply to your local Prudential office or to:

MR ALFRED WHITTLE ON NEED FOR RESTORATION OF ECONOMIC INCENTIVES

The fifty-sixth annual general meeting of The Wall Paper Manufacturers Limited was held on November 23rd at the Midland Hotel, Manchester.

Mr Alfred Whittle, FCA, Chairman of the Company, who presided, said:

Ladies and Gentlemen: As you have had the Directors' Report and Statement of Accounts for the year ended June 30, 1955, in your hands for some weeks, I do not propose to refer to all the items in detail but will comment briefly on certain important matters which appear in the Consolidated Profit and Loss Account and in the Consolidated Balance Sheet.

GROUP PROFITS AND APPROPRIATIONS

The Accounts show that the net profit of the Group before charging taxation amounts to £3,097,751. This figure is arrived at after deducting approximately £700,000 for debenture interest, depreciation, pension fund contributions and goodwill written off.

The charge for taxation £1,810,108 is the estimated amount payable on the profits of the year under review, leaving £1,287,643 as the net profit of the Group, a decrease of £233,442. The net profit added to the amount brought forward from last year makes available for appropriations and dividends £3,509,370.

Out of this amount the Subsidiary Companies have transferred £475,000 to their Renewal and Development Reserves and the Parent Company £250,000 to a similar reserve as well as £100,000 to General Reserve. In addition, £50,000 has been allocated to Pension Funds. Deducting these appropriations and the dividends already paid and those recommended on the Preference, Ordinary and Deferred Stocks there will remain a balance of £2,109,735 to carry forward to next year, of which £1,464,301 is attributable to the Subsidiary Companies and £645,434 to the Parent Company.

GROUP BALANCE SHEET

Capital expenditure to the extent of £1,192,000 has been incurred during the year, and this amount, after deducting disposals and depreciation, brings the book value of Fixed Assets to £6,042,686 as against £5,437,914.

Current Assets at a total of £18,365,960 need little comment, as the increases under this heading are due to expansion in trading. It will be observed that the Group's Current Assets now exceed Current Liabilities and Provisions by £12,095,291.

On the other side of the Balance Sheet Revenue Reserves, including that for future taxation and Unappropriated Profits, amount to £9,987,985, an increase of £1,016,957.

At this stage it would, I think, be appropriate to say a few words about the largest reserve we have built up and which is included in the amount of £9,987,985. I refer to the reserve for renewal and development.

RENEWAL AND DEVELOPMENT

The amount set aside for these purposes now stands at £2,760,000 and is intended to finance the various schemes throughout the Group: those already in hand and those which will be undertaken in the near future. At the end of the financial year the Group's commitments for Capital Expenditure amounted to £1,771,000, and since June 30th last further sums of approximately £400,000 have been sanctioned by the Board. I have already mentioned that during the past year £1,192,000 has been spent on additional Fixed Assets spread over many units of the Group. This expenditure is for new buildings and plant at our Paper and Wallpaper mills, our Paint, Mica and Fabrics factories and for the fixed assets of businesses purchased during the year.

We are indeed favourably placed in being able to finance these extensive capital schemes from our own internal resources. The steady ploughing back of profits for which your Company has been noted for many years enables us, now that restrictions on building have been removed, to go forward unhampered with the extension of works, the installation of new plant and the acquisition of new businesses which will further strengthen the already very solid structure of the Company. The enterprises in the Group will continue to expand and we shall constantly need to call upon our liquid resources which are just where we want them—in our own business—waiting for conversion into Capital assets as these are called for. The equity stockholders could have no better assurance for the future of their investment.

WALLPAPER

The demand for wallpaper was well maintained last year and sales were satisfactory. The factories were kept busy and a fair amount of overtime was worked. The profit from wallpaper manufacture has again been very small and quite incommensurate with the capital invested in the industry and with the hard work and inventive effort exerted by your Directors and the Staffs. We make no complaint about this. We knew in 1945 when production of wallpaper was resumed that the industry faced a period of difficult trading. We knew that the cost of paper would be very high for a long time and we accepted that the industry would have to bear, through purchase tax, a disproportionate share of the burden of the nation's fight against inflation. For this reason we chose

to regard the period as one of transition during which we have been prepared to nurse the industry back to full health without expecting it to give us a maximum return. Because of the commanding position of the Company we have been able to set standards for the whole industry and these standards have called for better and better quality. During the last ten years we have been witnessing, coincident with the improvement of public taste, the gradual elimination of inferior designs and colourings from the wallpaper collections and their replacement by wallpapers of the best design and colouring. Today our machines are producing effects which formerly were only obtainable by hand printing; the prices of these wallpapers are within everybody's purse. The three main wallpaper lines produced by your Company—Sanderson, Crown and Lancastria—are household words not only in this country but in every part of the world where wallpaper is used.

Your directors are conscious of their responsibility in the question of the price which the public pays for wallpaper (which is the most popular form of decoration). The company has for ten years shielded the householder from the very high cost of paper. I go out of my way to mention this because your company, in its wallpaper section, which is responsible for about 70 per cent of the United Kingdom output, is classed as a monopoly. In the minds of those people who have not yet grown aware of the economic debt which Great Britain owes to the work and achievements of its large industrial undertakings, monopoly is associated with high prices. I desire to place on record that so far as the wallpaper section of your Company is considered a so-called monopoly, it is to be credited with having given the public lower prices; and further that it will, so long as it is able and allowed to do so, continue its policy of high quality and low prices. It is an important part of this policy that we have the understanding support and collaboration of all those Distributors, both wholesale and retail, who have the best interest of the public and the good name of the trade at heart.

SERVICE TO ARCHITECTS

One of the problems of the wallpaper manufacturer is to get the whole of his range of patterns before the public so that the householder seeking novel and striking designs and colourings, those in the vanguard of fashion, may know whether what he wants is available. Such lines tend not to be taken up at the outset by distributors generally, a factor which results in the manufacturer being regarded by the public as conservative and not moving in line with other industries that keep abreast of the influences on design and colour, which now more than ever come from many parts of the world. We are doing

our best to solve this problem by the displays which we make and constantly change in our extensive showrooms at King's House in Manchester and at High Holborn in London. We have supplemented this by the forming of an Advisory Department whose specialised duty it is to give service to Architects on decoration. The facilities available in the showrooms and the new department are being fully used by the public and the profession. These services are complementary to those given by our leading distributor customers. I hope that stockholders will, when opportunity occurs, make a point of visiting either the Manchester or the London premises.

We continue to give the closest attention to our publicity policy and take great care in letting the Press have very early information about what we are producing and what we are doing. We are conscious that in one small way or another wallpaper is constantly in the news and we collaborate with the Press in securing accuracy of detail and information.

Export trade in wallpaper remains very difficult and new problems continue to be thrown up in different markets all over the world. Taking one year with another, we are about maintaining our figures, but we are often fighting difficulties unconnected with competition in price and quality. Our overseas customers and agents are regularly visited by directors and senior officials.

PAPER MAKING

Closely linked to our business of wallpaper manufacture is that of paper making. Very heavy expenditure has been made at the Hollins Paper Mill at Darwen, the whole of whose output is taken by our wallpaper mills apart from the lining papers made for our customers. Also extensive additions to buildings and machinery at the mills of the Darwen Paper Mill Company Limited were commenced during the year under review and will be completed during the early part of next year. These mills sell the bulk of their varied output outside the Group, but their contribution to the Parent Company's supply requirements is made without hindering sales to their other customers.

It has been very fortunate for us that during these last few years, when paper has been difficult to obtain, we have had our own sources of supply. The heavy expenditure on these mills, and paper making calls for very heavy investments on plant and machinery and on the adaptation of buildings to changing needs, has been and will, I am sure, continue to be justified.

The main restriction on paper making has been the shortage and the high price of the basic raw materials. The shortage is intensified by currency restrictions, but would not be completely removed by the easing of those limitations because world demand for paper is outstripping supply. It was indeed these considerations that some years ago impelled us to acquire the buildings and plant at Radcliffe at which our subsidiary, The Straw Pulp Manufacturing Company Limited, commenced the processing of home-grown straw (a substitute for imported wood pulp) for our paper-making mills. We continue to be very satisfied in having under our control this channel of supply of an invaluable paper-making material, even though only part of its output is absorbed in the subsequent processes of paper making for wallpaper manufacture. As mentioned in the Directors' Report, a paper-making machine has been erected and is in production at the Straw Pulp subsidiary company.

PAINT MANUFACTURE

Paint manufacture is an industry—both complementary to and competitive with wall-

paper—in which we have a most important stake in our ownership of The Walpamur Company Limited. Already one of the leading paint manufacturers, it is gratifying to be able to report the further substantial and solid progress made by The Walpamur Company during the past year. In an industry that is highly competitive the esteem in which its products are held continues to grow, a fact which we attribute to the importance attached to the maintenance of quality and to the strength of its marketing arrangements.

There is a continued growth in the popularity of its leading lines, Walpamur Water Paint, Duradio Enamel Paint, Muromatte Flat Oil Paint, and Peveril Emulsion Paint; also Walpamur Glossy Finish, a gloss paint that can be thinned with water—a unique process which we pioneered. The many other paints that are produced for retail and industrial uses are making the same progress as the leading lines. Indeed it is difficult to think of a type of paint, however specialised it may be, that The Walpamur Company does not make. The past year has seen parallel with a continued heavy expenditure on improved manufacturing processes and on fundamental research, a sustained expansion of marketing arrangements based upon the opening of new depots and the acquisition of further merchandising businesses. The Walpamur Company's overseas subsidiaries in Canada, Eire and South Africa are progressing satisfactorily.

The Walpamur Company, itself the centre of a very large manufacturing and trading group within the Company, is a heavy contributor to our profit.

BRUSHES

The Hollins Brush Company Limited has had a difficult year, and its profit is less than that of the previous year, although sales have not declined. Profit margins have been low, but it is gratifying to report that on the home market its brushes are held in growing esteem and enjoy a high reputation for quality. The distributing subsidiary in Canada has not yet developed to the extent necessary to earn a profit.

POWDERED MICA, PLASTIC MOULDING POWDERS AND EBONITE

The various grades of powdered mica produced by Micafine Limited, for the many industries that it serves, are in steady demand. The plant has during the past year been operating to full capacity; our building extensions and the installation of a new plant will be completed early next year.

Our interest in the field of plastics is represented by our subsidiary, James Ferguson and Sons Limited, and I am satisfied that valuable as is our share in this young and expanding industry it will grow increasingly so. The range of consumer goods containing plastic material continues to increase—the industrial demand is already very wide and also still expanding.

This subsidiary has not had as good a year as previously; the moulding powder section, although maintaining sales, had smaller margins of profit, but the Ebonite section has had another satisfactory year.

SANDERSON GROUP

All sections of this Group show increased turnover.

The daily attendance at the famous London showroom in Berners Street has been very large; indeed a "Help Yourself" section is being instituted to speed up selection of wall-

papers and fabrics by customers who prefer to choose that way.

It is hoped this year to start the rebuilding of the large block of premises in Berners Street which has gradually been acquired to house the expansion of the business since it first came there in 1865.

Sanderson Fabrics have had a record turnover with a large proportion going overseas. The new Jacquard weaving section is now making a big contribution to the factory output.

DISTRIBUTING SUBSIDIARIES

I go on next to speak about the Wall Paper Stores Limited, our growing chain of retail shops which are positioned over the whole country, particularly in those places where there were no shops specialising in the display and sale over the counter of our products. It would be difficult to exaggerate the important part these shops play in popularising wallpaper, paints and brushes and in their method of presentation. Their work over the years has been invaluable apart from the substantial contribution they make to our Group profits. We must continue to open shops where we feel that existing channels of distribution do not bring the complete range of our products before the public.

Our merchandising subsidiaries, which supply the decorators and retailers, have also made very good progress during the past year. The high standard of display of the Group's products in their showrooms and the care taken in the compilation of their pattern books have been factors in maintaining the decorators' trade.

SELLING PRICES

Our policy throughout the Group is to keep the prices of our products as low as possible. Your Company has a stake in many industries—wallpaper, paint, paper, pulp, brushes, furnishing fabrics, plastics, mica, etc., and manufactures all these different products under varying conditions of competition. The strength of your Company is brought out by the fact that its principal profit-making sections are those in which extreme competition has to be faced.

CANADIAN COMPANIES

It is most disappointing for me to have to report the trading loss incurred by the Canadian Wallpaper Manufacturers Ltd. In my statement last year I mentioned that one mill had been closed down and I regret to say that throughout the last financial year there has been a steady decline in the sales of wallpaper which resulted in uneconomic manufacture. The Canadian productions are of high quality but costs are too high to enable them to market their output profitably. Guidance has been given by the Parent Company on measures to be taken to improve the trading position, but it will take some months for the results of these measures to become evident.

The trading loss of the Dominion Colour Corporation is entirely due to the fall in sales of colour to our wallpaper mills.

The Crown Diamond Paint Company has increased its sales and has had a satisfactory year.

LABOUR

Our relations with the many Trade Unions with which our various activities bring us into contact remain friendly; we are receiving co-operation from them in what is one of the major economic problems of our time

and one which will very largely determine the future of our country—the working out of fair wage and bonus rates which will secure greater production and at the same time give employees their share of the fruits of greater output. This problem is acute in our wallpaper factories because of the narrow margins on production but it is almost as important in our other manufacturing sections.

The various staff and workers' pension funds now over 25 years old continue to expand and are a valuable bond with our employees. These funds total £2,817,046.

FUTURE OUTLOOK

I have given account of the fortunes and minor reverses of the various sections of the Company. It is traditional for the Chairman of this Company not to take the future for granted—this was so in the comparatively calm days before 1939 and today is certainly not the time for me to break with tradition. There are so many uncertain factors in the background at the present time.

Our national difficulties at the present time stem largely from the strain on our productive capacity of the demand for both capital goods and consumer goods. With the national economy running at full speed, with maximum production needing to be fed with more imported raw materials, and with the stabilisation of our price level seemingly as far off as ever, it is clear that those responsible for the conduct of the nation's business, and I include the Trade Unions in this category, are going to face a period of acute difficulties and stresses. The situation demands discipline and forbearance from all concerned, and not least from the State. It must be remembered that during the last 15 years our economy has been cumulatively distorted by subsidies and tax manipulations which have hidden the real cost of very many commodities and services. We are now passing through a period during which artificial aids and checks are being abandoned. The sooner we can get back to true costs, the healthier will our economy become. It is a signal misfortune that the pruning of subsidies recently announced is accompanied by purchase tax increases. It is the clear duty of the State to bring down its expenditure and to withdraw from the nationalised industries and the local authorities their privileged claim on our national resources. The restoration of economic incentives combined with lower taxation will bring the additional production which is the only cure for inflation.

The fortunes of few business undertakings today are determined entirely by their own efforts and foresight. External forces intervene to falsify the most careful production and marketing planning and doubtless will continue to do so during the next few years whilst the Government unravels the tangle of artificial distortions which so sadly afflict industry. I feel that so far as your Company is concerned we shall be able to find our way through the difficulties that are within our control.

TRIBUTES

I would like to record on behalf of the Directors our appreciation of the successful conduct of the respective businesses of the Group by the Executives and Staffs, both of the Parent Company and our numerous subsidiaries, and to thank the employees everywhere for their loyal co-operation and hard work during the past year. I am satisfied that with a continuation of this assistance the Company can look forward to the future with confidence.

The report and accounts were adopted.

McDOUGALLS TRUST LIMITED

(McDougalls Self-Raising Flour, etc.)

SATISFACTORY TRADING RESULTS

MR KENNETH A. E. MOORE'S REVIEW

The Twenty-second Annual General Meeting of McDougalls Trust Limited was held on November 17th, in London.

In the course of his address to the shareholders, the Chairman (Mr Kenneth A. E. Moore) said:

The hopes which I expressed a year ago have been fulfilled and, as you will have appreciated on studying the Directors' Report, we have had a most satisfactory year—in fact, the best in the history of the Company.

INCREASED SALES

Sales of McDougalls Self-Raising Flour reached a new high level, and the turnover of our non-milling subsidiary companies again broke all records. The combined profits for the year amounted to £790,400, as compared with £624,639 for the preceding ten months. These profit figures were achieved in spite of the fact that, throughout the past year, the retail price of our flour was lower than it was when the Government relinquished control over production and prices two years ago. Thus McDougalls have done something towards reducing the cost of living.

You will see from the Directors' Report that we are recommending a final dividend of 10 per cent on the Ordinary shares, making 15 per cent for the year, and that, in outline, the figures are as follows:

Consolidated trading profits.....	£790,400
Sundry credits relating to previous periods.....	6,294
	796,694
Deducting from this:—	
Provision for taxation.....	£423,748
Dividends paid or proposed (less tax).....	157,386
	581,134
there remains, to be ploughed in.....	£215,560

Of this, £100,000 has been added to General Reserves (making them up to £564,329), £110,000 to Reserves for Advertising and Contingencies (making them up to £310,000), and £5,560 has been added to the Carry Forward.

INCIDENCE OF TAXATION

It is interesting to note that in a good year such as this the Government, by way of taxation, is taking nearly three times as much cash out of the business as are the shareholders, and that the shareholders are leaving more in the business than they are taking out by way of dividend.

Put in that way, it sounds rather monstrous but I can assure you that it is quite a modest example of what is common form nowadays in any soundly managed, flourishing and progressive company. The moral is that the community ought to put up a statue to the Unknown Shareholder who, out of his savings, provides the capital for industry and takes all the risks, whilst his sleeping partner—the State—puts up no money, takes no risk, but takes the lion's share of the profits, all in hard cash. By comparison

Nationalisation sounds a ludicrously unattractive alternative to the so-called Private Enterprise system.

You may wonder why, in this exceptionally good year, we are only recommending a marginal increase in dividend. There are many reasons. They include, quite apart from the inroads of taxation, the necessity to have regard to the increased cost of replacement of plant and the increased working capital required to finance wheat and other stocks in an inflationary world.

Against this background and in the phase of financial stringency which has now descended upon the capital market it is obviously more than ever desirable to take the opportunity in a good year of putting away as much as is reasonably possible to keep the business in good shape and to finance development.

POSTWAR DEVELOPMENT

In the years since the war we have spent very large sums on modernising and extending our plants, in building up our own transport fleet, and in extending the range of our business. All this has been achieved so far by the ploughing-in of undistributed profits.

Meanwhile, looking back over the years, you will be interested to know that our main business—the production and sale of McDougalls Self-Raising Flour—has in-

creased nearly three-fold since 1939 and this remarkable progress has been achieved against the tide in the sense that, since the war, the total consumption of flour in the United Kingdom has been falling off.

The growth of the business in recent years has involved a heavy strain on management, staff and workpeople and I have received some appreciative letters from shareholders at the encouraging results achieved. I am sure that those shareholders present today will wish to join with the Board in expressing their especial thanks to those who, by their initiative, hard work and team-spirit, have made such outstanding progress possible.

It is early days yet to make any forecast as to results in the current year. Trade was slack during the exceptionally fine summer months for the reason that, not unnaturally, the housewife was disinclined to cook in a hot kitchen. The fine summer has, however, brought us something which we very much welcome—an English wheat harvest of superlative quality which is fully reflected in our product.

The report and accounts were adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY (Incorporated in the Union of South Africa)

EXTRACTS FROM CHAIRMAN'S SPEECH

The annual general meeting of the Johannesburg Consolidated Investment Company, Limited, was held on November 22nd in Johannesburg.

Mr H. J. Joel (the Chairman) in the course of his speech said that the net liquid assets, after providing for all taxation, had increased over the year by £2,204,000, i.e., from £858,000 to £3,062,000. That increase in the net liquid assets was due mainly to the reduction in taxation liabilities as explained in the Directors' Report. With regard to the amount of £4,938,000 transferred from Investment Reserve and applied in reduction of the book value of investments, the greater part of that adjustment related to their holding in Freddie's Consolidated Mines, Limited, which amounted to 7,479,528 shares at June 30, 1955, and had not materially altered since that date.

Turning to the Profit and Loss Account, income from investments showed a satisfactory increase of £187,000. Profit on realisation of investments had, on the other hand, declined by £364,000.

Apart from the advantage of non-liability to United Kingdom taxation in respect of the profits for the year under review, it had been possible to transfer to the credit of Profit and Loss Account the sum of £1,800,000 from the taxation provisions made in previous years. That arose partly from the income tax relief for a past year and partly from the effect of revaluation of investments on the taxable profits of a number of years. That amount, together with the profit for the year and the balance brought forward from the previous year, had enabled the transfer of a sum of £3,470,000 to Investment Reserve in order to make up the amount of £4,938,000 required for the adjustment of the book value of investments, and to provide for the dividend of 3s. per share less United Kingdom income tax, leaving a balance of £115,686 to be carried forward. It was his hope that the rate of dividend could at least be maintained at the present level.

GOLD MINING

The Chairman continued: References have been made at previous annual meetings of this Company to the effects upon marginal ore of increasing working costs.

It is indeed fortunate for the industry and South Africa as a whole that new mining areas have come to the fore, while the advent of uranium production has enabled certain mines which would otherwise have been on the verge of closure, to continue operating profitably.

The decline in the scale of operations of mines of this Group was foreseen, and in 1943 we commenced prospecting in the Orange Free State with the object of seeking out fresh mining ventures. The future of the Company depends largely on an ability to increase revenue and this in turn depends on an improvement in the rate of milling or in the value of the ore milled or both. The report of Freddie's Consolidated Mines, Limited, for the quarter ended September 30, 1955, emphasised the continuing difficulties encountered in endeavouring to increase the rate of production, but development is being vigorously carried out in an attempt to achieve this, and also to obtain information about the areas of the mine outside those already exploited.

ROAN ANTELOPE COPPER MINES LIMITED

(Incorporated in Northern Rhodesia)

The following is an abridgment of the Statement, dated October 18, 1955, by the Chairman (Mr Ronald L. PRAIN, OBE), circulated to the Members:

RESULTS FOR THE YEAR

Blister copper production for the year was 82,696 tons. The average cost of production of both blister and electrolytic copper increased from £126 1s. 0d. to £142 0s. 3d. The average realisation price of both types of copper for the year was £270 11s. 8d. per ton. The profit was £9,859,418 and the increase in the value of copper stocks brings this profit up to £10,626,303; taxes are estimated to be £3,896,000. The appropriation to Replacements Reserve is £1 million and the transfer to General Reserve is £1,400,000.

There remains £4,565,452 after bringing in £93,428 from the preceding year. Last July an interim dividend of 1s. 3d. per share, less taxes, was paid, and a final distribution of 2s. 9d., less taxes, is now recommended, making a total distribution of 4s. per share costing £4,494,000.

AFRICAN ADVANCEMENT

It was with much pleasure that we were able to announce last September that agreement had been reached between the Copperbelt Companies and the European Mine Workers' Union on a scheme which will provide immediately a number of new opportunities for our African employees and create for them the nucleus of an intermediate field of employment. The Agreement provides for a job survey to be undertaken as soon as possible of all the remaining jobs within the European field and provides for negotiations to follow the survey which will, we hope, result in a comprehensive plan which will represent a permanent solution of the advancement problem. The features of this plan, it is expected, will be the completion of the intermediate field for Africans and agreement on a permanent field of employment open to European Union members as at present and also open to suitably qualified and experienced Africans at the same rates of pay and emoluments as those enjoyed by Europeans similarly engaged.

This Agreement was the result of years of negotiation. During the last 10 years or so three Boards of Inquiry or Commissions have examined the problem of African advancement on the Copperbelt and increasing interest in this matter has been shown in many parts of the world. The Agreement that has now been reached reflects great credit on those who were responsible for negotiating it, and I should like to pay my tribute to the European Union for the realism with which they have dealt with this problem. A settlement along the lines envisaged will not only safeguard our European employees against any alleged risk of unfair competition, but will also provide for our African employees that real equality of opportunity which alone can give practical expression in the industrial field to the spirit of partnership on which the Federation is based. Africans will now have the chance, previously denied to them, of proving some of their claims. Difficulties in dealing with as complex a problem as this must inevitably arise from time to time, but given goodwill on all sides there appears to be now no reason why industrial relationships on the Copperbelt should not be placed on a sound and workable basis.

COPPER PRICE

When the price of any commodity rises as quickly and as much as the price of copper has in the last year, certain dangers arise; on the short term view the danger that the reaction in price, when it comes, may be just as drastic; on a long term view the danger that damage may be done permanently to that commodity's markets.

In the case of copper the position has been particularly vulnerable. For some time past consumers of copper, by which I mean both fabricators and end-users, have been concerned at three factors; the prevalence of strikes and other interruptions at the producing mines or smelters; the instability of the price; and the level of prices which they consider too high, whether by reference to past standards or to present production costs. Added factors have been the multi-price structure which, for reasons which I have not space to go into here, has existed in the copper world, and the difficulties in which many fabricators, particularly in Europe, have found themselves of financing their working stocks of a commodity which has risen in price so rapidly.

Because of these factors the fabricators and end-users have turned increasingly to the possibility of substitutes. It is, of course, easy to argue that substitution cannot replace all copper uses and that the remaining uses will absorb all supplies in sight. It is equally easy, however, to demonstrate that increasing consumer resistance must be encountered at each price rise over a certain figure which will vary from industry to industry. It so happens that the materials competing, each in their own field, with copper enjoy relative freedom from the handicaps I have mentioned above as applying to copper. Their prices enjoy great stability at what are considered reasonable levels and on the whole their supplies are not subject to major interruptions.

These problems have occurred at a time when large new productions of copper are about to reach the market. We have been increasingly concerned at the position, but we have realised that there is little any one producer can do to remedy the situation. We took the view, however, last May that while we could not hope to influence the price level or the incidence of strikes, we could at least impart some degree of stability to the market by quoting prices which would not change daily as was previously the case when our major contracts were governed by the London Metal Exchange quotations. Furthermore, we considered that such fixed prices should be approximately in line with the average of world prices as ascertained from time to time. In implementing this new policy we were not only reverting to the same policy as we pursued in the years from 1945 to 1953, but were also following the practice of most other large producers in the world. Our decision to make the change of policy was influenced by a request which was made to us by the copper fabricating industry of Great Britain. It has received the support also of the fabricating trade in other parts of the world, even if they are not our customers, and, as I mentioned above, most major producers in the world are now on some similar marketing basis, realising that it is up to the industry to do something towards matching the conditions offered by those other industries who market products which are now competing with copper.

RHODESIAN SELECTION TRUST LIMITED

(Incorporated in Northern Rhodesia)

MR RONALD L. PRAIN REVIEWS MAIN INTERESTS

The Twenty-seventh Annual General Meeting of Rhodesian Selection Trust Limited will be held at Salisbury, Southern Rhodesia, on December 16, 1955.

The following is an abridgment of the Statement, dated October 18, 1955, by the Chairman, Mr Ronald L. PRAIN, OBE, which has been circulated to the members.

I will start by reviewing briefly the position of the Companies in which we are mainly interested, namely, Mufulira, Chibuluma, Baluba and Chambishi.

MUFULIRA

Accompanying this Statement are the complete accounts, Directors' report, General Manager's report and Chairman's statement of the Mufulira Company, which between them will give you, I think, all the information you may require.

Our confidence in Mufulira as one of the great copper mines of the world remains unchanged.

During the year Mufulira made an issue of 666,667 shares at a price of £3 per share, this providing £2 million. We took up our rights, namely 400,200 shares at a cost of £1,200,600. Since the end of the financial year we have acquired from another shareholder a further 19,475 shares in Mufulira, together with a proportionate number of shares in Chibuluma, Baluba and Chambishi. Our holding in Mufulira is now 63.98 per cent.

CHIBULUMA

The annual accounts, Directors' report and Manager's report of the Chibuluma Company are being sent with this Statement. Since no Chairman's statement is issued by that Company, perhaps I may take this opportunity of adding a word on the present position at Chibuluma.

When the Chibuluma enterprise was started in 1951 it was planned to start ore hoisting in October, 1955. It reflects great credit on the Manager and his staff and the Consulting Engineers that the mine was in a position to carry out this programme. It is no fault of the organisation that certain delays have occurred in the arrival of the main winder and of the steelwork for the concentrator. However, by moving a temporary winder from Mufulira, ore hoisting did actually begin as planned in October, and will continue at an average rate of about 15/18,000 tons a month until the initial stopes have been opened up, when we shall be in a position to hoist the rated capacity of 40,000 tons per month.

The delay in the arrival of the main winder and concentrator steelwork was due partly to the suppliers, and partly to the dock strike in the United Kingdom. The concentrator is expected to be available for operations on or about April 1, 1956. Until then the ore which is now being hoisted will be added to the stockpile on the surface.

These delays will involve an unforeseen increase in the expenditure which must be incurred before revenue is received. The extent of this increase has still to be ascertained but it is hoped to avoid any call on shareholders to meet it.

The mill at Chibuluma will produce a copper concentrate and a cobalt concentrate. The copper concentrate will be smelted at one or more of the Copperbelt smelters and

the cobalt concentrate will be sent to the Chibuluma cobalt plant which is under construction at Ndola. This plant is expected to come into production about the middle of next year and arrangements are in hand for the treatment in Europe of its first product, which will be a cobalt matte containing about 10 per cent cobalt.

Apart from the unfortunate delays in arrival of equipment, which have arisen in the last few months, Chibuluma would probably have fulfilled its original time and financial targets.

After the share transactions mentioned in the preceding section our holding in Chibuluma is 64.29 per cent.

BALUBA AND CHAMBISHI

Our holding in each of these companies also is 64.29 per cent. Both are potentially large mines for the future and work is proceeding at both properties to increase our knowledge of the extent and characteristics of the orebodies.

RHODESIAN SELECTION TRUST SERVICES LIMITED

This Company continues to render administrative, managerial, technical and other services to all the Companies in the Rhodesian Selection Trust Group. It holds the appointment of Consulting Engineers to Chibuluma, Baluba and Chambishi and also to the Chisangwa, Kadola, Luapula, and Mwinilunga prospecting companies. Our interest in the latter companies is held through Mufulira's interest in these companies.

During the year the Rhodesian Selection Trust Services research and development centre at Kalulushi was officially opened and is already rendering valuable service to the Group as a whole.

EXPLORATION

Last July a new Company was registered in Southern Rhodesia called Rhodesian Selection Trust Exploration Limited, in which your Company has a direct share as well as an indirect one through Mufulira. This Company has been formed for the purpose of examining mining propositions within the Federation of Rhodesia and Nyasaland, but outside of the Copperbelt or of the main concession prospecting areas near the Copperbelt.

COMMITMENTS

I mentioned last year that in view of the increased scope and possibly greater financial commitments which your Company now has by virtue of its more diversified shareholding interests, the Board felt that the cash resources of the Company should be increased. Last year the dividend paid by the Company was somewhat less than its income and as a result the free cash in the Company was increased to about £297,000. This has been partly used up by the purchase of the shares in Mufulira, Chibuluma, Baluba and Chambishi which I mentioned earlier, which together cost about £175,000, reducing our free cash to £122,000. There are also continuing commitments on the drilling at Baluba and Chambishi, and some other minor calls on our funds.

For this reason your Board has this year

again decided to withhold a small proportion of the income to build up the cash resources further.

FINANCIAL AND DIVIDENDS

The income for the past year which, apart from a small credit for interest received, came exclusively from Mufulira dividends, amounted to £3,518,000, against which expenses amounted to about £65,000.

In July an interim dividend of 1s. 6d. per share, less taxes, was paid and the Directors have now recommended a final dividend of 3s. 3d. per share, less taxes.

If this recommendation is accepted by the shareholders in General Meeting the dividend distribution for the year will cost £3,357,000. This will allow the cash position to be built up again as outlined earlier, and the sum of £250,000 has therefore been transferred to General Reserve, representing approximately the free cash in the Company.

STOCK EXCHANGE LISTINGS

I indicated last year that we were taking steps to list the Company's shares on the New York Stock Exchange. Dealings began last July and have attracted considerable interest. During the first eleven weeks of trading in these shares the transactions in Rhodesian Selection Trust shares for three of those weeks were the highest of any security listed on the New York Stock Exchange, and the turnover for those eleven weeks was about 1,387,000 shares.

It is interesting to note that only three British Sterling area companies are listed on the New York Stock Exchange, of which two are companies in our Group.

During the year our shares were also introduced unofficially to the Brussels Bourse through the facilities afforded by the Banque Lambert in Brussels.

At the beginning of this year I convened informal meetings of shareholders both in London and New York which are the two main centres where the holders of the majority of our shares appear to reside. In view of the gratifying attendance at these meetings I propose again to call informal meetings within the next two or three months.

THE FUTURE

I cannot conclude this Statement without drawing the attention of shareholders to the historic agreements which were concluded last September between the Copperbelt Companies and the European Mine Workers' Union on the subject of African advancement, to which I referred in my Statement last year. This issue has hung over the Copperbelt for years, and it is gratifying to feel that at last the various parties involved have come to grips with the real problem. We hope that the first-fruits of this agreement will be a period of industrial peace on the Copperbelt, and perhaps equally important we feel that the pattern which is being set on the Copperbelt opens the door for a similar pattern to be adopted throughout the Federation of Rhodesia and Nyasaland with its declared policy of partnership. Your Company, and the Group which bears its name, is confronted both with great responsibilities and great opportunities in this young country, and shareholders may rest assured that your Board is fully alive to, and prepared to accept, such responsibilities and opportunities.

MUFULIRA COPPER MINES LIMITED

(Incorporated in Northern Rhodesia)

The following is an abridgment of the Statement, dated October 18, 1955, by the Chairman (Mr Ronald L. Prain, OBE), circulated to the Members:

RESULTS FOR THE YEAR

In spite of a strike during 1955, copper production totalled 83,193 tons, made up as to 47,240 tons of blister and 35,953 tons of cathodes. The average costs of production of all types of copper increased from £114 4s. 5d to £133 7s. 0d. per ton.

The curtailment of production occasioned by the strike accounted for some of the increase in average cost, but the greater part of the increase was due to the increased payments for mineral royalty resulting from the higher selling price of copper and to the cash bonus scheme. The remaining increase was due to the increased cost of power, railways and labour.

The average realisation price of all types of copper for the year was £273 19s. 0d. per ton. The difference between this figure and the cost figure mentioned above resulted in a profit of £11,554,261. The increase in the value of copper stocks brings this profit up to £12,069,354; taxes are estimated to be £4,420,000.

The appropriation to the Replacements Reserve is £1,500,000 and the transfer to General Reserve is £1 million. After making these dispositions there remains a sum of £5,552,105 available for distribution after bringing in the balance of profit of £121,511 from the preceding year.

Last July an interim dividend of 6s. per share, less taxes, was paid and your Directors now recommended a final dividend of 14s. per share, less taxes, making a total distribution of 20s. per share for the year.

MINE POSITION

Ore reserves were increased during the year by 6.7 million tons due to new information from development and drilling between the 1350 ft. and 1600 ft. levels at the western end of the mine and to drilling below the 1600 ft. level.

During the year the Boise shaft came into operation for the first time.

The electrolytic refinery is expected to be completed during the current year. We expect to make our first wirebars some time early in 1956 and thereafter the capacity of this refinery will very nearly match the capacity of the Mufulira enterprise as a whole. In due course we expect to be in a position to produce most commercial shapes of refined copper.

LABOUR POSITION

At the time of writing there are outstanding with the European Union two disputes, the first dealing with leave conditions, on which it has been agreed to go to arbitration, and the second dealing with a demand for a 15 per cent. increase in the basic pay for artisans, which will go to conciliation later in October.

As far as African labour is concerned, since the end of the financial year the Copperbelt companies have introduced a new scale of cash bonus and cost-of-living allowance, the previous allowance being consolidated into basic pay. There remains outstanding a claim by the African Union for an increase of 6s. 8d. per shift for all African employees represented by the Union. This matter has been to conciliation, and will now go to arbitration.

The Chamber of Mines has also offered to the African Union a scheme for re-grouping some employees so that they will now go into a higher group, and therefore enjoy increased remuneration, and furthermore an offer has been made to put all employees on an inclusive wage basis which at present applies only higher groups.

Another important recent development has been the recognition of the Mines African Staff Association by both the mining companies and the African Union.

Mr Prain's remarks on the two major questions of African Advancement and the Copper Price are identical with those contained in the abridgment of his Statement to members of Roan Antelope Copper Mines Limited (printed in a preceding page).

POWER

This time last year we were very concerned at the power position from three aspects, namely, supply of fuel, the provision of transport for fuel, and generating capacity.

During the past 12 months the position has changed considerably. The Federal Government has decided to proceed with the Kariba hydro-electric scheme which is expected to come into operation in 1960. Studies are now being made to see whether the Copperbelt will be able to get by in the year immediately before the commissioning of the Kariba scheme by means of its importations of hydro-electric power from the Congo, which are now expected to begin in the second half of 1956 instead of 1957, and of its own present and planned expansion of thermal generating capacity.

From the short term angle, the year has been more free from worry about fuel supplies than any year since the end of the war. To some extent this is due to an improvement in the rail position and perhaps to a greater extent to the fact that the strike in January and February this year enabled the mines to build up an unprecedented stock of coal. This has since been eaten into somewhat and the position is still not such as to warrant the total cessation of wood-burning. It would be ungenerous, however, not to admit that the position is better than last year, and I should like to pay tribute to the efforts which have been made by the administration and employees of the railways.

MISCELLANEOUS

Your Company has taken a participation in a new Company within this Group, called Rhodesian Selection Trust Exploration Limited, whose purpose will be to examine mining propositions within the Federation of Rhodesia and Nyasaland, but outside of the Copperbelt or of the main concession prospecting areas near the Copperbelt. The Companies owning the latter concessions continued their prospecting programme during the year, the work being carried out on their behalf by Rhodesian Selection Trust Services Limited. These concessions cover an area of 41,500 square miles. One of these Companies, Mwinilunga Mines Limited, announced last month an arrangement made with the New Consolidated Prospecting Company (Pty.) Limited, whereby that Company will carry out mineral prospecting operations over certain parts of the area covered by the exclusive prospecting rights of the Mwinilunga Company. This prospecting work will be spread over a period of four years and there will be a full exchange of technical information between the two Companies during these operations.

DALGETY AND COMPANY

RECORD NET PROFIT

The annual general meeting of Dalgety and Company, Limited, will be held on December 15th in London.

The following is an extract from the circulated Review by the Chairman, Mr D. Abel Smith, MC, for the year to June 30, 1955:

Australia has again enjoyed a bountiful season and, on the whole, seasonal conditions in New Zealand were not unfavourable. Our satisfaction at the continued increases in the size of the Australian and New Zealand wool clips has been tempered by the problems which confront us in providing the handling accommodation required. We are engaged in the construction of new Wool Stores at Brisbane, Newcastle and Christchurch, and have already carried out modernisation at other centres.

PROVISION OF SELLING FACILITIES

I mentioned a year ago that we had formed an associated company to operate in Smithfield Market. Our main object was to be in a position to provide selling facilities for any of our overseas clients who might wish to consign their meat to this country for sale. The response from them has so far been lukewarm, probably because in the past season they were able to sell outright in the countries of origin at highly satisfactory prices. The Smithfield venture has, none-the-less, proved highly successful, owing to the availability of meat from home and Continental sources.

The profit for the year, after providing for all Expenses and Taxation (other than Profits Tax on distribution), amounts to £781,633 as compared with £640,492 for the previous year. Although earnings did not quite reach those of the boom year of 1951, the net result, due to a reduced charge for taxation, is a record for the company. We are recommending a final dividend on the "A" and "B" Ordinary shares of 8½ per cent, which, with the interim dividend paid last May, makes a total distribution of 12 per cent for the year.

THE OUTLOOK

As the prosperity of the company is very dependent upon the prices of primary products, it is difficult to forecast with any accuracy how we are likely to fare during the current year. There does not seem much doubt, firstly, that our capital resources will be subjected to heavy pressure, both on account of our own building programme, and because it has become apparent that our farming and pastoral clients are tending to lean on us to an increasing extent for financial assistance in meeting their working expenses; secondly, that as a result of inflation, especially in Australia, most items of expenditure in the running of our business will be higher, and particularly salaries and wages, which are largely dictated by Arbitration Courts, and thirdly, that we are bound to feel the effect of the further fall in the price of wool, which is likely also to affect the price of sheep.

On the other hand, we have, since the war, been aiming to improve our organisation, to broaden the basis of our operations, and so to spread the overhead over a wider field. We are therefore able to face the future with more confidence than might otherwise be possible and, although it might be prudent to regard some reduction in profits as being likely, I do not think there is any occasion for undue pessimism.

TUBE INVESTMENTS LIMITED

A VIGOROUS RECOVERY IN EARNINGS

NEW RESEARCH FACILITIES

SERVICES TO NUCLEAR ENERGY INDUSTRY

A vigorous recovery in earnings, and details of developments to meet the needs of this new scientific age, were reported by Sir Ivan Stedeford, KBE, Chairman of Tube Investments Limited, in his annual statement circulated with the accounts to stockholders.

Sir Ivan said that the £8,150,000 sought by the recent capital issue was needed to finance the company's expansion of manufacturing, development and research facilities. The present speed and significance of scientific and technical developments had no precedent except in the period known as the Industrial Revolution, and was changing not only the things industry made but the way industry made them and the materials from which they were made. It was in this context that TI's development was taking place. For many years, the company had been able to provide the necessary finance mainly from its own resources, but the gathering speed of development now required turning to stockholders for added capital. He wanted first to touch briefly on this changing scene before he described how TI was combining developments in new fields with those in the conventional lines of business on which the company was founded.

FACING THE NEW AGE

The first line of advance was the development of synthetic materials to replace and supplement natural materials. In this, Britain had long excelled. It was of particular significance to the United Kingdom, which was dependent so much on supplies of materials from overseas. The second, and perhaps most spectacular, advance was the application of atomic energy and by-products of nuclear fission to domestic uses. In this, Britain, in important respects, was probably in the lead. The economic reward of nuclear energy might be hard and costly to win, but it was growing more impressive with every new discovery.

The third line was the development of automatic machines and instruments which made it possible to hand over to a set of mechanical devices many tasks in factories and offices now performed by men and women. There were already a number of automatic factories and, in time, there might be more, but here in the United Kingdom, automatic methods were likely to be applied more widely to particular processes and assembly lines than to entire factories, and the pace of progress, therefore, was found to be uneven. There were, however, factors which might drive us irresistibly towards automatic methods. Even though industry had been operating at full stretch with almost every available pair of hands, we had not produced enough to sustain a moderate increase in home consumption without sacrificing essential exports. This gap might well have to be filled by a greater use of more highly mechanised plant. But we would fail to gain the abounding benefits of the new industrial revolution unless we were ready to adapt our ways of thinking and organisation to it.

It had been the aim, said Sir Ivan, to condition TI to meet the impact of these changes and to derive for the company's employees and customers and stockholders the fullest benefits from them. TI had a long way to go, but the record of plans and activities might suggest that the company had at least

come to grips with each of the three main issues.

TI'S TECHNOLOGICAL RESEARCH

The first essential had been a considerable expansion of scientific and technological research resources. The conversion of Hinxton Hall, Cambridge, to research laboratories was virtually completed, and a team of scientists was already at work under the direction of Dr F. P. Bowden, FRS, of Cambridge University. The construction of additional laboratories was in hand. These included a "hot" laboratory for work on radio-active materials and the study of radioisotopes and tracer techniques. The Radio Research Group, under Dr A. Charlesby, DSc, PhD, formerly of Harwell, was already equipped with an electron accelerator. Hinxton would, it was hoped, make its contribution to the common pool of scientific knowledge, but its primary purpose was to direct TI towards new industrial processes and products.

The second requirement was a centrally directed organisation for working out in what way TI's factories and offices could best profit from scientific and technological advances. The "Technological Department" would develop the practical application of new techniques and materials of potential value to TI, up to the prototype or pilot production stage. Three sections of this Department were already in being. The Irradiated Materials Section, under Dr Charlesby, was concerned with commercial applications in this field. The Plastics Development Section, under Mr J. E. Gordon, BSc, would study the machinery of the plastics industry, exploit the chemical advances of recent years, and streamline production techniques. The Control Engineering Section, under Mr J. F. Coales, MA, would develop the application of automatic operations if TI's factories were economically advantageous. Work was already well under way in each section.

ATOMIC ENERGY DEVELOPMENTS

The formation of an automatic equipment section, Sir Ivan added, did not imply that serious attention had not been given to these principles. There had been a high degree of mechanisation in the £36 million spent on modernisation and expansion since the war. Outstanding here were the two tube mills at Desford and Wednesfield and the new cylinder plant at Chesterfield. These major projects were planned and designed long before the term "automation" hit the headlines, and had been regarded by TI more as a logical, if considerable, extension of mechanisation.

TI was already active—he could say, well-established—in the atomic energy industry. Although not directly engaged in producing atomically-activated plants, the company was playing its traditional part in supplying essential equipment and components. At the Geneva Atomic Energy Exhibition last summer—which was described as a "curtain raiser" to a new industry—the TI stand showed some fifty specialised products, which ranged from tubes in uranium itself, and in niobium, vanadium, tantalum, zirconium and beryllium, to bi-metal tubes, tubes lined with graphite, glass and plastics, and a series of couplings and fittings.

TI had long specialised in the manufacture

of tubes to withstand the ever higher temperatures and pressures and the increasingly corrosive circumstances of modern manufacturing processes. Many of these were immediately suitable for nuclear energy work, but the rarer and more difficult metals called for new methods of fabrication, and these TI developed to a degree which had stimulated the interest of both home and foreign manufacturers of nuclear reactors. TI also built Britain's first mill for rolling uranium.

RECOVERY IN EARNINGS

Preparations for the future, said Sir Ivan, had not diverted attention from immediate tasks, as the results indicated. Although costs continued their upward spiral, and world competition gained a still keener edge, trading profits after depreciation, at approximately £8,500,000, showed a vigorous recovery as compared with the two previous recession years, when relatively they fell from about the same figure to around £6 million. The improvement extended to almost all branches of activity. The rising demand for TI's main products, apparent towards the end of the previous year, gathered a momentum only limited by the availability of steel and labour, and resulted in a record turnover, both in value and volume. A significant factor had been the benefit of the large capital expenditure over recent years.

The sheet mills at the South Wales Aluminium Company had completed its first year of concentrated production, and this, coupled with a revival in demand, had yielded considerable benefit to the Aluminium Division. Output of tubes and extrusions by Reynolds Light Alloys Limited at Redditch also showed a substantial increase, and sales climbed to record figures. The Division trading losses of last year were converted into a profit, and this conversion alone accounted for about £700,000 of the improvement in the Group's overall results for the year. Unfortunately, a shortage of metal developed, and brought about two increases in the price of virgin aluminium and a return to metal allocation for fabricators in the United Kingdom.

CYCLE SALES UP

The Cycle Division had shown an agreeable increase in overseas and home sales, in spite of growing foreign competition, which often called for lower prices in face of rising costs. This was a trend which was likely to continue as indigenous manufacture of cycles overseas increased and Continental and Far Eastern manufacturers strove to break into our traditional markets. Whilst TI saw this as a still sharper spur towards greater manufacturing and selling ingenuity, it was not unaware of the implications of the struggle which lay ahead, and was engaged in constant research and development to improve competitive power and so make secure its dominant stake in this world-wide industry. The imposition of America's latest protective barrier against imported bicycles was a serious obstacle, and the impression remained that we had been penalised because we had been moderately successful.

Renewed import restrictions abroad and hire purchase regulations at home had had their influence, but the Electrical Division, nevertheless, made encouraging progress, particularly in the sale of Creda electric cookers.

The order books of Mersey Cable Works had been restored to health, although earnings were disproportionately low.

STEEL SUPPLY POSITION

The Steel Tube Division regained the ground lost in the recession of the two previous years. This was in part due to a resurgent demand, but largely to the £4 million work of new and additional tube-making plant approaching full production. Events had vindicated the expansionist policy for the Division, but the comparative decline in the rate of return over recent years demonstrated the effects of rising costs in this long period of inflation.

Steel supplies had been just adequate, but the outlook, particularly for alloy tube steels and steel strip, could not be regarded with equanimity. All that could be done was being done. The improved earnings of the Round Oak Steel Works for the past year, coupled with the development plans in hand, indicated a promising future for this company. When the £3 million expansion scheme for the production of tube steel, and to cater for the increasing demand for the company's traditional products was completed, he was confident that the decision to invest in Round Oak would be amply justified.

The decision some years ago to engage in the manufacture of capital goods was yielding encouraging results, the Engineering and General Divisions giving a good account of themselves and demonstrating an ability to expand their business. During the year, TI acquired the Bedford Plough and Engineering Company, Limited, and its premises were already in use for the extension of activities of W. H. A. Robertson & Company Limited of Bedford. A significant feature had been the development by Metal Sections Limited of a new prefabricated buildings technique which, in terms of design, cost and speed of erection, had an outstanding appeal, whether for large or small buildings.

NEW COMPANY IN INDIA

Sir Ivan said that he had visited Canada, India, South Africa and Rhodesia during the year and had been satisfied with the general progress of associate and subsidiary companies; reassuring reports had also been received from Australia and Argentina. A new company Tube Products of India, Limited, with a capital of Rupees 20 million (£1,500,000) had been formed in association with Messrs Murugappa & Sons, of Madras, for the manufacture of precision and mechanical tubes and manipulated components. A factory site had already been acquired at Avadi in the State of Madras.

Despite world competition and the setbacks caused by the rail and dock strikes, direct exports showed an improvement over the previous year, continued Sir Ivan. America, from being seventh on the list of markets three years ago, had moved up to first place. TI supplied materials and components to manufacturers who made Britain's exports in more finished forms, and so, when the national need was for more exports carrying a maximum of labour content, care had to be taken, in times of limited supplies, to strike a sensible balance between home and foreign customers. This necessity had resulted in indirect exports overtaking direct. On this basis, about 50 per cent of TI's total production last year had reached, or was destined for, overseas markets.

Concluding, Sir Ivan said that the struggle between nations for the initiative in design, quality and price was likely to become fiercer as the pace of technological progress quickened. The past few years had taught us that British industry to gain its share of world markets would have to fight every inch of the way. This competition was the greatest challenge which awaited us.

RHODESIAN ANGLO AMERICAN LIMITED

(Incorporated in Northern Rhodesia)

CONTRIBUTION OF PRIVATE ENTERPRISE TO FEDERAL DEVELOPMENT

SIR ERNEST OPPENHEIMER ON EXPANDING INTERESTS

The twenty-sixth annual general meeting of members will be held in Nkana, Northern Rhodesia, on Wednesday, December 14, 1955. The following is an extract from the statement by the chairman, Sir Ernest Oppenheimer, which has been circulated to stockholders with the annual report and accounts for the year ended June 30, 1955:

It has not previously been my custom as Chairman to issue a Statement, as a full summary of the operations of the copper mining companies is contained in the annual report.

While the shares in these companies continue to be our main investment, we have, particularly since the federation of Rhodesia and Nyasaland, expanded our interests and as we intend playing an increasingly active part in the development of the Federation, I believe that stockholders will now welcome an annual statement.

I do not think that many stockholders appreciate the wide extent to which private enterprise has contributed to the general development of the Rhodesias. The copper mining companies operating in Northern Rhodesia had to establish their own towns with communal and domestic amenities. They had to provide their own water schemes and their own power stations and many other essential services which, in a developed country, would have been the obligation of the Government or Local Authorities.

HEAVY CAPITAL EXPENDITURE

The mining companies and their ancillary units, for which we and our parent company, Anglo American Corporation of South Africa Limited, are responsible in Northern Rhodesia, not only found the capital funds of over £35 million required to open up the mines and to provide the necessary services, but have since then retained about £45 million from profits for the expansion of the industry and the development of services and amenities for their employees.

Our copper mining companies and those of the Rhodesian Selection Trust Group formed the Rhodesia Congo Border Power Corporation Limited to take over the distribution of electric power on the Copperbelt. The total cost of the installations required to provide power is to date £16 million and more has to be expended to complete the work in hand.

The Rhodesia Broken Hill Development Company has spent £1,300,000 on its Mulungushi and Lunsemfwa hydro-electric schemes and now, in conjunction with the Northern Rhodesian Government and the Broken Hill Municipality, has embarked on an extension of the hydro-electric power project on the Lunsemfwa River at an estimated cost of £1 million. This will, it is hoped, provide the power required at Broken Hill until power from Kariba becomes available to meet future requirements.

In Southern Rhodesia, the Wankie Colliery Company, on which the copper mines in Northern Rhodesia, the tobacco and other industries in Southern Rhodesia, and the railways and power stations are dependent for their coal supplies, has been committed

to capital expenditure exceeding £6 million. The company now has a productive capacity of some 4,500,000 tons of coal per annum and is expected to be able to produce at the rate of 5 million tons early in 1956.

The copper mining companies have with the mines of the Rhodesian Selection Trust Group established The Copperbelt Technical Foundation with the object of operating a series of technical institutions in the leading towns at an initial cost of £400,000.

KARIBA HYDRO-ELECTRIC SCHEME

The decision of the Federal Government to proceed with the Kariba Hydro-Electric Power Scheme on the Zambesi River is very important not only for the mining industry but for all consumers of power in the country. The project will provide the power requirements of the Federation for many years to come and cheap power will attract new industrial development and assist existing enterprises. The expansion will, however, create a great strain on communications within the country, and it is of the utmost importance that the Rhodesia Railways should be equipped immediately to overcome the present shortage of rolling stock and staff in order to meet the increased traffic as it eventuates.

We have indicated our willingness to assist in providing some of the funds required for the Kariba project and we are willing to help in the expansion of communications and other public works not only as an essential protection for our mining companies, but as a long-term investment in the country.

To this end we, jointly with Anglo American Corporation of South Africa Limited, formed Anglo American Rhodesian Development Corporation Limited in June, 1955. This Development Corporation has already raised a 15-year sterling loan of £2½ million in Holland, and has taken over the loan of £1 million made by us to the Rhodesia Railways in 1954. It has recently undertaken to provide, in the next two years, £5 million of rolling stock, including bogies and tank cars, which the Rhodesia Railways will hire from the corporation.

Geological prospecting in the Federation has been accelerated. Through our investment in Anglo American Rhodesian Mineral Exploration Limited, which is operating in Southern Rhodesia and Nyasaland, and in Chartered Exploration Limited, which will conduct an intensive search for minerals over a very large part of Northern Rhodesia, we will participate in any discoveries made by these companies.

AFRICAN ADVANCEMENT

Members will recall the disappointments and setbacks that characterised almost all negotiations on this complex subject for many years. However, with patience and good will prevailing, an agreement was signed on July 30, 1955, between the copper mining companies for which we are responsible and The Northern Rhodesia Mine Workers' Union whereby a measure of advancement for African workers on our

mines was agreed upon. It was also agreed that further measures of advancement would be considered by both parties later.

This agreement was followed by similar agreements concluded by the mining companies of the Rhodesian Selection Trust Group and, finally, by one between the Northern Rhodesia Chamber of Mines and the Mine Workers' Union embracing the copper mining industry as a whole.

Thus, another important chapter in industrial relations in this part of the world has been brought to a successful conclusion. There seems every hope that a permanent solution will be found which will be fair, just and acceptable to all concerned.

The progress in the two years since the Federation of Rhodesia and Nyasaland came into being in September, 1953, has strengthened the confidence we have always had in the territories which now form this new State. The benefits that we expected to flow from the integration of the complementary economies of Southern Rhodesia, Northern Rhodesia and Nyasaland are emerging, and the hopes that we held for the future of the Federation are being realised.

The Federation offers many opportunities for mining, industrial, commercial and agricultural development. It offers to men and women the opportunities of a new country with a young and healthy approach to its problems. It requires much in the way of capital and technical skills, and, in those fields which are within our capacity, we will continue to play our full part.

Copies of the annual report and accounts may be obtained from the transfer offices at Kitwe; 44, Main Street, Johannesburg; and 11, Old Jewry, London, E.C.2.

IND COOPE & ALLSOPP LIMITED

INCREASED SALES OF DOUBLE DIAMOND

The forty-third annual general meeting of Ind Coope & Allsopp, Limited, will be held on December 15th in London.

The following is an extract from the circulated statement of the Chairman, Mr Edward Thompson, MBE, TD:

This company has been granted the Royal Warrant of Appointment as Brewers to Her Majesty, and Graham's Golden Lager Ltd. as Purveyors of Lager Beer.

Home trade turnover at some 10 per cent above last year was the highest yet achieved. Overall, while draught beer sales remained steady, very substantially increased sales were recorded in Double Diamond and John Bull, a dark beer of similar quality which we recently introduced and which has had an exceptionally favourable reception.

As to the accounts, group trading profit and investment income has increased from £2,782,250 to £3,223,347. Group trade investments, up by £272,495, include loans by the parent company to Slaters and Bodega, and the Hambridge Brewery Co., and by our subsidiary in East Africa.

To assess the future trend of trading profits is as difficult as ever in a period complicated by increasing costs of production and other repercussions of inflation, increasing competitors for consumer purchasing power, and the vagaries of our weather. Having regard to these factors and the increased Distributed Profits Tax, your Board decided stockholders' interests would be better served by maintaining strong liquid resources and a more substantial dividend cover for the Ordinary Stock.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY LIMITED

CHAIRMAN'S ADDRESS

The Annual General Meeting of Trinidad Petroleum Development Company Limited was held on November 17th in London.

Sir Leslie Hollis, KCB, KBE (the chairman), presided, and in the course of his speech said:

As you will observe from the results of the past year's working, production and profits have both shown reasonable increases. Before dealing in detail with the figures relating to our past year's operations, I would like to give you some indication of the Board's general views on the present state of the Company's affairs and its prospects, and what plans your Board has in mind for the Company's development and future operations.

BRITISH CONTROLLED OILFIELDS LIMITED (IN LIQUIDATION)

During the year which has passed, we were, as a Board, conscious of the fact that our principal shareholder, the Liquidator of British Controlled Oilfields Limited, was seeking a buyer for his holding of 50 per cent of the ordinary capital of this Company. We have been informed by the Liquidator of British Controlled Oilfields Limited that although he has had negotiations with a view to the sale of his holding of Trinidad Petroleum Development Company Limited shares, these have not so far led to the receipt of an acceptable offer. Further, I understand that a scheme for the re-organisation of BCO is now under consideration for submission to BCO shareholders and to the Canadian Courts in due course.

EXPERTS' REPORT TO LIQUIDATOR OF BRITISH CONTROLLED OILFIELDS LIMITED

During the course of the year, American consulting engineers, Messrs Meyer & Achtschin, appointed by the Liquidator, inspected (with your Board's approval) the Company's properties and made a report, a copy of which was supplied to us.

The most important matter dealt with in Messrs Meyer & Achtschin's report was their estimate of the Company's proved reserves. On this subject I would say that the estimate given by Messrs Meyer & Achtschin as to the volume of our drilled reserves was substantially identical with the estimate given to your Board by the Company's experts. The Company's estimate of its additional recoverable reserves was, however, much larger than that of Meyer & Achtschin, and developments which have occurred since the date of the report establish that the views of the Company's experts are more realistic. I mention this point in support of the reference in the circular to shareholders of December 15th last as to the technical nature of the report in question and in support of the view of your Board that publication of this report or any part of it, unless accompanied by a detailed appreciation of the position by your Company's experts, would not serve the interests of the shareholders. I can only add that I am advised that the Company's production policy in relation to its reserves is consistent with good oil fields practice.

REMOVAL OF THE DIRECTION OF THE COMPANY FROM THE UNITED KINGDOM TO TRINIDAD

The activities of this Company are centred on the Island of Trinidad and the Board has

had under consideration the desirability of removing from London to Trinidad the Company's seat of administration. As you know, any such move would require the consent of HM Government. The advantages of a move to Trinidad include very considerable savings in Profits Tax and Income Tax, which I am advised would, on the basis of the Company's present earnings and dividends, be in the order of £100,000 per annum. There are other arguments which support the desirability of such a move, including considerations of a political nature which are very much in the mind of the Colonial Authorities in Trinidad, but there are, of course, disadvantages attached to such a removal. All these matters are being studied by your Board most carefully at the present time.

PRODUCTION

During the past year production of crude oil amounted to 3,434,239 barrels, an increase of 114,298 barrels over the preceding year. At the present moment our production is running at a rate of over 4 million barrels per annum. This substantial increase is due to a large extent to the results of a vigorous policy undertaken during the year under review whereby old wells have been worked over and either brought back into production in cases where they were closed down, or brought into increased production in cases where production had fallen to a low level. Further, we have been fortunate to bring into production one or two excellent wells in our Palo Seco area.

DEEP DRILLING

Under the advice of Captain Comins and the experts employed by the Company, we intend to review the policy of deep drilling hitherto undertaken by the Company. In arriving at this decision we have not ignored the necessity of proving up further reserves of production and in this respect we consider that we are likely to make far more progress by exploratory drilling to more moderate depths with consequent saving in the cost of the exploratory drilling programme. The knowledge obtained from deep drilling is always of value to other Companies operating in the area, and we consider that during the last four years we have done at least our fair share, taking all factors into consideration.

ACCOUNTS

Our profit of £871,730, a record in the history of the Company, shows an increase for the year of £98,319.

We have transferred to General Reserve £150,000 against £75,000 last year, and in addition our General Reserve has been increased by a further £200,000, being the amount considered by your Company's auditors as surplus to requirements for future taxation and, therefore, transferred from that specific reserve. Thus our General Reserve now stands at £1,100,000 as against £750,000 in 1954.

It is satisfactory to note that Current Assets were £903,000 in excess of Current Liabilities as compared with an excess of £760,000 at the end of the previous year.

LABOUR

Relations with labour were satisfactory throughout the year. On November 20, 1954,

the Oilfield Workers' Trade Union gave three months' notice to terminate the existing Wage Agreement, and on January 25, 1955, submitted a list of proposals for a new Wage Agreement which included a 25 per cent general increase for all employees. The Trinidad Government appointed a Board of Inquiry to enquire into the dispute, and recommended a general increase of 10 per cent and advised the parties to negotiate other outstanding points. A new Wage Agreement was signed on August 5, 1955, embodying the 10 per cent increase and regulating wages for a minimum period of two years and three months from that date. The additional cost to this Company of the new wage rates will be some £60,000 a year.

I will not venture to forecast the future. In an industry such as ours this would be a most hazardous undertaking. So many factors are completely outside our control, for example world prices for crude oil products, the dollar/sterling exchange, and, of course, to a considerable extent the volume of our production. However, the affairs of this Company are in good order, and in the absence of any adverse extraneous circumstances, I feel we can look forward to the future with reasonable confidence.

The report and accounts were adopted.

LEEDS PERMANENT BUILDING SOCIETY

YEAR OF OUTSTANDING PROGRESS

The one hundred and seventh Annual General Meeting of the Leeds Permanent Building Society was held in Leeds on November 23, 1955.

Sir Charles Davies (the President), in the course of his speech, said:

To those who share the responsibilities of control, there is great pride and satisfaction in presenting accounts which indicate prudent management, and show the result of another year's successful work. We can again report the achievement of several record figures.

We are proud to record an increase in the total amount invested in the Society in shares and deposits, and to have proof of the fact that the Society has continued to maintain the confidence of the public as an investment medium. In recent years, the public has become more Building Society minded, and investors and savers have become more attracted than ever to Building Societies as a means of sound investment, for the reasons that have been so frequently stressed, and which are so obvious.

The Accounts show that we have received during the year under review a total of £20,063,000 from Investors, in the Share and Deposit accounts, compared with the total into both accounts during the previous year 1954 of £18,663,000, an increase of nearly £1½ million in the year. This constitutes a record in the Society's history.

Notwithstanding rather heavy withdrawals, there remains an increase in the total amount invested in the Society in shares and deposits of £9,277,000.

The repayments of capital and interest from borrowers have followed a normal pattern, and, with the substantial receipts from investors after deduction of withdrawals, we have been able to advance during the year on new mortgages the sum of £17,824,000, which is the highest total ever advanced in any year.

The total assets of the Society at September 30th stood at £95,025,644, being an increase on the previous year of £9,723,010. We still retain our position as the fifth largest Society in the Country.

May I mention a fact which gives the Directors considerable satisfaction, namely that, of the very large sum advanced on mortgage during the year, 99 per cent of the amount was advanced in respect of dwellinghouses for owner occupation, and 1 per cent only was advanced on other types of security.

Our Management expenses are extremely low, judged by any standard, and will, I think, be found to be below the average of all Societies. If you take into account the growth of the Society's business during the year, the Management expenses, on a percentage basis, are less than in 1954, and represent .48 per cent of the total assets, as compared with .5 per cent the previous year. In terms of money, it means 9s. 8d. in every £100.

From the surplus on the year's working, available for appropriation, we have added £20,000 to Investment Reserve, £25,000 to the Staff Provident Fund, £300,000 to General Reserve, carrying forward £138,710.

We have now reached a landmark in recording our Reserves, which are now over five millions (£5,012,819) equivalent to 5.27 per cent of our total assets, 5.63 per cent of the total amount of share and deposit accounts, and 6.35 per cent of the total mortgage loans outstanding.

COCHRAN & COMPANY, ANNAN, LIMITED

WORLD-WIDE REPUTATION OF PRODUCTS

MR ROBERT ADEANE ON CONTINUED EXPANSION

The fifty-third annual general meeting of Cochran & Company, Annan, Limited (Engineers and Boilermakers), was held on November 22nd at 117 Old Broad Street, London, E.C.

Mr Robert P. W. Adeane (the Chairman), who presided, said: Ladies and gentlemen, this is the fifty-third Annual General Meeting of your Company and it is seventy-seven years since the Cochran Boiler was invented by Edward Crompton, the father of our late Chairman. Steady progress has been made since those days—progress based on high standards of production. Our products are now established and highly prized in almost every country of the world and in the ships of many seafaring nations.

The high price of combustible fuels and the urgent need to arrest the smoke menace has increased the demand for our standard Cochran Boilers, as well as for our larger capacity Economic Sinuffo Boilers and waste heat Boilers. I see no reason why the demand should not continue to increase. We have fully eighteen months' work on our books and orders continue to come in at a steady rate. It is our aim to reduce our backlog of orders and so be in a position to quote for nearer delivery dates.

Everything that can be done by way of expansion and modernisation within the limits of skilled labour available is being done to this end, and I wish to thank our customers for their forbearance when delays in delivery have been inevitable and to assure them that we shall press ahead with doing all in our power to speed up deliveries.

THE YEAR'S RESULTS

Our Trading Profit was £284,700 and exceeded last year's record total by £33,000. The net profit was £130,600, as against

The liquidity of the Leeds Permanent in Trustee securities and cash has been maintained deliberately at a high figure, and it will stand the test of any comparison. It amounts to 16.44 per cent of the total assets, and 17.56 per cent of the total liability to shareholders and depositors.

In the past 12 months, important changes in monetary policy have taken place. In September, in common with other Societies, we increased our rate to paid up Shareholders to 3 per cent, and to depositors to 2½ per cent, with Income Tax paid in each case.

There is no doubt that the economic conditions of recent months have had an effect upon the amount available to Building Societies for lending, and it has been difficult to satisfy the unprecedented demand for mortgage loans, which still continues.

Your Directors are very alive to all the current factors as they may affect the Society's operations, and they are determined to maintain a high degree of liquidity, so that all investors can look to this Society with confidence in the knowledge that their moneys, whilst earning a rate of interest, taking into account the payment of income tax, which compares more than favourably with any other form of saving or investment, are always available to them on demand, or at the shortest possible notice.

£97,000—of this amount Ruths Accumulators (Cochran Limited) contributed £4,278. We recommend to you a final dividend of 5½ per cent FOT on the Ordinary Capital as increased last year, which, together with the 3 per cent FOT already paid, amounts to 8½ per cent FOT; taking £34,000 for the year after allocation of £82,500 to General Reserve and £10,000 to Retirement Benefit Reserve. The Carry Forward at £29,674 is increased by about £3,000. All of the considerable expansion done since the war has been paid for out of retained earnings and the Company's cash position continues to be satisfactory.

In order to speed up deliveries an extension to the heavy Boiler shop was completed during the year under review, and since the end of the year a new shop for the 1,500 tons press, to enable a general re-arrangement of tools to be made, has been put in hand and is well advanced. Further purchases of machine tools have been made and the tool replacement programme has been brought right up to date.

CURRENT YEAR'S PROSPECTS

Before concluding, you will want me to say something about prospects for the current year. In common with most modern industries, we are finding competition in export markets much keener, and to meet this we are increasing the number of journeys made by our Directors and senior members of the staff to our overseas agents. In spite of the competition I look forward with confidence to increased expansion and continued satisfactory trading.

Finally, I wish to thank all those who, by the excellence of their work, have made such good results possible, and to express the deep regret of myself and my colleagues on the recent death of Mr E. A. Rex, our Assistant General Manager at Newbie, who for twenty-five years past gave loyal and outstanding service to the Company.

The Chairman then moved the resolution for the adoption of the report and accounts and the payment of a final Ordinary dividend of 5½ per cent, free of income tax, making 8½ per cent, free of tax, for the year.

The motion was seconded by Mr R. R. Stokes (Managing Director) and carried unanimously.

WANKIE COLLIERY COMPANY, LIMITED

(Incorporated in Southern Rhodesia)

LARGE INCREASE IN SALES

The thirty-second annual general meeting of Wankie Colliery Company Limited will be held in Bulawayo on Monday, December 12th.

The following is from the statement by the Chairman, Mr T. Coulter, which has been circulated with the annual report and accounts for the year ended August 31, 1955:

ACCOUNTS

The Profit for the year after providing for depreciation, Debenture Interest, Debenture Trustees' fees, and Directors' emoluments, but before taxation, amounted to £1,084,012 as compared with £563,339 for the previous year, being an improvement of £520,673.

Taxation absorbed £260,000 and a sum of £165,000 was transferred to Taxation Equalisation Reserve. In accordance with the provisions of the Coal Price Agreement, an amount of £250,000 was transferred to General Reserve which now stands at £735,000.

Dividend No. 61 of 4½d. per share was paid in May, 1955, and the Directors have declared a further Dividend No. 62 of 6d. per share which will be paid on or about December 8, 1955, to shareholders registered at the close of business on November 2, 1955. The total distribution for the year of £386,094 represents 10½d. per share and compares with 9d. per share paid last year.

Capital Expenditure on fixed assets during the year, less sales, amounted to £1,724,115 and after making allowance for amortisation of coal mining rights and depreciation, the Balance Sheet shows Fixed Assets at August 31, 1955, at £7,454,856.

Current Assets (excluding Stocks and Stores) at £2,487,183 as against Current Liabilities of £940,839 indicate a surplus of £1,546,344 represented by Federal Government Stocks and short term loans and deposits. This surplus will be required to finance the balance of the large capital programme which we embarked upon two years ago.

SALES

The following is a summary of sales of coal and coke for the year ended August 31, 1955, compared with the previous two years.

	1953	1954	1955
Tons			
Coal	2,781,023	2,732,957	3,414,719
Coke	158,821	154,617	220,966

It is gratifying to note that coal sales for the year increased by 681,762 tons compared with the previous year and more than offset the temporary setback that occurred in 1954: coke sales also showed an increase of 66,349 tons.

OUTPUT POSITION

Our development programme for coal production is well ahead of schedule, and the present capacity from the three collieries is already of the order of 4,500,000 sales tons of coal per annum, which is some 900,000 tons ahead of the existing coal-carrying capacity of the Rhodesia Railways. We have no doubts about honouring the guarantee we gave to the Government of Southern Rhodesia in 1953 that our output capacity would be raised to not less than 5,000,000 tons a year by the end of 1956. Our relations with the Railway Administration are close and cordial, and, while we acknowledge the improvement in the coal-carrying capacity during the last twelve months, there are still

many railway problems to be overcome before we shall feel assured that all the coal we can produce can be transported and the demands of our consumers satisfied.

PRICE OF COAL

In expectation of an improvement in the coal-carrying capacity of Rhodesia Railways during the current year, and the consequential improved efficiency which is so dependent thereon, we are reducing the average selling price for the current year by 5d. per ton to 18s. 10d. per ton at pitmouth.

During the year under review, satisfactory progress has been made on the programme of development and reconstruction, and the next twelve months should see this scheme virtually completed. Two years ago it was estimated that the cost would be in the neighbourhood of £3,300,000. It is now more likely to approximate £6 million, but the additional funds can be found from our own resources and further capital issues are unlikely.

Copies of the annual report and accounts may be obtained from the London office of the company, 11 Old Jewry, E.C.2.

HAROLD WESLEY LIMITED

(Manufacturers of Paper Products)

HIGHLY COMPETITIVE TRADING CONDITIONS

The ninth annual general meeting of Harold Wesley Limited was held on November 17th in London, Mr Percy Day-Winter (chairman and managing director) presiding.

The following is an extract from his circulated statement for the year ended June 30, 1955:

During the period prices of all raw materials increased, together with wages and other services, and due to highly competitive trading conditions it has not been possible to recover fully the additional costs and our profit margin has been reduced.

The Statement issued with our Interim Dividend stated that we were taking steps to remedy this position, and in this direction a new Plastic Section has been created, which it is confidently expected will enable our sales to be increased and have a beneficial effect on our results. The creation of this new department has meant additional capital expenditure for the necessary machinery and stocks of raw material.

The increase in Freehold Land and Buildings includes the cost of an addition to our Factory at Burton-on-Trent, with an area of 10,000 sq. feet. This is now completed and in use.

The increase in Plant, etc., has been due not only to entirely new Plant for the Plastic Department, but also to your Directors' policy of bringing machinery up to date, in some cases by replacement, and in others by the addition of new machines of greater efficiency and output.

The decreased Net Profit resulting in a considerable decrease in the amount required for taxation, carries, as its consequence, a decrease in dividend, which is being paid on a conservative basis, resulting in a substantial increase in the amount to be carried forward.

The Company's Subsidiary, Wesley & Clark Engineering Company Limited, made a profit this year, as against a small loss last year.

The report was adopted and the final dividend of 8 per cent, making 14 per cent for the year, was approved.

HOSCOTE RUBBER ESTATES, LIMITED

HIGHER PROFIT

The twenty-third annual general meeting of the Hoscode Rubber Estates Limited will be held on December 19th in London.

The following is an extract from the circulated Address of the Chairman, Mr H. B. Egmont Hake.

The profit before taxation at £54,313 is £22,552 higher than the previous year despite a fall of £15,688 in our receipts from the replanting cess fund. Last year those receipts included £14,508 relating to the years 1951 and 1952 which, of course, were non-recurring. Similarly there were then tax credits of £13,995 and £9,882 which, as I told you, has resulted from the final agreement of all our postwar assessments and of tax liabilities on war damage receipts to date. Lacking this year those abnormal credits (which last year assisted in maintaining the dividend at 12½ per cent) the profit after taxation is £32,876 or £4,261 more than twelve months ago, whilst the sum available for reserves and distribution, including the amount brought forward, is reduced from £57,635 to £53,442.

We have transferred £13,834 to Development Reserve, which is already credited with a capital profit of £1,166 made during the year, and now stands at £100,000. An allocation of £5,546 to Reserve for Replacement of Planted Areas restores the balance to £60,000 after charging the year's replanting expenditure; and we recommend a dividend of 17½ per cent. The Balance Sheet shows net current assets of £111,963 after reserving £23,250 for future taxation and providing for the proposed dividend.

TRINIDAD LEASEHOLDS

MR SIMON J. WOODS REVIEW

The Annual General Meeting of Trinidad Leaseholds Limited will be held in London on December 15, 1955. The following is extracted from the Chairman's statement for the year ended June 30, 1955:

The intensive competition and other factors that I have previously mentioned continued to depress our returns from oil and freight; also, wages and other charges have again risen. On the other hand, the burden of taxation was not so onerous.

A further increase in our Trinidad crude oil production was more than offset by an improvement in proven reserves.

The net profit of the group for the year, after providing for all charges, including depreciation and taxation, was £2,312,682 as against £1,851,629, the increase having arisen largely because of a lower charge for taxation.

Premium gasoline production for the United Kingdom, comprising "REGENT T.T." and "REGENT BENZOLE MIXTURE," was further increased to meet the demand for these high grade products.

Regent Oil Company Ltd., the marketing organisation through which our products are sold in the United Kingdom, has had to contend with some of the fiercest competition I have known in the oil business. Notwithstanding, I am glad to say that the motorist has remained loyal to Regent Oil Company's premium brands of motor spirit—"REGENT T.T." and "REGENT BENZOLE MIXTURE"—and thus has recognised our aim to provide products of the highest quality coupled with first-class service to the customer. As a result Regent Oil Company ended the year in an even stronger market position than before.

RHOKANA CORPORATION LIMITED

(Incorporated in Northern Rhodesia)

RECORD NET PROFIT EXCEEDS £10 MILLION

SIR ERNEST OPPENHEIMER ON AFRICAN ADVANCEMENT

The thirty-third annual general meeting of members will be held in Nkana, Northern Rhodesia, on Wednesday, December 14, 1955. The following is an extract from the review by the chairman, Sir Ernest Oppenheimer, which has been circulated to stockholders with the annual report and accounts for the year ended June 30, 1955:

The total net profit for the past year, at £10,020,000, constitutes a record for the Company, and is £540,000 in excess of the profit for the previous financial year on a comparable basis. This is a gratifying result, more particularly as production during the year was adversely affected by the strike of African employees during the first quarter of 1955. The fact that the profit of £6,190,000 arising from the Company's mining operations was only £100,000 less than last year is due, to a considerable extent, to the improvement in the price of copper and to our ability to maintain limited production during the strike period with the loyal co-operation of all European and certain African employees who remained at work throughout.

A small reduction of profit accruing from our mining operations was more than offset by an increase of £640,000 in our investment income, the dividends received from both Nchanga Consolidated Copper Mines Limited and Mufulira Copper Mines Limited being higher than in any previous year.

The Company's other major investment is in Bancroft Mines Limited. In January of this year the Board of that Company announced its decision to develop and equip the mine for an eventual production rate of 85,600 long tons of copper per annum, which is exactly double the tonnage originally contemplated. It is expected that the mine will come into production in 1957 and that the output will gradually be stepped up to 85,600 tons by 1960.

RESPONSIBILITY AND INTEGRITY—KEYNOTE OF AFRICAN ADVANCEMENT

The developments which have taken place recently in regard to African advancement are all the more satisfying to me in that they were achieved so soon after the strike of

African employees, which was regrettable not only in its effect upon the Company, but in that it revealed that the African Trade Union leaders had not yet appreciated to the full the measure of responsibility that is placed upon them by virtue of their office. The keynote to African advancement is responsibility and integrity and, now that the first steps have been taken, the African Mine-workers' Union must prove that they are worthy of the responsibility placed upon them. They must show that they have the ability and willingness to consolidate what has been made possible by the co-operation with the Companies of the European employees, and must take full advantage of the training schemes which are available to them.

I wish to take this opportunity to pay a tribute to both the European employee organisations—The Northern Rhodesia Mine Workers' Union and The Northern Rhodesia Mine Officials and Salaried Staff Association—for their considerable foresight in this matter. Those of the employees represented by the Salaried Staff Association are not affected immediately by the agreement to transfer a specified number of jobs from Europeans to Africans, but their readiness to entertain the principles thereby established should be given full recognition. The European Union's decision to co-operate with the Companies in the matter of African advancement is an important event and I regard the lengthy period of these negotiations as time well spent, as the considerations were carefully weighed before this important decision was taken. The question of African advancement is of vital importance. Good employee relationship is fundamental to the industry's future, and its attainment implies continuing and wholehearted collaboration between the employees and the Companies in the approach to a problem which has to be faced, but which allows of no easy nor rapid solution.

The coal stocks which were accumulated during the strike have enabled the Company to make up any shortfalls in coal supplies during the winter but, when this review was prepared, these stocks were still diminishing, and unless the Rhodesia Railways can transport, during the summer months, more than the normal monthly requirements of the copper mines so that the stock can be

replenished, operations will be seriously handicapped. Although we had hoped to discontinue wood-burning, it is now probable that this will have to be continued for some time to come. The position may be eased when power supplies from the Belgian Congo come through in 1956, but the improvement can only be temporary, as the Copperbelt's power requirements will continue to increase. Urgent steps must be taken to increase the carrying capacity of the railways.

I therefore welcome the formation by Anglo American Corporation of South Africa Limited and Rhodesian Anglo American Limited of Anglo American Rhodesian Development Corporation Limited, which Company has recently undertaken to assist the railways by purchasing £5 million of trucks which the railways will hire. It is also essential that power should be available from the Kariba project as soon as possible and we shall endeavour to play our part in assisting to finance this great project.

CONFIDENCE IN FIRM DEMAND FOR COPPER

It can be accepted that the substantial increase in the price of copper between June, 1954, and September, 1955, amounting to nearly £150 per ton, was, to a considerable degree, the direct consequence of strikes on the mines in Chile, the United States, and in Northern Rhodesia, and the recent recession from the peak of just over £400 per ton was therefore to be expected. I am confident that a firm demand for copper will continue in the future and that an increased world production can readily be absorbed. It must, of course, be expected that we should have to face competition from substitutes, especially aluminium, but this competition is intensified by the overall shortage of copper. It is satisfactory that additional tonnages of copper will shortly be available from the Bancroft and Chibuluma Mines.

I remain completely confident that the copper mining industry will continue to play a major part in promoting the development and well-being of the Federation of Rhodesia and Nyasaland. It will continue to offer a high standard of living to an increasing number of employees and to provide an important market for Rhodesian products, while its direct contribution to the revenues of the State is of outstanding importance. Moreover, it is our policy to assist financially and in other ways with the general development of the Federation so as to help in building up this new country on a sound basis socially and economically.

Copies of the annual report and accounts may be obtained from the Head Office, Kitwe, or from the transfer offices at 44 Main Street, Johannesburg, and 11 Old Jewry, London, E.C.2.

THE CUNARD STEAM-SHIP COMPANY LIMITED

FIVE PER CENT CUMULATIVE PREFERENCE STOCK
SIX PER CENT CUMULATIVE PREFERENCE STOCK

METROPOLITAN COLLEGE, ST. ALBANS

Or call at 30 Queen Victoria Street, London, E.C.4.

UGANDA PROTECTORATE

A vacancy exists for an Economic Adviser. This officer will be a member of the staff of the Ministry of Finance and will be required to act as Secretary to the Development Council and generally to supervise economic research and provide economic advice to the Finance Ministry and other branches of the Government. Candidates must be academically qualified and thoroughly experienced economists. Experience in responsible administrative positions desirable.

The salary of the appointment is £2,200 (fixed). In addition to the salary a variable cost of living allowance is payable, the rate of which is at present approximately 10 per cent of salary, subject to a maximum allowance of £162 a year.

The appointment may be held—
(a) On two years' probation to the permanent and pensionable establishment.
(b) On contract for a period of three-five years with a gratuity of 13½ per cent of salary (excluding allowances).
(c) On F.S.S.U. terms for a period of three-five years if the applicant is already a member of the system.

Government quarters are provided when available at a moderate rental. Free passages are granted on first appointment and on leave for the officer, his wife and children up to the cost of four adult passages in all. Liberal home leave is allowed on full salary.

Apply in writing to the Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, giving briefly age, qualifications and experience. Mention the reference number EAF 51452/101.

THE WESTERN REGION PRODUCTION DEVELOPMENT BOARD, IBADAN, NIGERIA, invites applications for the following posts:—
1. SECRETARY.
Candidates will include attendance at Board and Committee meetings, preparation of Agenda and Minutes, as well as general administration and legal matters.

Candidates must hold a legal qualification and have considerable administrative and secretarial experience. Consolidated salary £2,050 per annum. General terms of employment shown in 4 below.

Applications, preferably in the candidates' handwriting, stating age, family, qualifications and experience (set out in chronological order), to
The Chairman,
W.R.P.D. Board,
Ibadan, Nigeria,

to reach him not later than December 15, 1955. Envelope to be marked SEC.

2. SENIOR ASSISTANT SECRETARY.
Candidates with similar qualifications, but with less experience than that called for in the case of Secretary, will be considered. Basic salary £1,300 to £1,500 per annum, plus expatriation allowance where applicable. General terms of employment as shown in 4 below.

3. ASSISTANT NEW PROJECTS AND INDUSTRIAL MANAGER.
The duties of the successful applicant will be to assist in the examination of proposals for the establishment of industries in the Western Region of Nigeria, the assessment of their viability and the technical problems relating thereto, and in the case of established projects, the institution of control systems and the reporting upon progress. Candidates should hold a professional degree or equivalent and have industrial and managerial experience. Basic salary will be in the range of £1,300 to £1,500 per annum, plus expatriation allowance where applicable. General terms of employment as in 4 below.

Applications for posts 2 and 3 above, preferably in the candidates' handwriting, stating age, family, qualifications, practical experience (set out in chronological order), to
The Personnel Secretary,
W.R.P.D. Board,
Ibadan, Nigeria,

to reach him not later than December 15, 1955. Envelopes to be marked SAS and NPM respectively.

4. GENERAL TERMS OF EMPLOYMENT:
Quota allowance £60. Free medical service. Free passages for wife up to 10 per cent of salary. Home leave on full pay at the rate of five days per month of overseas service, normal length of tour eighteen/twenty-four months. Housing provided.

INDUSTRIAL OFFICER required by the NIGERIAN FEDERAL GOVERNMENT for Commerce and Industries Department for one tour of 18-24 months in first instance. Salary scale (including inducement addition) either £780 rising to £1,410, with prospect of permanency, or £840 rising to £1,530 a year on temporary terms, with gratuity of £100-£200 on retirement. Quota allowance £60. Age 25-40. For officer and wife. Assistance towards cost of children's passages and assistance up to £150 a year for their maintenance while in U.K. Liberal leave on full salary. Candidates under 36 years of age should have had industrial training with experience in management and some knowledge of industrial financial practice. Experience in industrial planning or possession of a qualification in economics or accountancy an advantage. Write to the Crown Agents, 4 Millbank, London, S.W.8, or to the Director of Commerce and Industries, 10, Broad Street, Lagos, NIGERIA. MIB/497/41EN.

FULLY QUALIFIED MECHANICAL ENGINEERS, with works management experience, required by important organisation, with interests throughout the British Isles and Commonwealth. Applicants willing to accept assignments for a limited initial period of one to three years in Canada, Africa or New Zealand, with a possibility of a final post in the United Kingdom, if desired, are invited to apply. Remuneration on a high scale, with superannuation facilities. Are not over 40.—Full details of experience, qualifications and previous appointments and salaries, in confidence, to The Managing Director, Box 293.

THE TRAINING OF TECHNICAL TEACHERS

Applications are invited from men and women of approximately 25 years of age and over for admission to a One-Year Course of Training as full-time Teachers of General, Commercial and Professional Subjects, and/or Office Arts (Shorthand, Typewriting, and other Secretarial work) in technical colleges and similar institutions. Applicants who wish to teach general, commercial and professional subjects should have a University degree, or professional qualification, or a Higher National Certificate in Commerce.

Applicants who wish to teach Office Arts should possess higher certificates of some recognised examining body in shorthand and typewriting, and should show evidence of a good general education.

In all cases applicants will be expected to show evidence of good business and other clerical experience.

The courses will begin in September, 1956. Recognised students will pay no fees and they will be eligible for maintenance grants for the period of the course.

Further particulars and application forms may be obtained from the following colleges on receipt of a stamped addressed foolscap envelope:—
BOLTON: The Principal (S/2/4), Bolton Training College, Manchester Road, Bolton.
HUDDERSFIELD: The Director (S/2/4), Huddersfield Training College, Queen Street South, Huddersfield, Yorks.

LONDON: The Principal (S/2/4), Garnett College, 83 New Kent Road, London, S.E.1.

MARKETING RESEARCH.—A well-known industrial Company invites applications to fill an appointment involving responsibility for that part of the marketing research function concerned with consumer and retailer research. A good honours degree in Economics or Business Administration is essential. Candidates must have extensive knowledge and experience of the techniques of sampling and the organisation and control of consumer surveys. This is a senior post, giving ample scope for technical and administrative development. The imaginative development of existing techniques in new methods will be paid to the right man, and in certain circumstances housing assistance may be available. Full details of qualifications and career to date should be sent. These will be treated as confidential.—Box 285.

ACCOUNTANT REQUIRED.—The Co-operative Wholesale Society Limited requires a qualified Accountant to be responsible for the accounts of its Meat Department, which operates nationally with headquarters in London. The candidate will be responsible to the Departmental Manager for the functional control and direction of all clerical staff at depots and area offices, and directly for the administration of the clerical staff at London Headquarters, where there is a punched card installation. Duties would embrace the integration of the accounting and costing arrangements of product units and the production units of the Department and the preparation of control statistics for management.

Applications are invited from candidates aged 30-45 years; will be treated in strictest confidence, and should be made to the Secretary and Executive Officer, 1, Bolton Street, Manchester, 4, stating salary required.

AMERICAN RADIO ORGANISATION IN EUROPE wants Czechoslovak and Hungarian analysts for audience research work. Applicant must be able to translate into English and write English effectively. Background necessary in social sciences, research or journalism. Minimum £600 annually. Family housing and transportation provided. Full details in first letter, please.—Box 297.

ASSISTANT STATISTICIAN required by Colonial Office. Duties: Work of Statistics Department includes advice to Colonial territories on statistical policy and compilation of Colonial statistics. Current subjects include statistics relating to demography, agricultural and industrial production, trade, balance of payments and national income. Salary scale £470 x £30-£680 x £35-£855, plus pay supplement £43.10s. 0d.—plus 8 per cent if 45½ hours per week.

Post is temporary and non-pensionable.—Write, giving date of birth, education, full details of qualifications and experience of posts held (including dates), to A.B.1542, London Appointments Officer, Ministry of Labour and National Service, 16 Tavistock Square, W.C.1, by December 10, 1955. No original testimonials should be sent. Only candidates selected for interview will be advised.

BRITISH OLIVETTI LIMITED
offer a career in sales to ambitious and personable young men ready to work hard to make the best of the excellent opportunities existing with this expanding Company. There are vacancies open on the London sales staff, and the successful candidates will receive a fixed weekly salary.

During the initial period when they are undergoing a thorough training course at the Company's school. Afterwards salary, commission and expenses will be paid. Write, giving details of education, etc., to Personnel Manager, British Olivetti Limited, 10, Berkeley Square, W.1.

CENTRAL ELECTRICITY AUTHORITY
SOUTH WALES DIVISION
Applications invited for Superannuation N.J.C. appointment of ASSISTANT IN THE STATISTICS SECTION of GENERATION (OPERATION) DEPARTMENT.

Salary: Grade 2—£525 to £575 per annum.
(a) To supervise routine calculations.
(b) Assist in the analysis and presentation of technical statistics.

University degree (preferably in mathematics or economics (statistics)) or equivalent and experience in the Electricity Supply Industry.
Application forms obtainable from Secretary, South Wales Division, Central Electricity Authority, Twyn-y-Pedwen Road, Gabafla, Cardiff, to be returned by December 8, 1955.—Vacancy No. 125/55.

ESSO PETROLEUM COMPANY LIMITED, Refinery Department, Fawley, have a vacancy in the Employee Relations Department for a Male Assistant to work as a member of a team dealing with a wide range of personnel work.

University degree or social science qualification desirable, but personal qualities and calibre equally important factors.
Progressive, pensionable post, starting not less than £600 per annum.
Write, giving personal details, in confidence, to Employee Relations Superintendent (Dept. E/R/S), the above address.

Applications must reach the above address by November 30th.

ECONOMIST required, to undertake the forecasting, market research and related work in the field of the Company's long-term sales planning. Will be responsible also for all market research analysis, surveys and special projects, and make frequent reviews of the forecasting techniques and performances. Graduate with degrees in economics and research experience on industrial problems, or with experience working in industry on problems of long-term development, should apply in writing, stating age, present salary, qualifications and experience, to the Personnel Manager, Joseph Lucas (Electrical) Limited, Great King Street, Birmingham, 19, quoting reference PM/D/121.

AMERICAN Plastic Model Kit Manufacturer who is developing the European EXECUTIVE.—Address letter of application, stating requirements and qualifications, to Box 305.

LATIN AMERICA
Executive of many years' administrative experience in finance, investigations, credit control, personnel relations, sales promotion and purchasing, with fluent Spanish, would welcome appointment in Latin America or with Canadian Company exporting to that area. Advertiser is English Chartered Accountant, age 46.—Box 291.

SENIOR Market Research Executive seeks change. Outstanding record, initiative and drive. Wide marketing/advertising experience. Salary not less than £2,000.—Box 299.

EXECUTIVE, 41, broad experience international trading, including many years' high-level managerial experience overseas, first-class connections and knowledge of countries, thoroughly versed export/import finance, foreign exchange, merchandising, sales promotion, seeks position Merchant/Confirming House or exporting Manufacturer. Willing travel overseas. Last salary £1,700, but progressive future outweighs initial remuneration.—Box 300.

CAVALRY OFFICER, 34, Staff College, just retired, requires post in commerce or profession, at home or abroad. Experienced in organisation, administration, staff, sports, etc. Any post requiring tact, initiative and personality considered.—Apply Major G. N. Rees, c/o Col. Beath, Burslem, Great Bolas, Wellington, Shropshire.

RUGBEIAN, Oxonian, single, 45, desires suitable post—minimum salary £800.—Rugby, French, German, some Portuguese, Spanish, experience export procedure, documentation, correspondence.—Box 302.

OXFORD Economist, 36, classics graduate, writer and broadcaster, widely travelled, bi-lingual French/English, excellent German, 4 years' commercial and financial experience City, seeks responsible position calling for personality and initiative.—Box 304.

Railways are *more* than Trains

Five trains being unloaded at the same time at Hams Hall Power Station

MECHANICAL HANDLING alone makes possible the vast tonnages moved by rail every week . . . every day. It makes possible not only the loading or unloading of coal wagons at high speed, but on it also depends the swift delivery of coal to power stations (themselves a prime essential in the chain of capital equipment and investment behind the trains). Mechanical handling equipment of all kinds has long been a speciality of **MITCHELL**, introducers of the first side tippler to handle wagons. Tipplers, conveyors, transporters, coaling plant, space-and-labour saving mechanical marshalling yards—wherever they are needed to increase productivity and raise efficiency, Mitchell can be relied on to provide '*know how*' for economic design and construction.

THE UPWARD TREND OF COMMERCIAL TELEVISION (4)

OVER A MILLION

adult viewers for **ATV**

On Sunday, November 13th, the average audience for the whole of "AA" time (8-9.30 p.m.) was over one million viewers; and all adults at that. This is shewn by the latest B.B.C. research figures for that week.

Over one million viewers. This is indeed commercial television history, and an even greater landmark for ATV, who have achieved it in only a few weeks. And these viewers—all adults—were a million potential buyers of your product. The cost of reaching them for a whole minute was less than £1 per thousand.

We keep on telling you the audience is growing. These latest figures are yet more proof of its growth—yet more proof that commercial television, and A.T.V. in particular, is a *very* powerful selling medium. No advertiser can afford to ignore it. Make sure of your time on A.T.V. by booking it well in advance.

ethylene glycol

Permanent type antifreeze that keeps your car's engine safe through all kinds of weather is dependent on ethylene glycol. Other Dow glycols help make resins for improved radio equipment — and are superior humectants in many industries.

Another example of Dow at work with industry to make better products for you.

Glycols are typical of the unseen contributions Dow chemicals are making to many products you enjoy today. Dow serves the industries that serve you. Sometimes you may see the famous Dow Diamond, as on the plastics Saran and Styron that add beauty and service to your daily living. Agricultural chemicals bearing the Dow Diamond are helping the farmer, too, by making his land more productive. For more information about Dow products, contact your representative in England, or write to Dow, Dept. 311-N.

WROUGHT TITANIUM

can you use it?

British Industry now has at its service

a new wrought metal—titanium.

Years of pioneer research and the development of special extraction and melting techniques by I.C.I. have

heralded its debut in Britain. Now it is ready

to revolutionise progress in our aircraft industry

and in other engineering fields.

can you afford not to use it?

Titanium is only half the weight of steel. Alloys (I.C.I. is now producing a steadily widening range) can be made which, besides being phenomenally resistant to most forms of corrosion are as strong as many high-tensile steels.

Already, I.C.I. titanium and titanium alloys are available in sheet, strip, rod, tube, wire, plate and forging stock. I.C.I. will be pleased to advise on the known and potential applications of this new and outstanding material.

IMPERIAL CHEMICAL INDUSTRIES LIMITED, LONDON, S.W.1.

multiply

And increase your productive efficiency. Since the introduction of Osram fluorescent tubes, research and development work within the Osram organisation has been aimed continuously at the attainment of an even higher lighting performance.

Spectacular progress in the increase of light-life and the reduction of prices is shown by comparing the modern Osram tube with that produced some years ago. Today's high-efficiency Osram tubes give twice as

much light, have over three times the life and are sold for about one third of the price. This marked progress helps you to multiply your light and reduce your expenditure. Every fluorescent lighting installation can be improved by using reliable, first quality tubes.

Your choice of tube is most important — there is a G.E.C. lighting specialist within easy reach and his services are available without obligation.

with **Osram**

Petroleum-chemical Pacemakers

Kellogg is privileged to announce its participation in another ethylene-from-petroleum plant in England for I.C.I.—Imperial Chemical Industries Ltd. leading chemical company in the British Commonwealth. I.C.I. is the originator of the polythene plastic and first to develop the polyester fibre Terylene.*

Designed, engineered and now under construction by Kellogg International Corporation at Wilton, Yorkshire, the new ethylene plant will utilize a unique Kellogg steam-cracking process which assures maximum on-stream efficiency. Its output will increase I.C.I.'s production of basic materials for polythene, polyester fibres and other products at Wilton and at I.C.I.'s nearby Billingham Works... considered the world's largest concentration of chemical producing facilities. The success of this important undertaking resulted in no small measure from the close co-operation and interchange of technology between I.C.I. and Kellogg International Corporation and its parent in the United States at all stages in the development, design and construction of the plant. Such teamwork is largely responsible for the unique international position the Kellogg organizations hold in petroleum and petroleum-chemicals. Your inquiries are welcome.

sonics and tonics

In spite of the approach of Christmas, this is not an advertisement for mineral waters, nor an essay on carol singing. But it has a connection with both.

Sonics—when the term refers to the faithful reproduction of good music—are a tonic for the tired mind, a perfect relaxation from responsibilities. To the music lover, such pleasant medicine must not be watered down, but taken neat, exactly as it went onto the recording.

Only real High Fidelity record reproducing equipment can give this result, and Classic Hi-Fi equipment is the finest obtainable.

We can make up a suitable prescription for those who do not know what to order, and despatch it to any part of the world.

hydraulic pumps

The Plessey Company Limited
Ilford • Essex
electronics • radio and television • mechanics
hydraulics • aircraft equipment

The Plessey unique design HYDRAULIC PUMP is the basis of the heavy lift operation of agricultural implements in modern British "powered" cultivation. It is typical of countless vital products supplied by Plessey to the Mechanical, Electrical, Electronic and Aircraft engineering industries. Managements in these industries are invited to acquaint themselves with the vast development and productive potential of the Plessey Group of Companies when considering forward production of finely engineered equipments.

Illustrated are: The Massey-Harris 744 Diesel, the Bristol '22', the McCormick International Super BWD-6 and the New Fordson Major.

Wives of SUCCESSFUL MEN HAVE PRESTIGE

They live in the public eye. They must at all times have nothing but the best. Wherever you find Coalport china and Georgian silver in the drawing room you'll find 'Prestige' in the kitchen.

These beautiful and practical products are the obvious choice of people for whom only the best will do. This year be *really* thoughtful and give 'Prestige' to those important people on your Christmas list. 'Prestige' Housewares are ideal for business gift-giving because they bring pleasure and real pride of possession, not just to one person, but to the entire family. Just hand your Christmas list to your secretary and ask her to visit any store where fine housewares are sold. They'll have a wide selection of 'Prestige'... for your customers and for you.

Illustrated is the 'Prestige' set of Kitchen Tools at 105/-.

At the Lowest Level

DOES the British Government understand its own foreign policy? One is impelled to ask the question by the extraordinary posture in which the Foreign Office has placed itself in the past week. Its avowed policy is to seek peace by firmness, to respond to any genuine initiative towards a stable settlement in the world while making it clear to the potential aggressors that no monkey business will be tolerated. But when a particularly nauseous piece of monkey business is perpetrated, what happens? An unfortunate official gets rapped over the knuckles for applying to it the perfectly truthful description of "hypocrisy" and the Permanent Under-Secretary of State accepts—at least does not reject—a protest from Moscow. The appearance of this, all over the world, will be that Britain is apologising for being deliberately slandered by the highest Communist leaders.

Mr Khrushchev is, indeed, a notorious dropper of bricks. But no mere slip of his fidgety tongue can explain away his fantastic charge, publicly made in Bombay last week, that the British, the French and the Americans had

started the second world war, sent troops against our country, and these troops were the troops of Hitlerite Germany.

He chose, rather obviously, to launch this breathtaking piece of nonsense at a rally of Indian Communists and fellow-travellers. Next day, he proceeded to India's national defence academy, where Lieutenant General Thimayya and his officers and men received him with polite correctness. A number of them wore medals which recalled that they had fought to check the Nazi and fascist drive towards Asia, at a time when Mr Khrushchev's party was everywhere sabotaging the struggle for the survival of freedom, and loyally maintaining its lucrative partnership with Hitler by rushing war supplies to help the Nazis overrun Yugoslavia and Greece.

It is true that Mr Khrushchev, an exemplary product of Stalin's schooling, seems to learn more slowly and painfully than did Frankenstein's laboratory-built monster. Perhaps he really has no idea that, long before Mr Molotov's incredible announcement (on June 14, 1941) that warnings of a German attack on Russia were being put about only by "the forces arrayed against the Soviet Union and the Great German Reich," Indians were fighting and dying alongside British, Australian, French and other comrades to protect Egypt and the Arab world and to set Ethiopia free. An obscure party employee in those days, he was probably never allowed to know that Stalin did not even acknowledge Mr Churchill's repeated warnings of the impending Nazi attack. A devout ignoramus today, he would be the last man to heed the thought that the allies' Thermopylaean resistance in the Balkans, which forced an infuriated Hitler to postpone invading Russia for over a month, quite possibly saved Moscow. Excuses may be made for childish ignorance and even for narrow racist arrogance. But there is no excusing a cold, venomous lie.

Whatever the motive, there is no doubt about the fact. Mr Khrushchev has deliberately chosen to bring Soviet relations with the western democracies down to the lowest level. There should be no illusion that he spoke in heat or in liquor. True, his bluff apology the next day for overrunning time—"speakers are like drunkards"—was oddly unapt in prohibitionist Bombay. But his upside-down thesis, that the western democracies "backed" that same Nazi Germany that assailed them long before it broke with Russia, is a standard text in domestic Soviet propaganda. Now it has also been launched at the peoples of free Asia, along with the countless other falsehoods and confidence tricks that the Communist chiefs have employed during their present tour. They must have taken into account the anger their smear campaign was bound to arouse in the West, just as they took into account, a few days earlier, the impression Mr Molotov's arrogance and intransigence would make at Geneva.

How the Indians propose to react to their guests' befouling of their hospitality is not yet clear. At the time of writing, there seem to have been no more than a couple of startled comments in the whole Indian press. That does not necessarily mean that no urgent private representations have been made to the Russians. One must sympathise with the Indians over the painful embarrassment that their generosity in providing Soviet leaders with a free platform has brought them. They doubtless honestly regret that their country has been used as the back-cloth for a revolting "smear" attack on a friendly people—for Britain, which in June, 1941, was the only western power in the field against Hitler, was the particular victim of Mr Khrushchev's calumny.

★

All that is the Indians' affair, and should be left to them. But there is something else that is very much our affair. This same pair, Messrs Bulganin and Khrushchev, are due to come to London some time next year. Can such a visit now possibly take place?

One is tempted to answer, emotionally and immediately, that of course it must be called off. But decisions of foreign policy should never be shaped by emotion, always by cool calculation. National *amour propre* should be kept under control, and the Foreign Office, like the Duke of Wellington to the Spanish grandee, should be prepared to bend the knee if a victory can be gained thereby. If dignity were the only thing at issue, it might be enough to suggest that Mr Bulganin should leave his companion at home—a diplomatic illness for Mr Khrushchev would be quite plausible after his sojourn in the drouth of India.

So let wounded feelings be put aside and the question asked in cool realism: would it serve a useful practical purpose for the visit to take place as planned? If so, then the recent insults should not prevent it. But if not, then they should be accepted as a heaven-sent opportunity for getting out of it.

The invitation was originally issued at the summit

in July. There was at that time just a little reason to hope that, if the dawning Russian realisation of the West's good intentions could be cultivated, it might be possible to make a little progress with dismantling the obstructions to a stable settlement. Having discovered at Geneva that Sir Anthony Eden and Mr Macmillan were quite human and even nice to know, let the Soviet leaders extend their education by coming to London and finding out that there really are no "aggressive circles" in the background. That was the argument in July, and there seemed to be something in it.

But there have been several changes since then. It is really not possible any longer to believe that the only obstacle to a settlement is the shyness, the ignorant apprehensions, of the Russian leaders. Mr Molotov made that quite clear when the Geneva conference was resumed. The smiles of July are now seen to be part of the game. The Communists are now evidently using on the western nations as a whole the technique that they have often used on their prisoners, the technique of breaking down resistance by inducing alternations of optimism and pessimism.

The other thing that has been made clear since July is that the Russian rulers are not interested in finding out—or in letting their subjects find out—the truth about the outside world. When Mr Bulganin and Mr Khrushchev go abroad, they do not go to broaden their own horizons or to correct their misconceptions about other people. They go to stir up the credulous masses and to make propaganda. When they are in India, they revile the western nations. While they were actually in England, they would say nothing nasty about the British, but plenty about the Americans. If ever they went to America, everything would be the fault of the "colonial powers." Just as the intention of their visit to India has been to make as much bad blood as they could between India and its western friends, so their object in coming to London would be to create as much mutual suspicion as they could between the British people and their American and Commonwealth friends. In short, since the visit was first mooted in July the useful purposes that it could serve have, by Russian action, been reduced to vanishing point, while the risks inherent in it have been shown, by Russian example, to be very much larger than was realised in last summer's mood of innocence.

It has been wisely said that, while public opinion may sometimes be right in pushing a government towards peace, it should be very cautious about pushing responsible ministers towards hostile acts. There may be some relevant facts that the public does not know. Let us therefore forbear from pushing the argument to what seems to be its logical conclusion. Let us simply say that the question to be addressed to the British Government is not whether, in the absence of a retraction and an apology, the invitation to London should stand. That puts it the wrong way round. The right way round is to ask whether there is any hidden reason why it should not be cancelled.

In Working Order

IT is now six months since Sir Anthony Eden was confirmed as Prime Minister by the British electorate. This may serve as one of two excuses for discussing how the organisational system of the Eden Government seems to be working. The other excuse is that the Government changes, which most people had expected just after the election, have not yet taken place. They no longer seem to be anticipated this side of the Christmas recess. There is perhaps no great reason now, although there did seem to be a reason in October, for wanting to hurry them on; but it is worthwhile to examine the administrative background against which Sir Anthony will have to make his eventual decisions about them.

When Sir Winston Churchill retired last April it was suggested in these columns that one compensation for the loss of a certain majesty in our affairs might be the gain of more order in them. On the whole that judgment holds good. Indeed, in the last few months the business of state seems to have been more ordered and more expeditious, not only than in the Churchill era, but than in the Attlee era as well. There have been occasional exceptions, of which the prolonged dithering over the call-up compromise was an obvious example. But, in general, the journalist in Whitehall now less frequently trips over what seem to be fully documented decisions, only to find that—because (in Labour's day) Ernest Bevin has objected or (in Sir Winston's day) the Cabinet has only belatedly got round to discussing the matter—they are suddenly reversed or returned, amid departmental recriminations, to an inchoate form. This much is pure gain.

It also seems to be fairly apparent what has brought about the change. As far as the outsider can see, staring through his glass darkly, individual Ministers, in their capacity as departmental heads, have more effective powers of initiative under this Government than under its immediate predecessors. It is from the departments that the main proposals now seem to surge forward, and straight up to Cabinet level. They are not sifted first through the appropriate executive member of the union of sub-Prime Ministers (as in the Labour period), nor do they have to wait their turn at the back of a long queue outside the Cabinet door, while brilliant—but time-consuming—one-man dissertations on the hydrogen bomb go on inside it.

What happens when there is disagreement in the Cabinet with particular departmental proposals, as there no doubt sometimes is, is more obscure; but this is a matter that is—or ought to be—obscure under any administration, until the leading figures in it look back from their old age and are willing to reminisce for history's sake. The general impression, however, is that the solutions found for disagreements in this Government have been tidier, more ordered, and more in line

with the individual departments' wishes than usual. This, in short, seems to be an administration in which most policy decisions have come up from below, instead of being imposed by sudden Prime Ministerial directives from above. There have, of course, been some such Prime Ministerial initiatives; shortly after the election, it looked as if there was going to be a rather alarming crop of them. But experience has suggested that whenever these initiatives prove to be rather woolly, for example in a sudden upsurge of enthusiasm for profit-sharing or for a new deal in industrial relations, they are very sensibly remitted to departments or Cabinet committees, for sober and detailed consideration there. There have been no public examples since the election of Ministers marching along in one direction, and then suddenly getting a peremptory order for "action this day" to march along in another.

★

If this is a fair picture of the working of the Eden Government, it provides a useful background to discussion of possible changes in its membership and composition. The first point to emphasise, of course, is that if Ministers in their individual departments are to be the mainspring of the Eden system, then it is important to keep those Ministers wound up for action. Fortunately, an unusually adequate number of them seem to be wound up for action already. They are wound up, very largely but by no means reprehensibly, by widespread personal ambition. There are still—to the Conservative mind and to most other minds as well—a series of distortions left over from the postwar period to be cleared up in almost every department, a number of obvious goals to be reached, and plenty of scope for personal reputations to be made in reaching them. And most Ministers know it.

This does not mean, of course, that the structure of Government is now in a state of dynamic equilibrium. For one thing, there is a danger that, as individual Ministers' tenures of office expand, the pleasures of pressing forward to the Cabinet's attention may pall, and the pleasures of a quiet life become more apparent. For another, there may be certain departments in which the pleasures of a quiet life—and of allowing awkward problems to pile up in the pending tray—may loom too large already. There are some people, for example, who would now prefer to see a man of ambition at the Home Office, rather than a succession of statesmen of quietly impeccable taste. But, in general, both at ministerial level and a little below it, the Conservatives have no obvious shortage of pushful young men; there is merely a shortage of high places for them to push to. Sir Anthony would be wise to remember this. If he

purposes to shuffle some of his senior Ministers about, he should not shuffle them into posts where they will continue to block the bottleneck at the top; he should keep those who are indispensable in their present offices, and shuffle any misfits out of the Government altogether.

★

This leads to consideration of the position of the most indispensable Minister of all, and to what is quite certainly the most important thing that needs to be said about any prospective changes in the Government. It has been widely reported that, just at the moment when there at last seems to be no need for a Deputy Prime Minister to co-ordinate domestic policy, Mr Butler wants to move out of the Treasury into precisely that office. One question to be asked is what on earth he would do there. There are a few non-financial matters for which some co-ordination of Government policy is needed; this is the job that seems so far to have been undertaken mainly by the Lord Chancellor, who has often been surprisingly good at it but who might occasionally benefit from help by a colleague with an imaginative rather than a legalistic attitude of mind. But this would in no way be a major office of state. The real task of co-ordination at the moment is a financial one; the one thing that the departmental programmes of the more forward-looking Conservative Ministers have in common is that all of them need more money. It is inconceivable that the Treasury would allow the task of rationing the money between these programmes to be undertaken by anybody but a Chancellor; least of all could it be done by an ex-Chancellor, jogging fitfully—and with inevitable

embarrassment—at his successor's elbow. If Mr Butler were to leave the Treasury now, he would be moving out of a major co-ordinating role into a minor one.

This would be a very great pity. It need not be denied that Mr Butler's stock has fallen quite sharply in the last few months. But he will be making a sad mistake if he takes this too much to heart. Politics is a funny business, full of inexplicable accidents, and Mr Butler's present loss of prestige is to be explained much more in terms of unfortunate accidents (he has had his full share of good luck in the past) and errors of presentation than by any defects in his policies. The current may easily flow the other way in a month or two. In any case, the only question that should be asked is where Mr Butler could be of most value to the country. There is no doubt that he is of most value to it at the Treasury. During his four years there, he has held the Government to the right policy of moving back from compulsive planning to reliance upon the mechanisms of freedom; if he were to leave the Treasury now, there would be a real danger that any successor, less committed to virtue, might gradually slide back towards the easy expediency of direct controls. And that would be the quickest single way of turning the—still very delicate—engine of Conservative progress into reverse.

Sir Anthony Eden's need, six months after the election, is not to revise the basic structure or machinery of his administration. It is merely to keep the present machinery moving forward, and to increase its tempo a little here and there. To do this he will have to face the embarrassment of asking some of his colleagues who are in the wrong places to retire gracefully. He should be equally firm in asking others to be cheerful about staying in the right places.

An Experiment with Time

SINCE September the United Nations Assembly, sixty delegations strong, has sat in New York, nominally representing the collective wisdom of the peoples of the world, nominally engaged in bringing them more peace, security and prosperity. How many among the hundreds of delegates would honestly claim that it has fulfilled either of these functions? How many positive achievements could they point to? How many of the world's two billion inhabitants are even conscious of the fact that the Assembly is doing anything at all? And, indeed, is it?

A patina of age is already settling not only on the edifice off 42nd Street but also on the rites performed therein. Age brings with it acceptance, and it now seems to be accepted by many people as the most natural thing in the world that statesmen, officials and experts, of whom some at least could be usefully serving the peoples who pay their salaries, should be closeted

for three or four months every year in Manhattan, engaged in debates the principal product of which is a mountain range of mimeographed records that nobody will ever read. Month after month the speakers drone on; the secretariat, completing bulky reports on esoteric subjects only to see them quietly pigeon-holed, is promptly asked to produce more; committees, sub-committees, expert committees, and provisional committees (usually self-perpetuating) are formed and shot out into the void like particles in a cloud chamber; and nobody is moved to ask the anguished question: "How long, O Lord, how long?" They know the answer.

The tedious performance does not, of course, lack critics; but they are mainly of the wrong kind. The Assembly's brontosaurian antics make it an excellent target both for those who dislike the whole idea of co-operation on a world scale, and for those who fondly

believe that a world riven between parliamentary democracy and variegated despotisms is already ripe for universal federation. Admittedly, within the United Nations system itself there are some cool heads who recognise the Assembly's disease and from time to time seek to apply palliatives. The Secretary-General has wrestled like Laocöon with its serpentine tangles, and has managed to prune the odd tentacle here and there. Committees have been formed—supreme irony—to discuss how to shorten the lives of other committees. But the only proven means of getting the Assembly to break up is to ensure that Christmas arrives punctually on December 25th every year; and even that does not always do the trick.

Solemnly, sadly, orator after orator laments the scant attention that press and public pay to the Assembly's quaintly named "activities," the tendency to by-pass it shown by governments that happen to want to get something actually done, the derision with which states both great and small ignore its pleas for good behaviour, the bottomless pit of oblivion into which its painfully agreed and amended resolutions sink each year. Few of these salaried mourners, or of their somnolent audiences, seem to feel any duty to think out for themselves why these things should be so. Yet the explanation can be given very briefly. The quality in which the Assembly is most fatally lacking can, in fact, be put into one word: brevity.

★

Unless it can achieve brevity, there is indeed no hope for it. Well-wishers of the United Nations can, and do, patiently explain to the impatient and the sceptical that Uno cannot exercise powers to maintain peace that it has not been given. They can explain that it cannot function as a true clearing-house for helpful suggestions when one half of the world's peoples are sealed off from the other by totalitarian controls. But they cannot explain why, given these obvious and strict limits to the organisation's effectiveness, the annual rites should always be so tedious, so costly, and so overwhelmingly pointless.

Collectively, the delegations and their governments are responsible for the undoubted fact that the Assembly becomes "news" only when something unusually foolish happens. This year it has caught the world's ear only by provoking France to withdraw, and, two months later, coaxing it to return; by keeping Italy, Ceylon, Austria, Japan and other worthy nations waiting on its doorstep while those two odd entities, Formosa and Outer Mongolia, snarl on the mat; and by getting ludicrously stuck over the selection of next year's Security Council. Any real town meeting that ran on so long and to such little purpose would be broken up by a rightly exasperated citizenry.

Meanwhile, there looms on the horizon what is, in this context, the appalling prospect that the Assembly will soon comprise not 60 delegations but 78. Each

of the newcomers will, without question, claim as full a hearing as the present members. Must future Assemblies, then, run for five or six months a year? And what after that? There will still be more than 78 sovereign governments, and their numbers will presumably increase as other territories attain independence. The British Commonwealth alone, which has already provided Uno with thirteen members, may provide another score in due time. Once the Assembly acquires over a hundred members, it might as well remain in continuous session, and thus save the delegates from dispersing each year with the dispiriting feeling that nothing has been achieved. But, before this *expansio ad absurdum* is completed, cannot something be done to restore its good name?

★

Surely something can. In the current issue of the unofficial British journal, *United Nations News*, there is advanced one of those ideas that often have all the more impact because they are cast in an ironic form. There may be better ideas for cutting the length of Assemblies down to sane proportions, restoring their dignity, reducing their cost to the taxpayer, saving mental wear and tear on senior diplomats, and penalising frivolous mischief-making—but they have not yet been put forward. Briefly, it is argued that, since the Assembly is above all a gigantic sounding-board, the equivalent of a radio or television network, those who exploit it as such should buy their time.

There need be no outcry that this would silence poorer nations at the expense of richer ones. On the contrary, it could be arranged to "soak the rich" as effectively as income tax does in Britain. For what is worth saying can, in any UN debate, be said in a few minutes; and each delegation could be allowed those first few minutes free of charge—after which a steeply rising scale of charges would make marathon speakers add to Uno's finances so generously that more taciturn nations could reduce their statutory contributions. Nor need it be feared that some notoriously defaulting governments would never settle their bills. The skilled engineers who have equipped the Assembly hall with microphones, headphones, and simultaneous translation, could easily ensure that all these were cut off the instant an orator's cash payment, previously inserted into a coin-box, ran out—and perhaps they could arrange that the speaker's podium descended into the nether world like a cinema organ keyboard at the same moment.

Who would lose by the adoption of some such fool-proof, fair-shares system? Assemblies would be cut to a fraction of their present length, to the advantage of taxpayer and weary statesman alike. The neediest nation would still have its say (and its vote), plus the satisfaction of seeing any delegation whose volubility exceeded its sense of thrift paying through the nose into the common funds. Delegates would soon be

discouraged (by their own ministers of finance) from frivolous mischief-making, outbursts of spleen, and the propounding of projects known in advance to be futile. The meek would inherit the town meeting of the earth. And—which is perhaps most valuable of all—people might again begin to listen to what is said in the Assembly. Short, pithy speeches are always more likely to be reported than long-winded ones. Short, pithy Assemblies might recapture the public attention and respect that long-winded ones have lost.

What is the alternative? To watch the expanding universe of jargon, bickering, and platitude on 42nd Street absorb more and more time, energy and money,

while Uno's own High Commissioner for Refugees must tramp the world to scrape up pitifully inadequate funds, and good folk in many countries, who, unlike the Assembly orators, seek no fame, plod along wet streets to collect coppers for the UN Children's Fund? To see the paper mountains rise to Alpine heights in a hundred dusty archive rooms while sixty governments can find only fifteen observers to watch the Israeli-Egyptian frontier? To see the United Nations itself fade slowly away behind thickening clouds of public boredom? Human ingenuity ought to be able to do better than that; and the first and most practicable remedy is surely a stiff dose of brevity.

Too Big for their Bounds

FIFTEEN years ago, the Barlow Commission recommended that a curb should be placed upon the further growth of London. Since the war, successive Governments have endorsed this recommendation. Attempts have been made to limit the sprawl not only of London, but of the other four obviously overcrowded industrial areas of Birmingham, Manchester, Liverpool, and Glasgow. The present Minister of Housing is an enthusiast for this policy. But, at the moment, his ideas are meeting with only very limited success.

The accompanying chart explains why. Men go where jobs are created. And, after a period of fairly strict control through the Board of Trade's licensing system after the war, industrial development is once again booming in the immediate vicinity of London and Birmingham. Last year, for example, 29 per cent of the new factory space authorised by the Board of Trade was earmarked for the London region—an area which extends roughly 30 miles out from Charing Cross. The boom in the Birmingham area is smaller but of longer standing; industrial development in the West Midlands region has accounted for about 12 per cent of new factory space licensed in the last three years.

The chart shows quite plainly why these increases have occurred. In the early postwar years, much industrial development that would otherwise have taken place in or near London and Birmingham was steered by Board of Trade controls into the development areas. But recently the employment needs of the development areas (which used to be called the distressed areas) have seemed less pressing; and the controls have therefore been considerably relaxed. The Board of Trade does still generally refuse to admit new firms into the London region; but it does very little to check the real force behind London's new industrial building, which is the demand for extensions by the prosperous businesses already there. It is now a very rare thing for any of these firms to be denied permission to expand their activities locally.

It is not self-evident that such a policy is wrong. There are many people who would argue that, since the hope of economic progress rests upon investment in success, nothing should be done to obstruct it. And if a successful firm on the Great West Road is told that it may not expand on the vacant site next door, but should go to the other end of the country, the result may be that the expansion does not take place at all. But it is important to look at the problem also from the point of view of the Ministry of Housing. For some years now employment has been increasing in the big cities—and especially in and near London—both absolutely and as a proportion of the national total. When the new factory projects recently licensed for this region have become bricks and mortar, this increase in employment is certain to be accelerated, perhaps

very considerably. And this is liable to make nonsense of the principles on which present town planning policies are based.

It will make nonsense, for example, of the idea of a broad green belt around the big cities: a green belt, however excellent in theory, is merely a mischievous and ineffective restriction if it gets in the way of a vast number of people striving to live reasonably near their place of work. Even more obviously, it will upset

the development plans of such unfortunate bodies as the London and Birmingham councils. Partly because of the need to replace their densely packed slums by modern buildings—but still more because of the need to make extra land available for roads, schools, parks, and congested industries—the population housed within the present boundaries of these two cities will fall, considerably and inevitably, over the next twenty years. Bigger and higher blocks of flats in the cities might slow this fall, but not by much. The London County Council estimates its overspill or export surplus between now and 1975 at 330,000; Birmingham estimates its at 250,000. Both authorities, particularly London, are surrounded by other congested areas facing similar problems. But, clearly, if all these people—and some more besides—continue to work in or near London and Birmingham, houses will have to be provided for them well beyond the present urban boundaries. The new suburban sprawl in the next fifteen years therefore threatens to dwarf its prewar counterpart, and the only effect of the Green Belt will be to drive London's tentacles still further out into the country. The Ministry of Housing's policy—and that of all the local authorities concerned—is based upon the belief that this would be a very bad thing.

★

The result, of course, is that the Ministry, and the local authorities under its wing, is now trying to follow a policy that is diametrically opposed to the *laissez faire* ideas of the Board of Trade. For some time, firms that have got Board of Trade permission to expand in London have found it more difficult to overcome objections from the local planning authorities than firms that have got Board of Trade permission to expand elsewhere. But Mr Sandys is now taking more positive additional steps. He has strengthened the LCC's hand in its attempts to modify the enormous expansion of office accommodation now occurring in central London. He is cutting the provision of new industrial land in congested cities as specified in their plans. He is urging the LCC to acquire vacated industrial premises so as to forestall their reoccupation. This last point, indeed, emphasises the absurdity of the present situation. At considerable cost (of which it would have to bear half itself) the LCC is being encouraged to convert away from industrial use any factory that falls vacant, in order to ensure that there is less industry in its area; while at the same time the Board of Trade may be allowing two new factories to be built down the road, in order to ensure that there is more. A basic contradiction in public policy has therefore become apparent.

It is usually a course of weakness to suggest that a committee or commission should look into a particular problem. But the Barlow recommendations are now fifteen years old; like so many wartime reports, they belong to an age which had had no experience of the new

administrative and industrial revolutions. What would a new inquiry be likely to recommend? It would, presumably, come to one of four conclusions:

(1) It might reiterate the original Barlow recommendation, and remind the Government exactly what that recommendation was. It was that Board of Trade controls over location should be limited to the power to restrict industrial growth in places where it was clearly undesirable, starting (and possibly finishing) with the London area. A resuscitation of the Barlow recommendation now would confine Board of Trade controls to a much narrower front than at present, but would make them fully effective there.

(2) Alternatively, a new inquiry might recommend that the Board of Trade's controls should be scrapped altogether; it might point out that the powers possessed by the local planning authorities would suffice on their own to limit industrial growth in the most congested areas, if they were harnessed to this task under national supervision. If Mr Thorneycroft were to lay down his responsibility, Mr Sandys would get the opportunity to lay down policies—and they would be policies that were consistent with the rest of his programme. This, however, would mean that controls of considerable economic importance would be wielded by a department that need not be sensitive to industrial requirements, which does not seem very wise.

(3) An inquiry might suggest that there should be more emphasis on inducements, and less on controls, in implementing the Barlow policy. For example, public money might be spent on setting up trading estates and other industrial facilities in areas that seemed to be well placed to attract workers away from London, Birmingham and other crowded cities.

(4) Finally, an inquiry might recommend instead that the Barlow principle should be virtually abandoned, in order to lift restraints on industrial investment in an economy that needs investment so urgently. But, if this were done, several other aspects of the Ministry of Housing's policy would have to be abandoned at the same time: plans for green belts would have to be drastically modified, there would have to be more emphasis on building large blocks of flats, and so on. The economic, as well as the social, cost of any such policy would have to be carefully weighed. It would be likely, so far as London is concerned, to be very considerable.

It has not been the object of this article to say which of these courses should be followed. The issue is, indeed, a very difficult one, as it always is when economy and amenity conflict, since the two opposing sets of arguments, being on quite different planes, never make direct contact with each other. The only dogmatic statement that can be made is that the present course should not be followed any longer. This course is for the Ministry of Housing to remember that the Barlow principle exists, and for the Board of Trade (which operates the key control) to forget it: for Mr Sandys to put on the screws while Mr Thorneycroft takes them off. The two Ministers would be wise to get together, or else ask for a new committee to arbitrate between them.

Notes of the Week

Labour's Unprofitable Hush

A LOUD hush can be heard in the Labour party as everybody is busy making alliances with everybody else, in order to show what a moderate chap he is. Mr Bevan even had a *soirée* with Labour's group of trade union MPs this week. When Mr Attlee agreed to stay on in the party leadership for a few months, his professed object was to secure a breathing space for armistices of precisely this kind. But at what cost to Labour's future are they being won? One casualty of this frigid peace may be the "rethinking" of policy. It has now fortunately been confirmed that the working parties which are to undertake this re-thinking will co-opt sympathisers from outside. It is to be hoped that the newcomers will bring in some fresh ideas, for they are going to be badly needed. Mr Griffiths indicated at a press conference last week that his conception of the terms of reference for one of the first of these working parties—that on "equality"—is that it should set out along the old, familiar, dead-end road of trying to think up new taxes to soak the rich. It is quite clear that he considers that these reports will have served their purpose if they are publicity documents that avoid giving offence to the various shades of emotion already contained in the party. Unity is regarded as the most important objective now.

★

The same blight threatens re-thinking about organisation. Here some outsiders have got the impression that, by pushing the party's nose down to the policy grindstone, Mr Morgan Phillips has pushed aside the dagger aimed at the heart of Transport House. This is not quite fair. Nominally, at any rate, the main proposals of the Wilson committee have been accepted, although little enthusiasm is being shown about such awkward matters as improving the lot of agents in marginal seats at the expense of those in safe areas. The one proposal that has definitely been dropped is a less grievous casualty than might appear at first sight. A special standing sub-committee to run the organisation is not, after all, to be set up; but the existing organisation sub-committee should be able to do the job quite well, now that an important change is to be made in its constitution. Hitherto the chairman of this committee has been the chairman of the party (and he, of course, has been far too busy to exercise any control over Transport House); but now the committee is to appoint a chairman of its own. Moreover, a special sub-committee is to be set up to deal with regional and field organisation—and it will consist of the Wilson committee, plus the new chairman of the organisation sub-committee (a job which Mr Wilson may still get).

It is, however, quite true that this chosen structure will not push Mr Morgan Phillips himself as far out into the snow as Mr Wilson had originally wished. But Mr Wilson, although he must be annoyed at some of the recent manoeuvres of old party-stagers against him, apparently does not want to be beastly to Mr Phillips now. The blunt fact is that the more active spirits in the party are beginning to feel that unity can best be maintained by not taking the most embarrassing—which mean the most effective—steps towards establishing a new policy or a new organisational structure. Mr Attlee should consider very carefully whether this really is what he was aiming at when he decided to defer his retirement. These are the months of the lotus eaters, and they should have been months of reform.

Competing Over What?

TWO things were made clear in Wednesday's debate about restrictions on broadcast discussions. One was that most backbenchers were seething with a quite unparliamentary resentment, although it was a resentment that was generally urbanely expressed. Much of this resentment was directed against fellow-MPs whom the BBC regard as airworthy, but it was also vented against newspaper editors who regard themselves as "directors general of the nation." It is a natural human failing to regard a forthright statement by anybody with whom one does not agree as an example of intolerable bossiness; but it is a terribly dangerous thing to reach for statutory powers to put that bossiness down.

The second point was that nobody seriously tried to pretend that broadcast discussions by outsiders may prejudice voting in Parliamentary divisions; while what Sir Robert Boothby says in a broadcast discussion could conceivably influence the way in which Sir Robert Boothby votes in a division, Sir Anthony Eden's vote is hardly likely to be prejudiced through his having been mesmerised, within the preceding fortnight, by Mr A. J. P. Taylor's face. The principal, and revealing, argument advanced by both Dr Hill and Mr Attlee was that broadcast discussions may compete with, not prejudice, Parliamentary debates. This would be true only if MPs designed their speeches in Parliament as propaganda to lay before the people, instead of as representations to the Government of what the people wants (or ought to want); perish that thought, even if it too often happens to be true.

Meanwhile the problem is to go before a Select Committee, though with the specific understanding that "the principle of some limitation to the anticipation of Parliamentary debates" is desirable. The members of the Select

Committee would be wise to begin their task by re-reading the speeches made in Wednesday's debate; and by taking note of the manifestations of some MPs' subconsciousnesses that have now been left as litter on the floor of the House. Nothing that was said during the debate justifies the contention that any restriction of free speech on the air can be in anybody's except individual MPs' interests. Those who are not MPs are justified in getting very angry about this decision to continue the gag.

Forward to Tax Reform?

MR BUTLER'S speeches during the committee stage of the Finance Bill have been interesting chiefly for the light they may throw upon the broad state of Government thinking about the purchase tax and the profits tax. Early on in these debates Mr Gaitskell had said that he feared that Mr Butler might intend to move from the present differential purchase tax towards a flat rate sales tax levied on all commodities; and he intimated that the Opposition would bitterly oppose this. It is impossible to avoid the suspicion that, in making this accusation, Mr Gaitskell was seizing a fairly simple opportunity to be a prophet. It would be easy for him to remember what his expert advisers were recommending as future broad objectives during his own days at the Treasury, to hint darkly that the Government might progress towards them, and to say in advance that this would be a very wicked thing to do.

But his tactics have had some interesting results. Two weeks ago Mr Butler said that although "at present no decision has been taken" about a sales tax and although there are no "ready-made schemes" in his pocket, yet "there is plenty for the present Government and a future Government to consider." This week he said that he would "make bold to suggest that tax critics and tax experts in the future will not be ungrateful to me for . . . broadening the scope" of the present purchase tax, by bringing in some articles previously exempt. This new breadth does, of course, make the transition to a sales tax easier.

★

As regards present profits taxes, Mr Butler said this week that he thought that "it would have been a very good idea" to adopt the recommendation of the Royal Commission on Taxation that he should replace them by a corporations' tax (i.e., a flat percentage tax on companies' profits, which would not vary according to the way, and the form, in which profits are used for distribution or for ploughing to reserve). But he indicated that he had shied away from any good ideas this time because he felt that he could not "encourage" dividend distributions in a Budget that was meant to restrain consumption. He went out of his way, however, to pay tribute to the way in which both the majority and the minority of the Royal Commission had performed their work, and to make clear that the commission's "conclusions are not prejudged by this Budget, which is an emergency Budget." For next April, as far as profits tax is concerned, and perhaps for later Budgets as regards sales tax, there is now surely a hopeful smell of broad tax reform in the air.

Cyprus Emergency

THE declaration of a state of emergency in Cyprus is an odious and risky necessity. It is odious for obvious reasons; it is risky because the authorities may now have to choose between inflaming the situation still further by making martyrs, or making a mockery of their own pronouncements; but it is a necessity because no solution of the problem is possible until the present violence has been stopped. No British Government can let the impression arise that it has been intimidated by the outrages of terrorists. The penalties now to be imposed—death for carrying arms and life imprisonment for sabotage—may seem draconian; but the man on the spot must be allowed to decide for himself what is necessary to restore order and it is hard to imagine anyone better fitted to do this than Sir John Harding.

Mr Lennox Boyd said on Monday that the Government recognises that to declare a state of emergency does not provide a solution. This is encouraging; so are various indications that the Government is trying hard to find a solution along the only lines that now seem possible. According to unofficial reports, it has decided that it could go so far as to acknowledge the principle of self-determination for Cyprus, without committing itself to any definite date. This would be a step forward, but unfortunately Archbishop Makarios may meanwhile have to take a step back if he is not to lose all his influence to the extremists. The proposal that he made some weeks ago to the Governor—that Britain should make just some such declaration on self-determination—evidently provoked strong criticism from the more extreme Cypriots; and he may now be forced to accept their view that to agree to self-determination without nailing the British down to any definite date would amount to deferring *enosis* to the Greek kalends.

Next week the House of Commons is to debate Cyprus. Whatever the Colonial Secretary has to tell it, it is to be hoped that nobody will try to make party capital out of this very serious and tragic situation. The Labour Party, in particular, should remember that the postwar Labour ministries are every bit as responsible for the present mess in Cyprus as is the present Conservative cabinet; and that if the Cypriot nettle had been firmly grasped years ago before ever the Greek and Turkish governments stung their fingers, Britain's allies in the eastern Mediterranean would not now be at loggerheads with it and with each other, and British soldiers would not now be being murdered in Cyprus.

Pistols Out in Berlin

THE Soviet commandant in Berlin, General Dibrova, caused a flurry this week by informing his American counterpart that East Berlin was no longer occupied territory but the capital of a sovereign East German state. The American commandant was protesting against the detention by pistol-waving "people's police" of an American military car which was taking two Congressmen round the Soviet sector, escorted by a United States officer. The car was

held up because its radio transmitter was maintaining contact with the American headquarters.

It is unlikely that General Dibrova meant to announce that the four-power status of Berlin was completely ended. He would not be in office himself if it were. On the other hand, his statement, and his announcement that he would convey the outcome of the talk to the East German authorities, confirm that last September's Soviet treaty conferring "sovereignty" on the "German Democratic Republic" has unpleasant practical implications for Berlin. Soviet military rights in Berlin were retained, but all matters concerning access to the city for civilians were placed in East German hands, and an Allied protest against raising the *Autobahn* tax was referred by the Russian commandant to Herr Grotewohl. The Russians evidently feel they have here a further means of forcing recognition of the East German state. They intend to make the western occupation officials subject themselves to its laws inside the eastern sector of the city. It is nothing new for the Soviet sector to be regarded by the East German authorities as the capital of their state, and the West Germans go almost as far themselves in regarding West Berlin for practical purposes as a *Land*. But it is new for the Soviet commandant to press East German laws on western officers, and the attempt will need to be firmly rejected.

On all such occasions the West Berlin government immediately demands a fresh assurance that the western powers are determined to maintain their position in the city, and Dr Suhr has done so again. Although it is not three months since the western governments solemnly reasserted that the status of Berlin was not changed by the Soviet treaty with the Grotewohl regime, they might well send another reminder to Moscow. The American reaction on the spot has been as categorical as could be desired. But it is certain that more trouble can be expected from the "people's police." Frenzied threats have been directed against the West Berliners for their demonstration after the Geneva conference; and the British commandant has had to call on General Dibrova to prevent the "reckless use of firearms" on the sector border. The western forces will have to show that they can protect "their" Germans or even the courageous Berliners will lose confidence.

Cabinet Crisis in Bonn

DR ADENAUER has returned to the *Bundestag* after his serious illness to face a cabinet crisis which has arisen owing to the failure of the Geneva conference. The Free Democratic Party chairman, Dr Dehler, and his colleague, Herr Middelhaue, economic minister in North Rhine-Westphalia, made speeches in which the refusal of the Chancellor and Dr von Brentano to hold bilateral talks with Mr Molotov was attacked, and a revision of the Paris treaties was demanded. The chance to make joint denunciations of the Soviet government's refusal to hold free elections was lost. As a result Dr Adenauer lost patience with Dr Dehler, who frequently makes unwise speeches, and he demanded an assurance in writing that the Free Democrats would support the policy of the government to which they belong during the remainder of its period of office. He was backed by his own party and by the other

member of the coalition, the German Party, in refusing to accept verbal assurances, though President Heuss intervened to plead for a meeting with the offending Dr Dehler.

This cabinet crisis brought out the latent split among the Free Democrats, some of whom—particularly in Berlin—want to see Dr Dehler go and some new leader elected who would not toy with Mr Molotov, while others go further than Dr Dehler in the other direction. Over the whole party hangs the threat that the Christian Democrats will do away with the present electoral system in favour of something like the British system; in this case, the FDP would decline into the position of the British Liberal Party. The divergent views within its ranks account for the fact that the party issues policy declarations which are full of contradictions, with something to please Dr Adenauer in one passage and a heart-warmer for Mr Molotov and the Social Democrats in the next. This dangerous way of conducting politics leaves the German public with only one impression—that Dr Adenauer and his foreign minister have in some way failed to do enough for reunion.

Eyes on Greenock

THE by-election at Gateshead West takes place next Wednesday, and that at Greenock on Thursday. Gateshead is rock-solid Labour (majority last May, 10,339), but Greenock could be much more fun. It was one of the oddities of the last election. Before the campaign every Labour supporter, with one exception, seemed to think that it was safe. The exception was Mr Hector McNeil, Labour member for the constituency since 1941, who went round telling his friends that he was in danger of losing it. In the event, he was very nearly proved to be right. His majority fell from 5,837 in 1951 to 1,033, and the swing to the Conservatives of 5.7 per cent was the seventh largest in any straight fight in the country. In the present by-election, which has been made necessary by Mr McNeil's death, the Conservatives have only to mark up a further swing of 1.4 per cent to capture the seat.

They probably do not really expect to get it. Many psephologists, who seem to be very annoyed with Greenock for so untidily and inexplicably exceeding both the national and the regional trend last May, believe that this must now be one of the hardest marginal Labour seats to overthrow;

March into the future... No.12

Maybe one day...

Let him play the radiogram and he's happy enough! But one day, maybe, instead of listening to the music-making of others, he will himself be the conductor of one of the world's great orchestras. Then, in giving pleasure to himself, he will give it to the millions who own a Philips radio. Even the deaf, in concert-halls equipped with Philips hearing aids, will be able to share his music. Philips records will carry his performances to the far corners of the earth. But, first, he will have used a Philips tape recorder to check and re-check every nuance of those performances, to achieve the interpretation that satisfies even his most exacting critic — himself.

they say that the swing to the Conservatives which it showed last May should be enough to satisfy it for many years. There are also the usual suggestions that the general election result was due to Labour apathy (although the turn-out of nearly 78 per cent was, in fact, slightly above the national average). The general expectation therefore seems to be that Greenock will elect, with an increased proportion of the poll and possibly an increased majority, Labour's Dr Dickson Mabon—who is described locally as a "clever wee man," at a time when Labour at Westminster badly needs clever wee men, especially those who are aged only thirty. In view of the strange things that happened last May, however, Labour cannot count this chicken before he is hatched; although why it cannot, in a constituency which it has held since the 1930s and which seems to be largely characterised by tenements and grime, remains one of the peculiarities imposed upon the electoral map of Britain by the last general election.

More for the Needy

IN the leap-frogging advance of national insurance benefits and national assistance scales, national assistance will shortly be on top again. This week, new scales, to come into force on January 23rd, were announced; they raise the allowance for a single householder from 37s. 6d. a week to 40s. and for a married couple from 63s. to 67s., with varying increases for dependants and for the blind and the tuberculous.

When the better off pensioners got their weekly rise of 7s. 6d. (11s. for a married couple) before the election, those on national assistance got an increase of only 2s. 6d. (4s. for a married couple). Although politics largely dictated this course—there are more unassisted pensioners than assisted—it could find one justification in the statistics. The increase in ordinary pensions lifted them to a level that more than compensated them for the increase in the official retail price index since 1946—it was in fact equal to the rise in the cost of living index of the London and Cambridge Economic Service. National assistance scales, after their 2s. 6d. rise, were about 88 per cent greater than the supplementary pensions paid by the Assistance Board in 1946, whereas the most that any appropriate price index could be said to have risen by the autumn of last year was 70 per cent. This was the rise registered by the cost of the subsistence items in the official index of retail prices (subsistence being taken to mean food, clothing, fuel and light, but not rent and rates because the assistance scales are not intended to cover these, which are met separately).

But ever since 1948, when the national assistance scheme replaced supplementary pensions, the changes in the Board's scales have tended to anticipate future rises in prices as well as to compensate for past ones. This week's decision continues that policy. By October of this year the continuing rise in the cost of subsistence had very nearly caught up with the rise in assistance scales since 1946. The new scales will thus restore a margin to meet further price rises. This is the right policy, and the Opposition is justified in pressing the Government to step up its pace. But this can only be done if there is a holiday in demanding parallel advances for those old-age pensioners who are not in need.

Potato Politics

MR HEATHCOAT AMORY's decision to allow imports of potatoes to start shortly has brought a sharp protest from the National Farmers' Union. Last year no imports were allowed until late in the season. This year the home-grown crop of potatoes is much smaller and crops are also light on the Continent. The Ministry has acted now to ward off the danger of scarce supplies and high prices later on this winter. The farmers, however, have complained that such promptitude may "affect the growers' market for his crop adversely," and could even "defeat the object of the guaranteed price system introduced this year."

This is blatant nonsense. Potato growers have been guaranteed that they will get minimum prices (at present £10 12s. 6d. a ton), which will provide them with adequate protection in periods of plentiful home supplies. The disposal of surplus potatoes on these occasions is likely to involve the taxpayer in a heavy loss. But in periods of relative scarcity, like the present, market prices rise above the guaranteed prices. The farmers cannot seriously regard it as part of their deal with the Government that they should be allowed to reap the highest possible prices in periods of scarcity, as well as getting the support of guaranteed prices in periods of plenty. Even this year, in making his announcement, Mr Heathcoat Amory has declared that imports will be controlled, so that prices of good quality potatoes will not "be depressed to uneconomic levels"; this, of course, is newspeak for saying that prices of British potatoes will still not be brought down to economic levels—in other words to the world market price.

The real lesson for the public is that potato-growing in Britain is already dangerously over-protected. Quite apart from the assistance given by the Government guarantee and the close regulation of imports, the reconstituted Potato Marketing Board has powers to limit the acreage under production. This power may also be used to force up prices, although its use seems certain to reduce farming efficiency by interfering with the growing of potatoes in crop rotations. Far from needing more protection, potato-growing in Britain would profit from rather less.

"Le Commonwealth"

THE French saying, "*le dieu défini est le dieu fini*," is remarkably apposite to the Commonwealth—a word as untranslatable into French as the French pun is into English. Indeed, "Commonwealth" in its modern sense is untranslatable into any language; and this in itself is an advantage, since it discourages attempts at a definition which, whenever one is made, always offends one or another of the members of the club. The word, like the thing-in-itself, rises unique and inexplicable above logic or consistency; but it works. Its members, all seeing it as something slightly different, and working it in different degrees, are convinced of its value; their conviction convinces outsiders. Burmese and Indonesian delegates to the recent meeting in Singapore of the Colombo Plan (which,

be it noted, started as a Commonwealth mutual aid arrangement and now extends far beyond it) solemnly impressed on Mr Marshall and Tengku Abdul Rahman, the chief ministers of Singapore and the Malayan Federation, that whatever they did they must hold to the Commonwealth.

Not only is the word Commonwealth untranslatable; it has now no face value in English: it does not imply, for instance, re-distribution of national income among member-states. Its seventeenth-century application to a republic with "levelling" tendencies had rather more meaning when it was adopted by the Australians for their federal state, for under that bond of federation the large states had to subsidise the small. (The Australians, with their ideas of a more closely knit empire, thus created a Commonwealth, while the Canadians, with their strong feelings against any formal, imperial organisation or central secretariat, shaped a Dominion, a Kingdom, and a Realm.) And the man who first applied the word to the changing British Empire was in fact a federalist and believed in a federal, or shared, empire. Lionel Curtis, before his death last week, saw the word shed all such meaning and cast off even the towline that linked it with the word "British." But to have found the one word which could comprehend and leave workable but indefinable the new relations between Britain and its growing number of ex-dependencies is not the least claim of a remarkable servant of the British people to be remembered with respect and gratitude.

Brown Study in Budapest

IN Hungary Mr Rakosi seems to be firmly in the saddle again; and since his return from a visit to Moscow he has been making his weight felt (and presumably carrying out his masters' orders) on the economic front. Last month the central committee of the Party met and, after hearing a report from him, passed a long resolution on the improvement of industrial production; and shortly afterwards the National Assembly sat through a whole series of speeches that summed up past achievements and failures and mapped out the way ahead. But for the planners in Budapest the way ahead, even with Mr Rakosi to guide them, looks sombre and murky.

Hungary, like most of the satellites, is supposed to start next year a new five-year plan that will be co-ordinated with those of the Soviet Union and the rest of the bloc. But only the annual plan for 1956 is ready, and although the full five-year plan has not been abandoned, there is visible pessimism about the date of its completion. According to Mr Berei, the president of the National Planning Office, the reason for the delay is the amount of "deep and profound study and work" that is necessary. Hungary is not the only satellite to find difficulty in drafting a five-year plan in accordance with Moscow's present wishes; but its task is particularly hard because since 1953 economic policy in Budapest has suffered from more violent oscillations and internal conflicts than elsewhere in the bloc. It is true the Hungarian spokesmen claim that the present year has been a turning point in the development of their country's economy, but they hasten to add that this is only by comparison with the "stagnation" of 1954 when Mr Nagy was trying to introduce the "new course."

Mr Nagy, indeed, has become a general-purpose scapegoat—even though he is still seen at the opera. It is he who is blamed for the planners' gloomy estimate that no great improvement in Hungary's economic situation can be expected next year. Another reason that is not mentioned is the sharp switch back to heavy industry that is contemplated. Nearly 40 per cent of total investments are to go to heavy industry, whose output is to increase by over 10 per cent, while that of the light industries is actually to decline by 3.8 per cent. The arguments that are produced to show that the supply of consumer goods will not be unduly affected by these changes are not convincing; and if the Hungarian worker finds that Mr Nagy's promises of higher living standards are so short-lived, it is unlikely that he will feel moved by the central committee's call for harder work and higher productivity.

Two Tickets to Kashmir

ALL the turbulence of recent years has not prevented Kashmir from remaining a favourite resort for Indians seeking to escape the summer heat of the plains. At this time of year, however, the valley of Srinagar is less frequented. India's Soviet guests may, admittedly, feel in need of a few cool days, especially after their trying time in Calcutta, where the same "masses" whom they profess to champion got too close for their comfort. But India can offer them many hilltops on which only a cool wind would blow in their faces. Their insistence on extending their original timetable in order to visit Kashmir can be interpreted only as a further experiment in embarrassing their hosts.

Unseasonable as their proposed visit may be, it is well timed for political trouble-making. A few months ago there was clamour in Pakistan for a "liberation" march into Kashmir, inspired by the similar Indian march into Goa in August. The prime minister, Mr (formerly Chaudhri) Mohamad Ali, quickly provided a lightning conductor for some of this pressure by announcing that a national conference on Kashmir would be held in Karachi. The conference, which ended this week, was an orderly affair, but it inevitably passed trenchant resolutions denouncing India's obstruction of a plebiscite for the Kashmiris; and in the streets outside, crowds shouted for a *jehad*—a holy war to free their fellow Moslems. The Kashmiris themselves have lately shown fresh signs of restlessness, and the Bakshi government (which was installed in Srinagar by the Indians after their original nominee as premier, Sheikh Abdullah, had been jailed for insubordination) has arrested many leaders of the campaign for a plebiscite.

Mr Khrushchev and Marshal Bulganin could hardly have been expected to overlook this opportunity. Systematically, almost by rote, the Soviet government is exploiting every local conflict in Asia. It has inflamed the Arab-Israeli frontiers, encouraged the Afghans to step up their "Pakhtunistan" campaign, and now it has its finger in the Kashmir pie. It foresees, no doubt, that any Indian irritation this may earn it will be forgotten once a bluff Khrushchev speech in Srinagar has incensed Pakistan and the Pakistani reactions have incensed India. Thoughtful Indians may, however, note that Mr Mohamad Ali has meanwhile been invited to Peking; and they may deduce that their two "peace-

loving" visitors' aim is not simply to endorse India's stand on Kashmir, but to exploit yet another conflict between non-Communist nations for their own profit.

Rings Round the Milk Rings

PERHAPS the most revealing—although possibly the least publicised—feature of the latest report of the Committee of Public Accounts is its criticism of some milk suppliers for refusing a discount on milk supplied to schools. Local authorities have been responsible for supplying milk in schools since October, 1954, when they took over that duty (imposed on them by the Education Act of 1944) from the Ministry of Food. The Ministry of Education then said that it expected them to get competitive tenders for the supply of milk, as they do for the supply of the many other things that they buy in bulk.

The Ministry was quite right to insist on this. Local authorities can reasonably expect a discount; they buy a million gallons of milk a week, and their annual bill is some £10 million. Even when allowance is made for the cost of putting the milk in bottles of one third of a pint, and putting a straw in each, the cost of delivering 300 or 400 bottles at one place is clearly much less than delivering the same number at separate houses. But the milk suppliers argue that the farmers, after all, have their fixed prices, and that their own margin was fixed on the basis of the maximum retail price. Some retailers who did offer a discount were presented with an ultimatum by the wholesalers, who threatened to cut off their supplies. In London, where, as the committee says, the economies of distribution are highest, four big firms supplying 75 per cent of the school milk have all insisted on the maximum retail price. They were: two champions of free enterprise, United Dairies and Express Dairies; and—just to make this matter non-political—the London and Royal Arsenal Co-operative Societies.

A meeting between representatives of the local authorities and the milk trade produced no concessions. But where the councils have tried toughness, toughness has paid. About a quarter of the local authorities have got their discount by refusing to buy at the maximum retail price, supplying in the meantime either milk tablets, dried milk, or nothing at all. Children replete with school dinners will hardly suffer if they drink less milk for a week or two, and those authorities that have not yet taken a firm line would be well advised to do so. Freedom to bargain works.

University Bulge Ahead

IN his address to the Court of Liverpool University this week the Vice-Chancellor, Sir James Mountford, referred to the launching of an appeal for funds, and produced some telling statistics to show how necessary it is that private and industrial generosity should supplement state aid to the universities. He reminded his audience of figures

S

The Christmas present for the man who seems to have everything.

A memorandum book, an appointments register, and a complete reference book.

A diary lay-out specially designed to meet the needs of the busy man.

A week's appointments at an opening; a book that lies open flat on the desk.

Facts and figures covering the world always available when required.

All information easily found by means of handy thumb-indexes.

Bound throughout in red leather; title blocked in gold.

Price (U.K. only) **41/-** (including postage and purchase tax)

Prices to overseas addresses vary widely; a schedule will be sent on request.

Full details are given in an illustrated pamphlet available from:

DIARY DEPARTMENT
The Economist, 22 Ryder Street, London, S.W.1

already published in the report of the University Grants Committee, showing that the real value of university building completed in the quinquennium 1947-52 was perhaps a quarter of the original estimate of £40 million which was accepted by Dr Dalton as representing the need.

At that rate, and on the basis of 1947 prices, in the seven years 1947-54 the universities ought to have had £56 million expended on their buildings. Yet within that seven-year period, when building costs have risen steeply, they have, in fact, had only £22.5 million expended on them for that purpose.

And that £22.5 million represented £15 million or less at 1947 prices.

The congestion is therefore already acute. But the future is much grimmer. More and more pupils stay at school until they are 17 or 18; and the "bulge" now filling the schools will be clamouring at the gates of the universities from October, 1961. The number of freshmen will then rise each year until 1966; as students stay for three or four years, the total university population will go on increasing up to 1970. Sir James Mountford estimates that even by 1963-64 it is likely to be half as large again as it is at present.

There are, of course, some things that Sir James did not say. It is arguable that the existing universities might be wise to raise their standards rather than to digest all the numbers who, at present standards, would qualify for entry; that the expanded and upgraded technical colleges, and perhaps some new university institutions, should have a greater share of them; and even (dare one say it?) that the universities might get more money from the Treasury if they submitted to even a portion of the cost control over building operations that is obligatory for the schools. Moreover, it is only very recently that the universities have shown their awareness of the "bulge." But it is impossible to deny the logic of Sir James's principal conclusion. If the "bulge" is to be accommodated in the universities, building for them ought to start now.

Delay on the Gold Coast

THE manoeuvres of the Gold Coast opposition groups, the National Liberation Movement and its allies, only make sense if their policy is to delay the granting of independence at any cost. The purpose of Sir Frederick Bourne's present mission to the colony is comparable to that of Sir Keith Hancock's mission to Buganda last year: it is to get all parties to agree on a constitution to be enacted by the British Parliament. But the NLM has steadfastly refused to meet Sir Frederick, although he has informally seen most of its leaders. The party sticks to its demand for a constituent assembly to create a federal type of government. Its latest excuse is that the present legislature has shown its "abject" subservience to the Convention People's party by bringing in a bill that would infringe the power of the Asanteman Council. This bill would give lesser chiefs in Ashanti the right to appeal in disputes to the governor in his discretion—a right long possessed by lesser chiefs elsewhere in the Gold Coast.

Meanwhile the country remains disturbed, and the dilemma before the British Government grows. It has

hitherto been assumed that the Parliament at Westminster will be willing to enact independence for the Gold Coast only if Sir Frederick can come back with an agreed scheme, which would contain safeguards for minorities. But the NLM does not believe in written safeguards; it thinks that Dr Nkrumah would be about as reliable once his powers are sovereign as Mr Strydom is. What happens next? It will be difficult to keep the country poised indefinitely on the verge of independence. Tension would rise even higher, more bloodshed would be likely, and the hopes of the Colonial Office to get this first African "Commonwealth country" away to a flying start would be destroyed. MPs here might be wise to say that obstructionism must be over-ridden—but this may mean not only that the NLM must abandon its federalism but that the CPP must at least concede a general election before independence.

Herr Abs on the Credit Squeeze

FEDERAL Germany's leading bankers have a very sound appreciation of the common interest which Britain and Germany share in maintaining each other's prosperity. Herr Abs, whose words receive nearly as much attention as those of the head of the *Bank deutscher Länder*, Dr Vocke, has made some pronouncements recently which may make wider circles realise their countries' interdependence. At the autumn Frankfurt Fair he reminded German businessmen that as a great proportion of their trade is negotiated in sterling, they should not operate against it. "We should talk of 'our pound,'" he remarked. This was an unusual thought for his audience.

More recently, Herr Abs has dealt with current German moves to counter inflationary tendencies, and has again shown his audience how closely British conditions are being watched. Speaking to businessmen in Mannheim on November 15th, he fully agreed with the Bank of England that the high degree of taxation and public investments make credit restrictions less effective than they used to be. Herr Abs joined the liberal economists who sharply criticise the federal, *Land* and local authorities for collecting large surplus funds, which they hoard or spend wastefully. They bear the major responsibility, he said, for the success or failure of the central bank's present credit restrictions. Though the maximum German income tax is only fifty per cent, Herr Abs pronounced firmly in favour of further reductions, which in his opinion would not have an inflationary effect. In a phrase which will echo round the country, he declared "A million taxpayers behave more sensibly than one public authority." His dictum is more likely to be true in Germany than in Britain, where taxpayers are not so thrifty by nature. The continued rapid growth of savings in Germany is clear proof that there is no inflation in the sense which Germans give to the word.

As Herr Abs and Professor Erhard have recently pointed out, "overheating" of the German market has taken place only in some sections of industry. Herr Abs emphasised that restrictions do not hit only the "bad boys" who continue to use short-term credits for long-term investments. They carry on the practice because it is still cheaper than to fund or repay debts, and they go on investing in plant—however unnecessarily—because the expenditure can be

written off against profits for taxation. The restrictions also hit firms who are struggling to build up a normal capital structure without resorting to undesirable means.

The measures taken in Germany are not yet as severe as in Britain, Herr Abs declared, but a potentially valuable part of German industry is relatively vulnerable to credit restrictions. For this reason Herr Abs, though he fully supports the measures taken hitherto, warns Germans that their future is even more dependent than in other countries on the restraint they exercise over wages, prices and investments.

Reprisals in Buganda

FIVE section chiefs in Buganda, who between them are responsible for collecting two-thirds of the province's revenue, are to go before the new Buganda appointments board or have already resigned in the face of hostile demonstrations and newspaper threats. This follows a period of victimisation of lesser folk who supported or are alleged to have supported the British authorities during the Kabaka's absence. The Kabaka has himself asked the people to forget the past; and a rather extraordinary joint appeal has been made by the governments of Buganda and the Uganda protectorate, in the names of the Katikiro and chief secretary respectively, for the maintenance of law and order. Evidently the average African's idea of the Hancock agreement is simply that the king has come into his own again. In an African despotism this involves settling scores with those on the losing side—chiefs and others who, having an official position, were bound to carry out the protectorate government's behests and who had trusted to the British authorities to protect them.

It remains to be seen whether these reprisals indicate a settled policy of restoring the Kabaka to his former position of power, within the paper forms of the new constitution. The *saza* chiefs are now civil servants, and cannot be removed at the Kabaka's pleasure; but the behaviour of the appointments board will show the lines along which the "king's friends" are thinking. If the Kabaka informally but unwisely asserts his power in Buganda on the one hand, while on the other the new legislature serves as a forcing house of political personalities, new and ugly strains could quickly be imposed on the relations between the province and the protectorate.

Storm Nearing Capetown

THE result of last week's elections to the reconstituted South African Senate was a foregone conclusion. The Nationalists had already eliminated the system of proportional representation and equality between provinces in the upper house, which was one of the essential conditions for the union of the four provinces in 1910; they were thereby assured of a heavy majority. The formality of the Free State and Natal elections and the appointment of the nominated members need not be awaited, for it is obvious

that the government will command the required two-thirds majority of both houses of parliament, which it needs to amend the "entrenched" clauses of the constitution.

But it is a somewhat hollow victory for Mr Strydom because, in the process of "establishing the sovereignty" of the South African parliament, he has succeeded only in undermining its standing both in the Union and in the world at large. Every act forced through by the new Nationalist steamroller, even if its legal status is established beyond dispute, will be regarded as immoral by all but the convinced Nationalists. But even at this late stage the legality of Mr Strydom's manoeuvre has not been fully proved. The opposition United Party has been seeking legal opinion, and it may seek an interdict from the Supreme Court to prevent the new Senate from sitting. Other legal steps are also in the offing. While no one would wish the courts again to be drawn into the political arena, that may unfortunately be necessary, as experience has shown that the most powerful force restraining the government is not the political opposition, but the non-political, incorruptible, and highly courageous judges.

With the constitutional issue again in the forefront the coming session of the South African parliament, which is due to open on January 13th, is certain to be stormy. Moreover, the government, which has been thoroughly nettled by the United Nations' assertion that its *apartheid* programme is making slow progress, is determined to

Talks with the Russians

To those writers and orators who are so irrationally and inopportunistly clamouring for peace, we have a few brief, clear words to say. In the first place, Russia has offered no proposals: none, therefore, are before us either for acceptance or rejection; and to describe us as repudiating her desires for an accommodation is simply false. In the second place, these gentlemen are anxious for a termination of the war either on satisfactory or on unsatisfactory terms: if the latter, they are self-condemned; if the former, we and all England are with them. For, we repeat, as we have over and over again had to remind our opponents, no party of any weight or consideration in this country is desirous to protract hostilities one day beyond the time when their true, original, ostensible object has been accomplished—viz., the security of European peace and independence by the complete deliverance of Turkey and the incapacitation of Russia from further aggression. . . . Let there be no self-deception in so grave a matter. There can be no delusion unless we wilfully delude ourselves. Is Europe independent and emancipated? Is Turkey safe? Is Russia amply warned and permanently baffled? The war has proved the resources and unmasked the designs of our enemy: has it yet conclusively vetoed those designs and exhausted or diminished those resources? Have we the slightest reason to believe that Russia is prepared to propose or accept such terms as will secure the abandonment or the defeat of her designs? And, above all, is it not perfectly certain that if the Allies were now to retire from the contest on any terms short of such, they would virtually be confessing to a failure, and be giving a tacit sanction and submission to the future consummation of projects which they had proved too feeble, or too poor, or too un-persistent to forbid? Now, or never, must Russia be told, once for all, "Thus far shalt thou go, and NO FURTHER."

The Economist

December 1, 1855

prove this false and intends to introduce a number of new racial measures. Among these is the bill designed to segregate European and non-European trade unions, and it is rumoured that the government will also bring forward its proposal to segregate white and black universities. A period of acute tension is in prospect.

Between Inertia and Hysteria?

To hold the civil defence corps together is no easy task. The new Home Office circular to local authorities sensibly faces some of the facts of the situation. It recognises that a large proportion of the strength of the corps is now on paper only; and asks local authorities to find out just how many volunteers are still serious in their intentions, without applying unreasonable tests of absenteeism. It also puts forward a new and shortened form of training, under which volunteers will go immediately to the section for which they have opted, instead of taking a general training first; it is this general training which has caused some volunteers to complain of the "indefinite" nature of their duties. Spare-time trainees are more easily kept interested if they pick up their general training while fitting themselves for a particular function (rescue, ambulance, etc.) of obvious relevance in an emergency.

But, of course, the real difficulty is the atmosphere of unrealism that surrounds any civilian training for thermonuclear attack. Lord Mancroft told the House of Lords this week that there could be no statement of the Government's full strategy for civil defence until the defence white paper appears next February: this will be acceptable only if his statement implies that the new policy, which he defined as "a realistic middle course between inertia and hysteria," is then at last made reasonably clear. Civil defence policy has inevitably taken time to think out, but the impression has been given that it is one neither of inertia nor hysteria, but of vacillation and despair. This has inevitably weakened the resolution both of local authorities and volunteers. The public has already discounted so much in terms of the effect of the hydrogen bomb that sensible plans for survival might even be bracing.

Stocktaking in the Services

THE contrast between the average serving officer's experience with control of government stores and that of the committee of public accounts continues to be marked. On the one hand it is not unusual for a senior officer to devote an entire and wasteful morning to an inquiry into a missing petrol tank. On the other, all this red tape at the periphery apparently does not make impossible a situation at the centre in which the code number of an item (with six digits) is added into the total of the surplus in stock. As the taxpayer's watchdog over such matters the committee of public accounts has barked loudly; and the taxpayer will learn with gloom that items that cost him £1 3s. 4d. each may be assessed for resale at 6d. each. It is easier to

understand the prosperity of those who deal in disposals when one reads that stores worth £15,900 were sold for £10, that cases of new spares never reached store at all but went direct for disposal, and that a packing case loaded with engines could be sold off as an empty. It is not surprising that Cypriot terrorists can arm themselves from Army stores in transit.

The size and complexity of service operations helps to explain such deficiencies—and they are probably no measure of the far greater waste that is meticulously accounted for under the system, and is therefore beyond the committee's criticism. Better stock control is the answer; but it should be made quite clear what this does and does not mean. It will be a great pity if the services' reaction to these strictures is to extend form-filling all down the line; too many man-hours at battalion level are already spent on that. The reforms that are needed should begin as an exercise in management at the top, with simplification and mechanisation (on which the services have already made a start) as their prime objectives. Unless this is realised, the rather breath-taking revelations in the committee's report could actually do more harm than good.

Aylmer Vallance

THE death last week-end, at a relatively early age, of Aylmer Vallance removes one to whom *The Economist* of a quarter-century ago owed a great deal. A contributor for many years, he was Assistant Editor from 1929 to 1933, and was from time to time in charge of the paper. Those who worked with him retain the lively memory of an engaging personality and of a journalistic virtuosity which could add both wit and weight to almost any subject.

Letters to the Editor

Calico Printers Yield

SIR—I wish to correct a false impression which must arise from your issue of November 19th. The redundancy scheme you mention is operated by a company limited by guarantee, Print Trade Reorganisation. Its powers to purchase printworks were confined to a period of three months which ended on January 31, 1950, and the life of the company was restricted to ten years ending October, 1959. The Board of Trade made it a condition of their certifying the scheme under Section 25 of the Finance Act 1935 that neither of these periods should be extended "without consultation with the Board."

It might conceivably be possible to persuade the Board of Trade to agree to the introduction of another purchasing period and even an extension of the levy period, but such a company needs more than powers to purchase. It needs money—either from the industry or the Exchequer. In 1949 those printing firms who intended to remain in the trade were willing to commit themselves to pay levies over a period of 10 years, only because they thought they could look forward to reasonable profits in that period as a consequence of the conclusion of our Mutual Aid (Percentage Quantum) Agreement to run for the same ten years. It was for a similar reason that the Finance Corporation for Industry felt they had sufficient security for the repayment of the money which they lent to Print Trade Reorganisation.

The Government tells the cotton trade to tackle its own problems, yet when one section of it (the calico printing industry) does so without any proved harm to the country's economy (in fact with an obvious and admitted increase of its efficiency) Mr Thorneycroft then takes away the essential basis of that section's organisation.

We cannot therefore allow him any credit for having "spared" our redundancy scheme or for having withheld his "fiat" in order that "orderly arrangements" for the reduction of redundancy in the calico printing industry may still be available—because they are not. The reason for this merciful act must be sought elsewhere and it may not be difficult to find. However automatically the Board may accept recommendations based on the theories and beliefs of the "Monopolies" Commission, the Board can hardly be expected to rubber-stamp the Commission's view that an agreement which the Board certified in 1949 to be "in the national interest" became against "the public interest" four years later.—Yours faithfully,

EDWARD COPLEY
Federation of Calico Printers

The Ban on Heroin

SIR—In your note on heroin you suggest that surgeons may be opposing the ban on this drug because they dislike official interference with their clinical treatment. Obviously doctors do not like interference and prefer to make their own decisions in their own wards, but that has nothing to do with this dispute. In the Institute of Cancer Research no patients are treated, but we are in very close touch with surgeons who operate daily on malignant growths. Pain is not so frequently a symptom of cancer as public discussion would lead one to believe, but when clinicians have to deal with it they want the right to prescribe heroin, not on some point of professional touchiness, but because they are convinced that in some cases heroin relieves the pain of cancer as no other drug will.—Yours faithfully,

D. E. W. GIBB
Institute of Cancer Research

Everybody's Servants

SIR—The Royal Commission on the Civil Service 1953-55 appears to have made no attempt to convert to its "salary equivalent" the gratuity ("additional allowance") paid to Civil Servants on retirement. This is not a normal feature of industrial pension schemes as the Inland Revenue will not approve schemes including such a provision.

The lump sum paid to a Civil Servant may reach or even exceed 1½ times his average annual salary over his last 3 years of service. For an industrial employee in the surtax range to save an equivalent sum out of taxed income during his last 10 years of service, he would need at least £550 a year of additional income, and the figure would increase rapidly in the higher salary ranges.

If this factor and the non-contributory nature of the Government pensions had been taken into account the increases in salary recommended by the Royal Commission would not have been justified.—Yours faithfully,

INDUSTRIALIST

Teachers Unimpressed

SIR—Your note on teachers' pensions concluded with the somewhat surprising statement: "Compared with most of the rest of us pensioners-to-be, teachers are very lucky people now."

Since you have indulged in comparisons, perhaps I may be permitted to do the same. I readily concede that in this age of inflation those with pensions based on pre-retirement salaries have

better prospects than those whose pensions are fixed amounts. In the latter category there are few whose salaries and conditions of work are really comparable with teachers'.

It would be more reasonable to compare teachers' pension arrangements with those of other public servants, most of whom, if not all, enjoy pensions based on pre-retirement salaries. Presumably all these are "lucky," though you do not mention them. Rather you made it appear that teachers are being singled out for specially favourable treatment, whereas on the contrary teachers are receiving worse treatment than other public employees. Though the cost of all pensions has risen, no existing public employees, except teachers, have ever been called upon to pay increased rates of contributions. Perhaps teachers are not so lucky after all!—Yours faithfully,

RONALD GOULD
National Union of Teachers, W.C.1

The Market for Aircraft

SIR—In your article of November 5th, just one sentence is devoted to the short-haul market. This reflects accurately the relative public interest here in "branch" air routes as compared with the trunk routes, and particularly the ocean routes. And yet it is probably fair to say that the branch lines of the world provide air transportation for infinitely more people on any other than a seat-mile computation. Certainly, the local services play a much more important part in the life of nations. Indeed, much of the development of Australasia and South America, to name only two great areas, has in recent years been made possible by short-range air transport. The economies of Brazil, Peru and Colombia, for instance, would be in danger of collapse if their internal air services were removed.

On the other hand, if the international airlines were discontinued, no country, no organisation, no individual would be more than inconvenienced; indeed, the chief result would be that we should have to revive the almost obsolete custom of conducting our affairs by correspondence—and they might be none the worse for that!

Your single reference to short-range operators remarked that many airlines are quite content to continue refurbishing their DC-3s. They would certainly like to carry on with this remarkable aircraft, but they will not be able to. The DC-3s are reaching a great age, their spares are beginning to be short, they no longer comply with international regulations, when these are strictly interpreted and, above all, their customers—the passengers—are demanding something better. Only those operators secure from competition can long delay re-equipment. The provision of that equipment is perhaps the most important and, let us hope, rewarding activity in the aircraft industry today.—Yours faithfully,

R. C. M. COLLARD
London, N.W.2

Books & Publications

Writer to the Establishment

GEOFFREY DAWSON AND OUR TIMES.

By John Evelyn Wrench.
Hutchinson. 487 pages. 30s.

WHEN Geoffrey Dawson became editor of *The Times* his predecessor, G. E. Buckle, wrote to him:

I have no doubt you will gradually and insensibly get into the habit of regarding all public questions, not from your own personal point of view, but from the impersonal *Times* standpoint. "WHAT OUGHT *The Times*, with its history and traditions, to say about this?" has always been in my mind. So is the continuity preserved.

Such advice was naturally congenial to Dawson, and it is no accident that in this biography the figure of the man is continually overshadowed by the office which he held for over a quarter of a century.

"Office" is the right word. To Dawson *The Times* was something more than a great newspaper; it was a national institution, comparable with the Bank, Parliament, the Monarchy and the Church of England. Printing House Square had its place in the topography of the Establishment along with Threadneedle Street, Whitehall, Lambeth and St James's. *The Times* has always repudiated the fiction that it is the voice of the Government—and rightly so. Governments came and went: *The Times* represented something more permanent, at once the mirror and conscience of the established order in church and state.

By upbringing and training Geoffrey Dawson was admirably equipped for such a role. The son of a small country banker from Skipton, he proceeded by way of Eton and Magdalen to a fellowship at All Souls, then by way of the Colonial Office and Milner's "Kinder-garten" to the editorship of the *Johannesburg Star* at the age of 31. By temperament, too, he possessed just those gifts that commanded respect in the official world. Hardworking, conscientious, shrewd, he had a deep conservative feeling for continuity and stability which won him the deserved reputation of being reliable. Untroubled by the doubts of more imaginative men, he took his duties seriously and was satisfied with the anonymity of a great civil servant, content to identify himself with the institution he served without a trace of self-seeking.

Any account of Dawson's life, therefore, becomes something more than the biography of an individual; it is part of the collective biography of the English governing class between the Boer War

and Hitler's war. This is the value of Sir Evelyn Wrench's book. If it adds little to what is already known of particular episodes such as the Abdication, the copious extracts from Dawson's journal and letters illuminate on every page the characteristic assumptions and limitations of those who directed the affairs of this country in the first forty years of this century.

Two of the most striking illustrations of this are to be found in Dawson's attitude towards foreign affairs and in his lack of interest in the social and economic problems of Britain between the wars. Dawson has been criticised for his advocacy of appeasement in the nineteen-thirties, and Sir Evelyn Wrench rehearses the familiar arguments in his defence. But what is much more interesting is to watch the formation of an approach to foreign policy from which support of appeasement followed naturally (if not inevitably). This approach can be traced back to Dawson's experiences in South Africa after the Boer war. Henceforth the imperial connection dominated his—as it did much of the Conservative party's—thinking on foreign affairs. The extent to which this distorted their picture of the world outside the Commonwealth, and blinded them to the revolutionary changes transforming it, is still imperfectly appreciated. For much of the Conservative party's imperialism in the twentieth century was only the parochialism of the nineteenth century's "Little Englanders" written a little larger. The failure to grasp the implications of Hitler's rise to power in Germany thus appears as part of the much bigger failure to understand how far the world of 1914 and the old balance of power had gone for good. In the clamorous seething world of the nineteen-thirties the judicious platitudes of *The Times*'s editorials sounded hollow.

How much more did the editor—or the readers—of *The Times* know of the new England springing up in the Midlands and the outer suburbs of London, or decaying in the distressed areas? There is barely a reference in these pages to the problems of unemployment and poverty, of the phenomena of mass education and mass entertainment. Such issues had no more place in the narrow traditional world of the Establishment, as seen from the editor's room in Printing House Square, than the gutter politics of the Nazis. The world of Trollope was confronted with the world of the *Daily Mirror*—and of Hitler. In that contrast lies the key to much in the history of Britain between the wars.

The Economics of Laputa

MARGINAL-COST PRICE-OUTPUT CONTROL.

By Burnham Putnam Beckwith.
Columbia University Press (London: Geoffrey Cumberlege). 291 pages. 45s.

THE title of this book, irresistibly recalling the notorious headline "Oyster Bars Jam Probe," is not its only irritating feature. Bumptiously sophomoric bad manners distinguish its style; a curious intellectual double standard (any guess is good enough to support my arguments; the faintest ambiguity or quantitative imprecision damns those of my opponents) characterises its matter. But its subject is important, both practically and theoretically, and inadequately discussed in economic literature. Its thesis is closely akin to, though in important respects differing from, that of Professor Lerner's "Economics of Control." In an imperfectly competitive economy, where a high proportion of enterprises work in conditions of decreasing cost, prices set to cover total outlay must largely exceed the cost of the marginal item produced; since these prices cut off a demand capable, by hypothesis, of being satisfied at a lesser sacrifice of real resources than that which they indicate, there ensues an irrational under-use of fixed equipment and a distortion of the economy. First tracing in its historical origins, then restating, this line of thought, Dr Beckwith concludes that every item should be sold at marginal cost (interpreted to include many services, such as retail delivery, now irrationally rendered free), and that the resulting deficits should be covered by Government subsidy. Investment decisions demand a different analysis; these should be based on a comparison of cost on the one hand and discounted marginal yields, plus consumer's surplus, on the other.

Dr Beckwith scores high on the internal consistency of his unorthodox model. This is the best-worked-out, most deeply studied analysis yet of the decreasing-cost economy; a generalisation from the railway-rates and public-utility case, long treated as a subject apart and fitting as awkwardly into the accepted competitive picture as the case of non-reproducible goods into the labour theory of value. The realism of the model is another matter. Evidence that larger productive units have lower unit costs is not evidence that total production, once its instruments are grouped in units of ideal size, is carried on in decreasing-cost conditions; nor does evidence of surplus capacity necessarily indicate anything more than rationally desirable elbow-room in an unpredictable world, like an idle taxi on a rank.

And when Dr Beckwith turns to practical prescription he takes wing straight for Laputa. The logically complete answer is all-embracing socialism (with no nonsense about trade unions, of course) and it may be that his prescriptions for capitalist economies are

deliberately designed to look ludicrous so that the appropriate moral may be drawn. Every prescription can, in its weird Laputan way, be related to optimum price and output theory. Some are genuinely excellent; a simplified version of Dr Beckwith's railway rates scheme would be no less workable and far more rational than any now existing. But their total effect, even charitably assuming away all politically based distortions, would be an economic nightmare in which no producer or consumer could ever budget a day ahead ("price stability is always an evil") and in which price-setting would absorb most of the energies of executives while the allocation and financing of subsidies similarly absorbed the energies of government. As for the entrepreneurs (or Commissars) instructed to add consumers' surplus to money yields before making an investment decision, Laputa itself would seem a haven of practical good sense to them. It is noteworthy that Dr Beckwith, while repeatedly pouring scorn on those who deny that consumers' surplus can be measured, nowhere offers the faintest adumbration of a method for measuring it. His prescription involves extending to the whole field of investment the crude, non-quantitative methods now used, well or ill, to decide road-building priorities.

Fudged answer for fudged answer—and even Dr Beckwith draws the line, in practice, far short of that minuteness of control needed, on his assumptions, to yield perfectly rational results—there seems no reason to prefer, outside perhaps the public-utility field, "marginal-cost price-output control" to the workings of an even moderately competitive capitalist economy.

As Others Saw Us

STRANGE ISLAND: Britain Through Foreign Eyes, 1395-1940.
Compiled and edited by Francesca M. Wilson.

Longmans. 306 pages. 21s.

MISS WILSON has had a happy idea and she carries it off splendidly. She has assembled a collection of impressions of Britain and Britons by visitors over five and a half centuries. Her anthology is fascinating good fun, admirably chosen and illuminated by the editor's own commentary so that it presents a sweep of social history and no mere bagful of snippets. Miss Wilson has divided her visitors into six periods—early discoverers to the time of Elizabeth, then the troubled but exciting century when no foreigner seemed much interested in the Stuarts and the Restoration, followed by the anglomania of the eighteenth century, the war with France, the Victorian age and the present century—each of them with a briskly written picture of the period and its personalities. If any scholastic puritans think that this is history made too easy, Miss Wilson adds a bibliography that will keep them busy for a lifetime.

This sunny scholarship is equally

suited to the bedside table or to the study. Its biggest appeal is bound to be to the curious who wonder what the foreigner thought of us then. The foundations of British character seem to have changed little in five hundred years. Andrea Trevisano in 1497 found the English great lovers of themselves, with no greater praise of a foreigner than "he looks like an Englishman." Eighty years later Van Meteren judged the English clever, handsome and well made "but, like all islanders, of a weak and tender nature" not vindictive but very inconstant and "very suspicious of foreigners whom they despise." These themes recur. So do smoking, tea and business deals done over a pot of ale. The English Sunday brings a comment in 1690: "a common practice, even among people of good substance, to have a huge piece of roast beef of which they stuff till they can swallow no more, and eat the rest cold the other days of the week." And the pudding—a dish very difficult to be described: "they bake them in an oven, they boil them with meat, they make them fifty several ways."

The English, one observer notes in 1727, "are very fond of a game they call cricket." Smokeless zones may be new, but not smog: "the immense consumption of sea-coal increases the quantity of fog, thickens it and renders it of longer duration." "Covetous of time" and "exact to a minute" are compliments of the early nineteenth century. Not all the observers are impeccable judges: the Frenchman, Simond, finds nothing to say of Salisbury save that the steeple is twenty inches out of perpendicular; indeed there is oddly little appreciation of English architecture from visitors during the periods of our building genius. But most of them are perceptive and accurate chroniclers of the British domestic and social scene. "Society being divided as by the rings of a bamboo, everyone busies himself with trying to climb into the class above his own, and the whole effort of that class is put into preventing him from climbing." That is Stendhal writing in 1821. Froissart, Erasmus, Voltaire and Casanova are linked down the years with Trotsky and Maurois in comments as neat and shrewd. And they would expect us to say that we come out "not too badly."

Expanding Australia

AUSTRALIA.
By J. C. Horsfall.
Benn. 223 pages. 21s.

IN 1930, Sir Keith Hancock wrote a wise and balanced book on Australia for Benn's "Modern World" series. Today he writes a friendly foreword to its successor in the same publisher's "Nations of the Modern World." This association inevitably invites a comparison which, however, it would be invidious to push too far. Mr Horsfall, an Australian-born economist and the first editor of *The Australian Financial Review*, has written a book more

Ulster under Home Rule

A Study of the Political and Economic Problems of Northern Ireland

Edited by T. WILSON

This discussion helps to explain why the majority of the people of the six counties have been unsympathetic to Irish republicanism and anxious to maintain the British connexion. It describes the Constitution and considers the use Ulster has made of its regional autonomy and whether the experiment has been a success. 21s. net

Documents on Germany under Occupation 1945-1954

Selected and edited by

BEATE RUHM VON OPPEN

The occupation of Germany after the Second World War represents a unique experiment in international relations. This volume is the only English collection of documents which includes the Eastern Zone and covers the whole period of occupation. 63s. net

OXFORD UNIVERSITY PRESS

The Labour Government & British Industry 1945-51

By A. A. ROGOW,
with the assistance of P. SHORE

"The great thing about this book is that it makes a start with the discussion of the main problems which must occupy democratic Socialists today."

"Critical honest description and analysis of the experience of the 1948-51 British Labour Government such as is contained in this book is almost all-important."—From the foreword by John Strachey.

History in a Changing World

GEOFFREY BARRACLOUGH

In this fast changing world it is now more important than ever to look at history through present-day eyes.

Professor Barracough here questions the preconceptions which have governed the writing of history for the last hundred years.

He has singled out the vital factors which have, today, taken on a new significance.

This book will help to form the outlook of a new generation.

18s. net

BASIL BLACKWELL

deliberately restricted in scope than was Sir Keith Hancock's. It is an economist's book, written with the primary object of describing the intensive development of the Australian Commonwealth during the postwar decade, and of explaining the difficulties that impede further development. As such, it is a successful book; but in spite of a workmanlike chapter on Australia's picturesque and raucous politics, and a rapid glimpse of the country's unpromising beginnings, it must be said that the value of Mr Horsfall's work, for the general reader, would have been greatly enhanced by a less sweeping assumption of knowledge.

It is still necessary to explain why Australia cannot—short of a revolution in the supply of energy—hope to become another United States, despite its comparable size. Most of Australia's 9 million inhabitants have crowded themselves into the fertile coastal plains, with their backs to the dry and inhospitable interior. Its development, though still rapid—indeed too rapid for economic health—is hampered, physically, by shortages of water and oil; civically, by a federal structure which has led to gross over-government and conflicting claims between state and federal administrations; economically, by over-dependence on the export sales of wool, a commodity subject to wild fluctuations on the world market; and financially by inflation and a shortage of capital. Much has been done to overcome some of these handicaps; but the

Second-hand books required

We are always glad to be offered books or whole libraries dealing with the following subjects:

Economics, Sociology, History, Anthropology.

SPECIAL NEEDS:

Clapham—History of the Bank of England.
Edgeworth—Papers Relating to Political Economy.
Feaveryear—The Pound Sterling.
Feis—Europe, The World's Banker.
Grant—A Study of the Capital Market in Post-War Britain.
Hobson—The Export of Capital.
Jenks—The Migration of British Capital.
King—History of the London Discount Market.
Marshall—Money, Credit and Commerce.
Wicksell—Interest and Prices.

The Economists' Bookshop

11-12 Clement's Inn Passage,
Aldwych, London, W.C.2.

shortage of capital for development remains intractable. As the author puts it: "The rate of Australia's economic development must be geared to the prospective level of London funds." This dependence on London has indeed caused much heartsearching by Australian economists aware of the trading advantages conferred by membership of the European Payments Union, but eager for American capital.

Mr Horsfall has performed a useful service by his clear statement of the dilemma of a country aware of its needs to expand but unwilling in the process to sacrifice its living standards. And, very properly, he leaves its solution to Australia's political leaders and economic pundits.

Diet of Oysters?

THE SUN, THE SEA AND TOMORROW.

By F. G. Walton Smith and Henry Chapin.
Hurst and Blackett. 184 pages. 15s.

WHEN Sherlock Holmes had occasion to mislead Dr Watson's clinical instinct and persuade his devoted supporter that he was indeed suffering from "Sumatra fever" he allowed his remarks to ramble in simulated delirium about oysters. "The world will soon be full of them," he said, "so quickly do the creatures breed." The two American authors of this book put the matter on a slightly more exact basis. "One oyster," they say,

produces several million young of which only comparatively few survive to maturity. From a purely statistical point of view, if this prodigious mortality did not occur the progeny of only two or three dozen oysters would within a short time be sufficient to feed the entire world population.

The problem of supplying the population of the world with food, raw materials and power is exercising the minds of an increasing number of people. The possibility of obtaining more fish from the present fishing grounds, of extending the profitable areas from which fish are taken, of using improved devices for catching fish, or of farming fish in ponds or in suitable areas of the open sea—all are matters worthy of serious discussion. Several proposals have been studied to use as human food the plankton upon which fish and whales subsist. The recovery of minerals and other raw materials from the sea has already been developed to some extent. For example, the Dow Chemical Company is reported to recover 20,000 tons of bromine and 40,000 tons of magnesium a year from sea water. Although the invention of atomic piles that "breed" their own fuel may make less urgent the search for sources of power to replace dwindling supplies of coal and oil, there is good reason to review the economics of power from the tides or from temperature differences between the bottom and the surface in deep water. Unluckily, "The Sun, the Sea and Tomorrow" is brightly written, and although all

these topics are touched on, the touch is that of a popular magazine article. To the British reader the prose style is from time to time indigestible. One can soon have too much of "the green magic of photosynthesis," or the "sterile dark of the abyss" and find it distasteful to learn that "we . . . scrape the dung from under the birds of the sea."

Italic Writing

FROM SCRIBBLE TO SCRIPT.

By Peter Rudland.
Allen and Unwin. 123 pages. 12s. 6d.

THE revival of good handwriting on the model of the Italian renaissance is one of the most useful and vigorous movements of the day. Children and adults alike are learning to write more easily, more legibly and more attractively; and they get more pleasure from it. First-class calligraphers, of course, are rare; but in this practical art half a loaf is better than no bread, and everyone can improve his handwriting with pleasure and profit.

Mr Rudland's book is one of the more practical manuals that have been published in recent years. It starts with a short history of handwriting, more plates than text; the plates are mostly old friends, and none the worse for that. He goes on to give practical instruction in italic writing, and ends with a dozen pages illustrating contemporary hands. His instructions are clear and sensible, though sometimes rather exacting: most people would doubt, for example, whether the tiro should be told to take two strokes to an "o" or to avoid horizontal joins between letters; here speaks the professional designer, whose skill sets high standards. But he makes up for this by encouraging his pupils to choose for themselves when they build up their new hand after studying the accepted models. The basic training is rigorous, but the end-product is free and individual.

Mr Rudland throws out some very interesting ideas, among them the concept that metal is an unnatural substance from which to make a nib; the best, though scarcely practical in a busy world, is a quill; cannot a plastic nib be made with the qualities of the quill?

The book is excellently produced, with many illustrations. It can be warmly recommended to beginners and to amateurs of good writing.

Books Received

USA: Its Geography and Growth.
John Murray. 124 pages. 10s. 6d.
The text of this book was originally prepared by the United States Information Service. Illustrated by photographs, it is intended to serve as an introduction to the subject, rather than as a definitive work.

A doubled standard of living needs a doubled supply of sulphuric acid

A doubled rate of industrial productivity, which alone can make the Chancellor's prophecy come true, will require a doubled supply of sulphuric acid for British industry. To this end, new plants, such as Marchon's Solway Plant at Whitehaven, are rapidly approaching full production. The Solway Plant is already producing sulphuric acid from locally-mined anhydrite. The process has the added advantage of co-producing standard Portland cement to meet the pressing needs of housing and capital development programmes.

Marchon Progress Again

There is a direct relation between the nation's rate of industrial productivity and its consumption of sulphuric acid, as shown in the graph. The broken line represents the index of production for the period 1946/1955. The full line shows the sulphuric consumption for the same period. Both figures are relating to 1948 as 100.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Democratic Manager

Washington, D.C.

SENATOR LYNDON JOHNSON of Texas, the country's second most distinguished heart patient and the leader of the Democratic majority in the Senate, has announced his return to health and political life by issuing a thirteen-point legislative programme for the coming session of Congress. It has been well received by his party, in spite of its ambiguities, because it offers a basis on which the Democrats can establish a legislative record that will be useful in next year's election without causing too much friction in the party in the meantime. Senator Johnson is rightly proud of two main achievements under his leadership in the last session: the technical efficiency with which the Senate did its business and the harmony obtained among the Democrats. He is not prepared to see these wiped out by a year of presidential campaigning; he does not intend the Senate chamber to be turned into a convention hall for the purpose of nominating a President.

All political programmes are bound to be a compendium of diffuse aspirations, especially in a country as diverse as America. But the balance of power in the national convention which chooses the presidential candidate and drafts the platform tends to be different from the balance of power within the congressional party, particularly where the Democrats are concerned. Both houses of Congress have a rural weighting and under-represent the majority of Americans now that they live in urban areas; the cities look to the President to press the issues of importance to them, while the conservative southerners, who dominate Congress when the Democrats are in power, hold urban radicalism at bay and pride themselves on their constitutional traditions.

Senator Johnson's success in his first session as majority leader, striking and indeed nearly man-killing though it was, was primarily a technical one; by his managerial skill he asserted a personal ascendancy over the ill-organised Senate. In spite of the impressive total of Bills completed, few of the measures passed were very important. The Senator could claim that, in some cases, those of the health, education and highway programmes, for example, this was because time was wasted over the half-baked proposals served up by the Administration. But Mr Johnson's real test still lies ahead; he has to prove that party harmony means something more than legislative immobility. His ambition indeed goes beyond simply making a success of the next session; he wants to use the work of the session to build a framework for the promises that will be made

on the platform on which the Democrats will fight next November's election.

The ambiguity of a presidential campaign lies in the fact that the candidate for the highest executive office runs on what is virtually a legislative programme, making promises which are left to his party's congressional leaders to honour. Senator Johnson does not want to find himself after the next election morally bound to a platform framed by liberal elements who are without a hope of controlling the machinery of Congress. The story of this next session will be to some extent the story of the efforts of this highly skilled manager to mould the Democrats in Congress into "a progressive party without being radical, a prudent party without being reactionary." If he emerges at the end in the strong position he is seeking to shape for himself, he can hope to delay the nomination of a presidential candidate until pledges have been made about the nature of the candidate's programme.

★

To what extent would such a programme be distinguishable from the "dynamic conservatism" to which President Eisenhower has given currency? Mr Johnson's legislative programme provides some clue. Of the thirteen proposals, at least two hardly stand a hope of passing: reform of the immigration laws and expansion of the public housing scheme. These are typical urban demands; Senator Johnson has introduced them because he realises that, for the Democrats to improve their present small majorities in Congress, they must win more seats in the northern cities.

Another of the proposals will bitterly divide the Democrats in the Senate, but this is a Texan matter which no Texan Senator, even though he is majority leader, can be expected to overlook. It is the removal of federal control from the well-head price of natural gas; a Bill to secure this was forced through the House of Representatives by the fierce efforts of the Speaker, Mr Rayburn, another Texan, and has still to negotiate the Senate. The measure is highly unpopular in the northern cities and will be energetically fought by Senator Douglas, of Illinois, and other liberals. This struggle will be particularly unfortunate for the Democrats in that the one battle-cry on which they are nearly all united is that the Republicans have indulged in "giveaways" of natural resources to private interests. It is evidently Senator Johnson's intention to do his duty by Texas and get it over with as early as possible in the session.

Of the remaining ten measures, the Democrats promise to offer more sensible ideas on health, education and highways than has the Administration, which ought not to be too difficult. On agriculture they offer a much less sensible, indeed in the literal sense a reactionary, idea—a return to high rigid price supports for farm products. Mr Johnson undertakes to pilot through the Senate a Bill extending old age pensions and lowering the retirement age for women which Mr Rayburn has already put through the House. The President's promise that something will be done for the depressed areas is matched and the liberals are offered the smallest possible instalment of their demands on civil rights for Negroes, a constitutional amendment abolishing the poll tax.

Finally, Senator Johnson is proposing a major programme of land reclamation and flood control and a tax cut for the lower income groups. He is evidently hoping that as a result of the recent floods in New England many northern Senators, who used to complain about "handouts" to the less developed south and west, may now be interested in bargaining for a share of this type of federal money. As for the tax cut, no connoisseur of political programmes, especially those of an opposition party, will be surprised to see it accompanying so many proposals for extra expenditure. It will be on his success in "delivering" these ten measures that Senator Johnson's achievement will be judged when next July comes round.

Controversy Goes to School

NEARLY two years of preparation preceded this week's conference in Washington of officials, teachers, parents and others concerned with the upbringing of children; the two thousand representatives from every state in the Union are supposed to give the President a comprehensive review of how American education can be improved. After so much advance planning it is rather unexpected that the conference should have become a subject of controversy, especially since there is no doubt about the basic improvements urgently required in the free schools today—more classrooms and more teachers. Both are already so scarce—and are to become so much scarcer in the next ten years—as a result of the surprising growth in population, that the quality of the education they provide is now a secondary consideration, even though a much discussed one.

Nevertheless, although no one questions the scarcity, it enters into the controversy. Those who claim that financial aid for education from the federal government inevitably means federal control of the state schools, insist that the admitted shortage of classrooms and teachers is being exaggerated. According to this argument, such exaggeration is designed to make the problem seem incapable of solution by the local authorities who are traditionally responsible, and thus to mobilise protesting parents in the drive for federal interference. But the groups who are thus accused maintain that the months of preliminary meetings at state and local levels have resulted in the present conference being packed with opponents of federal aid. Those who express this view—labour leaders and Democratic Congressmen are the most vocal of them—fear that this alleged packing, coupled with the complicated chain of

committees through which the conference is working, will prevent any constructive proposals being put before the President. He will, they say, be advised to do only what he wants to do.

But what he wants to do is not now quite so certain as these critics thought. Last spring he suggested that the federal government should help local authorities to borrow money to build schools; this proposal could hardly have been effective even if Congress had approved it. But this was only an emergency measure, to fill the gap until long-term remedies could be worked out. Mr Eisenhower's message to the conference suggests that he is now prepared to go a good deal further and give direct federal aid, in the form of cash as well as credit, to those areas which cannot afford to build the schools and pay the teachers their children need. What this will actually amount to will probably not be known until the President sends his recommendations to Congress next year—and then the controversy will really begin.

Steel on the Rise

WEDNESDAY'S announcement from the United States Steel Corporation of an increase of \$2 a ton in the price of its carbon steel cold rolled strip will probably swell the trickle of recent price rises in the industry into a stream. But for the present these advances are likely to be confined to particular products which are in exceptionally heavy demand, or are less profitable than the average, and to extra charges imposed when the customer has special requirements as regards size, shape or quality. The industry explains the advances as adjustments after the general rise

of \$7.35 a ton which followed last July's wage increase. It is notable that this price rise, contrary to some forecasts at the time, had no apparent effect on the demand for steel.

This is one reason why another general rise is prophesied for 1956; the occasion for it will probably be the further increase in wages which is expected to result from next summer's negotiations with the steel workers. Iron ore prices are also likely to go up by about 10 per cent before then. However, the main excuse that the steel companies are already giving for the coming advance is that they must build up reserves to finance future expansion and that they

must pay higher dividends so that they may be able to sell new issues of shares for the same purpose. The special tax concessions which have facilitated previous expansions are no longer available; there are cynics who suggest that the unusually frank talk about coming price increases may be designed to induce the government to restore these concessions.

The industry is now working to capacity—output in November should be even higher than in October, which set an all-time record—and customers are complaining not only that present deliveries are inadequate but also that they cannot obtain firm promises of all the steel they need for the early months of next year. Automobile manufacturers are one of the chief causes of the shortage, confounding the experts' calculations by taking more steel than was thought possible; but practically all users are pushing up their requirements. As a result the steel companies are convinced that yet another round of expansion is necessary. From plans already announced it looks as if this expansion will bring a growth in capacity of perhaps as much as three million tons a year for the next five years. To begin with, this can be achieved by further modernisation and extension of existing facilities, but such ambitious plans cannot be completed without building entirely new plants, a very costly affair under present conditions.

Tax Experts

Washington, D.C.

CONGRESS, in advance of another certain battle next year over taxes, has just been given the benefit of a great deal of rather bewildering academic advice on the subject. The Joint Committee on the Economic Report—which might be thought of as a somewhat pale American version of a Royal Commission—has published a thousand-page compendium of expert views on practically every aspect of taxation and will afford the eighty-odd experts a chance to state their positions orally in hearings beginning next Tuesday. Fortunately for the rare student—and even rarer Congressman—who is willing to plough through the heavy volume, most of the papers were submitted by independent economists and lawyers with no particular axe to grind; thus the study provides an excellent factual basis for the debates about to begin. Yet the rays of enlightenment produced by the publication are so diffuse on the one hand, and penetrate into so many corners which Congress prefers to be dark on the other, that its impact on the outcome of legislation next year is unlikely to be marked.

Nevertheless, if the experts provide little in the way of assurance about what future tax policy should be, their papers do warrant three broad conclusions about American taxation as it is. First, despite the publicised recodification of the entire tax law in 1954 under Republican sponsorship, it remains riddled with an astonishing variety of special provisions of a complexity matched only by their frequent inequity. One paper, for example, pointed to the notorious "Louis B. Mayer provision," long a favourite bogey of people who object to special-interest taxation. A lengthy paragraph in the law, innocently entitled "Taxability to Employee of Termination Payments," sets out involved conditions for generous tax treatment of lump sum pay-

ments on retirement from a corporation. It was understood, among the initiate, to apply at the time it was enacted to only a single cinema magnate. Almost all the numerous examples of this kind of special favour, said Professor William Cary of Columbia University in his paper, "have been re-enacted and are firmly embedded in the 1954 code."

The "loopholes" do not necessarily grant escapes only to an individual or very small group. The federal income tax contains a surtax rate running as high as 91 per cent for very large incomes, as business groups never tire of pointing out. But the taxes that very rich people actually pay are another matter. To begin with, they can "split" their incomes with their spouse and move into a much lower surtax bracket. If they invest in mining for oil or other minerals, they get a special "depletion" allowance which exempts up to 27½ per cent of income from taxation. If they make their money on the stock market, they pay a maximum of 25 per cent on their capital gains and get special tax relief on their dividends besides. If they are company executives, they probably get part of their compensation in the form of share options or retirement plans qualifying for special tax treatment. Even large estates can escape confiscatory taxation by clever use of life insurance, especially under changes made in 1954. Mr Randolph Paul, a private tax lawyer who used to work in the Treasury, concluded that in 1952 the actual effective federal income tax rate for taxpayers with incomes over \$100,000 was only 53.4 per cent, despite a theoretical rate of 88 per cent. There are plenty of millionaires in the United States—for better or for worse—and the tax laws help to explain why.

★

These facts of life are related to the second broad conclusion: the American tax structure is not nearly as progressive as a simple reading of the income tax form indicates or as popular belief holds. The papers elucidate this in a number of different ways. Professor Keith Butters of Harvard dealt with the conservative view that present taxes drastically impair the traditional role of the rich as suppliers of risk capital; he concluded after an exhaustive study that "the evidence indicates that as a group individuals in the upper income percentiles are still accumulating large amounts of new investable funds despite existing tax rates." In a more general way, Professor Richard Musgrave of the University of Michigan tried to tackle the elusive problem of just what portion of their incomes Americans actually pay in taxes of all kinds to all types of government—federal, state and local. He found that state and local taxation, bringing in nearly \$25 billion a year, is actually regressive, coming largely from sales (purchase) taxes and local property taxes. Counting all taxes, he discovered that the degree of progressiveness is moderate indeed; the man with an annual income of \$3,000 pays fully 28.3 per cent of it in open and hidden taxes, while the man with \$10,000, at 33 per cent, pays but little more. In fact, about the only progressive feature of the entire tax structure is the federal income tax, which has not been entirely emasculated by the many special provisions.

The third broad conclusion is perhaps the most important: namely, that there appears to be no reason to fear economic disaster from the current high level of taxation. Taxes, taken all together, now absorb close to 30 per cent of the national income. Entire sections of the Joint Committee's study were devoted to the effects of this taxation

on incentives and capital formation; the economists reached a surprising measure of agreement that the national economy can operate and is operating remarkably well in the face of such fiscal avarice. Indeed, if there is anything demonstrable about taxation at all, it should seem obvious that a country investing at new record rates and heading, according to the early surveys, for another fantastic increase in prosperity next year, does not seem to be severely hobbled by its taxes.

★

Half the federal government's annual receipts of some \$63 billion (not including social security taxes on employers and employees, which go into special insurance funds) come from personal income taxes, 29 per cent from corporation income taxes, 14 per cent from excises and the rest from miscellaneous items such as customs. It is a striking, and encouraging, fact that scarcely a paper submitted to the Joint Committee by the academic economists argued that this basic structure of taxation was mistaken. Indeed, the reverse was true. While there was a dizzying variety of criticisms and suggestions regarding individual aspects of the system, fully a score of papers argued directly or indirectly that the present system is admirably suited for handling as an economic instrument and contains a substantial element of built-in compensation against swings in the economy.

The basic reliance on income taxation means that tax liabilities fall much more sharply than incomes in a recession, and several papers pointed out the salutary effect this phenomenon had had in the 1954 slump. And there was little disposition to argue with the conclusion of Professor Theodore Andersen of Dartmouth College that, because of the very existence of high taxation, the federal government, through tax cuts, "can provide the nation's economy with a very quick and powerful stimulus should the necessity arise." Professor Paul Samuelson, of the Massachusetts Institute of Technology, grew positively rapturous about the possibilities of manipulation inherent in a tax structure both high in itself and organised as the American system is, while Professor Arthur Smithies of Harvard found that in this instance politics, for once, were compatible with economics. He contends that

if business interests had their own way, it is likely that consumption taxes would be adverse to business expansion. On the other hand, if the welfare point of view prevailed, business taxes might be raised so high and consumption taxes reduced to an extent that the economic growth, on which welfare itself so basically depends, would be retarded. In our happily balanced society each side of the political argument tends to save the other from its excesses.

Imports Down the Drain?

Washington, D.C.

THE Tariff Commission has decided that British cast iron soil pipes are being dumped in Californian homes. The decision appears to set a precedent; it has therefore alarmed American importers and has recruited wide support for their campaign to clarify the laws against dumping. British sewer pipes are, on the face of it, an

unlikely import. They are the wrong length and lack some of the fittings required for American standard designs and, since they are an unpopular freight with shipping companies, it is difficult to guarantee that they will arrive on time. That they earn any dollars at all is due to the enterprise of local importers and the phenomenal housing boom in California. The initiative was American and the price was fixed by local competitive conditions. It would be difficult to imagine any situation further removed from the original purpose of the 1921 Antidumping Act, which was to save American industries from massacre by the "predatory dumping" expected from European cartels.

Until a year ago the Treasury was responsible for both of the findings that must be arrived at before penalties are imposed under the Act; it must first be decided that the imports are being priced at less than their "fair value" and then that, as a result of this, an American "industry" is either "injured" or "prevented from being established." With this procedure complaints under the Act were seldom successful, but now the Treasury makes the first finding and the Tariff Commission the second. The Treasury has been consistently mechanical in its interpretation of "fair value," which currently means the price charged in the home market. But it used to require evidence of really substantial injury, while the Tariff Commission's thought processes on this point, as revealed in its first main decision on such a case, are bafflingly obscure but nevertheless ominous.

The majority of the commissioners seemed to treat as an "industry" six Californian companies which are responsible for eight per cent of total domestic production of soil pipes. The imports came to only four-tenths of one per cent of the American output and they equal only three per cent of output in California. The man who made the initial complaint was obviously the most marginal of producers, having been in and out of the business several times; some of the firms which appeared in his support were shown to be doubling their production and raising their prices and their profit. Thanks to the commission's finding of injury the unfortunate importers must now pay penal duties on the British sewer pipes, possibly even those brought in as long ago as December, 1953, four months before the complaint of dumping was originally made. It is difficult not to agree with Professor Jacob Viner, testifying before a congressional

subcommittee, that unless Congress does something to change this law the threat that now hangs over every American importer will be a more serious deterrent to anyone trying to enter the dollar market than even the famous "escape clause" in the Trade Agreements Act.

War on the Columbia

FROM A CORRESPONDENT IN OREGON

BOTH the Pacific Northwest of the United States and the Western Provinces of Canada are rich in natural resources; both are now developing these resources and as a result both are enjoying an economic boom and a rapid growth of population. But this community of interests has brought the sharpest disagreements between the two neighbours since the middle of the nineteenth century, when the pioneers who followed the Oregon trail tried to push the frontier northward as well as westward under the slogan "54° 40' or fight." The argument today does not concern the actual line which the national boundary should follow but the extent to which the region's resources of water and natural gas should be allowed to cross that line. The disagreements began over the plan for sending natural gas by pipeline from the fields in Alberta and British Columbia to factories and homes in Washington and Oregon. This argument over energy appears to have been settled, but it is being replaced by another, over the exploitation of the waters of the Columbia river, an international stream, for the production of hydro-electricity.

It is twenty years since the United States began to harness the Columbia river system; in it lies about one-third of the potential hydro-electric power on the North American continent. The river rises in British Columbia and drains Canadian territory for the first 465 miles of its 1,210-mile length. As it crosses the border, the mainstream carries an average annual flow of some 62,400,000 acre-feet of water, more than one-third of the 180 million acre-feet discharged at the river's mouth near Astoria, Oregon. Thus a substantial part of the water that turns the hydro-electric generators on the dams along the Columbia originates in Canada.

Many years ago the International Joint Commission was created to deal with the development of rivers (the St. Lawrence is another) which are shared between the United States and Canada. Until recently, as far as the Columbia was concerned, the commission confined itself to determining the extent to which water impounded in the reservoirs of dams south of the border might be backed up into Canadian territory. But then the American industrialist, Mr Henry Kaiser, who uses electricity from the Columbia to operate aluminium plants in Oregon and Washington, asked the provincial government of British Columbia to allow him to build a storage dam at Arrow Lakes, on the Canadian stretch of the river, to regulate its flow and thus to increase the generating capacity of the American dams from which he obtains his power. The provincial government approved the Kaiser plan, but in the Dominion Parliament it gave rise to a Bill empowering the central government to veto any provincial plan for the development of an international river. This legislation was sponsored by the Canadian war hero, General A. G. L. McNaughton,

who is senior Canadian representative on the International Joint Commission.

General McNaughton has conceived a grandiose scheme for making at least a part of the Columbia an all-Canadian river and thereby assuring that Canada should get the benefit of the water that now flows over the border to generate electricity in the United States. For part of its Canadian course, the Columbia river is only a few miles from the Thompson river, a major tributary of the Fraser, which reaches the sea without crossing the border. General McNaughton proposes that a tunnel should be drilled through the mountain ridge separating the two watersheds and that 15 million acre-feet of water be drawn each year out of the Columbia into the Thompson. He would also divert the Kootenay, another international stream, into the Canadian stretch of the Columbia, increasing the flow there also.

Thus General McNaughton hopes to capture for Canada a potential increase of hydro-electric power on the Fraser

river system of slightly more than 5 billion kilowatt hours annually. The effect would be, of course, to reduce by a like amount the potential output of the mainstream of the Columbia south of the point of diversion. The possible loss of electricity would be equivalent to a quarter of the output of all the US government dams now existing on the Columbia below the Canadian border.

The McNaughton proposal was the main item on the agenda of the October meeting of the International Joint Commission, which completed a week-long session without reaching the slightest agreement on the issues involved. However, General McNaughton announced early in November that investigations into the engineering feasibility of the diversion were achieving "promising results." If Canada proceeds with the plan, the prospect is that the United States will carry its objections to the World Court at The Hague.

Mr Len Jordan, the chief United States representative, told the commission that the diversion of so much water from the Columbia to another watershed wholly in Canada would result in "very serious injury to downstream interests in the United States." The Democratic Senator Neuberger of Oregon takes the view that Mr Jordan has actually

encouraged General McNaughton in his plans by opposing the payment of adequate compensation to Canada for the benefits accruing to the United States from water originating in Canada. Mr Jordan has described Canadian claims for such compensation in kind—that is, in electrical energy—as excessive. United States interests are joined by the Province of British Columbia in opposing the project of the Dominion government in Ottawa. The province points out that its valuable commercial salmon industry depends on keeping the Fraser river free for the migration of the fish; hydro-electric dams, it is argued, would destroy that industry.

Senator Neuberger believes that the international characteristics of the Columbia river make it urgently necessary to reach a mutual compact with Canada, looking toward the wisest use of the river's full resources. He points out that diversion of the Columbia into the Fraser basin might mean that hydro-electric output on the American side of the boundary could not be increased beyond present levels, while, if both countries relied on storage dams, such as that proposed by Mr Kaiser, the capacity of the many generators on the section of the Columbia which flows through Washington and Oregon could be expanded. Unless some agreement of this sort is reached, it looks as if General McNaughton's desire to keep Canadian water power for Canada may bring an acrimonious dispute to the longest undefended border in the world.

SHORTER NOTES

Tax receipts have been coming in so satisfactorily that the Treasury does not now expect to have to raise any more new money this year, as it had earlier planned to do. But its latest refunding, of over \$12 billion worth of securities falling due on December 15th, will be the most costly for over two years as the result of the recent rise in interest rates; this probably also explains why no attempt is being made this time to lengthen the term of the national debt. The two new issues, available only to holders of the maturing issues, are a one-year certificate at 2½ per cent and a 2½ year note at 2½ per cent.

In refusing to reimburse the Dixon-Yates group for the expenses incurred before the cancellation of the notorious contract with that combine for supplying electricity to the Tennessee Valley Authority, the Atomic Energy Commission, which signed the contract, has admitted that there was probably a violation of the conflict of interest laws when it was negotiated. It has thus apparently justified the Democrats who have long argued that the Administration was guilty of an impropriety in connection with this contract. Senator Kefauver of Tennessee is not letting the matter rest; nor is the Dixon-Yates group, which proposes to take the matter to court.

A ruling which may have wide implications for the government's security programme has just been given in a passport case. Judge Youngdahl has ordered the State Department to support its denial of a passport to Mr Leonard Boudin, an alleged Communist, with "evidence contained

in the record." The judge refused to accept the excuse that the charges came from "confidential informants" who could not be produced in public. The validity of this excuse, frequently given in security cases to prevent an accused person from confronting witnesses against him, may now be tested in the Supreme Court.

The Interstate Commerce Commission has applied the Supreme Court's decision on racial segregation in schools to public transportation. It has forbidden railway companies and bus operators to separate Negro from white passengers travelling across state boundaries on vehicles or in waiting rooms. Federal authorities have no control over transport facilities that operate only within a single state; thirteen southern states require racial segregation on public vehicles. It is expected that the ICC ruling will be appealed to the Supreme Court.

At the humorous suggestion of Mr Benson, the Secretary of Agriculture, President Eisenhower changed his hospital breakfast menu from beef bacon—a thinly sliced beef cut which is cured, salted and smoked—to regular pork bacon. This change was intended to dramatise the Administration's attempts to bolster pork prices. The latter have tumbled to the lowest levels in years and Mr Benson is trying to hold the line with the aid of an emergency purchasing programme.

A price war between cake mixes has recently ended, but the battle over quality, variety of flavours and ease of mixing goes on, with five different manufacturers all promising satisfaction to the housewife. As a result her use of these mixes has been multiplied by ten in eight years and grocers' shelves are overflowing with rival packages.

The Federal Power Commission has authorised the Idaho Power Company to go ahead with two of the three dams which constitute the controversial Hells Canyon project on the Snake River. Work is to start at once but Congress will probably try to put a stop to it when the new session opens.

MORE POWER AT LOWER COST

What the roc did for Sinbad, Napier will do for the air passengers of the near future. Napier engines will give helicopters their vertical lift and then, once airborne, their forward power. Eland turbo-props will be fitted in the Fairey Rotodyne, and the Oryx turbo-gas-generator in a new Percival helicopter.

Both these engines are variations on the general Napier theme: more power at lower cost.

Fly TCA and save money!

From now until March 31, 1956, you can fly to Canada aboard the most luxurious aircraft on the Atlantic crossing, at low, off-season fares!

Overnight by TCA SUPER Constellation

Aboard giant TCA SUPER Constellations (with your choice of First Class or Tourist accommodation), Toronto and Montreal are only a night's journey away from London or Glasgow.

Same-day TCA connections across Canada and to the U.S.A.

Flying across Canada or to the U.S.A.? Why change airlines? TCA fly you all the way! You can enjoy TCA Viscount travel on many Canadian inter-city routes, and, by the same famous turbo-prop aircraft, fly to New York (only 95 minutes away from Montreal), Chicago, Detroit (Windsor), and Cleveland.

TCA's Family Fare Plan offers really worthwhile fare savings to families travelling to Canada until March 31, 1956. For example a man and his wife save over £71 London to Montreal (tourist return). Ask your travel agent to tell you how much your family can save on one-way or return flights.

FIRST CLASS RETURN FARES	
London to Montreal	- £237. 9.0
London to Toronto	- £253.10.0
TOURIST RETURN FARES	
London to Montreal	- £168.19.0
London to Toronto	- £182.10.0

Approved IATA off-season fares

27 PALL MALL, LONDON, S.W.1, AND GLASGOW

Serving Europe, Canada, U.S.A., Bermuda, Nassau and the Caribbean

Give the finest pen in the world

Its name is Sheaffer. Treaties are signed with it. So are five-year film contracts. And the sort of cheques that hang framed in the Chairman's office. People whose names are as familiar to you as your own sign them with a Sheaffer. And all because the Sheaffer belongs to that way of living in which the best is only just good enough.

Go to the best pen counter you know. Hold a Sheaffer in your hand and you'll agree it looks the part with its slender silhouette, its unique tubular nib, its near-incredible Sheaffer 'Snorkel'.* Feel how smoothly it glides as you write 'To wish you a very happy Christmas'... and then you'll wonder who can be persuaded to give you a Sheaffer for Christmas too.

pneumatic filler

A flick of a finger—instantaneous filling on the downstroke. Cleans, flushes itself automatically.

*the world-famous Sheaffer Snorkel

Wiping nib, wiping barrel, a thing of the past! Snorkel tube reaches down, drinks the ink, retracts!

14-carat gold feather-touch point

A marvel of delicate precision and strength

matching sets

'Ensembles'—pen and pencil; 'threesomes'—pen, pencil and ballpoint. In handsome gift cases.

Skrip

The finest ink for the finest pens.

The World Overseas

Down and Out in Paris

FROM OUR SPECIAL CORRESPONDENT

SUDDEN drama arose in the Palais Bourbon late in the evening of last Tuesday at the close of what had looked like the most unexciting of crises. Nothing had foreshadowed such an ending. Up to then everything had proceeded according to schedule. M. Faure was doomed by parliamentary arithmetic, and one speech after another confirmed that its 297th day would be the last for his government. Everything seemed a formality. In accordance with the new procedure, for an hour deputies climbed the rostrum to deposit their ballot in person. Boredom reigned amid the lobby wizards awaiting the result. Then came the shock; 318 votes were polled against M. Faure—more than half the total number of deputies—and the constitutional conditions that would allow the government to dissolve the Assembly were thus fulfilled. The routine crisis was suddenly transformed into a historical occasion. Would this government dare to use the weapon of dissolution, which had been rusting in the constitutional arsenal since 1877?

The question was the more intriguing since the application of this legal procedure would achieve what, according to the opposition, was the real aim of the government: an early poll without any change in the unpopular electoral system. Many deputies had voted against M. Faure in order to prevent just that. A crisis, they had argued, would put everything back in the melting-pot and foil the governmental "plot" for an early election. But they carried out their counter-offensive with an excess of zeal and thus defeated their own ends. By a handful of votes they gave M. Faure, or rather his MRP and conservative ministers, an excuse to dissolve the National Assembly without giving it a chance to alter the voting system first. After some hesitation the government seized this opportunity.

Elections and electoral reform were clearly at the heart of Tuesday's debate. The choice of the next subject to discuss was merely a pretext. With his majority shaken by events in North Africa, M. Faure thought that the prospect of early elections would keep it together, but, when this project became entangled in the parliamentary labyrinth, he tried to please, or outwit, everybody and reaped only the fruits of suspicion. The opponents of an early poll, the partisans of reform, all those who mistrusted the Prime Minister's designs joined forces with the Gaullists who were still smarting over the Moroccan affair. The government's fall was a foregone conclusion.

This certainty added a light-hearted touch to the proceed-

ings. The Assembly laughed when a speaker compared M. Faure to Seyes, who when asked what he had done during the Revolution answered, "I lasted." It laughed even more when another claimed, in a curious metaphor, that one could see teeth in most deputies' eyes. M. Mitterand, acting as the chief spokesman of the Mendésist opposition, accused M. Faure of contempt for parliament—a somewhat ill-fitting indictment—and, more concretely, of an ill-concealed attempt to preserve the existing system of *apparetements*. The Socialist representative spoke in the same vein, followed by M. Duclos, the Communist leader, who proclaimed that this time his party would not come to M. Faure's rescue. Indeed, it was M. Duclos who raised the only important question of the debate—that of alliances. Turning to the Socialists, he asked them bluntly if—should a system involving alliances prevail—they would agree to work with the Communists. His implication was either a popular front on the 1936 lines, or else, beware.

The degree of Communist untouchability will play a key role in next January's elections under the present system. If Communist voters and deputies should remain outcasts, even in this period of "co-existence," the Rightist

According to the latest reports, elections to the National Assembly will be held on January 8th. Parties thus have five weeks to form alliances or *apparetements*. If either a party or an alliance gets over fifty per cent of the votes in a constituency, it pockets all the seats. If no absolute majority is reached, seats are divided through a form of proportional representation.

Dissolution was last applied by President MacMahon. Article 51 of the present constitution states that, if within a period of 18 months two governments have been defeated in a vote of confidence or censure by an absolute majority (actually 312 votes) the Council of Ministers can decide to dissolve the National Assembly. The President must issue a decree in conformity with that decision and elections must be held between the 20th and the 30th day after the promulgation of this decree.

majority will continue its rule. This was the tacit assumption of the champions of dissolution without change in the electoral law. But this project may yet turn against its authors. It is not impossible that the indignant and frustrated Socialists will look to their left. Despite the warnings of their national headquarters, many local Socialist parties may not turn a deaf ear to the wooing of M. Duclos; the *apparentement* might prove the illegitimate father of the popular front.

In all the calculations and permutations that are now being worked out in Paris there is one unknown factor—the ordinary voter, who for once cannot be left out of account. His choice may be distorted, he may be bewildered by all sorts of misguiding labels, but he cannot be gagged. If he is shocked by the record of the present majority and sees in dissolution merely a trick played by the “outgoing syndicate” in order to return, he can prevent this process of reincarnation by shifting his vote, by withholding it from the *apparentement*. But what is the real mood of the French people? Judging by the comments in the French press a dissolution may equally well be presented as a salutary move to get rid of this *chambre introuvable* or as a fraudulent attempt to preserve its spirit. In these circumstances it cannot be easy for the average Frenchman to make up his mind nor for experts to guess his reactions. The verdict of the French people may prove as surprising as the time-bomb which exploded in the Palais Bourbon this week.

Red Blueprint for Germany

THE Soviet German National Front has now issued its programme for reunifying Germany as a people's democracy. It is an elaboration of the decisions made at a recent meeting of the Socialist Unity Party (SED) leaders, for whom the Front is merely a facade. The administration has been changed to carry out these decisions. A puppet liberal, Dr Loch, has been put in charge of all-German affairs, without a ministry, in order to facilitate contacts with west German politicians. The demotion of the security administration which took place after Beria's fall has been cancelled and Herr Wollweber has been given a ministry of his own; and the predominance of heavy industry which Moscow has insisted upon everywhere since Malenkov's demotion, has been reflected in the sub-division of the Ministry of Heavy Industry into three, with the appointment of the chief Communist theorist, Herr Oelssner, to head a committee which will try to increase the production of consumer goods without hindering engineering.

The National Front programme is not essentially new. It merely states the Communists' aims in the clearer form which has prevailed since the two Geneva conferences. It repeats first and foremost the Soviet declarations on the need for a security system, and then sets out the methods of achieving the parallel Soviet demand that reunited Germany shall be a “peace-loving and democratic” country. Four terms are laid down: the “German Democratic Republic” must be recognised; there must be negotiations on a basis of equality between the Federal and Pankow governments and an all-German Council must be set up which will work out the status of reunited Germany; in the

Federal Republic all “militarists” (by which the Communists mean supporters of Nato) must be removed and an end made to the “dictatorship of the 150 multi-millionaires”—a phrase recently coined by Herr Ulbricht. The cold war between the two German states must be ended by collaboration in economic and cultural fields. More delegations must be exchanged, and contacts between the populations must be developed. Subversive activities against the German Democratic Republic must stop. The last demand has for years been a particularly hot favourite of the Communists. It means that RIAS (the American-sponsored wireless station in West Berlin) and various other organisations in West Berlin which keep up the spirit of resistance in the Soviet Zone must be closed down. At the same time, of course, underground Communist subversion in the Federal Republic will continue, as the free trades unions and the Social-Democratic Party have to be captured, and Dr Adenauer overthrown.

This section of the National Front programme should be seen against the background of post-Genevan propaganda in the Soviet Zone, which stresses that the internal political system in reunited Germany is just as important as the country's exclusion from military blocs. “The basic issue—the character of a reunified Germany—has been clarified,” speakers have reiterated. One recent commentator went on:

Naïve people have sometimes asked what should be changed in the German Democratic Republic so as to enable Germany to be reunified. This is now over and done with, for Geneva has made it clear that it is not in the Democratic Republic that changes are necessary. There nothing exists which runs counter to a peace-loving democratic Germany.

Such statements should end all doubt as to whether Mr Molotov might not have agreed to free elections if the West had accepted the Russian proposal for a “security” system.

Shoddy Goods

The National Front programme has a second section, dealing with the East German economy. It is an echo of the current Soviet insistence on the need for Soviet Russia to catch up with America in technology and productivity. The German workers are told that their attitude to work must change; they must stop producing shoddy goods just for the sake of the pay-pocket, now that the works belong to them and not to capitalist exploiters. This exhortation is very revealing, when it is considered that the Germans—as they have shown so miraculously in the West—are by nature among the world's hardest, most skilled and conscientious workers, almost fanatically devoted to their enterprises. The reason for their change under Communist rule can doubtless be found in the preference given to men who are politically sound rather than skilled, and to the inherent inefficiency of the Communist planned economy—to which the West German business men dealing in interzonal trade bear witness.

It has always been evident that the German Communists realised that they must raise the economic level of their territory before they can hope to secure support for reunion on their terms among sufficient West Germans. For this reason, the National Front programme always has been and still is, a long-term plan, and the latest version only re-emphasises how essential it is to strengthen the Democratic Republic.

In view of the vital importance to the Communists of this part of their programme, it is obvious why they should be extremely angry and worried about the number of young men and scientists who are leaving for better jobs in the Federal Republic. In October 9,200 youths arrived at the western reception camps, or 1,300 more than the previous month's total, and there were many thousands who came illegally. From 1949 to September 1955, it is estimated in Bonn that no less than 700,000 young men under 25 have fled westwards. It is small wonder that Herr Ulbricht is threatening their relatives with reprisals, and that Communist broadcasts denounce the refugees as traitors who will meet deserved punishment when Germany is reunited. But such denunciations will not bring the culprits back, and will give them a personal interest in opposing reunion on the lines of Herr Ulbricht's National Front.

Colombo Plan Optimism

AT the meeting in Singapore last October of the Colombo Plan's consultative committee the representative of India was the most outspoken critic of the Plan. He argued that economic development in the region was entering a new phase in which the provision of still larger lumps of external capital aid would be necessary. In the fourth report* of the Colombo Plan, which has recently been published, the authors are careful to avoid any direct reference to the Indian point of view. And, though the welcome decision to extend the Plan for a further four years until June, 1961, has been taken, there is no indication that the question of increased capital aid, as distinct from technical aid, is under consideration.

The report itself is mainly in an optimistic vein, though no attempt is made to conceal the problems facing the region. Indeed, with the population increasing at a rate of something like 10 million each year, and with levels of food consumption remaining below prewar in spite of all that has been done, it would be difficult to minimise the task ahead. Yet there are a number of encouraging features in the progress made during 1954-55, the period described in the report.

The flow of investment in both public and private sectors gathered further strength during the year, and the fact that the supply of machinery, plant and other capital equipment was more readily available in the world, and at somewhat lower prices, meant that actual outlays on development were substantially greater than in earlier years. Production was generally higher in 1954-55 than in the previous year, but the report is careful not to attribute this entirely to the development expenditure so far undertaken; the influence of favourable weather conditions and of a high level of world demand is fully recognised.

It was, indeed, a good year for most of the commodities produced by Colombo Plan countries. The production of tea, rubber, sugar, cotton and tin were all up, and in most cases the prices obtained were favourable. The important exception was rice and, by contrast with the rest of the region, the rice-producing countries, especially Burma and

* H.M.S.O. 5s.

Siam, had to contend with unfavourable terms of trade. Many of the vast irrigation projects are now coming into full operation. India will have increased its irrigation acreage by 5.9 million acres by March, 1956, Pakistan is planning to bring 4 million acres under irrigation and Ceylon's Gal Oya scheme, which will irrigate 100,000 acres, is progressing rapidly. The work done by rural development community centres is also achieving impressive results.

In the industrial sector, the area achieved “remarkable progress,” but the report adds a note of caution. Generally speaking the increased industrial output has been due to fuller utilisation of existing capacity, and in future further advances will depend on the installation of new capacity. Particularly good progress has been made also in the production of electric power. India, for instance, expects to have added 1.2 million kW. to its generating capacity by the end of its first five-year plan.

Welcome for Foreign Investors

When it comes to discuss external assistance, the report dwells on the advantages of attracting private foreign capital, and it has good words to say about the better hospitality now afforded foreign capitalists by most of the Asian member countries. The creation of new institutions, such as the Indian Industrial Credit and Investment Corporation, in which private capital from Britain, the United States, and India participates along with the Indian government and the World Bank, is warmly applauded. Pakistan, too, is taking active steps to encourage foreign capital, and most other countries in the region have announced more liberal policies towards foreign investors.

The coming year, however, is likely to be crucial for the future of the Colombo Plan. During the next few months, India, whose role in the region is considerable, will be announcing final details of its second five-year plan. The shape of its policies will clearly be of great importance to the other Asian members of the Colombo Plan system. Simultaneously, big new developments are pending as the Soviet Union vies with the United States and other Western countries with offers of economic aid to the region. The Colombo Plan, however, has firmly established itself as an instrument of good in South and South East Asia; but no effort must be spared to maintain its momentum.

The Big Whale Hunt

BY A CORRESPONDENT

THE nineteen expeditions now heading for the Antarctic for this winter's whale hunt have had their catch quota cut from 15,500 to 15,000 blue whale units. For several years fears about the future of whale stocks have led to successive cuts in the quota, but the limit now imposed is perhaps the lowest that will be tolerated. Much capital is sunk in this highly lucrative business; the Netherlands, for instance, have this year commissioned a big new factory ship which will operate in the Antarctic with eighteen catcher boats, six more than last winter. Obviously, to support an expedition on this scale, a large catch is necessary if a profit is to be made. It is encouraging for the industry that there has recently been a hardening in the whale oil market; advance sales have been made this autumn at £85 a ton compared with £78 last year, and a further improvement is expected.

In spite of the controls imposed on whaling since the war, and in spite of the very heavy capital investment and steeply rising level of operating costs, the industry has a remarkably good profit-making record. Nevertheless, the number of expeditions, the number of vessels composing each expedition, and the size, range, and power of the individual vessels, have increased far beyond what is necessary to fulfil the quota. As a result, the whaling season has grown progressively shorter, and the two to three hundred whaling ships have lain idle for the greater part of the year. Half as many vessels operating for a longer period could catch just as many whales. But every expedition is out for the largest possible slice of the limited cake, and is inexorably driven to employ more and more boats, and bigger and faster boats, in order to be sure of achieving a large enough catch before the quota is reached and the signal received to stop catching. An attempt to check the inflationary trend in whaling fleets was made last season, when, on Norwegian initiative, a voluntary agreement was concluded by the whaling companies to limit the number of catcher boats attached to each expedition. Unfortunately, it was not possible to get the agreement renewed this year, and more catcher boats than ever are on their way to the Antarctic, even though the number of whales they are allowed to catch has been reduced.

Keeping the Rules

Whaling, always intensely competitive, will obviously be even more competitive this season, and the international whaling agreement will be subject to exceptional strain. The agreement lays down not only the total catch quota, but also a number of regulations, such as the size of whales that may be caught. In the heat of a brief, intense hunting season, in boats scattered over the vast Antarctic Ocean, the strain on loyalty must be severe. This season the question of loyalty to the agreement is particularly uppermost because of the charges recently made by the Norwegian Whaling Association against the Panama-registered "Olympic Challenger" expedition owned by Mr Aristoteles Onassis. The Association alleges, with much supporting detail, that Mr Onassis has broken very nearly all the regulations that apply in the industry, and as a result has achieved a pro-

duction of whale oil worth more than £3 million. The Norwegian charges are now being studied, but in the meantime the "Olympic Challenger" expedition is again on its way to the Antarctic. The Norwegian and German seamen's unions have armed members of the crew (mostly Germans) with copies of the whaling regulations. So far, neither the Panamanian government nor Mr Onassis has made any statement or explanation.

It would be a pity if the international whaling agreement were to be disrupted through the disloyalty of an individual expedition. Obviously its maintenance, and thus also the maintenance of whale stocks, depends on mutual trust and confidence. On each expedition there are inspectors, but these are nationals of the country of registration. At the international whaling conference in Moscow last summer the Norwegian delegation proposed the appointment of an additional neutral inspector for each expedition. This reform, which is now being studied by the governments involved, cannot be introduced this season, and it is doubtful in any case whether Russia, for one, would accept it.

In spite of upsets and difficulties, it would be wrong to paint too gloomy a picture of the present position of the whaling industry. The co-operation achieved since the war is remarkable compared with the cut-throat conditions that prevailed before the war. That such countries as Britain and Russia, Norway and Japan, South Africa and the Netherlands, have been able to agree on common rules of conduct in the intensely competitive world of Antarctic whaling, is one of the more encouraging examples of practical international co-operation, and gives grounds for optimism about the industry in the future.

Taking Stock of FAO

FROM A CORRESPONDENT

FOR a body whose most intractable problem is the disposal of surpluses, the word stock-taking has an unpleasant ring. But there are other factors besides the bulging granaries of the New World which tend to put into an unfavourable perspective the achievements of the UN Food and Agriculture Organisation, whose tenth anniversary has just coincided with its biennial conference in Rome. For it is heir to the ills that affect all organisations of this type. It has for instance no executive powers, but must work exclusively through kindness and persuasion. The task of securing even a small measure of agreement between its seventy odd members is so formidable as to make the acceptance of even the most modest recommendation a matter for congratulation.

Concerted action would not, however, be so difficult if FAO decisions were always reached according to technical considerations. But the part played by experts in shaping policies appears to be declining with the passage of the years. One result is that the diplomats and financial experts have come more and more into the limelight and questions of national prestige, often on minor matters, have given rise to unedifying squabbles. Moreover, FAO has found its field of operations increasingly invaded by existing and newly established international bodies; and the difficulties to be overcome in order to secure both a clear line of division and effective co-operation between FAO and Gatt

THE steel AROUND YOU

In every British ship, afloat and building, there are sure to be many United Steel products — steel for hulls and fittings, for the boilers and engines, stainless steel in the galley, perhaps even the mainspring for the ship's chronometer! Wherever you go — by sea or land or air — you are surrounded by things to which United Steel have contributed some essential part.

ADVERTISING AND MARKETING IN ITALY

C.P.V. ITALIANA are one of the leading advertising agencies in Italy. They give their clients the sound and efficient advertising and marketing service which would be expected of a responsible agency in Britain or the U.S.A. The agency is a blend of British management — widely experienced in advertising

and marketing — and top-level Italian creative men; which means that proved advertising and selling methods can be applied to the taste and character of the Italian market.

C.P.V. ITALIANA's clients are of two types — those handled direct and those handled by arrangement with C.P.V. Export, Ltd.

or one of the other UN specialised agencies can easily be imagined. The very close liaison formed between the Technical Assistance Board and the FAO has led to an encouraging expansion of expert services to the under-developed countries, but only at the price of delay in the submission of the final technical assistance programmes and one of the tasks of the recent conference was to find means of reducing the administrative dislocation and uncertainty that this caused.

With even the most brilliant team of administrators, it would be surprising if FAO could overcome such an array of obstacles; and in fact the calibre of its senior personnel has tended to be uneven. Moreover, a recent Management Survey suggested that several sections could usefully be streamlined. But no international organisation takes kindly to the suggestion that all its work is not strictly necessary and the advocacy of economies by Britain and the United States seems to have been largely responsible for getting the former voted off the FAO Council.

The Proof of the Pudding

On the other hand a good deal of patient, thorough and constructive work has been done by experts sent by the FAO to under-developed countries. Their activities stretch from improving farm implements (even in such modest ways as replacing the sickle by the scythe), soil analysis and fixation, irrigation and flood control to a comprehensive campaign to wipe out pests and diseases. The recent conference managed to secure the maintenance and extension of joint regional action to combat locusts in spite of the considerable political obstacles involved. There has been excellent work, too, on the techniques of credit provision, the development of storage facilities, land reform, land tenure and a variety of other matters. The clamour for more assistance that the under-developed countries are making and the growing number of experts that they themselves are providing for export shows that the FAO's efforts in this direction have not been unappreciated or without effect. The pudding may sometimes look inadequate; but it is certainly eaten with gusto. But FAO does not only help backward areas. It acts also as a centre for statistics and agricultural data generally, as a forum for an exchange of views and as a stimulus for a number of useful organisations such as the Foot and Mouth Disease Commission.

It is when the emphasis changes to surpluses that FAO's success becomes a little more dubious. Production may have risen in most advanced countries during the last ten years, but consumption *per capita* in the poorer parts of the world such as Asia and South America is actually still lower than in 1938. The major problem, therefore, is to transmit the surpluses of the prosperous to the less well-to-do parts of the world. FAO has tried hard. It has set up a sub-committee of the committee on commodity problems at Washington to act as a clearing house for ideas on surpluses and has secured acceptance of a code of principles to ensure that disposals will not disrupt existing trade patterns. FAO is not so sure that these principles are in fact being observed and at the conference it decided to set up a working party to reconsider the whole question of surplus disposals. The conference also decided to create a working party to examine price support systems, doubtless with a view to steering nations towards a flexible system of maintaining total farm incomes at a certain level. The

hard fact is, however, that the gordian knot of surpluses will only be cut by a decision on the part of the Americans radically to revise their support policy. There are signs that this agonising reappraisal is in the offing and no doubt the United States Administration will, in reshaping its policy, take into account the danger that an anti-American front might be born out of the grievances of the under-developed areas and of America's competitors over the export of agricultural products.

In Search of Slogans

In the meantime, FAO has been supplementing the gentle pressure exercised on surplus countries by other more concrete recommendations. It has put part of its faith into the building up of larger stocks by under-developed countries as a buffer against crop failures and a greater part still into projects along the lines of the Indian pilot scheme, which supplies to workers on reconstruction undertakings food equal to the difference between present and past consumption and thus does not interfere with existing sources of supply. The keen interest shown in this scheme by numerous delegates is a hopeful sign. But it is clear that the provision of surpluses on special terms will tend to be looked on askance by other food exporting nations.

The trouble is that, like all bodies largely dependent on the propulsive force of ideas, FAO must put forward inspiring slogans. The call for "selective expansion" adopted two years ago neatly fills the bill. Unfortunately, the need at the present time is not only for the maintenance of the admirable work done on improving techniques and output in backward areas but for selective restriction, and for concentration on the more careful cultivation and conservation of high-grade lands rather than on putting marginal areas under the plough. This policy is not likely to strike crusading sparks, particularly among under-developed nations. But by the time the next conference is convened two years hence, the pressure of mounting surpluses may well induce FAO to come out more openly in favour of stronger measures to avoid the explosive situation produced by bulging granaries and starving bellies.

The Sudanese and the High Dam

BY A CORRESPONDENT LATELY IN THE SUDAN

COLONEL NASSER'S project for a high dam on the Nile has so dramatic a ring that it has captured imagination outside as well as inside Egypt. Therefore its implications for those who live upstream of it are escaping attention. The world hears that the Sudan, which is the country principally concerned, is to have half of the "net benefit" of the new water, and since this is more water than the Sudanese are using now, it imagines that they are getting a generous deal. But in fact they are perturbed. In Khartoum, a young government, beset with domestic problems, is being asked to give, now, a decision on proportions that will affect the Sudanese for all time. The issue, to the Sudanese, is not just their share in the immediate benefit (in the technical sense of additional usable water) nor yet the major disturbance to the Halfa

region that was described by the Cairo correspondent of *The Economist* two weeks ago. It is to safeguard a fair share, stretching far into the future, in the waters of the Nile.

The prime object of the dam is "over-year" storage, retaining the excess of high years to supplement low, so that all years are "average" and use can be constant and full. Clearly, the capacity of the reservoir must be very large, enough to cope with a cycle of low years yet with room for the excess if high years come instead: it must never get too full or too empty. Nor can use begin until an adequate starting supply has been accumulated, which means earmarking surplus water for an unknown and possibly lengthy initial period.

The idea of the High Dam was developed from the proposal for a third raising of the Aswan Dam, for flood protection, and as then conceived was combined with a project for flood-escape

The map illustrates the Nile River basin and its surrounding regions. Key features include:

- Geography:** The Nile River flows from the south (Lake Victoria) north to the Mediterranean Sea. The Red Sea is to the east. The Nubian Desert is located in Sudan.
- Political Boundaries:** Egypt, Sudan, Ethiopia, Saudi Arabia, Uganda, Kenya, and Congo are labeled.
- Major Dams:**
 - Aswan Dam:** Located in Egypt near the Mediterranean coast.
 - Sennar Dam:** Located in Sudan on the Atbara River.
 - Roseires Dam:** Located in Sudan on the Nile River.
 - Owen Falls Dam & Power Sta.:** Located in Uganda on Lake Victoria.
- Proposed Dams:**
 - High Dam:** Located in Egypt near the Aswan Dam.
 - Roseires Dam:** Also labeled as a proposed dam in Sudan.
- Irrigation Projects:**
 - Gezira:** A large irrigated area in Sudan.
 - Atbara:** An irrigated area in Sudan.
- Other Features:**
 - Wadi Halfa:** A lake in Sudan.
 - Jebel Aulia Dam:** Located in Sudan near Khartoum.
 - Proposed Canal:** A canal running from Lake Victoria towards the Sudanese coast.
 - Tunnel? (Power?):** A proposed tunnel in Ethiopia.
 - L. Albert, L. Kioga, L. Victoria:** Lakes in the region.
- Scale:** 0 to 200 Miles.

To fix the picture, some round figures are necessary. The population of Egypt is about 20 million, of the Sudan about half that figure. The gross areas under irrigation in Egypt now total roughly 6 million acres, in the Sudan roughly one and a half million. Neither can be considered simply—for example, the Egyptian practice of three crops in two years compares with an annual crop in the Sudan, and fallows differ—and the plain fact is that both countries have enough land, and prospective population, to use any amount of water. The limit, in a word, is water. The average annual flow of the Nile, measured at Aswan, is 84 milliard (thousand million) tons; it has been recorded as ranging from 42 to 155 milliard tons. Four-fifths passes from July to December, with the peak of the flood in September, and much is surplus and lost to the sea. At present the Sudan uses 4 and Egypt 48 milliard tons. Full control, by the High Dam, would add $84 - (4 + 48) = 32$ milliard tons, the division of which is now in question. Between 10 and 12 milliard tons would be lost, mainly by evaporation from the huge reservoir, and the net gain would thus be about 20 milliard tons of usable water—at Aswan. The comparable aggregate benefit of the schemes previously under study was estimated in 1952 at 10 milliard tons. The figure of 20 milliard is clearly an upper limit, assuming hundred-per-cent control: that of 10 milliard is almost certainly conservative. The High Dam project in its present form displaces, but cannot fully replace, the other schemes: they may follow, in the distant future—but with reduced benefit to be shared later.

Possibilities of Development

The half share offered by Egypt refers to the net benefit of 20 milliard (i.e., at the cost of half the 12 milliard loss) and may more than treble the Sudan's present rights. This is a great increase and would certainly cover development for many years. But it covers only development already planned. Both closer cropping and the utilisation of further areas (known to be suitable for development through postwar surveys in which consulting engineers and aerial survey took part) can double—and possibly treble—the Sudan's potential use of water.

The Sudan does not question Egypt's right to the 48 milliard tons now used, but does feel that Egypt had several thousand years start, (and, incidentally, acquired the "cheap" water), and that fair shares should take some account of the totals to date. To accept the present offer means that the Sudanese accept (besides the right of Egypt to draw on all surplus until the High Dam is first filled) a limit of certainly half, and possibly a third, to their long-term development potential—while Egypt may, in comparison, nearly achieve its target. The Sudanese would prefer first to settle shares of the balance of 32 milliard tons (and so, in effect, of the full 84 milliard) and then to be free to tackle such projects as they wished in order to make use of their share ; at the same time they would be ready with consideration and assistance for any project Egypt might propose.

FIGHTER TRENDS

The jet fighters produced in the immediate post-war years conformed to a pattern set by the 5000 lb thrust centrifugal compressor turbojet then current. Aircraft like the French Ouragan, the American Panther, the British Venom, the Swedish J-29 and the Russian Mig-15 all used this type of engine which, pioneered by Whittle, was initially developed by British industry. Weighing six tons and armed with four 20 mm guns this class of aircraft could climb to over 45,000 ft and fly at sea level speeds of between 600 and 650 mph.

In the next generation of fighters two complementary lines of development can be discerned, both based on axial compressor engines which have superseded the earlier centrifugal compressor types.

First comes the direct derivative of the post-war fighter—a heavier aircraft weighing eight to thirteen tons, powered by a bigger turbojet giving 10,000 lb of thrust or (for short periods and with thrust augmentation by re-heat) even greater power. Fighters in this class can clock a sea level speed of over 700 mph and some 900 mph in dives at altitude. In this performance category there comes that version of the Gloster Javelin powered by the Bristol Olympus turbojet, an engine whose fighter potentialities can be gauged by its performance in the Canberra which holds the world's altitude record. And in the development stage is the much more powerful turbojet which will push jet fighter speeds well beyond 1000 mph.

Side by side, however, with these immensely powerful and complex aircraft

there has been in development a simpler, smaller fighter weighing three or four tons, yet which, with the use of a modern 5000 lb thrust lightweight axial turbojet engine, would be in the same speed class as the heavy fighter. The smaller fighter is naturally limited as to the amount of offensive armament it can carry, but against this disadvantage are to be set, among other things, the rapidity and economy of its production.

Current European defence thinking envisages the primary role of the little fighter as ground attack rather than bomber interception, but it is seen that for small countries or those unlikely to be involved in the most sophisticated defence problems, the miniature fighter as interceptor could more than adequately serve their purpose. It could, moreover, by being available in larger numbers for a given sum of money, make the vital difference between having an air defence strength above or below the minimum requirement for 'at readiness' security. This minimum is an inflexible figure below which attritional processes reduce combat-ready strength to an unworkable level.

The Bristol Orpheus turbojet was designed to power the three-ton light-fighter (or a twin-engined six-ton fighter). It is already flying in the Folland Gnat, and it has been selected to power the French and Italian light fighters commissioned for NATO. The engine weighs about 800 lb and by comparison with the standards of the large and complex engines of which it is a smaller complement, it will be economical to build and maintain.

THE BUSINESS WORLD

How Fares the Squeeze?

MANY controversies are current about the mechanics of the credit squeeze, but one fact stands out clearly. It is exerting its effects much more decisively upon the total volume of money than upon that particular portion of it that has been created by the granting by the banks of loans and overdrafts. In the nine months since February 16th—over the whole period, that is to say, since Bank rate was raised to $4\frac{1}{2}$ per cent—aggregate net deposits of the clearing banks have fallen by £145 million to £6,112 million; in the corresponding period of 1954 they rose by £423 million and in 1953 by £374 million. This is a sharp, even violent, reversal of both the seasonal and the secular trend. Over the whole postwar period previously, the index of bank deposits compiled by Lloyds Bank, which is adjusted for seasonal fluctuations, had shown approximate stability only in 1949, and a modest decline in 1951-52. With those exceptions, deposits had been expanding almost continuously, carrying the index to a peak of 112 last February (1948=100). Since then there has been a continuous fall; at the date of the banks' latest make-up (November 16th) the index stood at 105.4, showing a fall of 5.9 per cent, or the equivalent of roughly £370 million of deposits. This is a true reduction, clean of seasonal distortions.

When the squeeze is measured in this way, it appears highly impressive, even dramatic. But much public discussion focuses upon the narrower measure of the trend of bank advances—and, more particularly, advances to the private sector of the economy as distinct from the nationalised public utility industries. By this yardstick, the net achievement looks much less significant. Over the nine months, total advances of the clearing banks have declined by only £86 million, and net repayments of indebtedness by the nationalised industries out of the proceeds of their stock issues on the market must have accounted for the whole of that

decline. This movement, it is true, contrasts with an approximately equal rise in the similar period of 1954; but, contrary to expectations, the rise in advances that had been proceeding in 1954 actually gathered speed during the first phase of this year's credit squeeze.

In the four and a half months to end-June, when advances reached their peak of £2,186 million, they rose by no less than £187 million. Since then they have been reduced by £273 million, but once again a large part of the reduction results from the funding of indebtedness by the nationalised gas and electricity industries. By mid-November the calls on their stock issues had brought in some £220 million, and if allowance is made for their current expenditures and for repayments to non-clearing banks, it appears that repayments to clearing banks must have reached nearly £150 million. Advances to all other borrowers, therefore, appear to have been reduced by some £125 million since June; and of this reduction £20 million (or more) must be notional, because the advances include cheques in course of clearing between the banks' own branches, and these internal clearings were seasonally inflated at end-June.

★

The effective reduction in the advances of the private sector therefore still falls well short of the broad target that the banks first set before themselves when they discussed the Chancellor's "request" at the end of July. This shortfall is not, however, any measure of failure by the banks to meet the official wishes, as much popular comment assumes it to be. The Chancellor himself never indicated any quantitative goal; he asked simply for a "positive and significant reduction . . . over the next few months." The much-discussed target of a 10 per cent reduction by the year-end was one devised by the banks themselves, partly as a broad

objective, but mainly as a means of ensuring that, in the effort to meet the Chancellor's wishes, the several banks were agreed about the order of magnitude, and thus might be able to keep more or less in step. If disinflation is imposed by fiat, instead of by raising interest rates to an "equilibrium" level or by full pressure upon the liquid reserves of the banking system, this is a point to which every banker will always attach much importance—lest he, individually, should carry a disproportionate share of the burden (and odium) of squeezing his customers and, worse still, lest competitors should take business that he, in due response to the official behest, feels bound to refuse.

BANK DEPOSITS AND ASSETS

London Clearing Banks	November 16 1955 £m.	Changes on	
		Month £m.	Year £m.
Deposits	6401.7	+ 25.9	-282.2
Net Deposits	6111.8	- 13.5	-320.9
Liquid Assets	2240.9	+ 84.0	- 45.7
Cash	520.2	—	- 14.1
Call Money	391.6	- 16.7	- 60.3
Treasury Bills	1215.2	+102.2	- 2.5
Other Bills	113.9	- 1.5	+ 31.2
Investments & Advances	3951.6	- 99.3	-271.0
Investments	2038.1	- 47.8	-325.9
Advances	1913.5	- 51.5	+ 54.9

The fact that private-sector advances have so far fallen by little more than 5 per cent from their peak is not, therefore, any reproach to the bankers. When it is recalled that the movement since June has reversed a strong upward trend, the banks can reasonably argue—as does an article in the current issue of *Barclays Bank Review*—that the reduction has already been both "positive" and "significant." The movement is, moreover, continuing; and the authorities have made it plain that they expect it to continue. It is far from sure, however, that it will proceed at an accelerating rate; there have lately been some signs of slackening of the decline, or at least of a failure to accelerate.

Inevitably, most of the advances that show the first effects of the squeeze are those that were most readily squeezable. As the *Barclays Bank* article rather platonically remarks:

Further reductions in advances will become correspondingly more difficult, for the obvious candidates have been tackled already, and from now on decisions will involve increasingly complex discussions on what is, and what is not, in the national interest. All such discussions tend to be wearisome, and must, at times, resemble medieval disputations.

It is certain, however, that a good deal of the pressure that has already been exerted has yet to show its effects on the actual amounts borrowed, since by far the

greater part of the results achieved by reviewing existing advances has consisted in a cutting down of borrowing limits rather than in pressure for reductions in advances already taken.

There has also been pressure of the more direct kind—for acceleration of promised repayments wherever possible, or for a speedy search for alternative finance in cases where the loan had been made in anticipation of more permanent arrangements. There is not much sign, however, that the banks have been forcing businesses into a speedier realisation of stocks; and the general appearance of the economy is proof enough that, if the banks have been tough at some points, toughness cannot have been general.

The real force of the squeeze, to the extent that it operates through advances, is, indeed, being exerted more by its impact upon prospective borrowing than upon existing loans. There is hardly room for doubt that the scrutiny of new applications is now a more exacting one than it has been for many years. In their effort to judge advances by the test of "national interest," the banks recognise in principle several categories of applications that merit special consideration—projects calculated to increase exports; projects keyed to national defence; certain types of outlay that promise a saving in imports; and normal seasonal requirements. Under each of these heads, credit-worthy applicants stand a reasonable chance of securing at least a proportion of the finance they seek, but in other categories the tests applied have been steadily tightened up—and the public's knowledge of this has caused a notable contraction in the number of applications coming forward. At this point, at least, there are signs that a new climate of opinion is being created, and as the process continues the change in atmosphere should become more marked and more pervasive.

STAGES OF THE SQUEEZE
(£ million)

London clearing banks	4½ months to June 30 1955	4½ months to Nov. 16 1955	9 months to Nov. 16 1955	Corres. 9 months 1954

* Percentage of gross deposits.

It is quite impossible to guess, however, whether pressure of the present kind, and proceeding at the present rate, will suffice. But if it should prove to be insufficient, the responsibility will rest squarely upon the monetary authorities rather than upon the commercial banks. Until end-July, the force behind the credit squeeze was wholly imposed by orthodox weapons: the rise in Bank rate; day-to-day credit management to keep money tight and thus to ensure a firm bill rate; and the sale of bonds by the "depart-

ments" to intensify pressure upon the supply of liquid assets available to the banks. In that phase the banks defended themselves against the pressure on their liquidity mainly by selling gilt-edged securities—and sold securities sufficiently to enable them to support additional advances. Because the squeeze upon advances was not developing as quickly as had been hoped, the Chancellor then reinforced these weapons by his specific request to the banks, and for the past four months the two types of pressure have been operating side by side.

The "request" has served its purpose of speeding

Steel Behind the Curtain

WITH an output of 41 million metric tons in 1954—it may reach 45 million this year—Russia is the world's second steel producer. Its output is not much more than a third of America's but well over twice as high as either Western German or British production (both of the order of 20 million metric tons this year). Set against population, Russian steel output per head is only about half Britain's or Germany's, and not much more than a quarter of that in the United States, which it always hoped to emulate—the two countries have in common at least vast land space, and Russia probably needs even more "transport per unit of production," than the United States. Its total crude steel capacity has expanded faster since the war than America's or Britain's (it was about 20 million metric tons in 1948), and it intends to raise output another third by 1960, to 60 million tons; but because its population is rising faster, too, its output per head seems likely to rise only about as fast as in Britain, and thus to remain about half as much.

Russia has never been a significant steel exporter, but now, in the much-advertised "era of competitive co-existence," it is offering significant amounts of steel-making plant and technical assistance to underdeveloped neutral countries such as India. Its efficiency, state of technique, and real capacity to compete are of growing interest to the West. This autumn's "return visit" to the Russian steel industry by a number of steel industrialists from Western Europe, though limited in scope, was highly informative upon these points. They saw only one corner of this widely separated industry, visiting plants around Moscow, in the Ukraine, and in Georgia in a 10-day flying trip. The British members' official report on the trip may remain confidential. But Sir Robert Shone, executive member of the Iron and Steel Board, who led them, and Mr Frank Cartwright, assistant managing director of the Steel Company of Wales, have made public some economic and technical impressions. The works they saw, not surprisingly, seemed to be among Russia's best: the experts were given frank answers to all their technical questions and often allowed to check them

up the attack upon advances, but it must be regarded as a support and not a substitute for the fullest exploitation of pressure on the banking system by the classical methods open to central banking and monetary control. There is not, in fact, any sign that the authorities are intending to pull their punches; but if they want a bigger total effect than they are getting now, the only sure way of getting it is to leave the banks in no doubt that their liquidity ratios, which have been strengthened recently by seasonal and other influences, will come under strong pressure during the tax-gathering season in the new year.

from factory records. Answers to some of the more searching economic questions remained rather vague.

The Western visitors visited an iron ore mine at Krivoi Rog, concentration and sinter plants, coking plants, one or two steel finishing plants, and two integrated steel works—Zaporozhe in the Ukraine, one of the vast plants built in the thirties, and Rustavi in Georgia, a smaller plant built since the war. In the thirties the Russians put their main emphasis on the economies of scale in integrated plant, and probably underestimated the transport costs entailed in assembling the vast quantities of materials that such plants require. Since the war that has been sharply corrected. Local resources have been exploited, and some plants have been sited near to markets: Rustavi, for example, mainly produces pipes and tubes for the nearby oil industry.

★

Much of the Russian plant resembled the American in design—a legacy of technical aid in the inter-war years. Technically, it impressed the British visitors as being standardised on good Western practice, rather than displaying outstandingly new developments. Some of the technical points they noted were:

1. The Russian industry is founded on large and widespread deposits of iron ore, still comparatively abundant and cheap by British standards, though the expansion of output is working its way through the richest deposits. The Russians are now working on a balance of the best and lower-grade ores, sintering extensively. Supplies of low-grade coals, too, are adequate; but the coking coals are more scarce and are high in ash and sulphur content.

2. Widespread use of high top pressure allows high driving rates in blast furnace operation. Zaporozhe has five blast furnaces, all of 26-foot diameter but varying in capacity, producing from 1,000 to 1,750 tons of iron a day.

3. Similarly, remarkably fast driving rates were observed in steel making. The 10 200-ton fixed open hearth furnaces at Zaporozhe (using 70 per cent hot pig-iron with a very low phosphorus content, and elaborately

graded scrap) were averaging 7½ hours from tap to tap, and 4,500 tons per week per furnace.

4. All the plant the team saw was elaborately instrumented—"no instrument one could think of was missing."

5. In comparison with its crude steel capacity, Russia is clearly short of modern finishing plant—especially of strip mills. If its intention that 40-45 per cent of ingot output in 1960 should eventually be made into flat products is to be fulfilled, it will have to build a large number of mills at home—which might affect what it could offer abroad.

6. Most of the works were well, if rather widely laid out: a high standard of housekeeping on actual equipment was combined with much less regard for offices, canteens, and amenities.

Output per head in these large integrated plants, Sir Robert Shone estimated, was "broadly comparable" to "the top end" of British plant, which produces about 25 per cent of British steel. This seemed to be a great advance on 1945, when British steel trade unionists said productivity was well behind the British. Russian steelmen still count American standards as superior—and as a goal.

To translate such comparisons of productivity into cost is an intelligible exercise in the context of the steel industry alone, though not in terms of Russia's managed currency or its general cost of living, which is inflated by a swingeing turnover tax on food and essential consumer goods. Taking wages in the steel industry as a datum, Sir Robert made some interesting comparisons with the British industry. Iron ore is cheap: a lower-grade ore (38 per cent iron, sintered to 60 per cent iron content), was available to the blast furnace operator at little more than a third of the cost of comparable (imported) ore in Britain. Coking coal was slightly dearer; but other coals cheap, particularly in relation to oil, so that a shift was observed at one plant from oil-

firing to producer gas. This may be one sign, among others, that the Soviet oil industry is failing to keep up with general industrial expansion there. Scrap is price controlled at a rather higher level in relation to wages than in Britain.

THE RUSSIAN EXCHANGE PUZZLE

Roubles to £	Wages	Prices of Steel and Hard Goods	Prices of Food and Soft Goods
11.8 (official)...	Double British	Double British	Four times British
20.....	Same as British	Same as British	Double British
40.....	Half British	Half British	Same as British

Steelworks plant appears to cost roughly the same, in relation to wages, as British plant. If wages be taken as equal, management is considered worth much more in Russia. A steel worker gets, say, 1,000 roubles a month, and the works director, say, 7,000 roubles (both forms of pay, incidentally, based largely on incentive systems), while Soviet income tax reaches its maximum of 13 per cent at 1,000 roubles monthly. To earn as much more in net income than a British steel worker with, say, £600 a year, a top manager here would need a yearly salary of £12,000 gross.

In terms of steel industry wages, then, Sir Robert Shone estimated that the total cost of steel—priced at some 600 roubles a ton—appears to be of the same order as British. Rather more surprisingly, the price of "hard" consumer goods—cars, radios, and television sets—also seemed to be about as much in relation to wages as in Britain (which is not to say that they were readily available). Such comparisons, which can only

be in broad terms, fit neither the official exchange rate of 11.8 roubles to the £ nor the cost of subsistence on food and soft goods, which are so high that they would justify a rate of 40 roubles to the £. Sir Robert concluded: "If trade could be imagined as flowing freely between the two countries, I am inclined to think that the exchange rate would settle at much nearer 20 than 40 roubles to the £."

That deliberate loading of the dice against essential items of consumption by a turnover tax, combined with a low basic rate of interest, is Russia's way of achieving vast forced investment without (since its postwar currency reform) internal inflation. Even as moderated by occasional political concern for the consumer, by Western standards it might be considered capitalism with a brutally big "C." It is backed by a tremendous educational output of technically and scientifically trained manpower. Investment in "heavy metallurgy," moreover, seems in 1954 to have been unchecked by the slight extra emphasis on improving consumption that year. Sir Robert comments:

So long as the Russian worker accepts half the real

standard of living of the British worker and achieves a somewhat comparable level of productivity, Russian industrial products can well be sold cheaply on world markets.

And he thinks there is, particularly in steel and steel goods, "every reason for a very real concern over the competitive power of Russia."

Russia, that implies, can probably afford to compete on level terms, if its vast obligations for housing and internal construction be partly ignored, as they may be. Whether it can afford to or not, in practice Russia certainly will compete on the world market where and whenever this suits its political ends—on level terms or lower. There is as yet no sign that it desires, even for political ends, to export steel. But it does wish to export steelworks plant, technicians and technical practice and the influence that goes with them. And the British team's impressions leave no doubt that in technical manpower, in a fairly comprehensive steel plant manufacturing industry and, clearly, an advanced instrument industry, Russia certainly has these particular goods to back its offers.

Business Notes

Markets Sagging Upwards

WHEN markets drift, they usually drift downwards. This week the drift has been gently upwards. From Wednesday of last week to Wednesday this week the *Financial Times* index of government securities remained on balance unchanged at 90.78. The industrial index, however, showed a modest gain from 189.9 to 190.3. There was good reason for this condition of steady stagnation: institutions that must face the certainty of ending the year with uncomfortable falls in the market values of their holdings are not anxious to make matters worse by selling on a narrow market. And the recent tally of their underwriting commitments leaves many of them in no hurry to buy. In the gilt-edged market the impasse was solved at least momentarily on Thursday when it was learned that of the £5 million 4½ per cent Glasgow loan, 87 per cent had been left with the underwriters. The new stock opened at 1½ points discount; other gilt-edged stocks weakened slightly; but industrials remained better than steady.

Two factors may help towards stability in the near future. If the British November gold and dollar reserve figures, which will not be published until *The Economist* has gone to press, should, as expected, show a substantially smaller gold loss than in October, that would make no red-letter

day, but it might be a steadying influence. Moreover, the fact that the Iron and Steel Holding and Realisation Agency is hoping to launch a public offer this month may mean a short close season for new issues in the gilt-edged market. It is necessary in law to offer the option of tendering at least one government stock (normally Treasury 3½ per cent stock 1979-81) instead of cash and for that purpose a reasonably steady gilt-edged market over the period of the offer would be helpful.

Consett Makes Ready

THE Iron and Steel Holding and Realisation Agency, having waited for steadier share markets, is expected shortly to come forward with another steel share offer. But although markets are steadier they are not hungry enough to swallow a giant like Steel Company of Wales, or Richard Thomas. The only surprise is that Consett Iron Company is the chosen one and that the ordinary shares and debenture stock of South Durham Steel and Iron Company that previously headed the list will have to wait at least until January.

Marketing the Consett £1 ordinary share will involve

more than £10 million. The company's rearranged capital will also include a debenture stock that the agency will retain for sale later. Fixing a price basis for the ordinary shares of a smaller, but important, steel company now is not easy. Yields on the leading steel ordinary shares that are already in private hands range from 3.45 per cent on Stewarts and Lloyds to 5.10 per cent on Colvilles; among the smaller companies yields range up to 5.75 per cent on Thomas Firth and John Brown. But all those yields reflect some discounting of higher dividends in prospect.

About 6 per cent is the probable yield basis for the Consett offer. That intention is based on two considerations. First, Consett historically does not rank among the top handful of steel companies. Secondly, during the period of public ownership the company has had much money spent on it. Loans from the agency at October 1, 1955, stood at £6.8 million. In advance of the prospectus the accounts for the year ended October 1, 1955, have been published and show an outstanding rise in net profits. Before tax, the figure was £2,071,309 compared with £874,127. Evidently the money spent on development is bearing fruit. Part of that money will be repaid out of the proceeds of the ordinary share offer, and part will be represented by the debenture that will remain unsold. The company is now much better organised and equipped than in the past.

Output Restrained?

BRITAIN'S total working population at the end of September was 24,014,000, which is only about 0.7 per cent higher than a year before. But the labour force of the industries that are measured by the official production index, which have steadily been drawing people from the rest of the economy, was about 2 per cent higher than in September 1954. That increase in manpower is of the same order as was attained between 1953 and 1954. The same cannot be said for the increase in output. This week's revised production index for August, provisional figure for September, and forecast of what the October figure will be bring the average for the first ten months of this year to 134 (1948=100), and suggest that production for the year as a whole may run out at about 5 per cent higher than last year. The rise between 1953 and 1954 was about 6½ per cent.

Two-thirds of this year's increase in output, the Chancellor of the Exchequer estimated last month, had come from engineering, shipbuilding and electrical goods, vehicles, paper and printing, and chemicals—which had outweighed lower output in coal and textiles. It does appear that production has been levelling off in at least some of the metal goods industries, though few statistics are yet available to demonstrate this. Whether this is due to the squeeze on home demand—which has now been applied progressively for eight months—is not easy to judge. Output of motor vehicles, one set of figures that does appear fairly promptly, has not yet suffered much—though at the marketing end there are signs that private demand for cars here is now declining more than seasonally.

Gatt Goes on Leave

THE tenth session of the Contracting Parties to the General Agreement on Tariffs and Trade, which opened at Geneva on October 27th, is about to end; but soon after the delegates will have returned to their countries they will again be packing their bags for a return to Geneva for the negotiating conference that opens on January 18th. The 1956 conference will probably last until May 1st. It will be a general round of tariff negotiations in which the United States is expected to indicate how far it is prepared to use the new—and limited—powers to reduce tariffs that were granted to the President under the Trade Agreements Extension Act of 1955.

The session which is now coming to a close was not concerned with tariff negotiations but with a mass of items arising out of the operation of Gatt. The most delicate issue concerned the accession of Japan and the resulting action by no less than fourteen of the thirty-five contracting parties in invoking Article 35 of the Agreement which in effect enables them to ignore the new member, withholding from him the privileges and courtesies of membership and continuing to apply to him all the discriminatory restrictions on trade which contracting parties have agreed to dismantle among themselves except in precisely defined circumstances.

Some of the delegates' time was taken up with complaints about the various waivers that have been granted to contracting parties, excusing them from the full rigours of the Agreement. A United States delegate reported that his country had not in fact imposed any new restrictions on agricultural imports permitted under the waiver granted last March. The reassurance was not too well received by the countries which have been mainly affected by the restrictions imposed under the waiver—Canada, the Netherlands and New Zealand. They judge good behaviour not in terms of maintaining the *status quo* but of gradually reducing the restrictions on the lines that were promised, albeit vaguely, by the United States when the waiver was granted. Belgium surprised the session by seeking to maintain a number of quantitative restrictions on agricultural imports. Coming from such a protagonist of free trade this seems to have had an effect out of all proportion to its real importance—though in sinning thus Belgium can claim to be in impressive company.

Coal—Prices or Planning?

MOST of the people who concern themselves with the likely future expansion of Britain's demand for energy prefer to skirt around one fact that is intimately related to that expansion—that coal, Britain's main fuel, is sold here for much less than it would fetch in a free market. As a result, it is cheaper to waste coal than to save it, and total demand for coal—and for the gas and electricity made from it—must to some extent be over-stimulated. In projecting curves of demand for energy or planning measures to make the necessary extra fuel available, it is

both statistically and politically convenient to assume that demand for fuel is utterly unaffected by price. But the Government can hardly object to dissent on this inconvenient point from a trade that thinks it is being deliberately put out of business by over-stimulation of coal demand at home—the British coal export merchants.

In an ably-argued pamphlet issued this week, "Freedom for Coal," the British Coal Exporters' Federation argues that this central distortion is an essential flaw in this Government's fuel policy. The exporters want the Coal Board freed to set its own prices commercially (these are still controlled by the Government under an ironbound "gentlemen's agreement"), and think that to make the British consumer pay a market price would considerably curb his exuberant consumption, leaving room for foreign trade in coal, import and export, whenever it happened to pay. Failing such freedom of prices, the exporters argue that only coal produced here should be allocated and sold at the artificially cheap price; consumers should have to buy such imported coal as they want at world market prices. If coal must remain so cheap, they would also like to see people who use it inefficiently penalised—this is a somewhat remarkable proposal that the National Industrial Fuel Efficiency Service should decide how much every big factory ought to be able to manage with, and that coal over and above such a "bogey" should be charged at the price of imported coal. On the supply side, they want wider opencast working, more encouragement for the small mine operators, and concessionary coal to be bought back from the miners at full pithead prices.

These "second-best" suggestions sound rather contrived—as the exporters are entitled to say measures of physical planning always do. Theoretically, at least, their case for a free market in coal is probably unassailable—particularly now that alternative primary fuels are being considered on a large scale. There appears to be little chance, however, of its acceptance in Whitehall. In spite of its introduction of the market principle into other sectors of the economy, in fuel this Government seems still resolutely committed to rigged prices and planning.

Scottish Banks Feel the Pinch

THE Scottish banks, unlike the London clearing banks, do not issue monthly statements; it is only from the balance sheets that the extent to which the credit squeeze has affected them becomes apparent. The National Bank of Scotland and the Commercial Bank of Scotland have both this week shown significant reductions in deposits, investments and advances (for accounting years to November 1st and October 29th respectively); the British Linen Bank had previously shown, for the year to September 30th, reductions in deposits and investments but a small net increase in advances. Of the three banks, only the Commercial Bank is paying more to its shareholders; its dividend of 11 per cent on the increased capital compares with an effective rate of 10.2 per cent for 1954.

Deposits of the National Bank of Scotland fell by £7½ million to £105½ million, those of the Commercial by £8½ million to £121 million—a combined fall of over 11 per

cent, compared with the fall of 5 per cent in the net deposits of the London clearing banks in the year to mid-November. Both banks, like the British Linen Bank and four of the big English banks, this year show holdings of government securities at below cost and redemption price, but above market price. The National Bank of Scotland values its portfolio at £51.3 million, compared with £53.5 million a year earlier and discloses a current market value of £49.5 million. The Commercial Bank reveals a reduction of nearly £5 million to £50.2 million (market value £46.8 million); but it sold no investments during the squeeze. The sales were made earlier to finance the acquisition of the Scottish Midland Guarantee Trust.

Lord Rotherwick, the chairman, makes no bones about the fact that the bulk of the £58,451 extra profit that the bank earned came from the hire purchase business of this new subsidiary (concerned mainly in the better end of motor finance). Accounts of that business are not separately shown, but the bank for the first time has to produce consolidated figures embracing a bank (which is allowed to make hidden reserves) and a non-banking business that presumably has to show the whole picture. Advances against hire purchase contracts stand at £7 million (there are no comparative figures since these are the bank's first consolidated accounts). Those advances have been financed partly on overdraft for the subsidiaries account for £516,530 out of the bank's £36,070,722 of advances. But the squeeze on a hire purchase company owned by a bank is just the same as on any other, and the bank has been required to reduce its subsidiaries' limits (which are not the same as actual advances) by 10 per cent this year and by a further 5 per cent in the new year. Like other hire purchase companies, Scottish Midland has been financed largely by deposits. The deposits in the consolidated accounts exceed those in the parent bank's accounts by £4.2 million and that is the mainstay of the financing.

South African Railway Loans

THE South African Railway and Harbour Administration, which has already received assistance to the tune of \$50 million from the World Bank, has this week come into the international market for two more loans, one of \$25 million and the other for £9 million. The sterling is being made available by the release by the United Kingdom government of part of the 18 per cent subscription to the World Bank, capital made in domestic currency. It is being lent to South Africa for ten years at an interest rate of 4½ per cent, including the 1 per cent statutory commission charged by the bank. The net rate is therefore well below the prevailing level of interest rates in London. Even with the 1 per cent commission the rate compares favourably with what South Africa would have to pay if it made an issue now in the open market in this country.

The dollar loan is being made in four separate tranches, \$3 million of three-year 3½ per cent bonds at par, \$3 million of four-year 4 per cent bonds at par, \$2 million of five-year 4½ per cent bonds at par, and \$17 million in ten-year 4½ per cent bonds issued at 98½. These bonds were issued by a banking syndicate headed by Dillon, Read & Co. They

carry an option for the payment of interest and principal in Swiss francs at the fixed rate of 4.30 Swiss francs to the US dollar and a fair line of these bonds will in fact be placed with Swiss investors. The bond issue is the first public offering of a South African stock in the United States.

The loans will be used to finance such schemes as the double tracking of sections of the main line from Johannesburg to Cape Town, the modernisation of the signalling system and further electrification of the Rand, Cape and Natal networks. Additional locomotives, freight cars and passenger coaches are also being purchased. The bulk of the sterling made available by the World Bank will be spent in the United Kingdom.

Hard Times for Celanese

INTERIM reports from British industrial companies are far too few, but the few this year have shown one common tendency. They all refer to the pressure of rising costs on profit margins, or their figures permit that condition to be deduced. British Celanese does not produce an interim report but it gives this year a series of footnotes to an unchanged interim dividend that are as disturbing as any interim profit statement could be. The 3 per cent interim dividend has been earned, but the directors report a substantial reduction in earnings for the first half of the financial year (the six months ended September 30th). The 1954-55 report showed a decline in profit when the other big rayon producers showed rising profits. It is now abundantly clear that British Celanese has not yet been able to arrest the downward trend and is still getting the worst of the synthetic textile industry's fortunes.

The substantial reduction in earnings for the first half of the current financial year, compared with the first half of the previous year—despite the fact that turnover was maintained—is attributed to three causes:

- (1) Higher wages and salaries.
- (2) Increased cost of services and of some materials.
- (3) A highly competitive market in which some selling prices had to be reduced and others could not be increased.

This must be read as a clear warning that the final dividend must depend on the results for the remainder of a year in which rayon output has been running high but British Celanese profits have not. There is much more that shareholders will expect to be told in due course. The rise in material prices has not affected cotton liners, the chief raw material that Celanese uses. Has it arisen on the chemical side? And has it affected the viscose producers as well as the acetate manufacturers? As for the squeeze on profitability, has it been as marked on tyre fabrics and industrial fabrics as on dress goods? If not, the viscose end of the industry may have escaped its worst effects. Above all, how is British Celanese, which has been experiencing increasing competition for some time, adapting its organisation to meet the strain? And is the policy outlined by the chairman last June of acquiring more manufacturing facilities overseas yet bearing financial fruit?

Cancelling the V. 1000

CRITICS of the Minister of Supply in the House of Commons have protested that his Ministry's cancellation of orders placed for the V. 1000 jet airliner leaves this country without a competitor with the big American jet transports now under development for the North Atlantic route. To this Mr Maudling was able fairly to reply that the Americans, for their part, had no non-stop airliner for that route to compete with the Britannia. If the Ministry of Supply is open to criticism at all in this affair, it is that the decision to cancel the order might have been taken sooner.

The V. 1000 was first planned as a civil, 100-passenger development from the Valiant bomber; by this means, it was believed, the cost of developing the airliner would be considerably lower than working up a completely new design. But it proved more difficult to make an airliner out of a bomber than was supposed. The V. 1000 has undergone many modifications; its performance has suffered, and its delivery dates lengthened, with successive changes. Transport Command, which would have taken six of the original aircraft for troop transport, has changed its order to Britannias, and the British Overseas Airways Corporation has never looked to be a potential customer. The Ministry has already spent £2.3 million on the V. 1000, and since neither the services nor the airline are prepared to place orders, there is no possible justification for continuing to spend public money on the project—or to encourage the manufacturers, Vickers-Armstrongs, to dissipate valuable technical manpower on an aircraft with no visible commercial future.

The Ministry has recently given figures to show how much public money has been sunk in specified aircraft since the war, much of it abortive. The figures do not, unfortunately, cover either the Ambassador, the Viscount or the Britannia, commercial aircraft which might have reduced the total.

Type and date ordered	Cost £	Type and date ordered	Cost £
Shetland 1941....	1,000,000	Hermes 1944.....	1,300,000
Apollo 1946.....	1,250,000	Air Horse 1947....	350,000
Brabazon 1945....	6,500,000	Princess 1946.....	8,000,000
Sandringham 1945	120,000	Comet 1947.....	4,250,000
Solent 1946.....	100,000	V. 1000 1953.....	2,300,000
Tudor 1944.....	650,000	Total	25,820,000

It is useless to press for the development, merely for prestige purposes, of a non-stop jet airliner for the North Atlantic if the design does not suit the needs of operators on that route. It is equally absurd to suggest that this decision marks a decisive defeat for British aircraft. When aircraft development costs on both sides of the Atlantic are so high, and the odds against success so heavy, it becomes almost unreasonable to talk about "British" or "American" transports. In all likelihood the next generation of long-range aircraft will have British-designed engines in American-designed airframes. The first function of airlines is to carry their passengers safely and economically, not to provide a favoured market for their domestic aircraft industries.

Spending £100,000,000 . . .

Today, and every day, Dunlop spends more than a quarter of a million pounds on raw materials and equipment—£100,000,000 in a year—creating and increasing trade and prosperity. This money is spent in many ways in many countries. It buys rubber, textiles, chemicals, carbon black, steel, plant and machinery, building equipment, timber, paper, fuel, food—hundreds of commodities needed in the Dunlop factories in all the five continents. Dunlop spending enriches many industries and creates employment for hundreds of thousands of men and women in Britain, in the Commonwealth and in other lands. The millions of pounds worth of raw materials bought by Dunlop are converted by skilled labour, modern research and production techniques into products known and demanded throughout the world.

DUNLOP makes things better for everyone

The nicest thing the typist can say about her machine is nothing at all. A good typewriter doesn't draw attention to itself—it does all you want it to quietly and quickly and well. And the Imperial '66' is the most efficient and most unobtrusive of all.

The Cost of Drugs

THE Committee of Public Accounts has a good deal to say in its latest report for the 1955-56 session about the cost of drugs supplied to the National Health Service. The Committee plainly dislikes the method of pricing that is followed in the pharmaceutical industry. Drugs are notoriously difficult to cost; research expenses too are heavy and often fruitless; the most valuable of life-saving drugs, produced perhaps after years of research, may have a tiny market if the disease that they treat is rare. So the industry is accustomed to look for its profits first from newly developed preparations in which a company has a temporary monopoly before its competitors enter the field, and secondly from the bread-and-butter drugs that treat a wide variety of conditions, where profit comes from high turnover.

The Committee has attempted to look into the costing of some of these drugs, especially those sold under brand names—the "proprietarys"—and has reported on finding profits of "up to 60 per cent on selling prices" with a return on capital employed "where it could be calculated" ranging from a loss of 24 per cent to a profit of over 100 per cent. There are many pitfalls and arbitrary assumptions in any calculation of "profits" or of "return on capital employed" for a single line of production. It may be that the pharmaceutical industry is earning a high return on some lines. But what attribution of joint costs and overheads to a particular product proves that this is so? These are not matters of simple demonstration, and the industry is not merely destructive in expressing "fundamental

disagreement with the basis normally adopted by the Government for computing cost and capital employed."

Is it possible, indeed, to attempt to apply methods worked out for government engineering contractors dealing with bulk orders to an industry using a wide variety of chemical processes and one, moreover, that can hardly be regarded as a government contractor in any ordinary sense? The industry supplies its drugs, or the bulk of them, to chemists who then dispense them to the public against doctors' prescriptions. It does not sell in bulk to a government department and it may not be wrong if it declines to accept the accounting procedure evolved for bulk purchases—this itself is not infallible in saving public money. The Ministry of Health has discussed these matters with the industry for a number of years and the industry should be kept under constant pressure for its own good and the country's good. But the costings and profit margins with which the industry is charged in this report are not enough to convict it of rapaciousness.

A Stable Basis for Wool?

RAW wool prices have settled down quickly this season. The opening fall in September was sharp, but soon spent. In the past two months merino prices have been steady, and crossbreds have risen slightly; stability has encouraged buyers to operate more freely, and confidence has fed on itself. Demand in London and New Zealand

How Ordinary Share Yields Have Moved

SINCE the industrial share market turned downwards in the last week of July the adjustment of prices has gone some distance. By the end of last week yield on the Financial Times index had risen by just over a full point from 4.28 per cent to 5.30 per cent. That is a major adjustment if an incomplete one. The charts below show how it has impinged on a few individual shares.

The first picture—the group of market leaders—shows remarkably little

change in yield between the July market peak and the end of last week. Many of them naturally yield less than the index (since the index is in essence an average some yields must be below it), but "blue chip" yields are still modest.

The second picture shows a group of shares chosen wholly because they have been speculative favourites, bought substantially for capital appreciation rather than for dividend. The picture suggests that that type of investor has not abandoned hope. The pattern is irregular,

but two shares actually show lower yields now than at the market's peak.

The third picture shows a group of shares, active but a little outside the market leader class. Here, on the sidelines, upward adjustment of yields has been sharp. In general, the higher the yield the sharper the adjustment has been. If tea shares showing yields well over 20 per cent and rubber shares with yields well over 10 per cent had been included the contrast would appear even more marked.

has been stimulated by an improvement in business in Bradford, notably in coarse and medium quality crossbred tops. China, nowadays Bradford's second biggest customer, has ordered about 2½ million lb of these tops, worth about £750,000. The orders are having an influence that is out of proportion to their size, because stocks of these

qualities are low and deliveries have to be completed within the next few months. In New Zealand and Australia this week prices were a shade higher and the new series of London wool sales opened well, prices for crossbreds and merinos commanding a slight premium over the Dominion markets.

How will prices fare in the New Year? Deflationary policies here and abroad may by then be more effective and the devaluation of the peso in Argentina has increased the competition among sellers of crossbred wools. But it is difficult to believe that the apparent surplus of wool has not been largely discounted; any further fall in prices could hardly be sharp. That is as well for the health of the sterling area. In the first four months of the season, to October 31st the average price of Australian wool was 45½d. a lb, nearly 13d. a lb less than in the same period of last season. Over the same period, for a similar quantity of wool sold, Australia's earnings were nearly £16 million lower at £61 million. Wool is the largest single export not only of Australia but of the whole overseas sterling area and Australia—as many exporters here are now painfully aware—is Britain's largest single market.

Cortisone in Quantity

FROM next Monday, the drug cortisone can be freely prescribed by doctors. This step marks the fact that production is now large enough to meet any foreseeable demand. The general medical opinion of the value of cortisone has undergone considerable change since the drug was first used, with most dramatic effect, for the treatment of rheumatoid arthritis. Its somewhat violent and occasionally dangerous side-effects make doctors reluctant to prescribe it where long treatment is likely to be needed; on the other hand, it is proving valuable in some cases of eye diseases and sometimes life-saving in asthma. *The Practitioner* and other medical papers have recently described in considerable detail its value and its dangers.

Production of cortisone in this country is based on the extraction of the chemical substance hecogenin from the juice of sisal leaves; this chemical is refined and forms the basis for a 20-stage process that eventually yields cortisone. The process is neither cheap nor simple but among its advantages over the original method, still used in the United States, of extracting cortisone from ox-bile, not the least is

the vast resources of raw material. The sisal process was developed out of funds provided by the National Research Development Corporation—Glaxo being the principal producer in this country—and it would not be surprising if licences were taken from NRDC by American cortisone manufacturers.

Charlie's Back!

CHARLIE has been officially reinstated. He was dropped four years ago, along with his wartime companions, Able and Baker, from the standardised phonetic alphabet for airline pilots drafted by the International Civil Aviation Organisation. He was, it was argued, too Cockney, especially for Spanish-speaking tongues. But it was one thing to introduce that Latin music-hall act, Alfa, Bravo and Coca into the alphabet and another to persuade pilots that Coca could ever mean the same to them as Charlie. Most English-speaking pilots have doggedly continued with the old alphabet, so that Icao's intervention has led to more rather than fewer different systems being used on the air networks.

Five changes have now been suggested and agreed, among them the return of Charlie and his friend Mike in place of that unfriendly spaceman Metro. The changes conform very closely to those recommended in a monumental and thorough investigation done in this country for the Ministry of Transport and Civil Aviation. No doubt clarity of meaning in the air will completely justify the proliferation of committees and the years of work that have gone to change five little words. The new alphabet, as it now stands, meets with rather more general approval than the old and is likely to come into use next March by the RAF and Nato as well as with the airlines. If an earthling dare use this double-talk, "Bravo, Charlie."

HP Squeeze Tightens

EVIDENCE is accumulating that the restrictions on hire-purchase finance are now exerting a tighter grip. Figures of contracts for November to be issued by HP Information next week are expected to show a fall of the order of 15 per cent compared with October. Hire-purchase

The Paper Bulletin

This is a new bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The third quarterly issue is now available. Full details from:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, London, S.W.1. Whitehall 1511,
Extension 144.

sales of radiograms and of television sets (though not of radios) claimed a diminishing share of an expanding total market in October. According to the figures of the British Radio Equipment Manufacturers Association, sales of television sets (helped both by independent television and the seasonal trend) rose from 138,000 to 282,000, but the percentage on credit fell from 55 to 51. Sales of radio sets advanced from 79,000 to 123,000, but the hire-purchase share of that market was more than maintained at 33 per cent, compared with 32 per cent.

Two other recent signs should not escape attention. The first comes from United Motor Finance, which is proposing to alter its capital structure so as to raise further finance. The company, which manufactures aircraft components in addition to its hire-purchase finance business, did well last year, raising its net profit from £61,000 to £125,000. Its preference dividend arrears have been cleared and it may be surmised that the company might have paid an ordinary dividend had it not had to reduce its borrowings (bank loans stood at £977,213 on March 31st) by £250,000. To facilitate the raising of capital the company proposes a modification of the participating rights of the preference shareholders, who are entitled to an extra ½ per cent beyond their fixed 7 per cent for every 2½ per cent above 5 per cent paid on the ordinary shares up to a maximum preference dividend of 15 per cent.

The other piece of news of the hire-purchase squeeze comes from Cannon (Holdings). The company manufactures gas cookers and other domestic appliances, and the chairman, Mr A. F. Oatley, announces the postponement of plans to build a new factory. He complains that makers of high grade appliances have been worse hit than the makers of the cheaper goods, and that it is the control of initial deposits rather than the squeeze on credit that has arrested the company's progress.

Silver on Offer

THE price of silver has fallen by 1½ cents in New York this week and that movement has been transmitted to London, where the quotation has been marked down by 1½d. to 77½d. The fall in New York has carried the price to 90-90½ cents, or below the guaranteed figure of 90.41 cents which the US Treasury is prepared to pay for domestic newly mined silver. The fall in the New York price is wholly seasonal. The jewellery demand for silver in the United States is both formidable and concentrated. After the autumn the requirements for the Christmas and New Year trade have been satisfied and that demand dies down completely. Some persistent but not large offerings of silver by primary producers coming on this quiescent market have caused a sharp marking down of prices. The fall has been intensified by the fact that no effective forward market for silver exists in the United States. It is all cash business, and on any given day offer and demand must balance with no forward market to smooth out the fluctuations. At the price to which silver has fallen in New York this week the strict London parity would be 78.4d., this being the figure at which silver bought in New York at 90½d. could be shipped to and sold in London. The discount to which the

London price has fallen below shipping parity reflects the tendency of potential buyers in this country to await further developments in the United States before coming back into the market.

Castings for Cars

OUTPUT from the iron foundries continued to expand in the third quarter, though not so fast as earlier this year. Total production of iron castings totalled 883,620 tons, 3½ per cent more than in the third quarter of 1954, while in the second quarter production had been nearly 8 per cent higher than a year before. Among foundry customers, the motor industry was still making the pace, taking about 15 per cent more than a year before, and the steel industry's growing output was reflected in the 10 per cent increase in demand for ingot moulds. Demand for castings from general engineering also was high.

Those three classes of customers take about three-fifths of the total tonnage; it seems to have been the pressure of work for them, rather than any marked slackness in other demand, that accounted for declines in deliveries to the pipe business and the railway equipment manufacturers. Deliveries of castings for the building and domestic appliance industries were also down. It hardly seems likely that any expected slackening in building could have affected orders as early as this, but it may be that the hire purchase restrictions on gas stoves and domestic heaters, which take a sizeable tonnage of castings, were beginning to tell by the late summer.

More and Cheaper Meat

BRITAIN can look forward to eating more and cheaper meat next year. Supplies of both home-produced and imported meat should be appreciably larger than in 1955, and it looks as though the public's appetite will have to be whetted by reductions in price. Supplies this year have been somewhat larger than last, the drop in home production being more than offset by the increase in imports and the reduction in stocks. The latest livestock returns suggest that while the increase in home output of beef next year may be small, supplies of lamb will be a good deal larger; the number of breeding ewes in September was seven per cent higher than a year ago and the number of sheep and lambs under one year old was six per cent higher. The decline in pig numbers appears to have been stopped by the recovery in bacon prices, and the price of pork is still high. The extraordinarily good demand for pork this year has surprised the trade; it seems that the Englishman's partiality for pork sausages survived the years of substitutes unscathed.

In New Zealand, Britain's major source of meat imports, output of beef and lamb is rising steadily, and shipments may be at least 20,000 tons higher next year. Aerial top-dressing of land is proving a boon in New Zealand where large areas could not be fertilised economically by any other method. In Australia too, production is rising, in part because the fall in merino wool prices is encouraging those

Steel men take an iron

Three men playing golf — grandfather, father and son. And they have something else in common, too. They are steelworkers at a large works near Glasgow. But they might be in Belgium or Brazil, Canada or France, on any golf course in the world. Wherever golf is played you will find British steel products. Steel in all its forms makes up over 40% of Britain's total exports. And sports goods too play their part in earning foreign currencies for Britain. Even your mid-iron is made of steel. Wherever there is steel there is British steel.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION

farmers who can switch to crossbred sheep, which carry more meat. But much of the growth in output tends to be absorbed by domestic consumption and shipments to Britain may be little higher than this year. Possibilities of increase are greatest in shipments from Argentina, although plans there so often go awry. If the recent improvement in shipments of chilled beef can be maintained in 1956, total shipments should be at least 50,000 tons larger than this year. The cattle are there; the difficulties are in bringing the meat to market. Altogether supplies of meat in Britain next year may increase by some 100,000 tons, or 5 per cent. An increase of that kind could hardly be absorbed without a moderate fall from the present highly profitable prices.

Plastics in Production

FOLLOWING a recent suggestion of the chemical products committee of OEEC, the Board of Trade is now compiling statistics from the plastics industry showing the output of the various plastics materials, rather than the way in which manufacturers use some of them. This change should give a comprehensible picture of the industry and a comparison of the growth and development of the more interesting materials here with progress in other countries. The new series is based upon returns from 160 manufacturers of plastics materials, and does not cover the activities of the much larger army of fabricators and moulders.

The result, for the first time, is a reasonably accurate indication of output of the two main classes of plastics—thermosetting, which cannot be remoulded once they have set after heating, and thermoplastic, which can.

	'000 tons					
	1951†	1952†	1953†	1954	Jan-June 1954	Jan-June 1955
Thermosetting . . .	130	110	110	143	71	80
Thermoplastic . . .	65	70	100	131	62	82
Total	195	180	210	274	133	162

† Estimates.

Since thermoplastic materials have now become the larger of the two it is to be regretted that polyvinyl chloride and polythene—the largest and the two with the fastest rate of growth—have been blanketed under the miscellaneous category which also includes polytetrafluorethylene (PTFE), one of the promising juniors of this industry. This has been done because of the rule that figures should be masked in this way whenever production is confined to a very few firms. On occasion, such a rule may be desirable: on this one, it seems futile, for the relevant figures are fairly common property in the industry.

The three firms producing "pvc," which is in heavy demand at the moment for non-inflammable belting in the coal mines, raised their output from about 30,000 tons in 1953, to about 40,000 tons last year; it may approach 55,000 tons this year. Polythene production has risen meanwhile from about 12,000 tons, to 20,000 tons, and to about 30,000 tons this year; and it is reaching a very

interesting stage, as ICI's patent expires next February. ICI, which developed the complicated plant to make polythene at high pressure and controlled temperatures, plans to produce 55,000 tons in 1957. By then, however, the plant that Union Carbide is building at Grangemouth should be about to start, and there may be other plants under construction using the greatly simplified low pressure methods recently developed in Germany and the United States.

Rise in Lead and Zinc

THE non-ferrous metals seem to be taking it in turn to demonstrate the strength of the market. Copper and tin held the stage until recently; now it is the turn of lead and zinc. After remaining steady for several months prices of both metals have risen sharply. On Thursday prompt lead closed in London at £110 5s. a ton, a rise of about £2 in the past fortnight; prompt zinc closed at £97 a ton, showing a rise of £4 10s., and the premium over three months was as much as £2 10s. a ton. For some time the price of lead in London has been below parity with the United States, so that Europe has been losing lead to the United States. The London price has now had to rise to draw metal to this market. The adjustment has also been helped by some signs of increased demand and by speculative buying in the expectation of a rise in the American price from 15½ to 16 cents a lb.

The rise in zinc is less easy to explain. The correcting of a miscalculation by some market operators seems to be mainly responsible for the sharp rise in the prompt price, and the rise in lead has helped sentiment. Prices of both metals may slip back a little, but both are supported by the voracious demand of American industry. Should that demand ease, the American authorities are standing in the wings, ready to take more lead and zinc into the strategic stock.

SHORTER NOTES

The fiduciary issue was raised this week by £50 million, to £1,850 million. In the week to Wednesday, the outflow of notes from the Bank of England reached £15.2 million—the first large movement of the Christmas season. The outflow in the corresponding week of 1954 was £17.3 million; in the ensuing three weeks there was a further efflux of £89.5 million. At present, the reserve in the banking department stands at £54.7 million, so that a further increase in the fiduciary issue, beyond the peak of £1,875 million reached in the summer seems certain.

*

Brush Bagnall Traction is a wholly owned subsidiary of the Brush Group, and not owned jointly with Heenan and Froude as was stated on page 774 of *The Economist* last week.

The British Nuclear Energy Conference, an organisation set up by the leading professional engineering institutions, held its inaugural meeting in London on Wednesday. Sir John Cockcroft, Sir Christopher Hinton and engineers of the Central Electricity Authority gave their views on nuclear power developments along now familiar lines. The Conference marked a new stage of promoting discussion among engineers and professional men who will eventually have to play a big part in atomic developments but who have until now had little or no direct contact either with those developments or the men responsible for them. Similar meetings are to be held each month.

Great Universal Stores announces an interim (unaudited) profit for the six months ended September 30th of £10,022,000, an increase of £784,000 over the corresponding half of the previous financial year. Of that increase £247,000 comes from companies that became subsidiaries since September, 1954. The company thus shows a sub-

stantial increase in earnings notwithstanding the hire purchase restrictions. The interim dividend is maintained at 15 per cent on a capital increased both by the new shares issued against the acquisition of Waring and Gillow and by a one for 10 scrip issue.

The most promising application for aluminium in building construction is corrugated sheeting to clothe walls and roofs; and there is a potential market for light aluminium sections in moving structures such as bridges, ships and road and rail vehicles. British Aluminium, which makes both, has now doubled its extrusion capacity for light sections at Warrington by installing two extrusion presses, one of 5,000 tons and one of 3,500 tons, which were obtained as reparations from Germany several years ago. The other major aluminium fabricator in Britain, Northern Aluminium, installed an 8,000-ton press at Rochester during the war and has smaller extrusion presses there and at Banbury.

Company Notes

COMBINED ENGLISH MILLS and HORROCKSES, CREWDSON. These two companies are typical of the more progressive wing of the Lancashire cotton industry. Combined English Mills is a big spinning combine, Horrockses a vertical concern whose interests extend from spinning to the marketing of its own branded goods. Both are in the quality end of the trade. Though each has suffered considerable losses on stocks this year—losses which they have preferred to meet out of profits rather

	Years to Sept. 30, 1954	1955
Combined English Mills		
Trading profit.....	1,255,672	532,004
Provision for taxation not required.....	150,000	100,000
Taxation.....	549,445	88,329
Depreciation.....	125,000	125,000
Net profit.....	655,233	337,953
Ordinary dividends.....	100,469	78,777
Ordinary dividends (per cent).....	8	6

	Years to Aug. 31, 1954	1955
Horrockses, Crewdsen		
Trading profit.....	489,732	395,265
Exceptional credits.....	209,922	359,371
Depreciation and renewals.....	110,722	107,035
Taxation.....	186,058	124,910

Ordinary dividends (per cent).....	12½	12½

than out of the stock reserves—it is the vertical concern whose profits have suffered least. Horrockses' trading profit fell by roughly one-fifth, whereas that of Combined English Mills fell by more than half. Turnover in the spinning combine must have been affected much more by the lack of confidence in cotton prices, and margins were lower for both companies. Despite this setback the companies face the future with a certain

amount of confidence. The chairman of Horrockses reports that a substantial flow of business has been maintained in the face of increasing competition. He is confident that though the industry as a whole must contract a considerable trade will still be available to companies that can produce quality goods from modern machinery. The chairman of Combined English Mills speaks in similar vein and makes the plea that the contraction should be orderly and not allowed to become a war of attrition. He points out that retail sales in this country continue to be high and that full employment seems to preclude any serious setback in demand; moreover, when current uncertainties over American cotton policy are settled there will be few stocks available to meet the revival of demand. At the moment his own sales exceed production. Having looked to their own energies, both companies then roundly condemn the government for its refusal to protect the industry against imports of cheap grey cloth; that, too, is typical.

TATE AND LYLE. Figures for Tate and Lyle, the sugar refiners, for the year ended October 1st represent another record. Indeed they are more of a record than at first appears, for the company accounts this time to a 52-week period, compared with 53 weeks. Turnover was again a record though only by a hairsbreadth, total sales of 2,111,916 tons showing an increase of 8,590 tons. Profits were well up, the gross trading profit being more than £500,000 higher than in the previous (longer) period. The final dividend of 12 per cent makes 16½ per cent for the year, which allowing for the 25 per cent scrip issue a year ago effectively

compares with 14 2/5 per cent. That dividend is generously covered; appropriations to reserves amounted to £1,450,000 compared with £1,250,000, while the cost of the net ordinary and preference dividends was only £872,913.

These figures by no means surpassed market expectations; the ordinary stock declined slightly to 65s. on the results to yield 5 per cent. They do however seem to show the group in a state of high prosperity. If there is a cloud on the horizon it is that export sales declined last year almost as much as home sales grew. It would be surprising if the export markets were not heavy going when sugar is in surplus, but it is much too early to assume that Tate and Lyle is being beaten out of international markets. The company has yet to show what effect the dock strikes have had. The two facts which are clear

	Years to end September, 1954	1955
Trading profit.....	5,410,496	5,989,912
Depreciation.....	1,065,138	1,294,315
Taxation.....	2,013,823	1,922,598
Net profit.....	1,995,070	2,326,616
Ordinary dividends.....	693,000	830,156
Ordinary dividend (per cent).....	11½*	16½
Appropriations to reserves.....	1,250,000	1,450,000
* Equivalent rate on present capital.		

even from the preliminary statement are that the home market last year showed itself capable of great expansion absorbing 1,421,557 tons compared with 1,287,618 tons, and that the profitability per ton of the company's whole business improved at a time when profit margins in many trades were beginning to be pinched.

ALLIED BAKERIES. This company's latest financial year to April 2, 1955, included the period of the bakers' race. Mr W. Garfield Weston, chairman of Allied Bakeries, was putting pressure on the millers by using imported flour

ON BUSINESS CREDIT

Every modern accounting department needs an efficient ledger posting system. Each customer's account must be instantly available, in a form that an executive can understand and act upon immediately. If you want to eliminate every trace of guesswork from your credit arrangements, send for the Man from Remington Rand. He'll explain, free and without obligation, how easy it is to base credit decisions on accurate, up-to-date facts.

* THIS IS VERTICAL VISIBLE

— the card ledger system that provides a running commentary on every customer's account. Easy to use, it speeds posting by permitting rapid selection of accounts; provides a graphic signal system for the effective control of overdues. It prevents mis-filing and clearly indicates any 'missing' card. Cards keep clean longer and remain completely legible. Vertical Visible is the system behind many of the world's largest ledger departments; it deserves a place in your office.

Send for the man from
Remington Rand

COUPON: I would like to know more about Vertical Visible.

and the big millers were hitting back by buying their way into the baking business. It was a period of rapid growth for Allied Bakeries; the operating surplus rose from £5,444,266 to £6,082,232, and the net profit after tax from £1,917,046 to £2,410,154. The ordinary dividend has been maintained at 22½ per cent for the year and is generously covered. That growth in earnings is matched by a continuous growth in the whole basis of the business which last year raised its investment in subsidiary companies from £9,705,716 to £11,595,054.

The new investments, of which £5,450,526 come too late to be consolidated, must help considerably in shaping next year's results. To the extent of nearly £3 million, the figure includes the Aerated Bread Company, an investment which will need substantial expenditure on re-equipment and modernisation. Among the trade investments there is £605,000—"a substantial investment not amounting to control"—in Meredith and Drew. Even though Mr Weston does not expect spectacular results from the acquisition of the Aerated Bread Company for several years to come, he clearly does expect the broadening of the business to bring improved results. For the first seven months of the current year he reports a profit increase of about £500,000.

The fruits of expansion and a forward selling policy may provide the answer to a problem that not every baker will find easy to solve. The profits on bread are narrow and full pay packets and rising living standards mean less consumption of bread, not more. Bread distribution is becoming uneconomic except in the most closely populated areas. Mr Weston is aware of these trends and is striving to cushion the impact on Allied Bakeries.

*

SIR GEORGE GODFREY.

The 4s. ordinary shares of Sir George Godfrey & Partners (Holdings) came to the public this summer under the best auspices and almost at the best possible time. The company, which makes air conditioning equipment, was sponsored by Industrial and Commercial Finance Corporation. Application lists opened on July 14th just a week before the *Financial*

Times ordinary share index reached its peak. The result of the offer was dramatic. A well-backed share offering 7½ per cent was received like hot cakes, many applicants went away empty handed, and the fortunate soon saw premiums of up to 10s. a share develop over the offer price of 11s. per share.

It is more striking that in the weaker markets that followed the premium has been held; the 4s. ordinary shares at 21s. now offer a mere 4½ per cent, which is high tribute to the status that investors ascribe to this Stock Exchange newcomer. The accounts for the year ended August 31st naturally add little to the prospectus estimates, which gave a reasonable guess at what the year's figures would show, but the company has now done a little better than that guess. The estimate was for a 20 per cent dividend; the directors' recommendation now is to pay at the rate of 22½ per cent for the short period from July 7th to August 31st. The estimate was that profits after paying

	Years to Aug. 31, 1954	1955
Fixed assets.....	210,263	219,984
Net current assets.....	705,899	975,804
Minority interests.....	188,980	190,124
Net assets.....	727,182	1,005,664

the dividend would leave £240,000 to be reinvested in the company. In fact trading profits rose from £561,041 to £602,323 and after taxation and dividend payments the amount ploughed back is £265,364.

New shareholders can glean much from the chairman's informative review. The company has footholds in Canada, Australia and South Africa. A ready market has been found for its air-conditioning equipment and superchargers. Much can come of the experimental work carried on at the request of government departments, for the company will not be slow to exploit the knowledge and craftsmanship thus derived as commercial applications develop. The chairman, Mr W. D. L. Theed, looks forward to the time when this work will make "a valuable contribution to the expansion of the profit-earning potential of the group." The company has a useful link with Rolls-Royce in the production of oil engines.

LONDON STOCK EXCHANGE

Next Account begins: December 14
Next Contango Day: December 14
Next Settlement Day: December 16

Throughout the account that ended on Tuesday, business in industrial securities has been limited, and movements in price have been small. The tone remained firm at the opening of the new account and several small gains were made. Gilt-edged securities were unchanged for the most part, although short-dated issues drifted slightly lower during the week, 2 per cent Exchequer 1960 losing 5/32 to 90½ and 4 per cent Conversion, 1957/8, fell to 99, which was 10s. below the price at which it was issued in October. Underwriters were left with 87 per cent of the Glasgow issue.

Bank and discount shares were again weak, Barclays losing 1s. 4½d. to 47s. 3d., and Alexanders Discount 2s. to 44s. 6d. Insurance shares held steady, with Pearl at 22½ and Prudential "A" gaining ½ to 46½. Brewery and building shares were mostly unchanged; but Associated Portland Cement slipped back to 100s. Of the stores, GUS "A" weakened on the interim announcement, and closed on Thursday at 39s. 9d. Debenhams receded further to 33s. 10½d., before recovering to 35s. 7½d. The leading stocks in the electrical field, improved, AEI reaching 80s. 10d., English Electric 63s. 6d., and GEC 63s. British Aluminium advanced to 50s. 7½d., and Turner and Newall to 106s. 3d.; but British Celanese fell to 22s. 10d., on the fear of lower profits. Hall Engineering touched 1s. 2½d. premium, following the heavy over-subscription.

Ford Motor rose to 47s. 9d. on American buying, and Standard advanced 4½d. to 9s. 4½d., on rumours, since denied, of an interest in the production of the new Ferguson models. Oil shares were marked up at the opening of the new account, after losing ground earlier. Ultramar continued to improve, and touched 35s. 1½d. Kaffirs revived on Wednesday, after drifting lower; Dominion Reefs, at 25s. 9d., being 3d. higher on balance. Bancroft recovered to 38s. 9d. in a firmer market for copper shares. Lead and zinc shares rose with the commodities.

Germany excludes West Berlin. (²) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxembourg. Italy includes Trieste. (³) New drachmas introduced May 1, 1954 (1 new drachma=1,000 old drachmas). (⁴) Thousand million drachmas. (⁵) 1937.

Financial Statistics

EXCHEQUER RETURNS

For the week ended November 26th there was an "above-line" deficit (after allowing for Sinking Funds) of £2,739,000 compared with a deficit of £19,762,000 in the previous week and a surplus of £396,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £4,931,000, bringing the total cumulative deficit to £611,977,000 (£446,730,000 in 1954-55).

THE MONEY MARKET

CREDIT conditions in Lombard Street continued stringent through the past week, except at the week-end. Rates on overnight money have ranged up to 4 per cent, and on Tuesday up to 4½ per cent. The market had to seek aid from the Bank on each of the first three days of this week, but on Tuesday and Wednesday the amounts involved were trifling.

The discount market again held its bid unchanged at the Treasury bill tender on Friday last—at £99 5s. 9d. per cent for the 63-day bills and £98 19s. 6d. for the 91-day. Applications for the shorter bills rose by £11.5 million to £75.8 million, their highest yet; but the offer was up by £10 million, to £60 million, and the market's allotment rose from 75 to 78 per cent. The offer of 91-day bills was down by £10 million, and despite a small fall in applications, the market's allotment fell from 66 to 61 per cent. On all bills together, its allotment fell from 68 to 66 per cent. At yesterday's tender, the offer of the two months' bills was restored to £50 million and that of the three months' to £240 million.

In the London exchange market sterling has been steady through the week, at around \$2.80½. In the bullion market, demand for gold has been active, and the price at the fixing rose from 249s. 8½d. an ounce on Friday last to 249s. 9½d. on Wednesday. Silver has fallen sharply, in line with the New York price. Cash silver fell from 79½d. an ounce on Monday to 77½d. on Wednesday.

3

Income Tax paid by the Society.
Equivalent to £5.4.4 per cent to investors
subject to the standard rate of income tax.

SAFETY-FIRST INVESTMENT

★ Income Tax Paid

The interest rate of 3 per cent per annum on Share Accounts, income tax paid by the Society, represents a return on every £100 invested equivalent to £5.4.4 per cent to all investors subject to the standard rate of income tax. Ordinary Deposit Accounts earn 2½ per cent per annum, income tax paid, which is equivalent to £4.6.11 per cent where the standard rate of income tax is paid. Amounts up to £5,000 are accepted by the Society.

★ Interest Half-Yearly

Interest, which is paid half-yearly, commences from the day after the investment is received and continues to the date of withdrawal. Sums invested may be withdrawn at convenient notice.

★ Security of Capital

Abbey National is one of the largest and oldest established building societies in the country, with over £200,000,000 total assets — a token of the confidence of more than 500,000 investors.

Ask today for details at your nearest Abbey National office, or write to the address below for the Society's Investment Booklet.

The man who can't save money

That's the man in the bowler. "Can't save a penny," he says—and believes it; though he is, in fact, one of Britain's most stalwart savers. Because of a simple decision he made some years ago, he is saving and buying security almost without knowing it—he is buying Life Assurance.

The greatest method of regular saving in this country is through Life Assurance—both personal policies and pension schemes. In this way Life Assurance acts as an important anti-inflationary influence. It also provides much-needed capital for the equipment of British industry, on which depend our standard of living and our ability to compete abroad.

LIFE ASSURANCE

A safeguard of real prosperity

ISSUED BY THE LIFE OFFICES' ASSOCIATION, LONDON • ESTABLISHED 1889

COMPANY MEETINGS

THOS. W. WARD LIMITED

MR H. W. SECKER ON A YEAR OF

GREAT ACTIVITY

The Fifty-Second Ordinary General Meeting of Thos. W. Ward Limited was held on November 25th in Sheffield. Mr H. W. Secker, OBE (chairman of the company) presided, and in the course of his report (previously circulated) said:

Last year I said it would continue to be our policy to extend our interests by the further acquisition of subsidiary companies.

This has been implemented to the full during the present year in which we have expended over £1,100,000 in acquiring subsidiary companies, the details of which I will refer to at a later stage. As this is a record in any one year, it must strike the key-note of the year's operations.

I would like to preface my remarks with some personal references to certain of the directorate. Your President, Mr Ashley S. Ward, had the Degree of Doctor of Laws conferred upon him by the Sheffield University and we all congratulate him on this signal honour. On January 31, 1955, Mr Joseph Walton, the Joint Managing Director, retired from the Board. He had completed over 50 years' service with the company and played an important part in its progress, particularly in building up our Railway Sidings and Constructional Department to the premier position which it occupies today. I am pleased to inform you that he has agreed to remain as the Consultant on Railway Construction matters and is also retaining the Chairmanship of the Darlington Railway Plant & Foundry Company Limited. We wish him a long and very happy retirement.

It is with regret, however, that I refer to the death in August last of Mr H. Glover Faulk who was a Local Director and who at the date of his retirement on June 30th last had completed 53 years' service with the Company, the greater part in our London organisation.

EMPLOYEES

The frequency with which each financial year comes round is apt to make the reference to the work of our employees seem somewhat conventional, but I would like to make it clear in no uncertain terms how much we owe to all employees in the group, whether young or old in years of service, male or female, for the very excellent results that I am able to bring before you. As some measure of recognition we are increasing the usual bonus to workpeople and staff, but I would like to pay particular tribute to the good relations which have existed with our employees during the year and to the loyalty and enthusiasm with which they do their daily work. There is a widespread view that amongst certain sections of labour there is a need for a greater sense of responsibility and for the elimination of restrictive practices, but we must also recognise that there is a solid core of workpeople who are very hard working and efficient, and I do feel that within our Group we are fortunate in having a majority of workpeople of such a type. I would also like to express my appreciation of the support given to me by my colleagues on the boards of both the parent and sub-

sidary companies, together with all executive personnel throughout the group.

TRADING ASPECTS

So far as your parent company is concerned its activities have been closely linked with the increasing production and prosperity of the Steel Industry, which in turn has resulted in an almost unlimited demand for all classes of scrap. We have therefore had a very busy year endeavouring to cope with the demands made upon us by our many friends, so that the company's total deliveries of scrap iron and steel, excluding imports, are once again a record in its history.

Our production tonnage in shipbreaking shows a reduction as the higher freight rates which have been ruling have kept many of the older ships in service. There are still a large number of old ships afloat, however, and in a more competitive freight market these should ultimately reach the breakers' yards. We are experiencing certain benefits from the substantial expenditure on the installation of more efficient equipment over the past few years, and during the year under review we have completed the reconstruction of a reinforced concrete jetty at our ship-breaking yard on the Thames which will allow for the carrying of heavier cranes and so increase productive capacity. With a similar aim in view we are also undertaking extensive improvements at the deep water berth at our Inverkeithing Shipbreaking Yard to accommodate additional crane capacity and we hope to complete the extensions during the current year.

The demand for all classes of scrap continues unabated and home supplies are having to be implemented by the importation of substantial tonnages from abroad, much from hard currency countries. If we are to make our contribution to reducing the balance of payments position it is imperative to search out all scrap, particularly obsolete plant and machinery, and thereby increase home production scrap and correspondingly decrease imports. We and other members of the Scrap Industry are always anxious to assist in the recovery, collection, preparation and delivery of scrap to the Steel Industry.

In our various engineering activities, that is in the construction of railway sidings, constructional steelwork and erection, factory planning and installation, machinery, industrial plant and contractors' plant, all sections have had a successful year. In connection with Contractors' Plant we have recently completed at Templeborough the erection of a further workshop covering 27,000 square feet equipped with suitable cranes and machine tools for the maintaining and reconditioning of tractors, excavators, cranes, locomotives, concrete mixers and similar plant. These facilities are additional to those we have already established at Templeborough, also at Titan Works, Grays; Fore Street, Glasgow; and Briton Ferry, and enable us to maintain our hire fleet in first-class condition, and at the same time undertake similar reconditioning work on contractors' own plant.

It is somewhat difficult within the short space of this review to survey the whole realm of activities engaged in by the Parent

Company, for to give you some idea of the complexity I would mention that our accounts are organised to record the results over 20 main activities and are again sub-divided into approximately 200 depots and sections, but apart from one or two minor exceptions I can say that I am well satisfied with the results that have been achieved. From this I do not want you to gather the impression that we are complacent, as we are continually reviewing our organisation.

The parent company's turnover at £214 million shows an increase of some £800,000 compared with the previous year, whilst the profits before taxation, excluding dividends from subsidiaries, are up by over £200,000. Broadly speaking, the physical volume of turnover has been maintained slightly above last year, as the monetary values are to a certain extent inflated by increases in certain commodity prices which have taken place during the year, an illustration of this being the sharp rise in the price of non-ferrous metals in which the monetary value of turnover has increased by approximately £300,000, although the tonnage sold is similar to that in the preceding year.

In view of the multifarious activities in which we are engaged it is most difficult, indeed well-nigh impossible, to bring costs and profit margins to a common denominator, and whilst it may seem that my last year's forecast of a narrowing of profit margins during the year under review is somewhat contradicted by the increased profits shown, the experience in a number of directions has borne out the forecast. As you will appreciate, however, our business is of such a nature that occasional opportunities arise for extra profitable transactions, and such that have arisen during the year, together with certain windfall profits on stocks arising from price increases, have largely contributed to the increase in profit shown.

As we are large users of the railways, spending about £14 million in railway charges per annum, the unfortunate strike in June last had repercussions on our business. Every aspect of this has already been fully presented and commented upon in the press and elsewhere, but however much our personal views may differ on the merits of the opposing cases, we can all unite in expressing the hope that such a blow to the country in its struggle to meet severe foreign competition will not be repeated.

Before I pass on to a review of the activities of our subsidiary companies, I would just like to bring to your notice a fact of which you may possibly not be aware, namely, that we have a department which is actively engaged in a subject which is in the forefront of our minds at the present day, namely, atomic energy. For some seven or eight years our Factory Planning and Installation Department, in addition to its other work, has undertaken Government contracts for the installation of plant and equipment on atomic sites. During that period we have done an appreciable amount of work on the Atomic Energy site at Sellafield and at its peak we had about 800 men employed there. This work has now been virtually completed, but I am happy to say that we are busily engaged on a large contract for the installation of processing plant and pipework at the Atomic

Energy site at Capenhurst in Cheshire, and furthermore we have recently been awarded a contract for similar work on the new site at Dounreay in Caithness. On this type of work we have a specialised staff who have gained very valuable experience over the years, and we have every confidence that on installation work we can meet any demands that may be made upon us by the Atomic Energy Authorities.

SUBSIDIARY COMPANIES

As I commented at the beginning of this review, we have made a record investment in the acquisition of subsidiary companies during the year and the companies included in this outlay comprise, in addition to Fredk. Town & Sons Limited of Halifax, to which I referred in my remarks last year, the purchase of the entire share capital of the Wolverhampton Steel & Iron Company (1946) Limited and Birchley Rolling Mills Limited from the Iron & Steel Holding and Realisation Agency which we effected in November last year, together with the purchase of the entire share capital of Frank Parker & Company Limited, a company engaged in the supply of all manner of small tools to the building and civil engineering industries, having its registered office and warehouses in Curtain Road, London; whilst we also purchased the old-established business of George Hassall Limited, Stockholders, Machinery Merchants and General Engineers, situated in Stoke. Our subsidiary, the Eldon Hill Quarries Limited, acquired the entire share capital of Derbyshire Mineral Mines Limited who occupy the adjacent area of land, which will round off the site and facilitate the quarry working.

The Wolverhampton and Birchley companies were subsidiaries of this company prior to their nationalisation in 1951, when, as you will recollect, they were taken over at a figure of £782,500. In comparison with the cost then standing in our books a capital profit arose of over £500,000, which was then carried to and the major part of which still remains in Capital Reserve. We acquired both these companies at the same figure as the take-over price and in all the circumstances, particularly in the light of the results that have been shown since the reacquisition, we consider that they are fully worth the figure that we have paid, and consequently we have retained the capital profit as a separate item in our balance sheet.

Since June 30th we have effected a merger of the two companies to reduce administration costs and to obtain the benefits of a complete integration of production and sales. The Birchley Rolling Mills Limited has been liquidated and the name of the Wolverhampton company has been altered to Wolverhampton and Birchley Rolling Mills Limited. The combined tonnage rolling capacity approximates 100,000 tons per annum, equivalent to 2,000 tons per week.

The extension of our interests in subsidiary companies is, of course, resulting in the combined profits of the subsidiary companies outstripping those of the parent company, and in view of the scale of our group activities I feel that shareholders should have brought to their notice the size and operations of some of the more important of our subsidiary companies. To this end you will see in the supplementary information following this report that we are commencing a new feature, in which we propose to include two of our main subsidiaries each year, to give a short write-up and illustration of their history, what they are doing, and the particular fields in which they are engaged. This year we have chosen The Ketton Portland Cement Company Limited and Thos. Smith and Sons (Rodley) Limited, which are amongst two of our largest subsidiary companies.

In his recent review on the year's work-

ings your deputy Chairman, Mr F. R. Stagg, who is the Chairman of the Ketton company, made a vigorous plea for improvements to our road system, which I would commend to you as one requiring very urgent action. Throughout our group we have over 250 lorries, which are continuously using the roads, in addition to which we are large hirers of transport, and the delay that is incurred in the transport of goods is having a serious effect on the cost of carriage. In his review the Chairman drew attention to the fact that there is an increase in traffic on the roads of approximately 38 per cent more than prewar, and it is vital that the Government should take action to construct new trunk roads.

I am somewhat disturbed at the Chancellor's remarks at a recent conference that no further road-building will be undertaken beyond plans already in hand, which as we know are woefully inadequate to meet the situation. It is difficult to realise that this country, thanks to people like Macadam, was a century or so ago leading the world in road construction.

The cost of carriage and handling is an important element in determining the delivered costs of production, and money expended on improvements to cope with and speed up transportation would be directly related to the reduction of costs which is so essential.

A rather unique ceremony was held at the works of Thos. Smith and Sons (Rodley) Limited at Rodley, near Leeds, on August 31st last, before a representative gathering, including the Parliamentary Secretary to the Board of Trade, the Commercial Secretary to the Canadian Department of Trade and Commerce, and the Lord Mayor of Leeds, to mark the dispatch of the 100th Universal Excavator to Canada and the 100th to New Zealand. The company is the first in Britain to sell so many machines of 100 per cent British design and manufacture to the important dollar market of Canada. In only five years these machines and their spare parts have earned more than 1,500,000 Canadian dollars for Britain, fighting stiff opposition from the USA and European countries.

The group turnover of £36½ million is some £6 million higher than the preceding year; of this turnover £15 million relates to subsidiary companies, compared with just over £10 million in the previous year, an increase of about £5 million, of which approximately £3½ million has been contributed by new subsidiaries acquired during the year.

Similarly the increase in group profits, before tax, of almost £540,000, includes £190,000 contributed by the new subsidiaries, whose results, however, do not cover a full period of 12 months and given a similar rate of profits to that earned to June 30th, it is estimated that the combined profit, before tax, for a full 12 months of such new subsidiaries, will be in the region of £300,000.

With one or two minor exceptions, the other subsidiary companies have increased on their profits in the preceding year, and their combined increase totals nearly £150,000, before tax. The remaining £200,000 of increase is contributed by the parent company, as referred to previously.

If the country's manufacturing interests are to prosper in the present-day competitive markets, greater and not less capital investment is needed. There must be more plant and machinery, together with an increase in the amount of available mechanical power, whilst more efficient use must be made of our existing plant. Your Board have this continually in mind and in addition to the capital projects to which I have referred in the parent company, we have schemes for relatively large outlay on a number of our subsidiaries, including Dick's Asbestos and

Insulating Company Limited, where we are erecting a new factory and installing new plant at an estimated cost of over £100,000, at Fredk. Town and Sons Limited, where we are extending the workshops and installing new plant again at a cost of over £100,000, whilst we have certain other projects under consideration.

You will thus realise why it is so necessary to leave such a relatively large proportion of profits to be ploughed back into our subsidiary companies accounts.

In this connection I would also explain that in the interests of the group taxation, we have deemed it advisable not to take any dividends from certain of the new subsidiaries acquired part way through the financial year under review.

Since the end of the financial year we have completed negotiations whereby we have acquired a 75 per cent interest in the business of Alexander Metal Company Limited, manufacturers of non-ferrous ingots, whose offices and works are situated at Bilston, near Wolverhampton. As this type of business is complementary to the parent company's activities in the merchandising of non-ferrous metals, we feel that it carries definite potentialities.

OVERSEAS TRADE

Last year I dwelt on the difficulties facing our Overseas companies and unfortunately the position has not shown any material change. Our French company has kept up its turnover but profit margins remain very small and similar remarks apply to our Scandinavian and Belgian companies. The Australian company has shown some small progress, but the import cuts recently announced by Australia amounting to £65 million in a full year are bound to have repercussions on Australian trade. However, I do know that our management and staff in each of the foreign subsidiaries are putting forth every effort to overcome the difficulties to which they are subject, and I can only hope that conditions will show some improvement.

TAXATION

Because of the growth in our group profits this year, we have had to set aside an amount of over £1,200,000 for taxation on the profits arising during the year, which is almost £200,000 higher than in the previous year. We industrialists are not ungrateful to the Chancellor for the small remissions of taxation which he was able to give in his last Budget, but there is no denying that the incidence of taxation is still far too high, particularly in relation to that borne by foreign competitor countries, and whilst it is realised that the inflationary trend at the present time may preclude the giving of any further immediate remissions of taxation, we do hope that so soon as the position is restored, the Chancellor will give further aid to industry.

The relief obtained throughout the group from Investment Allowances in terms of reduction of the assessable profits is in the region of £58,000, which is equivalent in terms of net tax to approximately £27,500, and this amount has been taken credit for in arriving at the total charge for taxation referred to above.

We have been carrying a relatively substantial provision for several years now against the possibility of taxation liabilities arising on the surplus realised on the vesting of our wagons in the British Transport Commission in 1947. Following the recent decision given by the House of Lords in the "Hudson" case when it was held that a "balancing charge" does not arise, we have been able to release such provision and bring it back to the credit of Profit and Loss Account. This mainly accounts for the increase in the

credit shown for Surplus Taxation charge in previous years, compared with the preceding year.

BALANCE SHEET

So far as the parent company's Balance Sheet is concerned, the main movements compared with last year are increases in (a) Fixed Assets of £91,000, (b) Shares in Subsidiary Companies £1,117,000, and (c) Excess of Debtors over Creditors £227,000. Against this Stocks have decreased by some £96,000 whilst Government Securities and Cash on Short Term Loan have decreased by £795,000, so that the net increase in Net Worth is in the region of £544,000.

You will notice that we have transferred the previous Provision for Contingencies of £400,000 to augment the General Reserve. In my remarks last year I said that although the contingencies against which this amount of £400,000 was raised had in the main been determined, there were still some outstanding points to finalise. We have effected a satisfactory settlement on such matters, and we are now able to release this amount.

Coming now to the group Balance Sheet, the main movements show an increase in Fixed Assets of £318,000, in Premiums on Acquisition of Shares £746,000, Stocks £575,000, and in the Excess of Debtors over Creditors, including outside interests of shareholders, £518,000. Against this there are decreases in Trade Investments of £48,000 and in Government Securities, Tax Reserve Certificates and Cash on Short Term Loan, etc., £709,000. The increase in Net Worth shown by the Balance Sheet is thus £1,800,000, but having regard to the fact that £400,000 of this is an internal transfer from Provision for Contingencies to General Reserve, the actual figure approximates to £1,400,000. In connection with the Premiums on the Acquisition of Shares we take the view that it tends to give a more realistic appraisal of the consolidated assets by including these separately at the gross figure instead of setting off Capital Reserves and showing only the lower net figure. Because of the inflationary trend in recent years, the Balance Sheet values of Group Assets are already considerably understated in terms of present day monetary values and we therefore consider that this method contributes in some small way as a corrective. Reference to the tabular summary of Group Assets as given in the supplementary information following this review shows the Net Assets of the group at June 30, 1955, to be £9,408,000, which figure includes the Reserve for Future Income Tax due January 1, 1957, of £1,005,000. On such basis, after deducting the Preferential Capital, the Net Assets attaching to the Ordinary Share Capital of £2,200,000 are equivalent to approximately 75s per share on balance sheet values.

APPROPRIATION OF PROFITS

The Balance of Profit available on the year is £747,838, which with Balance brought forward of £459,563, gives a total of £1,207,401. Dividends already paid total £89,306.

Your Board recommends the payment of a final Dividend on the Ordinary Shares of 11½ per cent, less tax, making a total of 15 per cent, less tax. It is proposed to transfer £400,000 to General Reserve, making that reserve £1,400,000 and to carry forward £567,169 as against £459,563 brought in.

The recommendations of your Board are submitted after due consideration of the interests of shareholders, the financial requirements of the group and the recent request by the Chancellor for restraint in dividend policy. In view of the decrease in the purchasing value of the £1, it is only equitable that some reasonable increase in dividend should be recommended, particularly as wages have increased at a

faster rate than dividends. In determining the amount of such increase, however, it must be realised that the expansion that has taken place in your group has been financed entirely from internal resources as no outside capital has been obtained since 1934. In the year just ended, in addition to the outlay of £1,100,000 in extensions of the group's interests, we have also financed capital expenditure in the group approximating £600,000, a total outlay of £1,700,000. We cannot therefore recommend sharp increases in dividend and also continue to finance further expansion from our own resources. Finally, in reaching our decision to recommend an increase in dividend of 2½ per cent less tax over last year, we have acted in what we believe to be the common good of the shareholders, the business, and the national interest, at the present time.

FUTURE PROSPECTS

Up to the present both the tonnage of the parent company and the volume of business handled by subsidiaries has been well maintained in comparison with the corresponding period last year. The difficulty in forecasting, however, is that there is so much more of the future than the present and also that I am as yet uncertain at the time of making this review, as to the remedial measures which the Chancellor will propose, on the reassembly of Parliament, to deal with the balance of payments position and to achieve a balance, between current consumption, defence, capital construction and the restoration of monetary reserves, on the one hand, and production on the other hand. Providing that the measures he takes do not result in a too drastic contraction of credit and capital expenditure, then I consider the prospects for your group in the current year to be very good.

The report and accounts were adopted and the dividends recommended declared. The retiring directors were re-elected and the auditors re-appointed.

STOTHERT & PITT LIMITED

The seventy-second annual general meeting of Stothert & Pitt Limited was held on November 23rd in Bath. Sir Llewellyn T. G. Soulsby, JP (the chairman) presided, and in the course of his speech, said:

The trading profit for the year is satisfactory and output has again increased. All departments were fully employed during the year and have contributed to this excellent result. Perhaps at this stage I should emphasise that in addition to cranes of many types we also have a very large business in Contractors' Plant, Pumps, Ships' Deck Machinery, Multi-Bucket Excavators, etc.

Although our turnover has increased I must tell you that we are experiencing increasing competition in export markets. Nevertheless the figures we are considering reveal continued progress and added strength though the profit margin both at home and abroad tends to decrease.

Our overseas effort is world-wide and we have made a very substantial contribution to the National economy.

Future prospects remain much the same as outlined in my statement a year ago. Our works are undermanned and this is limiting output and keeping up costs.

We have recommended a final payment of 12½ per cent making the total distribution for the year 17½ per cent.

The report was adopted and the Board's capitalisation and scrip issue proposal of 7 new shares of £1 each for every 13 Ordinary Shares held were sanctioned.

FAIREY AVIATION COMPANY, LIMITED

RECORD PROFIT

The twenty-seventh annual general meeting of this company was held on November 24th in London.

Sir Richard Fairey, MBE, Hon FRAeS, chairman and managing director, in the course of his speech, said: The consolidated group trading profit, for the year ended March 31, 1955, before providing for taxation, amounted to £2,159,568, as compared with last year's profit of £1,249,216. This is, of course, a gross profit of which taxation will take over 62 per cent; it is a group profit contributed to by our overseas companies and by our other subsidiaries such as Air Survey Company, and, as always, includes a considerable carry-in from previous years. This is our record profit and we have no apologies to offer on that account, least of all to the political theorists who declaim against all profits as such. On the contrary I here and now declare our intention of using our utmost efforts to continue to make profits.

This year is our fortieth anniversary, I having first incorporated the business as a limited company in July, 1915. It has been built up on profits not unassisted by a combination of initiative and sound engineering design and development, efficient manufacturing and conservative finance.

Our original capital was £22,750 of which only £15,000 was ever paid up in cash. Our first factory consisting of five wooden sheds on the site where the Hayes plant now stands cost us £807 6s. 8d., and our first offices, a brick building which still stands, cost £1,013 18s. 5d. Money went much further in those days. Our profit for the year was £7,114 11s.—not a bad start. So you see we had very modest beginnings but by the same financial and managerial policy that we practise today we had by 1929 reached the stage when it could be floated as a public company with a capital of £500,000. Today we are a group comprising not only this Parent Company with its four main establishments in this country but also our important overseas subsidiaries, in Canada, Belgium and Australia and other interests. Our combined net assets without any writing up are £4,957,296.

FORTY YEARS' ACHIEVEMENTS

During the past forty years we have designed and built 109 different marks of aircraft, of which 48 were distinct types ranging from small single-seaters to four-engined flying boats. Many of our aircraft such as the famous "Swordfish" have rendered yeoman service to the country and others have produced large sums from export trade; yet others have broken world records for performance. I think that we can claim that the remarkable Fairey "Fox" of 1925 altered the whole trend of design of military aircraft. We have pioneered not only aircraft but such things as variable pitch propellers, stressed skin structures, and the first free coupled twin engine.

We are still pioneering today in guided weapons, hydraulic control apparatus, precision casting and the specialised application of plastics and other new production methods—among which our patent envelope jiggling system is a marked success. Today we are developing the largest helicopter and the smallest helicopter and what we believe to be the fastest aeroplane in the country.

The report was adopted; the proposed dividend of 3s. per share, less tax, was approved and the proposed capitalisation of reserves was sanctioned.

THE COMMERCIAL BANK OF SCOTLAND LIMITED

GOVERNMENT'S DETERMINATION WELCOMED

BENEFITS OF NEW ACQUISITION

HIGH TRADITION OF SERVICE FULLY MAINTAINED

LORD ROTHERWICK SURVEYS THE YEAR'S RESULTS

The Annual General Meeting of Shareholders of the Bank will be held in the North British Station Hotel, Edinburgh, on Friday, December 23, 1955, at 12 noon.

The following is the Statement by the Governor, Lord Rotherwick of Tynney, which has been circulated to Shareholders with the Report and Accounts for the year ended October 29, 1955:

It is appropriate that I should first refer to certain changes which are being made this year in the presentation of the Accounts to Shareholders and in the submission of my Annual Statement as Governor of the Bank.

This is the first occasion on which we are required, in accordance with the Companies Act, to publish Group Accounts incorporating the results of our recently acquired subsidiary companies. As you will observe, we have taken the opportunity to change the form and style of the Annual Report, and we have also decided to adopt the now common practice of circulating with the Accounts my Statement to Shareholders, which previously was submitted at the Annual Meeting. We are sure you will agree that this new method of presentation is helpful by giving you within the confines of one booklet the outcome of the year's operations and my comments thereon.

It was with deep regret that we learned of the death in June last of my predecessor as Governor, the Right Honourable The Earl of Mar and Kellie, and I would again refer to his fine record of public service and his particular service to the Bank, extending over the long period of 65 years.

NATION'S ECONOMIC HEALTH

When I addressed you in December of last year I ventured the remark that the economic barometer had remained at "set fair" throughout 1954 and that there was no real evidence then of an inflationary gap emerging. Unfortunately these comfortable conditions did not continue throughout 1955 and each month has seen a growing uncertainty as to the state of our economic health and its future course. I need not elaborate on the symptoms which are disturbing—imports outpacing exports; wages and salaries rising faster than production; excessive demands for materials and labour; dock and rail strikes. These are all unhealthy symptoms and have been so diagnosed by those whose business it is to buy and sell sterling on the world's exchanges. Fortunately, we can still say that basically our economic health remains good and should continue so, provided the right things are done in looking after it. It is encouraging to know that we have a Government determined to seek—by trial and error if necessary—the proper remedies and correctives. As we already know, the Authorities first tried purely monetary remedies—higher interest rates and some instalment credit restrictions. After several months' experience these were thought to be inadequate and were supplemented by a "squeeze" on bank advances. Again after

the experience of several months, further remedies were considered necessary and were introduced in the Chancellor's second Budget Statement. As a result we now have a series of restraints and restrictions all along the line from interest rates to capital investment. No single measure is drastic, but it is hoped that these collective influences will be sufficient to restore the balance of health. If the principle of restraint is accepted by all sections of the community these expectations should prove to be well founded.

BANK'S STRONG LIQUID POSITION

I would like to say a word or two about the influence of some of these measures on the affairs of the Bank. The higher interest rates broadly cancelled out as between our deposits and advances, the extra interest paid on deposits being largely offset by the increased earnings on advances. Against that, we found that deposits tended to leave us, to seek more profitable investment elsewhere—particularly in Treasury Bills. We also witnessed a heavy fall in the market value of our Gilt-edged investments. Thanks to our strong liquid position we have not, so far, found it necessary to sell any of these investments since the market turned against us.

The second phase of restraints involving the Chancellor's request for "a positive and significant reduction in bank advances," meant that we were asked, in effect, to agree voluntarily to a course of action contrary to the interests of our shareholders and customers, on the grounds that it was thought by the Authorities to be in the national interest. We supported the official policy, but as a result we have had to put pressure on many of our customers, whose credit standing is undoubted but who happened to be borrowers at that time and were not fortunate in being associated with a privileged class of business such as national defence or exports. Such action is contrary to sound banking practice.

PROGRESS OF SUBSIDIARIES

You will, I feel sure, wish to know of our experience as the proprietors of The Scottish Midland Guarantee Trust companies which handle hire-purchase finance. A year ago I expressed confidence in the new investment which we had made. All that has happened since then justifies that confidence. Our subsidiaries have steadily progressed under the able guidance of their Managing Director, Mr John McQueston, who has been associated with these companies for many years. The field of their operations is mainly confined to vehicles and industrial plant and does not cover the finance of household goods. We have found that this association with Industrial Bankers has enabled us to enter into a number of composite financial transactions with our customers which might otherwise have been unsuitable. We feel therefore that through this acquisition we are able to offer a wider and more

comprehensive banking service to industry and commerce. It is also right that I should tell you that the increased profit earned during the past year is mainly attributable to the successful efforts of these companies.

BANKING GROUP AFFAIRS

I would now like to refer to the affairs of our banking group as shown in the Annual Accounts.

The pattern of our operations shows a reverse trend from that of the previous year. The main items on both sides of the Balance Sheet have contracted—Deposits, Liquid Resources, Investments and Bank Advances are all somewhat lower on the year. Only in the Note Circulation do we see an expansion.

You will see from the Bank's Balance Sheet that Deposits at fully £121 million are down by some £8½ million. As I have already stated, this fall is mainly due to a withdrawal of funds by some of our larger depositors who are offered a higher yield elsewhere, particularly in Treasury Bills. In spite of this we have maintained our liquidity, and the first group of Assets covering cash, short money and Treasury Bills, represents 40 per cent of our liabilities for Deposits and Notes—the same ratio as last year. Our Government Investments are down by almost £5 million, part of the realisation having been utilised for the acquisition and financing of our subsidiary companies. You will observe from the notes on the Accounts that the market value of the Government Securities is rather less than £47 million, as compared with a book value of over £50 million. I may say that "market value" is a somewhat fictional term as we could not unload our volume of investments on the market and find cash purchasers at the official prices. On the other hand these investments are all redeemable at par at fixed dates and we expect that in the absence of abnormal circumstances we shall have the opportunity of retaining them until market prices approach the par values.

Advances at £36 million are lower by £1½ million. At one time during the past year Advances reached a figure of £41 million so the restrictive policy which we have had to adopt is beginning to show results.

CONSOLIDATED ACCOUNTS

In the Consolidated Balance Sheet you will note that the amount due to our subsidiary companies under hire purchase contracts, after deducting unearned interest, is £7 million. These are spread over some 26,000 accounts and emanated from 21 branches, of which six are in Scotland and 15 in England and Wales. We hope to grow steadily from this solid nucleus of established branches.

The Consolidated Profit and Loss Account shows an increase in net earnings of £58,451, which, as I have already stated, is mainly attributable to our subsidiaries. In the early part of the year the growing volume of bank

advances enabled us to use our resources more profitably, but this trend was reversed in later months. We again experienced a year of rising costs, and in association with other Banks we granted in April, 1955, a considerable increase in salaries to members of the staff. Certain sections of the press seem determined to convey the impression that the clerical staffs employed in Banks are underpaid compared with other occupations. The truth is that Bank staffs are more highly paid than any other comparable group in the whole field of clerical employment. Moreover, as far as we are concerned, there is an annual pension on retiral which after 40 years of service amounts to two-thirds of the final salary, and we do not ask the staff to contribute anything towards this or other retiral benefits. We think it right that Bank staffs should be so remunerated, but we do not like to see false impressions created by a distortion or suppression of the facts.

APPROPRIATION OF PROFITS

Out of the Profits of the Year the Directors have appropriated £100,000 to Contingency Account and £100,000 to the Pension Fund. During the year the Trustees of the Widows' Fund increased the annual pension from £150 to £200, and at the same time increased the contributions from certain classes of members. The Directors think it right that the Bank should also give a further measure of support to this most valuable fund and have appropriated a sum of £10,000 for this purpose.

You will recollect that during the year we capitalised part of the Reserve Fund and increased the amount paid on each "A" Share from 6s. to 10s. Immediately prior to this change we paid a dividend of 17 per cent on the "A" Shares of 6s. paid. That dividend was equivalent to 10.2 per cent on "A" Shares of 10s. paid. The Directors now propose that there should be a further modest increase in the dividend to "A" Shareholders and recommend that the final dividend be 6 per cent (making 11 per cent for the year). The final dividend on the "B" Shares is at the rate of 5 per cent (making 10 per cent for the year).

Once again it gives me pleasure to express on behalf of the Shareholders our sincere thanks to the officials and staff of the Bank, at Head Office and Branches, for their loyal and conscientious support throughout the year, in which the Bank's high tradition of service to the public has been fully maintained; and I think that it is only appropriate that the officials and staff of our subsidiaries should be included in this appreciation.

THE DIRECTORATE

It is proposed that I be re-elected Governor; that Lord Saltoun be re-elected Deputy Governor, and that the Extraordinary Directors, whose names appear on the List, be re-elected.

It is also proposed that Mr Howard Usher Cunningham, the Ordinary Director who is due to retire at this time, be re-elected an Ordinary Director of the Bank.

Mr Robert Yaxley Weir and Mr Douglas Ainslie Foulis, who were 70 years of age this year, retire under the provisions of the Companies Act 1948. Special Notice of the intention to propose their re-election has been received by the Bank, and a Resolution to that effect will be put to you.

Mr Maurice Crichton, CA, Glasgow, and Mr Ronald J. Henderson, CA, Edinburgh, will, under the provisions of the Companies Act 1948, continue in office, and a Resolution will be proposed fixing their remuneration.

THE NATIONAL BANK OF AUSTRALASIA

(Inc. in Victoria)

RECURRENT ECONOMIC PROBLEMS

FUNDAMENTAL READJUSTMENTS NEEDED

The ordinary general meeting of The National Bank of Australasia, Limited (with which is united The Queensland National Bank, Limited) was held on November 30th, at Melbourne.

Mr H. D. Giddy (the chairman), in the course of his address, said:

Balance Sheet totals of £283,523,924 are £12,298,765 higher than last year, due mainly to an increase of £3,363,012 in the Paid-Up Capital and a rise of £6,137,731 in the Deposits and Other Liabilities item.

The increase of £972,029 in gross earnings was largely offset by a rise of £877,786 in working expenses. Net profit increased by £147,961 to £889,355, reflecting to some extent the intake of fresh capital in March last.

BANKING LEGISLATION.

During the year, public reference has been made to the approach by the Trading Banks to the Commonwealth Government with respect to the existing banking legislation. The proposals put forward are vitally important and, we believe, should be accepted if our banking structure is to be adjusted to conform with the present-day needs of our economy.

Bank liquidity has declined during the past year, the Australian liquid assets of the main trading banks last month being £64 million below the £586 million held in October, 1954. Our liquid assets were slightly higher last month compared with October, 1954, but, of course, we have been assisted by additions to our capital structure.

Such declines in liquidity, associated with a turn for the worse in our overseas balance of payments, present a banking problem of major importance. To what extent should the system absorb the shock? From 1945 onwards, official policy was to reject outright any deflationary procedure—this was stated categorically in the 1945 Commonwealth Government paper on Full Employment. In 1951/52 and again in 1954/55 the banking system attempted to act as a cushion for the community. However, on the latter occasion the view was officially expressed that the system should not cushion such adverse movements. Clarification is needed on this vital matter of high policy, otherwise the banks will continue to attract undeserved criticism.

MEASURES TO COMBAT ECONOMIC EMERGENCIES

After referring to the recurrent balance of payment difficulties, and inflationary pressures within Australia, and reviewing in detail the deep-seated influences which were tending to throw the economy out of balance, the chairman continued: As emergency devices to hold our external currency reserves and to ease internal inflationary pressures, import restrictions, pleas for restraint in spending, and a stringent bank-lending policy may be unavoidable. But to remove the basic causes of such emergencies will require, I think, measures that can be permanent and which touch fundamentals within the Australian economy.

In some quarters, the fashion is to attri-

bute our balance of payment problems and our inflationary tendencies to the existence of what is termed "excess demand" which, it is said, from time to time "spills over" into imports. Some who adopt this superficial explanation also offer a superficial cure. Heavier taxation, they say—and the figure of an additional £100 million per annum has been bandied about—would "skim off" this "excess demand" and bring us back into balance.

Faith in such a proposal is merely wishful thinking; wishful thinking which is very close to the socialistic line. Heavier taxation would mean a contraction in the capacity of private enterprise to operate—taking this phrase in its broadest meaning—and an expansion in the capacity for government activity. But our experience over the past decade has shown in convincing manner that it is not expansion in the capacity of governments to act that is needed but the reverse. Of course, in the modern world considerable government action is unavoidable, but let us remember that in our country it is already excessive.

It would be foolish to enlarge this capacity at a time when, above all, the urgent need is for fundamental readjustments within the economy and in the nation's attitude toward our economic difficulties.

In the long run I believe that the incomes of the community must be related to the real value of the effort made. In our case this value must be in line with the true comparative efficiency of our overseas trading associates and competitors, otherwise we shall not attain our objectives. Failing definite improvement in the true worth of our productive efforts, the real value of incomes may be reduced by further inflation.

There is overwhelming evidence that we have arrived at a position where economic realities have caught up with us and where artificial measures will prove useless. In truth, a somewhat greater effort on all fronts within the Australian economy for less in the way of immediate reward is the only way out.

DOMESTIC MATTERS

A satisfactory increase in the Bank's business over the past year has been recorded, deposits and advances each having risen by a little over £6 million. The new issue of shares was successfully completed during the year and Paid-Up Capital is now £10,089,037.

CONTINUED GROWTH OF BANK

The growth of population and business has continued to enlarge the demand for banking services. During the past year 19 new branches and 33 receiving offices were opened, bringing our points of representation on September 30th to 778 in Australia and three in London. An important recent establishment was the opening of a branch at Darwin on October 17th under the management of Mr L. R. Quodling, formerly a Branch Inspector in Queensland.

To meet the steady expansion of our business, some 55 new branch buildings have been erected over the past eight years and a large number of other premises have been purchased.

The report and accounts were adopted.

THE STANDARD MOTOR COMPANY LIMITED

(Manufacturers of Standard and Triumph Cars, Ferguson Tractors and Standard Commercial Vehicles and Diesel Engines)

RECORD PROFIT AND OUTPUT

LORD TEDDER ON EXPANSION PLANS

The fifty-second annual general meeting of The Standard Motor Company Limited, was held on November 30th at Coventry, Lord Tedder, GCB, chairman of the company, presiding.

The following are extracts from the chairman's statement, which was circulated with the report and accounts:

It gives me considerable satisfaction to present to you the Company's Accounts for the year ended August 31, 1955, particularly as these constitute a record both in Profit and in Output.

The Group Profit for the year before Taxation has risen from £2,273,563 in the previous year to £3,439,664. After deducting £20,620 retained in the Profit and Loss Accounts of the Subsidiary Companies, and after providing for Taxation, the balance to be added to the Company's Revenue Reserves is £1,934,044.

Careful consideration has been given by the Board in recommending that the dividend on the Ordinary Capital should be maintained at 12 per cent, being the same rate as for the last four years. The need to conserve the Company's liquid resources to meet competition, to buy the expensive capital equipment essential to modern production methods, and to help the country's fight against inflation has been well in mind in arriving at this decision.

FORECAST SURPASSED

During the year we produced and sold 98,647 cars and 70,909 tractors; a total of 169,556 units and an increase of more than 35,000 units over last year. This compares with the forecast I made twelve months ago in connection with our Preference Share Issue, when I gave a figure of some 161,500 units as being the achievable production for our Financial Year under review.

Of the vehicles sold by ourselves and the tractors sold by the Massey-Harris-Ferguson Organisation, some 90,000 units have been exported. These, together with appropriate Spare Parts, have earned more than £33 million of foreign currency for Great Britain.

NEW MODELS AND EQUIPMENT

I now turn to the Company's activities generally. The new Vanguard III Saloon, incorporating entirely new body features and having the well-proved Vanguard engine, was enthusiastically received at the Earls Court Motor Show last month. It is indeed a worthy successor to a range of Vanguard Cars of which we have made and sold throughout the world more than a quarter of a million. The body contract for this new car has been placed with the Pressed Steel Company of Cowley.

We also exhibited for the first time at that Show our new TR3—a successful development of the Triumph Sports Car, the TR2, which has achieved so many successes in major international sporting events.

Our range of 8 hp and 10 hp Cars, which now incorporates additional equipment, continues in great demand, and the whole of our Home Market Output planned for our present year to August 31, 1956, has been contracted for by our Distributors and Dealers. We have now produced and sold

more than 120,000 of these cars since production started in June, 1953, and present output is running at 325 per day, out of a total of 435 cars per day.

There is no doubt that, both at home and overseas, our products are giving sustained and reliable service. Our motor cars are setting up extraordinary performances. I quote particularly our Vanguard III petrol consumption of over 30 miles per gallon at an average speed of 40 miles per hour normal driving; our TR2 petrol consumption of 35 miles per gallon at over 70 miles per hour, and to the numerous reports we have received of our cars running more than 100,000 miles without major overhaul and with a negligible demand for replacement parts.

TURBO JET ENGINES

Rolls-Royce Avon Turbo Jet Engine Production within our organisation, under contract to the Ministry of Supply, came to a satisfactory conclusion during the year, and the capacity made available has now been changed over for our own domestic expansion. Following the delivery of the last Avon Engine on time, we received a letter of congratulation from the Director, Engine Production, Ministry of Supply, which reads:

"Your performance is worthy of the highest commendation; your Company entered the production of aero gas turbines without any previous knowledge and proved very quickly that your productive capabilities were comparable with any recognised aero engine manufacturer."

"Unfortunately, the Defence Programme limited the extent to which your capacity could be used, but the work carried out has demonstrated that British gas turbines can be produced, when necessary, by able automobile firms and that such engines have been and would be to the standard required."

"Please convey to all your staff my sincere appreciation of their efforts and their success on the Rolls-Royce Avon engine production."

DIESEL ENGINES

We are continuing to develop Diesel Engine Production, for installation in our vehicles and in Ferguson tractors.

We have completed arrangements with Auto Diesels Limited for the marketing by them of our complete range of engines, which they will adapt for stationary work, including pumping, generating, etc., thereby widening the range of our products. We anticipate that, with the marketing and research experience of Auto Diesels, a considerable contribution will be made to the economies of our overall production.

EXPANSION OVERSEAS

Our Overseas Interests continue to expand. As you know, we already have well-established associated companies in Australia, France, India and South Africa, and an operating Subsidiary Company in New Zealand. In addition to these, we have Marketing Companies in the USA and Canada.

In Australia, where we now have capacity for 100 vehicles a day, 50 per cent of the body is already Australian; axle production will start at the end of the year; engine

assembly is well under way, and a large proportion of the engine will shortly be manufactured there.

In France we are engaged in developing the production of the Ferguson tractor. Seventy-five per cent of the tractor is now made in France, and by April next year it will be 100 per cent. Our output is now almost 80 tractors per day, which will rise to 100 per day, or 25,000 per annum, by next spring. We are now the largest manufacturers of agricultural tractors in France, and all this has been achieved in two years.

We have so far installed some 300 machine tools in our Indian Factory, and engines are already being produced at the rate of 80 per month. We are just starting to manufacture the gearbox and rear axle.

In New Zealand and South Africa we have established complete assembly organisations, and we are ready to develop these important markets as circumstances dictate.

During the year we expanded into Eire by acquiring all the Share Capital of the Assembly and Distribution Company, McEntagart Bros. Limited, which has been handling our products there for some 25 years.

In addition to this, we have completed long-term plans in South America by the formation of a wholly-owned Subsidiary Company in Brazil.

VALUABLE ASSETS ABROAD

Our developments in these Overseas Markets are now starting to show profitable returns and there is no doubt that this policy has created valuable overseas assets for us and for Great Britain. In addition to the expansion of these companies with the natural growth of the countries, we have also achieved that flexibility so important in counteracting the adverse economic conditions which must arise from time to time. In particular, I refer to the import restrictions imposed by the Australian and New Zealand Governments, and our policy in these countries will now be to step up the rate of progress of local production there.

Our association with the Massey-Harris-Ferguson Organisation continues to be very close and most cordial and, in the course of the next few weeks, we shall have manufactured and sold to them half a million tractors since we started production nine years ago. In our opinion, only increasing benefits can accrue to us through our connection with their world selling organisation. As an example, I am now able to tell you that Massey-Harris-Ferguson have completed a considerable contract with the Yugoslavian Government, in the face of intense competition, for the supply of Ferguson tractors to that country.

CAPITAL COMMITMENTS

During the year under review we spent some 4½ million pounds on new Plant, Equipment, Dies and other capital assets and, as you will see from the Accounts, our Group has, in addition, outstanding capital commitments of four million pounds. These figures are indications of the developments which are taking place within our Organisation, and only emphasise the need for conserving

profits. Indeed, while it might appear that our profit is comparatively large this year, nevertheless it is only out of the profits which we earn on selling our products that we can develop and expand.

As part of this Capital Expansion Scheme plans have been formulated for the complete revision of the Company's Factory Layouts, to achieve more economical production, to increase our overall capacity and to introduce new projects. Such large-scale reorganisations cannot be effected without some temporary dislocation of production and it is inevitable that, in addition to the considerable revenue expense involved, a certain loss of potential output is, for a time, unavoidable.

NEW AUTOMATIC PLANT

An essential development in all large production factories is the installation of specialised plant. We ourselves are in the process of installing a certain amount of new automatic plant of this description. This form of progress has been labelled "Automation." We well appreciate that some people may, at first sight, view it with some apprehension, but we should remember that the only new thing about "Automation" is the word itself. Since the inception of mechanical methods man, in his first reaction, has tended to regard this form of development as a danger to his employment. In actual practice, however, industry has developed, production has increased, wages have risen and the standard of living in this country is now higher than ever before. Improved production methods represent only one stage in a process of natural evolution and will have the same effect as they have always had of invigorating industry, creating a larger and wider demand for our products throughout the world and thereby increasing our British standards of life.

The report and accounts were adopted.

LEETHEMS (TWILFIT) LIMITED

The twenty-seventh annual general meeting of Leethems (Twilfit) Limited was held on November 24th at Portsmouth, Mr C. H. Reynolds, MA, AMICE, JP (Chairman and Joint Managing Director), presiding.

The following is an extract from his circulated review:

The Company has succeeded in maintaining and, in fact, slightly increasing its total personnel; in consequence it has been possible again to increase our production as compared with last year. Every effort is being made to expand production still further both by improvements in machinery and the recruitment of more employees.

During the year a freehold site was acquired at Fareham for the erection of an additional factory; this will enable us to attract additional employees from a new area and ensure the maintenance of our steadily increasing production.

Total sales during the year were higher than last year and, although our Export figures were lower such decline was not serious.

Last year I reported increased minimum wages for the industry, and this year the Company has voluntarily made further wage increases. Yet another advance on minimum wage rates has just been agreed for the industry and it will be necessary, therefore, to increase some of our selling prices; we cannot continue to bear these additional costs out of our reducing margins even though we have succeeded in increasing our output.

The report was adopted and the final dividend of 7 per cent, making 10 per cent for the year, was approved.

REGIS PROPERTY COMPANY LIMITED

LARGER REVENUE

The seventeenth annual general meeting of the Regis Property Company Limited, was held on December 1st in London. The Right Honourable Lord Kennet of the Dene, PC, GBE, DSO, chairman, presiding.

The following is an extract from his circulated statement for the year to June 30, 1955:

Our Excess-of Rents over Outgoings, and other Profits, have risen from £408,020 last year to £465,915 this year. This increase is due to three causes: (a) Increased revenue from our Liverpool property; (b) Permitted increases of rent for repairs and services under the Housing Repairs and Rents Act, 1954, of which so far we have had only six months' benefit; (c) Increased rents consequent on renewals or relettings of space in our other office buildings hitherto let on a prewar basis.

Of this increase of £57,895, £35,784 is absorbed in additional mortgage interest on our Liverpool property. A few minor adjustments on other items leaves us with a net profit after tax of £93,622 as against £81,234 last year—a gain of £12,388.

We have yet to receive the benefit of lettings in the new section of the Liverpool building, which is now almost completed. In addition, we shall have in the coming year a full year's increases charged to tenants for repairs and services. Finally, there is still to come additional revenue from revisions of prewar office rentals on lapsed leases to the present rental basis.

Against these increases in revenue there will be a further charge for additional mortgage finance to repay the Bank advance secured to complete Section 4 of the Liverpool building and increased interest charges on certain mortgages due for renewal. There are also increased costs of maintenance and heating to be faced, but all these increased charges should be more than covered by prospective additional revenue.

HEAVY TAXATION

The Board are concerned, as I have previously told you, at the heavy impact of taxation upon companies such as ours. We have to pay 53 per cent of our Net Profits in Tax. The withdrawal of £107,730 from our profit of £201,352 in this way is a very heavy drain on our resources and gives us little scope to increase reserves. The carry forward will be £51,639, practically the same figure as last year, but we shall have strengthened our internal resources by retaining £24,286 Profits in our Subsidiaries this year as against £15,191 last year.

The market values of our properties are considerably higher than their Book Value and form a valuable undisclosed reserve. Moreover, as I told you last year, your Board has plans under review which should in due course still further improve the Company's position both from a Capital and a Revenue point of view, and they feel therefore that the small increase in Dividend of 1 per cent is fully justified.

During the year under review the Landlord and Tenant Act, and the Housing Repairs and Rents Act relating to repairs and services, came into force. The provisions made to assist landlords to meet the rise in these costs of repairs and services proved to be in some instances only transient unfortunately, for a great deal of the benefit in some items was immediately offset by further increased costs notably of heating which the landlords are unable to recover.

The report and accounts were adopted.

SERCK RADIATORS, LIMITED

INCREASED TURNOVER

The thirty-sixth annual general meeting of Serck Radiators, Limited, was held on November 25th at Birmingham, Mr W. H. Newton, MA, FCA, chairman, presiding.

The following is an extract from his circulated statement:

During the year ended July 30, 1955, the Company achieved a considerable increase in turnover, but the final profit before deducting taxation is £634,786, as compared with £693,406 in the previous year. We have been faced with continuing wage and other unexpected and unavoidable increases in costs over which we have no control, but which we have to a large extent absorbed rather than pass on to our customers, and while every effort to achieve economy is being made, it has not proved possible to offset the continuous and heavy increases which have fallen upon us. We have also encountered very keen competition at home and abroad, resulting in smaller profit margins.

Main Works.—During the current year the process of renewal and improvement will continue, and the total capital expenditure should be much as in the past.

Service Branches.—The Service Branches have again produced a satisfactory increase in profit.

Serck (Eire) Limited.—Additional premises have been acquired and plant installed for the manufacture of radiator blocks. Profits have been maintained.

Serck Radiators (South Africa) (Pty.) Limited.—Following Mr Harper's visit, successful steps have been taken to meet competition which was developing and profits continue to be satisfactory.

PROFIT AND DIVIDEND

While the trading profit shows a small decrease, it will be observed that the net profit after tax shows an increase, by reason of the repeal of the Excess Profits Levy and reduction in the standard rate of Income Tax. The Balance Sheet discloses a strong position.

Your Directors recommend a final dividend of 6d. per 5s. unit less tax, which, together with the interim dividend of 3d., makes a total dividend of 15 per cent.

AUDLEY ENGINEERING COMPANY LIMITED

Since the close of the financial year, your Directors have completed negotiations with the Directors of Audley Engineering Company Limited, Newport, Shropshire, for the acquisition of the whole of the 240,000 £1 Ordinary Shares. The Audley Company has for many years been very successful in the manufacture of valves for a wide variety of industries, in many of which we also are interested, and has an expanding business both at home and abroad. I have no doubt whatever that the association of the two concerns will enable both to develop more rapidly than would have been the case.

While we are now feeling the effect of increasing competition, particularly abroad, there seems no reason whatever why the business should not continue to progress. We manufacture a wide range of products used by many different industries, and we feel that we are well equipped to meet any change in demand for new designs within our range or for entirely new types of products. The Order Book remains satisfactory and we hope to achieve an increase in our turnover during the year.

The report and accounts were adopted.

HARMONY GOLD MINING COMPANY LIMITED

MR P. H. ANDERSON ON THE CONTINUED PROGRESS

At the Fifth Annual Meeting of shareholders held in Johannesburg on November 14, 1955, Mr P. H. Anderson, the Chairman, in the course of his remarks said:

Good progress has continued to be made at the property and your mine is now equipped to operate on the basis of a nominal milling capacity of 90,000 tons per month—the second 45,000-ton unit of the gold plant having been commissioned during the last month of the financial year under review. The monthly rate of milling is steadily being built up and reached 73,000 tons in October. The 80,000-ton uranium plant which was commissioned in April this year is being operated to full capacity by treating accumulated slimes from the dam in addition to current tailings from the gold plant.

FAVOURABLE MINING CONDITIONS

An initial available ore reserve at June 30, 1955, was declared at 931,000 tons with a value of 8.0 dwt over a stope width of 57.9 inches, equivalent to 463 inch-dwt. The favourable mining conditions encountered to date at the Harmony mine have permitted the use of widely spaced reef drives and raises and the adoption of a longwall system of stoping and the development of replacement reserves for the immediate future will be derived very largely from stoping operations. It is intended gradually to step up the rate of reef development as soon as possible after production has caught up with the present milling capacity, in order to ensure the provision of adequate stope faces to meet the requirements of any expansion planned for the future.

Now that the first stage in the opening up and exploitation of the Harmony mine is virtually complete, it has been decided to proceed with the sinking of the second main hoisting shaft, No. 2 Shaft, some 5,500 feet north-north-west of No. 3 Shaft. The Shaft has been excavated to a depth of 66 feet and the foundations for the permanent headgear and permanent winding equipment are under construction. Sinking with this permanent equipment is expected to commence in about eight months' time and the 26-foot diameter circular shaft, which is to be sunk to a depth of about 6,000 feet, should be ready for hoisting in from two to three years, depending on sinking conditions. The mine will then have a hoisting capacity of about 200,000 tons per month. Meanwhile, twin footwall haulages are being driven northwards from No. 3 Shaft and are expected to reach the site of No. 2 Shaft before the middle of 1956. This will considerably extend the base from which mining operations can be carried out, and the short boreholes being drilled at 65-foot intervals from the haulages up to the Basal Reef will give a useful indication of the values between the two shafts, pending the undertaking of actual reef development in this area.

Since my last address the reef body has, broadly speaking, continued to show no disturbance from faults and dykes of any practical significance; comparatively little water has been encountered and the quantity pumped to surface is still less than 300,000 gallons per 24 hours; negligible quantities of methane gas have been detected, and in view of the provision of adequate ventilation facilities the Government Mining Engineer has relaxed considerably the fiery mine regulations. There are, however, one or two points to which I would like to draw your attention.

Shortly after stoping operations got under

way it became apparent that the hanging wall, as in most of the rest of the Free State Gold-field, lacked the cohesion of that on the Rand in that these quartzites are laminated with distinct bedding planes. Due to this lack of cohesion, shearing of the hanging wall at the stope faces is inclined to occur despite close mat pack and waste support. Although the problem of controlling the hanging wall under these conditions is not regarded as serious, the generally weak nature of the hanging and the relatively wide stoping widths will entail the use of fairly costly methods of support. Fortunately, the position is not at present complicated by the presence of khaki shale.

DEVELOPMENT RESULTS

Development results during the past year have shown that in the Ventilation Shaft area values have tended to fall off a little, both in regard to percentage payability and inch-dwt. This was due in small part to the occurrence of a few isolated erosion channels, of which I made mention last year, but in the main to a general downward fluctuation; latterly, however, there has been some improvement to the north. In No. 3 Shaft area the promise held out by the high values intersected in the shaft reef and ore passes was fulfilled, and values in this area were very much better than had been anticipated on the indications given by the reef intersections in H.2 borehole and in the shaft. This deterioration in the one area and improvement in the other were to some extent compensatory, and the major factor contributing to the falling off in the overall development results during the past year was an abnormality in reef deposition encountered in the area between the Ventilation Shaft and No. 3 Shaft. It seems likely that the Basal Reef was originally deposited under shallow-water conditions, and that in this area there was a sandbank or group of sandbanks which precluded the deposition of the bottom portion of the reef; consequently, less gold was deposited, the reef is narrower and the footwall contact appears to be raised up towards the hanging—hence the adoption of the descriptive nomenclature for this localised occurrence "elevated footwall." This elevated footwall condition persisted on and off between 6 and 13 Levels in the east-west winze-raise connection between the two shafts, and in order to establish its extent on the strike of the reef, 10 Level drive is being advanced north and south. Stoping operations in this area commenced in May of this year, and two longwall stope faces of 1,000 feet each are being advanced north and south off the winze-raise connection in this elevated footwall area.

In the area between Nos. 3 and 2 Shafts the reef is being initially prospected, as I have already mentioned, by means of boreholes drilled at close intervals from the twin haulages which are being advanced northwards from No. 3 Shaft. The first four boreholes drilled averaged 599 inch-dwt, and conformed fairly closely with the general run of values around No. 3 Shaft, but thereafter results have been erratic in that in three holes the Basal Reef has not been fully developed—possibly due to local erosion channels or elevated footwall conditions; minor faulting with loss of reef occurred in another, and in two others there was loss of core due to grinding. Of the 21 boreholes drilled so far, the inclusive overall average has been 12.4 dwt over a channel width of 28 inches, equal to 347 inch-dwt. It is confidently expected, however, that this bore-

hole programme will yield improved results as the haulages advance towards No. 2 Shaft, which is located in an area where four boreholes drilled from surface averaged 1,350 inch-dwt.

FINANCE

In so far as the Company's finances are concerned, the funds required for the present capital programme, which is mainly in connection with the sinking of No. 2 Shaft, have been provided from profits and from temporary loan facilities of up to £1 million, which expire on December 31, 1955. I am pleased to be able to report that your Board accepted on Friday last, November 11th, an offer by The Central Mining & Investment Corporation Limited and Rand Mines Limited to subscribe jointly for 450,000 reserve shares at 28s. 9d. per share (being the closing market price on the previous day), thereby extinguishing the existing temporary loan arrangements made available by them. These two companies have also undertaken to grant new temporary loan facilities of up to £250,000 at 6 per cent repayable by December 31, 1956. While no definite decision has been taken in regard to the timing of any expansion in the rate of milling, it is hoped that any increase over the present capacity of 90,000 tons per month can be financed out of profits.

CHAIRMAN'S REPLIES TO QUESTIONS

A shareholder drew attention to the fact that uranium profits are published "subject to adjustment." He asked how these adjustments came about and whether they affected the grade, the quantity or the price of uranium. The Chairman pointed out that he was precluded owing to the provisions of secrecy imposed by the Atomic Energy Act from answering this question in detail. He did, however, point out that the reason for making the qualification "subject to adjustment" was that payments for uranium are based on a sliding scale formula depending on various factors which are not exactly determinable at the time the provisional payments are made and which necessitate periodical adjustments; as these adjustments were not likely to be very material it was considered preferable to make early announcements of the profits "subject to adjustment."

In reply to another question, the Chairman stated that it was intended to crosscut to the Basal Reef from the 17 level twin haulages before these reached No. 2 Shaft and to do some reef development in this area between the two shafts in the near future.

In reply to a further question, the Chairman stated that the pyrite flotation plant which was being erected at the Company's mine property was primarily for the purpose of ensuring that pyrite would be available for use in the uranium industry and that it was expected that only a nominal profit would be obtained from the operation of the plant as such.

The two special resolutions, dispensing with the necessity for the Company to comply with the provisions of Sub-section 9 of Section 70 quin of the Companies Act, as amended, and amending the Company's Articles of Association in certain respects to enable it to issue Bearer Share Warrants should it desire to do so at any time were passed unanimously.

The Report and Accounts were adopted.

BLYVOORUITZTCH GOLD MINING COMPANY, LIMITED

MR W. M. FRAMES' SPEECH

At the Eighteenth Annual Meeting of shareholders held in Johannesburg on November 15, 1955, Mr W. M. Frames, the Chairman, in the course of his remarks, said:

While there was an improvement in the supply of non-European labour the shortage of European personnel continued and although, by making the best use of the available labour force, it was possible to show a marked increase in the footage developed, the tonnage milled was only slightly higher.

During the first four months of the current financial year the seasonal decline in the non-European labour strength has been more marked than it was in the same period last year.

The power position has improved to an extent that has permitted the mine to revert to the 6 day milling week as from September.

The payable ore developed at 1,262,700 tons was greater by 386,700 tons than that for the previous year but the average value was lower by 0.6 dwt. per ton.

The development footage advanced on reef showed a noticeable increase during the year and the average value of payable disclosures improved appreciably compared with the previous year. This was due mainly to there having been more reef development in the eastern portion of the mine than had been accomplished in the previous financial year. Exploratory development in the western portion of the mine is continuing but the values disclosed continue to be lower than the average for the mine.

THE YEAR'S RESULTS

The benefits derived from the increased tonnage milled were more than offset by a slightly lower average yield and these factors, combined with higher working costs, caused the working profit from gold mining to fall by nearly £64,000 to £5,564,400 for the year under review. On the other hand, the working profit from uranium extraction—subject to adjustment—rose by £351,000 to £1,104,800. The total working profit of £6,669,300 therefore compares favourably with that for the previous year, being approximately £287,000 greater.

The presence of underground water fissures continued to be a serious factor in mining operations, particularly in A1 and A3 Sub-Incline Shafts where sinking progress was also retarded by the work involved in cutting and equipping of pump and engine chambers. A little over 7½ million gallons of water a day were pumped to the surface during the year under review, an increase of 820,000 gallons per day compared with the previous year. Pumping capacity was increased and, allowing for maintenance work on the equipment, the present facilities are capable of pumping approximately 15 million gallons of water a day.

Satisfactory progress has been made in advancing the twin haulages on 6 Level from No. 1 Shaft towards the position of the Sub-Vertical Shaft. Preparatory work in connection with the sinking of this shaft may commence early in 1956.

URANIUM

The uranium plant operated satisfactorily and at full capacity throughout the year. A further sum of £48,240 was expended during the year, bringing the total to £3,924,149, inclusive of interest on the loans, and it is

estimated that a further £141,500 remains to be spent on this project. At June 30th the amount outstanding, together with accrued interest, on uranium loan account was £3,587,559, which is being repaid at the rate of £124,691 per quarter until the end of the year 1963.

In my address to shareholders last year I mentioned the possibility of a plant being erected on the company's property for the production of sulphuric acid for use in the uranium industry. It was then estimated that the capital cost of this project would be about £430,000. That estimate was based on the assumption that the company would erect a sulphur-burning plant which would have relied entirely on imported raw material. On further consideration of the matter our technical advisers recommended the erection of a pyrite-burning plant which can use locally produced raw material and whose operating

cost will be lower than that of a sulphur-burning plant. The capital cost of the revised project is now estimated at about £750,000. Arrangements have recently been concluded with the Atomic Energy Board in terms of which the company will erect a pyrite-burning plant for the production of sulphuric acid, and the capital cost of the project will be provided by means of loan facilities being arranged through the same authority. It is considered that satisfactory profits will accrue to the company from the operation of this plant after providing for the amortisation of the capital cost and interest.

The special resolution dispensing with the necessity for the Company to comply with the provisions of sub-section (9) of Section 70 quin of the Companies Act, as amended, was passed unanimously.

The Report and Accounts were adopted.

THE ROVER COMPANY LIMITED

HIGHER OUTPUT—LOWER PROFIT MARGINS

The sixtieth annual general meeting of The Rover Company Limited will be held on December 21st in Birmingham.

The following is an extract from the circulated statement of the Chairman, Mr H. Howe Graham, FCA:

The progress which the Company has made in recent years has again been well maintained.

Last year I referred to plans for expanding our production capacity and proposals to increase our capital for this purpose. The new capital has since been raised and the expansion programme is well in hand.

Our output has risen steadily in the post-war years, and our sales of vehicles during the year under review showed an increase of more than one-third in both number and value as compared with the year to July 31, 1954.

The year under review was one of rising costs both of materials and wages, and despite the considerable increase in output we had to work to lower profit margins. Costs are still continuing to rise and although, as in the past, we have absorbed increases as far as possible against economies achieved as a result of the greater volume and more efficient methods of manufacture, nevertheless, in common with other manufacturers we have recently had to adjust our selling prices.

Whilst the final result for the year is eminently satisfactory, it must be borne in mind that the capital has been considerably increased during the year and having regard to this increase in capital the results are rather less favourable than one would normally expect; also due to rising costs of production the actual profit per unit produced is in fact less than it was in the previous financial year.

Every effort is being made and will continue to be made to expand our home and export markets.

The Surplus on Trading and Management Fees, together with Interest on Investments and Bank Interest amount to £2,407,530, and this represents an increase of £352,075 on last year's figure. The provision for Taxation this year is £1,074,911 as compared with £1,165,164 last year on a smaller profit. The Profit after Taxation has increased from £553,617 last year to £938,458. Your Directors are recommending a Dividend of 2½ per cent, less tax.

SMITH'S STAMPING WORKS (COVENTRY) LIMITED

INCREASED PROFIT

The sixtieth annual general meeting of Smith's Stamping Works (Coventry) Limited was held on November 28th at Birmingham, Mr S. Bramhall, MBE (chairman and managing director), presiding.

The following is an extract from the chairman's circulated statement for the period August 1, 1954, to July 30, 1955:

I have to report a profit for the year of £214,279 compared with £117,111 after providing £105,749 for depreciation of fixed assets against £98,228 last year.

We recommend a dividend of 15 per cent less Tax.

In my report to you last year I referred to the large capital expenditure undertaken over recent years in furtherance of our policy of maintaining our plant and equipment in the highest state of efficiency. I said then that much of our new plant was installed and many of our new projects were nearing completion and that we might expect to see an improvement in trading results in consequence. This forecast is confirmed by the figures now submitted to you.

While we have been handicapped by shortage of labour and raw materials, our up to date equipment has enabled us to increase our production with much the same labour force. Nevertheless we have not been able to meet the full demands of our customers.

While the cost of wages, materials and services continue to increase we have been able to offset to an extent the rising costs by better efficiency as the result of our capital expenditure, but some increase in selling prices has been inevitable. The supply of steel is a matter of concern to our industry. Notwithstanding the global increase in the productivity of the steel industry, there has been an insufficient increase in forging quality steels.

I am pleased to say that our order books are in a most healthy state; we have large contracts from motor car and heavy vehicle manufacturers, for general engineering and the aircraft industry. In this connection I have to refer to further capital expenditure necessary to meet the demands upon us for still larger forgings in special steels and new alloys. This additional equipment will absorb a further £250,000 and when the plant is finally installed, will emphasise our premier position as manufacturers of the highest grade drop forgings.

The report and accounts were adopted.

GOODE DURRANT AND MURRAY (CONSOLIDATED) LIMITED

COMPETITIVE TRADING CONDITIONS

MR L. A. KEMP ON OVERSEAS INTERESTS

The fifty-seventh annual general meeting of Goode Durrant and Murray (Consolidated) Limited will be held on December 16th at 197, Great Portland Street, London, W.1.

The following is the statement by the chairman, Mr Lewis A. Kemp, which has been circulated with the report and accounts:

It is with pleasure that I place before you your Company's results for the year ended July 20, 1955. You will see that the Net Consolidated Trading Profit of the Group is £95,983 and, after paying a 10 per cent Dividend on the Ordinary Shares, the total balance carried forward in the Consolidated Balance Sheet is £241,054.

As you have been informed, the Company has now changed its name to Goode Durrant and Murray (Consolidated) Limited, and has sold its trading business to two Subsidiary Companies, one of which will carry on trading in Australia in the name of Goode Durrant and Murray (Australia) Limited, and the other in London in the name of Goode Durrant and Murray Limited. The Company thus continues as a Holding Company, its main Assets being Freehold and Leasehold Properties in London and Australia and Shares in Subsidiary Companies. These changes took place after the close of the year to which these Accounts refer.

During the year we have formed a Subsidiary Company in New Zealand, for the purpose of fostering and maintaining business with that territory.

I am glad to report that the debt due from Brazil is almost cleared, and the small balance still to come should be received before our next Accounts are published.

The new building which is in the course of erection in Chiswell Street for the Offices of the Group has not progressed as rapidly as we should like, owing to the call on manpower and materials, but we expect to enter into occupation next May or June.

THE YEAR'S TRADING

Trade during the year under review has been beset with many difficulties, and in some directions we have found it hard to maintain turnover. Dock strikes have caused delay and, as generally happens, it was not possible to regain turnover lost. More recently we have experienced the "credit squeeze," which, although not affecting the Company's business directly, has considerable influence upon it by reason of the rise in the Bank Rate, equivalent to 1½ per cent, since our last Meeting. To some extent we were able to pass on this increased cost to our customers, but unfortunately we have now to bear a considerable part ourselves.

Import restrictions abroad were eased to some extent, but in other directions fresh and tighter restrictions have been imposed.

CHAIRMAN'S VISIT TO AUSTRALIA

I would like to add to the above general remarks some particular comments upon Australia, in which territory the Company is so vitally interested.

Since I last addressed you, I have revisited the Commonwealth after an interval of 25 years. I noticed great progress and development in building and industrial expansion.

Whilst Australia is still enjoying prosperous conditions and full employment, the rapid expansion of Hire Purchase facilities is having a retarding effect on Clothing and Drapery Sales, as weekly instalments on Electrical and other Household Appliances are claiming a larger proportion of wages and salaries.

Competition in the wholesale distribution of all classes of the Apparel and Drapery trade is increasing, and profit margins are becoming difficult to maintain, in face of rising wages and overall costs.

Our Branches in South and Western Australia report favourable conditions as a result of good seasonal rains throughout the agricultural and farming districts, and the season's Wool Clip is expected to be one of the heaviest on record.

May I now direct your attention to the

MODDERFONTEIN EAST LIMITED

MR N. W. S. LEWIN'S SPEECH

At the Thirty-ninth Annual Meeting of shareholders held in Johannesburg on November 14, 1955, Mr N. W. S. Lewin, the Chairman, in the course of his remarks, said:

Mining operations have, generally speaking, been carried out latterly according to a programme of gradual withdrawal from the south-eastern portion of the mine. In operations of this nature it is not easy to control the grade, and it so happens that the areas where mining has recently taken place have been generally of lower grade and more scattered payability than the average. The yield showed a decline of 0.073 dwt per ton. The tonnage milled, augmented by some 59,000 tons of ore from several low-grade development rock dumps, was higher than in the previous year. Working costs decreased by 9d. a ton and there was an increase of some £14,000 in the working profit. It was possible to maintain the dividend distribution at 3s. per share, absorbing £139,621.

DEVELOPMENT OPERATIONS

Development footage, 55 per cent of which was accomplished in the Klipfontein Corridor lease area, increased by 1,336 ft to a total of 8,234 ft. The percentage payability was fractionally lower than that for the previous year, but the value of the payable footage was slightly higher. Primary development was again confined almost entirely to the Klipfontein Corridor, where the results obtained continued to be generally disappointing, such payable ore as was revealed being only marginal. Shareholders are aware that the Corridor is not expected to contain a large tonnage of payable ore, but driving is continuing at points where there is still some promise.

At last year's meeting I mentioned the possibility of low-grade ore from development rock dumps being treated at a profit. Since then an appreciable quantity of this rock has been sent to the mill as make-up tonnage, with satisfactory results. During the first four months of the current financial year the average tonnage milled has been greater than in the same period of last year, but working profits have fallen by £20,414 owing

Balance Sheet, from which you will see that the amount of Trade Debtors and Bills Receivable shows a considerable reduction. This is entirely due to the method of finance and is reflected in the reduction in the liabilities under Acceptance Credits.

THE CURRENT YEAR

If I may venture to express my views as to the current year, I would say that so far as the Company's business is concerned, we are continuing to strive against severe competition and low margins of profit. Efforts are being made with a view to combating these difficulties, as some of our more profitable markets are temporarily closed to us. The world may be taking on a more peaceful outlook, but the nations competing for trade are progressively becoming more keen.

In conclusion, may I pay a warm tribute to our staff in the United Kingdom and overseas for their loyal and combined efforts, without which the Company could not have produced the result which your Directors have been able to place before you.

to the lower grade of underground rock treated.

The special resolution dispensing with the necessity for the Company to comply with the provisions of sub-section (9) of Section 70 of the Companies Act, as amended, was passed unanimously.

The Report and Accounts were adopted.

FABRIQUE NATIONALE D'ARMES DE GUERRE, S.A.

(Manufacturers of Armaments, Jet
Engines and Motor Vehicles)

Herstal-lez-Liège, Belgium

The annual general meeting of the Fabrique Nationale d'Armes de Guerre was held on October 27, 1955, and the following is a summary of the report presented by the Board:

Developments during the year ended June 30th last showed the continuance of the favourable trend which was first noticeable in 1950. Turnover figures, although slightly lower than in the previous year, remained high, and profits kept in step.

BUSINESS IN HAND

Orders received were in excess of deliveries, and the amount of business in hand at the end of the financial year accordingly showed a distinct rise on the previous year.

The Company continued its investment policy of the last five years, and took further steps to extend, rationalise and improve plants and installations.

PROFITS FOR THE YEAR

Net profits for the year amounted to Frs. 77,189,054.94. The amount available for distribution, including a balance of Frs. 2,508,691.33 brought forward, totalled Frs. 79,697,746.27, as against Frs. 73,929,574.26 for the previous year.

It was proposed to distribute dividends amounting to approximately Frs. 77.25 million, that is, Frs. 320 gross (Frs. 227.50 net) per share, and to carry forward a balance of Frs. 2,451,196.75.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

MR T. REEKIE'S ADDRESS

At the Fifty-seventh Annual Meeting of shareholders held in Johannesburg on November 15, 1955, Mr T. Reekie, the Chairman, in the course of his remarks, said:

The results at the mine were again rather better than might have been anticipated, mainly due to the higher yield and an improvement in the non-European labour supply which enabled the tonnage milled to be increased. The benefit of this was, however, largely offset by the continued rise in costs. Moreover, as has been pointed out in the Directors' Report, the problem of maintaining both grade and tonnage is becoming increasingly difficult. Owing to the declining number and increasingly scattered nature of the available reserve blocks which are distributed over five reef horizons the rate of mining from these reserves, and consequently the tonnage to the mill, must soon decrease. During this financial year, however, it might be possible, if the labour supply is adequate, to keep up the mill tonnage, but the yield is likely to be lower because of the preponderance of low grade ore available for mining. You will already have seen some evidence of a decline in yield in the published results for the first four months of the year and it is necessary for me to point out that it may not be possible to maintain the present level of monthly profits for the remainder of the year, and that thereafter, as may be deduced from the information which has been given to you, the trend of profits will be downward.

Although it was gratifying that the tonnage of ore developed last year showed a substantial increase and that there was a decrease of only 72,000 tons in the available ore reserves, here again I must mention that, as the areas suitable for development are limited, this position is unlikely to be maintained and that a more rapid rate of decline in the reserves is to be anticipated in the future.

CHAIRMAN'S REPLIES TO QUESTIONS

The Chairman read a letter which had been received from an overseas shareholder asking for a reply at the meeting to two questions raised in the letter.

In reply to the first question, as to why large parts of claims on the South, Bird and Kimberley Reefs had not been developed, the Chairman stated that the areas were almost certainly unpayable. In nearly every case, each such part was surrounded by unpayable reef and despite an appreciable amount of internal development in recent years, little additional payable ore had been exposed. The southernmost exploration on these reefs had revealed a steady decline in payability and value and all evidence indicates that the large intact areas are completely unpayable.

In reply to a further question regarding the possibility of extending operations on the Main Reef and Main Reef Leader beyond the Company's southern boundary, the Chairman stated that because of the large potential tonnages involved this matter had for many years been given most careful consideration. Despite the generally discouraging values above 60 level three costly winzes—62E1, 60E1 and 60W2—had been sunk from the lowest workings on these reefs towards the southern boundary; driving and raising had been undertaken and also some borehole drilling. Unfortunately this work had indicated payability of the order of 10 per cent which would render mining operations in that area unprofitable.

The special resolution dispensing with the necessity for the Company to comply with the provisions of sub-section (9) of Section 70 of the Companies Act, as amended, was passed unanimously.

The Report and Accounts were adopted.

ALLIED BAKERIES LIMITED

CONTINUED EXPANSION OF INTERESTS

The twentieth annual general meeting of Allied Bakeries Limited was held on November 24th at the May Fair Hotel, London.

Mr W. Garfield Weston, the Chairman, presided and, in the course of his speech, said:

I am very pleased to present to you our report on another year of successful trading and continued expansion of our interests.

Our successful development is not restricted to Great Britain. In Australia our Bakery interests are being steadily extended and we have most encouraging news of our biscuit activities. Current reports are most satisfactory. In South Africa, too, we have every reason to be satisfied.

We had, in the first half of the financial year, acquired a number of new Subsidiaries and further opportunities arose for substantial investments in Aerated Bread Company Limited and other Companies. In the first place, these acquisitions were financed by bank overdrafts but in August of this year we issued £5 million of 5 per cent Unsecured Loan Stock at a price of 97½ per cent which, under the conditions prevailing at the time, can be regarded as favourable.

HIGHER EARNINGS

Total Revenue at £6,332,000 shows an increase of £647,000. After all charges, we are left with a Net Profit of £4,884,000. Our total provision for Taxation is £132,000 lower, at £2,474,000, and the balance of profit remaining is £2,410,000, an increase of £493,000.

You will note that the Fixed Assets total of £11,595,000 is higher by £1,890,000 than last year. This is after providing the very large sum of £1,375,000 for depreciation during the year, so that the gross additions total some £3,265,000. The balance of Goodwill at £300,000 represents a decrease of £200,000 since last year. The aggregate cost of Goodwill at £4,655,000 is lower by £25,000 than a year ago; in other words, in return for the very large sums which we have spent on new acquisitions during the year, we have obtained net Assets valued at slightly more than the purchase prices.

The item "Interests in Subsidiary Companies not Consolidated" at £4,844,000, includes our acquisition of Aerated Bread Company Limited which will represent in due course a very valuable addition to our Group of Companies.

STRONG RESERVES

Revenue Reserves and Surplus have been increased from £3,878,000 to £4,707,000. This figure represents the balance of undistributed profits after adequate depreciation on our fixed assets and the appropriation of large sums to Depreciation Reserves and to Reserves in respect of Goodwill. This policy of retaining such a high proportion of our profits each year has enabled us to carry through our vast programme of development and expansion.

This year trading has, so far, been at a satisfactory level and we can reasonably anticipate some improvement on the year's results.

The Report and Accounts were adopted.

ANGLO-ECUADORIAN OILFIELDS, LIMITED

LARGER PRODUCTION

The thirty-seventh annual general meeting of the Anglo-Ecuadorian Oilfields, Limited, was held on November 29th in London, Mr F. C. Bowring, chairman, presiding.

The following is an extract from his circulated statement for the year to March 31, 1955:

Crude oil production for the year again increased, amounting to 328,661 tons compared with 313,081 tons for the previous year, an increase of 15,580 tons, approximately 5 per cent. The increase in production was, as in the previous year, entirely due to oil from shallow wells. There was a slight decline—725 tons—in production from the deep horizons. Increased shallow footage drilled was largely responsible for the higher production. The total footage drilled during the year was 219,539 feet compared with 210,445 feet the previous year.

Casinghead gasoline production was 160,241 barrels compared with 145,624 barrels for the previous year. The increase in production is the result of a full year's operation of the enlarged unit to which I referred last year. The Refinery at La Libertad operated at full capacity throughout the year. The total throughput of crude oil was 243,088 tons, compared with 202,185 tons in the previous year. The increase was made possible by the full year's operation of the Foster Unit which was completed in February last year. As I explained in my previous Statement, it was originally intended to convert this unit for the manufacture of lubricating oils and asphalt, but in view of the acute supply position of refined products it was completed as a straight crude distillation unit.

Our sales of refined products continued to increase rapidly. During March last the Government authorised some increases in basic prices, namely the equivalent of ¼d. per gallon on kerosene, 1½d. per gallon on diesel oil, and 1½d. per gallon on fuel oil. Unfortunately, despite every effort on our part, we were unable to obtain any increase for gasoline.

The new contract with the Government of Ecuador will be comprehensive, including authority to build a new refinery and revised terms for your existing development concessions. The terminating date for all your concessions will be 1977, with the option to extend for a further 10 years, i.e., to 1987, the year in which the refinery portion of the contract will terminate.

The Net Operating income at £1,134,392 as shown in the Profit and Loss Account just fails to reach the £1,141,120 achieved in 1954. British Taxation at £303,542 shows the considerable reduction of £95,661, which is explained by the cessation of the Excess Profits Levy, adjustments in Double Taxation Relief and in Initial and Investment allowances. As a result the net profit for the year available for allocation at £324,159 shows an increase over 1954 of £98,134.

To the net profit for the year, after the payment of taxation, of £324,159, there is added £153,443 brought forward from 1954, leaving £477,602 for allocation. Your Board recommends the distribution out of the profit earned during the year of 14 per cent (less Income Tax). The Board also recommends that £150,000 be transferred to General Reserve to increase it to £1,225,000, leaving £206,852 to be carried forward to the next

account. Your Board views the company's future with confidence.

CHA.RMAN'S ADDITIONAL REMARKS

Addressing the meeting, the chairman said: A great deal has happened since you received notice of this meeting on October 17th. You had then just received my letter to you of October 14th, telling you of the LOL offer of four LOL five shilling stock units and ten shillings in cash for each one pound AEO stock. That letter was followed by another, dated November 4th, in which was set out the terms of the new LOL offer of two LOL five shilling stock units and fifteen shillings in cash for two AEO 6s. 8d. units, or 13s. 4d. worth of each one pound stock which you held. It also gave details of the agreement which had been reached between LOL and SAG. On November 21st LOL agreed to purchase stock offered under both offers, and closed the offers. Accep-

tances to the original offer amounted to £250,000 stock and to the second offer £800,000 stock.

As one-third of the stock (or one 6s. 8d. stock unit) assented to the second offer remains in the hands of the stockholders of the company, Lobitos Oilfields acquired under the second offer £530,000 stock.

In addition, LOL and SAG hold on their own account £265,000 stock. Consequently, LOL and SAG now hold approximately £1,045,000 stock of this company, or almost 70 per cent of the issued capital. Other stockholders hold some 30 per cent of the issued capital of £1,500,000, that is to say, £455,000 or 1,365,000 6s. 8d. stock units. As a result of the two offers, LOL will issue Ordinary stock amounting to approximately £650,000, or 2,600,000 5s. stock units. Of this total, 1 million units will be issued to AEO stockholders who accepted the original offer and 1,600,000 units to those who

accepted the second offer.

It is the intention of the board to effect a transfer of residence of your company to Ecuador as soon as possible, and I hope that within the next few days you will receive a notice of an extraordinary general meeting of the company, at which you be asked to approve alterations to the Articles of Association of the company, to enable this transfer of residence to be made. I am sorry to have to ask you to meet again so soon after the annual general meeting, but it has not been possible to agree the alterations to the Articles and to give the necessary statutory notice in time to deal with them at this meeting.

I hope that I will be able to announce within the near future the actual signature of the contract between the company and the Government of Ecuador, as all the conditions of the contract have been settled.

The report and accounts were adopted.

Capital in respect of the current year. This must not be taken, however, as an indication of any intention that the total distribution for the year will be increased.

The report and accounts were adopted.

THE ANGLO-INDONESIAN PLANTATIONS

The Forty-fifth Annual General Meeting of The Anglo-Indonesian Plantations, Limited, was held on November 29th in London, Mr G. C. Denham, CIE, CBE (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement: Our trading results have been exceedingly beneficial to the Indonesian Government but by no means to the same extent to the Stockholders.

The payment of Indonesian tax reduces our profit by more than one-half. The transfer of this profit to the United Kingdom is limited as only 60 per cent of the balance can be remitted; the remaining 40 per cent has to be deposited with the Bank of Indonesia and can be used solely for capital works.

Yet once again we have to suffer further reduction as the attenuated remittable profit has to bear a cess of 66 per cent. The eventual result is that less than 18 per cent of our assessable profit is remittable.

We hope gradually to strengthen our sterling position in London and, should we continue to make profits, we may be able to consider a small dividend based on the present year.

Our decided policy is one of consolidation which will mean the reduction of the area of our cultivatable land, based on its economic use and qualified by the final clearing up of the position created by the illegal occupation of large areas of our freehold property.

Our future is in the hands of Government and I am sanguine enough to believe that the situation is steadily improving.

The report was adopted.

THE OUTLOOK

So far in the current year the trading of the Parent Company and its Subsidiaries has not been unsatisfactory, and unless any unforeseen events occur the trading profit of the Parent Company and of the Group for the year to March 31, 1956, should show some increase over those for the year.

The Directors contemplate, unless anything unforeseen should prevent it, paying an interim dividend on the Ordinary Share

THE BORNEO COMPANY, LIMITED

MR C. R. AKERS'S REVIEW

The One Hundred and Sixty-second Ordinary General Meeting of The Borneo Company, Limited, was held on November 30th in London, Mr C. R. Akers, the Chairman, presiding.

The following is an extract from his circulated statement:

The Accounts for the Parent Company show that the Net Trading Profit for the year at £363,100 is practically the same as last year. For the Group there has been a fall from £904,948 to £673,386 accounted for by a reduction in the profits of Borneo Motors Limited and its subsidiaries. After crediting £100,000 Provision for Taxation no longer required, and transferring £150,000 to Reserves, and after the payment of Preference Dividend for the year and an Ordinary Dividend of 25 per cent the same as last year, there was a balance of £30,061 carried forward.

The Excess of Current Assets over Current Liabilities of the Group is £2,324,681 as compared with £2,236,559 last year. A satisfactory feature is the fall in Bank Overdraft from £729,852 to £361,616.

Trading conditions in all our territories were difficult, and most of the adverse factors which I mentioned a year ago still persisted. The rise in the price of Rubber which took place during the year had no appreciable effect on our business, but I am glad to say that in the current year there has been some improvement, and our Motor subsidiaries are enjoying a satisfactory recovery in trade. I hope these conditions will continue and also that political uncertainties, disturbances and strikes will not unduly affect the outlook.

TEAK

As mentioned in the Directors' Report the deliveries of Teak Logs from our Forests

PRESS RELATIONS.—Experienced woman journalist, formerly editor of trade journal and familiar Fleet Street news values, will advise on press relations and undertake individual campaigns. Annual retainer preferred but not essential.—Box 312.

ASK your bookseller for the December "Books of the Month." Critics unsurpassed in distinction in the English-speaking world write on new books of history, sport, science, aviation, biography, theatre, music, cinema, ballet and other arts. Contributors to the December issue include Ted Kavanagh, Naomi Lewis, Andrew Boyle, Colin Brogan, Richard Bennett, Dudley Pope, and Maurice Richardson. If your bookseller is out of stock ask him to order.—Or write direct to "Books of the Month," 188 Piccadilly, London, W.1.

DOUBLE YOUR SMOKING ENJOYMENT.—Try Grosvenor, the State Express cigarettes with the pure white plastic tip. 10 for 1s. 10d.

SUCCESSFUL TUITION FOR THE B.S.C. ECON. DEGREE

Wolsey Hall (established 1894) provides successful Postal Courses in a wide range of subjects for the two examinations for the London University Economics Degree (three if Entrance is included). Very reasonable fees; instalments. Over 1,000 Wolsey Hall students have secured this degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

SPANISH. Intensive Course in London, January 2-6. All grades. **PORTUGUESE/SPANISH** Evening Classes from January 9th.—Educational Department, Hispanic Council, 2, Belgrave Square, S.W.1 SLO 7186.

WISE INVESTMENT follows wise reading. The *Investors' Chronicle* is the best informed and widest read financial weekly. For nearly 90 years it has been giving sound advice to investors. Two free issues from 30 LC House, 11 Grocers' Hall Court, London, E.C.2.

BARE BALANCE in Britain's external accounts is not enough; the leading article in the December issue of *THE BANKER* explains why—and questions whether the economy now is set towards true stability. A valuable background is provided by the two ensuing articles—*America's Quickenings Boom*, and *Subsidies, Rents and Rates*, a careful assessment by Leo T. Little of the implications of the new bill, and of its contribution to the solution of the housing problem. *THE BANKER* for December contains in addition *Argentina's New Hope*—the first detailed discussion of the dramatic changes in the economy that have followed the downfall of Gen. Peron; *A Central Banker Speaks Out: Italy's Drive for Prosperity*; and seasonably, *The Year's Best Reading*, a major review article of the most significant of new books in the economic and financial field; it finds the choice more rewarding than usual.—*THE BANKER* is obtainable from booksellers or from 72 Coleman Street, E.C.2, price 2s. 6d. From January 1st, annual subscription including postage will be 34s. 6d.

CARNATIONS KEEP YOU YOUNG.—Plants in your greenhouse are of endless interest every day of the year. Flowers in your home or office give atmosphere. Collection of 12 plants £7.10s. Collection of 25 plants £14. Carriage paid.—All in 6-inch pots, running to bud.—Dept. P.F.2, Allwood Bros., Ltd., Carnation Specialists, Haywards Heath, Sussex.

AUSTRALIA—UNIVERSITY OF NEW ENGLAND

ARMADALE, NEW SOUTH WALES
Applications are invited for the position of **LECTURER IN PSYCHOLOGY**. The Lecturer appointed will be required to participate in the preparation and supervision of courses for external students proceeding to the B.A. degree. He will, in addition, take part in the internal lecturing and tutorial programme of the department and will be encouraged to engage in research.
Commencing salary will be within the range £A1,200-£A1,750 per annum, according to qualifications, with annual increments of £A80. The salary is subject to deductions under the State Superannuation Act. The successful applicant will be expected to take up duties as soon as can be arranged after the date of appointment.
Finance is available for home purchase under the Staff Housing Scheme.
Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.
The closing date for the receipt of applications, in Australia and London, is December 30, 1955.

NEW SOUTH WALES UNIVERSITY OF TECHNOLOGY

SENIOR LECTURER AND LECTURER IN HISTORY.
School of Humanities and Social Sciences.
Salary: Senior Lecturer—£A1,800 range £A2,150 per annum.
Lecturer—£A1,200 range £A1,750 per annum.
Commencing salary according to qualifications and experience.
Applicants must hold a degree in history or equivalent qualifications and university teaching experience is desirable. The senior lecturer will be responsible for the history courses of the School. The main history course traces the history of Western Civilisation and Australia; but opportunity exists for the teaching of a wide range of topics. Further information may be obtained from Professor R. M. Hertzog, Head of the School of Humanities and Social Sciences, Kensington, New South Wales, Australia. First-class shipping fares to Sydney of appointees and families will be paid. Appointees will be eligible, subject to medical examination, to contribute to the State Superannuation Fund.
Four copies of applications, including the names of two referees, should be lodged at the offices of the Agent General for New South Wales, 56 Strand, London, W.C.2, and one copy forwarded by airmail to the Bursar, N.S.W. University of Technology, Box 1, Post Office, Kensington, N.S.W., Australia, not later than January 6, 1956. Mark envelopes "University Appointment."

LEADING OFFICE MACHINES MANUFACTURERS

with world-wide organisation are looking for ambitious and capable young men able to assist them in their plans for sales expansion. Candidates must be willing to work hard to advance their career and take advantage of the unique opportunities existing with this progressive organisation. Applications are invited for vacancies on the London sales staff. A paid period of training is offered at the Company's school, after which the successful candidates will be put in charge of a territory and paid basic salary plus commission and expenses. Write in confidence, giving full details of education, etc., to Box 276.

MEDIA EXECUTIVE required for large international screen advertising organisation situated in Mayfair. Ability to plan, to negotiate with clients, to supervise mainly female staff essential. Also knowledge of world geography and export markets. Good prospects for right man. Salary range £800-£1,200.—Box 315.
CHIEF ACCOUNTANT of a large Civil Engineering and Building Company requires an Assistant Accountant. He must be an able administrator and capable of appointment in the London Head Office, offering an interesting post involving the control of a large clerical staff. Applicants should have had a considerable number of years' experience with a large Commercial Company or as a senior audit clerk with a professional firm. Age preferably 35 to 50.—Write, quoting reference N.G.L., giving full details of experience, to Box 311.
MANAGING DIRECTOR.—An internationally known Pharmaceutical and Chemical company of highest standing is looking for a man of proved and outstanding ability. He is probably aged between 35 and 45 and holding a similar position with a smaller company or is just below this position in a large company in the same field. He must be an able administrator and capable of being backed by strong administrative abilities. He will have a strong personality, imagination and drive, yet will be able to delegate responsibility and inspire and command the respect of his executives. Financial arrangements will be made to suit the right man.—Applications, which will be treated in strictest confidence, should be sent, by letter only, to Austin J. Wright & Co., Solicitors, 116 Victoria Street, London, S.W.1.

SCIENTIFIC DIRECTOR

A qualified Metallurgist and Chemist, aged 50-55, with wide industrial experience of control research and development, is required by well-established Non-Ferrous and Chemical Manufacturers. He must be an able administrator and capable of experience at Board level and should preferably have U.S.A. contacts.—Write, giving brief but essential details in first instance, which will be treated in strict confidence, to Box 284.

A STATISTICAL ASSISTANT required by H. J. Heinz Co. Ltd. The job entails the analysis of statistical data; sampling in the human population and distributive trade universes; the preparation of charts and tables. A sound knowledge of statistical theory is required but commercial experience is unnecessary. Write, briefly, with full information, to the Personnel Manager, H. J. Heinz Co. Ltd., Harlesden, N.W.10.
LEADING International Airline requires services of Market Research Officer (25-30 years) in their London headquarters to investigate, observe and report on sales possibilities (travellers) within the United Kingdom.
Applicant must be fully conversant with all official sources of information, be able to assess value of trade agreements and be capable of preparing constructive reports for the guidance of the Sales and Traffic Division.
Applications, stating previous experience, age and salary required, should be addressed to Box 314.

SALES PLANNING OFFICER

Vacancy exists (through promotion) for young man with intelligence, vision and initiative to accept responsibility for Sales Forecasting and liaison with Production Departments in progressive and expanding electrical firm with international connections. Some knowledge of statistics an advantage.—Please state details of training, present salary, etc., in confidence to Box 31, C8146, A.K. Advertising, 212a Shaftesbury Avenue, London, W.C.2.

LEADING MANAGEMENT CONSULTANTS have several vacancies for qualified Engineers, with executive experience and with initiative, to act as Consultants after training. Age not over 40. Salary scale: £1,500 to over £2,200 per annum, with considerable further prospects for exceptional men. Superannuation and expense allowances.—Full details of qualifications and experience to Box 294.
SALES EXECUTIVE for promotion of a service to industry. The calibre and personality of applicants must fit them for discussions with top level of management. Only applicants giving full details of education, career and salaries to date, can be considered.—Box No. 314, R. Anderson & Co., 14 William IV St., London, W.C.2.

WANTED

Woman Secretary to organise and manage an office for a small team of technical executives at the head of a rapidly expanding engineering organisation. The post is one involving a great deal of responsibility, and applicants, who should be competent shorthand typists, should possess considerable experience in office routine and be prepared to build up from a small unit. Knowledge of French or German would be an advantage, but is not essential. Location of work, 15 minutes from London Bridge (S.R.).—Box 310.

OPERATIONS RESEARCH

Applications are invited for the appointment of a Mathematical Statistician to operate in the research division of a large industrial organisation in South East England. The field of responsibility will cover operations research, the design and analysis of experiments, and the application of statistical techniques. One or two years' experience in this field is necessary. Commencing salary will be in the range of £750-£850 per year.—Applications should be made to Box 309.

THE ALEXANDRIA WATER COMPANY, LIMITED

Alexandria, Egypt
R.C.A. 48
EXTRAORDINARY GENERAL MEETING
The necessary quorum as required by Egyptian Law not having been attained, the Extraordinary General Meeting due to have been held at the Company's Office in Alexandria on November 30, 1955, has been adjourned until December 7, 1955, at half past four.
Dated, Alexandria, Egypt, November 30, 1955.
By Order of the Board,
ALEX. L. BENACHI,
Chairman and Administrateur Délégué.

NEWCASTLE-UPON-TYNE EDUCATION COMMITTEE

MUNICIPAL COLLEGE OF COMMERCE
Principal: J. L. Gayler, B.Com., LL.B., Barrister at Law
LECTURER or Grade "B" Assistant required in ECONOMICS or MANAGEMENT or COSTING.—Further particulars and application form (returnable within two weeks of this advertisement) obtainable from Director of Education, Northumberland Road, Newcastle-upon-Tyne 1.

METEOROLOGICAL OFFICE, SCIENTIFIC OFFICERS.—The Civil Service Commissioners invite applications for permanent posts. The duties include research in atmospheric physics, covering the study of cloud structure, synoptic and dynamical meteorology, large and small-scale diffusion and turbulence, climatology, and development of instruments. There is a limited number of posts for forecasting work at the more important centres. Successful candidates will be given a course in meteorology before being assigned to a research or forecasting establishment for further training and experience. In some instances candidates with national service obligations can be commissioned in the R.A.F. for forecasting duties at R.A.F. stations. Further information may be obtained from the Director, Meteorological Office (M.O.10), Air Ministry, Kingsway, London, W.C.2.
Candidates must be between 21 and 28 during 1955 (up to 31 for permanent members of the Experimental Officer class). They must have a First or Second Class Honours degree preferably in physics or mathematics. Salary scale (men in London) £513-£925, somewhat lower in provinces. Women's salaries lower but being improved under equal pay scheme. Promotion prospects to Senior Scientific Officer (£1,070-£1,245), and higher posts.
Application forms from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. S52/55 (Met.). Latest date for receipt of completed forms December 31, 1955.

MANAGEMENT IN INDUSTRY

Vacancies for two **UNIVERSITY GRADUATES** occur in the ICE CREAM DEPARTMENT of J. LYONS & CO. LTD.
Men who have recently obtained degrees in:
Biology
Chemistry
Mathematics
Physics
Engineering or
Arts Subjects

will have considerable opportunity for advancement in a branch of FOOD MANUFACTURE which is rapidly developing in its scope. It is proposed to engage one graduate out of the first three faculties and one who has graduated in an Arts subject.
Successful applicants will be required to go through a training period for which the starting salary is £500 per annum.
Applicants are requested to write to:
The Personnel Manager,
J. Lyons & Co. Ltd.,
Cathy Hall,
London, W.14.

FULLY QUALIFIED MECHANICAL ENGINEERS, with works management experience, required by important organisation, with interests throughout the British Isles and Commonwealth. Applicants willing to accept assignments for a limited initial period, to five years in Canada, Africa or New Zealand, with a possibility of a final post in the United Kingdom, if desired, are invited to apply. Remuneration on a high scale, with superannuation facilities. Age not over 40.—Full details of qualifications, previous appointments and salaries, in confidence, to The Managing Director, Box 293.

DEPUTY CHIEF PERSONNEL OFFICER (salary up to £1,800) and two Assistant Personnel Officers (salary £1,000) required by large overseas company operating in West Indies.—Write in first instance for full details to Box 308.

BRITISH EUROPEAN AIRWAYS require an **OPERATIONAL RESEARCH OFFICER** to join a team engaged in the study and development of factors affecting productive efficiency throughout the Corporation. Applicants should have a good University Degree in Mathematics, Science, Engineering or Economics, and previous operational research experience. A sound knowledge of modern analytical techniques and the ability to apply them to practical problems is essential. Starting salary within the scale £985 to £1,290 p.a., according to qualifications and experience. Pension scheme. Air travel concessions.—Details of qualifications and experience to Head Office Personnel Officer, B.E.A., Keyline House, Rushlip, Middlesex.

ASSISTANT ECONOMIST/STATISTICIAN required by West Riding of Yorkshire Council, with experience in Economic Research and Forecasting Department. Preferably a recent graduate. State age, qualifications, experience (not essential) and expected salary.—Box 307.

RESPONSIBLE EXECUTIVE, with wide practical experience of Market Research backed by technical ability and up-to-date knowledge, seeks senior post in London area.—Box 316.

SENIOR Executive, under 40, in upper pay bracket of nationally known company, seeks appointment offering immediately wider scope. Investment considered if necessary. Highly successful record. Many years' experience marketing of branded products to the grocery and allied trades. Also bulk supplies to many industries. Wide interests and business connections. Willing to work anywhere, although London area pref.—Box 292.

O & M.—Management Consultant with 15 years successful record seeks settled position with progressive company as specialist in clerical organisation and methods. Has achieved reductions in overhead costs of £25,000 to £40,000 per annum. Ample energy and initiative.—Box 313.

EXECUTIVE, aged 34 years, Oxford graduate, sound managerial and administrative experience in manufacturing and retail organisations, seeking opening in reputable concern where hard work and initiative will ultimately earn commensurate reward. Moderate commencing salary.—Box 306.

RUGBIEN, Oxonian, single, 45, desires suitable post—minimum salary £800—fluent French, German, some Portuguese, Spanish, experience export procedure, documentation, correspondence.—Box 302.

FLUORINE CHEMICALS

Pioneers in the field of fluorine chemicals, The Consolidated Zinc Corporation, through its U.K. member, Imperial Smelting Corporation, ensures sufficient supplies of the raw fluorspar by operating its own mines in Durham. The fluorspar is treated and concentrated at the Nenthead Mill. The concentrated fluorspar is passed to the Avonmouth Works for the production of fluorine chemicals.

As research in Imperial Smelting Corporation's Avonmouth laboratories leads to new applications for this new group of chemicals, so is production adapted and enlarged to meet commercial demand. A great future is envisaged for fluorine chemicals and The Consolidated Zinc Corporation, is prepared to meet growing demands.

phenol

Telephones of phenolic resin are more functional and durable, plywood adhesives for boats more dependable, quality of motor oils improved at low cost—all through one common ingredient, Dow phenol.

... Another example of Dow at work with industry to make better products for you.

Though you won't always find Dow chemicals identified in the products you use each day, they are often the important basic ingredient that makes possible higher quality and lower price. Agricultural chemicals help the farmer make his land more productive—help him in his fight against weeds and insects. Magnesium by Dow is the lightweight metal that subtracts many pounds from power tools, luggage and ladders. These are but a few examples of Dow's contribution to progress through chemistry.

For more information about Dow products, contact your representative in England, or write to Dow, Dept. 309-N.

S.E.C. AND THE CHANGING WORLD 4

An artist's impression of a coal handling plant at a London power station

Materials handling... an industry for industry

In many industries 50 tons of material must be lifted, moved, loaded and unloaded to produce a single ton of the finished product; and the cost involved can be between 15% and 85% of the total cost of production of an article.

Materials must be moved both rapidly and economically with the minimum of human labour. For instance, at a London power station a coal storage of 750,000 tons can be built up at the rate of 400 tons an hour by one of the largest handling plants in Europe.

In fact, the bulk handling of materials has now become an industry in itself—a highly mechanised industry that calls for a complex range of specialist

equipment. And here the G.E.C. plays a major role.

From the G.E.C. group of works come all types of heavy duty materials handling plant. One of Britain's largest suppliers of this essential equipment, the company designs and manufactures coal handling installations for generating stations and plant for the handling and reclamation of iron and other metalliferous ores, coal, coke and limestone in countries all over the world.

At the present time, materials handling installations are being erected by the G.E.C. in Great Britain, Spain, Yugoslavia, Italy and Australia. Nor is this surprising for within the G.E.C.

lies an unequalled experience and understanding of the problems involved in the bulk handling of materials for industry.

THE UPWARD TREND OF COMMERCIAL TELEVISION (5)

Does Commercial Television sell the goods? Revlon, the great cosmetic firm, for one, are absolutely certain that it does. All their facts and figures go to prove it.

From September 25th onwards Revlon advertised their new hair-spray "Satin Set" exclusively on Commercial Television. The result? From then on sales all over the London ITA area started to rocket.

One store set a target 40% above their normal sales. They actually sold 140% over normal. Some stores doubled their sales; many stores sold right out. "No question about it" says Mr. George

Goodrich, Sales Promotion Manager of Revlon, "Television really sells the goods—and quickly."

There is every reason for these spectacular figures. For television is unique in the directness with which it reaches the potential customers in their most receptive state of mind. Television, in fact, is a selling medium with terrific impact. Particularly at weekends, where Revlon concentrated two-thirds of their Commercial Television time. For ATV has attracted a huge, loyal audience which it is building up and up. No advertiser can leave ATV out of his calculations. Book your time well in advance.

LIFE TALKS BUSINESS

When the doors open will your products get in?

Owing to unfavourable economic conditions some markets of the world are temporarily closed to certain products. Yours may be among them.

Some day—very soon perhaps—these markets will reopen, offering big opportunities for increased business and profit. Will your company be in a position to make the most of these opportunities? Or will its name and products in those markets have been forgotten?

Through their advertisements in the international editions of LIFE, the world's leading companies are maintaining recognition and prestige for their names and products behind trade barriers now.

Between them the two international editions of LIFE

circulate once a fortnight in 120 countries outside the U.S. and Canada. An advertising campaign in these editions will not only increase your company's business in world markets that are open to it now, but pre-sell its products or services in the markets of the future.

LIFE INTERNATIONAL—average net paid circulation 250,000-300,000 copies in English, circulating in 120 countries outside North America.

LIFE EN ESPAÑOL—average net paid circulation 250,000-300,000 copies in Spanish, circulating in Central and South America.

These are the INTERNATIONAL EDITIONS of LIFE MAGAZINE, with a combined circulation of over 500,000 copies every fortnight.

The Crusader and the ballotini beads

There is no romantic legend here. The Crusader happens to be a highly-efficient electric water heater and the ballotini beads are minute glass spheres scattered in thousands on road signs to give whole area reflection. But the two are related: the water heater and the reflective road signs are made by companies in the seven Divisions of Tube Investments.

So many things that make life easier, and sometimes save it, stem from the symbol TI, and its manufacturing companies—from oxygen bottles (which went to the top of Everest and Kanchenjunga) to hypodermic needle tubing, bicycles to rolled steel sections, flame-proof lighting to aluminium sheet, and mechanical handling plant to rolling mills.

The TI General Division, for instance, makes prefabricated structures for buildings, buses and railcars; aeroplane parts; plastic tubes; cold rolled metal sections; metal furniture; paints and industrial finishes; traffic signs, transport seating and shop fittings.

That is one TI Division among the seven which serve the world: Steel Tube Division, Engineering Division, Electrical Division, Aluminium Division, Steel Division, Cycle Division, General Division.

HYGIENIC ALUMINIUM for the FISHING INDUSTRY

In all the principal fishing ports, wooden boxes and tubs are being replaced by containers made of light, strong, *hygienic* aluminium. Pressoturn Ltd., pioneers of this enterprise, have supplied many thousands of aluminium containers to Britain's fishing industry in support of its campaign for improved quality, including 50,000 kits to Hull, the scene of our main illustration.

Pressoturn Ltd., a member of the Almin Group, is a development organisation with facilities for design and market research.

**"You want to
cut your costs—
so do I!"**

Here is something that can save you money, and speed your production: long-run manufacturing concerns have *proved* it. It is a polystyrene plastic for mass production by injection moulding. Its name is Lustrex.

Lustrex can replace many costlier and less stable materials. But it is no mere substitute—it is a material in its own right... tough, handsome and time-saving.

In many trades Lustrex cuts out whole processes—does away with preparation of material, finishing, assembling and colouring, and quite a few storage problems, too. You can get from "raw" Lustrex to finished, marketable part or product in *one operation*.

Lustrex is versatile too. Many modern radio cabinets are attractively moulded in Lustrex—and so are toys, electrical fittings, household wares, and packages for cosmetics, toilet accessories and a thousand and one other products. In modern refrigerators, it is used to make Freezer Drawers and Doors, Drip Trays and Door Trims.

Can you *afford* to ignore the advantages Lustrex can bring you?

Labour of Hercules

THE Labour party has chosen the only leader that it sensibly could have chosen from the candidates available to it; but it has had to make a painful and dangerous decision nevertheless. Everybody knows why the decision has been painful: the result of the ballot must have brought bitter hurt to Mr Herbert Morrison. There is something in Mr Morrison's manner that prevents people from seeing his merits, which are many and great. He was the organiser of victory for Labour in 1945, and no man has done more to make the party an effective organism. He has held some of the highest offices of state, and the non-Labour public should remember that he has always shown himself moderate, open-minded and devoted to the public interest. This is no ordinary politician who is now bowed off the stage. But if his curtain call is sad, it is also inevitable. Mr Morrison has been kept waiting too long, and it is now too late.

The reason why the decision to elevate Mr Gaitskell to the leadership is also a risky one may be less generally appreciated. It is that this week's choice may prove to be the start of an unprofitable slide of Labour to the Left. This may seem a strange thing to say when the man who has been elevated is Mr Gaitskell. The apprehensions that arise are not, of course, based on any sinister interpretation of his character. Mr Gaitskell is what he appears to be on the surface: a moderate, sensible and agreeable man—with a streak of political genius that nobody foresaw in him ten years ago. Indeed, the fears arise precisely from the fact that he is such a moderate and sensible right-winger. For the moderate and sensible right-winger in the Labour party—unless he is also a hero of the trade union movement—tends to be a lonely figure. It is no accident that nearly all the previous leaders of the party have been—or at the time of their election were thought to be—compromise candidates from the middle of the road. From the nature of the party, it is always subject to the pressure of dissidence on the left, and a man of the acknowledged right is in a difficult position for controlling the wild men. He is not well placed to fulfil the main function that must fall to any Labour leader in the next twenty years.

That function, to make no bones about the matter, is to turn his back on the age of Keir Hardie. This is not a contentious judgment of what Mr Gaitskell ought to do; it is a straight forecast of what Mr Gaitskell, if he is to lead the party successfully for the next twenty years, will have to do. Even by the time that Mr Gaitskell gets his first opportunity to become Prime Minister, in 1959 or 1960, Britain is likely to be a country in which about one-third of all families will own their own motor car, more than half will own their own television set, considerably more than half will have a stake in industrial pensions schemes, and a greater proportion of the people than ever before will be decently and modernly housed. What Britain will be like when Mr Gaitskell reaches retirement age, in the late 1970s, defies imagination.

It is quite clear, however, that for this new and emerging sort of society, which in the jargon of yesterday will be a mainly middle-class society, the precepts of Keir Hardie will have about as much relevance as those of old Mother Hubbard. The struggle of the people is now an inspiring struggle for more wealth, better leisure and more equal opportunity; it is no longer a bitter stage struggle against hard-faced capitalists, grinding poverty and grime. The new leader of Labour will have to retain all that is best in the Labour tradition, the idealism in it, the generosity in it, and the sense of progress in it. But he will also have to persuade the party to abandon some of its favourite catchphrases and beliefs. The test of a successful leader is whether he can get it to abandon them quickly enough to keep in touch with developing public opinion.

This is where Mr Gaitskell's right-wing antecedents will be in his way. The first desire of a party leader is to hold his party together, and a right-wing leader is under peculiar compulsions to make concessions to the left wing. One has been able to observe Mr Gaitskell doing it in recent months, from his fervour for nationalisation at Margate to the venom of his attacks on Mr Butler in the House of Commons. Ernest Bevin could afford to stand for commonsense and refuse to argue about it; but that was because he could always whistle up his faithful trade-union bodyguard. Mr Gaitskell has no such personal following; he can rule only by persuasion, and persuasion means conciliation.

Paradoxically, a left-wing leader would be a better guarantee of moderation, for his imperative necessity would be to keep the right happy; he would find himself both needing to make concessions to the right and better able to reconcile the left-wingers to them. But the only left-winger on offer this week was Mr Aneurin Bevan. There was a time, seven or eight years ago, when it seemed that Mr Bevan was going to succeed in making the transition (like another Welshman fifty

years ago) from an inflammatory politician to an administrator and a statesman. But by a series of personal and political decisions, Mr Bevan has made it clear that, if he is to emulate Lloyd George at all, it will be the erratic and destructive later years rather than the promising early ones. The party had no option but to reject him this week.

Mr Gaitskell was therefore the only possible new leader. Indeed, this is to put it too grudgingly. It is far too early to say whether he will develop into the formidable character that the job requires—a sort of Disraeli in reverse. But it is already clear that he is a very remarkable man. His meteoric rise from obscurity within ten years, assisted though it has been by the successive patronage of Dr Dalton, of Sir Stafford Cripps and of Mr Attlee, is sufficient proof of his quality. He is the first of Labour's intellectuals to have shown himself also to be an efficient administrator. What is more to the point, he has accomplished something that is harder for the intellectual than for anybody else—he has convinced the non-intellectual common man (who is so apt to take subtlety of mind for dishonesty) of his personal integrity. Compared with any other recent Labour leader, not even excluding Stafford Cripps, he combines the qualities of character and intellect to an unexampled degree.

It remains to wish him well in his task. This is no empty personal compliment; it is a matter of the highest public importance that Mr Gaitskell should succeed. For what this country, with its somnolent and arthritic tendencies, badly needs is a forceful and realistic party of the Left. It can be as radical as it chooses, and yet not hurt the common interest, provided only that it also finds itself on reality and sense. Labour is not such a party now—it is two parts old-fashioned, one part doctrinaire, and one part downright silly—but Mr Gaitskell may be able to rebuild it in this image. It will be a herculean task; but not an impossible one.

The Happy Hypocrites

THE ebullient head of the Russian Communist party and his prime minister must be happy men as they return from their costly month of junketing through southern Asia. They may not have achieved all that they hoped for, but they have set Asia by the ears—and that, it is now clear, was their chief aim. Admittedly, to dub Mr Khrushchev's activities mere trouble-making would be unfair to his versatility. He has applied unction, where he saw fit, as lavishly as he has flung vitriol. Vitriol, however, was the most active ingredient in the brew that the Soviet rulers offered to their hosts. The pattern of their innumerable speeches hardly varied. In every speech there lay, embedded in a mass of lip service to goodwill, peace and brotherly

understanding, a coldly calculated incitement to ill-will. Mr Khrushchev went out of his way—literally, in the case of his visit to Kashmir—to drag in contentious issues or to invent crude but venomous fictions. These were no mere outbursts of spleen, as he himself was at pains to deny. For example, his notorious utterance in Bombay, where he accused Britain, France and America of sending Hitler's army into Russia, was carefully repeated and elaborated a fortnight later in Rangoon.

This was a crude form of lying. Rangoon may seem to Mr Khrushchev a remote and credulous place; but some people there will remember that it was the signing of the Stalin-Hitler pact in August, 1939, that

freed the Nazis to start the second world war and share the initial spoils with Russia. The vital point, however, is not that the Soviet rulers' various inventions have been "fantastic" (as Sir Anthony Eden rightly said on Monday), nor that they can be proved false by turning to any reference book, but that they were premeditated. From the first day of their month-long tour, the two Russians set to work like beavers to "divide and fool."

It was multiple division. Their first and most obvious target was to embitter anti-western feeling among Asians, by recalling ancient wrongs as well as current grievances (and here Mr Dulles's ill-timed and ill-considered words about Goa gave them unexpected aid). They went so far as to warn an India which had achieved independence without war only eight years ago that it stood in deadly peril and must make ready to defend itself against a British attempt to reconquer it. This calls to mind not only the late Colonel McCormick's fear that George III's redcoats might yet attack Chicago, but also the story of the heron in the *Panchatantra*, India's equivalent of Aesop. Finding the fish in his favourite lake increasingly hard to catch by the usual methods, the heron warned them that fishermen were soon coming to net them all; and the frightened fish gratefully accepted his offer to carry them one by one in his beak to a safer place.

Secondly, the Communist rulers have also aimed at stimulating western exasperation at, and suspicion of, the Indians and Burmese whom they had tricked into appearing to applaud their lies. Mr Nehru and U Nu have not only been made to provide a magnificent platform for anti-western diatribes; they have also been made, by the use of "doubletalk," to appear slavish followers of the devious Communist line on numerous issues, a fact in which Moscow's worldwide propaganda apparatus is already revelling. Nor is that all. India and Burma are known to have strong feelings against "colonialism" and against "blocs"; and nobody in the West disputes their right to such feelings. But it is a somewhat different thing when democratic Asian statesmen are seen solemnly condemning blocs hand in hand with the builders of the mightiest power bloc in history; or joining, in a denunciation of "colonialism," with the one power that still holds vast areas of Asia in an iron grip, that deports whole Asian peoples by the million to bleak corners of Siberia, and uproots, for instance, Moslem Kazakhs from their ancient lands, while pouring white settlers into Kazakhstan.

★

Westerners can understand that traditions of Asian hospitality require the strewing of rose petals along Mr Khrushchev's triumphal way, and inhibit his hosts from publicly differing with him even when he most embarrasses them. But when they see an apparent readiness to echo Moscow's more vicious slogans, to

imitate its deceitful jargon, and to accept its patronage, they are not unnaturally inclined to suspect either hypocrisy or suicidal blindness. Having (like India and Burma) a free press and free expression, they have, inevitably, vented these suspicions. The conduct of the Soviet tourists shows that they sought to stir up precisely this kind of suspicion and acrimony.

But, equally clearly, they had a third aim: to divide free Asia against itself, widening the gap between those Asian states that seek security through defence pacts and those that shun them, and inflaming the Kashmir and "Pakhtunistan" disputes just as they had previously inflamed the Arab-Israel frontiers. It is noticeable in this context that these "standard bearers of progress" have not been in the least concerned to champion the more enlightened Asian countries against the more reactionary. On the contrary, several of the most feudal and fanatical regimes in the Asian-Arab world are now being wooed by Moscow. Trotsky once termed his rivals' morals "variable and at the same time elastic, like good braces." Mr Khrushchev, who sees the need to adopt a distinctly less revolutionary tone in Kabul than in Rangoon, has no difficulty in keeping his trousers up.

Likewise, his professed solicitude for the Asian masses has not prevented him from doing his utmost to poison the atmosphere of friendly co-operation between free Asian countries, and between them and the West, which means so much for their future. Nobody in southern Asia sees Russia as likely to help the region on anything like the scale of western aid, half a billion dollars' worth of which has already been provided for India alone. Indeed, it would be strange and unprecedented if the Communists seriously thought of helping non-Communist nations to avoid the very economic crises that, according to Marx's dialectic, are needed to impel them into the Communist camp.

Thoughts of this kind have, it seems, taken shape in the minds of many perceptive Asians as the Soviet visit proceeded. Mr Khrushchev's revamping of history has not gone unnoticed, nor has his evident intention of estranging India and Burma from their neighbours and friends. The way the Russians went home after this first month-long visit to the non-Communist world with their dogmas and preconceptions intact may, too, have recalled to some Indian minds another fable from the *Panchatantra*—that of the Unteachable Monkey. But it would be foolish to suppose that they struck no chords in even the most sophisticated Indian heart when they spoke of Goa or Kashmir or of the alleged exclusion of India from a place among the great powers. And among the countless thousands of newly literate, scantily educated Asians who read cheap, heavily subsidised Communist publications, the impact of the visit has probably been far more telling. As a correspondent who followed the Russians' tour points out on page 1038, thousands of children have been rehearsed in pro-Soviet slogans; and the "broad masses," to use the Communists' own phrase, were no doubt awed by the splendours they

witnessed—although it may be worth noting that after Marshal Tito's visit to Burma, many ordinary folk along his route were heard to say: "What a waste of money! It's only because he is a white man that the government takes all this trouble."

Whatever the extent of the Russians' success in putting across their propaganda—and it will not be possible to estimate it for some time—one thing is clear: the West ought not to be thrown into either rage or panic. Nothing, indeed, would suit the Communists better than a noisy dispute between westerners, with one faction saying "we must hasten to buy back Asia's friendship" (that is, offer lavish aid, at a moment when it will be clear to every Asian that these offers spring from fear, not from friendship), while the other complains "why waste more money on these ungrateful people, who have pocketed our earlier gifts and then spat in our eye?"

★

Sane thinking about these things ought to begin (not only in the West, but in free Asia, too) from a very different, very simple fact, so taken for granted that it is all too rarely expressed: the fact that free men, in all countries, have a common cause in checking the spread of tyranny. Now that the iron ring of Communist tyranny has closed round nearly a billion human beings, the free societies of Europe, Asia and America have no choice but to help each other survive. The collapse of either free Asia or the West would condemn the other to eventual surrender to the great monolithic power *bloc* north of the Himalayas. That is why the Communists are sweating blood to divide them.

It is nonsense, in this context, to think of "keeping Russian aid out of Asia." On the contrary, the appropriate slogan for the West to adopt here might be "come on in—the water's not too warm." The propagandist value of the new Soviet offers is short-term. It is indeed high time that Russia, which so loudly proclaims its wealth and its eagerness to help others, took on a fair share of the job of aiding poorer countries—and was publicly held responsible for doing so. Mr Khrushchev has offered to "share his last piece of bread" with several less well nourished Indian audiences; what has held him back? And, moreover, how long will it take for Soviet aid to become taken for granted, for Asian recipients to fret at its nakedly bilateral and choosy forms and urge Moscow, as they have urged the West, to channel it through multilateral systems such as Uno and the Colombo Plan?

The point that has to be got over to Indians and Burmese is that the West is not longing to enrol them in defence alliances, but is desperately anxious that they should remain free societies—an anxiety shared by all Indians and Burmese except a few extremists of both Right and Left. If, then, Russian economic offers are of a kind that helps them to avert difficulty and disorder, as western aid does, so much the better—and that is a point that needs to be got over to the

western public. And this example shows how the real problem of maintaining friendship between free Asia and the free West in the face of Communist splitting tactics is much more than one of economics; it is primarily a problem of understanding.

That does not mean high-powered, glossy propaganda ventures; nor does it mean mealy-mouthed silence about genuine differences of opinion. Argument is, in fact, the breath of freedom. Frank and sincere exchanges of views, even where agreement cannot be reached, are by far the best recipe for friendship between the democracies of Asia, America and Europe. To insult Asia's intelligence, as the Communist rulers have done by their gross flattery, their veiled barbs, and their "doubletalk," is not the way to win its friendship. If, on the other hand, Mr Khrushchev's hideous example stimulates the western world—which is regrettably sluggish in these matters—to listen more carefully to Asian views, to expound its motives more honestly to Asia, and to base its relationships with Asia on lasting friendship rather than on the tricks of the travelling showman (all things which the Russians have not done), then some good may come out of the past month's events.

Local Government Reform

The metropolis now contains, in its extended circumference, nearly as many people as Scotland; and the town population for ever increasing in a much greater ratio than the rural population, its condition, especially in relation to space, must have a commanding influence over all future legislation. This consideration makes the new Act for the regulation of the metropolis, under which the New Board of Works was elected by the different metropolitan parishes this week, of very great importance. . . . They seem generally to have been set about in a very ordinary way, without any solemnity. The clergymen or churchwardens, who are generally the chairmen of the vestries, either did not interest themselves in the subject, or had not comprehension of its bearings, and gave no explanation to the vestries of the duties they were summoned to perform, nor urged them to be careful in performing them. Yet it is not too much to say, if the jobbing and corruption of which we have heard so much throughout the empire as prevailing vices are to be destroyed, the destruction must begin from the electors. The reform must commence in parishes. . . . It seems probable . . . that the Act for the better government of the metropolis will be the commencement of a more fruitful change in our institutions than even Parliamentary Reform. . . . All existing sewers are placed in the hands of the New Board of Works, and under its exclusive control; but, if any other or better system be suggested, there is nothing in the Act which prescribes an adherence to the system already acted on. These are only specimens of the discretionary power which the Act places or confirms in the possession of the parishioners and the vestries; and, in the end, as the town population increases more and more, the principle of these discretionary powers, or self-government, if they be not nipped in the bud, will become more and more the general rule of the whole community.

December 15, 1855

How to Kill the Purchase Tax

MR BUTLER has flown a kite about the long-term possibility of turning the purchase tax into a sales tax. The newspapers have misinterpreted this very tentative action as a signal of early intent. The Labour and Liberal parties have reacted strongly against it. And Mr Butler has pulled in his kite a little lower. This seems to be the right reading of the rather bewildering cut and thrust about indirect taxation during recent debates on the Finance Bill. The reading is rather a sorry one. It is going to be a great pity if any party irrevocably strikes its attitude over this issue before thinking out what the issue means.

The first effect of any transition from purchase tax to a sales tax—and, theoretically, the only necessary effect—would be that the tax would be collected from some 700,000 retail outlets (including, possibly, such outlets as restaurants and garages) instead of from about 80,000 wholesalers. The single disadvantage of this would be that Customs and Excise officials would have more work to do in collecting the tax; but outside commentators have no need to emphasise this point to the Chancellor. The Customs and Excise will have emphasised, indeed probably over-emphasised, it to him already. The advantages of this method of collection would far exceed this solitary disadvantage. Some of the advantages would be mainly technical: the new method of collection would close some irritating loopholes, and it would obviate the wild changes that occur in retailers' stockbuilding whenever they think that purchase tax rates may be cut. But the big advantage of the new system would be that it would enable the Chancellor to tax services as well as goods; and Labour should note that this extension of the tax to services—suppose, for example, there was a penny in the shilling surcharge on restaurant meals, beauty parlour treatment and motor car repairs—might be generally progressive, not regressive, in effect.

If these were the only effects of a switch to a sales tax, then presumably there would be little party controversy about the value of it. But, almost certainly, there would be changes in relative burdens as well. Although, theoretically, retailers could be told to levy sales taxes at different rates, appropriate to the four current rates of purchase tax, they would be likely to get into a great muddle in trying to fulfil any such directive. The problems caused by oddities in the purchase tax schedules are great enough when they are problems for the big wholesalers to handle; they would drive the good lady who keeps the village store to distraction. For this reason, if for no other, a sales tax would probably have to be either a flat rate percentage tax on all sales; or else, more probably, a flat rate percentage tax on all sales except those of food and a few other essentials, plus a special luxury tax on a list of other items. Moreover, it would be administratively wise to keep this list of luxuries, as well as the

list of total exemptions from the tax, as short as possible. This might appear to be regressive, but would it be a bad thing?

Economically, it would not. The present graduation of purchase tax rates has been grossly misused by successive Chancellors. Far too often, whenever the British public and foreign importers have demanded more of the product of a particular British industry, or whenever there has been any other sign that the industry concerned ought to expand, a Chancellor has leapt in to discourage this expansion—by a discriminatory increase in purchase tax rates, in order to curb what he calls "immoderate demand." Conversely, Chancellors have often prolonged the death agony of declining industries by giving them discriminatory tax reliefs. This is the exact opposite of economic sense. Moreover, the idea that a graduated purchase tax can also be used to discriminate against luxuries runs into a major difficulty. It is that the things that are defined as luxuries in the conditions of today are the very things that ought to be the incentive goods for the workers in the conditions of tomorrow.

★

Presumably, if discriminatory indirect taxes had been introduced long ago, the British tax system would now be discriminating against everything except potatoes, black cotton stockings, and peasants' smocks. Should not Mr Gaitskell, in particular, recognise the implications of discriminatory purchase tax in a changing world? Just after the election he very wisely publicised the letter of a young constituent who said that workers of his generation looked forward with avid expectation to being able to buy a motor car. Should not Mr Harold Wilson recognise the dangers of imposing large indirect taxes on things that are considered, at any one moment of time, appropriate only for the rich? In his own childhood, if he is to be believed, the things that only the rich were supposed to buy included shoes. The idea of a discriminatory purchase tax on things that the better off workers are just beginning to buy is not a progressive idea. It is an essentially reactionary idea, designed to keep the workers in their present stations. The proper battle cry of the Left should be that within twenty-five years every miner has got to be able to buy his wife a fur coat. If Labour wants to redistribute real purchasing power, the most efficient method of doing this is to rely on direct taxes alone.

But this leads to the third—and perhaps the biggest—reason for present opposition to the idea of a sales tax. This is the fear that if ever indirect taxation were to get on a more sensible basis, Chancellors might rely more heavily upon it and less heavily upon a progressive income tax. There is no necessary reason why this

should happen ; but, once again, it seems a very reasonable guess that it would. For a really widespread sales tax would be a great money-spinner. A tax of a penny in the shilling on all consumers' expenditure, other than expenditure on food and rents, would bring in more than the £400 million-odd yield of present purchase tax. There would, of course, be pressure against levying the tax on some items of expenditure ; such as on insurance services and fuel, which are not taxed at the moment, or on alcohol and tobacco, which are heavily taxed under a different system already. But any Chancellor would be likely to become very enamoured of this weapon once he got it, and perhaps to turn his attention towards the possibility of using it to finance reliefs in direct taxation, in order to lift some disincentives to production.

★

It is presumably this fear that has led the Opposition parties to protest so loudly at Mr Butler's kite ; it is presumably this that led even Mr Philip Fothergill, speaking for the Liberals, to say that a sales tax would be "essentially a Tory concept." If critics are going to use pejorative terms about a sales tax, however, they ought to try to get their pejoratives right. For a sales tax would not be an essentially Conservative concept ; if anything, in modern parlance, it would be an essentially Communist one. In Soviet Russia today a sales or turnover tax is by far the biggest single source of Government revenue. As a result, the maximum direct tax on income in Russia is just over 2s. 6d. in the £. There was a delightful story in the *News Chronicle* recently about a visiting Moscow banker who was told that in Britain a man with his

income would pay tax at 15s. in the £. It was some time before he could be convinced that his informant was not joking ; when he finally was convinced, he said flatly that the British must be mad. In Communist autocracies, of course, the state can concentrate on the single objective of getting the revenue it needs in the way that will have the least harmful effects upon incentives to produce ; in non-Communist democracies considerations of securing greater equality in incomes must also play their part. But how great a part, and within what ranges ?

The Opposition parties would be wise to consider this carefully. This year there are going to be some 17½ million income tax payers, compared with under 4 million just before the war ; while successive Chancellors raise the level of personal allowances to try to exclude some workers from the range of income tax, successive increases in earnings and prices push still more workers into it. Already some skilled workers are at the stage where high direct taxes on their marginal income, and high indirect taxes on the sort of things they want to buy, are major disincentives to overtime working ; if British prosperity progresses as it should, many more workers will reach this stage in the next few years. Wise politicians of any party would seem to have both a sound and a subtle reason for agreeing that tax reliefs should be directed towards this economically important and politically marginal section of the community. It may be necessary to agree with Mr Butler's warning last week that nobody should "under-estimate the complexity and difficulty" of switching from purchase tax to a sales tax ; but this is the time to ask of him that he, please, should not underestimate the advantages either.

Fourth Term for Mr Menzies

MR MENZIES has won an unqualified victory over Dr Evatt, and has performed the unusual feat of increasing his government's majority, not just after one term of power—which was considered so notable in Britain last May—but after three. This was possible for Mr Menzies, as for Sir Anthony Eden, only because of the fratricide and follies of his Labour opponents ; and if Mr Menzies's is the greater achievement that is mainly because the Australian Labour party is in a far worse mess than the British. Mr Menzies has drawn a straight answer from the Australian electorate on the question of dealings with Communists. The Australians have made it clear that no person or party tainted with Communist sympathies will be allowed to govern. Mr Menzies has thus wiped out his referendum defeat in 1951, when the electorate rejected the constitutional amendment to give him powers to proscribe Communism. Perhaps the biggest

eye-opener of the Petrov case was the revelation that the Australian Communists had received \$25,000 from the Russians to help defeat Mr Menzies's referendum appeal.

What else has Mr. Menzies gained ? Until the results of the Senate election are known, early in the new year, it will not be possible to concede him complete victory in the general election. The Liberal-Country party coalition now hopes to scrape home with its Senate majority intact, which it hardly expected to do before Dr Evatt appealed to Mr Molotov to settle an Australian argument ; but this is not yet certain. The Australian Senate is a very peculiar upper house. Designed to give weight to state interests on the basis of state equality of representation and to reflect shifts in political allegiances more gradually than the lower house through the mechanism of re-election of one-half of its strength by turns, it in fact does neither ; on

the contrary, either it acts as a mere rubber stamp or it exercises a total veto. Without a majority in the Senate, any Prime Minister finds it hard to govern and almost impossible to govern well. It might seem reasonable to expect that after six years of Liberal power the Senate should be moving Liberal-wards. But as 18 government senators came up for re-election against 12 Labour senators, the upper house could swing perversely the other way, leaving Mr Menzies with a larger majority in the House of Representatives but with less chance of using it to push unpopular and controversial legislation through.

But even if it can be assumed that he will win the Senate (and he should have support from one sitting anti-Communist Labour senator) the actual poll does not suggest that he has won a mandate on his own positive appeal. In fact, the Liberal and Country parties polled a smaller proportion of the total than last time—43.6 per cent, compared with 46.3 per cent. The pro-Evatt poll declined rather more than this only because the anti-Evatt faction of the Labour party secured 5.7 per cent of the total votes—and instructed its supporters to give their second preferences to the Liberal candidates. Australia, on votes, remains what it has long been—basically Labour-minded. Labour débâcles of this kind only happen when Labour methodically cuts its own throat.

Now that Mr Menzies has won, he should be asked to reveal his constructive programme. The anti-Evatt campaign is over ; but presumably the anti-inflation campaign looms ahead and will not be anything like such easy going. Before the election, Mr Menzies could argue that he was unable to do anything drastic with a majority of seven—a credit squeeze, import cuts, a standstill budget, but none of them more than palliatives. With a probable majority of 30, and control of the Senate, there will be no more excuse for half-measures.

The Australian electorate itself is in a much more realistic mood. It is significant that the Labour executive, in framing the Labour party's official policy for the election, pruned it of the more flamboyant promises made when Dr Evatt himself drew it up for his frantic bid for power in 1954. The average Australian, after five years of increasing freedom from industrial strife, with his growing personal prosperity, and a stake in stability, as evidenced by the rapid extension of hire purchase, is nowadays less interested in the indefinite extension of state welfare and more concerned about the threat to his standard of life from inflation. In 1953 the arbitration court pegged the basic wage, which had always been blamed as the main cause of inflation because it was tied to the cost of living. The tie has been cut, yet the cost inflation goes on.

The inflationary spiral has no doubt been given a new push because individual awards to various industries have been granted recently on the cost-of-living figures ; but the basic causes of Australia's inflation go deeper. The country still does not attract enough capital to keep pace with its long-term needs, with the over-ambitious investment programmes forced by the states on the Commonwealth or inherited from the Labour era and still absorbing large resources, and with the rapid growth in population, swelled by a net migration of 80,000 yearly. Six years of Liberal rule have not completely reassured the foreign investor, or sufficiently encouraged the local saver. The valuation of the Australian pound at a 25 per cent discount against sterling remains a potent cause of inflation by operating as a permanent subsidy to the wool industry, and in times of boom pouring far too much money into circulation. The interest of the wool industry in the undervaluation of the Australian pound is sufficiently attested by the solid opposition of the Country party to any change. In the long run, the strength of the

Country party, with its over-weighted rural vote, is vital to the anti-Labour forces ; but in this Parliament the Liberals, with their big majority, should be able to put more pressure on their allies. Unless something is done, another three years of inflation will infallibly swallow all the good will the government has built up.

The world will take note that the anti-Labour victory has established Australia's distinctive foreign policy more firmly than ever. Dr Evatt bitterly denounced the sending of troops to

Malaya, so foreign to the Australian tradition, but intended as evidence of Australia's determined membership of Seato. In the complex of problems that surrounds the China Sea, the Australian line, taken by Mr Menzies and Mr Casey, the Minister for External Affairs, has been closer to the American than to the British.

One opportunity Mr Menzies would do well to grasp now that his position is so much stronger (and in an enlarged House) is that of injecting a little new blood into the tired old veins of his ministry. It has been an increasingly valid criticism of the Prime Minister's cabinet-making that he has given youth too little chance to prove its worth and shown too great a tenderness to old stalwarts who have done all the good they were ever likely to do, and who offer no competition to the Prime Minister's personal predominance. The appointment of the Minister for the Army, Mr Francis, as consul-general in New York, and Sir Earle Page's retirement from the Ministry of Health seem to open up the possibility of a whole series of changes in which the young men should find their opportunity.

It looks as if Dr Evatt's course is run. The effort which he made to force a left-wing policy upon the Labour party has ended in catastrophe, a moral story that elements in the British Labour party may ponder. Australian Labour is now urgently in need of a Chifley to reunite it on a moderate progressive programme; the most it will get seems to be a Calwell or a Makin. To regain power it will obviously have to move to the right; but the election showed that its right wing cannot exist separately. The anti-Communist candidates failed as completely as the anti-Evatt candidates did in the Victorian state election earlier this year. The right tactic was shown later by the Labour party in New South Wales, which united Catholics and non-Catholic moderates against Dr Evatt's bid for personal supremacy.

It is too early to see any direction in which the

demoralised Labour party can work out a new policy. But it is clear that what it needs to do above all else is to think out that policy and its objectives in relation to the social and economic changes which are coming over Australia. Socialism is written into the party's constitution, though the federal system has always frustrated its achievement; but Dr Evatt's attempt to force a left-wing policy down the throat both of the party and the country in the teeth of practical experience of the difficulties was senseless. It would be just as senseless for the left-wing elements now to encourage industrial unrest by way of direct action in retaliation for the defeat at the polls. A new policy needs hard thinking, and Australian Labour's weakness has been that in recent years it has done even less thinking and even more quarrelling than the British Labour party.

Notes of the Week

For Deputy Now

LABOUR's election results were: Mr Gaitskell 157, Mr Bevan 70, and Mr Morrison 40. This means that Mr Bevan polled what is now regarded as his full basic vote; and that the two hundred non-Bevanite Labour MPs divided for Mr Gaitskell, as against Mr Morrison, in the embarrassingly high proportion of four to one. As Mr Morrison has retired to the back benches, there is now a wide range of party posts to be filled. They include the deputy leadership, several offices in the Shadow Cabinet—including the Shadow Chancellorship—and possibly the party treasurership. Only the chairmanship of the sub-committee on organisation has been decided so far; Mr Wilson has at last been installed in this, his proper niche.

The most important decision, which will not be taken until after Christmas, will clearly be who is to be the new deputy leader. What Mr Gaitskell really needs is either a deputy whose presence by his side will give him a greater sense of security and power, or else an ally who believes in Gaitskellite policies himself and who can bring trade union support; what Mr Gaitskell should not want is a politician who is always doing the splits between right and left, and who might therefore induce Mr Gaitskell to do the splits himself. Assuming that Mr Gaitskell is not likely to be run over by a bus, there is therefore a good case for saying that either Mr Bevan (if he will take the job) or Mr Robens would be the best choices; many non-Labour people will

think that Mr Griffiths or Mr Wilson would be the worst ones. But the general impression at Westminster this week seemed to be that Mr Gaitskell will get Mr Griffiths all the same.

Incompatibilities East of Suez

LAST Monday's debate on the Middle East can have edified no one outside Russia. It was a bandying about of unrelated ideas, and of assertions that "something must be done," which did not yield a single plan for doing anything. It lacked coherence chiefly because no speaker uttered the essential truth that present British policy in the Middle East is pursuing two ends which are compatible only up to a point. The first is that of creating a defence mechanism against Soviet expansion on the lines of Nato, and has produced the Baghdad pact that entails aiding and arming local allies. The second policy is that of the Tripartite Declaration of 1950, whereby the three western powers seek to keep war between Jew and Arab at bay by rationing their armaments and freezing the armistice line between them. The two policies are compatible so long as the arming of a state under the first does not destroy the balance sought under the second, and the outside limit to which compatibility can be stretched is in the arming of Iraq.

For Iraq is now in a different case from its Arab neigh-

bours. Its mind is just beginning to work differently, first because its wealth from oil is creating within it vested interests, small as well as large, that it needs to preserve from upsets of the kind the Russians like to foster; secondly, because certain oilfields are situated so far north that Iraq feels the threat of Soviet expansion more than any other Arab state; and thirdly, because it has no common frontier with Israel. Its growing absorption with its own development is rendering it more loth than before to expend its substance on adventures two removes away. There are grounds for arguing that London can arm Iraq with one hand and preserve the Tripartite Declaration with the other.

Jordan on the Touchline

BUT arguments designed to reconcile the Tripartite Declaration with the creation of a Middle Eastern version of Nato collapse when a state on Israel's border joins the Baghdad pact. The clause in the Tripartite Declaration intended to maintain balance becomes unreal; the Israelis, moved by fear that Britain intends to squeeze them unduly, become more intractable than before; and the western world is farther from, not nearer to, the compromise for which Sir Anthony Eden is fumbling. It would render that goal yet more remote if it were to guarantee Israel, thereby increasing Arab intractability. Here are the dilemmas that will materialise, if, as may now happen, Jordan is wooed into the pact.

Naturally the Jordanians, half of whom are bitter ex-Palestinians, are divided on the issue. Many feel more drawn by the anti-Israel creed of Syria than by the anti-Communist slant of the new Iraq; some are being bribed with Saudi gold to feel the first way; a cabinet this week resigned over the issue. But if its successor sticks to the British connection and the dynastic tie with Iraq, the only British escape from incompatibility will be to admit that the Tripartite Declaration has failed at the lightly armed level and to call a meeting of the three guarantors in order to decide whether any purpose can be served by seeking to keep a balance between heavily armed contestants. It would be better to strike this balance jointly than to dissolve into three western factions separately arming old favourites.

Russian Advance Guard in Bonn

A DIFFICULT test for German diplomacy has begun. Mr Zorin's advance guard has arrived in Bonn. The Russian diplomats at once visited Beethoven's birthplace, thus putting a stamp of cordiality on the new period of Russo-German relations which will open when the Soviet ambassador moves into his mansion on the Rhine. The West German government is bracing itself to resist Russian blandishments. Herr von Brentano has made it plain that he is determined to hold out against recognition of the East German satellite regime. He has declared that the Bonn authorities will not open diplomatic relations with any state, other than the Soviet Union itself, which recognises the

"German Democratic Republic," and will break off relations with any state that does so.

The German Foreign Minister made his statement after the head of the Red Cross had reported that the Polish government was prepared to release its German prisoners only in exchange for the establishment of an ambassador in Bonn. In face of this fresh example of flagrant blackmail, the West German stand is remarkably firm. It indicates the vital importance of keeping Herr Ulbricht at arm's length.

The warning from Bonn will also place a number of neutrals in a quandary. Austria, India and Egypt are all being tempted by East German trade offers. In the Middle and Near East, in particular, the East Germans are offering machinery at dumping prices 20 per cent below western tenders, in exchange for surplus or low-quality commodities which cannot be sold to the West. The East German regime is claiming that both India and Egypt have already agreed to give its trade missions in their capitals something like consular status. This Communist claim, however, is premature; and it may never become reality if the western governments constantly make it clear that they take the same firm stand as Herr von Brentano.

Dr John's Come-Back

IT was a serious blow to the West German government when Dr Otto John, the head of its office for the defence of the constitution, crossed over to East Berlin in July, 1954, and subsequently made public statements about re nascent Nazism in the west which provided juicy material for Herr Ulbricht's propagandists. Dr Adenauer and his ministers were gleefully baited on the subject, not only by Communists and neutralists, but also by neo-Nazi elements, whose vendetta against Dr John arose from his British connections as well as his activities against undemocratic forces. But the federal Minister of the Interior, Herr Schröder, boldly and patiently maintained his insistence that Dr John was neither a Communist nor a deliberate traitor; he repeated this argument as lately as Monday, before a sceptical investigating committee, and on the very same day Dr John himself succeeded in eluding his guards and, apparently with some help from a sympathetic journalist, escaped back to West Berlin.

His return bears out the belief—already held by westerners who had seen him during his sojourn in Communist territory—that his going east was an impulsive, almost hysterical action, carried out under great nervous strain, and probably under some hypnotic influence, and that what he saw in the Soviet Zone stripped him of his illusions. He has left the Communists floundering, one of their mouthpieces brashly trying to pretend that he had returned to the west to check neo-Nazism, another alleging, just as unconvincingly, that he had been kidnapped. He has correspondingly strengthened Dr Adenauer's hand against extremists of both left and right. And his escape, which, even in the relatively easy circumstances of divided Berlin, must have called for ingenuity and courage, inevitably evokes reflections about the number of other individuals who have, at one time or another, "gone east" on impulse. How many of them would give their eye teeth,

to follow the prophetic John back to freedom, if they were not held deep inside the Communist empire or encumbered by families or other hostages against their escape?

The Message from Greenock

IN retaining its seats at two by-elections last week, Labour marked up a swing of 2.3 per cent at Greenock on a remarkably high poll, and of 1.2 per cent at Gateshead on an apathetically low one. The party's achievement at Greenock was dead on bogey. It would take a swing of almost exactly this size, spread evenly across the country, to bring Labour back to power in a general election.

But two notes of caution need to be sounded in Labour's ear. First, one of the reasons why it scored an above-average gain of votes at Greenock last week may have been that it suffered an above-average loss there (a swing of 5.7 per cent against it) in May; indeed the Conservatives' way of interpreting the result is that Labour has picked up considerably less than half of the ground that it had then lost. Secondly, the Conservatives do not seem to have alienated so many voters by Mr Butler's economy measures in the early months of this Parliament as they alienated in the early months of the last one; eight months after the 1951 election, it should be remembered, the Conservatives actually lost 10½ per cent of their share of the poll in a Scottish by-election (Dundee East), although admittedly some of this swing went to a Scottish nationalist instead of to Labour. And from that hard economic ploughing of 1951-52, the Tories can say, a rich harvest came in time.

Arithmetical abstractions apart, the Conservatives' simulated cheer from their defeat at Greenock is obviously rather more bogus than Labour's cheer from its victory there; but Mr Gaitskell has no reason to assume, on this evidence, that he will be borne into No 10, Downing Street on any purely automatic swing of the pendulum. He will have to do something positive to hurry that swing along.

Quieten Down

SIR DAVID ECCLES made a very good speech about teachers' pensions last week end, and most teachers know it. The national row that is now being so noisily conducted by a minority of teachers, and tacitly supported by a majority of them, is a colossal strategic error. Teachers usually get a very good press, partly because so many journalists who write about them are ex-teachers; they also usually get very careful treatment in Parliament, partly because their pressure group is spread so evenly across the country. But the latest tumult over the Superannuation Bill, culminating in the proposed ban on collecting savings and in other examples to children of how to undertake inefficient guerilla activity, has soared right outside the control of the teachers' usual champions; it is inducing a wide range of influential public opinion to ask what sort of people have got into the teaching profession.

It is important for the future status of schoolmastering that the broad mass of teachers should stamp this sort of thing down. Other professional groups are not regarding the present demonstrations as a welcome incursion of trade union efficiency into their own stratum of society; too many of them are regarding it—no doubt snobbishly—as a lower middle-class whine. And this is the worst possible development for teachers, if they are to gain—as they deserve to gain—a greater measure of professional status in their negotiations for a new Burnham award.

Post Mortem on a Strike

WHEN the English employees of Rolls Royce again refused to strike in sympathy, it was clear that the stoppage at Glasgow could not last much longer. It came to an end after mass meetings last Wednesday, and 7,500 men returned to work having lost seven weeks' pay and gained precisely nothing: Mr McLernon is still working at Blantyre and will presumably continue to ignore the men's agreement to restrict his production and bonus earnings.

The collapse was hastened by a rebel group at East Kilbride, which has been asking awkward questions about the role of the shop stewards who called the strike; and this indignation appeared to be shared by a local official of the Amalgamated Engineering Union. But it is not good enough to blame everything on the shop stewards now that the strike has failed. The strikers, abandoning in solidarity's name the ability to think for themselves, reacted blindly to the cry of "100 per cent unionism." They never stopped to question the way in which Mr McLernon found himself a non-unionist—some of those who did work at his factory did not even know that he was on his own and could not have "hogged" work from the other polishers. They chose to forget that several of those on strike had earned more over the last months than Mr McLernon; and that earlier, when he had less work than they, they had not shared their bonus

OUTPUT OF THE BRITISH COTTON INDUSTRY
WEEKLY AVERAGES

earnings with him (there was no reason why they should). Most fantastic of all, it now appears that more than 100 of those who made this stand for 100 per cent unionism had themselves been suspended from their unions for being in arrears with their dues.

It should have been the task of union officials to tell these silly sheep the facts and firmly to oppose the strike. But they too gave way, although half-heartedly, before the devious pressures upon them; and it has taken them seven weeks to find the courage to recommend a return to work. The management comes out of this affair with higher marks: in a circulated document it did try to tell the men the facts of the dispute. But the engineering employers' policy of refusing any discussions while men are on strike—which is intended to prevent the bypassing of the York agreement on disputes procedure—has the disadvantage that it does not help to acquaint the men with the true position or with the strength of the management's resistance. Some of their stickiness on this point derives from a misinterpretation of what the word "discussions" ought to mean.

Uno's Door Bursts Open

FOR many weeks the Canadian plan to break the deadlock over new admissions to the United Nations has been making a precarious passage between the Scylla of Soviet suspicion and the Charybdis of Nationalist China's intransigence. Last Saturday the proposal to admit simultaneously eighteen Communist and non-Communist candidates looked like foundering on the rock of Soviet suspicion of western good faith. On Tuesday it ran foul of both hazards, and seemed to have sunk. But the next day the Russian delegate performed a surprising salvage operation. He summoned an emergency meeting of the Council and proposed that all eighteen candidates should be admitted except Japan and Outer Mongolia whose case should be reconsidered next year. After vainly trying to secure Japan's admission as well, the startled Council fell in with the Soviet plan.

The blame for this unnecessarily hazardous passage must be shared between Formosa and Russia, but it was Formosa that threw the first spanner into the works when the Security Council met on Tuesday. Dr Tsiang tried to get South Korea and Vietnam added to the "package" of eighteen, although he must have known that this would be quite unacceptable to the Russians—and, indeed, to many members of the Assembly who dislike the admission of parts of divided countries. Mr Sobolev duly vetoed the proposal, whereupon Dr Tsiang vetoed the admission of Outer Mongolia; after that the fat was properly in the fire and the Soviet delegate, who has always insisted that it must be all or nothing, proceeded to veto all non-Communist candidates. His belated realisation that no one intended to double-cross him over the admission of the four European Soviet satellites may have encouraged his second thoughts next day; and although the exclusion of Japan is most deplorable, it was perhaps too much to hope that Mr Sobolev would renounce his pound of flesh in return for giving way over Outer Mongolia.

It is not easy to understand why Formosa should have chosen to throw its negligible weight about. It was not put

up to it by the United States. The Americans may have encouraged Chiang Kai-shek's intransigence by their own hawking over Outer Mongolia, but it is known that President Eisenhower sent at least two appeals to him not to use the veto. It is unlikely that the Nationalists have seen the writing on the wall and decided to go out with a bang rather than a whimper. Their propaganda shows that they are increasingly living in a dream world and it is quite possible that they simply overrated their importance to the Americans. To most other people, however, it is plain that their action will hasten the day when Nationalist China is itself ejected from the United Nations by the vast majority of exasperated members whose wishes it has flouted.

Dr Rhee Saws Himself Off

PRESIDENT SYNGMAN RHEE is still plucking at the nerves of his friends and neighbours. All South Korea's patrol vessels have now been mobilised to guard the so-called "Rhee line" between Japan and Korea, and its acting foreign minister, Mr Cho, has said that it will "resort to any method" to keep Japanese fishermen behind the line. Thus the threat made by the South Korean joint chiefs of staff at the end of last month to fire on Japanese vessels which cross the line still hangs over the peace of the area. A group of Japanese MPs who recently asked the South Korean minister in Tokyo if the declaration meant what it said were given the dusty answer that it was made "merely for the purpose of stressing his country's repeated warnings."

Meanwhile, it is reported that Japanese patrol boats are being used to escort fishing craft across the line and warn them of the approach of South Korean warships; and the likely reaction of the gunboat-and-grapeshot school of Japanese politicians has been indicated by the complaint of Mr Ogata—who may well be the next prime minister—that Japan has not shown enough strength. The Foreign Minister, Mr Shigemitsu, has promised that only peaceful methods, including perhaps an appeal to the International Court, will be used to settle the dispute, but he is likely to face a growing demand for a showdown.

American uncertainty about what to do with Korea is illustrated by the long delay in sending a new ambassador to Seoul to replace Mr Lacy, who retired last October. Although one cause of friction between South Korea and America was recently removed by a new agreement on taxes to be paid by foreign businessmen, the United States has been annoyed by the expulsion of one American who criticised the arrangements. Dr Rhee continues to incite demonstrations against the Communist members of the neutral nations' commission supervising the truce, who have to be protected by American troops; and he has now started to dun the United Nations Command for what he claims are its debts to his government. The President, who is due to fight an election some time within the next six months, faces a variety of problems on the home front, including a chronic budget deficit, a severe power shortage and far too high a price for rice. It may be his intention to divert his people's eyes abroad; if so, he is playing an extremely dangerous game, for his country's need of both American and Japanese friendship is painfully obvious.

Moscow Dog Fights

THE Fleet Street principle that "dog does not bite dog" was very unilaterally applied in Stalin's Russia. Gone were the early revolutionary days of newspaper controversy. *Pravda*, the official organ of the Communist party, alone had the right to bite; other papers were not even allowed to bark back. The precedent was broken last week when the governmental daily *Izvestia* rejected *Pravda's* strictures without any apology. The point at stake was insignificant—it concerned an article on maize cultivation—but the departure from the established pattern is not. It may merely indicate a very slight loosening of the straitjacket imposed by Stalin on the Soviet press; but it is more likely to reflect, obliquely, the factional struggle between his successors which goes on despite Beria's liquidation and Malenkov's deposition.

It is, however, impossible to deduce the exact alignments within the leadership from the faint echoes of the Georgian firing squads or the reshuffling now going on at all levels within the party in preparation for the first full congress since Stalin's death, which is to be held in February. This congress will presumably be given the new party line on a subject which seems to have aroused violent, if muffled, controversy, namely the pace at which the Soviet Union should proceed "towards Communism." The answering of this crucial question may not be achieved without some casualties in the party hierarchy.

There will be a preview of this congress before the end of the year, at the Christmas session of the Supreme Soviet. The budgetary debate will this time take place much earlier than usual, and should throw some light on the shape of the five year plan to come. The session may also be used to expand Soviet foreign policy in the new "post-summit" period, but Mr Khrushchev and Marshal Bulganin will probably have more to do than parade their Asian laurels. It was at a meeting of the Supreme Soviet at the beginning of this year that the bombshell of Malenkov's resignation was exploded. This month, too, Russia's docile "parliament" may also be presented with something outsize in Christmas crackers.

Wages on the Farm

THE Agricultural Wages Board is proposing to raise the wages of farm workers by 8s. a week, bringing their minimum wage up to £6 15s. This settlement was suggested by the farmers' representatives, as an alternative to the £7 minimum which has been strongly pressed by the workers' unions. Will it be enough to keep as many workers on the land as are wanted there, or to induce farmers to use their available labour more efficiently?

In the last year alone 25,000 workers have left the land for better-paid jobs in the cities. Farm workers suffer from the disability that they have very scant scope (compared with workers in industry) for earning more than their minimum wage. At present, skilled and experienced farm workers have no entitlement to higher wages than young and inexperienced ones, and they cannot in practice expect ever to make more than a pound or so extra above the

minimum. To provide any sort of promotion ladder in British agriculture is very difficult, because most farms employ only one or two workers, who are inevitably Jacks-of-all-trades; in consequence, hardly any workers can save enough to become farmers themselves, and those who do so frequently regret it. It would be possible to introduce a wage structure providing higher wages for special skills and experience; but the workers' unions have so far been unwilling to consider this idea until they have achieved a £7 minimum.

The trouble with the present wage compromise is that it is concerned only with the minimum wage instead of with incentives for skill, and will almost certainly be inadequate to stop the drift of the most able and ambitious workers away from agriculture. But it will add about £15 million a year to farming costs, and thus entitle the National Farmers' Union to demand a special price review in January when the wages award comes up for final confirmation. Such a demand (if it is made) will be purely tactical, since farm price guarantees are due, in any case, for their annual review in February. But the wage award will obviously be indignantly cited as justification for the farmers' resistance to the Government's new-found determination to reduce the level of the agricultural subsidies. All in all, it would have been better to have taken—either this year or next—a proper bite at the farm wage problem, rather than a nibble of a sort that does little to help the workers while yet embarrassing the application of a sound Government policy.

Receiving the Jamaicans

ONE of the first decisions made by Mr Norman Manley when he became chief minister of Jamaica was to have a report prepared on Jamaican migration to Britain; this report, written by Dr Clarence Senior and Mr Douglas Manley, has now been published. In many ways it is an unexpectedly cheering document. It records that a fair proportion of Jamaican migrants enjoy good personal relations with the British people, both at work and after it. Jamaicans find it easier to get accommodation, and are happier about the price they pay for it, than is often supposed. They are, apparently, beginning to realise that many things which they first put down to colour discrimi-

SHREDS OF EVIDENCE

But evidence of what? Some happening, back in geological time, left behind this strange material, with its long, thin, hairlike fibres; but, so far, the fibres have kept their secret. Their present usefulness, however—a usefulness which springs directly from this unique, fibrous composition—is no mystery at all. There is scarcely a branch of industry which does not make use of Asbestos in one form or another, either for its remarkable resistance to heat, or for its other highly distinctive properties. Asbestos, we suggest, is a material well worth looking into.

LIMITED

PLANT FOR CONSTRUCTION

On construction sites throughout the country, the best of modern mechanical equipment, from huge excavators to small power tools, is working efficiently in the service of John Laing and Son Limited. Working to a programme drawn up in detail long before work on site is started, these machines, whether moving earth, placing concrete, handling and hoisting structural units or even driving screws, are cutting the time and cost of construction as effectively as they are improving its quality.

Efficiency in site performance is ensured at the Company's 18-acre Plant and Transport Depot, where machines and vehicles are systematically maintained in full working trim. All plant is operated on a strict computation of running hours, thereby

Britain herself no less than the individual building owner today looks for speed, reliability and economy in construction work. All three require the fullest use of mechanical aids. Merely to mechanise is not enough—machines must be both operated and maintained to give maximum output.

minimising the risk of unforeseen and costly breakdowns on the job. Care and control of its mechanical resources play an important part in the Company's record of success in completing construction schemes efficiently and on time.

GREAT BRITAIN, CANADA, UNION OF SOUTH AFRICA, RHODESIA

The cure for acute labour shortage

If you find it hard to meet demands for increased production, look at Hull, where the labour position is easy.

Hull can give equal satisfaction on sites, transport, public utility supplies, export and inland distribution, and offers the products of many industries including—

Solvents and plasticisers, pigments, chemicals, adhesives, chalk, cement, oils and fats, latex; grinding media, hydraulic, chemical, electrical and general engineering services; wood, grain and oilseed by-products; containers (metal, wood, card), printing.

nation are nothing of the sort—for example, differences in the meaning of the word “skilled work” in Britain and Jamaica. Some of them realise that they must expect the British attitude to coloured fellow citizens to vary from person to person.

It is very clear from the report, however, that a good business is being made out of migration by shipping companies: some of the advertisements about prospects and conditions in Britain that are now appearing in the Jamaican press may be as misleading as those that often appeared in the British press in the nineteenth century about the dominions. Jamaicans who settle down here write home and, out of sheer vanity, say that they are earning more than they really are. This leads to disappointment, maladjustment and social evils, and Dr Senior and Mr Manley make comprehensive proposals to improve the situation. Their suggestions for a much more effective information service for intending migrants in Jamaica—one that would reach into rural districts—are welcome. They also propose a new West Indian welfare office in Britain. Its job would be to meet migrants on arrival and help find them accommodation; to give advice on British social welfare facilities; to supplement the work of employment exchanges; and to develop social contacts between the newcomers and residents.

It is certainly right that if Jamaicans migrate with their eyes open to realities, they should be given every help on arrival and thereafter. But the fact must be faced that these elaborate official arrangements imply that West Indian migration is becoming as permanent a feature of the British labour situation as Irish immigration has always been. It is doubtful if the British people have yet fully appreciated the changed social and psychological attitudes which this new source of labour, and of production, imposes on them.

Postage on Books

THE campaign being waged by authors, publishers, book societies and librarians against the new postal charges for books is reminiscent of their campaign in 1940 against subjecting books to purchase tax. Then the bookmen gained their point; today the Government seems determined to stand by its decision.

The new charges are certainly a steep increase on the old ones. On a book weighing a pound the postage will be 8½d., compared with 4½d. at present. In fact, although the postal rate for printed paper applies up to 2 lb, it will in future be ineffective on books weighing over 1½ lb because it will then have caught up the new parcel rate. On the other hand, the printed paper rate on books weighing less than 1½ lb will still be considerably less than the new ordinary letter rate, so it is not correct to say, as some of the bookmen have done, that books are no longer to be allowed favourable postal rates. The Government has considerably whittled away the subsidy that it now allows on books sent through the post. But it has not abolished it altogether.

Should the subsidy have been cut at all? There is no doubt that the big increase in postage may seriously affect the finances of libraries and learned societies, many of which

work to a very small budget. But the Post Office can hardly distinguish between books sent for genuinely educational purposes and books that are of as much use to the mind as a box of chocolates to the body. There is a much stronger case for arguing that the Government should not have discriminated in favour of newspapers, although naturally not many of us newspapers are arguing it (There is also a case for putting up the rate on all printed matter weighing less than 2 oz, even although the football pool coupons—which would be caught by this—already yield the Post Office a profit.) Newspapers are to be exempt from any increase for the very dubious reason—to quote Mr Gammans—that “it has always been the attitude of the House [of Commons] that people, especially those living in remote country districts, should get their newspapers as cheaply as possible.” Once discrimination of this sort is exercised, the Government's resistance to pressure from other bodies that can plead a case is weakened. If the £1.7 million to be obtained from the new printed paper rate had been spread over all printed matter, the increase need not have been so steep for books or for journals that are outside the Post Office's definition of a newspaper.

German Civilians Hold the Reins

THE investigating committee which was set up to screen all the higher ranks of the future West German Army is taking its work commendably seriously. It has rejected the application for commissions of four colonels who were already working in the office of the Minister of Defence, Herr Blank. Naturally enough, the minister's prestige is affected, and he has sprung to the defence of the four colonels. He is already out of favour in Germany for various reasons, one being his reluctance to hand over the personal dossiers concerning his staff to the committee. It is being argued that the committee should be induced to change its methods, to allow unsuccessful applicants and the Ministry of Defence to know the reason for the rejection of applicants, and perhaps to allow them to be re-examined by a “higher court” consisting of some of the members of the committee itself. The committee, however, does not want to make changes, and as it has been appointed by parliament it cannot be forced to do so.

German press opinion has on the whole rallied to the defence of the committee against Herr Blank, though it is suggested in some quarters that the committee might develop into a “Star Chamber” if its secrecy remains absolute. It is significant of the mood of the Germans that the former General von Manteuffel, a member of the Bundestag Security Committee, has been publicly supporting the civilian investigators' decision over the four colonels, as a matter of principle. His standpoint is that an officer who was good at paper work may not be the type wanted to train the new cadres of a democratic force. Only the best will be good enough for this work, and the basis must be firm, even though a long time may well be needed to establish it. There are few outside Germany, and perhaps Nato, who will not heartily approve this view. Even if the Germans are somewhat overdoing their zeal for civilian investigations, it is a fault in the right direction.

Italy's New Radicals

THE non-Communist Italian political parties are either so large and amorphous that they find it hard to agree on constructive policies, or so small as to be largely ineffective; and while the Christian Democrats stick together because it is so plain that in numbers lies safety and power, the smaller parties have no such restraint on their fissiparous tendencies. One exercise in fission, which will have surprised no one, was carried out by the Liberals last week.

At the party's national congress, over thirty members resigned and later announced the formation of a new Radical party. They acted in protest against what they believe to be the tendency of the Liberals, under the guidance of their energetic secretary-general, Signor Malagodi, to become increasingly conservative and subordinate to big business. Signor Malagodi, however, is the last person to be dismayed. The position of the Liberal party in the coalition government is not affected, since at present the dissidents appear to command negligible support among its fourteen deputies in the Chamber and none of its three cabinet ministers has gone over to them. Moreover, by sloughing off his highly critical left wing Signor Malagodi is much better placed to make his party the nucleus of a strong right-wing group which might win support among the divided and bickering Monarchists.

There is, in Italy, a body of intelligent, lay, progressive and moderate opinion which remains in the political wilderness because it disapproves of the record of the Christian Democrats, but finds the Liberals too conservative and the Saragat Socialists too ineffective. The new Radical party, with its emphasis on liberal principles, and, in the economic sphere, its opposition to monopolies and advocacy of tax reform, could well provide them with a political home. It enjoys, moreover, able and distinguished leadership; its founder members include Count Carandini, the first Italian ambassador in London after the war, Signor Villabruna, a former minister in the Scelba government, and Signor Pannunzio, the editor of the progressive weekly, *Il Mondo*. If it manages to become a real vote-catching political force, it may provide the nucleus for the moderate lay opposition to the Christian Democrats which Italian democracy badly needs.

New Start in The Hague

IN The Hague last week ministerial representatives of the Dutch and Indonesian governments began discussions. It is a tribute to the good sense of both sides that the talks have been possible at all, for not long ago relations between the two countries were strained almost to breaking point. But since the new government under Dr Harahap took over in Jakarta last August both parties have sought to find a way towards a friendly solution of their differences.

The chief of these concerns the future status of West New Guinea. No solution, however, of this vexed problem is expected at the present conference, as both sides have firmly reserved their standpoints on sovereignty. But there

are a number of other questions which the ministers can usefully tackle. On the agenda is an Indonesian request for a new agreement to replace the economic and financial arrangements made in August, 1954. The Indonesians would like a revision of some of the privileges and guarantees granted to Dutch business interests. In view of Dr Harahap's enlightened attitude towards foreign investment—a new charter for which is being drawn up—it should be possible to meet their request. No doubt the opportunity will be taken to review the whole field of economic cooperation between the Dutch guilder and the Indonesian rupiah. And there are other practical issues; the Dutch, for instance, might justifiably seek assurances about the conduct of the long drawn out trials in Jakarta of Dutch nationals accused of subversion.

The main aim of the present talks, however, is generally to re-establish mutual trust. But there will have to be a spirit of compromise on both sides. The Dutch would do themselves no harm by showing themselves at least willing to talk about the future of West New Guinea; they would not thereby be finally committed. The Indonesians, for their part, now that they have come to realise the advantages of quiet negotiation, would do well to ignore the gallery for once. It is a good augury that at the United Nations Assembly this week a way was found of discreetly dropping the subject for another year.

A Slum of One's Own

MR SANDYS is to introduce a Slum Clearance Compensation Bill which will adjust the compensation payable by local authorities for the acquisition of unfit dwellings. The Minister is keeping to the present principle that compensation in such cases can reasonably be limited to the site value, plus payment for good maintenance where appropriate. But he has decided to give relief to two groups of people: to those owner-occupiers now living in unfit houses who have bought them since 1939, and to the owners and tenants of small shops and businesses whose premises have been declared unfit. These two groups will in future receive the same compensation as will be paid to anyone owning an ordinary fit property which is compulsorily acquired. The concession to postwar owner-occupiers is designed to meet the more patent cases of hardship: during and after the war many people bought (and have often improved) condemned properties for lack of any housing alternative, and they would incur heavy losses if the law were left unchanged.

At the same time the compensation payable on account of good maintenance will be increased to allow for the greatly increased cost of postwar repairs. This element of compensation is at present limited to a maximum of twice the annual rateable value of the property. The Minister estimates that his special concessions relating to postwar owner-occupiers and to small businesses will apply to only about 8 per cent of all unfit dwellings; the adjustments in compensation for maintenance will, of course, apply to all unfit dwellings. Consequently he does not expect the cost to the local authorities of clearing the slums to be greatly increased. The local authorities themselves are not so sanguine. But the Minister's adjustments—which, even

now, will not meet all cases of hardship—have been designed in the hope that they will enable slum clearance to go forward without the considerable hostility that would otherwise certainly have arisen. There seems to be a good case, both politically and economically, for this Bill.

No Easy Nostrum

THE Liberal Council has received, and accepted, the interim report of a committee which it set up to work out a scheme for spreading co-ownership in industry. For a long time the Liberals have toyed with the idea that in compulsory co-ownership there might be a distinctive Liberal solution to the problem of industrial relations: one that would be superior both to the Tory formula of freeing enterprise and to Labour's problem child of nationalisation. But this report is likely to disappoint the more crusading Liberal spirits. The committee has failed to produce a cut-and-dried scheme; it is divided on the question whether any schemes which could be produced should be made compulsory; and is unanimous only that no single uniform scheme would fit the protean variety of industrial and commercial enterprise. It was guided to the conclusions by a group of four eminent economists, who had previously been divided upon the subject, but who now felt that their views had come "very close together."

The economists drew attention to the sheer technical difficulties of uniformity. How could one deal with all the problems connected with the supply of new risk capital to firms that gave workpeople shares on favourable terms? How could one avoid a situation in which workers in heavily capitalised firms would gain more than those in firms largely using direct labour? The economists' general conclusion was that "tax inducements were felt by most to be a great improvement on compulsion."

The Liberals' committee has now been re-constituted as a standing committee, to keep the problem under continuing study. One principal piece of advice can be given to this committee. It will be making a great fool of itself if it tries to find a distinctive programme, designed to sweep the country, exorcise Karl Marx's ghost, and form the basis of legislation "when the party regains power" (which it never will). The Liberals' real job is to be undistinctive but realistic: to press the Government to improve fiscal and other inducements to set up experimental schemes, and to do some hard and impartial research on the effects of co-ownership and its variants upon labour relations. They have taken a step towards this proper role by their latest decisions, and by the questionnaires that they have sent out and are now studying.

Market Report on West Africa

A MARKET report is, or should be, a perfectly cold-blooded and professional investigation of risks and possibilities of profit. It should no more give offence than a doctor's diagnosis. It is liable to error in much the same way, and

it is always possible to call in a second opinion. Therefore there is no cause for perturbation about the report on a business visit to Nigeria and the Gold Coast by Sir Percival Griffiths and Mr Maurice J. Watt, undertaken at the request of the Federation of British Industries. The report advises caution about heavy investments in Nigeria, and to some extent in the Gold Coast, until the political outlook has clarified. Perhaps the report might have been issued as a confidential document so as not to wound African susceptibilities; but apart from this advice it is, after all, a very fair and practical, if very general, analysis of trade prospects in both countries, and it goes out of its way to emphasise both the good will shown towards British people in both countries and the defects in British trading and banking methods.

The Gold Coast is on the verge of independence, and Nigeria faces big constitutional changes and a possible loosening of federal ties; it is natural for businessmen to be cautious in their appraisal at such a time. Nobody can dissent from the report's observation that rapid Africanisation of the civil service will probably lead to less efficient administration; it specifically says that the deterioration will be tolerable locally and will not make trade or business impossible.

It is, of course, arguable that as these countries approach independence Britain should show confidence in them, and strengthen ties with them by investment wherever possible. But this is an argument from policy, not business. The old saying that there is nothing so shy as a million dollars always

The Economist Diary A reference book for the desk

For the man who seems to have everything he could want, *The Economist Diary* is the ideal present. The appointments and memoranda section is designed to meet the needs of the busy man and in addition there are 72 pages of facts and figures, which together form a complete reference book.

The reference material covers a wide range of subjects, including elections, national income, banking, taxation, crime, manpower, commodities, and a special section giving the basic facts on 47 principal countries in the world.

The volume is bound in red leather and measures 10 in. by 8 in. Price (U.K. only): 41/- including postage and purchase tax. Overseas prices vary widely; a schedule will be sent on request. Full details of *The Economist Diary* are given in an illustrated pamphlet available from:

Diary Department, *The Economist*,
22 Ryder Street, St. James's, London, S.W.1.

Meet Mr Brandyman

He's the perfect host for Christmas festivities. Such a good mixer. Always ready to fit his mood to yours. In the company of ginger ale or soda he offers you the choice of two stimulating and refreshing long drinks.

NOW ON SALE

WHITAKER'S ALMANACK

The 1956 edition of Whitaker's Almanack is packed with concise information on all the topics that matter to men and women today. Very fully indexed for quick reference, it contains over 1,000 pages of facts and figures plus a 16-page photographic supplement. Remember, an out-of-date copy can be very misleading, so make sure of the new Whitaker.

With WHITAKER you can't go wrong about

POLITICS. All about the new Parliament. Foreign affairs: Facts and figures about the U.S.A., U.S.S.R. and all other foreign countries: U.N.O.
HOME AFFAIRS. Government departments. Statistics for everyone: from city populations to flying speeds, book sales to burglary figures. Directories of Banks, Insurance, Clubs, Trade Unions, etc.
SPORT. Classic winners. Olympic records. Batting and bowling averages. Cup finals. Rugby results. All other sports.
INFORMATION in innumerable other fields from Atomic Energy to Income Tax.

1,190 pages for 17/6. Shorter Edition, 700 pages 10/-. Also (ready December 19) Library Edition, leather, 30/-.

FROM BOOKSHOPS AND RAILWAY BOOKSTALLS. PUBLISHED BY J. WHITAKER & SONS LTD., 13 BEDFORD SQUARE, LONDON, W.C.1.

Will they be thinking of YOU?

It's been quite a year for the Baileys. Jack's promotion came through. They moved into their own house and they bought their first new car. No wonder Christmas is going to be such a splendid affair this year. Next year they may have even more to celebrate, for they are already talking about the things they want to buy in the months to come. Will they be thinking of your product?

You can be sure of telling this young family and millions of others like them all about your product by advertising in the Daily Mirror, which appeals outstandingly to the younger generation. With the biggest daily net sale on earth, the Daily Mirror offers you the most powerful mass market coverage at the lowest square inch per thousand rate of all national dailies. Daily Mirror readers are young readers. Your customers today . . . next month . . . next year.

carries the rider "unless it is taxpayers' money." The Volta scheme may come into this category. But if an industrial organisation asks for a report on any country, with an appraisal of the possible political influences on business, it is entitled to have it; and it is for its members, not outside commentators, to judge whether they consider a seven-week tour adequate to the market researchers' purpose. Most would-be investors, in any case, will make a far more detailed survey into the prospects of any particular scheme.

A Railway Reorganisation

THE experiment in devolution undertaken by the Eastern Region of British Railways will attract sympathetic attention. The area board intends by this scheme to secure a major devolution of authority and responsibility throughout the traffic departments of the Eastern Region, and to bring closer together the operating and commercial aspects of railway business. Past experience of British Railways suggests that these principles should have much merit. They involve the merging at headquarters of the separate responsibilities for commercial management and railway operation under an assistant general manager (traffic) and the controlling of the district responsibilities of the operating, motive power and commercial departments by a traffic manager for "each convenient line or area."

This move towards greater local authority and initiative, it is expected, should promote more flexibility and individuality in the service, a new responsiveness to local needs, and clearer desks for the headquarters management. The outcome will depend upon men, and on the way they react to changes in old ways of working and to new opportunities and responsibility. These changes have not been devised for general application to all regions; but the lessons that they teach will certainly need to be studied in all regions.

Flat Broke?

THE horse racing industry in Britain last week received a clear warning that it will need to put its stable in order, and then a windfall that—if wisely used—could help it to do so. The central feature of the Duke of Norfolk's report to the Jockey Club was that racecourse profits have fallen from 7 per cent (on an approximate capital investment of £5½ million) in 1952 to 5 per cent in 1954. He also said that attendances fell up to 1953, and that the decline then stopped only because people have been moving into the cheaper enclosures. This last point should be a hint to the Jockey Club about the way in which its economic thought ought to be moving.

To this dose of ducal pessimism there has come an unexpected antidote. The Special Commissioners of Inland Revenue have allowed an appeal from the Racecourse Betting Control Board against the taxation of its surplus. The control board is a non profit making body, which runs

the racecourse totalisators. It exacts a small levy; and from this, after meeting its expenses, it makes grants for such purposes as improving racecourses and subsidising the transport of the horses. If the new ruling is upheld—it is still subject to challenge—racing will get a useful blood transfusion of another £500,000 a year or so, plus a possible backlog of over £1 million.

But the windfall will become a menace if the rulers of racing expect it to answer all their problems. The real trouble with the sport today is that some owners feel—in the words of one eminent racing peer—that they should avoid "changing much of the character of English racing." For many racegoers the character of English racing today is represented by absurdly high prices for miserable amenities. Racecourses in this country are geared too much to the professional betting element. Few family men would care to take their wives, let alone their children, for an afternoon in a small, expensive enclosure dominated by howling dervishes, the bookmakers. There is no doubt that some people now in racing are on the verge of being squeezed out of it. Trainers cannot make ends meet except by successful betting; and owners can expect enough prize money to cover only a third of their costs. Racing needs to lay hands on some of the vast sums betted off the course, and this needs a change in the betting laws. When the Jockey Club sends a memorandum to the Chancellor in the New Year, it will no doubt make this point, together with its perennial appeal for another cut in the entertainment duty. The Chancellor can fairly retort that the racing authorities themselves can do more to solve their own problems in the proper economic way—by trying to attract more customers.

UNEMPLOYMENT IN GREAT BRITAIN (THOUSANDS)

Letters to the Editor

The Rolls Royce Strike

SIR—I would like to correct one sentence in the article in your issue dated December 10th. You said: "The Employers' Federation, standing by what Rolls Royce—perhaps unwisely—regards as a principle, has . . . refused to negotiate with any of these people while the men are still on strike." The facts are rather different. There is, as you know, a mutually agreed procedure for dealing with all questions arising within the works of federated firms; the operative clause of that agreement—which is the accepted basis of industrial relations in the engineering industry—reads "until the procedure provided above has been carried through, there shall be no stoppage of work either of a partial or a general character."

There is an undisputed obligation upon the workers, and particularly on the shop stewards, to honour that agreement, which was signed on their behalf by the executives of their unions. In this case they ignored the agreement and, instead of going through the procedure, they went on strike; this is done usually when the shop stewards have so little confidence in the justice of their claim that they are afraid to submit it to fair investigation, and think there is perhaps a chance of getting something by intimidation. They know that by going on strike they automatically stop all negotiations under procedure.

The principle that the Scottish Engineering Employers' Association, the Employers' Federation, and Rolls Royce—not "perhaps unwisely"—have been upholding is that agreements must be honoured by both sides. If agreements are to be dishonoured when it happens to suit one party to do so, it is no use signing agreements. We guarantee agreements by our members and there is a precisely similar obligation on the unions to do likewise with their members, but in this case they had actually been supporting them in their breach. It has to be brought home to a certain section of the shop stewards and workers that the sanctity of agreements in Britain is something which must be realised and maintained, not least in the interests of the workers.

I should also like to comment on your statement that "he [Mr Wilson] has not appeared to those who have interviewed him to be the expected firebrand, spitting out venom. . . ." It would be most unfortunate if we allowed ourselves to be lulled into a false sense of security by the new and more subtle technique of the Communists. Many of the most active Communists in Scotland now adopt what appears to be a sincere and

reasonable approach, in some instances backed by a pleasant personality. The psychology of their masters has improved.—Yours faithfully,

ERNEST FIELD
Scottish Engineering Employers'
Association, Glasgow

Cyprus Today

SIR—When the new Governor Sir John Harding arrived in Cyprus he invited the people to co-operate with the Government to restore peace and confidence. He has promised rewards ranging from £100 to £5,000 to those who would give useful information for the discovery of the terrorists. Why is it then that the people have not yet responded to these calls? The answer lies in the fact that all the Greek people of Cyprus believe that very soon the island will be united with Greece, and so long as they believe this they cannot and must not be expected to co-operate with the Government. The speeches made by Makarios, the broadcasts by the Athens radio and the statements of EOKA all emphasise that Enosis will be realised at a very early date and strengthen the belief of the people in this.

The majority of the crimes committed by EOKA today would never have been detected but for the Turkish Cypriots. There are also many Greek people who do not approve of terrorism, especially those whose business has been affected by it, but they are afraid to co-operate because they believe that Cyprus will soon be handed over to Greece and that they will then be branded as traitors and put into gaol.

Before peace and security can be restored the British Government must win back the confidence and respect of the people, by denying the statements of Makarios, Athens radio and EOKA, or by making it plain that Cyprus will develop into a self-governing territory within the British Commonwealth. The solution does not lie in a compromise with Makarios, but in stating British policy in definite terms.—Yours faithfully,

Nicosia

Chaos in the Making

SIR—I have read with mixed feelings your Note in your issue of December 10th. I grant that proper road planning could be secured here through the present machinery, but successive Governments have had thirty years to make up their collective minds. There being no indication of an appreciation

of the urgency of the problem, it is not surprising that possible alternatives are put forward. One of these has been road loans—with the natural corollary of a national authority to administer them. Leading in from there, why not a national authority with income assured against the vagaries of the annual Parliamentary vote?

When your describe as "starting up an old hare" the requests that have been made that a specific fair share of proceeds of national road taxes should be earmarked for roadbuilding, may I remind you that the "old hare" has obtained a new lease of life in many countries elsewhere within the last few years? Indeed, few other countries anywhere still consider that road user taxes should remain divorced from road expenditure. To give a few examples, governments of countries as far apart and of such diverse economic structures as New Zealand, Sweden, Western Germany and Japan have enacted within the last few years that road user taxes should be devoted entirely to road purposes. Other countries, including Brazil, Belgium, Denmark, France, India, Pakistan and the Union of South Africa have legislated for annual fixed percentages of road user taxes to be applied to roads. Government committees are also sitting in Holland and Switzerland to consider road finance methods which will ensure greater continuity than is provided under the present procedure of annual votes out of general revenue.

The British pattern for the provision of road finance that was formerly widely followed elsewhere has thus been outmoded. The new outlooks abroad are providing modern roads now, with benefits to local economies which (in some instances) work against our ability to sell abroad at competitive levels.—Yours faithfully,

C. D. MORGAN
British Road Federation, W.C.1

Unions Unfair to Women

SIR—In my travels since the war and from my knowledge of practice in American and European countries, including Russia, I am puzzled why the English craft unions maintain such a restrictive attitude towards the employment of women. As an example, it is unknown in England for a woman to be employed as a compositor in the printing industry, although it seems that keyboard manipulation is an activity for which, as many of them have proved, they are very well fitted. I am sure similar examples exist in many other industries. At a time when we are extremely short of labour, should not the unions consider it a national duty to bring themselves up to date and offer "equal opportunity for women" to enable us to build up the labour force we need to compete in world markets.—Yours faithfully,

D. K. WINSLOW, Editor.

Books & Publications

Mr Truman's Own Story

YEAR OF DECISIONS: *The Truman Memoirs, Volume I.*
By Harry S. Truman.
Hodder and Stoughton. 540 pages. 30s.

THIS full-dress account of the world-shaking events of Mr Truman's Administration, written while they are still fresh in his mind, is unique in the annals of the Presidency. Not since the early days of the Republic has a President set out to tell his full story, with documentation; few other Presidents have had such a story to tell. Mr Truman's own estimate of his years at the White House is implicit in the decision to devote the first of his two volumes to little more than the single year which followed his sudden elevation to the Presidency with the tragic death of Roosevelt. It was a year of enormous events: the end of the war in Europe; the first clashes with the Russians over postwar organisation; the end of Lend-Lease; and the decision to use the atomic bomb against Japan, a decision made, firmly and without regrets, by a man who six months earlier had not even known that the atomic bomb project existed.

It was also the year that shaped the new President. At the beginning he was asking hardened reporters to pray for him, for he felt "as though the sun, stars, and planets had fallen on me." At the end he is reading a stern and merited reprimand to the Secretary of State, Mr Byrnes, for not keeping him adequately informed, cheerfully accepting the resignation of the surprised Harold Ickes, and bluntly demanding that of Henry Wallace for insubordination over Russian policy.

The remarkable contrast between the inoffensive Throbbottom he appeared in 1944 and the President who knew his own mind is blurred, for British readers, by the omission of a chapter on Mr Truman's early years which appeared in the American edition. This is a pity for yet another reason. It would have provided a little relief and local colour in a volume that reads rather like an extended state paper. It is only in the "Dear Mama and Mary" letters, written to his mother and sister in Independence, that the private Truman peeps out.

But it is, of course, the public figure that is remarkable and significant, and not all the flat writing or disregard of the Washington political scene can conceal the industry and directness, the

devotion to simple concepts of world betterment and the courage that made Mr Truman, contrary to most expectations, a worthy successor to the great Roosevelt. Humble he might be, but he had a lively sense of the authority and responsibility of the Presidency and no reluctance to exercise it. Always willing to listen to advice, Mr Truman never seems to have failed to understand that the decisions must be his own, something his successor took longer to learn. He admits with engaging candour that he was given a sharp lesson himself when he signed the paper ending Lend-Lease without reading it. But to Mr Truman even a wrong decision is preferable to none at all. Nevertheless, it is hard to accept the impression that there were never other times when he was puzzled or at a loss on the world stage on to which he had been thrust with so little preparation.

Most of this volume deals with the frustration and disillusionment of the Americans and British at Russian hands. Almost from the first Mr Churchill was urging the American armies to press forward in order to meet the Russians as far to the east as possible; this remarkable example of foresight fell on deaf ears, for Mr Truman, General Eisenhower and the American Chiefs of Staff were unwilling to allow political aims to override military considerations. After Potsdam, however, Mr Truman made up his mind that the Russians should have no foothold in occupied Japan. Some of the most interesting, because less familiar, pages deal with the negotiations between China and Russia to carry out the pledges made at Yalta to induce the Soviets to enter the war against Japan; and the delicate problem Mr Truman faced when both the Chinese and the British demanded that the surrender of the Japanese should be received at Hongkong.

The early pages of the memoir give some idea of the cruel and relentless burdens of the Presidency. But in time Mr Truman learned to carry them lightly, and in the midst of harrowing international problems and vast reconversion adjustments at home, he began to plan to carry forward the New Deal, much to the surprise of those who had assumed that that "Roosevelt nonsense" could be forgotten. There were many more surprises in store from the man from Missouri, who is a prime example of the way the Presidency can bring out all that is great in its incumbent.

Flying Visit

INCOME REVISITED.

By A. C. Pigou.
Macmillan. 93 pages. 6s.

IN the preface to this little book Professor Pigou tells, with admirable candour, a story about "Income: An Introduction to Economics," his earlier and much-appreciated venture into exposition for the layman. It was based on a short course of lectures for engineering students at Cambridge; the first of these lectures was delivered to an audience of two hundred, the last to one of five. One can see why. Professor Pigou's idea of elementary statement is, literally, a statement of elements; of the triple-distilled essence of economic thought, a treatise's worth to each paragraph. He is not obscure. On the contrary, he is exquisitely and radiantly clear. But the ordinary human mind, like the human digestive system, is apt to be unhappy without a little roughage. The reader, even the previously quite uninformed reader, taking in this pellucid mental nourishment at his own pace, can supplement it with parallel reading and with reflection on specific instances, history, current events, popular errors and the like. The lecturer, forced to absorb it neat, gives up in despair.

"Income Revisited" opens with a chapter (of just over two pages) on economic theory and political institutions, and deals successively with money,

The Commonwealth and Sterling Area

75th STATISTICAL ABSTRACT

Provides a comprehensive picture of Commonwealth and Sterling Area Trade. It bridges the gap between national and international publications in that it enables the trade of the individual countries to be brought together and viewed as a whole.

17s. 6d. (by post 18s. 3d.)

The Colombo Plan

Reviews economic progress to date and the problems which still have to be tackled by the countries in South-East Asia. (Cmd. 9622)

5s. (by post 5s. 3d.)

Meat

Production, trade, consumption, and prices of the world's meat resources compiled in the Intelligence Branch of the Commonwealth Economic Committee.

5s. (by post 5s. 3d.)

HMSO

from the Government Bookshops
or through any bookseller.

consumer behaviour, capital accumulation, social and private welfare, wages, monopoly, and "fair shares." There is little attempt either to link these topics or to make each a rounded whole. Nor is the standard of difficulty the same; the chapter on wages, "The Share of Labour," is, for instance, far stiffer than that on money; that on "Fair Shares for All" is much more a brief ethico-political confession of faith than a piece of economic reasoning. The reader, moreover, is given virtually no help in relating what he learns here to what he may read on similar topics elsewhere or to such topics as are left untreated; public finance, for instance, or international trade, or the return to other factors of production than labour.

Altogether, "Income Revisited" cannot be hailed as a satisfactory book. It represents rather a succession of droppings-in on its subject than the consecutive return visit suggested by its title. But it is stimulating, it is distinguished, it is unerringly concerned with the heart of the matter; and the workmanship of its component parts is a delight. Satisfactory or not as a book, it offers what many "better" books cannot supply: contact with an absolutely first-rate mind.

German Armour-War

PANZER BATTLES: 1939-45.
By F. W. von Mellenthim.
Cassell. 390 pages. 36s.

THIS English translation of a book written by a former German major-general is undoubtedly one of the most readable and interesting as well as one of the most useful of all those coming from high-ranking military commanders on both sides after the last war. The author gives a remarkably lucid and brilliant account of the fighting and in particular of the use of armour, which he saw in Poland, France, the Balkans, the Western Desert, Russia, and again in the West.

The book is often depressing to read, when, for instance, the author describes how totally inadequate were the defences of the Siegfried Line in 1939; it could have been breached without the slightest difficulty by the French army when Hitler hurled the whole might of the Wehrmacht and Luftwaffe against the much weaker and badly equipped Polish army. Again, when he describes how the Maginot Line was "breached in a few hours by a normal infantry attack," or, when dealing with the *Blitzkrieg* in the West in 1940, he points out that the German army was much inferior by comparison with the Allied forces, not only in numbers of divisions, but also in tanks. General von Mellenthim writes that "the Allied leaders, and in particular the French, thought in terms of linear warfare of the first world war." Yet he admits that "the German army derived its concepts of armoured warfare from the British military writers, Liddell Hart and Fuller."

Of particular interest are the chapters

covering the campaign in the Western Desert: here, again, it is depressing to read that, in 1942, the British army had a great superiority over the Germans, not only in numbers, but also in artillery and especially in armoured vehicles. Undoubtedly Rommel emerges from this book as one of the most brilliant tank commanders; but at the same time the author pays high tribute to the leadership and fighting qualities of the British soldier and in particular to the British artillery. The chapters dealing with the campaign in Russia deserve careful study, because, apart from their historical interest, they reveal the fundamental qualities of the Russian soldier as well as the strength and weakness of his military machine. The author gives an impartial and profound analysis of the use of German armour and of Russian tactics. His conclusion is worth noting:

Today any realistic plan for European defence must visualise that the air fleets and tank armies of the Soviet Union will throw themselves upon us with a velocity and fury far eclipsing any *Blitzkrieg* in the second world war. So, too, is his view that "No air force, however powerful, will be able to stop the Russian masses. The Western world's most crying need is for infantry ready to do or die. . . ."

Selene

THE MOON.
By H. P. Wilkins and Patrick Moore.
Faber. 388 pages. 63s.

IT is not often that one can spot a new work which will prove a classic. This is it. One of its authors, Mr Moore, who is secretary of the lunar section of the British Astronomical Association, has already given us a "Guide to the Moon" (published by Eyre and Spottiswoode) suited to amateurs. This new big work, in collaboration with Dr Wilkins, who is Director of the lunar section of the association, contains the Wilkins 300-inch map of the moon—or rather, since the moon turns round the earth and on its axis at a rate nearly that required to keep the same face of the moon always turned towards us, a map of about three-fifths of the moon. The other two-fifths is for ever unknown and unseen of mortals, and will be so until they see the other side from some space-ship.

The bulk of the book is devoted to this map, in photo-strips and drawings made from all available sources. The names given to features on the moon—many of them as queer as the now-debated Arabic names of the stars—are then set out as indices following each section of the map, and extremely full definitions and explanations are given under each entry, including opposing views or explanations, together with clear expressions of the authors' conclusions. Many of these names now replace older ones, in which case both are given. The plates are remarkable, so are the drawings: views of lunar alps at sunrise and sunset are commonplace. Few people realise how many amateur

observers all over the earth retreat after dark into their gardens or on to roofs (if buildings are solid enough to prevent vibration) and, with anything from 4 in. refractors to big home-built reflectors, sketch away on paper lighted by a hooded lamp. In this way, as well as with "all modern conveniences," Dr Wilkins has built up the incredible detail of his huge lunar map. Thus on page 324 the section shows the lunar plain containing Janssen, mountain-ringed and packed with craters, with some fine clefts, whereof (and it is a good example) the authors say:

On the south, and close to the limb [edge], is Demonax, almost entirely explored within the last few years. Near it is Bousingault, the best example of a great ring, within which is another, within which in its turn, is yet a third ring. We have a fine specimen of a double ring in Steinheil and Watt, while the greatest valley on the lunar surface, that associated with Rheita, lies within this section.

Apart from architectural notes like "the church is worth a visit," it might be an extract from one of the newer British county guides under the careful eyes of a Pevsner. There are many appendices: on lunar photography, lunar maps, lunar observers, measurement of lunar altitudes, and—quite charming—on earthly myths and superstitions about Selene and her influence. But one cannot forbear to admonish these brilliant and unearthly luminaries (and their publishers) for slipshod English in a lovely book: in the new editions it deserves, they should do away with "different to" (page 39), "Meteors can, and have, produced" (page 40), "as dense, if not more so, than" (page 42), and others. *Mais où sont les proof-readers d'antan?*

Australia's Phoney War

WAR ECONOMY, 1939-1942: Series 4, Vol. III of Australia in the War of 1939-1945).
By S. J. Butlin.
Australian War Memorial, Canberra.
Angus and Robertson, London. 516 pages. 25s.

AUSTRALIA produced a first-class history of the 1914-18 war, and is evidently determined to produce one bigger, if not better, for the war of 1939-45. Whereas the earlier history devoted only one volume to developments in Australia itself, the history now being written devotes five volumes to "civil" history. The volume under review is the first of two on economic policy. Like the first volume of the two being written on political developments (by Paul Hasluck), which was the first of the "civil" series to appear, it ends with Pearl Harbour.

Mr Butlin is Professor of Economics at the University of Sydney. He spent the war partly as an academic economist and partly as an official of a government department. He is already known as a painstaking historian of early aspects of the Australian monetary system; this book shows him to be a master of contemporary economic analysis.

5 good reasons to
fly the Atlantic
by B.O.A.C.

Only B.O.A.C. offers
all these advantages

MORE LUXURY Only B.O.A.C. flies luxurious double-deck Strato-cruisers to N. America on First Class direct "Monarch" services, First Class "Majestic" and Tourist Class "Coronet" services.

MORE SERVICES There are more B.O.A.C. Transatlantic Strato-cruiser services than ever before at this time of year—specially suited to the business man—giving more comfort, more convenience.

OFF-SEASON FARES Special "off-season" return fare reductions on all First and Tourist Class flights, right through to March 31st.

FAMILY FARES PLAN Your family can fly for less if you fly the Atlantic together before March 31st. Only the head of the family pays full fare; the others pay much less. With a wife and two children between the ages of 12 and 25 on a First Class return journey, a man might save £300 and more. And you still gain the advantage of "off-season" fares.

TICKET INSTALMENT PLAN Fly now—Pay Later... use B.O.A.C.'s Ticket Instalment Plan. You pay only 10 per cent down and spread the balance over a period of up to 24 months. Fly B.O.A.C. now and enjoy the world's finest air travel at less cost.

Consult your B.O.A.C. Appointed Agent or B.O.A.C. Airways Terminal, Victoria, S.W.1 (VIC 2323), 75, Regent Street, W.1 (MAY 6611), or offices in Glasgow, Manchester, Birmingham and Liverpool (see your Telephone Directory for details).

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Long Look at the Farms

Washington, D.C.

AGRICULTURAL policy was the main item on the agenda of President Eisenhower's conferences with his legislative leaders at the beginning of this week. This Republican Administration has only one more session of Congress in which to prove that it is capable of putting American farming on a sound long-term footing. Moreover, this session will take place during an election year, when professional politicians of both parties will be clamouring for concessions with which to buy farmers' votes, both because the farmer is the most loudly discontented member of an otherwise prosperous community, and because he has acquired the reputation, perhaps unfairly, of being more prepared than anyone else to sell his vote for favours. Opposition leaders, with an interest in embarrassing the party in power, are in control of the machinery of Congress; Republicans from farming areas will tend to exaggerate the headway being made there by Democrats in order to panic their own party into shortsighted and expensive policies.

Despite all this, there is a glimmer of hope that this Congress will not disgrace itself, and may indeed confound its detractors. With politicians absent from the capital the vacuum has been filled by a series of expert reports on American agriculture from such bodies as the Twentieth Century Fund, the Conference on Economic Progress and the National Planning Association. Although the recommendations vary, all the surveys make it easier to analyse the real farm problem. At the same time reports received from the Senate Agriculture Committee, which has been travelling round the country to hold hearings at the "grassroots," strongly suggest that the Senators have been put into a highly pragmatic frame of mind by the great variety of circumstances and suggestions they are encountering. With all due allowances for scepticism, it is still quite possible that this more constructive attitude may survive their return to Washington.

The farmers' case—which is that, although their contributions to national production compare well with those of industry, they do not get a fair share of the rewards—can be backed up by two figures. Compared with the average of 1947-49, the prices they receive this year are down by 7 per cent, while the prices they pay for supplies, loans and labour are up by 12 per cent. Net income to the farm population as a whole from strictly agricultural activities has dropped from \$11.7 billion a year in 1947-49 to \$9.9 billion last year. But these figures need three

qualifications: the farm population is falling every year, the number of people on farms who get some income from other sources is rising, and there is such great variety in the scale of farming in America that total figures are misleading.

Last year there were 4.8 million American farms, a substantial drop from the 5.3 million counted in 1949, and they fall into four broad economic groups. There are 100,000 large, prosperous "factories in the field," with their minutely integrated production supervised by owners and managers in Cadillacs or light aircraft. These supply 26 per cent of total farm sales and their income is subsidised, like everybody else's, by the present price support system. A Mississippi cotton farm, for instance, last year put over a million dollars' worth of crops under government "loan," which is a euphemism for government purchase at an artificially high price. At the bottom of the scale there are two groups: some 1.7 million farms which are little more than residences or part-time hobbies and contribute little to the market, and over 1 million pathetically small and poverty-stricken farms, mainly in the south, which account for 8 per cent of agricultural output. These are not much helped by the price support system, except in so far as uneconomic little cotton farms are kept in bare existence by it.

When the politician says that the "family type farm" is an essential part of the American "way of life," he is speaking, or ought to be speaking, only of the remaining group, of rather over 2 million farms, which supplies 60 per cent of total agricultural output. Although income statistics are very inadequate, the Conference on Economic Progress makes a rough guess that the average income of families in this group from all sources is now about \$4,000 a year. This is, again very roughly, an income of the same order as that of the average industrial worker's family. This is not black poverty but, on the other hand, most farms of this type are now highly capitalised; it is fair to say that, except in wartime, these farmers do not get much of a return on their investments.

The great merit of the expert studies is that they divide the situation up into its constituent problems. The one million able-bodied farmers under 65, with family incomes of less than \$1,000 a year, obviously present a major social challenge which cannot possibly be met as a by-product of

general agricultural policy. Eighty per cent are poor whites and Negroes in the south; there are large poverty-stricken areas, especially in the southern Appalachian Mountains, where the conditions of life bear little or no resemblance to those normally associated with the United States. In many of these areas, the land is unsuitable for modern farm machinery. Either industry must be brought in or the people must be persuaded to migrate to the centres of industry. Unfortunately this is a long term approach. In the short run the heartrending cries of small cotton farmers who have had their plantings compulsorily reduced from, perhaps, twelve acres to seven because America is losing its export market provide a strong motive for Southerners in Congress to line up support from other geographical sections behind a policy of dumping cotton abroad.

The real agricultural problem is that of strengthening the true family farmer—America's backbone as he is often called. The grave defects of the present system of government loans are now more generally understood. It is not simply a question of the surpluses that have been built up but of a system which is altogether too indiscriminating. It encourages maximum production on the limited acres that may still be planted to the basic crops, especially wheat and cotton, without sufficient care for quality or for the state of the soil.

The various suggestions made by the experts all involve two features. One or other of the possible schemes for a "soil bank," which would make it worth the farmer's while to turn part of his land over to soil-building crops,

should be tried; perhaps the government should even lease acres from the farmer in order to keep them out of production for a while. Secondly, long-run plans should take account of the fact that, as the population rises and living standards rise with it, there will be a greater proportionate demand for animal products and less for cereals. Other ideas that have been put forward either tinker with the defects of the price support system or recommend that it should be scrapped in favour of direct subsidies.

The Secretary of Agriculture's National Advisory Commission and the American Farm Bureau Federation, the largest organisation of farmers, both of which met this week, spurned direct payments, stuck to the flexible price supports introduced by the present Administration, and endorsed the principle of the "soil bank." This is now included in the government programme, to be put before Congress early next year; other proposals in it are that controls should be eased on maize and wheat when used to feed livestock, and that an upper limit should be fixed on the amount paid to each farmer under price supporting operations.

But all long-term agricultural planning by the experts is over-hung, just as are all current attempts by the politicians to produce a satisfactory compromise, by the huge surpluses already in existence. The most difficult agricultural pressure to resist during the next session of Congress may be the demands from many different quarters that the situation be relieved by the kind of give-aways to other countries which keep the State Department awake at night for fear of reactions abroad.

Mr Dulles on the Spot

AFTER conferring with President Eisenhower and leading members of his Administration about the legislative programme that will be submitted to Congress in January, Democratic leaders agreed that in matters of defence and foreign policy bipartisan support continued to be the order of the day. It will, however, be a surprising instance of political self-denial if this agreement is carried out, for not only is there an election year in the offing but, through a combination of circumstances and blunders, the Administration's foreign policy is at present highly vulnerable.

In the Far East Russian propaganda and the antics of its leaders have been aided by Mr Dulles's ill-timed reference to the "Portuguese province" of Goa and by the suicidal obstinacy of America's especial ward, General Chiang Kai-shek. Despite personal appeals from President Eisenhower, Formosa chose to veto the admission of Outer Mongolia to the United Nations and thereby destroyed, temporarily, a "package deal" to admit a group of nations, many of them allies of the United States. Mr Dulles and Mr Lodge were left holding an empty bag. In the Middle East, Soviet blandishments have stolen a march on American diplomacy and the tense Israel-Arab situation threatens to complicate the cold war. In Europe, Soviet intransigence at Geneva has underlined once more the bitter truth that Germany cannot be reunited without Russian consent, however hard Mr Dulles may try. But above all, American diplomacy throughout the world seems to many observers to have lost much of its elasticity and impetus and Russia appears to be setting the pace.

In an able speech before the Illinois Manufacturers' Association, Mr Dulles conceded that the cold war had entered "a new phase" but added: "We need not become panicky because Soviet communism now disports itself in this new garb." He assured his listeners that the Administration would not reduce America's armed striking power nor its foreign aid programme and said that the latter would be handled with "somewhat more flexibility than heretofore." This assurance, combined with reports that the President would ask Congress to appropriate as much money as last year for foreign aid, appears to mark a compromise solution between those who favoured a curtailment of foreign aid and those who were pressing for greater expenditure and bolder conceptions. No doubt Mr Dulles has sound reasons for marking time, but it is not an attitude calculated to capture anyone's imagination or to evoke the loyalty of those Democrats who are already campaigning for the White House.

Knowland Rushes In

SENATOR KNOWLAND has rushed in, or has at least appeared on the threshold, where other Republicans fear to tread. He has failed to deny a newspaper report that he will announce his candidacy for the Republican presidential nomination at the beginning of February, if President Eisenhower has not before then declared his own intention of

THE ECONOMIST, DECEMBER 17, 1955

standing again. If he does, Mr Knowland insists that he will give his complete support to the President's election campaign, although this seems a little surprising in view of the Senator's recent criticism of the Administration's foreign and fiscal policies. It is his position as the heir of Senator Taft's conservative outlook which makes Mr Knowland more ready than is the party organisation to press the President for a decision. For Mr Knowland knows that the longer this decision is delayed, the more certain it is that, if Mr Eisenhower does not run, the Republican National Committee, if not the President himself, will choose the party's nominee. Even if the committee's sympathies did not, as they do today, follow the middle road mapped out by Mr Eisenhower, the members are well aware that only that road can lead to victory; there is therefore little chance that they would choose Mr Knowland.

The Senator argues, and there are many Republicans who will admit in private that his argument is sound, that it is unfair and undemocratic not to give the rank and file of the party an opportunity of showing what they think about potential candidates—and the candidates an opportunity of building up support among the rank and file. It is here that February 1st becomes an important date. For during that month begin several of the primary election campaigns, where such opportunities are provided; in these elections the voters in certain states—New Hampshire is the first, on March 13th—choose between at least some of the contenders for their party's presidential nomination. There is nothing to prevent others besides Mr Knowland from entering primaries, even if Mr Eisenhower has not announced his intentions by then. But until he has definitely said that he will not run again, these elections, which are in effect popularity contests, will be so overhung by the Republican voters' worship of the President that they will provide little guidance for the nominating conventions. This week's rather disturbing medical report strengthens Mr Knowland's argument, for it makes it even harder than it was for Republicans to convince themselves that the President will indeed be a candidate in 1956.

No Milktoast Movement

IN the words of its first president, Mr George Meany, the newly established American Federation of Labour and Congress of Industrial Organisations "is not going to be any milktoast movement." It already numbers 15 million workers and concluded its first convention by resolving to recruit 15 million more, particularly from the chemical, textile and construction industries. The AFL-CIO also showed a surprising ability to silence opposition within its own ranks and, as the closing gavel fell, it did look as if the new giant had come to stay on the American political and economic scene.

An impressive list of politicians from both parties paid their wary respects to the convention. None was more enthusiastically received than Mr Adlai Stevenson, especially when he attacked the "right-to-work" laws now enforced in nearly twenty states. These laws make illegal any contract which compels an employee to become a member of a trade union. The unions have long opposed these laws, on which the Administration has not taken a

THE THINGS WE DO FOR YOU - 6

You can live

all your life without placing a single contract with a Simon company and yet be beholden to the Simon Engineering Group for many things you take for granted.

For illustration, there follow a few words

on sulphuric acid

Sulphuric acid is so versatile and vital that without it industry would be hamstrung—perhaps you remember the sulphur-scare of 1951? Most of the modern contact sulphuric acid plants in the British Isles have been built by Simon-Carves, and the great tonnage of acid flowing from these plants enters in one way or another into the production of many of the things you own and use and wear and work with and travel by and couldn't do without. Divest yourself of everything for which sulphuric acid is directly or indirectly responsible, and you'd be largely immobilised and half-naked and perhaps even half-dead.

united stand, because they allegedly impose unfair restraints on attempts to organise workers and in that way depress wages. Mr Stevenson's endorsement of this view may alienate some of his moderate supporters, but it is a logical step in his attempt to bring the new labour federation squarely into Democratic ranks.

That the AFL-CIO's political ambitions may, however, extend farther was suggested by a clash between Mr Meany and Mr Charles Sligh, chairman of the National Association of Manufacturers. The NAM, an organisation of some 20,000 industrialists with strongly right-wing instincts, had invited Mr Meany to address its annual congress. Mr Sligh expressed the fear that the AFL-CIO would become a "ghost government" ruling the nation for the benefit of organised labour. Mr Meany retorted angrily that, if attempts were made to "disenfranchise unions" and prevent the federation from playing a legitimate political role, it would have no choice but to "start a labour party." No doubt tempers will cool and even the most sanguine labour leaders will realise that they cannot commit their 15 million adherents to a given political party or cause. But to many Republicans, and even to conservative Democrats, the determination of the AFL-CIO to eliminate the independent worker from industry and to play big-time politics will not come as reassuring news.

Ballistic Family

THE annual skirmishes between the three armed services, with each trying to prove to the public that it deserves a larger share of the defence budget than the Administration is prepared to grant it, have taken a fresh and, on one occasion, a spectacular form this year. About a month ago a match was staged between the Army's Nike, its anti-aircraft guided missile, and the Air Force's Matador, its jet-engined pilotless bomber. The Air Force had contended that the Nike, now installed to defend a number of important targets in the United States, was ineffective against supersonic aircraft; a series of misses by the Nike was followed by a double hit on the Matador, with both sides claiming that the decision was in their favour. This year's military rivalries centre round new weapons of these and many other more sensational types; it is known that more of them are now sufficiently developed to come into general military use and that spending on them is to go up. No one, however, seems to envy the Air Force its monopoly of the intercontinental ballistic missile. This is still under development, and is said to be meeting so many difficulties that a medium range—1,000 to 1,500 miles—ballistic missile, based on a ship, may, it is thought, be ready sooner.

Reports about these missiles appeared in the obviously inspired accounts of how work on a variety of new weapons was progressing which were published by several responsible military correspondents last Saturday. As a result, the Secretary of Defence, Mr Wilson, on the same evening announced that the programme for both long and medium range "surface-to-surface ballistic missile systems" had been accelerated, and that it had reached a stage where development and testing facilities must be expanded, with the ultimate objective of providing a whole family of such

missiles. While each service department had been performing specific tasks in this programme, the definite division of responsibilities between them was now necessary, co-ordinated by the Department of Defence. But Mr Wilson was not yet ready to say exactly how the lines were to be drawn, and it is presumed that here, as elsewhere, there are still rivalries to be soothed. This was the first time it had been acknowledged officially that work had begun on a medium range guided missile, but Mr Wilson denied, without carrying much conviction, that he had been influenced by recent reports of Russian progress in this field.

Education's Santa Claus

AMERICA'S privately supported colleges, universities and hospitals awoke last week to find their Christmas stockings magnificently filled by the Ford Foundation. In the largest philanthropic gesture in history, the foundation decided to give away \$500 million—\$150 million more than the total gifts made since its establishment and far more than the total assets of most of the other charitable trusts. The recipients, ranging from small liberal arts colleges and hospitals to the major universities, were so surprised by the news that many of them thought it was a Christmas hoax; but by next July half the money will have been paid out.

Six hundred and fifteen privately financed institutions of higher learning will receive \$210 million to enable them to raise teachers' salaries; as distinguished from a grant of \$50 million made last March, the present gift will not have to be matched by funds raised by the colleges from other sources. That means that teachers in all private institutions will profit equally. A further \$200 million will be given to some 3,500 hospitals supported by voluntary contributions so that they can improve their services. Finally, \$90 million will be set aside for the benefit of forty-two medical schools to help them to strengthen their teaching staffs. In making these grants the foundation specified that no college or university was to receive more than \$5 million—the amount given to New York University. The top grant to a hospital was \$250,000.

The trustees of the Ford Foundation were not only heeding the Christmas spirit—they were also being very practical. The foundation, and especially its off-shoot, the Fund for the Republic, have recently come under heavy political fire. The Fund for the Republic, which is devoted to promoting civil liberties, has been attacked for being left-wing and the foundation itself has been criticised for not doing enough to help small communities and less known centres of learning. Its present gift should do much to silence the critics. Moreover, the Ford Foundation is so prosperous that it has been threatened with "cash indigestion." When its holdings of Ford Motor Company stock go on the market next month, the foundation will receive \$400 million or more. But to invest so enormous a sum of new money in corporate securities is exceedingly difficult and any attempt to do so quickly would upset the bond market. Consequently, the foundation will have to retain much of this sum in liquid form while gradually investing the balance. By getting rid of a large part of its present holdings, the foundation will find it easier to absorb its new wealth.

Consumer on the Couch

FROM A SPECIAL CORRESPONDENT

THE American advertising man, usually one of the more enthusiastic practitioners of positive thinking, has recently tended to daydream about a lady whom he fondly calls Mrs American Housewife, or even Mrs Middle Majority. No heiress has ever been wooed with more flattering attention than this modest controller of the family purse strings. But the "adman" who spends \$8½ billion a year on the art of persuasion is taking no risk of losing his quarry through any unsuspected or wayward whims. In order to put his dreaming on a scientific basis, he has enlisted the aid of Freud to probe the lady's innermost feelings and basic urges. If she is hampered by guilt feelings about using cake mixes, for example, or suffers a traumatic aversion to prunes in the depths of her id, he will be ready with a therapeutic advertisement.

The vagaries of the consumer have become a weighty economic factor in the current era of abundance and consumer unpredictability casts a shadow over what would otherwise be an advertiser's Utopia. Advertising volume is expanding at an even greater pace than is the economy as a whole, and nationwide advertising is growing at the expense of local advertising. Business men, facing the alternatives of "promote or perish," are upping their advertising budgets. Statistics about production strike the ear with a satisfactory boom, and visions of infinitely expanding markets are suggested by such social phenomena as the flight to the suburbs and the "levelling up" of popular tastes. Certainly the consumer is spending as never before, but has he the physical capacity to swallow, say, six times as many bottles of soft drinks in 1955 as he did in 1954, which is what the promoters have planned for him? Somehow he must be cajoled or coerced into ever greater consumption.

A battle is now raging between two factions of "motivation researchers" (the latest class of market analysts) as to the best ways to find out how people really feel about a product. Disparagingly known to each other as the "head shrinkers" and the "nose counters," they disagree on whether a method using clinical tests such as three-hour "depth interviews," Rorschach or ink-blot tests and sentence completion tests conducted on about 250 individuals provides a better clue to public attitudes than direct questioning of thousands of people. While the quantitative or "large sample" approach is considered superficial, the qualitative or "small sample" approach is criticised for, among other things, assuming that the motives of 250 are a guide to the motives of millions, and for producing conclusions of such doubtful advertising value as that men hesitate to ride in airplanes because of an unconscious fear of having sexual relations with strange women. Nevertheless, probably more than half of the big advertising firms have added psychologists to their staffs and their findings have dictated many recent changes in both design and promotion.

To be effective psychologically an advertisement must "sell emotional security" rather than, as often in the past, stimulate fear and insecurity. The advertisement should create for the product a personality which fits the potential buyer's picture of himself. Because of its association with thugs, the cigar was consigned to near oblivion in the

nineteen-twenties, but was restored to eminence by a subtle campaign suggesting that Sir Winston Churchill, President Roosevelt, General MacArthur, Babe Ruth and others were devotees. The advertisements should also relate the product to one or more of the basic human drives—sex, security, sustenance and status. "Crunchiness" in breakfast foods satisfies the cruncher by allowing him to work off his hostility, serving both sustenance and security. As one executive put it: women do not buy cosmetics but hope, not perfume but allure, and they "are willing to pay more for hope and allure than for lanolin and witch hazel."

If there is a monument to the ingenuity and technical genius of the modern advertising man, it is probably the supermarkets, those dazzling emporia where an average of 4,000, and occasionally as many as 15,000, items sell themselves to the housewife. As a laboratory for the study of buying habits and advertising effectiveness, the supermarket is unsurpassed. Films of the shopper's behaviour reveal that more than half of her decisions are made on impulse. Even the number of times she blinks while shopping (14 times a minute as compared to 45 while paying) has been counted and unblinkingly interpreted as evidence that she buys in a semi-hypnotic trance, doing many things she did not intend. In order to snare her "impulse dollar" and insure that she buys a "flash-frozen" guinea hen stuffed with wild rice and cognac instead of the tin of beans she intended, the advertiser depends more and more on subjective "point-of-purchase" appeals, particularly displays and packages. Descendants of the impassive cigar store Indian, today's displays are frantically animated, assaulting the senses with light, colour and motion. The package, which has sparked the growth of a whole new industry, may make or break the product, depending on how it strikes the eye, promises "convenience" and is endowed with the "come-hither" look.

The grocery business's hope of increasing its share of the consumer's dollar depends in part on hard selling in competition with automobiles, foreign travel and other luxury goods and services which are also now being vigorously promoted. It probably will not be long before motivation researchers are called upon to discover how many fillet steaks equal a Cadillac and how many lobsters balance a trip to the Acropolis in the consumer's subconscious. Cadillacs, after all, are coming in a new streamlined package every year, and foreign travel, within the means of everyone, can be had in the "package tour."

UNEMPLOYMENT in the UNITED STATES
AS PERCENTAGE OF CIVILIAN LABOUR FORCE

The World Overseas

Pipeline versus Tanker

WHAT is the correct charge for oil that travels to market by overland pipe, instead of by sea and by tanker, when the pipe confers a major saving of money on the owners and operators of the oil, but runs through a third party's property? What is the fair price chargeable by that third party? Here is the question that underlay the several years of negotiation between the Iraq Petroleum Company and Syria that ended last week, when the Syrian parliament ratified an agreement that settles new rates and is said to write off all old grievances.

The reason for so protracted a haggle becomes obvious if one glances at the map and reflects on the psychology of the Levant. For the Middle East's oil lies in the east—in Iraq, Saudi Arabia, Iran and the sheikhdoms of the Trucial Coast—while to the west, three "have-not" states look on with envy. Until a decade ago, Syria, Lebanon and Jordan were, like the owl in Alice, content with a minor share of the treat; they were ready to welcome pipeline companies, to sell them the necessary long narrow strips of freehold land, and to look forward to a dividend from what had been useless desert in the shape of small security, transit and loading fees. But this scale of values has altered at sight of the mounting oil-revenues accruing to neighbours. Minds have been stimulated into calculating that ownership of the lands through which the oil must pass *en route* for its biggest market is an asset just as fortuitous, and just as exploitable, as the possession of subsoil wealth.

The company sees the matter differently. Western minds are bred on the notion that transit dues bear no relation to value, and ceased to be vexatious with the Barcelona Conventions of 1921. The IPC felt that it had done well by the countries of transit by lodging a major capital investment there, and by yielding them some regular employment and dependable cash dividends at no cost or risk to the receivers. At intervals since 1950, it has revealed some sensitiveness to the trend of local opinion by stepping up its offers of recompense, but, each time until the last, its

figures have been so much in arrear of Syrian and Lebanese thinking that none has been accepted. Meantime, the company too has contracted a grievance in that under the old agreement, on the basis of which it had perforce to continue its operations, the Syrians pinned it down to a piece of tit-for-tat in the shape of an exchange rate so disadvantageous that Syria was making an annual profit of £1 million sterling on company purchases of Syrian currency. Thus each party was feeling sore when, once again this year, they set about negotiating a new arrangement.

The compromise reached, which is a monument to the patience of the negotiators, has two main virtues. The first is that it aspires to cure the old accumulation of resentment on both sides. It provides for a down payment by the company of £8½ million sterling, in settlement of all outstanding claims. The second is that it establishes a basis for calculation of the charges that the transit country can reasonably make, and that the basis finally agreed is logical enough to offer some promise of durability.

The accompanying map shows that the oil piped to the Levant coast comes from two kinds of source—the one seaboard Arabian fields whence an alternative route is open *via* tanker and *via* Suez; the other, inland fields in Northern Iraq which enjoy no such easy alternative. Only the rate for the latter was being negotiated. But the negotiators were able to agree on two cardinal principles—the first, that the cost of carrying oil by pipe from Arabia could not exceed that of the same oil carried to the same coast by tanker; the second, that the price of oils of equivalent quality reaching the Mediterranean coast must be roughly the same whatever their source. The new tariff per ton and per 100 miles piped is therefore based on the cost of operating a tanker from the Gulf to the Mediterranean, set against a pipe-mileage figure that yields Syria a result of 1s. 4d. per 100 ton-miles. When to this is added a terminal loading fee of 1s. 1d. per ton at Baniyas, Syria's consolidated dues on the 26 million ton throughput that is anticipated in 1956

will be £6½ million sterling; the contrast with the old earnings, which were approximately £1½ million sterling per annum, including the profit on exchange, shows that the Middle Easterners are not the only people with a changed scale of values; the company, too, has moved with the times. The management of its fellow-pipeline, the Trans-Arabian company, is now being pressed by both Syria and Lebanon to pay transit dues on a similar basis, and is likely to fall in with their wish.

So much for the present: nevertheless, the future offers no grounds for complacency. The degree to which pipeline charges remain the sport of local politics is suggested by the strange majority that sanctioned ratification. Out of a Syrian parliament of 142 deputies, only 56 were bold enough to stand up for what was logically attainable (as against the dream figures being propagated by hyper-nationalists, or by Communists who want to worst the West by every available means, or by recipients of the Saudi-Arabian moneys that have changed hands during the current Saudi campaign for worsting Iraq). Nineteen members voted against ratification; most of them were people who prefer to be tempted by the current offer of a refinery and oil deliveries from Russia. No less than 66 abstained or stayed away, presumably in order to feel free to look askance at the agreement, if expedient at some later stage in home politics.

Protecting Foreign Investor

What protection can the foreign investor devise against their vagaries? One method is to interweave his enterprise with that of local entrepreneurs to a degree that causes these last to want to further, and not hinder, his operations. Experience elsewhere has proved that once local industries grow dependent on smooth operations by the oil company, its rating in parliamentary esteem changes for the better. Another technique would be to agree with foreign fellow-investors on a limit of endurance and then to stand upon it. But such agreement between IPC and Tapline is limited by the American anti-trust laws which have in the Middle East one disastrous effect unimagined in the Middle West. By inhibiting mutual consultations between the companies even on matters only remotely related to price, they shackle the latter in their contests with orientals who are adepts at playing foreigners off against each other.

There remains, therefore, only the protection offered by alternative routes. Seaboard oil, such as that of Arabia, can as easily travel by tanker; one effect of pressing for pipeline charges that equal tanker charges is to enhance a future preference for tankers. But inland oil is less comfortably placed. Practically speaking, Iraq is not quite inevitably Syria's prisoner. There is no physical obstacle to establishing an alternative route *via* Turkey, or by all-Iraqi pipe to a marine terminal on the Persian Gulf. But the economic obstacles are enormous. A capital investment of £40 million has been sunk in Syria; who wants, unless needs must, to sink perhaps another £60 million on the longer alternative haul through Turkey, or to pipe oil to a south coast where it is already available at negligible transport cost?

Yet there could come a point at which a decision that looks mad today will be weighted otherwise by the erratic course of Syrian politics. These are fast turning investment in pipelines that cross frontiers into a hazard that cautious investors would like to avoid.

Red Roses Across Asia

FROM OUR SPECIAL CORRESPONDENT

THE dwellers in Soviet lands will be able to watch almost every step of Mr Khrushchev's and Marshal Bulganin's triumphal progress through Asia. In every Indian and Burmese town through whose crowded streets the impressive Soviet motorcade has rolled, the Russian leaders' open car has been preceded by a truckload of movie cameramen, facing backwards, crouching low and cranking like mad. Meanwhile, Indian and Burmese cinemas are showing the Soviet films of Mr Nehru's and U Nu's tours of Russia. The cumulative celluloid impact on the masses of all these demonstrations of brotherly love is likely to be considerable.

The spectacle of two small elderly men in bell-bottomed trousers indefatigably traversing Asia preceded by a film truck would by itself be fairly laughable, but in addition Mr Khrushchev has missed no opportunity for amiable clowning, and has done almost everything except the Indian rope trick. He has worn Gandhi caps and embroidered hats, waved jewelled scimitars, beaten drums, embraced dancers, ridden elephants and had *kumkum* smeared on his forehead by young Hindu women. Most of the time, Marshal Bulganin has just trailed along, like the fourth Marx brother watching the other three perform.

The Russians have been travelling on a carpet of rose-petals thousands of miles long, kindly laid down for them by the governments who are their hosts. The loudspeakers, the elaborately decorated forums, the triumphal arches, the Soviet hammer-and-sickle flags obediently waved by the well-drilled schoolchildren along the route, have all been supplied by courtesy of Mr Nehru and U Nu. Indian maharajas have fought to be in the receiving line, and some local dignitaries have vied with one another in reviling "capitalism and imperialism" on the same platforms as the Russians.

Fidgets in Calcutta

All this has sustained Mr Khrushchev's good humour, so that he has been able to deliver his fieriest speeches against the West on nothing more potent than plain water and coconut milk. It also encouraged him to bait the Western newspaper correspondents on the tour in language which has been increasingly provocative. The West's reaction to his attacks has not abated Mr Khrushchev's high spirits. He looks on the country like a man who is rubbing his hands over it.

The same cannot be said for other members of the Russian party. Marshal Bulganin has preserved a calm inscrutability, but some of the others began to get the fidgets in Calcutta and have displayed increasing nervous irritability ever since the Calcutta mobs swarmed over the Russian leaders' car and forced them to take refuge in a police van. This applies especially, and perhaps understandably, to the Russian security officials, led by General Ivan Serov, the successor to Beria as head of the political police. While Mr Khrushchev has been attacking the West and baiting the Western pressmen without ever losing his broad smile, General Serov has been flying into childish tantrums. When

he announced at Bangalore that Russia had added to the world's collection of big bangs, and that this was the "proper answer" to the world's warmongers, Mr Khrushchev somehow managed to make it sound less like Big Brother in an ugly mood than like a righteous man girding on his armour purely for defence. But when General Serov, with icy venom, told a British photographer, "If you were in Russia you would be beaten up," shudders ran down quite a few spines, including those of Soviet reporters. When not in one of his rages, however, General Serov is merely an unobtrusive little man in a grey suit, and what the masses of Asians see is not Beria's successor being vindictive but Mr Khrushchev beaming.

The hysterical adulation which greeted the Russians in Calcutta was not equalled in other Indian towns, and in Burma the Soviet circus flopped badly enough for a Rangoon newspaper to make fun of it. The *Nation* pointed out ironically that the many sins of the British included teaching the Burmese such things as parliamentary democracy, which impeded Burma's progress towards the true goal of the one-party State, presided over by beaming Khrushchevs and ruled in day-to-day practice by snarling Serovs. Even the Calcutta mob scenes were more a product of Mr Nehru's warm-hearted encouragement than a symptom of genuine interest in the Soviet wonderland: Mr Nehru had told the Calcuttans to get in there and cheer, and Calcuttans love *tamashas*. They might have thronged the streets just as eagerly if Mr Khrushchev and Marshal Bulganin had been on their way to be hanged.

Well-drilled Schoolchildren

What was very evident was that Mr Nehru and U Nu showed an oriental determination at the least to equal, and if possible to surpass, the welcomes they had received in Russia; and that they were not above employing Soviet methods to achieve this goal. In both India and Burma the cheering, slogan-shouting, hand-clapping schoolchildren were lining the route by order; and the spectacle of those thoroughly rehearsed children doing what they had been told to do was far from funny. As the *Madras Mail* pointed out, in ten years or so these children will be voters, and "what could not have been done in ten years' indoctrination may have been achieved in one red-letter day"—at the instance of the Indian government. In Burma, the spectacle was still more painful, for the children lining the Russians' route shouted their slogans off pieces of paper supplied by the Burmese authorities. "Long live Bulganin and Khrushchev," they chanted. "Long live Burmese-Soviet friendship."

"Long live John Foster Dulles," suggested one of the wicked Western correspondents.

"Long live John Foster Dulles," obediently echoed the children.

"Long live Coca-Cola!"

"Long live Coca-Cola!"

Mr. Khrushchev and Marshal Bulganin can hardly be blamed for taking the fullest advantage of the opportunity afforded them by the Indian and Burmese leaders to make Communism appear thoroughly respectable in the eyes of the Asian masses, and, correspondingly, to make the West appear odious.

"Christmas Day" in Laos

ON December 25th—because it is the last Sunday of the year, and not because that date has any special significance to a Buddhist population—the Laotians will go to the polls. In so doing, they will fulfil, with six days in hand, their compact under last year's Geneva agreements, which laid down that general elections should be held in Laos in 1955. Under the country's constitution, the elections should have been held on August 28th; they were postponed by decision of the National Assembly and of the King's Council, in order to explore the remaining chances of an agreement with the Communist leaders of "Pathet Lao," the mythical state set up at the point of Viet Minh bayonets in 1953. The constitution provides that elections should be held on a Sunday: December 25th was thus the last day of the year on which the elections could be held.

Besides being the smallest of the three states of what was formerly French Indo-China, Laos is the most inaccessible and the most undeveloped. Almost impenetrable jungles and towering hump-backed mountains lend remoteness to

places that look close together on the map. The protection of his surroundings has helped Prince Souphanna Vong, the Pathet Lao leader, to retain his hold on Phong Saly and Sam Neua, the two contested provinces of his realm. And it is now clear that the Royal Government will not be able to regain control over the two provinces by constitutional means. Communist strategy has been to treat Laos in the same way as the genuinely divided countries—Germany, Korea and Vietnam. Though

few people had heard of Pathet Lao until the Geneva conference met, the Communist negotiators succeeded in getting at least its existence as an organisation recognised. But the authority of the Royal Government over the whole country was at least tacitly acknowledged, and the government declared that it would take measures to ensure special representation for the two provinces in the interval between the cease-fire and the elections. In practice, however, the government has been unable, even with the co-operation of the international supervisory commission, to assert its authority over the disputed provinces. With Viet Minh support, the Pathet Lao has repulsed with force all attempts by the royal army to enter the provinces and has played for time at the discussions that have alternated with periods of fighting.

When the two sides at last met in formal conference, at Rangoon in October, it was hoped that agreement might be

reached; and indeed, an agreement on a cease-fire was rapidly concluded. But when the conference resumed at Vientiane, the administrative capital of Laos, early last month, the Pathet Lao delegate, Phoumi Vong Vichith, put forward a series of demands, some of which, including requests for guarantees against abuse of democratic liberties and for freedom from reprisals or discrimination, were accepted by the government representative, Thao Nhoy Abhay. But there were also unacceptable proposals including a demand that the date for the nomination of candidates should be extended to November 12th; the government, which had already granted an extension from October 11th, the legal date, to October 31st, refused a further extension. In so doing, and in rejecting other unconstitutional demands, the government delegate reminded the Pathet Lao that the final declaration of the Geneva conference specifically laid down that elections should be held *according to the constitution*. When the Pathet Lao delegate insisted on maintaining his original demands, the government had no alternative but to call off the conference. The elections will thus, as the government has explained in a detailed statement to the chairman of the supervisory commission, be held only in the ten provinces that it controls.

There is little significance to the outside world in the contest between the Progressives led by the Prime Minister, Katay Sasorith, and the Independents led by the Foreign Minister, Phouy Sananikone; the two parties are little more than private factions, and they may be expected to co-operate as amicably after the elections as before. The long-term danger of the Communist provinces will remain. Despite the declaration of peaceful intentions by the Viet Minh Foreign Minister, Pham Van Dong, at the Bandoeng conference, there is little doubt that the 5,000-strong Pathet Lao "fighting units" are officered and advised by the Viet Minh. The government forces are probably five times as numerous; but any large-scale fighting between both sides would threaten to involve the South East Asia Treaty powers (who are pledged to defend the integrity of Laos) against the principal Communist powers of Asia—China and the "Democratic Republic of Vietnam."

German Industry Through British Eyes—II

BY OUR CORRESPONDENT LATELY IN GERMANY

TEMPELHOF airport is ten minutes' drive from the Kurfürstendamm, which makes Berlin the only major city with the luxury of air transport at its door. Each day between 400 and 500 refugees from the eastern zone are flown out from Tempelhof to Western Germany, a high proportion of them boys and young men. The flow through Berlin represents about two-thirds of the total who cross the border. What German industry would have done without this steady influx of labour is difficult to imagine.

Until a short while ago, the major pre-occupation in Germany was to find work, not to find workers. The spectacular recovery that has brought Germany back into the international markets as a major competitor of Britain has been carried out largely in the capital goods industries and

in building. These are the industries with rapidly lengthening order books—up to two years' delivery is becoming usual—with labour shortages and with wage claims to face. The sector making consumer goods has not shared in the same prosperity, although its turn may be coming.

One of the symptoms of internal strain has been the steady drift of men away from the mines into, it is said, the building industry; 10,000 have left in the past six months and the pits are short of between 20,000 and 30,000 men. Given the men, many people believe that Western Germany could produce enough coal to meet domestic requirements. As it is, the country is importing 9 to 10 million tons a year from the United States at 25 to 35 D-marks a ton more than German coal.

The textile industries, on the other hand, are generally as depressed as they are in England. It is estimated that about 500 million D-marks a year need to be spent on re-equipping them; during the past five years the average level has been 200 million D-marks. Although textile output has expanded, the increase has been slower than in the rest of the German economy, and the proportion of personal incomes spent on textiles is still falling. The same is true of the shoe and leather industries, and the rest of what are usually described as "soft" consumer goods. Rough estimates suggest that these industries are working to between 60 and 70 per cent of their capacity. It is debatable, of course, how much of this is due to an injudicious expansion a few years ago.

40,000 Scooters a Year

The trade unions, pressing for higher wages, argue that a bigger wage packet will help these industries, but it is possible to pick holes in their reasoning. As in Britain and in the United States, German consumers are showing a greater taste for the durable consumer goods, cars, refrigerators, television sets. Textile consumption per head in Germany is roughly half what it is in the United States; there is no reason, however, to believe that it is held down because of shortage of spending power. Given the amount of overtime that they work, the average German takes home quite a substantial pay packet.

It is more probable that any additional spending power will go to swell the demand for the steel-using consumer industries. A high proportion of the inflated orders for machine tools and other capital equipment comes in fact from the consumer industries. Several of the prewar manufacturers of such things as refrigerators are now planning to go back into the production of household goods for the first time since the war. The output of television receivers in a country where the television service is barely starting will reach 350,000 this year and should be running at 550,000 in 1956. The Volkswagen factory is reducing the proportion of its output sent abroad in order to meet home demand. In the south the BMW motor works is able to market 6,000 luxury cars a year in spite of competition from Mercedes, and is putting down production lines to build 40,000 Isetta scooters a year (licensed from Italy) because the German workman now prefers to ride to work under cover. The steel industry has installed one wide strip mill, and has two more scheduled for delivery in 1956, giving a total capacity of 3 million tons of wide strip a year. The biggest customer for this is the motor industry.

The government is attempting to check the demand for capital goods by allowing the tax concessions on investment

to die naturally at the end of the year; by budgeting for a 20 per cent real cut in the heavy physical volume of government building; and by holding on to a steadily accumulating budget surplus (to be spent on armaments, much of them imported, over the next three or four years). The central bank is attempting its own version of the credit squeeze; both sides are mildly satisfied with the results of the first few months' use of these classical weapons. But their calculations could so easily be upset by a general rise in wage levels, and it is puzzling to see how this can be avoided. A few weeks ago, industry and the unions faced a test case, a threatened strike in the steel industry over a claim for a 12 per cent wage increase. A rise in steel wages would not automatically lead to higher prices—as the unions point out, industrial profits are very high, and have up till now been used to finance a certain amount of reconstruction. Now that reconstruction is largely completed, higher wages could be paid out of those profits without affecting prices. But higher steel wages mean higher coal wages. Higher coal prices, which would follow automatically unless the government decides on a subsidy, certainly mean higher steel prices. And wage demands are not going to stop in the coal and steel industries only.

A situation of this kind is ripe for a gentle inflation in the Anglo-American sense—although certainly not in the German sense of a runaway currency. The German government is prepared to go to considerable lengths, including tariff cuts to increase imports, to prevent home prices from rising—even to the lengths of considering subsidies. In Britain, its attitude might seem unreasonably nervous. In Germany, it is conceivable that industry's lavish profits provide at least a temporary buffer out of which to meet higher costs without in fact raising prices. The moral is that British exporters should not be too complacent in the interpretation that they put on these domestic developments in Germany. Only if the Germans' appetite for cars and palatial offices (which are planned on a scale that dwarfs their British counterparts) and, above all, for housing, continues without check, will the situation get out of hand.

(Concluded)

Rumania's Party Congress

BY A CORRESPONDENT

FOR the third time in the last two years, the Rumanians are engaged in exhausting "socialist and patriotic emulation in honour of the historical Second Congress" of the Workers' Party (Communist), which is to open next Friday. The congress should have been held, at the latest, in February, 1951. It was not, however, until August, 1953 (when the "new look" economic policy was adopted), that a date was fixed for the following March. But March, 1954, came and went without any congress, and on April 20th the central committee belatedly announced that it would be held six months later, on October 30th.

This time it looked as if the congress really was going to materialise. Its agenda was published in August; there was a press campaign and "socialist competitions" and by October the papers were full of reports of "Labour heroes"

who, in honour of the congress were already fulfilling their norms for "1980" and even the year "2000." Delegates had already arrived in the capital when, only two days before it should have opened, it was suddenly announced that the congress was to be yet again postponed. The excuse given was that the meeting would have jeopardised the autumn ploughing and sowing campaign and the collection of compulsory delivery quotas. But the assurance that it would be held as soon as these were completed was not fulfilled.

This precipitate postponement was, it seems, partly due to the Kremlin's dissatisfaction with the general situation in Rumania and with the preparations for the congress and partly to some difficulties that Gheorghiu-Dej was experiencing within the party. The first year's results of his "new course" economic policy had not been encouraging, and had caused dissatisfaction among the privileged minority of bureaucrats, including his opponents inside the party. Gheorghiu-Dej apparently feared that at the first opportunity these might close their ranks in favour of one of the "deviationists," of whom he had only incompletely rid himself. On the one hand, a handful of sympathisers with Patrascanu (the former Communist leader who was officially executed in April, 1954) was still to be found amongst the old idealist cadres and former Socialists, although most of these had been purged in the late 'forties. And, on the other hand, the sympathies of the opportunists and careerists who had invaded the Party after 1948 and now form the majority of the party bureaucracy, were with Vasile Luca. They were encouraged by the fact that Gheorghiu-Dej's "new course" policies strikingly resembled the point of view for which the former Minister of Finance had been ostensibly purged in 1952. It was difficult to predict the strength that his supporters might muster at the congress and if they were to form alliances with others of his opponents who were still in power, a dangerous situation might be created for Gheorghiu-Dej.

Ana Pauker's Future

By the time Mr Khrushchev came to visit Bucharest last summer, however, Gheorghiu-Dej appears to have got the situation within the party well in hand (Vasile Luca had been sentenced to life imprisonment in November, 1954) and the Russian leader apparently gave his blessing to new plans for the party congress. These were announced at the beginning of October, together with a remarkable reshuffle of the leadership of the party, state and trade union machine. To Gheorghiu-Dej, who had already played the parts of Rumania's little Stalin and then Malenkov, was given the role of a local Khrushchev; he relinquished the premiership for the post of First Secretary of the party and was "elected" a member of the Grand National Assembly's Presidium, according to the Soviet pattern. His faithful and intimate friends, Chivu Stoica and Gheorghe Apostol, were respectively placed at the head of the government and of the trade unions. To underline his victory, Gheorghiu-Dej obtained the appointment of two of his men, the chief planner Miron Constantinescu and Lt. General Leontin Salajan as First Vice-Premier and Minister of the Armed Forces respectively. On the other hand, the Ukrainian-born General Emil Bodnarus, was moved from the Ministry of Armed Forces and made First Vice-Premier, while the Russian-born Josif Kishinevski, a survivor of Ana Pauker's faction, left his First Vice-

Premiership to act as deputy to the First Secretary of the party.

This temporary solution of the permanent faction struggle within the small Rumanian ruling clique on which the Kremlin can rely, removed one of the chief obstacles in the way of the "historical event." The election of the central committee, which is one of the duties of the congress, is thus reduced—as it should be in the best Communist tradition—to a mere formality. But from the list of those elected it should be possible to get a more exact picture of who has been purged. There may also be some clue about Ana Pauker's future status. According to reports from Bucharest her case was re-investigated this summer, at her own request, by a Russian commission, which apparently pronounced in her favour; but there has not yet been any public statement about her future.

The agenda of the congress is now evidently sufficiently impressive to satisfy the Russians, and barring accidents the congress should really take place, and should be as cosy as a model Communist congress ought to be. The ordinary workers, however, will only be represented by the managers, the foremen and the record norm breakers, who will applaud their leaders and pledge themselves to force the workers to "fulfil and overfulfil" their norms. The latter, however, sometimes find means of expressing their discontent; recently, for instance, the miners of the Jiu Valley demonstrated against the new rise in norms and thoroughly beat up the record breakers. The army had to be called in and the valley was cut off from the rest of the country for a fortnight.

Guatemalan Eyes on British Honduras

FROM A CORRESPONDENT IN GUATEMALA

THE Guatemalan government has decided to ask the Organisation of Central American States (OCAS) to study its claims to the territory of "Belice" (British Honduras), which in the official Guatemalan view is "our territory now occupied by a foreign power." The practical value of this step is not clear, but it is obviously one more move by President Armas's government to keep the issue alive. It has already sent an appeal to the United Nations setting forth its claim, and recently it accused residents of British Honduras of illegally crossing the Guatemalan border and gathering chicle, an ingredient of chewing gum, in Guatemala's province of Peten. Several British subjects were arrested, and a prompt protest by the British Minister in Guatemala City was rejected.

Guatemala's claim to British Honduras has been used from time to time by previous Guatemalan administrations as a nationalist gesture more to divert the public's attention from domestic woes and problems than as a forerunner of any serious action to obtain control of the territory. In fact, while most Guatemalans have been convinced by constant propaganda that the territory rightfully belongs to them, most thinking Guatemalans privately admit that if "Belice" were turned over to them tomorrow, they would have a serious problem on their hands. For one thing

British Honduras is not self-sufficient and Guatemala, in its present delicate economic position, would be hard put to it to find the annual subsidy that the British Government provides for the territory. There is also a racial problem. The population of British Honduras is primarily coloured while that of Guatemala is some 65 per cent pure Indian. Guatemalans have no desire to see a mixture of the two elements and at present Guatemalan laws strictly restrict the entry of all coloured people.

For practically a year after Colonel Castillo Armas, now President, invaded Guatemala and ousted the pro-Communist regime of the ex-president Jacobo Arbenz in June, 1954, his new government was too occupied with domestic problems to give attention to the "Belice" issue. In fact, the issue might still remain filed away in the Foreign Office if it were not for some developments that are now taking place.

Last month the government began to accept applications from the major American oil companies for exploration and exploitation permits under a new oil law passed some months ago. The majority of the applicants will probably ask for concessions in the province of Peten which borders

both British Honduras and Mexico to the north and west. The Peten region is a vast jungle area, sparsely populated and with no surface roads leading to it from the rest of Guatemala. In fact, the entire area is isolated from the rest of the country except by air. For years, oil deposits have been reported in

the region and major oil companies have spent large sums on surveys. But whenever they tried to obtain concessions, they were rebuffed. The present government, however, in its anxiety to improve the Guatemalan economy has decided to allow the oil companies to go ahead.

If oil deposits should be found in commercial quantities, the problem of piping the crude oil to a convenient port for export would be a serious one. Guatemala's Caribbean coast is short and its only port is Puerto Barrios. To lay a pipe line to Puerto Barrios would involve many difficult and extremely costly engineering problems. British Honduras on the other hand has a good highway leading from the port of Belize to the border with the Peten province and the least expensive and most convenient way to export any oil would be by either trucking the crude to the port of Belize or laying a pipe line to that point. But the Guatemalan government has made it clear that it will not allow any of its oil to be brought through the "occupied territory"; and although oil deposits have not as yet been confirmed the government's stand has already brought complaints from the interested oil companies. In the circumstances, it looks as if the present efforts of the Guatemalan government to stir up the British Honduras issue and possibly to ask for adjudication of the matter by an international body, is due primarily to its need for this convenient route for the transshipment of the oil that it hopes will now be found under Guatemalan soil.

Great new port built on Gulf of Aden

On the barren, scorching peninsula of Little Aden, men and machines have moved desert sand and volcanic rock to build, for the British Petroleum Company, a modern port and a giant refinery capable of processing five million tons of crude oil a year.

With Arab and Sudanese tribesmen as the only available local labour force, the contractors, George Wimpey & Co. Ltd., had a problem when it came to quarrying two million tons of rock for the harbour. As many of the men had scarcely seen anything mechanical in their lives before, the drilling equipment had to be foolproof and easy to operate. The choice was Atlas Copco rock drills. With these machines the huge operations at Little Aden were completed in the record time of twenty-one months.

Waterways freed from ice in Sweden

Compressed air is versatile. Atlas Copco provide the means for all its many applications. From rock drills for the vast Little Aden project to specially developed equipment used in Sweden to prevent ice formations on vital navigation channels. Here Atlas Copco compressors eject streams of air through perforated pipes laid along the beds of the channels. This forces the lower, warmer layers of water upwards, thus keeping the temperature of the surface above freezing.

Atlas Copco puts compressed air to work for the world

Atlas Copco compressed air equipment is manufactured or sold and serviced in 48 countries throughout the world by The Atlas Copco Group, which includes:— UNITED KINGDOM: The Atlas Diesel Co. Ltd., Beresford Avenue, Wembley, Middlesex; SWEDEN: Svenska Tryckluft AB Atlas, Stockholm 1; FRANCE: Atlas Polar S.A., 29, Rue Marbeuf, Paris 8e; HOLLAND: N.V. Holland-Atlas, P.O. Box 6056, Rotterdam; ITALY: S.A.M.P.A., Viale Marche 15, Milan; NORWAY: A/S Atlas Diesel, Postboks 94,

Oslo; TURKEY: Atlas Copco Ticaret ve Sanayi T.A.S. P.O. Box 490-Galata, Istanbul; SOUTH AFRICA: Delfos (Pty.) Ltd., P.O. Box 504, Benoni, Transvaal; CANADA: Canadian Copco Ltd., Montreal, A.M.F., P.Q.; U.S.A.: Copco Pacific Ltd., 930, Brittan Avenue, San Carlos, California; Copco Eastern Ltd., P.O. Hats off to

structural plastics

*the new
lightweight
material
that is making
such rapid
headway*

Already well known for their more spectacular applications, such as moulded boat hulls and motor car bodies, structural plastics offer unending economic possibilities for light, strong products of modest dimensions. Protective headgear, for instance, and many items of service or personal equipment made from structural plastics would be essentially light and yet have specific strengths comparable with steel. In these,

as in structural engineering applications, wherever weight/strength problems arise or high resistance to corrosion is a prime requirement,

structural mouldings may well provide the answer. Why not get in touch with B.I.P., the polyester resin people—perhaps they can help take weight off *your* mind!

What are structural plastics

Structural plastics consist of a reinforcing agent, such as glass fibre, bonded with a synthetic resin, most commonly a polyester type resin. Polyester/glass fibre mouldings can be made either mechanically or by hand fabrication and their essential characteristics are . . .

Lightness combined with strength—specific strengths comparable with steel.

High resistance to corrosion by a wide range of chemicals, including some acids, and to all but excessive heat.

Excellent electrical properties—high breakdown and low power factor, combined with good insulating and non-tracking properties.

Unlimited colour possibilities—in opaque or translucent shades.

THE BUSINESS WORLD

Price Leadership in Tyres

IN the tyre trade the Monopolies Commission encountered an industry unlike most of the other nine on which it has so far reported, and the changes it recommends in the trade go farther than it has ever suggested for any other. One change recommended by a majority of the members signing its latest report—that manufacturers should cease to set the prices at which their tyres are sold to the public—goes, indeed, beyond a limit that the Commission has hitherto seemed to set itself. Further, it goes bluntly against one of the provisions that the Government has committed itself to include in its forthcoming and reputedly strengthened legislation on restrictive practices. Is the Commission right?

The peculiarity that the Commission distinguishes in the pneumatic tyre trade is not so much that all the makers fix identical retail prices for the same kind of tyre, and announce changes in price at the same time—but rather that it believes these prices would remain “more or less identical” even if the makers did not consult each other about keeping in step. At present, the makers do consult: under the system outlined on the next page, the Tyre Manufacturers’ Conference recommends changes based on its estimate of the future level of costs, and all the postwar changes in tyre prices, except two minor changes made in 1950, followed such recommendations. The makers are in no way bound to follow these recommendations, or to keep in step with other makers. But in practice they do, and they rigorously enforce (through the British Motor Trade Association) the identical retail prices that they set individually. Prices of the tyres that they sell in other markets—those for new vehicles, agricultural equipment and aircraft, and those hired through “mileage contracts” to fleet operators—may vary more, but the identical basic price list is an element in settling many of them. The industry exports about a quarter of its output, and most of the tyres exported

are sold at common basic prices; in overseas markets where local tyre manufacture does not set the price level, discussions between the Dunlop Rubber Company, the Rubber Export Association of America, and other leading European manufacturers “result substantially” in a common world price level.

★

The Tyre Manufacturers’ Conference told the Commission that without their voluntary consultation on prices there would be “full-blooded competition” in the industry, eliminating the weaker manufacturers and forcing the exhausted survivors eventually to raise prices to recoup their losses. Dunlop did not agree; thinking it

an ill-founded suggestion, wholly unsupported by the evidence, if it were sought to infer that because after consultation prices are found to be identical, they would be different were there no consultations.

Nor does the Commission. It thinks that in this compact industry of only eleven manufacturers, operating with a large amount of special equipment, which began its consultations in the difficult trading years between the wars, price competition of the sort characteristic of industries with many manufacturers is unlikely to develop. Six companies dominate tyre manufacture: one, Dunlop, controls nearly half the British business, making it the natural “price leader,” but the other five are connected with companies of comparable power in other countries.

Even the price leader must be cautious in its policies since if it started an aggressive market policy others would reply and the financial results would be unpleasant. Common pricing in tyres, the Commission thinks, thus stems partly from the industry’s structure and partly from its history.

All the nine members of the Commission signing this report agree that the trade association’s consulta-

tions, collection of costings, and recommendations on prices are against the public interest and should be abolished; though there might not be much price competition if these arrangements were abandoned, they feel, "it is certain that with them there will be less, and that the incentive to the higher-cost producers to improve their efficiency will be less." Five of the nine feel this is not enough. If it is unlikely that manufacturers will compete by setting different resale prices, they think, price competition should be introduced at the distributive levels: manufacturers should no longer

be allowed to make retail prices in any way binding on any subsequent seller of the tyres.

The Commission's conclusion that price competition in the ordinary sense cannot be expected from the tyre manufacturers, even if collective consultation is ended, seems a convincing one as presented, though the outsider is not perhaps offered all the evidence upon which the Commission reached it. Price leadership in such conditions of oligopoly—when the dominant power of Dunlop in Britain is partly balanced by the powerful overseas connections of the other five major makers—

Facts about the Tyre Trade

NEARLY 28 million pneumatic tyre covers were produced in Britain last year, with about 23 million inner tubes, and more than 2½ million covers were remoulded from worn tyres. About 7½ million new covers and 5 million tubes, worth £22.4 million, were exported "loose"—apart from those sent overseas on exported vehicles. In 1952, when the volume of sales was about 25 per cent lower, the industry's turnover was about £96.5 million—£88 million from new tyres and £8½ million for remoulds.

Only eleven companies make tyres in Britain, though three more "manufacturers" have their branded tyres made for them by others. Seven are foreign-controlled: Goodyear, Firestone and Dominion are owned wholly, and North British owned as to 50 per cent, by American companies, Michelin and Bergougnan by French, and Pirelli by Italian. British Tyre and Rubber was originally owned by Goodrich, but the American company sold most of its holding in 1934. Avon has some technical liaison with Sieberling of Akron; Henley's, John Bull and Davies are smaller companies with no foreign connections; and India, the second largest British-controlled company, is owned by the largest, Dunlop.

Dunlop is by far the largest manufacturer in Britain: in 1951 and 1952, with its India subsidiary, it accounted for about 47 per cent of the tyre industry's turnover, and for more than 40 per cent

of the industry's "loose" tyre exports; it has also ten tyre manufacturing subsidiaries and associate companies overseas. Even so, tyres account for not much more than half of Dunlop's productive capacity.

* The tyre manufacturers also account directly for about a quarter of retreading business (by value) and supply most of the materials used by the hundred or so other concerns that do retreading. Dunlop and India in 1952 did about an eighth of retreading turnover, and an-

Total tyre turnover	£122.3m.	£96.5m.

other eighth through two retreading companies owned secretly, Regent and Tyres (Scotland); in 1953 Dunlop openly bought another major retreading company, and the Monopolies Commission thinks it probable that the group is "now responsible for well over 30 per cent of the total sales of remoulds."

The three-quarters of new tyre output sold at home go to four different markets, with different trading terms.

Original Equipment for new vehicles: Sales to the largest vehicle makers are subject to no restriction, but in 1952 the Commission found that most of them were charged identical prices for tyres of the same size and type in similar quantities—about 40 to 60 per cent below retail prices. Less important vehicle manufacturers are charged identical prices, which follow a Dunlop list.

Under Mileage Contracts the makers keep passenger transport operators'

fleets adequately tyred: the tyres remain their maker's property, being serviced and replaced as necessary. A common formula, which gives a rate per vehicle mile, is used with the schedule of identical retail prices and quarterly statistics of operation to set the basic fee.

All contracts for *Government Business* are put out to competitive tender.

Retail sales in the *Replacement Market* are done at identical prices for the same size and type of tyre. These retail sales are also altered simultaneously. There is no binding agreement on manufacturers to set common prices, though the Tyre Manufacturers' Conference makes quarterly estimates of future costs using returns from ten of the eleven makers, and recommends price changes based on these. Tyres remoulded by the manufacturers are also maintained at identical prices; the other retreaders have an association that recommends minimum prices—usually at a similar level.

The 27,000 dealers on the "Tyre Trade Register," since January, 1954, have obtained basic discounts on these identical retail prices from all manufacturers, plus a variety of additional discounts and rebates from different makers. Since 1927, Dunlop has been secretly buying its way into the distributive trade: the 23 companies it now owns, mainly through the Briggs and Marsham groups, now control about 20 per cent of tyre distribution in Britain, though about half of their sales are of other makers' tyres.

does seem "natural." It does not, incidentally, inhibit other forms of competition between the makers: apart from quality, the makers since early 1954 have been offering competitive additional discounts and rebates to dealers over and above the basic discount most of them observe. The makers are now thus fixing identical prices but not in effect charging identical prices themselves (even in the period between 1947 and 1953, when standard discount terms were agreed upon, Dunlop and other makers used to give additional secret "allowances" to certain customers). To some extent, therefore, there is price competition in the effective prices that a dealer can pay: but the manufacturers do not allow him to pass this on to the consumer.

Should these manufacturers—by exercising the right of individual resale price maintenance—be allowed to deny the tyre trader the chance to attract business to the extent that he can reduce his own costs, and the tyre customer the chance to buy at competitive prices? The majority of the Commission consider it would be against the public interest for them to be able to do so, and their recommendation is logical, if uncomfortable for the President of the Board of Trade to whom it is

£ s d of TV

COMMERCIAL television has made its first commercial mistakes. Financially, their consequences are not serious; and a bare three months' operations give no permanent answers about the effectiveness of the new services. Some recent comment about the troubles of the programme contractors has been much exaggerated. Commercial television is far from mature, but it is not dying in infancy. The test is whether the programme contractors and the advertisers—for both have had their troubles—show in coming months that they have the imagination and ability to get a firm grip on a difficult medium.

The poor financial results that will certainly emerge from the first year's London programmes were budgeted for long before the service was opened; they would still have been poor even if the planning of programmes and the choice of advertising rates had been perfect from the start. The sharp changes in programme plans and advertising rates made in the last week or two by the two London contractors are one stage in what may conceivably be a long process of finding a permanent success formula. Each contractor had to show financial resources of at least £1,250,000 on the assumption, supported by American experience, that its operations would show three years' loss before they began to pay. The results for a mere three months cannot determine the outcome, but they have taught some sharp lessons.

The two London programme contractors are Associated-Rediffusion, which puts out the five weekday

addressed. For Mr Thorneycroft, in the legislation he is proposing to introduce to regulate restrictive practices, has said he will make individual resale price maintenance more clearly enforceable in the courts. It is at least possible that a number of other trades that quote identical retail prices are in a similar situation to the tyre industry, where price leadership with or without binding agreement is to be expected. The Monopolies Commission, by singling out a kind of business situation where the only effective way to introduce any price competition at all may be to deny this now normal right of individual resale price maintenance, has done the Board of Trade an inconvenient service, and might conceivably save it from a mistake.

Whether resale price maintenance can be justified generally or in special cases is one highly debatable question; whether, if generally allowed, it can be abolished out of hand in the tyre trade is another. But the first question for Mr Thorneycroft is how these findings can be reconciled with his quite reasonable idea of taking away one excuse for the existence of secret trade tribunals by telling manufacturers to enforce their own price maintenance through the courts.

programmes, and Associated Television, which transmits during the weekends. It is a reasonable guess that the cost of putting out seven hours of programmes a day, seven days a week, is running at between £8 million and £9 million a year. The advertising revenue of the London station, on an equally rough and ready calculation, could reach between £7 million and £8 million, leaving a deficit of £1 million. People close to the business expect that the bulk of that loss will fall on Associated-Rediffusion, the weekday programme company, while they expect Associated Television to cover, or almost to cover, the cost of its Saturday and Sunday programmes. Neither guess makes allowance for any return on capital sunk in the business by the two companies.

Such results were not unexpected. Associated-Rediffusion assumed the heavier commitment when it undertook to put out five days of programmes compared with Associated Television's two. It had to engage a bigger staff, in a greater hurry, and had less chance of hand-picking them for their television experience. Heavy capital expense was incurred on the sheer floor area needed to get enough studios for 35 hours of programmes a week, and the pressure to produce them has left the less opportunity to argue about costs and to scrutinise estimates. These responsibilities were not undertaken blindly or without full knowledge of what they implied; the present loss is fairly close to, and in fact a little below, Associated-Rediffusion's original calculations. At the present high level of production

costs, the company would break even only if it could sell 90 per cent of the time allowed for advertising; bookings are in fact running at 70 to 75 per cent.

The first broad estimates about income and outgoings have turned out much closer to the mark than the first estimates about audiences. The advertising rates of both contractors were first fixed on the assumption that there might be a small but selective audience for programmes in the morning and late afternoon, a rather larger and more general audience in the early evening, a peak popular audience between 8 p.m. and 10 p.m., and a diminishing but still substantial one in the last hour until the programme closed at 11 p.m. During peak hours, advertisers were asked to pay sums of the order of £1,000 a minute for advertising time.

★

These calculations have been broadly true of audiences on Saturday and Sunday, but not of audiences during the week. During the peak viewing hours on weekdays, the number of viewers has been known to see-saw within the space of half an hour from 90 per cent down to 10 per cent of the total potential audience, and to fluctuate sharply during the whole evening. These oscillations have much perturbed the advertisers. They book their time without any guarantee of the precise moment when their advertisement will come on the screen. All that the contractors promise is that when an advertiser has booked peak time at the top rates on a given evening, his advertisement will be screened some time between 8 p.m. and 10 p.m. on that day. But because of the violent fluctuations in the size of audiences during those hours, some advertisers have found themselves paying peak rates when there happened to be only a tiny audience.

A fluctuating audience is part of the price that Associated-Rediffusion has paid for its ambitious attempt to fill five days' programmes at a stretch with so little time to prepare them. The quality of the programmes has been uneven, but it is not quality alone that has counted. The new audience begins to twiddle its television knobs the moment when a programme ceases to tickle its fancy. It revels in the freedom of choice granted to it under the Television Act and switches over readily from commercial to BBC programmes and back again to avoid any undue strain on its cultural loyalties.

Perhaps the wiser course would have been to start with fewer hours' programmes a day, instead of attempting to find material for seven hours of almost unbroken transmissions. It is easy to be wise now; and Associated-Rediffusion has acted quickly and rationally in altering the length and the timing of about forty programmes, and in re-shuffling the advertising rates in force at different times of the day. The changes in rates are especially interesting in that they reflect three months' data about the behaviour of London television audiences. The 90 minutes between 4.30 and 6 p.m. are now classed as off-peak times when

advertising can be bought at £325 a minute; previously the whole afternoon between 3 p.m. and 6 p.m. was charged for at the basic rate of £650 a minute. The hour between 7 p.m. and 8 p.m. is divided in the same way, the first 25 minutes being classed as off-peak and the next half-hour qualifying for the basic rate. From 7.55 p.m. to 10.5 p.m. is the peak rate period, for which Associated-Rediffusion charges at £975 a minute. The last 25 minutes of transmission, between 10.35 p.m. and 11 p.m. have become off-peak times. These changes sound confusing but they appear reasonable; they are designed not to increase the total revenue earning capacity of an evening's advertising but to take a more realistic view of the differing size of audiences at different times of day and to fit the rates, as far as may be, to the viewing public. They should make it easier than before to get an advertisement inserted at roughly the kind of time when the advertiser would like it to appear.

The scheme extends the peak two-hour period by five minutes in each direction, and still leaves Associated-Rediffusion with the necessity to iron out fluctuations in the size of the audience at peak times. This is a matter of programme planning and has been taken in hand. The morning programmes, however, call for separate comment. Associated Television has been largely free of the troubles that have surrounded the Associated-Rediffusion evening programmes, thanks to a more compact organisation with much experience both in television and stage production. Neither company, however, succeeded in building an audience for its morning programmes. This discouraged advertisers and has impelled both of the companies to drop morning transmissions.

★

The advertisers who provide the service's revenue also have lessons to learn. Some have not succeeded in suiting their advertising approach to the product they are trying to sell. Others have made the error of spending too high a proportion of their total advertising budget on television—a dangerous step when the medium is so new and when the results can hardly fail to disappoint them. Others have been so discreet in their advertising methods that it is occasionally difficult to discover what they are selling. Most of them are temporarily mesmerised by the size of the audience and want to book at the peak viewing hours, even though plenty of advertisers would get a better return at an off-peak time when specialised programmes were attracting an audience more suitable for their product. Changes in advertisers as well as in programmes are likely.

The audience for commercial television may occasionally prove fickle, but it is growing at a gratifying rate. From not much over 100,000, the number of receivers in the London area able to receive both programmes has risen to at least 450,000 and may be as high as 550,000 and has grown at this pace in three months. There seems to be general agreement that

the audience divides fairly equally between the BBC and the commercial service; this, broadly, is the finding of the different audience measuring services.

The total potential audience for the Birmingham transmitter opening in February is roughly half that of London, and the possibility of sharing programmes on this growing network should lead to a sharp drop in programme running costs. But experience in London has cast its shadow across Birmingham, and advertisers are not so enthusiastic about booking time during the weekday in that region as they are during the weekend. This has its ironic side. The weekend programmes, although they will be put out by Associated British Cinemas, will be largely those provided for London by Associated Television. Associated Television will be responsible for transmitting during the week in Birmingham, but would normally take most of the programmes put out in London by Associated-

Business Notes

A Breather for Markets?

IF the three week Stock Exchange account that opened on Wednesday and will extend over the end of the year should produce steady markets with occasional rises, this would be welcome indeed to many institutions, including the banks and the insurance companies, that make up their accounts to December 31st. They have an inconvenient fall in the market values of their portfolios which has absorbed most of, and in some cases more than, the surpluses over book values that were common enough a year ago. At the opening of the account markets showed the right signs. After a dip on the first two days of the week industrials rallied on Wednesday and the *Financial Times* index at 198.6 shows a net gain of 2.4 on the week. The index of government securities does not flatter the market. At 90.39 on Wednesday it showed no change compared with Tuesday and a net fall of 0.31 in a week. In fact there was a fairly widespread demand on Wednesday, a few prices advanced and the government broker took no action to hinder the advance.

There is a further reason for feeling that the gilt-edged section of the market may now enjoy an interlude from pressure. The success achieved for the Liverpool loan was maintained with a firm opening for the new stock which was bid for at $\frac{1}{2}$ premium, but this success was not won without toil, and probably some of the allottees had been persuaded to apply for a little more than they intend to hold permanently. Of other recent issues, there is probably some Glasgow and Rhodesia stock that still has to find a home. Even if it had not been for the programme of steel denationalisation offers—Consett is only one of a group of selling operations that the Iron and Steel Holding and

Rediffusion. So ATV's very success in London during the weekend is working against it in Birmingham during the week. The company plans to use some of its own stock of filmed programmes already shown in London to reinforce the weekday programmes taken from Associated-Rediffusion but this cannot be a permanent solution. The troubles of the programme contractors in London are essentially the problems of over-rapid growth and inadequate preparation, and they must be set right by experience. The basic commercial structure of the service seems, if anything, a little more solid than when the programmes began three months ago and the big advertisers show no sign of having been cruelly disappointed during this probationary period. But these are early days; what would happen if the boom in consumption were to falter or if newsprint became more plentiful would be another story.

Realisation Agency hopes to do shortly—there would have been strong arguments in favour of giving the market a rest to digest the recent gilt-edged issues.

The Consett offer impinges to some degree on both the gilt-edged and the industrial sections of the market, since former members of the company may tender Treasury 3½ per cent stock 1979-81 taken at £84 14s. 3d. per £100 stock. It was heavily applied for and resort to the ballot box is a certainty. Heavy over-subscription does not necessarily point to a big premium when dealings start but a premium of some sort is a reasonable hope. Indeed a feature of the difficult markets of the last few weeks has been the ready taking of ordinary share issues—perhaps because a fair section of investors who had pulled out of the market had cash in their bank accounts that could be used. With fixed interest stocks investors are more exacting. An important refinancing operation this week was the placing by Vauxhall Motors of £7½ million of 5½ per cent unsecured loan stock 1962-69 at £99 10s. 7d. per cent. The issue, done privately through Morgan Grenfell and Co., will provide a further portion of the money for Vauxhall's £36 million expansion programme. It shows a striking contrast with Vauxhall's previous issue of unsecured stock in September last year—4½ per cent at £100 10s.

Record Steel Output

STEEL output last month reached a record rate of about 21½ million tons a year, and the Iron and Steel Board this week forecast that the steel industry might be able to produce 21 million tons next year. November is always a month of high output in the seasonal pattern: last month's

figure makes it fairly certain that the total for 1955 ought to exceed 19½ million tons. Pig iron output last month was also a record: it reached an annual rate of well over 13 million tons. Some of that output came from a second big new blast furnace at Shotton, which was blown in last month; early next month the fourth furnace at Margam will be blown in.

The industry's capacity is thus rising and will continue to rise during next year—though production is not rising as fast as in Western Germany, which this year passed Britain to become the world's third largest steel producer, after the United States and Russia. Although the current order load underwrites production well into next summer, the industry is beginning to wonder whether steel demand will hold up enough to take the 21 million tons it is likely to be able to produce. These fears are customary and recurrent in the steel industry, but the pattern of deliveries gives them some weight. The biggest increases in steel demand this year have been from the motors, cycles and aircraft group, and drop forging (which works largely for this vehicles group), and from building. Even if total building activity levels off next year, the present state of orders for new factories suggests that structural steel may remain in high demand. But the prospects of the motor industry are now beginning to look rather uncertain—to the steel industry among other people.

Where the Squeeze is Pinching

THE latest quarterly classification of bank advances provides the first published guide to where the bankers' axe is falling; and, in addition, it gives the most accurate measure yet of the total amount of the chippings. In the three months to mid-November, aggregate advances made within Great Britain by all members of the British Bankers' Association fell from their all-time peak of £2,215 million to £1,981 million. Of this reduction of £234 million—easily a record quarterly fall—nearly £126 million is attributable to the repayments by the Gas and Electricity utilities from the proceeds of the calls on their public issues, which amounted to £190 million in this period. The reduction in all other advances thus amounts to £109 million—also a record fall.

The most striking fact that emerges from the detailed classification is that, whilst the bankers' restrictive pressures are apparent in almost every borrowing group, much their sharpest impact has been upon the personal and professional group. Advances in this big omnibus category were reduced by almost £34 million in the three months, or by 8½ per cent. This reduction is twice as large as that achieved at the height of the 1952 squeeze; and it almost restores the total for this group to the lowest point reached in that phase of contraction. Credit for the personal sector may also have been squeezed through pressure upon the hire-purchase finance houses, whose bank advances have been reduced at last—by £8.2 million to £36.9 million. But these advances still stand some £6 million higher than in February, despite the fact that no new credit lines have been granted since then. The advances of local authorities fell in the latest quarter by £11.1 million to £83 million, those of stockbrokers by £5.4 million to £8.8 million, and of miscellaneous financial borrowers by £7.4 million to £168.9 million.

The nineteen industrial and trading groups accounted for only just over £42 million of the reduction of £98 million shown by all categories within the private sector of the economy, or by only half as much as they fell in the equivalent quarter of 1952—when, however, the dominant influence was the impact of the steep fall in raw material prices upon the cost of financing stocks. In some categories the decline is partly due to seasonal causes. This is true in the textile groups (down by £21.8 million, but the £9 million fall in wool textiles must reflect the fall in price) and also in agriculture (down by £8.8 million) and building (£5.2 million). On the other hand, the repayment of £5.4 million by the retail trade group appears to be against the seasonal trend; and many groups whose borrowings are not subject to marked seasonal influence have shown small reductions.

The borrowings of six of the nineteen groups are now below their levels of a year before, whereas in August that was true of only two. Only five categories are still substantially above their 1954 levels. They are: food, drink and tobacco, by £31.3 million to £168.3 million; engineering, by £26.9 million to £167.2 million; agriculture and fishing, by £13.4 million to £234.1 million; building, by £8.6 million to £70.7 million; and shipping and shipbuilding, by £8.5 million to £24.8 million.

Britain Pays Up

THE Chancellor, as expected, announced in the Commons this week that Britain will make the full payments of interest and principal on the United States and Canadian loans when they fall due on December 31st. The payments comprise \$119.3 million on the United States loan, \$18.8 million on the lend lease settlement, and \$37.7 million on the postwar Canadian loan. Of the total of \$175.9 million, \$105.3 million is interest and \$70.6 million principal. The total service charges that Britain has made on these loans will thus be brought to nearly \$916 million. The first instalment fell due at the end of 1951, and since then full payment has naturally been regularly made each year. The provision in the 1945 loan agreement for a waiver of the interest payment if it could be shown that certain complicated conditions relating to Britain's balance of payments were satisfied has not been invoked.

Two further regular loan payments fall due this month: \$7½ million for the quarterly instalment on the Canadian interest free loan of 1942, and \$4 million for interest on certain loans received under the European Recovery Programme. The total strain on the reserves will thus amount to \$187½ million.

Disappointment from Dorman Long

DORMAN LONG may be the exception. Colvilles and Stewarts and Lloyds have both paid higher dividends than those forecast in their offers for sale. Dorman Long has not. Its ordinary dividend is to be 8 per cent, as promised in the offer for sale, as paid for 1953-54 and as paid during many years before nationalisation on a different capital. Yet there is a wishful note in the directors' comment on the dividend which suggests they would have liked

to be more generous if they had believed it wise. Having pointed out that the loan facilities arranged with FCI turn on the maintenance of a 8 per cent dividend, they say:

The profits for the year show a substantial increase but the estimated cost of completing the major development programme and providing for working capital requirements has also risen appreciably, and the rise still continues. In these circumstances, the directors have not recommended any change in the dividend for the year.

Just over a year ago the cost of the three-year development programme, running up to September 30, 1957, was put at £38½ million, of which about £8½ million was to come from Dorman Long's own resources.

* Including investment allowance reserve (1954: £289,400; 1955: £740,900).

† After charging depreciation, replacement, repairs and minority interests.

Like the other steel companies, Dorman Long makes a substantial reserve for the increased cost of replacing fixed assets. Iron and steel prices take some account of depreciation on a replacement cost basis and the provision of £1 million is a reflection of the extra cost of depreciation on a more realistic basis than on historical costs. The trading profits show an advance of about 48 per cent—an advance much more in line with that recorded by Colvilles than with the one achieved by Stewarts and Lloyds. The directors take pains to point out that these profits include substantial credits arising from increases in the prices of trading stocks and the benefit of higher prices from export sales as well as the effect of plants working up to and in some cases above normal capacity. The controlled maximum prices of iron and steel products sold at home, they explain, are based on plants working at an average rate below normal capacity.

Santa Claus in Cement

THE undertaking given by the Cement Makers' Federation not to raise home prices for portland cement before at least the end of next June will be significant in contributing to a stabilisation of industrial costs only if, as the federation itself argues, many other industries follow

suit. But the federation believes somebody must give a lead and it is hoping that its own announcement will be the snowball of a much wider movement. As a start, it has been in touch with other building materials industries; the response, however, has not been exactly what it would have wished. Plasterboard makers associated themselves with this week's statement and the federation expects one or two others to do so later, but some of the others it approached declined.

The federation would have liked to commit itself in advance to a period longer than six months, since it has increased its prices only twice in the last two years. As cement output has grown—by an average of about 4.5 per cent a year over the last three years—and as their efficiency has improved, cement makers have been absorbing a large part of their own rising costs. But nearly two-thirds of these costs, including coal, electric power and transport, which between them make up almost a half, are outside the industry's control. Nevertheless, cement makers have certain advantages for this purpose that other industries lack, such as a central price fixing organisation, a lower labour element in production costs, and an unsatisfied export market. This year they are exporting about a seventh of their total output of rather more than 12 million tons at prices still appreciably above those they charge customers here; export prices, moreover, are once more showing signs of hardening, so manufacturers should have little difficulty in shipping more cement abroad should home demand next year happen to ease a little. However, it would be churlish not to applaud the initiative of the industry in taking this step. It would not be sanguine, on the other hand, to expect their snowball to grow much larger.

Cotton's Two Options

NOR easily will the cotton trade take No for an answer. Its request for protection against the duty-free imports of cotton cloth is now being pursued along two channels. First the Cotton Board's revised claim for protection has been presented to the Board of Trade, and an earlier intention to delay it has been abandoned. Secondly the suggestion of an independent inquiry into Lancashire's case for protection against the Commonwealth has been pursued tentatively a little further. The suggestion arose at a recent meeting at which Lord Derby presided. The industry has not so far committed itself to that idea but a group from all sections met in London this week at Lord Derby's invitation, so that the idea could be explored further. The cotton men who met him in London came as individuals and not as representatives of the Cotton Board.

Trade Gap Widens

THE adverse balance of visible trade—the excess of imports cif over exports fob—widened from £52.8 million in October to £70 million in November, and have aroused fresh questionings about the power of the dearer money medicine to curb excessive imports. The figures have

had a mildly depressing effect on investment markets where greater caution may not be misplaced; but in truth the figures of a single month cannot carry undue weight in the argument. For over a year the trade figures have been distorted by dock and rail strikes, by the expectation of those strikes, and by their long aftermaths. Plotted individually the monthly figures look like the edge of a misused saw; the chart attempts to minimise, but not to eliminate, these abnormal factors by plotting the figures (except for the last two months) as twelve monthly averages.

It shows the characteristics of a vigorous and carefree economy marked particularly by rising imports. In the first eleven months of 1955 the value of exports averaged £241.1 million a month, little short of 10 per cent above the average for the same months of 1954. But the average value of imports for the same months was 16 per cent higher than in 1954. Against that background the latest month's figures are, as the Chancellor claimed in the closing stages of the Finance Bill debate on Monday, disappointing but not conclusive.

British exports in November at £262.2 million were £5.5 million lower than in October but were still the third highest figure ever recorded. Imports in November at £242.2 million were £8.8 million higher than in October but were still some distance from the record. Re-exports jogged along at £10 million, a decline of £2.8 million on the month but about the recent average. The adverse balance of £70 million was substantially higher than in either of the two preceding months, but still a little below the average of the first 10 months of 1955 which was £72.2 million. It is also possible to draw a little comfort from the high rate of British exports to the dollar markets. At £28 million in November these were £5 million less than in October and £1.4 million less than the monthly average of the third quarter of this year, but they were well above the rate that was running through 1954 and in the first half of this year.

The Gourley Case

IT has been a disturbing autumn for those who thought they understood some of the simpler principles of taxation. Hard upon the shock which the decision in *Sharkey v Wernher* gave to believers in the notion that a man cannot make a profit (or loss) out of trading with himself comes the House of Lords judgment in *British Transport Commission v Gourley* which upsets the practice of assessing damages for loss of earnings which had been judicially (although, as now appears, erroneously) approved for more than twenty years. In the lower courts Mr Gourley (who was a victim of a railway accident) had been awarded £47,720; £10,000 as a solatium for pain and suffering undergone, and £37,720 for loss of future earnings. The Lords, by a majority of six to one, accepted the contention

of the Commission that this latter sum should be reduced to £6,695, the difference of £31,025 being the estimated income tax and sur-tax which Mr Gourley would have had to pay if he had received this gross sum as income in a normal way.

The majority view was based on the principle that the injured person should be placed in the same financial position as he would have been in if the accident had not happened: taxation is imposed by law and, although not actually a charge upon earnings, is expenditure which must be incurred as a necessary consequence of their receipt; it is, therefore, relevant to the ascertainment of the loss sustained. The Lords would not concern themselves, in an action for damages, with the rights of third parties—the loss of the tax that the Revenue would have expected to receive if Mr Gourley had not been incapacitated.

The authority of a House of Lords judgment cannot be questioned, except by Parliament. But many laymen, with all proper deference to their Lordships, will feel that the substitution of net earnings after tax for gross earnings before tax as the measure of damages will be unfortunate. In 1946 Lord Keith (who was the dissident on this occasion) stated in his judgment in *Blackwood v André* that the incidence of taxation was a matter of no concern in the assessment of damages. At best it can only be an uncertain estimate: income tax is an annual tax and rates can change, sometimes even to the taxpayer's advantage. Nor can the future of sur-tax be safely assumed; if Mr Kaldor had his way it would be replaced by an expenditure tax from which, presumably, expenses met out of net damages received for personal injuries would have to be specifically exempted if injustice was to be avoided. At present, too, damages are not taxed again in the hands of the recipient but there can be no certainty that such freedom will continue: the Royal Commission recommended that lump-sum payments by way of compensation for loss of office should be chargeable, and although they excluded damages for personal injuries there is no assurance that Parliament would necessarily agree with them. And finally there is no doubt that the income that Mr Gourley receives from investing the "netted down" sum of £6,695 will itself be taxable.

If the object of the exercise was to put Mr Gourley in the same position as he was before he was injured, would not the fairest way be for the Transport Commission to pay him gross annual sums representing his loss of earnings which would then be taxable in his hands?

LIFO Knocked Out

THE iconoclasm of the House of Lords in the Gourley case is in direct contrast with the conservatism of the decision of the Judicial Committee of the Privy Council in *Minister of National Revenue v. Anaconda American Brass, Ltd.* This important appeal was against the finding of the Canadian Supreme Court that trading stock might properly, for taxation as well as for other purposes, be valued on the LIFO—last in, first out—basis. The Judicial Committee allowed the appeal: in the legal arena LIFO has taken the count, and its rival, FIFO—first in, first out—is in command of the ring.

The problem of stock "valuation" has been extensively rehearsed in recent years: it is recognised that it is not really a "valuation" of the stock unsold, but an accounting device which is necessary in order to arrive at the true costs of the stocks that have actually been sold during the trading period. The Revenue Authorities in this country have always held that FIFO alone achieves this result, and were supported as recently as 1953 by the Court of Appeal in the *Broadstone Mills* case. The Royal Commission, however, regarded the Revenue's view as "a very large claim": the tax code, it held, laid down no rules for "valuing" stock; FIFO had no special sanctity, being itself no more than an estimate, and other methods could be and are used with equal propriety for ascertaining commercial profits. The Commission recommended, therefore, that different businesses should be free, with suitable safeguards, to adopt the method which best suited their particular commercial needs.

The conditions which justify the adoption of LIFO as a proper and generally accepted method of accountancy were conspicuously present in the *Anaconda* case, and the decision of the Judicial Committee had been awaited in the hope that it might lead to some rapprochement between the fiscal and the commercial concept of profit. That hope, short of legislation, now seems to have gone, and the time has therefore come for Parliament to take a hand. "Profit" is a much abused word which has already far too many different meanings. But when Finance Acts charge "profits," the charge ought to be on profits computed in accordance with sound and accepted commercial and accounting principles. No question of avoiding tax comes into the argument at all; LIFO can cut both ways, beneficial on occasion, and pre-

judicial on other occasions. But there would be much practical relief, and no critical danger to the revenue, in a system that gives words their practical meaning and does not promote schismatic definitions.

Commercial Demand for Sterling

DESPITE the disappointing trade figures for November sterling has this week made a striking recovery. In terms of US dollars it has risen from \$2.80 $\frac{3}{8}$ to \$2.80 $\frac{1}{2}$. A similar improvement in sterling has occurred in terms of most European currencies. The movement was set off in the United States by substantial commercial demand for sterling, some of it for seasonal payments for wool. The covering of the sterling needed to make these payments had, as is now usual, been postponed to the last possible moment and the rush when the exchange had to be bought caused a movement in the rate out of proportion to the volume of business. New York has also been a buyer of transferable sterling, the rate for which has risen this week from \$2.77 to \$2.77 $\frac{1}{2}$. On the Continent, where bear accounts in sterling have been increased in recent weeks on rumours of Mr R. A. Butler's possible departure from the Treasury, this sharp rise in the sterling-dollar rate has frightened speculators and caused bear covering.

But in security sterling the exact opposite has happened: the premium on dollar stocks in London has reappeared. The premium on these stocks ran off completely in mid-

Getting to the Airport

THE central passenger terminus at London Airport, which was officially opened by the Queen this week, is expected to be in full operation in 1959; by then some 3 $\frac{1}{2}$ -4 million passengers a year may be travelling through it, as against nearly 2 $\frac{1}{2}$ million this year. For most of them, and for the friends and sightseers who see them off, road transport will still be the only practical way of reaching the airport from the heart of London. BEA has been running an experimental and subsidised helicopter service to and from Waterloo since July, lifting about one passenger in 250, but this is shortly to be withdrawn. If the service is resumed when more suitable helicopters become available in a few years' time, it is still unlikely to cream off more than an upper crust of airport passengers.

Road traffic should be eased when the scheme to extend Cromwell Road to bypass Hammersmith has been completed; this is expected by 1959—apart from one important flyover. But this new road, first mooted long before the war, can hardly be more than a palliative for traffic bound in both directions for the airport, the trading estate there, and for destinations further on.

Two or three years ago about 85 per cent of all air passengers travelled between the airport and London in the airlines' own coaches. This year the proportion is about a half, and it is still falling rapidly. But the total number of airport passengers has meanwhile swelled from a million to nearly 2 $\frac{1}{2}$ million—including traffic transferred from Northolt in 1954—which means a

marked growth in the number of private cars converging upon the Great West Road.

The prospective traffic needs of 1965, and beyond, when the airport may be handling 6 million passengers a year,

measure the two schemes recently presented to the Minister of Transport. One, put forward by the Transport Commission and BEA, is for a loop line to be laid from the Waterloo-Windsor electric railway near Feltham, with, presumably, a tunnelled approach under the south side of the airfield. No details of this plan have been published, except that its cost will be of the order of £10 million.

The other plan revives the idea of monorail services for short-distance, high-density routes. It was discussed by Mr Peter Masefield in an address to the Institute of Transport recently, when he envisaged an overhead system, suspended from pylons, with cars travelling at 150 mph and taking 5 minutes for the 10 $\frac{1}{2}$ mile journey. But on his calculations the service would break even only if it carried 8.8 million single-trip passengers a year, each paying 5s. 6d. for the round trip, or just under 5 million paying the present coach fare of 5s. both ways. The very limited experience of monorail operation and the 10 miles of steel girders stalking out of London may not give this scheme a marked appeal. But it is to be hoped that one, at least, of these plans escapes the pigeon hole.

September and the quotations remained near parity until November 28th, when a small premium of $\frac{1}{4}$ per cent returned. This week the premium took a sudden leap to $1\frac{1}{2}$ per cent though it has since fallen to 1 per cent. The rise in the premium was due to a small demand for dollar securities from resident institutions, which found the dollar premium market bare. It is probable that during the ten weeks or so when the premium had run off altogether a sizeable amount of dollars, resulting from sales of dollar securities by British residents, were transferred to the exchange control instead of being reinvested in other dollar stocks. Once sold in this way the dollars are lost to the security market. The period during which the premium on dollar securities in the London market ran off also saw the rate for security sterling fall to \$2.744. This is the rate which non-residents pay for blocked sterling they wish to invest in sterling securities.

Airwork Leaves the North Atlantic

THE air freight service across the North Atlantic opened by Airwork nine months ago is closing down. This is a blow to the development of traffic in air cargo and to the hopes of the British independent airlines. The company is still convinced that there is enough traffic in both directions to support a regular cargo service carrying consignments of a size and shape that would not fit easily into the hold of a passenger-carrying airliner and it bitterly attributes the failure of the new service to the conditions under which it had to be operated.

Airwork flew three times a week in each direction, and carried full loads on the outward journey. But air cargo to Europe tends to by-pass London Airport and to fly instead to airports like those at Amsterdam and Frankfurt that provide "free port" facilities for cargo in transit. Airwork has not been able to get what might otherwise have been its share of freight in transit, for example, to Africa and the Middle East. This question of "free ports" in Britain has been argued about for many years. Customs and Excise have consistently maintained that the British system of bonded warehouses and duty rebates adequately meet the needs of transit cargoes even though some of the biggest and most prosperous ports in Europe prefer to set aside special "free" areas for transit cargoes where no customs formalities of any kind need to be observed.

The company also complains that its cargo licence deprived the service of the flexibility it needed to pay its way. The other North Atlantic all-freight services, operated by Pan-American and KLM, frequently fly chartered passengers in their freight aircraft; Airwork, under the terms of its licence, is not allowed to do so and has to watch this traffic go elsewhere. Customs regulations about the wing-span of aircraft meant that Airwork's Douglas DC6 freighters would have attracted heavy duty, while similar machines built by Lockheed or Boeing would not. These major and minor irritants, piled on an already difficult operation, have proved too much. Airwork has been losing substantial sums on the North Atlantic service and is no longer willing to do so. The service ends on December 18th. It is a sad end to a courageous experiment, and

Airwork's case that failure was due to conditions under the control of the Government and not to lack of traffic deserves a considered answer.

Cash for Christmas

THE outflow of currency notes from the Bank of England for Christmas spending rose to £42.2 million; to accommodate it, the fiduciary issue was raised by £50 million to a new peak of £1,900 million. This efflux is the largest ever recorded in a single week; the previous record was the outflow of £40.3 million in the corresponding week of 1954. But the demand for currency in the last three weeks as a whole, at £90.1 million, has been £2 million smaller than in the similar period last year; and the proportionate expansion in the note issue in these weeks, at 5.1 per cent, has actually been the smallest since 1950. But the margin has been fractional. Moreover, another rough indicator of the pace of spending, the trend of national savings, provides no suggestion of restraint. The deterioration that became marked in the summer has been intensified in recent weeks—notwithstanding the special stimuli given by the new 4 per cent defence bonds and the increase in the maximum permitted holdings of savings certificates. In the three weeks to December 3rd net receipts from these sources and by the post office and trustee savings banks were just about balanced by encashments and withdrawals—whereas in the corresponding three weeks of 1954 there was a net receipt of over £21 million.

Inspecting Automation

SIR GEORGE BARNETT, Chief Inspector of Factories, is in as good a position as any man to watch the development of automation in Britain: his annual report, in spite of its inevitable emphasis on how factories go wrong, accidents, also packs in a comprehensive summary of the new ways in which factories are beginning to go right. In the report for 1954, published last week (which again includes

Nothing left to chance...

AIR PURIFICATION

In addition to normal air-conditioning, a vast Air Purification System makes doubly certain that the atmosphere throughout the Ediswan Lamp Factory is as clinically-clean and free of microscopic dust particles as human skill and ingenuity can contrive.

This immense plant consists of several Pumping Stations, each operated by 25 h.p. motors which deliver heat-treated, purified air via distributor ducts throughout the entire factory. Each Pumping Station circulates no less than 159,000 cubic feet (54 tons) of air per minute! The temperature of the circulated air is precisely stabilised by thermostatic control.

This is another example of the strict control and technical care insisted upon at every stage in the manufacture of Royal "Ediswan" Lamps. Nothing is left to chance—careful testing and checking of every lamp ensures that each conforms to the highest standard of requirement.

ROYAL "EDISWAN" LAMPS

The Edison Swan Electric Co. Ltd., 155 Charing Cross Rd., London, W.C.2
Member of the A.E.I. Group of Companies

L199

a classification of British factories by size groups) he says that the mechanisation of production continues to increase in many industries and "in some the whole pattern of the manufacturing process has in fact altered." The greatest advances are being made in the industries that handle raw or finished materials in bulk—oil refining, chemicals, gas and cement, the process industries where automatic control and instrumentation is already used fairly widely; but "machines for the mechanical handling of piece and other goods continue to be devised with almost bewildering frequency."

Coffee More Confident

THE return to freer trading conditions in coffee that occurred six months ago is producing results in the market sooner than most people expected. No longer is the trade so afflicted by loss of confidence in the exporting countries' exchange policies that it keeps its stocks down to a minimum; no longer are supplies in the producing countries piling up unsold. Freer marketing conditions have encouraged a heavier volume of trade, especially to the United States, where shipments have been running at double the 1954 rate. Roasters' stocks, which had been reduced by about 4 million bags (of 132 lb), are almost back to normal, despite a moderate recovery in consumption.

But that is only half the picture. Importers are still unwilling to commit themselves far ahead, so that supplies for near delivery are short and command a premium. A firm spot market exists at a time of impending surplus. That unusual conjuncture has been maintained because shipments from Brazil, though heavier than a year ago, have been easily absorbed in the consuming countries. The marketing of Central American coffee, which usually comes forward in quantity at this season, has also been delayed by abnormally heavy rains, and the shipment of new crop East African coffee to the United Kingdom has not yet progressed far enough for supplies to be greatly eased. Consequently the price differential between Brazilian and mild coffees is now much wider than normal. Santos No. 4 spot in New York is now around 52 cents, 13 cents below Colombia spot. A normal differential would be less than half that margin.

Forward buying must still be deterred by the fear that excess production this season must eventually depress prices. Indeed, even the spot price of Santos No. 4 in the New York market has recently begun to edge downwards. Moreover, importers cannot yet ignore the risk that the incoming Brazilian government may devalue the exchange rate yet again.

Tanker Freights Climb Higher

FOR the last seven weeks the tanker freight market has been climbing like a rocket. From August until the middle of October spot rates were running at just under scale rate (which is equivalent to 32s. 6d. a ton from Curaçao to London). Since then they have shot almost steadily up-

wards to scale plus 200 per cent—the rate at which some tankers have been chartered this week—with only a slight pause two weeks ago when the demand for tonnage from the Persian Gulf to North America eased for a while. This has given tanker owners with tonnage to put on the single voyage market their best winter season since 1951-1952.

Charterers have understandably been concentrating upon securing the tankers they need almost immediately, and owners have been finding it much easier to fix tankers for

loading this month rather than in January. This has also been true of consecutive voyage charters where fixtures for a few months only are now much more common. This week tankers have been chartered for three months at rates between a minimum of scale plus 125 per cent and a maximum of scale plus 200 per cent. The actual rate paid between these limits is the award made at the beginning of every month by the London Tanker Brokers' Panel, based upon market conditions for single voyage charters. This Panel makes various other awards as well, including the quarterly assessment shown in the chart. This is an average freight rate designed to cover all tanker tonnage, including the vessels owned by the oil companies as well as by the independent tanker owners.

Cash at a Discount

A FEW years ago Sir Eric Miller, the respected chairman of Harrisons and Crosfield, gave the bargain hunters a hint that conditions were reaching the point where the companies of his group operating in Indonesia might begin thinking about pulling out. Sir Eric is still thinking

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries will include:

The Industry's Development Programme Reviewed and the Outlook for 1956.

The Australian Market for Vehicles and Tractors. B.M.C., Standards and Routes: A Financial Assessment.

The Bulletin is fully illustrated by charts, amongst which are: Price indices of used cars and vans, new registrations in Great Britain and the hire purchase share of the market. For full particulars of this Bulletin, apply to:

THE ECONOMIST INTELLIGENCE UNIT,
22 Ryder Street, St. James's, London, S.W.1.
Whitehall 1511. Ext. 49.

but the point was not lost. Harrisons and Crosfield are conservative managing agents; their rubber and tea companies have built up big cash reserves largely in this country. Yet the Stock Exchange prices of the shares of many of them have fallen to a level at which the price and much more is covered by quick assets in sterling. If investors can imagine the companies putting themselves into liquidation and being able to salvage nothing from their estates and current assets in Indonesia, that would mean no disaster but a good profit for the shareholder who buys at today's prices.

Most of the Indonesian enterprises of the group have cash in excess of their market prices. Central Sumatra Rubber Estates 2s. ordinary shares for instance stand at 9d. The company has about 1s. per share in quick assets in this country plus an investment in Kulai Rubber Estate, a progressive Malayan company, likely to be worth at least another 5d. per share. Tanjong Rubber Company has quick sterling assets equal to about 11s. per £1 share and its shares stand at about 7s. No one can be surprised that the shrewd investors who discovered this potential goldfield are losing patience. Sir Eric had a tussle with Lord Blackford, chairman of the Guardian Assurance Company, at the Bah Lias meeting last June, when Lord Blackford suggested that the company should return 10s. per share in cash while still retaining ample liquid assets.

At this week's meeting of Harrisons and Crosfield Sir Eric Miller stiffened his attitude. He admitted pressure from shareholders of the group's Sumatra companies to distribute the bulk of the sterling resources but claimed that it was premature to take so drastic a step. It is easy to understand Sir Eric's reluctance. Rubber growing in North Eastern Sumatra has been a speciality of Harrisons and Crosfield. The terrain is excellent; the results once were good. Nothing is lacking except effective government, and with the ballot papers barely counted Sir Eric wants to give the new government, whoever may compose it, a fair run. Yet even if conditions improve in Indonesia some of those assets must still be surplus to any replanting that the group is likely to venture into in the near future. Sir Eric Miller must see the rubber shareholders' point of view.

Sisal in Demand

SISAL—nowadays the most important of the hard fibres—is enjoying an early and sharp recovery from its seasonal slack period and the price usually dips in the autumn, for sisal is basically an agricultural commodity, the raw material of farm twine. Barely two months ago, as the harvest in Europe and North America ended, No. 1 East African sisal fell £9 a ton from £85 to £76 a ton. Now it is up again to £81. The medium and low grades in particular are in strong demand. A year ago, by contrast, the seasonal recovery did not occur until late in December and even then prices were slow to rally.

What is the reason for the unexpected firmness this year? The harvest has been good, supplies of farm twines were well absorbed and stocks on the farms and with the spinners are both lower than they were last year. Moreover, it has not been easy for spinners to get back into full production earlier than usual, for producers are well sold for immediate shipment. The outlook for the producers now looks favour-

able. The replacement of binders by combine harvesters has been more than made good by the development of new outlets for sisal; baler twine is one of them, for baling hay and straw is growing with the improved management of grass lands. The continued limitation on imports of Manila hemp—a dollar commodity—has also enabled sisal to retain a large share of the rope market and the demand for packing twine rise when business is active. The newer and smaller uses of sisal are growing, too. Small quantities of the best grades are being used for making carpets and the drug cortisone is now being made from the sisal plant.

Demand thus appears strong. According to the Commonwealth Economic Committee, sisal now represents 62 per cent of total production of hard fibres. But it is a commodity that takes a few years to mature and production cannot quickly be stimulated. Output in British East Africa in the first ten months of this year was 176,719 tons, a mere 756 tons over the output in the first ten months of last year. The year 1955 will therefore not maintain the post-war average rate of increase in East Africa of about 10,000 tons a year. But a significant increase may well be achieved next year and even small changes in total world supplies could have a significant influence on the price of this traditionally volatile commodity.

Coal Compensation Nearly Complete

WITH the issue this week of about £5 million worth of Treasury 3½ per cent stock 1977/80 taken at Thursday's market-price of 83½, the business of paying for the nationalised coal mines is nearly ended. The mines were nationalised on January 1, 1947. Now, nearly nine years after the event, the final payment for the Lancashire collieries included in the present instalment leaves only the last fragment due for the small North Wales coalfield (well under £1 million) unpaid. There remains also a little to be paid for ancillaries of the nationalised mines, but no precise figure of that unpaid residue is available. It was roughly estimated that the total purchase price of the coal industry (the assets of coal industry value at £164,660,000 and the ancillaries) might amount to about £300 million. This week's interim payment brings the total so far paid up to almost £290 million.

Nearly all the remaining colliery companies are now in the process of liquidation or in need of money for the new trades they have developed. So the compensation stock will nearly all be sold to raise cash, and the procedure that has become standardised is again being followed. The government broker stands prepared to take the stock from the jobbers at the issue price. That is only reasonable, and not even a purist need cavil at this technical infringement of the principle that a government pursuing a tight money policy should not be a buyer of its stocks.

SHORTER NOTES

During 2½ months of the third quarter of this year the National Coal Board had the benefit of its increase in prices (though this was modified by the special arrangements for lower prices in the summer). These prices, however, were

not designed to cover the whole of the loss that the industry makes by importing foreign coal and selling it at the lower British price: the industry, in setting the new prices in July, budgeted for a continuing deficit on operations. This it is now incurring: it had a deficit of roughly £5 million for the quarter.

The motion from some of the shareholders of Union-Castle Mail Steamship Company seeking an injunction to restrain the directors from registering the transfer of the Union-Castle shares to the new company—British and Commonwealth Shipping Company—or giving effect to the terms of the proposed merger, was last week dismissed by Mr Justice Wynn-Parry. The judge held that the safeguards for keeping the new company under British control were not, as the plaintiffs had argued, illusory.

Rootes Motors has improved its offer to the shareholders of Singer Motors. The cash offer is raised from 1s. 6d. to 2s. 6d. per preference stock unit and from 1s. to 1s. 6d. per ordinary stock unit. Thus for each 16s. of preference capital the holder would receive one 6 per cent preference

share of £1 and 5s. in cash. For each £1 of ordinary stock holders will receive one preference share of £1 and 6s. cash. Sir William Rootes, the chairman of Rootes Motors, announced on Thursday that he believes his new offer to be much better than the rival one from Leadenhall Investments and Finance. He also gave the warning that his final date will not be extended beyond December 29th, and that in his view, if there is a stalemate in which neither offer receives a 75 per cent acceptance, the disintegration of the Singer business will be rapid.

The site of Northern Aluminium's 8,000 ton extrusion press is Rogerstone, near Newport, and not Rochester as was stated on page 876 of *The Economist* of December 3rd.

Continental Air Lines has ordered 12 Vickers Viscounts for use on its routes in the Western part of the United States; Viscount operations to date have been confined to the eastern half of the country. The order is valued at \$18 million and brings Vickers' total of signed orders for Viscounts up to 254.

Company Notes

HAWKER SIDDELEY. Superlatives are needed to describe the latest Hawker Siddeley results. But perhaps it is sufficient to record that within a few hours of their appearance the £1 ordinary shares rose 10s. 6d. to stand at 71s. 3d. This gain has been more than held and the shares now stand at 73s. 6d. xd. Throgmorton Street was jubilant because the purse strings had been loosened and seemed likely to be loosened still more.

First there was the handsome increase in the ordinary dividend from 10½ to 17½ per cent and then there was the promise of a 100 per cent free scrip issue, raising the ordinary capital to £23,289,400. This issue cannot simply be dismissed as a technical adjustment in reserves and capital: profits are so good that the issue could still foreshadow a further increase in dividend payments.

	Years to July 31, 1954	1955
Consolidated earnings:—		
Profit before tax	9,172,885	12,675,537
Replacement reserve	1,000,000	1,000,000
Development	940,736	
Taxation	4,497,092	7,146,794
Net profit	2,699,225	4,491,639
Prior year profits	316,752	1,191,296
Net income	3,015,977	5,682,935
Ordinary dividends	672,481	1,171,748
Ordinary dividends (per cent)	10½	17½
Retained profits	2,232,082	4,454,937
£1 ordinary share at 73s. 6d. xd. yields		£4 16s. per cent.

There are several strands in the rope of profits, all of them stout. The first is that profits after normal depreciation but before tax have risen from £9,172,885 to £12,675,537. Taxation has jumped just as sharply, from £4,497,092 to £7,146,794. Here the second strand is revealed for

£2,477,473 of Dominion taxation is included in the total charge. This indicates that the group's Canadian ventures are paying off brilliantly. Another strand is that profits relating to previous years have jumped from £316,752 to £1,191,296. A conservative reckoning would exclude such profits from any calculation of earnings but they show at least that Hawker Siddeley is in the full flood of production. The final strand is that, however earnings are calculated, the dividend still looks conservative when set against net profits. There is plenty of room for a bigger payment. That is why investors are willing to accept a yield of 4.8 per cent on the shares.

ASSOCIATED COMMERCIAL VEHICLES. The preliminary report of Associated Commercial Vehicles for the year to September 30th last is colourless. Profits show a slight improvement. Earnings before tax have risen by £131,302 to £1,151,335 and after tax from £451,474 to £579,491—a figure which excludes the credit of £76,068 arising on the sale of some fixed assets and from the writing back of tax provisions. But the recovery in earnings is slow. For the fifth successive year the ordinary dividend is left unchanged at 22½ per cent. On that dividend the £1 ordinary stock units at the current price of 62s. 6d. yield 7.2 per cent.

The directors' short report on the course of the year's trade shows a mixture of good and bad. Sales by the chassis division improved, though this recovery

was checked by "the slow delivery of materials and the lack of skilled labour," but the sales and profits of the bodybuilding division "fell considerably." The future may be a little brighter for, having reported that export sales were well maintained, the directors say that the total value of unexecuted orders on hand is double that recorded a year ago and that some improvement in the trading results of the bodybuilding division is expected in the coming year.

RALEIGH INDUSTRIES. Just as the Hawker Siddeley results can be put among the brightest of the year those from Raleigh Industries can be numbered among the more disappointing. Throughout the group's financial year to July 31st and in the months which followed, the production of bicycles was rising. Yet group profits before depreciation and tax show a slight decline from £2,588,765 to £2,484,932. This decline can probably be attributed to rising costs. But if that is the cause, it does not cancel out the disappointment.

Thanks to a fall in taxation (from £1,287,173 to £981,436) net profits have risen slightly from £1,021,589 to £1,192,666. But the directors have been content to put the increment in net earnings to reserves, leaving the ordinary dividend at 12½ per cent. After the Tube Investments report, some investors had been expecting a better showing from Raleigh Industries. Their disappointment can be measured in the fall of 3s. 9d. in the £1 ordinary shares, which now stand at 48s. 3d. xd., to yield about 5.2 per cent.

WATNEY COMBE REID and H. & G. SIMONDS. The reports of the brewery companies come thick and

fast at this season, and this year there is a touch of seasonable cheer about almost all of them. Thanks to a warm summer, sales in the brewing year to September 30th were higher than in the previous year and profits have risen slightly. A few of the breweries have raised their dividends but most of them have been content to leave them unchanged. One warm summer does not alter the facts that the trend in draught beer sales is downwards and that money must be spent if the companies are to hold their own in the competitive market for bottled beers or if they want to attract custom back to the public houses by improving amenities.

Two preliminary reports—one from the London and Home Counties brewer, Watney Combe Reid, and the other from the Reading brewer, H. & G. Simonds—serve as examples of this year's results. In the 15 months to September 30th Watney Combe Reid earned a profit before tax of £2,840,074; this is equivalent to an annual rate of about £2,270,000 which compares with a profit of £2,095,074 in the year to June 30, 1954. The net profit for the latest 15 months was £1,140,757, equivalent to an annual rate of about £912,000, which is higher than the net profit of £822,834 earned in 1953-54. For the 15 months the brewery has put the ordinary dividend at 25 per cent, exactly equivalent to the annual rate of 20 per cent paid in 1953-54.

Similar results have been reported by H. & G. Simonds whose profits before tax have risen from £608,472 to £629,162 and its net profits from £262,491 to £300,016; its ordinary dividend for the fourth year running is left unchanged at 22 per cent. The yield on the £1 deferred ordinary stock of Watney must be calculated on the assumption of an annual dividend of 20 per cent. On that basis the stock offers 6½ per cent at 60s. xd. This yield is lower than that offered by the Simonds £1 units (8 per cent at a price of 54s. 6d. xd. and is lower than the average yield of brewing shares. But this is due to the asset values underlying the equity—which recently were given some prominence by the abortive negotiations for the sale of Watney's brewery site in Pimlico.

KAFFIR DIVIDENDS. With the limelight on industrial equities, the Kaffir market has been depressed in the last few months. The Christmas dividends from the gold producers have not brightened up the market, though several of them were better than had been anticipated. The output of gold has risen but it has fetched a slightly lower sterling price. Costs have continued to rise but

that increase in the last few months, thanks to the recruitment of a bigger native labour force, has been flattening out. This helps to explain the slightly better dividends. But the market, which has had to absorb one or two shocks from the gold developers, is still waiting on the quarterly reports in January for a lead.

LONDON STOCK EXCHANGE

Next Account begins: January 4th
Next Contango Day: January 4th
Next Settlement Day: December 20th

The rise in equities which closed strongly last Friday when the *Financial Times* index of industrial shares reached 199.7 was checked early this week by the November trade figures. But with the opening of the new account on Wednesday the market rallied, though business remained small and the index rose to 198.6. Gilt-edged securities were inclined to ease, although a firmer tone prevailed later. War Loan recovered ½ to 76½ on Wednesday, but was ½ lower on the week.

Bank shares recovered during the week, Barclays gaining 1s. 3d. to 48s. 6d. Insurance shares remained firm; Legal and General rose ¼ to 19½, Pearl and Prudential "A" were unchanged at 23½ and 47½ respectively. Associated Portland Cement rose a further 3s. to 109s. and Eastwoods gained 6d. to 56s. Electrical shares returned to prominence in the new account after tending to be depressed by small selling. Plessey rose another 1s. 3d. to 83s. and A. Reyrolle 2s. to 106s. 6d. Standard and British Motor weakened with the fall in demand for new motors, but Rolls-Royce gained 1s. 10½d. to 117s. 6d. Tobacco shares were sharply better. Godfrey Phillips benefited from take-over rumours and gained 3s. 9d. to 18s. 3d., while Tobacco Securities rose 2s. 9d. to 50s. 9d. Textiles recovered, cotton and rayon manufacturers being well supported. English Sewing Cotton at 29s. 4½d., Lancashire Cotton at 28s. 7½d., Courtaulds at 44s. 3d. and British Celanese at 21s. 10½d. all rose over the week.

Canadian Eagle and Ultramar were prominent in the oil section, while the general tone remained quiet. United Sva Betong rose to 55s. in the rubber section. Dominion Reefs jumped to 26s. 3d. on the dividend, and New Pioneer gained 7½d. to 13s. 6d. on hopes of an association with the General Mining group. Randfontein advanced to 48s. 6d. and Daggafontein to 50s. 7½d. Coppers were higher, Rhokana reaching 45 and Tanganyika Concessions 8½.

THE MONEY MARKET

CREDIT supplies in Lombard Street continued plentiful before the weekend; on Friday and Saturday the Bank made some reverse sales of bills to mop up a surplus. But on Monday conditions tightened, whilst on the following day two or three houses were forced to take loans at the penal rate, though for a very small amount.

The market made no change in its bid at the Treasury bill tender on Friday last, offering £99 5s. 11d. per cent for the two months and £98 19s. 8d. per cent for the three months' maturities. The offer was unchanged at £50 million and £240 million respectively, but total applications for the 91-day bills shot up by £57 million to £361.1 million, so that the market's allotment slumped from 85 to 50 per cent. Applications for the 63-day bills fell by £3 million, to £61.2 million, but the market's allotment still dropped slightly, from 81 to 80 per cent. The allotment on the two maturities together fell from 83 to 56 per cent. At yesterday's tender, the offer of 63-day bills was raised by £20 million, but that of the longer maturities was cut back by £20 million.

Sterling has been strong in the exchange markets this week. The rate against the dollar, which last week was held at \$2.80½ only with the aid of official support, has risen steadily. On Wednesday the close was at \$2.80½. In the bullion market the price of silver rose in successive stages from 77½d. an ounce to 78½d. an ounce for spot delivery.

Incomparable Aids for Investors

300 SECURITY CHARTS

500 CYCLI-GRAPHS

The scientifically designed graphs of these monthly (80-page) and quarterly (128-page) publications (8½" x 11") provide an authentic and businesslike picture of the market's price-range patterns (weekly and monthly) plotted against the basic earnings and dividend background of a large coverage of the foremost listed U.S. equities.

Used together, these two Folios keep the investor apprised of both the long-range (12-year) and up-to-date (latest 21-month) trends for segregating growth, strong cyclical, or steady income situations from those in dubious position, as well as finding new opportunities or checking investment decisions.

With all data shown on uniform semi-log scales, these graphs enable the subscriber to keep more informed of basic trends and to quickly compare leading and lagging price performance, high or low price-earnings ratios, dividend yields and margin of earnings coverage. Transparent Evaluator sheet and many other special features. Compact, practical, widely used, economically priced; 23rd year of publication.

COMPANY MEETINGS

JOSEPH LUCAS (INDUSTRIES) LIMITED

MOTOR INDUSTRY'S RECORD PRODUCTION

INCREASED SALES TO AIRCRAFT INDUSTRY

MR A. B. WARING REVIEWS RESULTS AND PROSPECTS

The Fifty-Eighth Annual General Meeting of Joseph Lucas (Industries) Limited was held in Birmingham on December 12, 1955.

In his statement to the Shareholders, Mr A. B. Waring, the Chairman, said:

From the Published Accounts it will be seen that the trading activities for the year ended July 31st last show the following results:

	1955	1954
Consolidated surplus from operations after charging all expenses, making adequate allocations to reserves and providing for taxation at comparable rates.....	£ 1,801,346	£ 2,126,798
Deduct taxation charges applying only to last year—EPL and income tax not required.....	...	675,300
Add income not relating to trading operations for the year—dividends and interest, revenue from property, royalties and foreign manufacturing rights and profit from earlier periods..	405,741	260,939
Net income from all sources.....	2,207,087	1,712,437
Deduct profit retained by subsidiaries.....	978,256	545,006
Net profit of Joseph Lucas (Industries) Limited.....	1,228,831	1,167,431

From these figures it will be seen that after charging taxation on a comparable basis the consolidated surplus from Operations is £325,000 less than in the previous year. Last year's results bore additional taxes of £675,000 and this year income from non-trading sources increased by £145,000. Taking these two items into account the net income from all sources at £2,207,087 is greater by £495,000 than the previous year. Profit retained by the subsidiaries to meet expansion requirements has increased by £433,000 leaving the net profit for the year at £1,228,831—which is £61,000 more than in 1954. To this net profit has to be added the balance of profit brought forward from the previous year £236,000 also the parent company's proportion of the over-provision for taxation resulting from the reduction in the standard rate of income tax provided in the Budget last April—£170,000. These additions bring the profit available for appropriation to £1,635,000 against £1,382,000 for the previous year. In arriving at the results it will be seen that income not relating to the trading operations of the year is greater than last year due primarily to increased royalties and to an increase in profits from earlier periods which relate to deferred settlements of Government contracts. Taxation at £5,187,000 is £470,000 less than last year mainly due to the elimination of the Excess Profits Levy. Replacement reserve for buildings, plant and equipment and for Supplementary pensions are the same as previously. A special stock reserve of £350,000 has been made to cover the inflationary element in this year's stock increase.

DIVIDEND

In view of the results the Directors recommend a final dividend on the equity shares of 1s. 3d. per share which, with the interim dividend of 3d. per share already paid, makes a total distribution of 1s. 6d. as last year. In making these recommendations the Directors have given careful consideration to all factors

bearing on the Company's affairs and those concerning the Motor Industry which provides its major source of profit. The influence of immediate national circumstances has not been overlooked.

The net dividends recommended amount to £614,000 compared with £575,000 last year, and the proposed allocations to general reserve and employees funds are the same as last year. The carry forward to next year

restrictions which arise from national balance-of-payment problems will, it is hoped, prove to be only temporary as was the case in 1952 when similar circumstances prevailed. Australian made cars and trucks are on the increase and local production will no doubt receive further encouragement from the latest import restrictions. British manufacturers have arrangements for progressively increasing the Australian manufactured content of their exported vehicles and to a large extent the situation, expansion is taking place in the Company's own factories established in working on the manufacture of vehicle equipment in Melbourne, Adelaide and Auckland.

The National Income and Expenditure Blue Book for 1955 states that the output of manufacturing industry increased by 33 per cent between 1948 and 1954 whilst total wages and salaries increased by 60 per cent in the same period. The result is that the "wages and salaries cost per unit of output" for manufacturing industry as a whole is 20 per cent higher than in 1948. Within the Lucas Organisation the wages and salaries cost per unit of the car electrical equipment output of the Company is 20 per cent lower than in 1948 whilst, during the same period, the average hourly earnings of the workpeople concerned increased by 60 per cent. This has been brought about by greatly increased production; at the same time it reflects the higher productivity which has resulted from the continuous efforts to improve both designs and manufacturing techniques. The fruits of the efforts to improve productivity have been masked by the rising costs of materials and wages. The continuous search by the Company's laboratories for alternative less expensive materials and all the efforts made to economise in the use of materials have been able to do no more than slow down the rising tide of material costs. The price of copper, which is the principal raw material for manufacture of electrical equipment, rose by 70 per cent in the course of the year, and the price of zinc and lead by 21 per cent and 16 per cent respectively. Wages in the engineering industries were raised by 5 per cent. It is quite impossible to make offsetting cost economies at anything approaching this rate, and it is only the substantial increase in volume of output that has made it possible to get through the year without imposing price increases of a substantial nature. If the present volume of output were to fall, there would be the utmost difficulty in keeping down prices at anything like their present level.

The price policy of the Company has two main objectives: firstly to contribute all that it can towards the continuing success of the British motor industry, and secondly to maintain the position it has won within that industry as a supplier of specialised equipment, and in so doing to earn a fair reward for effort. The best interests of the Company will not be served by large profit margins, but by a regularly expanding market, and with this in mind it is our constant endeavour to make a full contribution to cheaper, safer and better motoring, road transport and mechanised agriculture. The prices of our equipment, whether supplied

in large volume to the vehicle manufacturers or over the counter as spares to the general public, compare favourably on a value-for-money basis with those of any other manufactured products available in this country or any other country, including the USA.

KEEN EXPORT COMPETITION

It may be appropriate to refer to the attention that has properly been given in the Press and elsewhere to the progress that is being made in export markets by German manufacturers. We should do well to take note of this virility on the part of our competitors, without, however, forgetting that figures expressing the rate of progress as a percentage of previous performance will always favour the late starter, as compared with the producer who has been maintaining a high average for a period of years. In the field of vehicle design and production the Germans have no set of natural laws operating in their favour. They have to purchase their raw materials in the world's markets, and there has never been any indication that their inventive genius is superior to what exists in this country. They have as a national characteristic a liking for hard work and for thoroughness in detail, nevertheless, a close examination of the German cars reaching the export markets does not reveal any important feature of design or specification or price which could be regarded as an advantage over the British counterpart; indeed, the reverse is more likely true. There are, however, indications that their overseas salesmanship and service arrangements are of a highly imaginative and comprehensive character, and of this it is necessary to take full account.

AIRCRAFT INDUSTRY

Sales to the aircraft industry were greater than last year; this achievement having been assisted by an increased contribution from the Company's Canadian factory at Toronto. The rapid growth of sales of aircraft equipment over the past four years has been due mainly to the rearmament programme and to a lesser extent the increased popularity of gas turbine engines in civil aircraft. The peak load of rearmament has now been passed, and although it is anticipated that a full share of the rising civil requirements will be obtained, nevertheless this will not replace the declining military volume. This situation has been anticipated for some time and efforts are being made to diversify the products of our aircraft equipment factories. Steps are also being taken to develop and produce hydraulic and combustion equipment for industrial and domestic purposes, but it is unlikely that these new activities will provide a financial reward for some time.

Future success in the aircraft equipment field depends on the ability to design and produce new devices to overcome the problems presented by high altitude and ultra high-speed flying, and at the same time to achieve economical production and operation. The Company's scientific and technical staffs are fully established and extremely well equipped to meet the demands now being made upon them.

The Directors express their wholehearted thanks to all employed by the Company, whether of senior or junior rank. All have responded admirably to the challenge of the needs and requirements of the year.

Finally, the shareholders will be pleased to know that on November 3rd Her Majesty The Queen and His Royal Highness The Duke of Edinburgh honoured the Company by visiting its Head Office and Works. The reception given to them by the workpeople and staff was truly inspiring.

The Report of the Directors and the Accounts were adopted.

ELECTRIC & MUSICAL INDUSTRIES, LIMITED

BEST RESULTS IN COMPANY'S HISTORY

The twenty-fourth annual general meeting of Electric & Musical Industries, Limited, was held on December 9th in London.

Mr J. F. Lockwood, the chairman, in the course of his speech, said: The final net profit was £832,000—an increase of £286,000 over 1954. This result is the best in the Company's history.

RECORDS, RADIO AND TELEVISION

In the financial year ended June 30, 1955, the value of our sales of gramophone records in the world was 33 per cent above the previous year. The EMI group of companies is the largest manufacturer of gramophone records in the world.

Our trademarks are known throughout the world as symbols of the best that can be obtained in recorded music. In addition, we have built up an outstanding organisation for recording, manufacturing or distributing in twenty-five countries. From these companies or branches records are sold throughout the world, and we can give artists and the public a service which cannot be matched by any other organisation.

The new range of television receivers is accepted by both the trade and public as providing brighter pictures of the highest definition. The introduction of the new EMI electrostatic cathode ray tube has made possible this great advance in picture quality, and our lead is now being followed by competitors.

We believe that we may have been the first in the world to have automatic electronically-controlled machine tools working satisfactorily under commercial conditions in a customer's factory. Development work is proceeding on apparatus of more complex design to meet the requirements of particular industries—especially aircraft. It is expected that this form of automation will rapidly gain favour because it will reduce production costs and widen the scope of experimental work.

We have just made a long-term agreement with the well-known Cincinnati Milling Machine Company of America, which is a firm of world-wide repute in the machine tool industry. This agreement provides for electronic apparatus of our design and manufacture to be used in conjunction with their machine tools and also licenses them to use our designs and patents. This will, we hope, result in a substantial export of electronic equipment and provide a useful dollar income.

OTHER FORMS OF AUTOMATIC CONTROL AND DATA PROCESSING

We shall complete next year a pilot model of a data processing system which is designed to do work not practicable with the equipment at present available here or abroad.

We are also co-operating with the National Research Development Corporation in the development of an advanced system of data processing for commercial and manufacturing purposes.

Both systems will use the digital computer technique and will be designed to allow for the rapid selection of items from large volumes of information and so avoid complex computing. The systems will be made as flexible as possible to meet many needs, for

example, banking and distribution, as well as manufacturing.

DEFENCE WORK

During the past year, our development, design and production teams have been fully employed on Government contracts for many types of military, airborne and naval electronic equipment. We have been asked to look further ahead and co-operate in the study and design of new equipment to meet the increased requirements and more difficult conditions of operation which will arise in the next decade.

We are now being asked to increase the range of our responsibilities in both new and established work. An example is telemetry equipment, which is used for transmitting flight information from trial guided missiles.

We are providing not only the missile equipment, but are also co-ordinating the requirements of users in order to assess the need for new designs. We also have a team operating at Salisbury, Australia, for the purpose of proving our guided weapon equipment on the trial ranges.

OVERSEAS BRANCHES AND SUBSIDIARIES

United States of America.—The business of Capitol Records, Inc., continues to expand. Their sales will have reached about £7 million in the calendar year. The "Angel" records, marketed by our other American subsidiary, Electric & Musical Industries (US) Limited, continue to attract the American public. The sales of these records, which are mainly of serious music, have increased by 150 per cent in a year. These records are all exported from Hayes.

The success of the "Angel" trademark in America has exceeded our hopes and more than justified your directors' decision to establish our own selling organisation for at least part of our products in America.

France.—The activities of our highly successful French subsidiary continue to expand. It employs 2,500 people and accounts for about 70 per cent of record sales in that country. It also has a good share of the market for record players.

Germany.—Our subsidiaries, now located at Cologne, are making rapid progress and reasonable profits. Their sales have improved by more than 70 per cent during the year.

Australia.—The business in Australia has an annual turnover of several million pounds. The manufacturing capacity, especially for records, is being increased to take every advantage of this profitable and expanding market.

FUTURE PROSPECTS

From next January we shall begin selling Capitol records in the United Kingdom. In the United Kingdom we do not yet know what will be the full effect on our turnover of the restrictions on hire purchase, the increase in purchase tax and the Chancellor's restriction of credit.

We are seriously concerned by wage increases which affect the prices of the goods which we have to sell abroad. Despite these difficulties, I think we can look forward to the future with confidence.

The report and accounts were adopted.

ANGLO-TRANSVAAL CONSOLIDATED INVESTMENT COMPANY LIMITED

STRONG FINANCIAL POSITION CONTINUES

HIGHER GOLD PRICE NECESSARY FOR WORLD STABILITY

INDUSTRIAL INTERESTS STRENGTHENED

The Twenty-Second Annual General Meeting of the Anglo-Transvaal Consolidated Investment Company Limited was held on December 9th in Johannesburg.

The following is an extract from the Speech of the Chairman, Mr S. G. Menell:

Ladies and Gentlemen,—I have pleasure in presenting for your approval the Directors' Report and Audited Statement of Account for the year ended June 30, 1955.

You will see from the Profit and Loss Account that the operations for the year have resulted in a net profit of £882,100 which is slightly higher than last year's record figure.

You will observe from the Balance Sheet that the book value of investments in Subsidiary and other companies amounts to £5,700,000, as compared with the figure of £6,400,000, being the market value of the quoted investments and at cost or Directors' valuation whichever is the lower, for unquoted investments. In addition to this surplus of £700,000, there is a specific provision of £600,000, giving a total excess value of £1,300,000. The reserves of the Company amount to £3,880,000 and current assets of £5,600,000 exceed current liabilities by £697,000.

I would also draw your attention to the accumulated reserves of various Companies in the Group since they became subsidiaries. In the accounts of your principal subsidiary, Anglo-Transvaal Industries Limited, the net aggregate amount of profits less losses of their subsidiaries total £994,000 which has not been dealt with in the accounts of that company. Your Company's proportion of this amount and of the amounts in other subsidiaries which has not been distributed, totals £740,300.

INDUSTRIAL

Anglo-Transvaal Industries Limited has had a record year and most of the Companies in the Group have extended their activities and increased their profits. This satisfactory position has been largely due to the conservative policy adopted during recent years of building up reserves to be employed in profitable expansion. It will now be difficult to continue this sound and prudent policy owing to the introduction of the Undistributed Profits Tax and young industries in particular, which should be given every encouragement to plough back profits for development and expansion purposes, will be unduly prejudiced.

It is hoped that in the interests of industrial progress, this Tax will be amended.

HIGHER GOLD PRICE NECESSARY FOR WORLD STABILITY

In view of the position which gold mining occupies in the country's economy, any serious problems confronting the Industry must be regarded as being in the forefront of national problems.

Two major adverse trends are hampering the Industry at present, namely, the shortage of manpower and the ever-rising cost structure, with which is coupled an unrealistically low gold price.

The shortage of manpower is forcing the Industry to work below its true capacity. This shortage is not confined to the gold mining industry, and is indeed a national problem, the solution of which is of prime concern to the State if the economy of the nation is to develop at a pace commensurate with its great potential. Our obvious remedy is that immigration must be fostered on a more extensive scale, but it is also necessary that the abilities of the Non-European must be put to wider and more effective use. It is manifestly beyond the capacity of rather less than three million Europeans to provide the skill and intellect required to support in a modern way of life, a community consisting of almost fourteen million inhabitants in our country.

The price of gold, over which the mining industry has no control, means that rising costs have greater significance in the gold mining industry since the gold mines are not able to pass on to the buyer of gold any of the increased costs in the way that manufacturing industries can pass on certain costs to the consumer. Since the time of the last increase in the sterling price of gold, in 1949, working costs in the gold mining industry have risen so rapidly and to such an extent that early advantages gained through devaluation have now almost disappeared. While the rise in gold mining costs during recent years has its origin principally in a general world-wide rise in prices, the position has been aggravated by supplementary inflationary conditions locally. This rising cost of production is particularly serious to those Mining Companies who have low profit margins.

The present unrealistic gold price has repercussions far and wide in the world's economy and social stability. One of the major problems is the inability to obtain security for one's future because of the progressive depreciation of currencies. It is the inevitable price of war that processes are set up leading to a constantly diminishing purchasing power of money, and, in the uneasy peace of the last decade, world conditions have continued to remain inimical to the restoration of stable currencies. In the aftermath of two major wars, the disruptive influence on the stability of our economic system is the one which demands the most urgent attention.

A generation has passed since the accelerated depreciation of currencies upon the reliance of which men had been inspired for so long towards attaining the goal of security for themselves and for those for whom they must care. The fast changing value of money—always downwards—as seen by this new generation, has tended to discourage thrift and to diminish the incentive for planning ahead for an ordered way of life. With this has come that relaxation of mental discipline which undermines the fibre of the individual, to the eventual detriment of the nation.

Two important and allied consequences of the failure of governments to maintain stability of currency are the discouragement of thrift and the stimulation of an unhealthy demand for consumable goods of all kinds—both potent causes of the inflationary trend

from which all countries are suffering today.

Wage increases in cash and in various guises have been granted from time to time in tacit recognition of lowered money values. This can only be a temporary palliative, however, as such expedients inevitably introduce a fresh wave of inflation and consequent further demands which can only be arrested by a physical inability to meet them because of the economic limitations of an employer's business.

The situation is a challenge which must be met successfully by the Western World.

Since the beginning of historic time gold has been the most highly prized and the most readily exchangeable commodity in the world. More rapid improvements in world standards of living date from the time when gold became more plentiful, or more correctly, less rare. In the period of nearly four centuries between 1492 and 1886, world production of gold amounted to approximately 12,200 tons, whereas in the 68 years between 1886 when the Witwatersrand was proclaimed a goldfield, and 1954, world production of gold totalled approximately 47,800 tons, i.e., the production since 1886 has increased fourfold in one-sixth the time. Of the 60,000 tons of world production of gold since the discovery of America by Columbus in 1492, the world stocks of monetary gold held in central banks and treasuries amounted in 1954 to about 40,000 tons, of which the USA held nearly 70 per cent. It is significant also that the 60,000 tons of gold produced in the world since 1492 has a value on today's price of gold of about 60,000 million dollars—a figure less than the value of one year's budget of the USA Government.

It seems abundantly clear, therefore, that the current production of gold falls far short of the world requirements, and therefore its overproduction cannot be envisaged. For this reason, and for the reason that monetary stocks of gold are seriously undervalued in relation to the monetary requirements of world trade, an upward revaluation of gold, in terms of universal currencies, including dollars, is a pressing necessity and cannot be delayed for very long. If we in South Africa, as a gold-producing country, stand to benefit when the necessary upward adjustment in the price of gold takes place, this would be incidental in the greater general world-wide gain. South Africa, already a major contributor to the store of needed gold, would add to its potential of remaining so by bringing in its ores which are uneconomic today, but the world would gain from currencies in equilibrium with gold, correctly priced, and so assist in promoting that tranquillity in the minds of men which is the keystone of world stability.

DIRECTORATE

I am pleased to report that Mr Anton Gray, who has had wide experience in mining in Southern Africa and who, up to last year, with a Director and a Vice-President (exploration) of the Kennecott Copper Corporation of America, has joined the Board of this Company with effect as from November 8, 1955.

BIRMID INDUSTRIES SUCCESSFUL TRADING

The annual general meeting of Birimid Industries Limited was held on December 13th at Birmingham, The Right Honourable Lord Burghley, KCMG (chairman of the company), presiding.

The following is an extract from his circulated address for the year ended July 31, 1955:

The high rates of production achieved in the previous year by the individual Group companies have been maintained or improved upon so that your company has experienced an even more successful year's trading than last year. I am bound to emphasise, however, as I did last year, that profit margins of the order of that shown by the Accounts can only result from high outputs which, in themselves, are dependent both upon available demand and productive capacity. Any fall in demand, therefore, which entails lower production rates would adversely affect profit margins.

Your Board are constantly alive to the need for developing cheaper and more flexible production methods, not only as a factor benefiting the national economy, but in order that the Group may operate successfully at lower outputs.

The total of capital and reserves now stands at £8,201,894. When this is compared with the issued capital of £2,397,500 it gives some idea of the magnitude of the resources of your company.

Demand has been well maintained throughout the year for all classes of cast and wrought products manufactured by the subsidiary companies. Indeed, it may be said that in many instances, sales have been limited by manufacturing capacity. Limitation of labour supply has been a prime factor preventing larger outputs being reached.

Despite this handicap, the design and introduction of better processes and equipment have led to steady improvements in output. Consequently, as compared with the last financial year, Group sales have risen by 27 per cent in value and 26.5 per cent in volume. Your companies have absorbed a high proportion of the cost increases consequent upon very considerable advances in wages and material costs.

It is not practicable to export the un-machined castings which form the output of your foundries. Indirectly, however, and particularly in the finished products of the motor and aircraft industries, your companies' products are exported to the extent of about 50 per cent of our output.

In the wrought light alloy field, Birimetals Limited maintain a very useful direct export trade in their specialised "Birmabright" alloys, and indirectly a much larger ratio of exports via the industries already mentioned.

The value of these exporting industries in earning vital overseas revenue cannot be exaggerated. We may be proud of the great part our Group plays in these important undertakings, which are so necessary for the nation's livelihood. The maintenance or expansion of these overseas markets, however, largely depends on our ability to maintain or lower prices, and these conditions cannot be met if wages and other costs are to be continually inflated, without a corresponding increase in productivity.

It is quite impossible to keep costs down against constantly rising wage rates and material prices, and it is much to be hoped that self-discipline in demanding and spending will restore full economic health without waiting for the unpleasant medicine of lost markets and unemployment.

The report and accounts were adopted.

O.K. BAZAARS (1929) (Incorporated in the Union of South Africa)

LARGER CONSOLIDATED NET PROFIT

DIRECTORS' REPORT ON PAST

YEAR'S OPERATIONS

The twenty-sixth annual general meeting of O.K. Bazaars (1929) Limited will be held on December 31st at Johannesburg.

The following is the Directors' Report, which has been issued to shareholders with the accounts for the year ended June 30, 1955:—

To the Shareholders.

Your Directors submit herewith in respect of the year ended June 30, 1955:—

- (1) The Directors' Annual Report;
- (2) The Balance Sheet and Profit and Loss Account of the Company;
- (3) The Consolidated Balance Sheet and Profit and Loss Account of the Company and its Subsidiary Companies.

DIRECTORS' REPORT

CAPITAL

The authorised and issued Share Capital of the Company has not been altered since last year.

PROFIT

The net profit for the year under review after providing for all expenses and taxation was £847,906 as compared with £782,261 for the previous year. The net profit available for allocation and appropriation in the

1954		1955
2,871,547	Balance brought forward from previous year	2,114,168
782,261	Add: Profit for the year	847,906
3,653,808		2,962,074
49,959	Add: Dividends from subsidiary companies out of profits earned since acquisition and undistributed at June 30, 1953	...
3,703,767		2,962,074
187,539	Deduct: Preference dividends	187,539
3,516,228	Interim dividend of 20 per cent, declared June 27, 1955, since paid	2,774,535
1,141,782		400,000
2,374,446	Deduct: Transfer to Capital Reserve	2,374,535
260,278	Balance which your Directors recommend be dealt with as follows:—	
2,114,168	For the payment of a Final Dividend of 40 per cent (making a distribution for the year of 60 per cent) to holders of Ordinary, "A" Ordinary and "B" Ordinary Shares	260,278
	Balance to be carried forward	2,114,257

Accounts of the parent company has been dealt with as set out below:—

CONSOLIDATED

ACCOUNTS

Shareholders are referred to the Consolidated Accounts of the Company and its Subsidiaries which show the position of the Group as a whole. The Consolidated Net Profit, after deducting all expenses, taxation and the interests of outside shareholders, is £1,099,579, which compares with £853,090 for 1954. The 1955 figures include a capital profit of £133,682, being the surplus realised on the disposal of certain fixed assets. There

has been transferred from Unappropriated Profits to Capital Reserve an amount of £400,000, which, together with that portion of the pre-acquisition profits of a Subsidiary, increase Capital Reserve to £4,085,888, as against the 1954 figure of £3,664,096. After the transfer to Capital Reserve of £400,000, General Reserves and Unappropriated Profits total £2,867,585, an increase of £261,075 over last year's figure. Capital and Reserves are £8,644,441, compared with £7,961,301 at June 30, 1954, after provision has been made for dividends. The increase in the Balance Sheet figure under the heading of "Property" is due to the acquisition of building sites, the erection of new branches and the inclusion in the Group figures of the properties belonging to the Fresta Group of Companies which are now wholly owned Subsidiaries and in consequence do not appear under the heading of "Investments." The shareholding in Dok Holdings (Pty.) Limited no longer appears as a "Trade Investment," and the surplus realised on the sale of this asset is included in the capital profit referred to above. The increase of £1,206,195 in trading stocks compared with 1954 is due to the opening of new branches, increased turnover, and the incorporation in the Consolidated Accounts of the trading stocks of the Fresta Group of Companies.

Raphael Brothers Limited and Sowden and Stoddart Limited.—Raphael Brothers Limited, a wholly owned Subsidiary Com-

pany, earned a satisfactory return on the Company's capital investment and Sowden and Stoddart Limited, a Subsidiary, showed improved trading results over last year.

C.T.C. Bazaars (South Africa) Limited.—Your Company continues to hold 54 per cent of the issued Ordinary Share Capital of C.T.C. Bazaars (South Africa) Limited, which Company is again paying a dividend of 10 per cent, the same as last year.

OTHER INTERESTS

Federated Shippers Limited.—During the year under review your Company received a dividend of £18,000 from Federated Shippers

Limited, being 15 per cent on this investment.

DEVELOPMENT

We are proceeding with our programme of enlarging and modernising existing premises, including those held under long-term leases. A number of trading sites, both in the Union and in the Rhodesias, have been purchased with the object of opening new branches, some of which are presently in the course of construction, and others in the planning stage.

During the year a branch was opened at Kroonstad, and since the end of the financial year we opened a Supermarket at Kenilworth, a Johannesburg suburb; we shall open a branch this month at Worcester. The rebuilding of the Durban store is progressing according to schedule, and the Company is already trading in a rebuilt portion of the new building.

GENERAL

There has been a marked improvement in locally manufactured merchandise, and we compliment the manufacturers on the high standard of their products. Although a certain amount of imported merchandise is still essential, over 80 per cent of all our requirements are purchased locally.

Business throughout the Union and the Rhodesias during the year under review has been good, and indications are that the current year will be no less satisfactory. Your Directors are optimistic of the future of both

the Union and the Rhodesias, and it is their opinion that it is in the best interests of the Company to proceed expeditiously with its expansion programme.

The attention of Shareholders is directed to the enclosed Circular and Notice, from which it will be seen that Resolutions will be submitted to Shareholders to approve (a) a Rights Issue of new Ordinary, "A" Ordinary and "B" Ordinary shares to holders of those classes of shares respectively, and (b) an offer to Shareholders of C.T.C. Bazaars (South Africa) Limited for the acquisition of their shares in that Company by an exchange of shares in O.K. Bazaars (1929) Limited.

The progress of our organisation and the satisfactory trading results could not have been accomplished without the enthusiastic and loyal co-operation and the efficient services of our 8,000 employees. The welfare of our staff is of first importance, and we provide many staff amenities which are constantly being extended and improved. We take this opportunity of extending to all members of the staff our thanks and appreciation for their services.

This year, as in previous years, bonuses were paid to the staff.

(Here follow details of Resolutions of Subsidiary Companies approved during the year.)

On behalf of the Board,
S. COHEN,
Chairman
M. MILLER,
Deputy-Chairman
Johannesburg,
November 30, 1955

Directors

THE CANADIAN BANK OF COMMERCE

RECORD YEAR OF GROWTH

MR JAMES STEWART ON THE ENCOURAGING OUTLOOK

The eighty-ninth annual meeting of The Canadian Bank of Commerce was held on December 13th in Toronto.

Mr James Stewart, CBE, the President, in the course of his speech, said: As we turn our thoughts to the year ahead, it is well to bear in mind the continuing importance of our trade to the maintenance of a high level of business activity. It may well be that the diversity and depth of our industrial evolution has provided some degree of "insulation" from recessions in other parts of the free world. On the other hand, the upsurge in United States business conditions certainly played an important part in stimulating our economic recovery this year. If it can be anticipated that the momentum presently inherent in the American economy will carry well into the coming year, then we can expect continued demand for our export products and confidence in business.

Looking at Canada's Gross National Production, the President continued: We seem at this point to have established a tempo of production and consumption . . . approximately \$26 billion. If productivity improves during the coming twelve months by two or three per cent in the aggregate, and if we assume even an average agricultural output, we well might anticipate an even higher Gross National Product for 1956. If confidence in the future continues firm, then business in most fields of activity should continue to show further improvement.

Reviewing the past twelve months, Mr Stewart said: 1955 has turned out to be a record year. The encouraging feature of the current picture is the recovery from the slow-down in business activity that took place

during 1954 and which continued into the early months of 1955.

I would conclude on a note of caution arising from the growing awareness of the fact that scientific developments well may have brought us closer to the absence of war as we understand it now. In fact, atomic and nuclear developments seem at this time to have generated a form of military stalemate. We must adjust our thinking to meet the change that this signifies. But of even greater significance to my mind is that under such conditions the dangers of propaganda are heightened rather than reduced. We must be on guard lest internal disturbances and doubts weaken the political and social fabric to the end that our basic objectives are obscured or that we lose the will to defend them. We must learn to live with the technological and scientific developments that we already have witnessed and those that are ahead of us, and we must resist attempts to destroy the political and economic framework within which we have accomplished so much.

GENERAL MANAGER'S REMARKS

Mr Neil J. McKinnon, Vice-President and General Manager, said: Total assets have increased to more than \$2,356 million in a record-breaking year of growth. Aggregate deposits increased by more than \$272 million over the previous year, and total assets increased by over \$298 million, reflecting the greatest year of growth in the Bank's history.

Reviewing business conditions during the past year, Mr McKinnon noted that the aggregate increase of all forms of credit had been substantial and said some degree of restraint would be justified to guard against "unwarranted expansion." However, he stressed that there should always be adaptation to the needs of business growth. He continued: The banking mechanism is a sensitive one, and policies and attitudes ought to be flexible at all times—with a full understanding that the business and trading environment is constantly in a process of change. The report was adopted.

THE CRITTALL MANUFACTURING COMPANY

OVERALL TRADING IMPROVEMENT

The thirty-first annual general meeting of The Crittall Manufacturing Company Limited was held on December 14th in London, Lord Braintree (the Chairman) presiding.

The following is an extract from his circulated review: The trading profits for the year, excluding investment income, amounted to £508,677, as compared with £452,225 for the previous year. This increase was primarily due to improvement in the results of the Parent Company, but each of the Subsidiary Companies consolidated have shown improved trading profits.

There has been a considerable increase in turnover as compared with the previous year. Against this, however, we have had to face very considerable increases in costs of raw materials, services, salaries, wages, etc.

So far as materials are concerned, the rises have been most serious in steel, brass and spelter. Under these headings alone we have had to bear an increased cost of £33,000 during the period; in a full year this would amount to £200,000.

National awards in respect of wages and salaries are responsible for an increased cost of £46,000 in the period; in a full year this would amount to £110,000. Finally, and in addition to all this, coal and steel increases in particular affected prices of many of the services and materials purchased by the Company.

Constant efforts have been made during the year to offset the effect of these increases by economies and improvements in manufacturing methods. Very considerable success was achieved in this direction.

It has long been the policy of this Company to use these economies to offset increases in cost. Unfortunately, however, the magnitude of the increases above referred to made it impossible for them all to be absorbed in this way. Consequently we have had to introduce certain limited increases in selling prices.

There has been a considerable increase in the volume of standard windows supplied for the rehousing requirements of the home market. In addition, the year has seen a marked increase in demand for all types of purpose made windows for the capital rebuilding that is now undoubtedly getting under way in this country. Overseas the sales figures reached an all-time record level of just over £1,600,000.

The current year has opened with a larger volume of orders on the books and work going through the factories than last year. It would, however, be foolish to prophesy that this state of things can easily be maintained throughout the period. The curb on house-building is already operating and this must inevitably have some effect on the demand for this product.

In other classes of building there is at the present moment a demand considerably larger than last year, but it seems inevitable that measures of national economy must adversely affect many classes of building. I am not without hope that the building trade, both builders and manufacturers, may make a contribution to maintaining high-scale production by shaving prices with the object of bringing about a more economic cost of building.

The report was adopted and the final dividend of 10 per cent, making 15 per cent for the year, was approved.

GLAXO LABORATORIES

WORLD-WIDE SALES PROGRESS

PRICE REDUCTIONS ACHIEVED BY IMPROVED TECHNIQUES

SIR HARRY JEPHCOTT ON OVERSEA INVESTMENT

The twenty-first annual general meeting of Glaxo Laboratories Limited was held on December 13th in London, Sir Harry Jephcott, MSc, FRIC, FPS, chairman and managing director, presiding.

The following is an extract from his review, which had been circulated with the report and accounts for the year ended June 30, 1955:

In last year's review I indicated that, because of the nature of our business, it would be wise to make further allocations to Capital Reserve and £500,000 has been added. In addition £500,000 has been placed to General Reserve Reserve, £100,000 to Exchange Reserve, referred to later, and £100,000 to superannuation and widows' pensions, provision for which is still far from adequate.

To reduce the disparity between interim and final dividends, we intend, so far as is practicable, to pay interim dividends of one-half the total distribution for the previous year, and an endeavour will be made to issue with the announcement a progress statement, though the extent of our overseas interests raises certain difficulties.

Difficult trading conditions have continued, but we have more than maintained our position. Our sales world-wide have increased by 8 per cent in value, and much more in volume, but at reduced profit margins. The sales increase was widely distributed amongst our many products, and it was especially pleasing that its oldest section, the infant food products, shared fully in the increase.

EXPANDING EFFICIENCY

It has long been our policy to give customers the benefits of economies in manufacture, and recently a number of price reductions were made at home and abroad. We know that these reductions will be as welcome to the Minister of Health at home as they are valued by our many customers abroad. The prices today of those pharmaceutical products we sold to the public in 1939 are, on the average, less than they were 16 years ago; this at the end of a period during which the cost of most goods and services has trebled.

The new freedom in the manufacture of and trade in dairy products has so far been rather to our advantage than the reverse. We are, however, faced with substantial capital expenditure in re-equipping our food factories at home and overseas with modern machinery, to secure the highest quality and lowest costs of production.

The overall consumption of antibiotics continues to expand, though competition, especially in some export markets, is very keen. We can continue to operate profitably in this field only by maintaining the highest technical efficiency.

Our cortisone, manufactured from hecogenin—a substance obtained from sisal grown in East Africa—is now in production and the output increases as the supply of raw material expands.

Our Virus Research Laboratory continues its work on poliomyelitis vaccine, and we are in consultation with the Medical Research Council and the Ministry of Health. The events in the USA earlier this year have

shown the need for further work to remove any risk, however remote, in its use. We have no doubt that this work, also going on in the USA and Canada, will produce a safe and effective vaccine.

NEW VENTURES

A building programme estimated to cost £600,000 is now being carried out. More office space is being provided at our Greenford headquarters and early next spring our Departments of Experimental Medicine and Bacteriology will move into a new block that will provide adequately for expansion. Extensions to our factory buildings will be completed towards the end of 1956.

In the production of pharmaceutical products great changes in medical needs are taking place owing to new knowledge. New drugs are discovered which replace the old. Some discoveries become permanently established; others do no more than meet a passing need. To maintain our position we must keep abreast of developments; consequently our annual expenditure on research now exceeds £500,000.

It is now established that some antibiotics, for instance streptomycin, have valuable application in the prevention and cure of certain fungal diseases of plants.

Our Research Department has been concerned with this development for some time, but, as we had not any experience in the marketing of horticultural products, we have acquired the Murphy Chemical Company, which has been long established in this field and has a high reputation. It will continue to operate as a separate organisation and under the same management, but in close co-operation with us.

A further substantial investment will be needed to provide adequate facilities for its expanding business. I take this opportunity for welcoming our new associates and assuring them they will receive our wholehearted support in the growth of our joint venture.

GLAXO TODAY

It is clear from comments received that some are unaware of the great changes that have taken place in the Company's activities since the first public issue in 1919. Then, apart from a substantial merchandising business, we were solely concerned in the manufacture and sale of the infant foods from which the Company's name derives.

Today we have a variety of manufacturing activities and products. We conduct our business in many countries with our own organisation and, often, manufacturing facilities. These developments in scope and geographical distribution have, by broadening the avenues of demand, added stability to our trading. At the same time they have introduced new difficulties.

In the present uncertain state of the world, the devaluation of currency, such as recently took place in Pakistan, may result in losses which are sometimes more nominal than real. Nevertheless, world-wide trading cannot be conducted without the risk of exchange losses and, as I mentioned earlier, we have added £100,000 to our Exchange Reserve.

Further, many countries encourage economically premature manufacture within their

own boundaries, accelerating our long-term plans for the establishment of factories overseas. We have invested more than £2 million in overseas subsidiary companies during the past five years.

There is inevitably a long time lag between the provision of funds and their translation into a live, virile organisation. Good progress is being made, but we shall need to wait a while longer before we reap the benefits of our actions—and, as your Board firmly believes, our foresight.

I close this review with sincere thanks to the men and women, at home and abroad, whose work has so largely contributed to the year's good results. Circumstances beyond our control, especially in overseas markets, constantly impose unforeseen and unforeseeable demands upon production. All these emergencies have been willingly met by the staff and, with their continued help and co-operation, we may look forward to another year of profitable trading.

The report was adopted.

THE FINANCIAL TIMES LIMITED

LORD BRACKEN'S ADDRESS

The twenty-eighth annual general meeting of The Financial Times Limited was held on December 13th at Winchester House, Old Broad Street, London, EC.

The Right Honourable The Viscount Bracken, PC (chairman of the company) said:

Your Board believes that the managing director and his colleagues in the management of this company deserve some praise for increasing profits in a year marked by protracted and extremely costly strikes.

"FREE PRESS"

Through the efforts of two Trade Unions all the London newspapers were forced to cease publication for nearly four weeks. All that need be said about this performance is that one of the peculiar signs of progress in the second half of the twentieth century is that freedom of speech is no longer synonymous with freedom of publication. A free press which is a right of the public, not of the newspapers, was established in Britain after long and arduous public agitations and Parliamentary struggles. This right has also been guarded by generations of judges. It can now be effectively vitiated at the whim of a comparatively small number of persons with some mechanical training.

COSTLY IMPROVISATIONS

The railway strike deranged most of our methods of distribution. While this strike did not force us to cease publication the cost of the improvisations necessary to get the paper to our readers was very considerable. It is almost unnecessary to add that both strikes led to sharp losses in revenue.

EARNINGS

As you will see from the accounts we are now considering, a resourceful management in the end succeeded in recovering losses and slightly increasing our consolidated profits before taxation. These amounted to £547,414 compared with £542,477 in the previous twelve months. We recommend, as we did last year, a final dividend of 12½ per cent and a bonus of 7½ per cent, making a total payment for the year of 32½ per cent.

PROGRESS

During the past year the circulation of the *Financial Times* has increased and has now

reached a record level. There is nothing surprising about this development. If you appoint a good editor and leave him alone; if you steadily increase information and features of much practical value to every trader, factory manager and investor, your paper cannot fail to grow in repute and circulation. One of the outstanding developments of the *Financial Times* in the last decade is that it continues to publish more information about the applications of science to industry and the creation of new techniques in management than any other daily newspaper in the world.

NEW OR TRANSFORMED INDUSTRIES

For many a year the *Financial Times* has stressed the truth that Britain, an island with few natural resources, cannot hope to maintain a good standard of living for all its people without an ever-increasing partnership between the laboratory and the factory. During the next quarter of a century some sections of our older industries will wither, some may die. But their places can be taken by a variety of new industries or widely saleable new products, most of which will be hatched in our laboratories. A country like ours with its many good workers by hand and brain, its primacy in fundamental

research, and its matchless engineering, financial, insurance and shipping skills, to mention but a few of its resources, has no reason to be faint-hearted.

BOOM FOREVER?

Britain can meet competition from any quarter granted industrial peace and some awareness in Whitehall of the folly of taking away more than half of the earnings of industry. Britain's industrialists and other traders should be allowed to retain far more of their earnings for the purchase of the best plant and equipment: for education, research and for the creation of larger cash reserves, which are much needed. This feverish post-war boom is not likely to last for ever, nor will foreign competition diminish.

REHOUSING

Some of our scattered offices and our main printing buildings are over-ripe specimens of Victorian or Albertian architecture. For the purpose of modern newspaper production they could hardly be more inconvenient and therefore costly. Our editorial department is separated by more than a mile from the printing plant. Our staff is working uncomfortably and uneconomically in six scattered buildings. The most of our leases are run-

investments in these companies stand in our Balance Sheet is far below their present value.

DIVIDEND

We are recommending payment of a final dividend of 20 per cent, making 30 per cent for the year, which is at the same rate on the 5s. shares as the 75 per cent we paid last year on the 2s. shares.

We have again included in the report and accounts some information relating to our various interests, all of which have continued to hold their pre-eminent position in their respective fields. In June, 1954, the *Investors' Chronicle* joined the Audit Bureau of Circulations, being the only publication in its specialised field to belong to that body. Its weekly circulation exceeds 27,000, a remarkable figure for a technical periodical of its character. Much of the progress of this paper is due to its sage and lively editor, Mr Harold Wincott. The *Investors' Chronicle* is an essential weekly investment for all those concerned with the management of their own or other people's money.

MR GEOFFREY CROWTHER

Of our various other interests, there is little for me to add. I would, however, make special reference to the editorship of *The Economist*, about which a public announcement was recently made. Mr Geoffrey Crowther is retiring from that post next year, after serving for 17 years, broken only by a period of public service in the last war.

Of Walter Bagehot, Mr Crowther's great predecessor in the editorship of *The Economist*, Mr Gladstone said: "During the time I was Chancellor of the Exchequer I had the advantage of frequent and free communication with him on all matters of finance and currency. Nor have I, in my experience, known anyone from whom in this important province more was to be desired, or who was more free and genial in the communication of his large knowledge and matured reflection." These words are also an appropriate description of Mr Crowther.

He has transformed *The Economist*. During his editorship the circulation has been multiplied by five, and it is now one of the

ning out. The war and building restrictions have too long prevented us from building premises adequate to our ever-expanding needs.

Last year I asked for your authority to obtain a site which would enable us to rehouse our newspapers and the St Clements Press and to provide room for future expansion. We have now got one. We shall soon sign a lease granted by the Corporation of the City of London for a site lying between Cannon Street and Queen Victoria Street, a little east of St Paul's Cathedral.

PLANS NEAR COMPLETION

Our plans for the new building are almost completed and we are applying to the Capital Issues Committee for permission to borrow the money required to finance this considerable project. I don't like spending much money on bricks and steel at a time when builders' costs are very big and indeed often incalculable. But there is no alternative unless someone is brave enough to assert that in this age of creeping inflation building costs are likely to fall. We hope to take possession of the new building before the end of three years.

The report and accounts were unanimously adopted.

most respected and most quoted papers in the world. Some people even deem it infallible—if it were it would not be so many-sided, lively and sometimes dancive. Wisdom and liveliness go well together.

When Mr Crowther retires from the editorship he will become a Managing-Director of *The Economist*.

The report and accounts were unanimously adopted.

NORTH KALGURLI

SATISFACTORY DEVELOPMENT

The annual general meeting of North Kalgurli (1912), Limited, was held on December 14th in London, Mr H. A. Kemlo, chairman, presiding.

The following are extracts from his circulated statement:

During the period covered by the Profit and Loss account we treated 323,725 tons of ore, with a gold content of 80,385 oz, the proceeds of ore amounting to £910,391. Mining costs were £753,295 and the net profit before taxation was £123,879 for the period of 64 weeks, against £135,775 for the previous period of 52 weeks. The lower profit is almost entirely due to premium sales having virtually come to an end, but in addition the average grade of ore treated was rather lower than in the previous year.

With a programme of capital expenditure under way the board have thought it prudent to allocate a further £20,000 to reserve, and to recommend a final dividend of 6d. a share, leaving a slightly reduced carry forward.

Mine development continues to be satisfactory. Since the end of the period covered by the accounts, monthly development footage has averaged around 1,100 feet, compared with an average of 881 feet during 1954.

We have a Mine of great potentialities, and the efficiency of our operations under our able General Manager and his loyal and enthusiastic staff is first class. It is this factor of efficiency, above all, which has made it possible for us to operate at a profit, although costs generally have been rising against a fixed price for gold, and which enables us to face the future with confidence.

The report and accounts were adopted.

JACKSON THE TAILOR LIMITED

(A Company in Association with
Montague Burton Limited)

GROUP RESULTS CONTINUE ON SATISFACTORY BASIS

EXPANSION OF TURNOVER

MR LIONEL JACOBSON'S STATEMENT

The Twenty-third annual general meeting of members of Jackson The Tailor Limited was held on December 14th at the Registered Office of the Company, 94 Clayton Street, Newcastle upon Tyne, Mr Lionel Jacobson (Chairman and Joint Managing Director) presiding.

The Secretary (Mr T. T. Scott) read the notice convening the meeting and the report of the auditors.

The following is the Statement by the Chairman which had been circulated to the Members with the report and accounts, and was taken as read:

These financial accounts cover a trading period of seventeen months to August 31, 1955. You will no doubt remember that your Board had given careful consideration to the change in the financial year end and this date was considered most suitable in that seasonal stocks are at their lowest ebb at that time of the year.

In consequence the accounts for the period do not lend themselves as readily to comparison with previous years nor in particular with the previous period of fourteen months. However, it will be evident that the results of the Group continue on a satisfactory basis.

SUCCESSFUL BRANCH DEVELOPMENTS

During the period under review the Retail Division has opened eight new branches in Wolverhampton, Bradford, Preston, Nottingham, Paisley, Coventry, Birmingham and Glasgow, all in key sites. In addition in St. Helens, Oldham and Warrington we have moved from our old sites to larger and more central positions where we are able to offer improved accommodation and service to our customers. I am glad to report that each and every one of these developments has proved a successful investment and will in due course reflect satisfactorily in the trading accounts. We are continuing with our programme of modernising existing branches with the resultant benefit to the older shops of the Group. An outstanding example of this is our original shop at 94 Clayton Street, Newcastle upon Tyne, in which a modern front has been installed and where this winter we are preparing to completely refit the interior. The beneficial influence of this policy of opening new branches and modernising existing branches will be evident from the accounts before you. Our turnover has increased and a larger proportion of the public than ever before are now being clothed by Jackson The Tailor.

Expansion of our turnover and manufacturing demand has necessitated further developments and we have acquired an excellent building in Newcastle upon Tyne in which for the first time for many years we have been able to centralise the warehousing of our Ready-to-Wear stocks and as a result give improved service to our customers.

As I anticipated in my last Report competition in our trade has intensified and

shows no signs of abating. We have, however, always based our policy on the minimum possible retail margins and since the end of our financial year our turnover has continued to improve and I feel we can look with some confidence to the future. In such circumstances with the further planned increase in the number of our branches and the prospect of expanded trade from our present Group we are continuing our policy of developing the Manufacturing Division. A new Works has been acquired in Sunderland and I am pleased to inform you that production has already commenced and will in due course provide a further valuable source of supply. In addition we have in hand a new Works at Gateshead which should be producing by the late Spring of 1956. When completed this Works will be the most modern and finest equipped in the North of England, if not in the whole country, and should ensure a steady flow of well-cut and well-tailored suits. These are the qualities on which the Jackson The Tailor business has been founded and through which it has expanded so vigorously in the past decade.

During the interim period prior to these developments the Manufacturing Division has had to contend with the heavy burden placed upon it by the demands of the public for our product. I am sure I am expressing your feelings as well as my own when I say how gratified we are at the manner in which they have overcome these difficulties and at the same time have continued to maintain the high standard of tailoring required.

PENSION SCHEME FOR WORKS EMPLOYEES

It has been felt for some time that some provision should be made for the payment of pensions to Works employees. Such a scheme is, of course, expensive, involving as it must some element for past service pensions for those of our employees who have been with us for many years. Further, it is usual for such schemes to be non-contributory, benefits being provided entirely from the Company's contributions. I am, however, pleased to announce that your Group has inaugurated such a scheme with effect from January 1st next. This means that now all employees of the Group will have the opportunity to enjoy a pension on retirement. Suggested improvements to the existing Staff Pension Scheme are now under consideration.

I should like to express my very sincere appreciation of the support I have received from all members of both the Executive and Retail staff during the last seventeen months.

The report and accounts were adopted.

The retiring directors, Mr S. H. Burton and Mr R. M. Burton, were re-elected, and the remuneration of the auditors, Messrs Price Waterhouse and Co., having been fixed, the proceedings terminated.

JOHN SMITH'S TADCASTER BREWERY LIMITED

LARGER PROFIT

The sixty-third annual general meeting of this company was held on December 12th at Tadcaster.

Mr W. H. D. Riley-Smith, chairman, in the course of his speech, said: The year under review has been one of contrast in trade conditions in the area which your company serves. In the first part of the year bad weather and industrial unrest in the South Yorkshire coalfield, the Docks and the Railways depressed sales, but we were helped by the warm and thirsty summer which followed, and the trading profit for the year ended September 30, 1955, at £1,163,447 was £33,175 higher than the previous year. Your directors recommend a final dividend of 9 per cent on the Ordinary Capital, making 14 per cent for the year.

Although there has been some relief in the burden of taxation, it still accounts for 10s. 10d. out of every £1 of profits. While the recent increase in distributed profits tax does not affect the figures now under review, in a full year, if we continue to pay dividends at the present rates, it will cost your company an additional £19,750. I would underline that distributed profits tax is charged not only on ordinary dividends but also on the fixed dividends payable on preference capital, so that in effect the profits tax on preference dividends has to come out of the profits available for distribution to ordinary shareholders. When I go on to tell you that 12s. 4d. out of each £1 of our sales has to be paid in beer duty, you will realise how great a tax collector is the brewing industry.

NEW HOUSES AND IMPROVEMENTS

Since I spoke to you last year we have opened four of the six licensed houses which I then said were being built, and the other two will be open early in the New Year. Next year we shall have another four houses going up and more are on the drawing board. We now know that within the next few years very many of our public houses will be affected by Clearance and Redevelopment Schemes, and, carrying out a policy of following the population, we have in hand necessary applications for new licences or removal orders. While this programme must cost us a lot of money, it is difficult to forecast accurately the overall effect on our trade in moving from older and dwindling centres of population to new and increasing ones, but it is in the best interests of our customers and your company that we should do so.

Our trade finds itself in a perplexing situation. There has, in recent years, been justifiable complaint about the amenities of some licensed properties. Until two years ago we were unable to carry out the improvements which we wanted and the public wanted because of building restrictions. As soon as we were able, we have set about our long overdue programme, and now the nation is exhorted to cut down on capital expense. I know that you will agree with me when I say that we must now proceed with our improvements, some of which have been waiting for sixteen years, and proceed with them to the limit of our resources. It is to be deplored that under existing legislation no allowance for taxation purposes is given on this type of capital expenditure but we deem it wise to provide in the company's accounts for depreciation on all its properties.

The report and accounts were adopted.

DEBENHAMS LIMITED

RESULTS AGAIN A RECORD

MR G. M. WRIGHT'S REVIEW

The annual general meeting of Debenhams Limited was held on December 14, in London, Mr G. M. Wright, ACA (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The Consolidated Trading Profit for the year ended July 31, 1955, has risen to the record figure of £5,025,131 from £4,797,347 last year. Net Profit, before taxation, is £4,366,057. Taxation requires £2,473,929, being 57 per cent of the Net Profit, as against 62 per cent last year.

The Consolidated Net Profit, after taxation, amounts to £1,892,128, and shows an increase over last year of £282,158. After crediting taxation provisions no longer required of £98,389 and debiting profits attributable to minority shareholdings, an amount of £576,433 has been retained by the subsidiary companies and £1,190,430, compared with £1,039,336, has been made available for appropriation.

The Directors recommend that £150,000 be placed to Reserve Fund and a Final Dividend of 2s. per share (making 2s. 9d. for the year) be paid on the Ordinary Shares. The balance carried forward to next account is increased by £36,617.

In February this year the borrowing powers of the Directors were increased in order to enable an issue of Debenture Stock to be made, but that proposed issue was forestalled at the last moment by a sharp increase in money rates. Owing to the continuance of these high rates, no further steps have so far been taken, but the programme of reconstruction and development must proceed, and the estimate of the Directors that some £4 million will be required from outside sources during the next few years still holds good. This programme is now depleting the cash resources of the Group; as the new stores which are replacing those destroyed in the war approach completion, so the strain on those resources will rapidly increase. It is in the best interests of the Company that this work of reconstruction should be completed in accordance with present plans, and therefore the Directors consider that it is their duty to follow a policy of retrenchment whilst the economic state of the country dictates that money should be dear and credit should be difficult.

Consolidated Balance Sheet: The surplus of Current Assets over Current Liabilities is £4,951,987, compared with £5,964,975 last year, but the Group reserves have been augmented by £1,063,241.

REBUILDING PROGRAMME

The eight large stores destroyed in the war represented an important part of our Organisation, and for this reason I have been careful to keep shareholders fully informed about the progress of the rebuilding programme. I am pleased to inform you that work on the new buildings is now proceeding apace and completion of these various reconstructions is in sight. Handleys of Southsea was opened for full trading in May last. Spooners of Plymouth is in the final stages of completion, and Marshall and Snelgrove of Birmingham will be finished early next year. The remaining stores will be completed within two to three years (some will be ready before that time, notably Curl Brothers, Limited, and Thornton-

Varley, Limited). Then, for the first time since the outbreak of war, we shall be able to reap the benefit of trading from properly equipped premises under normal conditions.

In the course of the year Debenhams and Freebody have converted their second floor into a Budget Shop, where moderately priced merchandise is displayed in the most attractive surroundings. The Budget Shop is the last stage in a planned extension of this store.

SUBSIDIARIES' PROGRESS

The profits of some of the larger subsidiaries are published and have in the main shown an improvement. A similar upward tendency is manifest throughout the majority of the other associated businesses, all of which I believe to be in a sound financial condition. As I have frequently stated, the wide-flung nature of our interests, which cater for all classes of trade, is a great asset to the Group, and has a steadying effect on earnings.

The process of modernisation is continuing, the most recent examples being at Affleck and Brown Limited, of Manchester; Bobby and Company Limited, of Leamington; Z. Dudley Limited, of Kingsland Road, E.; Kennards Limited, of Redhill; Pauldens Limited, of Manchester; and Plummer Roddis Limited, of Brighton.

No other stores have been acquired since I last reported to you, but in December, 1954, we purchased the freehold of Beacon House, Bristol. Part of the lower floors is occupied by our subsidiary, Jones and Company Limited, pending completion of their new building, which is now making excellent progress. The upper floors are suitable for offices, and it is intended to let this accommodation accordingly. In due course we shall develop this property as a modern store in the Marshall Group, for which purpose this building and its position are very well suited.

THE OUTLOOK

There is no doubt that our most pressing problems are twofold; ever-rising expenses and shortage of staff. The difficulty of controlling expenses is not a new subject for comment, but it is none the less an important one. I can only repeat that everything that can be done is done to keep these massive overheads at a reasonable level. The staff problem is common to all, and there is no easy solution to it.

The factors affecting trade in these times are many and varied, and although the physical controls which we endured in recent years have to a great extent been abandoned, we are still very much at the mercy of a Government fighting inflation, and the recent increase in purchase tax, designed to curb home consumption, is a case in point. I therefore find myself unable to forecast, with any degree of certainty, the immediate trading possibilities, but taking the longer view I consider the prospects are not unfavourable. Many of our businesses have been modernised and refitted and, when the new stores, which are on a larger scale than the old, are rebuilt, we shall be able to throw our full weight into competitive retailing, ready to grasp the opportunities that are open to us.

The report and accounts were adopted.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

RECORD INCOME

The annual general meeting of this company was held on December 8th in London.

Mr Robert Annan, the chairman, in the course of his speech, said: Turning first to the accounts of the operating company, New Consolidated Gold Fields Limited, the Working Profit for the year amounted to £1,828,000. The principal contribution continues to be made by dividends and interest on our investments, which at £1,467,000 constitute a further record and reflect the steady development of our important interests in the gold mines on the Far West Rand and in the production of platinum. The net profit for the year is £948,000.

We are submitting a resolution for the increase of the company's capital by the creation of 500,000 new Ordinary shares of £1 each, with the object of making an offer to the shareholders of The Gold Fields Rhodesian Development Company Limited to exchange their shares on the basis of one Gold Fields share for six shares of Gold Fields Rhodesian Development.

Our principal interest is still in gold mining, representing 77 per cent of the Stock Exchange value of our quoted investments. With large holdings in West Driefontein and Doornfontein where earnings are increasing, and in West Wits which will benefit accordingly, and our substantial holdings in Free State companies which are still developing or have yet to reach full production, our dividend income should continue to increase, provided the present operating conditions are maintained. The report was adopted.

W. & J. LAWLEY

The sixteenth annual general meeting of W. & J. Lawley, Limited, was held on December 14th in Birmingham.

Mr H. J. Gaunt (chairman and joint managing director) presided and, in the course of his speech, said:

The net profit for the year before taxation amounts to £55,887 as compared with £41,688 in the previous year. It is gratifying to be able to report this improvement in profits which arises largely as a result of a sharp increase in sales.

Out of the profit of £55,887 taxation requires £30,217, leaving a balance of £25,670. Your Directors recommend a dividend of 25 per cent.

Regarding the future, we cannot forecast what effect Government Policy will have on the Building Programme, but providing this is maintained at somewhere near its present level, we feel we can look forward with every confidence.

We have agreed to acquire the whole of the Issued Capital of E. Partridge and Company (Old Hill) Limited, who are makers of Drop Forgings, Smith Forgings and General Presswork. As substantial suppliers to the Building Trade this new acquisition will work in very happily with our own products, and should be greatly to our mutual advantage.

The Consideration for the Acquisition of the Company is the payment of £60,000 in cash and the Allotment credited as fully paid up of 400,000 1s. Ordinary Shares in W. & J. Lawley Limited.

The report was adopted, and at the subsequent Extraordinary General Meeting the creation of the additional Capital was approved.

INDIAN IRON AND STEEL COMPANY

RECORD PRODUCTION

MR T. LESLIE MARTIN'S REVIEW

The thirty-eighth general meeting of The Indian Iron and Steel Company, Limited, was held on November 28th in Calcutta.

Mr T. Leslie Martin, the chairman, in the course of his speech said: The outstanding feature of the working results of your Company for the year under review was the phenomenal production of finished steel which constitutes a record for the Company.

Given plant facilities and availability of raw materials, production is, of course, governed primarily by the will to work on the part of labour and I am pleased to report that since the unfortunate events of 1953 there has been a vast improvement in efficiency and effort on the part of the workers. Apart from the fact that without co-operative effort no industry can progress, this effort under a modern wage structure such as that adopted by your Company, brings its own material reward as the particulars of our payments to employees will demonstrate and it is more than unfortunate that the present incidence of taxation levied by Government denies any commensurate monetary reward to the executive and managerial staff on whose efforts, equally with those of labour, progress must depend.

IMPROVEMENT IN EFFICIENCY

The improvement in efficiency was very marked in the Melting Shop, where a large reduction was effected in the time taken for the repair of the Open Hearth Furnaces and with the added availability of the Furnaces it was, thus, possible to fully utilise the large stocks of pig iron and steel scrap that had accumulated as a result of the 1953 labour troubles in supplementation of the 521,838 tons of hot metal produced for steel-making purposes available from the two Blast Furnaces at Burnpur.

The output of steel ingots at 528,118 tons was, accordingly, a record for the Company and this, again, was increased by the large accumulated stock of ingots carried over from the preceding year. The Rolling Mills responded admirably to the challenge of the available tonnage of ingots with the result that a record production of 461,013 tons of saleable steel was finally achieved.

In view of the fact that the accumulated stocks of pig iron, steel scrap and rollable steel ingots have so greatly augmented the total production of finished steel during the year under review, it must be borne in mind that it is extremely unlikely that output results for the year 1954-55 will be repeated. There are other factors which may, and in all probability will, affect this.

DIVIDENDS

In the course of the early negotiations in 1952 in connection with the financial arrangements to be made to provide for the extensions now in progress, Government stated that in view of the large amount of finance that had to be provided by the Company from its own resources and the heavy indebtedness on loan account that would be incurred, they must be consulted in the matter of the distribution of profits earned, and at the appropriate time, commencing in June last, detailed and prolonged representations were accordingly made to Government to permit under the exceptional circumstances, not necessarily a

raising of the basic rate of dividend, but at least a payment of a special cash bonus for the year in order to allow to the shareholders some participation in the increased prosperity of the Company.

It is a matter of a great regret to your Directors that Government could not see their way to concede this or to take a wider view in the matter under the exceptional circumstances which were fully explained to them. Your Board, however, consider themselves bound by the orders of the Government on whose goodwill we must depend for discharging those onerous obligations which we have undertaken in connection with the expansion of the Company. These orders, they feel, cannot be ignored or their legality challenged without serious detriment to the interest of the Company. I urge upon you, therefore, the desirability, in spite of the disappointment that we all feel, of accepting with good grace the Government's final decision in the matter. The recommendation of your Directors is, therefore, limited to the payment of a dividend on the ordinary share capital at the previous rate of 10 per cent per annum, free of Indian Income Tax, the balance of the profits earned being carried to reserves.

INCREASE OF CAPITAL

There have been many rumours of late concerning the question of the Company raising further capital and I would take the opportunity of warning you that expectations entertained to the effect that rights or other share capital will be raised by the Company are premature and may prove to be without foundation. In order to explain the position I would remind you that there are two schemes of extensions which, though from a technical point of view may be regarded as one, are, on financial grounds, to be treated as entirely separate and independent of each other. The first one is described as the 1953 extensions in respect of which, as you know, we have incurred heavy liabilities to the World Bank and the Government of India. This scheme is in progress and is expected to be completed, all going well, in 1958.

The second scheme, described as the 1955 extensions, visualises the increase over the 1953 project of the production of saleable steel by 100,000 tons, the enlargement of the finishing capacity of the existing rolling mills and the addition of some new finishing capacity in order to make the production more flexible to meet the varying conditions of the market.

NEGOTIATIONS WITH GOVERNMENT

This scheme is still under consideration and negotiation with Government and no definite plans can be formulated until we know what the future retention prices, which are now under investigation by the Tariff Commission, are likely to be. It is for the implementation of this second scheme that the raising of further capital would be required, supplemented by means of such special element consisting of an increase in the new retention prices, as the Tariff Commission may recommend and the Government may allow, in order to fully cover the position. It will be clear to you, therefore, that no decision as to the necessity or other-

wise of raising further capital can be made until the Tariff Commission's Report and the Government's Resolution thereon have been received by us.

BOARD'S PRIMARY DUTY

Our primary duty is that we should not undertake any further liability which would in the slightest degree endanger the full and punctual discharge of all our heavy obligations in respect of the 1953 extensions out of the normal earnings of our existing equipment and of the new plant, after it has been completed and has been brought into operation. This is not to say that given reasonable conditions we would not be prepared to do our best to further the interests of the country to the utmost of our power.

What I wish to emphasise now is that until we know the recommendations of the Tariff Commission and the Government's Resolution, and have had full opportunity to assess the position we shall not be able to come to any decision as to the proposed 1955 extensions. The report was adopted.

THE WRIGHT SADDLE COMPANY LIMITED

SIR ARTHUR COLEGATE'S REVIEW

The Nineteenth Annual General Meeting of The Wright Saddle Company Limited was held on December 15, 1955, at Birmingham.

The Chairman said in the course of his speech:

The trading profit for the year ended August 31st last amounted to £107,477, as compared with £109,684 for the previous year. The net profit after all chargeable expenditure, but before Taxation, amounted to £86,534.

From this must be deducted Taxation to the amount of no less than £47,766, leaving £38,768. After adding the Taxation adjustment relating to previous years and the carry forward of £28,488, we have available the sum of £69,632, out of which an interim dividend of 6½ per cent (less tax) was paid last April. We now propose to put £15,000 to General Reserve, to increase the carry forward from £28,488 to £37,239, and to pay a final dividend of 11½ per cent, less tax.

It will be seen from the Balance Sheet that our liquid position remains a very strong one.

The past year has in many ways been a somewhat difficult one, but I think you will agree that the results are not unsatisfactory. The turnover was well up to our expectations, but while profits in the first half of our financial year were running at a reasonable level, the rapidly increasing costs both of materials and of wages made themselves seriously felt in the latter half of our year, and with the greatest reluctance we felt compelled to make some adjustment in our prices, which had remained practically unchanged for the past three years.

So far as the future is concerned, I am reasonably optimistic. The impression that I gathered at the Cycle and Motor-Cycle Show (which was held in London from November 12th to 19th) was that the industry is in a very healthy condition. The exhibits in range, variety and quality were such as could not have been seen in any other country in the world. We ourselves had our Stand as usual, at which we showed some of our latest developments, and we received many congratulations from all sides on our new gussetless and seamless spring seat Saddle. Its appearance on so many of the fine bicycles exhibited was a measure of

its outstanding success. Our new Duroflex Plastic topped Racing Saddle was also favourably commented on and we believe has a very considerable future in front of it, together with other models in this range introduced previously.

One of the features of the Show was the great interest shown in power-assisted Bicycles. We have been and are keeping closely in touch with this development and we are fully equipped to meet any demands which the Trade may make upon us.

There are several other directions in which we are interesting ourselves and I feel that I can say that your Company is well in the forefront so far as the demands of the industry are concerned. The new factory at Redditch is proceeding according to plan, and this will be of great assistance to us, especially when our older factories in Bristol Street are finally taken over by the Birmingham Corporation.

In conclusion I would remind you that our industry is extremely competitive—of which we make no complaint. We believe that we have the resources both financial and technical to enable us to obtain our fair share of the trade, and we shall not cease to take all possible steps to keep ourselves and our plant fully up-to-date. In this connection I wish to pay tribute to our Managing Director, Mr. C. A. Holland, and our Works Director, Mr. W. G. Sheppard, together with the staff whose teamwork has been invaluable in achieving the results which I have the pleasure of putting before you today.

The Report and Accounts were adopted. Mr J. H. Gold was re-elected a Director and the Meeting concluded with a hearty vote of thanks to the Chairman.

ANTOFAGASTA (CHILE) AND BOLIVIA RAILWAY

The sixty-seventh annual general meeting of this company was held on December 13th in London, Mr H. C. Drayton, Chairman, presiding. The following are extracts from his circulated statement for 1954:

The net receipts from the operation of our Railways and Waterworks were £668,630, a decrease of £367,395. After adding other income and the balance from 1953, and deducting the loss on operating the lines of the Bolivia Railway Company and Aguas Blancas Railway, fixed charges and the appropriations detailed in the Net Revenue Account, the balance to the credit of that Account at December 31, 1954, was £297,517.

In 1954 increased traffics were carried of Manufactured Nitrate, Copper Bars and Chilean Products, but there were decreases in the tonnages of other articles.

Passenger traffic in Chile showed a reduction of nearly 60 per cent in numbers compared with 1953 due to increased road competition. In Bolivia, on the other hand, there was an increase of nearly 20 per cent.

The chairman, addressing the meeting, said that they had had another big wage demand in Chile. Other industries had conceded a big increase in wages and this company would have to do something. They had put in for an increased tariff which would amount to 80 per cent. In Bolivia also they had very big demands and discussions were in progress. Last year he had said that the Bolivia Railway Company incorporated in America had been declared a Western Hemisphere Company, which solved many of their American tax problems. The difficulties had been overcome and the money could now come to the Antofagasta Company probably in February or March next. It would probably be not less than £450,000.

The Report and Accounts were adopted.

HARRISONS AND CROSFIELD

GROUP PROFITS MAINTAINED

The forty-seventh annual general meeting of Harrisons and Crosfield, Limited, was held on December 12th in London.

Sir Eric Miller, the chairman, in the course of his speech, said: The fact that our Group profits for the year under review are much on a par with those earned in the previous year might suggest to the uninitiated that we are merely pursuing the even tenor of a prosaic way. This is, however, far from being the case; the explanation is to be found in the diversification of our interests, brought about over the years as a deliberate act of policy.

The net profit applicable to the Parent Company, after taxation and all charges, including provisions brought back, was £657,384. The balance brought forward was £600,496, making available £1,257,880, out of which we have transferred to Reserve for unremitted profits £50,000, and General Reserve £575,000. The final dividend of 16 per cent will make 20 per cent for the year on the Deferred Ordinary Stock.

GROUP TURNOVER

Our Group trading turnover exceeded £50 million, apart altogether from the large volume of produce which we market for our plantation companies and the general merchandise which we handle as agents. The figure I have just given you will, I trust, make it clear, once and for all, that Harrisons and Crosfield are, first and foremost, merchants. Nevertheless, they continue to give wholehearted attention to the interests of the Eastern plantation companies, which they have done so much to foster.

Reviewing an eventful year in the Tea Industry, he said: The credit squeeze imposed by the Chancellor is forcing the trade to carry minimum stocks and to buy only for current or immediate needs. There may well be a further strengthening of prices in London during the next few weeks, but there is a lot of tea still to come from India which should have a steadying influence and prevent any undue rise in prices.

RUBBER SUPPLIES

In regard to rubber, he said: Available supplies of natural rubber and synthetics are likely to remain barely sufficient to cover essential requirements, and any urgent orders for near delivery may have a disproportionate effect on the price. There is general agreement that more fireworks in the market would be highly detrimental to the best interests of the Industry. This consideration, in my opinion, far outweighs any temporary financial benefit accruing to the Governments of the Eastern producing countries through the penal taxation which they are exacting.

US output of automobiles and trucks in 1955 has far exceeded expectations and will establish an all-time record of some eight million vehicles. Less spectacular but impressive growth is being recorded in the rest of the world, and the fact that road construction is lagging far behind current needs seems to be of no immediate effect.

The output of synthetics can be increased more speedily than that of natural rubber, but natural is still essential to the industry, and it behoves the Estates to proceed steadily with their replanting programme.

In conclusion, Sir Eric Miller said: It is proposed to make a free scrip issue of one share of £1 for every £2 stock now held.

The report and accounts were adopted.

HARRIS LEBUS LIMITED RECORD OUTPUT

The eighth annual general meeting of Harris Lebus Limited was held on December 14th in London, Sir Herman Lebus, CBE, JP, chairman and managing director, presiding, said the accounts show a profit for the period of 52 weeks to July 15, 1955, of £653,501 after providing for all charges, including depreciation, compared with £600,136 for the period of 53 weeks to July 16, 1954.

Income Tax and Profits Tax computed on the profit for the period amount to £355,058, leaving a net profit of £298,443, to which must be added an amount of £20,000 in respect of taxation provision made in previous years and now no longer required; accordingly, out of the results for this period, an amount of £318,443 is added to the amount of unappropriated profits of £115,440 brought forward from last year, making a total of £433,883 available for appropriation.

The Dividend on the Preference Stock, less tax, of £22,500 and the proposed Ordinary Dividend of 9 per cent which, less tax, amounts to £103,500, absorb £126,000.

Last year I informed you that we could look forward to improved results. These have all been realised, though to a smaller extent than would no doubt have been the case if the abnormal conditions had not occurred. These conditions became operative early in the second half of our financial year; it was then that the Chancellor twice increased the Bank Rate and followed this by restrictions on Hire Purchase trading.

HIRE-PURCHASE CHANGES

Until that time it was not obligatory in the retail trade that Hire Purchase Agreements for furniture should carry any down payment at all, and the purchase by the public of additional articles was permitted to be added to existing Hire Purchase Agreements. In February, 1955, the Chancellor ordered that a minimum down payment of 15 per cent must be made and that no addition to Hire Purchase Agreements would be permitted. A maximum term of twenty-four months for Hire Purchase Agreements was also imposed.

Reduction in the purchase of furniture by the public quickly followed and was very marked. Trade Associations and Trades Unions protested to the Chancellor, but he definitely decided that there would be no alteration.

The demand for our products has continued to grow and we have expanded our share of the available furniture market.

During the year under review, more units of furniture were delivered than in any previous year. Your Directors are not dissatisfied with results that show improvements on those of last year. The year 1955-56 has opened in a satisfactory manner.

Prices of our raw materials have remained at a high level. Freight rates of timber have continued to rise and these have a serious impact on our industry. The report and accounts were adopted.

CHAIRMAN'S ADDITIONAL REMARKS

The meeting concluded with the passing of a vote of thanks to the chairman, directors, staff and employees.

In expressing appreciation to the stockholders for their vote of thanks, the chairman said that he thought they would be glad to know that the demand for the company's products still continued to grow and the larger production and sales referred to in his review continued to operate.

THE ALUMINIUM CASTINGS COMPANY

A RECORD YEAR

SUBSTANTIAL EXPANSION OF TURNOVER

The forty-ninth annual general meeting of The Aluminium Castings Co., Ltd., was held on December 9th in Glasgow, Mr R. K. Calder (Chairman and Managing Director) presiding.

The following is an extract from his statement circulated with the accounts:

It gives me great pleasure to be able to report that the Group has enjoyed a record year. Turnover showed further substantial expansion, and as a result trading profit advanced by some £68,000 to £367,366.

Although charges against trading profits increased by £17,285, the profit before taxation increased by some 27 per cent to £264,200, as compared with £206,767 for the previous year.

The charge for taxation amounted at £133,777 to just over half the profit of £264,200, and the net profit remaining after taxation is therefore the very satisfactory figure of £130,423, as compared with £52,005 shown for the previous year.

After various provisions the final profit for the year amounts to £92,922, and this, added to the balance brought forward of £164,271, gives an available balance of £257,193, which your Directors recommend should be carried forward.

While Bank and other borrowings showed

ASSOCIATED BRITISH MALTSTERS

MODERNISATION AND DEVELOPMENT CONTINUES

MR H. N. HUME ON BOARD'S PROGRESSIVE POLICY

The thirty-fourth annual general meeting of Associated British Maltsters Limited will be held on January 9th, in London.

The following are extracts from the Statement by the Chairman, Mr H. N. Hume, CBE, MC, which has been circulated with the Report and Accounts:

After careful consideration and mainly because of the accelerated barley harvests resulting from the use of combine harvesters, your Directors have decided that July 31st is a more convenient and appropriate date on which to end the Group's trading year; in consequence, the accounts now presented are for eleven months to July 31, 1955, and the figures of the previous twelve months are not a strict comparison. If the profit of £311,540 is adjusted to twelve months there results a figure of £339,800, which compares with £368,550.

These accounts cover the handling of the appallingly wet 1954 harvest, and are as good as they are because of the very substantial drying and storage facilities we have put up since the war, and also because we have gone into the export trade to such a large extent. The need for storage is, however, not yet satisfied, and we shall have to go on spending money for this purpose. From the profit of the eleven months' trading, we recommend our customary 10 per cent dividend (which is, of course, at the annual rate of 10.9 per cent). Changing agricultural conditions are now forcing us to modernise, and we still believe that this modernisation should be financed in the main from the Group's own

some reduction at the date of the Accounts, I must emphasise that in the current year the Company has undertaken substantial additional borrowing in order to finance two major capital transactions.

Firstly, the Company has since the end of the year acquired the issued capital of Renfrew Aircraft and Engineering Company Limited of Renfrew, Ontario, Canada. This Company is engaged in the production of aero-engine components.

Secondly, it became necessary to secure a new factory on behalf of the Bright Companies, and this has recently been acquired and is now in full operation.

SUBSIDIARY COMPANIES' ACTIVITIES

Aluminium Bronze Company had a record year both as regards output and earnings. Continued expenditure on plant and improved operating efficiency have contributed to keep prices of the end product at reasonable levels, and I am glad to report, therefore, that progress has continued in the current year on an increasing scale.

Atkinson's Agricultural Appliances Limited failed to hold the record output achieved in the previous year, but the earlier heavy development expenditure bore fruit and earnings in consequence showed further improvement.

The Atkinson-Hacker Tractor Company again incurred a loss, which was met by a subvention payment.

The Bright Group of Companies have more than justified the confidence which your Directors expressed last year. Output has continued to advance month by month.

A very special tribute is due to Major

resources. We look forward to being able to repeat from time to time, the free issue from Reserves made a year ago.

The big new malt factory we built at Louth is giving excellent results, and from this experience we have decided to build another one in Yorkshire, the cost of which will be in the neighbourhood of £500,000. We hope the first part of it will be in use for the 1957 crop. Modernisation of several of our bigger and better maltings in various parts of the country continues, and in this way we can keep up the quality and service we give to the Brewers and other users of malt. Competition is becoming keener all the time, both at home and in export markets, and the only way to meet it and to absorb rising costs is to increase our efficiency.

CURRENT YEAR'S GOOD START

The wonderful weather of last summer was a great boon to the Brewers, and has also led to one of the heaviest barley harvests for many years, the yield being increased substantially by the new variety, Proctor. A fair proportion of Proctor is now being malted, and we await with interest the outcome of the use of this variety on a commercial scale for brewing purposes. In the current year we have therefore got away to a good start, and it only remains to hope for another fine summer. I feel that any prospect of a relief in the existing taxation on beer must now be regarded as unlikely for the time being and, with normal weather, the shrinkage in beer consumption (which was halted by last summer's weather) is likely to continue. Most fortunately, your Company has, since 1938, been developing an export trade to many countries, and this now constitutes a substantial part of our business.

The non-malting activities of the Group made a useful contribution to the profits now presented.

I hope this review will convince Stock-

Bright and his staff for the efficiency with which they conducted the recent removal of production facilities to the new works referred to earlier.

Burnley Aircraft Products again had a year of high activity. There was some decline in the level of new construction work, but the repair and service of Jet Engines more than offset this.

Scottish Aluminium Ware Limited again had a disappointing year although output increased substantially. The loss incurred was met by a subvention payment.

The Verichrome Plating Companies at Walsall and Larkhall both contributed record outputs and earnings and progress has continued to be made in the current year.

CONSERVATION OF RESOURCES

Despite the record profit achieved, I very much regret that it is essential to conserve the Company's cash resources and your Directors are again unable to recommend the payment of a dividend on the equity capital.

Your Directors have been negotiating for the provision of additional permanent capital, but the detailed negotiations have not yet been concluded.

In conclusion, I am sure that the Shareholders will join with me in paying tribute to the Directors and staff for their efforts in achieving such satisfactory progress. I am hopeful that the records of last year will be surpassed in the current period of operations, and this would be a most fitting achievement to mark the Fiftieth Year of the Company's existence.

The report and accounts were adopted.

holders that the management are constantly planning ways of improving the stability and prosperity of the Group.

LONDON AND RHODESIAN MINING AND LAND COMPANY

The annual general meeting of London and Rhodesian Mining and Land Company, Limited, was held on December 9th in London.

Sir Joseph Ball, KBE (chairman and managing director), presided, and in the course of his speech said:

The net profit for the year under review, after taxation, amounted to £48,542, as compared with £61,425 for the previous year. Your Directors recommend a final dividend of 6½ per cent, less tax, thereby making a total distribution of 10 per cent for the year.

Mining.—*Mazoe Consolidated Mines, Limited*: As a result of satisfactory development results during the year, ore reserves, both at the Connaught and Bucks Sections, show a substantial increase in tonnage compared with last year.

Sabi Valley Option: Last year I referred to the acquisition by your Company of a three months' development option over three blocks of base mineral claims in the Upper Sabi Valley. The recovery of the concentrates did not come up to expectations, and your Board decided to discontinue operations on the property.

Cam and Motor Gold Mining Company (1919), Limited: Operations at the Cam and Motor mine continue to be extremely satisfactory.

Coronation Syndicate, Limited: The Group mining working profits earned during the year amounted to £191,561, compared with £162,049 for the previous year.

The report was adopted.

AIRE WOOL COMPANY, LTD.

(Woolcombers and Topmakers)

LORD BARNBY'S STATEMENT

The twentieth annual general meeting of Aire Wool Company, Limited, was held on December 15th at Shipley. Colonel Lord Barnby, CMG, CBE, MVO (the chairman), presided. The following is an extract from his circulated statement:

RESULTS AND TRADING CONDITIONS

The Group Profits for the year after all charges but before Taxation were £204,104 and after Taxation £102,008 compared with £183,696 last year.

The Trading Year under review was, profitwise, disappointing, an experience not unusual with others in the same industry for comparable trading periods. Our Group turnover, however, constituted a record.

During our Trading Year there were many unhappy features of abnormal character all added to profitable trading.

The Dock Strike in Australia seriously delayed arrivals of wool. Competition of exceptional intensity from forward short selling of wool by Buying Brokers from origin at prices anticipating further declines, contributed to instability and lack of confidence.

Later came the Railway strike in UK and, still more disastrous for the Wool Textile Industry, the UK Dock strike. Many wool ships were diverted to the Continent to be further immobilised by strikes there while demurrage charges were loaded on the wool cargoes. Then came an advance in wages leading to an increase in combing tariff. All these extra charges, unprovided for in the sale price for forward delivery of Tops, had to be absorbed by the Topmakers. And all this added to inescapable inventory loss on stocks by reason of the decline in wool prices.

A final payment of 12½ per cent less Tax on the Ordinary Stock is again recommended, making a total of 25 per cent less Tax for the year, representing a percentage net Ordinary Dividend on the Ordinary Stockholders' Equity of a modest 2½ per cent.

Although our South African Topmaking operations were unprofitable, the Commission Scouring, Carbonizing and Combing Company, in which we have a joint participation with our South African associates, has experienced a most satisfactory year.

COMBING TARIFFS

The UK Combing tariff remains the lowest in Europe. Since the Combing tariff barely covers the replacement costs of machinery installations it compels reflection whether we are not merely handing to future overseas competitors the advantage of accumulated reserves of our industry. Incidentally, were the average work load for combed Top taken, and replacement costs of modern installation calculated, it would show this as representing an investment of around £4,000 per productive operative.

It would be unfortunate if in Monopolies Legislation hasty and emotional action to attempt to correct alleged malpractices of totally different character should hamper collective price agreements like that of the Wool Combing Tariff and so restore the wide open variations of irresponsible competition, though now sufficiently long ago to come only within the memories of the older members of the trading community.

WOOL POSITION

In 1951 when prices were previously nearly as low as now, the published activity of

combing and spinning machinery was 60 per cent; now, at time of writing, it is above 90 per cent. So with full employment, with peak wage earnings in UK and with a steadily expanding world population and rising living standards, the increase of world wool production should easily be absorbed. Lower wool prices usually mean wider distribution of finished products, which promises well for business in the near future.

Surpluses of primary commodities in Government hands are always a menace to prices. The left-over stocks of the past several years from the intake of wool by USA government under its Price Parity Support scheme has during the past year confirmed this. But uncertainties have in this case been increased by continual downward revision of appraisal prices. These unforeseeable releases of wool from USA stockpile at under current market levels have made users nervous and compelled a continual bearish outlook and a minimum inventory policy.

Government urgings to increase exports have been answered, as evidenced by wool top exports of 57 million lb during the first nine months of this year following a total of 67 million lb in 1954 (calendar). This compares with the average of 58 million lb for the previous three years' total exports.

FUTURE OUTLOOK

From dispatches in the Press and reading into Ministers' speeches it would seem we may expect progressive contraction of the cotton textile industry. (Such is the current pressure of "duty-free" imports manufactured with Asiatic labour—India, Hong Kong, Japan.) There is apparent composure in that displaced operatives absorbed into other industries will produce even more in export earnings. Ought we in wool textiles to read into this a warning of possible future pressure on our own industry from future manufactured imports from Asiatic countries?

We note progressive extension of plans for "commission" service factories overseas by large British corporations such as the BDA or the CPA. This appears to connote acceptance by them of inevitability. Such discussion on the propriety of British textile machinery exports which has, at various periods, been so stupidly pilloried.

As to the future course of wool values, it seems now as much as ever unwise to attempt any forecast. Of course, if wool production could be absorbed, as it was, in the 1952-53 year on a basis up to 160d. for a 64s. Top, with the marked expansion since then of buying power of the world it would seem reasonable to assume that on the present basis of under 110d. per lb there should be ahead of us good manufacturing activity.

In conveying my thanks on behalf of the Board to the Directors and personnel of all our Subsidiary Companies, I wish them to know that during this very difficult year of trading their wholehearted services and continuous loyalty have been more than ever appreciated. In this expression of thanks we wish to mention particularly our Managing Director, Mr R. P. Pitcher.

The report and accounts were adopted.

ALVIS LIMITED

STEADY PROGRESS

The thirty-third Annual Meeting was held on December 13th in Coventry, Mr J. J. Parkes (Chairman and Managing Director) presiding. The following is an extract from the Chairman's circulated Statement:

The Accounts show a Trading Surplus of £293,710, this being an increase of £28,859 over the previous year's surplus. With a Profit of £10,741 on Sales of Sundry Plant, the total Trading Profit becomes £304,451. Income Tax takes £131,750, and Profits Tax £22,000, leaving a net Profit of £150,701.

The fixed dividend on the Preference Stock absorbed £4,578, and £100,000 has been transferred to General Reserve (which now stands at £550,000), leaving, with the balance of Profit brought forward, £122,678. Your Board recommends a dividend of 10 per cent, less tax, on the Ordinary Stock, together with a participating dividend of 2½ per cent, less tax, on the Preference Stock, leaving £86,740 to be carried forward.
